The amalgamation envisages an underground connecting link between section 3D of Nourse Mines and City Deep which will enable ore to be brought to the surface through No. 5 shaft of that mine. Moreover, the underground arrangement will enable Nourse to extend its workings by another 2,000 feet which would otherwise not be profitable. All ore brought from No. 5 shaft will be treated in the City Deep mill, so that it can work to capacity, while the Nourse mill will be operated on a reduced scale mainly from ore mined in the upper section of the mine.

The merger will be effected by the issue of 391,832 £1 shares in City Deep to Nourse Mines in exchange for the whole of its undertaking. It is proposed to increase the authorised capital of City Deep from £1,695,000 in £1 shares (of which 60,000 shares are at present unissued) to £2,500,000 (of which it is intended to keep 473,168 shares in reserve for future capital requirements). In the event of a subsequent winding up, the terms of the proposal would enable Nourse Mines to issue the new City Deep shares to its shareholders on the basis of one City Deep share for every two shares of Nourse Mines held. This conforms very closely to the relative prices of the shares of the two companies on the eve of the announcement when City Deep were quoted at 2 and Nourse Mines at 1⅛. Perhaps the best reason to commend the merger to shareholders is the expectation that it should result in higher profits than the two companies could earn if they continued to work independently.

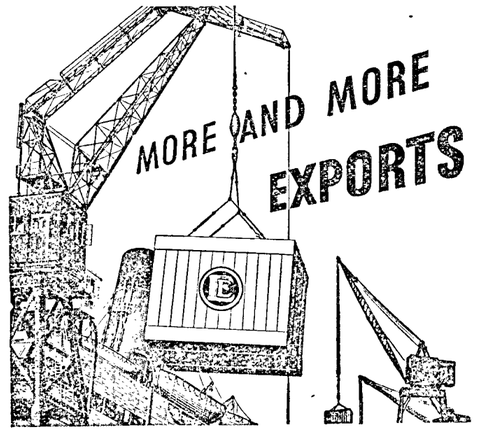
Clothing Stocks and Rationing

The latest figures for the wholesale clothing trade in July seem, at first sight, to lend weight to the renewed demands for the abolition of the clothing ration; but it is doubtful whether sweeping abolition can be accepted as proved. Recent additions to coupon purchasing power and the de-rationing of various items have indeed put demand to the test. Clothing sales increased sharply after the extra coupons were issued in June, but the increase proved shortlived. High prices (they are to be further increased from Monday next on a wide range of utility clothing) acted so effectively as a deterrent that the additional coupons have by no means been used up in full.

In July the wholesale clothing trade usually experiences an expansion in activity, in anticipation of the seasonal expansion in retail business in the autumn. This year, however, the index of wholesale sales fell by 11 per cent compared with June, and thus moved against the normal trend. But the fall of 11 per cent needs careful interpretation for it resulted mainly from a fall of 20 per cent in hosiery sales from the high level attained in June when sales were stimulated by the coupon bonus issue. Sales of all garments in July were slightly below the level of July last year, and there has been a striking increase of 55 per cent in stocks; this combined figure covers an increase of as much as 91 per cent in stocks of hosiery, and substantial increases, of 24 per cent and 48 per cent respectively, in the stocks of women's, and men's and boy's made-up clothing stocks.



The level of wholesale purchases of all garments has remained virtually unchanged in July compared with June, but compared with July last year purchases of all garments have fallen by 10 per cent. Again, this change covers wide divergences for individual items.

The trend during the past year is clear. Wholesale disposals have been lagging behind wholesale purchases and the net result is a substantial increase in stocks. From this movement the trade concludes the clothing ration is fast becoming an anachronism and for further support it points to the reactions to the coupon increase in June. But "clothing" is not a homogeneous commodity. There are many lines such as shirtings, fine cottons, certain types of men's suitings and high quality woollen fabrics on which the success of the export effort in textiles depends. To abandon clothes rationing would imperil this effort at a critical stage. But there is much to be said for greater flexibility in the rationing scheme—including, if necessary, the up-pointing of materials for which there is a good export demand.

* * *

Prospects for Prices

In August, for the second month running, the Board of Trade's index of wholesale prices revealed a slight fall. The decline was of no material significance—less than one-half of 1 per cent—but it prompts, nevertheless, further speculation on the vital question whether the peak in prices has been passed. Part of the decline was seasonal, for food prices generally fall in the summer months. But the chief reason appears to have been the relatively sharp decline in cotton prices which more than offset increased prices for coal, iron and steel and non-ferrous metals. Analysed in a different way, the slight fall of prices is chiefly reflected in basic industrial materials, and to a much smaller extent in intermediate products and manufactured articles.

THE ENGLISH ELECTRIC
COMPANY LIMITED

The "English Electric" factories constitute one of the largest British industrial organizations supplying the world with plant and apparatus for the generation, transmission, distribution and utilization of electrical energy.
These exports represent a major national asset and make an important contribution to help Britain pay for the imported food and raw material she requires.

Works: Stafford, Preston, Rugby, Bradford, Liverpool

INCENTIVE
IN A TYRE FACTORY
Co-operative Award System Raises Output and Quality

BETTER WORK, BETTER PAY. This is the gist of the Henley Tyre Co-operative Award Scheme that has recently raised standards of quality higher than ever before.

This is incentive in action.

All tyre manufacturers use the best materials available, reliable formulas, proved and trusted methods, but these alone do not ensure a finished product of a high standard.

TO RAISE QUALITY

The very latest machines take their part in making the tyres, but what decides whether a tyre is to be first class or not is the work that goes into over 50 processes that can only be done by hand.

The new Henley Co-operative Scheme does not rush output. It pays the workers on *quality*. Impartial experts assess the standard of each man's or woman's work.

As any commonsense business man would expect, quality has risen very considerably. So has output, though output is a secondary consideration.

The workers like the scheme. With no pressure to work fast, they can do good work that is rewarded by bigger pay packets.

Henley's like the scheme. It raises the already high standard of their tyres.

Motorists will like the scheme. Already it is giving them more perfectly constructed and harder wearing tyres. Extra incentive means fine workmanship. Fine workmanship makes Henley better than the good tyres they have always been.

INCENTIVE IN ACTION

For a fuller account of this successful quality incentive write for the descriptive booklet "Incentive in Action," Dept. Advt /L. at the address below.

HENLEY'S TYRE AND RUBBER CO. LTD.,
MILTON COURT, WESTCOTT, DORKING, SURREY.

It can, of course, be only a matter of conjecture at present whether the peak in prices has been passed. There are indications of lower prices in prospect for certain agricultural products—foodstuffs and raw materials—but their effect on British wholesale prices is likely to be problematical owing to the existence of contracts at fixed prices. Under more normal circumstances the beginning of a steady fall in prices might be expected, particularly

in primary farm products ; at present the whole structure of British wholesale prices is artificial. The domestic policy of the United States also has a profound influence on world prices. The new defence programme and increased stockpiling activity may well limit any fall in prices of certain commodities which may be in prospect It is still aggregate demand rather than aggregate supply, which threatens to be excessive

Shorter Notes

It is reported that ingot steel production in Bizonia during August touched a record postwar rate equivalent to 6,000,000 metric tons a year, which it was not expected to reach until next January. The Ruhr mills' production was 28 per cent over the original August target figure. Increased scrap deliveries, good coal deliveries, and improved labour productivity are thought to be the chief causes of this encouraging increase. It is to be hoped that the supplies of fuel and electric power will remain adequate to maintain them.

★

By a Board of Trade Order issued under the Companies Act, 1948, shipping companies, other than those concerned wholly or mainly with voyages between ports within the United Kingdom, Eire, the Channel Islands and the Isle of Man, will in future be exempt from the statutory obligation to disclose certain information relating to their reserves when making up their accounts. A company considering itself exempt must include a note in the balance sheet to that effect .

★

The disturbances in Palestine underlie the decision to pass the dividend on the ordinary and "A" ordinary shares of the Palestine Electric Corporation, for the net profit suffered an only moderate setback from £P158,067 to £P142,486. It would appear that the disturbances have so far not resulted in any significant damage to plant, but in a sharp rise in operating expenditure, which in 1947 increased by 34 per cent. The rise in costs was caused particularly by the need for special security measures. The cost of continued expansion has necessitated heavy capital expenditure, to which the chairman made reference last year. The cost was at first met from reserves, but more recently also from bank loans, which stresses the need for the preservation of resources. "As soon as circumstances permit," it is proposed to proceed with an issue of capital.

★

A meeting took place on Tuesday between representatives of the Engineering and Allied Employers' National Federation and the trade unions concerned to consider the recent recommendation of the Court of Inquiry to increase engineering wages by 5s. a week. Though no commitments were entered into, it would appear that the employers' federation are, in principle, ready to accept the court recommendations. Further consultations were due to take place at York later this week.

★

Mr Harold Wilson in the course of winding up the debate on the Address in the House of Commons last Friday foreshadowed that the export target for 1949 would probably be set, for the concluding months of that year, at 160 per cent of the volume of exports in 1938.

★

The Lord Chancellor has formed, in accordance with Section 31 of the Electricity Act, 1947, the arbitration tribunal to deal with disputes in England concerning the valuation placed on electricity stock which falls within the scope of the Act. A parallel tribunal has been formed to arbitrate in Scotland. *The Economist* on September 4th drew attention to the absence of such a tribunal in connection with the disputed value of Central Electricity Board 3½ per cent stock.

★

Steel production for August was at the annual rate of 14,117,000 tons, two million tons higher than in August last year. The most interesting feature of the output returns was the rebound after the holiday to a production rate of over 15 million tons per year.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Gestetner; R. & J. Hill.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) To latest redemption date. (m) 15 months. Yield Basis 25%. † Free of tax.

Consent of His Majesty's Treasury has been obtained to this issue in compliance with the Order made under Section 1 of the Borrowing (Control and Guarantees) Act, 1946.

Issue of £15,000,000 Government of the Commonwealth of Australia

3 per cent. Registered Stock, 1965-1967

at the rate of £100 per cent.

Interest payable 1st January and 1st July.
Six months' Interest will be paid on 1st July, 1949.

The Government of the Commonwealth of Australia will comply with the requirements of the Colonial Stock Act, 1900, in order that **Trustees may invest in the Stock,** subject to the provisions set forth in the Trustee Act, 1925.

OFFER OF CONVERSION TO HOLDERS OF

£16,082,849 COMMONWEALTH OF AUSTRALIA 3⅛% REGISTERED STOCK, 1946-1949.
(for which notice of repayment on 1st January, 1949, has been given.)

£5,170,146 VICTORIA 3% CONSOLIDATED INSCRIBED STOCK, 1929-1949.
(maturing 1st January, 1949.)

£21,252,995

COMMONWEALTH BANK OF AUSTRALIA is authorised by the Government of the Commonwealth of Australia to offer to holders of the above-mentioned Stocks, **conversion** of their holdings, in whole or in part, into an equal amount of Government of the Commonwealth of Australia 3 per cent. Registered Stock, 1965-1967, on the terms set forth in this Prospectus.

The aggregate amount of the above-mentioned Stocks outstanding is £21,252,995. This offer of conversion is limited to a total amount of £15,000,000 and the List will be closed when applications totalling that amount of Stock have been accepted. In any case the List will be closed not later than 7th October, 1948.

Principal of the new Loan will be repaid in London at par on 1st July, 1967, the Government of the Commonwealth of Australia having the option to redeem the Stock at par, in whole or in part, on or after 1st July, 1965, on giving three months' notice by public advertisement.

The Loan, which has been approved by the Australian Loan Council, is authorised by Acts No. 23 of 1919, No. 5 of 1928, No. 4 of 1929 and No. 46 of 1944, of the Parliament of the Commonwealth of Australia, and is issued in accordance with a law passed by that Parliament by which the Commonwealth of Australia, as from 1st July, 1929, took over the debts of the various States. The direct liability of the Commonwealth to Stockholders and Bondholders in respect of the Loans so taken over was confirmed in the Financial Agreements (Commonwealth Liability) Act, which became law in March, 1932.

Holders of Commonwealth of Australia 3½ per cent. Registered Stock, 1946-1949, whose applications for conversion are accepted will receive on 1st January, 1949, an interest payment of £1 1s. 11d. per cent. (less tax) representing three and a half months' interest at the rate of 3½ per cent. per annum from 15th September, 1948.

Holders of Victoria 3 per cent. Consolidated Inscribed Stock, 1929-1949, whose applications for conversion are accepted will receive on 1st January, 1949, the usual six months' interest then due.

Six months' interest on the new Stock will be paid on 1st July, 1949.

Applications for conversion must be lodged on the appropriate forms: in the case of Commonwealth of Australia 3½ per cent. Registered Stock, 1946-1949, at COMMONWEALTH BANK OF AUSTRALIA, 8, Old Jewry, London, E.C.2; and in the case of Victoria 3 per cent. Consolidated Inscribed Stock, 1929-1949, at WESTMINSTER BANK LIMITED, Stock Transfer Office, 41, Lothbury, London, E.C.2. Forms for conversion have been posted to the Stockholders, or, in respect of joint accounts, to the Stockholder first named in such accounts.

Applications for conversion of Victoria 3 per cent. Consolidated Inscribed Stock, 1929-1949, Stock Certificates to Bearer must be accompanied by the relative Stock Certificates, and unmatured Coupons, and must be lodged at WESTMINSTER BANK LIMITED, Stock Transfer Office, 41, Lothbury, London, E.C.2. Interest payable on 1st January, 1949, will be paid by Warrant.

Any Commonwealth of Australia 3½ per cent. Registered Stock, 1946-1949, not converted will be paid off at par on 1st January, 1949, together with an interest payment of £1 1s. 11d. per cent. (less tax) representing three and a half months' interest from 15th September, 1948.

Any Victoria 3 per cent. Consolidated Inscribed Stock, 1929-1949, not converted will be paid off at par on 1st January, 1949, together with the six months' interest then due.

The books of both the above Stocks will be finally closed for transfers on the evening of 30th November, 1948. Instructions as to the disposal of redemption moneys must be lodged at the appropriate Banks on the prescribed forms, which will be forwarded in due course.

The Stock now offered will be registered and transferable in any amount by deed, at COMMONWEALTH BANK OF AUSTRALIA, 8, Old Jewry, London, E.C.2. Stamp duty on all transfers will be paid by the Government of the Commonwealth of Australia. Interest Warrants will be transmitted by post at the Stockholders' risk, and in the case of joint accounts the warrants will be forwarded to the person first named in the account, unless instructions to the contrary be given.

Commonwealth of Australia Stocks issued and payable in London and the interest thereon, the property of persons not domiciled in Australia, are not, and will not be, subject to any taxes, duties or levies in Australia.

All Commonwealth Loans, all Loans issued by the several States and now taken over by the Commonwealth, and all Loans guaranteed by the Commonwealth, carry a Sinking Fund in accordance with the provisions of the National Debt Sinking Fund Act, 1923-1934, and the Financial Agreement Acts.

In the case of all such Loans, the following contributions to the Sinking Fund must be made out of Commonwealth and State Revenues :—

(a) On the present Conversion Loan and all Loans existing on 30th June, 1927, including such Loans when converted into other Loans, a minimum of 7s. 6d. Australian currency per £100 per annum ;

(b) On any new loan, 10s. Australian currency per £100 per annum.

In the case of Loans raised in the United Kingdom the contributions stated above are in respect of each £100 sterling.

The Sinking Fund moneys allocated by the National Debt Commission for use in London during the year ending 30th June, 1949, amount to £3,334,000 sterling.

COMMONWEALTH BANK OF AUSTRALIA is further authorised *to offer for subscription in cash Government of the Commonwealth* of Australia 3 per cent. Registered Stock, 1965-1967, to such amount as may be required to make up the above total of £15,000,000 in the event of conversion acceptances not reaching that total.

PRICE OF ISSUE £100 per cent.

Payable	**£10**	**0**	**0**	**per cent. on Application**
	£15	**0**	**0**	**" " 21st October, 1948**
	£75	**0**	**0**	**" " 1st January, 1949**
	£100	**0**	**0**	**per cent.**

An interest payment of 3s. 4d. per £100 Stock will be made on 1st January, 1949.

Cash applications on the prescribed forms will be received at COMMONWEALTH BANK OF AUSTRALIA, 8, Old Jewry, London, E.C.2, and must be for even amounts of £100 of Stock and be accompanied by a deposit of £10 per cent. on the amount applied for.

In the event of partial allotment, the surplus from the amount paid as deposit will be returned to the applicant. In case of default in the payment of any instalment at its due date the amount previously paid will be liable to forfeiture, and the relative allotment to cancellation.

Payment in full may be made on or after allotment, but no discount will be allowed.

Scrip Certificates to Bearer in respect of Cash Allotments will be issued in denominations of £1,000, £500 and £100, in exchange for Allotment Letters. These Certificates must be surrendered at the time the final instalment is paid, for exchange into Registered Stock Certificates, at COMMONWEALTH BANK OF AUSTRALIA, 8, Old Jewry, London, E.C.2. Interest Coupons *for 3s. 4d.* per £100 Stock, payable 1st January, 1949, will be attached to the Scrip Certificates.

The revenues of the Commonwealth of Australia alone are liable in respect of this Stock and the Interest thereon, and the Consolidated Fund of the United Kingdom and the Commissioners of His Majesty's Treasury are not directly or indirectly liable or responsible for the payment of the Stock or of the Interest thereon, or for any matter relating thereto.—40 and 41 Vict., cap. 59, sec. 19.

A commission of 5s. per £100 Stock will be paid to Bankers and Stockbrokers on allotments made in respect of conversion acceptances and cash applications bearing their stamp.

Prospectuses, with Statistical Statement relating to the Commonwealth of Australia, may be obtained from Commonwealth Bank of Australia, 8, Old Jewry, London, E.C.2 ; from Westminster Bank Limited, Stock Transfer Office, 41, Lothbury, London, E.C.2 ; from Messrs. R. Nivison & Co., 6, Threadneedle Street, London, E.C.2 ; at the Offices of the Government of the Commonwealth of Australia, Australia House, Strand, London, W.C.2 ; and from the Agent-General for Victoria, Victoria House, Melbourne Place, Strand, London, W.C.2.

COMMONWEALTH BANK OF AUSTRALIA,
8, OLD JEWRY, LONDON, E.C.2.

24th September, 1948.

The List for Cash Applications will open on Tuesday, 28th September, 1948, and will be closed at 3 p.m. on that day.

The List for Conversion Applications will be closed not later than 3 p.m. on *Thursday, 7th October, 1948.*

THIS FORM MAY BE USED.

APPLICATION FOR

Government of the Commonwealth of Australia

3 per cent. Registered Stock, 1965-1967.

To : COMMONWEALTH BANK OF AUSTRALIA, 22
8, OLD JEWRY, LONDON, E.C.2.

I/We hereby apply for £..... (say ..... pounds) of Government of the Commonwealth of Australia 3 per cent. Registered Stock, 1965-1967, according to the Prospectus of 24th September, 1948, and undertake to pay £100 for every £100 of Stock, and to accept the same or any less amount that may be allotted to me/us, and to pay for the same in conformity with the terms of the said Prospectus.

I/We enclose the required deposit of £ ..... being £10 per cent. on the amount applied for.

* I/We declare that I am not/no one of us is resident outside the Scheduled Territories† within the meaning of the Exchange Control Act, 1947, and that I/we shall not be acquiring the Stock on behalf of or as the nominee(s) of any person(s) resident outside those Territories.

* If this declaration cannot be made it should be deleted and a Form D (obtainable from a Banker or Stockbroker) completed as to Declaration 2A and the appended Certificate should accompany this application.

Ordinary Signature .....

Please write distinctly. *Full Name*..... (IN BLOCK LETTERS) *(State whether Mr., Mrs. or Miss or Title.)*

Address .....

.....

28th September, 1948.

† The Scheduled Territories.—The British Empire (except Canada and Newfoundland), British Mandated Territories of Cameroons, Nauru, New Guinea, South West Africa, Tanganyika, Togoland and Western Samoa, British Protectorates and Protected States, Burma, Iraq, Iceland and the Faroe Islands.

‡ The definition of "nominee" is given in the Bank of England's Notice E.C. (Securities) 1.

N.B.—Applications must be for amounts of not less than £100 and in multiples of £100.
Cheques should be made payable to BEARER and should be crossed thus :

a/c Australian Loan.

SECOND ALLIANCE TRUST COMPANY, LIMITED

REVENUE AGAIN INCREASED

AMPLE MARGIN OVER 24 PER CENT. DIVIDEND

MR W. D. MACDOUGALL'S STATEMENT

The sixty-fifth annual general meeting of The Second Alliance Trust Company, Limited, will be held in the Company's registered office, Meadow House, 64, Reform Street, Dundee, on the 8th proximo.

The following is the statement by Mr W. D. MacDougall, the chairman, which was circulated with the report and accounts for the year ending July 31, 1948.

I have pleasure in welcoming back to the board our colleague, Sir George Cunningham, who has been released from his duties in Pakistan.

The form of our accounts this year shows some small differences which are required to enable us to comply with the provisions of the new Companies' Act which came into force on July 1.

INCREASED GROSS REVENUE

There is a further increase in gross revenue which amounts to £289,000, as compared with £276,000 a year ago. After providing for expenses, taxes, interest on borrowed money and the dividend on the preference stock, there is available for the ordinary stock £91,159, representing earnings of over 41 per cent. We propose to repeat last year's distribution of 24 per cent. which will absorb £52,800, leaving a surplus for the year of £38,359. The reserve fund of £400,000 you will observe we are now required to divide into two separate accounts—a capital reserve consisting of share premiums amounting to £315,292, and a revenue reserve of £84,708; to the latter we have transferred from revenue £15,292, thus bringing this reserve up to £100,000 and the balance of the year's surplus has been added to the amount to be carried forward at the credit of revenue account.

VOLUNTARY DIVIDEND LIMITATION

The results for the year are satisfactory and would justify an increase in the ordinary dividend. The board, however, have decided that the principle of voluntary limitation of dividends accepted by the majority of industrial companies should on this occasion be observed here also. Although good reasons can be advanced to show that Investment Trusts should be exempt from this restriction, it is thought that if a gesture is to be made the wider its application the better. I hope it is recognised, however, that this gesture has been made purely for reasons connected with the present situation and that the continuance for any length of time of this restriction coupled with a heavy distributed profits tax will have serious repercussions in those industries which look to the investing public to finance their capital requirements.

Reasonable prospect of reward for risks undertaken remains one of the main props of our prosperity as a nation and its abolition, or the continued deferment of hope of its restoration, would seriously discourage that spirit of keen enterprise and vigorous effort which placed our industries, many of which, admittedly, are unsuited for nationalisation, in the position they hold.

REVENUE OUTLOOK

In the circumstances, the outlook for revenue in the coming year must be less promising as, apart from our overseas investments, there is little prospect of increased returns to balance any defaults and reductions which may occur. It is a question of degree, however, and I see no reason to expect that we will not be able to show our dividend earned next year with an ample margin.

CHANGES IN DOLLAR INVESTMENTS

Advantage has been taken of the permission to make changes in our dollar investments to which I referred a year ago. As you will observe from the directors' report, we have just over 5 per cent. of our funds invested in American securities, mostly in equities. The outlook in the United States is not without its disturbing factors, as witness the failure to check the course of inflation, and one must expect to experience from time to time those severe fluctuations in values which in the past have been a feature of the American economy. Nevertheless, the fact remains that the United States is today the most prosperous part of the globe and conditions ruling there permit the investor to share in that prosperity.

CONDITIONS AT HOME

In this country where the greater part of our funds are of necessity invested, all problems fade into insignificance before the crucial question as to whether our efforts to reduce the adverse balance of trade will be successful. Some progress has been made, but how far it is from what is required can be seen from the figure of £250 million given for the excess of imports for the first six months of this year. It is clear we shall have to do better than that even to pay our way during the period of Marshall Aid. When that ceases and we have to rely on our own resources, we shall be faced with a task the magnitude of which does not seem to be sufficiently grasped.

To increase production to the required point is in itself a formidable problem and even if achieved, to be effective it must coincide with a willingness on the part of our overseas customers to accept the additional supplies and the ability to pay for them. I find it difficult to believe that when temporary shortages have been filled, Britain's place in the world economy will be such that she can expect to continue to export on a scale sufficiently in excess of the prewar level to bridge the gap caused by the loss of our foreign investments and to enable us to pay for the imports required to maintain the standard of living to which we are accustomed.

At the close of the annual meeting there will be submitted for your approval certain alterations to the company's Articles of Association. These are of a formal nature, and, as is explained in the accompanying circular letter, involve no change in the existing practice, and I therefore recommend their adoption.

AIR-INDIA, LIMITED

MR J. R. D. TATA ON INDIAN AIR TRANSPORT CONDITIONS

The annual general meeting of Air-India, Limited, was held, on the 31st ultimo, in Bombay.

Mr J. R. D. Tata, the chairman, in the course of his speech, summarised the large increase in operations. The mileage flown increased by 78 per cent.; ton-miles by 112 per cent.; capacity ton-miles and passenger-miles by 106 per cent.; freight and mail by 266 per cent.; and gross revenues by 111 per cent. While the routes operated remained substantially the same, a Madras-Trivandrum service had been added and the frequency of the Bombay-Karachi route had been increased from seven to fourteen weekly. An additional direct service on the Bombay-Madras route was operated five times a week. The relatively greater increases in the capacity ton-miles and passenger-miles and in the general revenues were due to the fact that a substantial proportion of the services were operated with Viking aircraft whose payload and seating capacity were larger than those of the D.C.3.

Expenditure had risen 140 per cent. over the previous year, due mainly to the higher wage and salary bill, to a much heavier provision for depreciation, and to the acquisition of a fleet of Viking aircraft.

The Government of India had not yet decided on the shape and structure of the Indian air transport industry.

In other countries of the world the number of hours flown per aircraft used exceeded 3,000 hours per year. The average utilisation of aircraft in India was under 500 hours per year because the industry employed in the aggregate many times the number of aircraft required for the work to be done. As a result most of the air lines had lost heavily. Because Air-India had been long established and had developed a remunerative network it had escaped such disastrous circumstances. Even Air-India had been unable to reach the highest rate of efficiency, and their utilisation figures, although higher than those of others, had remained low. As a result, their costs were higher than they should have been.

The air transport industry of India was at present mainly equipped with aircraft purchased cheaply out of war surpluses. Gradual replacements with new equipment would be necessary within the next two or three years. While aircraft bought cheaply could be depreciated without undue financial strain over a short period of years, the depreciation of future fleets purchased at far greater cost would have to be spread over a much longer period. The grant of short term licences by the Government of India for, say, five years, would be unsound, because the raising of fresh capital to finance the acquisition of new fleets would be impossible. Licences should be issued for a period of ten years, and in any case not less than seven years.

The most important event of the past year had been the acceptance by the Government of India of a scheme sponsored by the company for the operation of an overseas service to the United Kingdom. The company's scheme involved the formation of a new corporation with substantial participation by Government both in the capital and in its Directorate. The greatest credit was due to the Government of India for reaching such an important decision of policy at a time of unprecedented crisis in the country.

The new corporation, Air-India International, inaugurated their Bombay-London service on June 8, 1948, and had rendered a good account of themselves up to now. The response from the travelling public had been most encouraging, and the initial frequency of one service per week was expected to be doubled shortly. The shareholders of Air-India could be proud of the part which their company had played in the establishment and running of such an important venture which had added to India's prestige in the world.

The report and accounts were adopted.

BOOKER BROTHERS, McCONNELL AND COMPANY, LIMITED

TAXATION BURDEN

PROBLEM OF RISING COSTS

MAJOR A. F. V. McCONNELL ON COLONIAL NEEDS

The annual general meeting of Booker Brothers, McConnell and Company, Limited, was held, on the 23rd instant, in London, Major A. F. V. McConnell, the chairman, presiding.

The following is extracted from his circulated statement:—

As forecast in the circular sent to shareholders on May 19, 1948, we are this year submitting a consolidated balance sheet and a consolidated profit and loss account.

PARENT COMPANY'S ACCOUNT

During the eighteen months period, after charging all expenses and £285,000 for taxation, our company earned a net profit of £180,229, which may be compared, after similar adjustments, with £96,562 earned in the preceding twelve months. Your directors recommend the payment of a final ordinary dividend of 3½ per cent. and a bonus of 2 per cent., both free of income tax. We have also been able to transfer £61,035 to general reserve and to increase the credit balance brought forward by the remaining small balance. These recommendations are made not only in accordance with what your directors consider the best interests of the shareholders and of the business, but also with the dividend policy which the Chancellor of the Exchequer has asked all companies to observe.

The group as a whole had to bear no less than £610,244 levied in direct taxes upon profits—a grievous and often discouraging burden. A burden which, if it is not lightened, must inevitably restrain any enthusiasm which we may feel for undertaking new enterprises—new enterprises which we think would benefit the peoples in the Colonial territories where we operate.

THE FINANCIAL POSITION

There is an excess of current liabilities and provisions over current assets; in other words, the parent company's financial position is by no means as liquid as is desirable. Since June 30, 1946, the value of land and buildings, plant, machinery, craft and equipment has increased by over £180,000, which largely comprises purchases of land and buildings necessary to our business, and also considerable increases to coastal craft in British Guiana. Net advances to subsidiary companies have increased by more than £130,000 and reflect in part inflation which has affected business generally and in part greater trading activity throughout the group. Inflation and greater activity are also reflected in the increases in stocks and stores from £524,307 to £830,774 and in debtors from £377,498 to £666,570.

This means that we are employing more capital. We have come to a stage where reserves built up in the past are insufficient to finance the replacement of stocks and fixed assets at ever-rising values, the greater trading activity which has taken place since the war, and indeed the natural development of our undertakings. Moreover, you will see from the notes attached to the balance sheet, that our plans for renovating, improving and extending the assets of our company and its subsidiaries and for replacing vessels lost in the war constitute a formidable financial commitment.

ADDITIONAL TEMPORARY FINANCE

Accordingly, early this year and subsequent to the close of these accounts; after obtaining increased borrowing power at an extraordinary general meeting held on February 12th last, acting with the advice and assistance of Lazard Brothers and Company, Limited, your board decided to raise additional temporary finance. £1,000,000 of Three and Three-quarter per Cent. Unsecured Ten Year Notes at par were placed with a few established investing houses. These Notes are repayable at a premium of a half per cent. in 1958 or, at our option, during or after 1953 at a slightly higher premium.

It may be that in the next year or so further temporary finance will be required, but even so, your directors do not think that it is desirable at this stage to increase the capital of the company on that account. Events within the next few years should make it possible to define more precisely our company's capital needs—in the meantime who can foretell the trends of inflation or its contrary, and the course of trading activity?

THE CONSOLIDATED ACCOUNTS

In contrast to the parent company, the consolidated balance sheet shows an excess of current assets over current liabilities and provisions to the extent of £786,452. This is satisfactory, and the issue of the Ten Year Notes materially improved this reasonably liquid position.

It is prudent, year by year, to plough back into any business part of the profits by way of appropriations to reserves. In the case of our sugar estates they are literally ploughed back into the land to the incalculable benefit of British Guiana and its people and ultimately, I hope, of the shareholders who at present reap a not over-abundant harvest from their very large capital commitment in this field. A commitment which in terms of pounds sterling is considerably more than the book value of our assets would imply. I must emphasise that this apparent undervaluation of our fixed assets is due less to their appreciation than to the depreciation in the value of money, thus underlining the financial problems inherent in their maintenance and replacement and in our programme of improvement and expansion.

Let me sound a note of warning. The consolidated profit and loss account, reflecting as it does a wide range of activities and undertakings from primary production to retail stores, will certainly be subjected year by year to far greater fluctuation than has been the case with the parent company.

SURVEY: BRITISH GUIANA

In British Guiana—where nearly half our profit is earned—the production of sugar is the foundation of our business. For sugar, 1947 was rather a disappointing year, the total output of the estates in which we are interested being 117,568 tons, against 120,347 in 1946. Unfavourable weather must be held mainly accountable for a decrease where we had hoped for an increase.

The British Ministry of Food continue to buy all our sugar available for export—for consumption both here and in Canada—and although their present agreement to purchase expires next year we have reason to believe that it may be extended.

The price they have paid us has continued to rise but scarcely in proportion to increased costs of production, and while the Director of Sugar always shows understanding of the problems of sugar producers, we cannot reasonably expect an ever-increasing price for our product

There is a tendency nowadays to regard rising production costs as an inescapable natural phenomenon, and to assume that prices paid for products will by some means or other be adjusted to cover these production costs, whatever they may be. This is a most unrealistic and dangerous attitude; in the past production costs had to conform to prices and the day will surely come, and it may come soon, when they must do so again.

THE BOARD'S PLANS

We for our part are doing all in our power to reduce costs. You know of many of our plans to increase output, to enhance efficiency, to obtain new plant and equipment in field and factory, to improve production technique, to seek more technical advice and to strengthen organisation. It must be admitted, however, that in the case of colonial industries the real need to improve the living standards of the people introduces an element of inflexibility in costs of production of which wages represent over half and the provision of better amenities for workers a further material proportion.

At the same time all who are sincerely concerned with the welfare of the people of British Guiana must reflect upon the fact that wages cannot increase *ad infinitum*; that a cost of production higher than the value of sugar will bring disaster not only to the company but to all who work on the sugar estates and indeed to almost anyone who earns a livelihood in the Colony.

RUM AND MOLASSES

Sales of the main by-products of sugar—rum and molasses—were satisfactory during these eighteen months, but here again high prices will not go on indefinitely. In the case of rum the price we receive, in relation to the exorbitant Customs duty in this country, represents a negligible part of the price of a bottle of rum to the consumer. It is an impressive fact that, at present levels, our company's sales of rum to Great Britain will contribute over £15,000,000 to the Exchequer in a year by way of duty.

There are clear signs of reduced demand for rum. We hope, however, that the excellence of Demerara rum coupled with advertising undertaken by Demerara rum distillers as a whole (in which they are handsomely assisted by the rum trade in this country) may go some way towards retaining the support which this valuable by-product gives to the sugar industry.

Apart from sugar our main interest in British Guiana is in the wholesale and retail trades. Today we are carrying stocks worth nearly four times as much as was normal before the war and sales have increased accordingly. Yet here again the zenith has been reached, and as profits margins are largely controlled by Government we must, if we are to compete successfully with others, pay closer and closer attention to wise buying and to efficient management.

AFRICA

On March 17, 1947, a holding company was registered in Northern Rhodesia under the name of Campbell Brothers, Carter and Company (Central Africa), Limited, with a nominal capital of £750,000, of which £400,000 has been issued, to take over the shares of the companies in Rhodesia and Nyasaland in which we are interested (exclusive of those engaged in the tobacco trade). Campbell Brothers, Carter and Company, Limited, who are a full subsidiary of ours, hold over 83 per cent. of the issued capital and the balance is held by former proprietors of the businesses acquired and by some senior employees.

Campbell Brothers, Carter and Company, Limited, who specialise in buying, shipping and financing for clients in the Union of South Africa and the Far East, themselves

reached new high figures during the period under review.

THE FUTURE

He is a brave man who would attempt to prophesy the future when international conditions and indeed economic and political conditions in the colonies are unpredictable.

We cannot expect that trading activities and values will remain at their present high levels, but, given peaceful conditions, I hope we can look forward with sober confidence to steady if not to spectacular progress.

STAFF

It has been usual for your Chairman to end his address with an expression of thanks and appreciation to our local directors and staff both at home and overseas. In once more following this precedent I am particularly anxious to avoid any appearance of performing a perfunctory duty. We owe a great deal to them all and we ask them to accept our most grateful and sincere thanks for their efforts.

The report and accounts were adopted.

GOLDEN HOPE RUBBER ESTATE, LIMITED

The annual general meeting of The Golden Hope Rubber Estate, Limited, was held in London on the 20th instant. In his address the chairman, Sir Eric Macfadyen, said: Issued capital as before is £364,490 (which is a little under £40 per acre of our planted acreage). Rehabilitation expenditure to date amounts to £32,890. Our claims for War Damage Compensation largely exceed this amount.

The crop of rubber harvested was 5,508,000 lbs. and proceeds of sale came to £262,907, yielding a profit of £38,913 after providing £39,145 for Malayan income tax and United Kingdom income tax and profits tax. From the balance we recommend the payment of a dividend of 8 per cent.

With two exceptions our estates are well off for labour and up to date I am able to say that none of them has suffered from outbreaks of violence.

It is remarkable that the agricultural conditions of our properties have on the whole been maintained. At the end of the financial year under review they were in better shape than at the beginning and even to-day there has been no serious deterioration. A substantial proportion of the output of 5,508,000 lbs. of rubber was turned out in the form of sole crepe with advantage to the average price realised, although the temporary conditions which stimulated that market may not last much longer. If security conditions permit we estimate to produce 6,000,000 lbs. of rubber in the current year. We made provision for undertaking in the present year some 500 acres of new planting or replanting (our total planted area is 9,314 acres).

The report and accounts were adopted and at an extraordinary general meeting which followed two special resolutions altering the articles of association were approved.

WILLSONS (LONDON AND PROVINCES), LIMITED

TURNOVER AND PROFIT EXPECTATIONS EXCEEDED

The sixteenth annual meeting of Willsons (London and Provinces), Limited, was held, on the 22nd instant, in London. The Rt. Hon. Lord Barnby, C.M.G., C.B.E. (chairman), presided, and in the course of his speech said:

The turnover and profit have exceeded expectations in spite of the reduction of profit margins, which resulted in a diminution of nearly £30,000. As an indication of the value which has been given to our customers, the gross profit margin on our sales for the 14 months shows a decrease of 2½ per cent.

At the commencement of the period we had to contend with the fuel crisis, appalling weather conditions and scarcity of supplies because of these circumstances.

The accounts for the 14 months ended March 31, 1948, show that the profits amounted to £105,479, compared with £118,316 for the 12 months ended January 31, 1947.

Your directors recommend that a final dividend of 20 per cent., less tax, be paid for the period on the Ordinary shares making a total of 30 per cent. for the 14 months ended March 31, 1948, which is approximately the same rate as the 25 per cent. paid for the 12 months to January 31, 1947.

The total reserves are £293,510, compared with a total in the previous balance sheet of £173,749. This total of reserves is in excess of the issued capital, which amounts to £261,382.

No allocation has been made to the stock equalisation reserve. In the previous accounts it was a new item, but as it was found that the depreciation of stock, as otherwise provided, was believed to be adequate, the amount standing to the reserve was transferred to that provided for future taxation.

The liquid position stands at £280,534, an improvement of £86,645. Fixtures and fittings of about 100 branches, our warehouse and head office stand at £21,302, a small percentage of the estimated cost of replacement.

How small a sum remains to shareholders as a reward is shown by a breakdown of every 20s. of receipts:—

	s.	d.
Cost of garments	15	1½
Wages, salaries, etc.	2	9
Rents, rates, repairs and other expenses and reserves, less receipts	1	3½
Income tax and profits tax		6½
Dividends		2½
Remaining in the business		1
	20	0

Additional branches are being added throughout the United Kingdom without haste as opportunity offers.

ENCOURAGING PROSPECTS

Your directors face the future with every confidence. The volume of trade for the first half of the current year is most encouraging. The reopened and new branches, the better selection of merchandise and exceptional values have all contributed to the excellent results. Our success is in no small measure due to the efforts of your founder and managing director, Mr. Maurice Mauray, in building up the fine organisation to meet and to encourage consumer demand in the shops selected by him.

It is widely felt that rationing of wool textile apparel could before now have been much further relaxed without danger to price rises. The volume of foreign cloth now being imported is nearly equal to prewar values, which suggests justification for greater freedom to the domestic wool textile industry, and from that would follow a better choice of materials for the making-up industries.

The report was adopted.

NOTICES

EMPLOYERS' ASSOCIATION: APPOINTMENT OF DIRECTOR

An important textile industrial organisation with headquarters in Manchester requires a Director of wide administrative and industrial experience. Candidates should be capable of expressing with clarity, firmness and moderation the views of the industry in its negotiations with the Government, Government Departments and Statutory Authorities on the one hand and Labour and Industrial Organisations on the other hand. No difficulty need be anticipated in arranging remuneration appropriate to the qualifications and standing of the applicant. Applications including full details of experience and career should be sent to Employment Manager, The Federation of British Industries, 21, Tothill Street, London, S.W.1.

A COMPREHENSIVE service for industrialists: The Advertiser specialises in the planning and conduct of political, social and economic surveys, public relations and public affairs, personnel relations: he has wide experience at home and abroad, and is accustomed to operate at high levels and on a big scale; preliminary consultation need incur no liability: highest possible references, of course.—Box 809.

B.COM. (Hons), 31, seeks post of wide responsibility in large export or industrial organisation to do research, information or development work. Systematic hard worker; thorough research experience on industry; development of new export markets; clear concise speaker and writer; all office routine and organisation; French, Spanish, German; widely travelled.—Box 810

INDIA.—Gentleman with varied organising and administrative experience, 15 years in business, 10 years Army, desires return to India in managership, administration, labour control or estate development.—Box 829.

MANAGING Directors, with multiple interests, requiring an assistant are invited to write to—Box 786.

CONTINENTAL HOLIDAYS

All inclusive arrangements. FRANCE—10 days from £17 19s. 6d. SWITZERLAND—10 days from £19 16s. (Swiss currency available). These are very special offers; early bookings essential. WINTER SPORTS enquiries invited.
HENRY ALLAN & SONS (TRAVEL), LTD., 25, Cockspur Street, London, S.W.1. Tel.: WHitehall 5237-9.

ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

APPOINTMENTS REGISTER

Employers seeking the services of Certified Accountants are asked to write to the Secretary of the Association, 22 Bedford Square, London, W.C.1. (Telephone: Museum 5163.)

APPLICATIONS are invited for positions in the Technical Economy Section of the British Cotton Industry Research Association. Successful candidates will engage in operational research, and a capacity for dealing with practical problems mathematically and analytically is required. Academic attainments will be regarded as evidence of ability. —Apply, Director of Research, Shirley Institute, Didsbury, Manchester, 20.

PERSONNEL MANAGEMENT. Business executive with wide experience finance, commerce and industry and with profound belief importances personnel management, training and welfare, seeks appointment, offering scope and opportunities, with concern who have similar belief. High level contacts and references. Public school, University, good war record.—Box 798.

BUSINESS MAN (Wykehamist), of proved ability and adaptability, with fine record in peace (sales and advertising administration) and war (lieut.-colonel, staff), seeks scope for creative thinking, initiative and modern methods of marketing and sales promotion.—Box 820.

EX-COMMANDER R.N. aged 46, adaptable, good linguist, seeks work. Eight prewar years advertising, market research, selling. Experienced planning, administration. War service included 2 years in Joint Planning staff of War Cabinet. Two postwar years in Foreign Office.—Box 825.

PROFESSIONAL WOMAN, highly experienced, widely travelled, especially Latin-America U.S.A. Put lic speaking; own car; requires appointment, possible work partly from own address, Kensington. Willing travel.—Box 839.

MANUFACTURERS in Birmingham have a senior executive position to offer. Applicants should have had wide commercial and administrative experience and possess good personality. Professional qualification or University Degree an advantage. Age limit, 35-45. Commencing salary £750, or according to experience and qualifications. —Particulars to Box 836.

Statistical Summary

GOVERNMENT RETURNS

For the week ended September 18, 1948, total ordinary revenue was £39,228,000, against ordinary expenditure of £75,403,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £8,069,000 the surplus accrued since April 1st is £215,959,008 against £203,248,486 for the corresponding period a year ago.

*PROPOSED UNIVERSITY COLLEGE FOR NORTH STAFFORDSHIRE

APPOINTMENT OF REGISTRAR.

Applications are invited for the position of Registrar to the proposed University College for North Staffordshire.

The site is Keele Hall, Newcastle-under-Lyme (*five miles from Stoke-on-Trent*).

The salary attached to the post is £1,250 per annum, rising by annual increments of £50 to £1,500 per annum. It is hoped that a house will be provided.

Candidates must have had administrative experience which would enable them to conduct the preparatory work in respect of the proposed University College. It is anticipated that this will be available for students in October, 1950. Actual acquaintance with the work in the office of a University Registrar would be considered an advantage, but not an essential.

Applications, stating age, education, qualifications and full particulars of experience, together with the names and addresses of three referees, should be sent to me not later than fourteen days after the date when this notice is published, endorsing the envelope "Appointment of Registrar."

HARRY TAYLOR,
Town Clerk, Stoke-on-Trent.

THE NORTH-EASTERN ELECTRICITY BOARD

THE SECRETARY'S DEPARTMENT.

Appointment of Establishments Officer.

Applications are invited for the appointment of Establishments Officer in the Secretary's Department at Area Headquarters at a commencing salary of £1,000 per annum.

Applicants must have had extensive experience of staff management and the application of salary and wage agreements.

The appointment will be subject to the provisions of superannuation regulations to be made under the Electricity Act, 1947, and to service conditions yet to be determined.

Applications, stating age, qualifications, experience and names of two persons to whom reference may be made, should be sent to the Secretary, The North-Eastern Electricity Board, Carliol House, Newcastle-upon-Tyne, 1, within 14 days after the appearance of this advertisement. Envelopes should be marked "*Establishments* Officer."

On October 11, 1948,

THE IMPERIAL BANK OF IRAN

Head Office, LONDON

will remove from 11, Telegraph Street, London, E.C.2, to

51, GRACECHURCH STREET, E.C.3,

where they were established before the war.

MERSEYSIDE AND NORTH WALES ELECTRICITY BOARD

APPOINTMENT OF EDUCATION TRAINING & WELFARE OFFICER.

Applications are invited for the above post, at a salary between the range of £850 and £1,000 per annum, according to experience and qualifications, subject to a later adjustment, if necessary, to conform with the scale of salaries agreed after negotiations with the appropriate staff organisations. Applicants should be of Degree standard in Engineering or Economics, and have had experience in the operation of training schemes for craftsmen, technicians and professional grades, and have the essential requirements of initiative, tact and the ability to promote good human relationship. Knowledge of the various Electricity Supply Regulations and Factory Acts will be an advantage. The duties of the post will include the organisation and supervision of extensive welfare schemes in accordance with the provisions of the Electricity Act, 1947.

The successful candidate will be required to satisfy the Board's Medical Adviser and to contribute to a Superannuation Scheme.

Applications on the prescribed form, which can be obtained from the Secretary, Merseyside and North Wales Electricity Board, Electricity House, Love Lane, Liverpool 3, must be returned in an envelope endorsed "Education Training and Welfare Officer," so as to be received not later than fourteen days from the appearance of this advertisement. JAMES RANKIN, Secretary.

WANTED, SECRETARY with good economic training for British Section of European League of Economic Co-operation. Good reading knowledge of French essential. Answers treated confidentially.—Box 831.

PERSONAL ASSISTANT to Director in London controlling Export business in the East is required, aged 35 to 40 years. Applicant must have practical experience, ability to negotiate on high levels, good correspondent, and creative ability. Post offers progressive responsibilities. Applications, marked Confidential, stating fullest particulars of education and previous experience, to Box 832.

BUYER, wide experience light and heavy engineering, sound knowledge of Government controls, excellent trade contacts, seeks change.—Reply, Box 834.

WANTED.—A SECRETARY with first-class professional competence and experience in university or other educational, cultural work. Excellent salary, interesting position for person who combines these qualifications with intelligence, energy, a sense of responsibility.—Reply to Box 835.

SCOTS C.A., five years' experience as Industrial Consultant with first-class record of reductions in Productive and Administrative Costs, seeks Senior Executive post with future prospects. Minimum salary required, £1,500 p.a.—Box 839.

Berlin Before Uno

THE pent-up secrecy over the Berlin negotiations has broken. In a spate of words pouring from foreign offices, news agencies, reporters and commentators, the world is learning, down to the minutest detail, the course which led to the final breakdown of the talks. From being the world's best kept diplomatic secret, the negotiations have become, overnight, the most fully documented of all contemporary disputes. Nor is it simply a question of throwing the searchlights of publicity upon the past phases of the discussions. From the private conference table the whole dispute will now be transferred to the largest public forum in the world. The deadlock in Berlin has been referred by the three western powers to the United Nations and all future exchanges will have behind them an amplifier which will send the argument to the ends of the earth. Nor is it only information that has been suddenly released. Pent-up emotions are also finding expression. One of these emotions is indignation. But another is fear, and for the moment it is certainly not the weaker of the two. In these last few days, there has for the first time been something resembling a war scare.

At a time like this, the first imperative is clear thinking. And the first step in clear thinking is to sort out the issues. One point that needs to be made is that the risk of war, whatever it may be, is no greater now than it was in June, or even earlier. Nothing new has now suddenly emerged. All that has happened is that what was suspected years ago by a few, and what was apparent months ago to many, has now been proved to the public—namely, that agreement with the Russian Communists is impossible. It is only the proof that is new, not the fact. Moreover, it is important to note what it is that is now proved—that the Russians are not interested in international harmony. There is no more proof than there ever was that they mean to make war. There is, obviously, some risk that they do. But, again, it is not the risk that is new but the realisation of it. And whether it be imminent or remote, there is no reason to suppose that it is any different today from what it has been for a long time past. It is right to see things realistically, and it is good that the public's eyes have been opened. The risk of war cannot, indeed, be dismissed; but to build up a war scare in September and October 1948 is to do Stalin's work for him.

A second distinction of issues that needs to be made is to separate the specific dispute over Berlin from the wider problem of relations with Russia. The specific issue is dependent on the wider one, of course; if there were no general quarrel with Russia there would be no problem at Berlin. But Berlin is not a typical example of the issues that are likely to arise between Soviet Russia and the West; it has some peculiar features of its own, and to treat it as if it were merely one of a long list, past and future, of similar incidents can only be misleading.

For the moment, it is the Berlin issue that holds the stage. From the mass of information issued by both sides, the outline of the abortive negotiations emerges with sufficient clarity. The first phase ended on August 27th when, after Mr Stalin's intervention, the western powers believed that they had virtually solved the crucial question of Four

Power control for Berlin's currency and that "agreed" instructions could be sent to the Commanders in Chief in Berlin. When, however, negotiations were transferred to Berlin, the the form they took finally convinced the Western Powers that the Russians were not, in fact, interested in securing an agreement. There was even a certain levity in the way in which Marshal Sokolovsky placed interpretations on the agreed instructions which seemed to be quite out of keeping with the previous discussions in Moscow. The turning point was reached, however, when the Marshal raised two entirely new points—the first, that all trade between Berlin and the West should come under Soviet control, the second, that in future the Western air corridors should be confined to uses specified by the Russians. Since this proposal would clearly deprive the Western Powers of their only safeguard against any future imposition of a blockade, there was no further point in negotiation. They decided to bring the whole dispute before the Security Council.

★

The immediate outcome of this step is likely to be a tremendous intensification of the war of words. In laying the issue before the United Nations, the Western Powers are appealing to what is sometimes called "the forum of world opinion." This phrase is, of course, entirely misleading. Beyond the Iron Curtain and wherever Communist influence is dominant, "world opinion" does not exist and the Western Powers could appeal to it until domesday without one of their pleas and explanations passing through the censor's net. The forum to which the Western Powers are appealing is primarily public opinion in their own countries and in Germany. The record of the Moscow talks proves beyond doubt that one side wished for a settlement and the other did not. The publicity which a full debate in the Security Council, and later perhaps in the General Assembly, will give to this fact can only be welcomed by the Western Powers.

There are, however, no grounds at all for complacency. It is not to be expected that the Russians will leave their opponents in the untroubled enjoyment of a watertight case. They, too, in effect, are appealing to the same forum; the chief objective of their propoganda is the peoples of the West and in particular, of Germany. It is already clear that the front on which they wish to fight is not the narrow issue of Berlin but the wider one of world peace. The main line of the Russian offensive has already been laid down—in Mr Vyshinsky's plea for the immediate reduction of all armaments by one third, in the proposals put forward by the Russians, and echoed this week by Mr Wallace, for a general withdrawal of troops from Europe, in the passionate advocacy of peace and the equally passionate attacks on the American "warmongers," which pour from Communist centres all round the world. The Russian tactic is to capture the leadership—in every country—of all the weary, frightened, distracted human beings who long for peace, and to use their horrified rejection of war as a means to prevent, in the West, the measures of rearmament which constant Russian provocation has made necessary.

The Western Powers' good conscience will not by itself be a sufficient answer to this Russian line. They must at all costs avoid the appearance of being on the defensive and of rejecting Russia's plans for "peace." The fact that the move is an impertinent swindle does not alter its appeal. Men and women everywhere shrink from the "black fury" of atomic war. The French are passionately anxious, by almost any means, to return to the ways of compromise and negotiation. Even the freely elected German *Magistrat* in Berlin has put in a plea for the withdrawal of all troops from Germany. It is dangerously negative to reject the "peaceable" proposals of the Russians on the ground that they are insincere, without at least proving their insincerity. It would be far better to accept them in principle and propose instant clarification of the methods whereby they can be honestly and securely carried out. Will the Russians, for instance, accept immediate inspection of all their arms, plants and depots? Will they withdraw not only their troops from Eastern Germany but their police agents as well? Will they disband the Communist police force? Will they accept elections supervised by a very large body of neutral guards and inspectors? In every case, the meaning of the Russian proposals must be brought into the open and the onus of refusal thrust back upon the Soviet spokesmen. Otherwise, the danger will remain that, in the course of the great public debate on Berlin which is about to open, the Communists may yet be able to turn a bad case into a propaganda victory.

★

Indeed, the Western Powers should not resist the Russian attempt to widen the debate from the particular to the general. Rather, they should welcome it, for it is on that general plane that they can build up their own confidence, and the world's confidence in them. At Yalta, as is now apparent, the Western Allies blundered into a position in Berlin that was always unwise and is now clearly revealed to the whole world to be a trap. In Berlin, it cannot be denied that the West is in a tight corner. If the Berlin issue continues to occupy the centre of the stage, Western diplomacy in general will similarly be forced on to the defensive. But on the wider issue of the cold war between East and West, the West is not on the defensive, it is not in a tight corner, it does not hold a poor hand. Quite on the contrary, so long as the issue is seen clearly—as it now is—there is a definite policy to pursue which holds out real hope of delivering the world from the nightmare of Communist aggression—and of doing so without bloodshed. The line of the Iron Curtain can be held in the cold war, and if it is held in firm strength, there is no doubt at all which side will prove in the end to be the stronger.

To this general proposition Berlin is an exception—a difficult and dangerous exception, admittedly, but still a special case. It must, of course, be pursued, and the Western Powers had no option but to refer it to the United Nations. But there is nothing to be gained, and a great deal to be lost, by treating it as if it were an epitome of Soviet-Western relations, and reposing all hopes for the wider issue on success in the narrower. For the United Nations' handling of the Berlin issue will certainly be inconclusive. Discussion and debate, whether it is in Moscow or Paris, does nothing to modify Russia's stranglehold on Berlin. No resolutions in the Security Council, no recommendations in the Assembly will let through one Western train or reopen a single road to the city. The actual physical situation today is what it was the day the airlift started. In this deadlock, every local advantage lies with the Russians while they wait for winter and weather and crumbling German morale to do their job for them. To debate only Berlin would be to concentrate the whole of the world's attention on the one point in East-West relations where the balance of technical factors is decisively in Russia's favour.

The true course for the Western nations to pursue is to do everything that is necessary to make it clear to everybody that they both can and will defend the present boundaries of the free world, and to prove within those boundaries that their way of life is stronger, richer, and more appealing to men's minds than the doctrine and practices of Soviet Communism. It is on this task that the West will do well to concentrate. The immediate need, now that the Marshall Plan is in working order, is to build up alongside it a similar structure of military strength and political confidence in Western Europe—towards which a significant step has been taken this week. If this can be driven ahead this winter, while the airlift maintains Berlin, that particular problem may by next spring have shrunk to its proper dimensions.

Revised Defence

IT was doubtless inevitable that the revision of defence plans should have coincided with the revival of fears of imminent war. The Government would not have undertaken anything so unpleasant if there had not been a serious deterioration in the international situation. Nor could so many memories of 1938-39 have been re-awakened without sending cold shivers down the spine of the general public. Nevertheless, a great mistake will have been committed if what is now afoot is regarded, either by the Government or by the public, as the improvised response to an emergency, or as the first step in mobilisation for war. For if it is an emergency measure, the expectation is that it will be reversed when the emergency passes.

What is now needed, however, is a revision of the permanent defence plans of the nation. Three changes in external circumstances have made this necessary. First, it is no longer possible to build on the assumption of a period of international peace and harmony. The conditions of the next decade, if actual shooting war is avoided, are going to be those of chronic tension and of cold war; this requires a re-assessment of the permanent establishment that is needed. Secondly, the emergency of mobilisation for actual war is not one that can safely be assumed to be even a few years distant; it may happen at any time, and this puts a new urgency into the plans for summoning the nation to arms. And thirdly, it is now clear which war must be planned for. There is only one major war that could conceivably break out in the next ten years and it is possible to be reasonably certain who would be the enemy and—what is of greater importance—who would be the allies. A revised defence policy should be shaped to meet these three new requirements.

★

It will be no easy task to plan and prepare the permanent military establishment for a great power that is entering on a long period of cold war. It involves the planning and execution of a military programme for which no time limit can be set, which must at all times be ready to mobilise the nation for first defensive and then offensive war, which must maintain the defence forces technically and tactically ahead of the potential enemy and all this while imposing the lightest possible pressure upon an already strained economy. Fully to succeed in such a programme would be to reach an ideal beyond the capacity of ordinary soldiers and statesmen. But that does not mean that there need be any obscurity about the aim.

The permanent military establishment has two tasks to perform. The first is to provide enough mobile military, air and naval units to deal with the varying tactical aspects of the cold war. At present these are the defence of Germany, the clearing of Malaya and the Berlin airlift, but the ingenuity of the Cominform can be relied on to provide others as the years go by. The second role of the regular force is to train each year's batch of conscripts and to keep the reservists sufficiently in touch with the services that they can be readily converted into efficient combatants in the event of war.

To fix the level of the regular forces is not easy but it is fairly obvious that the sum total will have to be increased over what has hitherto been planned. What will quite certainly be wrong—though in the present organisation of defence matters it can easily happen—is to proceed on the principle of a bit of expansion all round. The Army clearly has the strongest case for expansion, both because the prospective war would be largely a ground war and because the organisation of the Army is such that it can quickly and usefully absorb more manpower. The strategic necessity of the Air Force is hardly second to that of the Army; but there is less possibility of rapid expansion because of the high percentage of skilled trades required. But it may be that the Navy should actually have its manpower requirements reduced. It accepts practically no responsibility for training National Servicemen and its manpower level of 145,000 seems excessively high in preparation for a war in which, apart from anti-submarine and combined operations, there would be little fighting at sea. The public would feel more confident if it could be quite sure that these matters were being decided by logical calculation and not by service pride.

Even in the Army, however, numerical expansion by itself will do no good at all if it is not related to the quality and intensity of training. The experience of European countries should be enough to convince anyone that a period of conscribed training service is a drain on manpower with little corresponding benefit in an efficient national army unless the training curriculum is both intensive and adequately staffed. An engineering apprentice can serve his country better in Birmingham than doing cookhouse chores in barracks. This means that the problem cannot be solved simply by extending the period of the National Servicemen's full-time service—though that may well be needed. There must be an increase in the number of regular soldiers as well, so that the training of more conscripts can be more intensive.

Whether, an increase in the regular forces having been deemed necessary, it will be possible to recruit the required numbers of men and women is another matter. In a time of full employment and an inflated currency the King's shilling has no very great attraction. Better married quarters and better opportunities of training for civil trades will do something, but they do not alter the fact that the defence forces are an underpaid industry by any index of the cost of living. If Britain must have larger regular forces, it is certain that scales of pay will have to be adjusted so that at any rate they cease to be a deterrent. The cost of such an adjustment will not be large in terms of the total budget—not larger, that is to say, than can be covered by economies in the civil departments.

This constitutes no invitation to the Chiefs of Staff to belabour the Government for an increase in service manpower. The community pays double for every man in the forces, the cost of his maintenance and the cost of his loss to the productive part of the economy. The position of every man must be weighed in relation to the dual demands of a defence force which will prevent war and of an expanding economy which will remove many of the temptations to war.

★

The second main chapter heading in any defence policy is the creation of reserves and the provision of machinery for their rapid embodiment. Again the Navy presents the simplest problem, since it has little difficulty in keeping its volunteer reserve up to strength and can call on the Royal Naval Reserve which is provided largely by the Merchant Navy. The volunteer reserve of the Air Force was stated by the Minister of Defence to need 60,000 men to man the air defence communications and to provide a general reserve. But it is the army which provides the most urgent problem, since upon its Territorial units will fall the responsibility of continuing to train the National Service men from 1950 onwards. Its need to recruit 100,000 territorial men may well prove the most urgent of all the long-term requirements of manpower. Whether the three services are successful in bringing their reserves up to strength depends partly upon the quality of service and training that they are able to provide, but even more upon the clarity with which the Government

makes the realities of the cold war comprehensible to the people. The complacency or the frivolity of Ministers can undo the work of any recruiting drive.

There is also the particular problem of closing the gap until the flow of National Servicemen into the Territorial Army builds up a substantial reserve of men who will continue to be under part-time training. Fortunately there is an enormous reservoir of very thoroughly trained men who, for some years to come, will still be young enough to be of use. This is the purpose to be served by the creation of a register of the Class Z reservists, the men and women not embraced by any other reserve scheme but who have war experience or special qualifications. With certain sensible exceptions which exclude those engaged in the vital industries and services, it will allot a destination to every such reservist on the outbreak of an emergency, most particularly the anti-aircraft units. There is no reason why with modern recording technique such a scheme should not be very comprehensive. If it is well administered it should cover the gap left by the abolition of the old supplementary reserves of the regular army.

Reserves of manpower are not the only trained, quickly mobilisable reserves that are needed. The long-term plan should also include a comprehensive system for the training of industrial capacity and for the mobilisation of production. The Defence White Paper of February 1948 promised that the Ministry of Defence would be especially charged with co-ordination both for production and for research. The Joint War Production Staff was kept in being as the link between the strategy of arms and the strategy of armaments, but no announcement has been made of any appointment to its chairmanship. Indeed, nothing is known of any activity at all on this most vital side of the Ministry's responsibilities and the provision of equipment is still largely on a departmental basis.

The third main requirement is that Britain's defence plans should be worked out in the closest possible collaboration with all its prospective Allies. This does not mean, as some Labour members seemed to assume in last week's debate, that the whole burden can be thrust upon the United States by means of lend-lease. No doubt, in any future war as in the last two wars, the relationship between America and Britain would leave the former as a net provider and the latter a net beneficiary of lend-lease. But the important thing is not to underline this probability—still less to insist on it as a condition—but rather to enter on the process of detailed combined planning from which it will naturally emerge. With the European allies also the principles are clear and have been carried a step further —on paper—this week by the announcement of the creation of a combined planning staff by the Brussels Powers. The essential thing now is not to work out the principles of defence co-ordination, which are obvious, but to apply them, which will be very difficult.

The task of putting Britain's defences in order, of dovetailing them with the requirements of western European defence, and of creating the greatest possible condition of security consistent with the necessity of building up our economic strength, will impose upon the Government one of the most severe administrative problems it has faced. Mr Chamberlain is not remembered for his health policy, nor Mr Churchill for his finance measures, and at the bar of history it may well be that Mr Attlee's Government will be judged not by its social reforms or economic experiments, but by its ability to convert Britain to a country which can wield the sword without abandoning the plough.

Western Germany on its Feet

(By a Special Correspondent)

THE Berlin dispute was touched off by the currency reform in the western zones of Germany in the middle of June. Ever since then the world's attention has been concentrated on the political and military consequences of the reform in Berlin. Perhaps this is why so little has been heard of its economic and political effects in western Germany. Certainly, these are sensational enough. Western Germany is on its feet again. The contrast between economic conditions east and west of the Elbe is now so wide that only inexcusable folly or malicious obtuseness could now induce western Germany to turn towards the Soviet Union. It has for so long been a habit, both in Britain and in America, to look anxiously upon western Germany as a slum, whose denizens would almost inevitably be lured into the arms of the Communist East, that the extent of the recovery since the monetary reform of June 20th is hard to grasp. In Germany, whatever may be true elsewhere in the world, western ideas have the initiative, and a clear victory over Communism in the struggle for the minds of the Germans is already in the making. Only two mistakes might undo the combined effect of American aid and the elimination of nine-tenths of the currency. One would be if the Allied Bank Commission were to relax its grip on the volume of money and credit; the other, if anti-Socialism were carried to extremes which would affront the reasonable trade unionists of the West.

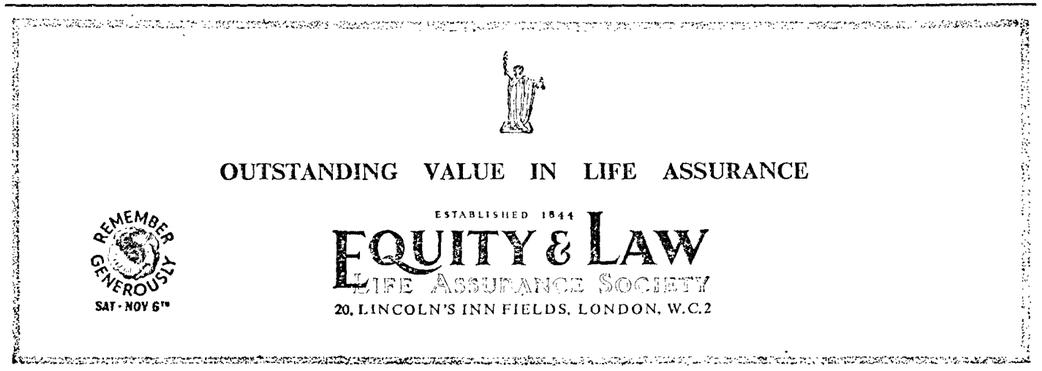
Though western Germany is on its feet, it is still shaky. The financial situation is not yet sound, with money circulating out of reach of the banks and the tax inspector. Double-book keeping and faked deficits will continue to be the rule until the promised capital levy—intended as a social measure to equalise wartime losses—is out of the way, and until Germans cease to think that their taxes go mainly towards occupation costs. Nevertheless, progress is real. Since June 20th, production has risen to nearly 70 per cent of the 1936 figure, and is still on the way up. The productivity of labour has increased by about 35 per cent. Steel output is nearing the rate of 7,000,000 tons a year. Only coal production—if the statistics are to be believed—still sticks at about 280,000 tons a day, which is well below the Marshall Plan's target. Nevertheless, there is almost a glut of coal in Germany today. With the economy back on a money basis, hoards which were acquired before currency reform are being used for production instead of barter. Over a quarter of the coal supplies which were allocated to the railways were, before currency reform, bartered away to obtain supplies and workers. Western industry is also gaining about 400,000 tons from the blockade of Berlin.

The days of semi-starvation of the "normal consumer" also vanished with the superfluous billions of Reichsmark notes. Greatly increased food imports and a good harvest have joined with monetary stringency to change the whole picture to one which begins to bear comparison with conditions in Britain. The normal consumer is now receiving 1,850 calories a day on his ration, and can add to his diet with unrationed fish, eggs, poultry and potatoes, as well as ample vegetables and fruit. In prosperous Bavaria an excellent sausage can be had off the ration in restaurants, and an eye is winked at other ostensibly controlled items. The black market in butter and meat still exists, but prices have fallen by much more than the 90 per cent which was the ratio justified by the cut in the currency.

These economic changes are visibly reflected in the people of western Germany in the autumn of 1948. The glum, resentful apathy that prevailed four months ago has given way to a new cheerfulness and energy. Perhaps the most characteristic and convincing sign of the recovery in German self-confidence is the new wave of complaints from the political and industrial leaders about the "inadequacy" of American aid (which, in fact amounts, with ERP and other forms of assistance, to a figure of over $1.1 billion), the burden of occupation costs, the folly of dismantling and Anglo-American control of "our foreign exchange." Dr Pünder, the Premier of Bizonia, roused cheers in the Economic Council last Tuesday by listing Germany's "demands" with the help of convincing but exaggerated figures. The western Germans, it should be emphasised, do not want the occupation armies to leave; but they do not want to pay for them. The new D-mark, they point out, is an Allied responsibility; it will be endangered unless occupation costs are borne by the Powers, unless more consumer goods are imported under ERP, unless the drain of resources in supplying Berlin is stopped, and investment capital is pumped into the producers' goods industry.

*

In every way the German leaders are, very naturally, trying to build up the strongest possible position for their country in the future world. Viewed from the depths at which they began three years ago, their success has already been considerable. It has now reached the point, with German steel production approaching that of France, when it no longer seems as absurd as it did to balance the advantages to European recovery of a larger German steel industry against its possible menace to European peace. The recent struggle in Paris over allocations of Marshall aid to Germany and the present disagreement over dismantling raise the painful spectre of an alignment of Britain and France against a combination of America and Germany. The Americans not only believe that the key to the military security problem lies in Germany's inclusion in western union (which can hardly be disputed); they also regard western Germany as the most promising field for Marshall aid (a much more questionable proposition).



The chief effect of the currency reform on the internal politics of Western Germany has been to intensify the long-standing dispute over the future of Germany as a liberal or a state-controlled economy. The dispute is important for several reasons. It may involve further disagreements within Military Government between British adherents of state control and American believers in free enterprise. It affects the future of Military Government itself, since, if the Frankfurt administration does not control its own economy, there will be little point in Military Government controlling the Frankfurt administration, even to the extent required by the Economic Co-operation Act.

The importance of the German experiment lies in the fact that the basic problems are those that affect all the countries of western Europe, though they present themselves more sharply in Germany. There has been an immense loss of wealth during the war. This means that the standard of production must be raised and the standard of living, in one way or another, must be lowered. How can this best be done, with the least risk of dangerous social unrest and with the best balance between productivity and social justice? By controlling and rationing poverty? Or by liberating the forces of supply and demand?

So far, if the doctrinaire arguments of the Socialists are rejected together with the exaggerated claims of the Right, the facts seem to give a provisional verdict for freedom from state control, on the one important condition that money remains tightly restricted. An experiment with freedom has already been started in the fascinating economist's laboratory that western Germany represents today. Before the startled eyes of the Anglo-American controllers, Dr Erhard, head of the Economics "Ministry" at Frankfurt, swept away price controls on all but basic foodstuffs, coal, iron and steel, at the same time as the currency was cut to the bone. The British, if not their American colleagues, had envisaged a controlled step-by-step rise in the legal prices from the 1936 level, at which they had been pegged successively by Hitler and by Military Government. So eager are the Christian-Democrat officials to secure the success of their new economic measures that they are even critical of the costly Anglo-American effort to save Berlin.

*

The spectacular improvement in the conditions of daily life makes the German Socialists' battle for the reimposition of controls an uphill struggle. They are driven back on obviously fallacious arguments and meaningless statistics. As in the parable of the emperor's clothes, a simple soul is needed who will come forward and point out the facts of Germany's economic life: that before June 20th controls had broken down in a maze of inefficiency and corruption, that almost nothing could be bought for the legal pegged prices, and that if the impoverished Germans cannot buy everything they now see in the shops, they are no worse off than most of mankind. Investigators, who come to Germany with preconceived ideas of a British system of controls and civic morality, are misled by a flood of statistics which apparently prove that the cost of living has risen dangerously since controls were lifted. Shoes, for example, for which the legal price was 12 marks before the currency reform, now cost around 30 D-marks. But it was previously almost impossible to buy a pair of shoes, except in the black market for about 800 marks. The prices which should be compared are those of goods now freely obtainable in the shops with the black market prices before currency reform; or the present black market prices with those prevailing before June 20th. It would then be impossible to declare that the cost of

living has yet risen beyond bearing; but if prices continue to rise, great hardships are in store for the unskilled worker and, still more, for the unemployed.

For the time being, in fact, nothing but good has come of the change to freedom. The reproaches made by the Socialists that "the worker is not getting his fair share," that "he has a daily struggle to meet his minimum needs" and "the goods are there, but only the man with marks can buy them," are but ways of saying that the German worker has a healthy incentive to greater production. The danger point would be reached only if price controls were lifted on the basic foodstuffs and if the lowest paid worker were unable to buy the rations.

To ridicule the economics of the German Socialists is one thing. But to withhold from them the sympathy and encouragement they deserve would be something very different. The trade unions are in a dangerously weak position. They are faced with the fact that their members (except the miners) are now more contented than before, that they are eager to work overtime and to keep their jobs, instead of taking days off to barter goods for food. Apart from this change of attitude in the workers, the unions have no funds with which to finance strikes. The danger exists, therefore, that their weakness will be exploited by the German employers who, wrapped for many years in the cotton wool of Government quotas, cartels and subsidies, find it easier to save on wages than to improve production methods. It is symptomatic that only about a quarter of the workers have secured the 15 per cent increase in wages which was authorised by Military Government last April. Two weeks ago, Military Government washed its hands of the wages question, which is henceforth entirely a German concern. The Germans are now considering whether it is right to maintain the wages stop after the price stop has been abolished, and whether to leave wages to be adjusted, like prices, by demand. Psychologically, it is vital to give the trade unionists the same freedom as industry; in practice, the union leaders will probably not secure any dangerously high increases, not only on account of their weak bargaining position, but because they realise the danger of starting an inflationary spiral.

It is now obvious that the Germans are leading the British and Americans into the position of appearing to oppose all Socialist principles, as well as those of Western democratic government. They have on two or three occasions recently passed measures which have been a deliberate challenge to Military Government. General Clay, who has the reputation for extreme opposition to Socialism, recently used his power to block a law passed by the Government of Hesse, which granted works councils a share in management. To most Germans, it was American influence which led British Military Government to reject another deliberately challenging measure passed recently by the Government of North Rhine-Westphalia, which called for the transfer of the Ruhr industries to public ownership. So far, it has been possible for the military authorities to excuse their vetoes on the grounds that the measures involved are of such importance that they must wait until a government for all western Germany can pronounce upon them. But if the German labour leaders are unable to offer their followers wage benefits and some moderate share in decisions, they may have no alternative but to lead them in revolt against the Occupation Powers. If that happens, it will be too late for regret that more moderate demands were not granted in time.

More Ministries?

THE machinery of government has always been a happy hunting ground for the amateur. Most of the learned treatises upon it have been written by men who had no personal experience of it all and, however diligent their researches into human as well as printed sources, must inevitably lose something of the feel of processes which, though dubbed mechanical, consist entirely of relations between men. The practical politicians do not often indulge in systematic analyses of their structures; and when they do are apt to take refuge in remarks, maddening to the academic, such as "there is no real system, but it works well because So-and-So is such a dominant personality"—remarks which threaten to deprive political science of half its name and all its dignity.

The rare occasions when a man of practical experience at the centre of government sets down a systematic description of the machine as he has known it are therefore very valuable. The best such occasion in recent years was Sir John Anderson's Romanes Lecture in 1946. But Sir John's experience ended—or at least was suspended—in 1945, and one chapter of Mr Francis Williams's new book* carries the story a little further. Mr Williams is not, in the strictest sense, a politician and he has never been a Minister; but as Public Relations Adviser to the Prime Minister his opportunities for observation have been excellent.

The title of Mr Williams's chapter is "The New Pattern of Government" and he is emphatic that something new has been evolved by Mr Attlee.

> For a Cabinet of equal Departmental Ministers under a Prime Minister who is himself "the first among equals" there has been substituted a pyramidical (*sic*) pattern of government designed to secure greater rapidity in action and a tighter centralised control of general political strategy. . . . At the apex of this pyramid sits the Prime Minister. Directly underneath him come a group of three senior "functional" Ministers, the Foreign Secretary, the Chancellor of the Exchequer and the Lord President of the Council. Directly under these three again come a group of five Ministers with co-ordinating functions of an important but less major character: the Minister of Defence, the Lord Privy Seal, the Lord Chancellor, the Home Secretary and the Chancellor of the Duchy of Lancaster. Below this group are the eight senior Departmental Ministers who are also members of the Cabinet and who therefore have the right to take part in Cabinet discussions not merely on their own Departmental affairs but on any aspect of policy. . . . Below the Departmental Cabinet Ministers come twelve Heads of Departments who, although formally of Cabinet status and paid the same salary as Cabinet Ministers, are not members of the Cabinet and only attend when specifically invited by the Prime Minister to deal with matters concerning their Departments.
>
> This pyramid . . . is buttressed and supported by a series of functional policy-making committees, the most important of which the Prime Minister personally directs, and which form an integral part of the new pattern of Government. He is the chairman of the Economic Policy Committee . . . [and] of the Defence Committee. He concerns himself similarly with the direction of broad policy in external affairs, and with a committee dealing with the development of atomic energy. . . . The new system thus provides machinery for the positive direction and supervision of all major aspects of policy by the Prime Minister to an extent that was quite impossible under the old Cabinet system. The three senior Ministers immediately next to the Prime Minister . . . each have functional as well as administrative responsibilities. . . . Each is in control of the co-ordination of policy in one particular sector of affairs.

Those who knew the Coalition Government of wartime will be inclined to enter a demurrer against Mr Williams's assertion that all this is new since 1945, and Mr Attlee's personal invention. There has always been a small core of strong personalities in every Government and though the present correlation of powerful Ministers with defined spheres of responsibility may be more logical than ever before, it is also in part accidental—unless, of course, Mr Attlee can be held to have foreseen Mr Dalton's indiscretion of less than a year ago, which accidentally removed an outstanding piece of illogic. But the system here described is certainly very different from anything that existed in peacetime before 1939.

It would seem, in fact, that between Mr Churchill's Government and Mr Attlee's, a development of considerable significance in British constitutional practice has now matured. A method has been discovered for dividing up the work that would otherwise fall upon the Cabinet and yet of maintaining the essential harmony of policy among the Government as a whole. The problem that was first authoritatively propounded by the famous Haldane Committee of 1917 appears to be on the way to solution. But it is interesting to observe that, as is entirely characteristic of British constitutional development, it has not been solved in either of the ways that the theoreticians have argued about for thirty years—either in the way that the Haldane Committee actually suggested or in the way that it has repeatedly been thought to have suggested. Both of these versions require the creation of a number of super-Ministers. In the true Haldane version, the super-Ministers would themselves each be departmentally responsible for a whole area of policy. A small Cabinet would be achieved by greatly reducing the number of Departments—that is, of fully independent Departments. In the crypto-Haldane version, the numerous Departments and their Ministers remain, but they are arranged in groups, each responsible to a non-Departmental super-Minister.

The solution actually arrived at differs from both of these. It differs from the truer Haldane proposal in that there are no super-Departments; each Department remains equal in the eyes of Parliament. And it differs from the crypto-Haldane proposal in that no Minister is subordinated to any other (except to the Prime Minister); each remains fully responsible to Parliament for the conduct of his Department and equally entitled to a voice in reaching decisions that concern it. The device that has been used to solve the problem is one to which surprisingly little attention seems to have been devoted before the last war: the device of the standing Cabinet Committee, empowered to take decisions in the name of the Cabinet. Committees of the Cabinet have long been familiar. But in the past they were all, or nearly all, appointed *ad hoc* and dissolved when the matter in hand was disposed of; and their function rarely extended beyond that of reporting back to the Cabinet itself. Sir Ivor Jenning's exhaustive and authoritative book on "Cabinet Government," first published as recently as 1936, refers to only two standing Committees of the Cabinet, of which one, the Committee of Imperial Defence, is admittedly a special case. Of the other, the Home Affairs Committee (corresponding to the present Legislation Committee), Sir Ivor wrote "questions of policy are not discussed, but must be reserved for the Cabinet."

It is apparently Mr. Attlee's practice to preside over most of these standing Cabinet Committees himself. Mr. Churchill did not do so, preferring (for excellent reasons) to concentrate his energies on defence. Which precedent will be followed in future remains to be seen. But in any event principles will have to be established governing the relation of the Committees to the full Cabinet. If every decision of importance is appealed from the appropriate Committee to the Cabinet (as sometimes seemed to happen during the war in the case of those Committees over which the Prime Minister did not himself preside), little is saved. Something in the nature of a doctrine of collective committee responsibility seems to be called for, by which a Minister who does not agree with the decision of a Committee will normally feel himself bound by it, not merely *vis-à-vis* Parliament, but also *vis-à-vis* his Cabinet colleagues as a whole.

*

If the new system really does work and the Cabinet has successfully divided itself, save for the decisions of highest policy, into a number of sections, then it is time to raise the question whether the average Government Department is not too large. A Department is a finite unit; it is a collection of administrative offices which is responsible to one political head, who is himself responsible to Parliament. Ideally, therefore, the maximum size of a Department should be governed by the number of subjects, of a nature to require the decision of a responsible Minister, that one man can look after without grossly overworking himself. Judged by this test, many of the existing Departments are far too large. Either the principle of responsibility breaks down, subordinate officials deciding matters without responsibility, or else the desks of the Minister and of the Permanent Secretary become bottlenecks. If the Cabinet system can now accommodate itself to a much larger number of Departments than hitherto, there is a strong case for splitting up a number of the present elephantine offices.

The leading candidate for such treatment is clearly the Board of Trade which, in spite of all the sections it has lost in the past thirty-five years, is still so large, and has such varied functions, that it must be an intolerable burden to its President and Secretary. The lines of cleavage into a Board of Trade for external matters and a Ministry of Industry for domestic concerns are already clear. The Ministry of Health, with its new responsibilities, might also with advantage be split up into two (or three) component parts, dealing with Health and Housing (or the two separately) and Local Government. The Colonial Office, it has sometimes been suggested, would be more manageable if it were divided into Africa, the Far East and the Rest (which would mainly be the West Indies). The Minister of Fuel and Power has had three major Bills in this Parliament and now has three nationalised industries to supervise; there is not much administrative connection between coal on the one hand and power on the other. The Post Office, again, divides itself easily into Post Office and Telecommunications.

There are at present 25 major Departments of State, or 28 if the Privy Council Office, the Duchy of Lancaster and the Law Officers' Department (all of which are represented in the Cabinet) are included. It may be that the machinery of British Government would move more rapidly if the number were gradually but deliberately raised to nearly 40. Each one could then function more efficiently, while the team could be kept in step through the new constitutional device of the Cabinet Committee.

"I feel sure she found **peace in her last hours"**

SO ends the report of a Deep Sea Mission superintendent asked to pray with a fisherman's dying wife. She left seven children when she died.

Providing fishermen's families with spiritual comfort, advice, often material aid—not only in bereavement but also all through their hard lives—is a vital part of the Deep Sea Mission's work in fishing ports. Donations or requests for further details are welcomed by the Secretary:—

DEEP SEA MISSION

(ROYAL NATIONAL MISSION TO DEEP SEA FISHERMEN)

44R N.M.D.S.F. HOUSE, 43 NOTTINGHAM PLACE, LONDON, W.1

NOTES OF THE WEEK

Defence of the West

Judged by peacetime standards the Western Defence Ministers have moved quickly since consultation on military provisions of the Brussels Pact began last April. Judged by cold war standards they are moving with diligence rather than dash. This week's meeting in Paris of Mr Alexander and his colleagues has done well to agree on a common defence policy and a permanent organisation to carry it out. It may be assumed that neither the policy nor the machinery could swing into action as did the Anglo-French staff arrangements of 1914. Rather are they intended at this stage to convince the United States that there is now a mould into which a new American Administration could pour such equipment, supplies, men and advice as an agreed defence plan would demand.

The latest measures should carry conviction in Washington, for they imply as much radical change in government outlook and behaviour as does ERP. Britain carries the main burden and will go on doing so for a long time to come; the Western chicks now gathered under its wing—and the Commonwealth wing—will not quickly grow into fighting cocks. Only by the most careful coordination of production and organisation can the Low Countries and Luxemburg make a useful contribution to rearmament; and only by the most careful handling, in unpredictable social and political conditions, can the French army become the reliable nucleus of a land force equipped from factories in Britain and America. It is as well to realise now that French opinion is deeply divided on defence. There are those who make the best of what they regard as a dangerous job by saying that strategy planned by Belgians and Dutch and Frenchmen will at least pay as much attention to keeping an enemy out of their territories as to mounting global counter-attacks from outside them. And then there are those who believe simultaneously in European union and the possibility of neutrality.

Lord Montgomery looks like becoming the first chairman of the new permanent organisation. It will be a testing experience for a man who dislikes committees and paper work. He will sit with colleagues who in France are cutting defence expenditure, in Holland are deeply involved in Indonesia, and in Belgium are uncertain how much their people will stand. The success of the new body will depend largely on the estimate it can make of the pledges of action that America can give now, and of the assistance in re-arming that it can give later. Without Washington's backing, paper plans will remain paper plans for all but the British.

There is one question of great importance which the military men cannot settle and which the politicians should have tackled before this: how are equipment and supplies transferred from one allied Government to another to be paid for? How does the debtor France equip an army with the help of creditors Belgium and Britain? Perhaps Sir Stafford Cripps will have raised the problem during his American visit: mutual aid in Western Europe would be the right preface to a new chapter in Lend-Lease.

* * *

Cold War in Uno

The first week's work of the General Assembly has simply confirmed what anyone could have foretold—that the entire session will be dominated by the tension between East and West. With the possible exception of Palestine and the Italian colonies, every political problem that is to come before the Assembly has already divided the world into two rival *blocs*, and, quite apart from specific problems, the distrust and hostility on both sides—painfully demonstrated in the opening speeches—has now reached such a pitch that it is certain to inject rivalry and suspicion into every item of the agenda, even down to the smallest detail of, say, narcotics control or staff administration.

If the attitude of Governments can be taken as a rough guide to the reactions of ordinary people, Russia is not making too good a showing at this stage of the cold war. The first week of the Assembly has been remarkable for the unanimously anti-Russian voting of all save the little *bloc* of Soviet-dominated states (to which Jugoslavia ostentatiously continues to adhere). Neither the Russians nor their satellites gained a single chairmanship when the time came to set up the six Committees of the Assembly—the Political, the Economic and Financial, the Social, Humanitarian and Cultural, the Trusteeship, the Administrative and Budgetary and the Legal Committees—and now that the Committees have started their deliberations, it seems unlikely that members of the Eastern *bloc* will even be asked to provide *rapporteurs*.

Russian policy has made this development inevitable. M. Spaak spoke for all the smaller Powers when he gave the Soviets seven good reasons why the world was now frankly frightened of Russia's ambitious policy—"more ambitious than the policy of the Czars themselves." But the degree of hostility makes it almost certain that agreement will be possible only on the smallest issues, and that the weeks ahead will be filled with heart-breaking and nauseating wrangling and abuse

Rivalry between the Great Powers is not, however, the only political force active in the General Assembly. The United Nations is on a great many secondary issues constantly exposed to the voting vagaries of two large *blocs*—the Arab and the Latin American. Were either *bloc* intent on great constructive purposes, their strength might counter the sterility of Great Power debate. Unhappily, their intentions are usually obscure and sometimes discreditable; no one certainly will congratulate them on their first achievement—that of deferring consideration of the Palestine issue in the teeth of Anglo-American efforts to secure an early decision. Palestine now falls to third place—below such longer-term items as atomic energy and Mr Vyshinsky's proposals for disarmament.

* * *

Foot and Mouth

Mr Shinwell has done a good deal to rehabilitate himself since his unlamented translation from the Ministry of Fuel and Power to the War Office. It will take a good deal more to rehabilitate him after his speeches on defence, first in Parliament and then at Salford. His speech in the defence debate was, up to its closing sentences, passable. It fended off all demands for information; it was not particularly polite; it was not particularly clear; but it was responsible and energetic—up to its peroration. Then, at the crucial point of the winding-up speech of a most crucial debate, Mr Shinwell served notice on the world that defence was of secondary interest to the Government. "We are not prepared to take steps—consistent with our security—to impair the national economy." On the most charitable interpretation, allowing for the ambiguity caused perhaps by a momentary confusion of language, he assured the people of Britain that their daily avocations would not be seriously disturbed and they could take rearmament in their stride.

So far, so bad. On Sunday, speaking at Salford, he went a great deal farther; and just what his hearers, the French, Belgian and Dutch governments, the Americans and the Kremlin made of his sentiments, time will perhaps show. It was no doubt legitimate to impute at least the possibility of sincerity to Mr Vyshinsky's disarmament proposals. It was certainly perfectly legitimate to decry *panic*. But what follows? Anyone who claims that the position is serious, that rearmament threatens production and the export drive, is a party propagandist, a Tory "overjoyed" at the national predicament. There is no emergency. ("Everyone except the Minister"—so sounds the echo—"knows that there is going to be a fuel crisis.") No one need be afraid of being called up. Plans may be laid, gestures made, but Mr Shinwell guarantees, before Salford and the world, that they are to be mere bluff. Whatever one speech by a responsible and unrepudiated Minister could do to encourage a baseless complacency at home, to discourage staunch friends abroad, to convince waverers that Britain is a broken reed and Britain's promises meaningless, to invite contempt and stiffen aggressive purpose, Mr Shinwell has accomplished. This is a great pity. Mr Shinwell has made himself well liked at the War Office: why does he not let his legitimate achievements speak for themselves instead of perpetually trying to convince Mr Attlee how dangerous it would be to drop him from office?

* * *

Two Files Behind Bevin

If the rules of the Constitution had not demanded the calling of a special session for the speeding of the Parliament Bill, it is probable that the gravity of the European situation and the necessity of obtaining support for the rearmament policy would have made it necessary to call one. The Government has done

the right thing for the wrong reasons. But short as the session was, the debates of last week showed that the division of opinion on foreign policy and defence is becoming more closely aligned with the division of the parties. A year ago while Mr Bevin was subject to considerable opposition from within the Labour Party he could rely—at least on questions relating to Russia or Communism—on the support of the Opposition. Now, however, while Socialist opinion has hardened against Russia and in favour of his policy, the Conservative Opposition is no longer prepared to give him uncritical support.

The Conservative Party under Mr Eden, who (except for M. Spaak) has the best record of consistency and honesty in foreign affairs of any European politician, sees a real chance of wresting the leadership of public opinion from an exhausted Foreign Secretary and a complacent Minister of Defence. They are in a strong position to demand a more clearly thought out policy in the Middle East and Germany, and greater evidence of effective execution of the new defence policy. There is no doubt that a worsening international situation would give the Conservatives an opportunity to display qualities of courage and intelligence which might very easily give them the leadership of the country at the general election. The danger of such a leadership would be to delude them—and in particular Mr Churchill—into neglecting to think out a domestic policy.

The remarkable unanimity of opinion which Mr Bevin and Mr Alexander received from the Government back benches springs mainly from honest conviction. Of the hundred Labour members who two years ago protested against Mr Bevin in the debate on the address, and of the seventy-two who voted against Mr Alexander on the length of military service, there are few who have not been convinced by the logic of events or the trend of opinion in the constituencies. Equally the desire to present a common front in view of the increasing criticism of the Opposition on foreign policy and defence and the ferocity of Labour Party discipline may have played their part. While those with honest doubts and fears received a hearing, the fellow travellers either absented themselves or remained silent.

Mr Zarubin, the Soviet Ambassador to Britain, reading *Hansard* on his way to Moscow for his holiday, should not conclude from the solidifying of party opinion on foreign affairs that it is possible for Russia to drive a wedge between them. The British public has its mind made up on the Russian question and on the defensive commitment necessary to counter aggression. It may later change its opinion on which is the best party to carry out this policy, but until the cold war is over the question is one of method not of direction.

* * *

Divided Left in Italy

Signor Togliatti's return to the active direction of the Communist Party in Italy brought thousands of comrades to Rome this week to demonstrate their loyalty to their "martyred" leader. The size of the assemblies and the fervour of the speeches did not, however, entirely disguise the dilemma which now faces the Communist leadership.

Their troubles began with the sweeping victory of the Christian Democrats in the spring elections. The Communist rank and file had been told so often and so confidently that they would achieve power at the polls that a sharp sense of disappointment and discouragement swept away former illusions. The reaction was twofold. On the one hand it bred defeatism and at last week's meeting of the party executive, Signor Longo, the Communist trade union leader, had to admit that the Party's greatest danger is "to underestimate its own forces and overestimate those of its adversaries." On the other hand, the reaction took the form of a new desire for violence. If victory could not be secured legally, why not conquer power by direct action?

When an attempt was made on Togliatti's life this summer, many Communist groups responded with violence and what appeared to be well-planned local insurrection. But such activities simply give the determined Minister of the Interior, Signor Scelba, the opportunity to put his police into action and might, if pushed too far, provide an excuse for banning the Party altogether. At his first public appearance, Signor Togliatti had therefore to warn his followers against "insurrectional opportunism," leaving the outside world in some doubt whether the Cominform line has changed since the death of Zhdanov.

The Communists do not, however, face the worst dilemma. That is reserved for the Socialists. Decimated at the elections, they are now divided into three main groups, each joined to the other by a series of minute gradations. The anti-governmental Socialists are divided between an extremist wing led by Signor Nenni, who this week offered his services as a Russian fifth column in the event of war, and a moderate wing led by Signor Romita, who wish to break every link with the Communists. Yet this group cannot quite bring itself to join with the Socialist followers of Signor Saragat and Signor Lombardo who support the Government and are represented in it.

The Italian Left is thus in a divided and unhappy state. It has, however, one asset—the difficult economic situation. The millions of unemployed, the underpaid government workers cannot fail to look Leftwards for leadership. Communist and non-Communist trade unions alike have to press for higher wages. As usual, it is not so much the strength of the Left as the failures of the Centre and the Right that continue to give Communism its supporters.

* * *

Abdullah versus the Hotheads

The Arab League is often the despair of its friends: it is so prone to talk, and so unwilling to face facts. Now its repute is anything but improved by the visible split in its ranks about the new "government of Palestine" that Egypt, Syria and the League's secretary general are sponsoring at Gaza. This move is directed, not against Israel, as it might appear, but against King Abdullah. It is the answer to the murdered Count Bernadotte's recommendation, expressly endorsed by Mr Bevin in last week's foreign affairs debate, that the Arab rump of Palestine should be incorporated in Transjordan. The new "government," if it could ever function anywhere, would be an Egyptian puppet, and its strings would be pulled by the Mufti, Haj Amin al Husseini. Ahmad Hilmi Pasha has consented as "Premier" to lend it *respectability*—the Mufti would have been too much for the world at large to stomach—and it includes the garrulous and dapper veteran, Auni Bey Abdulhadi, almost the only remaining member of *his never powerful Independence Party*. The Egypto-Syrian combination, with the Mufti in the background, at first wanted to set up this government in Arab Palestine proper, but King Abdullah firmly refused. So his enemies have blown the first really public breach in the League's ranks.

It is impossible to know how the Arabs of Palestine will feel about this development. In the days of the Mandate, it could be predicted that a majority in most towns, and all the peasantry, would rally to the Mufti, and in any case be ill-disposed towards Abdullah. But the Palestine Arabs are now scattered and dispossessed, and Abdullah, who from the first had realised that some kind of Jewish state would have to be accepted, has been the only Arab ruler to save a part of Arab Palestine from being overrun. Moreover, it will hardly be to the credit of the new "government" that it has been set up in Gaza, in the tiny coastal enclave into which the whole Egyptian army of intervention is uncomfortably squeezed.

There is a powerful Egyptian faction which wants to continue the Palestine war, and the setting up of this "government" is intended to face King Abdullah with the choice of recognising a government hostile to himself or branding himself as a self-seeking despot, intent on the aggrandisement of his kingdom at the expense of the Arab people. The renewal of hostilities would not disturb Egypt, since it is Transjordan which the Zionists would overrun. Egypt, on the other hand, has lost so much face by the pathetic antics of its army in Palestine, and the lying communiqués with which Cairo made them still more ridiculous that King Farouk may well feel he can recover some of his vanished popularity only by flying his standard in some foreign field. Syria's general reasons for resisting the aggrandisement of King Abdullah are well known, but there is a special reason why fighting in Palestine and Transjordan would not be unwelcome there. So long as there is no settlement with Israel, King Abdullah cannot use Haifa port; he is therefore dependent for all imports on Beirut. In fact Transjordan is the Hyderabad to Syria's India—with this difference, that it is the land-locked power which has the military force.

* * *

Siam Comes Into Its Own

The recent invitation to the Siamese to send a purchasing mission to London represents a shift in British policy, which is also revealed in the higher priority rating being given to British exports destined for Siam. The case for putting suppliers of Siam nearer the head of the export queue has been recognised for some time by British business men and officials on the spot; but only recently have their arguments been fully appreciated in London.

The short-term case arises from the need to keep Malaya

supplied with rice. The British have troubles enough there without having to reduce the distribution of rice. Yet this is the result that the disorder in Burma would produce if rice were not available in sufficient quantities from alternative sources —in the main from Siam.

The twin long-term arguments are economic and political. In order to pay the Siamese for their rice the sterling area must make enough goods available to satisfy their reasonable wants. Otherwise the accumulation of unspendable sterling balances will mean less willingness either to export adequate quantities of rice, or to part with them for sterling. Siam is exporting this year something over three-quarters of a million tons of rice, compared with about a million and a-quarter tons in the years just before the war. At present prices this is worth rather more than the £19.6 million earned by the 1939 crop. Like so many other primary producers, the Siamese want to buy capital goods, and their most pressing requirement is railway equipment, for which they have inquired unsuccessfully in Japan.

Habits of thought die hard, and it is often overlooked that sources of supply are nowadays as important to Britain as steady markets. In the last three years, when world shortages have focused attention on supply rather than demand, the point has been obvious. Now, there seems a danger that as supplies become freer and markets tighter, valuable markets—such as hard currency areas—may be over-cultivated at the expense of valuable suppliers. Siam's currency is soft and Bangkok temporarily holds a surplus of sterling; but its rice is now essential to the smooth working of the sterling area. It is recognition of this fact that has changed London's attitude recently.

The second argument for the change arises from the fact that Siam alone remains calm amid the bloodshed and confusion that rack its neighbours—Burma, Malaya, Indonesia, Indo-China and China. There is, indeed, a strong Communist party among its large Chinese minority, but very few Siamese are Communists. And the Bangkok government's attitude has been shown by its ready help in closing the Malayan border to the bandits on British territory. This anti-Communist bastion is well worth the careful attention and support of the Western Powers.

* * *

Start on the Blitzed Cities

The blitzed cities of Britain have had a disappointing three years since the war ended. Little rebuilding has been possible, except for temporary houses and shops which will later prove obstacles to the realisation of the cities' plans for reconstruction. The plans themselves, mostly prepared in the first flush of post-war idealism, are now seen in some cases to be too ambitious or too hastily contrived. For example, the road and rail proposals in the Hull plan, however desirable from an architectural or æsthetic viewpoint, have turned out to be impractical and too costly. It by no means follows that bold town planning is a mistake, so long as it is based on a thorough and realistic appraisal of social and economic factors, and plans such as that of Manchester, which were the fruit of considerable research, should bear the test of time.

Even the best plans, however, are confronted with the frustrations of delay and of increasing doubts about the extent of the cost. The work of deciding which are the central areas requiring comprehensive redevelopment (and thus attracting the higher Government grants) is going on slowly, with the Ministry enjoining a more cautious and piecemeal programme on the city councils than some of them like. Now at last Mr Silkin has announced that some blitzed cities may be allowed to start rebuilding their new centres in the near future, although the start will inevitably be a very small one.

This announcement should at least be a psychological tonic, and encourage the cities not to throw away their unique opportunities for proper redevelopment. But they still need assurance that the cost will not be too great. Government grants for redevelopment areas are reasonably generous, but the cost of land acquisition—even though limited to "existing use" values—is extremely high. Moreover, while the Town and Country Planning Act should ensure that proper planning puts no burden on the public purse for the country as a whole, an individual city still risks financial loss from reducing housing densities and increasing open space.

* * *

Food Subsidies Again

A written answer given in Parliament before the adjournment on the estimated current cost of the food subsidies should cause no surprise. Last July Mr Strachey admitted that their total was "something like £470 million a year." The table given in "Hansard" of September 24th merely shows how this £470 million is split up among the different commodities. It can be compared with a similar table given last March which showed the estimated cost of the subsidies in the financial year 1947-48:—

	Estimated Subsidy 1947-48 (£ million)	Estimated Current Subsidy (£ million)
Bacon	12·0	15·4
Bread	56·1	63·7
Flour other than for bread	24·1	37·1
Shell eggs	26·1	20·0
Carcase meat	61·0	60·2
Milk	34·5	37·5
Butter	24·7	36·8
Cheese	22·1	18·8
Margarine (domestic)	8·1	15·2
Cooking fat (domestic)	1·5	3·0
Potatoes	19·8	18·6
Sugar (domestic)	29·8	19·7
Tea	9·4	17·1
Other foods	*Cr.* 21·6	*Cr.* 4·4
	307·6	358·7
Animal feeding stuffs	33·2	66·5
Welfare Schemes :—		
National milk scheme	19·5	22·0
Milk in schools	7·5	8·5
Other	6·7	7·4
Unallocated payment to Argentina	10·0	...
Exchequer contribution towards New Zealand subsidies	4·0	...
Fertilisers and molasses subsidies borne by the Board of Trade	6·8	8·3
	395·3	471·4

Bad as the increase is compared with last year, it is bound to prove even worse. The estimate evidently does not take into consideration the higher price to be paid for Canadian wheat from July 1st, nor the higher prices to be paid for New Zealand's butter and cheese under the contract signed last July, nor the recently announced increase in the basic retail margin for milk. An actual subsidy of at least £500 million a year in the near future can be taken for granted.

Little purpose would be served by restating now the arguments against the food subsidies were it not for one important new factor—the Government's intention to spend an additional sum, unofficially estimated at £50 million, on rearmament. Hitherto there has been at least a faint hope that part of the necessary reduction in the Government's colossal expenditure could be achieved by a cut in its defence programme. Now that defence expenditure is to be not merely maintained but increased, the need to reduce the food subsidies is more urgent than ever. Yet all that Mr Strachey can do is to state once again that the abolition of the food subsidies would double the prices of some foods and be "ruinous" to the interests of the working class. What would, however, happen if the tea subsidy, increased this year from £9.4 million to £17.1 million, were abolished? Each person would pay 5½d. a month more for his ration than at present. Would this ruin him? Can the tea subsidy, indefensible on economic grounds, be justified by nutritional arguments? The abolition of the bacon subsidy would likewise increase the cost of each person's ration by just under 5d. a month. But together the tea and bacon subsidies alone would save the Government £32½ million a year. Is the general election too near for it to think again?

* * *

Housing Targets and Costs

Mr Bevan, while opening a new block of flats at Hammersmith this week, has again reiterated his forecast that by the end of October 750,000 families will have been rehoused. If the average family provided with a new home has averaged four people—perhaps a slight overestimate—this means that some 3,000,000 people will by then be in new homes. Measured by the comparable record after the 1914-18 war this is a huge improvement: measured against the time these new homes have been under construction and the multitude still uncompleted, the record is less splendid.

After Mr Bevan, the Mayor of Hammersmith sang the praises of the local authority in providing flats at 13s. 6d. a week for one bedroom up to 26s. 6d. for four bedrooms (excluding rates of 5s. to 10s. a week), as compared with flats at £200 a year built by private enterprise. In the case of Hammersmith the rents of the Council flats are estimated to cover the difference between the

capital and running costs of the flats and the Exchequer and local rate subsidies. In this respect Hammersmith has been more courageous than some other authorities which are avoiding higher rents by additional contributions from rates—thus putting a yet further burden on ratepayers. Even so the Mayor might have made clear that private enterprise is building without either the large Exchequer or rate subsidies. The experience of local authorities in erecting and running postwar blocks of flats with the expensive maintenance charges for lifts, hot-water, laundries and so on is still very new; but some authorities are becoming alarmed at the burden to be shouldered either by the tenant or rate-payers in general, and rents or rates may have to be pushed up further still, thus diminishing, perhaps to vanishing point, the difference in the true rent between "luxury" and council flats.

The problem of the increase in house-building costs since 1938 is discussed in detail in a report* published this week by the Ministry of Health. Unfortunately the figures relate to the autumn of 1947, and are outdated by a number of changes since then in the cost of materials and wages. They do, however, underline current anxiety about the relation between costs, rents and subsidies, and confirm past criticism about the waste arising from an over-ambitious programme. In an analysis of the causes which underlie the rise in cost of a three-bedroomed house from £380 in 1938/9 to £1,242 in 1947, the report says—

> the 1947 house, besides being larger, is built to better and more costly standards by higher paid labour using materials at increased prices, and working at a lower level of productivity.

No wonder the costs have risen. The figures used in the report are based on averages and tend therefore to be misleading. Three points, however, stand out: first that productivity per man had decreased by about 31 per cent between 1939 and 1947; secondly, that the increases in size and the improvement in fitments and outbuildings added another 26 per cent to the cost of construction and that local authorities have been steadily increasing the size above the minimum; thirdly, that the number of three-bedroomed houses built is out of proportion to the size of the families put in them. The Committee concludes—and who can disagree?—that, under the economic circumstances of the time, the programme has been carried out on a more luxurious scale than the country can afford.

* * *

Africa in London

It would be unwise to expect anything startling to be achieved by the African conference which opened in London this week. The mixed delegations of officials and unofficials from the different dependencies have come for discussions only, and their discussions will be mainly concerned with economic and social questions—with the elimination of the tse-tse fly rather than the Communist infiltrator.

Nevertheless, the conference is an important innovation. First, it ought to help to shake the delegates out of their too prevalent parochialism which leads them to believe that their local problems can be solved without reference to events elsewhere in the Commonwealth and the world. Secondly, many of the African dependencies now have unofficial majorities in their legislative councils, which makes the present delegations composed as they are of Africans and Europeans, more representative of the African people than any previous conference such as that of the African governors a year ago. This contact with each other and the outside world ought, moreover, to instil a greater sense of responsibility into the delegates than some of them are inclined to show in their own legislatures.

Thirdly, the conference may help to relax the strained relations between this country and the colonies. Never was there a time when Great Britain was so obviously anxious and willing to help the colonies towards greater independence and economic improvement. Yet colonial mistrust of its intentions is as intense as ever. The colonial problem, it would seem, is neither political nor economic, but psychological; if this is so, the more that can be achieved by personal contact between the Secretary of State and the representatives of local opinion, instead of through Whitehall minutes and directives, the better.

* * *

The Cape Franchise

The progress of political events in South Africa is once more becoming disturbing. No sooner does the Nationalist Government appear to be settling down quietly to the business of administration than it starts up controversial measures and revives the old fears of its real intentions. Last week the bill depriving Indians of their right to be represented in the Union parliament was given its second reading and passed by a majority of nine. Originally the right was granted to the Indians as compensation for forbidding them to own land in certain areas. The deprivation of this right, therefore, is a direct breach of faith by the Government which is morally, if not legally, obliged to honour the promises of its predecessor.

Dr Malan has now also threatened to abolish the franchise of the coloured and native voters in the Cape Province—*the only* remaining non-Europeans to have the vote. Moreover, he has threatened to carry this measure through, not according to the South Africa Act, which requires a two-thirds majority for such a Bill, but by a general election or by a referendum confined to Europeans only.

This last threat is also for other reasons sinister. The colour bar in South Africa is strong, and both sections of the European community would be reluctant to resist a measure with which many of them agree. General Smuts's United Party is divided against itself on the native question, and though they would probably act together against the Nationalists in parliament—thereby preventing the Government from getting a two-thirds majority—a fresh general election or a referendum would be likely to leave the balance of the parties as it is now—slightly in favour of the Nationalists. If, therefore, Dr Malan can abolish the Cape franchise unconstitutionally, he will have a useful precedent for forcing through other *unconstitutional measures*—such as the exclusion of British immigrants with "un-South African views."

what profits or losses such and such a publicly owned enterprise is making; or what were the reasons for the resignation of So-and-so from the Board; or what has happened about the grievances of the widget-fitters at Llanfair, etcetera. But, beside the case of Ned the pit pony at Bedlington Colliery, these minor frustrations are reduced to their proper perspective. Ned—so it is revealed in a full column of Hansard—had a sore back. His friends were worried about him. Failing to get satisfaction from local officials, they sought the highest authority; *mieux vaut avoir à faire au bon Dieu qu'à ses saints.* Mr Gaitskell, in full House of Commons, reassured them; Ned was on the surface, Ned was in good hands, Ned was getting veterinary attention, Ned's poor back was coming along nicely. Ned's champions were not entirely satisfied; they wanted a second veterinary opinion called in, dropped dark hints that the reasons for Ned's sore back were discreditable to the National Coal Board, to Mr Gaitskell, or at all events to somebody, and proposed to raise the matter on the Adjournment of the House—when, in accordance with Parliamentary tradition, it will be up to Mr Robens to relieve their anxieties. He is no doubt fervently praying for Ned's speedy recovery; in a land of animal lovers any bad news about his wrung withers (or whatever the technical term may be) would shake the whole nationalisation programme to its foundations. An earlier question concerned the grievances of a mere human, also subject to an immobilising ailment, whose local Petroleum Board had refused him petrol in spite of a doctor's certificate. That, it seemed, was not a proper subject for Ministerial judgment.

There is a good example for concerning oneself with the fall of sparrows and the sore backs of pit-ponies. But considering what topics are, by the mysterious neo-constitutional rules governing the relationship of Ministers to official bodies, ruled out of Parliamentary discussion and removed from the ambit of public criticism, one wonders just what Ned was doing in the House.

* * *

In the Name of Parity

In a recent book* on education there appears the following surprising statement:

> the Extra Year [the 14 to 15 year-olds] is not an extra year of school study but an extra year of school holiday.

The justification for this statement is based on a calculation of the lengthening of primary school holidays since the introduction of the 1944 Education Act whereby primary school teachers obtain "parity of esteem" with grammar school teachers by increasing their holidays from 10 to 14 weeks. Over a ten-year school life the extra year of schooling would thus be cancelled out, each child obtaining four weeks less teaching a year and an extra year in school at the end.

The calculation is not, of course, fair. While seventy-five per cent of local education authorities (excluding the London County Council) have now equated primary and secondary school holidays,

COMMITTEE'S RECOMMENDATIONS FOR HOLIDAYS
(Weeks)

	Primary Schools	Secondary Schools
Autumn mid-term	1	1
Christmas vacation	2	2½
Spring mid-term	1	...
Easter vacation	2	2½
Whitsun	1	...
Mid-summer	4½	6
	11½	12

a great many elementary school teachers were in the past receiving holidays only one and a-half or two weeks shorter than were their secondary school colleagues. Parity has also been achieved by shortening the holidays of secondary grammar schools. Nevertheless the arithmetic lays bare what is done more covertly in the name of equality. There are indeed some educational arguments in favour of shorter terms for pupils and teachers alike, and what is learned in the extra year at school will outweigh what is lost lower down. What is more serious is the attitude of mind among primary school teachers themselves. Even when an authoritative joint committee of the teaching bodies and local education authorities obtained evidence from parents, teachers and doctors about the optimum length of holidays its recommendations were turned down because the primary school teachers would have received half a week's less holiday a year. This is to put sensibility before sense.

* Old Wine and New Bottles. John Mander. Newnes, 7s. 6d.

Shorter Notes

The Swedish Premier made it clear this week that Sweden will adhere to its policy of "alliance-free" neutrality, an "armed neutrality." This is the old course and, in spite of pre-election hopes and hints abroad, there never was much chance of it being altered. Now that the elections have changed little except the respective strength of the non-Socialist parties, there is even less chance. In these circumstances some speculation is current on the possibility of Swedish arms being supplied, like other Swedish goods to both East and West. They may be, but the quantities are too small to enter seriously into account. Sweden's own defensive programme taxes production too heavily.

*

The organised retailers—those hard-pressed men—have passed a resolution that the census of distribution planned for 1950 should be postponed as covering so abnormal a period. The President of the conference went further; any census would be valueless to the trade, only valuable to the Government for the sinister purpose of preparing nationalisation, and likely in spite of all penalties to be boycotted by "hundreds" of small shopkeepers. There is, indeed, a chance of passive resistance. Small retailers have been kicked around, flattened under piles of forms, beset with narks and agents-provocateurs, and generally goaded into a thoroughly anti-civic frame of mind. They are hardly likely to be convinced by the argument that even the self-consciously free-enterprise American Government finds it necessary to collect statistical information far better than that available to the British Government, and that American business takes census enquiries quite readily in its stride. Perhaps by 1950, with clothes rationing (one hopes) a horrid memory, their loathing for forms may be less acute.

*

The adjournment debate on railway safety measures, late on Thursday last week, turned out to be a duet and not a discussion. Mr Champion, who spoke as "a practical signalman" and sits for one of the Derby constituencies, made a well-informed appeal for the extension of safety measures. In the public mind, railway safety is usually associated exclusively with systems of automatic train control, of which the system developed by the Great Western Railway is most familiar. But as Mr Champion showed, measures to guard against signalmen's errors are no less important. "Every signalman has made a mistake, or thought he made it, and has gone into a cold sweat, watching the rear light of the train moving into the darkness, hoping that he will not hear a crash." To which Mr Barnes, speaking his *secundo* part "as a member of the public," referred inevitably to shortages of equipment, but claimed with reason that the £6,000,000 or £8,000,000 required for extending automatic train control to all main lines was not an excessive sum, and disclosed that the Railway Executive has a programme in hand costing £5,000,000 for track circuiting (which provides safeguards against signalmen's errors).

*

Propaganda by envelope for the return to Germany of the eastern territories annexed by Poland is the latest symptom of reviving German nationalism. Letters arrive at their destination with labels attached on which appears a map of the "ancient German territories" (including East Prussia, part of which is now in the Soviet Union) and the slogan, "18 million Germans were fed by these lands." Propaganda publications with camouflage titles are also quite common, and London newspaper offices receive well-illustrated and thickly documented essays on the eastern territories which are marked as published with the approval of the British occupation authorities. To prevent the use of stickers is impossible, but it should be possible for the Bizonal authorities to stop the wastage of paper on dangerous propaganda.

*

Two points stand out in Queen Juliana's first speech from the Throne opening a new session of the Netherlands States-General last week. First, food subsidies in Holland will have to be reduced to bring the Dutch economy more into line with the Belgian for the completion of the Benelux union. Second, a beginning is to be made with Dutch naval and air force contributions to the defence organisation of the Five Powers of the Brussels Pact. Both decisions mean real sacrifice for Holland and compare favourably with the sacrifices now being made by other Western Union Powers.

Books and Publications

Possibilities and Prospects

"The Industrial Future of Great Britain." Europa Publications, Limited. 208 pages. 15s.

WITH the exception of one paper, the fourteen chapters composing this book consist of lectures delivered, during last winter, in a series arranged jointly by the University of London and the Institute of Bankers. Thirteen lecturers took part, experts drawn from both academic and practical pursuits, having widely different outlooks and voicing, from time to time, decidedly divergent opinions. The course was opened by Professor T. S. Ashton with a characteristically brilliant survey of historical origins and parallels, Professor G. C. Allen assessed the impact of war, Mr Anthony Hurd, MP, acted as spokesman for agriculture, Mr Robert Shone and Mr Bonavia underlined the importance of capital investment and maintenance in heavy industry and transport, Sir Jonah Walker-Smith and Mr Leslie Runciman respectively analysed the problems and achievements of the building and shipping industries; Mr F. W. Paish drew up the balance sheet of reconstruction, Mr Palache evaluated the rôle of long-term finance, Mr Leslie Gamage contributed a penetrating study of the export problem, Mr S. R. Dennison, under the title of New Industrial Development and Export, probed the practical implications of the first great economic principle—that you cannot eat your cake and have it too; Professor Sargant Florence, overlapping slightly with his predecessors, diagnosed probable trends in the organisation of industry and so wound up the course.

All the speakers or co-authors share a high degree of expertise, all are, though to varying extents, highly capable exponents of their subject, and the sum of their efforts is a most useful, informative, often stimulating and astonishingly readable book deserving a wide circulation. It owes a great deal to one contributor who took no part in the original lecture course—Mr Paul Bareau, who in a twelve-page introduction acts as impresario or compère, explaining the nature of the course, summarising and evaluating each speaker's message, and tracing the common threads which run through these thirteen independently evolved studies. This is a brilliant bit of work, and those readers who go to "The Industrial Future of Great Britain" for the sake of one item in which they have a particular interest are strongly advised to safeguard their sense of perspective by studying the whole book.

The conclusion drawn by Mr Bareau, and likely to be endorsed by the book's readers, is one of qualified and cautious optimism. Serious as are Britain's difficulties, whether jointly or severally considered, none of them poses an insoluble dilemma. With realism, energy, and unrelenting vigilance against that restrictionist "hardening of the arteries" and security worshipping which Mr Dennison pillories, the prospects are reasonably promising. Technical progress has not stopped; on the contrary, the vistas opened up by atomic energy are almost unbounded. "It is not," says Mr Bareau, "on hopes of this kind that we can begin to build in detail for the future"—that, obviously, would be sheer Micawberism. But "we can certainly use the hopes centred round this development to defeat the prophecies of gloom about the industrial future of this country."

From the Russian Front

"La Volga Naît en Europe." By Malaparte. Editions Domat, Paris, 1948. 348 pages. 350 francs.

THIS book contains the series of dispatches, censored and uncensored, written by an Italian war correspondent for the *Corriere della Sera*, while he was working on the eastern front. He covers first the invasion of the Ukraine by the Axis forces, and secondly the siege of Leningrad by the Finns. Before the war his anti-fascist writings had cost Signor Malaparte five years in exile on the Lipari islands. During the Ukrainian campaign his favourable assessment of the Russian chances of eventual success caused him

to fall foul of the Gestapo, which arrested him in the autumn of 1941 and sent him back to Italy. After four months in an Italian concentration camp he was sent off to Finland, whence he returned to help in the liberation of Italy.

In his preface to the French edition, Signor Malaparte describes his articles, which in book form were confiscated by the Germans in 1943, and which earned him a congratulatory visit from Signor Togliatti after the liberation, as his *geste de révolte* against Fascism. For those who were able to read between the lines they contained an encouraging picture of the ability of the Russian Army to beat back the invaders. The optimism was based on the fact that for the first time the very highly mechanised German Army was opposed, not by the predominantly peasant armies of the Italians and the Poles, but by another "workers'" army, "this colossal creation of the five-year plans," in which military discipline was allied to the technical discipline of the workshops. Moreover, the mud, the dust, and the vast distances forced the German Army gradually to revert to an old-fashioned infantry-type army. In the light of later events, Signor Malaparte, who is no more a Communist than a Fascist, regards the Russian successes with modified enthusiasm. The title of his book is designed to drive home the falseness of the illusion that Communism is an Asiatic phenomenon. He holds the unfashionable view that if a third world war is deferred for a number of years it would primarily be between the "democratic proletariat of western Europe and the proletarian dictatorship of Soviet Russia," with the United States playing only a secondary role.

However, it is not the forecast of things to come, but the descriptions of events past which especially distinguishes this book. The author's occasional purple patches on the beauties of nature cannot obscure the vividness of his descriptions. Two especially stand out. One is of the old Ukrainian peasants liberated from the Bolsheviks, clearing out their church which had been used as a granary, watched with tolerant amusement by the young, to whom it all meant nothing. The other is of a Finnish ski patrol setting off across the frozen Gulf of Finland to attack the Russian ships imprisoned in the ice off Kronstadt.

Introduction to America

"The American Union." By H. G. Nicholas. Christophers. 315 pages. 10s. 6d.

THIS book is an introduction, for the British reader who is approaching the subject for the first time, to the history of the United States from its colonial period through the developing years after the Revolution and the "fiery trial" of the Civil War to the day when America flung back the curtain that had been hiding the atomic age and faced the challenge of applying to the world the wisdom learnt during nearly four centuries of uniting a continent. The title of the book is particularly apt and it fills a gap between the shorter general introductions, which need to be supplemented by more factual studies if they are to bring real understanding, and the many longer histories, which are too complex for the reader who is seeking a simple explanation of how this United States grew from the beginnings which he remembers from his English history lessons to the importance which gives it daily headlines in his newspapers.

An author who tries to compress 300 years of history into 300 pages of pleasantly large type cannot avoid an occasional rather monotonous chronology. Once the days of the early settlers are past, the idealism that lies behind so much of the story of the Civil War, of the conquest of the West and of the New Deal, is somewhat obscured in the mass of detail. But the average reader, if he is also an average film-goer, will know far more about the romanticism of at least the first two than he does about the facts which Mr Nicholas presents so clearly. It is doubtful whether any better historical outline is possible within the limitations which he has set for himself, although possibly a little more emphasis might be put on the present-day importance of such fundamental institutions as the Constitution and the Supreme Court, which are hardly mentioned after the able descriptions of their formative periods.

But the development of that aspect of the United States which has the most direct impact on the British reader, its foreign policy, is traced lucidly and completely from before the days of the Monroe Doctrine to what is probably the most far-reaching transformation in American history, the reversal in the nation's thinking on international affairs between 1918 and 1945, a reversal which has been made even more complete, since Mr Nicholas finished his book, by the acceptance of the Marshall Plan.

Reference Library

To decide to create or expand a reference library is simple. To choose the material that should be included is work for a specialist. And, nowadays, to obtain the books themselves is often a considerable task. We would be glad to put our experience at your disposal.

The Need for Enterprise

"Enterprise First." By William Wallace. Longmans. 112 pages. 8s. 6d.

THE problem of how to preserve a spirit of enterprise in a period, if not necessarily of socialism, at least of widespread State intervention is attracting more and more attention. Planning will kill prosperity stone dead if some solution is not found to the present conflict between the healthy impulses of those who need freedom to pursue their schemes of industrial development, and the well-intentioned efforts of civil servants who are attempting to direct those impulses "according to plan." This book is one effort to solve this problem.

Mr Wallace is a director of Rowntree's and during the war was a director of a different kind in the Ministry of Food. He draws upon both his civil service and his business experience for his book and gives a very fair assessment of the relative spheres and fundamental differences between the civil service and industry and commerce. As with other successful temporary civil servants he has returned to business with a much better understanding of the problems and importance of the civil service.

The best parts of the book are concerned with descriptions of events in which Mr Wallace was personally concerned. His account of the relations between the State and the cocoa, chocolate and confectionery industry during the war are vivid and interesting, and the distinction he draws between the role of the Ministry of Food in determining major questions of policy, such as the types of goods to be made and the principles of rationing and price control, and that of the industry in implementing this policy from day to day are valuable. When, however, Mr Wallace slides from the particular to the general he is apt to seem innocent and repetitive. This is due in part to the delay in publication: for example, his conception of public boards is written without reference to any of the new nationalised boards and their teething troubles: similarly, other ideas which appeared new to the author when he wrote them down during the war are now over familiar. For all this Mr Wallace makes a sincere and unprejudiced attempt to distinguish between the right spheres of public control and private enterprise, and his conclusions, if not new, are fair and reasonable. This is a book which ought particularly to be read by other industrialists, and by the "regulators" in the Board of Trade.

Western Union

"Western Union." Prepared for the United Nations Association by Andrew and Francis Boyd. Hutchinson. 10s. 6d.

THE 175 pages of this book are equally divided between the work of Mr and Mrs Boyd and such statements on Union in Europe as Mr Bevin's "Western Union" speech of last January, the resolutions of The Hague Congress and the preamble and clauses of the Brussels Treaty. The editors give a simple and accurate analysis of the problems and stages of resolution which have brought the Western Union idea to its present prominence, including description of the working of such bodies as CEEC and ECE. Their objectivity is such that only a pleasing irony is allowed to creep in here and there. There are excellent appendices for reference, including "Dates in Europe's Story" and population figures for Europe and its overseas dependencies. The total is a useful and authoritative work of reference which is also short and readable. Further editions should give more attention to the experience of Benelux, to America's part in whipping on the Western Union movement and to Communist criticisms of it.

Letters to the Editor

The Planning Act in Difficulties

SIR,—Your comment in "Notes of the Week" in the issue of September 25th is true so far as it goes, but I think it misses the real point of the difficulties into which the Planning Act has run.

They have arisen almost entirely because land owners have good grounds for their belief that the compensation which will be payable for their lost development value will be hopelessly *inadequate*, and because they know that even what will be paid will not be paid for the best part of five years. They therefore cannot afford to sell their land at less than the amount at which it stands in their books. In cases where mortgagees require to be paid off before a sale can take place the owner has no option but to do his best to sell (if he is to sell at all) at something near the *pre-Act figure*—there is no question that a mortgagee requires payment from the owner/mortgagor on the old basis.

Compulsory acquisitions of (building) land by local authorities and Government Departments at the "existing use" value—which in practice is, so far as vacant land is concerned, purely nominal—must inevitably cause the complete disruption of the private owner's finances where he has bought (as almost all of them have bought) on the old basis. Apparently the Central Land Board is now threatening to lengthen the trail of land owners who are being beggared by the financial provisions of the Act.

Nevertheless, it is to be wondered if the Central Land Board's threat is not a piece of *bluff designed to frighten* landowners into selling in a free market at the "existing use" value. I think the bluff will be called, and I think it may fail for two related reasons. In the first place, no owner will sell at an uneconomic price (an act which may be tantamount to signing his own petition in bankruptcy) unless and until the situation is, in actual fact, taken out of his control; *furthermore, while it may* be possible to bluff a land owner, the Central Land Board will not easily bluff his mortgagee. In this event, administration of the Central Land Board's proposals will surely become an impossible task if owners do in fact hold out—as I think they will have to—until compulsory purchase proceedings are put in train and completed. When one considers the multitude of free market transactions it is simply not credible that the machinery exists—or can be brought into existence within a reasonable time—to enable the Central Land Board to indulge in large-scale and multitudinous land acquisitions.

Your fear that the "burden" (ie., the cost of land on the old basis plus the development charge) will be passed on to the consumer is not entirely justified. The effect of the Building Materials and Housing Act, 1945, and of the limitations of the selling and letting prices of properties erected under licence, should prevent this, provided that the provisions of this Act are correctly administered by local authorities. But what will *inevitably happen* is that developers who are limited to a selling or letting price which covers only the "existing use" value and the development charge, *but who are* faced with a cost in their books of a development which includes the cost of the land bought on the old basis and the development charge, will have to cover their commitments somehow. One way to do it is to scamp the building, and so reduce the cost, and quality, of construction—the other way is not to build at all.—Yours faithfully, FRANK HELLINGS

79 *Cannon Street, London, E.C.4*

The Reward of Work

SIR,—Whilst agreeing with the substance of Mr Brech's letter and your comment thereon in *The Economist* of September 25th, I think that two points are open to question.

The assumption that the level of morale is a direct product of the competence or deficiency of management is, unfortunately, an over-simplification. Nobody would deny that the quality of management is an important factor in contributing to the level of morale, but no industrial unit works in an ivory tower and morale is basically a national matter. The policy of a trade union, for instance, may affect the morale of a firm's workers far more than the activities of its management; the threat of war, the result of the Derby, the price of beer, a strike (official or otherwise) in some other organisation—these are the sort of factors that influence morale.

Personnel managers are beginning to realise that there is no simple answer to the problem which these conditions raise. So-called incentive schemes may or may not work according to the state of the political and social climate: even the standby of the rough-and-ready school of management—higher wages—is offset by an appreciable rise in the marginal disutility of work, and a further variable is introduced by a fluctuating cost of living. Yours faithfully, A. G. P. ELLIOTT

61, *Crossefield Road, Cheadle Hulme, Cheshire.*

No Peace—No War

SIR,—I doubt if your view of the analogy between Hitler in 1938 and Stalin today is strictly accurate. Surely *it is not true* that Hitler wanted war in any event (save in the sense of a limited liability campaign against, e.g., Poland or Czechoslovakia)? He wanted two things, (*a*) power and the accession of territory which that would represent; (*b*) in the process of obtaining it to humiliate if possible the former enemies and victors of Germany, though this was not quite unmodified in the case of Great Britain. What, then, does Stalin or the Politburo want? (*a*) Power as with Hitler; (*b*) the spread of Communism *à la Russe* till Moscow becomes the power centre and Mecca of a Communist world; (*c*) meanwhile a clear demonstration that the non-Communist nations are inferior to the Communist. In each case war was, and probably is, a possible instrument of policy whenever victory seems assured and the objectives cannot be obtained without it. Not otherwise. But *the threat of war* must be a continuous instrument of policy otherwise the objectives will never be obtained. To say that this is the Eastern question intensified may be true; but it is intensified out of all recognition of its prototype. *It is* clear that if this threat of war is to be effective any element of bluff in it must be carefully concealed. Such a policy naturally has *advantages for totalitarian* dictators operating against democratic governments, who cannot in the nature of things resort to war till they are driven into the last corner. Moreover, it handicaps such governments by imposing on them vast re-armament schemes which must embarrass and may crush them; or lead to a revolt of public opinion *against them*. There is, however, always the danger of an explosion taking place at the wrong moment. Unfortunately, history tells us that blindness on this score is a malady to which dictators are sadly prone.—Yours faithfully,

24 *Chester Street, London, S.W.1* JOHN MARTIN

From *The Economist* of 1848

September 30, 1848

A considerable number of gentlemen assembled at Brussels last week from France, Holland, England, and the United States, and constituted themselves a Congress for the Promotion of Peace. The excellence of the object admits of no doubt, but it is doubtful whether the gentlemen present exactly comprehend the present general cause for the interruption of peace. Their only idea of peace was the reverse of war between nations. . . .

Peace has now prevailed in Europe for an unexampled period. For three and thirty years most of its governments have been on friendly terms with each other. They long ago formed a great or Holy Alliance for the purpose of preventing war. They have held congresses for the same end. No sooner do disputes arise between any of them than others offer their mediation, and peace is preserved. England has become a great mediating power. She has mediated between the United States and France, and Holland has mediated in our disputes with the former. . . . With the flagrant example of Charles Albert before our eyes, we cannot say that sovereigns and governments have given up war altogether; but their animosities, hatred, and dread of one another do not now constitute the master evil of society, against which humane and enlightened men should direct their efforts. . . .

The congress has not duly appreciated the wants of the age. War between governments has practically, as well as theoretically received, we are happy to acknowledge, great discouragement. The war that now disturbs society is between established governments and revolution. . . . We have no knowledge of any period in the history of mankind when there was such a general hostility between the people and the rulers as now prevails on the continent, and such a general subversion of authority. . . .

AMERICAN SURVEY

Red, White and Blue Herrings

(From Our US Editorial Staff)

THE special trains of the various candidates for the Presidency and Vice-Presidency are now crawling backwards and forwards across the country, crossing and recrossing each other's tracks, sometimes barely avoiding the embarrassment of simultaneous arrival in the same town, sometimes following each other along the same stretch of line, as if they were electric trains on a miniature railway controlled by some small boy with a taste for risking collision.

Mr Earl Warren was the first to start, leaving Sacramento on September 15th and heading east. When he turned south at Salt Lake City to help the Republican candidates in Colorado and New Mexico, two of the states in which it is hoped that Senate seats can be won from the Democrats, the President slipped behind his back to San Francisco and Southern California. Mr Dewey, who had been hot on Mr Truman's heels, two days behind in Des Moines and only one in Denver, then gave up the chase and took the road to Albuquerque which Mr Warren had covered five days earlier. From there he went west through Arizona and passed the President, travelling in the opposite direction, between Phœnix and Los Angeles. Meanwhile Mr Warren had turned aside, in the hope of saving a doubtful Republican Senate seat in Oklahoma, before going east to show himself to thousands to whom he was only a name.

The campaign train is a feature of American electioneering which, like the Constitution, is impervious to change. Mr Wallace shows his complete lack of understanding of when to accept tradition and when to recognise the American desire for novelty by travelling about the country by air. The air has no "whistle stops" at which a candidate can, at the expense of five or ten minutes, flatter a whole county into giving him its vote. Nor is the campaign train itself susceptible to modernisation. Last week the Twentieth Century Limited, the most luxurious train between New York and Chicago, was provided with new equipment—including showers, a barber's shop, telephones and acres of rare panelling and stainless steel—for what is only an overnight journey. But the rolling-stock on which candidates and their staffs live for weeks at a time remains the same as that which carried President McKinley round the country. Streamlined trains have their advantages but they do not include a back platform on which to be seen and from which to speak. The all-important last coach sets the fashion for the rest of the train which, though given a coat of fresh paint, is made up of ancient Pullmans, upholstered in nineteenth-century plush.

At the back of this last coach hangs a red, white and blue illuminated sign (in Mr Dewey's case it reads "Dewey Victory Special") and above it there is a microphone which, at every stop, is connected with a loud-speaker van, brought to the station by the local Party Committee. The candidate and his family live in this coach. The next three or four are for the high command (the candidate's advisers, Senators from his home state, the Congressmen from his home district, his public relations staff and the manager of the train) and the local VIPs who join the train for the trip through each state. In front are the press, on whom the candidate must count to transform a local appearance into a national event. They have a dining-car, a club car, a work car (with a shelf along each side and a staff from the Western Union Telegraph Co. ready to throw their copy to messengers waiting at every station) and four or five coaches of bedrooms. Mr Dewey's train has seventeen cars and a constantly shifting population of between eighty and a hundred correspondents. Mr Truman's and Mr Warren's trains are two cars shorter, neither having the same attraction for the press.

The routes of these trains are decided and their stopping places chosen to influence the doubtful states and not to flatter the faithful. Nobody will waste any time this year on Maine, which held its Congressional elections in September and gave its new Republican Senator over 71 per cent of the total votes. But the inhabitants of Raton (population 7,607) and Las Vegas (population 5,941) in New Mexico must have been pleasantly surprised that both Mr Warren and Mr Dewey stopped to speak to them within a few days of each other. The small group of enthusiastic children and apathetic Mexicans who greeted them may not have seemed worth the time of such busy men. But Major-General Patrick Hurley is involved in a close race for the Senate with Mr Clinton Anderson, a race which he seems at the moment likely to lose, and every vote counts. So does every Senate seat in a year when control of the Senate is the only issue in doubt.

*

By starting first Mr Warren had the field to himself for two days, after which the words of the maior candidates drowned much of what he had to say. But his first speech at Salt Lake City set the tone which both he and Mr Dewey have kept ever since. "In both parties" he said "there are those who would say that all good flows from their own party and all political evil from the other. But the vast majority of Americans know that this is not true. They know that good Americans are to be found in both parties. They realise that there are progressives and conservatives in the ranks of both." Four days later, Mr Dewey, in Des Moines, announced that "I will not contend that all our difficulties today have been brought about by the present administration. So far as I am concerned this campaign will not create divisions among our people."

Mr Truman, on the other hand, redeemed his promise to "give 'em hell," by telling 80,000 farmers (who had gathered for a ploughing contest, not to hear the President) that "The Wall Street reactionaries are not satisfied with being rich. They are gluttons of privilege," a phrase worthy of Mr Wallace, but one which showed a certain ingratitude to such men as Messrs Forrestal, Lovett, Hoffman, Harriman and Lewis Douglas, all of whom have given up large salaries to work for him. As far as is known no farmers have made similar sacrifices. Not only was the remark tactless; it was also ridiculous. In the fields nearby were over fifty private aeroplanes and thousands of cars belonging to his audience. It was in vain that he reminded these farmers of their plight when the Democrats came into power in 1933 and their neglect at the hands of Republican administrations during the 'twenties. Gratitude for past favours has never been considered a good reason for voting.

The two Republicans have come down from their non-partisan pedestal only to discuss the problem of disloyal officials. At Salt Lake City Mr Warren introduced the subject tentatively by saying that "It will be no problem for Tom Dewey to get Communists out of the government—because he'll never let them in." This reference was so popular that he enlarged on it in later speeches and Mr Dewey took it up at once by reminding his audiences that they had been told by the President that the exposure of Communists in the government was a "red herring" although the Administration had appropriated $25 million to get them out. But the Republican candidates have no need, except to give contributors to the campaign fund some fun for their money, to take even this slight notice of Mr Truman's presence. The remarks about "red herrings" (to a country which, even if it does not approve of the Un-American Activities Committee, is genuinely alarmed) and "gluttons of privilege" have destroyed whatever faint hope the President might have had of recovering the ground lost during the last three years.

Mr Truman made a fundamental mistake in his campaign, one that his predecessor never made. Mr Roosevelt always took care to leave the role of attacker to his opponents, only occasionally, as he did in his 1944 speech to the Teamsters' Union, provoking them to bad-tempered indiscretions. But Mr Truman, perhaps out of desperation, has become the challenger and has left Mr Dewey to play Mr Roosevelt's part—that of the statesman whose appeal is above party. It is too late now to lead the Republicans into any such trap as that into which Mr Dewey fell four years ago, in his Oklahoma City speech; they need only to remain dignified to the end, oblivious of Mr Truman yapping at their heels.

At Philadelphia, though the Republican Convention was exciting and the Democratic gloomy, it was noticeable that the Democrats recited with pride the record of their sixteen years in office while Republican speakers, with few exceptions (among them Mr Dewey) attacked the memory of Mr Roosevelt and accused him of every crime, including "saving his political fortunes by plunging us into war." Had Mr Truman continued to remind his audiences of his party's record, contrasted it with that of the Eightieth Congress and left the attacking to Mr Dewey, he might have done better. It is apparent that Mr Dewey is not much impressed with the Eightieth Congress and is relieved that he has been saved, by the introduction of extraneous subjects, from having to defend it in detail. Many of its Republican members, however, who are proud of what they did, are obviously disappointed with him and Mr Warren. Having no understanding of the effect which a divisive campaign might have on American prestige abroad, they feel cheated when they hear only mild criticism of the Administration and none of its policies. Mr Dewey, well aware that he is likely to become President at a critical moment in his country's history, is making no unnecessary enemies. He will need, in the next four years, all the unity for which he is now asking.

American Notes

Dewey and the Atom

Governor Dewey dropped the first bombshell of his campaign only 400 miles from the New Mexican desert where the first atomic bomb was tried out. This was his suggestion that the development of atomic energy for civilian use be freed from the "dead hand of government" and turned over to private industry. If it had been up to Washington to develop electricity and the automobile, we would still be using paraffin lamps and the horse and buggy, Mr Dewey said. In the past the fierce debate over atomic controls has centred on the question whether government policy should be made by civilians or the military. Blockbuster or dud, Mr Dewey's preference for commercial exploitation is in one sense only a time bomb with greatly delayed action. For he did not dispute that government control must continue until the threat of war is cleared away, and this idyllic state of affairs is not likely to materialise very soon.

But Governor Dewey may regret, both on the stump and in office, this departure from his safe and sure campaign on national unity; it has provided the Democrats with a much-needed campaign windfall, and will cause many misgivings among independent voters who feel that atomic energy, like foreign policy, should be kept out of the political battle. Mr Kefauver has accused the Republican candidate of dragging the most important issue in the world into partisan politics; Senator Barkley sees the sinister hand of big business in a plot to turn the $3 billion atomic energy industry over to private profit. The cry of partisanship will be supported by reference to the Congressional atom spy hunt (though the Committee has had the grace to deny itself the luxury of open hearings, in the interest of security) and to the refusal of Congress to sanction more than two-year terms for members of the Atomic Energy Commission, on the ground that the new President's hands must not be tied.

The charge that private industry has been frozen out of participation in atomic development is hard to accept, given the technical and military risks which exist. Ownership of plant and resources and control of policy are in the hands of government, but private firms and university research departments run the laboratories under contract. Is it profits, rather than participation, which Mr Dewey objects to freezing out? Less than a year ago the chairman of the Detroit Edison Company was congratulating the Commission on calling in the "immense talents of American industry" to aid in plotting the industrial uses of atomic energy.

Over-concentration on the military aspects of atomic energy is a fault of the times. But the last report of the Atomic Energy Commission was more hopeful than ever before of the early development of atomic power for civilian use. It might, the report said, outrank coal and electric power in twenty years' time, given the condition that "breeder piles" prove practical. The first atomic power plant in history is to be constructed during the next eighteen months near Schenectady, New York, and operated by the General Electric Company. If the Commission's scientists are right, this pilot plant will produce even more fissionable material than it consumes as fuel in the generation of electric power.

* * *

How Not to Build a Party

"We've got to build a party, Beaney," said Mr Wallace to his campaign manager, Mr C. B. Baldwin, last week in the course of a speech which undermined most of the Progressive Party's existing foundations, leaving intact only the Communist base which Mr Wallace pretends is not there. He offended all the political proprieties in this speech; he wandered wistfully instead of leading with enthusiasm; he disagreed with his campaign manager publicly instead of privately as etiquette demands; his words had a sibylline quality which gave belated justification to the epithet of "Veiled Prophet" which the *Chicago Tribune* invariably applied to him in the days when he was Vice-President; he was imprudent enough to speak extemporaneously on an occasion of importance. Interpretations of his speech therefore vary, but his insistence that those liberals who do not break away from the Democratic Party now will have left it until too late, appears to have undone all the careful efforts made by Mr Baldwin earlier in the evening to attract the votes of progressive Democratic and left-wing but non-Communist independents. Mr Baldwin had given details of how the Progressives were helping those progressive candidates for Congress who were not prepared to abandon their Democratic allegiance. He thus tried to answer the criticism that the main effect of the Progressive campaign will be to ensure a reactionary government for the next four years and that the party is thus playing the Communist game.

Mr Wallace also contributed a slogan which will hardly stimulate his supporters to excessive efforts during the next few gruelling weeks: "Life begins on November 3rd"—the day after the election. His suggestion that the party must not depend on one man and that it must broaden the basis of its leadership also gave the impression that the Progressives would have to start their new life by finding a new prophet.

This embarrassing demonstration of political ineptitude was made worse by its occasion, a dinner of "Businessmen for Wallace." The extent to which their confidence had already been shaken was shown by the fact that only 400 were there, compared with 1,200 at a similar dinner five months ago. Estimates of the number of votes Mr Wallace is likely to get have declined in a similar proportion during the same period, from ten to three million. The businessmen followed the usual ritual, even if Mr Wallace did not, by paying $100 a plate, but most of the $2,500,000 which his campaign is expected to cost is being raised in a less traditional way, by charging from 60 cents to $2.50 for admission to his meetings.

Mr Wallace still finds the majority of his supporters amongst the young and the poor, the Jews and the Negroes, in the big cities and on the coasts. In New York City, where he is expected to get one-third of his total number of votes, it continues to look as if he may draw enough support away from the Democrats to give Mr Dewey the State. But in California, next to New York the chief Progressive stronghold, Mr Wallace's prospects are declining, and in Illinois and Missouri his name will not even appear on the ballot. His candidacy has only been actually certified in seventeen States, which besides New York and California include Michigan, Minnesota, New Jersey, Oregon, Pennsylvania and Wisconsin. However, he is said to be sure of a place in the ballot in fifteen more, and there is still hope of bringing the number up to the original forecast of forty-four.

The Big Stick

In the past the United States has sometimes been accused of reversing Theodore Roosevelt's advice to speak softly, but carry a big stick; America's voice in world affairs has been supported too often by potential, rather than immediate, might. Today Mr Marshall is equipped with a bigger stick than any other American Secretary of State in time of peace. In addition to the atomic bomb, which is always in the background of everyone's thoughts, the revival of conscription and the rearmament drive have met with overwhelming public approval. The strength of the Armed Forces has risen to 1,518,000 from the postwar low of 1,266,000. More recently, the Newport agreement suggests that at last the three Services are reconciled, if necessary, to fighting one, rather than three separate wars; and planning for industrial mobilisation has reached a point where it is expected to save from five months to a year in bringing the full resources of the United States to bear on any enemy.

The first fruit of the Newport agreement has been the drawing of a complete picture of what the three Services would require in the event of war. The Munitions Board is already placing "phantom" orders for 100,000 machine tools with 300 firms; a telegram will set these orders in motion without the loss of time and energy involved in 1941 when businessmen seeking contracts had to kick their heels in Washington waiting-rooms. It will now be possible to extend this web of shadow orders to other vital industries, and it is expected that, if war breaks out, no more than 18 months would be needed to bring mass delivery of every kind of equipment except the aircraft carrier and heavy bomber. The Munitions Board has already allotted 17,500 industrial plants to specific branches of production in the event of hostilities; it hopes, in all, to classify from 25,000 to 30,000. No great building expansion is expected, such as that which took place during the last war. On the industrial reserve there are 156 complete plants built for war manufacturing and now held in stand-by condition, and another 245 of these facilities leased to private companies who have contracted to make them available for war production within 120 days.

The National Security Resources Board is also drafting stand-by legislation on controls for Congressional approval, on two assumptions: that of a limited, and that of a full-scale emergency. Foresight of this kind failed to impress Congress in the years before Pearl Harbour.

* * *

The Defence Budget

The unity of the Armed Forces faces a new and severer test in the defence budget now being drawn up. This will be the first unified budget for all three Services; in the past, the Army and Navy presented, and lobbied for, separate appropriations. The inevitable pangs at this surrender of independence have been intensified by the $15 billion ceiling imposed by Mr Truman on defence costs for the fiscal year 1949-50. This is only slightly ($241 million) more than the amount granted for the year ending in June, 1949; the preliminary (and no doubt grossly inflated) requests of the three Services added up to $30 billion. It is thought that this ceiling, if maintained, may require the reduction of some programmes already underway. But the maiden voyage of the first unified defence budget involves more than Mr Forrestal's ability to induce each Service to moderate its ambitions. The budget he draws up must pass the scrutiny of the Bureau of the Budget, of the President, and of Congress; and there is no guarantee that Congress may not upset the apple-cart by reallocating the money, or increasing or decreasing it, as it did over the 70-group Air Force in the last session.

One additional hazard this year lies in the fact that although the Budget will be presented to Congress by Mr Truman, the odds are that it will be implemented by Mr Dewey. It is not thought that Mr Dewey's views on foreign policy will allow him to demand drastic cuts in defence, but the new broom of a Republican Administration will be expected to substantiate its claims to efficiency and economy; the most in preparedness will be required from every defence dollar. There seems to be a case, if the Republicans are victorious in November, for extending bi-partisan co-operation from the State Department to the National Military Establishment during the two months before they are installed.

The chief reason, however, for limiting the share defence may take of the national cake is the desire not to impose new and unmanageable inflationary pressures. It is thought that, without the revival of controls, a $15 billion defence budget is all that can be absorbed as long as business is booming. The revival of military Lend-Lease is beginning to be discussed; unofficial reports suggest that Congress may be asked to appropriate $2 billion for military assistance to Europe for the fiscal year beginning in July, 1949. But it must be remembered that in 1940 there were unemployed men and resources; without a recession, the supply of arms from America would, like an increase in the domestic defence budget, present the new Administration with the prospect of reimposing the controls the Republican party has steadily opposed.

Shorter Notes

In a recent Gallup poll Americans indicated their approval and support of a military alliance with western Europe. Three out of every four people questioned were in favour of joint defence plans between the United States and the Marshall Plan countries: this sentiment has grown during the summer as the Berlin crisis has compelled attention. Democrats and Republicans have similar views on a firm policy toward Russia (80 per cent of the individuals polled are willing to risk war to stay in Berlin) and international co-operation. This is an astonishing contrast to public opinion after World War I, when there was general determination to forget about Europe.

★

Due to recent experiments in the development of chemically coated seeds great oaks could now grow from larger acorns. Although the process is still in the evolutionary stages some growers are already advertising seeds covered with ingredients which facilitate germination. Very small seeds are enlarged so that they can be planted individually, which has the dual advantage of reducing waste of the seed and the hours spent on thinning and transplanting. Vegetables whose germination can be ruined by extreme dry or wet soil conditions are protected by the covering and their growth is stimulated by the chemicals impregnated in the casing. The cost to the grower is higher than for uncovered seeds but it is claimed this is repaid by the greater yield and the labour-saving advantages of the invention.

★

Retired and disabled miners gathered their first fruits from last June's coal wage agreement on September 16th when they received their first monthly pension cheque of $100 from the United Mine Workers' Welfare and Retirement Fund. To be eligible the pensioner must have worked as a miner for twenty years, be 62 years of age and have retired after May, 1946. At the age of 65, he will draw regular social security benefits, which will increase his income to between $130 and $140 per month. Actually many of those eligible for welfare pensions are expected to continue work in the mines, where wages average almost $300 per month. Payment of the pensions is made possible by royalties of 20 cents a ton put into the fund by the coal operators.

★

In spite of an anticipated carry-over of six million bales this year, the Secretary of Agriculture has decided that cotton is not yet in surplus supply and he has announced that there will be no marketing quotas imposed on the growers for the 1949-50 crop. The knowledge that marketing and acreage restrictions will not now be required gives the planter the assurance of one last lush year before support prices are reduced. Political tempers in the south may be sweetened by this assurance. Another result of this decision is that funds from the Department of Agriculture will not be available to help finance the Economic Co-operation Administration's exports of cotton.

★

The news that the Civil Aeronautics Board has permitted the airlines to raise fares by 10 per cent barely reached the public in time to be apparently contradicted by a spate of sales promotion campaigns designed to convince the poor, the unhurried or the timid traveller that staying on the ground is an expensive luxury. In an effort to compete with non-scheduled lines and to encourage lagging public air-mindedness, the carriers are offering temptingly reduced fares for family parties and discounts of as much as 20 per cent on commuter trips. Groups attending conventions also get bargain tickets, and there are various other reduced rates in operation or planned; in fact, the passenger who cannot fit into one or other of the categories of cheaper flying is unlucky.

★

Pulp mills which are being planned in south-eastern Alaska are expected to bring greater prosperity to the territory where local industries, at present, offer only seasonal employment. The Indians claim a right to the timber in the National Forest: until their case is decided by the Supreme Court, the Government will hold for them in trust moneys received for the lumber.

THE WORLD OVERSEAS

Belgium and European Recovery

THE nations taking part in the Marshall Plan have already assigned Belgium a leading role in the four-year effort to put Western Europe on its feet. Under the recent payments agreement, reached by the Marshall countries in Paris, Belgium is expected in the first year to give its needy neighbours a sum of Belgian francs equivalent to $207.5 million. That figure represents over four-fifths of the aid Belgium will receive from the United States, close to five per cent of its national income, and 15 per cent of its 1947 exports. Moreover, it is possible that demands of an even more far-reaching nature will be made on Belgium when the 19 participants meet this week to discuss their four-year investment programmes.

The Belgians are worried lest what is demanded from them in the name of European recovery should seriously injure their own long-term prosperity. Can they help substantially in the reconstruction of western Europe without jeopardising the future efficiency of their own industry? Belgian technicians insist that much of their industrial plant stands in growing need of modernisation, and they realise that under normal conditions the necessary increase in investment would mean a cut in the Belgian standard of living. With Marshall aid they had hoped both to increase investment and to maintain their recent living standards.

What worries Belgians even more is that if the recovery programme works out along the lines now indicated, it may bring further unemployment to their textile and luxury trades, and may eventually threaten the very existence of these industries on their present scale.

Some of the other partners in ERP do not share Belgian fears. They think it is time that Belgium restricted consumption, used the savings thus made for expanding industry, and passed on to the partners—through the payments scheme—the purchasing power to buy the products of expanded Belgian industry. Indeed, they are prepared to go further. Since the continued well-being of Belgium depends on the prosperity of its best customers, they argue, then surely no sacrifice in the common interest is too great, even if it involved transitional unemployment and readjustment of industry.

The ultimate decision seems to depend on the answers to a few basic questions. How obsolescent is Belgian industry? How high is the present level of production, investment and consumption? Where do Belgium's long-term export markets lie?

Belgium emerged from the war with little major damage to its industry, and by the beginning of 1947 the general index of industrial production already stood at 93 per cent of the average 1936-38 level. Since then there has been further progress, and today many industries are very close to the peak reached during the 1937 boom and well ahead of the 1938 level.

BELGIAN PRODUCTION
('000s Metric Tons, Monthly Average)

	1936-8	1947	First Half, 1948
Cast iron	261	235	304
Pig iron	253	235	296
Alloy steel	6·0	5·3	5·6
Finished steel	198	206	252
Cement	250	217	280
Coal	2,425	2,033	2,162

Recovery, however, has been uneven. The coal industry is the black sheep of the Belgian economy. Although the number of miners is far greater than before the war, yet the monthly output for the first six months of this year was ten per cent below the 1936-38 average: for some time there have been no signs of any upward trend in output. The Belgian mines are handicapped by a set of problems now familiar elsewhere—shortage of skilled workers, absenteeism, continuing exploitation of over-age mines and use of obsolescent equipment.

As a result, costs of coal production have risen far above the 1938 level. In monetary terms there has been a more than five-fold increase and, when allowance is made for the fall in the value of the franc, the real costs of production have almost doubled. This increase has in turn produced inflated costs throughout Belgian industry; until total coal output is raised and the cost per ton substantially reduced, Belgian industry will depend precariously on the persistence of a seller's market.

The problem of ageing equipment and high costs is not limited to mining. At liberation the average age of industrial equipment was 30 years. Belgian producers urge that, apart from coal, the comparatively high prices of Belgian goods on international markets is the result of the widespread policy elsewhere of hidden export subsidies. Without these subsidies, they claim, Belgian prices would be more than competitive. This claim may be true of the present, but Belgian competitors are re-equipping fast with modern machinery and are not likely to remain high-cost producers. If their costs fall, it may well be that Belgium can only maintain its high level of manufacturing exports by lowering production costs through modernisation. That is why in recent months Belgian experts have shown a quickened interest in re-equipment.

In 1946 Belgian gross capital investment at 22 billion francs amounted to no more than 11 per cent of the national income. In 1947 the ratio had increased to 16 per cent. Certainly by American, and even by recent British, standards this is a relatively low proportion. According to the Ministry of National Re-equipment the amount of new capital invested in Belgian industry in 1947 totalled 34 billion francs. Its sources were estimated as follows:—

Source	Billions of francs
Investment through company reserves	13.8
New capital issues	14.2
Parastatal (semi-state) credit institutions	4.5
Loans from abroad	1.5

In its estimates for the future, the Ministry puts the average total requirements for investment at 32.5 billion francs in each of the years 1948-52. Provided that no change occurs in the national income, this is equivalent to 15½ per cent. In arriving at this total the Ministry has assumed that 17 billions will come from the reinvestment of company reserves and 13 billions will be raised through new flotations and parastatal institutions (roughly comparable to the corporations in Britain under public control). The balance, varying from 2½ to 5 billions, is to be provided by foreign loans. It is on such estimates of investment (amounts far in excess of prewar ratios) that the Belgian contribution toward putting western Europe on its feet has been calculated.

The plan which Belgium submitted at Paris over a year ago expressed the hope that by 1948-49 the production of finished steel, crude and semi-finished steel and pig iron would be double the 1938 level and that coal output would be 90 per cent of the 1938 figure. Textile output was already higher than before the war, and the planners anticipated further expansion, especially in the rayon branch. Fertilisers were to be well in excess of the prewar average and only in the production of agricultural foodstuffs would there be a deficit. At the time plans were submitted the figures for 1947-48 were still only forecasts, and it is worth noting that the target has been met for coal, crude and semi-finished steel, finished steel and pig iron.

The next question is whether Belgium can maintain this progress and at the same time keep consumption at its present level. Since liberation consumption goods have played an important role in Belgian economic policy. That policy was to remove wartime controls as rapidly as possible and to depend on the dynamic of conventional economic incentives. During the first two years of peace the policy involved a considerable import surplus, largely from hard currency areas. It was made possible mainly by US, British and Canadian payments for military expenditure and for Belgian contributions under reverse lend-lease. In addition Belgium received Export-Import Bank loans totalling about $100 million.

Factors in Inflation

Throughout 1947-48, however, this liberal economic policy was threatened because Belgium's exports went increasingly to soft-currency countries, which became less and less able to pay for

them. Well into 1947 Belgium continued to finance these exports by extending credits, and these soon reached $250 million. But when sterling became inconvertible, Belgium was forced to curtail loans and to conserve gold and hard currency reserves by discouraging imports. As a result the monthly average of imports fell from 8,160 million francs in the last six months of 1947 to 7,300 million in the first half of this year; over the same two periods exports rose from a monthly average of 5,500 million to 5,900 million. These movements have inevitably encouraged inflation. Between July, 1947, and June, 1948, the retail price index rose by 18 per cent with the largest increase in the foodstuff category.

The narrowing of the import-export gap helped Belgium to finish the year in a fairly healthy position. Its 1947 balance of payments show that when to its visible exports 62 billion francs are added invisible items worth a further 26.5 billion there was a deficit of only 5.5 billion. Hard currency reserves of the Central Bank were actually higher at the end of 1947 than a year earlier. Moreover, the retention of these reserves was possible without any setback to consumption. By 1946 the volume of retail trade in department stores was within 10 per cent of the prewar level and for 1947 was a clear five per cent above.

Where in the workings of the Marshall Plan do the Belgians see a threat to their achievements and aspirations in the realm of production, investment and consumption? The aim of the European Recovery Programme is certainly not to check total production. But what seems possible is that Belgium will be called upon to re-direct production and to re-deploy men and materials away from the consumer goods trades into the capital goods industries. The immediate result would be increased unemployment in the consumer goods trades where the problem has already reached serious proportions. Belgians see the beginning of such a trend in the insistence by their European debtors that they be allowed to use the franc grants exclusively for the purchase of Belgian capital goods. It is the opinion of Belgian officials that either the size of the grants should be reduced or the recipients should be compelled to take consumer goods as well as scarce capital equipment.

Changing Pattern of Trade

In all probability the Belgian Government would prefer a reduction of these grants. Government circles are especially concerned to increase investment in public works such as roads and harbours; but under the present taxation system with its heavy dependence on indirect taxation, the government itself cannot easily raise the necessary funds. It had hoped instead to obtain them by using the Belgian franc "counterpart fund" of Marshall aid. But after grants worth $207.5 million are extended to the debtor nations, Belgium is left with a franc "counterpart" of only $42.5 million, or a little under two billion francs. Unless this sum can be augmented by loans from the World Bank and US private banks, public investment will suffer.

Finally, there is the problem of Belgium's long-term export markets. Where and how will Belgium be able to sell all its goods once its competitors are back on their feet? Since liberation, the pattern of Belgium trade has changed. Before 1939 exports of manufactured goods accounted for less than one-half the total. They now constitute well over two-thirds. Moreover these manufactures are mainly durable consumer goods, and it is with this trade that the Belgians are most concerned.

Their view is coloured by memories of the over-production crisis of the thirties when producers of primary goods and of heavy capital equipment were the most disastrously hit. Consumer goods industries were not affected with equal force. There is thus a growing conviction that a similar overproduction crisis will recur and that their best insurance lies in holding on to their consumer industries. It follows that the Belgian intention is either to avoid expansion of the capital goods industries or to link it with the development through long-term schemes of new and assured markets in Africa, Eastern Europe, or Latin America.

In the light of all these hopes and fears, Belgium is likely to bargain hard in the coming months and to insist on certain minimum conditions. First, there should be no delay in the modernisation of Belgian industrial equipment. Second, there should be no substantial cut in their standard of living. Third, the use of Belgian franc grants should be made within the framework of existing trade agreements, and the other Marshall nations should not be permitted to push forward with their own investment programmes at a rate which will drain Belgian resources. If in return for meeting these conditions, Belgium is asked to expand as well as to modernise heavy industry, then it may demand a further condition. Expanded capacity must go hand-in-hand with the certainty of new and reliable markets.

The Arab Refugees

ALREADY a tinge of propaganda is beginning to colour the saga of the Arab refugees. Is their present distribution the whole of the story? Whose fault is it? Did not some of them flee in needless panic? Large sections of a world sated with refugee stories are prone to listen to reasons for passivity. But to anyone, whether priest, Levite or Samaritan, travelling the ways from Jerusalem to Jericho in September, 1948, the cause of the traffic going down is less important than two consequences affecting the future. Of these, the first is that unless outside help is given quickly and in quantity, the approaching cold weather, which is sharp in the highlands, will kill thousands of shelterless people. The second is that unless the outside world recognises a responsibility not only for succouring but for settling people whose civil and religious rights (in the League Mandate) and human rights (in the UN Charter) it once pledged itself to preserve, they threaten a tragedy of great dimensions in the Middle East.

In all, Arab refugees from Palestine number about 360,000. The bulk are in Transjordan, which was by mid-September housing 160,000 and spending £8,000 a day on bread alone. (These figures should be set against those for its population and annual local revenue, which are about 340,000 heads and about £P1,200,000 respectively.) In Palestine itself, the few who have got as far as the Jordan valley are relatively well off; they have been tented by the Arab Legion, can draw water from the Wadi Qilt, and could weather the winter in their sheltered spot below sea level. The many who are still in the Judean hills could not, and must presumably descend on and swamp the hitherto adequate camps round Jericho. Probably the most affecting sight in the hills is at Bir Zeit, north of Jerusalem, where about 14,000 destitutes are ranged on terrace upon terrace under the olive trees—a tree to a family—and are forced to consume the bark and burn the living wood that has meant a livelihood for generations. Here and at Nablus, where the organisation is slightly more systematic, there is at present so little milk for babies that abortion seems the kindest way out. The Lebanon is housing about 70,000, of whom 30,000 are destitute, and having swarmed like locusts through the prosperous little villages of the southern coast, are now massed in camps near Sidon and Beirut. In Syria, which has had smaller numbers to deal with, and has received its contingent at second hand, the Committee for the Liberation of Palestine is running a receiving camp, with card indexes, DDT and organised sanitation in evidence.

Count Bernadotte's Report

The plight of the destitute can best be pictured by giving some of the evidence upon which Count Bernadotte based his report.

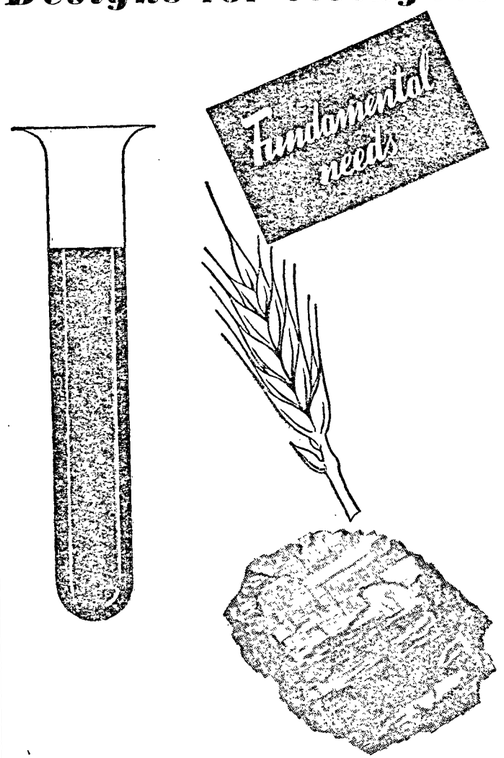
When Sir Raphael Cilento, United Nations Director of Aid for Refugees, inspected Transjordan, he made an analysis of 508 typical families. This revealed that 2,644 out of 3,453 persons, or just over 75 per cent, were either under five, over 60, or else pregnant and nursing mothers. Their men are not necessarily dead, but are lost. The immediate needs of these families included 4,100 blankets, 11,000 garments and 1,929 pairs of shoes. The sample is of course not typical of the whole 320,000; but it is a fair cross-section of those elsewhere. Only the free food provided, so far, by the Arab governments keeps them alive.

It should be realised that all these people burn with resentment not at the mistakes committed by their own leaders, of which they are unaware, but against the British and the west—almost more even than against the Israelis—for leaving them to such a fate. Resentment against Britain is quickened by the presence, among their members, of many middle class people who worked for the Government of Palestine, who had not cashed their last salary cheques owing to the closure of the banks since May, and who now wholly mistrust these. Two further points to remember about the local state of mind are that the custom of blaming foreigners for everything has become endemic, and is to all appearances justifiable because first aid was rendered by Arabs only.

Exodus in Two Waves

But only when the present plight of the refugees has been grasped, and its consequences weighed, is it important to examine how much of it is of Jewish and how much of Arab making, and whether it could have been avoided. The exodus happened in two waves. The first, which broke around May 15th, consisted

in the first place of inhabitants of Haifa and Jaffa (with Arab populations of 62,000 and 93,000 respectively) and then—as the Israeli forces surged north from Haifa—of the inhabitants of Acre also. The second wave, consisting of rural as well as urban families, coursed inland when, in June, the Arab states elected to resume fighting and the Israelis overran the Ramle-Lydda area. These second fugitives were all destitute, as the Israeli troops gave them an hour in which to quit, but simultaneously requisitioned all transport.



The events of the first exodus are described as follows by a British eye witness:—

> On April 21st British Military and Police evacuated certain buildings, mainly in the commercial quarters of the town, which they had previously occupied, and withdrew to the British residential zone and to the Port, holding a narrow connecting link between these two districts. Upon the British withdrawal, the Haganah and certain Irgun Zvai Leumi units made a determined attack upon the Arab-held quarters of Haifa, and within twelve hours had completely overcome all Arab resistance. A considerable number of Iraqi and Syrian irregulars was killed and the Arab residents of Haifa fled, in a state of utter panic, to the (British-held) port area; to the Roman Catholic Monastery of Stella Maris on Mount Carmel, and to St. Luke's Anglican Church compound in the German Colony. During the subsequent days, the Jewish authorities who were now in complete control of Haifa (save for the limited districts still held by the British troops) urged all Arabs to remain in Haifa, and guaranteed them protection and security. So far as I know, most of the British civilian residents whose advice was asked by Arab friends told the latter that they would be wise to stay.
>
> However, of the 62,000 Arabs who formerly lived in Haifa, not more than 5,000 or 6,000 remained. The remainder fled, many by sea to Acre or Beirut—paying exorbitant fees for their passages—others in convoys of three-ton lorries, provided by the British Army and protected by British Military escorts. The latter went either to Acre or to Nazareth (both of which towns subsequently fell into the hands of the Israeli forces). So far as I am aware, no effort, apart from urging the Arabs to stay, was made by the Jews to interfere with this exodus. In the majority of cases the refugees took all the movable property that they could take on the lorries—I believe a limit was imposed in some cases—and if they had time they either bricked up or secured as strongly as possible the entrances and windows of their houses and shops.
>
> Various factors influenced their decision to seek safety in flight. There is but little doubt that far the most potent of these factors was the announcements made over the air by the Arab Higher Executive, urging all Arabs in Haifa to quit. The reason given was that upon the final withdrawal of the British, the combined armies of the Arab States would invade Palestine and "drive the Jews into the sea," and it was clearly intimated that those Arabs who remained in Haifa and accepted Jewish protection would be regarded as renegades. At that time, the Palestinian Arabs still had some confidence in the ability of the Arab League to implement the promises of its spokesmen. The news of what happened at Deir Yassin had been widely circulated among the Arabs all over Palestine. It is possible that the Arabs feared a repetition of this incident, as an act of retribution for the massacre of the Jewish technicians at the CRL installation in Haifa Bay in December.
>
> Not until a couple of months later—by which time it was quite obvious that the refugees were not coming back—did the Jewish authorities take steps to enter those houses which had been evacuated by the refugees, or to break down the bricked-up doors of their shops. And, in any case, these entrances were effected legally, by orders of the (Jewish) Custodian of Enemy Property (appointed by the Israeli Provisional Government) and records have been kept of the goods (some of them foodstuffs urgently needed by the remaining population, both Jewish and Arab), which were confiscated.

In Jaffa, Irgun units attacked the town before the British had left, when it was defended by Iraqi and Syrian irregulars. These last were forced back, and Jaffa would no doubt there and then have fallen into the hands of Israel but for the action of British troops, who threatened to engage the advancing Jews. The latter then retired to Tel Aviv. The Iraqis and Syrians thereupon seized a chance to loot locally, particularly in Christian Arab houses, and then made a get-away with their spoils. The unfortunate local Arabs at once followed.

It is plain that no authority—Jewish, United Nations, British or Arab—can wash its hands of all responsibility. The future is the important issue at stake. Immediate relief is on its way in some quantity. Apart from the Arab States, whose generosity has been great, Great Britain heads the list of contributor nations with a first £100,000 promised on August 3rd. The first tons of United Nations goods reached Beirut on September 15th. Private subscription lists range from dollars from oil companies

Designs for living...

The Simon Engineering Group specialises in a wide variety of industrial plants, ranging from coal washeries, coke ovens and power stations to flour mills and granaries.

These plants help to produce food, steel, gas, chemicals, heat, light, power—products and services vital to civilised life.

In more than forty countries throughout the world Simon plants uphold the reputation of British engineering and serve the fundamental needs of humanity.

A GROUP OF COMPANIES SERVING THE FUNDAMENTAL NEEDS OF CIVILISATION

(who prefer to be nameless on account of repercussions among Zionists) to pounds raised by the Anglican See of Jerusalem. But blankets and the like, though vital, are not a total solution. The prime need is for resettlement or restitution on terms that Israel, as well as the western nations, would, if only for self-interested reasons, do well to make generous.

Nationalised Industry in France

[FROM OUR PARIS CORRESPONDENT]

THE "fiasco" of the nationalised industries is a favourite theme for joyous comment in the French conservative and business world. It excites American resident officials or commercial visitors here into a frenzy of pride at the innate wisdom and good of private enterprise. Rightwing and financial newspapers, notably the most sericus of them all, *Le Monde*, never tire of publishing special articles giving figures, facts and illustrative anecdotes which decisively prove that the larger part of French industry (calculated at about 70 per cent of its total value) which is now under state control, is in a contemptible state. Protagonists of the nationalised industries are hard put to it to retort, for the case is triply strong: they have so far failed —it is alleged—economically, financially and socially, and certainly they have exposed to scorn these who regarded them as a panacea for dilapidated France.

Economically they have failed, because they have economised neither effort nor men. Overheads, which concentration and centralisation should have reduced, have steadily risen; in the mines, for example, the proportion of clerks and administrators to miners has doubled since the liquidation of the private companies. Productivity has decreased in most branches of nationalised industry, notably in the mines where the postwar miner digs only three-quarters of his prewar average. The aircraft industry is a notorious example of nationalised muddle and waste, while Air France now has to fly foreign planes—or, at best put foreign engines into French frames—to reassure its worried clients.

As for the financial position, the nationalised industries are either running at a deficit or, according to informed *inspecteurs de finances*, are "arranging" their accounts so as to eliminate such liabilities as repairs and renovations and so obtain a fictitious equilibrium. The figures cannot be definitely ascertained as no general balance sheet is submitted, although the present government has declared that regular methods of accounting will henceforward be rigorously applied. The issue has come to the fore since the most spectacular bankruptcy of recent months in France concerned the nationalised company of SNECMA (aircraft producers). They had to shut their doors on pay-day at the end of May.

Centre of Big Strikes

Socially, the case against the nationalised firms is even more damaging, for it was, above all, a social purpose which led to their original appropriation by the state. Yet almost every large-scale strike has started in a state-controlled industry; the work of the mines is more damaged by strikes than any branch of production; the country lives in constant dread of a cut in electricity and gas supplies; and on the only two occasions on which your correspondent has seen street fighting in Paris itself, the trouble started with demonstrations by employees of the government. The first was when the dustbin-men emptied their garbage cans in a heap outside the Hôtel de Ville and came to blows with the police who were discouraging them; the second last week when the aircraft workers hurled paving stones at the police who prevented them from marching on the Elysée to protest against economies ordered by the government, which would have cost many of them their jobs.

With a case as good as this, and fortified by the approval of inadequately or belatedly indemnified shareholders (in many cases of the lower as well as the upper middle class), all sectors of conservative opinion can scarcely withhold their delight. Both batches of nationalisation were carried through in a mystical fervour (*Front Populaire* and Liberation) when it was hardly possible—or indeed safe—to denounce them. Now, with the political pendulum swinging far to the right (the pendulum swings further and more sharply in France than in Britain), the cries of "I told you so" have an almost vengeful resonance.

In fact the verdict—which a numerical majority of the French public has probably already passed—is premature. With two centuries of experience behind private enterprise and barely a decade behind state control, the respective merits of the two systems cannot yet be judged, either from the standpoint of efficiency or social justice.

The French nationalised industries (mines, armaments, transport, the large banks, electricity, gas, the principal insurance companies and a miscellaneous number of individual businesses still in their experimental phase) are developing under three basic handicaps. First is the heritage from private owners of a generally stagnant, and in some cases actually declining, business. Between the two wars the French economy, largely for demographic reasons but also because of cartel restrictions and protective practices, had fallen in technique and output far below British, let alone American standards. Since 1939 the disparity has considerably increased. Impoverished and denuded of external assets, each sector of the French community has struggled to pass on the consequent sacrifices to the others; and in the resulting inflationary chaos the devil—complete with hammer and sickle —has taken the hindmost. The nationalised industries have been the principal victims of the inflation, because the government, trying to hold prices so as to avert political disaster, have generally found it easier to block prices which they themselves control than those charged by recalcitrant traders. In many cases the theoretical deficit in the nationalised businesses has resulted from artificial price pegging—with the taxpayer standing the cost either way.

Pawns in the Struggle for Power

Second among the handicaps is the fact that both batches of *nationalisation*, prewar and postwar, coincided with extreme political tension, and the nationalised industries at once became pawns in the struggle for power. Today nepotism and jobbery are reported from many sectors of the bureaucratic machine (jobs are offered—indeed created—against money or political influence). For example, when the Communists were in charge of the Ministries controlling armaments and industrial production, they found jobs in the nationalised concerns for their own devotees; now the boot is on the other foot. The French nationalised industries are particularly vulnerable to internal political and social divisions, since they were executed in a doctrinaire rather than practical manner. Accordingly management was transferred from a single owner to a tripartite board, in which the state, the workers and the consumers (in some cases including former directors) shared power. Thus in the electricity management M. Marcel Paul represents the unions (he recently found it worth while resigning his seat in parliament to maintain this office) and occupies an admirable strategic position to prepare for the general strike on the Cominform's D-Day. Dispossessed shareholders are as unlikely to co-operate in making the new system work, as is M. Paul, pledged to upset the regime.

The third handicap under which the nationalised industries are labouring is the crisis in public savings, which affects all French productive enterprise. The cause is simple; in an inflationary economy there is every incentive to hoard or stock, and none whatever to save and invest. Given the political instability of the regime, the diminishing capital available for investment naturally finds its way into private rather than into the public purse. The misdirection or freezing of national resources is one of the major causes of France's economic decline.

In these circumstances it is doubtful whether the branches of industry now under state control would fare any better in private hands. In the impoverished and revolutionary state of French society today, the country requires the treatment which will divide it least. The state is generally incompetent and often corrupt, but if the present uneasy equilibrium is destroyed, incompetence and corruption may seem a lesser evil than civil war. The "incentives" argument can be pleaded both ways: by far the most remarkable postwar performance in the French economy has been the speed and efficiency with which the technicians and railwaymen of the nationalised railways restored their battered and dislocated communications to the present admirable level.

Some of the mistakes will have to be remedied: closer financial control and reductions in personnel have already started. The tripartite management of any business whatever will soon have to be recognised as an economic and administrative absurdity. And some of the small firms confiscated by the state in 1944 to punish collaborators will slip from public into co-operative or private hands. But an attempt to restore the great bulk of nationalised industry to private hands might, in the event of a major electoral victory for the right, seem practical politics. Yet such a restoration could only serve to accentuate political tension, class war and social and monetary instability. France, more than ever, would become an ungovernable country and its entire economy—not merely the nationalised sectors—more than ever paralytically dependent on foreign aid.

THE BUSINESS WORLD

European Recovery—I

Planning Europe's Power

This article is the first of a series on the scope for European industrial co-operation. Economic integration is still a phrase, not a policy. The working out of policy depends to a large extent on the existing technical resources and location of Europe's key industries. The series starts from the premise that a fuller discussion of these technical factors for industries like power, steel, coal, and agriculture is necessary to establish what economic integration implies. For this reason the series will try to deal in facts about specific industries, so far as they are ascertainable, rather than the broader questions of a unified economic policy for Europe.

UNLIKE most of the industries of Europe, electric power supply had a record of rapid, almost uninterrupted expansion from the end of the first world war until the beginning of the second. The expansion of supply was abruptly halted by the war; but demand continued to expand and by 1946 it would have been 50 per cent greater than in 1938 had it not been forcibly restrained. Power rationing, disconnection of supplies and other forms of restriction have become a common feature of economic life in Europe. It is unfortunate that the expanding supply and expanding use of electric power has come to be regarded almost as a law of nature, only momentarily suspended; the restrictions are usually accepted as an expedient from which the consumer may hope to be freed in a few months, or at most in a year or two. The facts point the other way. The average increase in demand before the war was between 6 and 8 per cent a year, and generating capacity was being increased at almost the same rate. But since the war the annual rate of increase of demand has jumped to about 15 per cent; and the planned increase of capacity over the next five years does not amount to more than about 10 per cent a year.

The shortage cannot, it is clear, be removed quickly, and it cannot be removed by anything less than a large programme of expansion. For such expansion, however, the available resources are limited. If they are to be used to the best advantage, certain (at least) of the new projects require to be internationally planned, internationally supported, and put at the service of more than one country. This is one precondition of any successful attack on the European shortage. But there is a second precondition: that the necessity is recognised of deriving increased power supplies from the sources of energy which can best be spared. Deep-mined coal is not one of these sources. During the years in which the electric power industry has been growing, the production of the coal mines of Europe has tended to decline; and, indeed, shortage of coal is one of the factors which swell the demand for power. The high price of deep-mined coal is itself enough to make power undertakings look for other sources of energy. In the Ruhr and Lower Rhine area, which is the principal source of thermal energy in Western Europe, it has caused the Rheinisch-Westfälische Elektrizitätswerke to return to its old and sound policy of basing its generating system not on the hard coal of the Ruhr but on the brown coal of the area between the Rhine and the Belgian frontier. This was the policy evolved by Stinnes and Goldenberg before the first world war. It led to the development of the brown coal workings near Cologne as a source of cheap power on a vast scale, using a fuel of low heat content which could not be economically transported to other markets. Under the Nazis the brown-coal stations were starved of new plant, and plans to improve them were postponed; they were regarded as militarily vulnerable, and new plant was put into the Ruhr instead. But brown coal and water power offer the best hopes of expanding the European power supply without unreasonably raising the price of power or diverting scarce hard coal away from users who cannot dispense with it.

There is no lack of electric power projects which satisfy these requirements. Plans for increasing the supply of electric power from brown coal, and for tapping new hydro-electric sources in the Alps and along the European rivers, have existed in detail for years. To mobilise the necessary resources to start work on them is another matter. These are schemes which require international support. They have the drawback that the main physical investment must be placed at the source of energy, outside the political control of at least some of the interested countries. Each of the interested countries has its own national schemes, many of them of an immediate kind, for which it can only with difficulty (if at all) find the necessary plant. There is an obvious temptation to push on with the national schemes first, and to leave the international schemes to a later and happier day. International negotiation in the power world in recent months has been concerned largely with finding ways to skirt round the temptation. It has had, so far, only a limited success. In discussion, in the collection of facts, and in comparing the relative merits of different plans, the European technicians have a good record. But when the point is reached of seeking finance, steel, building materials and generator plant, progress becomes slow.

From the end of the war to the middle of 1947 the task of European power co-ordination was in the hands of the Public Utilities Panel which had grown out of allied technical co-operation in the closing stages of the war. Its achievements in restoring the damaged power systems of the former occupied countries were substantial. In 1947 it handed over to the Electric Power Committee of the United Nations Economic Commission for Europe, which has continued to study plans and assemble the facts on which estimates of total needs could be based. In the examination of plans, separate working parties have examined the two clearly defined subjects of hydro- and thermal generation, while a third has investigated the possibilities of long-distance transmission. All these studies are conducted on a regional basis, with study groups for the Rhineland, Silesia, the Alps and the Danube.

One of the most ambitious projects for the development of run-of-stream energy is that necessitating the canalisation of the Rhine from Basel to Strasbourg. This project will comprise eight stations with an estimated annual output of 4.250 million KwH, of which one at Kembs is already in service and another at Ottmarsheim is under construction. The Rhone and its tributaries are to acquire twenty-two medium-sized stations developing a total capacity of 12,000 million KwH, in addition to the three famous stations of Genissiat, Chancy-Pougny and

Seyssel. Considerable navigational improvements will result from the completion of these projects.

Alpine water power resources are exploited by Austria, Italy and Switzerland. Austrian projects envisage a total installed capacity of 6,500 million kWh in the Vorarlberg mountains and East and West Tyrol, while a ten-year plan in the Italian Alps should raise Italy's contribution by nearly twice that amount. Switzerland has five large projects which will raise the total of Swiss installed capacity to within two-thirds of the country's potential. Water-power development plans in Scandinavia and the United Kingdom are of less direct relevance to the European programme. Development of the Danube, which holds the largest untapped potential in Europe, is likely to be held up by political difficulties. Taking the river as a whole, less than 10 per cent of the available capacity has so far been exploited.

The brown coal resources of western Germany are now recognised as important to the industrial potential of the Benelux Union and Northern France as well as to the Ruhr basin itself. German technicians estimate that the brown coal workings can yield 20,000 million kilowatt-hours annually for the next 50 years; and this is taken to justify a doubling of the existing generating plant.

*

The Committee of European Economic Co-operation at Paris last year was faced with the task of estimating the total effect of the existing power schemes in the participating countries and western Germany, and of superimposing on those schemes a further international plan to cover their most serious omissions. Its published statistics showed that the net effect of the national plans reported by the countries concerned would be to increase the total installed capacity from 42.1 million kilowatts in 1946 to 65.5 million in 1951. This was an impressive programme, but there were flaws in it. In some countries there were sharp variations in the amount of power available (or expected) in winter and summer. There were not only few installations for transmitting power between one country and another, but some countries (notably Austria) had a surplus of power in one part of their territory and a deficit in another part, without adequate inter-connecting lines. And the figures collected assumed that a great deal of obsolete plant would be kept working, with a consequent waste of coal. The committee concluded that the electricity shortage would continue throughout the years 1948-51 unless further action was taken, and it was on this ground that it recommended an international programme of nine plants in Italy, France, Switzerland, Austria, and Germany. Of the nine projects, six were hydro-electric, two based on brown coal, and one geothermic. The Paris organisation passed on to the ECE at Geneva the task of promoting the international programme. It also asked Geneva to study the desirability of a European high-tension network.

Eventually, if the attempt to deal with the power problem on a European scale is to be maintained, the necessity of a European grid will have to be faced. Technicians have already given thought to the design and even the detail of such a grid, but neither the material nor the political conditions for its success exist at present. There are individual exchanges of power across frontiers, and complaints against their working are few—surprisingly few in view of the fact that in most of them Germany is the preponderant partner. Power lines are at present working between Brauweiler (Cologne) and Jupille in Belgium, and between Brauweiler through Coblenz to Landres in France. The Jupille line was built during the war to carry power from Belgium to Germany, and is now used to carry it from Germany to Belgium; but during the severe winter of 1946-47, when the brown-coal workings failed, Belgium agreed for a few critical weeks to reverse the flow. The arrangement between Germany and Austria, by which water-derived power from the Vorarlberger Illwerke supplements the German thermal stations, has survived both the Anschluss and the collapse and has produced valuable experience; and the RWE plan to build a long-distance transmission system to carry alternating current at 400 kilo-volts between the Austrian Alps and the Rhine-Ruhr area has by no means been abandoned. This system will obviously be capable of further extension to serve any of the countries (France, the Benelux countries, and Switzerland) adjoining western Germany. All those countries are already entered at some point by lines connected with the RWE central switching station at Brauweiler. Only in the east of Germany—not in the west—do the political boundaries prevent the movement of electric power.

But it is easier to sketch out grandiose projects for the future than to cope with the hard facts of the present. One of the hard facts is that, although a reasonably good organisation exists to get international agreement among the experts on the projects that are desirable, there is no organisation yet capable of ensuring that the projects are realised in the teeth of national competition for the metals, building materials, and machinery which they require. Another is that the heavy electrical industries of Europe are in no condition to supply the full needs of the national programmes, and that many even of the existing power plants of Europe are being starved of ordinary replacements and maintenance. Goldenberg, one of the sites for expansion under the international scheme, is an outstanding example. The output of Goldenberg has been increased in the past eighteen months by building new cooling towers, and this (given the shortage of timber) is an achievement. It has not been improved by repair of the mechanical installations. The example can be repeated in many other places. The plants capable of making generator and transformer plant are few, and the important part of them which is in Germany was badly damaged by the war; but their present production is negligible even compared with their damaged capacity. They depend on supplies of rolled steel, dynamo sheets, transformer sheets, tubes, and stainless steel—precisely those types of steel product which are most scarce and of which the German steel industry could begin to supply more if it were allowed to do so.

ELECTRIC POWER PRODUCTION UNDER THE NATIONAL PLANS

Uses of Manpower

TWO important things have happened since Sir Stafford Cripps addressed the Trades Union Congress nearly a month ago on the need for greater efficiency in production. The first is the agreement between the Marshall countries for grants from the creditor countries to make good the deficits of the others, an agreement which particularly involves greater demands for British exports to Europe. The second is the Government's decision to take the first steps towards rearmament. Both facts have a direct relevance to a point of view which Sir Stafford emphasised, by repetition, in his Margate speech. He then claimed that there were no more resources of manpower to throw in to increase production; a new stage in Britain's efforts towards economic recovery and paying its way had been reached, since "we have used up all our manpower and even imported quite a lot to help us from Europe." With a given volume of employment, the only way of increasing the real standard of living was by greater output per head—either by using more muscle or more brain, and he put the main emphasis on more brain.

The widening ripples of this frank speech are still extending throughout industry. It has been taken seriously by the TUC, whose response promises a much more favourable background than first seemed possible for the work of the Anglo-American Council, now beginning its examination of British industrial methods. Yet the two new factors—effective European co-operation and rearmament—present an important challenge to the major premise on which the Chancellor's speech was founded, that British manpower is now at full stretch. Sir Stafford did not indeed suggest that manpower was being used in the best possible way; but that inference might easily have been drawn by anyone who had only casually studied his speech. The test whether manpower is being used in the best possible way does, however, affect the strict logic of the Chancellor's diagnosis, for if it can be shown that too large a proportion of the nation's manpower is being absorbed in unproductive employment, or in production of secondary importance, the case for maintaining that there are no more resources of manpower to throw in to increase production is correspondingly weakened. The proof or disproof rest upon an examination of the anatomy of full employment.

At the end of July, the total working population in Great Britain was put at 20,265,000, a figure fully half a million higher than the rough estimate for mid-1939, and exactly half-way between the total at the end of 1947 (20,430,000) and the forecast in the "Economic Survey" for the end of this year (20,100,000). In the first seven months of this year, however, the total industrial population increased by nearly 170,000, because the reduction in the armed forces (including those on release leave) was twice as large as the fall in the total working population. The "Economic Survey" anticipated an increase in the total industrial population to 19,320,000 by the end of the year; by the end of July that figure had already been surpassed. Moreover, the total numbers in civil employment, with only five months to go, are 200,000 higher than the "Economic Survey" estimate for the end of the year. The expected rise in transitional unemployment has not occurred; indeed, unemployment at the end of July was lower than it was at the end of 1947, before disinflation had been attempted; and the total in civil employment in July (19,069,000) was not only well over one million higher than in 1939—it was also a comfortable record ever since the employment figures have been compiled in their present form.

On this showing (the detailed figures are given in Table I) it might seem that the claim that manpower is at full stretch is entirely justified. It is obvious enough that unless the working population can be increased, or the armed forces and the unemployed reduced, the total numbers in civil employment cannot be expanded much further. A distinction has to be drawn between the estimated population of working age (that is, males between 15 and 64 and females between 15 and 59) and the total working population which offers itself for employment. An example will make this clear. At the end of 1946, the estimated population of working age was 31,659,000, made up of 15,962,000 males and 15,697,000 females. But the total working population at the same date was 20,414,000, of whom 14,629,000 were men and 5,785,000 women. Similarly, the working population at the end of July was composed of 14,534,000 men and 5,731,000 women, but the estimate of population of working age (at the end of this year) is 15,965,000 men and 15,620,000 women. Thus between 36 and 37 per cent of the women of working age are, in fact, employed, compared with about 91 per cent of the men.

The prospect of raising the working population depends upon the future trend of the population of working age, its composition by age and sex, and the assumptions which are made about the proportions of the two sexes which enter into the working population. Estimates given in the *Ministry of Labour Gazette* in May, 1947, suggested that by the end of 1951 the population of working age will have fallen to 31,535,000, of which 16,030,000 will be men (an increase of 65,000 in three years) and 15,505,000 women (a fall of 115,000). The calculation then assumed that the working population for men in 1951 would represent 90.5 per cent of the total male population of the same ages, while for women the percentage was assumed to fall to 34.3 per cent (compared with 42 per cent in mid-1945). There is, therefore, a double fall in the case of women, first in the numbers of working age, and, secondly, in the proportion of those who are likely to offer themselves for work. Moreover, while the total number of men in the working population is likely to increase somewhat (from 14,534,000 at present to 14,540,000 at the end of 1951) there will be a pronounced fall in the number of men below 40, coupled with a bigger increase in the number aged 40 and over. But the fall in women in the working population (from 5,731,000 at present to 5,320,000 at the end of 1951) will be more severe in the 15-24 age group than in the 25-39 group. The working population of 1951 (if the Ministry's assumptions prove to be right) will contain 230,000 fewer young women and girls than in 1946.

The purpose of setting out these figures is not to introduce the widely-ranging topic of Britain's future population problem, but

TABLE I—WORKING POPULATION AND EMPLOYMENT, 1939-48
('000s)

	Mid 1939	Mid 1945	End 1947	July, 1948	End 1948 (Economic Survey)

(a) Now increased by longer service.

rather to emphasise that the trend of population now in sight offers no hope of an increased working population except through a change in the proportions of men and women of working age who enter the working population. Recent figures of employment may suggest that the Ministry was too pessimistic in its estimates sixteen months ago, but it would certainly be optimistic to expect that the number of women available for employment will remain at its present high peacetime figure. And this, coupled with the increased manpower absorbed by the forces and the improbability of any further material reduction in unemployment, means that the total numbers in civil employment will in due course begin to fall from the present figure of 19,069,000.

TABLE II—DISTRIBUTION OF INDUSTRIAL POPULATION, 1939-43

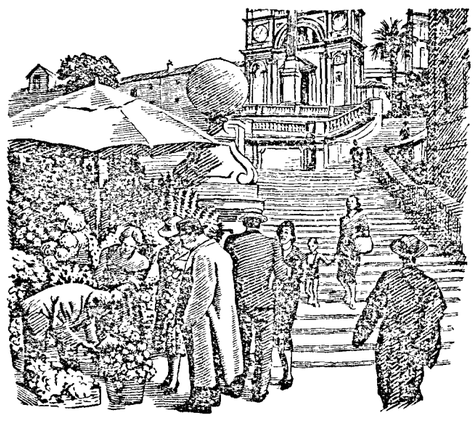
* Total manpower: numbers on colliery books are 40,000 lower.

Table II gives the detailed figures for these three groups of industries and services (they are summarised in Table I) before and since the war, together with the manpower targets laid down in the "Economic Survey." This document observed, last March, that "labour is not at present, and is unlikely to be in 1948, the limiting factor in economic activity as a whole." It argued that any projected distribution of manpower would, therefore, be largely a forecast of the results of other factors, and that if some figures turned out differently it would not necessarily be in every case a matter of regret. It then made the categorical assertion:



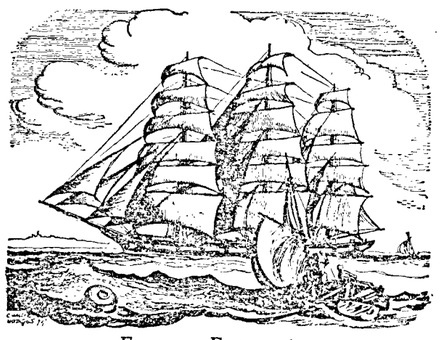
> But the labour forces proposed for coal, agriculture and textiles are targets in the full sense. They are numbers believed to be required to reach specific objectives in the set of output and export targets decided for 1948. The attainment of these manpower targets is among the first necessities in 1948.

It is doubtful if it would be so confidently asserted today that manpower is not a limiting factor in economic activity as a whole. Moreover, the results are not proving entirely satisfactory. The "targets in the full sense" will not be attained, unless—as is inconceivable—in the last five months of the year another 85,000 workers can be found for textiles, 24,000 for the mines and 27,000 for the farms. These industries, and the big amorphous group "other manufactures" are the main laggards. In addition, some of the other groups which have "turned out differently" show increases which are certainly a matter for concern. Distributive trades, which were to have lost manpower this year are still gaining labour; in July they were already 40,000 above their end-year forecast. Building and civil engineering, originally intended to take a relatively big cut, have a larger labour force. There was to be no extra manpower for hotels, entertainment, sport, commerce and finance, professional and personal services, laundries and cleaning; yet these trades were expanded by 40,000 in the first seven months of this year. There is little change in the civil service and other central government service; but local government service is 67,000 above the end-year estimate. And it is significant that the only manufacturing industries which are well above their "Economic Survey" manpower allotments are clothing and food, drink and tobacco, which serve the consumer.

These figures are themselves eloquent of the need for the Chancellor's policy of disinflation—and also of its virtual failure so far as a method of inducing industrial manpower to move from the less to the more essential industries. The changes postulated in the "Economic Survey," of course, have no absolute validity. But the fact remains that six groups which cater for the consumer, or his shelter, or his local government, are now absorbing 370,000 more employees than they were supposed to absorb by the end of the year. They have hung on to manpower which was expected to become temporarily unemployed and to move into the essential industries; and the latter still stand nearly 175,000 below the estimate.

Thus the argument that manpower is at full stretch is true only with the reservation that a lot of it is not being used in the best way. There is still too much employment in the consumers' trades and in government service, and too little in the basic dollar saving or dollar earning industries. Now the demands of rearmament and of more exports to Europe to fulfil ERP obligations have to be added to those which have already absorbed British labour to the practical limit. To estimate the extent of these new demands is very difficult—perhaps 50,000 additional workers on defence orders, at this stage, is a plausible guess, but it is difficult to put any kind of figure forward for the provision of "unrequited exports" from Britain to Europe under the European payments agreement. A further extension of rearmament would certainly lead to strains on manpower.

In this situation there are three possible solutions. The best would be a transfer of labour from less to more essential industries; but that policy, argued with such logic in the "Economic Survey" has virtually failed in practice. The second would be an increase in output, which in the short run could only be secured by a lengthening of working hours. At this, Ministerial hands are already being thrown up in horror, as though there was something inherently right about the shortened working week, or as if it was barely within the capacity of labour. The third and least palatable would be to throw some present commitments—overboard—not exports for compelling reasons; not housing, social services or, perhaps, the consumers' trades for a mixture of political and economic reasons; but presumably that part of the investment programme which is easiest to cut without public protest, like industrial building and re-equipment. The Government must be held to their recent statements that they have no such intention.



A Flower Market, Rome.

Rome, Paris and the Riviera . . . New sights, new sounds, new horizons. But the colour and bustle of foreign shops and markets remain the most vivid memory of our continental holiday. And the money with which we bought those honey sweet oranges, that lovely length of silk and those ingenious toys? Well, we took Travellers Cheques issued by Barclays Bank. We got them from our local branch, as easily as buying a stamp, and we changed them whenever the need for money arose. The Bank took care of all the financial technicalities, and left us free to plan the perfect holiday. The Manager of your local branch would do the same for you.

BARCLAYS BANK (FRANCE) LIMITED
BARCLAYS BANK S.A.I. ROME

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

Business Notes

The Chancellor in Washington

All the publicity concerning the Chancellor of the Exchequer's visit to Washington has necessarily related to his official pronouncements as British Governor of the Fund and Bank. In his address at the opening session of the third annual meeting of the Governors, Sir Stafford Cripps stressed that the economic picture of the world today was not quite what had been anticipated by the creators of these institutions, but, he added, "we must not, because of these unfortunate accidents of history, underestimate the importance, either of the Bank and Fund's creation or of their continuing and developing existence." In his inaugural address Sir Stafford wisely turned away from safe generalities at certain points to deal with departures from the code of monetary conduct laid down by the International Monetary Fund. With multiple currency practices and disorderly cross-rates in mind, he pointed out that Britain from its own experience was conscious of the way in which departures from this code affected the workings of international commerce.

Of the other topics of discussion to which the Chancellor has devoted himself in Washington, one of the more important concerns the transferability of drawing rights in the European payments scheme which has yet to be finally approved by the Organisation for European Economic Co-operation in Paris. The British case against transferability has no doubt been forcibly stated by the Chancellor both to representatives of the ECA in Washington and to Mr Snyder and his experts at the US Treasury. The outcome of these particular discussions will have an important bearing on the deliberations of the Council of OEEC in Paris in the coming week.

* * *

The Ottawa Talks

The Anglo-Canadian financial and economic discussions closed at the end of last week with the issue of an agreed statement. Its text goes as far as could be expected of an official communiqué to hint that some questions have been left unresolved at the end of the talks. The discussions apparently ranged over the whole field of economic relations between the two countries during and also after the completion of the European Recovery Plan. The focal point of these discussions was "the difficulty of the dollar and sterling balance of payments problem and the efforts which would be required on both sides to help narrow to manageable proportions the gap in exchanges between the two countries."

To this end the United Kingdom will make every effort to expand its exports to Canada, but, the official statement adds, "it will be necessary to make some adjustment in the United Kingdom import programme of recent years." The two Governments declare themselves satisfied that "there is a prospect of a large and continuing trade between the two countries," and they undertake to do everything possible to avoid any sudden change in the pattern of that trade. In order to facilitate the free and prompt exchange of full information on commercial and economic matters of mutual concern, a continuing committee of representatives of the two countries is to be set up, which will meet regularly in Ottawa and in London.

The discussions between representatives of the two countries have now been transferred from Ottawa to Washington, whither both Sir Stafford Cripps and Mr Douglas Abbott, the Canadian Finance Minister, journeyed after the end of the Ottawa talks. Mr Abbott has publicly stated that the future of the now frozen balance of the Canadian loan to Britain would be one of the subjects for discussion during his visit to Washington.

* * *

The Monetary Fund on Exchange Policy

The annual report of the International Monetary Fund for the ten months to April 30, 1948, deals candidly with the difficult problems which the Fund had to encounter during this period. On the question of exchange rates, the report draws a contrast between stability and rigidity. One of the basic purposes of the Fund is "to promote exchange stability" but this implies that when adjustments in exchange rates are necessary, they should be made, though made in an orderly manner. On the question of the validity of exchange rates, the Fund reiterates the now familiar point of view that "so long as an exchange rate does not hamper a country's exports, there is little to be said in

present world conditions for altering it." The report adds, however, that "in some countries the exchange rate is becoming a restraining factor on exports and is adding to the difficulty of earning convertible currencies."

The report naturally has a great deal to say about fluctuating exchange rates and multiple currency practices. It points out that exchange stability cannot be achieved in a country where inflation is rampant and it recognises therefore that in certain exceptional circumstances, such as those of China and Greece, "the temporary use of a fluctuating exchange rate is necessary to enable a country to prevent a breakdown of its trade." This dispensation, however, does not exonerate certain countries from blame for introducing so-called free rates, which in turn have permitted the emergence of disorderly cross-rates. The report describes the effects which such disorderly cross-rates are likely to have on the direction of international trade, and points out that the changes in the pattern of trade which result from them are likely to reflect short run considerations and local peculiarities, which have no permanence about them. Changes of this kind will therefore merely add to the difficulty of restoring balances of payments and convertibility of currencies. For these reasons, "the Fund attaches great importance to the maintenance of orderly cross-rates."

The report states that all members of the Fund, other than El Salvador, Guatemala, Mexico, Panama and the United States, have availed themselves of the provisions of the Fund Agreement which allows them to maintain exchange restrictions on current payments during the transitional period. In this context, the report describes in some detail Britain's attempt and failure to restore the convertibility of sterling in 1947 and concludes that "British experience shows that the establishment of convertibility of currencies can succeed only when the underlying conditions are favourable to a system of multilateral trade and payments. Until the great trading countries whose currencies are used for international payments have restored a reasonably satisfactory balance in their current international accounts, they cannot undertake the obligation of permitting free transferability of their currencies for current transactions."

*

The report also deals with the various problems that have arisen during the past year in connection with gold policy, including external sales of gold at premium prices and subsidies to producers. There is a note of defeat about these comments, and the Fund has to admit that "there is ample room left for greater support of the Fund's policy" and that "there should be more vigorous enforcement of the gold regulations in certain countries."

On the subject of the Fund's exchange operations, the report points out that in starting activities in a war-devastated world, and before relief and reconstruction requirements had been met, a risk was run that some of the Fund's resources might be used for other than temporary assistance. This risk was assumed "in order that the Fund might make a contribution to the maintenance of national economies and of exchange stability during the transitional period."

The statement of income and expenditure for the ten months to April 30, 1948, shows a total income of $4,186,000 of which $4,080,000 came from service charges on exchange transactions. The expenditure in this period amounts to $2,627,000 leaving a net income of $1,559,000. The budget for the year to April 30th next estimates administrative expenditure in the current 12 months at $4,187,000.

* * *

World Bank and Lending

The third annual report of the International Bank for Reconstruction and Development was presented to the governors at their meeting in Washington this week. The report analyses the major economic problems facing various areas of the world and suggests remedial lines of action. Total loans made by the bank amount to $525 million of which $445 million were made in the previous year and only $80 million in the 12 months to June 30, 1948, covered by the report. These later operations, however, are of interest as precedents for new types of financing. For example, they include two loans totalling $16 million to Chile for development purposes—and not for reconstruction which had hitherto dominated the bank's operations. The past year also saw first loans by the bank to private enterprises and the first use of its guarantee powers. These precedents were combined in the loan to four leading Dutch shipping companies, secured by mortgages on ships, with the subsequent sale to a group of private United States banks of notes representing these loans.

The report deals at some length with the relation of the bank's operations to the European Recovery Programme. In this context, the report states that "it seems clear that there is a real need for bank financing in addition to the financial assistance made available by the Economic Co-operation Administration. Furthermore, since the first claim on ERP funds will be necessarily for those imports most immediately essential, the long-range investment field seems obviously the one most appropriate for bank assistance." The bank, therefore, intends to supplement ERP by financing projects which involve permanent additions to Europe's productive capacity. The bank's interest in assisting Europe has not, however, prevented a development of its interests in other parts of the world. Apart from the two loans to Chile for hydro-electric and agricultural development, several other propositions are "in an advanced stage of negotiation."

The report describes the machinery which has been evolved by the bank to ensure that the proceeds of its loans are used only for the intended purposes. As a first step in this system of supervision, the proceeds of a loan are subject to withdrawal by the borrower only upon a satisfactory certificate that expenditures have been or will be made for the purchase of the specific goods or services covered by the loan agreement. Subsequently, the bank conducts an investigation of the end-use to which the goods are put. Throughout the report, stress is laid on the importance of the bank's advisory functions; it argues that the effectiveness of this institution should be judged "not so much by the number or amounts of its loans . . . but rather by its success in influencing attitudes, in promoting a realistic constructive approach to development problems on the part of its members and in fostering a greater degree of confidence among investors."

* * *

Wages Merry-go-round

Only by the narrowest of margins was the Amalgamated Engineering Union impelled to accept the recent award of the Court of Enquiry of an increase in wages of 5s. compared with the 13s. which had been sought. The acceptance of the Confederation of Shipbuilding and Engineering Unions which followed was, on the face of it, more decisive, but it left two questions unresolved—first, whether the Confederation's acceptance would be supported by the men themselves, and, secondly, whether the efforts of the unions would now be directed to obtaining their aims through the "simplified wages structure" which the Court suggested should be worked out in negotiation between the two sides. The threat of local stoppages through dissatisfaction with the engineers' award may not have been wholly removed, but the attempt to organise token strikes on Clydeside appears to have met with small success. The importance, first of the AEU's acceptance, and secondly of the failure of a section of the shop stewards to secure support for the stoppage of work in protest are both significant—for the Union is powerfully influenced by Communist members and officials, who have done their utmost, in pursuance of their party's policy, to oppose the Government's policy of stabilisation, and have been loud in their protests against the inadequacy of the 5s. increase which has been granted.

Claims are now before the Railway Executive and the London Transport Executive for an increase of 12s. 6d. for railwaymen. The cost of this claim for the railways alone is estimated at £20 million in a full year, and the provision of such a sum would clearly be impossible, given the present trend of the railways' net revenues. The Executive may well be hard put to it to earn any net revenue to meet its interest charges this year. And the concession of even a partial wages increase would raise the question of increasing the railways' charges at a time when they are embarrassed by loss of passenger and merchandise traffic. The Railway Executive has yet to give any indication of its attitude towards the union's claim; if it is rejected (which again would raise embarrassments of another kind, involving the relations of nationalised undertakings with organised labour) the claim would presumably go to a committee of enquiry.

The third wages claim, now in preparation, is that of the National Union of Agricultural Workers, which intends to present its case for higher minimum wages at the meeting of the Agricultural Wages Board shortly. So far, the Union has not formulated its demands in precise terms, but it is seeking broadly to bring agricultural wages and conditions in line with those obtaining in industry, by increased minimum wages, higher overtime rates, and a reduction in the 48-hour week to 44 hours. The Union can obviously make much of the concessions to industrial workers during the past twelve months, and of the need to increase the agricultural labour force to fulfil the Government's farm policy. Under the present arrangements for fixing farm prices, it would be the unfortunate consumer (or the unfortunate taxpayer, who is largely the same person) who would have to foot the bill for any increase.

* * *

Exit the Steel Board

On Thursday, the two years' term of office of the Iron and Steel Board came formally to an end. It was a condition demanded by certain members of the Board that it would not be part of the functions "of the Board or of the members from the steel industry" (of which there were two) "to advise the Government in connection with plans for public ownership." Its functions have been strictly concerned with the supervision of the industry's development—it has acted as an independent assessor advising the Government on the merits and timing of the various sections of the development programme devised by the British Iron and Steel Federation immediately after the war—and with the functions formerly exercised by the Iron and Steel Control over production, distribution and prices. As an experiment in public control without public ownership it has proved valuable.

Its future, in view of the Government's intention of nationalising the iron and steel industry and the known reluctance of the majority of the board to become involved in any such proposal, continued up to the last day of the two years to be obscure. The Ministry of Supply has now disclosed that the members were all asked to serve a further year, and that, with the exception of the trade union members, they refused. They did, however, indicate that they would be willing to carry on for long enough to deal with the outstanding problems on which the board has lately been engaged, and that this work could be completed by the end of 1948. When the resignations take effect the board will be wound up, and the Ministry of Supply is to carry on its work.

* * *

The New Quota Year

The quota provisions for the first year of the new Films Act came into force yesterday, with every promise that the coming year's work would be even more frustrated by controversy than its predecessors. Attempts to legislate for the film industry still meet, as they have always met, the difficulty that the industry itself speaks with too many voices which conflict too completely; the art of synthesis between the interests of different branches in the industry has never been developed. This was evident in the negotiations last winter which preceded the introduction of the Bill. The exhibitors wanted a reduced quota, with a maximum of ten per cent for independent theatres in competitive areas; they also wanted the renters' quota to be continued, and opposed the separation of the quota for short films from the quota for first features. The British Film Producers' Association opposed the exhibitors on all three points. The Film Industry Employees' Council supported the producers, but with variants and qualifications. For practical purposes no collective interest of the film industry as a whole was brought to bear on the question at all.

To mark the present occasion, the President of the Board of Trade has contributed a foreword to a survey of the state of the British film industry which *Kinematograph Weekly* publishes this week. Mr Wilson describes the quota legislation as "fundamental to the British film industry's future in world conditions as they exist today," and expresses confidence that "the industry can be counted on to make every effort to fill the quota." Effort is one thing, success another; the actual prospects of British film output in the next year or two are hard to assess, and not easy to see in bright colours. The British film-producing establishments consist of 24 studios, which have 72 sound stages and 643,000 square feet of floor space. This compares well enough with the position in 1937, when the industry had 21 studios with 64 stages and 550,000 square feet of floor space. But the present studio space is by no means fully utilised. According to the estimate made by *Kinematograph Weekly* (which assumes 60 of the 72 stages to be suitable for feature film production, and limits the average time taken in production to 12½ weeks and the space required to two stages for each film) the present space is sufficient to produce 120 feature films in a year. But the same survey concludes that in fact only 62 first features and 12 second features will be completed this year. This compares with 58 "major features" completed last year; and this in spite of the fact that, with the new mood of financial realism among the film producers themselves, the average investment in each film has been much reduced.

Gestetner

LIMITED

TOTTENHAM, LONDON, N.17

The Company manufactures the world-famous "Gestetner" Duplicating Machine and accessories. It has branches throughout the United Kingdom and subsidiary companies or representatives in all parts of the British Commonwealth, in Central and South America, the Far East, and many countries in Europe. Extensive servicing facilities are available throughout the organisation.

Preference Dividend (7%)	Net £10,106	
Ordinary Dividends (30%) Plus bonus (7½%)	Net 83,205	
		93,311
Retained in the business		£60,508

Extracts from the Directors' Report are appended:—

"Both in volume and value the exported percentage of the Company's products exceeded the Government target and constituted an all-time record. The recent Pan-American conference held at Bogota, Colombia, standardised on Gestetner equipment. At the General Assembly of the United Nations in Paris, Gestetner equipment will produce the Official Reports and Statistics. We are proud to report these triumphs of a British product.

"The Gestetner Service to its users has maintained the reputation for which your Company is known.

"Factory production and sales at home and abroad have reached the highest peak experienced in the history of the firm. Active research has contributed to the high quality of our manufactures and our new products; continued efforts are being made to improve production methods and new plant is installed wherever further improvements can be effected. Every endeavour will be made to maintain production and sales in the unknown circumstances of the year ahead."

France's ECA Funds

The United States' direct and immediate contribution to the easing of the mounting financial crisis which faces the French Government has been to agree to release a sum not exceeding 45,000 million francs out of the balances deposited against the receipt of Marshall grants by France. A further release of equal amount will be considered later in October. This means that virtually the whole of the francs deposited against dollar grants are in effect being swept back into general circulation and are not being used in repayment of debt. Had they been so used, they would merely have increased the French Government's need to borrow. The release of these funds will, however, have one important psychological effect, for it will avert, for the present, the need of the government to seek an increase in the ceiling of 200,000 million francs which at present limits the total of advances to the State by the Bank of France and which was being closely approached. The Economic Co-operation Administration in Washington has emphasised that this release of ECA balances to France is conditional on measures to restore financial equilibrium and that it would not have been made but for the steps taken in this direction by M. Queuille's new Government. The danger may be that, following this first concession, France may come to look on the expenditure of the internal proceeds against Marshall grants as a normal feature in its budgetary arrangements. In that event, France will find it more than difficult to do without this particular help in the future.

* * *

South Africa's Gold Cover

The persistent drain of the gold reserve held by the Reserve Bank of South Africa has called for counter measures by the South African Government, which has now introduced a bill proposing to reduce the statutory gold cover for the currency from the present ratio of 33⅓ per cent to 25 per cent. The Minister of Finance, Mr Havenga, in justifying this measure, has claimed that the new figure was the same as the minimum statutory reserve in the United States, a fact which in his view put the mark of respectability on the proposed change. Mr Havenga also admitted that the latest statement of the Reserve Bank showed that the gold reserve had fallen to 31.3 per cent, the lowest ratio yet recorded, though he added that the cover would be raised to 33 per cent if the gold lent to Britain were taken into account—which would surely be a revolutionary method of calculation.

The main issue on which the new bill has to be judged is not whether the proposed statutory figure is higher or lower than that which obtains in the United States or elsewhere, but whether effective measures are being taken to arrest the fall in South Africa's gold reserves. On this score, there is still no ground for reassurance. Mr Havenga has pointed out this week that he is still opposed to import controls—which in effect means that he is still prepared to pay in gold for American imports of every kind, essentials or luxuries. The South African authorities are still thinking in terms of the possibility of a loan from the United States, though Mr Havenga was prepared to admit that this would only bring temporary relief. Unless they brace themselves for the effort of introducing some selective control of imports, they may soon be astonished at the rapidity with which the margin between a 33⅓ and a 25 per cent reserve can disappear.

* * *

British Trade with Denmark

Our Copenhagen correspondent writes: The British trade exhibition in Copenhagen—the biggest British exhibition ever held abroad—which opened a fortnight ago and closes this week-end, had two handicaps to fight. One was the weather. Twelve hundred British firms displayed their goods on stands in five different places in Copenhagen, and the rain and gales which have swept the streets might easily have threatened the attendance. They did not do so. In the first week, there were half-a-million visitors, and the fleet of double-decker buses which came from England for the occasion carried them expeditiously between the different sections of the exhibition. From a commercial point of view, the two main organisers, the Federation of British Industries and British Import Union in Copenhagen, can claim that the exhibition has been a great success.

The other handicap will not be defeated so easily. This is the restriction on Danish imports. Many visitors must have felt the torments of Tantalus when they saw goods on exhibition which they are not permitted to buy. The Danish Minister of Commerce, Mr J. O. Krag, has held out little hope that import licences will be given in the near future for many of the more expensive luxury goods. And the definition of "luxury" nowadays covers many articles of use, such as household furnishings and equipment. Yet British exhibitors do not complain. They have booked orders up to limit of the licences at present granted and most of them have also taken extra orders in the hope that licences may be given more freely later. Before the exhibition opened, there were some complaints from Norway and Sweden that Copenhagen had been chosen for the display. But the number of visitors from both countries and from Finland, too, showed the interest of businessmen in these countries in the exhibition. Most of the exhibitors have met many old customers from the three other Scandinavian countries.

The motor show undoubtedly attracted the greatest attention. This section had been allocated the most requiring of all the exhibition halls—the old riding house at Christiansborg, next to the Royal stables. It had never been used for an exhibition before and was never intended for one. But, in the shadows of the grave granite masses of the castle, gay sunblinds outside the gloomy colonnade and bright colours inside provided very attractive surroundings for the British motor-cars. The few American cars which have been imported into Denmark have been nicknamed "Dollar grins," while the more modest, but attractively styled, British cars were immediately baptised "Sterling smiles." Denmark needs some 25,000 new cars and there is no doubt that the lines of these cars, coupled with their modest petrol consumption, will gain them a high place on the Danish market. This motor show, although not the biggest section of the exhibition, was the most popular.

The Danes before the war used to consider British methods of displaying their goods and advertising them (as well as the unwillingness of manufacturers to adapt them to the customers' demand) as a little old-fashioned. The British export drive, and the Danish hunger for goods, seem to have brought buyer and seller nearer to each other.

Richard Crittall

Until quite recently the failure of Richard Crittall and Company (a heating and ventilating engineering concern which is not to be confused with Crittall Manufacturing, makers of metal windows) to make a profit for 1947 was presumed to reflect a difference of opinion between the directors and the auditors on the treatment of development expenditure. The first hint of trouble had been given in June, when the first half-yearly payment was deferred on 450,000 5 per cent cumulative £1 preference shares, issued at par by Whitehead Investment Trust and more than five times over-subscribed as recently as December last year. In August came the serious implications of the appointment of a receiver and a new board of directors, following the disclosure of a trading loss of an unstated amount. Finally, at this week's meeting of unsecured creditors, all illusions have been dispelled. For now it is evident that the company will indeed be fortunate to escape liquidation. For the time being this step has been averted by a creditors' moratorium until November 15th on the vote of four hundred unsecured creditors. Three unsecured creditors have been appointed as a committee to keep in touch with the directors in their efforts to salvage something from the wreck.

This will indeed be a herculean task. According to Mr H. V. Cozens, the new chairman, shareholders have already lost 95 per cent of their capital. In a statement of the approximate position at August 19th given by the receiver, Mr R. G. Leach, total creditors' claims are put at £1,316,000, of which £30,000 is attributable to preferential, £608,000 to secured and £678,000 to unsecured creditors. Against this, assets amount to £879,000, including £280,000 due from subsidiaries and £200,000 for work in progress. All save two of the subsidiaries have been making considerable losses and the receiver has rightly been concentrating his attention on instituting drastic economies since the neglect of the fundamental principles of costing has apparently been chronic. The rot has gone so far that liquidation seems to be the only possible fate for most of the subsidiaries, though there may well be difficulty in realising their work in progress and stocks. Liquidation is not contemplated for the parent company, whose goodwill is still held to be worth something, nor for Richard Crittall Marine, Magnetic Valve, Grierson, N. V. Stralingswarmte and Richard Crittall Stralingswarmte. Total losses of the parent company are likely to exceed £1,000,000, and losses are still apparently being made. Total orders are valued at some £1,835,000, of which running contracts represent £270,000.

More information on the position will be available next week, when the consolidated accounts for 1947 are expected, but an accurate picture of the present predicament of the group may not be available for some months. A reconstruction scheme is under consideration by the new board and the receiver. It will be surprising if, as a result of these discussions, the shares of Richard Crittall emerge worth even the low values of 2s. 10½d. for the preference and 3d.-1s. for the 1s. ordinary recorded this week. The case has a close parallel, both in the speed and magnitude of the reversal of the company's trading experience, in that of Miles Aircraft last year.

Italian Debt Service Delays

In face of the growing impatience of sterling bondholders, the Italian Treasury has this week given the reason for the delay in providing funds to meet the obligations agreed in July on the Italian Credit Consortium 7 per cent 1927-47 bonds (capital repayment in full and arrears of interest up to March 1, 1947) and on the Royal Sardinian Railway 3 per cent bonds (arrears of interest at 3 per cent to September 15, 1947, and payments in full thereafter). Under the new Italian Constitution, it appears, severe controls have been placed on any supplementary budget appropriations, which such payments would entail. No indication has, however, been given of the time which will be required to pass legislation permitting the payments, though it is nearly eighteen months since payment was agreed in principle and eight months since arrangements for payment were stated to be in hand. Meanwhile it has been announced that, in accordance with the Anglo-Italian Property Agreement of April 17, 1947, contractual arrears on the 5 per cent Maremmana Railway 1862 sterling bonds will be paid up to September 15, 1947, in sterling, with effect being given to the drawings which have taken place in Rome (this proviso led to the bonds being called nominal this week until the actual drawings become known). After that date payment will be made at the same rates of interest offered to United States bondholders, which are considerably lower than the contractual terms. Interest on outstanding bonds will be paid at the rate of 1 per cent per annum from September 15, 1947 (the official date of the Peace Treaty with Italy) to July 1, 1950, at 2 per cent from July 1, 1950, to July 1, 1952, and thereafter at the rate of 3 per cent. From January 1, 1953, to July 1, 1957, a sinking fund of 1 per cent will operate, and from January 1, 1958, to July 1, 1977, at the rate of 2 per cent, on the total nominal amount of the bonds presented for enfacement up to September 15, 1950. The Italian Treasury reserves the right to redeem all outstanding bonds at the redemption price plus accrued interest. In the case of Italian residents interest will be paid in lire in Italy.

Apart from the failure of Italy so far to agree to make sinking fund payments in respect of its portion of the Austrian Government Guaranteed Conversion Loan 1934-39 (it agreed in July to make interest payments) the only outstanding sterling bonds for which the resumption of interest payments has not been arranged are the 4½ per cent bonds of the Adriatic Electric Company. It is understood that discussions are taking place between the bondholders and the Italian Government.

Local Hauliers and the Operating Centre

The Transport Act made provision for the public ownership of road haulage services, but left local haulage open to privately-owned transport on strictly defined conditions. The principal restriction is that no vehicle covered by an "A" or "B" licence may be used commercially beyond 25 miles from its "operating centre." Thus an operator whose centre is more than 25 miles from, say, London, could not carry goods for hire or reward to London; but an operator just inside the 25-mile limit could carry goods from London to a point 50 miles away.

Thus the definition of "operating centre" becomes a matter of great importance in determining the scope which remains for private haulage business. The Act defines the operating centre as the "permanent base or centre from which it is intended that the vehicle will normally be used." But it also allows an operator to ask the licensing authority to specify the operating centre for his vehicle; the decision rests with the licensing authority, but clearly if licensing authorities generally were prepared to specify a notional operating centre for a haulier whose actual base was near the fringe of his area of operation, it would greatly affect the range of private haulage operation which would be permissible under the Act.

This point was the germ of an application—the first under the Transport Act—on behalf of a road haulage concern at Luton to change its operating centre to London Colney. Luton is 30 miles from London and London Colney only 18 miles. Unless the operator succeeded in his application, therefore, he would not be entitled to carry goods to London, as he has done in the past. But the licensing authority of the Metropolitan Area this week held that to grant the application would have the effect of defeating the clear purpose of the Transport Act. From their refusal of the application there is no appeal. It now rests with the operators, if they wish, to seek the permission of the Transport Commission to operate beyond the 25-mile limit. This, too, is a matter for the absolute discretion of the Commission. But at least the principle emerged from Monday's hearing that the Road Transport Executive will not refuse a permit unless it is satisfied that "the Commission's services give at least as good a service as that which obtained prior to the appointed day."

Commercial Vehicle Outlook

British manufacturers of commercial vehicles received a severe test during the war years. They were required at the same time to expand production rapidly and to meet a new standard of criticism, particularly from the Services, which had exacting standards of performance and were disposed to complain of too little standardisation. As a result of the wartime stimulus and the keen demand since for British commercial vehicles, production today is almost twice as big as before 1939. The cut in the capital programme has concerned itself mainly with the heaviest types of vehicles, and has not greatly affected total production. The value each month of commercial vehicles manufactured in this country now exceeds £9,000,000.

At the first International Commercial Transport Exhibition since the war, now held, as formerly, at Earl's Court, British manufacturers and a handful of American and French makers are showing current models, all of postwar design. Little things, like the provision of left-hand steering, indicate awareness of foreign requirements. While the case for sending abroad the bulk (75 per cent) of passenger cars made is straightforward, the decision also to export a high proportion of commercial vehicles must have been more difficult. In the first six months of this year 84,000 commercial vehicles were manufactured in this country, and 34,000 of these, valued at £16½ million, have been exported; of the exports, 40 per cent have gone to hard currency markets. The end-of-year target requires the industry to export the value of £3,200,000 a month, a figure which has already been exceeded in recent months. Before the war 14 per cent of commercial vehicles made were exported; the proportion is now approaching one-half. The Commonwealth countries still provide the best market; Australia in the first half of this year bought 4,675 commercial vehicles worth £2,100,000. Substantial exports of spare parts suggest that adequate provision is being made for maintenance. The United States has developed into a surprisingly interesting market. While it is virtually impossible to compete with American lorries in American markets, sales in the USA of British delivery vans have increased sharply.

Inevitably deliveries to the home market are slow, though for some types of commercial vehicles delays are beginning to be reduced. The exhibition shows little that is revolutionary, but much that embodies wartime experience under severe practical conditions. Among the most interesting exhibits are tipping devices on lorries and trailers, which obviate much needless manual work. The dollar shortage abroad, as here, coupled with delivery delays for American trucks, has given the commercial

We make no claim . . . . . .

We make no claim to have agents in all the chancelleries of Europe; no statesmen are in our pay; we possess no keys to secret archives; we tap no telephone lines . . . . but we do claim to be well-informed and able to report with authority on many subjects. 22 RYDER STREET, ST. JAMES'S, LONDON, S.W.1

vehicle maker a breathing space, which may continue for some time. Within the limits of productive capacity much good use has been made of this period. But if commercial—or passenger—vehicles are to become a staple export of this country, prices will certainly need to be watched.

Americans and Middle East Oil

Mr Frank W. Abrams, chairman of the Standard Oil Company of New Jersey, joined in the discussion on the nature of the American interest in the Middle East when he addressed the American Chamber of Commerce in London a week ago. He was at pains to emphasise that, so far as the oil industry was concerned, the interest was very great: "The oil industry of the peace-loving countries is making an all-out effort, industrially and financially, to expand Middle East production." This was not, he explained, because of direct American needs for Middle East oil, which was "not counted upon in the immediate years ahead to supply any significant part of the American market." But the oil resources of the Middle East would affect the American oil position by reducing the necessity for the present large exports of oil from the western hemisphere.

The sixteen Marshall Plan nations would use about 900,000 barrels of oil a day this year—nearly 50 per cent more than they used in 1938 In the Marshall Plan allocations oil occupied second place only to food, and "a major part" of the oil supplied to western Europe this year under the Marshall Plan would come from the western hemisphere despite the pressure of demand there. But it was estimated that by 1952 about 65 per cent of Europe's total oil requirements would come from the Middle East.

To replace the western hemisphere by the Middle East as the major supplier of European demand would (said Mr Abrams) require the solution of major transportation problems. The tanker fleet would not be able to carry "the greatly increased supplies which we hope will be flowing from the Middle East within the next few years," and it would in any case be more economical to carry the oil to the Mediterranean by pipeline. Six major lines, ranging from 16 to 36 inches in diameter, were now contemplated or actually under construction by various oil companies. But their completion was being retarded by a number of factors, including shortage of steel; he stressed the need to raise steel-making capacity in Europe.

The question of building new refineries in Europe is one in which Standard Oil is greatly concerned, and Mr Abrams conceded the necessity for increased facilities to process oil at the point of use in western Europe. But the advantages of large scale could not be entirely neglected, and "a substantial proportion of the Middle East crude will continue to be refined at the point of production or at the end of the pipelines carrying it to the Mediterranean." Mr Abrams mentioned the plan prepared by his group for constructing a big refinery at Fawley, but did not commit himself far as to the prospects of carrying it out. Agreement with the British authorities, he indicated, had still to be reached. He did not say what were the questions at issue; but it is known that they include the convertibility of the earnings of what will be an unusually large dollar investment.

* * *

Australian Internal Loans

The consent of the Stock Exchange Council for dealings to take place under Rule 163 (1) (e) in six internal Commonwealth gilt-edged issues, of which a total of £391,000,000 stock is outstanding, has given an official stamp to dealings which have been lately growing in volume. Until permission to deal had been obtained the authorisation of the Stock Exchange Council had to be sought for each specific bargain. This requirement has arisen from the provision under Rule 163 (1) (e) that only securities for which dealing facilities had been granted on a dominion colonial or foreign stock exchange before September 23, 1946, were eligible under the rule. The six Commonwealth stocks concerned, which include the five listed in the accompanying table together with a 3⅛ per cent 1959-62 issue at present on tap in Australia, enjoyed no such facilities until after the required date. But even under Rule 163 (1) (e) bargains are not marked in the Stock Exchange Official List.

Interest in these stocks has recently been stimulated by speculation on the possibility that Australia might follow New Zealand in revaluing its currency to parity with the United Kingdom pound, despite official Australian denials. In that event holders of these loans would obtain a capital profit of around twenty-five per cent while enjoying higher yields than obtainable on gilt-edged securities registered in this country.

No difficulty exists at present in remitting interest payments from Australia and residents in the United Kingdom and elsewhere in the sterling area may receive up to £A104 per annum from Australia free of Australian income tax. The double taxation agreement between the two countries provides for an offset against United Kingdom taxation of such Australian taxation payable on amounts exceeding £A104. While restrictions on the movement of capital to Australia via these channels might be prompted by future developments, at present no formal restrictions exist. The probability that the London demand for these stocks is not yet important enough for measures to be taken by the Australian authorities may be inferred from the relatively small premium existing on prices of the issues over their Australian parities. In any case Australia may not find the flow unwelcome, since it provides support for gilt-edged prices there while the interest payments to London holders of the stocks can be met without imposing any strain on the Dominion's sterling account.

Centrifugal Spinning

A new system of spinning evolved over the period since 1939 by the Keighley firm of Prince-Smith and Stells has now reached the stage of being demonstrated to the textile trade, and seems likely to arouse lively interest. It was described in some detail in *Textile Weekly* on September 24th. Substantially, it is the application of centrifugal spinning (already used in the rayon industry) to the spinning of dry fibres; and, although designed primarily for worsted, it is claimed to be applicable to cotton, flax, rayon staple, and indeed any dry fibre yarns. It is for this general application that the processes have been passed by the originating firm to Textile Machinery Makers, Ltd., for development.

They centre upon a new method of recovering dry yarn from a centrifugal spinning container. But in applying this principle the opportunity has been taken to plan afresh the entire processes of drawing or roving, spinning, and twisting yarns, and to design a series of machines capable of being used separately with other machinery but calculated to give the best results when used together. Higher speeds, larger packages, fewer end-breaks, a great reduction in labour requirement and a reduction in floor-space per lb of yarn produced are among the important advantages claimed. The semi-automatic doffing operation evolved requires only brief manual attention at its conclusion, and is so designed that the absence of any attention does no harm, but merely delays the start of spinning on the new bobbin. The machines can therefore be run through meal breaks and can be left to run themselves out at the end of the day; the setting of a switch enables each machine to be stopped at a predetermined time, and it will be found ready to complete doffing and start spinning at the beginning of the next working day. The machines are driven by individual electric motors.

These machines are already to be seen at work, but to put them into commercial production will require new tooling and to a certain extent new plant. Even for the initial purpose of serving the worsted industry, much of this has still to be done; it seems likely, therefore, that the entry of the centrifugal system into cotton spinning may be delayed for some time yet.

COMPANY MEETINGS

THE DISTILLERS COMPANY, LIMITED

PROGRAMME OF EXPANSION

GROWING DRAIN OF HEAVY TAXATION

MR HENRY J. ROSS REVIEWS POSITION AND PROSPECTS

The seventy-first annual general meeting of the company was held in the North British Station Hotel, Edinburgh, on Friday, the 24th ultimo, when the chairman, Mr Henry J. Ross, presided.

The chairman said:—

When I had the privilege of addressing you last year it was in my capacity as deputy chairman, our then chairman, Lord Forteviot, being seriously ill, and, although we all fervently hoped for his recovery, it was not to be, and he passed away on October 24, 1947. His death was a most serious blow to the company over which he had presided with such dignity and distinction for the previous ten years, and his loss is keenly felt as a peculiarly personal one by every member of the staff from the highest to the lowest.

As is mentioned in the report, my colleagues on the board have done me the honour of appointing me to the vacant chair. Whilst naturally proud of being called to this high office, I am very conscious of the heavy responsibility accompanying such an appointment, and all that it means to follow in the wake of such a long line of distinguished predecessors. It will be my aim, however, to continue to serve the company and the stockholders to the limit of my ability.

You will also observe from the report that, since we met last, we have lost the services of another director in the person of Mr John Nicolson. Mr Nicolson retired on pension on March 31st of this year, after having given loyal and devoted service over the long period of 38 years. Those of us who were in close, almost daily, contact with Mr Nicolson appreciated his wise counsel and guidance, particularly in all matters practical, and while we shall miss him it is good to know that he has left behind him a trained staff who have been reared in the best D.C.L. tradition.

The appointment by the board of Mr William Reid as a member of the management committee took place on November 13, 1947. Mr Reid has spent his entire business life in the trade, and is at present chairman of John Haig and Company, Limited, as well as chairman of the Group Home Sales Committee. The management committee will benefit greatly by his wide and varied experience.

STATEMENT OF ACCOUNTS

Turning now to the statement of accounts, you will have noticed that these have been prepared in compliance with the requirements of the Companies Act, 1948. The adjusted figures of March 31, 1947, have been entered in the balance sheet and in the consolidated balance sheet for comparative purposes. In the profit and loss account, however, the previous accounting period was for 10½ months with varying accounting periods for the subsidiaries, consequently the figures are not comparable, and, for that reason, have not been inserted.

TRADING PROFITS

The manufacturing and trading profits of the company and its subsidiaries, including an item of £406,677 for inter-company profits in the stock valuations of subsidiary companies released during the year, amounted to £11,119,057; to this is added (1) Income from investments and interest £905,007, and (2) Provision for taxation made in previous years not required and released £597,601, making the total revenue £12,621,665. Income tax and profits tax required the large sum of £6,021,149, and after the necessary provisions, writings off and transfers to general and superannuation reserves made by subsidiary companies as detailed in the report, there was a balance of £4,644,135. The proportion applicable to outside shareholders in subsidiary companies was £339,099, and the undistributed profits of subsidiary companies applicable to The Distillers Company, Limited, was £684,203 (as against £190,728 retained in this way in the previous accounting period). At this stage, with the amount brought in, there was available £4,388,986, and the board agreed to apply £1,000,000 to general revenue reserve, and to write off premiums and expenses on purchase of debenture stock for cancellation, £156,676, leaving sufficient for the dividends distributed or recommended, and to increase the carry forward from £768,153 to £887,051.

DIVIDEND

The dividend on the ordinary stock for the year is 1s. 1 1/5d. per unit of 4s. which compares with 1s. per unit for the previous 10½ month period. This is in effect a small reduction, but the board has had to have regard to the heavy expansion programme they have authorised. In common with other large companies, your company is feeling the growing drain of heavy taxation, and the increased costs of replacing stocks and other assets. In addition, in the expansion programme, we face the higher prices for capital assets and the expensive delays in obtaining deliveries of necessary material and equipment. There is no doubt that the ultimate total cost of this programme will prove greater than the estimates, although careful consideration has been given, and is being given, to modifications, where possible, to offset these increased prices.

BALANCE SHEET ITEMS

The company's legal balance sheet calls for comment on the following matters:—

(1) The general capital reserve has increased to £1,132,116 by the transfers thereto of the profit on realisation of certain investments during the year and of recoveries in respect of war damage to properties previously written off.

(2) The revenue reserves total £12,932,545, and it will be noticed that the opportunity has been taken to close certain free reserves by transferring the amounts at credit to general reserve.

(3) During the year the company purchased for cancellation all but £19,400 of the debenture stocks. As I mentioned before, the premium and the expenses of purchase have been written off out of revenue.

(4) Under the heading of fixed assets, lands and buildings and plant, etc., are included at what might be called nominal amounts. For this reason, the directors are satisfied that neither further writings off nor depreciation are required at this time. It has not been found possible to ascertain the original total cost of these assets or of the total writings off and depreciation applied thereto over the past years, and consequently they are inserted at cost, or at cost less sales and amounts written off.

(5) Investments in subsidiary companies now total £23,957,531, a substantial increase of £3,848,641 since the previous date of balance. The main items contributing to this increase are:—

(*a*) The formation of a new subsidiary called The Distillers Company (Biochemicals) Limited, to take over the factory at Speke, Liverpool, engaged in the production of Penicillin, formerly erected and managed by the parent company as agents for the Ministry of Supply;

(*b*) The purchase of the business of J. and W. Hardie, proprietors of the well-known "Antiquary" brand of whisky. This business was converted into a limited company, and is being carried on as a subsidiary company;

(*c*) The securing of a controlling interest in The Peerless Refining Company (Liverpool), Limited, manufacturers of margarine, cooking fats, etc., part of which are sold to The United Yeast Company, Limited, for its bakers' sundries trade;

(*d*) The acquisition of the total issued ordinary shares of The Manchester Chemical Company, Limited, manufacturers of essences, baking powders and other requisites for bakers;

and

(*e*) The purchase of the issued share capital in Alexander Bonthrone and Sons, Limited, Maltsters, Freuchie, Fifeshire.

Your directors are hopeful that these investments will prove of real value within the organisation, and will give reasonable yields on the amounts expended.

(6) These new investments, and the increase in current and loan accounts of subsidiary companies have caused a reduction in the company's holdings of British Government securities. At the date of balance, current assets totalled £21,177,738, as compared with £26,365,894 at the previous balancing date.

The consolidated balance sheet shows that capital reserves, revenue reserves and profits unappropriated total £32,753,590. Adding this amount to the issued capital of The Distillers Company, Limited, we arrive at approximately £50,000,000 as the amount invested in the business as represented by the values at which the assets are stated in the books. It must be borne in mind, however, that, as I have already mentioned, certain of the fixed assets have been written down to practically nominal amounts, while market value of trade investments is, in the aggregate, greatly in excess of book value. Current assets exceed current liabilities by £47,000,000, but I must point out that the increase in stocks is partly due to replacements at higher prices. It will be noticed that at March 31, 1948, the outstanding commitments for capital expenditure amounted to approximately £1,305,000, but this does not, of course, cover the completion of the expansion programme authorised by the board.

DISTILLING

When I addressed you last year, the hope was expressed that further distilling licences would be issued to avoid closing down our distilleries, and I am glad to say the industry received authority in December, 1947, to purchase an additional 75,000 tons of cereals, which enabled continuity of production to be maintained Since that time, further negotiations have taken place with the Ministry of Food, and, while full and free production of potable whisky is not yet possible, the Minister of Food, realising the importance of Scotch Whisky, not only in the present but in the future economy of this country, authorised the granting of 250,000 tons of cereals to the industry for the period to April 30, 1949. Licences for that quantity

have been issued, and it will be appreciated that this is an important step towards the replenishment of the general stock position. These licences have again been subject to certain conditions regarding the further stepping up of exports to hard currency areas, by reducing the quantity available for the home market, and to which I will refer later in my remarks.

In order to ensure the earliest possible production at our grain distilleries, it was decided to reopen our Caledonian Distillery, which has been silent since 1941. The plant, however, has been maintained in working order, and you will be interested to know that production will commence there within the next 10-14 days.

The operating malt distilleries completed their 1947-48 licences before closing down in the early summer, and I am glad to say a good start has been made with the 1948-49 season.

SCOTCH WHISKY SALES—HOME AND EXPORT TRADE

Last year, an arrangement was come to with the Ministry of Food in terms of which the proportion laid down for distribution from May 1, 1947, was 3 gallons for export to 1 gallon released for the home market. This arrangement continued in force until April 30, 1948, as from which date a new arrangement with the Ministry became operative.

As a *quid pro quo* for the allocation of further cereals, the Ministry insisted on a still greater increase in exports to hard currency markets, and, in view of the stock position, this could only be effected by our making a further reduction in the supplies available for the home market.

The board view with great regret the present meagre allocation being made to the home consumer, and, as soon as the stock position permits, it will be their desire to bring about some alleviation in this direction. We have always taken the view that a healthy trade at home is a necessary adjunct to our export business, and this factor will not be lost sight of.

During the period under review, the rate of duty has been raised on two occasions. In the supplementary budget, introduced in November, 1947, an increase of 33s. 4d. per proof gallon was made, and again in the budget of April, 1948 a further increase of 20s. per proof gallon. The rate of duty now amounts to the enormous figure of £10 10s. 10d. per proof gallon, and the retail price of a bottle of Scotch Whisky is 33s. 4d., of which 24s. 7d. goes to the Exchequer. Representations were made to the Chancellor on both occasions, pointing out the penal nature of this taxation, but, so far, without avail.

The board will continue to use every endeavour to bring about some reduction in this fantastic rate of duty.

To all intents and purposes the export trade is under Government direction, and the industry was allotted a target figure to cover shipments to dollar markets, such as Canada, United States of America, South America, etc. In satisfying the needs of the Government for the year ended April 30, 1948, it is gratifying to record that our group companies played a very important part, although, to accomplish such a result, and in accordance with instructions from the Ministry of Food, it meant a drastic cut of supplies to "soft" currency countries as well as to the home trade.

Notwithstanding the difficulties with which our group firms have had to contend, our well-known brands of Scotch whisky continue to occupy a prominent place overseas, and are in constant demand.

GIN

Likewise, our Gin companies continue to enjoy an increasing demand for their various brands of gin—Gordon's, Booth's and Burnett's—both at home and abroad. This happy position reflects the very high standard of quality which is consistently maintained by our gin group companies in their brands. By arrangement with the Ministry of Food, particular attention is also being paid to "hard currency" markets.

YEAST

The yeast factories have been working practically to full capacity throughout the year under review to meet the demands for their products in home and overseas markets. I regret that permission has not yet been granted by the authorities to proceed with the new yeast factory in the south of England. In the meanwhile, plans and specifications have been prepared, and the company is keeping in close touch with the appropriate authorities. It is hoped that, within a reasonable period, a start on the erection will be allowed.

Although costs of production of the various products have risen quite substantially over the period, no increases in prices to the consumer have been applied.

INDUSTRIAL SECTION

It can be well understood that even greater interest is now being taken by the members and others in the industrial side of the company's business, and particularly so in the large and important extension programme in chemicals and plastics authorised by the board. It is satisfactory to record that, in general, good progress has been made in all the various sections, and outputs and profits have been well maintained throughout the year. Certain key materials, of which we are large consumers, have remained critically short, but the supply position as a whole has improved. This, we hope, will eventually lead to some degree of relaxation of Government control and the introduction of normal trading conditions.

Our programme of extensions, to which I have already referred, has been hampered and delayed by shortages of both constructional materials and labour, and there are, as yet, no signs of any improvement in this respect. Whilst this is a great disappointment, it must be emphasised that the directors are satisfied their plans for expansion are based on what they regard as the long term requirements of a stable market.

The new plant for our subsidiary, British Geon, Limited, at Barry, South Wales, which was reported last year as under construction, commenced operations some months ago. The sales of the product "Geon" brand of polyvinyl chloride, are developing well both at home and in certain overseas markets. Adjacent to this factory, we are erecting another for our subsidiary, British Resin Products, Limited, to take over and expand their existing manufacturing activities now carried on in three smaller units elsewhere.

PURCHASE OF PENICILLIN FACTORY

As I have mentioned, in the year under review negotiations were completed for the purchase from the Government of the penicillin factory at Speke, Liverpool, and this transaction was followed by the formation of the Distillers Company (Biochemicals), Limited, with an issued capital of £1,000,000. Gratifying progress has been made, and the company is now marketing a high grade of crystalline penicillin. Close attention is also being paid to the production of streptomycin, and the development of similar anti-biotic materials.

In the industrial alcohol market, adequate supplies of molasses were available throughout the year, although the price was still very high. On the whole, so far as can be gauged at present, the outlook for this section is more favourable now than it has been for some time.

The directors have given careful consideration to extending the field of research and development, and a very substantial sum, larger than in any previous year, was appropriated for this purpose. Some of the work is of long-term nature, but particular attention is being paid to consumer research, from which the company has derived real benefits in larger outputs and better quality of various materials.

Last year, reference was made to the provisional agreement between the company and the Anglo-Iranian Oil Company, Limited, to erect a plant at Grangemeuth for the production of chemicals from petroleum, and I am glad to inferm you that the project has been approved by the authorities. A small company was formed, under the title of British Petroleum Chemicals Limited, with a nominal capital of £100. The initial work is now well in hand, and application has been made to the capital issues committee for permission to increase the capital of the company to £5,000,000, which will be subscribed equally by the two companies. It is not necessary to emphasise the fundamental importance, to the Distillers Organisation, of this association with the Anglo-Iranian Oil Company. The advent of more competitive conditions in the chemical industry should not weaken the position, because the scheme has been designed to fit in with, and to become an integral part of, the existing manufacturing interests of the industrial side of our organisation.

FUTURE PROSPECTS

I am sure you will agree that it is neither possible nor desirable, under present conditions, to forecast very far ahead, but I am able to inform you that, so far as the current year has gone, the margin of profit has been well maintained up to the standard of the year to March 31, 1948. There is the added satisfaction that the conservative policy regularly adopted by the board over the past years, with the ploughing back of substantial amounts out of profits, has placed our company in a strong financial position with good reserves.

It is anticipated that, in future, dividends on the ordinary stock will be paid twice a year, with the interim in February, and the final in October.

TRIBUTE TO STAFF

And now, ladies and gentlemen, I cannot close without a word of praise for our staff —a very widely scattered staff, located, not only in Scotland and England, but in Wales and Ireland, and overseas in Canada, Australia, India, South Africa, and in the U.S.A. To each and all, the thanks of the directors are due, and I am sure the stockholders would wish to be associated with this tribute, for, without the devoted efforts of the staff, the satisfactory results now before you would not have been possible.

The report was adopted.

GOLD EXPLORATION AND FINANCE OF AUSTRALIA, LIMITED

INCREASED REVENUE

The fourteenth annual general meeting of this company was held, on the 28th ultimo, in London, Mr. C. T. Pott presiding.

The following is an extract from a statement by the Board circulated previously:—

For the year ended March 31 last revenue from dividends and interest, amounting to almost £91,000, reflects increases of £37,900 in the Western Mining Corporation dividend and £2,800 in interest received, offset by an aggregate decrease of £20,200 in the distributions by Gold Mines of Kalgoorlie and Victoria Gold Dredging. Administration and general expenses went up by £4,000, partly due to increases in normal administration costs and partly on account of visits to Australia by directors and senior officials.

The net revenue for the year at £78,686 was £5,600 more than the previous year's figure, but the net provision for taxation is £12,000 higher at £44,134, largely due to the increase in the profits tax. After bringing in £3,547 from last year the balance on profit and loss account is £38,099, out of which it is proposed to pay a dividend of 6¼ per cent. (7½d. a unit) less tax at 9s. in the £, requiring £31,385 and leaving £6,714 to be carried forward.

For some time past the board has realised the desirability of transferring the control and management of the company's affairs to Australia and has therefore applied to the Treasury for permission so to do, under the Exchange Control Act, 1947. Permission has been received and a scheme for transfer will be placed before the stockholders as soon as the necessary details can be completed.

The report was adopted.

WATNEY COMBE REID AND COMPANY, LIMITED

THE PRICE OF BEER

The ordinary general meeting of Watney Combe Reid and Company, Limited, was held, on the 24th ultimo, in London, Major A. C. Bonsor (the chairman) presiding.

The following are extracts from the chairman's circulated statement and speech:—

June 30, 1948, marked the completion of 50 years of trading by the company under its present name. The amalgamation in 1898 brought together and perpetuated in name three kindred firms. Watneys first became associated with the Stag Brewery in 1837, although there had been a brewery there long prior to 1700. Combe and Company, Limited, and Reid's Brewery Company—formed in the late 1700s—were successors of pre-existing breweries.

During the year under review, the Chancellor of the Exchequer introduced two Budgets, each of which resulted in an increase of 1d. a pint in the price of beers of average gravity, and of 2d. a pint in the better-class beers. The price of beer such as is allowed to be brewed today is too high, and must lead to a serious reduction in sales, of which there are already distinct signs.

CATERING

It has always been our aim to provide facilities for catering where it is practicable, and despite difficulties, food is obtainable in 94 per cent. of the company's houses, of which 40 per cent. serve main meals totalling over 141,000 a week, in addition to an incalculable number of less substantial meals served at bars and snack counters. There still seems to be an impression in the minds of several responsible people that the interests of brewers lie solely in the sale of beer, wines and spirits. We have a much higher conception than that of our duty to the public, and these figures will help to reinforce our claim as an industry to be allowed our full and proper share in planning licensed houses of the future in this country.

Having regard to the requirements of the future and the ever-rising cost of building work, further appropriations are required, and the transfer of £250,000 from this year's profits to the properties and plant contingencies reserve is recommended. Any appropriations we can make today have to be made out of profits which are taxed at twice the prewar rate, The cost of building today is just over twice the prewar cost. As a result a new building today requires the appropriation of over three times as much profit before taxation as a comparable building required prewar.

The following sub-division of each £1 received by the company may be of interest: Beer duty and taxation, 11s. 8.4d.; materials, 3s. 6.2d.; working expenses, 1s. 9.5d.; salaries, wages and pensions, 1s. 7.3d.; preference and ordinary dividend, 3d.; deferred ordinary dividend, 8.8d.; reserve, 2.8d.

The report was adopted.

GUEST, KEEN AND NETTLEFOLDS

GOOD RESULTS FROM TEAM WORK

The annual general meeting of Guest, Keen and Nettlefolds, Limited, was held on the 23rd ultimo at Birmingham, Mr. J. H. Jolly (chairman and managing director), presiding.

The following is an extract from the chairman's statement:—

It is with pleasure that your directors submit the financial results of the group for the year ended March 31st last. It should be recorded at the outset that they have been achieved despite great difficulties and many frustrations. For these results I want in your name to pay tribute to the management, staff and workpeople throughout our organisation. They are splendid. I can assure you that the results they have achieved have been due to the team spirit between management and workpeople that has been built up over a long period of years.

TRADING PROFIT

It will be seen from the consolidated profit and loss account that there has been a considerable advance in the trading profits of the group before charging debenture interest, depreciation and taxation. The present year's total of £6,101,839, against £4,465,294, constitutes a record. Many factors have contributed to these increased profits, the main ones being that rising costs have been partially offset by increased volume of production, by increased efficiency, and not least by the splendid team spirit to which I have already referred. In addition, the increased capital subscribed two years ago and the profits retained in the business during past years are now becoming more fully remunerative.

The increased trading profits are to a great extent nullified by the large provision for taxation. No less a sum than £3,162,967 has to be charged to cover the liability on the year's profits of the group. Only £873,984 is to be distributed to the stockholders.

The consolidated balance sheet shows current assets of the group amounting to £25,038,142, against which must be set the current liabilities of £9,632,214—admittedly a good position.

WHY NATIONALISE ?

It has been stated by Government spokesmen that in October or November a measure will be introduced into Parliament for nationalisation of the iron and steel trade in whole or in part. Your board are still firmly convinced that, from the country's point of view, it would be a national disaster if the state, with its cumbersome, slow moving and doctrinaire methods, attempted to control by nationalisation that highly complex industry known as the iron and steel trade. It is a striking fact that nationalisation of industry has not shown any greater efficiency, any lowering of prices, any improvement of quality or service, or contributed anything more to the competitive power of Great Britain in export markets than when operating under private enterprise; rather the reverse.

In the critical state of this country's economy, it is not too much to ask that there should be a halt to nationalisation schemes at least until it is seen whether nationalisation already undertaken justifies itself.

One should be able to look to the Government placing country before party, but if not, and they do proceed with the nationalisation plan, may I ask all stockholders to be active in the protection of their rights and make their views known to their representatives in Parliament. Meanwhile, the iron and steel industry has supported the country's efforts in an outstanding measure by way of record outputs and reasonable costs of production.

EXCELLENT PERFORMANCE OF STEEL TRADE

Since this excellent performance of the steel trade has become more generally recognised, there has been a tendency for its opponents to press for nationalisation on the grounds that it is a monopoly and because power is in the hands of a few. The charge of being a monopoly cannot be upheld for the simple reason that the Government already effectively control, for example, prices, extensions of buildings and installations of new plant and even the raising of capital. Your own company is a very good example in repudiation of the statement that the ownership of the industry is in the hands of a few.

Fifty-five per cent. of the ordinary stockholders, or over 12,000 individuals, each own not more than £200 nominal stock, and the number of members holding over £1,000 nominal stock is only 1,000 out of nearly 23,000.

The uncertainty as to how and to what extent nationalisation may affect your own group with its many finishing and engineering trades has caused your board considerable thought as to the extent to which they were justified in pressing on with many schemes for modernisation of plant to still further improve competitive power. Many products of the group are directly exported, and many others form component parts of articles, plant and machinery exported by our customers. We are of the opinion that it is not sufficiently, or widely enough, recognised that unless British industry does cheapen its costs of production very quickly, the country's export trade, so vital to our standard of living, will be in danger of serious setback. We believe that it is insufficiently realised that the Marshall Aid Plan does not solve this country's economic problems but, at best, provides only a brief breathing space. In spite of, or because of "planning," Government Departments take three to four times too long to weigh up industrial situations and to take effective decisions.

Your board, however, feel that, in spite of the present uncertainty, they are justified in the national interests, and in yours, in proceeding with considerable expenditure some of which will be quickly justified but some much longer in term as regards profits.

TAXATION HINDERS EFFICIENCY

On the subject of equipment expenditure there are two aspects that should be mentioned. The first relates to retained profits. We have not increased the dividend distribution because we joined in the voluntary undertaking given to the Chancellor of the Exchequer for the adoption of that course for one year from March, 1948. You will remember that this was done "on the assumption that the necessary complementary action is also taken by way of stabilisation of wages as set out in the White Paper, together with a reduction of Government expenditure." One could wish that there were more signs of these assumptions being fulfilled. As previously mentioned, out of the taxed profits of the year we have transferred to reserve or left undistributed much more than has been paid out in dividends to stockholders.

Under such conditions and with the necessity of much larger sums required for financing stock-in-trade and customers' accounts, to which reference has already been made, industry is driven to the raising of additional capital for keeping itself abreast of latest developments. It is difficult to find any logical defence for the maintenance of profits tax on that part of earnings ploughed back into business.

The report and accounts were unanimously adopted and a final dividend of 7 per cent., less tax, making 11 per cent., less tax, for the year, was approved.

GEORGE COHEN, SONS, AND COMPANY, LIMITED

YEAR OF GREAT ACTIVITY

MR CYRIL M. COHEN'S REVIEW

The twenty-fourth annual general meeting of George Cohen, Sons, and Company Limited, was held, on the 28th ultimo, in London, Mr Cyril M. Cohen (chairman and managing director) presiding.

The chairman, in the course of his speech, said: It is again a pleasure to your board to welcome you at this meeting and to present accounts reflecting a year of great activity, also, I am happy to say, a further improvement in the state of the group's affairs.

After providing for all costs, including depreciation, at the rates allowed for taxation purposes, and after deducting the proportion of net profits applicable to minority shareholders, the net profits for the year amounted, before taxation, to £909,165 and, after taxation, to £412,975.

The case has been ably stated by other speakers, and I do not propose to dwell on the appeal by industry to the Government for a more realistic attitude towards wear and tear allowance. I merely observe that the present illogical state of affairs is a positive encouragement to unsound financial practices. We ourselves have made no attempt to assess the replacement costs of our fixed assets, but, with these and other considerations in mind, we have placed very large sums to reserve.

Of our total profit of £412,975, we have left with subsidiary companies £61,985, bringing the reserves and undistributed profits in these companies' balance-sheets up to £400,114, and we have made a transfer to general reserve in the parent company's books of £210,000 to bring this figure up to £600,000, an amount which, incidentally, is equal to the nominal ordinary capital. We have transferred to the employees' pension fund—I outlined the purpose of this to you last year—the sum of £17,073, reimbursing the fund to the extent of the amount paid out during the year and raising it to £55,000. We have paid the 4½ per cent. preference dividend costing £24,904 and also an interim dividend on the ordinary stock at 8 per cent. costing £26,400. I will shortly propose that we pay a final dividend of 12 per cent., making 20 per cent. in all and costing a further £39,600; and that we increase the carry-forward by £33,013.

You will recollect that last year I stated that while we should hope to continue to pay reasonable dividends, having due regard for our shareholders' interests, it was our intention to adopt a prudent course and to plough back adequate reserves into the business for purposes of development and consolidation.

Since the date of our last meeting, the Federation of British Industries, to which we belong, have agreed to support the government's policy of disinflation and, in particular, most of the member companies have undertaken to restrict the amount of their distributions to that of the previous year. Our case, however, is a special one in that we have no properly comparable rate of dividend for the year to March 31, 1947, owing to the change in the company's capital structure, but your directors considered that you would wish them to comply with the spirit of the agreement and we have accordingly limited the recommended rate of distribution to 20 per cent. of the nominal value of the ordinary stock.

We are now reaping the benefit of the extensive modernisation and general re-equipment which we began some time ago. Although some of the resultant economies have been absorbed by rising costs outside our control, the improved state of efficiency of our many works is yielding fruit and the all-round increase in turnover, which was only achieved by dint of great endeavour on the part of our staff and workpeople, is, as I have already indicated, favourably reflected in the satisfactory trading figures before you.

You may have noticed that when preliminary reports of our accounts were announced in the press, some of the financial commentators, referring to us as "the well-known scrap metal merchants"—or in similar terms—ascribed the favourable results of our year's trading to the substantial success of the National Scrap Drive—from which it was suggested our augmented profits were materially derived. Since that impression may persist, I feel it right to cite some relevant facts and set them in proper perspective.

Although it is by no means the predominant activity either of the group or the parent company—and to this I will refer again in a moment—we are one of the two largest organisations in the kingdom concerned with the recovery and supply of iron and steel scrap, and we have indeed played an active part in connection with the widely-publicised scrap drive. However, the tonnage of iron and steel scrap we handled was only slightly higher than in the previous year. Selling prices were, and, of course, are, rigidly controlled. There were fairly considerable increases in the costs of collection and processing. So any variation in the financial out-turn of our operations could but be within very fine limits.

This apart, the necessity to impel every ton of iron and steel scrap to the consuming works continues to be of urgent importance, and we think we are rightly keeping our eye more closely on this objective than on the purely commercial one of making the maximum profit. We look upon it as our privilege and duty to assist the iron and steel industry in its magnificent efforts. Our trading in scrap non-ferrous metals is worthy of brief mention because it was both substantial and successful. But the fact remains, and I must again emphasise it, that we are much more than—I quote—"well-known scrap metal merchants."

By any standards, your group's engineering activities considerably exceed its scrap activities in magnitude and scope. For example, E. & L. Steelfounders & Engineers Ltd., are one of the four biggest makers of Carbon Steel Castings and also the largest makers of Mobile Cranes in Great Britain—they also manufacture Air Compressors, Steam and Petrol Engines. T. C. Jones & Company Limited are Structural Engineers and experts in Concrete Reinforcement. Metalclad Limited manufacture Woodworking Machinery. The Parent Company's Contractors' Plant Hire Fleet is unexcelled in the number of its machines, and as Machinery Merchants, Stockists and Reconditioners we are the largest in the country—and probably in the whole world.

I am pleased to say that our powder metals department has emerged from its infancy and has begun to contribute to the group's revenue. It is especially gratifying that no less than 85 per cent. of the output was sold for export. We have actively continued our programme of research and development in the manufacture and use of iron powders. Much original work is being carried out at East Ham and at the group's research laboratory at Letchworth.

The parent company's general business in plant, machinery and industrial equipment, continues to be very brisk and all our shops engaged on reconditioning and re-building are working to capacity. A large proportion of the machinery sold is destined either to be put into production by concerns who manufacture for export, or for export by ourselves. Indeed, the volume of our export business is very substantial and has shown a satisfactory increase despite the handicaps imposed by currency restrictions and the difficulties of obtaining import licences in so many foreign countries.

You will expect me to make some reference to future prospects. There is no doubt that business is becoming more competitive and difficult to obtain. Our sales departments are increasingly active and, thanks to their efforts a scrutiny of our up-to-date returns provides no evidence of any appreciable decline in the volume of business being transacted by the group as a whole. There are so many uncertainties, however, that it would be unwise for me to make any forecast as to how long this state of affairs may continue. The activities of your group are efficiently co-ordinated and organised and we have every confidence in our ability to secure a fair share of the orders emanating from the engineering, metallurgical and allied industries with which we are so closely linked—and well equipped to serve.

I have already, I fear, detained you overlong, but before I conclude I should like to refer to one or two subjects of current interest which inevitably have their impact on undertakings such as ours—and, I believe, on most of British industry.

It is common ground that the nation's paramount need today is for maximum production—to swell our exports and sustain our standard of living at home. But if that aim is to be achieved, a number of removable obstacles must be swept aside.

All artificial restrictions on output must go. Workpeople should receive incentives to greater effort—and worthwhile ones; and so should management and industry as a whole. It cannot be said today that self-interest and the much maligned profit-motive are the main driving forces in industrial progress, but human nature being what it is, they must inevitably count. A fiscal system based on the formula "tails-you-lose-heads-I-win" is scarcely calculated to stimulate new ventures. Indeed, the rewards offered to the venturer nowadays are penury if he fails and penal taxation if he succeeds—and the drain on working capital caused by the latter intensifies the risk of the former.

If we are to have unremitting exhortation from Government departments, let us also be vouchsafed help. It is a matter of urgency that the galling and time-wasting entanglements of bureaucratic procedure should be eliminated. I can testify that even when a project has been finally approved by the government department immediately concerned, these convolutions can impose delays beyond all reason on its materialisation, to the jeopardy of the original sound conception.

From every point of view—to relieve the disheartening burden of taxation on workpeople, managers and shareholders alike, to lessen inflation, to save manpower, and, simultaneously, to release industry from the trammels of excessive control—economy at the centre is imperative.

To use a business metaphor, Great Britain, Limited, is endeavouring to carry too cumbersome a load of administrative overheads. More than 10 per cent. of our total working population of 20 millions are civil and local government servants, and, exclusive of the nationalised industries, there are actually 700,000 more than in June, 1939, when the rearmament programme was under way. Can we escape the feeling that here exists a potential source of some of the additional brains and pairs of hands that industry requires?

The report and accounts were unanimously adopted.

LONDON TIN CORPORATION LIMITED

CHAIRMAN'S SPEECH

The twenty-second annual general meeting of London Tin Corporation Limited was held, on the 29th ultimo, at the Chartered Insurance Institute, 20, Aldermanbury, London, E.C.2.

Mr J. Ivan Spens, the chairman, who presided, said:—

ACCOUNTS

The accounts for the year ended April 30, 1948, are in a new form to comply with the Companies Act, 1948. There were certain alternative methods of presentation, but, on balance, your directors came to the conclusion that the form adopted was the most satisfactory one.

With regard to the profit and loss account of London Tin Corporation, I should perhaps remark that the final dividend of 15 per cent. declared after April 30, 1948, by one of the Malayan mining subsidiary companies, Berjuntai Tin Dredging, Limited, has not been included under "dividends from investments and interest," so, in consequence, it is not a deduction from the mining profits in the consolidated profit and loss account. The 5s. shares of this company are quoted in Malaya and Australia.

The 4s. shares of the other Malayan mining subsidiary company, namely, Lower Perak Tin Dredging, Limited, are unquoted, and for purposes of valuation as at April 30, 1948, have been taken at book cost, which is under their par value. Actually, since that date, the share capital of Lower Perak has been increased by £164,817, being the subscription at par of 824,088 shares, to allow repayment to be made of the balance of certain loans outstanding—originally obtained for the purpose of equipping the property.

I must warn shareholders that the substantial balances shown as standing to the credit of the profit and loss account of these two subsidiary companies must be retained there by the boards of those companies until the position as to war damage compensation and cost of rehabilitation is finally clarified, although the boards may be in a position to be more liberal as regards future distributions of the annual profits.

MALAYAN WAR DAMAGE COMPENSATION SCHEME

As has already been reported fully in the Press, a memorandum on proposals for a Malayan war damage scheme has been laid before the legislative councils of the Federation of Malaya and of Singapore. These councils have appointed a joint select committee to examine the proposals and to report back.

Until the select committee's report is made and the matter has had the consideration of the legislative councils, the amount to be made available to the tin industry will not be known. Any balance of rehabilitation expenditure not recovered from the funds available will be a charge against Malayan tax spread over six years, but discussions with the revenue authorities here as to the basis to be adopted in the case of companies registered in the United Kingdom have still to be held.

VISIT TO THE EAST AND AUSTRALIA

Early in this year I paid a visit to Malaya, Siam and Australia, in order that I might see conditions there and discuss with those on the spot any problems which were before them. I also visited, by courtesy of our friends the Billiton Company, various tin mines in the Netherlands East Indies. This visit, on which I was accompanied by Mr W. M. Warren, the chairman of Anglo-Oriental (Malaya), Limited, I found most interesting and instructive, and we look forward to being able to reciprocate when representatives of the Billiton Company are able to visit us in Malaya.

MALAYA

In regard to companies operating in Malaya under the management of Anglo-Oriental (Malaya), Limited, 28 dredges are in production out of the 40 which should be brought into production. This is an addition of eight producing dredges since I last addressed you. Others are being repaired as urgently as possible, but there are some dredges which will have to be transferred to fresh areas because the ore reserves remaining in the properties in which they are, are insufficient to justify rehabilitation in situ. These dredges, therefore, will take some time yet to bring into production.

I visited all the dredges which were in operation and was greatly struck with the keenness and enthusiasm which I found everywhere. The supply position in regard to steel and electrical equipment still makes rehabilitation a slow business, but I believe that we are getting all the assistance which we can reasonably ask, not only from the Government in Malaya, but from the Colonial Office, the Ministry of Supply and suppliers. Malayan production, on the whole, has increased from 12,831 tons concentrates in the first half of 1947 to 27,582 tons concentrates in the first half of 1948.

In regard to the companies under our management, it would seem that their position could be strengthened and considerable economies made, should it prove possible to effect further amalgamations.

Many of our companies have their properties intermingled and separate stores, accounts, etc., have to be kept for each. Dredging courses have to conform to the boundaries of the various leases as the dredge of one company may not encroach on the property of another, whereas if the leases belonged to a suitable larger unit, a more efficient and economical programme could be worked out. Further, those companies which have only a small number of dredges, in many cases only one, are severely handicapped if the dredge has to go out of action for any prolonged period, or to be transferred from one area to another. This question of suitable amalgamations is under active consideration, both in London and Malaya, and I trust that some scheme will be found possible to procure the benefits which I have set out above, but no actual action can probably be taken until the position as to war damage compensation and cost of rehabilitation is nearer to finalisation.

A pension scheme for staff similar to that in force in Nigeria is under consideration. I am of the opinion that this would be beneficial to the mining companies concerned, as well as to the staff eligible for membership.

As shareholders are well aware, there has lately been considerable trouble in Malaya from a very small section of the community who have formed themselves into gangs and operate in the jungle-covered hills, and who have made murderous attacks at various and widespread points. The breaking up and capture of these gangs is now being energetically pursued and, while one cannot hope for an immediate cessation of activities diffused over such a large area it can be expected that with continued energetic action the trouble in time will be overcome.

I have to inform you with deep regret that two of our European staff have fallen victims to murderous attacks.

This state of affairs had not come to a head during my visit and I found that our relations with our labour force were good and the labour contented. There were still agitators amongst the officials of the labour unions, but it is of interest to note that when these recent outbreaks commenced these agitators disappeared and some of them no doubt joined the gangs to which I have previously referred.

SIAM

At Bangkok Mr Warren and I were able to deal with certain matters outstanding, as at that time negotiations were still in progress in regard to the repossession of properties in Siam under our management. These negotiations have now been completed and these properties have been repossessed. Orders are coming through now for the necessary plant and equipment, and the mines will be brought into production as early as possible—the date depends, of course, on deliveries and certain other factors.

Meantime the Siamese Government have, under the terms of the Peace Treaty, refunded to the various companies an agreed sum against the value of the ore which was mined during the Japanese occupation, and also repaid the balance of the buffer stock money due to the various companies. The position in regard to war damage claims is that while provisional claims were lodged some while ago, and while advances against these are being made by the Siamese Government, official claim forms have only lately been issued and the Claims Commission has yet to consider them.

BURMA

In Burma conditions during the year under review have been far from settled, but three dredges belonging to the Tavoy Tin Dredging Corporation have been producing, but the general position, as you are doubtless aware, has recently further deteriorated.

TRIBUTE TO STAFF

The staff in Malaya, Siam and Burma have had, and are having, an anxious task which they are carrying out with great courage and ingenuity. I hope shareholders will allow me, through Mr Warren, who is with us today, to convey to all this staff their appreciation of what has been done and is being done, particularly in the last few months. (Hear, hear).

AUSTRALIA

I visited the offices of A.O. (Australia) Pty., Limited, in Sydney, which are in the charge of Mr Coates, and which are now in full working order and proving of great assistance to our organisations both in Malaya and Nigeria. As and when it has been possible, equipment is ordered in Australia, but supply conditions there are not easy and the export of fabricated steel only is permitted. I was glad to have the opportunity afforded me of visiting the works of some of our main suppliers.

NIGERIA

Conditions in Nigeria have not changed to any great extent since I last addressed you. Production has been steady and satisfactory and a considerable amount of work has been done in the way of prospecting. We have been handicapped in this by the lack of power drills which we require, but these I hope will shortly be available.

I understand from Mr Eric Wilson, the chairman of A.O. (Nigeria), Limited, that the African Workers' Councils, to which I referred in my speech last year, have proved themselves of considerable benefit and have led to a feeling among the African workers that they are given every opportunity to voice any suggestions they may have for improvements and for closer contact with the management.

In August, 1947, a visit was made to the properties of Amalgamated Tin Mines of Nigeria by representatives of tin mining friends operating in the Belgian Congo.

Your corporation have, in conjunction with the government in Nigeria, taken steps in the formation of a company to prospect the Cameroons. This area has not previously been prospected on any large scale.

While the formation of this company has not yet been finalised, our chief geologist has made a survey flight and a short ground reconnaissance to get an idea of the formation and possibilities of the country, and will, in the next few months, lead a ground prospecting expedition with the object of demarcating the most likely areas and getting a more accurate view of the general geology.

TIN PRICE

The buying price for tin metal paid by the Ministry of Supply who are acquiring the output, both from Malaya and Nigeria, until June 30, 1949, has been increased by steps to £550 per ton. At the lower levels at which it stood until May 30, 1948, many Chinese miners in Malaya found it impossible to produce economically.

Shareholders may remember that last year I referred to the increase in operating cost, and the increased cost of materials and transport—none of these has diminished. I also mentioned the necessity for mining companies setting aside larger sums than had to be provided prewar, so as to have funds available for replenishing ore reserves and the replacement of plant and machinery. I might equally have mentioned the increased costs of river and road deviations, which must often be carried out to government's specifications in order to complete the extraction of ore.

I do not, therefore, consider the present price of tin affords an unreasonable return from properties which are already equipped. The question of the price of tin metal governs the purchase of new equipment for unequipped areas, which tend generally to be lower in tin content than in the past.

While purchases of tin metal are undoubtedly handicapped at the moment by currency difficulties, there is a potential demand which is considerably higher than present production, and while the process of electrolytic tinning shows certain economies in the use of tin for tinplate, I believe that these economies should, in turn, lead to an extended use of tinplate when conditions are more normal.

TIN STUDY GROUP

In my speech last year I advised shareholders that this international body had been constituted and had held its first meeting. In April last a further meeting was held in Washington, at which I attended, and at which both producing and consuming countries made available to the meeting their estimates of future production and requirements. After study of these figures a working party was appointed to make recommendations to the study group, the next meeting of which is to be held at The Hague towards the end of October.

Supplies of tin during present shortages are allocated to the various countries requiring it by a committee sitting in Washington, and while this system of allocations remains in force the re-establishment of a "free" market in tin is difficult, if not impossible. The annual production of tin, when those countries whose mines were overrun by the Japanese are fully rehabilitated, is likely to be in excess of the actual annual consumption.

In my opinion it is essential that matters are not left until there is a burdensome excess production, which can only lead to disorganisation in the industry, harmful economic effects in the producing countries, and probably violent fluctuations in the price, all of which are harmful not only to producers, but also to consumers. It is my sincere hope that the question will be faced and dealt with in the near future, even although there may be, for a period, residual buyers for purposes of strategic stock piles.

The report and accounts were adopted.

The retiring directors were re-elected and the proceedings then terminated.

GOLD MINES OF KALGOORLIE, LIMITED

HIGHER TONNAGE

The fourteenth annual general meeting of this company was held on the 28th ultimo in London, Mr C. T. Pott presiding.

The following is an extract from a statement by the Board previously circulated:—

The mill operated at the record rate of just over 12,300 tons per four-weekly period and treated 166,087 tons, of which 1,714 tons came from a lease belonging to another company. The 41,206 ounces recovered from the company's own ore realised the equivalent of 42s. 4d. per ton of ore treated, an increase of 3s. 11d. compared with the year before, of which 3s. 5d. is accounted for by an increase of 0.39 dwt. per ton in the gold yield and 6d. is in respect of lower Federal gold tax payments. This tax was suspended in September, 1947.

Operating costs increased by 1s. 4d. to 32s. per ton, due chiefly to higher development costs and a consequent rise in the development redemption charge. Wages have been increased and the working week shortened under new awards which became effective in December, 1947, and by further increases in the basic wage rate and the industry allowance.

The profit before appropriation increased by £23,192 to £82,683. The dividend recommended is the same as last year, 5 per cent. less income tax.

For some time past the board has realised the desirability of transferring the control and management of the company's affairs to Australia and has therefore applied to the Treasury for permission so to do. Permission has been received and a scheme for transfer will be placed before the stockholders as soon as the details can be completed.

The report was adopted.

(*Continued from page 552*)

the Argentine Government, sooner or later, to acquire foreign tramway interests. Although it has been known for some time that the possibility of a purchase was being explored by the Argentine Government, representatives of Anglo-Argentine Trams in London have consistently denied any firm knowledge that a purchase was in prospect. Yet presumably the Bill providing for the acquisition of the total assets of the Buenos Aires Transport Corporation, introduced in the Chamber of Deputies this week after its approval by the Argentine Senate, can hardly have come as a complete surprise to the Anglo-Argentine Trams group, whose interests represent approximately one-third of the issued capital of the Corporation. It is intended to begin the liquidation of Buenos Aires Transport Corporation within ten days of the enactment of the Bill. The assets will be disposed of in one block, presumably to the Argentine Government. In the meantime, three Government-appointed trustees will be responsible for maintaining the services and ultimately supervising the liquidation and disposal of the assets.

A tentative figure of £11¼ million was being canvassed a year ago as a likely amount of compensation for the interests of Anglo-Argentine Trams in the corporation. But conceivably the Argentine Government may feel that events have moved in their favour in the meantime. The finances of the Corporation have indeed gone from bad to worse as a result of increased costs, uneconomical working and the compulsory maintenance of a low uniform tariff; the resulting deficit has in fact been financed by the Argentine Government to an extent which cannot be far short of the Corporation's permanent capital. What value then is to be placed on the interests of Anglo-Argentine Trams in the Corporation? They appear in the balance sheet of the company at December 31, 1947, at a book value of £19,585,110 out of total assets of £20,711,413. Obviously the company's claim to adequate compensation will need to be vigorously pursued if it (and the sterling interests in Buenos Aires Lacroze Trams, City of Buenos Aires Trams and Buenos Aires Town and Docks Tramways which will also be involved) is not to be victimised.

Shorter Notes

The Union Corporation has notified Urawira Minerals, Limited,, that it has decided not to exercise its option on 400,000 shares in the company and to resign from its appointment of technical managers of the property. In March, 1947, Union Corporation exercised an option on 300,000 shares in the company. This decision follows the failure to discover an ore body on the property in Tanganyika which would justify large-scale mining and mining operations. Urawira Minerals have sufficient funds in hand to continue the development of the Mukwamba ore body for the next 18 months, and will erect a mill with a capacity of 100 tons daily. The construction of a railway branch line costing £1,000,000 to the mine at Mpanda is being financed by the Tanganyika Government. Considerable progress has already been made with the railway.

★

The Board of Trade has now decided to take the first full census of distribution early in 1950. The information to be collected will relate to 1949. It will be compulsory for wholesalers, retailers and certain other services as shoe repairers and hairdressers to provide all data required. Opposition to the census has again been voiced at the autumn conference of the National Chamber of Trade, which urged the President of the Board of Trade to reconsider his decision.

★

Production of deep mined and open cast coal in the latest week has risen by 72,600 tons to 4,125,600 tons. Coal production during the corresponding week last year was 3,897,700 tons. The rise in production shows the usual seasonal recovery after the holiday period, but still leaves weekly production of deep mined coal below the level to ensure the 1948 target of 200 million tons. On present indications, and unless there is a major improvement in output, production of deep mined coal may fall 2 or 3 million tons short of the target of 200 million. Open cast coal promises to exceed the 11 million tons target by about 1 million tons.

On September 24th applications for bills to be paid on Tuesday, Wednesday, Thursday and Saturday were accepted as to about 52 per cent of the amount applied for at £99 17s. 5d. and applications at higher prices were accepted in full. Application for bills to be paid on Monday and Friday at £99 17s. 6d. and above were accepted in full. £180 million (maximum) of Treasury bills are being offered for October 1st. For the week ended October 2nd the Banks will be asked for Treasury deposits to the amount of £170 million (maximum).

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'c'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). *(a) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield.* * Assumed average life 15 years 6 months.

Established over 80 years

BANK of NEW ZEALAND
Incorporated with limited liability in New Zealand

Represented at over 260 points in New Zealand and at Melbourne, Victoria; Sydney, New South Wales; Suva, Fiji; Apia, Samoa.

London Office: 1, Queen Victoria St., E.C.4. O. M. Samuel, Manager.

Head Office: WELLINGTON, N.Z
P. L. Porter, General Manager

NATIONAL BANK OF EGYPT
Incorporated in Egypt. Liability of Members is Limited.
Head Office - - - CAIRO
Commercial Register No. 1 Cairo.

FULLY PAID CAPITAL - - £3,000,000
RESERVE FUND - - - £3,000,000

London Office:
6 & 7 King William Street, E.C.4.
Branches in all the Principal Towns in EGYPT and the SUDAN

NEW BUSINESS CONTACTS IN CANADA

We are prepared to give practical help and guidance to British business men in establishing new trade connections in Canada

ENQUIRIES WELCOMED

THE CANADIAN BANK OF COMMERCE
(Incorporated in Canada in 1867 with Limited Liability)
2, LOMBARD STREET, LONDON, E.C.3.
Head Office: TORONTO, CANADA

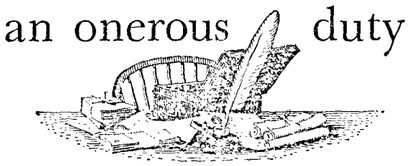
UNIVERSITY OF OXFORD
AGRICULTURAL ECONOMICS.

RESEARCH INSTITUTE requires immediately an economic statistician or economist for investigations in economic and social relations between agriculture and industry. Particulars from Secretary (Parks Road, Oxford).

A MATURE business man, age 40 to 50, with wide management experience, who desires a new interesting and profitable field of activity, can find a unique opportunity with a Professional Organisation of standing. The essential qualifications are: First-class health, abundant energy, a good tactical and social sense, and familiarity with the structure of industry. Early interviews will be arranged with suitable applicants who send, in confidence, full particulars of education, career to date and views for the future as to present and eventual remuneration.—Box 837.

New Business Contacts

With its wide network of Branches, The Union Bank of Australia is able to give the fullest assistance to those seeking to establish new business relationships in Australasia. If desired, visitors so interested will be put in touch with importers and exporters of standing.



Full information is available on all aspects of industrial, commercial and social conditions throughout Australia and New Zealand.

Head Office: 71, CORNHILL, LONDON, E.C.3.

Branches throughout Australia and New Zealand.

The UNION BANK OF AUSTRALIA LIMITED
Established 1837

Relief from an onerous duty

A friend who agrees to act as executor or trustee may find the duties more onerous than expected. The appointment of Lloyds Bank secures the services of experts without losing the human understanding expected from friends. Before making a will or creating a trust, ask the Manager of any Branch of Lloyds Bank for details of these services.

LLOYDS BANK LIMITED
HEAD OFFICE: 71, Lombard Street, London, E.C.3.

What is the Commonwealth?

ON Monday next the Prime Ministers of the Commonwealth, or their deputies, will assemble in conference in London. The agenda they have set themselves is an important one. It covers the problems of Europe and South East Asia, defence, the effect of Western Union upon the Commonwealth, and the economic and financial relationship of the Commonwealth nations to each other and to the world. But the public has been warned to expect nothing very definite from the conference. It will be merely "an exchange of views." It will not tackle any problem which will arouse controversy among the participants. It will not bind any of the delegates to decisions which might need ratification by the sovereign legislatures of the nations taking part. With the staggering, across the Channel, beneath its load of insoluble problems, with the prospects of European union hardly out of the talking stage, there has been an excess of caution in warning the world not to expect very much from the oldest and hitherto the most successful international system. Must it be assumed that the framework upon which the British Commonwealth is built is now so strained that only the lightest of burdens can be rested on it?

One has only to consider the diverse and even contrary interests of the delegates to realise the difficulties that would lie in the way of any attempt to reach formal conclusions. Mr Mackenzie King, from Canada, crowns by his attendance a long career of opposition to any formal machinery of Commonwealth action or consultation. Dr Evatt, for Australia, represents a country unalterably hostile to the immigration of Asiatics, who people the three new Dominions of India, Pakistan and Ceylon. Mr Eric Louw, for South Africa, speaks for a government which has just embarked on a policy of racial oppression, which is incompatible with the ideals of the Commonwealth. Mr Liaquat Ali Khan and Pandit Nehru are the Prime Ministers of two Dominions which are unofficially at war with each other, while the latter is the heir to a traditional quarrel with South Africa.

This is a very different situation from the seemingly stable world of 1926, when Britain and the Dominions agreed that they were free and autonomous nations and launched themselves into a formal interdependence upon a wave of rosy self-congratulation. Even then, there were obvious divergences of interest among the nations, but their connection with Britain and the crown, their common parliamentary, administrative and legal tradition, and their preponderantly British populations, made it possible to achieve a great deal of agreement and common action. In the succeeding years, the Commonwealth did work. The Ottawa Conference, whatever might be thought about the policy there pursued, was a considerable achievement in the technique of common action. And the outbreak of war proved in 1939, as it had done in 1914, that the absence of formal ties did not mean an absence of coherence on major issues. Differences certainly existed within the prewar Commonwealth, but if they could not be settled they could at least be discussed by men who subscribed to the same rules and who were prepared to accept roughly the same obligations. Even Eire could be regarded as

the exception which proved the rule. There was, in those days, a great deal to be said for the Mackenzie King view of the Commonwealth, that it was a free association of likeminded nations, improved rather than hampered by the lack of formal organisation.

The different situation that the Commonwealth now faces does not arise out of any fundamental change in the relations between the United Kingdom and the four "old" Dominions. The efforts of the war gave all of them, in greater or less degree, an enhanced feeling of independent nationhood—but it also taught unmistakable lessons of interdependence. The ideas of the Statute of Westminster have stood the test of experience as between the original parties to the Statute. What creates the new situation is the acceptance into the Commonwealth, as full Dominions, of three Asiatic countries, with the promise of more to follow in future.

Whether this policy has been pursued as the result of deep deliberation in Whitehall it is impossible to say. So far as unofficial observers can tell, however, it has been more instinctive than deliberate. British policy has always repudiated any antithesis between Commonwealth and Empire; its theory has been one of steady progression from complete dependence at one end to Dominion status at the other. If India, Pakistan and Ceylon had reached the stage of being entrusted with complete responsibility for their own affairs—why, then, of course it was in Britain's interest, and in theirs, that they should remain within the Commonwealth.

Nobody—to judge by appearances—stopped to inquire what effects their admission would have on the Commonwealth. Yet even if these Asiatic Dominions were willing to enter on exactly the same terms as Canada and Australia, their presence would inevitably make a great change to the practices of the Commonwealth. What has hitherto held the Commonwealth together, in the absence of formal ties, has been common traditions, common instincts, common loyalties—all that is involved when one people regards another as its own kith and kin. None of these links exist between the Indians, the Pakistanis, the Ceylonese and the people of the other Dominions. The "old" Commonwealth could be an effective unity without formal organisation; the new hardly can. In the "old" Commonwealth, the partners could be relied on to understand each other without formal treaties; in the new it will be difficult to be sure that anything is understood unless it is put down on paper.

Moreover, it is becoming clear that the new Dominions will not be prepared to stay in the Commonwealth on the same terms as the "old." India, for example, wishes to be a republic, and probably all the Asiatic Dominions will demand an independent national status for their citizens. These wishes might have been resisted if they did not happen to fit in with another of the instinctive beliefs that has grown up about the Commonwealth's structure, that the looser the Commonwealth became the stronger it would be. So there has been a tendency to say that if the common allegiance to the Crown is a stumbling block to the new Dominions remaining within the Commonwealth, it can be dispensed with, and that if objection is taken to the word "British," it can be removed. But the argument that looseness of structure and absence of obligation are positive blessings is another example of a doctrine that may have been true in the past, as between the "old" Dominions, but can hardly be projected into an entirely different situation. No one would cling to the Crown and to common citizenship merely as symbols if their removal sustained some reality. But if the Crown and common citizenship go, exactly what is left of the Commonwealth? And if the obligations of Commonwealth membership are non-existent, what exactly is the justification of making sacrifices to keep India in? Just how would relations between the United Kingdom and India differ if India followed Burma right out of the Commonwealth? And in whittling down the concept of the Commonwealth to keep India in, how much of the intimacy of contact and consultation between the United Kingdom and the "old" Dominions is being lost? To be quite specific, do the Dominion Governments, now that there are seven of them, get all the secret telegrams that they used to get when there were only four? And if not, is not something real being sacrificed for benefits that it would be hard to define?

These questions are not asked with the intention of suggesting that the answers are self-evident. They may have been thought out, and satisfactorily answered, in Downing Street. But they ought also to be publicly asked and publicly answered. Nor is it intended to suggest that the idea of an expanding Commonwealth should be abandoned. To evolve a system by which the Commonwealth could include nations of diverse races and traditions would be an achievement far surpassing any in the political history of the British race. But if it is to be successful it will be necessary to be very clear about the purpose for which the Commonwealth exists. It cannot be done by simply projecting into the future ideas that were evolved to meet a much simpler problem. While it was made up entirely of British nations, a certain vagueness was permissible, since the members could be relied on to react in much the same way in any situation and were by nature striving for much the same ends. If, however, it is to contain nations with different aspirations and a different political tradition, it is highly unfair to ask them to obey rules of which they are not conscious.

*

Perhaps the first step towards clarification should be to make articulate what have hitherto been the vaguely understood obligations of membership in the Commonwealth. Quite simply, they could be reduced to six rules. First, an acceptance of the rules of international law and a willingness to settle disputes with other members of the Commonwealth by discussion, conciliation or arbitration. Second, a respect for racial minorities. Third, a readiness to pursue on the world stage foreign policies that move on parallel or converging lines. Fourth, a willingness to undertake defensive commitments in accordance with a policy worked out by and for the whole Commonwealth. Fifth, an undertaking not to pursue unilateral economic policies without regard for their effect upon the other nations of the Commonwealth. Sixth, a willingness to permit the movement of citizens of any part of the Commonwealth over the whole of it, if not without restraint, at least with a minimum of regulation.

It would be going far too far to ask the Dominions—and the United Kingdom—to sign these principles on the dotted line and abide by them under penalty of expulsion. But each member of the Commonwealth ought to ask itself how many of *these principles* it accepts. If there is any Dominion that cannot accept most of them, then it and the other members ought to ask what it is doing in the Commonwealth. And though nothing would be more calculated to disrupt the Commonwealth than to suggest two classes of Dominions, or anything but complete equality of status among all the Dominions, it would be reasonable to draw the conclusion that consultation should be much closer among those members who accept all the obligations than it can be among those who reject some. This would be the means whereby some members of the Commonwealth could be freed of what they regard as irksome obligations, without the existing ties between other members being thereby weakened.

These ideas are vague. But it is by their exploration and elaboration, it is suggested, that the next stage in the development of the Commonwealth can be entered upon. It is not only, or even mainly, in this island that ideas need to be clarified. Britain did not create the British Commonwealth. It is the work of the British Dominions, the practical expression of the idealism of Macdonald, Laurier, Deakin, Botha and Smuts, men who saw how independence could be reconciled with membership of an international group. At every step in its development Britain has gone no further than the Dominions were prepared to go. But the United Kingdom is still the most powerful and the most experienced member nation. Its connections are world-wide and only it embraces the particular interests of all the other nations. London cannot abandon the position of leadership, although it can no longer shoulder all the burdens. Equally, however, it cannot effectively wield that leadership, if every action that calls for a sacrifice of independent action is regarded as a Macchiavellian threat or a revival of the imperialism of Joseph Chamberlain. The Commonwealth countries have need of each other as never before. The interdefence of Britain and Canada, of New Zealand and Australia has never been more obvious. But the old safe world in which the "loose connection" flourished no longer exists, and unless the Commonwealth revises the standard of conduct and co-operation which it expects from its members, it will become merely a sentimental fiction. There is no virtue in mere size—"the larger the assembly of sheep, the more it appeals to the wolves." A sprawling collection of nations with no common obligations, with no co-ordinated line of action in world affairs, and at odds with each other makes up an international system which is a travesty of the word Commonwealth.

"Push, Prod and Encourage"

BY virtually unanimous report, the American Presidential election is taking a course that will put Governor Dewey into the White House on January 20th next. This prospect is laying a self-conscious mantle of statesmanship over his campaign speeches, and by the same token it lends them an unusual importance. What a candidate says on the hustings is usually a poor guide to what a President will do in office. But Mr Dewey has no need, this year, of demagogy, and he is carefully advised by men who, at least so far as foreign policy is concerned, are well informed about the true state of affairs. The world would do well to listen to what he has to say.

His chief speech on foreign policy was that delivered at Salt Lake City on September 30th. In the main, it should bring deep satisfaction to anxious European listeners. Not only were the main outlines of the Truman-Marshall policies specifically endorsed, with less of the detailed fault-finding than *might* have been expected from, and forgiven in, a Republican candidate; it was also easy to detect, between the lines, a willingness to go further and to supplement economic aid to Europe with the promise of military support. So far, so very good. But there was one sentence which inevitably makes the European listener sit up with a start. This was the statement that "We shall use [the programme of aid to Europe] as the means for pushing, prodding and encouraging the nations of western Europe towards the goal of European union." National pride is a strong and a sensitive emotion, and there must have been many people in western Europe—even among those who hope for a really effective western Association — who felt their hackles rise on reading words so blunt. But there is really no reason why the reaction need be one of indignation or of suspicion. It is difficult to find in history a case of an effective union of separate sovereignties being achieved except in the presence of some outside pressure or incentive, and a pressure such as Governor Dewey suggests, which is accompanied by much assistance in the present and the promise of more to come, is infinitely to be preferred to the alternative compulsion of fear, the results of which may be more spectacular at the moment but are likely to be repented of more quickly. When the record of Marshall aid is impartially surveyed, it is easier to criticise the Americans for too easily accepting the inviolability of European sovereignty than for too much prodding.

Those who have the cause of Western Union at heart will therefore hope that Governor Dewey means what he says. There are, nevertheless, certain reservations and cautions which may be suggested to him and his advisers when he enters on the course of "pushing, prodding and encouraging." There are good and bad ways even of doing good and even a nation as strong and as rich as the United States will find its task easier if the susceptibilities of European pride are enlisted on its behalf rather than mobilised to resist it, as the Communists will miss no opportunity of doing. "Talking tough" always gets a statesman credit in his own country, and nowhere more so than in the United States; but Mr Dewey might well find that the support it lost him in Europe would prove to be far more vital to his purpose than any he gained in America. Most of those who quote Theodore Roosevelt's injunction to "speak softly and carry a big stick" forget the first half of it. The nations of western Europe are sufficiently conscious of what they stand to lose by any dissociation from the United States that it is unnecessary to labour the point; they are very ready to respond to soft speech.

No one in Europe has any right to complain if conditions are attached to American generosity. But the response will depend on whether or not the conditions are possible of attainment. That was the trouble about the terms that were attached to the dollar credit to Britain in 1945—not that conditions were attached, but that those which were attached proved to be quite unworkable and in one particular at least—that of the convertibility of the pound sterling—actually led to some retreat from the objects they were intended to advance. The difference between the loan conditions and the Marshall conditions—between 1945 and 1947—is that the Marshall conditions are eminently reasonable and realistic in principle. But they still need to be reasonable and realistic in their detailed application if they are not to finish, as the loan conditions did, by making things worse. In pushing, prodding and encouraging the western European nations towards unity, Mr Dewey should beware of asking them, at any stage, to do anything that appears to them plainly impossible, however it may appear to him. Moreover, "possible" means not ideally possible, but politically possible. Let American politicians ask themselves what they would find it politically possible to do, in the United States, in the way of the relaxation of tariff barriers and immigration restrictions, the pooling of sovereignties, of citizenship, of defence plans—and let them not ask their fellow politicians in Europe to do very much more, or to do it very much more quickly.

Perhaps the best service that the devotees of Western Union can now render to the cause is to work out in detail some of these possibilities. The best answer that those who complain of unreasonable American pressures can make is to work out a practically possible time-table. There are, in fact, several practical choices to be made and the sooner they are brought out into the open the better. For example, it seems natural for Americans to express their ultimate aim (as Mr Dewey did at Salt Lake City) as the United States of Europe and to describe the process of arriving at it as that of federation. These expressions are second nature to Americans, and they are also often

on the lips of an active federalist movement in Europe. If the words are meant loosely, all is well. But if "federation" is defined strictly, and if what is aimed at is the creation in western Europe of a federal government deriving its powers directly from the peoples, independently of the national governments—which inevitably means, at least in part, in opposition to them—then it is time to pause. It is conceivable that a western European federal government, in this strict sense, if it could be created, would be far firmer and more stable than any other. But what is certain is that it would take far longer to create. If the Americans—and the European devotees of Western Union—want quick results, they will be well advised to work through the national governments and not to lend their support to movements that are bound to antagonise them.

Another very similar distinction needs to be made between the possibilities of action in the economic and politico-strategic spheres. It is one of the favourite fallacies of the age that intractable political problems can be solved by economic means, that if people can only be made well fed and kept fully employed, they will cease to be nationalistic and warlike and will settle down in federal harmony. It must be confessed that there is more than a trace of this fallacy in the original Marshall idea. But unfortunately it *is* a fallacy, and progress in forming an economic union of western Europe now waits upon political consolidation, not the other way round. There are two main reasons for saying this. The first lies in the nature of the problem. Economic structures cannot be radically changed overnight. The heads of a great international business, operating in every one of the OEEC countries, were recently asked what the effect on their business would be if the trumpet were suddenly to sound and every existing obstruction to trade and finance within western Europe were to disappear. The answer was, in substance, that it would make very little difference to their current operations—since the national productive units and the national channels of trade existed, it would almost certainly be most economical to go on using them—but that it would make a great difference to the programme of future development. What is true of one business is true of the whole area. A whole industry in one country may be uneconomic. But that does not mean that it can be swept away—such things cannot be done in a democracy in the twentieth century, on either side of the Atlantic. What can be done is to see that the future growth is placed elsewhere. It follows that the process of economic unification, even in ideal conditions, must necessarily be one of gradual growing together. Quick results are not to be expected.

The second reason why politics must precede economics is that almost every economic decision is influenced by considerations of national security in time of war. Until Governments are absolutely certain that, in any future war, western Europe will fight, and will be defended, as a single whole, they cannot abandon their responsibility for making each of their nations, separately and individually, as strong as possible.

The beginning must be made on the political plane, not on the economic. It must be made between the governments, not between the legislatures or the electorates. That is why what has been done by the parties to the Brussels Pact (where accusations of "dragging feet," if they can be made at all, do not lie against the British) represent sounder progress towards the ideal of Western Union than anything that can be expected on the economic plane at Paris.

The purpose for which these points are made should not be misunderstood. This journal was one of the earliest and has been one of the most persistent advocates of a closer association of the western European nations. The series of articles in support of the idea that have appeared in these columns goes back to the middle of the war—to a time when (it is perhaps pertinent to recall) the chief obstacle to its progress lay in the rooted objection of official and private American opinion to anything that seemed to contradict another Republican Presidential candidate's dream of "One World." That the salvation of the peoples of western Europe depends upon their achieving political and economic unity we take to be absolute truth. Nor would we delay by a single day the attainment of that objective—indeed, time is cruelly short. But it is difficult to think of a branch of public policy where the pursuit of the theoretically perfect is more likely to impede the attainment of the practically good. We would not have Mr Dewey relax any of his pushing, of his prodding, or of his encouragement. We pray that he may have the wisdom not to push and prod at large, but in the directions where he can achieve most, and most quickly.

Agricultural Policy

AT present, the main issues of agricultural policy are dormant. Both major political parties—the Conservatives even more than Labour—are committed to an all-out programme of agricultural expansion, and although their policies for achieving this end are crude, and their hopes of doing so uncertain, the testing time has not yet arrived. Thanks in part to increased supplies of feeding-stuffs, progress over the last year towards the agricultural targets has been moderate but not strikingly good. This year's harvest, which earlier in the season promised bumper crops, suffered some setback from the weather in July, although in some areas much leeway has been recovered since then. The yields of the major crops are actually very well above average, even if an appreciable proportion of oats and barley, is in poor condition. Since a higher acreage was under cereals than for several years past, the final result in quantitative terms may be quite impressive. The potato crop may be a record one, and sugar-beet has come on well in the last month's sunshine. For the country as a whole, as opposed to certain unlucky districts, the harvest should prove on balance a good one. The farmers' chief complaint is that harvesting costs have been unusually high.

However, it will be during the next two years that the farmers' readiness to expand production will really be put to the test. The incentive to do so was provided a year ago by the Government in the form of a considerable all-round increase in the schedule of guaranteed prices. It is not impossible, however, that the farmers will ask for more incentives of the same sort in their annual negotiating contest with the Ministry of Agriculture, which starts in a few months' time. It can be argued that costs have risen and next month is likely to see the presentation of a new claim from the agricultural workers. From the viewpoint of the whole national economy, clearly no time could be less appropriate for fresh demands to be made on the public purse.

Thus, although the agricultural barometer is for the moment set steady, there is every prospect of squalls ahead. Now is the right time for a general overhaul of the nation's agricultural policy so that the industry can ride successfully through the crucial period of the next few years. There is, however, little evidence of heart-searching in either official or farming circles. Politicians vie with each other in condemning the shameful past treatment of British agriculture, and in making lavish promises for the future. The trouble with this sort of talk, as at least the farmers know, is that it can change overnight once the cost of implementing the words becomes insupportable to the taxpayer. The farmers, for their part, alternate between the assumption that the guarantees given by the Agriculture Act will continue to be interpreted strictly according to their own specifications and the completely opposite suspicion that they will be dishonoured altogether.

Both the politicians' and the farmers' attitude ignore the realities of the situation. The two aims of British agricultural policy—that of growing considerably more food at home and that of ensuring to the industry a permanent measure of stability—are now widely accepted. The actual targets set by the Government, and the larger and vaguer speculations in the Conservative party's Agricultural Charter, may very well be over-ambitious, but the general desirability, for a dollar-starved, payments-ridden economy, of an increase in the home production of food is not open to question. Again, it may be that stability is now being conferred on the industry in a way that creates too much rigidity and too little incentive to greater efforts; but stability is none the less a necessary objective for an industry which is peculiarly susceptible to market fluctuations and vital to the whole economy. The point is, however, that these two aims constitute not the end but only the beginning of policy-making. Their very realisation over a period of time depends on ensuring that the large, protected agriculture which they envisage does not press too heavily on the rest of the economy. More bluntly, it requires that the cost of providing the farmers with guaranteed prices and assured markets shall not be higher than the taxpayer and the consumer between them are able and willing to shoulder. The proper application of this criterion has been softened since the end of the war by the scarcity and high price of imported food, and by the need to stimulate domestic production at almost any cost. But the situation will certainly change over the next few years, and is already beginning to do so.

If it is to do so, now is the time to prepare, for already there are signs of a breeze springing up. The general level of import prices, it is true, has continued obstinately upwards, although the bumper American harvests this year may be the means of reversing the trend; but it is very likely (barring war) that import prices will begin to fall during the next few years, although no one can say whether the fall will be a large or small one. At home, rising production, in so far as it materialises, may actually bring about an occasional surplus in some commodities, such as eggs and potatoes, even though demand continues to be inflated by enormous food subsidies. Were the food subsidies to be selectively reduced—and one day the case may become too strong for the Government to resist—derationing of some foods might quickly become possible. If it be assumed, on the other hand, that the cost of food to the consumer continues to be pegged at its present level, it will be vital to keep down the cost of food subsidies, which have become both absolutely greater and relatively more burdensome than ever before. In these circumstances, the Government will find it awkward to have to buy food in a dear home market, if there is a cheaper overseas one available—as in increasing measure there may be. Under either set of contingencies, home-produced food may gradually come to appear embarrassingly costly—either to the consumer who will have difficulty in affording it in sufficient quantities, or else to the taxpayer who will grudge shouldering permanently so heavy a burden after the worst of the food shortage is over.

*

The danger of this situation arising springs from the extreme rigidity of the prices guaranteed to the British farmer. They can only move easily in one direction—upwards. Prices are settled at the annual review mainly from an analysis of the profitability of various types of farming, adjusted by reference to the cost structure of the individual commodities. Insufficient attention is given to the probable price movements of individual imported foodstuffs considered in conjunction with their availability. Still less attention is paid to the future trend of consumer demand and of individual tastes (admittedly hard to ascertain in present circumstances). The effect of basing prices primarily on financial returns is to lessen the resistance to the rising spiral of costs in general, and the wage level in particular. Moreover, the data considered at the review now include an index of farming profitability in relation to the income of other rural workers, thus further tying the Ministry to a duty of making farming pay rather than of paying farmers what the nation can afford.

These remarks do not amount to a contention that farmers as a class are grossly overpaid. Some of them may be. It is an inevitable corollary of a system that bases prices on average costs (especially when this has come to mean in practice costs that are a good deal above the average) that the really efficient or fortunately located farmer gets high profits. The averagely efficient small farmer, though he is far better off than he was before the war, gets no more than a satisfactory real income for his exertions. The contention simply is that an industry whose remuneration is handed out by the Government on a mainly cost-plus basis leads a dangerously sheltered life. It is unresponsive alike to the changing conditions of world markets, from which it is effectively insulated, and to the changing needs of the national economy, which are expected to follow rather than to lead its internal requirements.

The next few years, however, will force British agriculture out of its shell. No other nation protects its agriculture so thoroughly, and as the tide of inflation recedes all round the world this fact may become unpleasantly plain if high farm prices remain here. At the same time, the need for internal economy—for cutting costs and for reducing

Government expenditure—is getting too strong to be gainsaid. British agriculture cannot be permanently insulated from these changing circumstances. The only question is whether its adjustment will be gradual and harmonious, and carried out in a way which preserves its stability and facilitates its expansion, or whether it will be sudden and unpleasant, involving the modification or postponement of its main objectives. The phase of production at any cost is definitely over. Even the programme of agricultural expansion will not be pursued if its cost becomes excessive; and even the guarantee of assured prices and markets may one day be dishonoured if its interpretation is too exacting.

The farmers would do well to think twice before asking for higher prices in such unpropitious circumstances. It is very much in their interest to make the Agriculture Act work successfully, and the way to do this is to pursue their rights under it with moderation and adaptability. This is the more necessary since it is now quite clear that the coercive powers which the Act provides are being used with great moderation. Even the farmers' fears of wholesale dispossessions and of "farming from Whitehall" are gradually receding. They never, of course, had much foundation. This means, however, that the price-fixing mechanism must act as the main instrument for raising efficiency as well as for ensuring stability, and for guiding production as well as for stimulating it when necessary. It is the channel for interpreting the nation's needs to the farmers, as well as for satisfying the farmers' requirements. Therefore, to bind this mechanism closely to a costings formula is to prevent it from fulfilling a vital half of its function.

The present method of fixing farm prices primarily by reference to farming profitability rests only on convention and is not written into the Agriculture Act itself, which carefully enables the guarantee to agriculture to be fulfilled in a wide variety of ways—for instance, by the payment of an annual subsidy, varying with the quantity of a commodity produced, instead of by the fixing of prices. So far, the ingenuity of the draftsmen has been put to no use. It is time the Government took a stand against this unsatisfactory convention which every year it has allowed to get more rigid and more firmly entrenched. To do so will not mean immediate drastic changes. The Government's powers of limiting the quantities of any commodity for which the guaranteed price will be paid might profitably be used soon in one or two cases—for instance, to establish a larger riddle for potatoes for which the guaranteed price is payable. Generally speaking, however, the nation still needs all the food it can get. The main principle for the Government immediately to establish is that other factors besides farmers' costs (interpreted in a somewhat favourable way), and, in particular, the cost and availability of overseas supplies, the needs of consumers, and the exigencies of the national economy, are given their full weight in determining the guaranteed price schedules. This does not mean that farmers' costings should be ignored or that they should be given a raw deal in any way. On the contrary, to make the Government guarantee to agriculture more flexible and more productive of farming efficiency is the one sure way of stopping the risk that it may one day break down.

One Year of the Cominform

TO single out one year of Soviet Russia's relations with its satellite states and Communist parties is, in a sense, misleading, for it may suggest that the year is in some way different from all preceding years and that Soviet policy during that period underwent some striking change. This is not, in fact, the case. Ever since foreign Communist parties lost their last vestiges of independence from Moscow—somewhere at the beginning of Stalin's ascendancy, say, in 1928—one principle and one alone has guided the policies of nations and groups which accept Russia's spiritual overlordship. It is that the defence of the Soviet Union by the exact methods laid down by the Soviet Union is the sole *raison d'être* of a Communist government, party or individual member. As Dimitrov, the prewar head of the Comintern, put it in defending the Nazi-Soviet Pact of 1939:

> The historical dividing line between the forces of fascism, war and capitalism on the one hand and the forces of peace, democracy and socialism on the other hand is in fact becoming . . . not the formal attitude towards Soviet power and socialism in general, but the attitude to the Soviet Union which has been carrying on a real existence for the last twenty years.

Dimitrov's definition might have been written yesterday. There is now, as there always was, only one loyalty in the Communist Party—to the interests of the Soviet State as interpreted by the Soviet Communist Party.

The foundation of the Cominform on October 5, 1947, should not, therefore, be thought to denote any profound change in Soviet foreign policy; but it did mark a definite change in tactics. From 1945 to 1947, the Russians pursued what might almost be called a leisurely policy in Europe. It is true that they secured Communist predominance in the states occupied by the Red Army and had succeeded in suppressing the remnants of German Social Democracy in their own zone before Easter, 1946. But in general they permitted "bourgeois elements" to survive in the various governments of eastern Europe; and though the Communist members of western coalition governments were troublesome, they were not entirely obstructive. It may be that this relatively mild phase was due to a belief in and a desire for co-operation with the western world. It is equally likely that the slice of Europe bitten off by the Communists needed some mastication before it could be swallowed. It is also likely that the leaders in the Kremlin, gazing into their Marxist horoscope and seeing the stars foretell inevitable depression and slump for the western world, believed not only that time was on their side, but that not much of it would be required.

*

Whatever the explanation, the year 1947 brought this period to an end. The reasons were partly political. Even at its leisurely pace, Russia had swallowed enough of Europe to perturb the western world, and in Germany and Greece the pace was becoming anything but leisurely. Another factor was economic. The plight of western Europe seemed to make the spread of Communism inevitable, and the strongest member of the western world, the United States, woke up to the dangers of letting Europe drift under Soviet domination. The Truman Doctrine—of March, 1947—was limited and confined itself to an area, Greece and Turkey, in which Russian pressure had already become definitely threatening. But the second move—the offer of Marshall aid in June, 1947—affected the whole of Europe. Moreover, since it was made impartially to needy nations on either side of the Iron Curtain, it struck at the core of Soviet influence. The Czechs and the Poles actually accepted the offer before they could be called to heel by their masters in Moscow.

It may well be that this acceptance on the part of the Czech and Polish Governments was the decisive factor in determining the Russian leaders to establish the Cominform. In October, members of eight of the Communist parties of Europe were summoned to Warsaw to confer with the parent Russian party, and there the late General Zhdanov, at that time a secretary of the party and an ex-member of the Comintern, outlined to them the "new historical situation," called on them to set up a new Communist Information Bureau—the Cominform—and laid down for them the methods whereby the interests of the Soviet Union must be defended.

Zhdanov echoed Dimitrov in defining the essence of the new situation. The world was once again divided into "two camps"—

> the imperialist, anti-democratic camp, the principal aim of which is to establish the world domination of American imperialism and to defeat democracy; and the anti-imperialist and democratic camp, the principal aim of which is to undermine imperialism, strengthen democracy and liquidate the remnants of fascism.

In other words, America and the western world were formally outlawed and the Communist parties were called to follow Soviet leadership in defeating, rooting out and destroying the common enemy.

General Zhdanov was perfectly explicit on the means whereby the "western threat" was to be countered. In the first place, the Marshall Plan would be defeated in the West. This part of the strategy fell principally to the lot of the French and Italian Communist parties. They were censured for leaving the coalition governments in France and Italy, since they could have wrecked the Marshall Plan more easily in office than out of it. They must now either attempt to recover political power or by strikes, unrest and local violence to undermine the economic bases of the Plan. These were the marching orders of the western parties.

The second aim of the new strategy was to "close the ranks" in eastern europe. The two years of co-operation with the "bourgeois" and social democratic elements in each eastern country had left some non-Communists in positions of authority, and had also inflated the Communist party itself with new recruits of doubtful ideological purity. Closing the ranks under the direction of the Cominform was therefore to take two forms—the ejection and suppression of all non-Communist elements in government and state, and the purging of the Communist parties themselves to bring them back to the true Lenin-Stalin line—in other words, to total subservience to Moscow.

The third aim of the new campaign was mentioned only briefly by Zhdanov, since it could only be of indirect concern to the Communist parties of Europe. This was the launching of an attack upon "the rear of the capitalist system" by backing and reinforcing local nationalist movements in south-east Asia and in the colonies.

*

This, then, was the triple programme of the Cominform—to undermine the Marshall Plan, to impose total Communist control on eastern Europe and to stir up difficulties in the colonial world—and now that a year has passed since the campaign was launched, some attempt can be made to assess its effectiveness. The first effort—to check and undermine the Marshall Plan—has had only very limited success. In fact, were the Marshall Plan confined to 1948 alone, the Communists, particularly the Communists of France and Italy, would have to admit failure. The Marshall Plan has come into being and the two chief attempts to defeat it before it even began ended in fiasco. Last November, the attempted general strike in France petered out and, as a result, a mass of workers left the *Confédération Générale du Travail* and joined or formed independent unions. In Italy, the April elections which were to have "swept the Left to power" ended in a resounding victory for the Christian Democrats. The Marshall Plan, however, has four years to run and, since the first anniversary of the Cominform has coincided with a new Communist-inspired coal strike in France, it is still too early to say whether the French and Italian Communists have been decisively defeated in their efforts to undermine the economic and political stability of western Europe.

On the second aim—the consolidation of eastern Europe—a similarly hesitant judgment must be passed. On the one hand, a social revolution of major proportions has been forced through. In each eastern European state the remnants of non-Communist rule have been brushed away. The execution of Petkov in Bulgaria, the condemnation of Maniu and the emergence of Anna Pauker in Rumania, the crushing of the Social Democrats in Hungary, Rumania and Bulgaria, the disappearance of the Peasant Party in Poland have all been accomplished and, at the end of February, the most "bourgeois" of all eastern European countries—Czechoslovakia—was forced from one week to the next into the rigid framework of a people's democracy. Today, Communist rule is absolute from one end of the Iron Curtain to the other.

*

At the same time, each country has purged its own Communists, and dropped all pretence of having local Communist interests separate from those of Moscow. Since eastern Europe is still predominantly a peasant area, it is above all in the agricultural field—with the imposition of speedy collectivisation—that the adoption of the Moscow line has been most immediately felt. In each country the change of policy, coupled with the purge within the party, has led to great tension and uneasiness. In Poland, it even ended in a sensational change in party leadership, Mr Gomulka going into semi-disgrace—in spite of recantation—and new power passing to the men of Moscow, President Bierut and Jacob Berman.

Thus it would seem that the policy imposed by Moscow has had reasonable success. It has, however, also led to the worst and most damaging defeat yet inflicted on Russian leadership. One man could not tolerate the process of *Gleichschaltung*: Marshal Tito's revolt, which earned him expulsion from the Cominform and has left him as the lonely challenger of Russian overlordship in the Communist world, did more damage to Moscow than any failure in non-Communist territory could ever do. His opposition proved that Russian hegemony can be unbearable even to convinced and devoted Marxists and that Soviet imperial control cannot automatically crush out of existence all local differences and revolts: instead of consolidating eastern Europe, the Cominform has succeeded in producing a deep and undisguisable split.

The third point in the Russian programme—the anti-western offensive in the Far East—has now been proceeding for some six months and no judgment of final success or failure can yet be hazarded. But the immediate aim of diverting western attention and resources eastwards and of disrupting Far Eastern production has at least been partially realised, and it is no use disguising the fact that it is among these backward colonial peoples that the Soviet Union is likely to find its most fervent recruits.

One salient fact surely emerges from the record of 1948. It is that the Cominform, like Mr Molotov's diplomacy or Mr Vyshinsky's rhetoric, has had in reality an effect exactly opposite to that intended by its Russian instigators. The aim was to defend the vital interests of the Soviet Union, to weaken and divide its enemies, and to safeguard it against the risk of war. But instead of dividing Russia's enemies, it has united them. Instead of lulling them, it has roused them. Instead of disarming them, it has driven them reluctantly to consider the possibility of war. For one year's work of a body founded solely to safeguard the security of the Soviet Union, this is surely a very momentous and quite disastrous result.

NOTES OF THE WEEK

Berlin: No Change

From the first day of the blockade in Berlin, the Russians have made no secret of their purpose in imposing it. They have sought, by means of its pressure, to compel the western Powers in the first place to postpone or abandon their plans for a government in western Germany and for drastic economic reorganisation—including the reform of the currency—and in the second place, to bring the whole question of Germany's future back to the Conference table of the four Foreign Ministers. Such was the plan four months ago. It has not changed today—as Marshal Sokolovsky, Mr Molotov and Mr Vyshinsky have all reminded the west this week.

Both Marshal Sokolovsky in a press interview in Berlin and Mr Molotov in a formal Note from Moscow have offered to reopen the talks on Berlin. Mr Molotov has even hinted that the point upon which the talks broke down—the Soviet claim to control all future air traffic with Berlin—might be modified and control limited to the "elimination of currency frauds." Nevertheless, Marshal Sokolovsky let it be understood that the renewal of talks would reach a positive conclusion—the raising of the blockade—only if the western Powers agreed to reconvene the Council of Foreign Ministers.

This point was taken up vigorously in Paris by Mr Vyshinsky in his attempt to convince the Security Council that the Berlin crisis lies outside its competence. He maintained that, according to Article 107 of the Charter, matters concerning enemy countries must be referred to the Foreign Ministers' Council and that, in attempting to bring Berlin before the Security Council, the western Powers were acting in violation of international law. The only correct course, Mr Vyshinsky argued, would be to reconvene the Council and refer to it not Berlin only but the problem of Germany as a whole.

The western Powers have naturally refused to defer reference of the dispute to the United Nations and by 9 votes to 2 the Security Council has been seized of the issue. Yet it is difficult to see how its deliberations can change the situation. Too much importance need not be given to the idea of a truce during which both parties would mark time and try to reach an agreed settlement for all Germany. The value of Uno's intervention lies in the fact that any "incident" arising out of the Berlin situation will now come to the notice of the Security Council before national feelings can be exasperated to the point of violence.

* * *

Vyshinsky and the Atom

Precious days which might have been spent in working out a settlement for Palestine have been wasted by the Political Committee of the United Nations Assembly in repeating the familiar debate about the control of atomic energy. The Americans and Canadians began it by proposing adoption of the reports which embody two years' work by the Atomic Energy Commission. This would have meant that the Assembly gave its authority to the largely American proposals for control and inspection agreed to by a majority of the Commission, but opposed by a Russian-led minority.

A swift end to Russian attempts to postpone any such decision seemed in sight. So on Saturday Mr Vyshinsky performed not a somersault but a handstand: he suddenly gave up his previous insistence that atomic weapons must be destroyed and banned before any control system is agreed and established. He asked that the Atomic Energy Commission should prepare simultaneously two draft conventions, one for the "prohibition of atomic weapons" and the other for the "establishment of effective international control over atomic energy." The wording is vague, but the proposals may be regarded as a concession from Moscow, provided it is not forgotten that the three Communist members of the Commission have already held up progress for two years, have shown themselves badly briefed on technical matters, and could quite well spin out convention-drafting over another year.

It should be noticed, too, that bad staff work in the Vyshinsky camp led the Ukrainian Mr Manuilsky to denounce a Belgian suggestion which was intended to soothe the obvious Soviet anxiety about American bomb stocks. It was that a convention on the abolition of weapons and the control of energy should be *concluded* simultaneously. Mr Manuilsky, presumably aware that Mr Vyshinsky had come very close to this in asking for simultaneous *preparation* of two such conventions, attacked the Belgian suggestion as "nothing but sophistry calculated to attain nothing but complete lack of control." Such frivolity—or carelessness—makes it difficult to believe that the Russian proposals are sincere.

Yet Mr Vyshinsky's insistence that the abolition of atomic weapons must come first is understandable and shrewd. He knows it disturbs the consciences of the Americans and their friends. If it were the Soviet Government and not the Americans that had a stock of bombs, there would be a large majority of the Assembly in favour of their immediate destruction. No one wants the weapon to be used but, until they are stronger and better organised, most governments in the west will feel safer for knowing that the Americans have it in reserve. However, by the time it could be displaced by adequate "conventional weapons" the Soviet Government would probably have the bomb too. And so the dilemma goes on.

*

In the present state of American-Soviet relations there seems to be only one way to get atomic energy controls started: it is for the Americans to put into action with Britain, the Commonwealth and the Brussels Powers the main principles of the Lilienthal Report and the Baruch Plan. They should be tried out on a regional basis, over the vast area of territory represented by the North Atlantic group and their overseas allies and possessions. That would at least ensure control of atomic materials over a great portion of the earth. It would give Americans the chance to show how sincere they are in offering to submit their own research and production to international inspection. It would offer opportunities to find out whether international control and inspection are workable, even among governments with a common interest in peace and good will (they are obviously not yet practicable for a government so distrustful and secretive as that of the Soviet Union). It might calm the fears and soothe the consciences of many scientists and statesmen. It might even begin the release of the Soviet rulers from their present fear of facing an angry, impatient America, conscious of a monopoly of power to destroy quickly what it fears.

By east as well as west defence is now being organised regionally. So is economic recovery. There is no reason to suppose that control of atomic energy can yet be organised in any other way.

* * *

Miners Below the Mark

Mr Gaitskell, who called the members of the National Coal Board and the executive of the National Union of Mineworkers together on Thursday to discuss coal production, has to face an increasingly firm prospect that the mines will fall short of their production target for this year. It is doubtful how much can now be done about this, and Mr Gaitskell may well be worrying already more about the effort for 1949 than about the failure in 1948.

It is true that the target of 200 million tons of deep-mined coal for 1948 was once "an absolute minimum," but these things have a way of proving relative after all. The probability now seems to be a deficit of 3,000,000 tons of deep-mined coal, to be partly offset (but only partly, both as to quantity and quality) by an extra 1,000,000 tons of open-cast. Regrettable though this is, it turns out that it can be borne, and without reducing exports, by using up some of the excessive stocks which were left from last winter (and which, it now appears clearly, might just as well have been exported six months ago). But what of next year, when the production target for the mines will be 10 million tons higher than the target which is now being missed, and when exports and foreign bunkers have been fixed at 23 million tons? To meet these commitments will require (whether the coming winter proves mild or sharp) not an occasional spurt but a sustained effort. But they will have to be met if the British coalfields are to return to their proper place in the European economy.

The organisation of a sustained effort for this purpose is, frankly, more important than the reaching or missing of a precise figure for the present calendar year. From this point of view it is less the absenteeism of the moment that matters than the general tendency to rise which absenteeism has displayed over the past few months. It is the general intractability of the productivity

problem despite large investments of machinery and despite all the assaults that have been made on it that causes concern.

This can be diagnosed in London, but it can only be tackled at the pits. The new joint committee which Mr Gaitskell has established will only justify its existence if it sets clear objectives and succeeds in making them mean something to the men in the pits.

* * *

Air Transport Economics

Their appetites whetted by references to various future types of aircraft with inter-planetary speeds of up to 25,000 m.p.h., some enthusiasts may regret the comparative timidity of Mr Peter Masefield's paper* read before the Royal Aeronautical Society last week. Such regrets would be quite misplaced, for by concentrating on the vital economic aspect of air transport, Mr Masefield has done a useful service. "Operating economics are the essence of air transport," he says: a fact that is commonly overlooked by the politician and the technician. Even those who recognise the truth of this statement are themselves frequently handicapped by the lack of satisfactory standards of measurement. Mr Masefield, in an illuminating and well argued paper, attempts to provide some.

Starting with the proposition that air transport, if it is to be fully effective in its essential purpose of providing improved communications, must be safe, swift, regular, frequent and cheap, he examines the main economic factors which must be reconciled to achieve this. The incidental information is apt and interesting. More persons were kicked to death by donkeys in the United States last year, for instance, than were killed in air crashes. The deficit on British civil aviation "for a typical year in the immediate future" is estimated at some £28 million, on an expenditure of £71 million under all heads. In 10 or 12 years, however, Mr Masefield expects it to pay its way.

To reach this happy state progress is necessary in three main directions. Aircraft and engines must be made more reliable. Air traffic control must be improved: not only do 40 per cent of present air fatalities occur during approach and landing—which automatic control would largely remedy—but the inadequacy of the existing system rules out jet air liners as a practical proposition. Thirdly, the business efficiency of the air lines must be increased: on the main lines overheads at present average 40 to 70 per cent of total costs.

In taking advantage of any improvements in these fields it is essential to match, as far as possible, the sizes and types of aircraft to the routes and stages over which they will operate. To do this, satisfactory methods of assessing operating standards are necessary. Mr Masefield makes a great contribution to this problem. Among the unconscionable number of variables which appear when an attempt is made to assess the performance of a particular aeroplane on a particular route, there is only one constant—time. Using a unit of time as his base, he has developed an "Hour Chart," which makes possible a quick and reliable comparison of performances. Operating costs are also treated in a new and more precise way than is provided by the usual division into direct and indirect costs. The fundamental conception is that costs are governed by the hours flown and the number of landings, and that revenue is governed by the miles covered and the load factor achieved. He therefore divides costs into fixed annual costs, hourly cruising costs and take-off and landing costs. The result is a much better analytical method. Various representative aeroplanes, both present and future, are tested by these formulæ. And it is encouraging to note that, on present information, the Airspeed Ambassador and the Bristol Brabazon appear outstanding. Operational experience with these machines may modify the verdict. But the new approach in Mr Masefield's useful paper will be a great help in evaluating the evidence for these and other aircraft.

* * *

De Gaulle's Recipe for France

On October 5th, the first anniversary of the Cominform, the French Communists presented their parent organisation with a birthday present in the shape of a coal strike. Refusing the offer of M. Queuille's Government to raise wages by 15 per cent, the *Confédération Générale du Travail* has declared a strike of indefinite duration in the coal mines; so great is the workers' discontent with the constantly rising standard of living that neither the Socialist *Force Ouvrière* nor the Christian Federation has been able to counter the strike movement—although the Christian unions are seeking to limit it.

The strike is one more alarming symptom of the disintegration of public order and discipline in France. The succession of weak centre Cabinets, the alarming fall in the value of money, rising prices and rising costs have all conspired in recent months to counteract the revival of production and the return to greater political stability which followed the collapse of the general strike last November. After reaching an index of general production of 112 compared with 100 in 1938, the monthly index for August fell back to 100. More ominous still, recent polls have shown that the Communist vote is again rising—a sure sign of disillusion and disgust among the rank and file.

Against this background, General de Gaulle has no very difficult task in attacking in the most violent terms the men of the "Third Force" politically responsible for the present *débâcle*. In his press conference in Paris last week he compared them to "rotten planks" and to men "swimming in dirty water." But the General would carry more conviction if he could give reasonable proof that he is better equipped than the Socialists and the Radicals and the MRP to resolve—within the framework of democratic order—the two fundamental problems of French society. The first of these concerns the Left. How can effective administration be carried on if the mass of the workers give little or no support to their own government and are led by men whose first loyalty is to another state? The second concerns the Right. How can a country's finances be stabilised if the well-to-do consistently avoid the burden of taxation? Both problems might be settled by strong-arm methods—by outlawing Communism and by imprisoning reluctant taxpayers. But would democratic freedom survive the strong arm? This is the dilemma M. Queuille and his followers cannot solve. Could General de Gaulle do better?

It is difficult to believe from his published statements that the General's solutions are compatible with the maintenance of liberty. His identification of "Frenchmen" with the members in his own "Rally," his dismissal of Communists as "separatists," his promise that no strikes or "illegality" would stand in his way if once he were elected, are not reassuring in a century in which dictators have been more easily established than overthrown. As for the economic difficulty—the non-co-operation of the prosperous classes—the General glosses it over. He speaks of reducing state expenditure and of simplifying taxation, but by no hint does he suggest that the burden of French recovery shall be more equitably shared. All this has an ominously familiar ring—strong measures to suppress the Left, the velvet glove over the not very iron fist for the Right. Such has been the universal recipe of dictatorship in the twentieth century. General de Gaulle may have other, more constructive paths in mind. He has yet to prove that this is in fact the case.

* * *

The General's Price

The possibility that the return of General de Gaulle to power may be the signal for authoritarian rule in France was underlined by the General's comments at his press conference on the future

* Fourth British Commonwealth and Empire Lecture. Some Economic Factors in Civil Aviation. By Peter G. Masefield, Director of Long Term Planning and Projects, Ministry of Civil Aviation.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

The Economist Intelligence Unit
22, Ryder Street, St. James's,
London, S.W.1.

of European defence. A pathological sense of national pride and an utter inability to consider national prestige and power in reasonable perspective have been two certain hall marks of dictatorship in this century. Unhappily, General de Gaulle misses almost no opportunity of betraying the presence of both emotions in his conception of France's mission in the world. His recent press conference was no exception. His statement that it was a cockeyed idea (*quelque chose de boiteux*) to defend Europe from London and that the centre of European defence must be France is perhaps geographically and theoretically justifiable. But General de Gaulle, of all men, should know how much better after 1940 the defence of France fared in London than in Paris and, on the morrow of Britain's full entry into the Pact of Western Union, it is more than ungenerous to imply that Britain always thinks of defence in terms only of its own island.

No doubt, General de Gaulle was not making a considered statement on the Western Defence Pact—a military development without parallel in time of peace—but the direction of his thought is only betrayed the more clearly by the fact that the comment was almost an aside. France's associates are warned that a French Government headed by the General will be an exceptionally difficult and intransigent ally. Thus, at a time when many people on both sides of the Channel are beginning to wonder whether General de Gaulle may not after all be the only solution to France's discontents, the General himself has gone out of his way to remind them what a price they may be called upon to pay in return for "Gaullist order."

* * *

Europe's Advance in Production

The general purpose of the European Recovery Programme (ERP) is to put western Europe "back on its feet" by 1951. Several interpretations of this target are possible. If it is taken to mean that industrial production should be restored to at least the prosperity levels of 1937, then in many of the ERP countries that has already been achieved. By the beginning of this year each country's index of general industrial production, with the exception of Belgium and western Germany, was ahead of the prewar base year.

INDEX OF GENERAL INDUSTRIAL PRODUCTION
WESTERN GERMANY (BIZONIA) AND 7 ERP COUNTRIES
(Base 1937=100)

Countries	1946	1947	1948					
			Jan.	Feb.	Mar.	April	May	June
Belgium	72	86	93	92	96	98	95	92
Denmark	101	112	123	125	124	124	123	121
France*	79	95	105	112	112	112	117	115
Netherlands	94	93	103	99	107	106	103	109
Norway	100	115	116	132	128	129	139	138
Sweden	107	108	108	111	112	113	112	112
United Kingdom†	96	100	109	113	109	113	109	114
W. Germany (Bizonia)‡	33	38	44	45	48	50	46	51

* 1938=100. † Adjusted from *Monthly Digest*. ‡ 1936=100.

Figures for the third quarter of this year are not yet available, but it is reported that the increase in the index of Bizonia is striking. Production by the end of August was back to 67 per cent of the 1936 level, undoubtedly a reflection of the currency reform last June.

In Bizonia, increased coal production is the key to further gains in production. This is no less true of France, where any prolongation of the current miners' strikes must soon be reflected in a sharp fall of the index of industrial production. Even before the strikes there had been little success in building up coal stocks, and it was clear that domestic consumption would have to be restricted during the coming winter. Industry is now threatened with similiar restrictions.

* * *

Boundary Commission's Progress

The Local Government Boundary Commission is having a trying time. Wales, as its last annual report pointed out, presents special difficulties; and it now appears that these include, besides a sparse population and a difficult terrain, a mole-like intransigence on the part of its locally elected representatives. The Welsh Counties, apart from Glamorgan, are much too small and poor to be satisfactory administrative units; their average population is 85,000, and average rateable value under £400,000. In its report, the Commission put forward four alternative ways of regrouping the Counties to form better units, and invited discussion and counter-proposals. The Welsh Counties' sole response has been to declare before the Commission their unanimous and unalterable opposition to any change whatever, an attitude which amounts to requiring the Commission to abandon the task which Parliament has set it. The most the Welsh Counties will voluntarily do is to investigate the possibilities of mutual co-operation, a field in which they are anyhow extremely backward. Since the Commission can get no assistance or evidence on the spot, it has cancelled its Welsh tour. If the Welsh Counties' fate is now settled in London, it will be nobody's fault but their own.

The Commission is now embarking on a review of the minor local authorities, but it is up against the strange obstacle that it may not reduce the status of a municipal borough. How is it to deal with the many small boroughs which at present are ineffective units? It can, in theory, incorporate a rural district within a borough—with the undesirable consequence of eliminating the parish councils—but it cannot do the converse.

This difficulty must sometime be rectified; but the basic trouble, which may legitimately exasperate the Commission, is that of having to begin reorganisation of the minor local authorities without first receiving the Government's verdict on its major plan for the reform of counties and county boroughs in England. The politicians, viewing this as an issue on which votes cannot be won but may be lost, mean to stall until after the next election, and very likely longer. The plan, however, has had a better reception from the local authority associations than any other plan of comparable effectiveness would be likely to receive. If ever it is politically unacceptable, then local government will continue to decline to the loss and dissatisfaction of everyone except those Government departments which are anxious to supersede it. Meanwhile, it is wasteful and unfair to keep the Commission and its staff engaged on tasks which can only be properly carried out after the major decisions have been taken.

* * *

London's Gravel

The first report of the Advisory Committee on Sand and Gravel contains a valuable and detailed analysis of the situation of gravel workings in the Greater London area, which have already caused considerable loss to agriculture and amenity. Sir Patrick Abercrombie's belief that reserves were abundant, and that the industry's activities in this region could therefore be closely circumscribed, is shown to be unfounded. On the contrary, after allowing for the indefinite reservation of 10,000 acres of first-rate agricultural land, and for immediate and projected development (including Heathrow airport, which conceals valuable deposits), there remain only about 20,000 acres suitable for gravel-winning, all of which should in the Committee's view be earmarked for this purpose in planning schemes. Much of this 20,000 acres too is highly valuable agriculturally, and should theoretically be kept back as long as possible. Unfortunately the best agricultural and gravel-winning lands are found together in the Lea Valley and western Middlesex. If no restrictions are imposed, it is expected that London's enormous demand for gravel—put at perhaps 10 million cubic yards annually—will have exhausted all the main sources of supply within 30 to 40 years, except the larger but less satisfactory reserves in the Vale of St. Albans.

The issue therefore is whether or not to stimulate artificially workings in the Vale of St. Albans, in the interest of conserving reserves elsewhere and of temporarily protecting good farmland. The Committee reject this idea on the grounds that it would involve excessive and difficult restrictions over output, markets, and prices. It does not consider sufficiently the possibility of guiding development in a broad way by fixing differential development charges—by areas, not by firms—under the Town and Country Planning Act. However, it does suggest that the land allocated for gravel-working should be released by instalments, so as to give greater security to agriculture. It also insists rightly on the compulsory restoration of worked land after use, and is optimistic about what can be done in the direction of protecting amenities, although less so over reinstating agriculture.

This report, despite the difficulties it reveals, is on balance a good example of the advantages which can be had from the planned resolution of conflicting claims on land. Even if the conclusions are not all right, its method of closely reasoned argument is the right way to enlist the co-operation of the interests and local authorities affected, and the understanding of the general public. Moreover, the Committee plumps for broad allocations of land between different uses, but eschews detailed finicky controls over individual applicants, except in the issue of restoration. In this it is surely right.

Tightening the Middle Class Belt

"The toad beneath the harrow knows
Exactly where each tooth-point goes. . . ."

Mass Observation's September Bulletin, following in more detail an earlier inquiry, gives the results of a questionnaire circulated to its own panel of observers, who were asked to submit full details of one week's expenditure and thus provide evidence on how adjustments were being made to the higher cost of living. The average net income of panel members was £11 10s. a week, which puts them, as a group, rather below the middle-class average figure, though still well above the average wage-earner; and they were one and all finding the going extremely difficult. Even where the weekly income still covers the regular, easily budgetable outgoings on food, rent, bus fares, smokes and such, the less regular items—clothing and household replacements, holidays, etc.—can disastrously tip the balance towards insolvency. As one informant is quoted as saying, "There is always *something*." Some are digging into savings; others are making practically a clean sweep of expenditure on books, entertainment and even tobacco; others, more constructively, are looking for extra part-time jobs. No one is shown as taking a deep breath and, so to speak, moving down one—to working-class quarters for instance. The average budget offers no scope for major readjustments such as giving up the family car; and if one is outside that charmed circle of subsidised housing and subsidised canteen from which the weekly wage-earner sallies forth to make the fortunes of pool promoters, it is not much use trying to better one's condition by entering it.

A little further up the scale, the rather better-paid technicians and professional workers hang on by the skin of their teeth to a standard which, at the grim last, they could relax; the misguided creatures still insist on paying education fees, but it is much more possible to remove a child from the pleasant surroundings and small classes of a private school than to scrape the necessary cheeseparings off other items in the family budget. Higher still, it is genuine luxury expenditure which is being pruned—as witness the troubles of the radio and hotel industries. But among small salary earners questioned by Mass Observation the middle-class dilemma appears at its grimmest. In a sense, it typifies the national problem itself—the extreme difficulty of moving down the economic scale in the face of necessity. It is all very well to cut one's coat according to one's cloth when working in one's shirtsleeves. The trouble about budgets, both national and private, is that when the cloth is cut it shrinks before it can be fashioned into garments.

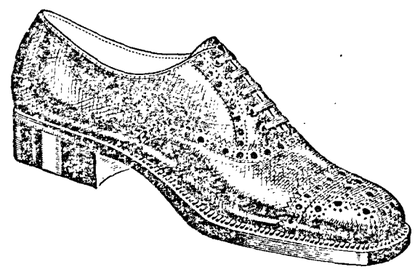
Hopes and Fears in China



The Republicans have been making China an issue in the American Presidential election campaign. To judge from Mr Dewey's reported declarations, American support for the Chinese Government is likely to be increased, rather than reduced, if he becomes President. The sub-committee of the House Foreign Affairs Committee headed by Representative Bolton, Republican, of Ohio, has brought out a strongly worded report rejecting the thesis that the Chinese Communists are "not really Communists" and describing China as a "laboratory" for the expansion of Communism in industrially backward regions of the world. There are other signs, too, of pressure for a more energetic policy towards China. In the present state of American feeling about Communism and the Soviet Union, it is inevitable that there should be concern over the one sector of the world front on which Communism is at the moment militarily gaining ground, especially as the country involved is the most populous on earth and is traditionally an object of American protective care.

The Nanking Government leaders are aware of this trend in America and are anxiously hoping for a Republican victory and an increase of American backing after November. But meanwhile they are under heavy attack, for the Communists also are no doubt influenced by the same prospect and are doing their best to make hay while the sun shines. Their capture of Tsinan, the provincial capital of Shantung, was the most important victory they have yet won south of the Great Wall, and in Manchuria Changchun has now fallen to them, leaving only Mukden and the coastal strip from the Great Wall to Chinchow in the southwest in the hands of Government forces.

According to the Nanking version the Changchun garrison has not been captured, but is fighting its way southward to join the troops holding Mukden; the move follows the emergency visit

of President Chiang Kai-shek to Peiping and Mukden to deal with the situation created by the fall of Tsinan. The President has doubtless been urging his commanders in the north, Fu Tso-yi and Wei Li-huang, now cut off from Central China except by sea, to hold out until more American help is forthcoming. The war is passing out of its guerilla phase, as the Communists now have enough industrial plant in Manchuria, including Soviet-occupied Dairen, to produce munitions on a fairly large scale, and determined attempts to take Mukden, Peiping and Tientsin may be expected in the near future.

* * *

Educating the Manual Worker

Sir George Schuster, addressing last week's annual meeting of the Union of Lancashire and Cheshire Institutes, expressed some doubts about the present educational policy which deserve very serious consideration. Educational ideals today suffer from confusion; confusion, among the recipients, between the ideal of something to live by and that of something to live with, between technical qualification and the quality of civilisation; confusion, among educationists, between the ideal of making accessible to all the treasures hitherto most generally reserved for the upper strata of the "black-coated" class, and the ideal of finding for each type (whether potentially "black-coated" or not) the education which should fit it best.

The traditional education of the public or grammar school and of the university fitted the needs and tastes of the professional man and administrator. It gave him both equipment for his work and enrichment for his leisure, and until comparatively lately the controversy over the value of the classics was almost the only indication that there might be some difference between these two aims. For commerce and for technical work in industry, the gap was wider, but science and economics could still form part of a "liberal" education producing a civilised, as well as a proficient, new entry. For the manual worker, however, the case is different. The humanities have no obvious bearing on the work of a fitter, as they have on that of a cleric, a statesman, or a lawyer.

One danger is that of casting, if not pearls before swine, at all events caviare to the general—a process not merely wasteful but positively harmful to the bored and rebellious victims; another is that of labelling youngsters as members of a caste nearly as rigidly delimited as Aldous Huxley's Alphas, Betas, and Epsilon Semi-Morons, and thereafter conditioning them by a properly determined diet, without unsettling ingredients, whatever their later development. Distasteful as the notion may be to democrats, there are Alphas and Epsilons, and a super-Epsilon developed to the top of his epsilonic capacities is still not an Alpha—"parity of esteem" notwithstanding. But that is no good reason against preferring the super-Epsilon to the Epsilon double-minus who emerges, from long endurance of an irrelevant curriculum, to confound employers with his ineptitude and unreliability, civic and military authorities with his illiteracy, and himself with an utter incapacity for enjoyment above the level of the pin-table.

* * *

University Salaries

The perennial controversy over university salaries boiled up again last week when the Vice-Chancellor of Cambridge University addressed the University Senate. Since the controversy is composed of two distinct sets of arguments, which are about to become inextricably mixed up, it is as well to distinguish between them at the start. On the one hand there are the arguments, common to almost all the professions, that salaries have not kept pace with the rise in the cost of living. Actually the salaries of university teachers have risen quite considerably since 1939, but in neither leisure nor in cash are they, and particularly the professors, as well off as they were before the war. Dons are not singular in this, but the difficulty of their situation is underlined by the more attractive rates of pay which are available in industry. Below is a table of salaries typical of the civic universities.

	£†
Professors*	1450 — 1750
Lecturers Grade I	850 — 1050
Lecturers Grade IIa	750 — 850
Lecturers Grade IIb	600 — 750
Lecturers Grade IIc	550 — 600
Assistant Lecturers	400 — 500

*Full-time clinical professors receive £2,500.
†All staff receive £50 p.a. children's allowance for each child.

It should be observed that, contrary to the Vice-Chancellor's assertion, £1,450 per annum is the minimum and not the maximum salary for a professor, and one not really unsuitable for the less distinguished men or for the smaller universities. In addition every university receives a block sum from the University Grants Committee in proportion to the number and distinction of its professorial staff, for distribution at the university's discretion to its professors. And a university may prefer to raise every professor's salary a little, rather than reward outstanding men. But even £1,750, representing the earnings of a highly trained man with great influence in the community at the peak of his career, is not an attractive salary.

The second and explosive element in this controversy is the recommendations of the Spens Report on the "Remuneration of Consultants and Specialists" (Cmd. 7420). If these are adopted specialists in hospitals will be entitled to £1,500 at the age of 32, rising to £2,500 after ten years. In addition, if they are of outstanding ability, they may be eligible for the special awards which will increase some specialists' salaries by from £500 to £2,500 a year (all at 1939 values). Such a proposal hits the universities directly. Non-teaching specialists, working at a hospital and paid under the National Health Service will receive £2,500 per annum, plus an adjustment for the fall in the value of money, plus, perhaps, a special award, whereas the clinical professors at the hospitals, paid by the university, will have to be content with £2,500. This is hardly to persuade good clinical men to take up teaching. If, on the other hand, the university equates the salaries of its clinical professors with those of the non-teaching specialists, it would leave a large gap between the clinical and the non-clinical professors, which is equally unfortunate. Or thirdly the universities may be forced to upgrade all professorial salaries (on government grant) thus setting up a new merry-go-round of salary claims, which may affect still other professions. The effects of the Spens report are likely to go on reverberating for a long time; they illustrate the embarrassing side of bringing hitherto unplanned and unco-ordinated parts of the economy under the aegis of the state.

* * *

Nurses' Salaries

Another example of the difficulties that arise when salaries of groups of workers are treated in isolation can be found in the nursing profession. The salaries of student nurses have been revised from September 1st, with the result that those in their first year are now paid £200 a year, of which £100 is paid in cash and £100 is the value of board and lodging. From next January they will receive an all-in payment of £200, out of which those resident in hospital will pay £100 for their keep. This change in the method of payment is designed to emphasise their status as students rather than hospital workers. In cash they will now have an increase of £30 a year (£45 a year compared with their salaries before July 5th). Second and third year students will get an extra £10 and £25 a year respectively, plus £5 for passing the preliminary examination.

These increases in salary should put an end to one of the student nurses' grievances—that, after deductions for superannuation, national insurance and this-and-that, they have little salary left to them. It is worth noting, however, that the new method of an all-in payment will make their income taxable, to a negligible extent at the bottom of the scale, but quite heavily if, as seems to be generally desired, the new method is introduced all the way up the nursing scale. But if the monetary demands of student nurses are satisfied, what of the staff nurses and sisters? The actual cash salary—that is, exclusive of the value of board and lodging—of a staff nurse is £140, rising to a maximum of £200 after fifteen years. The cash salary of a ward sister is £180, rising to a maximum of £260 after twelve years. The rise in the salaries of student nurses may increase the number of nursing recruits, but if the present gap between student nurses' salaries and those of staff nurses and ward sisters remains as small as it is, where is the incentive for trained nurses to stay in the profession?

Staff nurses and ward sisters have another grievance. As the Royal College of Nursing recently pointed out, when all due deductions are made from a staff nurse's salary, a kitchen maid in a London hospital gets £12 a year more and a ward orderly £25 a year more. When Sunday work and split shifts are paid for, the London kitchen maid and ward orderly receive more than the ward sister. Many hard things have lately been said of the ward sister and her attitude to the student nurses. But how is the right person to be selected to fill this responsible post when her services are assessed at little more, and possibly less, than those of an untrained, unprofessional person under her command?

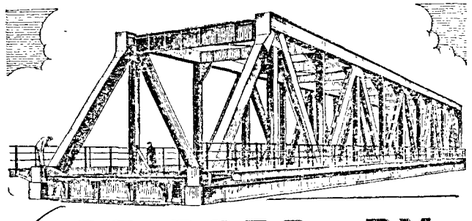
Beetle Resin—a product of B.I.P. research—binds together this sand core for casting tractor wheels.



British Castings now better than ever

Shortage of natural oils for bonding the sand cores from which castings are made, resulted in B.I.P. research workers being called in. The outcome is that sand cores now bonded with "Beetle" Resins possess good green and dry strength, are highly permeable by gases, and resistant to damage by damp. Sand cores may be outside your province, but our research and development men are expert at ironing out any problems concerning the use of amino-plastics. Call them in to co-operate with *your* research workers whenever you strike a sticky problem.

No Future for Dismantling

Fewer and fewer Germans believe that the bulk of the dismantling plans agreed between the British and the Americans a year ago will now be carried out. The attempt to sell the revised level-of-industry plan to the Germans as something final and inescapable never went well; since the American initiative a few weeks ago asking for a final review of the dismantling question, its failure has become complete. Dismantling has again become the main issue between the British authorities and the public opinion of the British zone. Americans and Germans find themselves on the same side. As always, it is against the British, not against the distant member Governments of IARA and their reparations claims, that feeling arises. However unfair, it is clearly inevitable, and the British authorities (hard though it may be to blame them for changing their policy at a slower pace than the State Department) can reasonably be blamed for failing to take such an obvious fact into account in their tactical handling of the dismantling question.

The present version of the German case against British dismantling policy runs somewhat as follows. If, it is argued, the western European countries aim seriously at a co-operative effort for European recovery, then the claims of individual governments for this German plant or that can hardly weigh against the oversiding question: will the plant best serve the European economy during the vital years 1948-51 if it is being worked by Germans, or if it is being pulled down, shipped abroad, and fitted together again? German technicians, who have experience of pulling down foreign industrial plants and bringing them to Germany, know that a heavy plant will take eighteen months or two years to pull down and eighteen months or two years to put up again. In some of the most important plants on the dismantling list (notably the steel plants) it is doubtful whether they will ever be fit to put up again at all.

Granted their assumptions, these arguments are, over a certain field of heavy industry, unanswerable. They can only be rebutted by denying that the economic need for production in Europe is more important than the political demand (mainly from France and eastern Europe) for a reduction of potential German power. The Germans know that the Americans have decided that the economic need comes first and believe that the British will soon have to toe the American line.

In the circumstances it is exasperating to the Germans to see the British putting up a show of resolution and tackling the physical task of dismantling with unprecedented energy. The increase in dismantling activity at this moment may be accidental; it may result merely from the fact that currency reform has made it easier to hire labour. But many Germans believe it to be an attempt to get as much as possible pulled down before the inevitable reversal of policy comes.

It is, for instance, fairly common knowledge at Frankfurt that, once the British concede the principle of revision, the August Thyssen steel works at Duisburg-Hamborn will be one of the first to come off the list. But dismantling operations have started at these very works in the last three months. It will be some time before the heavy installations begin to come down—and before then policy may have changed—but already about 3,000 tons of lathes, milling machines, shaping machines and presses have been dismounted from their foundations and collected in one of the undamaged shops. What is the reason for this—pure enthusiasm? The August Thyssen plant has not yet even been allocated. It was not, until lately, the practice to dismantle a plant until it had first been allocated and a representative of the recipient country had inspected it.

* * *

Dutch Food Subsidies Cut

It should be useful and interesting to watch the social and political effects in Holland of the Government decision to make a 40 per cent cut in food subsidies. It reflects, among other things, the fact that the new Cabinet is slightly more to the Right than the old, even though it is headed by a Labour man, Mr Drees.

The representatives of the workers have been quick to warn against the rather jubilant note which they thought they detected when the cut was announced last month in Queen Juliana's speech from the throne. The Socialist trade union congress has reported to the Cabinet that the peaceful state of Dutch labour relations since the war (almost unparalleled elsewhere in the West) would be endangered if prices went up while wages stayed down. They point out that freedom from rationing will prove a one-class pleasure if the expected general fall in the price level is too long in coming, or does not come at all. Likewise the Protestant trades unions asked the Cabinet to consult organised labour before committing itself once for all to the liberal economic policy which the completion of the Benelux union with Belgium demands.

Our correspondent in The Hague points out that even now the poorer classes cannot make ends meet without drawing on their savings bank accounts, or using the so-called consumers' credits (government subsidies for the purchase of textiles, household equipment, shoes, etc.). The rich are still relatively well off, even though the differences between their living standards and those of the rest of the country have narrowed since the war. It is only a year ago that the Government "dividend stop" of 6 per cent was raised to 9 per cent instead of being abolished, to the annoyance of those business men who do not see in it the necessary price for industrial peace and continuity of production.

The cost of these subsidies, as expressed in the agriculture equalisation account, under a special head in the Dutch budget, was 376 million guilders in 1946, 283 million in 1947 and 498 million in 1948 (it will, in fact, amount this year to some 600 million guilders). The decision to make the 40 per cent reduction is rooted in the pledge to the Château d'Ardennes conference of June 1st to achieve complete economic union with Belgium by 1950, and is only one of the sacrifices that face the Dutch before they cure their growing indebtedness to their neighbour.

Shorter Notes

The British Government has lost no time in its effort to stimulate recruiting. Within two days of each other Mr Shinwell inaugurated a six months' campaign to treble the size of the Territorial Army, and the Secretary of State for Air launched a drive to recruit 1,000 men a week for the next two years into the regular RAF. The two objectives are quite different, although the public, confused by oratory, brass bands and posters of smiling youths sunning themselves on tropic shores, may find it hard to decide just what their country needs of them. The Territorial Army needs a very swift expansion from 50,000 to 150,000, chiefly to undertake the training of National Service men from 1950 onwards, and partly to form the immediate emergency reserve. If it can expand at that speed, it will certainly need the whole of 1949 in which to shake down into efficient units. The RAF, on the other hand, in addition to needing 60,000 men for its reserve formations, must recruit its regulars at five times its present rate of 200 a week in order to compensate for increase wastage caused by diminution of the length of National Service to 12 months and in order to increase its regular strength from 129,000 to 180,000. It will be a new test of the Government's powers of explanation and persuasion, and of the extent to which improved conditions can overcome the ex-Serviceman's intense antipathy to the thought of returning to the old grind.

*

The export of British jet-engines to Russia is one of the points on which Sir Stafford Cripps had last week to reassure American opinion. No such engines have been exported for a long time. Under an agreement reached in the cordial days of 1945 several dozen Rolls-Royce "Nenes" have been sent to Russia. These were of a model earlier than that on which the Americans themselves rely so much; and the Russians have not had the benefit of continual collaboration in improvements with the Rolls-Royce research team. The fact remains that a Cabinet decision three years ago gave the Russians jet engines with centrifugal compressors. This type has several advantages over the engine with axial flow compressor, which they had already captured from the Germans. With Rolls-Royce engines delivered from Britain, they will have been able to save themselves much time in research and experiment by comparative tests of the two types.

*

The first essential step in standardising industrial and military equipment between Britain, the United States and Canada is about to be taken. Reports from Washington last week foreshadowed an early agreement on standard screw threads for all three countries. At present British and American nuts and bolts

THE ECONOMIST — BY AIR

THE ECONOMIST, 22 RYDER ST., ST. JAMES'S, LONDON, S.W.1

are not interchangeable, and before anything can be done to standardise bigger items the screw threads must first be brought into line. The agreement will clearly take some time to put into practice, for, apart from the need to alter the machinery producing nuts and bolts, the change may affect every mechanical contrivance in the country. The agreement will be of great importance to defence and to industrial co-operation between the three countries. Endless delays were caused during the Second World War because of the difference between British and American screw threads, and the need for standard measurements has been the subject of conferences in London, Ottawa and Washington ever since.

*

The British Communist Party is grasping the opportunity presented by the Government's rearmament policy. In a manifesto issued on Wednesday it sets out a comprehensive list of objects for "the people." Throw out the Superforts—in occupation of Britain. Bring home the troops from Malaya, Greece and the Middle East. End the servitude to Wall Street. Co-operate with Socialist Russia to save peace. Strengthen the United Nations. Raise wages and living standards. More houses and schools, not more planes. This is to be achieved by agitation, by street corner and factory-gate meetings, by bombarding MPs and by bringing every trade union organisation into the fight. Unlike the battle on wages, this new programme will be in rivalry with conduct in opposition to the Government's policy. By a confusion of words and facts the Communist Party will strive to appear as the champions of peace and order. Since they have decided to fight the battle in the open they present the Labour movement with an excellent opportunity to explain the real issues.

Commonwealth co-operation on defence is at last being lifted above the level of junior staff officers and training colleges. Mr Dedman, the Australian Minister for Defence, has announced in Canberra that Britain and New Zealand have sent service representatives to join the Australians for planning defensive strategy in the Pacific. More important still, he announced that reciprocal arrangements had been made for the Australian Government to be represented in the higher defence councils of Britain and New Zealand. The new arrangements mean that each of the three Dominions, including Britain, will share in the defence councils of each of the others. Such co-operation is a real advance on the loose system of liaison officers which has hitherto bound the three countries together in peacetime. By working together at the point where strategy is discussed and formulated they will be able to evolve and recommend common views on defence policy which will have far more weight than the present separate and sometimes divergent doctrines.

*

The British Travel Association announces that in August 68,421 overseas visitors arrived in Britain, an increase of 34 per cent on the average for August in the years 1936-38. The £28 million estimated for tourist earnings in 1948 is almost certain to be achieved. Whether this year's record figures, helped by the Olympic Games, will be repeated is another matter. The efforts of the British Travel Association are not helped by the Catering Wages Council, whose wage scales for hotel employees are making it difficult, if not impossible, for many hotels to provide decent service or even to keep open at all in the winter months.

Letters to the Editor

The Passing of Mr Jinnah

SIR,—I write to protest against the two editorial notes dealing with the Indo-Hyderabad affair and Mr Jinnah's death, which appeared on pages 448 and 449 of your issue of September 18th. To assert that Mr Jinnah's death was "hastened by the news of the impending Indian invasion of Hyderabad and the nervous strain of deciding Pakistan's policy in the crisis" is pure hyperbole; but if it is meant to be taken seriously we ought, in the interests of accuracy, to add that other contributory factors to the Quaid-e-Azam's demise were Kashmir, the tribes, Pathanistan and provincial stresses, particularly in East Bengal and West Punjab. Actually, Mr Jinnah had been a very sick man for two months or more; but even had he been in robust health there are no grounds for thinking that Pakistan had the right to intervene in support of Hyderabad or could have done so successfully. In any case, the Nizam has now made it clear that the solicitude of his admirers, both here and abroad, was really rather overdone. I suspect that many Pakistanis are glad that the Hyderabad issue is at last out of the way, though they would probably not admit it publicly.

But what is really distressing to those who believe that a close Indo-British friendship is not only desirable but possible, is the apparently almost unanimous condemnation of India's action based on what appears to be a fundamental misunderstanding of Hyderabad's position before and after the lapse of paramountcy. Never at any time in the last 200 years has Hyderabad been an independent sovereign state in direct relationship with other such states. If she had, paramountcy itself would have had no meaning. Such relationship as the Nizam had with Britain was through a government subordinate to the British Government, i.e., the old Government of India. The position is admirably set forth in the late Lord Reading's letter to the Nizam of March 27, 1926, when as Viceroy and Governor-General he was called upon to answer claims of a much more moderate character than those which His Exalted Highness has more recently preferred against the Indian Government. It was not to be expected that the latter Government would require a smaller interest in Hyderabad than its predecessor, but to imply that there is some kind of basic similarity between events in Hyderabad in 1948 and those in Czechoslovakia in 1938 is, I suggest, straining credulity a bit too far. In any case, the dissolution of the Mir Laik Ali administration, and the Nizam's wise and creditable action in the face of the Indian advance into the State puts an end to speculation as to what might have been.

Whatever the arguments may be about Kashmir, the writer's opinion, based on a fairly long study of conditions nearer the spot than most British commentators, is that India has been almost wholly right over Hyderabad. In the circumstances, it is a pity that a large section of the British press and public opinion has shown so unfriendly an attitude to India on this question. The average Hindu is now more than ever convinced that British opinion is permanently biased in favour of Moslem interests wherever they are situated, which (apart from questions of right and wrong) seems rather a pity seeing that the great bulk of our own interests in the sub-continent are located in the Indian Union.—Yours faithfully,

4, *Lyons Range, Calcutta,* 1 GEOFFREY TYSON

AMERICAN BANKING SYSTEM
A SKETCH By R. S. SAYERS

This book contains a sketch of the banking system of the United States, a system which, while sharing most of the basic principles of British banking, is unique in its decentralised form. Chapters on the structure and business of the commercial banks are followed by a view of the Federal Reserve System and an analysis of the methods of control exercised by it. The latest developments receive considerable attention and in a final chapter the author reflects on some implications of these developments, and on the question, Can 1933 come again? 7*s.* 6*d. net*

MODERN BANKING *By the same Author*
Second edition, 1947. 15*s. net*

OXFORD UNIVERSITY PRESS
AMEN HOUSE, LONDON, E.C.4

Uses of Manpower

SIR,—The article in your issue of October 2nd on "Uses of Manpower," which poses the problem of the distribution of labour and suggests possible action, does bring out clearly our present unbalanced labour position.

Comparing July, 1948, with mid-1939, why are public utilities employing more? There seems no reason, apart from shorter hours or lower output, why they need 14 per cent more labour. They should be reorganised on a 1939 basis.

In building and civil engineering we could get all the work at present planned, if not more, from the prewar number of workers and so save 67,000 men, if their effort was up to prewar. In house building, as you say elsewhere in your issue of October 2nd, the productivity of labour is down 31 per cent.

Consumer service, sport, etc., should be reduced to 1939 and save 55,000. The main reason for the increase is because we have too much leisure, too many Saturdays off when we ought to be working to save ourselves. The Civil Service by reorganisation—it is notoriously overstaffed—and by removing controls, which policy had a good result in Germany, could be pruned of 150,000 persons. In the same way local government should be made to disgorge 200,000.

The above savings would release half a million workers for the basic and manufacturing industries, increasing their labour force by approximately 5 per cent. The largest savings are well under the control of the Government to enforce if they really want to do so.

Our working week should be increased by three hours. I believe a sincere appeal to do this would bring a real response, if all grades of workers were treated alike, office, factory and public services. It would mean no longer hours than were worked by most in 1939, and seems a small price to pay in order to gain national independence and regain our standards of living.

The 10 per cent increase in production, so often called for, could be found in the two methods suggested above. I am confident such a programme, if properly launched, would be well received and have a stimulating effect on production all round.

Workers are tired of pampering and being lectured at. They want to see firm action with a plan they can understand. They want to see some of the paper-pushers taken off their backs and set to real work. Then they would get some of the cynicism out of their souls and really go to it.—Yours faithfully,

Rutherglen, Stoke Bishop, Bristol J. B. STEADMAN

The Arab Refugees

SIR,—I should like to thank you for the appeal you have made for the Palestine Arab refugees, but I hope you will permit me to say that the article in your issue of October 2nd is in some respects unfortunate.

The British authorities have bad consciences concerning the circumstances in which their sudden withdrawal to the Port area of Haifa before the Mandate ended resulted in its seizure by the Jews and the flight of the Arab inhabitants. Your eye-witness account of this incident reads to me like an *ex parte* statement for the defence.

I wonder what evidence has enabled your correspondent to decide that the announcements made over the air by the Arab Higher Committee had a greater influence in causing the Arabs to flee than their fears of a repetition of the Massacre of Deir Yassin? This is what Count Bernadotte says on the subject:—

> The exodus of Palestinian Arabs resulted from panic created by fighting in their communities, by rumours concerning real or alleged acts of terrorism, or expulsion.

My doubts as to your correspondent's objectivity are enforced by his statement that "it was possible that the Arabs feared a repetition of the Deir Yassin *incident* (my italics) as an act of retribution for the massacre of the Jewish technicians at the CRL Installation in Haifa Bay in December."

You are no doubt aware that the Arab attack on the Jews employed at the Haifa refineries was started because Jewish terrorists flung two bombs at a car containing a hundred Arab workmen, and that the Arab Legion beat off the attackers and rescued many Jews. That he should find any analogy between this incident and the appalling atrocity of Deir Yassin casts grave doubts on your correspondent's judgement.

With regard to Jaffa, you write of Syrian and Iraqi looting. I have seen an eye-witness account which states that the Jews descended on Jaffa like a swarm of locusts, and stripped the Arab houses of everything, including telephones, pipes, basins and electrical fittings. On this question of looting, may I again quote Count Bernadotte?

> There have been numerous reports from reliable sources of large-scale looting, pillaging and plundering, and of instances of destruction of villages without apparent military necessity. The liability of the Provisional Government of Israel to restore private property to its Arab owners and to indemnify those owners for property wantonly destroyed is clear.

You would no doubt agree that the remarks you made in your issue of July 8th that "if Arab society were anything but rotten, the Arab States would not be waiting for international charity to do something about their refugees," has been proved by events to be most unjust. As you now realise, Arab generosity in the relief of these refugees has set an example to the Christian world; and it was Great Britain, as you point out, and not the Arab States, who guaranteed the civil and religious rights of these people, and the United Nations and not Transjordan which inherited the Mandate.—Yours faithfully, E. L. SPEARS

164, *St. Stephens House, Westminster, S.W.* 1

Revised Defence

SIR,—In the article on "Revised Defence," which appeared in your number of October 2nd, it is stated that the community pays double for every man in the forces, the cost of his maintenance and the cost of his loss to the productive part of the economy.

No, Sir, it does not. The only thing double is your reckoning, which is incorrect. The real cost is the loss of the man's civilian output, and the calculation stops at that. That is bad enough. Don't make it any worse.—Yours faithfully, G. L. SCHWARTZ

28, *Spencer Drive, Hampstead Garden Suburb, N.* 2

From *The Economist* of 1848

October 7, 1848

"RUINS OF MANY LANDS." By NICHOLAS MICHELL. William Tegg and Co., Cheapside.

THIS poetry is somewhat above the common-place poetry, of which every country has its full share. The thoughts are natural, and generally pleasant, and the verse polished. The following lines from "Petra" will show, if such an expression be permitted, the average worth of this composition:—

> Calm sinks the sun o'er Edom's blighted hills,
> And the whole air a pulseless silence fills:
> The round red orb hath reached th' horizon's brim,
> Shooting its crimson flames ere all be dim;
> Across the broad sand gleam the living fire.
> Quivering, like hope, around each rocky spire.
> These glories change, as lower sinks the sphere,
> And still each moment lovelier tints appear;
> Saffron and amber flood the gorgeous west,
> Fairy-like towers in hues Elysian drest;
> Now shafts of pallid gold are upward cast,
> But all to softened purple yield at last.
> So suns went down when Israel trod this wild.
> So, when they buried Aaron, evening smiled.
> That mighty orb ne'er tires or dims its ray;
> Bright as when earth was born, it flames today;
> Man only passes, with his race, and age,
> His works alone are blotted from Time's page;
> Cities will melt away, e'en like his dust,
> And granite tombs at last resign their trust.

There are some better, but some worse passages, but none in which there is not something to win the reader's attention, or excite his sympathy. Erudite notes at the end of each chapter, give additional value to the volume. The subject chosen by the poet is an excellent one, and susceptible of much illustration. The present number is confined to the Ruins of the Dark Era; but he proposes to treat successively also of the Ruins of the Classic Era, and of the Ruins of the Miscellaneous Ages, though what he means by the latter term is not very clear. If the execution should correspond to the design, a magnificent poem will, in the end, be added to our literature.

Readers of the Economist ...

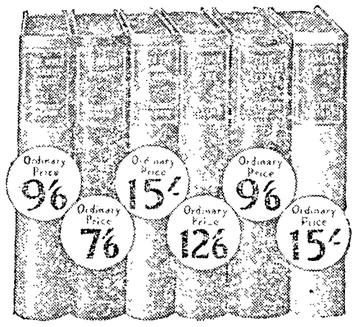
The Easy Way TO INVEST MONEY



Buy National Savings Certificates the Bank way—it is simple, automatic and without any additional charge to you. You just sign the Special Banker's Order form which your Bank Manager can now give you, authorising either a single purchase of National Savings Certificates, or a regular monthly investment. That is all you have to do—and with a stroke of the pen you will have helped to secure your own future, and your country's prosperity.

You can now hold 1000 10/- units of the new Certificate, and in ten years this £500 will have grown to £650 free of tax. Secure for yourself this profitable gilt-edged investment by calling on your Bank Manager.

SAVE — *The Bank Way*

Issued by the National Savings Committee

WORLD BOOKS *The Book Club of QUALITY*

Readers of *The Economist* can benefit from this remarkable offer by joining WORLD BOOKS, the Reprint Society's famous Book Club. The Selection Committee, composed of five leading London publishers and the Chairman of the Book Society, chooses for every month an outstanding recent book, prints a special edition, binds it beautifully, and yet supplies it to members for a fraction of the ordinary published price—an achievement only made possible by the co-operation of over 130,000 satisfied members all over the world.

£3·9/- WORTH OF BOOKS FOR **24/-**

Note the magnificent programme for coming months: every selected book is of wide appeal and by an author of the highest repute. Then study WORLD BOOKS production features below, which, in the conditions of to-day, are quite incomparable.

FORTHCOMING PROGRAMME

October:

THE WIND CANNOT READ by **Richard Mason**
Moving first-novel, portraying tender romance of R.A.F. officer in India and Japanese girl from whom he learns the language between campaigns in Burma.

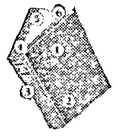
November:

THE JUDGE'S STORY by **Charles Morgan**
Brilliant character study of a High Court Judge whose career is endangered by his efforts to save a young girl. Latest novel by famous author of *The Fountain*.

December:

WHEN THE GOING WAS GOOD by **Evelyn Waugh**
Entertaining volume of travel memories, recording "all I wish to preserve" of four outstanding books. Lively narrative of vanished conditions by happy-go-lucky traveller.

January, 1949:



LONDON BELONGS TO ME by **Norman Collins**
The famous novel of teeming many-sided life, presenting the real London in a succession of intimate scenes with humour and sentiment.

February:

THE FRANCHISE AFFAIR by **Josephine Tey**
Unusual mystery novel based on a notorious *cause célèbre* in which two countrywomen are wrongly accused of assault and abduction.

March:

SAMUEL PEPYS: The Man in the Making by **Arthur Bryant**
Distinguished historian's searching and honest record of the daily doings of our greatest diarist. An enthralling biography as thrilling as any novel.

PRODUCTION FEATURES

1 Fine quality buckram on stout board covers.
2 Uniformity of style and size; variety of colour.
3 Distinctive spine with title blocked in real gold-leaf on soft leather panel.
4 Top colour-sprayed to tone with panel.
5 Well-planned format, clear and graceful typography.
6 Carefully selected book-print paper of highest quality obtainable.

HOW TO JOIN

There are no membership fees. Your only obligation is to buy, at 4/- a copy, at least six future books; *but you can omit any one title in each sequence of four*. Simply post enrolment form below.★

NOTE: If you prefer to obtain WORLD BOOKS *through a bookseller belonging to the Associated Booksellers of Gt. Britain and Ireland, please send his name and address with your own, so that we can adjust his quota of copies and arrange for him to supply your books.*

★ **To WORLD BOOKS, The Reprint Society Ltd., 22 Golden Square, London, W.1, Eng.**
Please enrol me as a member of your book-club, WORLD BOOKS, as from the "choice" for ..... (State month desired after reading list above.) I agree to accept and pay for a sequence of at least six selected books and to continue my membership after the first six months until I cancel it by a month's notice.

☐ **I enclose deposit of 54/-** to cover the cost of twelve books at 4/-, plus 6d. each for postage, etc.
☐ **I enclose deposit of 27/-** to cover cost of six books at 4/-, plus 6d. each for postage, etc.

AMERICAN SURVEY

Balance at Full Employment?

(From Our US Editorial Staff)

WHETHER or not new faces appear in Washington in January, new faces are being presented now to the housewife and the business buyer. They are salesmen soliciting and competing for orders, widespread advertising of bargain sales of merchandise, and the offering of discounts from quoted prices instead of premiums above them. Americans are no longer competing solely in getting goods, but, to an increasing extent, in finding buyers. This change is not universal; goods are not going begging or even plentiful in all cases. But the tone is changing: this winter's prospective oil shortage is failing to materialise, for lately production has been exceeding consumption; much less is heard of the steel shortage since the higher prices imposed earlier in the year have performed their orthodox rationing function; and there are empty houses for sale and empty apartments for rent in many sections of the country with their availability being advertised and prices being stated. The change in agricultural supplies has of course been widely heralded.

The change which is occurring is much more one of tone than of price, though substantial price cuts are no longer as rare as reasonableness among Russians. Indeed, the overall cost of living and wholesale price indexes are still making new highs. But increasingly the price quotation signifies the presence of goods ready for delivery. While the height of prices is certainly unpopular, this annoyance is not aggravated to the extent it has been by queueing or distant and uncertain delivery dates.

The American economy is moving into a state which it has not experienced for nearly twenty years—a condition of something like balance between supply and demand. The nineteen-thirties were of course marked by very low demand and under-employment. From this extreme the war lifted the economy abruptly on to a level characterised by insatiable demand and over-employment without any perceptible interval of balance at full employment. Thus the present trend represents a new experience for the large proportion of the population at or under the age of 40.

This may be only a temporary phase in a long inflation, merely another short interruption like the stock market fall in the autumn of 1946 and the commodity price break of last February. The Chiefs of Staff have just supplied the Munitions Board with M-Day specifications, the pace of activity in the defence organisations is noticeably quickening and military expenditures are mounting. If the Russians wish it—and they still act as though they do—they can bring into existence a much more powerful military force in the United States, possibly accompanied by a further round of inflation. Apart from this possible stimulus, consumers may engage in another wave of bidding prices higher; they have before shown some signs of hesitation, though less pronounced than those now appearing, only to abandon their inhibitions a little later. In the aggregate they are very well supplied with funds and, as always, with desires. There are experienced observers who are convinced that the American inflation still is a long way from ending. In the past, they have been right in disregarding hesitation of demand.

But even more prevalent than the expectation of another wave of inflation is the fear that the change in tone presages depression. The boom already has had an unusually long life. The argument runs that many deferred wants have been satisfied by the high rate of production in recent years, and supplies both in the hands of business and consumers are substantial. Many people are living beyond their means and cannot indefinitely continue to do so. Lower farm prices will cut farm incomes, the Republicans will cut the rate of government expenditure, exports are falling and will fall further, the high level of prices and costs is choking off capital formation. Costs are so high that even a small decline in volume will turn profits into deficits on a wide scale and set in motion a spiral of liquidation.

★

These divergent views have one assumption in common: that the American economy is soon to suffer. This general resignation to approaching misfortune is the almost inevitable result of twenty years of life under conditions of one economic extreme or the other and a vast mass of economic and business literature whose predominate affirmation is that the American economy is unstable. The disciples (and distorters) of Keynes dominate American economic thought and have surrounded themselves with a gloomy haze of inevitable tendency toward depression, about which something could and should, but probably will not, be done. Perhaps the next most influential group follows some variant of the quantity theory of money and postulates inflation and yet more inflation. Many politicians, including most labour leaders, have their own prescriptions, and are persuaded, and try to persuade others, that serious trouble is the inevitable and imminent consequence, of failure to follow their advice. Professional economic advisers and consultants busy themselves finding problems to report to their "customers." The existence of an advanced stage of hyperchondria is not in the least surprising.

The view that misery is inevitable has virtually ruled out any exploration of the possibility that this country could have a considerable period of fluctuations within an area of prosperity and reasonably full employment. Yet the past twenty years are not the whole of history. The most careful analyses based upon various assumptions about this postwar period have consistently proved to be wrong: the country has not yet had depression and high unemployment, nor sufficient inflation to deprive the great majority of the population of a higher standard of living than they enjoyed before the war or even during the prosperous nineteen-twenties.

This third and happier possibility would not, of course, preclude fluctuations. But there have been long periods in this country where the fluctuations up and down have been held within narrow limits. It would not be impossible even with a continuation of the war of nerves—though actual warfare would preclude it. It would rest upon the not unreasonable supposition that unprecedently large and widespread holdings of money, and much more equitable distribution of incomes, would provide large new markets which could be tapped by even small price concessions or increases in attractiveness and utility. It would rest upon the belief that the demonstrably rapid advances in science and technology can make possible just such developments to widen markets. It would be based upon the supposition that unwise or harmful public policies pursued by any private or public group will not persist indefinitely without changes produced either by enlightenment or necessity. It would be based upon the existence of very large resources continually being expanded by science. It is argued that the monetary disintegration which has aggravated previous declines seems most unlikely in view of the vast safeguards which have been erected.

Only time will tell. But predictions of disaster have proved false in both the recent and the long past. It is at least a possibility worth exploring that the change in American economic tone presages prosperity instead of poverty, even though the doubtful profess to hear in it echoes of the "new era" talk of 1929.

Federal Aid to Education

[FROM OUR US EDITORIAL STAFF]

THE first main crop of war babies, scrubbed and polished and six years old, has just presented itself at the doors of the 169,905 public (that is, Government-supported) elementary schools of the United States. Before the war there were from 2.2 to 2.5 million births in the United States annually. Last year there were 3.9 million. In 1952 the elementary school population will be 21.4 per cent larger than it is now; by 1957, 45.6 per cent larger. Between 1939-40 and 1944-45 the cost for each pupil rose by 42.4 per cent; since then, further substantial increases have taken place. The value of public school plant and equipment in 1943-44 was nearly $8 billion. Yet it is hard to find the State in which the provision of more school facilities is not a controversial political issue.

These are some of the reasons why the various Bills for federal aid to education, introduced, considered by committee, and in one case passed by the Senate, but buried by the outgoing Congress, are likely to be back on the calendar soon after the new Congress convenes. Traditionally, education has been considered a matter for the localities and the States. But Federal land grants to the States for the support of education have been made since the earliest years of the republic. Congressional appropriations for State colleges of agriculture and mechanic arts began in 1862 and were expanded with the development of agricultural experiment stations and extension services. The end of the first world war saw grants for vocational instruction in secondary schools and for rehabilitating the industrially disabled. During the last war various training programmes, a school lunch plan, and a construction programme for war areas were undertaken. Since then the GI Bill of Rights has supplied the means of college education to thousands of veterans. In 1945-46, Federal aid for education totalled $47,712,607.

But basically, elementary and secondary education has been planned, executed and paid for by the counties, townships and cities and the States. The question now under discussion is whether the taxable capacities of the governmental units that have supported education in the past are capable of supplying the funds required to give a modern education to all the children, and, if not, whether Federal support can be provided without at the same time introducing Federal control of educational policies.

The case for Federal aid is impressive. The people of the United States are one people. But, educated on a State basis, they enjoy widely differing opportunities. The States differ greatly in the income of their inhabitants, in State and local revenues, in the proportion of those revenues applied to education, and in the number of children to be educated. In 1945, when the total of private incomes for the country was $155 billion, New York's share amounted to $20 billion and Nevada's to $210 million. If the income total of State is divided by the number of its children aged from 5 to 17 the quotient varies from $9,009 in California to $2,067 in Mississippi. The proportion of income payments expended for elementary and secondary public education averaged 1.6 per cent for the country as a whole; it varied from 2.5 per cent in New Mexico to 1.1 per cent in Maryland. In 1939-40 the best financed schools spent some $6,000 on each classroom, the poorest less than $100. The school-leaving age varies in different States from 14 to 18.

In three-fourths of the States more than half of the public school revenues are derived from local taxes, most of which fall on real property. For the country as a whole, in 1943-44, slightly over 65 per cent of the schools' $2.6 billion total revenue came from this source. Increasingly, educators are urging the adoption of a sales tax; they say that its regressive features are less objectionable at present income levels than in periods of depression, and the yields are high.

But with all the tax increases that supporters of better schools may hope to secure from State legislatures, the amounts obtainable seem unlikely to be enough, particularly in the poorer areas, most of which are high in child population. During the war little new construction could be done. The schools went into the war after a depression period when approval of bond issues was hard to get. Available funds have now lost a large part of their purchasing power. There have been sizable gains through consolidation, but more than half the elementary schools still have only one teacher and the transportation of some 20 per cent of the school population by bus to consolidated schools has raised costs by about $23 per child per year.

During the first half of this decade a number of the poorer States made large percentage increases in their expenditures on schools: Nebraska, Kentucky, Virginia, Arkansas and North Dakota raised their school budgets by as much as from 71.1 per cent to 92.5 per cent. A second such increase seems impracticable in the near future; yet three of these States are still among the twelve with the lowest standards. Since the migration from the poorer areas of young people of working age is very high, ignorance is constantly diffused over the whole country, imposing a drag on any increase in production and wealth and handicapping the national security; 8 per cent of the men examined under Selective Service were rejected for educational deficiences.

*

Reasoning such as this was behind the proposed "Educational Finance Act of 1947," which passed the Senate last spring and represents the point at which discussion will be resumed in January. The benefits offered are an annual appropriation of $300 million, for which States applying would be eligible under a formula taking into account the number of children of school age, the State's resources, its own efforts to finance education, and after four years of operation the expenditure from State and local funds of at least $120 per pupil. A minimum flat payment of $5 per child would be made to all States; an additional $45 would be available to States qualifying under the formula. Estimated allotments would range from the basic minimum in the top sixteen States to amounts ranging from $2.3 million to $22.3 million for the twelve States with lowest present expenditure per pupil.

Resistance to the measure comes from four main sources. Large sections of voters wish to minimise all Federal expenditures; the US Chamber of Commerce, the National Association of Manufacturers, and various taxpayers' associations have indicated their disapproval. Then there is the doubt that a government agency which paid a considerable part of the cost of the piper would refrain from suggesting the tunes, however careful a distinction the Act makes between policy and finance. Many of those who fear Federal interference in policy in a programme of support of current running expenses, however, are in favour of a Federal programme to help meet construction costs. Bills similar to the Hospital Construction Act of 1946 have been introduced in both Houses.

Two other objections concern minorities. Funds under the Act would be available for public schools only, except in the sixteen States which already use State funds to support non-public (mostly parochial) schools. The recent Supreme Court decision upholding the use of tax funds in New Jersey to transport pupils to parochial (i.e. Catholic) schools reaffirmed the principle that separation of Church and State must be maintained. Catholic objections in the North are reinforced by Southern alarms over the maintenance of segregation under the Act. A Federal district court in 1940 held that States must not discriminate with respect to teachers' salaries on a colour basis. Led in a number of instances by the National Association for the Advancement of Coloured People, pressure for the provision of equal facilities in elementary and secondary schools is being increased throughout the South. So far, the Courts have regarded the provision of equal facilities within each State as

constituting equality of opportunity. The declaration in the Education Bill that no State shall have to change its constitution to apply for benefits is intended as an assurance that the question of segregation—embedded in the constitution of most Southern States—will not be raised. Nevertheless doubts exist in the minds of some Southerners, in part as a result of the failure to pass, at the last session of Congress, a Bill permitting States to make compacts for the purpose of supporting regional colleges. This measure was intended to permit the organisation of a number of advanced schools of medicine, law, and the like, for Negroes. The establishment of equal facilities, in each State separately, for the number of Negro students now qualified to enter would be more expensive and less efficient than if the States operating segregated school systems consolidated their resources. The measure failed because adherents of non-segregated schools attached an anti-segregation rider.

Yet despite all of the reasons why individuals and groups oppose Federal aid, an educational deficit is accumulating which demands action. It shows up most sharply in current figures on teacher shortages. The economic magnetism of other occupations can be appreciated from the fact that in 1946-47 nearly 54 per cent of teachers in public schools were paid less than $2,000; 16 per cent less than $1,200. In terms of salary, lifting the mind in a public school is less rewarding than minding the lift in a public building. In 1941, 90 per cent of the students in teachers' colleges were preparing to teach; by 1947, the percentage had dropped to 67 per cent. Men teachers are becoming a rarity; the relation between pay and availability is seen in the fact that 21.1 per cent of teachers are men in the twelve States with highest expenditures on education as against 9.6 per cent in the twelve lowest States. Last year the crop of new teachers numbered 19,964. The normal annual turnover due to death, retirement and resignation is 70,000. This year's increased enrolments require 20,000 new teachers. One teacher in eight is serving on an emergency substandard certificate—30,000 to 50,000 of them would be replaced if their boards could do better. All told, the present deficit runs somewhere between 150,000 and 175,000 qualified teachers.

American Notes

The Dewey Doctrine

Of the four major Presidential candidates, Governor Dewey alone appears to have realised that it is the foreign crisis which is in the forefront of men's minds and to have matched his campaign to the hour. Even before the breakdown with the Russians he had insisted that peace was the nation's most urgent domestic problem and unity its best defence. This strategy has the advantage of relegating the Eightieth Congress—and President Truman's attacks upon it—into the shadowy and rather discreditable background. But it also reflects the real anxieties Americans are feeling and the major problems any new Administration must face.

The most important speech of the campaign up to the present has been Mr Dewey's outline of foreign policy at Salt Lake City. None of the points he made was entirely new, but besides giving overwhelming support to the American position at Paris, the speech suggested that the Republicans will want to move faster in Europe and farther in China than the present Administration. The greatest monument to the American Century, in Mr Dewey's view, would be the creation of a United States of Europe; he insisted that economic aid should be consciously used to "push and prod" Europe into a federation which would provide a third force as a bulwark for peace and a guarantee that American generosity would not be frittered away in mere relief.

The funds provided last June for the Marshall plan will all be allocated by April 1st; early in the new session Mr Hoffman will have to apply for a supplementary appropriation for the second quarter as well as laying the groundwork for the second year's appropriation. In the Foreign Assistance Act the federation of Europe appeared only as an aspiration in the preamble. With the growing risk to peace, it has become the greatest of unwritten conditions of aid. When the appropriations come before Congress there will be strong support for linking them with the progress toward breaking down national barriers which in the United States seem obsolete and dangerous as well as wasteful. Whatever the dangers of forcing the pace in Europe, Governor Dewey may, with reason, feel that without concrete political achievements in Europe there is a risk, not only to further aid, but of a disillusionment with Europe which might lead to a new form of isolationism.

* * *

First Round of the Campaign

The first round of the campaign is over: Mr Dewey is back in Albany, Mr Truman in Washington. So far Mr Dewey appears to have outgeneralled the President as successfully as he himself was outgeneralled by Mr Roosevelt four years ago. His statesman-like preoccupation with foreign affairs and the national unity has been contrasted unfavourably with the ease with which Mr Truman left Washington at a time of crisis to pursue his election vendetta against Congress all the way to the West Coast. While Governor Dewey was looking every inch a President and recalling Mr Dulles from Paris for consultation, Mr Truman's absence is taken by his critics as final and incontrovertible proof that he is far from indispensable to the conduct of affairs in Washington. This was a mistake Mr Roosevelt never made.

The Democrats, for their part, accuse Mr Dewey of running a "campaign of cliches" and of taking refuge under the umbrella of the bipartisan foreign policy from the real issues before the country. Mr Truman has taken for granted the fact that there is unanimity on foreign policy, and has tried, sometimes rather crudely, to keep alive the issues of social justice which will be important long after the Russian menace has faded away. Controversy and hard hitting also would, it was thought, bring out the heavy vote usually considered to be favourable to the Democrats. But judging from the registration figures in New York City, the poorest since 1936, the campaign has failed to catch fire.

On the other hand, the maturity and responsibility—and probable success—of the Republican campaign was rewarded this week by the announcement, in what Mr Alistair Cooke has well described as a three-column encyclical, that the *New York Times* will support Mr Dewey. This paper, which, despite its Democratic traditions, prides itself on its independence, supported Mr Willkie in 1940 and Mr Roosevelt against Mr Dewey in 1944, using foreign policy as its touchstone. This year it concludes that Mr Dewey has a firmer grasp on foreign policy than he had in 1944 and that his irrevocable commitments to the Marshall plan, American military strength, and a bipartisan foreign policy are proof of a new and vigorous Republican internationalism which can be counted upon to overrule the party's provincial and isolationist elements.

* * *

Freedom for Food—and Aluminium

The Anti-Trust Division of the Department of Justice is bringing its year-long drive to free the production and sale of food from monopolistic restraints to a not unexpected climax at the height of the election campaign. It has followed its recent attempts to deal with the high prices of milk and eggs by filing suit against the four leading meat-packing firms—the Armour, Swift, Wilson and Cudahy Companies—and is seeking to divide them into fourteen separate units. These four firms, according to the Department, have accounted for well over half the total slaughter of livestock in the last ten years, and they are accused of suppressing competition by agreeing to control the amount of livestock each will purchase, by using uniform cost formulas and by selling at substantially identical prices. The companies naturally protest their innocence and point out that the Courts have not upheld similar charges in the past. In their view the suit is a purely political attempt to shift responsibility for inflationary prices.

Certainly the Administration will not lose votes by a move which offers the housewife a plausible explanation of why meat remains the most expensive item in her budget without putting the blame either on the farmer or on her own greed. But, owing to the slowness of the judicial process, the suit cannot have any direct effect on meat prices until long after the election. By that time they will probably have fallen in any case, as the result of the straightforward working of supply and demand, which is the chief reason for their high level at present.

In the opinion of the Aluminum Company of America, it is political considerations again which have caused the Department of Justice to renew its attack upon the company at this moment. The electoral advantage of showing solicitude for the small business man may also have something to do with the investigation of the Dupont industrial empire which has just been opened. When, in 1945, the Courts decided that Alcoa had in 1940 monopolised the aluminium ingot market, the decision whether that monopoly still existed was left until the end of the war. Alcoa insists that the sale of surplus plants to two other firms, who now control half the aluminium ingot market, has restored competitive conditions, but the Department of Justice argues that Alcoa still dominates the industry entirely and has asked the Courts to force the company to reduce its power and size.

The Department cannot be unaware of the political ramifications of its present activities, but the increase of $1,000,000 (to nearly $3,500,000) in this year's appropriation for the Anti-Trust Division has certainly a good deal to do with the new energy which has been injected this autumn into the fight against "conspiracies to maintain or increase prices of food, clothing and housing" and against the increasing concentration of economic power. Business men who hope that a Republican Administration will turn a blind eye on monopolistic practices should remember that it was a Republican Congress that provided this increased appropriation and that the first President to make a name for "trust-busting" was a progressive Republican, Theodore Roosevelt, in whose footsteps Mr Dewey appears willing to follow.

* * *

Red Herring Rampant

If coats of arms were drawn up to commemorate campaigns, that of 1948 surely should bear a red herring rampant. The House Committee on Un-American Activities has called upon the Attorney-General to indict five men and women for wartime espionage in connection with atomic energy research. Its interim report suggests that two scientists at work on the bomb can be linked with a mysterious Arthur Alexandrovitch Adams, a Soviet agent now vanished; another with a native Communist, and a fourth with a Soviet official. But the report fails to live up to its advance billing as a rival to the Canadian spy-trials; it shows that espionage attempts were made by the Russians (as indeed, who could doubt) but fails to prove that information of importance was transferred. The Committee, so far, has failed to find a Gouzenko. Mr Clark has refused to prosecute, on the ground that the Committee has produced no new evidence to justify an indictment, and that the proposal was pure publicity-seeking. But it will take a better answer than this to satisfy those alarmed by Government inaction, though it will hardly be produced by the old threat to impeach Mr Clark for obstructing Congress.

The temporary chairman of the Committee, Mr McDowell, who recently alleged that the indictment of the twelve Communists had purposely been drawn with loopholes for their escape, is now to have to support his allegations before a Grand Jury; the Department of Justice is considering an investigation into Mr Parnell Thomas's alleged malpractices; and Mr. Alger Hiss has at last brought his suit for slander against Mr Whittaker Chambers for calling him a Communist. At a higher level, President Truman has redeemed, to a great extent, the mistake he made when he flung the "red herring" charge at Congress. In a speech reducing the spy danger to its proper proportions, he urged that the Communist danger without is infinitely graver than that within; the loyalty review programme has found less than three-tenths of one per cent of all the 2,000,000 Federal employees open even to suspicion. He insisted on the importance of maintaining democratic safeguards both to protect innocent reputations and prevent the demoralisation of the civil service. Governor Dewey, however, has not been able to resist the ominous applause greeting statements that after January 20th there will be no more Communists in the Government—and the implication that at present it is riddled with them.

But few liberals at this stage will feel they can quarrel with the decision of the Atomic Energy Commission to instruct two of its contractors, the General Electric Company and the University of Chicago, to refuse to bargain with two unions whose officers have refused to sign anti-Communist affidavits. This alone would constitute no proof of Communist control, but there is no lack of evidence that the policy of the two unions which will be affected—the United Electrical Workers and the United Public Workers—follows the party line faithfully. The risk is not only that they may have access to secret information, on atomic energy, but that work on atomic energy projects might be disrupted. It is hoped that pressure of this kind may persuade the union members to replace their leaders.

THE WORLD OVERSEAS

State and Workers in Hungary

(From a Special Correspondent)

SINCE the beginning of this century the masters of Hungary, for one reason or another, have fitfully urged the country towards industrialisation. Now this aim is being pursued in deadly earnest—it is, after all, the only obvious solution of the problem of the over-population of the Hungarian countryside. The Three-Year Plan, which was launched in August, 1947, is still hampered by reconstruction needs; but it is hoped, nevertheless, to complete it by the end of 1950, and to go straight ahead with a new Five-Year Plan and a longer-term electrification project.

Planning goes hand in hand with nationalisation; mining and heavy industry, and indeed all concerns employing more than a hundred people, are now owned by the Hungarian state, which has, since March, become the employer in 85 per cent of Hungarian industry. As the state tends to become the only employer, it also tends to become more Communist in political quality. What kind of employer is this Hungarian Communist state? Efficient, but unloved, would be the briefest accurate reply.

Hours worked and wages at present received in the factories of Hungary are regulated according to an agreement which was worked out by trial and error during the last three months of 1947. A 48-hour week has been established. This generally means working from 8 a.m. to 5 p.m. from Monday to Friday, with a paid half-hour off for lunch, and on Saturday from 8 a.m. to 1.30 p.m., or in any case for 5½ hours. The factories provide a good midday meal at a nominal price. Wages, raised by 15 per cent in the previous August, are based upon average output in September, 1947. They vary from a minimum of 1 forint (5d.) an hour for unskilled work to 2.50 forints for skilled labour. If one produces more than average output one earns at a very slightly higher rate. Income tax is automatically deducted, but insurance (30 per cent) is paid by the employer only, that is—except for such categories as domestic service or shop assistant work—only by the state; and whereas the insured worker received the sketchiest medical attention before the war and the revolution, he is now as well cared for as anyone, except perhaps the very few people who still have money to spend on private doctors. A fortnight's paid holiday is the rule. The most conspicuous difference between the old private employer and the new state is that the former probably lived in a private house near the factory and that this house has now usually become a Communist nursery-school for the factory workers' children.

Thus the workers' life is well organised but hard. Owing to the austere financial policy of the Government, prices have been high, and the wages indicated above provide the working man with very little purchasing capacity, though he is able to buy bread more cheaply than people who earn more than 1,500 forints a month. During the last few months food has become more plentiful and therefore cheaper; there has been a big drop in the price of sugar. Budapest bus and tram fares have fallen, but one forint even now only pays two single tram fares. Wealthy visitors passing hastily through the capital believe that one can buy everything for money, but this is not true; there are shortages which come and go rather as in Britain—they depend upon seasonal conditions, Russian demands and the requirements of Hungary's export trade. The working people's most frequent complaint is familiar enough, too, for it is about their miserable housing conditions. The Government has, indeed, deliberately

invested capital in the reconstruction of communications, and especially of the bridges over the Danube, rather than in any kind of housing; it is significant that Gerő, whom many consider to be the most important political personage in Hungary, should be Minister of Transport.

Hard living conditions help to account for the lag in production which is still rather below the prewar level. Through a big increase in the number of miners more coal is being produced than in 1938, but it is less per single miner. Poverty of output is a general postwar phenomenon whether in western or eastern Europe, especially in over-populated countries which need foreign currency in order to pay for essential raw materials and are therefore trying to export goods which require intricate workmanship. After a war skilled labour is hard to come by, particularly in a country which draws its labour reserves from an overgrown peasant population. The Hungarian Government is doing a good deal to extend technical education, and picked factory workers are let off two hours work a day in order to receive four hours' evening instruction in their jobs.

No Right to Strike

The last Magyar prisoners of war are now returning from Russia. They, like the agricultural labourers who still have no land, are difficult to employ and tend to remain unemployed. There is in fact a fairly high unemployment figure, and one sees a good many beggars in the streets of Budapest—they are very often peasant women. The trades unions are responsible for unemployment relief, but even today only a small proportion of women workers are enrolled as members of trades unions.

No doubt the majority of working people in Hungary, as in most other countries, is mainly occupied with making both ends meet—in Eastern Europe one has always expected to be at the mercy of authorities whom one cannot control. Before 1945 the severest penalties were attached to holding Communist views which were likely to condemn a man to death or long-term imprisonment. But in a quiet way the Social Democrats had built up a big trades union movement. It was true that it was liable to police interference at the slightest provocation, but it was able to create a certain solidarity and some possibilities of self-help. Though there was a good deal of Nazi talk at the big Manfred Weiss machine factory at Csepel outside Budapest before and during the war, the most intelligent and reliable workmen were bound together in the socialist trades unions. In 1945, when the country was liberated from Hitler and war, the Social Democrats hoped to take the lead in the organisation of industry. In June of that year works committees were set up in every factory with more than 20 employees, and for some time they exerted a good deal of influence even in the matter of management. The trades unions become extremely powerful and were able to obtain a number of advantages for their members. Inevitably lengthy and bitter disputes arose between Socialists, Communists and those of other political complexions within the committees and the unions. By 1947 the Three-Year Planners were not prepared to allow time and energy to be dissipated in dispute, and when the Plan was initiated the right to strike disappeared; for to strike can be made to look like sabotage and the National Planning Office can demand the death penalty for those who sabotage the Three-Year Plan.

End of the Social Democrats

During the first half of the present year the Hungarian Social Democrat Party was eliminated, for it was too humane and it had too many political principles. Those of its members who did not wish to split with the Communists have come into the Communist-deminated Hungarian Workers' Party; the rest have retired and, retiring, have lost their jobs: they are not actively persecuted but they cannot find work. They receive no help from the trades unions which have also become Communist preserves. Since the nationalising decree of last March the Communist or Workers' Party controls both the employing machinery and the organisation of the employed; in other words the trade unions would seem to have become superfluous. They are being preserved, one presumes, in order rather to gain the workers' sympathy for their employer than the employer's sympathy for the men.

The Communist leaders make no bones about it—they know very well that they are not popular even with the industrial working class. On September 19th Jozsef Révai, who is the Communist publicity chief and editor of *Szabad Nep*, the chief Workers' Party newspaper, announced in that paper itself that it is read by only 12 per cent of the Party; he added the figures for the leading Budapest factories—in the Ganz factories 30 per cent of the Party read their own paper, at Csepel 20 per cent and at the big MAVAG factories, where 6,000 out of 8,000 employees are Party members, only some 780 read *Szabad Nep*. That was three weeks ago and Révai's revelation was to begin a campaign which should change the state of affairs. It is unlikely, however, that the working people will really change their attitude towards a regime which has revoked the right to strike and made destitute some of the Socialist leaders in whom they had most confidence. There is a certain anti-Semitism mixed up with their feelings, too, for all the leading Communists are Jews.

It is a little curious to reflect upon the striking similarity between the sociological views of the Communist rulers of Hungary and of some of the most influential citizens of the United States—"Efficiency first and never mind about political principles." Gerő has made some Socialists uneasy because he employs the best technicians regardless of their political past, just as the United States wish to mobilise the technical ability of Germany. The Budapest Communists have no time for democratic discussion in the management of industry. They think we overdo rationing in Britain. And in finance the Hungarian regime is as orthodox as its most orthodox political opponents.

The New Zealand Pound

[FROM OUR NEW ZEALAND CORRESPONDENT]

NEARLY two months have passed since the restoration of New Zealand currency to parity with the pound sterling. It is still much too early to assess the full effects of that dramatic action. Indeed, a year or more may be required to test the wisdom of the decision from New Zealand's point of view. Only now is the period of economic readjustment beginning. But, despite the somewhat critical tone of British comment which has been cabled to New Zealand, return to parity has been accepted with equanimity in New Zealand itself. Now that the shock of Mr Nash's Budget night announcement has subsided, the general inclination is to regard the change as a restoration of national self-respect.

It is felt in New Zealand that British criticism may have been influenced overmuch by Canada's dubious example in revaluing its currency.

The *New Zealand Herald* argues that Canada's revaluation was largely in terms of dollar, not sterling, exchange. By achieving parity with the United States dollar, Canada rendered itself liable to a sudden influx of imports from the only country in the world which has a wide range of exportable surpluses and which, incidentally, has the greatest ease of physical access to the Canadian market. A point of strength in New Zealand's present position is that its revaluation of currency is not an attempt to "buck the dollar." New Zealand may hope to gain from a reduction in the price of dollar imports, but, as a member of the sterling area, dependent on its dollar pool to cover its balance of payments with the United States, New Zealand cannot at this juncture encourage an unlimited flow of American imports. The appreciation of New Zealand currency is with sterling; it is with Britain that New Zealand carries on the bulk of its trade.

New Zealand's vital dependence on its exports of primary products—particularly wool, meat and dairy produce—has caused most attention to be given to the effects of the exchange rate decision on farm finance. It was to offset the fall in overseas prices for primary products that New Zealand depreciated the rate of exchange to £125 NZ to £100 sterling in January, 1933—the rate at which it remained until August 19th last. What, then, are the likely effects on the farms of return to parity?

Effect on Farmers

Last year New Zealand sheep-farmers received a record wool cheque of £37,500,000. The exchange decision will automatically cut the cheque by 20 per cent. While this is a heavy blow it is one which might have been caused by normal market fluctuations. The world still wants wool. But New Zealand's total clip has shown a tendency to decline. It remains to be seen whether increased production can partly offset the loss on exchange. But because wool lacks State guarantees or reserve funds, the exporter of wool is in the least enviable position of any section of the farming industry.

New Zealand's total exports in the year ended March 31st, 1948, produced £140 million so that on those figures the loss through the exchange decision would be £28 million. To "cushion" that loss, increases gained in new seven-year contracts will provide £9,600,000 (dairy produce £5,200,000 and meat £4,400,000) and sums placed in "pool" accounts last year

under the stabilisation policy will produce £11,700,000 (dairy produce £5,700,000 and meat £6,000,000). Thus, on last year's figures, the deficiency remaining would be £6,700,000.

In addition, there has to be taken into account the benefits accruing to farmers through the effect of the new exchange policy in cheapening imports. Some of the most significant items are farm machinery, fencing wire and rock for superphosphates.

While, then, the overall picture may show that New Zealand farmers face a substantial cut in income, there are compensating factors which support the Government's view that the return to parity with the pound sterling has been made at the most appropriate time. The new contracts made with Britain for meat and dairy produce in particular should stimulate production.

Internally, the Government's hope is that the exchange policy will substantially reduce costs. How far the decision was political and how far financial is still being argued, for there will be a general election in New Zealand toward the end of 1949, and the Labour Government's majority in the present Parliament is slender—42 seats against 38.

Demand for Higher Wages

Industrial Labour has refused to be appeased by the promise that the exchange decision will have widespread effects in reducing costs, and through the Federation of Labour (the central trades union organisation), new wage demands are now being formulated. Eighteen months ago the wage demand from the unions was "£1 a week or else," and from October 1st of last year the result of this demand was an increase of 10s. a week in the general wage level. The 1948-49 demand for "£2 or else" is now being prepared.

The National Council of the Federation of Labour, when it met in Wellington late in September, instructed an apparently reluctant National Executive to act upon the decision of the former council in February last to ask the Government for an amendment to the economic stabilisation emergency regulations to enable an approach to be made to the Court of Arbitration for "a greater share of the national dividend for the workers as a class" rather than for the restoration and preservation of wage relationships between various sections of the workers, as has been the Court's practice.

The National Executive has also lately followed a policy of overhauling the price index as a means of establishing a basis for wage rates. This policy, however, has caused delay, and will no doubt involve much more delay before a general wage adjustment, if any, can be claimed. The National Council is insistent that an entirely new clause is essential in the stabilisation regulations to ensure a substantial further wage increase. How soon pressure within the unions will develop and what the Government reaction will be are questions to which the answer will be keenly awaited.

But it is still too early to judge the effect of the new exchange rate on internal prices. The prices of some imported goods have fallen. Motor-cars, bicycles, some motor accessories, paint and wallpapers are already cheaper. But many traders do not want to cut prices of English goods until stocks now on their shelves have been cleared. Mr Nash conceded that such people "might worry a little in the meantime." He said, however, that he was convinced on the evidence of the demand that they should be able to clear a fairly large part of their stocks before any appreciable quantity of new goods arrived. The wisest course, he suggested, was to meet the situation at once; then, when the new goods came in, a rate of prices would rule that would be beneficial to all.

Trade With Australia

Another "worrying" aspect of the new exchange rate is the effect on New Zealand's export trade with Australia, which is reported to have cancelled orders for New Zealand fish, canned tomato goods, processed cheese, crockery and certain wood products. Fiji, too, is reported to be transferring foodstuff orders from New Zealand to the cheaper markets in Australia. As a sidelight on the effect of economic relations with Australia, New Zealand tramways are virtuously refusing to accept Australian coins tendered by passengers, and gas-meter readers are accepting Australian shillings only at a discount.

However, it is not expected that any serious trading difficulties will arise between Australia and New Zealand over exchange. One significant indication of long-term planning between the two countries has been given since New Zealand restored its pound to parity with sterling. Australian newspaper interests will provide £800,000 of capital to enable a New Zealand firm to double its output of kraft (or sulphite) paper pulp. The contract

provides for variation of price from time to time "to suit prevailing conditions."

The Government's decision to adjust import licences in accordance with the exchange decision means that this year at least there will be practically no change in the volume of goods coming into New Zealand. Mr Nash has said that imports will be so arranged that their cost will not exceed current income. The rising cost structure in the United Kingdom and the ill-balance of stocks in New Zealand are two other factors, making difficult an assessment of New Zealand's future trading position. The unsettling trend of New Zealand's economy was shown by the trading figures for the year ended March 31, 1948—exports, £140,126,000, and imports, £138,390,000. This favourable balance of only £1,736,000 contrasted with £25,642,000 and £31,978,000 in the two preceding years.

Meanwhile, the public awaits the practical internal results promised by Mr. Nash in a national broadcast a few days after his exchange announcement—that there was no doubt that everyone would benefit, some immediately and directly and others by sharing in the national advantage. A few examples of cheapened goods have been quoted, but the signs are that no spectacular declines can be expected and that in some cases the effect of the exchange adjustment will be only to prevent rises, especially in some imported drapery lines.

From a political point of view the Government must have sympathetic regard for the people's pockets in the election year of 1949. Only minor concessions were given in this year's Budget, the main one being a concession of £10 to all income taxpayers. The exchange adjustment has been described as the first shot in the election campaign. While it has won fairly general acceptance because it enables the New Zealand pound to look the pound sterling squarely in the face, the taxpayers and the housewives will expect practical results in cheaper goods. But meantime the militant unions are unrelenting in their campaign for still higher wages. Whether a Labour Government can stimulate production and still hold wages at the present level may well be the test of the exchange policy.

Bulgaria Under the Communists

[BY A CORRESPONDENT]

THE main feature of today's Communist economic system in Bulgaria is the enormous role played by unpaid "voluntary" labour, controlled by two Government agencies: the Headquarters of the "Brigadier Movement," and the High Command of the Labour Army in the War Ministry. According to official figures there is at present a standing army of 250,000 brigadiers, an astonishingly high figure for a country whose entire force of manual workers is about half a million. Nearly four million men and women are reported to have served in the different brigades during the past three years. This summer alone there were 30,000 brigadier groups in the country.

Briefly stated, the system works as follows: all men and women capable of manual work "volunteer" to spend their annual month's leave in a labour brigade. After that the brigadiers are entitled to one week's free holiday in a Government hostel. While working in the brigade volunteers get free food but are not paid anything for their labour. Brigades have been formed in almost every Government enterprise, but they are used mainly in the construction of roads, railways, dams, barracks, etc.

Official figures estimate the work done by brigadiers during the first six months of 1948 at a value of one and a half billion levas. (1,200 levas to the £ according to the official Bulgarian rate of exchange.) The brigadier movement is voluntary in name only. Students who have not been brigadiers cannot go on with their university studies; civil servants who have not spent their month's holiday in the brigade are liable to be dismissed.

The second source of unpaid labour, the Labour Army, is believed to number some 100,000 labour soldiers, is part of the regular army, and is manned by conscripts. It was founded in 1921 by the then Agrarian Prime Minister, Stambolisky (it was successfully imitated by Hitler, on a large scale, in the middle thirties). These men live in barracks, are commanded by officers and receive military training as well. Their term of service is two years, and they are sent to work on enterprises where more skilled manual work is demanded. As soldiers they receive no special pay. The extent to which this labour is used can be seen from the official figures of all workers in the enterprises controlled by the Communist Government's Ministry of Road and Construction: 5,000 skilled workers, 10,000 non-skilled workers, 25,000 brigadiers and 30,000 labour soldiers. Bulgaria's economic dictator, Deputy Premier Traicho Kostov, has declared that "the brigadiers and the labour soldiers are the soul of the Bulgarian reconstruction and building programme."

Inducements for Peasants

The Communist policy towards the peasants marks a definite deviation from the orthodox Communist Agrarian line throughout eastern Europe. It seems that the Bulgarian Communists were directed to concentrate their war against the peasants mainly in the political field. Hence the hanging of the Agrarian leader, Petkov, and the savage persecution of all prominent Agrarian leaders. Economically, however, the Communists have been careful not to antagonise the peasants unduly. Thus, even now, the peasants are allowed to sell all their produce over the official Government quota, which has to be given to the state, on the "free market." This practice was strongly attacked by Left-Wingers within the Communist Party, but was defended by the Communist Deputy Premier, Kostov, with orthodox Capitalist arguments.

> The policy of allowing the peasants to sell their over quota produce in the free market should be continued, in spite of the fact that it gives advantages to the rich peasants and even to the kulak elements in the villages. This is necessary because the collective farms form only a small number of our farms, and there is no other way to guarantee the normal development of agriculture and the food of the people, besides allowing the peasants to be interested in getting a profit on the free market if they get bigger production.

The food and clothing ration system of Bulgaria is a curious example of the Communist idea of equality put into practice. It has six grades. The biggest rations go to the underground mine workers and "those considered at their level"—the party bosses and the senior Government officials. After them come the surface mine workers and the not so important party personalities; followed in their turn by the heavy manual workers, the white collar workers and, finally, the private citizen. Any worker who works overtime becomes a "shock worker" and receives double rations. The "intellectual workers" (writers, artists, musicians, painters, lecturers, etc.) also get double rations in food and clothing. People who are "not employed in a way useful to the community" are denied all rations.

Harvest Militia in Action

According to the Communist Press the economic plan of the country works very smoothly and has resulted in increased production in every field, with the exception of construction and building work under Government projects. Only 31 per cent of the Government projects in this field have been started. The Communists blame the "reactionary minded" engineers, architects and technicians for this failure, but the real reason is known to be an acute shortage of iron, cement and bricks.

That the peasants are still loyal to their executed leader, Petkov, is obvious from the extraordinary police measures which the Government has introduced for the protection of the crops. In addition to the "economic militia," whose aim it is to discover and punish "saboteurs and foreign agents who aim to disrupt Bulgarian economy," this summer—for the first time in Bulgaria, and perhaps for the first time in Europe—a special "harvest militia" was organised throughout the country. This consists of armed Communists who, under the direction of the Communist militia, form "harvest protection groups" to stand on guard in the fields twenty-four hours a day. A special decree forbade any harvesting or any other field work without the supervision of this new militia.

With the exception of Albania, Bulgaria has suffered more than any other Balkan country from the Stalin-Tito rift. Bulgaria's relations with her southern and south eastern neighbours, Greece and Turkey, are actually at breaking point, and this has shut her off completely from the rich Middle East market. Jugoslavia was Bulgaria's only outlet to the west and to central Europe. There are no direct rail and road communications between Bulgaria and Rumania; the construction of a bridge on the Danube was to have begun this year, but it has been postponed indefinitely owing to the lack of building material. Now the Jugoslav-Bulgaria frontier is virtually closed. This has made Bulgaria even more dependent on Russia for exports and imports. According to the latest figures nearly 85 per cent of Bulgaria's foreign trade is now concentrated in Russian hands—a higher percentage than the corresponding figure of German-Bulgarian trade relations (about 60 per cent) ten years ago.

Dressing Gown Diversity

On the question of dressing gowns, tastes are infinitely varied. Some men we know would live in them, given the opportunity; others scorn them outright. Some want only warmth, while others seek glamour ever more abundant. That's why we keep a very wide choice of dressing gowns in stock—in wool and rayon; in all degrees of weight and warmth; in self colours, checks, and designs both restrained and grandiloquent. From £5.8.6. (with 7 coupons).

Pyjama Paradox

If a sleeper has abundant latitude to toss and turn, the odds are that he won't. That is the principle on which our pyjamas are made. They are cut loosely and well. With two-way collars; in many cheerful designs on coloured or white grounds. From 12/11. 8 coupons.

PETROLEUM MAKES PROGRESS

Buried Treasure

Deep beneath the limestone rocks of Iran lie the oil-bearing strata. To locate and tap these precious stores of oil is work for geologist as well as engineer. The Anglo-Iranian Oil Company neglects no method known to science or industry of developing these great natural resources in the interests of progress. Last year the Company processed 18,565,507 tons of oil in its Abadan refinery alone—a proud record for Britain. And every ton saves precious dollars!

European Recovery—II

Factors in European Steel

THE problem of production in Europe has in certain ways shifted its ground since the Paris meetings in the summer of 1947. Coal has ceased to be the main limitation in industrial production; its place has been taken by steel. Coal is becoming more and more a problem of qualities and their utilisation, and of costs. Steel has not yet reached that point; it stands out still as an overriding shortage in total quantity, and no branch of production is exempt from the consequences. Signs that, even in steel, deficiencies which have so far been absolute may soon become relative, and may centre on specific qualities and types of product, can already be discerned. But the total deficiency is not yet overcome. It results from a general expansion of demand in Europe, and from the virtual absence from the industrial scene in the first three postwar years of the former principal European steel producer, Germany.

In simplified form the various national plans which were fitted roughly together last year at Paris are a long-term effort to replace the vanished (or merely suppressed) German capacity, together with an immediate effort to get high production out of the existing capacity in the countries outside Germany. But they are complicated in practice by other factors. The steel industries of Europe at the end of the war were not merely suffering from inadequacy in volume. The war had distorted, as well as reduced, the international flow of iron, steel and the raw materials of iron and steel. Techniques of production, and the balance between different products and types of steel, had been changed under pressure of circumstances, and plans had to be made to change them back. In every European country the war had prevented or delayed the replacement and improvement of plant, and in every national plan could be seen the desire not merely to expand but above all to improve and refashion the technical make-up of the industry to fit it for competition in future years.

Readjustments of this kind are necessary. There is, however, no automatic law which ensures that solutions designed by each country separately to meet its own necessities will result in a general solution of the necessities of Europe as a whole, or of the Marshall countries as a whole. This is illustrated by two of the points on which the plans collated last year at Paris were out of date almost as soon as they appeared. The plans proposed to repair some of the raw material deficiencies (particularly metallurgical coke and scrap) by getting more than 2,000,000 metric tons of crude and semi-finished steel annually from the United States; but the Americans quickly intimated that not more than a fifth of these quantities could be expected. The plans also required substantial imports of scrap from the United States; not only are these unlikely, but the scrap agreement concluded this week reflects the American determination to get scrap from Germany which the European countries had assumed would go to them—and which the Germans have shown little readiness to export at all.

These are merely two of the ways in which the flow of materials for steelmaking is likely to diverge—is, indeed, already diverging—from the pattern outlined in the original Paris plans. They will no doubt be reflected in the new plans now being digested by the OEEC. But what of the longer-term programme, the expansion and improvement of the steelmaking capacity of the sixteen countries? Taken together, the national plans for new steelmaking plant represent an immense effort of capital expenditure which will require self-denial in other branches of capital investment, and will of course absorb substantial quantities from current steel production.

The British plan alone involved, at 1946 prices, an expenditure of £168 million. It involves the building of 24 new blast furnaces, nearly 6,000,000 tons of steel furnace capacity and a corresponding increase in rolling-mill plant: in all, a gross expansion of about 40 per cent in British iron and steel capacity, spread over a period of about eight years. It is designed to produce not merely a larger industry but a more efficient and better-integrated industry; indeed, the plan as drawn up in 1946 included the scrapping of much old plant, so that the net increase in capacity would be considerably less than the volume of new plant installed. Even so, the net expansion in capacity to be achieved by 1951 (shown in Table II) was put at nearly 1,700,000 tons. This is to be accompanied by other advantages, notably a saving of 6 cwt. of coal in the blast furnace for each ton of pig-iron produced (as compared with the 1937 standard) and an increase, urgently needed, in the supply of sheets and tinplate. At the same time the exploitation of the low-grade Northamptonshire ore is to be expanded; the British plan assumed a continued world shortage of scrap.

Any assessment of the net effect of the British expansion must change, of necessity, as the execution proceeds. Costs of construction have risen in Britain, as elsewhere, since the British programme was formulated; they may affect the later stages of the programme in an unexpected way. Large parts of the British programme are designed specifically to reduce production costs, and the new plants will, of course, be more efficient than the old. But they will also have cost more than the old plants, and more than they were expected to cost when they were designed. British steelmasters have begun to consider whether efficient new plant, burdened with its inflated capital costs, will be so much more economical than the old plant after all. They (or their successors, if the steel industry is nationalised in the meantime) may therefore decide to keep old plant in service which they had originally intended to scrap. At the same time the new plant will go into production, and the effect may be a larger net expansion of British steelmaking capacity than was at first intended.

The largest of the Continental programmes is the French plan which requires an eventual expansion of French steel capacity to perhaps 15 million tons at a cost of more than a billion dollars. During the four-year period to 1951 it proposes to concentrate on the modernisation of equipment and the re-integration of the stages of production at a number of the French steelmaking centres. The French steel industry has lately shown itself unwilling to accept the scrapping of old plant which this will involve. But its contribution to annual steelmaking capacity during the four-year period was stated at 2,000,000 tons—still a big net expansion. Financial and political difficulties in France make it uncertain whether these objectives will be reached in the time laid down. And time is in a certain way an essential element of the Monnet Plan; for the plan assumes a fundamental rearrangement of the economic geography of western Europe which is only likely to take place if the restrictions on German output and German economic enterprise

are maintained. It begins to appear unlikely that those restrictions will be maintained in their full rigour for much longer. If they are not, what happens to the basic French thesis that the Ruhr coke must in future be taken to the Lorraine ore instead of the Lorraine ore being taken to the coal?

Of the remaining national plans only an incomplete picture is gained from Table II which shows not the total new capacity which is proposed but only the net increase in capacity which is to result. Thus Belgium is engaged on improvements in the finishing end of the Belgian steel industry, and the Belgian contribution to expanded production during the four years will probably be considerable; but Belgium estimated that there would be no change in the national total of steel capacity by the end of the period. The increase of only 124,000 tons in Luxemburg finishing capacity is only a modest reflection of the activity of the Luxemburg steel industry. Action by Sweden to expand the output of high-grade ore seems essential to the success of the European production plans, but no such prospects were held out in the Paris estimates. Indeed, Sweden's own intention of building new blast furnaces was expected to reduce the Swedish ore available for export. But there have lately been fresh discussions with Sweden by a number of users, and it now seems possible that Swedish exports may increase instead of declining. By using more rich ore the steel industries of western Europe have effected great savings of coke, and Swedish ore has already partly replaced coke as a limiting shortage.

In none of the plans for expanding the steelmaking capacity of the western countries does the possibility of getting plant as reparations from Germany play any important part. Some German steel plant has already gone to Russia—notably the Dinslaken strip rolling mill and the Krupp works at Essen-Borbeck—though nothing has been heard of any results which the Russians may have obtained in attempting to assemble those plants at their new locations. In their attempt at forward planning a year ago, the western countries arrived at a guarded formula: German reparations plants were important to them, but allocations (they said) were too uncertain to permit of their being included in any plans. Since then, allocations have made little progress. The resultant situation is a curious one. Reparations play their part on the debit side of the steel balance-sheet, for the Paris plans for western Germany assume that the dismantling of steelworks in the Ruhr and Lower Rhine continues. And dismantling is, in fact, proceeding at a little more than its previous lethargic pace; it began during the summer at the August Thyssen works at Duisburg. But there is no entry on the credit side. This may prove entirely realistic. A steelworks which was efficient in Germany may, after dismantling and transport, contribute little but scrap to the recipient country. But there is a further uncertainty whether the Americans will permit dismantling to go on at all. American ideas about the policy to be pursued in western Germany have become, since the inception of the Marshall Plan, increasingly difficult to ignore, and the United States has in the last few weeks asked for a fresh review of dismantling to ascertain its effects on the European Recovery Programme. Those effects are fairly simple to describe. The programme, as it stands and so far as the iron and steel industries are concerned, expects nothing from dismantling. But its estimates of national and European production in the years 1948 to 1951 assume that a third or more of the German steel industry will

be permanently out of action. If particular German plants are taken off the list, therefore, no national plan will be visibly affected. But the effects if the German steel industry were to resume production on the scale of which it is at present capable would be quite another matter. For the German steel industry would in that case again be a full competitor for supplies of coke, scrap, and high-grade ore.

In the past four months a number of happenings, some of them fortuitous, have enabled the steel industry of the Ruhr and Lower Rhine to revive at a startling rate. From 297,000 tons in April ingot steel production in the combined zones rose to 378,000 tons in June, 457,000 tons in July, and 510,000 tons in August. For some months in succession production has been well ahead of the monthly targets set by the bizonal authorities. There seems little doubt that the target figure of 5,725,000 tons for 1948 shown in the Paris report will now be exceeded, and that the figure of 8,188,000 tons for 1949 could be revised to something over 9,000,000 tons. The causes include currency reform (which has transformed the problems of recruitment and productivity), the Berlin crisis (which has diverted metallurgical coke from eastern Germany), and the Anglo-American differences over steel scrap (which helped to assure, during the late summer months, plentiful supplies of scrap to the German steel industry). Imports of Swedish ore have begun to arrive in Germany, and contracts have been made for expanded imports.

The immediate European steel problem is concerned more with the materials for making steel than with the steel plant itself. New construction, larger blast furnaces, new open-hearth plants, better plants for the pre-treatment of ores and for the preparation of scrap, may play an important part in bringing European heavy industry to the level of efficiency needed if it is to hold its own in the future. The problems limiting present production (they bear, of course, on the ability of Europe to provide the steel for new and better steelworks) are problems not of capacity, but of the organisation of supply and the economical use of materials. Pressure of coal and coke shortage since the war has forced the steelmaking countries to reduce heavily the amount of coke used to make a ton of steel, and this can be done. But it is done at the cost of making scrap a scarce commodity, and at the cost of neglecting the abundant deposits of lean ore and competing more and more keenly for the short supplies of rich ore. These are the problems which call most urgently for international planning.

High Shipbuilding Costs

"THE time is coming," declared the chairman of the Peninsular and Oriental Steam Navigation Company, at the launching of a new liner this week, "when shipowners will cease to place orders on a blank cheque." This is not the only occasion in recent weeks on which the industry has been reminded that the problems of costs and productivity are as important for shipbuilding as they are for any other industry. The shipyards have been fully occupied since the war on the rebuilding and reconversion of British liner and cargo tonnage; they have also been building an impressive tonnage for foreign owners; for two or three years they have been enjoying what looked like an unassailable sellers' market. Now the shipbuilders have been put on warning. Shipowners are much less confident than they were about future freight rates and the future volume of seaborne trade. They seriously question whether new tonnage built at present high costs can, over the long view of twenty years or so, earn much more than its mere keep.

That the shipbuilding industry has not already felt the effects of this hesitation is due to a number of factors: the length of time which has been needed to satisfy the abnormal demand for new ships to replace war losses, because of the sheer size of the programme; the much increased emphasis upon new tanker fleets, now that dry-cargo building is passing its peak; and the difficulty of the industry in obtaining a smooth flow of materials and a willing labour force to maximise both the volume and the speed of its output. A shipyard is first and foremost a place where the products of many industries are assembled and converted. To build a large passenger liner on the Clyde, or a whaling factory ship in Belfast, brings employment for many trades in all parts of the country, making a wide range of goods from steel, marine engines, electrical gear, tablecloths, taps or turbines to propellers, paint and plastics. At the moment British shipbuilders have orders for merchant ships on their books valued, at a conservative estimate, at some £325 million; the major portion of this considerable sum will eventually be distributed over many industries, large and small. The rate at which these multifarious ancillary industries can produce components for the shipyards has its inevitable effect on the amount of tonnage which can be completed in a given time. Conversely, any hold-up in the shipyards will influence the demand for these ancillary products. But to say that the efficiency of the shipbuilding assembly process is conditioned by the supply and cost of the many intermediate products which it uses is not to deny the importance of efficiency of management and the productivity of labour in the industry itself.

It is not easy to measure the precise effects of these diverse

factors upon current shipbuilding output. Shipbuilding is a continuous process, and even in ideal conditions it involves a lengthy period of production. Hence its results can be judged only over a fair period of time. Twelve months ago it was fairly clear that the delivery of ships was being delayed by the inability of suppliers of certain components, such as electrical equipment, to meet the demand, but these difficulties now seem to have been largely overcome, and supplies of components of this kind seem to be coming forward as fast as they can be used in the shipyards. Indeed, some firms which make ships' equipment may now be wondering whether they have not already outpaced the shipyards—an apprehension which in more normal times would only be induced by the absence of orders for new ships, and the threat, or sight, of empty berths. This new element of concern on the part of certain suppliers of components is in significant contrast to the fact that today British shipbuilders have more orders on their books than ever before, amounting to more than 4,500,000 tons gross.

There is no satisfactory statistical method of measuring the output of the shipbuilding industry. To measure completed ships merely in terms of gross tonnage is to overlook the possibility that the amount of work represented by two ships of similar tonnage may be very different. Moreover, different types of ships take varying periods to complete, with the result that wide fluctuations will appear in the figures of ships launched or completed if an unduly short period is taken. The six-monthly figures given in the accompanying table provide a basis for deducing the trends of output in the shipyards, though they do not tell the full story of all the work handled by them, which includes ship repairing and reconversion work and naval shipbuilding and repairing, for which no reliable statistics are available.

Source: *Lloyd's Register of Shipping Quarterly Shipbuilding Returns.*
* Figures taken from the *Monthly Digest of Statistics*, not strictly comparable with Lloyd's Register figures, which were not available for the periods concerned.

The outstanding feature of this table is the persistent rise in the total tonnage of ships under construction at the end of each period. For some time past the explanatory notes to the quarterly shipbuilding returns issued by Lloyd's Register of Shipping have regularly included the following formula: "It is to be remembered, however, that the tonnage of vessels under construction continues to be influenced by the delays which present circumstances are imposing upon the completion of ships, and the consequent prolongation of the time required for building them." The reiteration of this authoritative, but non-committal, statement invites speculation about the nature of the "present circumstances" which show some signs of becoming semi-permanent. The industrial disorganisation resulting from the fuel crisis and severe weather early in 1947, had serious repercussions on shipbuilding, which is largely an outdoor industry. At the same time, the large-scale programme of reconverting troopships to passenger liners of modern standard was at its peak, and was making heavy demands on labour and materials. In those circumstances the output of completed ships for 1947—958,000 tons gross—was creditable, and cast no reflection either on the efficiency of management or on the willingness of shipbuilders to work. After the milder winter of 1947-48, and the great diminution in reconversion work, the tonnage of completed ships might have been expected to rise more rapidly than present estimates suggest. The figure of 508,000 tons gross for completions in the first half of 1948 does not, it is true, include two or three large liners which have been or will be completed before the end of the year, but the industry itself estimates that the total for the year will be in the region of 1,100,000 tons, or about the average of the years 1941-44, when the industry was occupied mainly with naval work, which this year has been non-existent.

Comparison of the movement of tonnages laid down, launched and completed, indicate a hold-up in the progress of work on the stocks. A hold-up at any stage in the shipbuilding process can soon become serious, for efficiency depends on forward planning and provision, which are frustrated by any interruption to the smooth flow of work from one stage to another. The longer-term prospect for the industry can be measured by the amount of work for which firm orders have been secured for delivery over the next two to four years. This total amounts to some 4,500,000 tons gross; at present, 15 per cent of this tonnage is now fitting out, about 30 per cent is on the stocks, and the remaining 55 per cent is still waiting for berths.

Since there is no shortage of labour, nor generally of components other than steel, and the number of berths occupied cannot be increased, it seems plausible to attribute the slow rate of progress of work on the stocks to the shortage of steel, or to the unproductivity of labour, or to a combination of the two. Shipbuilders themselves are convinced that steel supplies are the predominant factor, and the majority of the workers would naturally be inclined to agree, for they are impressed by the occasional signs of underemployment where work is held up through lack of steel. The risk arises that the worker may be inclined to go slow to avoid "working himself out of a job"—not, as used to be the case, because there are no orders to follow, but because the materials may be exhausted.

Whether shipbuilding labour is putting forward its fullest effort is difficult to judge; when allowance is made for the installation of new equipment since 1939 it seems possible that it is not doing so. The establishment of joint production committees throughout the industry is intended to try every possible method of increasing efficiency and output. Such efforts merit support, but few things would have such a salutary effect on output in the shipyards as a regular flow of materials in sufficient quantities. When shipbuilders had control over the buying and stocking of steel, their efficiency in this respect had a material effect on production costs and economy in individual yards, but managements are no longer free to buy as they choose. But in this they are no worse off than other users of steel—and indeed last year they were probably better off than the rest, for their deliveries exceeded their allocations.

Delay in production inevitably adds to the cost of a ship. It is not the only or even the main factor which influences shipbuilding prices, but other factors being equal, delayed delivery means that a smaller volume of new tonnage must carry a greater burden of wages and overhead expenses. The rise of 5s. in engineering wages will add to the rise in direct costs, and it is likely to be followed by some rise in shipbuilders' wages. The effect of this and of the shorter working week can be compensated only by an increase in output.

At this point the demands of shipbuilders come into conflict with the demands of other users of steel, and the last word must inevitably rest with the Government departments responsible for allocation. Shipbuilders are apprehensive that any increase in steel supplies might be used as a bargaining weapon in the conclusion of trade agreements with some of their competitors abroad. The shipbuilding industry has a good export record, and its export potentialities are not, in fact, being fully used because output is still subject to the limitations on steel. Merchant ships for foreign owners to the value of more than £100 million are on order in British shipyards at present. In the first eight months of this year, ships and boats to the value of £26 million were exported—an average of £3.24 million per month, compared with the revised "Economic Survey" target of £2.15 million by the end of 1948. August, it is true, was an exceptional month, but the proportion of foreign work in hand is increasing, and exports should be at least £3 million a month at the end of the year. Ships built for British owners themselves have an export content, for they are the tools with which the shipping industry earns its invisible income and saves dollar freights.

Shipbuilding is not a luxury industry, and it is discouraging that it should be working somewhat below its maximum capacity. Until the industry's output can be brought nearer to its potential level of some 1,750,000 tons gross of merchant ships a year, however, there is little prospect of a fall in the cost of ships, nor even of a check to the continued rise. If building costs rise farther, shipowners will be the more reluctant to place new contracts when the current tanker shortage has been overcome (and 62 per cent of the ships not yet laid down are tankers), despite the fact that by that time there will be urgent need for replacing older tonnage which is still in use. Hopes of establishing steadier output and employment in the industry will then vanish and high costs will condemn it to a succession of boom and slump.

Business Notes

Gilt-Edged Advance Farther

History was made on Wednesday, when a bargain was marked in 3 per cent Transport Stock at par. This achievement would be the more impressive, but for the reservation that the price includes 16s. 3d. of accrued interest. But it marks the clear emergence of a new phase in the market. For two or three weeks past, it has been the gilt-edged market, and not equities, which have made the running when conditions were favourable. That in itself is not surprising given the readiness of investors in these times to gain what safety they can, and given too the comparative lack of attraction of equities. For the latter are tied down by dividend limitation; there is accumulating evidence that profits are far less easy to make; and even the strongest concerns are now having to tackle the problem of making adequate provision for capital replacement at to-day's high prices out of their taxed income.

* Flat yields.

But safety even in the gilt-edged market is comparative. And the surprising feature of the market's behaviour during the past week or two has been the readiness of buyers to absorb the "longs" and the undated stocks. There are suggestions that the departmental "tap" in 2½ per cent Treasury Stock is no longer flowing so freely. Institutional investment funds have returned and are exerting the now familiar pressure on a market relatively short of stock. It was Dr. Dalton's strategy to stoke these funds, and bend the market to his will. His successor has been more discreet and, it would seem, more effective, by letting the market do his work for him.

The table on this page gives a comparison of gilt-edged yields at several important dates under the two regimes. Since the Budget, the whole market (with the exception of its extremes among the shorts and the undated stocks) has advanced so steadily that gross redemption yields are 5s. per cent lower than they were in April. The recent interest in the undated stocks owes something to their relatively attractive yields, though the investor might pause to consider whether the extra 3s. per cent on "Daltons" is a reasonable evaluation of the difference between its one-way Treasury option from 1975 and the fixed final date of Transport Stock in 1988. Certainly, the pace in the undated stocks has been hot this week.

The Chancellor's American Trip

A few shafts of light have been allowed to reveal intriguing glimpses of Sir Stafford Cripps' crowded agenda in his visit to the United States. The immediate purpose of the visit, namely the business transacted by the governors of the International Bank and the International Monetary Fund, appears to have caused no untoward difficulty. Perhaps the most interesting glimpse that has been allowed to appear of the discussions on the work

of the Bank was the suggestion made by the President, Mr McCloy, at the final plenary session, that member countries should consider the question of making available for Bank financing some portion of their local currency subscriptions. This suggestion was obviously pointed at Britain. Sir Stafford Cripps pleaded that for the time being at least he saw little prospect of the United Kingdom making any part of its sterling subscription available for sterling loans by the Bank. He justified this by pointing out that Britain was already fully pledged in its commitments to export capital and make the corresponding unrequited exports. He hoped, however, that with a further increase in the volume of production in Britain the Government would bear in mind the desirability of canalising any additional unrequited exports it could afford through the operations of the Bank.

Outside the strict agenda of the Bank and Fund meetings the principal subjects of discussion appear to have been the transferability of sterling and the terms of the ECA loan to Britain. On the first of these subjects the Chancellor found representatives of the US Administration still inclined to prod Britain rather faster on the road to convertibility than the British Government wished to travel. American opinion still takes at its face value the British Government's statement that the suspension of convertibility in August, 1947, was a temporary measure. Administration circles in Washington are beginning to develop serious qualms about possible Congress criticisms of the abrogation of a fundamental clause in the Anglo-American Financial Agreement by the unilateral act of one of the parties to which *post facto* consent was given by the US Secretary of the Treasury without referring the matter to Congress. This renewed interest in convertibility has been given a topical peg by the proposed transferability of sterling contributions and drawing rights under the European Payments Scheme. The familiar British arguments against such transferability have again been propounded in Washington but, apparently, without bringing conviction. The Council meeting of OEEC in Paris which was to put its final mark of approval on the payments scheme this week has been postponed for another few days, a development which suggests that final agreement on this point has yet to be reached.

* * *

ECA Loan Agreement

Sir Stafford Cripps also succeeded in carrying to final agreement the negotiations on the terms of the ECA loan to Britain and the release of the sterling deposited as counterpart to ECA grants. The loan for the first twelve months of the Marshall Plan will amount to 300 million dollars. Interest will be at 2½ per cent, the loan is to be repaid over 35 years and there is to be an initial five-year moratorium on the service of the loan. The full terms will be published in the next few days.

Sir Stafford Cripps has been indefatigable in his public relations work. He has spoken to the Press at lunches and at conferences in Washington and New York. He has been "quizzed" on the radio networks. On all these occasions he has developed the theme of British recovery, of British sincerity in the cause of European co-operation and reconstruction and of the ultimate solvency of Britain by the end of the Marshall Plan period. The US Administration and representatives of ECA appear to have been duly impressed by the details of the four-year plan which is to bring Britain into balance with the Western Hemisphere by the year 1953. Dealing with the long-term programme of the whole group of Marshall nations Sir Stafford, before leaving the United States, made a statement which will surely find a hallowed place in future editions of Sir Ernest Gower's "Plain Words." "When the four-year programme is finalised we expect that as a result of the co-relation of the four-year programme of the eighteen territorial units we shall discover the most effective means of European co-operation." That was not the purest or most lucid note on which to finalise the Chancellor's visit to the territorial units on the other side of the Atlantic.

* * *

Marshall Sterling Released

Agreement has at long last been reached between the British Government and the Economic Co-operation Administration in Washington on the release of the sterling accumulated in the Treasury's special account at the Bank of England as counterpart of the ECA grants to Britain. The first evidence of that agreement was provided by the Bank of England Return published this week, which shows a fall of £49,282,000 in the amount standing in this special account, leaving in it a balance of £4,326,000. It was later confirmed by an ECA announcement that £50,100,000 of the counterpart fund would be used for debt retirement. This figure, it should be noted, is approximately equivalent to about 95 per cent of the previous balance, and thus leaves in the account the 5 per cent of the "counterpart fund" which, in accordance with the ECA Agreement, must be kept at the disposal of ECA to finance its administrative expenditure in this country and to be used for the stockpiling of strategic materials. It might be added that the whole of the amount remaining in this account is already far more than committed for one single stockpiling operation, namely, the American purchases of rubber. The £50,100,000 has been released in accordance with the provisions of the Economic Co-operation Act to repay Government debt, and has been applied in the redemption of the special interest-free notes held by the Bank of England against the moneys deposited in the special account. This operation is clearly shown in the Bank Return, where Government securities have fallen from £361.8 million to £315.9 million. One interesting implication of the decision to apply this money to redemption of debt is that no part of the special account sterling is being earmarked to finance the British contribution to the European payments scheme. When sterling is needed to provide resources under this scheme it will be raised in the normal way by fresh borrowing operations.

* * *

French Bills in London

The political and economic turmoil in France is being watched with some apprehension in the City. There is no free exchange market here by which to measure that apprehension. The only practical evidence of it is an increasing reluctance on the part of the discount market to take French bills, and the difficulties that are being experienced in maintaining the syndicates of acceptance houses which have in the past extended commercial credit facilities to France. One of the most important of these lines of credit, that for financing imports of sterling area wool into France, is at present due for renewal. Quite apart from the question of the risks involved, the problem of renewing commercial credits to France can hardly be divorced at present from the imminent coming into operation of the European payments scheme and of the outright contributions which the British Government will be making to France under that plan. From the French viewpoint, it may also be desirable to switch the financing of sterling area imports from a commercial credit basis to that of the drawing rights under the payments scheme. The credits bear interest and must be repaid. The drawing rights are outright gifts. Unless, therefore, the French authorities are out to raise all the wind that they can muster at the moment, both through gifts and loans, they can be expected to reduce the facilities they are at present enjoying on the London market.

If there is no open market in London in which to measure distrust in the franc, Paris effectively fills the void. In that market, what might be called the official free dollar rate has risen to 313.20 francs. The artificiality of this so-called free rate may, however, be judged by the fact that the rate for dollar notes has this week ranged at around 472 francs. Bank of England notes have also benefited by the flight from the franc, and have risen to their record price of 1,400 francs. These movements have been paralleled by rises in the prices at which gold has been quoted in the free market. If, as is all too evident, the strike movement can only be met by wage concessions, the time will soon arrive when the present official rate of the franc will have to be abandoned. The subject of another French devaluation is said to have been discussed at the International Monetary Fund meeting in Washington. The French representatives again urged the impossibility of fixing an economic and tenable parity for the franc, and suggested that the whole foreign exchange market might be freed, leaving rates to find their own level and thus avoiding some at least of the nefarious consequences of the dual regime of official and unofficial rates that has obtained since the last devaluation of the currency.

* * *

Winter Electricity Charges

The British Electricity Authority and the area boards have taken action, but without evident enthusiasm, on Mr Gaitskell's request to implement the main immediate proposal made by the Clow Committee. A surcharge of 0.35d. a unit will be added to the unit charge for domestic tariffs for three of the winter months. It seems probable that this is the smallest increase which the Ministry of Fuel and Power thought might be effective. The average unit charge in domestic two-part tariffs is about ¼d. But if fixed charges are taken into account, the average total price paid

THE

STANDARD LIFE ASSURANCE COMPANY

For Mutual Assurance

Established 1825 *Assets exceed £54,000,000*

SPECIAL ATTENTION IS DRAWN TO THE FOLLOWING CONTRACTS:—

1. **BUSINESS MAN'S POLICY** Inexpensive Life Assurance with options to convert at a later date to an endowment assurance either with or without profits.

2. **FAMILY INCOME POLICY** The ideal contract for a young married man: maximum life cover at minimum cost.

3. **POLICIES FOR CHILDREN** (*a*) "Public Schools" Policy. Provision for education by means of premiums spread over the early years of a child's life.

(*b*) "Early Thrift" Policy. Should be effected as soon after birth as possible to provide a splendid life or endowment assurance policy when the child attains the age of 21.

(*c*) "Family Protection" Policy. A policy on the life of a parent incorporating valuable options on the life of his child at age 21. Income tax rebate is allowed on the premiums.

An enquiry will bring full particulars.

BARCELONA TRACTION, LIGHT AND POWER COMPANY, LIMITED

REPORT BY PRIOR LIEN BONDHOLDERS' COMMITTEE

In its last Report the Committee said that it would make a further statement when the effect of the appointment of a Canadian Receiver was known. The Canadian Receiver has now through his Solicitors informed the Committee that he proposes to contest the bankruptcy proceedings in Spain. The Committee therefore now presents a further report.

1. Three weeks after its appointment, the Committee sent a Delegation to Spain to investigate the position there. The Delegation returned on May 10th and reported, inter alia, that :—

(*a*) They had been courteously received by the Spanish Authorities, who had afforded them all reasonable facilities for their enquiries, and they were assured that the rights and privileges of the sterling Bondholders would be fully borne in mind in all circumstances.

(*b*) In their considered opinion, after taking legal advice, the interests of the Bondholders would be well served by the Spanish bankruptcy proceedings against Barcelona Traction and, in any case, as Barcelona Traction had not attempted to enter an appearance within an extended time limit, those proceedings could not thenceforward be successfully challenged by Barcelona Traction or any other applicant.

(*c*) The Spanish Judicial authorities had instituted proceedings in the Criminal Courts against certain officials and former officials of Barcelona's subsidiary, Ebro Irrigation Light and Power Company Limited, on charges of misappropriation of funds involving large sums of money. The Spanish Receiver informed the Delegation that the basis of the charges was that there was insufficient evidence in the Spanish books of Ebro to indicate the manner in which such money had been expended.

(*d*) Arising out of the matters referred to in (*c*), proceedings against the Ebro Company itself for the alleged export from Spain without authority of over Pts.40,000,000 (which at the present official rate of exchange is equivalent to over £900,000) were under consideration by the Court having jurisdiction in currency offences.

The Committee has to report that these proceedings for currency offences have since been formally instituted and a provisional embargo of Pts.410,000,000 (equivalent at the current official rate to over £9,250,000) placed on the assets of Ebro, which are the principal underlying security for the Barcelona Traction Bonds.

2. The only interest that the Prior Lien Bondholders have in the matters referred to in 1(*c*) and (*d*) above is the extent to which the payment of Barcelona Traction's indebtedness to them may thereby be prejudiced. The Committee has seen Ebro's recent statement in the Press to the effect that all funds of the Ebro Company have been fully accounted for and that the charges of misappropriation are wholly unfounded. The Committee feels, however, that the Bondholders are entitled to further information on the following matters :—

(*a*) If Pesetas have, in fact, been exported from Spain, the currency in which they became available, and

(*b*) the manner in which such exchange was utilised and the reasons why it could not be made available for payment of interest on the Bonds of Barcelona Traction.

3. In view of the Delegation's report, the Committee on May 20, 1948, asked the President of Barcelona Traction for information on various matters, including whether any funds had been transferred out of Spain, and if so, what had happened to the countervalue as indicated in paragraph 2 above. The President refused to supply the Committee with any of the information required and, further, did not accept the Committee's invitation to a joint discussion.

4. The Committee sent to the National Trust Co., Ltd., of Toronto (as Trustees for the Prior Lien Bondholders and the First Mortgage Bondholders) a copy of its communication to Barcelona Traction together with certain supplementary questions, including whether the Trustees had knowledge of any assets outside Spain. They also invited the Trustees to send a representative to London for consultation and suggested that the Trustees should call a meeting of the First Mortgage Bondholders to ascertain their views. The Trustees in reply said, inter alia, that they were not aware of any assets of the Company outside Spain except the "portfolio" held by the Trustees, a small amount of sterling in London and a small amount of dollars in Toronto earmarked for Head Office expenses. The Trustees refused to call a meeting of the First Mortgage Bondholders and instead of entering into consultation with the Committee announced their intention of applying immediately to the Ontario Court for the appointment of a Receiver. The Committee considered that this was a prejudicial step in the existing circumstances. After taking legal advice in Spain, the Committee is firmly of the opinion that the interests of the Prior Lien Bondholders will best be served at this stage by participation only in the Spanish bankruptcy proceedings. Therefore, as previously reported, the Committee protested strongly against the Trustees' proposed step being taken at that stage without full consultation. Nevertheless, in spite of the arguments put forward by the Committee, the Trustees insisted on the immediate appointment of a Canadian Receiver.

5. Having formed the above opinion, the Committee refrained from entering an appearance in the Ontario Court, since to do so would raise complications as to jurisdiction, but, through the Trustees, informed the Ontario Court of its objections. However, the objections were overruled, and a Canadian Receiver was appointed on July 15th, 1948.

6. The Committee is of the opinion that the information which it sought to obtain from Barcelona Traction, as indicated in paragraph 3, should be made available without further delay. It proposes therefore to request the Canadian Receiver to provide such information.

7. The Committee considers that the object of the Prior Lien Bondholders is to obtain, at the earliest possible date, payment in sterling of their capital and twelve years' arrears of interest. This object can, in its view, only be attained as a result of participation in the bankruptcy proceedings in Spain, where the underlying assets are situated. The Committee has accordingly entered an appearance in the Spanish bankruptcy in order to ensure that the interests of the Prior Lien Bondholders are directly represented, and it has now been advised that its appearance has been accepted. September 30, 1948.

by domestic consumers on two-part tariffs is about 1½d. a unit, so that the surcharge is a little under 25 per cent on the total bill. This is enough for the householder to feel—*though he is* consoled by the prospect of recovering it by a rebate over the remaining three quarters of the year. But is it stiff enough to achieve its purpose of flattening out the winter-peak of domestic power consumption in the cold months ?

No doubt the surcharge will have some effect ; in a mild winter, it might even achieve its full object. In a cold winter, when the need for economy is greater, the deterrent effect of an increase of less than a quarter is unlikely to be spectacular. And, as a note in *The Economist* of August 7th pointed out (and the announcement of the surcharge confirms), its incidence will have to be spread over a wider period than the three months (December, January, and February) at which the measure is aimed. With continuous meter reading, the period of the surcharge will vary from district to district, and in many houses a large part of the surcharge must fall out of the vital months. Thus the modest result obtained will be further watered down ; it may be useful, but it will probably not be enough. It is fair to suppose that the Clow Committee had in mind some stiffer increase than this. But, in the end, no increase of prices for all domestic current in winter can solve the problem of interference with industrial supplies at peak periods. For an effective reduction in domestic consumption at the peak, only maximum demand metering or devices to take domestic appliances out of service in peak periods can be ultimately effective.

* * *

Odeon Indebtedness

As might have been expected, the General Cinema Finance Corporation, whose capital was acquired by Odeon Theatres some nine months ago, proves to be the nigger in the woodpile in the first Odeon Theatres group accounts, for the year ending June 26, 1948. In fact, the consolidated balance sheet is so heavily weighted by the figures for GCFC that the more satisfactory position of the remainder of the group has to be discovered in the separate accounts of the parent company and the other subsidiaries. While there was no obligation upon Odeon Theatres to publish the accounts of GCFC, which is a private company, it was obviously wise to do so. But while shareholders may feel obliged for their inclusion, their content does not remove the doubts (especially on the part of preference shareholders) which were raised last December when, after prolonged public debate, Mr J. Arthur Rank revealed the position of GCFC as at September 28, 1946. Since 1946, short-term advances of GCFC from the banks, from other companies of the Odeon Theatres Group and from other sources have been increased from £7,094,098 to £12,891,001 though other current liabilities have been reduced by about £400,000. Moreover, of these short- and medium-term loans, £10,806,250 (compared with £5,876,525 on September 26, 1946) is represented by expenditure on film productions, of which £4,804,190 is attributed to released films and £6,002,060 to unreleased films, uncompleted films and film rights less amounts written off. While £5,231,310 of this indebtedness is of an intergroup character (which would not be reflected in the consolidated accounts), the remainder clearly accounts for a substantial part of the Odeon Theatre group's indebtedness of £15,263,382 for short- and medium-term loans. Again, the group item of £12,431,117 for film production and rights is only £1,624,867 more than the corresponding figure for GCFC. The accounts of the group are discussed in some detail in this week's *Records and Statistics* Supplement.

What is done is done. The question now is to consider the financial position of the Odeon Group as it now stands, with Odeon Theatres Limited as the parent company with the major part of the country's film production, distribution and exhibition under its sway. Mr Rank has stated that "whilst recognising the important part temporary bank advances play in the finance of our industry and in particular the film production side, my colleagues and I are not unmindful of the desirability as soon as practicable of rearranging on a long-term basis a substantial portion of this credit." But here is the dilemma. On its own profit record, GCFC alone scarcely represents an inviting long-term investment risk, though in the past year it has almost broken even, after showing a net loss of some £474,777 in 1945-6 The fact that it is now under the wing of Odeon Theatres may or may not improve that risk, though its presence there hardly enhances the investment status of Odeon Theatres itself. Evidence of this was forthcoming in the fall of the 5s. shares of Odeon Theatres to 30s on the day following the publication of the accounts.

In his latest statement Mr Rank expresses confidence that the balance sheet value attached to film productions which have been released (amounting to 44 per cent of the total investment of GCFC in film production) will be recouped from their exhibition. The report also states that the value of unreleased and incomplete films should be "good and recoverable"—they amount to just over £6,000,000 in the GCFC books, but "no final opinion can be formed until we see the finished product."

As for released films, the method of valuation is "not as satisfactory now as when the company started to trade more than ten years ago." The group is therefore feeling its way in step with the advice of the Inland Revenue towards the adoption of graduated amortisation tables by means of which the cost of each released film will be written off over the period of its estimated life. Obviously, even if the valuation should ultimately prove to be conservative, its present magnitude, erected on a basis of largely short-term credit, poses a major problem for the group and its bankers. The decisions not to enter into further fresh fields, to institute tighter control and greater centralisation, to eliminate a large number of subsidiaries of Gaumont British Picture Corporation whose results are in the past year less satisfactory, and not to increase dividends above the level of 1947 (though there appears little scope for any increase on the latest results) are first steps in the right direction.

* * *

Mr Rank and the Quota

Mr Rank, in his statement as chairman of the group, devoted enough space to the quota question to make it clear that the maintenance of the 45 per cent quota has become an important interest of the group. He described the 45 per cent quota as "realistic," and indeed stated that he had supported "whole-heartedly" the still higher figure (50 per cent) which was put forward by the Films Council. This was a change from his former public attitude on the subject, and he explained the change by referring to two considerations, neither of them of a particularly reassuring kind. One consideration was the indifference shown by Hollywood to British film interests when the supply of American films was abruptly stopped. This was not the only reference in Mr Rank's statement to the unsatisfactory state of relations with the American industry ; he said plainly later that the Americans had been making "no serious attempt" and taking "no active measures" to play more British films. Still, he intended to persevere in his efforts to secure reasonable playing time in the United States.

The second consideration referred to the independent British exhibitors—and here Mr Rank, who has been bitterly criticised by some exhibitors for appearing to assume the part of enforcement officer for the quota, acknowledged that he had been "examining very carefully the distribution and exhibitors' position in this country." He found that outside the circuits some 800 exhibitors were faced with no competition in their own locality:

> In spite of this, very few exhibitors were playing more than the legal quota of 17½ per cent and, in fact, there were many defaulters who did not play this percentage, though, had they wanted to support British productions, there were films available to them either from this group or elsewhere.

The implication—that British exhibitors were not playing British films because they did not want to do so—is plain.

This reluctance is now, up to a point, acknowledged by both sides. On the exhibitors' side it is attributable to two things: doubts about the quality of many of the films offered, and dislike of the commercial terms on which they are rented. On Tuesday

Fact-finding

In the RECORDS AND STATISTICS supplement to THE ECONOMIST more facts are put promptly on record than anywhere else in the world. By means of the cumulative monthly index, published in the first issue in each month, any fact that has been recorded in the current year's issues can be quickly located.

RECORDS AND STATISTICS is available on postal subscription only. The subscription rates are £2 10s. a year for RECORDS AND STATISTICS alone or £5 together with THE ECONOMIST.

The Economist, 22 Ryder Street, London, S.W.1.

Mr Rank met a delegation from the Cinematograph Exhibitors' Association which tried to persuade him to consider the booking plan drawn up by the independent exhibitors some months ago. They do not appear to have gained any concessions.

Few of the independent exhibitors have entertained any hopes of getting Mr. Rank, in the circumstances, to relax his booking terms. They have come to rely more on the possibilities of exemption from the quota, or at any rate of relief. Most of the decisions on relief from quota obligations have by now been made by the Films Council; the Cinematograph Exhibitors' Association is examining the Council's detailed answers to exhibitors' applications. Up to the present relief has been granted to 1,353 applicants and refused to 835; for the latter there are still possibilities of appeal. Since the quota is much higher than in previous years, it would be unwise to rule out the possibility that default may increase substantially the extent to which the quota fails to be observed. In the year 1946-47, with a 17½ per cent quota, 1,328 defaults by exhibitors were recorded by the Board of Trade. This was higher than in the preceding year, when the quota was 15 per cent and the total of defaults by exhibitors 1,149.

* * *

Easier Controls for Shipping?

Further revision of the present transitional arrangements for the control of British shipping is under discussion, but final details have not yet been worked out, as an announcement from the Ministry of Transport last Saturday was careful to point out. In the deep-sea dry-cargo trades, the present system came into operation in September 1947 for a provisional period of one year, the expiration of which has given rise to some speculation about the future. By agreement with the Minister of Transport, the shipping industry set up the Shipping Advisory and Allocation Committee, which undertook to allocate the available deep-sea tonnage required for the Government's programme of dry-cargo imports, and to advise the Minister generally on the arrangements to relate the supply of tonnage to the Government requirements. Every voyage still requires a licence from the Minister, who also retains his power of direction, although he has not had occasion to use it.

The ability with which the new organisation has handled the import programme during the year, including the Black Sea and Australian grain hauls, supports the case for a further relaxation of controls, but it remains to be seen how far the authorities will be prepared to allow a full return to normal commercial operation. The least that might be expected, perhaps, is an extension of the system in some form to include intermediate and short-sea trades, for the deep-sea dry-cargo programmes have been far more efficiently and economically handled by the Shipping Advisory and Allocation Committee than the short-sea programmes for which Government departments have been responsible. The most that could be done would be to remove all controls, but the Government is unlikely to let the strings go entirely; and so many departments are at present involved that it may not be easy to obtain unanimity of view among them. Those who support the principle of bulk buying of commodities by the State would probably be the most reluctant to see the licensing system abandoned, although they may be prepared to substitute some form of "blanket" licence for individual voyage licences.

As long as the world shortage of tanker tonnage persists, there is little likelihood of a return to a free market for this section, but there is no longer a shortage of dry-cargo tonnage. "Free" tramp freight rates, for example, are generally well below the level of those still subject to schedule, a fact which lends weight to the argument that the schedule should be finally abolished. Free and schedule rates would then naturally find a common level, certainly lower than the latter, but possibly a little higher than the former in most trades. This would confront inefficient operators, who are sheltered by the schedule, with stiffer competition, and some might even be eliminated; but the more efficient owners would be free to exercise their acumen in handling their vessels to the best advantage. In any event, greater participation in the cross-trades is more likely to lead to a further increase in the "invisible" earnings of British shipping (particularly hard currency earnings) than to any increase in the dependence on foreign tonnage for implementing British import programmes.

* * *

The End of Booty Scrap

A year ago the representatives of the sixteen Governments meeting in Paris pointed out that the United States had been, before the war, one of the main sources of steel scrap supply for Europe. Their hope that the United States could be persuaded to resume their part in the postwar world was quickly dispelled by Washington. But little more has come, so far, of the other European hope for scrap supply—Germany. Until June of this year, when currency reform made German scrap dealers for the first time willing to sell, contracts for commercial scrap rarely produced any results. Since then scrap exports have been held up by the Anglo-American differences which have just been resolved by the agreement concluded in Washington. The United States (the agreement clearly shows) must now be regarded as a major buyer of German scrap. There is, indeed, little in the document to reassure either the British steel industry or the other European consumers. Experience has made the British sceptical of the prospects of getting from Germany the 1,850,000 tons of scrap exports which the agreement talks of for the coming twelve months. They have a fair knowledge by now of the special technique required to buy scrap in the Ruhr and Rhineland. They have found that a contract in the brief-case is not the same as a consignment on shipboard, and that three equidistant dealers may well have claims on the same blown bridge. They have even mastered the procedure for dealing with the Joint Export-Import Agency. Knowledge of this kind has brought them advantages, but the material results have not been commensurate with the results of the booty scrap system, which has short-circuited the JEIA procedure and has so far provided the bulk of the scrap obtained by Britain, or by anyone else, from western Germany. Booty scrap is now, after a final 75,000 tons, to end. By any serious political standards it was high time for this decision, and the Foreign Office may well be grateful to Washington for helping them to it. But this does not make any easier the admission in the agreement of the American demand for parity with Britain in future allocations of commercial scrap. The authorisation of last May—200,000 tons to the United States, 300,000 to Britain and 100,000 to other countries—is confirmed. The British view that this arrangement gave more than was reasonable to the United States is well known, and was, indeed, one of the causes of the recent scrap deadlock in Bizonia. Further, another 100,000 tons is allocated to the United States "to bring the US share to parity with the above-mentioned UK share of 300,000 tons." Similarly, the United States is to get another 75,000 tons (but against payment) to match the last British booty consignment.

The other European countries gain no more than a prospect of collective parity with the British and with the Americans in future allocations. When the 850,000 tons already apportioned has gone, the collection of the next 1,000,000 tons is to begin, and this is to start with 125,000 tons for the United States, 125,000 for the British and 125,000 for the other countries together. These quantities are, of course, highly speculative. If they come true, they are an advance on what the European countries have been getting, but much less than they would like; the gap left by the lost American scrap supplies has still to be filled from somewhere. These countries do, however, gain a concession of principle which is not trifling. An *ad hoc* committee is to be established in Paris to recommend allocations of scrap exports from western Germany and the OEEC countries; it is to consist of representatives of all OEEC members and of the United States. It will have no over-riding powers; decision is to remain with the member Governments and in the Bizone (the only important exporter in the near future) with the military governors. But the interest of the OEEC countries—who include Germany's western neighbours—is recognised, and this is to be welcomed.

Three-dollar Crude?

The action of Phillips Petroleum Company last week in raising by 35 cents a barrel their price to Texas oil producers has caused natural concern about the prospects of a new general increase in American crude oil prices, which would soon (if it happened) exert pressure on world prices of crude and of petroleum products. It follows a period of agitation among the independent oil companies in the United States for an independent buying policy, and among the numerous small Texas oil producers for a higher price. But up to the present the majority of the "independents" have not followed the lead given by Phillips Petroleum: the principal exception is the Barnsdall company, which supplies to Phillips and which also buys largely in the same fields. These two companies are now paying three dollars a barrel for the largest range of Texas crude. Up to the moment the general price has not responded.

The major oil companies are perturbed and anxious at the appearance of what they regard as an inflationary buying policy. Economically they think it avoidable; politically they think it most inadvisable at the present time. Their intention is to resist any price-raising tendency at present, but the general shortage of

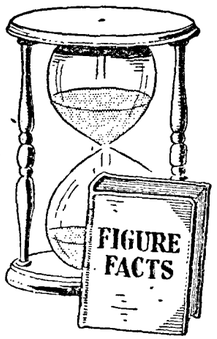
It's fun to fly by flying boat!

AGE-OLD CEREMONY
—New Style

"Crossing the Line" is celebrated with traditional trimmings on the Short flying boat. The "victim" looks very happy about his situation—he knows he can clean up in the well-appointed wash-room, have a drink in the cocktail bar, and then relax in the roomy cabin. His memories of his first "Crossing" will be the pleasant ones always associated with *flying-boat* comfort.

THE LAST LEG

On the promenade deck one of the Solent's stewards is pointing out places of interest on the last leg to Johannesburg. In a flying boat there is an unrestricted view from every window of the panorama below.



SHORT FLYING BOATS are flying all over the globe. By B.O.A.C. from Great Britain to Australia, Africa, India and the Far East. In Australasia T.E.A.L., in Scandinavia D.N.L., and in South America A.L.F.A., and C.A.U.S.A. are using Short flying boats, too. Your travel agent will give you details.

COURTAULDS

IN THE UNITED KINGDOM

No 8 THE WEST RIDING

COURTAULDS' associations with the West Riding of Yorkshire go back to the time when black silk mourning crape was the firm's speciality, and rayon was only a dream of science.

It was from a famous Yorkshire textile firm that the late Henry Greenwood Tetley joined Courtaulds in 1893, later to play the leading part in establishing the British rayon industry and laying the foundations of the Company as it is today.

In 1917 Courtaulds purchased Spring Hall Mills, Halifax, where they began to use rayon on a large scale for making furnishing fabrics. Then, buying their yarn from Courtaulds, other manufacturers soon followed the Halifax example.

Next, in 1937, the Company acquired Westcroft Mill, Bradford, then at a standstill, and equipped it with worsted combing and spinning machinery. There Courtaulds showed how their "Fibro" rayon staple could be spun into yarns for use in weaving the kind of cloth for which Yorkshire is famous, thus widening the use of rayon in the worsted industry.

During the Second World War Westcroft Mill provided yarn for Service blankets and garments, and Spring Hall Mills wove cloths for West Africa whence Britain obtained rubber, palm kernels and oil.

Finally, Courtaulds recently opened Bull Royd Mill, Girlington, Bradford, acquired in 1944. Here they are weaving, on the most modern automatic machinery, Yorkshire suitings and dress fabrics in which rayon staple is blended with wool.

Of over 25,000 people employed by Courtaulds in the United Kingdom about 400 are engaged in the Company's three West Riding Mills, each of which demonstrates under commercial conditions how rayon can best be used in one form or another.

This is one of a series of statements to inform the public of some part of the contribution made by Courtaulds' industrial enterprise to economic well-being in various districts of the United Kingdom.

Issued by Courtaulds Ltd., 16 St. Martins-le-Grand, London, E.C.1

oil, though it has recently shown signs of relaxing, is still enough to make resistance not entirely a straightforward matter. It is to be supposed that they will do what they can. A curious question arises for students of American anti-trust law, who are learned in the price-maintaining operations of monopolists. How does the law stand if the big companies concert action not to keep prices up, but to keep them down?

* * *

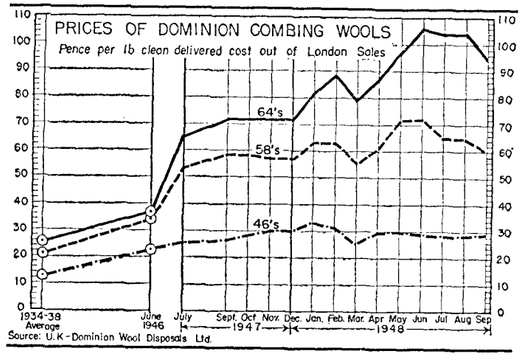
The Nuffield-Austin Arrangement

It is hard to set a precise limit to the trading advantages which might be attained in the motor industry—especially when trading and supply return to less artificial conditions—by large scale, the pooling of models and the joint development of production and design. If the arrangement announced this week between the Nuffield Organisation and the Austin Motor Company means these things, it can be a notable step forward. But precisely what it means is by no means clear at the moment. The joint statement issued by the two companies lays emphasis on the "constant interchange of information" which is intended; but it goes on to suggest much more than that:

> The object is to effect maximum standardisation, coupled with the most efficient manufacture, and, by the pooling of factory resources, a consequent reduction of costs.

Standardisation of vehicle accessories (which has still not gone far enough) is obviously included in the intention. Does the intention also include a reduction of the number of models produced by the two groups, a concentration of the production of engines and chassis and an expansion of the volume of production of each remaining model to a point at which the full advantages of large scale can be brought to bear on production costs? At present neither partner in the arrangement is able to employ its plant at full capacity. In both, changes in production and the announcement (recent or expected) of new models make it misleading to draw any close conclusions from the actual ranges of models at present on the market. But these, though they have been reduced in the last few years, are still fairly numerous, and there are evident possibilities for reduction. Measures to bring costs down are urgently needed, and decisions of this kind, if they are to achieve their effect, will need to be radical.

If, however, co-operation in design, production and marketing were to be complete, it is hard to avoid the conclusion that a pooling of financial interests would be necessary too. The two firms have said nothing yet about any such arrangement.



* * *

Fall in Wool Prices

Mr Harold Wilson's recent contention that the abnormally high prices for wool were the result of private trading, whereas under centralised buying raw cotton prices have tended to fall, was unfortunate on two counts. In the first place, the cotton and wool markets cannot be directly compared, for conditions of supply and demand in them differ greatly. In the second place, the remark was ill-timed, for it was made after the wool market had already begun to reveal a noticeable weakness. In fact, since the beginning of the new season wool prices have failed to maintain their buoyancy. At the London sales which closed last week, merino prices were almost 10 per cent lower. In the Dominions, particularly Australia, prices have fallen even more markedly and the fall appears to be gathering momentum. So far, the drop has been largest in best "free" merino wools, prices of which have fallen 20 per cent. Prices for "faulty" merino wool have fallen between 10 and 15 per cent, while crossbred prices (56s. and under) have remained firm.

Wool buyers seem at last to be switching to the cheaper qualities instead of insisting on the best types. At the close of last season, prices for the finer merinos were bid to a very high level by countries indulging in bulk purchase, and some readjustment is overdue. At the moment, there is a marked disparity between London and Dominion prices; the former are on the average 7 per cent dearer. This is no doubt due to the shortage of combing wools in Britain and European countries to feed the mills. Wool bought now in Australia would not be available to the manufacturers until three months hence. The uncertain international situation is also making buyers cautious, particularly as consumer resistance is beginning to be felt in many countries. In France, the possibility of a further devaluation of the franc must tend to accelerate purchases to the limit of the available sterling.

A recent issue of the Commonwealth Economic Committee's *Wool Intelligence* suggests that world wool production during the current season may increase by 3 per cent to 3,800 million lb. (greasy basis), and the output of apparel wool, by the same percentage, to 2,980 million lb. The proportion of merino wool is expected to increase. This improvement in supplies may tend to correct the abnormal rise in fine merino prices, but as the accompanying chart shows, the disparity is still so great that a full readjustment will only be possible if consumers shift their demand to inferior qualities on a large scale. At the second meeting of the International Wool Study Group in London this

week, it was estimated that world stocks of apparel wool would decline by 790 million lb. to 2,761 million lb. during the current season, an estimate which suggests that the level of consumption will be only 3 per cent smaller than a year ago. If this proves to be correct, it will be all the more imperative for countries to switch to crossbred wools because there are now little or no Government owned stocks of merino wools.

Coke Ovens and Coal Board

The independent coke ovens, unlike the collieries, are not subject to compulsory purchase. If the National Coal Board wishes to acquire an independent coke oven plant, or the owner to sell, it must negotiate a sale with the other party. Altogether nine companies owning coke ovens fall into this group. The National Coal Board has so far made two bids, one for the coke ovens of the Birchenwood Coal and Coke Company, of Stoke, and the other for the coking assets of Brancepeth Gas and Coke (which is controlled by Strakers and Love).

If the coking assets of the nine companies in this category are eventually sold to the National Coal Board, the coke oven owners may, as the Coal Industry Nationalisation Act, 1946, is worded, be able to obtain a satisfactory price. It would be to the detriment of all parties if, in the long run, a sale were not achieved. The coke ovens are often surrounded by plant and land already vested in the National Coal Board, which is no doubt ready to acquire more coking capacity—nowadays highly profitable. But that prosperity is the trump card of the coke oven owners. In prewar days many of the ovens were making little or no profit. Plants are ageing and often in need of renewal Some of them were built 15 to 20 years ago, and considerable sums will soon have to be spent on relining and more costly measures of renovation.

The sums involved play a decisive part in determining the eventual valuation which should be placed on the equity of the companies concerned. Considerable advances have taken place in the shares of the coke oven undertakings, based on widely differing estimates. Public interest has centred on three concerns, Monckton Holdings, British Benzol and Coal Distillation, and Benzol and By-Products. Monckton Holdings, according to the chairman's statement, has been approached by the National Coal Board to open negotiations for the sale of its coking plant. Shareholders are informed that "every facility has been given towards the furtherance of negotiations, but so far no concrete proposal has been received." At the beginning of this year, Monckton Holdings ordinary shares were dealt in only on the Sheffield Stock Exchange and could be bought at 8s. Six months ago, when the shares were introduced to the London market, the price of the fully paid £1 ordinary shares was 17s.; this week it has reached 50s. 6d. Movements in Benzol and By-Products have been no less spectacular. The company has paid no ordinary dividend in recent years; its 10s. ordinary shares are now valued at 12s. 6d. compared with no more than 1s. 1od. at the beginning

of the year. British Benzol and Coal began coke production in 1929, and in 1937 a capital reconstruction was effected. Its coal and ancilliary assets were vested in the National Coal Board on January 1, 1947. The 10s. ordinary shares have recently advanced from 55s. to 92s. 6d.

These price movements show the measure of confidence first, that the National Coal Board will take over the coking plants and secondly, that it will be prepared to pay generously. But they count on very favourable assumptions turning out to be true. It remains to be seen whether the Coal Board will be prepared to agree to the sort of prices which some recent purchasers of coke oven shares have been assuming.

Rise in Bank Deposits

London clearing bank deposits rose by £47,389,000 between August and September. The rise in true deposits was £1,635,000 larger than this, cheques in course of collection and items in transit being down by that figure. Deposits are thus within the £4½ million of the high record for the end of June, and are well above this record if the true figure be taken, since at the end of June cheques in course of collection and items in transit were about £56 million higher than last month. The principal influence in the continued expansion of deposits is still to be found in the increase of bank advances. Last month this item rose by a further £14,928,000 to £1,341,537,000, which is about £193 million higher than a year previously. The next largest change among bank assets last month was a rise of £12 million in Treasury deposit receipts. This was accompanied by increases of £11,232,000 in bills discounted and of £1,234,000 in short loans. The banks investments, which touched their peak towards the end of last year, when they were within a few hundred thousand pounds of £1,500 million, have declined with considerable regularity to £1,472,173,000. Last month's movement represented a drop of just under £2,000,000. The cash holding underwent a sharp contraction of £8,232,000 in September as compared with August, thus correcting the abnormal inflation of the cash ratio in the previous month. From 8.45 the percentage figure has fallen back to the more normal level of about 8.34.

* * *

Half-year's Revenue

No final conclusions were ever to be drawn from the revenue figures for the first half of the financial year. Students of the trend of the nation's finances will take note of the fact that the surplus of ordinary revenue over ordinary expenditure for the six months to September 30th amounts to £261.2 million. Ordinary revenue itself is £21.1 million lower than in the corresponding period for 1947-48, but the estimate for the full year presumes a fall of nearly £80 million, and comparability between the two periods is seriously affected by the process of "clawing back" credits a year ago, and by the inclusion of Indian payments under miscellaneous receipts this year. Genuine tax revenue is coming in satisfactorily, but expenditure is proportionately higher than the estimate for the full year. The reduction is £62.9 million for the half-year, compared with a budgeted reduction for the full year of £211.4 million. Supply expenditure has been running at a higher rate in recent weeks, reflecting in part the increased cost of food subsidies (officially admitted to be costing £480 million a year, instead of £400 million provided in the Budget).

On capital account, the six months' figures are broadly in line with Budget calculations. But the savings side of the account is, of course, far less satisfactory, since heavy repayments are in effect absorbing a disproportionate part of the revenue surplus. The extent to which these factors will prevent the Chancellor from achieving his full aim of a genuine surplus of £330 million cannot be prejudged from the half-year's figures alone. And the second half of the financial year will begin to reflect the extra costs of rearmament which did not appear in the Budget.

"Counterpart Funds" Accounting

The official announcement on the release of ECA counterpart funds gives a detailed account of the sequence of moves through which these funds are created and utilised. This may be summarised as follows:—

1. The funds originated from the sale by the UK Government to British importers of the dollars to pay for ERP imports. These dollars came from British dollar reserves and the sterling went into the Exchange Equalisation Account.
2. This sterling was invested by the Account in short-term Treasury obligations. The sterling acquired by the Treasury in this way replaced a corresponding amount of short-term debt held by commercial banks and the money market.
3. When necessary documentation had been completed, the ECA in Washington reimbursed the British Treasury for the dollars it had spent. The Treasury then sold these dollars to the Exchange Equalisation Account, which paid for the dollars by turning back to the Treasury the short-term Treasury obligations it had bought in the previous step.
4. Normally, the Treasury could have cancelled these obligations at this stage and its short-term debt would have fallen to a corresponding degree. However, in order to anticipate its commitments under the Economic Co-operation Agreement, the Treasury had to maintain the identity of the counterpart funds. To do this, the Treasury transferred its obligations to the Paymaster-General, who opened a Suspense Account in the name of the Treasury.
5. As the United States Government notified the Treasury of the dollar cost of assistance, the Treasury transferred its assets from the Suspense Account with the Paymaster General to the Special Account with the Bank of England, and the Treasury's short-term obligation to the Paymaster General was replaced by a corresponding obligation to the Bank of England.
6. The two Governments decided that the most effective use that could be made of 95 per cent of the funds in the Account at the present moment would be to apply them to the retirement of debt. This will be done by the Treasury, which will draw on the Special Account to effect a cancellation of a corresponding amount of the Treasury's short-term debt held by the Bank of England.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Odeon Theatres Group; Powell Duffryn; John Lewis; Qualcast.

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his 'General' Personal Accident Policy he received £10 a week until he was fit.

Peace of mind costs very little

£1 a year covers you for £10 a week accident benefit. Are you wise to face the risk—and all that it means to your dependants—*without* this cover? It's worth while finding out more about this and other benefits of the 'General's' Personal Accident Policies—just send the coupon. PA/6

Please send me full particulars of 'General' Personal Accident Policies.

AVIATION AND SHIPPING COMPANY, LIMITED

SATISFACTORY TRADING OF VESSELS

MR NOEL PURVIS'S SPEECH

The twenty-fifth annual general meeting of the Aviation and Shipping Company, Limited, was held on the 30th ultimo at Winchester House, Old Broad Street, London, E.C., Mr Noel W. Purvis, F.I.C.S. (chairman and managing director) presiding.

Mr G. E. Titley read the notice convening the meeting and the auditors' report.

The chairman said: Ladies and gentlemen.—The directors' report and statement of accounts for the year to June 30, 1948, have been before you for a while and with your permission I would suggest that they be taken as read, but in one or two instances where I think you should have further enlightenment on the accounts I will touch upon such items later.

DETAILS OF VESSELS

We have this year put before you the details of the vessels which we actually own and those which we run as disponent owners. I would like you to know that the profits on voyages for the year under review have not been affected by the steamers "Avisford" and "Avisbay," as the former since being acquired has undergone extensive survey and only commenced trading after the end of our financial year. The "Avisbay" will commence trading towards the end of this year as she is now being reconverted for commercial trading. With regard to the "Avisglen," this vessel did six weeks trading before the end of the financial year. You will, therefore, appreciate that had these three units been available for earlier trading your directors would have had a higher profit to disclose. We are very pleased with these three ships and feel sure that they will prove a useful acquisition to our fleet.

You will recollect that at our last meeting I mentioned that we were acquiring the control of two further vessels of 10,000 tons deadweight each. These vessels are the Avismoat and Avisvale, registered in the name of your wholly owned subsidiary the Ascot Shipping Company, Limited, whose accounts I think you will regard as satisfactory.

With the exception of the Avismere, now undergoing survey, and the Avisbay previously commented upon all vessels are satisfactorily trading. The majority of the vessels are well fixed to the end of December, 1948, and in some cases to later dates. There has been, as you are no doubt aware, a reduction in rates in various freight markets which is bound eventually to be reflected in the figures of tramp ship-owners. Nevertheless, I still feel that reasonable profits may be earned even at the reduced rates and provided we do not see, as we do not at the moment, any serious slump in rates the figures for your company should again make satisfactory reading when they are before you next year.

AVIATION BALANCE SHEET

If you will be kind enough to refer to the Aviation balance-sheet you will find that an investment at cost stands at £114,318. This represents the cost of the acquisition of the share capital of £1,000 in the Ascot Shipping Company, Limited, but carried with it the option to purchase the two ships which we have since exercised for the Ascot Shipping Company, Limited—namely, the "Avismeat" and the "Avisvale." Effectively, therefore, the figure of £113,318 was the cost to the group of the option to purchase these two vessels and in the consolidated balance-sheet has, therefore, been added to the cost figures shown in each individual balance-sheet. In other words, the total figure in the consolidated balance-sheet is made up of Aviation vessels at cost less depreciation, etc., £686,564, Ascot vessels at cost less depreciation, etc., £188,961, plus £113,318, being the cost of the option to purchase as mentioned before, a total of £988,843.

There is one other item which I would like to explain to you this morning, and that is, if you refer to the consolidated balance-sheet you will notice there is apparent an excess of current liabilities over current assets. This is not at all alarming, or to be viewed as such, but the position is that as required by the new Companies Act, we have provided fully in the creditors for future capital expenditure instead of showing it by way of a note on the balance-sheet. The principal item concerns the cost of the reconstruction of the Avisbay, but this liability does not fall to be fully liquidated until early 1949, although your directors have considered it sufficiently current to be put in the current liabilities.

TAXATION

The method of showing the reserves for taxation has been altered in the accounts presented to you in order to comply with the requirements of the Companies Act, 1948. Taxation currently due now appears under current liabilities, while the reserve for future taxation, that is, the 1949-50 income-tax assessment to June 30, 1948 (not due until January 1, 1950) is shown under revenue reserve. Your companies have provided for all taxation arising out of the profits to June 30, 1948.

The amount provided in the Ascot Shipping Company, Limited, accounts is the estimated 1949-50 income-tax assessment not due until January 1, 1950.

As regards The Aviation and Shipping Company, Limited, you will see in the profit and loss account that £11,212 has been provided for profits tax to June 30, 1948. The reserve for taxation has been arrived at after availing ourselves of initial allowances, previous losses and carry forwards for tax purposes. There is no estimated liability for income-tax for 1949-50. The reserve for future income-tax consists of income-tax not due until January 1, 1949.

TRIBUTE TO STAFF

I would once again express my personal thanks to the members of the Board for their continued valuable co-operation. Also to the shore staff and officers and men employed by the company.

I now take pleasure in proposing that the directors' report and statement of accounts for the year ending June 30, 1948, be received and adopted and that a final dividend of 35 per cent., less tax, be declared payable on October 1, 1948, to members registered on September 20, 1948.

The resolution was carried unanimously.

The retiring director, Mr. H. Ascoli, was re-elected; and the auditors, Messrs. Willoughby Binns and Company, having been reappointed, the proceedings terminated.

THE ANGLO-CEYLON AND GENERAL ESTATES COMPANY, LIMITED

RECORD CROPS

The sixty-second annual ordinary general meeting of this company was held, on the 5th instant, in London.

Mr Robert Adeane, O.B.E., presided in the absence of the chairman, Mr Francis W. Douse, who is abroad on a visit to the company's estates.

The following is an extract from the chairman's statement:

The operations of the company for the year ended March 31, 1948, have been satisfactory. Despite the none too favourable climatic conditions during the year, the tea crop harvested on the Ceylon estates constituted a record at 5,314,725 lb. and represented 5.2 per cent. increase over the crop for the previous season. This was particularly gratifying as it has been the policy to increase the yield from the estates in order to offset so far as is possible the continually rising cost of production owing to the persistent upward trend of wages and all other production costs. As a result of the larger crop, working costs rose only 1d. per lb. Our cocoa interests have been diminished by the acquisition of Kondesalle Estate by the Ceylon Government. The compensation received by the company was fair and reasonable.

I must now refer to the very serious burden of taxation being borne by European interests in Ceylon. At present there is, in effect, double taxation, and British companies are actually paying out something in the neighbourhood of 65 per cent. of their profits in taxes. If estates are to be properly kept up and efficiently run this burden must be eased and sufficient cash resources left available for carrying out capital expenditure and improvements, and other development which is not allowed as a deduction for tax purposes.

SUGAR RESULTS

Mauritius.—Climatic conditions during the year were good and the island produced a record crop of approximately 350,000 tons of sugar. The crop secured by the company and its subsidiary, Mon Tresor and Mon Desert Ltd., amounted to 45,485 tons, and the net price realised was approximately £22 per ton. Costs continued to rise but were offset to some extent by the larger crop. During the year, Beau Climat Estate, covering some 425 acres, has been purchased, and will provide additional canes for our Britannia factory.

For the year under review the trading profit of the company and its subsidiaries amounted to £554,980, of which £539,474 was earned overseas. There remains a balance of £140,499, which represents the profit available for the company itself, and, with the £57,110 brought forward from last year, less £10,000 for retrospective taxation in the United Kingdom and Ceylon, there is £187,609 to be dealt with. An interim dividend of 10 per cent. was paid in February last, and the directors now have pleasure in recommending a final dividend of 15 per cent. These dividends will absorb the sum of £82,500.

The consolidated balance sheet again reveals a strong position, the reserves and undistributed profits of the company and its subsidiaries standing at £692,013. The surplus on liquidation of a subsidiary company has been increased from £242,480 to £260,494 by the addition of a further amount received from the liquidator. As regards the current year, prospects are quite good. The crop in Mauritius is favourable, although it is too early yet to estimate whether it will be larger this year than last.

The report was adopted.

THE AUROCHS INVESTMENT COMPANY, LIMITED

SATISFACTORY RESULTS OF YEAR'S OPERATIONS

SIR HAROLD MOORE ON THE CAPITAL REORGANISATION

The twenty-third annual general meeting of the Aurochs Investment Company, Limited, was held on the 30th ultimo, in London.

Sir Harold Moore (the chairman), in the course of his speech, said: The balance-sheet and accounts together with the directors' report having been printed and circulated, I assume it is your pleasure that they be taken as read. (Agreed.)

It will perhaps be an advantage to all present, and particularly to those who have become stockholders since our last annual meeting, if I recall the financial situation which existed at that date. The present board had just assumed office, and through their efforts the company had been provided with a sum of £100,000 in cash. With this amount at their disposal and with the assistance of borrowing facilities which the stockholders then accorded to the directors and with the active co-operation of the Whitehead Industrial Trust, Limited, as managers, an operating profit of £44,000 has been earned in something less than 11 months.

At the time of the last annual meeting *The Financial Times* Industrial share index was 135. By the end of August, 1947, the index figure had fallen to 104.2, a drop in values so severe as to constitute a slump. Although since that time there has been some recovery, Industrial equities are still in a somewhat depressed state. I mention these facts merely to emphasise the difficult position in which investment and finance companies were placed, particularly after we assumed control, and I think I may be allowed to say that the greatest possible credit is due to our managers, to whose care and selective judgment the satisfactory result of the year's operations is mainly due. In times such as those through which we have been passing a net gain of £44,461 on an effective capital of £100,000 is no mean achievement.

SOUTH AFRICAN INTERESTS

In the early part of 1948 I visited South Africa with the object of exploring in conjunction with the directors of the Whitehead Industrial Trust, Limited, the possibilities for the satisfactory employment of capital there. You are probably aware that the Whitehead Industrial Trust, Limited, have established a South African company which has carried out some successful business. We are very interested in the future of South Africa and have no doubt that the preliminary work which we have done will in due course produce satisfactory results.

After the conclusion of this ordinary general meeting you will be invited at an extra-ordinary general meeting of the stockholders to consider two matters—first of all to adopt new articles of association which are required to bring us up-to-date and in line with the new Companies Act. The only novel features in the new articles are those to which your attention is directed in the circular letter which accompanied the notice.

RECONSTRUCTION SCHEME

The other matter which you will be asked to consider at the same extra-ordinary general meeting is the scheme for the reorganisation of the company's capital which has already been fully explained in my circular accompanying the notice of meeting. You will, I am sure, agree with the board that it is not in the interests of the stockholders to carry £2,100,000 of capital with effective assets of only £140,000 and after much thought and consideration of the best advice obtainable the reconstruction scheme has been put forward with a view to altering that state of affairs and providing means whereby the available assets of the company can be substantially increased from time to time.

If these proposals receive your approval their adoption will pave the way to restoring the company to a financial position comparable with its large issued capital and will accelerate the date at which the payment of dividends can be commenced.

I think you should know that since the last annual meeting three directors of the Whitehead Industrial Trust, Limited, were co-opted to the board. They were Mr J. E. Williams, Mr Philip Randall and Mr J. D. Kyle. As part of the present scheme it has been considered desirable that two of them, Mr J. E. Williams and Mr Philip Randall should retire from the board in order that the majority of the board shall consist of directors who are independent of the Whitehead Industrial Trust, Limited. The only representative of the Whitehead Industrial Trust, Limited, now on the board is accordingly Mr J. D. Kyle, who is a very valuable member, and offers himself for re-election.

At the risk of repeating myself I should like to say that both Mr Hughes and I greatly value and appreciate the good services which the stockholders have received from the managers during our first year of control. The directors feel sure that the scheme of reorganisation which I trust you will presently adopt coupled with the close co-operation between ourselves and the Whitehead Industrial Trust, Limited, will ensure for your company a most successful future.

The report and accounts were adopted.

At a subsequent extra-ordinary general meeting the proposed new articles were adopted, and the scheme for the reorganisation and refinancing of the company's capital was approved.

BRITISH HOMOPHONE COMPANY, LIMITED

SIR HERBERT MORGAN'S SPEECH

The annual general meeting of the British Homophone Company, Limited, was held, on the 30th ultimo, in London.

Sir Herbert E. Morgan, K.B.E. (the chairman), presided, and in the course of his speech said: The net profit for the year, before taxation, shows a slight increase, being £16,007, as compared with £14,482. The consolidated profit and loss account of this company and its wholly owned subsidiary company, Ebonestos Industries, Limited, shows a result which I am sure you will agree is very satisfactory. The charge for taxation on the current year's profits amounted to £26,100, as compared with £2,764. In spite of that, the combined net profit, after taxation, is almost double that of the previous year, being £19,965, as compared with £10,002.

The consolidated balance-sheet shows a very strong position. The shareholders must always bear in mind that the British Homophone Company, Limited, and Ebonestos Industries, Limited, trade as one complete unit. They are both under the same general direction and in their turn are a part of a group of plastics undertakings controlled by Crystalate, Limited.

May I now say a word of the products of our company and emphasise the distinguished position that it has gained for itself in the plastics industry? We, who have been established for 50 years, are proud of the fact that we supply high precision plastic mouldings to all the Government Departments concerned with production, such as the Admiralty, Air Ministry and Ministry of Supply. Your board look forward to the future with reasonable optimism.

The report and accounts were unanimously adopted.

AMALGAMATED ANTHRACITE COLLIERIES, LIMITED

REPLACING LOST INCOME

The twenty-fourth annual general meeting of Amalgamated Anthracite Collieries, Limited, was held on 4th instant, in London, Mr John Waddell (the chairman) presiding.

The following is an extract from his circulated statement.

The ultimate position of A.A.C., Limited, will be that of a holding company holding the balance which remains of compensation stock, together with the shares of the trading group, Anthracite Holdings, Limited. The principal trading subsidiary of Anthracite Holdings, Limited is British Anthracite Sales, Limited, and, the foresight in forming this company many years ago is likely to prove it to be the most valuable asset belonging to the company. This company has for many years enjoyed an excellent record.

I must say that, although we cannot anticipate replacing all the lost income within 1948, or even for a year or so after that, we have already made substantial steps towards replacing this loss in income, and I can say with every confidence that the income from sources other than wagon owning in 1948 is likely to show a useful appreciation over that for 1947. Although I am confident of a satisfactory improvement in this respect in 1948, I must sound a cautionary note. The long-term position is likely to turn out satisfactorily.

This company, however, which is the successor to activities started as long as 20 years ago, is now solidly established and has a good record and widespread activities, both as regards the value of its assets and earning capacity, and is likely to prove of the greatest possible value in securing a regular return to stockholders.

The report was adopted.

OLYMPIC PORTLAND CEMENT COMPANY, LIMITED

PERCENTAGE OF PROFIT MAINTAINED

The thirty-seventh annual ordinary general meeting of this company was held on the 27th ultimo, in London, the hon. Gerald H. G. Williamson (chairman of the company), presiding.

The chairman in the course of his speech said:

The operations at Bellingham for the 15 months showed a profit of £16,125 after providing £19,947 for depreciation and depletion. The corresponding figures for the 12 months ended December 31, 1946, were £12,153 and £17,033, so that the percentage of profit has been maintained.

The manufacturing cost of cement produced was considerably higher than in 1946 the relative increases being 18 per cent. for standard and 25 per cent. for high early.

I am pleased to inform you, however, that now that the new kiln has really got going, manufacturing costs are coming down. Production of both clinker and cement have increased considerably since April. Deliveries during the first quarter of the new year—that is, April to June—totalled 138,500 barrels, while in July they were 99,000 barrels and in August 107,000 barrels.

I said last year that thanks to the conservative financial policy adopted in the past, it had been possible to undertake the modernisation programme from the existing resources of the company, but I am afraid this forecast has proved too optimistic in so far as the final costs greatly exceeded contractors' estimates.

The report and accounts were unanimously adopted and a dividend of 10 per cent. actual, less income tax, for the 15 months period was declared.

Statistical Summary

GOVERNMENT RETURNS

For the 12 days ended September 30, 1948, total ordinary revenue was £141,817,000, against ordinary expenditure of £104,599,000 and issues to sinking funds £160,000. Thus, including sinking fund allocations of £6,229,000 the surplus accried since April 1st is £253,016,763 against £211,508,000 for the corresponding period a year ago.

THE ALEXANDRIA WATER COMPANY, LIMITED, ALEXANDRIA, EGYPT

INTERIM DIVIDEND

NOTICE is HEREBY GIVEN that an Interim Dividend of FOUR SHILLINGS per £5 share on Coupon No. 120 will be paid without deduction of British Income Tax but less Egyptian Government and Alexandria Municipal Taxes amounting to 5·92d., making 3s. 6·08d. net, on and after the 15th October 1948, at the National Bank of Egypt, in Alexandria at Rue Toussoun, or in London at 6, King William Street, E.C.4. Dated, Alexandria, Egypt, the 16th September, 1948.

By order of the Board.
ROBERT WALTON, MANAGER.

MARKETING OFFICERS, NIGERIA

A number of vacancies exist for Marketing Officers in the newly-formed Department of Export and Marketing, Nigeria. Salary £660 x £30—£900, plus expatriation allowance of £200—£300 (pensionable).

Their duties would be to exercise executive functions in connection with the controlled marketing, evacuation and shipment of produce from Nigeria. This would involve correspondence and direct negotiation with buying agents in regard to matters affecting marketing, from the time produce is purchased at upcountry buying stations to the time of delivering on board ocean vessel. The subjects dealt with include the prescription of buying prices and transport differentials, inspection, grading, storage, handling, containers, means of conveyance to port, lighterage, check weighing, the transmission of shipping documents and the maintenance of statistics. They will be required to advise on matters of policy in regard to produce marketing and will be required to advise African shippers in matters regarding the export trade in general, and they should possess tact and administrative ability, a sound general education with a University degree, preferably in Commerce or Economics. Candidates should, if possible, have had some experience of the produce trade, and a knowledge of general conditions in Nigeria or a West Coast Colony would be of advantage. Familiarity with Government procedure is also desirable but not essential.

Candidates under the age of 35 preferred but up to 40 will be considered.

Write for application form, quoting this advertisement, to:—Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, S.W.1.

NORFOLK EDUCATION COMMITTEE

KING'S LYNN TECHNICAL INSTITUTE

Organising Master: W. A. BURROWS, B.Sc.

Applications are invited for the following full-time post:—

TEACHER OF SHORTHAND (PITMAN'S) AND TYPEWRITING. Ability to teach other subjects an advantage. Candidates should hold appropriate qualifications and have had business and teaching experience.

Salary in accordance with the Burnham Technical Scale (Men £300-£435; Women £270-£414). Initial salary according to qualifications and experience. Further particulars and form of application may be obtained on receipt of a stamped addressed envelope to the Chief Education Officer, County Education Office, Stracey Road, Norwich, to whom applications should be submitted within 14 days of the appearance of this advertisement. Envelopes must be endorsed "Technical Institute."

W. O. BELL, Chief Education Officer.

County Education Office, Stracey Road, Norwich.

UNIVERSITY COLLEGE, EXETER

APPLICATIONS are invited for the post of Assistant Lecturer in Economics. Further particulars may be obtained from the Registrar.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. (Econ.) Degree is a valuable qualification for statistical, research, and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall and, later, moderate fees payable by instalments, if desired.

UNIVERSITY OF SYDNEY

LECTURESHIP IN ECONOMIC STATISTICS

Applications are invited for the position of Lecturer in Economic Statistics in the Faculty of Economics. The salary range is £600 (Australian) per annum rising by annual increments of £50 to £800 (Australian) per annum and is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to qualifications and experience. Applicants should have an Honours degree in Economics with specialisation in Statistics or a degree in Mathematics with training in Economics and Statistics. Duties include teaching of statistical theory and methods to both Pass and Honours students under the supervision of the Senior Lecturer in the subject. Previous lecturing experience is not essential, and recent graduates will be considered for the position. There will be opportunities for research. Duties commence as soon as practicable in 1949. Further information may be obtained from the Secretary, Association of Universities of the British Commonwealth (formerly Universities Bureau of the British Empire), 32, Woburn Square, London, W.C.1. Applicants supported by testimonials and giving the names of three referees close on December 31, 1948, with the undersigned.

G. DALE, Registrar, University of Sydney.

FOOD chemist and nutritionist, Ph.D., F.R.I.C.; seven years in chemist to a firm of food manufacturers and to an associated company making animal feeding stuffs followed by seven years in *scientific civil service at home and in Africa and Germany*, seeks constructive appointment offering more scope than a post-war Ministry. Box 848.

CROWN AGENTS FOR THE COLONIES. Applications are invited from qualified candidates for the following post:—

SECRETARY (Male) required by the Government of Nigeria for the Agricultural Department for one tour of 18 to 24 months with prospects of permanency. Salary plus expatriation pay £800 rising to £1300 a year. Commencing salary according to age and war service. Outfit allowance £60. Free passages and liberal leave on full salary. Candidates, not over 40, must be educated to University degree standard and have had previous secretarial experience. A knowledge of shorthand and typing would be an advantage. Apply at once by letter, stating age, whether married or single and full particulars of qualifications and experience and mentioning this paper to the Crown Agents for the Colonies, Millbank, London, S.W., quoting M/N/2917/30 on both letter and envelope.

THE Federation of Master Cotton Spinners' Associations, Ltd., invites applications for an executive position requiring the following experience:

(a) Principles and modern methods of cost ascertainment.
(b) Modern wages structures, including both time and piece rates based on scientific study.

Experience on the spinning side of the cotton industry, though essential, would be an advantage.

The appointment carries a commencing salary of not less than £1,[illegible] with participation in the Federation Pension Fund.

Applications stating age, professional qualification and experience should be addressed to the Director, The Federation of Master Cotton Spinners' Associations, Ltd., 68-70, Deansgate Arcade, Manchester, 3.

VACANCY exists in a Government Department for Temporary Principal of Research Officer in Leeds. Salary range £880-£1,188 a year, starting pay according to age, experience and qualifications. Candidates must have University degree in Economics, Statistics or kindred subject with at least Second Class Honours or equivalent, and knowledge and research experience on distribution of population, trade and industry, communications and services, natural resources, etc.

Applications giving age, particulars of experience and qualifications and posts held including dates should be addressed to the Regional Appointments Officer, Ministry of Labour and National Service, Bishopsgate House, Bishopsgate Street, Leeds, 1, quoting Reference No. 7[illegible]. Original references must not be forwarded. Only candidates selected for interview will be advised.

LEADING London Book Publishers require first-class executive assistant. Practical knowledge of accountancy, office management, staff control and export procedure. Preferably B.Com., A.C.I.S. or equivalent qualifications. Age 25-30. Good salary and prospects. Write giving particulars of experience, qualifications, age, salary required to Box F652, c/o Streets, 110, Old Broad Street, E.C.2.

ACCOUNTANT-SECRETARY required by Private Company supplying of Raw Materials to the Chemical and Pharmaceutical Industries also Import and Export. Excellent prospects for man with good education, organising ability and integrity. Salary not less than £5 but according to qualifications and experience.—Write full details Box 842.

Cards on the Table

THE record of the first three weeks of the General Assembly unhappily suggests that the Russians have a shrewder view than the western Powers of the use to which the gathering can be put. The Assembly is not and cannot be a place where decisions are taken. It was conceived, not as a legislative or executive body, but as a place for free and constructive discussion. It has become the biggest sounding board in the world, and it can send the speeches of the statesmen assembled there to the ends of the earth. It is open to any power to distort it into an instrument of propaganda.

Mr Vyshinsky has so far gained the advantage simply because he has shown more understanding of the vital role of propaganda in the battle that rages between east and west. His own rear is guarded by the almost total censorship of the Soviet sphere of influence. Before him lies the wide open ear of public opinion in the western states, and it is to this audience that his every word is addressed. Such a tactic should not be dismissed—as it tends to be dismissed by traditional professional diplomatists—as "mere propaganda." The concurrence of the mass of the people is a vital factor in the effectiveness of democratic diplomacy, and what Mr Vyshinsky aims to do is to bewilder and disillusion public opinion until people feel alienated from their government and unwilling to respond to its lead. He is concerned with far more than a propaganda campaign; he is attempting to strike at the foundations of western defence.

The Russians are shrewd enough in their assessment of mass psychology to know that in the world today the profoundest feeling of ordinary men and women is a longing for peace. They know, too, that of all forms of warfare it is atomic war that casts the darkest shadow over people's imagination and conscience. They are therefore trying to exploit this deep passion for peace in order to weaken the solidarity of the western world. Mr Vyshinsky's performance at the General Assembly is simply a high light in a campaign that has been going on ceaselessly for months—a campaign designed to convict the western Powers, and the United States first of all, of the charge of "warmongering" in the eyes of their own people.

The fact that, at this moment, Russian intransigence has compelled each western state to consider, with the utmost unwillingness, the necessity for some measure of rearmament makes the charge of "preparing for war" more difficult to brush aside. All over the world the Communist Party is engaged in passionate attacks upon increases in western military expenditure and in demonstrations "for peace." Mr Wallace has subordinated every other issue in his campaign to this. Wherever today there is fellow-travelling, there is the whispered or shouted accusation that the United States is actively preparing for war with Russia, that the leader of world imperialism is poising its atom bomb to strike down the "Land of Socialism." Day by day, this flood of propaganda pours out across the world, amplified by the General Assembly.

This is the background that must be grasped if the significance of Mr Vyshinsky's performance in Paris is to be properly assessed. He

has made three offers to the other Powers: to sign a convention on atomic control provided there is a simultaneous convention on the destruction of atomic weapons; to reduce armaments by one-third if others will do the same; and to "put all the cards on the table"—in other words to disclose Russia's scale of armament provided the other Powers furnish the same information. These are the offers which have been headlined from one end of the free world to the other. Each is designed to show the reasonableness of Russia's approach; each seeks to pin responsibility for the present state of armed preparedness upon the western Powers; each was launched in a lather of accusations of American imperialism and warmongering; and each is now the main basis of discussion in the Assembly. In short, by being the one to make the proposals, Mr Vyshinsky has seized the initiative. To the outside and largely ignorant world, he has managed to appear the one leader pleading for disarmament, while the others hesitate and discuss and hold back.

*

This western failure to capture the initiative is understandable. The concerting of the policies of three separate sovereign Great Powers is bound to be a more formidable business than the enunciation of purpose from a single centre—Moscow. Mr Vyshinsky does not have to worry lest Marshal Stalin should send Mr Malenkov to talk to Mr Truman "face to face" on atomic energy just as he, Mr Vyshinsky, is taking an opposite stand in Paris. The episode of President Truman's attempt to send Chief Justice Vinson to Moscow to discuss atomic energy was doubly unfortunate. The proposal suggested division among the western Powers, but the President's withdrawal of the project on Mr Marshall's *strong advice* has played straight into the hands of Mr Wallace and his supporters. They are now saying that the President's "effort for peace" has been crushed by the warmongers in the State and War Departments.

DISARMAMENT BY THE WEST

	United Kingdom			U.S.A.		
	1944-5	1945-6	1948-9	1944-5	1945-6	1948-9
Men in Armed Forces.....	5,119,500	2,055,000	846,400	8,300,000	...	542,000
Military Budget	£5,125 million	£4,410 million	£692·6 million	$83,735 million	$84,530 million	$13,400 million
Naval Vessels in Commission— (a) Major.... (b) Minor....	approx. 450-500 ...	... ...	approx. 100 ...	1,182 92,165	... ...	277 483

It is not only the inevitable hesitations of non-totalitarian governments which make their mistakes in public that has led the western Powers to lose the initiative. They almost certainly underestimate the effectiveness of the Russian line. Anyone in possession of all the facts must obviously find it very difficult to take Mr Vyshinsky seriously, for he has not bothered to present a serious case. When a man of his intelligence rolls out the stock figures about the percentages of the American and Russian budgets devoted to armaments—79 per cent in the American case, 17 per cent in the Russian—without mentioning that the Russian budget, being that of a totally planned and government-owned economy, covers most of the Soviet Union's national income, whereas the Federal Budget is a fraction of the American national income, he can hardly be surprised if informed observers conclude that he is not concerned with facts but only with effects.

As for disarmament, the scale of western disarmament since 1945 is so staggeringly beyond the one-third proposed by Mr Vyshinsky that it is all too easy for the western Powers to believe that the facts speak for themselves. The table on this page measures disarmament in Britain and America by three vital criteria—budget expenditure, scale of armed forces and scale of the navy (which received particular emphasis from Mr Vyshinsky). In each case, the fall has been nearer to seven-eighths than the timid one-third proposed by Mr Vyshinsky.

As for his plea for "cards on the table," it comes as a crowning impertinence from the one Government that has refused all information on the state of its military forces. There has been no secret about British or American armaments since the war. Year by year, budgets and blue books have publicly recorded their decline. Only in Russia is information totally inaccessible. Yet this is the Power that demands full access to the facts—as if the west, and not Russia, had guilty secrets to hide.

*

This combination of drastic disarmament and demobilisation on the western side and the total darkness obscuring the Russian picture has one meaning only. Mr Vyshinsky is asking those who have disarmed already to cut their defences still further, when they are in complete ignorance whether Russia's armaments may not be at this moment two-thirds greater than their own. Moreover, he asks them to do so at the moment when their delayed and unwilling acceptance of the menace of Russian policy is compelling them to rearm. It is hard to blame western statesmen for failing under these conditions to take Mr Vyshinsky seriously.

In such a situation of total distrust, there is only one conceivable method of banning atomic warfare and of achieving genuine disarmament in the immediate future. That is to institute a system of international control of armaments so effective that not even the Russians with their vast territory and their vaster duplicity could evade its provisions. Control is the only answer to the present crisis of confidence, and to judge by the Russian record on the Atomic Energy Commission, control is the one thing they will not concede.

This is the case which no doubt dominates the minds of the western leaders—a case as self evident as it is unequivocal, a case upon which the disarmed west can rest with a clear conscience. Unhappily the case is by no means so self evident to the world at large, which either does not know or has forgotten the facts and is in any case more likely to read the headlines than the full report. In spite of the excellence of the western position, in spite of the full rebuttals made by various western statesmen, Mr Vyshinsky retains the initiative. Even if Mr Warren Austen's case is irrefutable, even if Sir Hartley Shawcross's summing up is masterly, they are still discussing Mr Vyshinsky's proposal and in fact turning it down. Out of the world, therefore, goes the picture of Mr Vyshinsky pleading passionately for peace and disarmament while the "warmongers" think of more and more arguments to evade his challenge.

There is only one technique for dealing with Mr Vyshinsky, and that is to wrest the initiative from him. Instead of refusing a reduction of one third in armaments, the western Powers should have instantly proposed instead a reduction by three quarters and have concentrated discussion on Russia's weakest point—the question of control. Every proposal on disarmament from this day forward should come from the western leaders and each should be backed with a detailed plan of supervision which the Russians must be forced to accept and respect. The present pattern—that of Russia offering and the west rejecting—is precisely the situation which Mr Vyshinsky set out to achieve. The most careful arguments, the best marshalled facts, the most patient explanations by the western Powers will not counter this situation. It can be met only by compelling the Russians to say "no" until they find it pays better to say "yes."

Towards a Conservative Policy

THE annual conference of the Conservative party presented a strange contrast between the cheerfulness and confidence with which the routine business was conducted and the sombreness of Mr Churchill's closing address. His words were intended for a wider audience than the delegates at Llandudno, and his review of the balance of peace and war had as little bearing on the fortunes of the Conservative party as his speeches of the nineteen-thirties. He was speaking as a world statesman, for whom the grand strategy of international affairs has a greater significance than the vicissitudes of party politics. If anything can be deduced from one speech, it may be that it marks his preference for a more olympian and judicial role over the detailed responsibilities of party leadership.

On domestic party issues, the Llandudno conference exhibited greater unity and confidence than any since the general election. It is apparent that one of the Conservative party's greatest handicaps, the apathy and intransigence of the constituency associations, has been partly overcome. It is true that the Conservative Central Office possesses nothing like the centralised power of Transport House; in particular, it has too little voice in selection of good candidates. But the party as a whole has taken to heart Lord Woolton's remarks about the need for money and membership. To more than double the membership of the party in two years and to increase it by a million members in the first six months of this year, is a considerable achievement. Whatever may be said of Lord Woolton as a source of political inspiration, there can be no doubt of his ability as a party organiser.

This rebirth of confidence within the Conservative Party should not blind its leaders or its supporters to the great distance which has yet to be travelled before it can exert an overriding claim to the leadership of the nation. In the first place, many subjects of which the Tories were once the especial champions now receive equal attention from the Labour party. There have been times when the Conservatives talked—and with some justice—as if they had a private monopoly in Imperial affairs, but there is no truth in it today. The Opposition may claim that in Commonwealth affairs the Government has pursued a policy dictated largely by the pressure of events, but equally it cannot avoid the reproof that its own attitude on India and Burma has not been helpful. In colonial affairs the Labour government has been exceedingly active, and although it can be charged with administrative naïveté and over-optimism, the only difference here between Socialists and Conservatives is one of timing and not of aim. In foreign affairs, too, the same basic similarities are to be found; for the best part of three years the Opposition has supported the Foreign Secretary against the recalcitrant members of his own party. Opposition criticisms are perhaps gaining increasing weight, but criticisms do not amount to an alternative policy. Only on questions of defence can the Conservatives make out a serious charge against the Government, and defence is not a subject on which elections are won.

On the issues which do exercise the voters, the same difficulty confronts the Conservative party. Full employment and social security are linked in the public mind with the Socialist government, and their conjoint origin in the wartime Coalition government is easily forgotten. If these policies were to break down, it would be Communists, rather than Conservatives, who would gain in popularity. Even so, if the Conservatives are seeking working-class votes, they will have to convince the voters that a freer economy offers prospects of full employment at least as good as in the period of postwar state control and Daltonian inflation. Equally, simple opposition to economic controls cannot of itself constitute an alternative economic policy. "Set the people free" is a ringing but elusive slogan; challenged by Ministers about the particular controls they wish to remove, the Opposition have been too content to point to a few obsolete regulations overdue for reform, and have shrunk from putting forward a comprehensive programme of financial and economic policy. Diffidently and under pressure, the Government is lifting controls, and by the time the election comes it may have gone as far as any Conservative administration might dare to go in the same direction.

*

The indispensable condition of party government has been classically defined in terms of "broad and intelligible differences of opinion, views of home and foreign policy of two distinct sorts, each of which might be held and was strongly held by honest and capable men." It is just these broad and intelligible differences which seem to be lacking from the present political scene. And it is a characteristic defect of the Tory party in opposition that it attempts, in Disraeli's words, "to construct a party without principle," relying on some supposedly superior quality in its leaders rather than upon offering a sounder policy to the nation. It is always tempted to appeal to the nation on the ground that it represents a higher level of political courage and ability and is able to minister to the practical needs of the country unhampered by dogma or copybook theory. But here again circumstances are against it. It is true that the Tory party contains a number of able administrators of long experience, but it is questionable if they have any overwhelming advantage in ability over the present government. Mr Churchill apart—and his gifts are pre-eminent in only part of the field of government—the senior members of the present government match in experience most of the figures on the Opposition front bench. And dominating both front benches is the figure of Sir Stafford Cripps, marching like Weir of Hermistoun "up the great, bare staircase of his duty, uncheered and undepressed." He is applying, without abandoning his own political principles, all that a Conservative chancellor could apply with any hope of success, in the present temper of politics and the present difficulties of the country.

There are three situations which might cause a revulsion of feeling in favour of the Conservatives. The first is a grave worsening of the international situation, including the direct threat of war. The second is a major breakdown in the British economy, caused, say, either by an unexpected break in Marshall Aid or by acute industrial unrest brought about by Communist activity. The third would be the capture of the reins of government by the left-wing of the Labour party. The first eventuality would probably result in a coalition. The second might produce a coalition, and the third would almost certainly bring a Conservative government to power. Although all three are possibilities which it would be unwise to write off, none of them comes within the realms of practical political prophecy. No wise Conservative would wish to see any of them come about, nor aspire to office in the bitter circumstances which they would create.

There is at present a dangerous tendency in the Conservative party to confuse successful party administration with successful policy making. There is a strong belief that the results of the opinion polls show an inevitable swing towards Conservatism, whereas they need the most cautious interpretation. There is a conviction that the Conservatives, as the largest alternative party, are benefiting from the inevitable unpopularity of the policy of austerity, and that the swing of the pendulum is with them. There is a belief that the timing of the Iron and Steel Bill will

make it possible to fight the election on that issue, and thus rally all but the diehard advocates of nationalisation. Failing that, it is held that the growing importance of defence and of foreign affairs will make the nation readier to listen to the Conservatives.

All this may be true, but if the Conservatives wish to regain the leadership of the nation it is all largely irrelevant. On a generous assessment of the present swing of the pendulum, the Conservatives in 1950 might achieve no more than rough parity with Labour—a majority of fifty seats either way. A solid rally of the middle-classes to their banner might enable them to form a government, but it would be quite impossible to carry one on, without the respect, if not the votes, of organised labour. To take or share office as the result of a crisis would be merely to set aside and not to solve the problems of an alternative policy.

Largely as the result of its own internal divisions, the Conservative party has not in the past three years evolved an alternative policy for the nation, and it has now less than a year and a half in which to do so. The Industrial Charter touches only the fringes of an immensely difficult subject. The Agricultural Charter is an attempt to outbid the Socialists for the support of the farmers. "A property-owning democracy" is still hardly more than a slogan. No attempt has yet been made to tackle the internal and external economic problems of Britain as they will exist in, say, 1952, and to work out a policy for economic expansion, for Western Union, or for colonial development. No statement of policy exists which applies, within the limits of what is possible, the principles of enterprise to industry and commerce, and which unequivocally reverses the old Tory habits of favours for big business and restrictive practices. Statements of a general character are not enough. The Conservative party must work out a detailed application of general principles, in terms simple enough to bring conviction and comprehension to the ordinary man and woman. Until it has gone through that painful process of re-education, it cannot claim to possess an alternative policy for the nation.

If there is nothing in the present state of public opinion which should give the Conservative party any ground for complacency, there is nothing to give it cause to despair. The interests which it represents are for the most part honourable and permanent. The candidates it presents for Parliament are individually as able and upright as those of any other party. At its best, its leadership is as courageous and intelligent as that of the Labour party. It has a sense of the historic needs and aspirations of Englishmen which are too often overlooked by Socialists. But it has lost its hold over the imagination of ordinary men and women in Britain. To regain it it must show that it is not the party of big business, of landowners, or even of the middle-class. It has to produce a national policy for national problems, superior in merit and more appealing to the electorate, than any the Labour Party can offer.

The Unimportance of Franco

FOR two years or more British policy towards Spain has been to let sleeping dogs lie. Mr Bevin and the Foreign Office have had their hands much too full to spare time for the long, delicate political and economic game which has to be played before sufficient Spaniards will combine to force General Franco into retirement, or before he mellows by natural processes into a dictator as relatively reasonable as his neighbour, Dr Salazar. At intervals Mr Bevin has been briefly critical about the state of affairs under the Caudillo—sufficiently rude to reassure the Labour Party that the civil war has not been forgotten, yet tactful enough to get a British trade agreement with Spain signed without undue fuss. The rest has been silence, with an occasional discreet glance at the activities of the Spanish republicans in France and of the monarchists in Portugal.

Within the last fortnight a Republican Senator from America, on a quick tour of strategic sight-seeing in Europe, with two generals and an admiral, has woken the sleeping dogs. The barking has begun all over again—in Paris, Washington, London, Madrid and, of course, in Moscow. What impressed Senator Gurney, as chairman of the Senate Armed Forces Committee, was the morale of the Spanish people, the size of General Franco's army—the second largest in western Europe—the defensive possibilities of the Pyrenees, and the air bases available in Spain and its neighbourhood. By the time he reached home he had concluded that Spain should be admitted into the United Nations: he stated publicly that "it's not up to us to tell any country what kind of government it can have." During the Senator's tour it had become known that fifteen of the twenty Latin American governments in the United Nations were likely to propose the admission of Spain to membership. This made it inevitable that Mr Marshall, Mr Bevin and Mr Schuman should consult in Paris on the subject; and the Spanish monarchists and republicans in exile naturally felt impelled last week to lay before the western statesmen such evidence of unity and determination in the quarrelsome ranks of the Spanish opposition as would deter the three foreign ministers from any change of attitude towards Franco.

Senator Gurney has, of course, done nothing more than strike a match rather carelessly near a trail of powder laid by others. American and European strategists—not surprisingly—have had their eyes on Spain for some time; they would have been poor advisers if they had not appreciated the importance in war of the ports and airfields on the Bay of Biscay, of the mountain barrier in the rear of France and of the air route to Africa and the Middle East. Indeed, it was their duty to point out these facts to their political chiefs. It was then an easy step to suggest that diplomatic pin-pricking of Franco should cease, and to ask why Spain should be ostracised when the ex-enemy Italy was being spoken of as a possible member of Western Union. And all the time, behind the casual talk of service chiefs and the marshalled arguments of their staffs, lay the tendency of some Americans to think of a future war in terms of the last: withdrawal from central Europe in a rearguard action, followed by counter-attack and liberation. In such trains of thought nations—the British Isles as well as Spain—figure as bases and defensive positions, not as moral and political entities; and, in some American eyes, Spain is seen as a more defensible position than France. When such thinking begins to influence foreign policy it is time to call a halt for reflection.

Reflection must begin with the facts as they are, and the relevant facts at the moment are these. First, there is in Britain, the Commonwealth, France and in the Scandinavian countries the strongest feeling against Franco and his regime. Its roots are deep and tangled. Young men and women who barely remember the victory of Franco in the civil war, with Nazi and Fascist aid, feel as strongly as veterans of the International Brigade. A mood of shame and indignation comes over any European Liberal or Socialist who hears talk of coming to terms with the regime established 12 years ago. He may be able to suggest no alternative; he may not even understand the Spanish people's dread of further civil war—now the main prop of the Caudillo's power; he may even recognise that international Communism is not what he thought it was in 1936. But the fact remains—he will have no truck with Franco. This is an

unchangeable political fact, well understood by Mr Bevin and by statesmen in all countries of Western Union.

Second is the fact that the whole movement towards co-operation in the west, economic as well as political, has declared its loyalty to certain principles. It is true that there has been no suggesion of inviting Spain to join the Brussels Pact, although that would come if the strategists had their way; but it is worth recalling that the signatories of that pact declared their intention

> to fortify and preserve the principles of democracy, personal freedom and political liberty, the constitutional traditions and the rule of law which are their common heritage.

If those are to be the rules of the western club—and they should remain so—then Franco must expect to see Spain blackballed so long as he retains power. To choose this moment, therefore, in the development of Western Union to press the question: "How shall the west come to terms with Franco?" is to foment deep suspicions and dissensions in western Europe, to divide parties which have been slowly rallied by such leaders as Mr Bevin into confident and united support for their present foreign policies. It is easy to demonstrate that the arguments used to exclude Spain from Uno—notably by Poland—could be turned against Communist governments which are already members. It can likewise be argued that many things said and done against the Franco regime in fact rally many patriotic Spaniards behind him. Yet on this matter mere logic will make no impression on the average European Liberal and Socialist, or on many men and women of the centre and right as well.

Third is the fact that the governments of the west—among them the United States Government—have accepted the United Nations Assembly's decision of December, 1946, that members should withdraw their ambassadors from Spain. That decision stands, and there is not the slightest reason to believe that the British Government would propose or even vote for its reversal, even though the absence of a skilful ambassador in Madrid probably does more harm than good to British interests and policy in Spain. What is now less certain is whether a Republican President would feel bound by this decision, although a spokesman of the State Department last week did his best to cover Senator Gurney's tracks by saying that "American policy is to support the decisions of the United Nations."

Last and not least important is the fact that, as recently as March 4, 1946, the Governments of Britain, France and the United States issued a joint statement on policy towards Spain. They agreed that so long as Franco continued in control

> the Spanish people cannot anticipate full and cordial association with those nations of the world which have, by common effort, brought defeat to German Nazism and Italian Fascism which aided the present Spanish regime in its rise to power and after which the regime was patterned.

They expressed the hope that liberal-minded Spaniards would soon find means of bringing about "a peaceful withdrawal of Franco," abolition of the *Falange*, and the establishment of a *caretaker government* which would leave the Spanish people free to determine the type of government they wanted, and to choose their leaders; "the Spanish people themselves," it was emphasised, "must in the long run work out their destiny." There would be no interference from outside.

★

These then are the political facts—as important as geographical facts—which must be understood by the strategists. A word must be added about the political and strategical probabilities. To bargain at this moment with Franco—whose price is and will remain high—would be to weaken the west in the cold war of propaganda and prestige, for the sake of uncertain gains in defensive preparations. For what might be spent on Spain's railways, power stations, airfields, army and equipment would have to be taken away from the Brussels Powers—for on present estimates there is no surplus for Franco. Is this really the intention of Senator Gurney and those who think like him? Again, is it conceivable that the Franco regime would allow that free movement, close collaboration and friendly interference which military and economic co-operation with the United States involves? Would Franco trust even a Republican administration in Washington sufficiently to give its representatives in Spain the free hand they would ask for? It is surely more realistic to assume that only imminent danger, the dread of losing his grip on power under the impact of a European war would induce in the Caudillo a compliant and trusting mood. Lastly, can the Americans really afford to let the French believe that, in case of war, they contemplate a retirement to the Pyrenees and the British Isles? Such an assumption makes nonsense of the whole European Recovery Programme.

It is the declared intention of the British, French and American Governments not to interfere in Spain's internal affairs. In spite of the excited accusations of the Spanish press during the last week, there is no trace of Mr Bevin's hand in the latest moves of Señor Prieto and Señor Robles among the exiles. Is there then to be no British or no western policy towards Spain? Is economic aid to be denied indefinitely to the Spanish people, burdened as it is by inflated food prices, huge military expenditure, worn-out industrial equipment, scarcity of raw materials, and inability to trade in a normal way?

There is surely a clear answer to both these questions. Economic aid to Spain now would benefit not the people but a corrupt and economically inefficient regime. As for British policy, the answer surely is that the curbing of Communism and the displacement of Franco are part and parcel in the same operation. As the Communist threat to western Europe recedes Franco's *raison d'être* will disappear. As Europe's recovery advances, the contrast with their own poverty will become in-

tolerable to the Spanish people. As liberal and democratic forces in the west show themselves strong and efficient—as they were not in 1936—more Spaniards will see an interest in bringing them to bear on the problems of their country.

It will be objected that this is a long-term policy, that it does not meet the defensive needs of the moment. It is, indeed, a long-term view, but the west must postpone some of its tasks to the future. In the huge operation of political and economic recovery which is now under way there must be priorities, as in every great enterprise. And to decide what shall be done about Franco and his part in the defence of western Europe is no more a matter for decision in the immediate future than is the future defence of western Germany by Germans—another topic discussed among the strategists.

What is needed now in the west—with the aid and advice of America—is steady agreement on principles and aims, and concentration of purpose and energy. Anything which distracts attention and promotes dissension is a nuisance; and at the moment the regime in Spain is merely a nuisance. Franco is not now strong enough either to threaten peace or to give the west a decisive advantage in war. In fact, the relations of the west with Spain would demand serious attention only if the Franco regime were crumbling, and if there were an effective opposition within and outside Spain ready to guide the country peacefully and democratically into new paths. At the moment there is no sure sign of either development. It would be better to wait until there is, to forget and forgive Senator Gurney, and let the dogs go to sleep again.

Will the Planning Act Work?

THE object of the Town and Country Planning Act is to get effective public control of all uses of land. The Act has introduced revolutionary changes in the British system of land tenure. It requires any private owner or builder who seeks to develop his land, or to put it to a different use, first to get permission from the local planning authority (or on appeal from the Ministry of Town and Country Planning). If permission to develop is refused, no compensation is normally payable to the owner; if permission is granted, the owner must pay a "development charge" to the state, equivalent to the anticipated increase in the value of the land, before he starts to develop it. In theory, the logical effect of this arrangement should be to reduce the market price of every piece of land to the value attributable to its existing use, whatever that may be; for the state now holds the exclusive right to develop land and to sell this right if it chooses. Finally, the Act extinguishes all development values previously in private hands, but seeks to compensate owners for their lost rights from a fund of £300 million. Responsibility for disbursing this compensation fund and for levying development charges is in the hands of the Central Land Board, appointed by the Minister.

So much for the theory of the Act. But the land market—always a tricky and unpredictable forum—is not reacting as the official logicians expected. Land has been changing hands at prices well above "existing use" values. Some aberrations of this sort are natural and were expected. The Act is highly technical, and the public finds its implications difficult to grasp. Allowance must be made, too, for personal and incalculable factors. A householder, for instance, who specially covets a neighbour's field or garden will willingly pay much more for it (and will probably have to) than its agricultural value. But, as the chairman of the Central Land Board made clear on Thursday, the prices now being paid by many purchasers of land will get them—and of course the Board as well—into serious difficulties.

The Town and Country Planning Act rests on two assumptions, which if unfounded would seriously damage the public interest and offset the Act's effectiveness as a planning measure. The first assumption is that the Act will not, on balance, discourage or retard private development but will merely steer it to appropriate sites; the second is that it will not put up the average costs of development. These assumptions are in part complementary—for an increase in costs must eventually defer development. Their validity is challenged by the present behaviour of the land market. If land is consistently bought for development at more than its existing use value, and if the full development charge is then exacted by the Central Land Board, the total cost of development must be greater than it was before the Act was passed, and the extra cost will eventually be passed on to the occupants of new premises. Moreover, much private development is at present being carried out by individuals who build their own houses, and they have no remedy against excessive land costs beyond their own willingness to pay the purchase price. At present, perhaps, there is more danger that private development may be made unduly costly (to the consumers' detriment) than that it may be stopped by high prices. Both dangers exist, and the second is likely to grow with time and could have very damaging effects if the permitted volume of private development were to be raised above its present low level.

A further complication arises from the changed character of many current land transactions. It is not infrequent for a vendor to sell jointly with his land the benefit of his claim on the £300 million compensation fund, and to get in exchange the equivalent of a 1947 price. Unless the claim for compensation is eventually met in full, the purchaser stands to lose on the transaction, whilst the vendor passes on an obligation which the Act meant to be his. Of course, the purchaser may again pass on the difference, or some part of it, to the purchaser or tenant of the developed property. How far the £300 million will suffice to pay reasonably fair compensation to all claimants is uncertain. It is, in any case, quite unlikely to be sufficient unless extra provision is made for the mineral rights whose value was supposedly allowed for but was probably undercalculated. Moreover, few claims on the fund will be met in full since they mostly contain an element of floating value which will quite legitimately be discounted, whilst a further loss arises from the fact that claims will not be settled for several years. If purchasers pay much more for land than its existing use value, and take a contingent claim on the £300 million, they may be aggrieved by the final settlement; in part, their own ignorance will be to blame, but an inequity will arise which even legislation would find it difficult to remedy.

If the Town and Country Planning Act is to work even with some degree of efficiency and equity, the Central Land Board must assume the unenviable task of coaxing or coercing the land market into complying with the Act's broad intentions. The Board's main coercive weapon is its ability to enter the market with compulsory powers of acquisition, which it is already threatening to employ. Even this weapon, however, could not tame a really obdurate market, for it is quite impossible for the Board to watch and to intervene in all the multitudinous private transactions in land. Nor would the Board wish to do so. Even if it were practicable, to resort to measures of public compulsion on a really large scale would be to defeat the intention of the Act, which is to work with and not against private enterprise.

To gain its ends, the Central Land Board will have to rely primarily on persuasion and not on coercion. Persuasion may

be employed on two fronts. Purchasers of land can be encouraged to resist prices which are obviously higher than existing use values; and vendors may be wheedled into disposing of their land more cheaply than at present. The first tactic may enjoy some measure of success. Many private purchasers are still unaware of the full meaning of the Act, and the market could not quickly bring itself to make a drastic revaluation of the established scale of land prices. The Act supposed that it would, and so missed the essential point that the conventional element in prices, particularly of land, is proving stronger than the theory which underlies the Act. There is no great shortage of building plots (building licences are the difficulty) yet in some areas keen competition for particular sites is driving up prices. Would-be developers are free to report cases where the price asked is excessive, and the Board will then offer to buy the land itself. Its intervention in such cases, if necessary by the use of compulsory powers, could only affect a corner of the market directly, but its indirect restraint on the offers of purchasers and the demands of vendors might have some effect.

The task of wheedling the vendor is much harder. As regards land whose early development is not contemplated, the Board can do little more than urge the purchaser to pay no more than existing use value. The case is rather different with land whose early development is desirable and practicable. Contrary to the strict theory behind the Act, it is now accepted that the vendor should be allowed—indeed, he cannot easily be refused—some margin of profit in such cases, otherwise he simply will not sell at all. The Board's problem is to keep his profit to a minimum to prevent land from being acquired for speculation instead of development, and to stop the exploitation of compensation claims, as it were, as a condition of sale at high prices. It may be possible to persuade the vendor himself to pay the development charge before parting with his land in cases where permission to build is immediately available. The Board is willing to fix the charge subject to the conditions that the land is sold to a specified purchaser who must begin building within twelve months (thus preventing the creation of a market in development charges which would inflate prices and retard development). It will then let the owner sell at any price he can get, on condition that the amount of the development charge already paid is disclosed to the purchaser. This arrangement gives owners a clear incentive to sell their land in appropriate cases, whilst giving the Board a useful and necessary indication of the proper level of development charges, which would certainly be revised upwards for similar cases in the future if the owner's profit turned out to be a large one.

By a cunning blend of persuasion and coercion the Board may make some headway in bending the market to its will. The market may also of its own accord move slowly into a greater compliance with the Act's intentions. Neither result, however, is certain, nor in any event can the Board's success be complete or be secured in a way that is free from unsatisfactory and inequitable features. Partly because of the unsatisfactory compensation provisions, and partly because of the inherent character of the land market, neither owners nor builders are willing to forgo all profit from the development of land. Since, however, the Central Land Board has a statutory claim to the whole of the profit arising from development, the necessary incentive to private owners and builders can only be supplied either by fixing the development charge at less than the theoretically "right" level or else by adding to the total cost of development—or by a mixture of both. Both results are undesirable. To have to vary, for reasons of practical expediency, a charge which ought to be settled for all applicants by a uniform rule is to introduce an undesirable element into public administration. Yet this may be the only way of lubricating the machinery of the Act.

To ensure the effective public planning of the use of land is an aim accepted by all political parties; it is essential to physical and social reconstruction; and it involves the solution of the problem of compensation and betterment. No way of doing this which is clearly superior to the method introduced by the Act, has yet been propounded. There may well be a case—indeed a necessity—for amending legislation on some of the Act's particular features. But the only fullblown alternative which could replace it is that cherished by the extreme Left—the nationalisation of the land.

NOTES OF THE WEEK

Mediation on Berlin

The Argentine Foreign Minister, as chairman of the Security Council, has been attempting mediation in the Berlin dispute and has failed. The Russians, despite some indirect evidence that Mr Vyshinsky was impressed by what Dr Bramuglia told him of the western attitude, insist on keeping the matter out of the hands of the Security Council. They want to take up negotiations where they were broken off on August 30th—that is to say, in the meeting of the military commanders in Berlin. That would at least ensure further delay and argument until the end of this month, when weather conditions—the Russians seem to believe—will threaten the air lift more effectively than the rolling of Yaks or the flying of balloons. What is less generally realised is the disastrous effect that continuance of the blockade is having on the economy of the Russian zone. The western Allies have at least one ace in their hand. They too can afford to wait, provided that they do not keep their eyes fixed only on Berlin.

The records will show that the western Ministers did not send Dr Bramuglia empty-handed to Mr Vyshinsky. They made it easier for the Russians to be moderate without losing face, provided that Mr Stalin wanted good relations more than a local success. All the details and complications of the British White Paper on the dispute published last week—on which the Foreign Office deserves congratulation—must not be allowed to obscure the real issue: which is that force has been and is being used to blockade Berlin.

There is growing reason to suspect that the Russian reason for not wanting an equitable settlement in Berlin—except on terms which would bring them a bonus—is their awareness that, if the power to squeeze the western Powers in Berlin were once given up, they might find it impossible to assert a similar grip elsewhere. What they are bargaining for is a position from which they can wage the cold war with the maximum effect and the minimum risk of actual fighting. That Berlin has a unique value for this purpose is shown by the war scare which has run through the west in the last two months. It would be only worth giving up in exchange for concessions which would expose western Germany to economic distress, political disillusionment and infiltration from a Communist-dominated capital.

Mr. Churchill's Warning—and Omission

Few seem to have noticed the significant differences between what Mr Churchill actually said at Llandudno on Saturday and the text of his speech released to the press beforehand by the Conservative Central Office. The changes that he made show how carefully his words were weighed and how conscious he was of his responsibility to a vast audience beyond his immediate vision. They suggest too that he was not thinking of an ultimatum backed by atomic bombs to be delivered to Moscow, but was expressing cautious confidence that by firmness the western Governments could avert war.

There remains, nevertheless, a puzzling and sinister vagueness about his renewed demand that "we ought to bring matters to a head and make a final settlement." Is he proposing presentation of the west's terms for settlement, backed by an implied

threat to use force sooner or later; or does he mean a bold broadening of the narrow front on which the diplomatic struggle with the Soviets is now joined? Presumably he means the latter: for in one and the same paragraph he urged that the western Governments should "formulate their just demands while they have the atomic power and before the Russian Communists have got it too"; and he referred in no apologetic spirit to "our Christian and altruistic inhibitions against using this strange new power." Mr Churchill knows that the western Governments, as now constituted, are incapable of threatening resort to war, and would not be believed in Moscow if they tried to do so.

Mr Churchill had one outstandingly apt and penetrating passage in his sombre and memorably phrased address. "We ought not," he said, "to go jogging along waiting for something to turn up." The west must formulate "its just demands," and he gave a rough list of them: let the Russians "retire to their own country" and "liberate the eleven ancient capitals of eastern Europe"; let them "cease to oppress, torment and exploit" their zones of Germany and Austria; in the Far East let them "cease to distract Malaya and Indonesia . . . liberate the Communist held portion of Korea," and stop fomenting civil war in China. That is not a bad programme, provided it is understood that the price of its fulfilment might be Anglo-American withdrawal from Germany and Austria. It is at worst a timely reminder to Mr Bevin that he has not clearly restated the objectives of British foreign policy since he admitted that collaboration with Moscow in international activities of control, security and reconstruction had become impossible. If the Berlin question were cleared up satisfactorily tomorrow, what would Mr Bevin press for next?

*

Mr Churchill's brutal and realistic analysis is a necessary answer to the ruthless Communist analysis by Soviet leaders dead and alive (of which specimens appear in an article on the Moscow-Belgrade correspondence on page 629). What he said at Llandudno may have sent shivers down many spines in the west, but it will have thrilled many still hopeful hearts in eastern Europe. For there the next question for Mr Bevin and Mr Marshall—and for whoever speaks for France—is clear: how is the growing economic and military strength of western Europe and America (including their temporary monopoly of the atomic bomb) to express itself in diplomatic strategy and tactics? How, in fact, is power to be exerted offensively against the Soviet Union without recourse to war? That is the question which Mr Churchill did not answer at Llandudno, and which Mr Bevin was unable to answer when it was put to him recently by his military advisers.

* * *

Dominions at Downing Street

There is a faint hope stirring that the Prime Ministers of the Dominions will get down to hard facts. The fine phrases which characterised the first few days of their meeting this week in Downing Street seem to be giving way to plain speaking. So long as the meetings remain secret—and it is right that they should be—it is impossible to judge their temper accurately; nevertheless, the official daily bulletins of their progress are beginning to show welcome signs that the Prime Ministers have not gathered together simply to indulge in an orgy of self-praise.

The two most important issues before the meeting are economic co-operation and defence. Both involve a degree of give and take which the Dominions have not had to consider before in times of peace, and it is too much to suppose that agreement will be automatic. On Monday Sir Stafford Cripps outlined Britain's four-year plan for its share in the European Recovery Programme. His speech to the Prime Ministers encouraged their faith in Britain's recovery, but at the same time it emphasised that Britain is a member of two clubs, the European and the Commonwealth. The Dominion representatives were obviously worried, for if Britain was to provide so much capital equipment for the continent, would there be enough left over for the ambitious schemes for industrial development which most of the Dominions have drawn up? The dilemma is by no means insoluble, but the solution will involve the co-ordination of the economic plans of the Dominions, and this in turn will mean that some Dominions may have to curtail some of their pet schemes. Hard bargaining will be the order of the day, but this should serve to strengthen rather than weaken the bonds of the Commonwealth. It will at least reveal who is willing and who is not willing to co-operate.

Constitutional issues appear to have been shelved for the time being, but they cannot be avoided for ever. Eire's break with the Commonwealth and the absence of Mr Costello from Downing Street show that the links between the Dominions are not infinitely elastic. It is also probably more than a coincidence that the opening of Parliament on October 26th, when the Prime Ministers will still be here, is to be accompanied by the full regalia of Crown and Sceptre.

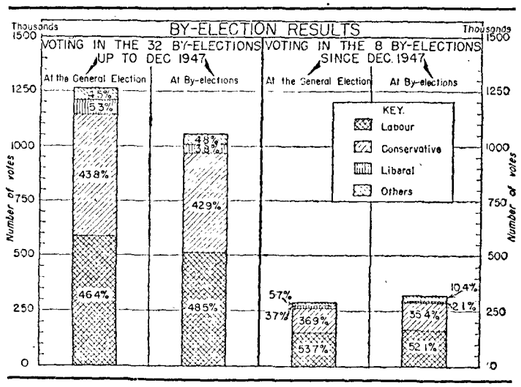
The African Conference Goes Home

It is generally agreed that the conference of delegates from the British African territories was a good idea successfully carried out. From every point of view closer contact and mutual understanding between the various colonial legislatures and Great Britain are desirable. This would be true at any time, but especially now, when plans for a forward surge of colonial development coincide both with a time of severe economic difficulty for the whole complex of which the colonies form part, and with a determined attempt from the outside to exploit those difficulties, spread disaffection, and, if possible, reproduce the conditions of Malaya throughout the African continent.

There is an obvious short-run possibility of conflict between the interests of the colonies and of this country, and a rather less obvious but overwhelmingly more important long-run harmony. Like other economically and socially backward areas, Africa faces a dilemma. A poverty-stricken and largely uneducated people, chronically below par through malnutrition and ill-health, needs trained men, equipment, transport, social services, a service for soil reclamation and pest control—in a word, capital investment on a huge scale both in human and material form—in order to raise itself to tolerable standards; yet it has no margin, or no margin approaching the adequate, out of which to provide itself with these things, nor, even if it had attained them, to carry their immediate running costs until such time as they shall have produced their beneficent effect. Help must come from outside—in this case, from Britain.

Britain's own dilemma, the strain on its own resources, is, however, such that a full-speed, uninhibited campaign of *colonial development for colonial benefit alone is impossible.* Such assistance as Britain can give depends on its success, and the success of the sterling area as a whole, in restoring and maintaining solvency in face of the rest of the world. The short cut to solvency, favoured by totalitarian powers of all kinds and at all times, is to exploit every inch of colonial territory and every pair of colonial hands for all they are worth; therein lies the opposition of interests, and the opportunity of malignant trouble-makers. The long-run harmony lies in the advantage accruing to Great Britain from association with enriched, transformed and permanently prosperous colonial territories—an association certainly not to be achieved by the methods of the exploiter—and in that accruing to the colonies from association with a stable, solvent Britain able, by reason of that stability and solvency, to provide further help towards their economic progress. The fact that the interests of both parties must—in the interests of both parties—be harmonised at every step affects both the nature and the timing of colonial development, and makes mutual understanding more important than ever. The Lancaster House conference, as a contribution to that understanding, ought to be the first of a series.



* * *

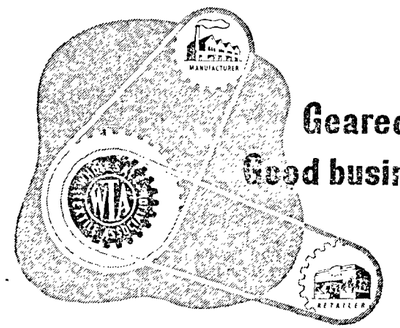
Above Suspicion

Whatever the outcome, it is good that a full judicial enquiry should follow the allegations of irregularities in the Board of Trade. The integrity of the Civil Service, and indeed of the whole administration, ought to be in every sense above reproach; which means that it must not only be complete, but be manifestly seen to be complete. It has always been one of the great assets of British public life; and its maintenance has grown immeasurably in importance as the role of the Government has been extended. That very extension, of course, both offers opportunities for more or less serious lapses from the high traditional standard and, even given an impeccable maintenance of that tradition, opens a wider field to suspicion. It is the more essential that suspicion, where it arises, should be thoroughly ventilated. Any other course would lead either to a general lowering of standards, or to irresponsible imputation of guilt even when no shadow of evidence exists.

Scottish By-elections

The by-elections in the Gorbals division of Glasgow and in the Stirling and Falkirk Burghs have continued the Government's remarkable record in holding on to its seats. As the following chart indicates, there is nothing in the voting at by-elections during this year to show any important change in the percentage of the votes polled by the Labour Party. Such votes as they have lost appear to have gone as much to minority parties as to the Conservatives.

Nevertheless, there is no uniform pattern about the division of public opinion, as the Gorbals story clearly demonstrates. The total poll was down by about 7 per cent from the General Election, but the Labour majority fell from 15,804 to 6,525. This was partly due to the difference in personality between the locally beloved Mr George Buchanan, who held the seat for many years, and the new Labour Member, an extremely self-effacing lady who was nominated largely as a result of Roman Catholic pressure, and who refused to discuss such burning topics as housing. The increase in the Conservative poll by 2,000 votes is an indication of the growing disillusionment with Labour, especially in Scotland. The casting of over 4,000 votes for the Communist Mr Kerrigan was largely due to his own personal qualities and to the energy which his party put into the contest. He used almost every known device to gain local popularity, including a platform of anti-Americanism, recognition of Israel, anti-partition in Ireland (45 per cent of the Gorbals population is Irish Roman Catholic), home rule for Scotland, and disarmament. This is the first time in 25 years that the Irish question has been in Scottish politics, and the size of the Communist poll is a tribute to its usefulness.



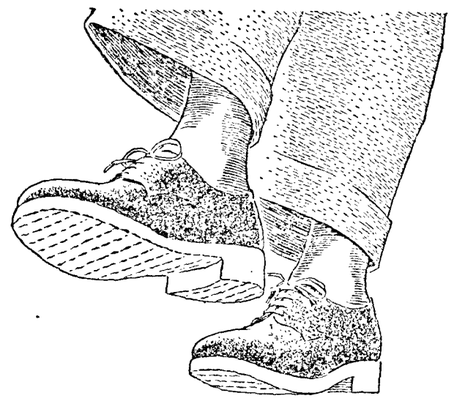
In the Stirling and Falkirk election, the Labour majority was reduced by more than a third, but the Conservative vote was only slightly increased, the change in balance being due to the candidature of a militant Scottish Nationalist. The Labour Party put up a determined effort to return the seat and their success indicates among other things the urgent need for the Conservative Party to improve its Scottish organisation which at the moment is exempt from the reforming zeal of Lord Woolton.

* * *

Recurring Strikes in France

The strikes in France are the epitome of the country's mortal sickness. They are virtually unavoidable in a community in which the cost of living has risen by 30 per cent in a year while the maximum increase in wages offered so far is 15 per cent. This situation reflects the incompetence of the divided central government, the refusal of the possessing classes to accept the necessity of high and strict taxation and the constant flirting of sections of the government with the idea of total *laisser faire*. In such conditions, all respect for the central authorities tends to banish among the more poorly paid workers and the situation is ripe for protests and strikes.

At this point, the other fundamental weakness in France comes into play—the existence of a body of determined well-disciplined men who are pledged to do all in their power to disrupt the French economy. The Communists are open in their determination to destroy the Marshall Plan and to ensure that no



Geared for Good business

The modern wholesaler has a highly geared, sweetly-tuned organisation which carries the products of the factory to thousands of retail outlets with equity, economy and efficiency. For the manufacturer this means guaranteed continuity of production through stock being regularly ordered in advance of season. For the retailer it means ready supplies of "the pick of the market" in the quantity and price range his trade demands.

Issued in the interests of Economic Textile Distribution

A crêpe sole is the only finished product made from pure rubber

Normally, to make rubber articles tough, resilient and enduring enough for every day use the rubber must be compounded with special chemicals. Of the many chemicals used by the rubber industry the most important are included in a group known as accelerators. Monsanto are the largest manufacturers of rubber accelerators in the world.

MONSANTO CHEMICALS

SERVING INDUSTRY . . . WHICH SERVES MANKIND

worker takes part in the "war against the Fatherland of Socialism." The strikes which have closed the mines for a fortnight and are continuing sporadically in all the vital sectors of the French economy—in metallurgy, in transport, in the docks—might have broken out in any case. Indeed, the non-Communist miners were unable to counsel their members not to strike, so bitter is the feeling over the rise in prices. But the presence of a Communist general staff fomenting and exploiting the situation clearly means that the strike movement will do the maximum harm to the French economy.

There is only one way to break the deadlock. It is to stop inflation and stabilise prices. The French worker is chary of purely political strikes—as he showed in November, 1947. But the pressure on daily existence is now too severe for patience. However, the Queuille Government shows no more sign than any previous coalition of possessing the courage to grasp the financial nettle, and while the central power hesitates and dithers, the Communists grow daily more confident of their power to reunite the trade unions under their leadership—and General de Gaulle more certain that he will be called to re-establish "republican order."

Western Commanders at Work

Planning, as distinct from reconnaissance, for the defence of western Europe really began this week with the first meeting in London of the committee of commanders-in-chief, with Lord Montgomery in the chair, and some familiar Shaef figures around him. It has taken six months to work towards this stage, and the shindy in Paris that attended the appointment of the chairman and of his land commander, General de Lattre de Tassigny, revealed the kind of political and social difficulties that arise in the co-operation even of friendly governments.

The intention is that what is now called a committee of commanders-in-chief shall become, in case of war, the nucleus of an integrated operational staff, chosen and trained beforehand. There has been so much misunderstanding of the Western defence organisation that it is as well to make the pattern clear. At the top of the hierarchy stands the Western Union Defence Committee, consisting of the Defence Ministers of the governments concerned. This body deals with high policy and meets periodically to discuss decisions like those taken in Paris last week. Below it comes the Western Union Chiefs of Staff Committee, also meeting periodically, which considers broad policy and strategy. This met recently with Lord Tedder, representing the British Chiefs of Staff, in the chair. So far this committee has had no American representative present at its meetings.

At the base of the hierarchy comes the first organisation of all—the parent cell, as it were, of the whole defence organisation—the Military Committee of the Five Powers and its service staffs. This has the job of planning, exploring difficulties and solutions, co-ordinating information and generally keeping momentum. American and Canadian observers sit in at its meetings.

Five Power Defence Organisation

Western Union Committee of Defence Ministers

Western Union Chiefs of Staff Committee

Commanders in Chief Committee (Western Europe) | Military Committee of the Five Powers and their Service Staffs

The body of which Lord Montgomery is chairman is an offshoot of these three related bodies. It is responsible to the five Ministers of Defence and to the Chiefs of Staff in their joint capacity, although salaries and expenses are for the time being paid by individual governments. It is incorrect to describe Lord Montgomery as chairman of the West European Chiefs of Staff; he is in fact commander-in-chief of land, sea and air forces that will be combined—if not integrated.

*

The French still feel, in their heart of hearts, that the cart has been put before the horse—that a guarantee of American aid and a military alliance should have been obtained before they committed themselves so deeply to a defensive combination against the Soviet Union. It is, of course, constitutionally impossible for Mr Marshall or Mr John Foster Dulles to give such a guarantee without the authority of Congress; but they seem in Paris to have gone as far as they dare in assurances about future American policy.

These American assurances may have lightened the most pressing difficulty, which is not military but financial: how is France, and to a lesser degree Holland, to pay for the urgently needed equipment which Britain and others can supply? Presumably Sir Stafford Cripps has brought back from his American visit new ideas on a riddle which is holding up the service experts in their planning.

* * *

Jekyll and Hyde Horner

The split in Mr Arthur Horner's personality as a member of the Communist Party Executive and as an official of the National Union of Mineworkers is becoming increasingly apparent. The Wigan by-election, where as the secretary of the NUM he had to send good wishes to the official Labour candidate in his campaign against a Communist, was but one incident in a long series. Now as a member of the committee which is studying the problem of coal production, he has to support the policy of maximising output, at a time when the Communist line is to sabotage the European Recovery Programme and slow down production.

This state of affairs might have continued for some time, so long as Mr Horner committed no major indiscretion. But the incident that has arisen during his presence at the conference of the French Confédération Générale de Travail (which is officially boycotted by the TUC, although the miners agreed to send him as a fraternal delegate before the strike began) must surely bring matters to a head. Mr Horner has declared that he welcomes the resolution from the Communist-dominated South Wales branch protesting against the shipments of Welsh coal to France while their French "comrades" are on strike. Mr Will Lawther, the miners' President, has vehemently declared that the miners must support these exports as a necessary contribution towards European recovery. For the moment, this is a battle of words and press statements, since both men are speaking as individuals. But when the full Executive of the NUM meets at the end of this month there will be strong pressure on Mr Horner to "come clean" and say whether he is in fact the miners' Jekyll or the Cominform's Hyde.

A Bribe for the Miners?

With the now familiar autumn exhortations and threats to the miners there has appeared the suggestion that some concession should be made on pay-as-you-earn income tax, which is alleged to be a deterrent to regular attendance. At the meeting of the Coal Board and the miners' leaders last week, the point was put forward, and the board is to make a study of the effects of PAYE which Mr Gaitskell may then take up with the Government. If any concession is applied exclusively to the miners, it is a thoroughly bad suggestion; there is no justification whatsoever for singling out the miners and letting them off part of their tax payments on their overtime earnings at the expense of other taxpayers, in order to induce them to work harder and turn up more regularly. Criticism of the detailed working of PAYE is, indeed, widespread, and a modification may well be due. But this criticism is valid for industrial workers generally, and if the system is wrong, why should textile, agricultural or steel workers have to submit to it, if the miners do not? Mr Gaitskell's offer to look into the case is only justifiable if it is applied generally.

Fortunately the Trades Union Congress is as unlikely to favour preferential treatment for miners in the shape of tax concessions as it was for extra rations. But the very fact that inducements of this kind are canvassed only underlines the need for more constructive ideas. The announcement that the round target of 200 million tons is to be broken down and discussed in each pit is, therefore, welcome. Hitherto the target for the year has been fixed at the headquarters of the Coal Board. It would be far more sensible to calculate it from the bottom up on the basis of what each pit can be expected to produce. Until the colliery manager and the individual miner are working towards a properly calculated objective, neither can give his full support. This is a matter for management on the spot, and it is an ominous sign of its own lack of self-confidence that the Coal Board has been prepared to support yet another *ad hoc* committee of six Coal Board members and six trade unionists to examine the means of encouraging increased output and to boost production generally. Can this body contribute anything more than further confusion? What has happened to the Burrows Committee set up last May after Sir Charles Reid's resignation? It is still investigating the Coal Board's organisation, and it appears that its report, even when ready, will not be made public. A new committee every three months will not achieve anything.

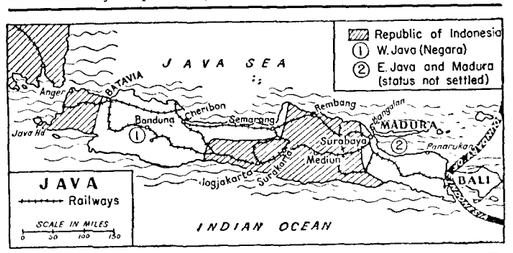
The Choice Before Israel

Fresh breaches of the Palestine truce, at Jerusalem and in the Negeb, are deflecting attention from problems of equal scale in the settled areas. Of these, the most far-reaching at present in the balance is the future pattern of the Israeli state. Shall it be democratic in the western, or in the eastern, sense of the word? Israelis are divided. Large numbers, chiefly those born in central Europe, hope that it will turn out to be something like Czechoslovakia in its heyday—with Weizmann as its Masaryk and Ben Gurion as its Benes. Numbers also large, but born farther east, see nothing repugnant in totalitarianism and think that an expansionist Israel would do best to hitch its fortune to the Russian star.

The easterners have scored two successes in the last week. One was in the sentence passed on a Briton, Mr Sylvester, for alleged espionage during the fighting in Jerusalem. The other was in the superficially comic, but at bottom sinister, incident of the mass Stern Gang "escape" from Jaffa gaol.

Mr Sylvester, one of the five British employees of the Jerusalem Electric Corporation who were kidnapped by the Irgun two-months ago, but later handed over to the Israeli authorities, was sentenced by the Jerusalem District Court to seven years imprisonment for "broadcasting information useful to the enemies of Israel." He in fact used one of the three small local transmitters that were supplied for purposes of intercommunication to the three points at which the British residents remaining after May 15th were asked to congregate for safety—the cathedral, the consulate and the power station. Mr Sylvester was at the power station. Most of the messages interchanged seem to have been of the "All well here" variety. One transmitted by Mr Sylvester may have been less prudent. If so, an adequate and balanced reaction to it would have been a warning by the Jewish security authorities on no account to refer to the accuracy of anyone's shooting; an alternative would have been the impounding of the transmitting apparatus. Upon the evidence, the sentence of seven years delivered by Judge Halwy (who referred, in his judgment, to membership of a "spy ring" of which no evidence whatsoever was proffered) is explicable only on grounds of politics. It was a manifestation of anti-British gall. It was also the delivery of a pound of flesh to the Irgun. There is to be an appeal. Possibly the higher court will produce new and strong evidence against Mr Sylvester. Unless it does so, it should not let pass this first display that the judiciary is a prey to political considerations.

*



The incident of the Stern Gangsters' escape from gaol points in the same direction. Nearly two hundred of them got out "for a breather" and "to prove that there are no walls which can hold us." Some of their guards connived. The majority strolled back in their own time. Their armed escapade, said one Israeli police officer, was unimportant because they would "never shoot Jews." But is this the heart of the matter? These young men and women stand for a totalitarian solution of Israel's case. They have already proved that by battle and if necessary by murder they intend to secure a bigger Israel and to brook no interference from the United Nations. Either their crimes and intentions must be taken seriously and baulked now, or else the Israeli Government must admit the logic of the conclusion that it is so sympathetic to the gangsters' ends that it is ready to wink at their means. On present evidence, it is running with the hare and hunting with the hounds. It is refusing to follow the gang's train of thought to its inescapable climax, which is that no Israeli leader can afford to parley or compromise with the outside world without risking his neck.

These two happenings are not complete parallels, but they have points in common. And, of these, the most important is that both are manifestations of a sense of justice that is not objective. To found a new state upon this basis is to face east, not west. The choice is open. Only Israelis can make it. Will it be freely made, or made at the point of a Stern Gang gun? This the Israeli Government still has it in its power to say.

Communists Misfire in Java

The Communist insurrection in the Republican area of Java now appears to have been a failure in so far as it aimed at the overthrow of the Soekarno-Hatta Government. Even as an outbreak of earth-scorching it has had only limited success, if it is true, as claimed in Jogjakarta, that the oil refineries at Tjepoe have been recaptured intact, though some of the oil tanks were burnt out. Guerilla warfare may continue, but the Communist armed forces have clearly been insufficient to seize power; the bulk of the Republican army remained loyal to the Government. It is reported that the Javanese Communists were not ready for open insurrection, but obeyed the instructions brought from Moscow by Moeso. If so, it is merely an example of the Kremlin's use of expendable local Communists in attempts to embarrass and distract nations belonging to Western Union.

The slogans used by the Communists in Java revealed the fear that at long last an agreement between the nationalist Hatta Government and the Dutch was imminent; to prevent such agreements and maintain a condition of warfare or armed deadlock, at whatever cost to the native population, is clearly the present policy of the Communists in South-east Asia. The point should be made very emphatically in British publicity in that region.

The outbreak of the revolt and its collapse have had the advantage of separating the goats from the sheep in Java. As long as the Indonesian Communists were a part of the Republican nationalist movement, with a strong hold on various para-military, youth, peasant and trade union organisations, there was always some force in the Dutch argument that the moderate leaders were merely a "front" without real power, and that concessions to the Republic would be likely only to transfer the ultimate control of Java to the Communists. Fear of such a possibility has recently affected American policy with regard to Indonesia, and has increased sympathy in Washington for the more intransigent school of Dutch opinion. Now, however, that the Communists have come out in armed opposition and have been crushed, it will no longer be possible to discredit the Jogjakarta Government with charges of crypto-Communism, and the Republican Ministers themselves can be expected to be less frightened in future of being lashed from the Left if they sign a treaty with the Dutch. The new situation may be disappointing to the Dutch irreconcilables who hanker after a "second police action" in Java, but it should strengthen the hands of those who have genuinely striven for an agreement.

20,000,000 more mouths to feed each year

While man multiplies his race by 20,000,000 people a year, the world rumbles on to disaster. Mass starvation and world strife are constant threats unless enough food is produced to feed today's and tomorrow's hungry millions.

Until man can repair the damage of soil erosion, and the antiquated production methods of the majority of the world's farmers are modernised, every acre of still arable land must be made to yield up more food than ever before. The "Ferguson System" of *complete* farm mechanisation can play a constructive part in this world-wide objective.

The "Ferguson System" co-ordinates the action of "Ferguson" tractor-implement units. It gives more traction without built-in weight that packs the soil. It gives finger-tip and automatic hydraulic depth control of implements carried by tractor. Its versatility and manœuvrability enable farmers to produce more food at less cost from every available acre.

*Every week, for Harry Ferguson Ltd., more than 1,000 "Ferguson" tractors are manufactured by The Standard Motor Co. Ltd., and more than 5,000 "Ferguson" implements by foremost British manufacturers.

B 6

Practices (Inquiry and Control) Act, which received the Royal Assent last July. Sir Arnold Plant, in an article in the current number of *Lloyds Bank Review*, has some detailed criticisms to make, which agree very closely with those made in these columns, of the limitations imposed on the Commission's freedom of action and the refusal to make possible any parallel inquiry into the restrictive practices either of trade unions or of Government-established bodies; but his welcome is none the less a warm one. When, however, he considers the prospects of success in achieving the Act's purposes, he puts his finger at once on a paradox of Government policy. The same Government which loses no opportunity of denouncing either monopoly capitalism as such or—according to which voice is speaking—"private unenterprise"—has done everything to provide and perpetuate a perfect medium (in the bacteriological sense) for its growth. The precedent was set between the wars, and wartime expedients reinforced the trend away from competition. "The most potent single cause of the recent increase in restrictive agreements," says Sir Arnold, "is the detailed Government planning of production, distribution and foreign trade." The example to which he gives most attention is that provided by the film industry; but the same effects can be observed throughout the economy. Concentration reduces competition; allocation of materials by quotas strangles the growth of the efficient and safeguards the inefficient; the control of profit margins and the allocation of markets "imitates," says Sir Arnold, "the practices of the private cartel," and the importance of trade associations has been enhanced by their role, both during the war and after, as negotiators with the Government planners and controllers.

Much of the consequent growth of restrictionism must be regarded as merely part of the inevitable price paid for the equally inevitable distortion of the economy by war. Controls were necessary then; many are still necessary now. Others, however, are not, except on the Socialist assumption that anything is an improvement on the detestable price system, and in face of a Socialist disinclination to relieve the strain on the economy by reducing public expenditure. The principle of not allowing one's right hand to know what one's left hand is doing, or how one's general economic policy may be frustrating the effectiveness of any particular piece of legislation, is the last one which should satisfy genuine planners.

* * *

Abusing the Health Service

A new barrier has come between the health services and those who need them. Before July 5th the barrier was money. It is now the claims made on the services by those who do not really need them but are determined to get something in return for the large insurance contribution they pay each week—ignoring the fact that the insurance contribution would have to be paid whether there was a health service or not. Mr. Bevan's recognition that the health service is being abused in this way, as shown in his address last week to the Association of the Executive Councils, is very welcome, for the popularity of the health service, after such an inauspicious gestation period, might have blinded him to the danger of its becoming too popular.

To a certain extent the abuses are the fault of the professions concerned—of the doctor who prescribes unnecessarily in order not to lose a patient, of the optician who supplies spectacles unnecessarily in order to make more money. But in the main the abuse comes from the public. The man who bought a new pair of spectacles before July 5th and now demands a free pair from the health service to keep as a spare is guilty of further delaying the time when a person who genuinely needs spectacles can get them. The woman who treats her doctor's consulting room as if it were a grocer's shop and says "I want a certificate for corsets, a certificate for spectacles and a bottle for my indigestion" is reducing the practice of medicine to a farce.

Doctors could cap stories like these a hundred times over. The effect of such abuses is not only to waste the resources of the health services to the hurt of those who really need them and to lower the general standard of medicine. It also adds considerably to the cost of the health service. The estimated cost of the prescriptions dispensed in England and Wales in the first month is £1,500,000. This, it should be emphasised, was both a summer and a holiday month; the cost in the season of illnesses will be far higher. It may well be that the original estimate of £11,450,000 for the period July 5th-March 31st will have to be doubled. Clearly, the introduction of the health service has added an unforeseeable amount to the already high cost of the social services.

It was always arguable that the principle of a free national health service was mistaken since it could so easily and so dangerously be abused. Unless the general public uses it, in Mr Bevan's words, "prudently, intelligently and morally," the pessimists will be justified.

* * *

Whitehall Goes to the Country

Further details have been published about the plans for the permanent transfer from London of 50,000 civil servants. These cover twenty departments, and involve the removal of sections of anything from 250 to 13,000 persons. Out of a civil service of some 700,000 people, 60 per cent are already scattered over the country in post offices, employment exchanges, assistance board offices and the like. The present scheme is to take a slice out of the hard core of headquarter offices in order to relieve the congestion of the metropolis.

During the transitional stage there are bound to be difficulties while old ties are broken and new ones are made; nor are all receiving centres equally enthusiastic about their new visitors. But the main difficulty is how an efficient service can be maintained when individual departments are divided between several centres. On the whole the choice of the sections that are to be dispersed seems to have been judicious and they appear to be as nearly self-contained as is possible. But the secret of successful dispersal in peacetime as in war is a proper delegation of authority, so that contact between London and Bath, Worthing or Gloucester is limited to important questions of policy at the top and routine exchange of information at the bottom. It is fatal to the speed of business and to a sense of local responsibility if authority is not delegated to the limits of good sense. During the war regional offices were often the object of ridicule because they appeared to be forever awaiting instructions from Whitehall. This mistake should not be repeated. If physical dispersal also results in local independence something more than relief from congestion will have been gained.

Quite apart from these advantages, dispersal can add new life and interest to old areas. The drift to London and the big cities over the past fifty years has denuded many smaller centres. A well-directed reversal of this movement will have an effect that is good or bad, depending on the extent to which the displaced communities become absorbed into local life, and do not regard themselves as superior enclaves of metropolitan exiles.

* * *

The Rockefeller Millions Move South

Comparatively little attention has been paid to the important experiments which Rockefeller interests have been promoting in Brazil and Venezuela for the last two years. Yet they may lead, there, to revolutionary changes in farming and in living standards. The sponsoring authority is the International Basic Economy Corporation, which was founded as a result of Mr Nelson Rockefeller's wartime experiences of the stimulus given by American methods and capital to all fields of Latin American production. A group of US enterprises, financed by Rockefeller, is endeavouring, in co-operation with the governments concerned and on a profit-making basis, "to break"—in Mr Rockefeller's words—"the bottlenecks in the economies of these countries."

The main emphasis is on improving agriculture, from the development of the land itself by irrigation, scientific feeding, and the use of modern machinery and techniques, to the efficient and economic distribution of produce. At every stage in the process difficulties arise. Innovations are resisted by suspicious supporters of traditional primitive inefficiency, and vested interests wanting to perpetuate existing conditions offer no support. Because present methods are inefficient farming is considered a bad risk by local capitalists who expect quick and large returns and have not the country's interest sufficiently at heart to attempt to improve agriculture by long-term loans at low rates of interest. These have to be provided spasmodically by the Government.

So far fresh finance without fresh methods has achieved little. It is the peculiar merit of the Rockefeller plan that new techniques are to play at least as important a role as fresh capital. If the project succeeds, it should start a self-perpetuating process. Agriculture, being on a sounder footing, will attract capital to up-to-date farmers. By cheapening production as a result of improved efficiency, and by making investors content with a reasonable profit in return for increased security, this process could transform the economies of the countries where it is applied.

There are so far few signs that domestic capital in Brazil and Venezuela is being tempted away from purely speculative enterprises with glittering profits into more solid development. The project may provide the pattern of a new influx of American capital—if it succeeds—as well as a justification of the concept of free enterprise. And in the technical sphere, whether it succeeds or not, this private Development and Welfare Fund may well have useful lessons for British enterprise in the colonial empire.

Shorter Notes

Russian pressure on the Finnish Government has increased in recent weeks. At the end of August a formal complaint was lodged against the allegedly slow progress of work on the strategic Salla railway, which Finland has undertaken to build for Russia. Then there was a protest against the condonation of "fascist activities"—in contravention of the peace treaty. Meanwhile the Communists inside the country lost few opportunities for criticism. These tactics have a twofold interest. First, the responsibility for the sins of omission or commission belongs mainly to the previous Cabinet, with its strong Communist element. Second, the reports of the Finnish Communist press, even of the Cominform's paper, were quoted as serious evidence—a familiar trick. The aim apparently is to frighten the Socialists into admitting Communists into the Cabinet.

★

The influence of Sir Ernest Gowers can be discerned behind the announcement that London Transport's notices to the public are to be written in simpler and friendlier language. Examples of the new look given to the notices show that it abides by three of the rules for official writing he laid down in *Plain Words*: short sentences, the active rather than the passive voice, and the concrete rather than the abstract noun. Thus—to take one example—"failure to adhere to the scheduled times of the buses" becomes "if your bus is late." Government departments, business men—and journalists—please note.

A short visit by Mr Schumann to the French Zone of Germany this week establishes a remarkable precedent. It is the first time since the war that a French Foreign Minister has gone out of his way to meet and establish points of understanding with German political leaders in the zone under his charge. The visit probably foreshadows an attempt by Paris to consolidate German opinion favourable to French policy before the zone merges with Bizonia.

★

The true reasons for the resignation of the late Dr Benes from the office of president of Czechoslovakia in May have been established beyond doubt by an article contributed on October 12th to the *Manchester Guardian* by the former editor of *Narodni Osvobozeni*. It is clear that the present Communist Government received from Dr Benes a signed record of a conversation with Gottwald, the Prime Minister, in which he strongly criticised the new constitution, its conception of the "will of the people" and the proposal to hold elections with a single list of candidates. Dr Benes found in the constitution no guarantees of civil rights or of the independence of the judges; they would be in practice at the mercy of the Minister of the Interior. For these reasons, not because of his doctors' advice, President Benes insisted on resigning.

★

Oxford University is the first university to come into the open about its opposition to the new school examination proposals, which would debar any child from taking the proposed "general certificate of education" until the age of 16. Criticism of the Minister's decision is contained in the University's annual report, which points out how undesirable it is to use age as the basis for assessing a child's readiness to take an examination. And it condemns even more roundly examination arrangements which are viewed solely from the point of view of the average pupil and done in such a way that the education of the more gifted is prejudiced. Will the Minister of Education listen to such authoritative criticism before it is too late?

Books and Publications

Blackett on the Bomb

"Military and Political Consequences of Atomic Energy." By P. M. S. Blackett, Turnstile Press.

PROFESSOR BLACKETT has written a book which is in part extremely valuable and in part extremely mischievous. Its value lies in the technically competent and clearly argued analysis of the potentialities of atomic energy within present or closely foreseeable technical limits for military or economic purposes. It is a salutary corrective to the more extravagant conceptions of the atomic bomb as the "absolute weapon" which have had a great influence on public opinion and even on high official circles. Professor Blackett makes a good case for the view that the atomic bomb is not a weapon by which a Great Power could be knocked out by a *Blitzkrieg* unless adequate military forces were available to follow up such an attack with invasion and occupation; that atomic bombing from the air is no substitute for military strength on the ground; and that the record of strategic bombing during the last war does not justify the theory of its decisive character, even with far more potent (but necessarily far fewer) bombs. He claims that recent technical developments have favoured the defence against the bomber, except over short distances, while rockets with accuracy of aiming at really long range are not yet in sight. He concludes that the idea of an easy victory in a war against Russia owing to America's lead in atomic explosives is fallacious, and that the Russians themselves do not take the bomb very seriously. Their behaviour certainly seems to confirm this view.

On the economic side Professor Blackett points out that the more deficient a nation is in supplies of fuel and power, the more it has to gain from the development of atomic energy as a supplement to its other resources. For this reason there is a basic conflict between an international control of energy for purposes of strategic security, which would require primary atomic plants to be evenly distributed between various parts of the world, and the economic need of backward countries to concentrate on atomic energy development owing to lack of other sources of power. This conflict of interests indeed exists and its importance has, perhaps, not been sufficiently recognised. But the fact that a majority of nations, many of which might suffer economically from control such as was proposed in the Baruch Plan, have nevertheless supported it, shows that they set security from atomic war above limited economic interests, and they are not likely to be persuaded otherwise by Professor Blackett's suggestion that, because the atomic bomb is not "absolute," it is not a serious danger at all.

It is on the political side that Professor Blackett's book may do great harm, because lucid technical arguments are used, in combination with political assumptions never explicitly stated, to lead to conclusions which are oddly reminiscent of editorials in the *Daily Worker*. According to him the only danger to peace arises from bellicosity in certain American military and political circles; the Western European nations are seen as in no way endangered by Russian expansion, but merely as pawns of the United States, and their neutrality in a Russo-American war is discussed. From the valid criticism of the magical qualities commonly ascribed to the bomb the author proceeds to infer that the Western nations ought to take risks in accepting the Russian proposals for abolition of bombs without thorough inspection, because absolute security is unattainable and a limited agreement is better than none at all. Yet he himself, in justifying the Russian stand, says that the secrecy of Russian arms production is one of their greatest military assets and that it would be sacrificed under the Baruch Plan without sufficient guarantee that America would actually discard the bomb. But as long as Russia envelops her productive system in a mantle of secrecy unparalleled in modern times and pursues a policy as treacherous as that to which the world has become accustomed during the last three years, the Western nations are fully justified in refusing to discard, for mere paper guarantees, a weapon which, even though not "absolute," could have important military uses.

A Political Novel

"The Plague." By Albert Camus. Translated from the French by Stuart Gilbert. Hamish Hamilton. 285 pages. 9s. 6d

The Economist does not now usually review novels. Nor would it review this one simply in order to discuss how far it is in line with pure Sartre, and how far heresy to existentialists. M. Camus's impressive book is *The Economist*'s business, however, because it contains a political as well as a philosophic message.

The plague of the title strikes Oran in, presumably, 1939. First, rats appear. They die on doorsteps. They stink. Their significance is not understood. Then men, too, sicken. Still the danger passes public understanding. "They went on doing business, arranged for journeys and formed views. How should they have given a thought to anything like plague, which rules out any future, cancels journeys, silences the exchange of views." Finally the true nature of the emergency is grasped. Oran is sealed off from the world. The occupier has settled in. The plague, like the Germans, has severed a portion of France's living tissues from the rest of the body.

The remainder of the book is the portrait of a community's reaction to unimagined danger, as well as to the total upset of daily life. And as such it is a human document of the first order. Its power lies in its capacity for spotting and probing thoughts and emotions—some of them base, others stimulating—that lie, ready to germinate, in all of us, but that blossom only when conditions become exotic. Several French critics have said of the book that no written word has caused them to relive to the same extent the trials, fears and futilities of the years under the Germans. To one British reader, perhaps the most poignant passage in a searching book is its description of the sense of severance from an outside world that is broadcasting futilely inappropriate messages into the beleaguered city. Is it for lack of space, or for lack of imagination that English reviewers have dwelt only upon the book's philosophic significance, and have forgotten to say that it is also an important political document? If for lack of imagination, the lapse is alarming. For does it not mean that we are mentally out of tune with the very neighbours with whom we seek Western Union?

Economic History for Everyman

"The Industrial Revolution, 1760-1830." By T. S. Ashton. Home University Library (OUP). 161 pages. 5s.

THIS latest addition to the Home University Library sets a new standard of excellence even for that admirable series. In so small a compass the reader may expect, perhaps, to find minute and up-to-date scholarship ingeniously compressed, at the cost of a total dessication of all human interest and mental stimulus; a succession of generalisations memorably stated and convincingly linked, but backed by inadequate evidence; or a thesis selectively expounded without perspective or balance. It is certainly rare for him to find, as in Professor Ashton's work, a combination of neatly summarised research, lively humanity, stimulating generalisation, bread-and-butter fact, and an unfailing sense of perspective, all embodied in prose of unmistakable, though entirely unpretentious, literary quality. It is a pleasure to be able to recommend a book, whether to the student or to the general reader, so entirely without reservation—unless, of course, a reservation is implicit in the reviewer's disclaimer of that special expertise needed to pass judgment on the minutiæ of historical scholarship.

The period covered is brief, from 1760 to 1830, picking up the story when Professor G. N. Clark's admirable *Wealth of England* left it and stopping short of the Railway Age, the great reforms, and all the *Sturm und Drang* of the mid-nineteenth century. But it is skilfully keyed in to its place in history. The genesis of the "wave of gadgets" which, in the words of the schoolboy so pleasantly quoted by Professor Ashton, "broke over England in 1760" is carefully traced; among the contributing causes—the filtering down of scientific curiosity, the agricultural advances of the preceding half-century, the spread of propitious political ideas, and the accumulation of capital—Professor Ashton attributes most importance to the last. (Indeed, one of the most remarkable features of his book is the way in which, without painful technicalities, the reader is introduced to the theory of the relation between interest rates, industrial activity, real wages and technical progress.) This emphasis on the economic does not prevent him from giving due attention to the technical aspects of change. Few accounts of the great inventions leave the unmechanical reader with any genuine understanding of the problems and solutions involved. This one does.

Nor is the human side of the story neglected. Just how individualistic were the early captains of industry? What was the balance of human gain and loss in the movement of industry from home to factory? Just how damnable was the institution of child labour? Professor Ashton certainly does not whitewash the Industrial Revolution, but he does set its black spots in perspective beside its achievements, and exonerates it from many of those evils, which, coinciding with it in time, were the result not of technical change, but of war and harvest failure.

Letters to the Editor

Soviet Propaganda

SIR,—The word "propaganda" continues to flourish in any description of the Russian system of behaviour. We read of some "western spokesman" "dismissing" every Russian move, such as the offer to supply the western sectors of Berlin, as "pure propaganda." You yourselves speak, in this week's first article, of Mr Vyshinsky winning the "propaganda war."

This seems to me a most dangerous underestimate of what the Russians are doing. Whom do the Russians hope to propagand ? Us ? We are not to be converted. The Russians ? The secret police can attend to that.

The Russians are the world's best chess players. No move which they make is propaganda. Everything is manoeuvre. They have very nearly pulled off a fool's mate in Berlin. There is an almost exactly parallel threat to our queen in Vienna. Their bishop is still threatening Greece. And how have they achieved this position on the board ? Because every subtle knight's move, every quiet slipping up of a distant pawn, is "dismissed" by her completely non-comprehending opponents as "propaganda."

The only thing to do, sir, if we are not to continue to be outmanoeuvred like this, is to break off the game and refuse to play. Whenever that happens Mr Vyshinsky, or some other, delicately uncovers a piece, as an invitation to stay on the board. The atom proposal is a case in point. You think this is propaganda ? I think not. It smells far more like a temptation to exchange our most valuable pieces for some worthless castle in the air. Then, indeed, the four million Russian pawns could move in for the checkmate to our King, unopposed.—Yours faithfully,

ANTHONY GIBBS

Spurfold House, Peaslake, Surrey

More Ministries

SIR,—Your article "More Ministries," October 2nd, suggested that granted an effective system of government by Cabinet Committee administrative bottlenecks might be reduced by increasing the number of departments, and therefore the number of political heads available to deal with matters needing Ministerial decision.

Two criticisms seem inevitable. With more departments Cabinet committees grow bigger, and may lose some of their power of effective decision. Discontented minorities being larger are more likely to wish to break the rule of collective responsibility to the committee and to appeal to the Cabinet.

Then more Ministries will mean that more MPs hold government posts. The glory of the House of Commons is that reserve of strength which enables it to bring down a Cabinet—as we saw in May, 1940. But any increase in the number of Ministries must weaken this independence. In May, 1940, 55 M.P.s were Ministers, Parliamentary Secretaries, etc., today the number is 68. You suggest that the number of departments be increased from 25 to 40. If that were done over 80 M.P.s would hold Government office, and the hordes of Parliamentary Private Secretaries would multiply further. Goodbye to the vitality of the Commons!—Yours faithfully,

University College, Southampton PETER G. RICHARDS

From *The Economist* of 1848

October 14, 1848

But the great feature of the week [in the City] has been the panic in the railway market. We have forborne entering at length into this question in the present week, pending some inquiries which are being made. That a great depreciation of railway property would take place sooner or later from the causes which we have so often pointed out, we were quite prepared to expect; and if distrust has now assumed an indiscriminate and wild character, the directors have themselves chiefly to blame in not having furnished more explicit accounts to the public.

In making these remarks, we are fully alive to the difficulty of showing such accounts in a form which, while they are not exposed to be greatly misunderstood in swelling the actual liabilities of a company, will fairly and explicitly show all its engagements, many of which may be contingent upon events very much under the control of the companies themselves. As it is, there is no doubt that very heavy contingent liabilities for further expenditure of capital upon works which promise but a very small dividend, while high rates of interest have been guaranteed upon the capital with which they are to be completed, attach to most of the companies; and the folly . . . of companies giving absolute guarantees to lines, whatever may be the general receipts at the time, now becomes apparent. As long as trade is brisk, and traffic good, such an arrangement may answer; but when the general receipts, from any cause, fall off, the fixed payments still to be made to the guaranteed lines may absorb a large portion, if not the whole, of such diminished receipts, in cases where the extent of guaranteed liabilities bear a large proportion to the lines on which they are chargeable.

Nationalised Industry in France

SIR,—In the article which appeared in your issue of October 2nd on "Nationalised Industry in France," your Paris correspondent stated that in the mines the proportion of clerks and administrators to miners has doubled since the liquidation of the private companies. I think that this statement conveys a rather misleading impression.

The greatest effort in modernisation and extension of mines is taking place in the coal basin of Lorraine. Since the geological conditions there are more favourable than in any other coal basin in France the French are making their main investment effort there, though naturally the Nord and Pas de Calais region is also of great importance. In view of the requirements in administrative personnel and employees made by the investment programme it may be of interest to give the figures of these personnel employed in 1938 and in 1948, together with the figures for miners of all classes.

	1938	Feb. 1948	Proportion of B+C to A 1938	1948
A. Miners	24,069	43,270		
B. Employees	1,900	3,300	8%	8%
C. Administrative...	150	270		

These figures relate to the basin of Lorraine only. After the war and before nationalisation took place, the 1938 figures had been largely exceeded. Unfortunately I have not the figures for June, 1946, just before nationalisation. It would appear, however, from statements given to me by members of the staff of the Charbonnages de France, at Merlebach, in Lorraine, where I obtained the above figures that there have been no major changes.—Yours faithfully,

167, *West Heath Road,*
London, N.W.3 RAYMOND F. LYONS

Uses of Manpower

SIR,—From his letter of October 9th I feel that Mr Steadman is falling into the common trap of assuming that a simple, all-embracing solution can be found for the complex problem of the re-distribution of our manpower.

Would the suggested pruning of 150,000 civil servants really help to man our coal mines, foundries or farms? It is no easy matter to adapt the army of penpushers so detested by the disciples of Mr Lewis Ord to the completely different types of work and abilities demanded by the undermanned industries: the same general argument holds good for the majority of the workers in the other "undesirable" occupations.

Again, it is easy to comment from the pleasant surroundings of Stoke Bishop that we have too much leisure, too many Saturdays off and that our working week should be increased by three hours. It is quite true that with our present economic difficulties the hours should not have been shortened, but Mr Steadman would find it a hard task to put over such a line of approach to the workers living in the backstreets of Birmingham or my own Black Country,-who for the first time in their lives have the opportunity of spending long week-ends away from the smoke and grime.

From the years I spent as a machinist and foundry worker I feel that the solutions suggested, though theoretically sound, would not work in practice. When we talk of the "Labour Force" we tend to forget that it is composed of individuals and that, unless compulsory direction of labour is resorted to, a plan of action must be formulated which appeals to the individual, not one which only takes into account the mass. It may be that "workers are tired of pampering and being lectured at (and that) they want to see firm action with a plan they can understand," but the answer, to my mind, is far deeper than that, though what it is I frankly do not know, and neither, it seems, does anyone else !—Yours faithfully,

The Union,
The University, Birmingham 15 JOHN CLEWS

AMERICAN SURVEY

Power and Policy

(From Our US Editorial Staff)

UNTIL last week Senator Vandenberg had been staying quietly in Michigan and taking no part in the campaign. On September 11th he had flown to New York to see Mr Dewey and Mr John Foster Dulles and issue the statement that "regardless of political differences at home, we are serving notice on the world that America is united to protect American rights everywhere," but that was a national, and not a party, appearance. But on October 4th he returned to Washington and, in a half-hour talk on the wireless, described his conception of the bipartisan foreign policy. When he had finished his listeners had heard little about campaign issues, but they had learned a great deal more about how a foreign policy is born and agreed upon than they had done in weeks from either Mr Dewey's manicured paragraphs or the President's roughcast sentences.

On October 10th he carried the lesson one step farther by showing how such a foreign policy is to be carried out in a world in which the United States has agreed to act not only through Congress, but also within the United Nations. Both lessons were underlined by the dangers inherent in the President's highly publicised impulse, withdrawn almost as soon as suggested, to send Mr Vinson, Chief Justice of the Supreme Court, as his special messenger to discuss the Berlin situation with Mr Stalin.

One of the problems of American foreign policy in the past has been the gap between protestation and performance. There appeared to be no contact between the men who spoke of idealism and those who acted with realism. Mr Wallace Carroll, Director in London of the Office of War Information from 1942 until 1944, writing of the arrangement with Darlan in his "Persuade or Perish" says "America had spoken such fine words, America had proclaimed such proud principles and now, at the very first temptation, America had to all appearances cast principle aside and struck a bargain with one of the most despicable of Hitler's lackeys." "To-day when we wonder," he goes on, "why Europe doubts our motives and even fears us, we must think of those days in 1942. . . . Here was a classic example of the folly of ignoring public opinion in war or in politics." Here, even more, perhaps, was an example of the American habit of leaving words and action in separate compartments and believing American action was automatically hallowed by American interest.

Senator Vandenberg has been able, since then, to bring the two halves of American foreign policy together. At San Francisco he made the words of Article 51 fit the reality of the Monroe Doctrine and legalised the "regional arrangements" which are being of such use today. During the debate on Greek-Turkish Aid, he insisted on associating the programme with the United Nations, thereby making the actions fit the protestations. He insisted, both in the Marshall plan and in the Vandenberg Resolution, that self-help and mutual aid must be apparent and that national security of the United States must be affected before aid was given. And it was he who put into the Republican platform the paragraph:

> We shall say what we mean and mean what we say. In all of these things we shall primarily consult the national security and welfare of our United States. In all of these things we shall welcome the world's co-operation. But in none of these things shall we surrender our ideals or our free institutions.

Last week he said that "these are principles of intelligent self-interest." This week he suggested that European countries by intelligently consulting self-interest also might find the formula that would shake them out of their "sixteen airtight compartments" and that then the United States would be able "to retire from a Europe which has restabilized itself."

The danger is no longer that the United States will not admit its self-interest but that it will use its power too diffidently. It is no accident that international diplomacy has always been pictured in this country as a game of poker, a game in which the cunning European powers—and particularly Britain — always held the aces. It became accepted in the United States that the possession of aces was, in itself, a disgrace, a proof of cheating. Aces, it was felt, were not come by honestly; they came from the sleeve and were known as Power Politics. Now that the United States finds itself monotonously with four aces in every hand, it is often reluctant to use them. When it does its blushes lead others to believe that they have, indeed, come from the sleeve.

*

Mr John Foster Dulles has said that no nation is so poor as one that has only dollars to give. The United States has had a sneaking feeling for many years that it was in exactly that position. Many of its own prophets have said so, beginning in the last century with Henry Adams, who, believing that his country was quite unfitted for the responsibility that would be its when British economic power began to fade, recommended an isolation as complete as possible to save the United States from the shame of failure. Ever since, the fear of failure has driven one Administration after another to shelter, after short forays into the foreign field. Policies have been picked up and laid down as if they had no more weight than jack-straws and the Truman-Vinson demarche, threatened and then withdrawn, shows how persistent that habit is. The fact that a President of the United States, feeling however close at home the hot breath of a campaign rival, could fail to realise what havoc his suggestion would wreak upon a delicate situation abroad is a symptom of an unawareness that is national as well as personal. They are still a minority who know, as one commentator puts it, that "unhappily we live in a time when we cannot draw a breath or flick an eyelid without international complications."

Last week, when Senator Gurney announced that he thought that Spain should be included in the European Recovery Plan and given military aid he did it, as he said, "from a practical standpoint" and made no pretence that he considered General Franco a "Christian gentleman." When asked whether he cared whether a country was democratic as long as it was anti-Communist, he replied that "I do care, but it is not up to us to tell any other country what sort of government it shall have." Senator Gurney is from South Dakota, in the heart of that Middle West which has until lately made a profession of giving other countries far more impertinent advice than hints on the constitution of their governments.

American foreign policy, unless, which is unlikely, it ever again gets into the hands of those prophets of unintelligent self-

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

interests the isolationists, seems now to be set on a steady course. "We are realists," Senator Vandenberg said, "in the presence of the dangers which confront us and the Western world today." This automatic acceptance of the identity of the United States with the Western world also makes present policy different from past policies. It was hardly as common members of a Western civilisation that President Wilson or even Mr Roosevelt suggested solutions of European problems. They were gods who came in on their machines and left on them again somewhat in the manner of schoolmasters after restoring order in the dormitory. They recognised no continuing danger to their own country.

*

The size of the country and the strength of its industrial machine have, in the past, blinded the American people to the limits of their power, to the fact that their population of 140 millions could not hope to stand alone forever against other races, already more numerous and increasing at a faster rate. But the potential enemy is no longer a western European power which can be under-rated on a basis of acreage; it is a power which, in both space and manpower, has the advantage over North America. In such a position, any country would be well-advised to look for allies, and to forget some of the ideological rigidity which has inhibited the United States in the past. Governor Warren may say, and believe, that it is the American Constitution which makes the difference between freedom and serfdom, but there are many who would now prefer to agree with Sir Stafford Cripps when he told the Federal Bar Association in Washington that "democracy as we understand it denotes a control by a freely ascertained majority of the people over what would otherwise become the irresponsible acts of their leaders." And it is in western Europe and the British Commonwealth that such democracy is available in the present crisis. Mr Dulles remarked in January to the Senate Foreign Relations Committee concerning the countries of western Europe that "they are plenty strong of themselves. They have over 200 million people—educated, able people. They can be stronger than we are. They are not now, but they can be." The value of that strength is now being recognised.

At the moment American foreign policy is, understandably, pre-occupied, on the surface, with stopping at all costs the advance of Soviet power. What is remarkable is that it should be trying to do it with a strategy which, even though it may be imperfect, is designed to have a permanently beneficial effect and is not a mere stopgap. If the United States seems not to understand the difficulties, for European countries, of the economic integration, the military co-operation and, above all, of the political federation for which it is pressing that is not strange. The real test of understanding will come when, by the logic of its own arguments, it is faced with the next step. Senator Vandenberg has not said anything about Atlantic Union; but it is implicit in his arguments.

American Notes

No Mission to Moscow

Mr Truman stumbles from one miscalculation to another. During his recent election tour he was criticised both for leaving Washington during the Berlin crisis and, by the more sophisticated, for allowing it to become apparent that his absence made no perceptible difference to American policy. But his brief interlude in Washington between campaign forays has proved even more disastrous. Whatever motives Mr Truman himself may have had for proposing to send Mr Vinson as a special envoy to Moscow, his political advisers plainly hoped that this new initiative would dispel the insinuation that the President has no share in shaping foreign policy, and dreamed of a diplomatic triumph which would transform his chances of re-election.

No calculations could have been more mistaken. Owing to a certain precipitancy in engaging time on the air for Mr Truman to make a "non-political" broadcast before Mr Marshall had been consulted, the news of Mr Vinson's shortest-lived assignment leaked out, causing consternation in Paris and rumours of a rift between the President and his Secretary of State at the worst possible moment. The cancellation of the broadcast which followed Mr Marshall's veto came the same day, but too late to prevent the damage to the President's prestige.

A fatal comparison has now been drawn between Mr Truman's inability to foresee the consequences of appearing to go over the heads of Mr Marshall and the American delegation at Paris, and his blind spot two years ago when, during another campaign, he rashly approved Mr Henry Wallace's Madison Square Garden speech and had to choose, a few days later, between the foreign policies of Mr Wallace and Mr Byrnes, then Secretary of State. Then it was Mr Wallace who had to go. This time it will be Mr Truman himself and the millstone he has hung round his own neck is so heavy that it is thought it may drag down to defeat other Democrats whose prospects in the contests for House and Senate, up to now, have been much brighter than those of the President.

The incident has given Mr Dewey another opportunity for a display of statesmanlike restraint. In the interests of national unity, he has refrained from any direct reference to Mr Truman's gaffe, though the occasion of his renewed charges of weakness, wobbling, and clumsiness on the part of the Administration will be lost on no one. The incident, after all, can be relied upon to speak for itself. If tailor-made, it could hardly have been better designed to illustrate the Republican thesis that Democratic vacillation and irresponsibility have marred the execution of the bipartisan foreign policy.

* * *

Commodity Price Setback

Almost throughout the postwar boom, a prosperous United States has lived in fear of depression. It is a fear which has coloured every discussion of anti-inflation controls, and one which has on several critical occasions seemed to justify the acceptance of openly expansionist measures, such as the generous settlement of wage claims, the timidity of monetary controls, and the prolongation of inflated farm price guarantees. Only a week or two ago, Reserve Board policy was attacked by one influential economist who declared that monetary restraints were adding more uncertainty "to what is already a disturbing down-trend."

The most recent pointer to some decline in business activity ahead has been the behaviour of commodity prices. In sharp contrast to the upward curve which followed the winter break in grain prices, the Bureau of Labour index of wholesale prices has made no net headway for about three months, touching a postwar peak (1926=100) of 169.2 on two occasions in that period, but falling back to 167.1 for the week to October 2nd.

A more sensitive indicator is the Moody's index of staple commodities (1931=100). Moving in a range far wider than the Bureau's index, which covers finished goods prices and fuel costs, the Moody's index plunged from a late 1947 high point of 462 to almost 400 in February. Unlike the Bureau of Labour index, the Moody's yardstick has never regained its 1947 high. At the end of June it began a slow but persistent decline which culminated in a sharp dip to below the 400 mark on October 5th. Since then a modest recovery has taken place.

The weakness of grain prices (especially maize) accounts for a very large part of this tumble which is justifiably held to be an important pointer to possible changes ahead. But some other commodities such as vegetable oils and dairy products have fallen, and there has been what looks like a temporary flurry in meat and livestock prices. Perhaps more important is the "stickiness" shown by some other groups, although the latest attempt to lift crude oil prices, and the railroad wage claims, with their consequent pressure for higher freight charges, show that directly opposing forces are still at work.

Are the temporary props of the postwar boom (on which the Council of Economic Advisers spoke at such length some time ago) now being kicked away? To such a query, the answer today contains something affirmative, unless one assumes the development of an arms programme, in which case business could not anticipate the retention of its present freedom from direct controls. Despite the autumn trade recovery from seasonal summer slackness, there has long been an accumulation of evidence to suggest that inflationary forces have lost their earlier vigour. But it is by no means possible yet to assess the potential pace or scope of the forces of recession. The Council, in a recent declaration, held that inflationary forces would continue to present dangers throughout the rest of 1948. The balance of probabilities certainly does not suggest that anything like a collapse is near at hand.

Sisyphus at the Federal Reserve Board

Business caution has been reinforced in recent weeks by widespread speculation on the possibility of an abrupt change in monetary policy, through an abandonment of the bond support programme which has attracted a growing measure of criticism.

For well over a year now, the US Treasury has been juggling with the dual policy of making some attempt to impose mild curbs against credit expansion, and simultaneously "protecting" the long-term rate on Government securities at 2½ per cent. The net result has been that every effort to apply the curb has been offset by sales of Treasuries to the Reserve system—sales which bring an automatic and corresponding increase in bank reserves, which can be used again to create a volume of credit several times as large as the actual gain in bank reserve balances.

As the boom has progressed, this flow of bonds to the Reserve banks has been quite unprecedented. From the close of June until October 6th, Reserve bank holdings of government securities, the foundation of the credit structure, have risen by $1.6 billion to $23.1 billion, and commercial bank reserves by $2.2 billion to $19.6 billion, although reserve requirements over that period were up by as much as $2.4 billion. The flood of security sales has followed naturally from the effort made by the commercial banks to comply with new reserve requirements, but insurance companies, and other financial institutions have been equally large sellers.

From a purely technical viewpoint, this process could no doubt continue for some time. But the banks, which are naturally far more sensitive to falling bond values than some other commercial holders, have become increasingly restive. They have seen the imposition of gradually tightening restraints against their own expansion, and they look wistfully at the freedom of insurance companies to unload their Treasury portfolios, and to seek more attractive investment channels. Their growing discontent was summarised by the *National City Bank Review* which declared in September that there were two ways out of the monetary dilemma: one, the restriction of bond sales; the other, removal of the bond price "peg." "The first solution is that of a controlled economy. The second, that of a price economy."

The Reserve Board and the Treasury hold still to their task of maintaining long-term Governments at par. By hardening short-term rates, they are endeavouring to attract bank funds into Treasuries, and thus to offset the inflationary effects of long-term bond sales. It is a process which cannot continue indefinitely. In the words of Mr Russell Cornell Leffingwell, chairman of J. P. Morgan and Co.: "To try to make short money scarce and long money cheap is a task for Sisyphus." Paradoxically, Mr Leffingwell's attack stems mainly from the belief that Reserve Board tactics hold the menace of a deflationary movement far more drastic than any which might follow a general rise in interest rates. While he does not like bond "pegging," Mr Leffingwell, too, shies away from "active dear-money or any deflationary steps." The Reserve Board has not solved its dilemma; but whether it enforces another rise in short-term rates, or raises reserve requirements to their full legal limits, or retreats altogether from its bond support programme, it must move, so long as income and employment remains at present high levels, in a direction which does not encourage speculative fervour.

* * *

Mr Wallace's Olive Branch

The Third Party has shown a belated sensitiveness to the charge that, by splitting the liberal vote, it was serving the Communists' interests by ensuring the election of reactionaries to Congress. Despite Mr Wallace's public misgivings of three weeks ago Mr C. B. Baldwin, the party's campaign manager, has announced the withdrawal of its candidates from a number of races in which liberal Democrats are facing strong Republican opposition. Most important, because it affects a Senate contest in one of the doubtful states, is the withdrawal of the Progressive Party's candidate in Minnesota, where Mr Humphries, the Democratic Mayor of Minneapolis, is attempting to unseat Senator Ball. Other candidates to whom the olive branch is being extended include Mrs Helen Gahagan Douglas, campaigning in California to hold her House seat, and Mr Chester Bowles who is running for Governor in Connecticut. Mrs Douglas has been the classic example of an outstanding liberal who incurred Progressive hostility because of her support for the Marshall Plan and her criticism of Russia.

Many Democrats, Mr Baldwin earnestly assured his press conference, have become much more liberal in recent weeks and

Progressive candidates, even when their names are on the ballots and cannot therefore be withdrawn officially, will campaign for their election. The quid the Third Party hopes to gain for this quo appeared when Mr Wallace appealed to the Congress of Industrial Organisations to support Progressive candidates engaged in a straight fight against Republicans.

This about-face may be merely a concession to moderate opinion inside the Third Party, but it looks very much as though Mr Baldwin were throwing half his passengers overboard to keep the ship afloat. In Illinois it appears that the party offered—in vain—to withdraw its Congressional candidates in return for help in securing Mr Wallace the place on the ballot now denied him. In Minnesota a recent unofficial poll promised Mr Benson, the Progressive candidate, only a handful of votes. At a time when estimates of Mr Wallace's vote in November are steadily declining—it is now put as low as 2 million—the party may reasonably have decided to concentrate what funds, energies, and hopes remain behind its Presidential candidate.

Mr Baldwin pointed out that the Progressive Party now has only about 100 candidates running for the House and 11 for the Senate. Two of these are negroes in the South—a purely symbolic gesture. Outright endorsement of Democratic candidates, Mr Baldwin said wistfully, would be much greater if it were not that Democratic backers threatened to cut off campaign funds if the advances of the Third Party were accepted. Certainly the political ineptitude and unreliability which, with its Communist support, account for the sharp decline in the Third Party's fortunes, make Mr Wallace's blessing a doubtful asset. The endorsement of the Third Party has been sharply repudiated by Mrs Douglas and carefully avoided by Mr Bowles. Its somersault comes too late to do either its candidates or those of the Democrats very much good.

PROs Abroad

(From Our US Editorial Staff.)—The refusal of Sir Stafford Cripps's Public Relations Officer, Mr S. C. Leslie, to talk to a group of correspondents unless *The Chicago Tribune* was excluded—which aroused some indignation in Washington—brings into question the wisdom of Cabinet Ministers taking with them to America men who, whatever their value at home, have no knowledge of the very different and more complicated technique needed for relations with the press in Washington. The British Information Services, even after severe postwar cuts and the limitation on its independence and, therefore, on its efficiency, since its absorption into the Foreign Office, is trained and equipped to handle a visitor's relations with the press better than a stranger after a few days' stay. A great deal of lip service is paid, in the United States, to the ideal of a "free and responsible press," but it is the freedom which is guarded with vigilance by newspaper publishers and correspondents alike, while the question of responsibility is left largely to individual conscience. A strong tribal feeling still exists in every profession and community in the country and the tribe, even though it may disapprove of the actions of one of its members, comes to his help as a body when he is attacked from outside. The correspondents of the other papers involved would probably none of them have been inclined to defend either the policies or the methods of *The Chicago Tribune*, but they were prepared to defend the right of its correspondent to attend any press conference to which they were called. They are always on the watch for any sign that their privileges, which are such that any diplomat might envy, are being or might be abridged. The thin end of this wedge is, in the eyes of the newspaper profession, as dangerous a weapon as the atomic bomb. If Public Relations Officers must go to the United States they should at least remember this.

House-cleaning in January

Mr Dewey has guaranteed that the Communists will be the first into the Washington dustbin next January, when he gives the Federal Government its promised house-cleaning—"the finest there ever was." That house-cleaning may be a good deal more thorough than the Republican party regulars have bargained for. After sixteen years without a home, their chief desire is to find room for as many pieces of their furniture as possible. But, if Governor Dewey's housekeeping methods in New York are any guide, he will probably feel that the Federal house in Washington is overcrowded; he may even want to close some of the rooms. He will certainly not be content merely to replace Democratic junk with Republican lumber.

Mr Dewey will have the advice of a house-cleaning expert, Mr Herbert Hoover, who heads the Commission on the Organisation of the Executive Branch of the Government, due to report to the new Congress in January. The monumental task of this Commission is to recommend means of simplifying the structure of government, of clarifying its lines of authority and of reducing its cost. The need is unquestionable: for example, there are said to be 57 agencies making loans to farmers, 28 doing social welfare work, 16 preserving wild life. In the last quarter of a century, the number of Federal employees, now over 2,000,000, has been quadrupled and the Federal budget has increased tenfold.

Mr Hoover is not alone in thinking that the high cost of government threatens the national standard of living. Congress set up the Commission in the hope that an expert and objective study of the structure of government would make it possible to give substance to the Republican promises of economy and efficiency, which years of reiteration on political platforms and Congressional floors have not made any less empty. The Democratic Administration, on the other hand, has done a certain amount not only to abolish some of the emergency agencies which grew up during the depression and war years, but also to regroup some of those remaining into more comprehensive units. Nevertheless, Mr Truman welcomed the establishment of the Commission wholeheartedly; he is well aware that the present system—or lack of one—imposes an intolerable volume of work on the President. In recommending means by which this burden may be lightened, the Commission is expected to put more responsibility on the Vice-President, and thus to enable Mr Dewey to keep his pledge that Mr Warren will be more than a figurehead.

In choosing the twelve members of the Commission, a careful balance was preserved between the political parties, between officials and non-officials, between the legislature and the executive. Both the members of the Commission and the many experienced citizens who are assisting their investigation are men of the highest reputation; they are refusing to publish their report until after the election, so that it will not become a political issue, even though it will inevitably be critical of the Democrats who have been in charge of the Government for so long. The first attempt to reorganise the Executive was made in 1798 and there have been many since, all unsuccessful; however, the enormous expansion of governmental activity in recent years has given the question a new urgency. There are strong vested interests in the Government and in Congress, which resist any change, and not only will the recommendations be complicated, but they will deal with such controversial questions as Federal responsibilities and States' rights. Nevertheless, this time the prospects are unusually bright for the achievement of at least some degree of reorganisation, particularly if the recommendations of this exceptionally authoritative Commission are given the energetic backing of the new President while the prestige of his election is still fresh.

Shorter Notes

General Eisenhower took office as President of Columbia University this week. His inaugural address, which was one of the most statesmanlike speeches made in the United States for a long time, will probably be quoted long after the words of all the Presidential candidates are forgotten. His theme was the challenge to freedom and the role a modern university must play in its defence through devotion to intellectual liberty and refusal to take refuge in academic ivory towers. He said: "In today's struggle no free man, no free institution can be neutral." General Eisenhower received an ovation at the close of his address and the hope of many people that he will not remain permanently in academic life has been revived.

*

Mr Petrillo, head of the American Federation of Musicians, has reversed an opinion; he now finds that the sound made by a harmonica is, after all, musical and he has decided to admit harmonica players into his union. Mr Petrillo does not deny that his change of heart or, more precisely, of ear, is connected with the fact that harmonica players have been making recordings which are still banned by the Musicians Union. Recently several well known entertainers, including Larry Adler, have joined the Musicians Union and so presumably the public will in future hear their harmonicas less often. An official of the Guild of Variety Artists to which the harmonica players have belonged, accuses Mr Petrillo of raiding his union—artists cannot be members of both—and he charges that the "czar" of the Musicians Union is living up to his high-handed reputation by this most recent arbitrary decision.

THE WORLD OVERSEAS

The Moscow-Belgrade Letters

(By a Correspondent)

WHILE the Jugoslav Foreign Minister, Mr Kardelj, performs in Paris as a loyal member of the Soviet diplomatic train, the bitter disputes between his master and Mr Stalin, between the Belgrade Communists and the Cominform goes on. Last week the Belgrade Communist newspaper *Borba* carried hostilities a stage further with a series of articles revealing to its readers Mr Stalin's personal activity in the attack on Marshal Tito—who may be the author of the articles. These recall the correspondence between the Central Committees of the Soviet and Jugoslav Communist parties, which led to Jugoslavia's expulsion from the Cominform. It would easily fill the pages of a middle-sized book; although it consists only of eight letters—three Soviet and five Jugoslav. Although the Soviet letters reveal, better than any other postwar Soviet documents, the real motives behind Moscow's international policy, as well as Mr Stalin's tactics in his dealings with Communist parties outside Russia, they do not seem to have received in the British press the attention they deserve.

It is worth bearing in mind that one of the chief actors in the Moscow-Belgrade drama, the Soviet Ambassador in Belgrade, Arkady Lavrentiev, is no ordinary Soviet diplomat, but one of the Kremlin's most trusted political agents. An engineer by profession, Lavrentiev was sent to the Foreign Ministry for the first time during the 1937-38 purges, when he was in charge of cleaning up Soviet representatives in south-east Europe. Mainly as a result of his activities, the Soviet Ambassadors in Ankara and Sofia were proclaimed traitors and liquidated. The Ambassador in Turkey was shot in 1938, together with a score of other diplomats, but the representative in Sofia, Razkolnikov, escaped to France, where he published his own version of the purges. (He was reported to have "committed suicide" during the war.) Lavrentiev was then sent to Sofia, with the rank of Minister, in charge of Balkan affairs. During the war he acted as the liaison between the Soviet Central Committee and the east European Communist parties. In 1945 he attended the San Francisco Conference in charge of Soviet satellite delegations.

The published correspondence reveals that the first serious difficulties between the Soviet Government and Marshal Tito occurred in 1945, and Lavrentiev was sent soon after to Belgrade. Tito was doubtless fully aware of the real meaning of this diplomatic appointment, and it is obvious from the correspondence that Lavrentiev was cold shouldered and distrusted in Belgrade from the start. The Marshal even forbade him to get in touch with party leaders, and complained to Mr Stalin:

> We think that he (Lavrentiev) has no right to collect information about the activities of our party. That is not his business as an Ambassador.—(Jugoslav letter of 13.4.48.)

Informers Around Tito

Lavrentiev was successful, however, in obtaining the services of two members of the Jugoslav Politburo—Hebrang and Zujovic. Apparently Marshal Tito was unaware of this until the spring of 1948 when, in the Jugoslav Politburo, they backed the Soviet viewpoint. Both were promptly arrested, and Marshal Tito, in protesting to Mr Stalin about it, pointed out that the information of the Kremlin's two informers was "faulty." Rather naïvely Mr Stalin replied that his information came "not only from Zujovic." (Second Soviet letter.) However, at present Moscow appears to have no informers in the Belgrade Politburo, and Marshal Tito has liquidated all would-be candidates by the quick Stalinist method: they were shot. Zujovic was denounced by his former colleagues of the Central Committee as an "indurate fractionalist."

The correspondence draws a striking and unfamiliar picture of Stalin as a sensitive, peevish man, who cannot tolerate criticism either of his regime and his policy, or of the behaviour of his officers abroad. Thus, when Djilas complained of the moral behaviour of Soviet officers at a meeting of the Jugoslav Politburo (which, after all, is the Jugoslav Inner Cabinet, and whose proceedings are the most sacred of all state secrets), Mr Stalin despatched a long and angry telegram to the Marshal, and Djilas had to take an aeroplane and hurry to Moscow to apologise in person. (2nd Soviet letter.) General Velebit, one of Marshal Tito's most trusted assistants and Deputy Foreign Minister, was sacked because, on an unspecified occasion, he expressed "anti-Soviet views." (For this he was accused of being a British spy, but it is obvious that Mr Stalin did not take the charge seriously, as he recommended that Velebit should only be removed from the Foreign Ministry and not liquidated.) (2nd Soviet letter.) Three secretaries in the Jugoslav Embassy in London, besides the Ambassador himself, were accused of being British spies, though the Soviets would not reveal their names. (2nd Soviet letter.)

Supreme Authority of the Cominform

The most valuable part of the correspondence deals with Communist internal affairs, and relations among the European Communist parties. Mr Stalin leaves no doubt about the true role of the Cominform: gone are all pretences of the independence of national parties. The 3rd Soviet letter says:

> During the organisation of the Cominform all Communist parties agreed with the unquestioned principle that every Communist party is responsible to the Cominform.

Further, the Cominform is raised to the status of a supreme political body for all states in the Soviet bloc:

> The Cominform is the party political basis of the united international front. Any policy of deviation from it leads to treason. . . . —(3rd Soviet letter.)

In the Soviet letters there are many more revealing and most interesting—because they are so authoritative—explanations of Soviet policy. On the problem of the Communists' relations with non-Communist parties and states, Mr Stalin's Central Committee states: "Communist parties can live and develop only in open warfare against the enemies of Communism." (2nd Soviet letter.) Or: "In the transition period from capitalism to socialism the class war does not become less bitter but, on the contrary, more bitter and more intensified." (2nd Soviet letter.) The theory that there could be "peaceful development of capitalist elements alongside socialism" is called a "rotten and opportunist theory." (2nd letter.) Soviet Russia gives "material and other assistance only to friends" and any country or party which is anti-Soviet "deprives itself of such help." (2nd letter.)

Further on Mr Stalin points out that the Jugoslav Communist regime was established only by force of Soviet arms, which "created the conditions for the Jugoslav Communist party to come to power." He openly states that the Communist parties in France and Italy could not seize the reins of government only because "unfortunately the Soviet armies could not give the French and Italian Communist parties similar assistance." (2nd letter.)

Finally, Mr Stalin's lengthy explanations on the role of the Communist parties within the state are also worth quoting, if only because they are the first published official Soviet postwar admissions that the Communists have absolute power in all Eastern "democracies."

> The Party is the highest political organisation of the working class, which stands over and above all other political organisations and state departments, including the Soviets in the Soviet Union and the National Councils in Jugoslavia.—(2nd Soviet letter.)

One could hardly find a better formulated definition of the completely subordinate role played by the non-Communist parties, city and county councils and parliaments, trade unions, etc. in the countries behind the Iron Curtain.

Appeal to the Masses

Most surprising of all, especially in the light of later events, was Moscow's apparently complete ignorance of the real feelings of the Jugoslav people, including the Communists, towards the Soviet Union. Mr Stalin certainly believed that his denunciation

of Marshal Tito would be enough for the "healthy" (anti-Tito) Communists to take over. His first letter says, somewhat pompously:

> We have no doubt that if they get the chance to know about it the Jugoslav party masses will reject with anger this (Tito's) criticism against the Soviet Communist Party, as anti-Soviet, as alien and enemy-inspired. We think it is precisely for that reason that the Jugoslav party leaders have been criticising us secretly, without telling the masses of the people of their attitude.

Dutch Plans for 1949

WHEN the Netherlands Minister of Finance last month introduced the budget for 1949, he outlined briefly the present economic position of the country. His outline is of particular interest at a time when the ERP nations are taking stock preparatory to convincing Mr Hoffman that they will be on their feet by 1952.

The Minister pointed out that while industrial production for 1948 will probably be some three per cent above the 1938 level, this apparent recovery is none the less deceptive. Since 1938 there has been a 13 per cent increase in the working population, and this means that output per head is in fact down by about ten per cent. Moreover, the indices for individual industries show a good deal of variation. The black spots are in building, where production is 70 per cent of the 1938 level; in coal mining, lumber and clothing at 80 per cent; and in agriculture at 88 per cent.

The export-import position, according to the Minister, is still highly unsatisfactory. At the moment, only 50 per cent of Dutch imports are covered by exports—a gap that makes Britain's balance of payments look positively healthy.

In bringing together these unpromising statistics of production and international trade, however, the Minister pointed to some light at the end of the corridor. He expected a fall in world prices of agricultural produce which would enable the government to reduce food subsidies, and he welcomed the proposed return of intra-European trade and payments to multilateralism as "a step in the right direction." Having offered these crumbs, the Minister, so to speak, shook his head and advised his listeners at home and abroad that for the Netherlands such aids were inadequate. The future welfare of the country depended above all on the economic recovery of Germany and Indonesia and on fully restored trade relations with these two prewar bases of Dutch prosperity.

Resources	Billions of Guilders 1948	1949	Needs	Billions of Guilders 1948	1949
National product at market prices of business sector*	11·11	11·96	Consumption of :— Personal sector	9·68	9·98
Public authority sector	1·18	1·14	Public authority sector	2·07	1·94
Deficit in balance of payments on current account†	1·13	0·84	Net investments of :— Business sector	1·63	1·87
			Public authority sector	0·01	0·15
	13·42	13·94		13·42	13·94

* Including 0·102 income from abroad.
† The deficit with the dollar area is higher; the amount given here is a balance including some non-convertible surpluses with soft-currency countries.

Hint of Lower Taxes

Inevitably the budget was set against a background appeal to the nation to live soberly and to save. In return there was a hint, almost a promise, of a reduction in the heavy tax burden now borne by the Dutch citizen. The budget estimates for next year are based on calculations made by the Central Planning office; and the planners, in their turn, have worked on three main assumptions. First, production in 1949 will show a further expansion of six per cent—largely as the result of increased output in mining and building. Second, there will be no further reduction in holdings of gold and foreign investments. Third, public authorities will not require any resources beyond those provided for in the budget.

On the basis of these assumptions, the budget laid down the following general lines of action. Imports required for rationed goods must not exceed the mid-1948 level, and as far as possible imports of non-essential goods and all imports from the dollar area are to be reduced. Investment by public authorities must be held severely in check, while investment in the private sector is to be stimulated. Stocks of raw materials will not be increased and the consumption of building materials, paper, petrol and coal will be held down.

From the standpoint of other ERP nations, one of the more interesting tables in the budget statement deals with the national income and its proposed uses.

The table shows that the net investment, both public and private, for 1949 is estimated at 2.02 billion guilders, or approximately 14 per cent of the national income. It is expected that half of the funds required for this investment next year will come from the net savings of business and nearly 40 per cent will be furnished from abroad. Such reliance on outside aid for the expansion of Netherlands industrial capacity may strike some critics as excessive, but it is well to remember that average consumption per head in Holland is still considerably below prewar levels.

Throughout the budget statement runs the suggestion that Netherlands Government policy is moving in the direction of increased economic freedom—in part the result of a change in faith, in part because such a realignment is a necessary condition for fulfilment of the Benelux union, where the pace is set by the decontrolled Belgian economy.

Disarmament After Three Years

WHEN President Roosevelt returned from the Crimea Conference he said he had hopes of a peace so secure that the Allies would gradually be able to cut down their armaments. Later events proved him to have been far too optimistic, but the precariousness of the present peace has not deterred Mr Vyshinsky from bringing up once more before the United Nations Assembly the subject of general disarmament. The delegates at San Francisco in 1945 approached the problem tentatively, merely authorising the General Assembly to "consider the general principles of co-operation in the maintenance of international peace and security, including the principles governing disarmament and the regulation of armaments"; they made the Security Council responsible, with the assistance of the Military Staff Committee, for drawing up plans for the regulation of armaments. It was obviously felt that the necessary corollary to the regulation of armaments was the formation of an international police force.

The Soviet Union has never been loth to take the initiative in producing far-reaching disarmament proposals, ever since Mr Litvinov made his début in the Preparatory Commission for Disarmament in 1927 with a startling proposal for the abolition of all armies, navies and air forces. In October, 1946, when the General Assembly was preoccupied with Mr Baruch's proposals for the control of atomic energy, Mr Molotov suddenly produced—what few doubted was a red herring—vague but grandiose proposals for "a general reduction of armaments." He later amplified these proposals with the suggestion that two commissions should be established "within the framework of the Security Council"; one was to supervise the reduction of armaments and the other the prohibition of the use of atomic energy for military purposes.

Throughout the ensuing Assembly debates the main point at issue was whether or not the special control commissions should be subject to the Great Powers' veto in the Security Council. The stubborn Russian stand that they should be so subject on one occasion provoked Sir Hartley Shawcross to declare that "a scheme subject to such hazards would be a fraud, a delusion and a snare. Do not let us foist this humbug on the world." Eventually, however, on December 14, 1946, the Assembly unanimously passed a resolution which, after recognising "the necessity of an early general regulation and reduction of armaments and armed forces," provided for the establishment "within the framework of the Security Council" of an international system of control and inspection operating through special agencies, which should derive their powers and status, not from the Security Council, but from the conventions under which they were established. Their work would, therefore, not be at the mercy of a veto by any of the Big Five. This important concession by Messrs Molotov and Vyshinsky led to a certain modified optimism, although most of the Westerners would have agreed with the Canadian Secretary of State when he said that any further progress would require a "pious obstinacy."

New and Conventional Weapons

At the end of December, 1946, the Russians, again taking the initiative, suggested the immediate establishment by the Security Council of a commission which would submit proposals for carrying out the Assembly's resolution on disarmament within three months. But the Council soon became hopelessly embroiled

in disputes as to whether or not the proposed commission should concern itself with atomic weapons. The Russians held that it should, and alleged that the Americans were determined to hold on with both hands to that "queen of horrors, the atom bomb." The Americans felt it would be both unnecessary and unwise, since the Atomic Energy Commission had already reached the point of producing a plan for the most stringent control of atomic weapons. They asked whether the Security Council was to advance towards atomic security from the point already reached, or was it to retreat and start the whole weary business all over again.

The absurdity of such a procedure made the Russian motives seem extremely suspect, especially as they more or less admitted that they planned to renew their efforts to obtain information about atomic weapons through the new commission. When the Atomic Energy Commission had been proceeding with such admirable discretion,, no one in the west could regard with equanimity the prospect of a new commission, legally empowered to demand wholesale revelations about atomic weapons. It was also felt that the Russians did not want to be held to what pledges had been wrung from them on atomic disarmament, and would try to submerge them in the vast and complicated issues of general disarmament It was certainly true that the chances of agreement on atomic control would be immeasurably lessened if it was made contingent on an agreement on general disarmament, because while there were bases for agreement on the former, for agreement on the latter there were none.

At last, on February 13, 1947, the Security Council voted, by ten votes to none, with Russia abstaining, to set up a Commission on Conventional Armaments, consisting of members of the Security Council, which should submit to the Council proposals "for the general regulation and reduction of armaments and armed forces." Although matters falling within the competence of the Atomic Energy Commission were specifically excluded from the jurisdiction of the new Commission, the Russians started their old game of trying to get atomic weapons included in the Commission's discussions; but it was eventually decided to leave all mass-destruction weapons—atomic as well as lethal chemical and biological ones—to the atomic energy experts. The Commission was supposed to submit proposals within three months, but its progress has been aptly compared with the picture of a man mounting a descending escalator backwards. It was not until nearly five months after the Council's decision that a working plan for the Commission was approved; twelve months later again the Commission had not got as far as deciding how to start work, and its working committee reported last July that there was no point in going on until there were peace treaties with Germany and Japan, international control of atomic energy, and, above all, "an atmosphere of international confidence."

Inspection or Abolition First?

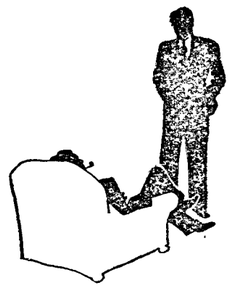
The discussions in the Conventional Armaments Commission showed that the Russians and the west were poles apart in their approach to the problem of disarmament. While Russia argued that nations must first disarm and then evolve a system of control and inspection, the west held that a reduction of armaments must be accompanied by agreement on a system of control and inspection. Again, while Russia argued that disarmament would itself remove the mutual mistrust which was bedevilling international relations, the west held that armaments were the effect not the cause of the prevalent distrust, and that disarmament could not precede a satisfactory peace settlement. As a first step towards establishing mutual trust the British delegate made a vain appeal that all members of the United Nations should submit detailed reports of their trained military manpower.

It is difficult to see that Mr Vyshinsky's latest proposals, now before the General Assembly, do anything more than provide new material for the Russian diplomatic offensive. It is true that they contain a novel element in the proposal that the Big Five should immediately reduce their land, air, and sea forces by one third; but quite enough is known of the relative strength of their armed forces to make it obvious which power would benefit most from such a plan. In fact the paradoxical situation continues in which the country most prolific with suggestions for a policy of disarmament is the country which, by its whole policy, has steadily destroyed the necessary bases for such a policy. When the British representative on the Conventional Armaments Commission, referring to the need for international confidence, said that men were justified in carrying umbrellas so long as there were prospects of rain, Mr Gromyko retorted that rain was not man-made, but international confidence was. He did not, however, add that no men could do more towards restoring that confidence than himself and his colleagues.

China's New Currency

[FROM A SPECIAL CORRESPONDENT]

SHANGHAI, *September 18th*



CHINA'S new currency, whose introduction on August 19th was greeted with scepticism in commercial circles in Shanghai, has so far held up better than anyone expected, and no rate in regard to the American dollar other than the official rate of 4 gold yuan to US $1.0 is being quoted. It has resulted in a temporary improvement in the position of the central government; but it is generally agreed that the new measure will mean little unless the government can follow it up with some military victories against the Communists. There is no change in the factors responsible for China's inflation—the civil war, lack of revenue, an unfavourable balance of trade, an inefficient administrative machine and the maintenance of a vast army. The lull which has characterised the military scene all through this summer is now drawing to a close, with the Communists attacking strongly at Tsinan in Shantung and in south-east Manchuria.

The government's campaign to enforce the surrender of gold, foreign currency and foreign holdings is being carried out by terroristic methods—probably the only methods that would work in the present situation. The Generalissimo's eldest son, Russian-educated Chiang Ching-kuo, has been despatched to Shanghai as Economic Supervisor, in charge of the Economic Police and other special intelligence units, and more recently has been appointed Commander of the Woosung Garrison. Shanghai, in effect, is under martial law. Several prominent Chinese businessmen have been arrested, including a son of that strange, powerful, underworld figure, Tu Yueh-sheng, who is said to control most of the gangs and labour unions in Shanghai. A colonel of the Woosung garrison has been shot for illegal speculative activities and a Chinese businessman is under sentence of death. Many more Chinese businessmen have been arbitrarily arrested and detained for interrogation. The result is that a wave of apprehension verging on panic has gripped the Chinese merchant community and many members of the foreign community as well. There is a widespread feeling that, praiseworthy as may be the government's determination to curb present abuses, it is unjust to make investigations into the past, for it is safe to say that there is not a man in Shanghai, British or foreign, military, official or civilian, whose slate is completely clean. Prior to August 19th contravening official regulations was a condition of life.

Goods Not Coming Forward

Several unfavourable results of the currency reforms are to be noted. Firstly, as was only to be expected, Chinese, who are now afraid to keep their funds in gold or American dollars, are turning to other commodities, such as diamonds. Some, with holdings abroad, are allowing these holdings to go into escrow. Secondly, it is reported from outlying areas, like Hankow and Canton, that uncertainty over the new currency, combined with the enforcement of price controls, has resulted in goods not coming forward. In Shanghai, for example, you can buy a chicken at one of the city markets at the controlled price; but if you want a nice fat chicken you will either have to pay extra on the side or buy it in one of the villages just outside the city. Thirdly, the current campaign to stop hoarding is making all traders nervous about holding stocks and is inevitably slowing up what trade there is.

The government's present economic campaign in Shanghai, illegal and arbitrary as it often is, is yet an indication of their determination to try and make the new currency work. They realise that this is their last chance and that if this fails it will almost certainly result in the downfall of the government. The introduction of the new currency was carried through with a skill and secrecy of which one would not have thought the present government capable. It was known only to a small number of people and there was only one small leakage—from the Ministry of Finance—which resulted in the unloading on the stock market of a large number of Wing On shares. The malefactors are now being tried in Shanghai. One of the most interesting features of the reforms was that the Americans were neither consulted nor informed. The American Ambassador, Dr Leighton Stuart, accompanied by Admiral Oscar Badger, visited the Generalissimo at Kuling not long before the announcement of the new reforms, but they were not let in on the big secret. This new-found resolve of the national government to help itself and not to depend on outside aid is a welcome phenomenon—although one cannot help wondering whether it is not already too late in the day to affect the eventual outcome.

THE BUSINESS WORLD

Inflation in India

AMID the turmoil and distractions of India's post-partition problems, economic affairs were inevitably allowed to fend for themselves. There was no positive or blameworthy neglect but to a new, harassed and largely untried administration, finance cannot have occupied a high place among the many urgent problems that were crying for attention and solution. As a result, many unhealthy developments of which the germs were already very much alive in the body economic before partition have gained in virulence since India attained its independence in August of last year. The inflationary potential has now reached a point at which the twin problems of prices and currency have thrust themselves to the very top of the list of priorities and within the past few days an ambitious plan of anti-inflationary action has been announced.

It must be stressed at the outset that India's monetary stability had been greatly undermined during the war years. The official index of wholesale prices, based on the month of August, 1939, had risen to almost 300 by the end of 1946 and was just over this figure by the date of partition. Since partition it has climbed steadily to the neighbourhood of 350. The Bombay cost of living index also based on August, 1939, had risen to around 250 by early 1947 and has since been climbing towards 275. It is only necessary to compare these indices with the comparable figures for Britain, and to bear in mind the fact that the sterling-rupee ratio has remained unchanged at 1s. 4d., to realise that a dangerous measure of inflation has taken place in India and that unless it is corrected it must ultimately call into question the existing exchange valuation of the rupee.

The report of the Reserve Bank of India for the year 1947/48 is both eloquent and threatening on this subject. It points out that the rising trend in the general level of prices gathered momentum during the twelve months to last March. It attributes the steady increase in inflationary pressure to a number of influences. The money supply tended to remain more or less stable during the first half of the period but increased sharply during the second. Although the Government had almost balanced its revenue budget during the year, a deficit in the capital budget contributed considerably to this inflationary expansion in the circulation. In addition there was a general decline both in agricultural and industrial production. The output of food grains in the Dominion of India (including Hyderabad), which had averaged 43 million tons in the years 1942/46, had fallen to 40 million tons in 1947. In such major industries as jute, cotton, cement, paper, matches and chemicals, output in 1947 was lower than in 1946. This fall was partly due to inadequate supplies of raw materials but it was also explained by civil disturbances, particularly in the north, and by industrial unrest.

Against this background of declining production, aggravated by restrictions on imports, particularly after the suspension of convertibility of sterling in August last year, salaries and wages continued to rise—a movement which was helped by a number of awards by industrial courts and the Government.

Towards the end of 1947 the Government of India announced a policy of gradual removal of controls over prices and distribution. Its action was justified by the glaring administrative defects which had been revealed in the working of these controls and which had tended to perpetuate conditions of relative scarcity. The gradual decontrol of prices and the upward revision of those of such materials as steel, cement and coal, which remained under control, inevitably appeared to reinforce the already severe inflationary pressures in the country, despite the expectation, in the longer run, that the policy of decontrol might achieve its object of releasing goods from hoards and securing a substantial increase in industrial production.

The measures of decontrol which were then taken, and the summoning of the Industries' Conference, which set out a programme of increased productivity, have not produced, in the relatively short period which has elapsed, the results expected of them. A point has now been reached at which more drastic and immediately effective measures must be taken if the danger of really damaging inflation is to be averted. The new plan, of which the broad outlines were announced last week by the Indian Minister of Finance, at least aspires to the necessary virtues of comprehensiveness and severity.

The Government's policy has four immediate objectives. The first is to keep Government expenditure as low as possible and increase revenue by all possible means. The second is to allow no further rise in prices and the cost of living. The third aims at securing as soon as possible a progressive reduction in prices and at increasing the volume of goods and services available for consumption. The fourth contemplates an effective curtailment of the purchasing power in the hands of the community. To these ends, a number of specific measures have been tabled. One is to limit the dividends distributed by public companies to a figure not exceeding the average paid for the two years ending March 31, 1948, or to 6 per cent on the paid up capital, whichever is the higher. In order to keep down Government disbursements, it has been decided to postpone the repayment of EPT deposits and the release of refunds for a period of three years. Exceptions to this last rule will be allowed in special cases where industrial concerns have been counting on the repayments to pay for new capital equipment.

It has also been decided that the deficits of the Government and of the Provinces must be covered and that budget surpluses must be aimed at for next year. The estimates for the current year indicated a deficit of Rs 2.13 crores for the Central Government budget and of Rs 15½ crores for the Provinces. In addition to this, the volume of capital expenditure to be covered by borrowing will add appreciably to the inflationary pressure created by the deficits on the ordinary budgets. A committee of the Cabinet has now been set up and charged with the task of reviewing, and pruning where possible, all development plans of the central and provincial governments. This committee will establish an order of priorities of accepted schemes and all expenditure on schemes which are not likely to prove immediately productive will be postponed. The provincial governments whose deficits have played so large a part in fanning the inflationary flames are being strongly urged to strengthen their finances and to reinforce their revenues by a levy of agricultural income tax wherever it is not now levied.

To stimulate industrial production, the Government has decided to make considerable concessions in tax allowances for depreciation of plant and machinery. New industrial undertakings are to receive complete exemption from income tax for a specified period, while the raw materials, plant and machinery

imported into India for industrial purposes are to be granted relief from customs duties. With the same object of improving industrial production, the Government of India is now considering a scheme for the better distribution of essential and scarce commodities such as iron and steel, cement and oil products.

In the hope of encouraging savings the Government has decided to raise the permissible limits for investment in postal savings bank accounts from Rs 5,000 to Rs 10,000 and in national savings certificates from Rs 15,000 to Rs 25,000. To meet the needs of institutional investors for short-term securities, the Government has also decided to issue Treasury deposit receipts somewhat on the British model. These will run for six, nine and twelve months. Finally, in order to give some reality to its policy of wage stabilisation, the Government is taking steps to enforce compulsory arbitration in industrial disputes and to ensure that the awards of industrial courts are duly obeyed.

On paper, the programme looks impressive and its form is in keeping with the immense task that has to be tackled. The prospects of its fulfilment must, however, be realistically discounted to allow for continuing political uncertainty in India and for the raw and untried administrative machine that will have to put it into operation. Something must be seriously wrong with the state of India when such a sober and respected firm of bankers and bullion merchants as Messrs. Premchand Roychand & Sons of Bombay can state, as they do in their latest Annual Market Review, that "the controls had become a great farce and were only creating a cesspool of corruption. The black market was the rule rather than the exception . . . inflation ran its hectic course spilling misery all around. The upward pressure of prices never relaxed but was often accentuated by wage increases which labour wrung from employers." India is probably learning in a hard school how difficult it is to maintain an honest administrative machine. Only an administration of unquestioned integrity can tackle the economic problems that will have to be solved if the rupee is to be held at anything like its present exchange value.

European Recovery—III

The Role of Agriculture

WESTERN Europe depends largely on its own agricultural production. Even before the war imported food supplies accounted for only one-fifth of annual requirements at the most; if the United Kingdom were excluded, the proportion imported would be much smaller. Since the war, however, agricultural production in western Europe has been lower than it used to be. For the crop year 1946-47 it was estimated at only 75 per cent of the 1934-38 level. Imports, moreover, have been restricted by payments difficulties. In all, consumption measured in terms of calories has been reckoned to be some 20 per cent below the prewar standard. In the first two years after the war some relief was afforded by UNRRA shipments; latterly it has been afforded by Marshall aid. But although the Marshall Plan provides for some expansion of food imports, the success of the recovery programme in food depends on western Europe's ability to resuscitate its own agriculture.

The agricultural patterns of western and eastern Europe differ widely. In the west, agriculture takes second place to industry, but it is more highly capitalised, with a higher productivity per man and per acre than in the east. It specialises more on livestock products; it requires fertilisers and imported feedingstuffs in large quantities. In eastern Europe, it tends to be more primitive and is concentrated largely on grain production. If this pattern is to persist, it will be essential to revive trade between eastern and western Europe. Before the war, there were two dominant movements in the European trade in foodstuffs; first, the large scale shipment of wheat and other cereals from eastern Europe to the West and, second, the shipment of livestock products and fresh fruit and vegetables mainly from western Europe to Britain. The plan for European recovery assumes that both these prewar characteristics will be restored.

In 1946-47, the acreage devoted to the main agricultural crops in western Europe was 8 per cent lower than before the war, except for coarse grains, where the acreage was slightly larger than in 1934-38. The output of these crops, however, apart from sugar, was fully 10 per cent below that of the prewar period, and the same was true of the livestock population. The numbers of cattle had regained their 1934-38 average, though those of sheep and pigs were 5 per cent and 37 per cent smaller respectively. Output of milk products was down by 30 per cent and of meat by 34 per cent. The same trend was also evident in poultry; flocks were reduced by 20 per cent while egg production was 34 per cent smaller. These figures give some impression of the serious fall in agricultural productivity in Europe. Fertilisers were scarce during the war and soil fertility was seriously depleted. Farm equipment was worn out or destroyed. Labour in the occupied countries was drafted to Germany. Supplies of concentrated feedingstuffs for the livestock production were no longer available. Modern agriculture also depends on a host of other specialised materials such as improved seeds and insecticides, which were equally in short supply. This legacy of the war years had to be made good.

But the production cycle in agriculture is lengthy; the simplest plans may take two or three years to materialise. For livestock they take even longer. If at the end of hostilities there had been an abundance of fertilisers, farm equipment and feeding stuffs, and if agricultural labourers had returned to their former occupation, recovery to the prewar level of output would still have taken at least three years. But, instead of abundance, there were shortages. Some improvement was achieved in agricultural production in 1946, but matters were made worse again by the severe winter of 1946-47 and the summer drought which followed, causing output in 1947 to fall sharply. A serious reduction in yields of arable crops has been made good this year. But the shortage of feed for livestock caused a reduction in numbers of cattle and sheep, so that recovery was postponed by at least two years.

Most western European governments have embarked on long-term agricultural development schemes. These give some impression of how agricultural production is expected to expand by 1950-51. Broadly speaking, the area devoted to grain crops and the numbers of livestock are expected to regain their prewar level; the acreage under sugar beet and the numbers of poultry are expected to exceed their 1934-38 averages. These targets for 1950-51, with actual figures for 1946-47 and the average of 1934-38 are shown in Table I. But output is not expected to increase so rapidly. A comparison of Tables I and II reveals that the target increase in output by 1950-51 compared with prewar is not commensurate with the corresponding increase in acreage or cattle numbers, except for potatoes. But within this period the population of western Europe is expected to increase by 11 per cent. The restoration of livestock numbers to their prewar level can be achieved only if adequate supplies of feedingstuffs are available—and about this there is some doubt. One of the main objectives will be the expansion of milk

production by 1950-51 to slightly above the prewar level. The recovery in meat production is expected to be less marked; by the end of the Marshall period output will still be 12 per cent below its 1934-38 average, though the proportion of meat in the form of bacon and pork will increase. On the basis of information so far available it is difficult to criticise the official data contained in Table I; even so, the planned increase in cattle numbers appears to be too rapid, and in pigs too slow.

Although total agricultural production in western Europe may, perhaps, regain its prewar level by 1950-51, the pattern of trade in foodstuffs between the participating countries will alter appreciably. The United Kingdom, for instance, expects to be less dependent on imported foods, particularly those at present obtained from the Western Hemisphere. Cereal and potato production, which was expanded considerably during the war years, will be reduced in favour of livestock production, but the level aimed at will still be 10 to 20 per cent above prewar. With livestock, the emphasis will be on milk rather than meat. Both Denmark and the Netherlands expect to resume their prewar exports of meat and dairy products, still mainly based on imported foodstuffs; the Netherlands, however, intends to switch from the export of butter to the export of cheese and processed milk. Norway and Sweden intend to expand agricultural production for their domestic markets without attempting to recapture their prewar export trade which was largely focused upon the British market, whereas France plans to expand output from a smaller cultivated area. Such are the plans. Whether they are mutually compatible remains to be seen. The dovetailing of export surpluses with import requirements will be only part of the problem; the major difficulty will be fitting these agricultural programmes into the general economic programme.

Yet these plans, which form the basis of the European Recovery Programme, are dependent for their fulfilment on certain assumptions. In the first place, they presuppose an adequate supply of agricultural raw materials—fertilisers, equipment, feedingstuffs, insecticides and seeds. Secondly, they presume the maintenance of East-West trade in Europe. Thirdly, they envisage development of agricultural production in colonial areas. These latter projects, so far as the United Kingdom is concerned, are well behind schedule, so that to this extent the targets laid down in the European plan may not be achieved. East-West trade is likely to continue in spite of the apparent worsening of political relations. South-east Europe will still want to dispose of its grain surplus to western Europe in return for industrial equipment. Nevertheless, in the longer term, this basic assumption of East-West trade may be open to question, because the splitting up of large estates and the development of industrialisation in these countries is likely to change their agriculture towards mixed farming and livestock and away from cereal production. Major changes of this kind might mean the destruction of the very basis of East-West trade in foodstuffs.

The most important assumption of immediate concern is the availability of fertilisers, farm equipment and feedingstuffs. Before the war, western Europe was a net exporter of nitrogen and potash but an importer of phosphates; in 1946, however, it was a net importer of nitrogen. The bulk of plant nutrients is obtained from farmyard manure and this source has been affected by the decline in livestock numbers. Consumption of commercial fertilisers at present is probably at the prewar level, but Europe, nevertheless, plans almost to double its output of fertilisers by 1950-51 and most of that will be consumed domestically. But the future level of fertiliser production depends on industrial plant, coal and electricity, and it is doubtful whether production can be increased at the anticipated rate. Europe is not short of phosphate; the small import requirement shown in Table III is due to the relatively restricted capacity to manufacture superphosphate—the raw material, phosphate rock, is in plentiful supply and readily available in North Africa. Western Europe, however, is not so well supplied with potash. The only important sources are France and western Germany, but the latter's output is used entirely for its own needs. Imports could be obtained from eastern Europe (in particular the Soviet zone of Germany), Spain and Palestine provided that trade is maintained with these countries.

No less important than fertilisers is the supply of agricultural machinery. There has already been a marked expansion in the mechanisation of western European agriculture, but requirements of tractors are expected to be three times their prewar level by 1951. If the plans materialise, western Europe will have a sizeable export surplus of tractors—although it will still be necessary to import small quantities of heavy tractors—while import requirements of other machinery in 1950-51 are estimated at 543,000 tons compared with an export surplus of 390,000 tons. Britain must be the mainstay of this increase in production of agricultural equipment; its share of total output can be seen in Table III. It has already achieved a remarkable rate of increase in production of tractors and agricultural machinery, and exports have been maintained at a high level. But the future plans depend largely on sufficient steel. If supplies of steel for farm equipment were curtailed, the future of Europe's agricultural recovery would be in jeopardy. Criticism has already come from the United States that the projected increase in mechanisation is too great.

But given the present scarcity of agricultural labour in all countries of western Europe except Italy, increased supplies of agricultural machinery are essential to raise agricultural productivity and to replace the loss of draught animals since 1939.

Western Europe's agricultural recovery programme depends on increased livestock production. Hence it requires an expansion in the supply of feedingstuffs and, in particular, of concentrated feeds. The Food and Agriculture Organisation has recently estimated that in 1946-47 the supply of concentrates in the principal countries of western Europe was less than two-thirds of the prewar level, and that the supply of all feeds was 85 per cent. The shortage of bread grains, the higher extraction rate in flour milling, and the use of certain coarse grains for human consumption have led to a further shortage in the supply of feedingstuffs. During the current season there will certainly be a sufficiency of bread grains and coarse grains. But this improvement is likely to benefit only egg and pork production. Cattle and sheep are more dependent on oil-cakes, and not even the most optimistic estimates expect the world supply of oils and fats to regain its prewar level before 1951, if then. There has, of course, been considerable develop-

October

With the close of the holiday season many firms are preparing plans and reviewing prospects for future endeavours. All interested in overseas trade, and particularly those who are entering this field for the first time, are invited to consult the Midland Bank. At Overseas Branch, 122 Old Broad Street, London, the Bank has a Foreign Trade Information Department which is specially equipped to give information and advice on trade with other countries. It is prepared to assist in establishing agencies and, from the wealth of material at its disposal, to provide channels of approach between exporters and importers. This service is at the disposal of traders and merchants in all parts of Britain, and is available in response to inquiries at any branch of the Bank.

MIDLAND BANK LIMITED

ment in improving grasslands, grass drying and silage which has helped to increase indigenous supplies of animal food. Nevertheless, farmers will have to be assured of a more enduring increase in the supply of feedingstuffs before they can be encouraged to expand their livestock herds to the required extent.

This year's favourable crops, therefore will increase the amount of food available for human consumption in western Europe. But they are unlikely to contribute directly to agricultural recovery. There is always scope for better farming methods, better seeds, and other technical improvements, but basically agricultural recovery depends on an expansion in industrial output. This relationship is very close. It implies that agriculture must be assured of increased supplies of fertilisers and farm equipment ; it also implies an expansion in consumer goods and a general improvement in the economic health of western Europe. It is one thing to expand agricultural production ; it is another to ensure an efficient distribution of the goods produced. Ration schemes and governmental regulations help, but the only certain method of securing a proper distribution is by making it profitable for farmers to exchange their produce for the goods they want.

Business Notes

The New Governor

The City has learned with regret that Lord Catto will retire from governorship of the Bank of England at the end of the current year—that is, on February 28th next. His decision to do so was not, however, unexpected. Lord Catto succeeded Lord Norman in 1944, and thus completes this year the five-year term which he has long been known to have regarded as a maximum. Indeed, on his reappointment after the nationalisation of the Bank in 1946, it was generally understood that his aim then was simply to ensure due continuity in the Bank's affairs. The two years or so which have since elapsed have demonstrated that the formal change in regime has been accomplished, as most informed people expected it would be, without the slightest hitch. In ensuring this smooth transition, the close personal relations which Lord Catto had established with the Treasury during the war have doubtless played an important part. Meanwhile, Lord Catto, as he points out in a letter to the Chancellor, will attain the customary retirement age of seventy within a few weeks of the date on which he will retire.

The new Governor will be Mr Cameron Cobbold, the present deputy-Governor, whose appointment sets a precedent. Mr Cobbold will be the first Governor in the Bank's long life of over 250 years to arise from its select ranks of senior officials and executive directors. He joined the Bank as an Adviser in 1933, became an executive director in 1938, deputy-Governor in 1945 and now, at the very early age of 44, is Governor-designate. It is an impressive record, and all in the City will wish him well. Nationalisation of the Bank has certainly not made its governorship a less critical post ; and the prospect of gradual transition of the national economy from rule by rationing to rule by price may add greatly to the responsibilities of the Governor in the next few years. The new deputy-Governor will be Mr D. G. M. Bernard, now aged 60, who has been an executive director since 1939.

Dollar Drain Slackening

The drain upon Britain's gold and dollar reserves—which are the central reserves for the whole sterling area—showed a welcome slackening during the third quarter of this year. In that period the total gold and dollar deficit for the sterling area, before taking account of ECA reimbursements of dollar expenditure, amounted to £76 million. This, as the accompanying table shows, compares with a total expenditure of £147 million in the first quarter of the year and £107 million in the second quarter. Earlier in the year the deficit was being partly financed by drawings on the residue of the dollar credits or by purchases of dollars from the International Monetary Fund, but in this latest quarter the only offset against the gross expenditure has come from a further reimbursement under the European Recovery Programme. These reimbursements necessarily take place in arrear, and it is clear from the figures to date that the lag is considerable. For the second quarter of the year—i.e., the initial ECA period—Britain was allocated £100 million in ECA grants and loans, but by the end of the quarter it had received dollar reimbursements equivalent to only £22 million. Further reimbursements in the third quarter amounted to £41 million, although for that quarter an additional £83 million was allocated in grants and loans. After taking credit for the reimbursements actually received at the quarter-end, the net drain on reserves during the quarter was accordingly £35 million, reducing the total gold and dollar reserve to £437 million (to the nearest million).

Britain's gold and dollar reserves for the whole sterling area showed a welcome slackening during the third quarter of this year. In that period the total gold and dollar deficit for the sterling area, before taking account of ECA reimbursements of dollar expenditure, amounted to £76 million. This, as the accompanying table shows, compares with a total expenditure of £147 million in the first quarter of the year and £107 million in the second quarter. Earlier in the year the deficit was being partly financed by drawings on the residue of the dollar credits or by purchases of dollars from the International Monetary Fund, but in this latest quarter the only offset against the gross expenditure has come from a further reimbursement under the European Recovery Programme. These reimbursements necessarily take place in arrear, and it is clear from the figures to date that the lag is considerable. For the second quarter of the year—i.e., the initial ECA period—Britain was allocated £100 million in ECA grants and loans, but by the end of the quarter it had received dollar reimbursements equivalent to only £22 million. Further reimbursements in the third quarter amounted to £41 million, although for that quarter an additional £83 million was allocated in grants and loans. After taking credit for the reimbursements actually received at the quarter-end, the net drain on reserves during the quarter was accordingly £35 million, reducing the total gold and dollar reserve to £437 million (to the nearest million).

By end-September, therefore, Britain had received in dollar reimbursements only £63 million of the £183 million of Marshall aid ostensibly due for the previous six months. It would perhaps be unwise to assume that the whole of this provisionally allocated aid will in fact be received ; but the outstanding sum of £120 million is sufficiently large to enable the Government to feel that the true level of reserves—after allowing for the lag in dollar reimbursements definitely due—is being maintained above the £500 million which, as the Chancellor recently announced, must be regarded as the basic minimum. By contrast with the catastrophic rate of exhaustion of reserves last year, the recent performance is heartening. But it cannot be too strongly emphasised that the extent of ECA aid expected in the first year is still only just sufficient to finance the current rate of sterling area expenditure—after taking credit not only for ECA loans as well as grants, but also for that portion of the grants which will be received only if the sterling area makes corresponding unrequited exports to western Europe.

Postscript to Ottawa and Washington

On his return from his visits to Canada and the United States the Chancellor of the Exchequer this week gave the Press a carefully phrased summary of the results of his talks. Even the careful phrasing could not altogether hide the fact that the end of the talks in Ottawa still left considerable differences of views between the two parties. The Canadians "accepted the harsh necessity of our limitation of Canadian imports during the period of recovery, but stressed their anxiety that by the end of that time we should be able to deal more freely in Canadian products. They were anxious that our necessity to enter into bilateral agreements with other countries should not prejudice our capacity to export to Canada, and should not tend to channel our trade permanently in other directions than the Canadian." Sir Stafford tried to reassure them by explaining that Britain was equally anxious to reach a much larger degree of multilateralism in its trade, but that in the existing circumstances bilateralism was inevitable. The question of releasing the remaining $240 million of the Canadian credit was broached, and an early announcement on this subject is due to be made.

From his visit to Washington the Chancellor brought back an impression of the value of the International Bank and Fund, whose meetings of governors he attended. He expressed his confidence that they could both play a really useful part, not so much in dealing with the present emergency conditions, but in organising longer-term methods by which more stability can be brought to international economic relations and provision made for the development of world resources. The Chancellor discussed the European Payments Scheme with Mr Hoffman, and, answering questions on this subject at his press conference this week, appeared well satisfied that the British point of view, and in particular the British objections to the transferability of sterling drawing rights under that scheme, had been adequately met. The Chancellor had reviewed the operation of the 1945 loan agreement with Mr Snyder, Secretary of the US Treasury, but explained that it would have been inappropriate in existing conditions to enter into negotiations for altering that agreement. In answer to a subsequent question, Sir Stafford said that no one could assume the resumption of sterling convertibility to be

near enough to warrant discussion of the matter. Reports from Washington continue to suggest that in the minds of many Americans one criterion only is used by which to judge the return of Britain to solvency and viability by the end of the Marshall period, and that is the resumption of complete convertibility of sterling. The Chancellor seems to have done his best to disabuse Americans and also Canadians of this idea, and to substitute for convertibility as a criterion of recovery the Government's plans—and hopes—of restoring the UK balance of payments to equilibrium by the year 1952-53. The detailed document, which apparently goes into *minutiæ* of the likely balance of payments between Britain and all other important nations of the world in the year after the Marshall Plan is due to end, has provided the text for most of the "off the record" and behind the scenes lectures given by the Chancellor. It also has provided him with a new fount of buoyant optimism, which, since his return from North America, he has been trying to impart to the delegates at the Commonwealth conference in London.

Intra-European Payments

The council of OEEC this week gave its final approval to the details of the intra-European Payments Scheme for the year ending June 30, 1949. The net contributions and equivalent drawing rights under that scheme have already been published and were set out in *The Economist* of September 18th. More detailed figures of the prospective surpluses and deficits in the balance of payments between each set of European countries will be found in a table on page 352 of the current issue of *Records and Statistics*.

Since the agreement was reached on these figures on September 10th, the remaining points of doubt have been successfully cleared. The most important of these concerned the transferability of drawing rights granted under the scheme. Automatic transferability was strongly objected to by Britain and will not in fact be granted under the scheme. Automatic compensation will apply only in what, under the Bank for International Settlements scheme, has come to be known as "Category A" compensations which are simple cross-cancellation of debts, the net effect of which is to reduce intra-European indebtedness all round. In "Category B" compensations, which are possible only where one creditor is prepared to increase his claims on another member as a result of compensation of a debt owed to a third party, transferability will be effected only on an "administrative" basis, that is, with the consent of all the parties concerned. This in fact means that Britain will be able to safeguard itself against the possibility that sterling may get into the hands of countries which, by the operation of the Payments System, would be able to demand gold.

Other points which have caused some difficulty are concerned with the linking up of the contributions in the European payments scheme with ECA conditional grants. Belgium has strongly objected to making its contributions, which are relatively substantial, in anticipation of the receipt of conditional grants. The fear which constantly haunts Belgium is that by increasing its unrequited exports to Europe it will stimulate the inflationary forces which already are far too strong in the Belgian economy. Belgium appears to have been reassured on this point of timing by a promise that conditional grants will be made as soon as the creditor countries in Europe make their currencies available to the debtors. The other difficulty has concerned the possibility that the drawing rights may not be fully utilised. The point at issue has been whether, in such a case, conditional grants would be correspondingly reduced. Such a possibility must be envisaged with some apprehension, since the total amount of Marshall aid is barely sufficient for Europe's essential needs. On this point, also, some reassurance has been provided by ECA, with a suggestion that unutilised drawing rights might be carried over from one Marshall year to another. The full details of the payments scheme and of the trade rules which have been hammered out in Paris over the past few weeks should be published during the coming week-end.

Rewriting the Steel Plan

"It is not, perhaps, altogether appreciated," observes the September issue of the *Statistical Bulletin* of the Iron and Steel Federation, "how exceptional has been the achievement of the industry in formulating a national development plan so promptly—a plan which in 1946 the Government accepted as being broadly right—and then in actually carrying it through." But this does not mean that the results which the steel plan produces will be the results which its authors expected it to produce. The *Bulletin* discloses that the plan, as it has developed, is likely to raise British steelmaking capacity to a point well above the expected 16 million tons. The new figure is put at 17½ million or possibly even 18 million tons.

One of the reasons for the revised expectation was discussed in an article on European steel in last week's issue. The increase in costs of construction is prolonging the economic life of old plant, which may therefore be kept in service instead of being scrapped. Another reason is to be found in the various expedients which have already enabled more production to be got out of the existing capacity: notably the conversion of 25 per cent of steel melting plant to oil-firing, and the agreement for the continuous working of steel melting shops, which alone has added about 750,000 tons to effective melting capacity. At first sight these considerations might suggest that the expanded estimates apply more to steel melting than to the other stages of iron and steel production. But the fourth reason given by the *Bulletin*—that "the actual plants being built have almost invariably a larger capacity than was allowed for in the broad scheme originally formulated"—means particularly that the blast furnace capacity will be larger. The industry has not lost sight of the shortage of scrap, and, as the plan is working out, the ratio of pig iron to scrap used in British steel production will probably, in fact, be greater than the first estimates envisaged. This will require larger imports of ore, which seem unlikely to come from Sweden; the possibilities of expanding ore supplies from North and West Africa (and particularly from Sierra Leone) are receiving attention.

Nobody wants redundant steel capacity. But by a happy chance the recent Government examination of future steel demand has led to the conclusion (the *Bulletin* discloses) that demand also will be greater than was expected. The requirements of export to balance Britain's overseas payments have made it necessary for British foreign trade to concentrate more on machinery, vehicles, and other steel manufactures than was thought probable in 1946. At the same time the necessity has been accepted of cutting down imports of commodities such as timber for which steel will have to be substituted. Colonial development and the new oil refineries will both take more steel. "Assuming a continued high level of employment, therefore, a figure of 18 million tons has been agreed as a reasonable estimate of probable requirements in the early 1950s."

The matter is not automatically one for congratulation. In the forecasts of future trade requirements there is much that is speculative, and (as the *Bulletin* acknowledges) resources invested in steel are withheld from other industries and withheld from export. "It is not, therefore, lightly to be assumed that it is all gain to build a steel industry of almost unlimited capacity."

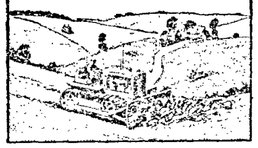
* * *

Steel Output and the Scrap Prospect

In September, the first full month after the holidays, British steel production returned to the high level of June. The average weekly output of 296,800 tons of steel ingots and castings in September corresponds to an annual rate of 15,435,000 tons; it is 25,300 tons a week more than in August and 30,600 tons a week more than in September, 1947. The organisers of the home scrap collection drive, which was launched a year ago, can reasonably congratulate themselves on the increase of iron and steel scrap supplies by a million tons in twelve months. Further appeals are being made to maintain and, if possible, to increase the scrap collections. These continued efforts are clearly necessary if the high rate of steel production is to be maintained.

In Germany the Anglo-American scrap agreement has already been reflected in an announcement by the Joint Export-Import Agency that 1,225,000 tons of scrap are to be released for export between now and January. Of this, 500,000 tons are to be released to American buyers, 500,000 tons to Britain, and 225,000 tons to other countries. These are handsome figures, but it would be unfortunate if they led anyone to suppose that their realisation can be taken for granted. Bizonal export trade in scrap has never yet approached the dimensions which have been predicted, and in the last few months it has been almost at a standstill. Only with the German steel industry has a brisk German trade in scrap come into being since currency reform; this is reflected in the improved bizonal steel production figures which were announced at Düsseldorf on Tuesday. It is not to be supposed that the German buyers will now retire from their own scrap market, or that official policy will oblige them to do so. The export programme is therefore presumably additional to their requirements, and it may be doubted whether the organisa-

RECLAIMING 30,000 ACRES



1. For 1,000 years the turf of the Sussex Downs lay undisturbed, except by grazing sheep. But war forced the authorities in 1942 to take great stretches for battle training.

2. For four years troops fired thousands of tons of ammunition into the slopes, and covered their surface with wire and concrete, trenches and gun-pits.

3. 'Caterpillar' Diesel Tractors are now speedily clearing the Downs of their dangerous litter, so that the urgent job of food production may begin again.

Before the Sussex Agricultural Committees could begin reclaiming the downland, miles of rough roads had to be cleared by 'Caterpillar' Bulldozers. Before ploughing could begin, innumerable shell and bomb craters had to be filled in, and undergrowth, wire, and defence works had to be uprooted. Once again, 'Caterpillar' equipment, provided and serviced by the Jack Olding organization, has saved precious time, manpower and money.

No fewer than 3,000 islands and islets go to make up the beautiful chain known collectively as the Bahamas. Of these only a few are inhabited—among them San Salvador where Columbus first made landfall on his voyage of discovery in 1492. The best known of the islands is New Providence where Nassau, the capital and one of the Empire's most inviting playgrounds, provides wonderful bathing and big game fishing with a climate which combining as it does a northern sky with a southern sea, has earned for the Bahamas the name of the "Isles of June." During the war a Royal Air Force training base was established in Nassau. Later, when it became important to secure a steady flow of aircraft to the Allied Forces in Europe and Africa, the Island proved an important link in the famous Atlantic "plane ferry" service.

Full and up-to-date information from our branch in Nassau covering local conditions and commercial trends in the Islands is readily obtainable on request.

tion or the physical equipment for handling these vastly increased quantities is ready to hand. The new price of $28.50 a ton at the German frontier, announced by JEIA, does not differ greatly from the price of $26 on the site at which export contracts were being concluded in the spring, before the deadlock arose; but it is still a high price. The British steel industry will do well to continue to place as much reliance as possible on home supplies.

* * *

ECA and the Fawley Refinery

A report from Washington this week brings into the public eye the discussions that have been going on about the projected refinery of the Anglo-American Oil Company at Fawley. This plant, if it is built, will be the largest single unit in the UK home refining programme. The parent company, Standard Oil of New Jersey, although it has promoted the scheme up to a point, has never yet appeared to have taken a final decision to go ahead. This may be attributable in part to a desire to see the future pattern of European politics and of the European oil trade more clearly before the company commits itself to an exceptionally large capital expenditure. But the scheme is also being held up by the uncertainty whether the earnings can be made convertible into dollars. The British Government, though it supports home refining (and the expansion of the oil industry in the United Kingdom) in principle, is presumably reluctant to accept the creation of a big new dollar claim. In the circumstances Standard Oil of New Jersey has been exploring the possibility of getting the ECA to guarantee the investment.

This possibility arises from the clause in the Economic Co-operation Act which empowers the Administrator to "facilitate and maximise the use of private channels of trade," and for that purpose to guarantee the transfer into dollars of the income from approved investments. The Administrator's power of guarantee even extends to eventual repayment of the capital. It is, however, limited to a total of $300 million under the Act of 1948.

To guarantee the full proposed investment on the Fawley project would take a big slice of that total. The sum of $100 million mentioned in the Washington reports appears, at first sight, to be an underestimate. Mr Frank W. Abrams, the chairman of Standard Oil Company (New Jersey), when he addressed the American Chamber of Commerce in London last month, spoke of a planned throughput of 128,000 barrels a day. Estimates of the cost of building a modern refinery vary, and costs have indeed been rising; but if it is taken at the fairly modest figure of £2,250 per ton of daily throughput, a refinery of the size mentioned by Mr Abrams would be likely to cost more than £35 million. To underwrite the whole project would therefore absorb not much less than half of the total amount at present available from ECA funds for investment guarantees. The amount of the guarantee would (under the terms of the Act) have to be deducted from the total of ECA allocations. It would be surprising if Mr Hoffman were to give such a guarantee without hesitation.

* * *

Floating Debt Policy

The Treasury this week has made a small net repayment—one of £6,500,000—of indebtedness to the banking system and money market, despite the raising of the week's tender issue of Treasury bills to the record figure of £190 million, or £20 million in excess of the corresponding bill maturities. During the week there has therefore been a switch of Treasury indebtedness from Treasury deposit receipts (the outstanding total of which was reduced by £26½ million) to Treasury bills. Increases in the outstanding volume of tender bills, often also involving similar switches from TDRs to bills, have been the normal feature of floating debt policy each autumn ever since 1942, when it was first recognised that heavy issues of six months TDRs in the early autumn imparted an undesirable rigidity to the banking position during the phase of heavy tax collections early in the New Year. This particular disadvantage of the TDR, however, has now been mitigated by the arrangement made a few months ago whereby TDR issues, instead of being standardised on a six-months currency, now range from five to seven months. In recent weeks the Treasury has taken full advantage of this new flexibility, not merely to ensure that TDR maturities will occur early in the New Year in weeks in which in the past there have been some embarrassing gaps, but also in order to split up the bigger blocks of maturities. Thus, in each of the past three weeks, when TDR maturities have ranged from £185 million to £90 million, the replacement issue has been broken down into each of the three permissible maturities.

In view of the better disposition of maturities thus achieved, there had been some doubt whether the authorities would this year make the usual seasonal increase in the tender issue of bills. Their decision to do so was the more welcome in money market circles, for, despite the huge volume of bills now passing through the discount market, the ratio of money market assets to deposits shown by the monthly banking statements is actually running a little below its 1947 level. At around 20 per cent, however, it is probably an adequate level, and is slightly above the ratio on which the banks were working in the years immediately before the war—in the phase of so-called "famine" of Treasury bills. The authorities, at all events, seem reluctant to see the tender issue of bills rise much beyond the "basic" figure of £2,210 million which has ruled for the greater part of this year. At yesterday's tender the maximum amount of bills on offer was reduced to £180 million, suggesting that in the ensuing week the offer will revert to the basic figure of £170 million. If that happens, the seasonal increase this year will have been, as in 1947, only £40 million, and will have raised the total outstanding temporarily to £2,250 million—also the same figure as was reached twelve months ago. Over the same period, however, the outstanding total of TDRs has risen by £200 million to £1,452 million—fully £250 million above the postwar low point reached early this year. The direct cause of this expansion is to be found in the redemption, last spring, of the 3 per cent Conversion Loan and in the Argentine Rail re-purchase operation; but the fact that none of these additional TDRs have been translated into bills strongly suggests that the authorities regard the present bill issue as a virtual maximum unless and until bank deposits expand further.

* * *

Coal Output and the Yield of Extra Time

The improved Saturday output achieved in the mines last week is welcome, but there is nothing in the figures to suggest that the problem of reaching the 1948 target is likely to be solved by Saturday work or overtime. An example is the West Midlands division, where a joint appeal from the divisional board and from the National Union of Mineworkers obtained, relatively speaking, a good response. Nearly 50 per cent of the face-workers are reported to have attended for work in 58 pits in the West Midlands; this was the best Saturday attendance of the year, and produced 70 per cent more coal than the previous Saturday. But what are the quantities involved? Last Saturday's production in the division was 23,380 tons—an increase of 9,500 tons over the previous Saturday. But Sir Ben Smith, the chairman of the West Midlands Board, has asked the division for an increase of 55,000 tons a week. Clearly, the required increase can come only from improved performance on ordinary days.

The national figures give the same impression. A Saturday shift was worked last week in 308 collieries and yielded 119,400 tons of coal; on the previous Saturday (October 2nd) it had yielded 107,000 tons in 253 collieries. (Some collieries work the extra shift on alternate Saturdays only, some not at all, and some irregularly.) Output on October 9th was the highest for any Saturday since June 26th, when 121,300 tons were produced. During September the Saturday output had been about 100,000 tons, and during the holiday period it had been much lower. But last April Saturday output was in the neighbourhood of 160,000 tons.

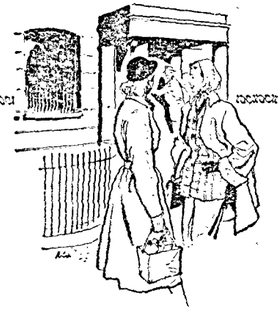
Some pits work, or attempt to work, an extra half-hour a day during the week instead of the Saturday shift. But the extra half-hour, which was worked to a certain extent at 153 pits last week, yielded only 14,800 tons. This, added to the Saturday output figure, brings the product of all extra time worked last week to 134,200 tons—less than a fifth of one ordinary day's output. The detailed figures which would show how much these 134,200 tons cost are not readily available, but the cost of such a marginal increase in output must certainly be heavy. The annual report of the National Coal Board mentioned that extended working hours added 3d. a ton to the average cost of coal in November and December last year.

The weekly statement of the Ministry of Fuel and Power shows that last week's output of deep-mined coal was 3,917,400 tons—an improvement of 38,100 tons over the previous week. Total deep-mined production in the first 40 weeks of the year was 149,292,700 tons. This leaves 50,707,300 tons to be produced in the remaining 12 weeks to reach the target—a weekly requirement of 4,225,000 tons.

* * *

Dollars for Burma

Despite the political and economic turmoil, a further agreement has been made between the British and Burmese Governments to provide the latter with dollars from the sterling area pool. For the half-year ending December 31, 1948, Burma will be able to draw on the central reserve of the sterling area up to an equivalent of £2,000,000 to meet its essential needs for hard currencies. This will be in addition to Burma's own hard currency earnings. This must be regarded as highly favourable treatment of a country which has severed itself from the Commonwealth, has expropriated British property without giving adequate assurances on compensation, and in which the political situation is steadily deteriorating. It is, however, a mark of the integrity with which the banker to the sterling area continues to play his role, and it may yet be the means of giving the recognised government of the Union of Burma the wherewithal to safeguard its authority over that distracted country.



* * *

Australian Loan Success

The latest conversion issue of £15,000,000 Australia 3 per cent 1965-67 stock has had the success generally predicted for it. Since conversion applications amounted to £14,312,882, only £786,118 of the new stock remained to be allotted to cash subscribers. The amount applied for in cash has not been stated but appears to have been considerable despite the lapse in the firmness of gilt-edged issues on the day before the cash list was opened and closed. In consequence cash applications have been drastically scaled down. Full allotment was made for amounts of £100 of stock; £100 of stock was allotted on applications from £200 to £2,000; £200 for amounts between £2,100 and £4,000, and 4 per cent on larger amounts, with a maximum of £2,200 for any one applicant.

In the meantime, interest in Commonwealth internal loans, which were discussed in *The Economist* of October 2nd, continues to grow and prices have advanced up to 1½ points for most of the issues. There has also been a broader inquiry for Australian registered industrial issues from institutional and private investors in both London and the provinces. While this has been largely stimulated by speculation about the possibility of a revaluation of the Australian pound, there has been a wider appreciation of the full effect of the Double Taxation Agreement concluded between Australia and the United Kingdom in October, 1946. There is, however, a difference in the application of this agreement to non-resident individuals and companies domiciled in the United Kingdom. Whereas individuals are allowed exemption from Australian taxation on amounts earned in Australia up to £104 a year, companies are liable to taxation on income exceeding £1. Whereas individuals are not required to lodge an income tax return for income less than £104, companies are required to do so and must appoint a "public officer" in Australia by notice in writing to the Australian Commissioner of Taxation. Introductions to firms of chartered accountants willing to act can easily be effected through any London broker.

In respect of ordinary dividends of companies registered in Australia the Double Taxation agreement works distinctly to the advantage of United Kingdom recipients—either individuals or companies. For, in the case of ordinary dividends the Inland Revenue in this country allows an offset against United Kingdom tax of the full amount of company taxation in Australia, and personal tax (which is levied separately from company taxation) at half rates. This advantage does not apply in the case of a dual resident or a person carrying on business in Australia. Company taxation is, of course, not recoverable by Australian residents. Nor, in the case of preference dividends or the participating portion of dividends on participating ordinary shares, is there any offset against company taxation. But, as with ordinary dividends, in these cases relief is afforded from personal tax at half rates (unless received by individuals entitled to exemption up to £104 of income remitted). In the case of Commonwealth internal loans there is a full offset of personal taxation against the liability for United Kingdom tax, but the Australian liability is reduced to some extent since internal loans issued after 1940 carry a rebate of 2s. in the £ (applicable to all Commonwealth internal loans so far dealt in here), while consolidated loans (all loans issued before 1940) bear interest at the rate applicable in 1930 and are taxed at the rate applicable in that year. It should be noted, however, that new private companies (including companies registered for "nominee" purposes) are subject to a primary tax of 6s. in the £ and to undistributed profits tax but not super tax. New legislation is being prepared in Australia to revise the status of private companies but it seems unlikely that it will result in changes which will greatly affect the position of United Kingdom investors.

It's such a friendly Bank!

If you have hesitated to open a banking account because you consider your affairs to be too small—remember this: The Westminster Bank believes firmly that the real importance of any banking transaction is its importance to the customer. The Bank's dealings with all who use its services are in consequence characterised by a friendly consideration and a genuine desire to see things from the customer's point of view . . . which may, perhaps, be the reason why we are so often told that the Westminster is a friendly bank. The Manager at any branch will be glad to tell you more about the Bank and its services.

Russia's Offer for Ceylon Rubber

Reports that Russia had offered to buy Ceylon's existing stocks of natural rubber and the entire output for 1949 at a price approximately 2½d. a lb. above the current market level appear to be somewhat exaggerated. It seems that Russia asked for a substantial quantity of rubber for immediate delivery which Ceylon could not meet from its available supplies; subsequently Russia suggested a guarantee of supplies during the next year. This change in Russian buying policy is apparently not due to any political motive, but rather to the fact that some of the rubber it has purchased in the Singapore market did not conform with specifications. Having found that open market purchases had not given satisfaction, Russia appears to have decided to give bulk purchase a trial.

Previous estimates have suggested that Russia's annual requirements of natural rubber were of the order of 100,000 tons. Were Russia to purchase the entire output of Ceylon for 1949—say 90,000 tons—and current stocks—approximately 10,000 tons—the total would reach these estimates. But even so the purchases would provide no net addition for consumption; they would reflect merely a switch of purchases from Malaya to Ceylon, with presumably a counter-balancing switch by Ceylon's present customers.

It is difficult to see what advantage such an offer would have for Ceylon. It would mean closing the present market and substituting governmental control. It would insulate Ceylon from the international rubber market for at least a year, with a consequent loss of goodwill. Other reports that Russia was negotiating to buy 18,000 tons of rubber from the Dutch have been denied in The Hague.

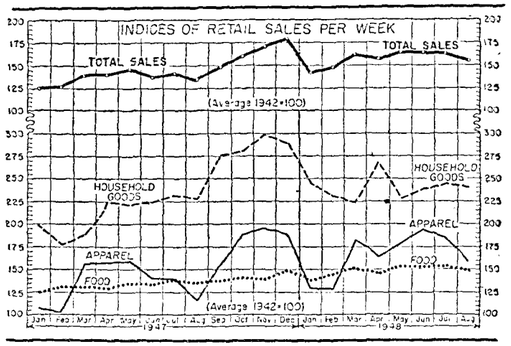
World production of natural rubber up to last August amounted to 977,500 tons, which represents an annual rate of 1,470,000 tons compared with the Study Group's estimate for 1948 (made last April) of 1,390,000 tons. Consumption over the same period has totalled 885,000 tons, or 1,330,000 tons for a full year. There is still no definite evidence that the political troubles in Malaya have actually reduced rubber production, whereas output in Indonesia, which is increasing, was estimated in July to have reached 40,000 tons a month—of which over 30,000 tons came from smallholders. The United States still holds the key to the rubber situation. During the first eight months of this year production of synthetic rubber at 357,500 tons has been 32,500 tons in excess of consumption, but this is still higher than the minimum required by government legislation. Recently the US Reconstruction Finance Corporation approved plans to expand the production capacity of the new "cold rubber" to 160,000 tons. If this new synthetic rubber fulfils its promise and proves suitable for tyre treads, the natural rubber industry may have to revise its long-term calculations. "Cold rubber" has first to prove by experience that it can compete with the natural product. It will not be sufficient to claim that it is better than general purpose synthetic.

* * *

Anglo-French Oil Co-operation

Examples of economic integration are still rare enough among the Marshall Plan countries for the arrangement, reported from Paris, for a measure of Anglo-French co-operation in oil supply and refining to merit particular interest. The French, because of their acute shortage of foreign exchange, are obliged to restrict their own use of petroleum products severely. Their refining capacity, however, is at present greater than the British. France embarked on an official policy of home refining in the early nineteen-thirties. Its refineries suffered a great deal of war damage, but the progress made in restoring them has been impressive, and further expansion is going on under the Monnet Plan. French refining capacity is already 10 million tons a year, and about 2,500,000 tons more than the French economy in its present situation can use. The French Government is anxious, therefore, to use the refineries to earn foreign exchange.

The arrangement now made is that the Anglo-Iranian and Shell groups will deliver 4,000,000 tons of crude oil to France in the year ending October, 1949, and that 2,500,000 tons of this will be at the disposal of the French economy. The intention is that the remaining 1,500,000 tons will be refined in France for British account, and the products re-exported. It is believed, however, that the arrangements between the British and French companies at present cover only the period to the end of this year.



From the French point of view (since it will probably enable France to increase its consumption of petroleum, and this will assist its other industries) the arrangement is no doubt justified. But it may be doubted whether its economics would bear close scrutiny. A large part of the unemployed refining capacity in the Marseilles area, and it seems likely that the products for re-export will be made available at French Mediterranean ports. But Mediterranean markets for refined petroleum are not easy to see; French North Africa, at present supplied from the Caribbean and the Persian Gulf, is the most probable. There seems to be some danger of extended double carriages, and higher costs. But there may be some advantage to the British side in the arrangement, for the supply of refined products to British markets is hampered, in present circumstances, by the closing of the Haifa refinery and the Southern Iraq pipe line.

* * *

Retail Sales Fall

Retail sales in August declined by 5 per cent, but at 156 the Board of Trade index was still well above the level (136) of twelve months earlier. All categories declined, with the largest drop occurring in clothing. This is to some extent a seasonal movement, but coupon concessions became effective at the beginning of the month and footwear was taken completely off the ration. Sales of men's and boys' wear (to which, indeed the coupon concessions were most applicable) fell by over 20 per cent, women's wear by 12 per cent and footwear by 4 per cent. The general experience of retail shops appears to be that the downpointing of certain apparel goods stimulated sales for not much more than one week; buying then fell off again sharply. Regionally, the reduction in weekly sales seems to have affected Central London and the West End least, with a decline of 7½ per cent, and suburban London most, with a fall of 22 per cent. The spread throughout the rest of the country ranged from 13 per cent in the North-East to 19 per cent in Scotland. Yet despite these lower sales figures, apparel stocks at the end of August showed a slight fall owing to a drop in stocks of women's wear, but were still considerably larger than a year ago.

Sales of household goods showed only a slight reduction on the month, but stocks of both furnishings and hardware increased.

Food sales were 3 per cent smaller, but still some 10 per cent above the level of August, 1947. Grocery and bakery sales showed the largest increase (13 per cent) on last year; for this, the abolition of the bread ration may have been responsible. Café and fresh milk sales were 10 per cent higher than in August, 1947, but sales of fresh meat, fruit and vegetables declined. Food stocks at the end of the month were 12 per cent higher than a year earlier.

These trends give rise to certain speculation, but the available data are not complete enough to permit serious conclusions. In any case, since August is a holiday month, movements in sales are difficult to analyse. But it is still apparent that the high prices for textiles are reducing the volume of purchases in spite of the relaxation of clothes rationing. But food prices are still subsidised, and the effect of de-rationing foodstuffs has been an increase in consumption.

* * *

Threatened Jute Shortage

To judge merely by the figures, Dundee ought to be assured of its raw jute supplies until the end of the year, provided that the expected shipments arrive from Pakistan. But recent arrivals of raw jute in Britain have been insufficient to allay Dundee's fears of a shortage, and jute consumption is there-

INCENTIVE
IN A TYRE FACTORY
Co-operative Award System Raises Output and Quality

BETTER WORK, BETTER PAY. This is the gist of the Henley Tyre Co-operative Award Scheme that has recently raised standards of quality higher than ever before.

This is incentive in action.

All tyre manufacturers use the best materials available, reliable formulas, proved and trusted methods, but these alone do not ensure a finished product of a high standard.

TO RAISE QUALITY

The very latest machines take their part in making the tyres, but what decides whether a tyre is to be first class or not is the work that goes into over 50 processes that can only be done by hand.

The new Henley Co-operative Scheme does not rush output. It pays the workers on *quality*. Impartial experts assess the standard of each man's or woman's work.

As any commonsense business man would expect, quality has risen very considerably. So has output, though output is a secondary consideration.

The workers like the scheme. With no pressure to work fast, they can do good work that is rewarded by bigger pay packets.

Henley's like the scheme. It raises the already high standard of their tyres.

Motorists will like the scheme. Already it is giving them more perfectly constructed and harder wearing tyres. Extra incentive means fine workmanship. Fine workmanship makes Henley better than the good tyres they have always been.

INCENTIVE IN ACTION

For a fuller account of this successful quality incentive write for the descriptive booklet "Incentive in Action," Dept. Advt /L at the address below.

A HEALTHY LIVER

Carbon Tetrachloride has many uses. It will put out fires, it will clean clothes. It is a solvent for rubber, oils, fats and greases; it will cure liverfluke in sheep; it is also a useful chemical reagent. This versatile chemical is made by Albright & Wilson Ltd.

ALBRIGHT & WILSON LTD
CHEMICALS
CARBON TETRACHLORIDE

Henry Cavendish first showed the world how water — the most important of all chemical compounds — could be made synthetically. Cavendish discovered that it was composed of the two gases now called oxygen and hydrogen, and in 1784 prepared water by exploding a mixture of them in a glass vessel. The apparatus which he used is still preserved at the University of Manchester. Cavendish was also the first to weigh the Earth and the result he obtained was astonishingly accurate. Cavendish also discovered the composition of nitric acid, and was the first chemist to recognise hydrogen as a definite chemical element. He prepared it by treating zinc with sulphuric acid. He was also the first practical experimenter to find a means of drying a gas, which he accomplished by passing it through pearl ash.

All these discoveries have proved of immense importance. Though both his parents were English, Henry Cavendish was actually born at Nice in 1731. He was educated at the University of Cambridge, and from 1760 until his death in 1810 his whole time was devoted to science, and in particular to physics and chemistry. Though he was extremely shy, shunned publicity and never attempted to exploit any of his discoveries, the work of this English chemist has been of great and lasting benefit to science and industry throughout the world.

ICI

fore to be curtailed from an early date. Stocks of raw jute in the United Kingdom were officially reported to total 39,800 tons at the end of August—or nearly 20 weeks' supply—compared with 52,400 tons twelve months earlier.

The figure is low—though at the end of 1947 stocks were as low as 33,600 tons. Stocks of imported jute goods, on the other hand, have increased from 44,800 tons at the end of August, 1947, to 67,300 tons at the end of August, 1948. But it is not the visible supply of raw jute which gives rise to anxiety (though the stocks may not be composed of the required types); the problem is to ensure a steady flow of imports. Some 45,000 tons of raw jute was allocated for shipment from Calcutta between October and December. The Indian Government, however, has now stopped all jute exports during October owing to the low level of stocks at the Calcutta mills. And it is possible that this ban may continue until the end of the year. In that case, Dundee will be entirely dependent on supplies from Chittagong, which are generally of inferior quality.

The export quota of raw jute from Pakistan to the United Kingdom was fixed at 37,000 tons for the first half of the season. This amount would in any case be inadequate to cover British requirements, which for six months would amount to at least 52,000 tons at the current rate of consumption. Moreover, owing to transport difficulties arising from the recent flooding, it is likely that even this export quota may not be met in full.

Dundee is of course trying to use its stocks sparingly, but it is substantially dependent on the shipments of raw jute which arrive from the Indian continent. Production of jute manufactures in Dundee had been improving, although it had not yet reached its prewar level, and the labour force was steadily increasing. Unless the curtailment in consumption is merely temporary, the industry might have to dispense with labour; in that case, it would take a very long time to get it back. The threatened reduction in the output of jute cloth is also likely to have serious repercussions for carpet manufacturers. Although unlimited quantities of woollen, worsted and mixture yarn are now to be permitted in the manufacture of carpets, output cannot be increased unless larger supplies of jute cloth are available. There are no satisfactory substitutes, but clearly if jute manufactures become really short, sacking and other more essential uses will have to take priority over carpets. Part of this deficit in output might be filled by larger imports of jute cloth, but Britain's account with India would hardly allow any significant expansion of such imports.

* * *

Dearer Base Metals

The recent rise in British base metal prices should have caused little surprise to the London market. At the beginning of August, New York prices for copper, lead and zinc were raised to, or above, the corresponding British prices. It was generally known that the Rhodesian selling price for copper was higher than the American; hence, as soon as new contracts were made, sterling copper was bound to become dearer. In the case of lead and zinc, the New York market has usually set the pace in prices. Even the timing of the higher prices could have been foreseen, although admittedly there was no certainty that the Ministry of Supply would necessarily follow the dictates of the market.

From October 1st the British copper price has been raised by £8 to £140 a ton, lead by £22 to £112 a ton, and zinc by £17 to £92 a ton. These prices compare with current New York quotations of £131 a ton for copper, £108 10s. a ton for lead and £83 10s. a ton for zinc. Thus the Ministry of Supply's selling price for copper and zinc is above the American levels (as it has usually been in the past) though the gap between the two sets of prices is narrower. Lead is the exception. Hitherto, the Ministry bought its supplies cheaply from Australia, and British manufacturers benefited accordingly. Some months ago, it was announced that a substantial tonnage of Australian lead would be sold to the United States, and while it was known that the quantity to be exported to Britain was unlikely to fall, it was nevertheless expected that the price for supplies to Britain would be brought more into line with the world level. The new British lead price, like other base metal prices, has been higher than the corresponding New York quotation, but the purchase price still appears to be a little below the world level.

World output of all the base metals continues to expand, notwithstanding the strikes in the United States and Mexico which have caused a temporary stringency in lead supplies in the western Hemisphere in recent months. But world production is still inadequate to cover consumers' requirements, particularly as the new defence programme comes into operation in America. So long as American consumption remains at its current high level, there is little chance of a break in metal prices.

It might be unwise to read too much into the Ministry of Supply's policy of adjusting domestic non-ferrous metal prices, yet it would seem to confirm the belief that the Ministry buys its supplies from sterling sources on short-term contracts of three to six months, and, moreover, that it is now attempting to keep British metal prices in line with trends on the world market from quarter to quarter. If this inference is correct, metal consumers, by watching international price movements will in future have a shrewd idea of what changes may be made in British prices.

* * *

The Movement of Wages

As was generally expected, shipbuilding and repair workers are to receive the same wage increase as the engineers, and in their case also this takes the form of an addition of 5s. a week to the national bonus. Some 200,000 workers, it is estimated, will benefit. The unions' claim, which was for an increase of 15s., was originally to have been heard by a special Court of Inquiry, but after the engineers' acceptance of the Forster award, it was sensibly decided to reopen direct negotiations instead. Last week's agreement is the result. Despite the shop stewards' agitation and threats of strike against the award (which are roundly condemned in the current *Journal* of the Amalgamated Engineering Union) there has in fact been very little disturbance in the workshops.

Several other wage claims are now pending. Negotiations are being opened on the wages of women engineers (who have a clear case for improvement); the railwaymen are next week to hear the Railway Executive's reply to their demand for an increase of 12s. 6d., and the Agricultural Wages Board will meet early in November to decide on the farm workers' claim for a substantial increase. Thus, by the time the special conference of trade union executives meets on November 18th, considerable additions may well have been made to the national wages bill, driving further nails into the coffin of the White Paper on Personal Incomes.

Denmark's Debt to Britain

The British and Danish governments have agreed to an arrangement for funding the £22 million debt owing by Denmark to Britain. This arrangement took effect from October 1st, the date to which the European Payments Scheme is being antedated. The funding agreement must be regarded as incidental to the European Payments Plan, the intention being to remove this accumulated debt from the intra-European clearing which is about to begin. A sum equivalent to the £22 million is to be placed in a special account in the Danish National Bank and will bear interest at ½ per cent per annum. The debt is to be gradually repaid out of the proceeds of current trading transactions and the intention is to arrange the bilateral trade between Denmark and the sterling area in such a manner as to wipe out the amount outstanding within a period of four years. A number of similar funding or "consolidation" agreements are likely to be announced in connection with the coming into force of the European Payments Scheme.

SECURITY PRICES AND YIELDS

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (a) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) To latest redemption date. (m) 15 months. Yield Basis 25%. † Free of tax.

Shorter Notes

In pursuance of Rule 113 of the Stock Exchange the Council have fixed October 8, 1948, as the official date of the drawings of Maremmana Railway 5 per cent 1862 bonds, which were drawn in Rome between 1940 and 1946. The numbers of bonds drawn in this period have now been made known in this country. Dealings in these numbers were resumed this week up to Thursday, the final date for dealings.

*

An agreement, recently ratified by the National Joint Council for the Building Industry, which came into force last week, provides for the extension of the guaranteed week for building operatives. Hitherto the guarantee has only operated where time has been lost through bad weather, and the operatives have for some time been pressing for its extension. They have obtained only a part of the full guaranteed week of 44 hours which they sought. Under the new agreement, an operative will receive a minimum payment of 32 hours a week, if he is prevented from working by the weather or by plant breakdowns, material hold-ups or other causes outside his control. On his side, he will be expected to present himself for and remain available for work, and "be willing to perform work in another building operation of which he is capable."

*

A shorter note on September 25th may have given a misleading impression about the exemption of shipping companies from disclosure of certain reserves. Exemption is not an automatic right; it is granted by the Board of Trade only after application is made and the conditions of the Order are satisfied.

*

The clearing banks' Treasury Deposit receipts increased from £1,322.5 million in August to £1,344.5 million in September, that is by £22 million and not by £12 million, as stated in *The Economist* last week. Cheques in course of collection and items in transit did not fall by £1,635,000, as was stated, but rose by £8,305,000.

COMPANY MEETINGS

THE MERCANTILE AND GENERAL REINSURANCE COMPANY, LIMITED

INCREASED ACTIVITY IN EVERY BRANCH

Mr RICHARD GUINNESS'S SPEECH

The annual general meeting of the Mercantile and General Reinsurance Company, Limited, was held, on the 14th instant, in London, Mr Richard S. Guinness (chairman of the company) presiding.

The Chairman, in moving the adoption of the report and accounts, said:

The accounts submitted for your approval show increased activity in every branch; I wish I could add that this activity carries with it commensurate earnings, but 1947 will be remembered as a most difficult year, not only for world-wide British insurance, but also in every insurance market.

FIRE AND MISCELLANEOUS ACCOUNTS

The premium income on fire and miscellaneous accounts totals £2,136,215. As this premium income increases, it is the constant endeavour of our management to see thereto that these premiums are garnered from many countries so that the laws of average may prevail. Unfortunately, in 1947, these laws have not prevailed, with the result that our fire and miscellaneous account, after provision for all outgoings and for £180,911 increased reserve for unexpired risks, calls for a transfer of £97,719 from profit and loss account.

ADVERSE FACTORS

There are many contingencies that have brought about these adverse results. The havoc of war has left behind serious deterioration in fixed property and industrial equipment; buildings and contents have become less stable and must remain in bad repair for lack of labour and materials; fire protection has in consequence become more difficult and, above all, the normal hazard has greatly deteriorated in every sense. In a period of inflation the costs of replacement become more and more disproportionate to the volume of premium income. The result has been that fire losses have been excessive, motor claims far above the average both in number and amount; burglary, particularly in Great Britain, also theft, more prevalent. Premiums deemed equitable hitherto have proved woefully deficient and in consequence heavy losses have fallen upon both insurers and reinsurers. This unhappy situation will call for skilful adjustment on revised bases equitable both to the insurer and to the insured.

MARINE BRANCH

I am glad to state that the marine branch has enjoyed more favourable results with a net premium income of £73,995 for 1947 account, to which is added £59,486 in respect of previous years, giving a total premium income of £133,481. After meeting all claims and charges, a balance of £174,854 remains in the fund after transfer of £37,284 to profit and loss account in respect of the years 1943 and 1944 now closed.

LIFE ACCOUNT

The life account has again shown great vitality; this important branch has been cautiously built up over a period of years, and it is gratifying to note that the life assurance fund at £1,093,854 has passed the million milestone. Mr Foster, F.I.A., our actuary, and his assistants combine prudent selection with expert service, with the result that our reassurance facilities for the life account meet with ever-increasing demands; a valuable contribution to the general effort to stimulate British insurance and reinsurance in all quarters of the globe.

The United States, South America, Australia, New Zealand and India have been visited by our general manager or by his assistants, old friendships have been cemented and new relations established which we will strive to maintain by efficient co-operation. I am sure that the shareholders will join in expressing appreciation to the management and staff; it has been a year of strenuous effort under difficult conditions.

THE DIVIDEND

The dividend proposed is the same as in recent years, viz., 5 per cent., free of tax.

Mr H. P. Hewitt, who has so ably filled the post of secretary since 1919, has retired. Mr Richmond, hitherto assistant secretary, has been appointed in his place.

Sir Richard Nosworthy has nominated Mr Hewitt as his alternate on the board, a suitable recognition of his valuable services which will thus continue available to us.

Mr Owen Hugh Smith has resigned his seat on the board after thirty-two years' service. I am sure the shareholders will join his colleagues in an expression of thanks for his long service and regret at his resignation. Mr Hugh Kenneth Goschen has been co-opted to fill the vacancy.

I beg to move the adoption of the report and accounts now before you and the declaration of a dividend of 5 per cent. per annum, free of income tax, for the year 1947, upon the paid-up capital.

The resolution was carried unanimously.

The retiring directors were re-elected, the auditors re-appointed and the proceedings terminated with a vote of thanks to the chairman.

GENERAL CEYLON RUBBER AND TEA ESTATES, LIMITED

HIGHEST PROFITS SINCE 1942

The 51st annual ordinary general meeting of this company was held, on the 12th instant, in London, Mr J. Gilroy Annan (the chairman) presiding.

The following is an extract from his circulated statement:

It is with pleasure that your board report an increase in profits for the year 1947, which, at £59,534, before making provision for taxation, are the highest since 1942. The tea crop of 2,533,999 lb. is the largest since 1920 with the one exception of 1942, when some 33,000 lb. more were harvested. The rubber crop on the other hand shows a decrease and is the lowest for seven years past, but this is only to be expected since the areas slaughter tapped under the Government Capital Compensation scheme were in the

main out of production, while the remaining rubber areas intensively tapped during the war years received a much needed relief by a less intensive method of tapping.

Your directors recommend the appropriation to general reserve of £5,000 and the writing off of £3,000 from expenditure under the capital compensation scheme. When subjected to tax at the standard rate, the proposed gross dividend of 6½ per cent. closely approximates the average net distribution over the 6 years to 1944 after adjustment of Dominion income tax relief. A dividend of 6½ per cent. on the nominal capital represents only 4.2 per cent. on the true capital employed.

Up to the end of July in the current season there have been harvested 1,559,112 lb. of tea and 623,221 lb. of rubber which compare respectively with 1,606,301 lb. of tea and 652,560 lb. of rubber for the corresponding period of 1947.

The report was adopted.

METAL TRADERS LIMITED

DIVIDEND MAINTAINED

The twenty-eighth ordinary general meeting of Metal Traders, Limited, will be held at the registered offices of the company, 7, Gracechurch Street, London, E.C., on the 26th instant.

The following is the statement by the chairman, Mr Frank L. Baer, circulated with the report and accounts:

Our accounts are presented in the form required under the provisions of the new Companies Act which has recently come into force, and comparative figures for the preceding year are shown in the balance-sheet of Metal Traders, Limited.

It is a great satisfaction to your board that the results for the year under review have allowed us to recommend the same dividend as for 1946-47. In this connection, although the dividend is 250 per cent. on the issued capital, taking into account the reserves and carry-forward, the dividend is in fact less than 20 per cent.

Metal Traders Inc. — The directors of Metal Traders Inc. decided to capitalise their surplus assets by issuing one share for each existing share, with the result that we — Metal Traders, Limited—now hold 10,000 shares of 50 dollars each. No addition has been made in our balance-sheet in respect of this issue of shares, the investment continuing to be carried at cost. Such cost figure is very substantially less than the directors' valuation of the shares at the present time.

Our New York friends continue to do a profitable business in many parts of the world, some portion of which in the past was taken care of from here, and in consequence such profits now accrue to New York instead of London.

L.P.C. Lead Pigments and Chemicals, Limited.—As foreshadowed a year ago, the issued capital has been increased. The company continues to trade with excellent results.

Brookside Metal Company, Limited.—There is no change in the capital structure of this company, whose activities in the scrap metal business fit into and, indeed, complement our trade in virgin metals.

The Metal Exchange remains closed. There is nothing which I can usefully add to the announcements which have appeared in the press from time to time regarding the negotiations with the Government.

Mr. Walter O. Stern, who has been an active member of the management for over 20 years, has been elected to a seat on the board. A resolution will be submitted at the forthcoming general meeting to confirm this appointment.

Statistical Summary

GOVERNMENT RETURNS

For the 9 days ended October 9, 1948, total ordinary *revenue* was £64,898,000, against ordinary expenditure of £75,163,000 and issues to sinking funds £441,000. Thus, *including* sinking fund allocations of £8,670,000 the surplus accrued since April 1st is £242,310,988 against £206,612,548 for the corresponding period a year ago.

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with limited liability).—ONTARIO AND QUEBEC RAILWAY COMPANY FIVE PER CENT. DEBENTURE STOCK. SIX PER CENT. COMMON STOCK.—In preparation for the payment of the half-yearly interest payable on December 1st next, the Debenture Stock Transfer Books will be closed on November 1st and will be reopened on December 2nd. The half-yearly interest on the Common Stock will be paid on December 1st to holders of record on November 1st.—R. F. TREMAYNE, Deputy Secretary, 8 Waterloo Place, Pall Mall, London, S.W.1. October 8, 1948.

MERCHANT VENTURERS' TECHNICAL COLLEGE, BRISTOL

DEPARTMENT OF COMMERCE

Resulting from promotions, two vacancies for full-time Lecturers occur, for which applications are invited.

(1) A graduate Lecturer in Statistics (including Mathematics) and Economics.

(2) A graduate Lecturer in Economics and Economic History.

Both posts will carry responsibility allowance additional to scale salary in the case of suitably qualified and experienced applicants. The basic salaries will be in accordance with the Burnham Technical Report, in which previous teaching and industrial experience will be taken into account in fixing the scale position.

(Basic Scale, £300 by £15 to £555, plus £30 graduate allowance, plus any allowances as above.)

Forms of application and further particulars obtainable on application to Registrar, Merchant Venturers' Technical College, Bristol.

ANDREW ROBERTSON, D.Sc., F.R.S., Principal.

APPLICATIONS are invited for an appointment in an industrial organisation at a salary of between £850 and £1400, according to experience and qualifications. Work will consist mainly of research in economic, industrial and sociological problems. Applicants should possess a university degree and should have wide knowledge of and interest in current affairs. Qualifications or experience in economics would be valuable, but the chief requirement is a capacity for critical analysis and clear thinking. Age should preferably be between 30 and 40. Applications stating age, education, qualifications and full particulars of experience should be sent to Box 855.

TO COMPANY DIRECTORS.—Is a substantial Company or Trade Organisation interested in a top-level executive? At 33 years of age he earns £2,000 p.a. as Director-Secretary of a national Trade Organisation. Noted organiser, ten years' varied experience Boards of Directors, Public Relations, Government Departments, Trades Unions. Honours professional qualifications, but technical training and knowledge are only the background to unlimited horizon. This is the right man for a "big job" ensuring financial return commensurate with responsibility and prestige.—Box 854.

POSITION open Book-keeper Cashier, Timber Exporting Company, Lagos, Nigeria. Must be conversant with costing system, able to supervise expenditure and deal with African staff. Willing travel up country. Commencing salary £800 p.a.—Box 852.

URGENTLY required. Coaching for Logic Intermediate Examination. Write Box 847.

M.A., 2nd Class Hons. Econ., 4 languages, seeks post.—Box 856.

FOR SALE.—The 1946-48 Edition of Keesings' Contemporary Archives. Excellent condition. £6 for quick sale.—Box 860.

NATIONAL NEWS-LETTER: Applications are invited for the post of Assistant-Editor. Age 30-40. Previous experience as leader writer or free-lance essential. Starting salary £800 p.a. Send full details in writing to Business Manager, National News-Letter, 62, Buckingham Palace Road, London, S.W.1.

The Enemy Within

IT is no mere coincidence that agreement over the first positive steps in European co-operation should have been reached in Paris last week-end at the very moment when the French coal industry had been brought to a standstill. The two events mark the clash of opposing aims—the one a constructive attempt on the part of the western European countries to seek their economic recovery through mutual effort and the assistance of the United States; the other a destructive campaign to cripple one of the weakest members of the group, to demonstrate the failure of Marshall Aid as a recipe for European recovery, and to dishearten and entice waverers into the Russian orbit. The fact is that Marshall aid is working; but equally it is a fact that the Cominform, which was recreated by the Soviet Union to fight the whole concept of western recovery with American assistance, is now fighting with the gloves off.

At the moment, the warfare is open only in France. But it is being pursued clandestinely and undeclared in other countries too. The jargon and dreary clichés of the Cominform newspaper should not be dismissed as ideological clap-trap. They are evidence in themselves, that the single-minded aim of Communism is to sap resistance, to weaken the forces of democracy as that word is understood in the west, to bore from within in every field of human activity. The Cominform makes no bones about these aims. Indeed, the results of Communist infiltration are plain enough to see, not only in France, but also in this country. The recent boast of the Cominform newspaper that "in a majority of the capitalist countries the Communist parties play a decisive role in the trade unions which number millions of members" is, for all its exaggeration, too near the truth to be comfortable. It is palpably true of the present predicament of France.

The question of Communist influence and leadership in the British trade union movement has now become an issue of first-class importance. What has happened in France could happen here, if Communist influence was sufficiently strong. There are signs that the fight for power has now been joined. Ten days ago, Mr Arthur Horner, who is secretary of the National Union of Mineworkers and is a Communist, told the meeting of the *Confédération Générale du Travail* in Paris that just as Russia had aided the British miners in their strike in 1921—to the extent, he claimed, of £1,000,000—so the British miners would support the French miners in their strike. This wholly unauthorised offer of support in a Communist-organised strike, designed to frustrate the part which France might play in European recovery, drew an immediate denunciation from Mr Will Lawther, the president of the NUM. Mr Lawther is, in Mr Horner's words, "a great proletarian who has been led astray"—*anglice*, he is not a Communist. So the National Union of Mineworkers has a president who is a supporter of European co-operation under the Marshall programme, a Communist secretary who has described the European Recovery Programme as "the American pattern for the reconstruction of Europe at the expense of the working class," and two Communist leaders in the important Scottish and South Wales areas. In all, there are four known Communists on the executive committee of the

NUM. Their presence has for some time past been an embarrassment, involving decision by majority vote ; at the moment, when crucial discussions are going on with the Coal Board and the Minister of Fuel and Power to inject a new sense of discipline and urgency into coal production, their policy could easily become one of positive hindrance.

But coal is by no means the only industry of vital importance in which Communist influence is significant. On the small national executive of the Amalgamated Engineering Union, there are two members out of seven who are Communists ; but the main influence in this union is exerted by the national organisers, of whom three out of four are Communists. The president and secretary of the Electrical Trades Union are both Communists, and both elected this year. In some unions, on the other hand, a few Communist candidates have failed to secure election to the executive committees in the past twelve months. Obviously, there is no question of Communist domination even in those unions where Communist influence is strongest among the higher officials. In that sense, the British trade union movement has succeeded in avoiding the Communist dictation which is at present holding the French industrial economy to ransom.

Yet Communist influence, though short of control, is certainly strong enough in these key unions to pursue guerilla warfare. So far, it has pursued a discreet line. It has stopped well short of direct action, even where, as in the recent awards for higher engineering and shipbuilding wages, conditions seemed fertile for some effective trouble-making. But that can be credited to nothing more than tactical expediency. The economic state of Britain is very different from that of France, and the authority of the Trades Union Congress is, on the whole, supported by the broad mass of the eight million members of its affiliated unions. It is presumably on the calculation that the time was not yet ripe that Mr Horner had not declared in this country what he was moved to say in Paris ten days ago.

Now that open controversy has broken out between Mr Horner and Mr Lawther, the decisive trial of strength in the unions can hardly be delayed much longer. It is useful to try to define a little further the extent of the field over which the battle will have to be fought. The Iron and Steel Trades Confederation is anti-Communist, though the Amalgamated Union of Foundry Workers (whose secretary is now in Budapest, with officials from two other unions, attending the meeting of the Hungarian trades unions) is more sympathetic to the Communist viewpoint. Nor is the influence of Communist ways of thought unduly strong in the counsels of the National Union of Railwaymen—though traces of it can certainly be found. The Transport and General Workers Union has eight Communists on an executive of 38, compared with 9 out of 34 seats a year ago. Except in the docks, the stewards and organisers of the union, however, seem to be less affected by Communist influence than those of some other unions, like engineering. In building, the president of the union is a Communist, and there are Communist members on its regional councils. In the textile, footwear, pottery and hosiery unions, Communist influence is negligible, but it has grown in the distributive trades and in clothing, and in the professional and non-manual organisations, the effect of Communist influence is out of all proportion to their size.

What effective measures can be taken to end the equivocal position of Communist union officials ? The TUC has always disclaimed any right to intervene in the domestic affairs and government of its affiliated unions. It is a Congress, not an executive federation. It has rested on the assumption that the democratic system of trade union government was proof against the emergence of forces inimical to the aims and aspirations of organised labour. Unfortunately, this bulwark of strength—as it should be—has been neglected by the indifference and gullibility of large numbers of trade union members. The Communist forces have been more energetic, better organised, and uninhibited by scruple. They have used their small but active minorities to gain possession of large areas of the heritage of trades unionism in this country.

Thus, the doctrine of non-intervention on which the TUC has hitherto been disposed to rely is now becoming out of date. It has to find some means to the effect that Communist influence or control may exploit the power of the unions in ways which are inimical to the broad interests of their members, which are opposed to the policy of a Labour Government which the TUC, to its credit, has been ready to adopt, and which are designed to further the spread of Communist disruption in the west in the interest of Russian policy. Its present difficulties are not to be underestimated, for the risks to the trade union movement—to say nothing of the risks to the further progress of economic recovery in Britain—are great. But now is the time for the TUC to find its voice. It must point out the dangers which trade union members are running by failing to vote for officials of their true choice. It must get rid of the idea that Communist influence in the unions is an old problem which will somehow solve itself. Today, it is a new and urgent problem. With the spectacle of France, prostrate and enfeebled, before them, the truly democratic forces in British trades unionism have a horrible example of what could happen here, unless they bestir themselves to fight for their rights.

India—A New Great Power

DISCREETLY, and with circumspection, some of the Dominion Prime Ministers approached last weekend the problem of defining afresh the constitutional relations which hold old and new members of the Commonwealth together. With Mr Nehru away in Paris, they explored the issues raised by Eire without losing sight for a moment of the fact that they might arise, too, with India. Chequers was the appropriate place for such delicate probing, but it must be expected that the operation will soon pass to the Cabinet Room in Downing Street and from there to Parliaments. Until more is known of the Indian attitude it would be premature to discuss its pros and cons ; but there is one thing which should be clearly understood now, before public debate begins. It is that India is now a Great Power in Asia ; that if it stays in the Commonwealth, there will be an unprecedented partnership between the leader of western Europe and the possible leader of Asia ; that the power to be exercised by each will be deeply affected by the nature of the tie between them and between India and Pakistan. That Britain and India have vital interests in common is clear ; what is less obvious to many is the ability of India, whether as a Dominion or as a state outside the Commonwealth, to advance and defend those interests.

In the last four years two great events have occurred which have abruptly and radically transformed the prewar balance of forces in Asia. The first was the utter defeat of Japan and its disappearance as a Great Power; the second was the departure of the British Raj from India after a war which had apparently left its control intact. Almost equally important was an event which was hopefully expected, but failed to occur: the emergence of a strong and united China as the main factor of peace and stability in the Far East—a possibility which was recognised in advance by the inclusion of China as one of the five permanent members of the Security Council of Uno. Today, with Japan prostrate and China torn with devastating

civil war, the Far East is a zone of weakness and instability, and the intervention of the United States can only to a limited degree compensate for the lack of self-relying strength or order in either country.

The collapse of Japan has been in a certain sense a defeat for Asia, since a Far Eastern Great Power has been eliminated without being replaced by another, and the whole region has become exposed to the rivalries of external forces. The transfer of power in the Indian sub-continent, on the other hand, has been a signal success for Asia, since two Asiatic nations have replaced European rule over a vast area, without dissolution or breakdown of the apparatus of government which they have taken over.

*

It is not easy in this country to make the mental readjustment required to think of India as an independent power playing a leading role in world affairs. The extent of Indian industrialisation during the last twenty years, the numbers of Indians acquainted in some degree with modern technology, and the fund of financial, administrative and organising ability in India, are also still inadequately recognised. The British built in India more solidly than they knew, and the teacher's proudest hour should always be when his pupil is able to do without him. Whatever India has learnt from Britain has been so well learnt that it has been able to emerge as a modern state, with an administration and an economic structure unrivalled among eastern countries.

The former Indian Empire has been reconstituted as two states, one with a population of well over 300 millions and the other much smaller, but nevertheless about as populous as the United Kingdom. The disparity in population between the two units is accentuated by the contrast of industrial potentials, for India is heir to all the principal industrial areas developed before partition. By the tests of man-power and industrial capacity, therefore, India is in a different category of strength from Pakistan, and even by itself can qualify for the rank of a Great Power. On the other hand, Pakistan is better off than India as regards food supplies and is also better furnished with exportable surpluses for the world market. Further, Pakistan holds the north-western mountain keys to the Indo-Gangetic plain, and is thus responsible for the defence of India as well as of the most vulnerable land frontier of the sub-continent. It follows from these facts that India and Pakistan are interdependent to a high degree both economically and strategically, and that India's status as a Great Power must vary according to the state of its relations with Pakistan. The two nations in close co-operation can be extremely strong ; but as long as relations between India and Pakistan are those of hostility and suspicion, India will be vulnerable to all kinds of untoward events.

Theoretically, perhaps, India might achieve a re-unification of the sub-continent by military conquest or coercion of Pakistan. In fact, whatever the economic and strategic gains, India would pay too high a price in political weakness by the forcible incorporation of so large a reluctant minority—as it would have done also if there had been no partition. Apart from outright conquest, the only way for India to achieve a working equivalent of the former Indian unity is by a good understanding with Pakistan, which means in the first place a reasonable settlement of the Kashmir dispute. There can be no amity between Karachi and Delhi as long as the deadlock in Kashmir remains unresolved. Whatever the past merits of the quarrel, India can now afford to be generous ; it has so clearly demonstrated its military efficiency in the campaign against Hyderabad that it has no need to keep up the fight in Kashmir merely for the sake of military prestige. If a settlement were once reached there no territorial issue between India and Pakistan would remain and the way would be open for real co-operation. If India and Pakistan can work together, they can not only assure peace to the whole vast area formerly ruled by Asoka, by Akbar and by the British Viceroys ; they will also exert a powerful influence for stability both in the Middle East on the one hand and in South-East Asia on the other. Their joint interests are bound to extend their horizons both west and east of the Indian sub-continent. Not long ago there was hardly a politician in India who was actively concerned about the country's external interests; all attention was concentrated on domestic affairs and on the struggle for national independence ; foreign affairs remained under British direction up to the final transfer of power, and it was fashionable to regard the North-West Frontier almost as a British invention. Now that independence has been achieved, the new governments of India and Pakistan are quite well aware that they have to guide the destinies of their countries in a world of great strains and stresses which can affect the regions close beyond the Khyber or east of the Bay of Bengal. Nor are they unaware of their countries' dependence on supplies of food, oil and other essential commodities from nearby countries — an interest which must cause them to keep a very sharp eye on what happens in Burma, Indonesia or even Iran. Pakistan, as a Moslem state, has also a special interest in the fate of all Moslem countries, and therefore of the Middle East as a whole ; and India also has an interest in the independence of the states which can serve as buffers between India and the Soviet Union.

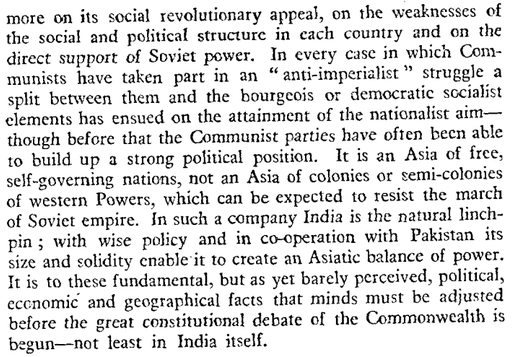
As a factor of resistance to, and "containment" of, Russian expansion India is of immense potential importance precisely because of its own inherent strength, as distinct from the aid which can be given to it from outside. Without the strength and cohesion of India, there would be a great danger of a Russian expansion all over Asia, because of the absence of any effective resistance by the Asiatic states themselves. The Russians have a large population of their own in Asia, strong military forces available on the spot, and their Communist fifth columns in each country; against such pressure in the largest of the continents neither Britain nor the United States can do much across intervening oceans, unless factors of real power are working for resistance within Asia itself. No expenditure of dollars, no military missions can build barriers out of states rotten with corruption, lacking the essentials of a modern economy or torn with internal faction. That lesson is being learnt in the Middle East. India, however, possesses not only great man-power and resources but also a relatively advanced administrative and economic apparatus, directed by men of notable ability and energy; it can stand on its own foundations in defence of its independence, capable of using effectively whatever assistance may be forthcoming from elsewhere.

*

It has now become customary to refer to the ideological and national conflict between the Soviet Union with its satellites and the nations of western Europe and North America as a struggle between east and west. The identification of Russia with the east gives rise to highly coloured passages of political rhetoric, as in the statement that the frontier of Asia is on the Elbe. The Asiatic element in the Russian population and culture has indeed always impressed west European observers. Yet, to the peoples of Asia, Tsarist Russia was simply one of the European powers expanding into Asia. To the traditionally minded Hindu, Moslem or Confucian, Tsarist Russia was one of the Christian nations with no part or lot in his own cultural heritage. On the other hand, to the young Asiatic eager to acquire western knowledge and ways of thought for modernising his country, Tsarist Russia was never the model ; for it was regarded as "backward" and it was from the most advanced western nations that the innovators desired to learn. Thus it

came about that the Russian language never spread in Asia beyond the limits of the Russian empire. French became the auxiliary language from the Mediterranean to Persia, while England became the principal medium of western cultural influence, not only in India, where Britain ruled, but also in China and Japan. Today, in spite of the attraction which Communism has for a section of the *intelligentsia*, the bulk of the educated classes throughout the zone of independent countries south of the Soviet Union—from Turkey to Japan—have closer cultural ties with the nations of North America or of Western Union than with Russia.

In so far as Soviet Russia has succeeded in gaining an ascendancy of influence in Asiatic countries, it has been by championship of nationalist movements against the sovereignty or privileges of western nations. But now, with independence gained, nationalism strives to preserve itself against new subjection from whatever quarter, and Communism must rely more and more on its social revolutionary appeal, on the weaknesses of the social and political structure in each country and on the direct support of Soviet power. In every case in which Communists have taken part in an "anti-imperialist" struggle a split between them and the bourgeois or democratic socialist elements has ensued on the attainment of the nationalist aim—though before that the Communist parties have often been able to build up a strong political position. It is an Asia of free, self-governing nations, not an Asia of colonies or semi-colonies of western Powers, which can be expected to resist the march of Soviet empire. In such a company India is the natural linchpin; with wise policy and in co-operation with Pakistan its size and solidity enable it to create an Asiatic balance of power. It is to these fundamental, but as yet barely perceived, political, economic and geographical facts that minds must be adjusted before the great constitutional debate of the Commonwealth is begun—not least in India itself.



Air Lift to Berlin

THE air lift is like a knight's move in a game of chess; it enables the west to hold its position in Berlin by jumping over the opposing pieces which threaten it. So far it has achieved spectacular results, but five months of winter and bad weather lie ahead. If the air lift should fail, or if it should have to be substantially reduced, Mr Bevin, Mr Marshall and M. Schuman would find themselves where they were four months ago. They would have to face again the urgent dilemma either of having to use force to break the blockade, with the possibility of starting a war, or of having to withdraw from Berlin, with the certainty of encouraging fresh demands from Moscow. Moreover, there would then be no third choice.

The immediate question is, therefore: can the air lift be maintained? In particular, can it survive the fogs, frosts and blizzards of the next four or five months? The experts believe that it can. They base their belief first on the increasing efficiency of the air crews and flying control staffs—the average weight of loads carried is now roughly 4,300 tons per day; second, on the extensive use of radar and navigational aids, combined with the opening in December of a third airport at Tegel in the French sector; and third, on the flexibility of the organisation—what is lost due to bad weather on one day can be made good by increasing the scale of the operation on the following days. They point out, too, that the present scale of the air lift has enabled the Allied authorities in Berlin to build up substantial reserves which are there to be used if persistent bad weather should seriously interrupt the flow of supplies. From June 28th, when the air lift began, until the end of last week, British and American aircraft together had flown more than 300,000 tons of food, coal and other goods into Berlin.

The air lift has been and is a remarkable achievement—certainly the most remarkable of the western "cold war" effort. It was originally meant to do no more than supply the western garrisons in the city; almost immediately after it started, its scope was extended to include the German population as well. It was also originally meant to be no more than a short term measure; now it has been developed to cover plans for supplying the western sectors of the city for several months ahead. From concentrating at first solely on food, the air lift now includes coal, industrial equipment and consumer goods; whereas in the beginning it only catered for imports into Berlin, it now brings exports out of the city and has gone some way towards restoring the flow of trade. From makeshift beginnings, it has become the biggest air transport operation ever attempted.

The record of the air lift stands, in fact, as a monument to the Anglo-American genius for improvisation. When the British and American Governments first envisaged the supply of Berlin by air, they thought that it would last only a month at most. Even when that month had passed, it was still continued on a day-to-day basis. It was not until the Moscow talks failed at the end of August, two months after the air lift had begun, that long term plans were laid. In the early days, the officers who were organising the operation—then operation "Carter Paterson"—were given no figure of the daily tonnage required; they simply provided as much as the aircraft at their disposal could carry. Co-ordination between the Royal Air Force and the United States Air Force was loose and informal; civil aircraft—notably the "Flying Tanker" of

Flight Refuelling Limited—were hired on a weekly basis; air crews got little rest and less leave; and the flying control organisation creaked under the strain.

At first nearly every serviceable aircraft belonging to Transport Command of the RAF was sent to Germany; but experience soon showed that, taking into account the limitations imposed by the loading airport at Wunsdorf and the unloading facilities at Gatow, a smaller force more intensely operated would produce better results. As the operation got under way, the numbers of aircraft and of their return journeys per day were increased. The new runway at Gatow was completed, and additional airports were brought into use at the loading end. Skilled mechanics were sent over from the home commands, and the release of RAF tradesmen and aircrews was deferred.

It was obvious from the beginning that the limiting factor would be the number of aircraft which could land on the Berlin airfields. The Western Powers possess only three air corridors, each twenty miles wide, through the Russian zone. They run from Hamburg, Bückeburg and Frankfurt to the Berlin control area. To reduce congestion, aircraft are routed into Berlin by one corridor and out by another. The flying control organisation has also been simplified until it is now possible to accept one aircraft every three minutes at Gatow during daylight. At night the gap is necessarily larger and the theoretical maximum is 480 aircraft per day; the practical limit seems to be between 440-450 aircraft per day. Tempelhof airport in the American sector is being brought up to the same standard as Gatow, and when the new airport at Tegel in the French sector is ready, the practical limit in good weather will be more than 1,000 aircraft per day.

Since the number of aircraft which can be accepted in Berlin is limited, the weight which each aircraft can carry is of great importance. The York and the Skymaster carry nearly twice as much as the Dakota. From the point of view of capacity, therefore, four-engined Yorks, Skymasters and other big aircraft only should be used. But the Yorks were never designed for such short and frequent journeys and, as a result, the British have been obliged to retain the otherwise uneconomical Dakotas for the air lift. The Skymaster, however, is showing itself to be well up to the high standards required, and the Americans are steadily increasing the number available.

★

The British share in the air lift has been out of proportion to both Britain's resources and its commitments abroad. Although now British aircraft are bearing less than a third of the burden of the air lift, in the beginning they took an equal share with the Americans. Even the present figure is misleading, as the proportion is calculated by weight of the cargoes carried rather than by volume. The Skymasters operating from the British zone carry coal, which is easily loaded and unloaded. The aircraft touch down, unload and take off again in a matter of thirty minutes. The British aircraft, the Yorks and Dakotas, carry bulky cargoes of miscellaneous items ranging from textiles to potato crisps, which are neither so heavy as coal nor as easy to stow and unload. The weight carried and the speed of the turn round of British aircraft are therefore both less than the American, though the effort is nearly the same.

Moreover, Britain's commitments abroad are greater than those of the United States. Transport Command of the RAF is responsible for keeping open the trunk routes to most of the eastern hemisphere. Their chief duty is to be ready to deal with emergency transport operations in an area of the world where emergencies like the frequent terrorist campaign in Malaya are all too frequent. The air lift to Berlin has meant that these commitments have had to be slightly reduced. In the present state of world affairs the reduction cannot be acceptable for long.

The situation is improving. The different proportions borne by the two countries have become less important than the total scale of the air lift. American aircraft are now using airfields and administrative facilities in the British Zone, taking advantage of both the shorter journey to Berlin and the better flying control organisation; an American officer has been put in charge of the whole operation with a British officer as his deputy and in charge of the air arrangements in the British Zone. Slowly and empirically, a better arrangement is being evolved—the Americans providing more men and aircraft, the British providing the majority organisation and facilities.

Much still remains to be done. The differences between the American and British style of doing things is the same as that with which British troops became distressingly familiar during the war. With men and money to spare, the Americans have been lavish. Each American aircraft is attended by three crews and 30 maintenance men. Each aircrew makes only a few consecutive return journeys and is then able to relax in the mess while its colleagues take over. The British are not so fortunate. They have, proportionately, only half the number of air crews per aircraft; their quarters are less luxurious; leave is less frequent. The inclusion of air crews from Australia, New Zealand and South Africa has done much to relieve the strain, but a greater reduction in the British effort with a corresponding increase in the American is necessary for the long term programme now in progress.

Civilian commentators have from time to time expressed doubts of the ability of the British and American air forces to continue operating in bad weather. So far these doubts have not been justified. On two days last week, for example, there was fairly thick fog over Berlin. The reduction in the air lift during those two days was even less than had been expected—the load carried amounted to approximately two-thirds of the normal. There have not so far been enough days of bad weather to come to any hard and fast conclusions, but the results on those days have fully borne out the experts' hopes that the effect of winter should not be very great.

The men and the machines working in the air lift bear a heavy responsibility. It is the confidence in their ability to continue operating under any conditions that is the mainstay of the West's refusal to negotiate with Moscow under duress. They have undoubtedly impressed the Russians and they may have made them think again before embarking on any more offensives against the West. But the air lift can never be more than a temporary substitute for a constructive policy. For, though it may be cheaper than war, it is too expensive to be continued indefinitely in peace.

Self Help and Charity

LORD BEVERIDGE, originator of the most comprehensive social security scheme the world has yet seen, has written another report* designed to show that a scheme run by the state is not enough. There is not only scope for "voluntary action" in the social service state; there is an urgent need for it. Thus does Beveridge the Third meet the main criticism of Beveridge the First—that the "national minimum" would kill the spirit of voluntary service and voluntary effort which have given this country so much in the past.

The voluntary principle is indeed as peculiar a feature of life in Britain as are its political institutions. Nowhere has voluntary service so triumphantly blazed the path of social reform. Nowhere has co-operation between the state and voluntary services been so close—with the result that the state has often used a voluntary organisation to carry out an essential public need. All this has been said many times before. The feature of the new Beveridge Report is that it dissects the vast hotch-potch of voluntary effort, classifies it and shows what part each form can play in the social service state.

The term voluntary has itself changed its meaning over the years. Formerly a voluntary organisation was one in which the workers were unpaid. Today a voluntary organisation is something independent of public control, irrespective of whether its workers are paid or not. A voluntary hospital before July 5, 1948, was not less a voluntary hospital because its medical staff received salaries or sessional fees. Nor was it less a voluntary hospital because it put beds at the disposal of the local authority in return for payment. It was a voluntary hospital because it was not under public control. The essence of voluntary action is that "the agency undertaking it has a will and a life of its own."

Within this definition, Lord Beveridge shows that voluntary action may be inspired by two main motives—mutual aid and philanthropy. Mutual aid grows from the realisation that by pooling needs and undertaking to help others in misfortune one helps oneself. Philanthropy springs from social conscience. The most obvious examples of voluntary action inspired by mutual aid are the friendly societies (the friendly societies proper, not the industrial assurance companies which called themselves friendly societies after the national health insurance act of 1911) and the trade unions. Philanthropy has taken many forms and produced an extraordinary variety of institutions and organisations ranging from Dr Barnardo's Homes and the Boy Scouts to the British Drama League.

Social legislation since the war has encroached upon both fields of voluntary action. The national insurance scheme provides a basic minimum income in the event of sickness, accident, death and unemployment, and also for old age. The national health service has put an end to one of the biggest examples of voluntary action—the voluntary hospitals—and by providing a comprehensive service to treat all forms of sickness, disability and their after-effects seems to have made many forms of philanthropy unnecessary. The Children Act impinges on the work of the philanthropic organisations for homeless children. The National Assistance Act obliges the local authorities to enter a field which hitherto voluntary action has made peculiarly its own—the provision of homes and hostels for old people.

Yet Lord Beveridge is right to claim that the need for voluntary action still exists. The recommendation in his first report that the state should provide a uniform flat rate of benefit to subsistence level was intended to leave untouched "the freedom and the responsibility of the individual citizen in making supplementary provision for himself above that level." Although fears were expressed during the passage of the National Health Service Act about the future of the hospital contributory schemes, which were designed to provide the treatment now to be given free by the state, many of them still continue for new purposes. There may not be a need for mutual aid to the same degree that existed before July 5, 1948. If by national insurance an income sufficient for subsistence is forthcoming in sickness, unemployment and old age, it may no longer be necessary for people to make supplementary provision for themselves. But that many will want to do so cannot be denied.

*

The need for philanthropy is well established. Lord Beveridge cites numerous cases where individuals have fallen through the uniform mesh in the net of the social services, most of them suffering from some physical handicap. Any service provided by the state tends to be stereotyped; it must be defined, to prevent its wrongful use, and it must be standardised, for convenience of administration. The best system cannot exactly meet individual needs. In fact, the very encroachments of the state in the field of social service have led to a new form of philanthropy—the citizens' advice bureaux, originally established on the outbreak of war, but still fulfilling a need today. The seventeen bureaux maintained in London deal with 8,500 inquiries a month. Many of them are concerned with a citizen's relations with his fellows—like marriage difficulties or getting rid of a difficult lodger—but a great many are concerned with his relations with authority, and the bureaux may have to take up his case with, for instance, the housing authorities or the pension authorities. The essential feature of the citizens' advice bureaux is that they are independent; if they were another department of the local authority or the central government, they could not fulfil the same need.

But if the need for voluntary action, inspired by both motives —mutual aid and philanthropy—can be taken for granted, what of the environment in which it has to work today? The state does indeed pay lip service to voluntary effort. Even such an advocate of state action as Mr Bevan has said that voluntary service is still wanted, not to compete with the national service, but to see "where the shoe pinches." He told the British Hospitals Contributory Schemes Association, early this month:

> We want the voluntary spirit to reach out to new fields and endeavours and to show the Governments of the future where they should also come and make available to everybody what your vision has sought out for the few.

Unfortunately the state's attitude to voluntary action is inclined to consist, as Lord Beveridge says, of warm words and cold comfort. There is no need to argue once again the rightness or wrongness of the decision to divorce the friendly societies from the administration of national insurance. Whether right or wrong—and Lord Beveridge, whose report has been written at the request of one of them, is convinced it was wrong—it was clearly a blow at the voluntary principle. The restrictions under which housing societies operate, and the provision in the Finance Act of 1946 restricting the benefit of charitable covenants to income tax alone, not surtax, are other examples of cold comfort.

But it is not positive action by the state which is likely to hurt voluntary effort so much as the general environment of the times. The redistribution of wealth necessary to provide Beveridge the First, and the full employment which was the object of Beveridge the Second, both press hardly on Beveridge the Third. The last few years have, it is true, seen the establishment of the biggest charitable trust this country has known —the Nuffield Foundation, whose third report was published last week. King Edward's Hospital Fund reported larger subscriptions and donations in 1946, after the decision to nationalise the voluntary hospitals was known, than in 1938. Fewer large gifts but many more smaller gifts may be the outlet of the charitable instinct in the future. Much more serious is the absence of leisure in the middle class from which sprang most of the philanthropists of the nineteenth century and whose members have been responsible for carrying on most of the philanthropic service of this century. The average housewife, declares Lord Beveridge, has more leisure today than her mother or grandmother. She has far fewer children—Elizabeth Fry, it may be pointed out, had eleven—and a better house. Indeed, he sees in the new leisure of the working class itself a new field for voluntary service. But most voluntary service has hitherto been done by part-time unpaid workers from the middle class, and where a voluntary organisation uses paid workers it has to compete with the state for their services. The possible lack of surplus incomes, coupled with the probable lack of surplus manpower, make it necessary for voluntary action to be directed economically and intelligently. The day of the eccentric charitable trust has gone; so has the day of the small local and individual charity. Money given for charitable purposes can more usefully be employed by the larger type of organisation. But there is a danger lest through over-centralisation voluntary action may become as bureaucratic as a state social service. The right compromise seems to be the central collection and disbursement of funds, with local agencies such as the Family Welfare Association, for family and individual case-work, to see that individual needs are not left neglected.

Voluntary action also runs the risk of becoming a vested interest in the need it sets out to fulfil. As Mr Bevan said, voluntary workers must always be prepared for the state to snaffle their own good work and make it universal. When that happens, they must be willing to step down and not fight to retain a voluntary organisation merely because it is voluntary and not because it is the sole means of meeting a proved need.

On the whole, however, the danger to the country is not that voluntary action is likely to be overdone as that it may not be able to flourish. Whether it does pioneering work in new fields or supplements state action in fields already won, it is as essential to the life of the country as it has ever been. But it can no longer rely on the philanthropic motive of the few to carry it along. It is the many who have benefited, at the expense of the few, by the redistribution of wealth. The obvious corollary to the social services provided by the state for the mass of the citizens today is that they should be willing to undertake some voluntary service, however small, in return—that they should learn to give as well as to receive.

NOTES OF THE WEEK

The Dominions Take the Initiative

The conference of Dominion Prime Ministers seems to have run away with its organisers. The stately progress of lectures by responsible Cabinet Ministers has been interrupted by the downright attempts of the Dominions to bring clarity and purpose into the vague groping towards a fresh view of Commonwealth affairs. Every day brings fresh news of the Prime Ministers' determination to "cut the cackle" and get down to business.

After their cautious and somewhat pessimistic statements before the conference began, the British Government should feel gratified that their initiative in bringing the Prime Ministers together is producing such fruitful results, but there are signs that they are beginning to wonder what the Dominions will do next. Committees have been set up to examine economic co-operation, defence and methods of Commonwealth consultation. A private group consisting of Canada, Australia, New Zealand and Britain is concerning itself with the constitutional problems raised by Eire, and which may be raised by other Dominions. Other committees have looked into the status of High Commissioners, the conduct of foreign affairs and the relations between the Dominions and the colonies. If only half of what has been suggested is put into practice, the Commonwealth will have advanced further in the past two weeks than it has in the past twenty years.

From Britain's point of view the progress may not be all pure advantage. The suggestion that some sort of permanent economic secretariat should be set up to plan the development of the Commonwealth—or of least a large part of it—as a whole and with powers to allocate raw materials and capital equipment, necessarily implies considerable modification of Britain's own plans. The tables are being neatly turned. Though the suggestion has not yet been accepted, and will in any case have to be modified to enable Britain to play its promised part in Europe, Britain may yet find itself struggling for some degree of independence from its filial Dominions.

*

When the conference began, defence shared with economic co-operation first place in the agenda. The brief statement issued after their discussion on Wednesday did not reveal much, but it is known that the predominant idea of most of the Dominions was to set up regional defence organisations. Mr St Laurent of Canada, for example, has been "crusading" for an Atlantic Union; Australia, New Zealand and Britain have already created a joint defence committee for the Pacific; and it is to be hoped that something similar has now been planned for the Indian Ocean and south-east Asia. By implication, too, all the Dominions have accepted the European commitments which they may incur through Britain's membership of the Brussels Pact. Whether they themselves will actually seek to enter the Pact will depend on the concurrence of the various Dominion Parliaments, which may not readily agree unless their own security is guaranteed by a reciprocal agreement.

On all practical issues the conference has without doubt been a great success, but on questions of right and wrong political expediency seems to have kept the Prime Ministers dumb. Obviously it would have been difficult to bring up such issues as South Africa's treatment of the Indians and Bantu, or India's use of force against Hyderabad, or the colour bar in Australia. They were issues which would have divided the conference. Yet, if Communism is to be successfully routed, strict adherence of the Commonwealth to fundamental principles and traditions must not falter. So long as those principles can be flouted with impunity by any Dominion which cares to do so, the Commonwealth will lack the inward power to retain men's trust in its purpose.

* * *

Eire and the Commonwealth

The absence of an Irish delegate to the Commonwealth conference has not prevented the question of Eire's position from being discussed. An informal meeting at Chequers last Sunday took place between Mr MacBride, Eire's Minister for External Affairs (who is the prime mover in Eire's decision to break the link with the Crown), Dr Evatt, and the Prime Ministers of Britain, New Zealand, and Canada. The three senior Dominions ostensibly participated because they have large Irish populations, but their presence was really due to the fact that they, as the core of the old Commonwealth, are most concerned with the question of the place of the Crown in the Commonwealth relationship. The purpose of the meeting was not to discuss the validity of Eire's decision to repeal the External Relations Act of 1936, which anyway reduced its connections with the Crown to a solemn farce, as its wartime neutrality made nonsense of its connection with the Commonwealth. It was an attempt to ensure that everyone concerned understood the changed situation which will face Eire as an independent and foreign country, and to assess what kind of precedent the first deliberate secession from the Commonwealth will create.

The first problem is that of citizenship. Britain has already explicity recognised Irish nationality by the British Nationality Act. But the other Commonwealth countries have not, and even in Britain there are a large number of Irish people who possess the status of British subjects. (Just how many there are is not known, since neither government has ever thought it necessary,

to collect the statistics.) Presumably, these people will have to decide in which country they intend to be alien. Moreover, there is a constant movement back and forth of Irish casual labourers who will be subject to the disabilities of aliens. There is, of course, nothing to prevent the full application of international law from being tempered by a Treaty, and it may indeed prove the forerunner of similar arrangements with western European countries when the arrangements of Western Union are more advanced.

The problem of Eire's economic relations is no less important, but it will not arise at once. Its commercial treaties with Britain are based on Imperial preference under the Ottawa agreement: Irish dairy produce, for instance, enters Britain duty free, while Danish produce does not, and the Irish farmer gets the best price of any of Britain's suppliers. Under the present system of bulk buying and subsidised food, this makes very little difference to the demand for Irish produce, but it will be very important once there is a move towards freer markets. Since Eire will no longer be entitled as of right to Imperial preference, Britain will be under strong pressure to refuse it, both from Denmark who could demand equal treatment, and from New Zealand who could claim a right to better treatment. Moreover, when the Charter of the International Trade Organisation comes into force in 1951, such an agreement with Ireland (and by the same token the preferential arrangements made with the other new foreign country, Burma) will rank as a discriminatory practice. If Britain were to maintain a preferential arrangement with Eire, it would have no case for resisting the conclusion of similar arrangements between, say, South American countries, which would be harmful to its own interests.

Such difficulties can, however, be overcome if both sides are determined to do so. What is much more important than Eire's legal position as an independent foreign country is the spirit in which it leaves the Commonwealth, and the spirit which it embraces common obligations with Britain and the other western European countries. Perhaps it will find it easier to abandon its parochial attitude towards the world as a member of a European community.

* * *

The Fourth Parliament

On Tuesday next, the King will open Parliament with the full splendour of a state occasion. Whether the panoply of the Household Cavalry, the glitter of the Irish coach, and the playing-card splendour of Earl Marshal and Lord Great Chamberlain will be fitting to the occasion will depend entirely upon the quality of the announcements which His Majesty's Ministers have written into the speech from the Throne. This is the last full and fully effective session of the present Parliament, and it is the last chance for the Cabinet to prove that it contains not merely "good plain cooks," but statesmen.

The early part of the session—perhaps the whole of it—will be dominated by the Iron and Steel Bill, whose provisions will be public before the end of the debate on the Address and Reply. It will be highly contentious, and its provisions will need the most careful parliamentary scrutiny. The nationalised coal industry has nowhere near reached its final form of organisation after three years. To adopt such a happy-go-lucky approach towards the steel industry, with its much more delicate structure, might very easily wreck the whole of Sir Stafford Cripps's plan for recovery. If steel must be nationalised, the most open-minded and careful consideration must be given by Parliament to the means by which it is to be effected.

The Steel Bill will give the Government a chance to display qualities of intelligence and reason which have not been evident in previous discussions of nationalisation. The Opposition are mistaken if they think that the Labour movement will abandon this cherished project, but the Government will be equally mistaken if they delude themselves that with the nationalisation of iron and steel they have completed the task which the nation has set them. They have now to abandon the shelter of Socialist doctrine and move forward into the uncharted seas of national leadership.

There has lately been much talk of unity at home. If it is taken to mean a decision to avoid contentious subjects and to suppress genuine differences of opinion, it would be harmful to the political health of the nation, without greatly impressing either Britain's friends or its enemies. But at least it should mean a renewed determination on the part of the Government—and equally on the part of the Opposition—to set the interests of the nation above that of class and to cease filling the air with a mixture of pretentious clichés and cheap jibes.

Long Road For Liberals

Reduced to a handful in the House, buffeted at by-elections, weakened by desertions, the Liberal Party refuses to acknowledge defeat with an obstinacy which excites the admiration of its friends and the derision of its enemies. On the heels of Mr Frank Byers's appeal for a £100,000 fighting fund comes the new statement of party policy, *Programme for Britain* (which is summarised in the week's issue of *Records and Statistics*). Certain parts of this, particularly those dealing with peace and the social services, demonstrate the extent to which ideas first launched by Liberals have permeated the policy of both other parties. One idea—that for industrial "co-ownership"—frankly needs to be taken back and baked a little longer. The proposals to merge the Ministries of Food and Agriculture under one Minister of Cabinet rank, to make county agricultural committees elective by the county, set up new agricultural credit facilities, and institute a Land Court, compare favourably with the auction-room tactics of Labour and Conservatives in this field; the reform of estate duties to encourage the spread of property is in line with the best economic opinion, as is the proposal to put teeth in the campaign against monopoly and restriction and restore competitive private enterprise in road haulage.

But satisfactory and refreshing as it is to see an opposition party thus descending from the general to the particular, *Programme for Britain* is less valuable for its individual proposals than for the spirit which it embodies. Alone among the parties, the Liberals place first among the aims of state action the freedom and opportunity of the individual. "Set the People Free" is an attractive slogan, but all the antecedents of Toryism show that its proper translation is "A Free Hand for Big Business." The Labour substitution of one set of vested interests for another, while less pernicious in that the vested interests concerned form a larger minority, has for its background a monolithic collectivism even less compatible with individuality. Both are parties of authority, hierarchy, and corporativism; the biggest difference between them is only the difference in the beneficiaries of privilege. Both distrust enterprise and mobility, and both cherish a static conception of society. Therefore the traditional view of Liberalism as a centre position between left and right, or as a state of tepidity between hot and cold, is completely inappropriate to the present day. To use a simile no doubt grossly unjust to both the larger parties health is not a middle position between measles and cholera.

The middle-party attitude has been very nearly fatal to organised Liberalism, and there is little time left to alter it and to build up what is virtually a new party. There is no force-of-habit Liberal vote to carry the Liberal remnant through another General Election; there is little old-guard opinion to be stirred by the evocation of past glories. If Liberalism cannot, between now and 1950, make a sufficient impact to ensure a fresh start, the party is almost certainly doomed; and many who have never thought of themselves as Liberal with a capital L will surely regret its disappearance. Though influence may come, in a more evenly balanced House, long before power, the road from Westminster to Downing Street will be for the Liberal Party a long and difficult one.

Strikes in France

M. Benoit Frachon, one of the Communist leaders of the present French strikes, sounded quite confident when he spoke recently of "proletarian blood flowing." So it is probable that there will be a last flare-up of violent clashes between strikers and the police or troops, before lack of funds and the firmness of the Government bring the men back to the pits in decisive numbers. By spreading disorder and anxiety the Communists appear to be deliberately inciting a weary population to put General de Gaulle into power—a tactic which experienced observers in France have long expected them to follow. The results hoped for are, of course, civil war—or something very close to it—estrangement between France and its neighbours, and the interruption for months—maybe years—of the nation's economic and political recovery.

It has been said often enough that the strikers have burning and justifiable grievances about the cost of living; but it takes more than this to make men destroy their places of work and sources of livelihood. That is what has been happening in mines where pickets have made safety measures impossible and caused the breakdown of gas and electricity supplies. What the miners refused to do against the Germans they are prepared to do against their own Government. For such behaviour there can be no one simple explanation. There are complex and confused motives behind the strikes, and it is in such confusion that a determined

and organised minority can lead crowds in a direction which is not plain to them.

In more than one sense the Gaullists and the Communists are now allied against the "Third Force" Government, though each party would deny the suggestion. Whatever M. Queuille and M. Moch do, one of the two extreme parties benefits. If force is not used against sabotage and anarchy the Gaullists feel their biceps and say what they would do; if force is used, the non-Communists see the right to strike being suppressed by authority and draw closer to the Communists. Moreover, the situation varies from district to district, and it is known that as many as 30 per cent of the miners abstained from voting in the referendum through which the Communists tried to get the decision to strike confirmed.

The other unions have so far lent only ragged support; but if the miners return to work, it is likely that the dockers will come out, and after them other trades. M. Frachon must keep tension high and production dislocated if the orders of the late Mr Zhdanov are to be carried out. One feature of the situation which must perplex the extremists is the loyalty and reliability of the police and other security forces. The lesson of Prague has been learnt by M. Moch; it is the economic lesson that has yet to be learnt by the people and their Ministers.

* * *

Mr Marshall in Greece

It may be hoped that Mr Marshall will have gained from his brief visit to Greece a better understanding of that bewildering country. The army's success at Mount Grammos has not ended the guerrilla war. Economic confusion continues, with little prospect of improvement as long as resources have to be devoted to combating the rebels. Political leadership is still conspicuously lacking but a practical alternative is not easy to find, nor is the moment very suitable for change, even through elections. Everything depends on the suppression of the rebellion, and this seems impossible as long as the small though efficient Greek army has not only to fight the bands of Markos but to hold a mountainous frontier 600 miles long against infiltration from neighbours.

There is one feature of the Greek question to which Mr Marshall might profitably give his attention—the position of Albania. This small country has no friendly neighbour. It has recently quarrelled bitterly with Jugoslavia. The division between the tribal north and settled south has always been a source of weakness to a country whose material resources are few and whose population does not much exceed one million. The loyalty of either region to the Communist regime of Enver Hodja is doubtful. Yet this small state does not fear to flout international authority by supplying the rebels of Markos or to refuse redress for the sinking of British destroyers. So far Hodja has got away with it and treats as weakness the caution of the western pluto-democracies.

Can the western Powers in fact find no way of dealing with this impudent braggart? The evidence against him collected for Uno is decisive enough to justify action. And if Hodja chooses to continue provocation, he might be reminded that the coastal plain from Durazzo to Valona is very open to the sea.

The "liquidation" of the Albanian nuisance depends of course on the attitude of Jugoslavia. Tito still simultaneously insults the West and offers to trade with it; he helps Markos, yet is on the worst of terms with all his eastern neighbours and is denounced daily by Moscow's Holy Office. If Greece's frontiers with Jugoslavia and Albania could be neutralised or sealed, the rebels could be crushed, resources could be diverted to civil expenditure and the economic and political recovery for which the Greek people passionately longs, could at last begin. Here is a task for American and British diplomacy, the success of which would not only strengthen European security but save Congress many million dollars.

* * *

Is it Safe to be British?

Another direction in which British policy might show more vigour and speed of action is in the protection of British subjects abroad. In Jerusalem, Mr Sylvester is condemned to seven years' imprisonment by a district court of Israel on evidence and in circumstances which are an embarrassment to moderate Jews. Mr Evans is condemned by the Communist Government of Rumania to three years' imprisonment on a charge of fraudulent administration of money of the Steaua Romana Oil Company, which has been subjected to legislation and regulations of a frankly discriminating kind. Now this week an official of the British Information Office in Prague is arrested—with a Czech employee—in his own reading room, flung head-first into a car by Czech policemen, detained for nearly two hours and then returned without adequate apology from Dr Clementis, the Foreign Minister. Nothing has been heard either of any compensation for the British subjects who were tried with Mr Sylvester and acquitted for lack of evidence, or of British action to take the case before the Security Council.

Such cases could in normal times be treated as exceptional lapses from the normal behaviour of foreign governments towards British subjects, to be corrected by traditional diplomatic methods. Now times are not normal, and there is clear reason to believe that these cases of victimisation are regarded by the officials responsible as part of the cold war. That being so, the British Government should be prepared in each case to retaliate as soon as it is clear that redress is not being made with adequate speed and courtesy. To be effective, retaliation need not be made in kind: to ensure that the case of Mr Wallis and his assistant is speedily cleared up, the best reprisal is not necessarily to suspend the activities of the Czech press attaché in London, superfluous though some of them may be. More effective would be measures taken in the economic field, where British power to hurt is not negligible.

Action in the economic sphere would prove, what is sometimes doubted in eastern Europe, that British exports to a country are not considered by His Majesty's Government more important than the safety and dignity of His Majesty's subjects. Unless the Foreign Office is allowed occasionally to show its teeth in these cases of manhandling, they will become more and more frequent. British subjects abroad are entitled to take literally the words of the Secretary of State which are printed inside the cover of their passports:

> Request and require in the name of His Majesty all those whom it may concern to allow the bearer to pass freely without let or hindrance and to afford him or her every assistance and protection of which he or she may stand in need.

* * *

Palestine in Paris

Playing for time in diplomacy has become an occupational disease in Uno. The Arab delegations in Paris have caught it—with quaint results. In the Assembly they want to delay discussion of the Bernadotte plan; in the Security Council they argue for stern enforcement of a prolonged truce. Superficially, their attitude may look logical, but a moment's analysis of the facts available reveals it to be inconsequent in the extreme.

The Arabs' vote to postpone the Assembly discussion—which they gave and, with Latin-American suport, carried in the teeth of vehement advice from all their friends, including Britain—seems to have been based on two emotions. One was a simple head-in-sand distaste for facing a debate in which they will have to acknowledge what they have never yet had the courage to admit to their home publics—the existence of an established Israel. The second is a belief that time is on their side and that, once the American elections are over and Israel's friend, Mr Truman, is out of the way, something will turn up. Their attitude would make sense only if they held military advantages. They force questioners to the conclusion that they hope these may yet materialise.

In the Security Council, by contrast, they admit by implication that they have militarily no hope of gain. Their representatives—Syria and Egypt—are pressing hard for rigid maintenance of the truce. Here, again, their attitude would be logical only if there were the power, either in the Arab ranks or in those of the United Nations Observer Corps, to freeze the current military position; but this does not exist. On every count it is obvious that the Arab leaders would be well advised to swallow the medicine of a quick international settlement before Israel is offered, or snatches, any more chances of presenting them with *faits accomplis*.

If proof of this judgment is wanted, it is to be had in the last ten days' events in the Negeb. On or about October 15th a Jewish convoy, passing down a road in the Falujja area, twenty miles north of Gaza (which the United Nations had proposed as a truce supply route to outlying Jewish settlements, but which has, in fact, been exposed to fire from Egyptian guns), was attacked and forced to withdraw. The Israeli forces seized upon this piece of imprudence in order greatly to better their military position. They relieved their settlements, widened their corridor and, as a result, have now reduced the Egyptians to the pass which, pre-

viously, they themselves faced—that of maintaining tenuous communication with isolated outposts. The Israeli forces are even said to be investing Gaza. In the Security Council, Dr Ralph Bunche, the acting mediator, is suffering all the drawbacks of lack of resolute support. He has asked for and obtained a new order to cease fire, coupled with a request for withdrawal to the positions held before these incidents occurred—but who expects Israel to abandon such useful advantages?

Two parties are therefore being courted. One is the Arabs, to whom it should now be plain that to play for time is to court fresh setbacks. The other is the United Nations. In the Negeb—as everywhere else where their verdict is challenged—they must either use force or confess to impotence; or else mouth commands which, because there is no one to execute them, make their Organisation look worse than undignified.

* * *

Lawyers and Libel

The Lord Chancellor's Committee on the law of defamation appointed in March, 1939, has finally issued its report. Dissatisfaction with the law of defamation as it exists at present can be grouped under three heads. In the first place the law does not extend to protect defamation of the dead, nor what is called "group defamation," that is, statements defamatory of a class or section of the community but which do not name any one individual; nor does it protect invasion of privacy, which is a subject akin to libel by analogy only. Defamation remains a personal matter. In the second place, the law of defamation is in other ways too wide, in the sense that it permits a man to claim damages for defamation when there was in fact no intention to defame him as an individual. Finally, the legal rules and conventions that have grown up around the Court proceedings themselves are too rigid and arbitrary and both may cause injustice to the individual and increase the cost of the proceedings.

On the first point, the report does not advocate any extension of the law. It considers that an action for defamation should remain an action available only to an individual who claims that he has been wronged and that it should not be available to protect the reputation either of the dead or of members of a particular class of society. Again, on the complexity of the actual proceedings themselves, the report suggests a series of useful but minor alterations in the law which they think will patch up the more serious difficulties without changing the legal structure. It is over their recommendations in respect of the second group of complaints that most disagreement will arise, for it is in this group that most alleged libels in print fall.

Publishers and writers consider the law of defamation too wide because it disregards the intention of the writer. The test it applies to any set of words is "do the words used defame the plaintiff in the eyes of any reader?" not, "What did the writer intend the words to do and mean?". If two men of the same name live in the same place and one commits bigamy, any publication in a national paper of a report of the conviction for bigamy may at once bring a successful claim for libel from the one who did not—a result which, in the words of the report, "offends one's sense of justice." But it does not seek to alter this basic rule, but it does propose some measure of protection to the publisher of an unintentional libel by making it possible for him to publish an apology and correction and to rely upon that as a defence to any claim for damages. Even this protection is qualified by a suggested provision that, if the claimant can show that there was any want of care in connection with the original publication, he can still recover damages.

The principal complaint about the present law is that it permits the bringing of claims for libel which are little better than blackmail. Provided a claimant has even a shadow of a case, it is often cheaper for a newspaper to pay him £500 than it is for it to defend the action and to pay its own costs if successful. The proposal that a plaintiff would have to prove want of care in such cases would not, indeed, make them impossible, but it would certainly make them far more difficult to bring and easier to defend. Negligence invites appropriate penalties, but there still remains some force in the contention of Mr Christian, the dissenting member of the committee, when he says "I am not satisfied we have done everything possible to render them [actions for defamation] less tempting to initiate and costly to resist."

* * *

Mr Morrison's Heart and Head

"The Consumer in Relation to Non-Competitive Industry" sounds more like the title of an article in the *Economic Journal* than of a speech by the Lord President of the Council. Mr Herbert Morrison, addressing the British Institute of Management last week, explicitly renounced the use of economic analysis—and then demonstrated how the absence of a consistent structure of thought can beguile even a sensible speaker into absurdity. He had some good points to make about the limits of competition, and also about the greater, rather than lesser, safeguards for the consumer gained by the transfer of an already monopolised service from private to public control. But his account of the consumer's powers of self-defence was calculated to make a field-day for Professor Jewkes. "Under the competitive system," he said, "the threat of withdrawal of custom can be a spur to efficiency. The corresponding safeguard in the case of socialised industries should be their sensitiveness to public complaint." What a parallel! The "threat of withdrawal," if it ever becomes more than a threat, is something objective, to be studied on sales charts; a quantitative measure of comparative efficiency in meeting public demands. "Public complaint" may result in someone's head being undeservedly offered up on a charger, or in the acceptance of quite unjustified public losses; or, if the executive concerned are adept stonewallers, in nothing at all. It cannot possibly provide a quantitative measure and guide to action.

Similarly, the clash of interest between consumers and workers in the "public sector" evaporated consolingly into such generalisations as that "relatively low" wages should become "higher and fairer," subject to the workers' obligation not to demand "unreasonably" higher wages or shorter hours; and that "much" of the benefit of technical advance should go to the consumer. "Low" relatively to what? "Fairer" by what criterion? What is "unreasonable"? How much is "much"? The fact is that monopoly—necessarily more watertight when statutory—knocks the props from under the price system and breaks the link, provided by competition, between the importance of a service, whether direct or indirect, and the magnitude of its reward. The only check available remains the consumers' power to "withdraw his custom" in favour of some not too remote substitute—a power exercised every time he elects to travel by coach rather than by rail or to carry his own goods under a C licence. The supine ineffectiveness of consumers' councils merely reflects his impotence when no possible substitute exists.

Mr Morrison's heart is in the right place. He does hold that nationalised services are made for the public, not (as some of his colleagues apparently hold) that the public is so much sausage meat to be fed through the nationalised services. But he is altogether too casual about the grave, if not insoluble, problems of price policy in the public sector of the economy.

* * *

Red, White and Black

The control of the black market in petrol as announced on Tuesday has been extremely successful. Mr Gaitskell and the Vick Committee are to be congratulated on a skilful operation which has proved much more effective than was originally hoped. The only cause for complaint up to now has been the inequitable treatment given to supplementary allowance holders who have had their basic ration deducted from their allowances and who might, as things have turned out, have been treated more generously. But even this point of irritation has been partially soothed by Mr Gaitskell's frank admission that his Ministry's estimates were overcautious and much farther from the mark than those of the motoring organisations, and by his promise that the deductions of the standard ration will be tapered off gradually till next May so that thereafter the possessor of a supplementary allowance will have the full basic allowance as well.

The original estimates allowed for a saving of 100,000 tons of petrol a year as the result of the introduction of the red petrol scheme plus a saving of 20,000 tons as the result of cuts in supplementary allowances. This was to be redistributed in the form of the basic ration. In the event it has been found that savings have been running at the rate of 380,000 tons a year instead of the budgeted 120,000 tons, with the result that after providing for the basic ration the Ministry are about 250,000 tons up in their estimates of net saving.

THE ECONOMIST — BY AIR

Annual Subscription Rates

U.S.A. and Canada:	£6 or $24.	Union of South Africa:	£5.5.
S. and C. America (exc. Mexico and W. Indies	£7.	Hongkong: £5.15 or HK$93. Gibraltar, Malta: £3.15.	
Australia: £6 (sterling).		Germany, Poland, Iceland: £5.5.	
New Zealand: £10.10		Rest of Europe: £4.5.	

THE ECONOMIST, 22 RYDER ST., ST. JAMES'S, LONDON, S.W.1

This handsome balance would have permitted an immediate levelling of supplementary and non-supplementary rations, but for the demands of the Berlin airlift, the increased requirements of the Services and the need to build up stocks. The savings so far made have already contributed 100,000 tons for these purposes and will continue to be drawn upon during the winter. In the face of these additional demands it is a matter for much satisfaction that one of the minor pleasures of life can be maintained and even improved without a further drain on dollars and in spite of additional demands. A victory is twice itself when the achiever brings home full numbers.

Korea—Rehearsal for Germany?

The moves which Moscow is now making to gain a position of moral advantage in the diplomatic struggle over Korea are of interest, not only in relation to Korea itself—which is by no means unimportant in current affairs—but also as a dress rehearsal for tactics which might be adopted in Germany.

The Russians have announced their intention to withdraw their troops from Korea by the end of the year, challenging the United States to do the same; Tass has now stated that the Russian withdrawal has actually begun. The United States has declared that a contingent of American troops will remain in Korea to protect the Seoul Government, no longer as an occupation army, but by invitation of the recognised sovereign authority of independent Korea. Whatever the legal form of the arrangement, however, the retention of American troops after the withdrawal of the Russians will obviously give Moscow a considerable propaganda advantage. It will be used to demonstrate that the North Korean regime, being based on popular support, needs no foreign protection, whereas President Syngman Rhee's Government can only survive if propped up with American bayonets. What qualifies this Russian case is the fact that Russia started to build up a Communist-controlled Korean army in North Korea long before the Americans took any steps to organise a similar force in their zone. The Korean Communists have thus still a long lead in the organisation of armed force, which they would certainly use if there were only Koreans and not American troops to be dealt with.

That Russian military withdrawal does not mean any great change in the relations previously existing between the Russian military authorities and the Korean Communist administration is indicated by the fact that Terenti Shtikov, who was army commander in North Korea, has been appointed Soviet Ambassador to the "Korean People's Democratic Republic." The other states of the Russian *bloc* are also entering into diplomatic relations with the North Korean Government. Thus, when the Korean question is again discussed by Uno, several members of Uno will have given diplomatic recognition to a government which claims the right to represent Korea in opposition to the claims of the authority elected under supervision of Uno commissioners. Uno can hardly have any dealings with the North Korean Government without repudiating its own decision on Korea, which was designed to ensure free elections. As the Russians refused to allow the Uno commission to enter their zone, and as no parties outside the Communist-controlled *bloc* are tolerated there, no free elections could be held except in the American zone. It is hard to see how this situation can be altered, but it should be closely studied in London and Washington for the guidance it can give to possible developments in Germany. An offer of unilateral withdrawal by the Russians from a zone closely tied to the Soviet economy, dominated by a German Communist militia, and organised to lead a nationalist appeal to the Germans of the west is a possibility that cannot be ruled out.

Count Sforza Looks Westwards

While premature attention has been focused on Spain by the itinerant strategists, the Italian outlook on international affairs has been changing. This shift of opinion looks like bringing Italy nearer the western point of view. Rome, in fact, has been weighing again the question of joining the Brussels Pact. The new phase began with a memorandum which Count Sforza, the Italian Foreign Minister, sent to the French on August 24th. The subject of the memorandum was the projected French-Italian Customs Union, for which the necessary legislation is now being drafted in each of the two countries. Count Sforza, however, took the opportunity to add that a union like the Organisation for European Economic Co-operation, of which Italy is of course a member, did not exclude any of its members joining "a union like that of Brussels, to which, indeed, it is to be hoped that other countries may adhere."

The next step was Count Sforza's review of Italian foreign relations in the Chamber of Deputies on September 28th. He criticised the Soviet Union, and said that the economic link of the French-Italian Customs Union was only one aspect of the closer relations desired with France. These remarks have brought the whole subject of Western Union back into conversations heard alike in the parliamentary corridors of Montecitorio and the cafés round the Galleria del Corso. Inside the Government there is a good deal of opposition to Count Sforza's move away from neutrality in the cold war. It comes both from the constitutional or right-wing Socialists, under the leadership of Signor Saragat, and from Catholic Action, whose paper *Quotidiano* shows great concern about military commitments.

Count Sforza, nevertheless, has plenty of support. He returned to his point, that Italian neutrality in a third world war would be impossible, with another speech in the Chamber on October 13th. Further observations in this connection have been heard from high Italian diplomatic personalities in Paris. Referring to the Italian colonial question, it is being said that "it would be better if the Great Powers could defer deliberation for another year. That would give time for developments in both Italian and British public opinion. A British gesture on the African colonies could still catch Italian opinion in time to forestall the process of Italy relapsing into the position of an American satellite, which would rob the West of a creative Italian contribution to continental structure and security."

The Italians rejected the idea of joining the Brussels Pact in the months immediately after it was signed, unless their Peace Treaty could be altered to allow them a larger army, fortification on the Jugoslav frontier and a return of their colonies. They are still naturally anxious to achieve any or all of these objects, but it looks as if they are coming round to the view that they must make a move soon. Anything which the British or Americans could do to help them make up their minds would be well worth doing.

* * *

Voice from Barbados

"We do *not* look upon the British Government as a ruthless exploiter. We do *not* regard the ties that link us with the British Crown as an intolerable yoke." In such unequivocal phrases did Mr Grantley Adams of Barbados, an alternate member of Britain's delegation to the General Assembly, defend the British Colonial Empire before the Trusteeship Committee of the United Nations last week. He is well qualified to speak, as representative in the Barbados House of Assembly since 1934, and Leader of the House since 1946. Mr Adams is also a member of the Barbados Executive Committee, which is the principal instrument of government in the colony, and President of the Barbados Progressive League, which is the largest political party in the colony. His experience is not confined to the public affairs of his own colony, nor even to those of the West Indies as a whole; he has an encyclopædic knowledge of the whole colonial empire.

Mr Adams's unsolicited testimonial brought a welcome element of novelty into what would otherwise have been only a dreary repetition of the debates in Geneva last September, when a special Uno committee met to discuss the information on "economic, social and educational conditions" collected from non-self-governing territories in accordance with Article 73 of the Charter. When the same subject came up for discussion in Paris before the Trusteeship Committee of the Assembly, the Russians repeated the performance they had put on in Geneva, and combined attacks on the colonial Powers with a display of much solicitude for the peoples whom they "exploited." The Soviet delegate recommended that Uno observers be sent annually to all non-self-governing territories to survey the situation and, presumably, to provide the information on political and constitutional matters which the wicked colonial Powers refused to provide of their own free will.

Mr Adams did not assert that the British Colonial Empire is perfect, but he repeated forcefully the arguments which his British colleagues had set forth in Geneva—that the British Government could not allow the interference of any third party while it was working out the constitutional and political progress of the colonial peoples; that the colonial peoples themselves did not want "to have too many cooks spoil the broth"; and that the fullest information on these subjects was always placed in Uno libraries. He went further, and without any beating about the bush, exposed

the Soviet attacks on the colonial Powers for the cynical political manœuvres that they undoubtedly are:

> Frankly, Mr Chairman, the impression that some of the speeches made here have made upon me is not one of solicitude for the peoples of the non-self-governing territories, but simply one of desire to attack administering Powers at all costs.

It is too much to hope that Mr Adams will impress the Russians and their satellites, but his words will perhaps have impressed the colonial peoples for whom he spoke, and help to prevent them from being misled by propaganda, to which Communists can give a very plausible twist. If this happens then some good will have come after all out of the misuse to which the Russians have subjected the Trusteeship Council ever since they joined it.

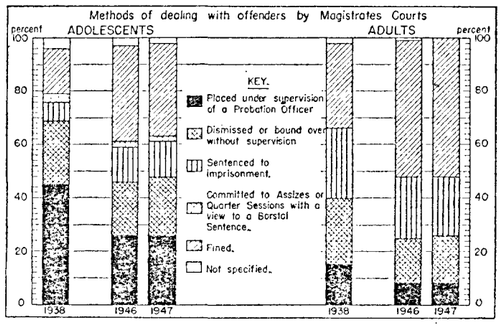
Pensioners of Two Wars

The first report of the Ministry of Pensions since the war provides the factual background against which the treatment of the war disabled will be discussed in the coming session of Parliament. An all-party motion has been tabled calling for a Select Committee to consider war pensions and allowances. Those supporting it compare the level of war pensions with the level of wages and salaries, and the substance of their case for an increase is that whereas wages have doubled, pensions have gone up only from 40s. a week (for one hundred per cent disability) to 45s. a week in the thirty years since the end of the first world war.



But, as the Ministry of Pensions report makes clear, the position of the war pensioner today is far better than it was in 1919 or 1939. The 40s. fixed in 1919 should be considered against the cost-of-living index at that time, which was 215. In 1946, when the amount was raised to 45s., the cost-of-living index was 203. Further, the rise in the basic pension is only a small part of the more generous treatment of war pensioners. Pensions themselves are granted more freely; allowances are paid for wives and children even if these family responsibilities are assumed many years after the disablement was incurred; there are unemployability supplements and constant attendance allowances for the severely disabled, and special hardship allowances for those who, owing to their disability, have to accept less well-paid jobs. But the best comment on the position of the war pensioner today is the fact that up to March 31, 1948, only 11,594 awards of the unemployability supplement had been granted, of which 9,057 were the pensioners of the 1914 war. The overwhelming majority of the 756,864 disabled of the two wars (including civilians) are in full-time employment, and in these cases the pension and family allowances are a tax-free addition to wages.

There may be a case for arguing that war pensioners have been left behind in the scramble for larger shares of the national cake, and it may well be true that there are instances of individual hardship which are hidden by the official statistics of pensioners in employment. The case for a Select Committee, which would go beyond the official story, is well founded. But it is surely better to give an extra 10s. a week to a war pensioner who is unemployable, or in real hardship, than 5s. a week all round. The best thing the state can do for its disabled is to create the economic conditions which allow them to be employed rather than to add a few shillings to their basic rate of pension.

* * *

Abundant Crime

Mr Ede's speech at the reopening of the police staff college last week coincided with the annual publication of the criminal statistics for England and Wales.* Their coincidence could not be neater, for the statistics reveal only too clearly how inadequate heavier sentences are for the prevention of crime. The courts are using fines and imprisonment more and more as deterrents, and relying much less than before the war on the more constructive work of the probation officer. This policy is obviously ineffective so long as sixty per cent of all crimes are not cleared up by the police: it is because "liberty plucks justice by the nose" that potential malefactors continue to think their crimes a good risk. Only a much greater fear of detection will reduce the business of the criminal stock exchange. It is for this reason that steps to increase the strength and efficiency of the police are much more likely to reduce the number of lawbreakers than heavy sentences on the minority who are caught. The reopening of the staff college is therefore welcome if it will lead to an increase in the number of successful detections per police officer, the criminal version of higher p.m.h. It is to be feared, however, that only a major increase in the police forces will make a radical difference.

The diagram above illustrates the change in the type of punishment over the past nine years. The figures refer only to cases brought before the magistrates' courts and cover the 69,000 cases tried in 1938 and the 98,000 cases tried in 1947. The higher courts—Assize, Central Criminal and Quarter Sessions—dealt with 9,000 and 18,000 cases respectively in these two years. In both the same tendency is discernible, though it is much stronger in the magistrates' courts: in 1938 45 per cent of adolescents and 15 per cent of adults were placed under the supervision of a probation officer. By 1947 the percentage had fallen to 26 per cent and 8 per cent respectively, while fines and sentences of imprisonment had increased. Unfortunately the greater severity of the Courts in their efforts not to make a scarecrow of the law is likely to have an opposite effect and to increase the number of hardened criminals.

* * *

Rates or Rents?

A practical illustration of the dilemma facing local authorities in meeting the present heavy cost of house-building was given at the meeting of the London County Council on Tuesday. The combined Exchequer subsidy and rate contribution on a number of building schemes in relation to costs and rents is shown in the accompanying table. The figures show the strong contrast in cost between schemes which have been built since 1945 but to prewar standards (because sites and foundations were ready in 1939, but were frozen during the war), and those built according to the more liberal modern standards of size, density and internal fittings.

Of the 2,162 flats involved all but 114 are of prewar type with certain improvements, while the 1,062 houses are up to the full Bevan standard. As far as the flats are concerned, every scheme of prewar type shows a net surplus when the annual charges are set against the revenue from rent, subsidy and statutory rate contribution. One flat scheme built on postwar standards also showed a small surplus, but the second and larger scheme had a deficit. But the large housing scheme presents a much more serious picture, particularly as the whole estate is on one site and economies from the large-scale of operations might have been expected. After the revenue from rent, subsidy and rates is set against costs, there is an annual deficiency of £23 per house. What the LCC, in common with other authorities, has now to decide is whether this deficiency is to be met by higher rents, a larger contribution from rates, an appeal to the Exchequer, or a return to less generous living standards. It is an awkward problem.

LCC DWELLINGS ON WHICH RENT FIXED SINCE JANUARY, 1948.

Trade through the Iron Curtain

It is a curious feature of propaganda among fellow travellers that they regularly demand expansion of British trade with eastern Europe without looking to see if it is expanding already. The large recovery made since the end of the war is already bringing its value close to that of 1938. British trade with the nine eastern countries shown in the table below, as a percentage of total UK trade, rose in the first half of 1948 by 83.8 per cent over the total for 1946.

Expansion of UK trade with European countries, non-members of OEEC, 1946-1948.

(Overall trade figures in £ million.)

Country	1946	1947	First Half 1948	1938
USSR	16.12	21.89	14.73	51.87
Poland	11.48	11.56	8.83	17.01
Rumania	0.09	0.22	1.68	5.24
Hungary	0.31	4.15	3.72	3.11
Czechoslovakia	8.52	16.43	8.37	10.78
Jugoslavia	7.23	6.50	3.63	3.80
Albania	0.50	0.55	0.02	0.02
Bulgaria	negligible	0.14	0.18	0.85
Finland	22.48	39.55	20.18	25.12
Totals	66.73*	100.99†	61.34‡	117.80§

* 2.95 per cent of total volume UK external trade, 1946 (£2,266 million).
† 3.38 per cent of total volume UK external trade, 1947 (£2,984 million).
‡ 3.43 per cent of total volume UK external trade first half 1948 (£1,801 million).
§ 8.3 per cent of total volume of UK external trade, 1938 (£1,452 million).

Moreover, the gradual recovery of the eastern countries from the devastation of war—with much aid from the west—has enabled most of them to make a much better show of balancing their trade account with Britain during the first half of this year than during the two previous years. For example, whereas during the first half of 1947 the value of British imports from Czechoslovakia was £1,992,277, and the value of exports to Czechoslovakia was £5,979,039, during the first half of this year the corresponding figures were £4,306,632, and £4,068,720.

The Economic Commission for Europe in Geneva has been devoting much time and effort to developing intra-European trade to the benefit of countries on both sides of the iron curtain. At a recent meeting delegates from Russia, Byelo-Russia, and eight satellite countries sat down with delegates from eleven Marshall Plan countries and the United States to discuss the revival of east-west trade, and they decided to set up a permanent committee to study what can be done. Britain has already made a notable contribution to this revival, but it is often forgotten that its power to increase this contribution depends largely on whether the right goods are available for exchange. There is only a limited supply available of the British machinery and capital equipment which the east Europeans are most anxious to obtain; and, as Mr McNeil pointed out on Wednesday, it might well seem more profitable to send most of what there is to France, or the Dominions or East Africa, rather than to Poland and Jugoslavia.

It is also often forgotten that the eastern countries, although they could doubtless produce eventually large exportable surpluses of food and raw materials which Britain needs, there is no guarantee that they will in fact do so. As the report of the ECE committee on trade and industrial development points out, the reconstruction and development plans of the countries behind the iron curtain will have important implications for their foreign trade. Big changes in the relation between agricultural and industrial production are contemplated and it is time there was more information available about them.

One of the less satisfactory aspects of Mr Myrdal's direction of ECE is the way in which the east European governments are allowed to contribute incomplete and inadequate information to reports and studies undertaken. It is partly because of the latitude they get and the valuable information secured by Moscow from the western delegates that the Soviet satellite delegates behave at Geneva like reasonable beings.

Cards on the Table

The figure for the total present strength of the American Armed Forces given in the table on p. 610 of last week's issue should have been 1,531,880 and not 542,000.

Shorter Notes

A serious blow both to Norwegian recovery and to ERP was struck by Norwegian Communists at the end of September, from which the activities of their comrades in France and other countries south of Norway should not be allowed to divert attention. In defiance of their union and contrary to the general agreement to defer wage claims to more propitious times, shift workers in *Norsk Hydro*—Norway's largest industrial concern—forced a stoppage of work. The most important of the firm's products is nitrogenous fertilisers; over 400,000 tons were exported last year. The interrupted supply of fertilisers hits at Europe's food production—a vulnerable and vital sector of recovery plans. One may assume that this is one of the actions decided upon at the recent meeting of Scandinavian Communist leaders. Reports from Oslo indicate, however, that any successes here will be more than offset by a further hardening against the diminishing but more ruthless Norwegian Communist Party.

*

The British people stubbornly refuse to relinquish their habit of taking their holidays in July and August. Such is the message of a popular pamphlet put out by the British Holidays and Tourist Board who are fighting a dogged battle for staggered holidays. Although only 50 per cent of workers and their families left home in 1947, all holiday accommodation was full during the peak season. Fifty-one to fifty-two million people travelled in 1947 on the main lines in August, as against an average of 38 million for June and September; and the price of accommodation was 18 per cent lower in those two months. The popularity of the period around August Bank Holiday arose from the fact that prior to the general introduction of holidays with pay it profited the average worker to take his holiday in what was by statute a week of short earnings and the effect of holidays with pay has been merely to move the peak to the week before the holiday, thus giving a ten-days break.

*

A number of London restaurants may have to close over Christmas, because, caught between the upper and nether millstones of the 5s. meal limit and the necessity to pay treble wages for work on holidays, they cannot face the financial loss which they would be certain to incur. Trade Union demands run mad will produce a festive season as bleak as even Mr Scrooge could have wished.

Intelligence

Specialists and research workers, statisticians and overseas correspondents: all these contribute to the columns of *The Economist* each week. Through The Economist Intelligence Unit, the same sources can be put at the disposal of business firms and other organisations. The fable of the restive horse

There was once a Horse who frisked and capered, side-stepped, frolicked or loitered as the fancy took him. 'Why not?' quoth he, 'so long as I've a bagful of oats and the sun shines down.' Just then from a nearby wood came the howl of wolves. 'Nay now,' cried the Horse, as he sprang forward, 'it shall never be said that I couldn't take a hint.'

As a nation slow starters, once the race is on we show both speed and endurance. TI have as much faith in Britain's power to outstrip economic calamity as they have in their own manufactures. The one is expressed in the other, for thousands of people abroad have reason to think of Britain in terms of steel tubes, electric cables and equipment, bicycles, light-alloys or paint from TI.

Letters to the Editor

What is the Commonwealth?

SIR,—The Commonwealth has, in the past, rested upon five unwritten rules: that a common outlook would always produce common action; that the main burden of policy would always be carried by Britain; that all the King's subjects would share a common citizenship; that both the unity of the Commonwealth as against the external world and the majesty of each individual Government in relation to its citizens could best be symbolised by the common devotion to the Crown; and that England would always provide a market for the food and raw materials of the rest of the Commonwealth in return for first share in supplying that part of their needs for manufactured goods which their own industries could not satisfy.

The last ten years have destroyed and seriously modified every-one of these assumptions. Eire's neutrality has shown that common views may not produce a common reaction; Dr Malan's election programme has given us a warning that even the basic views may not always be common. The dollar deficit and the aeroplane have made England incapable of carrying the main burden of defence and foreign policy any more; it has already been agreed that the basic Commonwealth citizenship will in future come second to separate local citizenships; even Imperial Preference has become less important, as a sign of the eagerness of Commonwealth countries to help each other, than bulk contracts on favourable terms, the release of sterling balances, or assistance in obtaining needed capital goods. Even the Crown never meant to, say, a French Canadian what it did to a New Zealander, and now Eire is proposing to abolish it even as an external symbol.

Insofar, therefore, as the Dominions in Asia wish to have separate citizenships, or to assert their right to neutrality, or to have Presidents instead of Governors-General, or to get bigger sterling releases rather than larger preferences, they are asking for nothing which is not an accepted part of the Commonwealth constitution as it stands today. The real bond holding the Commonwealth together is a set of common political conceptions, democracy and the rule of law, the realisation that ends do not justify means, the belief that the end of government is the greatest happiness of all, not the good of a class or the aggrandisement of a race; and these beliefs the Asian Dominions share. Nehru and Liaquat Ali Khan have lived them, Gandhi died for them.

I do, however, agree that in the difficult situation in which we all now find ourselves the present loose constitution of the Commonwealth does not make for the quick and effective action required.

I think the Asian Dominions would be perfectly prepared to consider a tightening-up, and there are many advantages in their doing so; India and Pakistan have the only really large reserves of good fighting men in the Commonwealth. But it must be quite clear that whatever rules are drawn up will apply to everybody equally, to S. Africa as to India, to ourselves as much as to Pakistan. If there is to be community of citizenship, South Africa will have to revise her Indian policy. If defence is to be shared, India will have to be encouraged to take the lead for the whole Commonwealth in the Indian Ocean, in just the same way as Australia does in the Pacific. Indians and Pakistanis in Malaya or East Africa will have to be treated in the same way as the British, not as if they were aliens like the Chinese or the Arabs. And if India and Pakistan and Ceylon are to fight for the Brussels Pact Powers, it must be clear that the Brussels Pact Powers will also fight for them. Admittedly, any Asian Dominion which stays in the Commonwealth must accept the obligations as well as the privileges of membership; but the rest of us must make quite sure that we welcome them as brothers, and not just as not very successful cousins.—Yours faithfully,

MAURICE ZINKIN

28 Ebbsfleet Road, Cricklewood, N.W.2

"A Railway Slump?"

SIR,—In a recent article, entitled "A Railway Slump" (September 11, 1948) you remarked upon the rapid increase in the number of vehicles operated on "C" licences during 1946-47 (page 427).

The figures which you quote are the grand totals of all vehicles specified on "C" licences. Included, therefore, are showmen's special vehicles; vehicles owned by local authorities; electrically propelled vehicles; steam-driven and gas-fuelled vehicles; light vehicles used by shopkeepers, delivery vans of all sorts, milk, bread and laundry roundsmen and the heavy vehicles used by builders' merchants, brewers' draymen, and the many other traders who carry large tonnages in their own immediate localities. We do not know how many vehicles are used in this way, but we can safely guess that the majority of all vehicles specified on "C" Licences are employed wholly on local hauls. All these should be removed before the figures are used to indicate a growth in private traders' operations over longer distances in competition with the railways and other public transport. Unfortunately, the statistics collected by the licensing authorities do not allow the necessary distinctions to be drawn.

The only other figures relevant are the numbers of vehicles on which motor tax is paid. Vehicles for this purpose are divided by unladen weight (in some ranges by quarter-ton intervals) from 12 cwt. to 8 tons and over. But no difference is made between vehicles specified on "A," "B" or "C" licences, and no precise information is, therefore, available even about the unladen weight of vehicles operated by "C" licensees. Needless to say the grand total of vehicles registered for motor tax does not agree with the grand total specified on "A," "B" and "C" licences. For one thing the figures are collected at different times of the year—for another the one includes Post Office vans while the other does not.

The truth is that nowhere are there any statistics from which we can estimate, even approximately, how many of the vehicles on "C" licences are used by traders to carry goods in competition with public transport. I myself doubt very much whether anybody (even in the Ministry of Transport) knows this quantity. Let us therefore first beg Ministers and officials to ascertain and publish a few simple facts showing the distribution of traffic between private and public carriers before reopening a question which, as you justly remark, "raises the most fundamental issues about the transport user's freedom of choice and the spur of competition to be applied to the gigantic road and rail transport system which will eventually be operated by the British Transport Commission."—Yours faithfully,

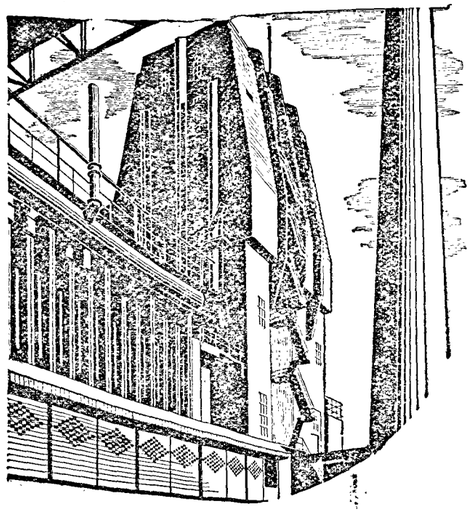
From *The Economist* of 1848



October 21, 1848

A Correspondent in the City concludes a letter to us—"How spiteful the *Times* is against the *Economist*! I hope you will give it them well." It is not worth our while. Our time and our space are too valuable. Any notice we might take of the "*thin-veiled jealousy*" which has been so long evinced towards us, and the pains we have taken to furnish early, correct, and important commercial information, in that quarter, would only give some little importance to attacks which are otherwise harmless, at least to us, whatever they may be to those who indulge in them. . . .

But there is one little point on which we will make a remark, and we will do so very good-naturedly. We are told that it has excited great merriment amongst some of the frequenters of 'Change to see the transparent effort which the *Times* has used to make "*A Merchant*" of Cornhill the medium of expressing its own grumblings. "*A Merchant*" of Cornhill is made, in a letter to the *Times*, to complain that, although he had sent every morning for several days, and several times on Friday, and again on Friday night, to the parliamentary publisher, he could not procure a copy of the Board of Trade Tables which appeared in the *Economist* on Saturday. Our correspondent says, "The *Times* has forgotten that Friday is a foreign post day, when merchants have something else to do than to send after parliamentary papers which they know will come to them in their own way the instant they are published. But," adds our correspondent, "three lines from the recently published very clever satire, entitled a 'Modern Visit from the Devil by one in Babylon,' and dated from Belgravia, explains the real truth":—

His "own correspondent," he said, with an air,
Wrote long letters dated from everywhere,
Though he never stirred out from a certain small square.

The *Economist* has never relied for its success or its usefulness on fictitious or adventitious circumstances. Men must have very little observation who have not discovered before they have been many years in the world, that the only source of certain success . . . is steady, well directed, and unremitting assiduity.

COAL

MANKIND used to regard coal simply as a source of heat, and wasted millions of tons by inefficient combustion. Coal is known today as a source of coke, gas and by-products which, with their many derivatives, are vital to hundreds of industrial processes. In Britain, Europe, Scandinavia, Asia, India and Africa coke ovens and by-product plants by Simon-Carves Ltd. are helping to make the most efficient use of one of the world's basic raw materials.

Within the last twelve years alone Simon-Carves Ltd. have undertaken nearly forty contracts for coal carbonising plant in nine different countries—a total of over a thousand coke ovens to carbonise more than 20,000 tons of coal a day.

The Unimportance of Franco

SIR,—It is difficult to find fault with any one sentence or paragraph in your article "The Unimportance of Franco." I feel nevertheless that its negative conclusions do not fully cover the needs of the moment. Spain cannot, without ultimate loss to ourselves, be left to vegetate until the defeat of Communism and economic recovery in the west cause Franco to disappear behind the receding coat-tails of his *raison d'être.*

We do not like Franco's autocracy and we do not like the methods by which he came to power: many Spaniards agree, but they know that at heart every Spaniard is an anarchist, and even liberal-minded Spaniards conclude that to live at peace Spain needs a strong government. They consequently prefer the autocracy of Franco, which they know and can cope with, to either of the two possible alternatives: the anarchy that would result from any attempt at parliamentary government or the Communism which could only come about after severe fighting.

If it be granted that this is a representative Spanish view, and I believe it is, it is logical that we should shape our policy accordingly, particularly after the unfortunate showing that we have made in collaborating (with the best intentions) with regimes many times crueller and more reactionary than Franco's. The present Government, as witness, for instance, the fact that the works of Garcia Lorca may now be published in Spain, is becoming progressively less rigid. In Spain one has none of that feeling of terror which was omnipresent in Germany before the war and is now present in eastern Europe. This tendency to liberalise will be encouraged if we begin to treat Spain a little less like a naughty child. The course we have hitherto adopted has notoriously succeeded in rallying the people behind Franco and in retarding that process at the same time.

It would clearly be dishonest and, for the reasons set out in your article, dangerous to perform a complete *volte face* and welcome Spain's present Government with open arms. But let us be a little realistic; let us admit that Spain *is* part of western Europe and that by shutting the door we are helping neither her nor ourselves. If, in an ill-conceived effort to salve our consciences for the shortcomings of 1935-1939, we continue our present policy which helps no one, we shall one day find that we have no friends left in Spain. We cannot at this stage open the door wide, but we can without losing face leave it ajar. The recent trade treaty alone is not enough: in modern prisons the prisoners still contribute to the economy by sewing mail bags; but in the hope that they will not always be old lags they are at the same time given a little psychological encouragement.—Yours faithfully,

M.F.

Push, Prod and Encourage

SIR,—I would beg to differ from certain conclusions of the article, "Push, Prod and Encourage," in your issue dated 9th October, 1948.

While granting that economic structures cannot be radically changed over-night, I can find no reason for believing either that the political problems of Western Union are any less intractable, or that "what has been done by the parties of the Brussels Pact represents sounder progress towards the ideal of Western Union than anything that can be expected on the economic plane at Paris."

First, the greatest achievement in setting up the Paris organisations has been the submerging of political differences by common economic necessity. It has been possible to draw into the economic structure of Western Union states like the Scandinavian countries and Switzerland, which give no sign of offering their political or military allegiance.

Secondly, a primarily political approach to the problem of Western Union would prejudice the first line of defence against Communist expansion westward, which is the economic rehabilitation of the recipients of Marshall Aid. Not only would such an approach frighten away the politically and military timid among the western Powers, but the measures of rearmament implied by the Brussels Treaty paradoxically would threaten, and in fact are threatening, the basis of economic defence which opposition to the Communist threat demands.

I would suggest that the attainment of the "practically good" can best be achieved by the measures of western economic integration, the need for which has so often been stressed in *The Economist.* The "theoretically perfect" lies rather in the political sphere.—Yours faithfully,

B. H. MARCUSON

THE WORLD OVERSEAS

Rough Justice in Germany

(By a Correspondent)

THE increasingly acute differences of opinion between the Western Allies and Russia have given German affairs a particular twist, and have presented the problems of occupation in a new light. Denazification, more than any other of the major tasks of British policy, has been subject to this change of perspective, and the enormous difficulties of carrying out the original plan in its entirety have increased the tendency to make it the plaything of public opinion. Recent political developments in Western Germany have thrown into sharp relief some of the inconsistencies of the policy itself, and the attitude of both British and German public opinion towards it. Some of those who a year ago spoke loudest for the end of denazification now feel alarm at the possibility that German nationalism and disguised Nazism might return as factors in Western German politics. It is therefore not untimely to examine British denazification policy in its original form and intention, now obscured by later political influences.

Long before the end of the war SHAEF planned the first steps for the destruction of National Socialism and militarism in Germany. To eliminate the danger of German aggression in the future was considered as possibly the most important reason for the occupation of Germany. The original SHAEF policy of arrest, put into effect the day Allied troops crossed into Germany, was designed to eliminate all the potential leaders of armed resistance, as well as to seize all persons who might later be held responsible for atrocities and war crimes. A secondary, but in the long run no less important, consideration was the need to render impotent those politically dangerous adherents of the Nazi regime who, if left at large, might sabotage the effort to create a democratic administration in Germany.

The speed of the final German collapse, and the rounding-up of those capable of active military resistance, exceeded all expectations. This was due to the well-planned disposal of millions of Wehrmacht prisoners and to the rapid location and arrest of potential "Werewolves" by the intelligence staffs. Even if subversive resistance had been organised on the scale expected, the movement could thus never have had any chance of success.

Tangle of Nazi Administration

After elimination of the purely military danger, the political task of the occupation authorities was twofold. In the first place the existing tangle of Nazi administration had to be cut out and isolated in order to protect the new and extremely tender plant of its democratic successor. The construction of democracy in Germany had to be preceded by the destruction of National Socialism. It was further clearly stated at Potsdam that militarism represented as great a danger to democracy and the peace of Europe as the Nazi creed. However, while it was easy enough to indict both National Socialism and militarism at a conference table, it was far more difficult to translate this abstract indictment into positive action against individuals. The original SHAEF arrest policy was based on the categorisation by rank in the Nazi party and in its numerous affiliated organisations. This method, if by no means perfect, was the best available under the circumstances, and was successful in fulfilling the primary object of removing and neutralising the existing Nazi administrations.

The position of militarists was far more difficult. Was a soldier's rank to be the only criterion? If so, what was the difference between the German soldier and his opposite number in any other army? In order to avoid the possibility of condemning soldiers all over the world, it was necessary to crystallise a special definition for German militarism. While the Western Allies accepted the theory of an aggressive German nationalism as traditional in the officer corps, the Russians came to interpret the term in accordance with the Marxist definition of bourgeois imperialism as a development of capitalism generally. The Western definition thus confined militarism to the German officer class, without necessarily using rank as a yardstick. It must, however, be borne in mind that there was a great similarity of views between this military class and the influential body of nationalistic Junkers and industrialists, who, although classified separately as "Nazi industrialists" in the arrest category, were really far more akin to the militarists.

While the Nazis had to be found and arrested, the militarists were mostly already in Allied hands as prisoners of war. By the end of 1946 the numbers held in internment reached their peak of about 70,000 civilian internees in the British zone alone. The attempt to build a democratic local administration in their absence was, however, not proving a great success. This was partly due to the fact that the arrest of politically important Nazis had not been as thorough and successful as the original action aimed at militarily subversive elements.

Handing Over to Germans

The most important difficulty facing efforts to establish a new administration was the failure of local denazification. This process had been designed to eliminate the smaller Nazis from active participation in civil government. Although denazification was a quasi-legal process in form, it was only in very exceptional cases that definite facts, such as would have survived the tests of an English court of justice, were available. In the vast majority of cases the evidence consisted of the opinions as to character given by neighbours or friends of the accused, and the judgment had to be based on the personal opinion of the judges. It was no exception for former members of the SS to bring a previous superior as witness of good character in return for a similar service when the witness himself was being denazified elsewhere. Obviously the whole success of the procedure depended on the character of the judges. Professional judges were excluded automatically since they had of necessity all been members of the party. So selection was left to British officials, often unacquainted with conditions in Germany, and became a very haphazard affair. Sometimes the judges had only been denazified recently themselves.

It is thus surprising that the British, early in 1947, saw fit to hand over the responsibility for denazification entirely to the Germans, except insofar as British security was directly involved. In spite of the honest and successful work of many individual courts the German population soon lost all respect for denazification in the western zones. At the same time its shortcomings provided a magnificent instrument of propaganda for the Russians.

Until the judgment of the International Military Tribunal, all measures against individuals belonging to organisations indicted at Nuremburg had of necessity been merely tentative; while most of the potential criminals had been arrested, no measures for their disposal could be taken. This did not, of course, effect the trial of those responsible for individual acts against existing criminal law, such as murder, arson and theft. The Nuremburg judgment provided the necessary legislation to deal collectively with such organisations as the SS, the Gestapo and others. To carry out these decisions proved, however, very difficult. New German courts had to be established to try the members of the guilty organisations, a matter of great difficulty in view of the prevailing and acute shortage of suitable lawyers. Then it was found that many of the minor SS and Gestapo men, originally arrested as dangerous to British security, had been released and should thus have been re-arrested—by now an impossibility. It took almost a year in any case before the necessary machinery could be established to begin the trials. Even in July, 1948, there were still 6,000 of these cases on remand awaiting trial.

By this time the disposal of the internees in the camps had become urgent. Public opinion in England was shocked by the fact that a considerable number of civilians should be interned under British rule in Germany without trial and in direct con-

travention of the principle of *habeas corpus*. At the same time the policy of retrenchment in Germany made the feeding and guarding of a cumulative total of 74,000 internees, as well as a large number of prisoners of war, an increasingly difficult and expensive task. A release procedure was therefore worked out, which was to include high-ranking German officers and members of the General Staff Corps. As usual when a policy is hastily planned and executed in the face of the pressure of public opinion and financial necessity, speed replaced accuracy: the previous thorough method of examination prior to the release of an individual was replaced by a procedure whose main object was the release of as many internees as possible in the shortest time. The small trickle of compassionate releases before October, 1946, soon became a flood. The numbers in internment decreased from 55,000 in August, 1946, to 34,000 in January, 1947, and to about 15,000 in May, 1947.

Increased Rate of Release

The form chosen was a procedure similar to denazification. Responsibility for decisions was taken out of the hands of the trained intelligence staffs and given to untrained officials, of whom one on each board of three was required to have a legal background. None of these officials was necessarily acquainted with German affairs. As the judgment therefore depended almost entirely on the personal impression made by the internee on the board examining his case, the more skilful and clever (and therefore usually the more dangerous) the man, the more likely he was to obtain his release. This tendency particularly favoured the well educated and able officer of high rank at the expense of the indoctrinated minor Nazi incapable of disguising his views.

During the last twelve months political developments and public opinion have tended to increase the rate of release still further. Originally the release of important internees was coupled with the imposition of certain civil restrictions and police supervision. Gradually the boards tended not only to make very little use of their power to recommend further periods of internment, but also imposed fewer and fewer restrictions. At present the remaining number of internees is very small, 600 altogether in July, 1948, and confined to obviously unrepentent nazis and a very few high-ranking officers who fall directly under the group of independent army commanders and members of the High Command (OKW) specifically mentioned at Nuremburg for trial by Germans. It would therefore seem that even those few safeguards provided in the release procedure of October, 1946, have been dropped in favour of an outright policy of release.

In judging the internment and denazification policy of the last three years three questions must be answered. How correct were the premises on which the policy was based? If they were correct, how successfully would the policies adopted have dealt with the problem? Finally, how successfully has the policy been implemented in any case?

A Fifteen Year Problem

The original plan announced at Potsdam assumed that the solution of the whole problem would take ten to fifteen years at least. There is no obvious reason why the present political situation in Germany should in any way have altered the correctness of this assumption, even if it reduced the time available by over two-thirds for other reasons. Yet the changes that have been made in the original policy seem to assume that the German problem is now well on the way to solution, that a recurrence of German aggression in the future has become utterly impossible, and that the view of the situation taken at Potsdam was entirely erroneous. It was further taken for granted by those who made the first policy of arrest that the release of internees would not generally take place until a democratic administration had been firmly established and enjoyed the genuine support of the German people.

As far as the execution of the denazification policy itself is concerned (insofar as one can speak of one continuous policy after such radical changes) the treatment of a unique political question by legal means has tended to nullify the original political objects, though it may have dealt more fairly with individuals. Thus an individual who had been interned because, in the opinion of the occupying power, his outlook and activities might represent a danger to the most vital political objectives of the allies, was now offered a chance of release if he could prove by quasi-legalistic means that his actions on release would not represent a danger to whatever might be allied policy in the future. The recent statement by the British Military Governor regarding denazification that "rough justice had been done" shows that even the highest authorities in Germany have adopted this legalistic view of a policy purely political in origin.

Statistically denazification and decentralisation have no doubt been a success. Over 90 per cent of those interned have been released after some form of investigation into their cases, and an enormous number of minor Nazis have been dealt with by the German courts. The trials of members of organisations found collectively guilty at Nuremburg is proceeding apace. If denazification can really be reduced to a legal basis, rough justice may indeed have been done. On the other hand, whatever else might be said of the sometimes cynical methods of denazification by German anti-fascist "bloc" committees in the Russian zone, it has always remained a purely political affair without any legal superstructure, and, for a policy quite unrelated to an attempt to dispense individual justice, has been successful.

Ultimately the success or failure of the British effort will be shown in the future, when the political safety curtain of occupation is removed. Since the policy adopted cannot have eradicated the hard-core of political nationalism, of which National Socialism is after all only an expression, there may be some odd growths in the lush political vegetation growing up under the warmth of Anglo-American favour. It may even happen that the recent nationalistic movement fostered by the Russians in the East will join up with similar latent elements in the West, though the obvious economic discrepancy between Western and Eastern Germany stands in the way. It is significant that already today the two major political parties in the West have expressed alarm at signs of open reappearance of an aggressive political nationalism, the same parties who protested against the "human indignities" of denazification only 12 months ago. In this paradox between the method of denazification, and its original objects and desired results, lie the difficulties of the present and the dangers of the future.

Tempers Rising in Cyprus

[FROM A SPECIAL CORRESPONDENT]

Nicosia, October 17th

DURING the last few months the political situation in Cyprus has greatly deteriorated, both from the British standpoint and from that of all Cypriots who prefer a quiet life to a life of political hurly burly and physical insecurity. No major outbreak of violence has yet occurred, but the antagonism between left and right—already described in *The Economist*—has hardened into a social and economic boycott in most towns and villages. On the left the throwing of grenades and the preparation of dynamite has become much more frequent. Their missiles are destined for several targets: their political rivals, their employers, usually British or American, at the mines, and—the police believe—the American monitoring station now nearing completion on the island. In the din emanating both from the terrorist left and from the less violent but no less noisy right, the large middle group of moderate opinion feels less than ever inclined to shout for a hearing. It is a grave thought that the island's British administration contains at the top no person with sufficient presence, character or capacity for capturing public imagination to save a situation which, though deteriorating, is not desperate. What is needed is a governor who can ginger Whitehall, and through Whitehall, Athens into a joint statement on the dangers inherent in Russian policy in the Eastern Mediterranean.

For it is now obvious that the Cypriot left wing is simply carrying out orders that are but one facet of Moscow's anti-western activity in the area. Otherwise why plan to blow up the very installations that are bringing in much-needed dollars to right Cyprus's sorely unbalanced international trade position? The left, which controls a majority of the political groups that pass under the name of trade unions, has money enough to finance lengthy strikes. It is believed that some, at least, of this came in the form of smuggled gold sovereigns from a Red fountainhead located in Beirut.

12,000 Jewish Prisoners

Their importance as a potential source of trouble is enhanced by the presence in the island of a residue of the detention camps for Jewish immigrants, situated round Famagusta. The majority of the 12,000 immigrants still there are able-bodied men of military age.

Especially since the rejection of the Habeus Corpus action inspired by the Israeli Government, their mood is, possibly understandably, extremely ugly. Many have been in detention camps of

sorts since 1938 and now feel that they will never get out. It is at present inadvisable for visitors to enter the camps. The British Army guards supply their rations and some clothing—a winter issue is about to be made—and the American Joint Distribution Committee provide comforts most liberally But the troops who guard the double rows of high barbed-wire rarely go inside. For this reason, and because the internees resolutely refuse to be counted, the camp authorities are by no means certain of the actual numbers. It is believed that some of the more enterprising, or more valuable to the Jewish war effort, have escaped and have been taken to Palestine in small caiques or launches. Those who are left spend most of their time practising close-combat exercises and drilling. There is steadily accumulating evidence that if the bulk are not Communists, the camps are Communist-dominated. Contact with the island's leading Communists is believed to take place. In addition, the official Israeli radio station, *Kol Israel*—the Voice of Israel—has been hinting very strongly recently that their only hope of freedom is a mass break out from the camps.

There have been minor and least two major attempts to escape. Two separate tunnels, as good or even better than most constructed by British prisoners of war, have been discovered. One was 150 feet long and 15 feet deep; it had electric light to assist those working in it, which was operated from the cables feeding the searchlights which play along the barbed wire. The second, not quite so long, contained a telephone. Both tunnels were completed when, almost by chance, they were discovered. One, it is thought, had been used by a few of the ringleaders who had got out into the town to make arrangements with contacts there for a mass escape. The other had only just been finished and there were no signs that anyone had used it.

The Cyprus Police, a loyal and efficient force of about 1,000 men (it may shortly be increased) could not handle an escape of several hundreds or thousands of determined Jews; the Army could only do so by the use of all the force at its command. Such an eventuality would be deplorable, and British pressure for a quick Palestine decision in Paris is, naturally enough, in part actuated by self interest. Until His Majesty's Government can send these Jews on their way with a clear conviction that it has not infringed Count Bernadotte's truce terms, it must be a prey to grave anxiety lest they stage a rising that tempts the Cypriots left to rise with them.

Turkey's Silver Jubilee

[BY A CORRESPONDENT]

ON Friday next, October 29th, Turkey celebrates the twenty-fifth anniversary of the founding of its Republic. It deserves congratulations upon many counts—on twenty-five years of peace, of a rising national income, of major industrial development, of satisfactory struggle with illiteracy, of transition—at least in its cities—from a mediæval to a modern way of life. Few countries have so greatly changed, in so short a period, in such stable conditions. From its allies in the west it deserves a special greeting upon being the only dictatorship in Europe which has over several years sustained and practised the concept that it must get out of totalitarian ways if it is to become the sort of state that it wants to be.

Just how far this process has evolved is illustrated by this week's happenings over by-elections to fill thirteen vacant seats in Parliament. In Turkey by-elections are held *en bloc* about half way between general elections; the next general election is due in 1950. The 1946 general election was held on the basis of a new electoral law. This had become imperative on account of the birth—as it were by presidential permission—of an Opposition in the western sense of the word. The new law therefore substituted for the old electoral colleges, run by a single party, a system of committees to run direct first degree elections in all constituencies It is obvious that under such an arrangement, in a young country, an immense responsibility falls on those supervising the polls. Can a peasant who cannot read or write record a secret vote? The Government, taxed with this question, argued that it had done everything possible to enable him to do so; undoubtedly its explanations of the process were painstaking to a degree. The opposition answered that secrecy was not assured. "They tell us," said its leader, speaking in Istanbul at the end of last month "that a similar electoral law to ours is in force in England. But it must be remembered that in Britain it is not the law, but political morale, which predominates, and that nobody would ever dream of forging elections."

In a word, the Democratic Party, echoed by the smaller Nationalist opposition party, charges the Government with falsifying the last general election, and demands changes in the electoral law that will give it safeguards for the future.

Fair Methods at the Polls

Before holding the by-elections, the Government attempted to meet this demand. It passed a new bill, and consulted the Democrats over its drafting. But the new text does not satisfy these last. It does not meet all their requirements. They remain incensed, and have, together with the Nationalists, boycotted the by-elections. They have been supported in this course by all but one of the independent newspapers of importance. The new Bill makes an attempt to adjust a situation in which the polls were supervised by privileged persons, civil servants and local government officials who are, and will for some time to come be, the Government—Republican People's Party nominees. It strengthens the hand of the electoral committees who supervise secrecy at the polls, and it renders falsifiers liable to prosecution and severe penalties; but it does not concede to the Democratic party its two principal demands. Of these the first is that the magistrature shall be represented on the supervisory body. The Government replies that, under the constitution, magistrates may not meddle in politics. The Democrats retort, pertinently enough, that they are not being asked to meddle, but simply to see that all is fair. Their second demand is that the election committees shall be "mixed"—that it shall include opposition nominees.

Since only he Government party voted in the by-elections, the results are not a complete guide to the state of public feeling. But the small percentages that went to the polls—first reports record a poll of only 10 per cent in Ankara and Instanbul, though in rural districts it was heavier, amounting to between 20 and 40 per cent—suggest that, as is only human, there is widespread reaction against a party that has held power for so long. It is strong in the towns, and seems to be undisturbed by this year's split and purge in the Democratic party ranks. Broadly speaking, it represents the reaction of big business to rigidity of government control; a point to watch, therefore, over the next years is how far the Government attempts to cede points in order to meet this criticism. One of the Democrats' chief weaknesses is that they have in their upper ranks no economists of the calibre of the men serving the Republican People's Party. Like their counterpart the British Opposition, they lack and badly need a Cripps.

New Patriarch in Constantinople

The Œcumenical Patriarch, Maximos V, who has for long been ailing in mind and anxious to resign, has at last given up his office. If, as is expected, a majority of the Turkish bishops who elect his successor vote for Athinagoras, Archbishop of America, several important consequences will ensue.

For the first time for five centuries there will be a Patriarch of Constantinople popular with both Greeks and Turks (Athinagoras was born a Turkish subject in Ottoman days, but subsequently became Bishop of Corfu, and a Greek subject, before becoming an American citizen; his candidature is greatly favoured by the present Greek Government). Secondly, an extremely competent man will succeed to the office; Athinagoras has during his time in America put some order into the once chaotic state of Orthodox Church affairs there. Lastly, the directives now being issued by Moscow radio for use in his election can be confidently predicted. They are that Russia, containing the biggest Orthodox Church community in the world, deserves to be the seat of the Church's primary patriarchate; that a patriarchate which demands the election of a Turkish citizen is subject to Turkish pressure, and that this particular Patriarch is resuming his Turkish nationality simply in order to serve as the "tool of American capitalists."

These arguments may sound well to Russians. To others, they ignore the facts, first, that the Orthodox Primary is based not on numbers but on theological precedent; and, secondly, that the Turkish Government has scrupulously observed its rule not to meddle in Orthodox Church affairs provided that the Patriarch is a Turkish citizen and does not dabble in politics.

AMERICAN SURVEY

Next Year's Aid for Europe

(From Our US Editorial Staff)

SENATOR VANDENBERG'S warning that the programme of the Economic Co-operation Administration will be very carefully examined when Congress returns to Washington was issued just as the agency completed its first six months of operation. Congressional concern will, of course, be focused on western Europe, and on its progress towards a unified recovery. But the ECA headquarters in Washington bears the responsibility for accepting the programme drawn up at Paris as a satisfactory first step toward carrying out the ends which Congress had in view when it passed the Foreign Assistance Act. It also has had to work out the procedures necessary to make the Act effective. So Congress will want to inspect what has been happening in ECA at Washington as well as in Europe.

On April 6, 1948, Mr Hoffman started with an Act of Congress (unaccompanied by appropriations), some empty space in a new office building, and a small group of people from other agencies who had worked on the committees which laid the groundwork for ECA. His immediate needs were funds and a competent staff. The assembly of the team posed the question of how well it would be possible to staff a government agency in a period of full employment in peacetime. The question has been answered satisfactorily. By no means all of the top appointments were accepted by the first men to whom they were offered, but the quality of the men who did accept Mr Hoffman's invitation to work for longer hours, and for less money, is impressive. The distaste of Congress for the State Department suggested it would be unwise to depend too much upon that source. The men most clearly available were a group from the Department of Commerce—Mr Harriman, Mr Foster, Mr Bissell, and others. The Administrator had two other resources to fall back on. He could play on the nostalgia of some of the business men who had worked in Washington during the war, and his Committee on Economic Development had given a number of executives experience in semi-public service in the years since 1940. No one could complain that these men were impractical idealists who, in the famous phrase, had never had to meet a payroll. It is doubtless an ironic accident of history that ECA's budget director, like the Congressman who attempted to slash ECA's appropriation last June, is also a Mr Taber from New York.

The bipartisan character of the two top Washington appointments, those of Mr Hoffman, a Republican congenial to Mr Vandenberg, and Mr Howard Bruce, a Democrat favoured by the White House, makes it highly unlikely that, if there is a change in government in January, the staff of ECA will undergo many serious changes. In 1933 the incoming Democrats lost no time in providing transportation home for Mr Hoover's Commercial Attachés. In 1949 there may be some exceptions, but by and large the staff of ECA is expected to survive a Dewey landslide.

There are two public boards attached to ECA which help to make it representative of the nation, rather than of one party or any one set of interests. One is an advisory group representing agriculture, labour, management, and the professions. Its function is to interpret aid to Europe to the various pressure groups, and act as a buffer between them and ECA. Another advisory committee, on fiscal and monetary problems, is also representative of a wide cross-section of opinion.

★

Authorisations to buy, rather than the actual procurement of supplies, are the chief business of ECA, because Congress put great emphasis on the use of private trade channels for purchasing. The range of considerations to be taken into account has been of the broadest. Problems have been presented both by commodities in short supply like steel, and by those of which there is a surplus, like tobacco. So far, the ECA has kept in reserve the right it possesses to appeal to the Secretary of State to rule that the export of a given commodity promotes the security of the United States. Trade attitudes and pressures have varied directly with supplies. Warnings against depriving Americans of essentials have been varied by thinly veiled invitations to ECA to carry out a dumping programme.

Opinions vary about how soon real shortages may develop, and in what commodities they will appear. An investigating committee of the House has just reported that 10 to 12 per cent of all US sheet and strip steel production in the last nine months has been sold at grey market prices. The present voluntary allocations programme, which sets aside steel for urgent needs, is due to expire in February unless Congress extends it. Rearmament, insofar as it takes the form of aircraft production, will chiefly affect the light metals, but increasing shortages are foreseen within six months in a wide range of industrial materials. It should be noted, too, that actual deliveries under ECA authorisations, especially of industrial items, are still far smaller than the sums committed; the reduction of supplies in the American market owing to purchases financed by ECA will, therefore, be much sharper in the latter months of its first year than it has been to date.

By contrast, some industries have reached the stage where their salesmen are looking for orders, and many agricultural commodities are now returning to a state of surplus, with the government committed to support their prices. A Republican Administration whose pre-election promises included a balanced budget might be strongly tempted to make ECA's appropriation do double duty.

★

ECA is clearly determined to account, with unprecedented thoroughness, for every penny it spends. In its accounts, no "miscellaneous" categories are to be permitted, lest Congress suspect that something unsavoury is being hidden. It will be interesting to see whether one decision on the technique of accounting, achieved with great difficulty by the Harriman Committee, and eventually approved by Congress, comes back to haunt the request for the second year's appropriation. This was the decision to fix the ratio of loans to grants on the basis of a country's ability to pay, and for ECA thereafter, to assign monthly expenditures to the country's account in accordance with that ratio. This is based on a belief that in a balance of payments operation there is no difference between a loan dollar and a grant dollar.

Such a procedure, clear as is may be to the financial community, may be less so to Congressmen who were insistent on the segregation of $1 billion for loans and transfer guarantees to American businesses making investments in the participating countries. (Business investment has been very slow; a few inquiries, mostly relating to the United Kingdom, have been received, but only one proposal is at all near consummation. The recent loan commitments of ECA indicate it does not count on needing anything approaching the $300 million authorised for transfer guarantees, and financial opinion in New York minimizes their importance to the prospective investor). The traditional concept that a loan must be for a specific purpose dies hard in Congress. Congressmen, and others, may find it difficult to understand that when ECA finances British imports of food, it releases for the construction of capital goods in Britain labour and materials which would otherwise have to go into exports, and that Britain's productvity may be increased as much in this way as by direct investment of American loans in British factories or mines.

A misunderstanding on this point could become serious in connection with one of the several lines of attack on ECA's appropriation for next year. These can already be foreseen. Actually, ECA will have to appeal to Congress twice, once for funds to carry it from the end of its first year of operation in April to the end of the American fiscal year in June, and again for its next annual appropriation. One complaint will come from those who perennially try to substitute the perfect for the good, and demand federation now with an insistence chiefly indicative of their ignorance of Europe's past. Another will be the neo-isolationist line that the United States should keep its economic resources at home, that a military union is the one that is readily feasible, and that military lend-lease is the most effective way of aiding Europe. But perhaps the most dangerous resistance will come from those who have reached, more or less reluctantly, the view that ECA is turning into another Unrra. They will argue that the participating countries have been interested solely in grants, and took loans only when forced to do so. They will insist that the terms for loans have been watered down until the word is a misnomer, that few long-term projects have been undertaken, and, most important, that there is no sign of those joint projects representing the first steps toward the unification of the markets and resources of Western Europe.

These impressions will make Mr Hoffman's task more difficult when he appears before Congress to justify further appropriations. It has been pointed out that the stress put by Mr Dewey during his campaign on the importance of ECA will make it impossible for him if he is elected, to avoid supporting Mr Hoffman's requests. But the fact remains that ECA was expected to be concerned with western Europe as an emerging entity, not with an assortment of separate participating states. A President seeking Congressional support will be in a much stronger position if he can point to some concrete evidence that a start toward unification has been made.

It is quite true that the country-by-country studies to be presented next year by ECA will contain impressive indications of recovery up to and beyond prewar levels, even though they may not entirely justify the optimism expressed by Mr Hoffman on his return from Europe. But before the war, these countries had resources beyond their borders which are no longer available. It will be very hard to convince Congress that there is any alternative—except resignation to a declining standard of living and power—to a bold move to include the territories and resources of Europe within a single economic area.

American Notes

Ten Days to Go

With only ten days left before the election, the exchanges between the two parties are growing more heated and more extravagant. In a campaign in which foreign policy floats precariously above the battle, the dispute has now turned to the question of who first proposed this exercise in self-denial. Mr Dewey's claim to the lion's share of the credit both for initiating a bipartisan approach to foreign affairs and for transforming ERP into something more than "just a handout" has brought a sharp rejoinder from Mr Cordell Hull who, up to now, has taken no part in the campaign from the hospital bed in Maryland where he has spent the last two years.

His reminder that neither party—and certainly not the Republicans—can stake out an exclusive claim to the bi-partisan concept of foreign policy is made more to keep the record straight than for its effect on the election results. The *New York Times*, on the basis of reports from correspondents in the doubtful States, estimates that Mr Dewey is certain of victory in 27 States with 333 electoral votes (266 are needed to win). Mr Truman is given only nine States, with 82 electoral votes. These are chiefly Southern and Border States, where the Dixiecrat infection has been resisted: Arizona, Arkansas, Georgia, Kentucky, Missouri, North Carolina, Oklahoma, plus Nevada, and Rhode Island. Governor Thurmond, though his States' Rights party is on the ballot in 11 Southern States as well as two others, is expected to carry only four. Mr Wallace, however great the popular vote he rolls up, is given no chance to carry a single State. Of the eight States still considered doubtful, three, West Virginia, Texas and Tennessee, with 43 electoral votes, are leaning toward Mr Truman, and three others, Maryland, Montana, and New Mexico, toward Mr. Dewey. The long lead Mr Dewey is expected to enjoy in the Electoral College does not mean that the popular vote may not be fairly close. Dr Gallup believes it may follow the pattern of 1944 and 1940 rather than that of the landslides of 1932 and 1936.

In the races for the House, the Democrats are thought likely to pick up from 11 to 20 seats, with the Republicans winning in four other close races. The net again, however, would still leave the Democrats far from achieving the increase of 31 seats necessary to give them a majority in the House. The belief is also gaining ground that the Republicans, thanks to Mr Dewey, will be able to hold the Senate, though his last-minute decision to make another crusade through the doubtful States in support of candidates who, in the main, are likely to oppose his policies, suggests that it is still a close thing.

Should there be a tie in the Senate, the Republicans would continue to control its organisation and its committees; but Mr Warren, as Vice President, would have to stand ready to cast deciding votes, and might not have time for the new executive duties being planned for him. A Democratic victory, among other results, would deprive Mr Vandenberg of his valued chairmanship of the Senate Foreign Relations Committee and make him more open to offers of a Cabinet post.

★ ★ ★

Mr Dewey's Pledges

In one respect there is a striking similarity between the campaigns of 1940 and 1948. In both, the chief issues the United States was about to be forced to decide have lain, like icebergs, mainly below the surface. Mr Winthrop Aldrich alone (who, it is thought, may be the next Secretary of the Treasury) has openly advocated the granting of military lend lease to Europe, and the related question of the size of the military budget is still undecided. Mr Truman's ceiling of $15 billion for defence (which includes $600 million for stockpiling) has now been challenged by the military, who declare that if it is enforced, they will not be able to meet the target of a 70-group air force by 1952, expand the Services as planned, or proceed with their schemes for increased production of weapons. It is hoped that once the election has verified Mr Dewey's claims to the Presidency he and his advisors may be brought into consultation with the Administration on foreign and related domestic issues. In 1932 Mr Roosevelt declined an offer to share Mr Hoover's responsibilities during the prolonged vacuum between his defeat and Mr Roosevelt's inauguration. Today, the interval is much shorter; the need for a firm policy is quite as great; and no gulf like that between Mr Hoover and Mr Roosevelt separates the leaders of the two parties.

In his campaign Mr Dewey has been promising "All this and a balanced budget, too"—all this including more strength for defence, a Department of Social Progress to co-ordinate federal welfare work, the extension of social security, continued support of farm prices and broadened services to agriculture, more housing, the expansion of government-owned power plants, and continued aid to Europe.

However generalised, this is a programme with a New Deal flavour which many of the Republicans in Congress—and particularly in the House—will find difficult to swallow, particularly if it not only rules out further tax reduction, but leads to tax increases or deficit financing. It is a sign of the care with which Mr Dewey is mapping out not only his campaign, but his Administration, to avoid major pitfalls, that he has taken time out to visit Mr Halleck, a disappointed candidate for the Vice-

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Presidency and Republican leader of the House. Mr Halleck's views on both domestic and international issues have run strongly counter to those Mr Dewey has been expounding. With the help of other stand-pat Republicans like Mr Martin, Mr Taber and Mr Knutson, he could, unless propitiated, delay and cripple Mr Dewey's programme.

* * *

New Line in Houses

Boards are beginning to remain up for an appreciable time outside empty houses, which are also being advertised again in the newspapers. The number of houses started each month is declining and only about 900,000 are expected to be built next year, compared with an estimated 950,000 this year. The housing boom is drawing to a close, but the housing market is far from saturated. The boards and the advertisements refer only to a special class of house, houses for sale at a price of $13,000 or more. America still needs over 1,000,000 new houses a year for the next ten years, but they must be houses to let at reasonable rents, or to sell at under $10,000. The housing legislation passed at the special session of Congress did something to encourage the construction of dwelling units for letting, with what success cannot yet be judged. The problem of selling prices, which have doubled in the last ten years, has been made acute by recent increases in the cost of labour and materials, but high costs plagued the housing industry long before the present inflation.

One answer has been found by the Southern Research Institute, which has designed a four-room concrete bungalow, no more unsightly than the wooden shacks it replaces, which the owner can build himself for $550, with $350 more for plumbing. At the other end of the scale are the prefabricators, who had visions of applying industrial mass production methods to the product that the masses need most. Their visions have turned out to be realisable only at a prohibitive cost, because of the hard facts that defeat more conventional house builders—local building codes, restrictive labour practices, lack of capital—and of some that are peculiar to themselves—shortages of material that interrupt production and the high cost of transporting finished houses from factory to site.

There is, however, an intermediate answer that has been found by a number of builders, of whom the most publicised is Mr William Levitt, of Long Island. He is building houses at a rate of 450 a week for rent, almost unheard of in America today, at $65 a month, or for sale at $7,990 (not long ago it was $6,990). Only veterans can have these houses, since only veterans can obtain the government guarantees on which, combined with ordinary Federal Housing Administration insurance, Mr Levitt depends for the financing of his operations. This means of obtaining the capital needed for large-scale building will not be available for ever, but even though this particular answer to the problem of cheap houses has only a limited usefulness, some at least of its lessons have a wider application.

Mr Levitt avoids many of the troubles of the prefabricators by introducing production line techniques on the site instead of in the factory. His houses, four rooms and an attic, side by side in gently curving rows, are fundamentally identical, although the pitch of the roof and the finish of the walls may vary. This similarity enables him to buy his materials in bulk, made to his specifications, from suppliers who usually work only for him and are often owned by him. Foundations are prepared before the frosts and he plans his schedules so that neither men nor machines are ever idle. His workmen specialise in particular jobs, such as fixing shingles, installing bathtubs, many of which require little skill. But Mr Levitt pays high wages in order to avoid labour troubles and to remain independent of the trade unions.

All this means that a Levitt house is as good, or better, value than any in America today. The cost price even includes those essentials of the American way of life, modern heating, electric refrigerators, Venetian blinds (bought by the freight car load), which the iconoclasts are suggesting might be foregone in the interests of building a house which the homeless can afford. Some at least of the 6,000 families living in Levittown, where every house is built by Mr Levitt on plots 60 by 100 feet landscaped by Mr Levitt, on concrete streets named Crabtree Lane or Honeysuckle Road, with a swimming pool and a church to every thousand homes, must feel that the advertisers' dreams which filled the magazines a few years ago were not as misleading as they have often meanwhile seemed to be.

The Future in Coal

In 1940 one of Mr Willkie's liabilities was the vicious attack of Mr John L. Lewis on President Roosevelt and his endorsement of the Republican candidate. The miners were not deterred from supporting Mr Roosevelt, and other voters were alienated. This year Mr Lewis attacked Mr Truman with equal vitriol at the convention of the United Mine Workers in Cincinnati, as "a man totally unfitted for the position. His principles are elastic and he is careless with the truth." But Mr Dewey, who is probably as well pleased, received no direct endorsement; he was even rebuked for his support of the Taft-Hartley Act.

Mr Lewis appeared before the convention not only sanctified by his struggles against the Taft-Hartley Act, glorying in his wounds and boasting of his enemies, but triumphantly able to report the beginning of pension payments to retired and disabled miners. His position in the union has never seemed more impregnable; any sign of opposition was immediately overruled. The miners' gratitude took the form of raising Mr Lewis's salary to $50,000 a year from $35,000 (making him the highest paid union leader in the world), designating Mr. Lewis's birthday, February 12th, as a miners' holiday (it is observed by non-miners as Lincoln's birthday), and, in anticipation of further legal disputes with the Government, raising the monthly dues from $2 to $4, of which half will go into the international's treasury. The union, despite the heavy fines incurred, still has over $13 million in the bank; this new recognition of the increased dollar value of membership will raise its annual income by nearly $12 million.

But the convention also reflected awareness of a threat even more dangerous than the use of the injunction. For the first time since the United States entered the war, supply is catching up with demand in coal. The chief factor is the fall in exports; at about 25 million net tons in 1948, they will be only just half over those of 1947. Many mines are curtailing output. In the South the "snowbirds"—the makeshift workings brought to precarious life by high demand and high prices—are melting. Coal supplies now stand at a four year peak of over 64 million tons. Production is slightly down from that of last year, but is still above that of 1946 and 1947 and much greater than it was before the war.

*

Mr Lewis served notice that if the days of anarchic competition, overproduction and wage cuts which characterised coal before the war returned, the mine-workers would stabilise the industry by a share the work campaign. "If there is only three days' work a week, for this industry, we will have three days' work for everyone. If we are going to starve, we starve together." Such a move would be based on the "able and willing to work" clause in the miners' contract. In the anthracite districts of eastern Pennsylvania, a stabilisation plan operated by the union, the owners and the State, decrees how many days' work a week there exists, on the basis of demand. In soft coal there has been no such stabilisation plan since the Guffey Act, passed with the active support of the UMW, was declared unconstitutional ten years ago.

An attempt to share the work will probably be made before the situation becomes desperate. The coal contract expires on June 30, 1949. The aims of next year's negotiations were left to the discretion of Mr Lewis, but they are likely to include a 7-hour day and 35-hour week (which the miners had before the war) with no reduction in take-home pay, now averaging about $70 for a 40-hour week. (In 1919, when Mr Lewis became president of the union, it was $30 a week.) The union believes a 35-hour week sufficient to produce all the coal that can be sold.

The coal operators, meeting in New York, insist that the demand for high-grade, well-sorted coal is still more than they can meet. But they are energetically seeking to broaden that market, by research into push-button boilers, petroleum synthesis from coal, and coal-fired gas turbine locomotives. The larger firms are also seeking vigorously to lower costs by installing new machinery while profits are good and the machinery is available. The purchase of Polish coal with ECA funds, not unexpectedly, was condemned and the industry is apparently hopeful that the need, in the name of security, of conserving oil reserves will lead to a revival of the importance of coal as America's chief source of fuel.

* * *

The Giannini Empire

The charge of "credit monopoly" brought against the Transamerica Corporation of San Francisco by the Federal Reserve Board is one more sign that the west has come of age. It is not many years since the "money power" was synonymous with Wall Street, and all the threads of the money trust seemed to lead to an eastern spider. Transamerica is the gigantic holding company of Mr A. P. Giannini, the founder of the Bank of America; it holds, beside a 20 per cent interest in this, the largest bank in the world, controlling interests in banks in Nevada and Oregon, life insurance interests and other credit enterprises, as well as having a finger in real estate, fishing and many manufacturing undertakings.

A two-year investigation lies behind the present hearings, held under a never before used authority of the FRB, which empowers it to enforce the anti-trust laws as they affect banks and bank holding companies. It is believed that the FRB was compelled to act as its own policeman because Mr Clark, the Attorney-General, doubted whether there was sufficient evidence to justify the intervention of the Department of Justice. Rumour also suggests that it was Mr Marriner Eccles's energy in forwarding this investigation and in supporting Senator Tobey's Bill to limit the expansion of bank holding companies which was responsible for his replacement as chairman of the FRB by Mr McCabe. This is only the latest of a long series of Mr Giannini's brushes with authority: with the banking supervisors in California, the Securities Exchange Commission, former Secretaries of the Treasury and eastern financial interests.

If the FRB (which in these hearings acts as prosecutor, judge and jury) finds the charges substantiated, Transamerica may be required to sell all its interests save those in the Bank of America. With its resources of $5 billion, its 516 branches in California and six other western States and its 4,000,000 customers, this in itself is an empire any Cæsar might envy. Since 1904 the Bank of America (originally the Bank of Italy) has made steady, if spectacular, progress toward that bigness which Californians like to think is typical of their state. Every opportunity beckoned. Not only did California permit the combination of commercial with savings deposits, which is one of the Bank of America's most useful assets, but it is one of the few states which permit state-wide branch-banking. Most states either prohibit it absolutely or limit it to a single community. But California was also expanding much faster than the rest of the country. During the bank's 50 years of existence the population of California has multiplied fivefold; from being the twenty-first state in population, it has leaped to third place. Moreover, the war subjected California to a forcing process which compressed the industrial growth of a lifetime into a few years.

But the Bank of America is three times the size of its nearest competitor in California; a favourable environment is only part of the story. Its management has always made a speciality of serving small customers, either with deposit facilities or loans. And it has been quick to take advantage of the investment opportunities offered by instalment and consumer loans, including the home mortgages guaranteed by the government.

* * *

Rail Rates and Wages

The recurrent pattern of railroad wage and rate advances is causing some concern to industry. It is true, of course, that the spectacular rise in operating costs justifies the contention of the managements that relief must be afforded if a basic industry is to keep its head above water. But at times like the present, a fresh upward move in transport costs tends to have an explosive effect throughout industry precisely because the impact is felt most severely by steel and other metals, and by the bulk durable goods where there is still evidence of considerable pressure against present price levels.

Wage costs account for more than one-half of gross operating revenues, and there is no reason to believe that the railroads can secure stability at present levels. The industry greatly strengthened its competitive position against road and water transport during the war years, when freight rates were virtually held to pre-war levels. Since that time, however, rates have risen by about 45 per cent on 1939, and while the financial position of most companies is now immeasurably stronger, there is very little margin against increasing costs. In 1947, the main line systems altogether retained only $500 million from operating revenues of $8.7 billion. This year, the net income level will be not more than $650 million, although gross receipts may be as much as $1 billion higher than in 1947. Moreover, this improvement will be due to the rate relief afforded. Business activity has held at peak levels, but the volume of goods traffic in 1948 has been lower than in the previous year, a clear indication that traffic is being lost to competitive services.

Fresh wage awards have been granted to some railroad workers from mid-October at an estimated cost of about $60 million yearly. This concession, however, covered only a very small proportion of claims from all grades of workers. If awards are made to all workers on the same basis, the annual cost would be as much as $400 million. But the other unions concerned are demanding far more radical changes in hours and working conditions, and the total advance in costs could then be as high as $1.5 billion, a result which would put many companies on the road to eventual bankruptcy.

To meet the first wage claim, the railroad managements asked for a further rate increase of eight per cent early this month. To meet other claims, the Interstate Commerce Commission is now asked to sanction a rate advance of 13 per cent which would bring the general level of rates to more than 60 per cent above prewar. Some further relief seems certain. But the industry is unlikely to do more than to hold its present precarious margin over operating costs, and its position during a time of rapidly contracting business activity would then be decidedly unhealthy.

* * *

Taft and the ITU

The long-drawn-out battle of the printers against the anti-closed shop provisions of the Taft-Hartley Act reached a new, but not decisive, stage when Judge Swygert last week in Indianapolis found the international union and four of its officers guilty of contempt for persisting in seeking closed shop conditions despite an injunction issued by the court against such practices. Some time ago the printers reached a settlement in New York and other cities which included "competency tests" for non-union printers applying for jobs, but in Chicago an ITU local is still being sustained in its ten-month-old strike against five newspapers. Senator Taft, one of the fathers of the Act, in a meeting with some of the counsel for the NLRB, expressed dissatisfaction with the desultory fashion in which it was being enforced in the ITU case. Not long after, Mr Denham, national counsel to the NLRB, asked the court to forbid the international to continue to pay strike benefits to the Chicago local, prohibit the ITU from encouraging strikes in violation of the injunction, outlaw contracts which discriminated against non-union printers, and those which gave union foremen the right to hire and fire.

The court's order upheld Mr Denham on points three and four, but failed to include the other two prohibitions. The union is now celebrating a limited victory, and considers that Mr Denham and Senator Taft have been defeated in what it charges was an attempt to break the Chicago strike. No penalty, aside from costs of the action, was imposed upon the union, and its officers were given five days to submit a statement showing that they were complying with the ruling. In effect this seems to mean time to put its Chicago house in order and remove from the contract sought any suggestion of discrimination against non-union printers.

The decision of the court is only temporary. A stay has been granted, and the entire case has yet to be reviewed by the National Labour Relations Board, whose ruling will replace that of the court.

Shorter Notes

A year ago it would have seemed impossible that the government information services, then the target of the bitterest criticism in Congress, could ever become too popular. The view then was that private industry could do the whole job better; and the government very nearly had to abandon its information activities. Today, despite the pitfalls and strains offered by an election year, the information service, and in particular the short-wave "Voice of America," are accepted by most Americans as a matter of course. Indeed, Mr George Allen, who heads the information service, complained recently that the tendency is for the pendulum to swing too far the other way, and that public opinion is willing to leave to the government a larger share of the task of interpreting America to the world than he considers desirable.

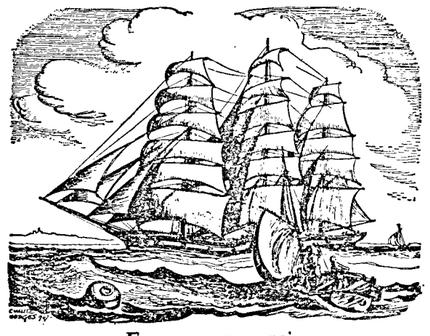
*

The negotiations between Mr Petrillo, of the American Federation of Musicians, and the gramophone record companies, which it was hoped would end the ten-month-old ban on the making of recordings, have failed, for the time being. Mr Petrillo reopened discussions with a proposal for making the union's welfare fund conform to the Taft-Hartley Act by appointing a neutral trustee. No reasons were stated for the failure to come to an agreement, but it is believed that Mr Petrillo's terms were too high, and that they included a demand for royalties on records issued from master recordings during the ban, and on recordings made by foreign musicians.

*

In order to allow further examination of technical problems the Federal Communications Commission has suspended action on the authorisation of new television stations. Three hundred applications which are pending will therefore be delayed for possibly six months. Any changes will be designed to give the public better service according to Mr Wayne Coy, chairman of the Commission. Thirty-seven television stations which are now in operation and eighty-six which are in the process of construction are not affected by the FCC decision.

A Georgian Crisis



In the unsettled period of the Seventeen Forties, James Martin showed his faith in Britain's future by acquiring the freehold not only of the premises bearing the sign of the Grasshopper in Lombard Street, hitherto rented since Tudor times, but also of the adjoining property of The Three Crossed Daggers. This was in 1741, when the Young Pretender's invasion was so soon to follow. The old private bank was absorbed in 1918 by the Bank of Liverpool, whose title was changed to Martins Bank Ltd. ten years later.

MARTINS BANK

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

THE BUSINESS WORLD

The Sliding Franc

LAST Monday the exchange value of the French franc underwent a process euphemistically described in the official announcement as a "realignment." For the time being this description can perhaps be justified. There has as yet been no new devaluation of the French franc against the dollar and gold. The effective commercial rate with the dollar, so far as French exports are concerned, is this week precisely what it was last week. There has, however, been an effective devaluation of the franc against currencies other than the three which have been quoted in the recognised free market—the American dollar, the escudo and the Swiss franc. That devaluation marks the disappearance, so far as concerns transactions of the same broad categories, of the differential exchange rates which previously obtained in France. Henceforth the effective rates for all currencies for all commercial transactions (as distinct from financial transactions and tourism) will be related on a uniform principle to the official parities as notified to the International Monetary Fund—in a word, the disorderly cross rates which have existed for the past nine months will be ended. The commercial rate for the dollar will be the basic standard rate on which the other rates will be calculated.

The new exchange arrangements therefore represent a fundamental and welcome departure from the system introduced last January. All that remains of the devaluation at that time is the official rate of 214 francs to the dollar. This will serve as one of the two factors in the calculation of the effective commercial dollar rate, and will be used for no other purpose. The other factor in the calculation is the rate of the dollar on the tolerated free market during the seven Bourse sessions preceding the two last working days of every month. The commercial rate for the dollar for the ensuing month will be the mean of these two rates, official and free.

In the few days before the new arrangements were introduced, the dollar rate in the free market was 313 francs. On the basis of this figure and of the official rate of 214 francs the mean commercial rate for the dollar has thus been fixed at 264 francs for the remainder of this month. The rates for sterling and other currencies have been fixed by applying to this basic dollar rate the official cross parities. In the case of sterling, for example, the effective commercial rate has been obtained by multiplying 264 by 4.03 and the rate was fixed at 1,062 francs to the £. Since last Monday the French franc has been quoted in London at 1,061-3. The only occasions on which the commercial rates will be altered in the course of the month will occur when the free dollar rate moves by 5 per cent or more as compared with the average of the previous month. In that event the commercial rate for the dollar and all other currencies will be immediately recalculated on the basis of the then current free dollar rate and the old official parity of 214 francs.

The implications of these new arrangements are obviously of great importance. Most important, all pretence of a fixed parity has now been abandoned. The old official parity is still used as a calculating factor but its significance as a parity—that is, an effective rate at which business is done—has disappeared altogether, and with its disappearance has gone the discipline which a fixed external parity is always bound to exercise against any policy calculated to endanger that parity. Such discipline may not have been particularly in evidence in France lately, but the removal of the last vestige of it is bound to make for even greater fluidity in the franc exchange system than has obtained in the past. The franc is now on a sliding standard.

The determining factor in the commercial rate of the currency will be the tolerated free rate for dollars. This is the rate at which American tourists will still be able to sell their dollars in exchange for francs. It is also the rate at which certain financial transactions, including capital movements from the United States to France, will be concluded. Since the devaluation of last January it has also been the rate at which French exporters to the United States and the two other hard currency countries, Portugal and Switzerland, have been able to sell one half of the proceeds of their exports, the other half having to be sold to the Bank of France at the official rate of 214 francs. Thus, for these exporters, the new arrangements involve no effective devaluation of the franc, since the new mean commercial rate will be the same as the average rate obtained under the former system. The free rate has been closely controlled ever since it came into being last January. It was then the declared intention of the French authorities to allow the hard currencies quoted in the free market to be bought to pay for certain inessential imports to France. It is clear, however, that, for good and obvious reasons, the necessary licences for such imports have not been granted, and the only effective buyer of dollars, escudos and Swiss francs in the free market has been the French Government. The tolerated free rate of the dollar, which started life at about 304 francs last January, was held fairly steady at about this level until it was allowed to rise to 313 francs in the few days preceding the "realignment" of the exchange system.

The outcome of this transition of the French exchange regime to a completely floating system will depend on the behaviour of the free rate, which in future will have a significance far greater than it has commanded in the past. Whatever control may be imposed upon it, this free rate will tend to reflect the true value of the franc and if, as seems all too likely, the purchasing power of that currency continues to decline, the free market in due course will reflect that depreciation. If it can be assumed that the free market rate reflects the true economic parity of the currency, it follows that the commercial rate for the dollar and all other currencies will continue to overvalue the franc to an appreciable extent. That degree of overvaluation, moreover, will increase with any further depreciation of the franc, since one of the two elements in the calculation of commercial rates will be the anachronistic and wholly artificial fixed official rate of 214 francs to the dollar. The bigger the margin between that rate and the more realistic free rate, the greater will be the overvaluation represented by the commercial rate, which will be an average of the two.

The new exchange arrangements therefore fail to remove one of the main handicaps under which the French balance of payments has recently been suffering, namely the overvaluation of the franc in France's external commercial transactions. The position of other currencies, such as sterling, which have hitherto been quoted only at the official rates, will indeed be eased. But that advantage will soon be exhausted if costs and prices continue to rise in France—some important increases have been announced in the past few days—and if the gap between the old official rate and the free market rate widens.

The new system, in effect, represents the worst of both worlds. It creates a sliding standard which will offer no encouragement to stern monetary policy in the defence of a fixed parity and at the same time it condemns France to a permanent overvaluation of the franc in the exchange market.

The French authorities deserve, none the less, commendation for their decision to remove the objectionable multiple exchange practices that had developed since the beginning of this year. The disorderly cross rates have disappeared, and in future all commercial rates quoted for the franc in Paris will be related to one another at the official parity notified to and sanctioned by the International Monetary Fund. Before reassurance on this point is complete, however, it may be well to await further evidence of the strict limitation of the tolerated free market in dollars, escudos and Swiss francs to the operations for which it is intended. If the depreciation of the franc continues and if, therefore, the margin between the commercial rate and the free rate widens, increasing temptation will be put on French traders to divert commercial exchange transactions to the free market by giving them the appearance of financial operations. French ingenuity in these matters being what it is, and the technical competence of the French exchange control also being what it is, it would be wise to allow a fair margin for the growth of such transgressions.

No effective answer to these problems can, however, be found on the purely technical plane. So long as the French franc is under suspicion, particularly by the nationals of France itself, no exchange system and no exchange control will be proof against evasion and abuse. The new exchange arrangements probably make the best of a bad job. They remove the most objectionable feature of the earlier system, and for that reason they are welcome to Britain, which was one of the main victims of the now defunct system of differential exchange rates. At the same time they provide an elasticity which might make it possible to establish fixed and truly economic parities if domestic conditions in France improved so far as to make the calculation of such parities possible.

It can only be hoped that this degree of elasticity will not be allowed to weaken the heroic efforts that will be needed by any French administration which seeks to restore some semblance of order in its finances and confidence in its currency.

European Recovery—IV

The Changing Trade in Coal

THE crude necessity of supplying Europe with coal, which for a time overrode all other necessities save that of food, has for the moment been largely met. This, however, is only the first stage in increasing Europe's coal supplies, for if the design of European recovery works as it should, the needs of industry for coal will greatly expand. The next stage is to supply coal efficiently, from the most convenient places, clean, in the right qualities, at reasonable prices: and to secure these supplies for the future. When these questions are considered, it becomes apparent how rough and provisional were the coal plans compiled in the Paris meetings last year. When they can be answered, the future outlines of European trade in coal — outlines to which the individual countries, Britain among them, will require to adjust their particular plans—will begin to emerge. Up to now it has been apparent merely that the customary outlines have been distorted. The "restoration of the prewar pattern of the European coal trade," envisaged in the Paris report, continues to be doubtful.

At the time of the first Paris meetings, the pattern of European trade in coal was most distorted, and European dependence on American coal was at its greatest. Britain and the Ruhr, the natural suppliers of western Europe, had not succeeded since the war in resuming their normal role; the United States, which took their place for the moment, supplied 5.9 million tons of coal to Europe in 1945, more than 17 million tons in 1946, and more than 16½ million tons in the first six months of 1947. Early in 1947 British exports stopped altogether, and Britain, too, began to take coal from the United States as one of the measures to insure against a recurrence of the winter crisis. In the summer of 1947, coal exports from the United States to Europe reached a level of 3½ million tons a month. It was clear enough that any attempt to make Europe solvent would have to begin with food and coal. "Current availabilities have never caught up with consumption requirements," wrote the Paris report, with an odd mixture of emotion and official restraint. "It is quite impossible by statistical means alone to convey the full import of such reduced availabilities in terms of human hardship."

The necessity was, and is, bigger than the mere necessity of catching up with arrears. European recovery required also a vast general expansion of industrial activity which a mining industry restored only to its 1938 level would be insufficient to support. The Paris meetings formalised and collected the various national industrial plans. Thus they demonstrated that coal mining in western Europe, which between 1929 and 1938 had tended to decline, would need to expand again to well beyond its 1938 proportions if industrial demand was not to run further ahead of coal supplies. The countries participating in ERP (including western Germany) used some 471 million tons of coal and lignite in 1947; in 1938 they had used 552.2 million. Their net requirements for 1951 were estimated at 609 million tons—a figure that appeared at the same time possibly too low, in that it seemed doubtful whether it would support the full productive effort which was proposed in industry at large, and too high in that the prospects of producing and paying for such quantities of coal seemed slender. The following table gives a simplified outline of the first Paris plan:

Coal and Lignite.

Requirements of the OEEC Countries (including W. Germany).

	1948	1949	1950	1951
Requirements (including exports and bunkers)	535	562	594	620
Production	477	512	552	583
Import Requirement	58	50	42	37
Estimated imports from Poland	16	24	27	30
Estimated imports from other sources	1	1	1	1
Estimated import requirement from US	41	25	14	6

These estimates may have appeared realistic at the time they were made: the United States exported as much as 37 million tons of coal to Europe in 1947, and the rate of export rose to about 40 million tons a year in the last months of the year. But they do not appear realistic today. The western European countries have faced the necessity of getting through the year on less coal than they wanted: the Paris report to ECA on the first year's programme, issued this week, puts the revised requirement for 1948-49 at 30 million tons less than was estimated last year. And this will still permit "a considerable increase in industrial activity." The western countries are already taking much less coal from the United States: purchases of US coal

have been limited, after all, to 15.1 million tons in 1948-49. It appears, therefore, that reliance on American coal will come to an end sooner than was expected.

This implies that restrictions on coal consumption will continue in most of the member countries, and in some countries will be fairly severe. It also implies that the effort of Poland to establish itself as a principal supplier of the western European countries will be successful. Poland, at the end of the war, held not only her own former coal-mining districts but also the Silesian mines which had been German—an area with an annual production before the war of about 70 million tons. The mines themselves had survived the war in better shape than the mines of the Ruhr and of western Europe. But their operation was disorganised by movement of population, and their access to western European markets was impeded by appalling transport difficulties. The Poles have made swift revival of coal output the basis of their own three-year industrial plan, and the expansion of their coal exports the basis of their foreign trade in the next few years. So far as output is concerned, they have done well; their target of 67 million tons for 1948 will probably be reached and possibly exceeded, and there seems no reason to doubt that the present Polish coalfields will next year comfortably exceed their prewar output. The Polish production target for 1949 is 75 million tons, and the target for 1950 is 80 million tons: Polish representatives at Geneva have spoken of an ultimate target of 90 million tons, which implies that the Poles are also planning long-term development and the sinking of new mines. They have lately been exporting a third of their output or more. In June of this year they exported 2,500,000 and in July 2,700,000 tons.

Agreements with the Soviet Union place the Poles under an obligation to export large quantities to Russia and the Soviet Zone of Germany. Thus in 1947, while they supplied 7,843,000 tons of coal to the OEEC countries, they exported 9,131,000 tons to Russia and to the Soviet Zone of Germany. Their desire to export to the West is not in doubt. But it is clearly difficult for them to resist Soviet requirements, and the case for supplying eastern Germany from the Silesian coalfield, its customary supplier, is in any case strong. To some extent the success of Poland in exporting Silesian coal to the West may be taken as a measure of the stagnation of the former German markets for Silesian coal. The OEEC report on the first annual programme expects imports from Poland in 1948-49 on a scale 70 per cent higher than in 1947.

Most of the Polish coal exported, however, is steam coal; Polish supplies cannot, therefore, meet the particularly urgent need among the OEEC countries for coking and gas coals. For this—as indeed for the restoration of the European coal economy in general—the revival of the Ruhr is indispensable. The Paris meetings last year recognised this fact: indeed, one of their most solid results was that coke supply has during the past year been treated as a separate and urgent problem, and the arrangements made have achieved a good deal of success. The OEEC programme now estimates that 43 million tons of metallurgical coke will be available for 1948-49. This is an increase of 32 per cent over last year. Some of this is a book-keeping improvement; it does not mean that 32 per cent more metallurgical coke will be made, since the measures agreed by the Coke Working Party at Geneva have involved not only increased production of coking coal and the working of some formerly unused German coke-ovens, but also some diversion of metallurgical coke from domestic uses. Steelmakers have also been induced to use small coke which they would in the past have turned down. But all these measures help to relieve the coke shortage.

For this improvement the revival in the Ruhr is largely responsible. In 1947 the German Bizone had a surplus of coking capacity of 9,000,000 tons. Bizonal coal policy proceeded to concentrate more on coking coal, and between July, 1947, and July, 1948, bizonal output of hard coke was increased by nearly 500,000 tons a month. The results of the effort are seen in the Geneva allocations of German coal and coke for the fourth quarter of 1948:—

German Coal and Coke Export Allocations.

(Coal Committee, Economic Commission for Europe)

	mn tons	mn tons
Metallurgical and foundry coke	1.700	
Coking fines	0.875	
All metallurgical fuels	—	2.575
Other coal		0.925
Total allocations (fourth quarter, 1948)		3.500

These figures exclude most of the Saar coal output, which (under the three-Power agreement on the Saar) is increasingly being withdrawn from the German allocation. So far as the exports from the Ruhr are concerned, 2,500,000 out of 3,500,000 tons are now of metallurgical qualities. A year ago, for the fourth quarter of 1947, the Coal Committee at Geneva had to allocate 2,890,000 tons of German coal and coke and of this quantity only 1,650,000 tons were metallurgical fuels.

There are other indications that the Ruhr, which at one time seemed likely to be the most intransigent element in the European recovery plans, is at last beginning to revive on an important scale. The swift recovery of Ruhr steel production was mentioned in an article in this series on October 9th. Hard coal production had already, before the inception of the European recovery programme, enjoyed sustained attention from the Anglo-American authorities, and a swift and spectacular increase in Ruhr coal production was therefore hardly to be expected. But the target of 86 million tons set for 1948 was still 15 million tons higher than the 1947 production, and required a serious effort. During the winter and spring the bizonal Coal Control continued to offer food parcels, cigarettes and consumer points, but the effects on production, though not negligible, proved to be temporary.

Since the reform of the German currency in June, different methods have been pursued, and the results are beginning to look impressive. Special incentives have already been for the most part removed, and a recent announcement made it clear that they were to end altogether by the end of the year. Future Anglo-American policy will be to rely on the purchasing power of the new money as an incentive to effort. The change presents difficulties. Payments in kind have the effect of sheltering the worker from price changes in inflationary times. Deprived suddenly of this shelter, the German miners (like the majority of people in western Germany) have been expressing strong discontent with the rising prices. Any prediction of the trend of Ruhr coal production must, therefore, carry the reservation that if prices get out of hand the trend can be upset (as it has been in France by labour troubles).

But it is clear that for the moment the new currency, combined with the greatly improved food situation in western Germany, is an effective spur to effort; daily production has climbed steadily through the autumn, and has shown itself immune from the sharp fluctuations of the early months of the year. The daily average for the first two weeks of October was 296,600 tons, and by the middle of the month daily production was over 300,000 tons. An output of 7,600 tons a month for the last three months of 1948 is necessary to reach the target of 83 million tons. This seems likely to be reached and possibly exceeded; a steady daily rate of 315,000 tons does not seem out of the question by the end of the year. There are signs also that the Germans, who have resented the compulsory coal exports carried out since the war, are beginning to realise the value of exports to their eventual trading position.

In coal, as in steel, it may thus prove that the part to be played by western Germany in European recovery was at first underestimated. Germany is also important as a supplier of mining machinery; the Belgian, Dutch, Saar and Polish mines, containing largely German equipment, are in

urgent need of German replacements. Negotiations this summer have made it clear that the part to be played in existing coalfields by American mining equipment is more limited than was at first thought, and it seems likely that, as industrial recovery proceeds in western Germany, bigger exports of German equipment may replace some of the expected American supplies.

INDICES OF PROGRESS IN HARD COAL PRODUCTION
(Weekly Average, 1937=100)

	U.K.	Germany (British Zone)	France	Belgium	Netherlands
Vol. of production	91	65	106	92	77
Numbers employed	95	95	139	119	129
Output per man-shift (underground)	97	64	79	77	65
Output per man-shift (overall)	95	61	74	77	75

Indices are for June, 1948. Source: *Economic Commission for Europe.*

To raise coal production in Europe is taking, it is evident, prolonged and painful efforts. But the efforts are being made, and they are succeeding, if not uniformly, then at least well enough to put the buyer of coal in a more favourable position than he has enjoyed since before the war. Already it is possible, if one source fails, to replace it with another. International allocation has become a more complex matter than it was; coal is allocated not merely in bulk, but in special qualities for specific uses. Expenditurue on coal has to be weighed, almost as in normal times, against other possible expenditures, and already it is not uncommon for the Coal Committee to concern itself with the re-allocation of coal which has been allocated once but not taken up.

So far as the British economy is concerned, this position suggests a reassessment of the attitude towards international trade in coal which has grown up, through force of shortages, since the war. The first point which presents itself is that export trade in coal no longer means the shipment of redundant quantities, unpredictable in volume and haphazard in quality. If foreign buyers cannot get—and be sure of getting—the coal they want from Britain, it is hardly now out of the question for them to seek it elsewhere; certainly it will not be out of the question for long.

From this point of view the British failure to export coal since the war, and the present failure of the British mines to keep fully abreast of the production targets, hold serious lessons. Before the war the intra-European trade in coal was substantially divided between Britain and Germany. The British export target for this year was, at best, the bare minimum necessary to keep open the possibility of recovering the British position in the next few years. This commitment will (it is to be assumed) be met for this year, but because of the deficiency of total production from the British mines, it will be met to the extent of perhaps 2,000,000 tons, or perhaps 3,000,000, from stocks. But next year's commitment is substantially greater (to the OEEC countries it is 14 million instead of 6,000,000 metric tons). To discharge this will take a substantial increase of British production. To discharge it satisfactorily will take a more than proportionate increase; for, with the return of competitive conditions to the coal trade, it becomes not merely desirable, but essential, to see that the coal supplied to foreign buyers is clean and of the desired quality.

This can be secured by raising production to the point at which selective selling becomes possible. It can, alternatively, be secured by planning for quality: by paying more attention to cleaning, grading, handling, and the concentration of productive effort on the better qualities of coal. The second of these two policies seems, on a first examination, the better suited to the needs of the future; for it appears doubtful whether a mass market, free from competition, will return.

Business Notes

Chancellor on Disinflation—

Many people lately have been making divergent guesses of the extent to which pressures unforeseen or underestimated last April are threatening the Budget surplus which formed the basis of the Chancellor's disinflationary programme. Some commentators, after totting up the extra burden of cost of living subsidies, the presumed cost of rearmament, of deferred releases from the Services and the Berlin air lift—not to mention the uncovenanted expenses of the Health Service and the rising cost of capital construction schemes—had concluded that most of the expected surplus had already been prospectively absorbed. Sir Stafford Cripps's assurances at the Bankers' Dinner at the Mansion House on Tuesday have therefore come as a surprise. He affirmed that "the main structure of the Budget is unaffected."

> Revenue is holding up well, even though it may be "once for all," and there is no reason to suppose that the Budget forecast will not be realised. On the expenditure side—so far as any present decisions go—something extra will be required for Defence Services, and there will be some increase on the Civil side, especially in food subsidies . . .
>
> But the combined effect of these and one or two other possible increases should not make any very important changes in the total surplus, though there may well be some reduction. The main structure of the Budget is unaffected. I cannot, of course, forecast what might happen if we were driven by international developments to take further special action as regards our own defence or that of western Europe.

If that statement should be taken at face value—and, certainly, the rest of the speech showed a characteristically careful objectivity—it must mean that this year's additional bill for Defence is likely to be a good deal smaller than has been generally supposed, for it will be noted that the Chancellor has not counted upon any actual gain in revenue, while it is known that the charge for cost of living subsidies alone is now running at an annual rate of £70 million beyond the year's estimate.

Although in this and certain other matters the Chancellor spoke in reassuring tones, he is far from being content with the achievements of the past twelve months. After touching briefly upon the sluggishness of the redeployment of labour—perhaps a shade too briefly, for he did not mention the closely related problem of the flattening out of the production curve—he emphasised that the most difficult part of the task of restoring equilibrium still lies ahead. He frankly acknowledged that "we shall have our job cut out" even to maintain the present volume of exports—let alone raise it to the target level for 1949. Hence the crucial importance of keeping down costs by buttressing the Budget surplus with a larger volume of genuine voluntary savings, which are needed also both to release resources for export effort and to provide for the increased industrial investment necessary to promote productivity and competitive efficiency.

—And Lord Catto on "Excessive" Investment

On this last point, Lord Catto's speech at the same function came as close to challenging the policy of the Government as any Bank Governor—even one who has announced his retirement—is ever likely to do in public. But his implied criticism of the investment programme—which the Chancellor now puts at £2,000 million a year—ran on unfamiliar lines. Most people have been concerned at the insufficiency of private industrial re-equipment and maintenance, and have deplored the way in which this has been constricted by Government determination to maintain a very large housing programme. The Governor did not make this point, and in the context of his other criticisms its omission almost suggests that he does not sympathise with it. His main concern is that the capital programmes are running at a rate in excess of available resources, and that this will "seriously upset" the disinflation policy and cause costs to rise further.

As a general proposition, this may be true; and there is no doubt, too, that specific projects within the programme (quite apart from the scale of housing) are either uneconomic or too ambitious in the straitened circumstances of the moment. Lord Catto remarked that some of them—both Governmental and private—are costing two and even three times the original estimates, and

he questions whether such development will be fully competitive in any period of setback. A careful review of the whole programme with the object of weeding out such schemes—unfortunately, Lord Catto gave no hint of their character—is overdue. But it would be a great mistake to regard such a process as a means of reducing the total investment outlay: its primary purpose should be to make room for projects of greater economic merit. In a period in which Britain is still sustained by disinvestment abroad at the rate of between £250 and £300 million a year, it would surely be sheer defeatism to cut the projected total of domestic investment merely on the ground that it is difficult to persuade the hard-pressed British people to carry the burden. Perhaps Lord Catto did not mean to suggest this; yet that seems to be the implication of his remark that individuals cannot be expected both to save and to pay taxation at its present level.

Apart from this, what seems to be troubling the Governor most is the impact of capital outlays upon the banking situation. The steep rise in bank advances which so pleased the banks in the early postwar phase has been regarded rather differently since disinflationary influences began to disclose some of the weak spots; and the recent slackening of the rise in advances owes something to this change of attitude. Everyone will agree with Lord Catto that bank advances are not a desirable form of finance for capital projects for indefinite periods or for carrying stocks which become excessive. But in present conditions the authorities would certainly be mistaken if they drew from that axiom the conclusion that total investment outlays are necessarily excessive or specific projects uneconomic, merely because they involve a large and sustained expansion of bank advances. The decisive considerations are the economic merits of the individual projects which make up the total programme, and the capacity of the country to provide the real resources which the programme requires. The consequential method of finance should not, and must not, rank as a governing consideration. This does not mean, of course, that the financial precepts are of no account. On the contrary, anything that can be done to promote the classical techniques of financing—such as the repeal of the obstructive and foolish bonus issues tax—should, as Lord Catto argued, be undertaken at the earliest possible moment.

* * *

European Payments Scheme

The report of the Council of OEEC on the first annual programme gives a brief description of the principles to be followed in the intra-European payments scheme which came into force on October 1st. The report states that it was necessary to raise new financial resources to enable debtor countries among the European participants in ERP to settle with their creditors without recourse to gold or dollars. After complicated negotiations, the member countries were successful in drawing up a payments scheme, the main principle of which is that net creditor countries should receive dollar aid in the form of grants equivalent to their estimated surplus in Europe on condition that they contribute in their national currencies an amount covering that surplus from the funds set aside as a counterpart to their dollar aid.

The scheme, which is to be under the general supervision of OEEC, arranges for financial settlements by a system of compensation to be administered by the Bank for International Settlements. The compensation will be carried out in two stages. First, the agent will ascertain the monthly deficits between each pair of member countries; these deficits will then be reduced by the use of resources already available to the debtor countries in the currency of their creditors. Debts owing to Britain, for example, will be paid out of sterling balances of the debtors if such balances exist. The agent will then carry out to the maximum extent an all-round writing down of balances, both debit and credit. He will then be in a position to ascertain what "drawing rights," available under the payments scheme, are needed to cover any deficits which remain, and he will give instructions for the necessary funds to be provided.

In cases where the full amount of available drawing rights has not been used, the agent may be authorised to use a drawing right granted to one country to meet a deficit which that country has with a third country, but provided only that the latter is itself a debtor to the country which has granted the drawing rights. Translated into specific terms this would mean that the British contribution to France could be used by France to pay for goods imported from Belgium only if Belgium were a debtor of Britain If the compensation and transfers of drawing rights conform to these conditions they are classed as "first category compensations" and may be carried out by the agent automatically and without reference to the countries concerned. The second stage will consist of a compensation involving an increase in one country's balances held by a third country. These will be known as "second category compensations" and will require the prior consent of the countries concerned so as to enable them, if they wish, to avoid compensations which would involve setlements in gold.

The scheme therefore provides for the multilateral use of currencies so far as present circumstances permit. All the member countries have recognised the need to work by stages towards the free convertibility of currencies, and the agreement is the first step in that direction. The payments scheme also recognises the desirability of consolidating existing debts between the participants. Where substantial debts exist, their intrusion into the clearing scheme would cause serious jamming from the start. The member countries are therefore asked to examine what possibility of consolidation or funding exists, and how far the new payments scheme can be launched with the tables cleared.

* * *

Trade Rules for Europe

The principles of commercial policy to which the participants in the intra-European payments scheme have bound themselves have wisely been left in the most general of terms. The preamble to the statement of principles stresses the desirability of making the fullest and wisest possible use of the new resources which will be available under the payments scheme, and adds that "the development of trade should be along lines which will facilitate orderly progress towards multilateral trading." The need, therefore, is for a rationalisation as well as an increase in the flow of intra-European trade. For purposes of this statement of principles the participating countries are divided into three groups; the net creditors, the net debtors and the intermediate countries. The broad objective of the trade rules is to remedy excessive disequilibrium in the balances of payments arising from trade among the participating countries. The precepts laid down in the statement may be summarised as follows:

(1) All participants should maintain normal exports necessary to the recovery of the other participants and, in particular, each should do its best to increase exports which will enable

The MERCANTILE BANK *of* INDIA

Agencies in New York, Bradford, Manchester

the other countries to obtain in Europe goods otherwise only obtainable for dollars.

(2) Net debtor and intermediate countries should do their best to increase their current exports to the net creditor countries in order to reduce disequilibrium as much and as quickly as possible. (There is an escape clause in this to protect the priorities accorded by debtor and intermediate countries to exports to countries with which they have special relations, including those between a metropolitan country and its associated territories.)

(3) Net creditor and intermediate countries should buy additional goods and services as freely as is reasonably practicable from the net debtor countries. This is clearly intended to encourage creditors to import inessentials from debtors in order to reduce existing disequilibrium.

(4) The same injunction as in (3) is laid upon net creditor countries in their purchases from intermediate countries.

(5) Net creditor countries will facilitate the use of the new resources under the payments scheme to finance the exports of goods essential for recovery. Although this clause does not say so in so many words, it is evidently intended as a warning to net creditor countries to desist from the practice of "tied sales" under which exports of inessentials are made a condition of the sale of essential goods. This clause is also watered down by a reservation which states that "it is not intended that the application of these principles should jeopardise vital economic interests in any participating country," though no attempt is made to define what these "vital economic interests" are.

(6) Net debtor countries should exercise in their external expenditure the maximum economy compatible with their economic recovery.

The Council of OEEC has invited the participating countries to examine whether their commercial policies are in accordance with these general recommendations and has also invited each country to call the attention of OEEC to instances in which those recommendations are not being followed by others. Full details of both the Payments Scheme and the Trade Rules are included in this week's issue of the *Records and Statistics* Supplement.

* * *

£100 Million for Electricity

The new Electricity issue, the lists for which opened and closed on Thursday, proved to be much larger than any of the City estimates had envisaged. The amount involved was £100 million, but, although the gilt-edged market had begun to look rather vulnerable in recent weeks, and had in fact lost ground over the first week of the present account, the impact effects were quite small. For this result the authorities deserve most of the credit, for the operation was certainly skilfully devised and timed. The offer took the form of 3 per cent British Electricity Guaranteed Stock, 1974/77, at a price of 99½—the guarantee, of course, being that of the British Government. As a full trustee security, the stock on these terms fitted fairly neatly into the yield structure for the major gilt-edged securities, although by comparison with certain stocks, it looked definitely cheap. Significantly, the disparity with the existing 3 per cent BEA Stock, 1968/73, was particularly marked, for the net price of that stock on the eve of the announcement was 101⅜—a difference of nearly 1½ points by comparison with the new stock, although its maximum life is only four years longer. Among direct Government obligations, the nearest comparable securities are the 3 per cent Savings Bonds 1965/75, and 3 per cent Transport Stock, 1978/88. The former, with its two years shorter maximum life than the new stock, offered, on the eve of the announcement, a final redemption yield of £2 18s. 7d. per cent, compared with £3 0s. 6d. on the new stock; on the Transport Stock, with its eleven years longer life, the yield was £3 0s. 10d. In short, in offering the stock at half a point below par, the authorities evidently made a small concession to the size of the issue—and, in this context, it is significant that the operation was not underwritten. At least as significant, however, as this slight shading of the issue price was the decision to spread the payment instalments over a period of five months, so that the loan will not be fully paid until mid-March; the first interest payment, due on that date, will accordingly be 12s. 6d. (less tax) per cent.

The first effect, on the morrow of the announcement, was a general marking-down of gilt-edged prices. But these were mainly precautionary moves; by the close of business the net effect, on the gilt-edged market considered as a whole, was small. On the day, the largest movement was a fall of ⅛ in 3 per cent Savings Bonds, 1965/75; the existing 3 per cent Electricity Stock lost only ¼, Transport Stock fell by ⅜, while the irredeemable were unchanged. The firm appearance of the market on Thursday, while the lists were open, perhaps suggests that the effect of the new loan has probably been discounted by these losses.

* * *

The Coal Committee and Absentees

Coal output showed a further small improvement last week; at 3,981,000 the output of deep-mined coal was 51,000 tons higher than in the previous week. But Lord Hyndley's recent appeal was for a weekly output of 4,336,000 tons; it still seems likely that the mines will miss the year's target by about 3,000,000 tons. There can be no lightning course of action by which the joint committee of the Coal Board and the National Union of Mineworkers could remedy this deficiency; its decisions will therefore be scrutinised to see what hopes of an effective, if slower, remedy they contain. All that is publicly known up to the moment is that the committee has been meeting daily and has been going through its agenda in a workmanlike manner. The agenda contains some difficult points of detail. The committee has been trying to work out measures against persistent absenteeism, and the kind of measure under consideration is the proposed joint attendance committee to watch absenteeism at each pit. Offenders who carry absenteeism beyond tolerable limits should (it is suggested) be liable after a first warning to fines, down-grading, suspension from work or, in extreme cases, dismissal.

The scale of penalties is a relative simple matter; much more difficult is to decide who shall apply it. Shall it be the committees, or shall the mine managers be endowed with an authority which has become unfamiliar in their hands? The trade union side is understood to favour putting the responsibility on the manager. This, if it became effective, might be the beginning of a new trend. The mine manager's authority has been steadily reduced over a period of years—not only under nationalisation, but also in the wartime labour shortage which preceded it. There might be advantages in restoring it. These matters are, however, still at the least effective stage of any measures designed to promote changes in the coalfields—at the stage of discussion in London. Any recommendations which the committee makes will require to be considered by the executive of the NUM, and possibly by a special delegate conference, before they can be made effective in the coalfields; and, as past experience has shown, not even the approval of a special delegate conference can be guaranteed to bridge the gap between the leadership and the pits.

* * *

The Organisation of the Coal Board

The National Coal Board has announced its intention of making public some (at least) of the report of the Burrows Committee. But this comes after evident hesitation, and it is perhaps still necessary to insist that the publication should be full enough to throw the light that is needed, and early enough to be useful. There has already been an unreasonable delay, which arose (no doubt) from a misunderstanding of the question whether the inquiries of the Burrows Committee are a public or a private matter.

Clearly an authority such as the Coal Board has to be permitted on occasion to examine its own organisation without the full light of publicity. But two considerations have to be remembered. The Burrows Committee was set up last May, at the time of Sir Charles Reid's resignation, less through a private flash of inspiration in the Coal Board itself than as an answer to a serious and rising volume of public criticism and disquiet. That the criticism has lately been less vocal indicates no more than a suspension of judgment; it does not mean that the disquiet has died away. Once public concern has been aroused over the efficiency of the National Coal Board, the matter is a public one which cannot be dealt with quietly. But it is a public matter also for another reason: the Coal Board is important not only in itself, but also as an experiment in which methods of public control of a major industry are being tried out. The progress of the experiment has lessons for other industries, too. If these lessons are to be learnt in time to avoid more mistakes of the same kind, with more waste of time and effort, it will be necessary for not only the conclusions of the Burrows Committee, but also a large part of the evidence on which its conclusions are based, to be publicly known.

activities in the western hemisphere comparable to its expansion programmes in Europe and the Middle East. Mr George Legh-Jones, in announcing the loan this week, gave some indications of the projects for which it would be used. These include the exploration and development of new fields in Venezuela, and the building of new refinery capacity there. Mr Legh-Jones also mentioned Colombia and Ecuador, Alberta and New Brunswick. Refineries in Colombia and Alberta appear to be possibilities, though the main Shell discoveries in Alberta so far have been in natural gas; gas lines were among the capital projects mentioned. It was already known that the Shell Caribbean Company was pursuing an active development policy in Latin America and Canada, and the desire of the group to play its full part in expanding the oil supplies to the United States from the American continent needs no explanation. Clearly a dollar loan raised in New York, and to be spent largely on American equipment, will be used to supply the dollar markets. Thus the enlarged activities of Shell Caribbean will not directly contribute to European oil supplies, but they will figure in the world-wide equations which it is the business of the big international oil companies to solve: if American markets are more adequately supplied from American sources, then European markets can be better supplied from Middle East sources.

The amount of the loan is $250 million; it is the largest single operation in oil finance put through on the New York market. It takes the form of an issue of 4 per cent bonds which are being taken up at par by a group of US and Canadian insurance companies. The bonds are repayable in 20 years, but redemption is to begin in six years at the rate of $10 million a year; this will leave $100 million to be paidoff at the end of the term. The assets of the Shell Caribbean Petroleum Company alone are between $700 and $800 million, and the group appears confident that the expansion now proposed will increase its earning power rapidly—by more than the amount needed to repay the loan within the term fixed. In former days an operation of this kind would have been financed from London; this is no longer possible, but it is still encouraging that it can be done at all on this scale, on reasonable terms, and without any surrender of equity. As the group has pointed out, the operation falls within the general intention of the article in the European Co-operation agreement which recommended:

> measures to locate, identify and put into appropriate use in furtherance of the joint programme for European recovery, assets, and earnings therefrom, which belong to nationals of the United Kingdom and which are situated within the United States of America.

In the complicated negotiations which have been necessary to bring about the loan, ECA itself has not been engaged. But the British, Netherlands, and US Governments have been consulted and have each given their approval.

* * *

Check to the Export Drive?

The value of exports in September totalled £131 million—or barely £500,000 more than the low level of August. Yet Mr Harold Wilson described these latest figures as "a remarkable achievement in the face of great shortages of materials and the growing and ominous development of a buyers' market." In August, exports showed a much less marked decline from the peak figures of July than in the corresponding month a year earlier. But as there was no marked recovery in September (unlike last year), the 10 per cent fall in exports, due mainly to the holiday period, was proportionately the same as in 1947. Calculated on a daily basis—September had 26 working days—exports last month were smaller than in August. The rate of exports in terms of value has fallen below that of last May. The volume of exports for September has also declined; it is provisionally estimated at 132 per cent of the 1938 level against 133 per cent in August and 140 per cent in July.

BRITISH EXPORTS

(calculated on the basis of 26 working days a month)

	£mn		£mn		£mn
January ...	115	April ...	126½	July ...	140
February	122½	May ...	135	August ...	135½
March ...	126	June ...	139½	September	131

Exports of coal increased slightly during the month, and overseas shipments of all the main industrial items, except textiles and vehicles, were also larger, in terms of value, compared with August. Machinery exports regained their leading place, and showed the largest increase (£1,400,000) owing to continued expansion in the export of agricultural tractors. The fall in textile exports was modest, but the export of vehicles fell by £4,000,000; the sharp fall in the export of locomotives outweighed the increase in motor vehicles and motor-cycles.

September's figures are still influenced by the incidence of summer holidays, and it would be easy to exaggerate the significance of the month's decline. But the levelling off in industrial production, which has been in evidence since the end of 1947, is sufficiently serious to raise questions about the future course of the export drive. If output does not expand, an increasing volume of exports can be achieved only at the expense of the home market. It is surely not the "ominous development of a buyers' market" which is slowing down industrial output. And it can hardly be the "great shortage of materials," for world supplies and British stocks of primary raw materials have expanded during the past year.

Admittedly, imports during September, at £169 million, were nearly £4,500,000 less than in August, and were the lowest since last February. But the main decline was in food, drink and tobacco, which dropped by nearly £5,000,000. Imports of raw materials were £2,000,000 smaller owing to lower imports of non-ferrous ores and oilseeds. Imports of manufactured goods, however, increased by almost £2,500,000, and half of this increase was due to a further large import of grey unbleached piece-goods from Japan for finishing in this country and subsequent re-export.

* * *

Rhodesia's Gold Subsidy

The question of Rhodesia's gold subsidy duly made its appearance on the agenda of the recent International Monetary Fund meeting. As had been clear all along, the method chosen by the Government of Southern Rhodesia to subsidise its domestic gold production by paying a higher price than the official parity was directly contrary to the IMF agreement. This had to be recognised by the United Kingdom representatives. As a result of discussions between the International Monetary Fund and the British and Southern Rhodesian Governments, agreement has now been reached for a modification of the manner in which the gold subsidy is to be granted. The Southern Rhodesian Government has undertaken to modify the legislation to conform with the Fund's principles, and the outline of the new proposals, which will replace the present offending law, will be discussed with officials of the IMF. It is probable that the way out of the difficulty will be found on the lines already traced by Canada's precedent in 1947. In that case a flat subsidy included in the price paid for all gold produced was replaced by a differential subsidy based on costs of production and designed specially to encourage the operations of marginal producers. This alternative method of subsidising has every advantage over the first, including the great virtue that it does not offend the IMF theology on this point.

* * *

An ECA Investment Guarantee

The first guarantee by ECA of a dollar investment in Europe was announced this week; it applies to the formation in the United Kingdom of a new company, Cabot Carbon Company, Limited, in which the Boston firm of Godfery L. Cabot, an old-established manufacturer and exporter of carbon black, will hold a half-interest A plant is to be built on the Mersey under the supervision of the Boston firm, and will supply to the British market types of carbon black which have previously been imported from the United States. Its capacity will be between 8,000 and 10,000 tons a year; it will therefore replace between 20 and 25 per cent of the carbon black at present imported. The American investment will not exceed $850,000.

Little has been made known of the detailed proposals which are being considered for ECA investment guarantees. A spokesman of ECA in Washington said recently that about six proposals were being considered for investment in Britain, and some 20 or 30 for the rest of Europe. The largest is undoubtedly the proposed refinery of the Anglo-American Oil Company at Fawley, which was discussed in a note last week, and the future of which is still uncertain.

One of the difficulties of ECA in considering whether to give a guarantee must be to decide whether an investment would, or would not, have been likely to go forward without the guarantee; the intention of the Foreign Assistance Act is clearly that investments should be supported only when they would not take place without ECA support. One undertaking to manufacture carbon black in the United Kingdom was formed in July. This undertaking (Philblack, Ltd., first announced as Palatine Development Company) will manufacture at Avonmouth, and will use another American process. It was found possible then to lease the furnace black process of Phillips Petroleum Company and to arrange for the necessary American technical co-operation without any dollar participation in the investment itself; the capital is being raised in this country. Yet a third carbon black project, which was to work in co-operation with a third US firm (Columbia Carbon), has also been mentioned; room could probably be found for a third plant without saturating the market, but it is possible that the sponsors may be doubtful of this.

* * *

Merchant Shipbuilding Returns

The returns issued by Lloyd's Register of Shipping for the quarter ending September 30th show that the total of merchant shipping under construction in the world has risen to 4,203,873 tons gross, compared with 4,021,889 tons gross at the end of June. Work in hand in Great Britain and Northern Ireland, however, has decreased by 34,704 tons since June (from 2,243,703 tons to 2,208,999 tons), although the present total is 106,734 tons more than a year ago. The rise in the tonnage under construction abroad can be attributed almost entirely to the renewal of activity in United States shipyards, where a new tanker programme has begun. There are now 17 tankers, totalling 270,940 tons gross, under construction in America, compared with only eight, of 114,940 tons, at the end of June. The tonnage of tankers building in Great Britain has risen from 579,205 tons to 610,275 tons in the same period. Tonnage of all types building in France has risen from 331,216 tons to 399,612 tons, in Sweden from 241,980 tons to 263,625 tons, and in Denmark from 118,711 tons to 136,496 tons; but most other shipbuilding countries show slight declines. Argentina appears for the first time, with a small vessel of 130 tons gross.

The drop in the total of work in hand in Great Britain is only slight, but it is welcome if it indicates a reversal of the recent tendency for arrears of work to mount up through delays both on the stocks and in fitting out. The tonnage of ships completed, launched and begun, however, shows a decrease on last quarter's figures at every stage. Tonnage completed was 271,620 tons (274,323), bringing the total for the first nine months of 1948 to 779,582 tons gross. Ships launched during the third quarter totalled 271,679 tons, compared with 301,730 tons in the second and 181,168 tons in the first quarter. Work was begun on 238,206 tons, compared with 375,000 and 213,451 tons respectively. There is also a slight decline in the proportion of ships for foreign account under construction in Great Britain, but the present figure of 31.5 per cent (695,550 tons gross) is still a good one. An exceptional batch of export deliveries raised the August export figures to more than double the normal monthly average. It is recorded that 64 per cent of the ships under construction in the world, and 43 per cent of those building overseas, are being built under the inspection of Lloyd's Register surveyors; the provision of this service is an invisible export which deserves notice.

* * *

Colliery Shares Valuation

It is now considered improbable that the work of the Central Valuation Board in allocating the global sum of £164,600,000 among the valuation districts under the Coal Nationalisation Act, 1945, will be completed before next February. After that will follow the even more protracted work of the District Valuation Boards of fixing the amount to be paid to each company. According to responsible estimates, this process may take two or three years more. Hence the valuation of colliery shares, or the colliery element in shares of companies which do not intend to liquidate, is likely to provide scope for debate and statistical exercise for some time ahead. The formula adopted by different statisticians for assessing the break-up value of colliery shares has not varied greatly.

COLLIERY COMPANIES

Company	Estimates of Break-up Values		Middle Market Prices			Remarks
	Estimate (a) Oct., 1945	Estimate (a) Sept., 1948	Price, Oct. 1945	Price, Oct. 1947	Price, Oct. 20, 1948	
Bearpark Coal & Coke £1 Ord.	36/3	33/9	16/6	17/3	24/-	Small life. Low output per man-shift.
Bolsover £1 Ord.....	47/6	56/9	49/4½	73/6	81/3	...
Butterly Co. £1 Ord..	31/-	44/6+	34/9	45/3	49/6	Large non-colliery interests.
Doncaster Amal. £1 Ord.	20/9	20/2	15/6	19/6	26/3	House property.
Hilton Main £1 Ord..	33/7	35/-	26/6	50/-	54/4½	Brick works.
Sheepbridge £1 Ord..	46/1½	51/6+	43/6	48/-	70/4½xd.	Large engineering interests.
Staveley Coal & Iron £1 Ord.	49/6	50/6+	50/-	69/6	93/1½	Large chemical and other non-colliery interests.
Yorkshire Amal. 4s. Defd. Ord.....	2/9	3/-	2/-	3/4½	4/-	...

(a) These estimates were made by two different brokers.

Most calculations follow the method adopted by a firm of brokers three years ago that the basis of the computation, even for any particular company, must be a compensation figure representing some ten years' purchase of the standard profits of the companies of each valuation district. A recent broker's estimate, which has provoked some interest, has arrived at 10.46 years' purchase as a basis after weighting average profit per ton in each district by an efficiency factor for the district. This confronts

BANKING

From time to time the RECORDS AND STATISTICS supplement to THE ECONOMIST contains special surveys on various aspects of economic affairs. In next week's issue there will appear the

Banking Supplement

which will contain articles on British and American banking and the world dollar problem. The series of statistical tables covering home, Commonwealth, and foreign banking, which have appeared for many years in banking surveys in THE ECONOMIST, will be found in the supplement.

RECORDS AND STATISTICS is available on postal subscription only. The subscription rates are £2 10s. a year for RECORDS AND STATISTICS alone or £5 together with THE ECONOMIST.

the shareholder with the difficulty of taking a flat rate of estimated profit per ton for all the companies in any one district when the individual mines themselves may vary greatly in age and efficiency.

The authors of the latest estimate pose this problem but do not provide the answer to it. In addition, in assessing break-up values they say quite frankly that they have made no allowance for compensation outside the global award for ancillary assets and stocks of stores unspecified in balance sheets. Yet this item, which they consider might provide an additional sum equal to 25 per cent of the global award (many put the figure much higher) may be of overriding importance in some particular cases. Finally, in arriving at figures for the net liquid assets of particular companies, which must of course be added to the compensation sums to get an estimate of break-up values, they admit the impossibility of distinguishing provisions in some balance sheets which may become free in the event of liquidation. To that extent net liquid assets will be understated.

Altogether, these latest calculations in themselves appear to provide inconclusive evidence that colliery shares are overvalued at current market prices. Their conclusions may well be true none the less, for the rise in the prices of colliery shares over the past three years has been considerable, as can be seen from the accompanying table. In fact, in many cases it has overtaken earlier and not widely divergent computations of break-up values. It is also of no small importance for colliery shareholders that "interim income" ceases at the end of this year.

* * *

Rail Wages Again

Three groups of railway workers received replies to their wage claims this week—London Transport employees, the National Union of Railwaymen proper and its hotel and catering section. Although no statement has yet been issued, it is generally believed that the claims have been rejected outright. The union will thus have to decide at its executive meeting on Monday whether to submit to the rejection, submit the claim to the industry's arbitration machinery, or invite the Minister of Labour to institute a separate inquiry. The remaining possible course—to threaten a stoppage—seems improbable, although there will be strong pressure for direct action from some parts of the NUR. It is generally expected that the claim will be submitted to arbitration.

While there is a case for levelling up the wages of lower-paid railway workers and ironing out some of the existing anomalies in the wages structure, it would be impossible to justify the entire claim on its merits. Railway workers were recently granted an all-round increase of 7s. 6d. (they look upon their present claim of a 12s. 6d. increase as the balance of their original demand for £1 a week more), and the cost-of-living argument, on which their claim was mainly based, applies equally to any other section of the working population. It is true that a public Board should provide decent wages and conditions for its staff, but, as Mr Morrison pointed out in his speech to the British Institute of Management last weekend, there is equally a duty on the workers in a nationalised industry not to exploit their position or take any action which would force prices up. The present claim could be met only by raising fares and charges once more.

* * *

The World's Wheat

Revised figures for this year's Northern Hemisphere wheat harvest show that output is even larger than the preliminary forecasts suggested. According to Broomhall's *Corn Trade News*, the total crop should reach 3,854 million bushels compared with 3,303 million bushels in 1947 and 3,536 million bushels before the war. This is a significant expansion and, without taking into account the harvests in the Southern Hemisphere, it implies that output of wheat per head of population is almost restored to its prewar level. European production in 1948 has made a remarkable recovery from last year's small crop, though it is still 14 per cent below the 1935-39 average. The main deficiencies have occurred in Italy, Hungary, Rumania and Bulgaria. The wheat crop in India and Pakistan is also nearly back to prewar proportions, while output in Canada is 25 per cent heavier and in the United States 70 per cent heavier than in 1935-39. Estimates are not yet available for the Australian and Argentine crops, but

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 't'). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. • Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly (e) To earliest redemption date. (t) To latest redemption date. (m) 15 months. Yield Basis 25%. † Free of tax.

By "Orient Star" to Shanghai

With the opening by K.L.M. of their new "Orient Star" service, the great eastern city of Shanghai is brought within 2½ days' journey of Europe. The liners are Constellations—spacious, luxurious, with ten thousand horse-power security. Service leaves once a week. Air freight carried on all flights.

Reservations from all Air Travel Agents or K.L.M. Royal Dutch Airlines, 202/4, Sloane Street, London, S.W.1. (SLO. 9656) and at Manchester, Glasgow and Dublin.

It's time you flew K·L·M

National Savings Certificates

Savings Certificates are a gilt-edged investment. They may be bought in single documents representing 1, 2, 3, 4, 5, 10, 25, 50 and 100 units of 10/- each.

Each Savings Certificate costs 10/-. You can hold 1,000 of these 10/- Units in addition to permitted holdings of Certificates of earlier issues.

£500 invested in Savings Certificates becomes £650 in 10 years time. All interest is tax free.

With Income Tax at 9/- this is equivalent to a taxable investment yielding £4 . 16 . 8 per cent. If you are paying more than 9/- in the £ it is even more attractive.

Working Profit	£272,283	£0 2 5
Total Profit for the year		£276,797
Balance unappropriated at 30th June, 1947		416,787
Transfer from Shareholders' Contingency Reserve		11,000
Amount previously appropriated for Capital Expenditure, now reverted		15,102
		£720,589
This amount has been dealt with as follows:—		
Silicosis Act, 1946—Provision for outstanding Liabilities and Provision in respect of additional outstanding Liabilities	£22,667	
Taxation	2,833	
Forfeited Dividends Account	11,904	37,734
		£682,852
Dividends declared during the year: No. 76 of 10 per cent. and No. 77 of 10 per cent.		249,520
Leaving a balance unappropriated of		£433,332

The available ore reserve was re-estimated as at 30th June, 1948, as follows:—

	Tons	Value, dwt.	Width, inches.
Main Reef	586,000	4.8	57.4
Main Reef Leader	1,181,000	4.5	53.0
South Reef	665,000	3.9	45.0
Bird Reef	1,257,000	2.8	61.1
Kimberley Reef	115,000	3.0	64.4
Total	4,799,000	3.7	55.2

There are in addition 1,225,000 tons of payable ore valued at 4.1 dwt. per ton contained in shaft and safety pillars not at present available for stoping. Compared with the previous year the available reserve decreased by 175,000 tons, the estimated stoping width being 0.6 inch less and the value unaltered. Operations were adversely affected by a continued shortage of European and native labour.

The full Report and Accounts (with Plans of Workings) may be obtained from the London Secretaries, A.MOIR & CO., No 4, Leiden Wall Buildings, London, E.C.2.

BRITISH CELANESE LIMITED

The Report and Accounts for the year ended 3rd July, 1948, contain the Directors' recommendation for the payment on 17th February, 1949, of the following dividends to Stockholders registered as at the close of business on 5th January, 1949.

A Participation dividend of 1.3875% actual, less tax, on 7½% Participating Second Cumulative Preference Stock in respect of the year ended 30th April, 1948, and

A dividend of 8% actual, less tax, on Ordinary Stock in respect of the year ended 3rd July, 1948.

The following Account is extracted from the Report of the Directors and audited Accounts for the year ended 3rd July, 1948, which will be posted to Stockholders on or about 2nd November, 1948. The figures for the previous year have been adjusted to enable proper comparison to be made. Expenditure on Research and Advertising for the year has been written off in arriving at the Balance of Trading Account.

COMPANY MEETINGS

UNITED DAIRIES, LIMITED

CONTINUED CONTROL OF MILK SUPPLIES

WIDESPREAD AND VARIED ACTIVITIES

MR LEONARD MAGGS' STATEMENT

The thirty-third ordinary general meeting of United Dairies, Limited, was held, on the 15th instant, at the Connaught Rooms, Great Queen Street, London, W.C., Mr Leonard Maggs (chairman and manager director) presiding.

The secretary (Mr Allan Mair, CA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated on September 22, 1948, with the report and accounts for the nine months ended March 31, 1948, and was taken as read:—

I feel it will be in the interests of the many members who are unable to attend the annual general meeting on October 15th, if I circulate my remarks with the directors' report and accounts.

The accounts do not call for much comment, as the synchronisation of the closing dates of the accounts of the parent company and the subsidiary companies has made it possible to produce consolidated accounts for the whole group.

PROVISION FOR TAXATION

As the parent company's accounts now close in the fiscal year 1947-48, the future taxation provision has only to cover the estimated 1948-49 income tax liability, whereas if the accounts had been made up to June 30th, provision would also have been made for the 1949-50 liability.

Against this, however, the group is liable to additional taxation because of the change of the accounting year, although to a considerably lesser extent than if such change had been made in either of the last two years. Provision has been made for this liability in the accounts under review, but the Inland Revenue authorities have wide powers for dealing with assessments on a change of accounting years, and it is hoped they will agree to exercise these powers in favour of the company. Additionally, it has been necessary to provide the retrospective increase in profits tax for the year to June 30, 1947, announced after the accounts of the company for that year had been closed.

The net result of these factors is to release tax provisions amounting to £29,400 as shown in the group profit and loss account.

Deferred Repairs: Although, during the period covered by the accounts, there has been some expenditure on repairs which were scheduled as "deferred," there has undoubtedly been further deterioration in the assets on account of its not having been possible to carry out all the repairs needed. The amount expended during the year on repairs scheduled as "deferred" has been charged against profits, and the provision for deferred repairs left at the same figure as last year, namely £791,130.

DISPOSAL OF GROSS REVENUE

The following statement shows how every pound sterling received by the group in respect to sales of milk, milk products and other products was absorbed. Comparative figures for the previous year are also shown.

	1948 s. d.	1947 s. d.
Cost of milk, goods for resale, and raw materials for production of other goods	14 7½	14 7½
Salaries and wages	2 7½	2 5¼
Other expenses, including containers, depreciation, rents, repairs, etc.	1 10½	1 9½
Taxation, national and local	0 6½	0 7¾
Paid as dividends	0 2	0 2½
Retained in business for development ...	0 2½	0 3¼
	20 0	20 0

The foregoing summary covers all the widespread and varied activities of the group. The result of the milk side of the business, including subsidiary activities such as goods purchased for resale by shops, and (in Scotland) the bakeries, was not so satisfactory, the net retainable profit earned in relation to turnover available for dividends and development being just over 1 per cent.

GOVERNMENT CONTROL

Control by the Ministry of Food of milk distribution and milk product manufacture continues substantially on the same lines as I reported to you fully in my remarks on previous years' accounts.

Margins on Milk: Since I reported to you on the last occasion, there has been no increase in the margins allowed to the trade to cover processing, wastage, provision of bottles and bottling, delivery, collection and cleansing of empty bottles, booking up and giving of credit; we still have to carry out these services in London for about 1½d. per pint bottle. That there have been further increases in costs is unquestionable, and the Ministry of Food is being pressed by the industry to revise margins to cover these increased costs, over which the trade has no control.

Milk supplies: There has certainly been an improvement in milk production throughout the country, production in May this year having been an all-time record. If adequate supplies of feeding stuffs could be made available, milk production would increase substantially—possibly to the extent of doing away with the necessity for restricting supplies of milk to consumers.

REPORT ON MILK DISTRIBUTION

I reported to you on the last occasion that the Minister of Food had appointed a committee to examine and report to him on matters relative to the distribution of liquid milk, this report has now been published.

The main recommendation follows that of the Lucas Committee, appointed to examine the Agricultural Marketing Acts, and recommends the establishment of a commission. This Commission is apparently to take over part of the functions of the Milk Marketing Boards, the Ministry of Food, and the industry. It now having been decided that the Ministry of Food is to continue in existence, I cannot see any need whatsoever for the setting up of another bureaucratic body, at a direct cost to either the producer or the consumer, or at an indirect cost to the whole country through taxation

It is recommended by the committee that in addition to being regulatory this commission should actually trade, and thus enter into competition with the concerns it would control, which seems fundamentally wrong, and against recognised principles of fair play.

DOMINION INTERESTS

We are in the process of forming a company in Australia, to take over the business of Messrs J. E. Handbury and Sons, Pty., Limited, who have four factories in the State of Victoria, at present manufacturing chiefly butter from cream separated on the farms, with a little cheese, and a merchanting and export business. It is our intention to equip these factories to take in whole milk instead of home-separated cream, and to manufacture milk powder and (ultimately) possibly condensed milk, in addition to butter and cheese.

I am glad to say that the Handbury family are taking a financial interest in this new company, and a share in the management, which should be a great asset, as the family is well-known in the dairy trade in Australia, and held in very high esteem.

Our New Zealand company, Dairy Products, Limited, whose original factory for the production of sugar of milk from whey is at Edendale, in South Island, has just started to operate a new factory, at Kapuni, in North Island.

I hope our new venture in Australia and our increased investment in New Zealand will add to the earning capacity of our company, and also make valuable contributions to the economy of Australia and New Zealand.

TRIBUTE TO MESSRS B. DAVIES AND F. E. STILL

It is with much regret that I have to report the retirement from the board of Mr Ben Davies and Mr F. E. Still.

The name of Ben Davies has, for very many years, been a household word in dairy circles, not only in this country but in the United States of America and on the continent of Europe. He started work in his father's business at a very early age, and it was in this business that he commenced pasteurising and bottling milk in London. I believe I am correct in saying that this was the first successful venture of its kind in this country. Following the incorporation of the retail businesses into United Dairies' group in 1917, Mr Davies undertook the responsibility of operating the processing depots until the time of his retirement from active management in 1941. The expansion in the output of these depots and the many changes in technique were in considerable measure due to his efforts. In addition to this work, he has been director of laboratories and chairman of our research advisory council. This body has been most valuable in advising those responsible for operation of the correct technical approach to the many problems that surround them.

Mr Frank Still began work at Croydon in the business belonging to his father. At the time of the incorporation of the retail dairy businesses he became managing director of Welford Surrey Dairies and a member of the retail directorate. When further reorganisation of the retail businesses took place, Mr Still accepted the very responsible position of director in charge of provisions and central stores. He has vast experience in the purchase and supply of retail provisions and was mainly responsible for the consolidation at the Central Stores, Western Avenue, of the intricate distributive system of goods to all shops and depots in the London area.

The unfailing devotion to their work of both these gentlemen will always remain a source of inspiration to those who follow them, and I am happy to say they have both signified their willingness, although not on

the Board, to give the company at all times the benefit of their great experience.

DIRECTORATE AND STAFF

The recommendation of the election to the board of Mr. A. Bracher, of Wilts United Dairies, Limited, Mr. D. A. R. Knight, of United Dairies (London), Limited, and Mr K. W. Pocock, of the Edinburgh and Dumfriesshire Dairy Company, Limited, continues our policy of calling to the board from time to time those who have rendered the company valuable service and proved their ability. I am confident that their election to the board will add considerably to our strength.

I should like to express appreciation of the work of the officials and staff of the company. The harmonious and efficient working of the many sections of our organisation is largely due to their efforts and their helpful attitude.

The report and accounts were unanimously adopted and a final dividend on the ordinary stock at the rate of 10 per cent actual, less tax, making 15 per cent for the period, was approved.

The retiring directors, Mr William A. Blake, Mr Leslie L. Ferris, Mr Clifford C. F. Smith and Mr J. Gordon Stokes, were re-elected; Mr A. Bracher, Mr D. A. R. Knight and Mr K. W. Pocock were appointed directors; and the auditors, Messrs Peat Marwick Mitchell and Company, were reappointed.

A resolution was also passed amending the articles of association.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

RANSOME AND MARLES BEARING COMPANY, LIMITED

RECORD TURNOVER

The thirty-second annual general meeting of Ransome and Marles Bearing Company, Limited, was held, on the 14th instant, at Newark, Notts.

Mr F. W. Baker (the chairman) in the course of his speech said: I have pleasure in submitting for your approval the balance sheet as at June 30, 1948, together with the profit and loss account for the year to that date, and the directors' report. Our turnover for the year to June 30, 1948, created a new record both in value and in volume of production, and we anticipate a further increase in the current year, as new plant and premises come into production. The installation of new plant at the main factory, and the consequent shop reorganisation has continued steadily, and the Grantham factory, which was allocated to us by the Board of Trade on a rental basis earlier in the year, has almost reached the production stage. The Bunny factory has played an important part in achieving this year's record output and has proved a very successful acquisition.

At Newark itself the labour position continues to be a limiting factor, but if the housing position improves more rapidly in the future than it has done up to the present it is possible that additional labour may become available. If not, we now have room for expansion both at Bunny and Grantham, so that our future growth will not be restricted.

RE-EQUIPMENT AND EXPANSION

The year's record output is largely due to the programme of re-equipment and expansion on which we embarked at the conclusion of hostilities in 1945. Since then we have expended no less than £521,365 on buildings and plant, while the amount of stocks and book debts to carry the increased turnover has risen by £360,000 in the same period. To have financed this without a new issue or even short term borrowing is due entirely to the accumulated profits of years which have been consistently ploughed back into the business. It is a very clear demonstration of the fact that the majority of industrial expansion comes from profitable trading. Our research department has been considerably expanded and housed in new premises, leased from the Ministry of Supply two years ago, as in the opinion of the board this must continue to take a leading place in our development.

In the last 10 years we have provided wages and salaries to the extent of over £11,000,000. Out of every pound of sales in 1948, 8s. went in wages and salaries, and in material supplies and services, which are largely made up of wages to other industries, another 8s. The wages, salaries, holiday pay, pensions, etc., in 1948 were £802,000 greater than in 1939, while the net dividend distributed to stockholders, after deduction of tax, is £5,250 less.

UNABATED DEMAND

The demand for our products continues to tax our capacity to the utmost, and there is every indication that we will readily dispose of our expanding output. A very large proportion of our output has been exported in finished products such as motor vehicles, machine tools, and other equipment, so we have played an important part in the export drive, and will continue to do so, but we are hopeful that extended capacity will enable us to devote a larger proportion of our output to direct exports.

In this age of mechanisation, ball and roller bearings have an assured place and we have every confidence in the future demand and our ability to maintain our position in the industry.

The report was adopted.

(*Continued from page 682*)

even if these crops are together some 15 per cent below the 1947-48 figures, world wheat output would still be at least 5 per cent above the prewar level.

This season, America expects to ship at least 450 million bushels and Canada 240 million bushels, of which 140 million bushels will come to the United Kingdom under the wheat agreement. In 1947-48 United States exports amounted to 480 million bushels and Canadian to 200 million bushels. ECA funds will at any rate enable western European countries to import sizeable quantities this year. But when Marshall aid finishes, will the viability of western Europe be assured, given the present geographical distribution of world wheat production? Or will the United States cease to be a major wheat exporter?

The wheat market is also dependent on both the maize and the rice crops. This year, the American maize harvest is of record size, totalling over 3,500 million bushels, of which probably well over 300 million bushels will be available for export. World production is likely to be at least 15 per cent above the 1935-39 average, which totalled 4,740 million bushels. Maize exports are also expected to be available in quantity from eastern Europe and the Soviet Union. It is clear that Europe will have little need to approach Argentina this year for coarse grains, although large stocks still exist in that country.

The prospects of the Burma rice crop are still good, but the political unrest in that country is likely to restrict exports severely. In this case wheat from the Western Hemisphere will no doubt be shipped to Asia to prevent famine. World grain supplies are sufficiently plentiful to cover these additional requirements. The most serious problem which is likely to arise, however, is congestion in the North American ports, where port handling facilities will be hard pressed to cope with the large quantities involved.

Shorter Notes

Owing to a typographical error, last week's article on Inflation in India stated that the sterling rupee ratio had remained undisturbed at 1s. 4d. since before the war. The figure should, of course, have been 1s. 6d., which has been the rupee parity for more than 20 years.

Largely because of the ending of the school year, there were increases both in the total working population and in the numbers engaged in civil employment in August. The employment exchanges placed 380,000 workers in jobs—the highest number since the Control of Engagement Order came into force last October. But the undermanned industries, for which manpower targets were set in the *Economic Survey*, still show disappointing results. Employment in agriculture increased by 3,000, leaving another 24,000 to be recruited by the end of the year; textiles, which gained 4,000 workers, have as many as 81,000 to get to reach their target; the labour force in the mines actually declined, making the target of 750,000 set for 1948 even more remote than the output target of 200 million tons. At the same time the number employed in the distributive trades, which the Government hoped to reduce, rose by 21,000. These figures make it perfectly clear that the redistribution of manpower which is a declared object of the Government's labour policy is simply not happening.

*

In consideration for participating rights in mining companies that might be formed to mine the area, New Pioneer Central Rand Gold Mines, through its subsidiary, Strathmore Development, has acquired from Middle Witwatersrand (Western Areas) and associates all prospecting rights owned by them over certain farms adjacent to the southern boundary of the New Pioneer property, Stilfontein 39. Middle Witwatersrand is also to sell to New Pioneer vendor and subscription rights to the portion of Hartebeestfontein 41 held under prospecting and option contract by Union Corporation.

*

The participation of United Kingdom steel interests, which include Thomas Firth and John Brown, in the development of the new iron and steel works of the Government of Southern Rhodesia is considered likely to result from discussions at present being held with the Southern Rhodesian authorities. The present plant at Queque originally cost £2,000,000 to erect, and plans are under consideration to quadruple its present capacity of 17,500 tons.

Statistical Summary

GOVERNMENT RETURNS

For the week ended October 16, 1948, total ordinary revenue was £45,969,000, against ordinary expenditure of £57,185,000 and issues to sinking funds £361,000. Thus, including sinking fund allocations of £9,031,000, the surplus accrued since April 1st is £230,733,681 against £186,936,495 for the corresponding period a year ago.

CROWN AGENTS FOR THE COLONIES

Applications from qualified candidates are invited for the following post:—

ACCOUNTANT required by the Government of Nigeria for the Marine Department for one tour of 18 to 24 months with prospects of permanency. Commencing salary according to age, war service and experience in the scale £690 to £1,200 a year, including expatriation pay. Outfit allowance £60. Free passages and liberal leave on full salary. Candidates, preferably not over 35 years of age, must be qualified accountants and have a thorough knowledge of commercial accounts and of time keeping and cost for ship construction, engineering and repair work. They must have the ability to supervise the accounting for large quantities of marine and engineering stores and to organise and administer the work of a large clerical staff. Apply at once by letter, stating age, whether married or single and full particulars of qualifications and experience, and mentioning this paper, to the Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting M/N/18697/3C) on both letter and envelope.

ADVISER FOR TRADE AND COMMERCE

A vacancy exists for an Adviser for Trade and Commerce to the Government of the Gambia.

Candidates must have business experience, preferably in produce trading. Knowledge of buying and handling Colonial produce is desirable. The duties of the post are to advise generally on matters of Trade and Commerce and to organise the establishment and take over the direction of a Department of Trade and Commerce under which would fall as one of its main responsibilities the executive work of the proposed Gambia Oilseeds Marketing Board in the purchase, sale and export of all groundnuts and palm kernels. The new department would also take over from the existing Department of Supplies and Minor Industries the functions of price and import control and of developing local industries.

Salary, £1,100, plus £350 on pensionable terms. *If contract* terms are desired, a higher salary would be considered, with gratuity of £37 10s. for each three months of service.

Age limit, 45 years.

Apply, quoting this advertisement, to Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, S.W.1.

GENERAL MANAGER required for a chemical plant in the North of England. Applicants must be of proved capacity in a position of similar responsibility and, preferably, with chemical engineering or chemical engineering qualifications. Age not less than 35. Commencing salary £2,000/£2,500, according to experience. Appointment carries benefits of excellent superannuation and incentive bonus schemes. Applications, which will be treated in strictest confidence, should give fullest particulars of experience.—Box 861.

HONOURS graduate in Economics, 34, qualified pharmacist, at present holding administrative post with manufacturing firm seeks new appointment, offering scope for advancement, preferably in the south of England. Interests not confined to pharmacy. Good war record (Captain) and several years administrative experience.—Box 815.

ABLE young (25) Oxford M.A., bilingual French, v. fluent German, little Spanish, seeks post old established firm Europe, Scandinavia. Initial salary immaterial, but good prospects essential.—Box 845.

ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

APPOINTMENTS REGISTER

Employers seeking the services of Certified Accountants are asked to write to the Secretary of the Association, 22 Bedford Square, London, W.C.1. (Telephone: Museum 5163.)

ADMINISTRATIVE COUNTY OF LONDON

CHILDREN'S OFFICER.

THE LONDON COUNTY COUNCIL invites applications from suitably qualified persons for appointment, on a permanent basis, to the position of Children's Officer, at a salary of £2,000 a year. The Children's Officer will have the duty of advising on all questions concerning the exercise of the Council's functions under the Children Act, 1948, and will be administratively responsible for the child care services provided by the Council thereunder. The person appointed will be subject to the Council's Superannuation and Provident Fund Scheme. Forms of application (stamped addressed foolscap envelope necessary) obtainable from the Clerk of the Council (G), The County Hall, Westminster Bridge, S.E.1. Applications must be returned so as to be received not later than November 27, 1948. Canvassing disqualifies. (2065).

WEST HARTLEPOOL EDUCATION COMMITTEE

SECONDARY TECHNICAL SCHOOL.

HEADMASTER: J. S. HOWARD, B.Sc.

Applications are invited for the post of Assistant Master to teach COMMERCIAL ARITHMETIC, BOOKKEEPING and COMMERCE, to commence duty on January 1, 1949.

Applicants should have had commercial and/or teaching experience. An interest in school corporate activities would be an advantage.

Salary in accordance with Burnham Scale.

Further particulars and form of application may be obtained from the undersigned, the completed form to be returned within 14 days of the appearance of this advertisement.

L. DOWSLAND,
Chief Education Officer.

Education Offices, Park Road, West Hartlepool. October 11, 1948.

PERSONNEL DEPARTMENT IN SOUTH LONDON FACTORY requires a Statistical Officer. Preference given to young graduate who has sound reasons for entering the field of personnel work. No previous experience required except for some knowledge of statistics. The candidate is not expected to hold the position of Statistical Officer for more than two years by which time opportunity will have been provided for training and participation in the wider field of personnel policy.

Commencing salary (man or woman) £300 to £400 depending on qualifications. Selection of candidates will be by the Group Discussion method. Apply with details to Box E 830, L.P.E. 110, St. Martin's Lane, W.C.2.

ACCOUNTANT, qualified, required by a leading British manufacturer of medical products operating in India and Pakistan. Applicants should preferably be under 30 and unmarried. Salary, prospects and provident fund good. Write immediately to Staff Manager, Glaxo Laboratories Ltd., Greenford, Middlesex.

MALE SECRETARY aged between 20-26 years required for the President of a world-wide organisation. Fast Shorthand and Typing, and fluent knowledge of French essential. This is a unique opportunity for an ambitious man, offering excellent prospects for advancement. The applicant must be prepared to travel by air when required. Apply in writing to the Personnel Manager, 15, Old Bond Street, W.1.

ALL-ROUNDER, age 23, good Cambridge degree Economics and History, some Statistics, widely travelled, with fluent French, good Russian, some Danish, Spanish, German, typist, ex-parachutist, driver car, capable public speaker, seeks useful position with excellent prospects.—Box 857.

CHARTERED ACCOUNTANT, 29, B.Sc. (Econ.), ex-Captain Intelligence Corps (languages: French, German), seeks appointment having wider interest than that usually presented by professional accountancy and where initiative and organising ability would be of value. Box 864.

MARKETING, Sales Promotion, and Advertising enthusiast. Manager for front rank manufacturers, also advertising agency experience. Public school man (Winchester) and lately Lt. Col. (Staff). Eats work, welcomes responsibility, uses brains. Seeks new executive post.—Box 821.

Parliament and People

AMID ceremonial splendour, Parliament has embarked upon its fifth session. If the resumption of prewar ritual and magnificence came as a welcome reminder of the deep roots and continuing strength of Parliamentary institutions, the prosaic words of the King's Speech were no less a reminder of the problems which a disordered world thrusts upon them. Distrust and dissension among the nations is impeding recovery; the peace is threatened by Russian policy in Berlin; the problem of the balance of payments remains unsolved; the shadows of possible war demand the urgent overhaul and expansion of the armed forces and provision for civil defence. Here are questions difficult and pressing enough to tax all the resource of Ministers—questions on which the nation, as distinct from party supporters, will infallibly judge them when the election comes. Whatever else happens during this long fifth session of the present Parliament, these major issues will be the very stuff of politics, and they will demand the wisest counsels of both sides of the House.

But if they were to be given the prominence that they deserve, the Government would have been wise to offer some relaxation in the pace and pressure of legislation. It has not done so. The Parliament Bill is to pass through its final routine stages—a lever to prise open the door through which the Steel Bill can pass into law by 1950. The Steel Bill itself is to bring under public ownership—or rather to enable an Iron and Steel Corporation to acquire the securities of—certain companies extensively engaged in the production of iron ore, or of pig iron or steel, or "in the shaping of steel by a rolling process." Of this measure, more will be known by the time this issue of *The Economist* is in the hands of readers. Two general observations can nevertheless be made about it in advance. The first is that no respectable arguments have, so far, been put forward for this measure at this time. The Prime Minister contented himself on Tuesday with saying that the production of iron and steel in the right quantities and qualities is basic to the planning of the economy of this country. But even if that argument were acceptable, it would justify the nationalising of several other industries only somewhat less important than steel. If the needs of planners were all that were at stake, they could be secured—as they have been secured during the past three years—by measures stopping well short of state ownership.

The second point is that steel is pre-eminently an issue about which the nationalisers, in Mr Morrison's phrase, have to prove their case. It will not be enough for them to do so in terms of the prewar shortcomings of the industry, or in terms of the alleged advantage of a public monopoly instead of a private monopoly. They will have to prove, if they can, that nationalisation will produce an industry better organised and technically superior to that which is now emerging from the supervised efforts of the steel industry itself. To say that this basic issue is non proven would be far too charitable. There is an overwhelming presumption that, in the period during which "planning" has critical relevance—the next four years, when Britain may hope still to receive American aid—state ownership of steel can at best make no material

difference, and at worst will do serious damage to recovery.

These are preliminary judgments, which await the evidence of the Bill itself. That Bill will be the main plank of the Government's legislative programme, and it will honour its last election commitment. But the energies of Ministers, their advisers, and their supporters are also to be sustained to deal with a large programme of worthy but unexciting legislation. Measures are promised for national parks, for access to the countryside, and for the preservation of wild life. Magistrates' Courts are to be reorganised, and legal aid made more readily available for persons of modest means. Jurors are to be paid; there will be legislation on coastal erosion and the safety of life at sea. The patent law is to be revised; provision is to be made for the better training of nurses; safer milk, producers' marketing boards and the development of the white fish industry are to be considered. Scotland is to have better water supplies and an amended criminal law on the English pattern. The powers of local authorities over new housing and the improvement of existing dwellings are to be extended. As if this were not enough, the King's Speech promises that other measures will be laid before Parliament if time permits. Given the partial restoration of private members' time—for which ten Fridays are to be set aside after Christmas—and the normal proceedings on Supply and the Budget, it is obvious that Parliament is in for a very busy time indeed.

There is, indeed, more than an air of unreality about the programme. The Parliament Bill is a device to ensure that the Government has its way over steel. The Steel Bill is a political commitment, not an act of constructive economic policy. The rest of the programme is well-intentioned, and unobjectionable in principle. But while this spate of Bills is passing through the Parliamentary mill, major forces will be shaping themselves in the country and in the world. Crucial decisions about the defence of western Europe have to be taken. The melancholy choice has to be made between rearmament and further recovery—for the fact that Ministers have been able to assert that the measures so far taken will impose no significant strain on the British economy is a reflection of their strictly limited extent, not of the capacity of British industry to add an impressive armament programme to its present urgent commitments. The delicate omission from the King's Speech of any reference to the extension of military service is in itself a symptom of half-heartedness in the matter of defence.

*

Yet the responsibilities of foreign policy and defence will call for qualities of wisdom and courage in no way superior to those which will be needed to meet the nation's economic problems. Failure in economic policy would invite failure in everything else. The general phrases of the King's Speech give only the broadest indication of the Government's plans and hopes. "Ministers will continue to devote themselves to the problem of the balance of payments . . . We shall hope to progress further towards paying our way abroad and restoring the prosperity of our country and the world . . . By increasing the individual contribution of skill and labour, we must build up our production still further." The compulsions are recognised, but as the new session proceeds, they will assume increasing urgency. For it is the unfortunate fact that production in Britain seems no longer to be increasing. The evidence assembled in the British economic plan for 1948-49, lately presented to the Organisation for European Economic Co-operation, shows that the Government does not expect any material increase in the output of manufacturing industry as a whole—its estimate ranges from an actual fall of 1 per cent to an increase of 4 per cent compared with the second quarter of this year. The same lack of dynamism is evident in the forecast of exports for 1949; here the figures are presented in a needlessly confusing form, but their story is inescapable—the period of rapid expansion of exports is coming to an end. A later article surveys these forecasts in greater detail. All that need be said here is that 1949 may be a year of high achievement but not high enough to promise that Britain will be able to earn its present standard of living, unaided, by 1952.

It has become something of a habit for Ministers to make more than the best of Britain's economic achievements during the past twelve months. Corrective measures have been applied to the yawning gap in dollar payments, but it will require a miraculous transformation in the terms of trade to close it by 1952. And merely to close it rests on two assumptions—the first intolerable, and the second far from certain. The first is that the volume of imports to this country, to support an increased population under conditions of full employment, shall be restricted to 75 per cent of the volume of imports in 1938, itself not a very impressive prewar year. The second is that the volume of British exports can be permanently kept as high as 160 per cent of the 1938 volume, irrespective of changes in the volume and character of world trade. In contrast to the recent optimism of Ministers, the plans which they are unfolding for 1949 suggest a much greater caution. Indeed, they are, in their broad implications, pessimistic.

This fatalism about exports is partly justified by changing demand in the world market. But it rests too on the assumption that manpower is at full stretch, that no more labour can be attracted to the export industries, and that no greater effort by management and men is possible. In the common trade union view, increased output can only be obtained from investment in new machinery, not from applying greater effort and improved organisation to the machinery which already exists. The point is rejected in the King's Speech itself. But the Government has the obvious duty of strengthening "the individual contribution of skill and labour" by the highest wisdom and courage in its economic and financial policy. It will not find this duty easy in a pre-election year. It would be doubly fatal if differences of opinion between the Government and the Opposition about economic policy at home were to degenerate into a vulgar race for vote-catching.

In no aspect of economic policy is wisdom more needed than in the programme of capital investment on which the Government has embarked. Last week's White Paper emphasised the long period which has still to elapse before many of the major schemes of industrial reconstruction begin to bear fruit. To the voices which have criticised the size of these commitments has lately been added that of the Governor of the Bank of England himself. But objection to the capital investment programme cannot possibly lie against its absolute size. Britain is setting aside no more of its current income (together with the assistance which it is getting from other countries) than is essential for its industrial survival. There may be ground for criticism of the choice and timing of some of the projects. Their planning in detail may leave much to be desired—it is, for example, richly ironical that electrical generating plant will soon be ready and will have to be put in store because the power houses will take two more years to build. The proportion of effort and materials devoted to housing and other social investment is, given the country's present resources and future prospects, unduly high. Economic policy must learn that Britain's economic resources leave no room for any choice of capital schemes based on notions of absolute necessity.

The special need of the new session, therefore, will be the exercise of political honesty, avoiding on the one hand any despairing idea that the British people are incapable of further effort if they are properly led, and seeking by every means to complete the process of economic recovery and independence which has already covered promising ground. The Government will have everything to gain by pursuing the truth and by inculcating a new *élan* in the nation's economic life. It will lose everything if it conceals the nation's real economic task behind a curtain of political expediency.

After the Commonwealth Conference

THERE used to be a witticism, current among the diplomatic staffs of the Commonwealth countries, that the most abiding result of a Commonwealth conference is a group photograph in the garden of Downing Street. There were many reasons for thinking that the meeting which has just ended would be a polite "interchange of views" avoiding all the thorny and difficult subjects, and leaving the vital and controversial questions to be settled unilaterally among the countries concerned. But, in fact, that has not happened. There has been a genuine effort to discover not only how much unanimity exists between the nine countries of the Commonwealth but how far their differences in policy are of importance, and what hope there is of settling the private quarrels that exist between some of the participating countries.

The work of the conference can be divided between matters of policy, which for the most part were discussed in full session, and the more delicate constitutional matters which were dealt with informally. The communique which was issued at the end of the discussions dealt only with the former. It is of a very general nature, but it is more than a statement of the "highest common platitude." It endorses the British Government's policy in regard to both the Brussels Treaty and the forecast of its commitments to the Organisation for European Economic Co-operation. These were regarded by the conference as inescapable commitments which the United Kingdom has rightly undertaken, and which, although they might conflict with the short-run interests of the Commonwealth countries, were in the long run essential and desirable. This is a tribute both to the spirit of the conference and to the clarity with which Mr Bevin and Sir Stafford Cripps outlined the United Kingdom's position.

The communiqué establishes the positive aspect of the resistance to Communism and, pedestrian though its wording may be, it is the first Commonwealth document ever to set its ideals so high: "The representatives of Commonwealth Governments affirmed their purpose to build up the economic strength of their countries and to take all appropriate measures to deter and resist aggression. At the same time they will do their utmost to encourage an increased production of wealth so as to achieve higher standards of living, especially for the peoples of the less developed countries of the world, as a constructive contribution to the preservation of world peace." If these words genuinely mean an active policy, they represent a considerable advance over the particularist sentiment of previous conferences.

The Prime Ministers also decided to recommend to their governments measures for improving Commonwealth consultation on foreign affairs, economic affairs, and defence. Exactly what form this will take will not be known until the proposals have been discussed in the nine Cabinets concerned. Some clue, however, is given by the reference to the value of consultation on the Ministerial level. While it is impossible to envisage permanent joint organisations involving the consultation of Ministers, it is to be hoped that it does mean more frequent meetings of Ministers in capitals other than London. This applies especially to the United Kingdom Secretary of State for Commonwealth Relations, who is only too often loaded with a number of irrelevant tasks which the other members of the Cabinet are not disposed to handle. If he does his job as it ought to be done, he will be the busiest, not the freest, member of the Cabinet.

The present consultative machinery of the Commonwealth dates from a more leisurely and more isolated age, and it is well that the conference has decided to overhaul it. On questions of defence and foreign policy the Canberra Conference on the Japanese Peace Treaty offers a useful precedent. On economic policy the wording of the communique suggests the creation, not of combined boards on the wartime pattern, but of a central clearing house for economic information. The new countries of the Commonwealth, in particular Pakistan, showed as great a desire for the proper function of the machinery of co-operation and consultation as the old, and at times a desire to bind the conference to more integrated arrangements than the latter felt desirable for themselves. The only country which seemed unwilling to subscribe to the general principle of co-operation and consultation was South Africa. Its commitment extends to the fight against Communism but beyond that its delegate, in a public speech in London, described his brief as being "conditioned by South Africa's interests and by a strict observance of the principle of 'South Africa First.'"

*

The constitutional questions were much more ticklish. By implication, the decision to drop the word "British" as a description of the Commonwealth has obviously been accepted, although it was never formally discussed by the conference. It is right that it should be dropped, for the Commonwealth no longer contains more than one-sixth of British stock, whatever may be its historical origin. Equally, the word "Dominion" has disappeared from official statements, although its going leaves a void in the vocabulary which is but clumsily filled by the words "Commonwealth country."

The most significant event of the conference, was the willingness of the Prime Minister of India, Pandit Nehru, to take a full and constructive part in the conference. It was known that Pakistan and Ceylon were anxious to take part but it was not known beforehand how far Mr Nehru was prepared to enter into frank discussions with the other Prime Ministers.

ROYAL EXCHANGE
ASSURANCE: INCORPORATED IN 1720

If he had come as a man paying a farewell visit to an association of which his country was only a reluctant and formal member, the talks would have taken a very different turn. As it turned out, he was prepared not only to participate wholeheartedly—if with a certain quiet scepticism about the future—in the plenary sessions, but to take the lead in private discussions on the future of India's relationship with the Commonwealth.

It would be idle to pretend that India's future relationship with the Commonwealth can be settled by personal cordiality. A formula must be found which will satisfy Britain and the countries of the original Commonwealth—that is to say, one which does not disturb the position of the Crown as the connecting link. At the same time, it must take account of India's declared intention (declared perhaps in haste, but not easily revocable), expressed in a resolution—drafted by Mr Nehru himself—to be an "independent Sovereign Republic." The principle of double citizenship can be accepted under the British Nationality Act passed earlier in the year, but there is no such easy disposition of the question of the Crown. To the nations of the old Commonwealth the Crown, representing the common traditions of parliamentary government and the rule of law, is not a symbol which they will willingly relinquish.

However, given the present cordiality of relations between India and the Commonwealth, a compromise can probably be found and upheld. It would be as well, if Mr Nehru can separate the question of Commonwealth relations from the other agenda of the Indian Constituent Assembly, for the matter to be held in abeyance for a few months until various alternatives have been thoroughly thought out and tested, not only upon Indian public opinion, but upon those of the other Commonwealth countries. But the decision turns upon political and not legal questions. If India is convinced that its lonely position as the only great Asiatic power, and its long connection with British methods of administration and jurisprudence, give it a permanent community of interest with the Commonwealth, a legal formula will be found, however unfamiliar it may be.

The situation differs from that of Ireland after 1921, with which it is so often compared. Ireland retained its connection with the United Kingdom under duress, and has been steadily attenuating it ever since. In Ireland there was a deep-rooted desire for a republic as such and the Irish—or at least their political rulers—have shown a willingness to pay a heavy price to get rid of the symbols of association. But India—where, in any case, republicanism draws its strength from an intellectual movement and is contradicted by popular tradition—may be prepared to negotiate a compromise from a recognition of mutual interest and a willingness to subscribe to the principles which, though often unexpressed and often ill-expressed, underlie the Commonwealth association. If this is so, then a formula can surely be found that will avoid the two opposing dangers—the one of so loosening the tie of association that it ceases to have any meaning at all, the other of so formalising it that it chafes.

There is, however, one question which bedevils the relationship of Pakistan and India to each other and to the Commonwealth—the dispute in Kashmir. A resort to open warfare would make a mockery of combined defence schemes or of economic co-operation in that region of the Commonwealth. The private talks held between Mr Attlee, Mr Nehru and Mr Liaquat Ali in London on Kashmir do not seem to have achieved much. But if the statesmanship which all three displayed in the plenary sessions could be devoted to ending the dispute, whether by agreement to a solution or agreement to abide by arbitration, it would be not only a personal triumph, but a practical exposition of the vitality of the Commonwealth.

Previous conferences of Commonwealth Prime Ministers have formulated and recognised changes that had been gradually occurring. The 1948 conference may by the spirit in which it was conducted have effected radical changes itself. The possibility that the Commonwealth might include three Asiatic nations only became apparent eighteen months ago. It is now certain that two, and it is possible that all three of them, intend to remain within it. It is too early to assess the immense changes that will flow from this decision. The new members will demand a greater degree of precision and probably of effective co-operation in their relations with—if not the whole Commonwealth—at least with Great Britain. The nations of the old Commonwealth were nascent communities anxious to assert their sovereignty against the United Kingdom. The new countries are drawn from ancient civilisations to whom the practical advantages of an international community may seem more important than Simon-pure sovereignty. One thing, however, is certain. The new Commonwealth will be based not on a common race or tradition, but on a community of ideas.

Work to the Workers?

THERE are two ways of judging the Government's policy on the distribution of industry. The first is to measure its success in preventing the recurrence of widespread unemployment in what used to be called, with reason, the distressed areas. The second, and much wider, question is concerned with the real economic cost of the policy—whether it diverts resources into the development areas which could be better employed elsewhere, or prevents the movement of labour from these areas to other districts which are desperately short of men. The first aspect of the problem can be called the social aspect—though its economic consequences are important. The second raises the purely economic issue whether the forced revival of areas which have lost part or whole of their economic *raison d'être* may not in the end prove more costly than the development of regions which have positive economic attractions.

Last week's White Paper* reviewing the first three years under the Distribution of Industry Act was encouraging about the first issue, and silent about the second. It starts from the premise, which underlay the Act and has inspired every phase of the Government's policy for industrial location, that the development areas enjoy an inevitable and natural entitlement to new industrial projects. "The Government," claims the White Paper, "has not given preference to the development areas to the neglect of all other parts of the country." But by building licensing and the exercise of planning consent under the Town and Country Planning Act of last year, the Government has complete power of veto over any industrialist who may wish to set up a factory outside the development areas, and with few exceptions it has been exercised.

The present economic state of these areas is utterly different from what it was in 1932. In the four main areas at that time (South Wales, Scotland, the North East Coast and West Cumberland) there were 830,000 unemployed, or nearly 40 per cent of the insured population. Five years later, the figures had been reduced to 410,000 and 18 per cent respectively, partly owing to measures taken under the Special Areas Act but largely owing to economic recovery and rearmament. By June last, total unemployment in the development areas (the old areas with their boundaries redrawn, together with South Lancashire and Wrexham) was only 101,900—4 per cent of the insured population—and a quarter of a million more men and women were at work in them than in 1939.

This transformation is, of course, due in large part to increased activity in the mines, shipyards and general engineering plants in the whole country, and not by any means solely to special measures in the development areas themselves. A further distinction has to be drawn between the new industrial establishments which are being erected by private industry in the development areas and those which are being provided directly by the Government. The former include, among others, the enormous new factory of British Nylon Spinners at Pontypool, the new chemical works of ICI at Wilton and the extensions at Billingham, and Patons and Baldwins' new wool textile mill at Darlington. Whether all these projects would have been sited in the development areas, in the absence of Government sanction, may be doubtful, though several of them would probably have gone there in pursuit of labour or suitable sites, particularly on the North East coast.

According to the White Paper, employment has been found for 104,500 workpeople, either in Government factories adapted for peace-time production, in other existing premises, or in new factories financed by the Government or by private industry. But of this total, less than one-third has found employment in new factories—there are 443 of them, and they still have less than half their intended labour force. Another 740 factories are planned, and 530 of them are under construction. In full production, they are expected to absorb another 185,000 workpeople. Well over half the employment to be provided will be in Government financed factories, which have already cost £25 million, and will ultimately cost £38 million. But this figure does not cover the full cost, nor is it quite certain to what portion of the new schemes it relates. Loans to companies (nearly £1,000,000 has been advanced), clearing of derelict sites, improvements in water, sewerage and gas supplies (costing about £9 million) and the special provision of houses for key workers are among the extras which have to be taken into account. All told, a commitment of the order of £50 million has been undertaken, from public funds.

*

Measured by the numbers so far placed in employment, the experiment in directing new industries to the development areas has been very costly. The argument that the areas were ready for the reception of new industries, if only they could be persuaded to go there, proves to have been exaggerated, for new basic services and housing are having to be provided at the expense of other areas where conceivably they might be better employed. Nor does the Government's statement address itself seriously to the question of what kind of industrial employment should be provided in the development areas. It takes its text from prewar days, when the areas were depressed because the demand for capital goods was deficient. There is even a slight note of regret in the statement that "although the dependence of the development areas upon capital goods industries has diminished, the percentage of the insured population yet engaged in them exceeds that for the country generally." Consolation follows a few lines later: "The whole industrial pattern of the areas has become more varied and less vulnerable to depression than it was during interwar times." And what is the result, in this present period of unsatisfied demand for capital goods?

> Some of the new consumption goods industries have, in fact experienced troubles because in recent months, the demand for their products having fallen below the level of supply, they have had no recourse but to discharge part of their labour force. It must be recognised that the creation of a sufficiently diversified economic structure is bound to be a slow process.

It is hardly surprising, therefore, that the reviews of progress in the individual areas should be hedged around with provisos—"provided no general economic depression intervenes . . . so long as a high and stable level of employment is maintained in the country as a whole . . . provided the general level of purchasing power is maintained. . . ." But if there is one thing which can be said with fair certainty of the economic prospect over the next five or ten years, it is surely that the demand for capital goods and coal is likely to be better sustained than the demand for some of the consumers' goods which are the typical products of the smaller factories in the development areas. These industries largely employ female labour, and therefore do little to alleviate the unemployment among unskilled men and exminers of whom there are still a number in Wales and Scotland. Lipsticks, fancy goods and electrical appliances are all desirable, without doubt, but not if the labour, materials and capital resources devoted to them could be better used for new industrial development of a more fundamental character. Perhaps the first idea which will have to be unlearned in the Government's policy for the development areas is the notion that "light" industries escape from depression virtually unscathed, whereas "heavy" industries oscillate violently from boom to slump. The danger, now that light industries have been established, is that no effort will be spared to keep them at full employment, even when the demand for their products changes. As contributors to the saving of imports or the expansion of exports, their value is much lower than that of the distrusted heavy industries.

The White Paper does not pursue such discussions. It is content to explain why West Cumberland and the North East Coast should still be retained as development areas, though unemployment only amounts to 3 per cent in each of them. It argues the case for adding Merseyside, with 25,000 unemployed (5½ per cent of the working population) to the list. It stretches the problem of the Scottish Highlands where depopulation rather than acute unemployment is the main cause of concern, and where it finds that development area powers should be used to create "a focal centre of industrial development for the Highlands" bordering on the Cromarty and Beauly Firths in which hydro-electric power will soon be available. Political pressure has been pointing the way to both these new additions for months past. That, perhaps, exposes one of the chief weaknesses of the policy; it is governed not by any explicit principles about the distribution of industry, but largely by the demands of representatives of the development areas, in Parliament and elsewhere.

It is time, indeed, for a careful review of policy on the development areas. Like so much that the Government does in the economic field that policy is based on the assumptions that the conditions of pre-war slump will recur; that labour in the areas is largely immobile; and that the "social investment" which already exists in the development areas justifies the placing of new industries there, often far from their markets. It presupposes, moreover, that despite the promise of full employment the development areas will always have more men than jobs, and consequently that jobs must be taken to them or created for them. Yet full employment, if it is not to have damaging consequences of rigidity and waste, also implies high mobility of labour between jobs and between districts. Development area policy runs counter to this aim. The reserves of labour in the areas are not being encouraged to move into essential industries elsewhere. To that extent, exports are being lost. But to bolster up employment in the development areas, the whole location of industrial investment is being distorted in their favour, irrespective of comparative economic advantages in these and other areas, and without giving adequate consideration to the end-products of many of the factories which have been laid down. To that extent, the best return is not being obtained from the resources—already low enough—which are being devoted to new capital investment in the country as a whole. Britain's present predicament is that there are too many jobs and too few men—too few in essential employment in the capital goods and export trades, and too many in consumption trades and services. Development area policy is not easing this predicament; on the contrary, it is adding to it.

* Distribution of Industry. Cmd. 7540.

force of Germans under Field-Marshal Paulus, General von Seydlitz or any other national leader. One may assume, therefore, that the militia that is now being formed is riddled with Russians of the armed MVD—the Soviet equivalent of the *Waffen SS*.

It is this aspect of the new force, and the probable use to which it will be put, that makes it a menace, as well as yet another breach of Potsdam. True, it will first be used for the purpose of guarding the frontier between eastern and western Germany, as the Russians are extremely anxious to stop the flight of men and machinery from their zone. But Dr Fischer has also declared that the force will be needed to maintain "peace and order" if the Soviet Army withdraws "from a part of the country"; he has hinted, too, at civil war in the west. The rising in South Korea organised last week to coincide with the withdrawal of the Russian regular army from the north, suggests what Dr Fischer has in mind. If the Russians leave their zone, their interests there and in western Germany will be well looked after by a strongly organised and deeply entrenched Communist party, confident that the future will offer opportunities to cause doubt and trouble beyond the Elbe

* * *

Parliament Begins

Although the Iron and Steel Bill was formally presented to the House of Commons on Wednesday, the fact that its full terms were not to be published until Friday (after *The Economist* had gone to press) gave a certain unreality to the first three days of parliamentary debate. Political feeling has hardly begun to develop since most of the attention of the House has been given to the issues where such feeling is hard to arouse—to the formal opening of the debate on the Address, and to foreign affairs. The Prime Minister's request for a Tribunal of Enquiry to investigate the alleged malpractices in the Board of Trade drew a dignified display of unanimity from the rest of the House, and an honourable damper on wagging tongues from Mr Churchill.

Many of the Bills outlined in the King's Speech are administrative measures into which neither side will be able to breathe much political fire (although it is possible that the decision to permit the introduction of Private Members' Bills may strike some sparks). The debates on iron and steel will therefore be all the more heated, for they will represent one of the last Parliamentary chances for a comprehensive statement of the economic and political faiths of the two major parties. But so far it has been possible for speakers only to spar around the subject. The Liberal party has refused to come down on either side, although Mr Clement Davies stated that the onus of proof that nationalisation was necessary rested with Mr Morrison. It will be an unusual feat of leadership if the Liberal party can be persuaded to speak and vote with one voice on this question.

The difficulties which what might be called the liberal wing of the Labour party will have with its conscience was represented in its extreme form by the decision of Mr Ivor Thomas to cross the floor from the Labour to the Independent benches. Mr Thomas is a representative of a considerable number of men of intellectual liberal leanings who joined the Labour party in the 1930s as the only party which could oppose Brummagem Toryism, and who find themselves unhappy in a Socialist party which has lost its spiritual *raison d'être* and its intellectual drive while being dedicated to an equally Brummagem material policy. But the ties of party, once assumed, are hard to break, and it is unlikely that there are many other members who are prepared to revolt on the issue of the nationalisation of steel.

* * *

The TUC Takes the Gloves Off

Any fears that the TUC General Council would be unduly inhibited from taking a strong line on the Communist issue, because of its habitual reluctance to interfere in the affairs of individual unions, have been dispelled by the statement which has now been issued to all affiliated unions. This is by far the most direct and bitter pronouncement that has ever come from Transport House. Trade Union executives are urged to "counteract every manifestation of Communist influence" and to take "energetic steps to stop these evil machinations which threaten the economic recovery of the country." Much of what the Council says is already familiar. It refers to the Communists' "servile obedience to the Cominform" in the "interests of a foreign power," to their sabotage of the European Recovery Programme and, what is most important in this country, the campaign to magnify industrial grievances for political purposes. But the vehemence of the statement, which was followed by the censuring of Mr Horner's support of the French pit strike by the National Union of Mineworkers is of great significance.

It remains to be seen what practical effect the statement will have on the individual unions and upon their ordinary membership. In most cases elections of union officials are not due till next year, so there is no immediate prospect of unseating the Communists in key positions, but a great deal can be done at a lower level if the non-Communists turn up at branch meetings or take action on the lines of the Manchester electrical shop stewards against Communist influence in the workshops.

The General Council has itself set the pace by its decision to call on the World Federation of Trade Unions to suspend its functions, and to withdraw if the Federation refuses to agree. It is not exactly clear what is involved in "suspension," nor how it will work, and since in any case the WFTU is unlikely to put itself voluntarily into cold storage, this in fact means British withdrawal. Ever since Mr Deakin declared at Margate that it was impossible to co-operate with the Russians in the WFTU, it has been increasingly obvious that it was only a matter of weeks, or at the most months, before the final break came. The American Congress of Industrial Organisations is bound to follow the British lead. Few tears will be shed at the passing of this body, which was nobly conceived as a great manifestation of international working class solidarity, but which has never grown up, and which has eventually deteriorated into one more forum for the quarrel between east and west.

* * *

Communist Failure in Malaya

Although it may be some months yet before the small terrorist force in Malaya is completely destroyed, it now seems certain that the Communist campaign has failed. Mr Malcolm MacDonald, the Commissioner-General for South-East Asia, pointed out in London on Tuesday that the intention had been to disrupt the production of tin and rubber, thereby embarrassing Britain's economic recovery—and incidentally Russian purchases of those strategic materials. The success of the troops and security forces has stopped the Communists from achieving that objective, and production of tin and rubber is now higher than at any time since the war.

This is welcome news. When the terrorist campaign began five months ago, there was a real danger that it would engulf the whole peninsula; the Government was slow to measure and grapple with the emergency, and many believed that the appeal to Malay nationalism, coupled with the fear of the Chinese Communist bands, would lead to a widespread rising against the British. That the danger is past is due partly to the display of strength which the Government eventually made, partly to its social and administrative reforms and their effect on the Malays, and partly to the fact that by far the greater proportion of the terrorists—and their victims—were themselves aliens in the country. Mr MacDonald announced that, since the beginning of June, out of 223 civilians who had been murdered, 17 were Europeans, 25 were Malays, 169 were Chinese, and the remaining 12 were a mixture of Indians, Javanese and primitive natives. Moreover, out of the 430 terrorists who had been killed or captured during the same period, 407 were Chinese, 15 were Malays, two were Indians and one was Siamese. Much of the credit for repelling the Communists is also due to the Malay trade union leaders, who staunchly maintained their independence and vigorously resisted Communist attempts at infiltration.

The Government must not now rest on its laurels. The organisers of the conspiracy in China and elsewhere may try again; there is also the possibility of trouble from Communists in Southern Siam. The squatters have to be dealt with and the network of police posts and intelligence needs improvement. Moreover, the Malays, who have shown themselves able and effective allies, will expect to see hastened forward many reforms which are still little more than paper plans.

* * *

Next Questions for OEEC

Now that the western governments have signed and delivered to ECA their agreed programme for the first year of the recovery programme, they are hard at work on the even more formidable task of preparing the four-year master plan requested by Mr Hoffman last summer. What the Americans expect to see is a consolidated plan for the 19 countries showing how, by 1952, each member intends to pay its way within a viable

western Europe. November 1st was the date set for delivering the finished product, but December 1st would seem to be a more realistic dead line.

Some of the individual programmes have not yet reached OEEC headquarters, and the bulk of them were submitted only last week. Even among those which have been received the contents are often less than adequate. Those countries which have not entirely succumbed to the attractions of planning hesitate to commit themselves to detailed quantitative achievements in a remote future. In other cases, although the planners have shown more assurance, there is some doubt about the skill and integrity of their statistical technique. A tendency also exists for some countries to ignore the obligation to provide with their plans a reliable and wholehearted guarantee of thorough-going financial and currency reform. Since the total plan can be no better than its composite parts, a greater effort will be required from many of the individual governments before the work of co-ordination can begin.

Once that process has started the ERP countries, taken as an organic unit, must find answers to these baffling questions. Is it advisable to base plans on a substantial degree of East-West trade? Is it possible to reconstruct stable and profitable markets in Asia, Africa and Latin America? Above all, how can the western European demand for dollars be brought eventually into line with a supply of them determined by the ordinary processes of international trade?

To some extent all these problems can be approached with no more equipment than a slide rule and a few sheets of paper; but realistic co-ordination would be impossible without added light on two topics. First, how far is the United States prepared to go in planning and making known its own import policy over the next four years? And, secondly, how far and how hard does Mr Hoffman wish to drive the countries of western Europe towards establishing a system of controls, regulations and sanctions, necessitated by the four-year plan?

Authority Wins in France

The drift back to work has begun among the French miners and has coincided, as expected, with a flare-up of shooting and violence which has challenged the Government to assert its authority with swift and powerful military operations. Their object was not only to save pits from permanent damage by neglect of safety precautions, but also to allow miners in groups and individuals to assert their right to return to work against the intimidation of pickets. The political purpose is as important as the economic, and if the Government can cling firmly to it they may find that the crisis in the mines has strengthened rather than weakened their position.

Although damage in the mines "liberated" by troops is not as great as was expected, especially in the crucial areas of the north, the French economy has suffered and will continue to suffer severely from a month's dislocation of its basic industry. Twenty-four days of strikes have cost the nation 3,000,000 tons of coal; and it will take some weeks to restore full production in the pits from which two-thirds of France's coal is mined. And even when there has been some return to normal in this industry, the chances are that similar troubles, inspired by the same motives, will arise in other industries. The Communists in the CGT are playing a desperate game, and they dare not run the risk of repeating the failure of last November.

Two good things have come out of the strike. First, public opinion has been shocked by the violence and cynicism of CGT policy and has begun to rally behind the Government and against the extremists of Left and Right. Secondly, the Government has now felt itself strong enough to threaten, through M. Mitterand speaking on behalf of the Cabinet, that negotiations on workers' grievances will be re-opened, "notably with trade union organisations that have displayed, in this period of crisis, a republican and patriotic attitude." With some 1,500,000 workers in the non-Communist *Force Ouvrière* and another 800,000 in the Christian Workers' Federation, the CGT may find some falling away from its own membership of 2,500,000. More and more Frenchmen realise that it is their security and prosperity which is being attacked through the strikes, and that their genuine wage grievances cannot be solved unless France gets back to work.

Better Magistrates

The King's Speech promised legislation to amend the law relating to justices of the peace, which presumably will embody the recommendations of the majority report of the Royal Commission under Lord du Parcq. This will preserve, at least for some years, the system of unpaid and lay justices, appointed by the Lord Chancellor with the help of local advisory committees.

But the magistrates have taken heed of the criticisms of lay justice over the past years. It is realised, even among some of its most ardent champions, that it cannot be preserved unless magistrates have a better knowledge of their jobs than most of them possess at present. Hence the familiar recommendation of training—a recommendation, incidentally, which is rapidly becoming identified with attempts at enabling old bottles to receive new wine. This need for training was one of the themes of Lord Templewood's address last week to the Magistrates' Association. But the best way to improve the magistrates' benches is not to compel or to persuade them to undergo a course of training. It is rather to choose the right people to fill them and then to see that they can be kept continuously informed on matters relating to their work. Indeed, if the right person is chosen—a person with an alert unbiased mind, with insight and sympathy—he will make it his business to keep himself informed. The real question is whether such people can be found to fill the benches unless they can do so as full-time paid members of a magisterial profession.

Until Lord Merthyr's prophecy, in his minority report of the Royal Commission, comes true, and lay justices gradually disappear, the best thing that magistrates can do to fit themselves for their task is, not to undergo a formal course of training which will rapidly become out of date, but to keep abreast of modern knowledge on the causes and prevention of crime and on the treatment of offenders. They will not always be able to act on that knowledge. But it should persuade them of the virtues of an open and informed mind.

* * *

Mr Tomlinson Fails to Explain

It is embarrassing for a Minister to find his decisions strongly criticised by unofficial opinion after the whole matter is supposed to have been thrashed out and settled once for all; but such is the fate of the Minister of Education *in re* his decision to fix the minimum age for the new General Certificate of Education at sixteen. A fortnight ago Oxford University came into the open with its objections to this decision. Last week Cambridge University expressed its anxieties, and is even considering the development of its own entrance examination on a much larger scale. One of the main causes of the storm that seems to be blowing up is the manner in which the decision was reached. No one really knows the grounds on which the Minister made up his mind, and, in the absence of an argued case, currency is given to every story of political pressure.

After the publication of the Secondary Schools Examination Council's report in September, 1947, an extraordinary silence settled over the subject for nearly seven months. During this time there were busy negotiations between the schools, the universities and the Ministry, and strong objections were made to the examination proposals. These were, however, confidential, and when the Minister finally announced his decision in April, 1948, no reference was made to the objections, and no proper attempt was made to explain how the scheme would work or why the reasonable fears of a number of educational authorities had been brushed aside.

The Economist by Air

It is now possible to send The Economist by air at a yearly subscription of £7 to all destinations in

South America, Central America (exc. Mexico), West Indies.

The Economist, 22 Ryder Street, St. James's, London, S.W.1

The confusion on the subject is considerable. On the one hand there are those, Oxford University included, who consider that the minimum age limit, by deferring the time when sixth form specialisation can begin, will penalise the bright child in favour of the average child, will lower standards, and will reduce the intellectual quality of entrants to the Universities. On the other hand, the regulations governing the new examination permit a pupil to obtain a general certificate of education in no more than one subject, and this absence of a minimum range of subjects has caused others to fear yet earlier and narrower specialisation by the less responsible types of schoolmaster. Both fears are justifiable. There is also an almost silent centre party which believes that it is possible to maintain standards while reducing early specialisation within the framework of the new scheme. This controversy will never be straightened out until the Minister gives a full and frank review of the possibilities and his own reasons for his decision. If quality can be maintained and ability encouraged with an examination at sixteen (and later at seventeen), then it is up to the Minister to say how.

* * *

Royal Designers

The Royal Designers for Industry are almost more regal than industrial in their current exhibition, *Design at Work*, and the inquiring industrialist may well be confused by the bizarre assembly of objects so elaborately presented in Burlington House. The exhibits are sadly few in number and this paucity has been eked out by current conventions in exhibition display which are almost more literary than graphic. Bold assertions assail the eye, "London Transport design is impersonal and English, following no conscious style" declaims one notice, a statement which is plainly nonsensical and does disservice to many notable architectural and engineering achievements carried out under the personal direction of the late Frank Pick. The English tradition in design was never more personal and conscious than during the eighteenth century and never better.

The exhibition includes gold cigarette cases, Nonesuch books, a sword of honour, a model of a King's yacht, hand-tooled bindings, a Prime Warden's badge and other objects for rarefied markets. Britain has always excelled in the skill and craftsmanship inseparable from the design of such things, although it is worth noting that in earlier times the craftsman was frequently also the designer and now the craftsman in metal must seemingly receive instructions from a designer. Britain's primary need in industrial design today is an immense number of prototypes for well-designed, mass-market products: it is in this division of design that we so lamentably lag behind Swiss and Scandinavian technicians. There is little evidence in the *Design at Work* Exhibition that the Royal Designers are dealing with these major problems. An exception to this general criticism is the section which documents the development of "Utility" furniture. This display could profitably have been larger, for here is certainly one of the most invigorating stories of co-operation between bureaucracy and industry, between Civil Servant, manufacturer and designer.

The membership of the Faculty of Royal Designers in Industry is limited to forty. Of those forty less than half are now actively concerned with the contemporary problems of industrial design. If the Faculty is to mean anything at all it must recognise that Penguins are more typical examples of industrial design than Nonesuch volumes, and that more toothbrushes are bought each day than silver niello toilet brush sets.

* * *

Lost Face in Nanking

It is now reported that the Chinese Government is preparing to evacuate the forces which are still holding on to Mukden and other places in Southern Manchuria. These reports follow the partial success of Communist operations against the Government's coastal corridor beyond the Great Wall. If the remaining Government strongholds in Manchuria were to be entirely given up, the Communists would be left in possession of the whole communications system of the territory from the Amur to Dairen, and would be free to proceed to the systematic political and economic organisation of a new "Manchukuo."

The Chinese Government, on the other hand, could theoretically re-group and concentrate its forces in North China to deal with the Communist armies there, though this advantage would be largely cancelled if the Manchurian Communists followed up in force to help their North China comrades. It is on the issue of the struggle in North China that the outcome of the civil war will really depend. The natural geographical separateness of Manchuria, its prolonged detachment from China under Japanese rule, and the key positions there so generously ceded to Russia by President Roosevelt and Mr Churchill at Yalta seem to have marked out Manchuria as untenable for a Chinese central government under present conditions. Yet its very distinctness would render possible a secession without mortal damage to China as a state, whereas there is no natural frontier between Peiping and the Yangtse, and full Communist control of North China would break China into two halves with no definite line of division.

In Nanking there are signs that the reverses in the field are beginning to have political effects. A certain Lu Fo, in a speech in the Legislative Yuan, has boldly declared that President Chiang Kai-shek is too tired to carry on, and should be given a year's holiday abroad. Another deputy has attacked the Soong and Kung families, pointing out that, whatever happens to China, their great wealth in gold and American dollars will enable them to live in comfort elsewhere. In spite of the Information Minister's appeal to the Associated Press not to report these speeches, they have found their way into American newspapers, and will doubtless have their effect in Washington.

The more progressive non-Communist political groups in China are now apparently convinced that no headway can be made against the Communists without a thorough house-cleaning in Nanking, which should not stop at the President himself. An article from our Special Correspondent in China, printed on page 705 shows how the present clique domination is ruining Nanking's own cause; General Fu Tso-yi, described as the ablest of the Government's commanders, is kept short of arms, presumably because of jealousy in the capital. After the American Presidential Election it may be that Washington, in providing aid to China, will begin to take a stronger line about the efforts of Nanking ruling circles to bring about their own defeat.

* * *

Bargaining over Beef

The agreement under which Britain gets meat and other food from Argentina expires in December. But the Argentines seem in no hurry to renew it. Señor Miranda, head of the National Economic Council, has several times postponed his visit to England. Now there is talk of Dr Bramuglia, the Foreign Minister, coming from the Uno meeting in Paris to conduct trade talks in London or even of a British mission to Buenos Aires.

These delays are understandable on other grounds than those of health and personal ambition. Britain's bargaining position has improved somewhat since the incontinent sale of the Argentine Railways. Argentina's position has deteriorated. Stocks of grain, unsold because too highly priced, are rotting in store. And the new harvest will increase pressure on inadequate storage space. Meanwhile, the country's balance of payments becomes more and more adverse in spite of increased restrictions.

In these circumstances the statement of the Argentine Ambassador in Washington last week that Argentina was ready to offer its products for sale at American prices provided it got in payment the goods it needed, also at American prices, "or the dollars to buy them," is particularly interesting. There is some evidence that the Argentines intended to demand part payment for meat exports to Britain in dollars or convertible sterling. This was never feasible so long as Argentine prices remained so much higher than American: Britain would have been debarred by the terms of the ERP agreement from using dollars in this way. Conversely, as soon as Argentina's prices become more reasonable, there will be no objection in principle to those offshore purchases of Argentine products for which its leaders are so avid, payment being in dollars or dollar goods such as capital equipment. Any such transactions would have to be normal sales quite free of conditional purchases of grain or linseed oil.

If Argentina remains obdurate, the problem for Britain will be to pay for imports from Argentina with British goods after the railway money is exhausted next March. Imports and exports would have to balance. Britain buys from Argentina at present at an annual rate of about £100 million and sells at a rate of only £40 million or so. There is little chance of balanced trade unless Argentina relaxes import restrictions on inessential British goods and also reduces its export prices. For reasons noted above, its grain prices are likely to fall. Pressure could be put on meat prices by a flat refusal to buy: this tactic was applied with less justification to Denmark; Señor Miranda has threatened that the

Regular scheduled flights to five continents and 42 countries, with stops at 57 well-remembered ports of call, are a routine performance for B.O.A.C. Speedbirds.

AT THE
CANADIAN INTERNATIONAL TRADE FAIR
TORONTO...MAY 30-JUNE 10, 1949

Producers and manufacturers of every nation are invited to show their products at the new world market-place — the Canadian International Trade Fair — to be sponsored again in Toronto by the Canadian Government, from May 30 to June 10, 1949.
Exhibitors' applications should be received as early as possible, in order to permit the most equitable allocation of available space. Later applicants will risk disappointment.

exportable surplus will be eaten rather than sold at too low a price. But more probably stocks would accumulate until, after three months or so, no more cold storage space was available. One may reasonably expect that meat would then be offered at a lower price. The British meat ration would meanwhile be cut by up to one-third, which would admittedly be imposing a considerable sacrifice on the British consumer. But would not this sacrifice be accepted by the public if it made our foreign suppliers more reasonable in future negotiations?

* * *

Hungary and Czechoslovakia

The official reconciliation between Czechoslovakia and Hungary is, even by the standards of east European "popular democracy," a remarkable piece of demagogic dishonesty.

For three years after the war, there was deadlock between these two governments. The Hungarians unwillingly accepted the loss of the territory recovered, by Hitler's favour, from Czechoslovakia in 1938, but asked that the Hungarians living in that territory should enjoy full rights of Czechoslovak citizenship. The Czechoslovak government demanded an exchange of population between the two countries and evaded the question of what was to be done with those Hungarians who would still remain in Czechoslovakia after the exchange was completed. On the Czechoslovak side, it was the Slovak rather than the Czech politicians who were intransigent, and among the Slovak political parties the most chauvinistic were the Communists—especially Mr Clementis, then Assistant Minister, and now Minister, of Foreign Affairs, and Mr Husak, Chairman of the Slovak "Board of Trustees" or regional government. Both these gentlemen wildly exaggerated the number of Slovaks in Hungary and wildly underestimated the number of Hungarians in Slovakia. Their purpose was to create a plausible excuse for the simple expulsion of Czechoslovakia's Hungarian minority. In April, 1947, Husak declared to a British correspondent that there were 400,000 Slovaks in Hungary. No Slovak right wing politician would have dared to talk such nonsense.

Now, however, the Communist governments of the two countries are about to form a beautiful friendship. The Hungarians of Slovakia have long ago been robbed of most of their earthly possessions, and whether they now enjoy in Czechoslovakia or in Hungary the perfect freedoms of Soviet Eastern Europe is of little importance to them. Of even less importance to either government is the welfare of either minority. But it is important that public opinion in the west should understand the utter lack of principle shown by the Communists: first they inflame chauvinism to a temperature seldom reached even under Fascist regimes; then they suddenly announce that complete agreement exists, and that only reactionaries like Cardinal Mindszenty or Mr Ripka are for disruptive nationalism.

A good example of the contrary tactic, now being used elsewhere in eastern Europe by Communists in a different set of circumstances, is the revival of Communist-sponsored chauvinism in Bulgaria, directed against Jugoslavia and its policy in Macedonia. It will be remembered that, until Tito became an indurate Trotskist deviationist, it was considered by Bulgarian Communists a bourgeois chauvinist crime to suggest that Macedonians were not completely happy within the Jugoslav People's Republic.

* * *

New Fashion for the Czech Press

Nothing could be more logical and more tidy than the way in which the Communists of Czechoslovakia now propose to run the nation's newspapers. They will be written by experts, directed and inspired by the party, licensed by the state and presumably—although this is not made clear—financed by the sections of the community for whom they are written. The recipe is likely to produce dull proselytising sheets, uniform in outlook and impeccable in taste—in fact good in every respect save that they will not be free newspapers.

At the annual congress of Czech and Slovak journalists in Prague last weekend Mr Kopecki, the Minister of Information, forecast this drastic reorganisation. Two things without which a healthy and independent press cannot survive are to disappear: advertising—already under government control—is banned in daily newspapers and will be confined to a special advertising journal; and competition is to be abolished by making each newspaper specialise in the interests of one group. In future, farmers, lawyers and soldiers will be expected to buy and read only the special publication devoted to their interests. The Nazis attempted something similar twelve years ago.

Mr Kopecki told journalists that from now on they must think first of educating their readers, paying special attention to the class struggle. Criticism would remain "essential," but it must not "confuse" the readers. The universities and his own Ministry would be reorganised so as to maintain a flow of experts and expertise into the profession. Mr Kopecki is obviously drawing on his experience in Moscow between 1938 and 1945, during part of which he was in charge of the "screening" of the foreign press.

Mr Kopecki's job has been made easier by the reforms introduced into the press after the liberation—reforms which, be it remembered, have been seriously recommended by London journalists to the attention of the Royal Commission on the Press. Instead of being owned by individuals, Czech newspapers were in the hands of political parties, trade unions, co-operative societies and cultural organisations. Ownership was licensed by the state, and it was said in defence of the system—particularly by the Left—that this method of ownership would provide more honest and impartial fare than could any privately owned newspaper. Those who said at the time that this was the first step towards uniformity and state interference were laughed at. It is now their turn to laugh last and longest, and to seek old-fashioned journalism in the pages of the underground press.

The Hangman in Germany

On the motion for the adjournment on Tuesday night, the Under-Secretary of State for War gave a most unconvincing and untenable answer to criticisms of the detention of the German generals, and the decision to send them at long last to trial. The treatment of these four men—three since the death of von Brauchitsch—as members of both sides of the House made clear, offends the public conscience. But that is not the whole story.

Week by week, for eleven weeks, ten German war criminals will be hanged in Landsberg prison, chiefly for crimes against Allied soldiers and airmen. On Monday, a former captain in the S.S. was sentenced to be hanged at Hamburg for ordering the execution of 90 British prisoners of war. Is there to be no end? That all these men have been sentenced for horrible and revolting crimes goes without saying; but, as the extract from *The Economist* of 1848 reminds us this week—and if it was true a hundred years ago it ought to be truer still today—the penal code is no longer founded on the instinctive desire for vengeance. It is founded on reason and the desire to promote the welfare of society.

It may have been arguable that, as soon as the war ended, both the instinctive desire for vengeance could be satisfied and the welfare of German society promoted by the swift execution of alleged war criminals, which would have impressed upon the German people how horrible the crimes were. Now, with every month that passes, memories of the atrocities fade, and the Germans become impressed more by the brutality of the punishment than by the brutality of the crimes. The more this happens the less justifiable on grounds of expediency, and the more revolting in principle, becomes the series of mass hangings. It is no answer to say that there is no alternative punishment, and that the criminals cannot be let loose in German society—there is always imprisonment.

Before they allow the hangings to continue, year in, year out, the Allied governments should ask themselves exactly what purpose they are meant to achieve and whether, in practice, they do not do far more harm than good. In the present circumstances of western Germany the policy of hanging makes even less sense than the policy of denazification described on p. 665 of last week's issue.

Too Many Mimis

The British Actors' Equity Association can hardly feel happy about the protests, passed last week at a meeting called by its operatic members, against the "infiltration" of foreign prima donnas into British opera companies. (One contemplates, with an awe mingled with longing, the imagined vision of some bygone Mimis engaged in this act of infiltration.) There is, of course, nothing new in the trade union objection to interlopers, or the nationalistic objection to foreigners—particularly to foreigners of superior natural gifts or training. But it is more than usually

out of place, even on the narrowest economic reckoning, in this particular context. Opera is still, in this country, what Dr Summerskill would call an acquired taste. There is as yet—with all due respect to a number of valiant and promising efforts—no continuing body of British operatic talent, and although British singers of the highest quality do exist, they are thin on the ground. If British opera is to thrive, to attract a public to form a taste, to form part of a national way of life as it has done elsewhere—and only so can it provide a nursery for rising British talents—it must be able to draw on the greater experience and more developed ability available where the tradition is well established. It is far more to the interest of aspiring British singers, not to mention those less aspiring who could hardly hope for prima donna status, that opera should thus become a national institution, than that a few more among them, sheltered from foreign competition, should play Carmen or Madame Butterfly to half-empty houses.

If there still survives any snobbish preference for foreign names, irrespective of the talents of those bearing them, or if the training of promising British singers is shortsightedly neglected in favour of celebrity-hunting, the indignant members of Actors' Equity have a case. But it is a case for choosing singers on their merits, regardless of nationality; a case for positive action, for better training and teaching, not a case for the merely negative expedient of exclusion. To hedge, as did the Chairman of the meeting, by conceding that "great foreign artists will always be welcome," while demanding safeguards against "foreign artists imported to displace British artists capable of doing the job," is to attach quite inappropriate meanings to "greatness" and "capability." There are, of course, any number of British sopranos "capable" of singing Mimi—or Isolde, or the Queen of the Night—after a fashion; but the public is equally capable of staying away from their performances, and going to the cinema to see Mr Edward G. Robinson or Mlle. Michèle Morgan.

Not So Plain Words

The matter of the Memorandum to the OEEC is dealt with elsewhere in this issue; but its manner really deserves separate notice. Has Sir Ernest Gowers written in vain? Every journalist knows how difficult it is to achieve clarity, variety, and some semblance of ordinary decent English when translating columns of figures and percentages into sentences and paragraphs. But need even the Treasury, its literary faculties numbed by this effort, produce such expressions as "the achievement of viability" or such sentences as "These specific projects" (i.e., groundnuts) "tend to attract more attention, but larger results are of course secured by the development of facilities already in existence"? (*Anglice*, or semi-*Anglice:* "These specific projects get more public notice, but bigger results will come from the development of those projects which already exist.") Probably it is too late to protest against the word "to programme"; one can stomach, though without relish, the notion of housing proceeding "at the same pace as that now ruling;" one can understand, but not admire, the phrase informing the reader that "it is normal for the incidence of Exchequer receipts to rise with the passage of the year." But the cumulative effect is depressing. Style is the man; even a style so

—seraphically free
From taint of personality

as that proper to the Civil Service.

No man, one can presume, naturally achieves characteristics such as this style implies; they are an occupational risk or disease of officialdom. The corresponding ailment in political life appears on the side of language, not as an anaemic and emasculated verbosity but as a tendency to use words with a Humpty Dumptyesque indifference to their accepted meanings. "Fascist beast" (for non-Communist) is only a rather extreme example of a collection of sounds, like the spitting of a tomcat, conveying little but the writer's disapproval. Nearer home, what further meaning should one attach to Mr Bevan's recent description of the steel-masters as "intellectually bankrupt"? Intellectual richness, one feels fairly sure, is not a quality to which they have ever laid claim. Of course a conscientious and felicitous handling of language may rank correspondingly low among Mr Bevan's priorities; but the cause of mutual understanding, which is, after all, of some importance both in administration and in politics, is only furthered when both administrators and politicians cease content to degrade it on the one hand into formulae and on the other into incantations.

Books and Publications

The Third Way

"Civitas Humana." By Wilhelm Röpke. William Hodge and Company. 235 pages. 21s.

DR ROPKE has a considerable reputation on the Continent as the standard bearer of an uncompromisingly liberal economics. He has influenced Professor Hayek and coloured the whole work of the modern Austrian school. His *Gesellschaftskrisis der Gegenwart* had a world-wide circulation. In this country, however, he is little known outside specialist academic circles. "Civitas Humana" is intended to have a general appeal; it is written for the educated but non-specialist reader, and is an impassioned, closely argued and weighty plea for a reversal, before it is too late, of the process of centralisation, collectivisation, and proletarianisation; for the "third way" between anarchy and collectivist despotism. It is a great deal wider in scope than either Professor Hayek's "Road to Serfdom" or Professor Jewkes' "Ordeal by Planning," for it deals not only with the economic foundations of society, but with such politico-philosophical problems as legitimate authority, constitutional checks and balances, the relation between cultural community and nation state. As an economist, Dr Röpke is an extreme individualist without holding any brief whatever for the nineteenth century and its legacy. We have to beware the danger of "making the principle of the market economy responsible for things which are to be attributed to the whole historical combination." These things—proletarianisation, monopoly, widening inequality—are no part of the free enterprise system in itself. As for cycles and depressions, the severity, though not the existence, of these is equally due to other things than free enterprise as such. (The argument here is by reference; Dr Röpke has been immersed in trade cycle controversy for the last twenty years, and does not attempt to summarise his theses all over again.) Politically, he can best be described to the English public as a Distributist. Small industrial units, small peasant properties, small shops, small political groups are essential to a healthy society. Only thus can real, as against theoretical, civic power be democratically distributed. From the need to limit and curb the state spring his preference for the federal organisation, his emphasis on the rôle of the judiciary and on the liberty of the press, his plea for a wide distribution of property. (He does not quote J. A. Hobson's distinction between "property" and "improperty," but it fits his line of thought very well.) His book, in fact, is full of ideas, full of intelligence, full of humanity; almost any page will start a valuable train of thought, whether in agreement or disagreement.

It is the more a pity that the translation is simply unspeakable, or, more accurately, unreadable.

From Communism to Pacifism

"Gandhi and Stalin." Two Signs at the World's Crossroads. By Louis Fischer. Gollancz. 163 pages. 10s. 6d.

MR LOUIS FISCHER is one of the ever-growing band of those who, having started as Communists or enthusiastic admirers of the Soviet system, have seen it at work and have been disillusioned. The return-travellers from Communism have arrived at various destinations: Mr Fischer has moved towards pacifism. He has deep humanitarian sympathies and an ardent social idealism, with a horror of cruelty and compulsion which is today all the stronger because he so long kept it away from his consciousness in his Moscow days. He has now written a book of a highly rhetorical kind, in which he tries to communicate his new faith to a wide public. It is not a book of systematic analysis or rigorous argument, but it has great emotional force and achieves here and there some memorable phrases. Mr Fischer is convinced that "the crisis of our era is essentially moral."

What he finds most alarming in the contemporary world is "the readiness of so many persons to sacrifice liberty and morality in the hope of achieving security."

There are not many writers who can claim, as Mr Fischer does, to have sat through a six and a quarter hour interview with Stalin. The strongest impression he derives from his Russian experience is that of the overwhelming personal autocracy of Stalin, of the lack of initiative not inspired from "the centre." In Gandhi he found the type of authority depending entirely on personal influence without violence or compulsion. Gandhi, he writes, "was able to perfect the method of non-violent yet dynamic and direct action which fuses the impatience of revolutionists with the scruples of idealists." He remarks that Gandhi would "use government as little as possible"; his teaching was directed to an awakening of social conscience through a reformation of individuals. Mr Fischer, however, cannot follow Gandhi all the way; he points out that Gandhi never lived under a thoroughly totalitarian regime and did not realise how it can destroy all freedom of expression. Mr Fischer cannot quite bring himself to advocate that democracies cast away all their weapons, but he thinks that a Third World War would revive all that is worst in western nationalism, even if Communism were defeated, and he believes that a gospel of democracy, as Walt Whitman understood the term, can alone provide a real antidote to Moscow's creed. As he declares with disarming simplicity: "Everyone can behave better than he does."

Soviet Documents

"Calendar of Soviet Documents on Foreign Policy." Compiled by Jane Degras. Royal Institute of International Affairs 248 pages. 18s.

THE unforgivable neglect of Soviet material by British libraries, and of Soviet studies by British universities, has been the cause of a great deal of painful toil over the last few years. It is only now that the ordinary student of international relations is being enabled to refer to relevant Soviet documents. This calendar published by Chatham House will make a great deal of difference.

At last one can tell what documents there are, where they have been printed in Russian, and where (if at all) in translation. The student will derive still further benefit when the promised three volumes of selected documents in translation are made available. It is understood that the first of these, at least, is far advanced. The Calendar covers the years 1917-1941, and one must hope that a supplement bringing it nearer to the present time will be forthcoming. The editorial work on the present volume, both as regards selection and arrangement, has been done with great competence; but, since speeches and newspaper articles are regarded as documents, room should also have been found for all the resolutions of the Congresses of Soviets and of Party Congresses dealing with foreign policy. Some guidance on the material relating to the Communist International would also have been helpful and relevant. An index of the Soviet personages referred to, with some identifying matter, would have been welcome. Perhaps this gap can be filled in the volumes of translations.

Propaganda and Education

"I Want to Be Like Stalin." Gollancz. 144 pages. 7s. 6d.

IT is a pity that the publishers have, by the title and dust-cover of this book, striven to convey a false impression of it. One expects something sensational and terrifying. In fact, it is a sober translation by G. S. Counts and N. P. Lodge, of the Teachers' College, Columbia University, of parts of the official Russian text book on pedagogy by B. P. Yesipov and N. K. Goucharov, published in Russia in 1946. As such it is certainly interesting and disturbing and of wide general interest; it is not a shocker except to those who have not expected the Soviets' educational methods to be as thoroughgoing as their other methods of propaganda.

The most outstanding feature of this book for teachers is the strength and consistency of its purpose. By comparison, western educational authorities appear to dither pathetically in their search for objectives. The Russians go straight ahead to fit their children into the pattern of society which they are building: from the earliest stages they are to be made to feel part of the society in which they live, to serve their collective, to deify the state, to discipline themselves for work and for war. Although much of the instruction is over-simplified, it has the overwhelming advantage of being single-minded, and even by western standards much of it is unexceptionable, as far as it concerns conduct, and the virtues of courage, initiative, truthfulness or resolution. The fundamental deficiencies in this Russian doctrine are twofold. On the one hand, it is impossible to reconcile the rules for good conduct—honesty and truth—with the distortion of facts with which children are fed. On the other, the glorification of the state and of war for its defence twists the whole philosophy of education awry. The chapter on the development of patriotic sentiments (page 56) is the most alarming of the book; mathematics, geography and out-of-class-work are discussed with reference to their value for military studies; history is used to foster hatred and class enmity. After two generations of such mental food, the difficulties of reconciling east and west will be almost insuperable.

Documentary History Continued

"Documents on British Foreign Policy, 1919-1939." E. L. Woodward and Rohan Butler (Editors). Second Series. Vol. III., (1931-32). H.M.S.O. 617 pages. 21s.

THE latest volume in this Series of documents is devoted to the two subjects of Reparations and Disarmament. In the section on Reparations, full records of the plenary sessions and of other meetings which took place during the Lausanne Conference are preceded by chapters on the negotiations for the postponement of the Conference and on German internal affairs between February, 1932, and the opening of the Conference in June. The second section covers only the preliminaries of the Disarmament Conference—when the main topics were the appointment of a Chairman, the suggested postponement of the Conference and the development of the German claim to equality of status—and the period of the Conference up to the Resolution of July 23, 1932.

In this last chapter the documents recorded are not, of course, the proceedings of the Conference itself—they were published long ago by the authority of the League—but reports of separate meetings held between British and French and American representatives while the Conference was sitting. The chapter also includes telegrams, relevant to the Conference, to and from H.M. Ambassadors in Paris, Berlin and Rome and the British delegation in Geneva. These reports and telegrams are chiefly concerned with the clash between the German claim for equality

The Economists' Bookshop

New West End Branch

•

On November 1st a West End branch will be opened at 30a, Bury Street, St. James's, London, S.W.1 (in "The Economist" building). A selection from our stock will be on view at Bury Street, where the hours of business will be: Weekdays, 10 a.m. to 6 p.m.; Saturdays, 10 a.m. to 1 p.m.

* * *

The chief stock of books will continue to be held at 11/12, Clement's Inn Passage, where the hours of business are: Weekdays, 9.30 a.m. to 6 p.m. (to 7.30 p.m. on Tuesdays and Wednesdays during the University term); closed on Saturdays.

and the French security thesis; and they add little, directly, to the information already available on this central issue. Other subjects discussed include supervision, budgetary limitation and the control of aviation.

The process, thus scarcely begun, of supplementing the proceedings of the *Disarmament* Conference with the Foreign Office telegrams and reports of meetings between delegations will be continued in subsequent volumes of the Second Series.

Shorter Notices

"Economics." By Frederick Benham. Pitman. 535 pages. 12s. 6d.

DR BENHAM'S *Economics*, the chief prop and stay of the first-year university student for the last decade, offers comparatively little *fresh matter* in this its fourth edition. The wartime addition on War Economics has been deleted and replaced by a characteristically sound and objective, though necessarily rather sketchy, survey of Postwar Problems. Dr Benham must have thought long about the pros and cons of reshaping his book so as to assimilate employment theory, monetary and interest theory, and the treatment of public finance, into a coherent whole in the Keynesian manner; he has decided against it. He has made, with considerable skill, those alterations which enable the student to assimilate the general theory when he meets it, but it seems a pity, in a book aiming at comprehensiveness, that he did not elect to take the plunge.

"Elements of Economics." By J. W. Roche. Macdonald. 138 pages. 4s.

Mr Roche's *Elements of Economics* is a handy little *primer*, laudably close to brass tacks, introducing the necessary minimum of technicalities with considerable pedagogic skill, and adorned with illustrations one or two of which are worth a chapter in themselves. The style is not calculated to win readers outside the schoolroom, and the plan is rather scrappy, but all the essentials are there, and if formal economics is to be regarded as a school subject at all—which many doubt—Mr Roche's book is certainly the right sort of tool for its teachers.

Letters to the Editor

United States Foreign Policy

SIR,—I think you owe it to your readers to point out that there are historical and fundamental differences between the two major American parties on questions of foreign policy, and that there are real dangers to the success of American foreign policy if the election results favour the Republican party.

Ever since it went down to defeat in 1920 under Woodrow Wilson's banner, the Democratic party has been the party of internationalism in the United States. The issue goes even further back, to the great tariff debates of the nineteenth century, when the Democratic party stood, as it still stands, for more abundant international commerce. As a result of these ancient struggles, the Democratic party is united on foreign policy as it is on nothing else.

It is not mere campaign invective to point out that the Republican party is a recent convert to the cause. Mr Dewey sought the Republican nomination in 1940 as an isolationist; in 1941 he condemned the Lend-Lease Act, and in 1944 his support of internationalism was not above suspicion as mere political lip-service. Senator Vandenberg had a consistent isolationist voting record in the Senate almost until the time President Roosevelt plucked him out to be a member of the United States delegation at San Francisco. If the conversion of these leaders of the internationalist wing of the Republican party is of such recent date, how much shallower must be the convictions of the other stalwarts who make up the present narrow majority in the party in favour of international co-operation?

Russophobia, helpful as it may be in getting isolationist votes for such measures as the Greek-Turkish aid bill and the ERP, is not a policy. In the immediate future the first danger point is in tariff policy.

The Republican party engaged in an *open revolt* against the Hull-Roosevelt tariff policy this spring—and was dissuaded from destroying the whole reciprocal trade principle only by the promise that the subject could be taken up *next year*. Whether Senator Vandenberg will then be able to defer the execution again is very doubtful. Whether Mr Dewey, assuming he is elected, will interpose his veto, in the first year of his Presidency, against one of the most cherished projects of his own party is even more doubtful.

The second danger point is in further appropriations for ERP. The Republican party is under inexorable pressure from the high income groups to reduce income taxes. This year the ERP and the Republican passion for tax-cutting collided dangerously. The new expense of ERP and the tax-cut appear to be the cause of the budgetary deficit which is now anticipated. Foreign spending is a much more vulnerable subject for economy than any of the domestic elements of the budget, where a cut may offend organised special interests. In the Senate, this year, Mr Taft's proposal to slice a third from the ERP authorisation split the Republican vote neatly down the middle.

Those are the immediate dangers. But if foreign policy begins to slip in these important quarters, the rout may be complete. Insufficient appropriations could mean the failure of ERP, and the failure of ERP could mean the collapse of the whole fabric.—Yours faithfully,

DAVID D. LLOYD

2501 Ridge Road Drive, Alexandria, Virginia

Agricultural Policy

SIR—All farmers do not enjoy the protected prices suggested in *your* article "Agricultural Policy." Anyone who paid Cox's Orange Pippin apples. Today, despite the fact that labour, spraying and everything else is vastly more expensive, the maximum retail price is 1s.

It is hardly an encouragement to grow *good* fruit because whereas before the war although good fruit realised a higher price than today's maximum, poor fruit was available cheaply. Today the tendency is for all grades to make the controlled maximum price which becomes in fact the minimum retail price.—Yours faithfully,

W. H. S. WILLIAMS

Little Whatmans, Biddenden, Kent

From *The Economist* of 1848

October 28, 1848.

. . . THE estimate of crimes made by the people at large—the instinctive estimate, we may call it, of conscience—differs from that of the statesman and philosopher. The public, revolted by an offence, would take vengeance on the offender without weighing the consequences. The philosopher and statesman, though they share the instinctive feelings of the multitude, have a further duty to perform. They examine the motives and the effects of actions, and they only sanction or ordain punishment from the conviction that it prevents crime and promotes the welfare of society. . . . Regardless of all considerations of this nature the public instinctively hate and detest certain actions, and jump to the practical conclusion, because they are offensive to their feelings, that they must be put down by rude but legalised violence. The latter was the origin of all penal laws, and as the view of the statesman and the philosopher comes to prevail in society . . . the original foundation of penal laws has been departed from, and the cruel punishments most recommended by the impulsive feelings of anger, hatred, and vengeance, have been given up . . .

Every observer and inquirer into this subject . . . is well aware that the system of statesmen has moved continuously in one direction. There has been a gradual and successive abatement and abolition of all the cruel punishments that were originally dictated by feeling or sentiment. . . . It would not be difficult, perhaps, to point out the ultimate end, at present little thought of, to which this gradual amelioration in penal jurisprudence must lead. It is sufficient to remind the reader that for a considerable period, and by a considerable party, the total abolition of capital punishments for all offences has been demanded. In connexion with this, the mercy shown to the Dublin rebels . . . must give an additional impulse to the progress already made and bring about, at no distant day, the total abolition of capital punishment. It implies, therefore, in the end, the extinction of the system of controlling and governing mankind by terror.

The Nursing Profession

SIR,—*I was very interested to read your comments, in* your issue of October 9th, on the effects of the new salaries for student *nurses on other ranks of the* profession. In Dr Cohen's Minority Report, the lack of a comprehensive understanding of the *profession* as a whole is apparent to those who have spent their *lives in it. It was, it* seems, the young student nurses who were *chiefly consulted about* the difficulties and strain of nursing, and one of the reasons given for the wastage of recruits was the *inhuman attitude of ward* sisters. Perhaps there are still left a few tyrannical women, but these are in a minority. Today discipline and hospital etiquette consist simply of good manners and a respect for the superior knowledge of others—nor should it be forgotten that that superior knowledge was gained in an era of far more rigid training than the present-day student nurse will ever experience.

Few people take into consideration the type of girl we are often asked to train: young girls, very young girls most of them, nearly all nice girls, but typical of the age—the type who will sit in an armchair and watch their mothers do the washing-up, who have no idea of discipline or manners, who have little initiative or self-reliance or unselfishness. We see them with little mental agility or conscientiousness or pride being coaxed by material reward into what should be the finest and most self-sacrificing profession in the world. The bait now is good money and emoluments, and little emphasis is laid on character and the expensive training they will receive. Only those who really love the work will want to continue with it, and even then their keenness will often be frustrated by the realisation that once trained they will be worse off.

Where, you rightly ask, is the incentive for trained nurses to stay in the profession? Higher pay will now surely come, but that is not the only reason for the lack of staff. If the student nurses have days off or are at classes, who does their work on top of her own? The ward sister. If the ward maid has a day off, who sweeps the floors? The ward sister. If the ward orderly is away, who cleans the sinks and tidies the cupboards? The ward sister. If the ward is very busy, who works solidly from 8 a.m. to 9 or 10 p.m. with no off-duty time? The ward sister. It is the sister, or the staff nurse in her absence, who holds complete responsibility; and it is to her that all blame is attached when anything goes wrong. How can you blame her if she does get irritable when she is thoroughly overworked and under great nervous strain for lack of proficient help?

By all means give the student nurses everything that can be given to them to make them happy. But remember, too, the staff nurses and the sisters; give to them the same and much, much more, so that the student nurses will desire promotion. Remember, too, the words of the song the old negro sang in the engine-room of a river steamer:

> Oh, you gotta get a glory
> In the work you do;
> A Hallelujah chorus
> In the heart of you.
>
> Paint or tell a story,
> Sing or shovel coal,
> But you gotta get a glory,
> Or the job lacks soul.

—Yours faithfully,

WARD SISTER

Uses of Manpower

SIR,—Mr Clews in his letter of October 16th makes some remarks about my suggestions on "Manpower" which I cannot let pass without a reply. Why should not civil servants go into industry and farming, from which many of them came out? I have myself taken one this year and he is now running a farm I own.

I have been in manufacturing for 26 years and now manage two factories employing 450 persons. My people are producing in many departments a higher output per head than before the war and it is slowly rising. In one factory last year we wanted extra output for export. I put the facts before my Works Council, they agreed we ought to work an extra four hours on Saturday mornings for a period. It was a voluntary effort and, apart from married women whose circumstances made it impossible, we had practically a 100 per cent attendance.

I believe that an appeal to the individual would be successful if he were really to understand the need and the danger of his present position.—Yours faithfully,

J. B. STEADMAN

Rutherglen, Stoke Bishop, Bristol

THE WORLD OVERSEAS

Impressions of China Today

(From Our Special Correspondent)

THE China situation must appear highly bewildering to the reader in England. But the truth is that if one spends six months wandering about China today, especially if one can get off the beaten tracks into the interior, one's dominant emotion at the end of it all is also bewilderment, and the less confident does one feel about making sweeping generalisations. Since, however, one has to generalise, the main conclusions reached by your correspondent were as follows: Firstly, the Communists are winning; secondly, whether manipulated by Moscow or not, they are playing the Russian game, and are solidly on the Russian side in the present world struggle for power; thirdly, there is still a surprising degree of wishful thinking, amongst foreigners in China as well as abroad, on the following questions: Are the Chinese Communists really Communists? Can you impose a Communist system on a people so intensely individualist as the Chinese? Will the Communists retain their present freedom from graft and dishonesty? Is there a split between the Manchurian and North China Communists? Is a compromise settlement possible? If the Communists come out on top, will it be possible for the foreign firms to do business with them?

China is a country in the grip of a civil war, but neither side makes it possible for a foreign correspondent to accompany troops in the field. It is almost impossible to see anything of the actual fighting unless one accidentally happens to be in a place when it is captured. One gets the impression that neither side is very strong, and that, although casualties are higher than in past Chinese civil wars, much of the fighting follows the traditional Chinese pattern of movement and manœuvre, with the losers, when they are cornered, preferring to surrender rather than fight it out. Very noticeable is the Maginot-mindedness of the Nationalists and all the zones threatened by the Communists are dotted with fortifications, nearly always built with conscripted peasant labour. Mukden has a pill-box at every street intersection; Taiyuanfu is surrounded by hundreds of three-storied concrete towers, like lighthouses. A foreign military observer described the Nationalists as being "defensive beyond belief." The only Nationalist field-commander with any real offensive spirit is General Fu Tso-yi, and the Communists keep him and his troops chasing up and down his long North China corridor from one end to the other. His troops, sturdy young Suiyuan peasant boys, personally devoted to their commander and proud of their nickname "Yellow River Bend Babies," are amongst the few Nationalist troops who will fight it out. But there are not enough of them and they do not have enough arms. When General Fu scraped some American dollars together recently and tried to buy some arms from abroad on his own, he was politely told by the various foreign governments he approached that they could only do business with and through the central government. Probably the next best troops on the Nationalist side north of the Yangtse are the Mohammedan Chinghai cavalry divisions in Shensi and Honan. They too are personally devoted to their commander, the brilliant and courageous 28-year old son of the Governor of

Chinghai, but a more powerful motivating force in their case is the pride of an aggressive minority with a long martial tradition behind it. As against these outstanding exceptions, one must set the picture to be seen any day on the docks at Shanghai, of ill-kempt, ill-armed, ill-trained, undisciplined, unwilling conscripts, whose families did not have enough money to purchase their exemption from military service, waiting to be shipped off to the war zones. The American Advisory Group, which is trying to reorganise the Chinese army along American lines, is essentially a long-term affair and is not making much difference to the present military situation. The new generation of young Chinese officers, mostly middle-school graduates, are usually smart in appearance but do not impress as being formidable fighting men.

When I arrived in China this summer, I was amazed that anything should continue to function, with a currency that changed its value from day to day, spiralling upwards at an ever-increasing rate. But it was odd how quickly one learned to deal in millions instead of ones and mastered the specialised mechanics of life in a country gripped by inflation. For the Chinese, who are naturally clever with figures and money matters, the mental adjustment has been a gradual one. The effects of the inflation were less severe because there were other currencies, more or less stable, in which all the more important business was transacted: American dollars in the Yangtse valley and the north, Hong Kong dollars in the south, and silver dollars throughout the northwest, not to mention gold, which has been pouring into the country, chiefly through Macao. Three dollars in a Peiping curio shop meant three American dollars, three dollars in Chinghai meant three silver dollars, "three hundred dollars" at a wayside stall in Nanking meant three hundred ten-thousands, or $CNC3,000,000. Well over half the Hong Kong note issue is circulating in south China.

The country-people have suffered less than the town-dwellers. Their attitude, in the remoter country districts, towards the civil war is well summed up in the old Chinese proverb—"In the right hand a sour pear, in the left hand a prickly pear." In Shanghai, despite the seeming chaos and deterioration, the masses of the people are actually better off than they were before the war and real wages have doubled. The civil war is causing a certain uprooting and movement of peoples, but it is not to be compared with what took place in India last summer. All the big cities in nationalist hands are crowded with refugees of the more prosperous landed and official classes, some, formerly very rich, now living in penury. Near famine conditions in Shensi have been causing many thousands of peasants to migrate northwards into Nationalist Suiyuan. Famine conditions in Mukden last May were sending refugees out in the other direction, into the Communist territories, looking for food.

Towards a Classless Society

Economic stringency is bringing about the same movement towards a classless society that it is in England. It costs the head of a government department in Nanking 30 per cent of his salary to keep a servant, compared with 4 per cent before the war. Nearly all property-owning Chinese in Nanking have let their houses to foreigners at American dollar rentals while they themselves live in the garage or the gateman's quarters. Economic stringency has also brought about the terrible increase in corruption which characterises present-day China. In the big cities there is little unofficial social intercourse between foreigners and Chinese because the Chinese cannot afford to entertain and do not like to accept hospitality they cannot return. Somehow life goes on. In the same way that a Chinese can sleep soundly ten yards away from a pneumatic drill with an arc light beating into his face, so the people carry on cheerfully and fatalistically under material conditions that would long ago have caused explosions in other countries.

The people who are suffering most and for whom one feels most sympathy are the teachers and the students. An assistant professor at a northern university, who was going to England under the auspices of the British Council, told me that he had had to spend $CNC10 million out of his salary for that month of $CNC21 million (about £4 4s.) on a pair of new, and not very good, brown leather shoes. The Dean of the Arts Faculty at this university had such a small house that when one of his children was home for the holidays he had to sleep on the floor. Another professor had only two small rooms for himself, wife and four children, which had to serve as bedroom, dining-room, kitchen and study. "It's not easy," he said, "to do any good intellectual work under these conditions." The medical officer of this university, unable to support his mother, pregnant wife and six already under-nourished children on the monthly equivalent of £3 10s., drowned himself in the lake. A subscription was opened for the family, to which some junior lecturers gave more than a month's salary. The only way in which teachers in China can meet with any capital expenditure is by selling personal possessions, and most have few personal possessions left.

Students Turn to Communism

Students at most of the universities live eight, ten or twelve to a room, sleeping in two-tiered bunks, with a crude table and a naked light to work by. Tea is too expensive, so they drink hot water. In the mess-hall, where they feed together twice a day, they will be lucky if they get meat more than once a fortnight or rice more than once a week. Most of the students today come from poor country families and practically all of them are maintained, in whole or in part, by the government. It is possible that in Communist territory teachers and students would cheerfully put up with these conditions for the sake of a cause. But in nationalist territory nowadays there is no idealism or enthusiasm to buoy them up, only an embittered frustration, which reminds one irresistibly of India and which makes it difficult to discuss political topics in a detached way. One cannot argue; one can only press buttons and listen.

Small wonder that these educated classes, possibly the most important single element in the country since amongst them are the leaders of tomorrow, are turning more and more towards Communism. Estimates by foreigners in educational circles in Peking, the main scholastic centre, of the number of Communist sympathisers amongst the students range from 50 to 90 per cent and include almost all the students who take any interest in politics. It was easy to get irritated with the students in Peking this summer, with their constant strikes, sometimes on very flimsy pretexts, and their demonstrations against American aid to Japan (really against American aid to China, but the authorities would not permit this). These young men, "rushing to meet their chains," will have little freedom to demonstrate under a Communist government. But it is important to understand the deep frustration that underlies such demonstrations.

Purge in Czechoslovakia

(FROM OUR PRAGUE CORRESPONDENT)

THE law for the better protection of the Republic has now come into operation. The Government will henceforward be able to redouble its efforts to get rid of the saboteurs, spies, calumniators and other enemies of the people whom Government spokesmen blame for slowing down the triumphant march of the country towards socialist prosperity. According to Dr Cepicka, the Minister of Justice, one of the chief obstacles in the path of socialist progress has been the 1923 law for the defence of the republic which, he said, protected only the capitalist system, and was aimed chiefly at keeping the workers in chains and facilitating the arrest of anyone who applauded the Soviet Union.

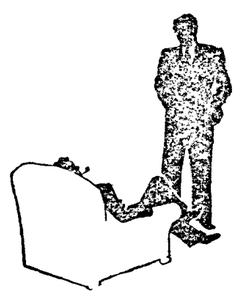
In spite of the law's shortcomings, however, not a day passed during many weeks preceding the enactment of the new law without the newspapers reporting sentences of imprisonment on literally dozens of persons of all classes, from ex-capitalists to active workers, for alleged espionage, sabotage and the publication and distribution of so-called "seditious" pamphlets. According to unofficial but entirely credible estimates, the total of arrests in the six weeks from the beginning of August to the middle of September was well over 18,000. The figure no doubt includes many persons taken into what may be termed preventive custody during the tense days after President Benes died, and before he was buried. Most of those who were arrested at this time were released a few days later without trial and allowed to go home; but even if these are excluded, the number of persons whose sentences have been published in the press since August runs into thousands. If all this could happen under the old law, it is scarcely surprising that non-Communists are seriously perturbed about what may happen to them under the new.

The purge of course is not confined simply to those who have received prison and compulsory labour sentences. It runs through every walk of life and does not by any means exclude the Communist Party itself. In the case of the latter, the process is known as "verification" which, in so far as the old members of the party are concerned, consists largely in calling upon them to confess their sins publicly and promise to be better boys and girls in future—morally as well as politically. One of the newspapers recently published an account of a "verification" meeting at Melnik, a small town 25 miles north of Prague, where the Lobkowic family used to have a castle and a famous vineyard. One member confessed that he had devoted too much of his time to his private affairs. Another finally admitted his family life was not at all what it should be and promised to make amends.

In fact, it all sounded remarkably like a revivalist meeting or a public confessional.

Those Communists who are found guilty of having really strayed from the true path are finding that the effects of "verification" are by no means restricted to confession and absolution. Expulsion from the party generally not only means loss of one's job but also acts as a bar to other employment in the state of life to which one's training has been directed. A good many of those involved are people who were forced into the party after the February revolution. Such people are now apt to be branded as "careerists," though often they had no option but to join. Verification in their case means that they are deprived of their party cards; what will happen to them nobody knows. It is difficult if not impossible for them to find another job in any state concern. In order to eat, some of them will doubtless drift to the land or be sent to the mines. As for the rest, no one knows. If they are lucky, they may win a prize in a state football pool. A Slovak woman the other day won Kcs. 2,500,000—£12,500. As there is a law against millionaires the maximum prize was thereupon reduced to Kcs. 300,000.

Of the hapless non-Communists who are being purged without receiving prison sentences, over 2,000 are Sokolists accused of abusing their position during the Sokol festival last summer to stage anti-Government demonstrations. While they have been driven out, the trade movement collectively and individually has been scooped in, and the Sokols can now be said to have been brought to heel; though doubtless they still contain many who will have to be "re-educated." Meanwhile the action committees are similarly busy "cleansing" the ranks of the trades and professions. A number of journalists, for example, have been expelled from their union—the last batch of 18 a week ago last Thursday. Students accused of anti-Communist activity in the past are being forbidden to continue their studies in the future. And so it goes on. In all cases, anyone so purged loses his or her job.



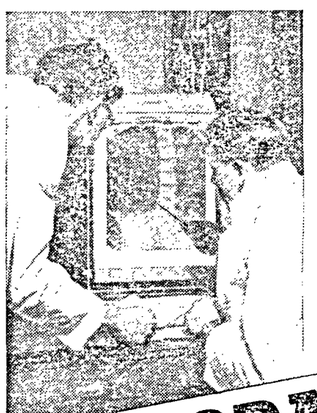
Victims from every Class

Those purged and those actually arrested come from every class and every walk of life including the new ruling class. For example, of a group of 16 men and women arrested in Moravia recently for "preparing and distributing illegal and seditious leaflets," one was a baker, another a butcher, a third a works foreman, a fourth a carpenter, a fifth an engineer, and most of the rest clerks. A group of eight charged with conspiring to steal arms from members of the police, and of setting fire to nationalised enterprises, consisted entirely of workers. An abbot and several monks have been sentenced for helping people to cross illegally into Austria. Soldiers, students and others have received long terms of imprisonment, and in one or two cases death sentences, on being found guilty of espionage on behalf of the American Counter Intelligence Corps. Two of the soldiers were non-commissioned officers and many of the rest, workmen and farmers.

In the circumstances it is a little difficult to know just what Mr Rudolf Slansky, Secretary-General of the Communist Party, meant when he said last month: "Ideologically and organisationally, we must prepare our party for a sharpening of the class struggle." The arrests and sentences make it quite clear that in Czechoslovakia there is no Mason-Dixon line or colour bar below which every class in the community is solidly red. It is of course possible that he was referring to the small shopkeeper class, which the Government regards as solidly anti-Communist. In a recent issue of the tailors' journal, a member of the tailors' action committee declared that shopkeepers had not been granted the extra rations given to other workers because of their anti-Communist attitude. He added that their anti-Communism was proved by the fact that they had one and all cleaned their windows—usually dirty—when President Benes died, and had filled them with obnoxious floral decorations. It is quite true that, during the period of official mourning, many shop windows displayed the red and white carnations which were the emblem of Dr Benes's former party, the National Socialists. If it was a crime for the shopkeepers to commemorate Benes in this way, why did the Government accord him a state funeral and walk behind wreaths many of which were of the same colours, and why were white and red flowers strewn on the ground for the hearse to drive over?

New Varieties of High Treason

Be that as it may, there is every prospect that Mr Slansky's proposition—if taken to mean that the Communists are in a class by themselves and that the non-Communists are all reactionaries—will be put into effect and that the new law for the Defence of the Republic will be one of the instruments. The law enumerates many new varieties of high treason and misdemeanour some of which—for example, the ban against "calumniating" members of the Government or foreign states in alliance with



"I think I'd like a White Horse better than anything"

MAXIMUM PRICES:—Bottles 33/4, ½-Bottles 17/5 as fixed by the Scotch Whisky Association

"Better operate at once..."

The surgeon who relies on X-ray photographs for his diagnosis takes it for granted that they will be available. But chemicals, essential for processing them, are in short supply owing to increased demands at home and for export.

Kodak do their best by ensuring fair distribution of what there is. They ask all users to observe the utmost economy with these materials.

Czechoslovakia—seem to be applicable to foreigners, like your correspondent, as well as to Czechs. As Great Britain is not one of Czechoslovakia's allies, it is still permissible for a Czech newspaper-man to say what he pleases about British politicians, as for example that Mr Lawther has "completely sold himself to American imperialism." But woe betide your correspondent if he were to suggest, even in a British newspaper, that Mr Zapotocky or any other prominent Czech trade unionist had sold himself to anybody.

Among the treasonable offences, espionage is described as "one of the worst"; like the crime of calumny, that applies to espionage against Czechoslovakia's allies as well as against itself. Such a provision would appear to have little meaning unless Czechoslovakia's allies have secrets inside Czechoslovakia's boundaries into which it is not desired that anyone should pry, and the precise implications of this part of the law must therefore be regarded as obscure. Sabotage is also treasonable, though the word does not appear to be defined in the law. Another crime is the spreading of rumours with the intention of causing panic. A further clause is aimed at priests who "misuse their priestly functions for political purposes." Just what will be regarded as misuse is a matter for conjecture. Last Sunday, a preacher declared that God's wrath would inevitably fall on the children of iniquity, and some members of the congregation were convinced he meant the present Government. If the Government itself takes the same view of such pronouncements, the lot of the vast majority of priests is likely to be an extremely unhappy one.

Priests are not the only unhappy people in Czechoslovakia today. Even the Government shows clearly by its actions, especially the multitude of arrests, that it is not feeling particularly happy itself. The workers, who are faced with an extension of hours of work and tighter control over their working lives, are becoming increasingly disillusioned; they are wondering what will happen at the end of the year when many of the rights and privileges of works committees are transferred to the manager—a change which, though highly desirable in the interests of efficiency, is a complete reversal of what the trade union movement has previously stood for. Finally, there are those who stand in constant apprehension lest they themselves or someone near and dear to them will be either purged or sent to gaol or both. In such circumstances it is little wonder that people are said to be still crossing the frontier to the tune of 20-25 every day, and that many of the country's best technicians and some members of the Communist Party are among them.

Benelux in the Last Stage

COMPLETE economic union by January 1, 1950, is envisaged by the Governments of Belgium, Holland and Luxemburg in a memorandum on the principles underlying their joint long-term economic programme which they recently submitted to the Secretary-General of the OEEC. This will be the final step in the process begun in 1944, when the three Governments signed a provisional customs convention, and continued on January 1st last, when a customs union actually came into effect.

The memorandum indicates that steps will be taken to overcome the obstacles which have, up to the present, stood in the way of economic union between the Netherlands and the already existing economic union of Belgium-Luxemburg. The chief of these is the difference between the Dutch economy, which since the liberation has been rigorously controlled, and the Belgian, which has been almost entirely free from controls. The Dutch, who at the Château d'Ardennes conference last June came a good way towards adapting their economic system to the Belgian, have now apparently come the whole way: they have agreed that the increased production essential to the recovery of the Benelux countries demands the removal as quickly as possible of all obstacles arising from postwar controls and regimentation. They agree that to re-establish an equilibrium between supply and demand will not only allow the gradual abolition of rationing, but will also allow price controls to be lifted from all but a few commodities. The disparity between Dutch prices, which have been forcibly kept down, and Belgian, which have been allowed to rise, has hitherto proved an important obstacle to economic union; the Dutch decision to lift most price controls together with the partial removal of subsidies already completed, should help to correct this disparity. At the same time the Belgians concede that, for the time being at any rate, it would be unwise to allow complete economic liberty. Consumption will have to be restricted to a certain extent and measures taken to guarantee a high level of employment.

Need for Trade with Germany

The primary aims of the Benelux countries' long-term programme is said to be the attainment of an equilibrium in their joint balance of payments, at the latest by 1952/3. This will in particular involve solving the problem of their dollar deficit; and maintaining the full employment which is considered necessary to achieve both economic and social stability. The chief factors retarding their economic recovery are the increase in population, especially in the Netherlands, the Indonesian war, and the almost complete elimination of Germany as a trading partner, as well as the loss of all the prewar income from German investments. During the years 1936-38 German exports to the Benelux countries represented an average of 18.1 per cent of their total imports, as compared with 2.8 per cent in 1947; while Benelux exports to Germany represented 14.5 per cent of their total exports, as compared with 2.8 per cent in 1947. The Benelux countries therefore believe that their economic recovery demands a solution of the German problem providing for removal of all trade barriers between themselves and Germany, the re-establishment of their former river transit traffic to and from Germany (which before the war yielded the Netherlands an annual income equal to $100 million and Belgium one of $40 million) and adequate safeguards for the German investments of Benelux citizens.

The three countries agree to co-ordinate their production and investment programmes, and to develop as much specialisation within each country as is compatible with the harmonious development of the internal economic structure of each. Both the Netherlands and Belgium-Luxemburg face serious difficulties in developing their export programmes. Those of Belgium arise from the shortage of Belgian francs and hard currencies among its customers; those of Holland from the fact that most of its traditional exports consist of luxury or semi-luxury goods which many countries cannot now afford to buy. It is hoped that Marshall aid, by raising the standard of living in Europe, will help to improve Benelux's export markets. But it is pointed out that this improvement can only be made if Belgium lowers its costs of production, and if Holland is willing to change to some extent the type of goods it produces; if the other OEEC countries give up their policy of import restrictions; and, above all, if a really efficient system of multilateral payments and exchanges is introduced.

AMERICAN SURVEY

Election Caucus Race

(From Our US Editorial Staff)

ON June 24th the Republican Party nominated Mr Dewey as its Presidential candidate and on July 15th the Democrats chose Mr Truman. Since that time both candidates have made hundreds of speeches and declaimed hundreds of thousands of words. There is no indication that any of these words has had an electrifying effect on the American people or their opinions. Nothing that has happened has altered, while much that has happened has confirmed and heightened, the impression of the two men held by the country before the conventions. Mr Truman is still thought of as a thoroughly likable bungler, Mr Dewey as an efficient inhuman being. The President's appearances all over the country have deepened the popular liking for him; his political action during the same period has sharpened the apprehension over his ability. Mr Dewey's cautious avoidance of commitments has increased public respect for his political adroitness though raising some doubts about his exact position in the spectrum of his party's opinions.

There is a general agreement that each man has made one important blunder in this campaign. Mr Truman's was the decision to send the Chief Justice of the Supreme Court to Moscow. Mr Dewey's was his shout of "Lunatic"—the only spontaneous remark, it has been said, that he had made in months—when the driver of his train, having overrun the water-tower by a few feet, started to back slowly into the crowd at one of the whistle-stops. (The driver took the rebuke philosophically, saying that he thought just as much of Mr Dewey as he had before it, which wasn't a great deal.) It is typical of both men that the President's error was in the field of public policy and Mr Dewey's in that of public relations.

In every Presidential campaign something of the flavour of popular feeling for the candidates can be judged from the jokes made about them. Mr Dewey suffered four years ago from some unusually bitter ones. He has not been much more kindly treated this time. On the evening of his nomination Mr Norman Thomas, the Socialist candidate for President this year and every year since 1928, remarked that it all went to show that it was possible to influence people without making friends. *The New Yorker* a few days later reported its impression that "our Governor is exactly what the party wants, but not very much." The jokes at Mr Truman's expense have been kinder but no less devastating. "We looked at him," Mr Thomas said, "and we said to ourselves: It's right. Anybody *can* be President of the United States." And he warned an audience in Buffalo that "anyone who would follow Mr Truman's banner must be prepared, like Stephen Leacock's hero, to ride away rapidly in all directions." Mr Thomas, indeed, has been the success of the campaign, his speeches having become collector's items. He is no longer seriously concerned with his own fortunes after twenty years of defeat, but is providing a running commentary on his rivals which has delighted even such a severe critic as Mr H. L. Mencken. His political philosophy may not attract many votes but he is well able to express popular sentiment on the candidates of the major parties.

That neither of these candidates should have grown in stature over the hard months of electioneering is in itself something of a surprise. It had been assumed that the President would collapse under the burden of a losing battle while the Dewey machine would collect votes with a methodical and inexorable precision until November 2nd, by which date Mr Truman would look as bedraggled as Mr Landon did twelve years ago. Nothing of the sort has happened. Both Mr Truman's energy and his optimism seem inexhaustible. On his trips he has made back-platform speeches from five in the morning until after midnight without appearing tired or losing his good temper. Contrary to prediction he has drawn larger crowds than Mr Dewey, a phenomenon which has led to many arguments among the experts. The best explanation offered is that people, having come to the conclusion they will have to vote for Mr Dewey, prefer not to be reminded of the necessity for such a choice. They have no inhibitions about going to listen to a President for whom they have no longer any personal responsibility.

★

Mr Dewey's strategy has, from the beginning, shown every evidence that he and his advisers still remember how Mr Roosevelt led him into a controversy, which was fatal to him, four years ago. A sigh of relief was reported from his train a week or two ago when it passed Oklahoma City, where the disaster happened last time, without incident. His trips this year have been described as pre-inauguration tours in which he can thank the electorate for their support, rather than attempt to gather votes, but his refusal to put his generalities into shape has occasioned some sharp criticism and even hints that, perhaps, once elected, he intends to forget the policies he has been advocating and settle down to the easier life of getting on with Congress. Such a theory is shown to be too pessimistic by Mr Warren Moscow, the *New York Times* reporter in Albany who wrote in his "Politics in the Empire State" of one of Mr Dewey's campaigns for the Governorship: "He made several speeches formally 'opening' his campaign and several more formally 'closing' it, with no campaign in between. He has since been accused of never deviating from that original policy." Yet, as Mr Norman Thomas pointed out "No Democratic Governor in any state can point to anything like the Fair Employment Practices law or the law against discrimination in education which Governor Dewey finally decided to put through his docile legislature" in New York after that campaign.

Such caution may have been unnecessary in New York State, in 1942, but there are good reasons for it at this time. The calculations on which the early predictions of an easy campaign and a triumphal procession to the White House over the corpse of the Democratic Party were based took no account of the Senate problem, or perhaps they assumed that all the doubtful Senators would be able to ride in on Mr Dewey's coat-tails. This idea has proved wrong. Strong personalities of the Roosevelt type can carry any number of nonentities into office with them. The failure of both Mr Truman and Mr Dewey to impress themselves as more than mediocrities has made the personality of the local candidate more important than it has been for a generation. And it is the personality of the local candidates which is bedevilling Mr Dewey.

There are probably eight Senate seats which the Republicans could lose. In Kentucky, where the Democrats are certain to

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

get a majority in the Presidential race, the odds should be in favour of their electing a Senator also. In fact, Senator Cooper, a Republican, is not thought to be in danger because of his good record. But the other seven Republican candidates, some of them in normally Republican states, who are in trouble, are all isolationists in good standing. Senators Brooks (Illinois), Wilson (Iowa), Dworshak (Idaho), Revercomb (West Virginia) and Ball (Minnesota) were, for instance, among the seventeen who voted against the European Recovery Programme. Representative Ross Rizley (Oklahoma) was not in the Senate but he voted against it in the House. Of the seven only Senator Robertson (Wyoming) voted for it, but his affirmative vote was hardly consistent with his normal position on foreign policy. On many other subjects besides ERP these seven oppose the policies to which Mr Dewey is committed, while their Democratic opponents could be trusted to support them.

The predicament in which Mr Dewey finds himself is most marked in the case of Senator Revercomb, who was responsible for the Bill to admit displaced persons which discriminated against Jews and Catholics. Senator Revercomb stubbornly refused to accept alterations to the Bill suggested by the candidate after his nomination. Mr Dewey has pointedly refrained from going to West Virginia, since he knows that any gesture towards Mr Revercomb would endanger his position with the Jews and Catholics in New York State. He is not prepared to risk 47 electoral votes to save one Senator. But, in the case of the other six, where his own fortunes are not so directly involved, he has given token approval, by asking the voters for a Republican Senator, while avoiding any display of enthusiasm.

*

Judging from these Senatorial races, the temper of the country seems to be running more strongly against the isolationists than in any previous election, and is giving the Republican high command some serious problems. If they lose control of the Senate it will be a proof that the electorate has taken the foreign policy portion of their platform seriously and relieved them of some members of their own party who disapproved it. Yet if they lose control they can do nothing to put through their domestic policy and may have difficulty in passing constructive legislation of any kind. Mr Dewey is left, therefore, with the unenviable task of trying to elect isolationist Senators, knowing that they will be the bitterest opponents of his programmes. It is enough to make anyone cautious.

Equally dangerous to his peace of mind when he gets to the White House will be his failure to ingratiate himself with the press, on whose good will a President must depend. It was remarked at Philadelphia that the enthusiasm of the Albany reporters who would be losing Mr Dewey was rather excessive. As the campaign has progressed the Washington correspondents have come to agree with them and the tone of despatches from the Dewey train has become increasingly acid. The reporters have hardly seen the candidate and have been treated with some brusqueness when they did. Finally, one of them wrote to the *Washington Post* to say that "one of the first unities to disappear should he be elected President is whatever unity he now possesses with the press" and forecast an "efficient national administration in which news is carefully channelled through proper canals, and heavy barriers placed between the reporter and even such high officials as Cabinet officers. It has already so happened in Albany—it can happen in Washington. . . . How long will it be before the press yells?" It will not be long. If Mr Dewey finds himself with a Senate controlled by the opposition on one side and a hostile press on the other he will have an unhappy four years.

American Notes

Campaign Cash

The costs of campaigning, of the special trains, the broadcasts ($17,000 for an evening half-hour on a single network), the fleets of cars, and mountains of literature, have gone up, like everything else; but fund-raisers are discovering, in what may prove the costliest campaign in history, that an assured result—victory in the case of the Republicans, and defeat in the case of the Democrats—is not calculated to loosen the purse-strings of the public. The Democrats, always the less affluent of the two parties, in addition suffer keenly this year from the defection in the South, the diversion of liberals in the North to Mr Wallace, and the alienation of Jewish supporters over the Palestine issue. Whatever economies can be effected through the fact that Mr Truman is President—in the cost of travel, for example—are sorely needed.

Reports from the national committees of both parties show that the Republicans have taken in just under $1.5 million and spent $1.7 million, and the Democrats have received $1.2 million in contributions and spent $1.5 million. But these figures are largely meaningless. With the real fight, this year, in the elections for the Senate and, to a lesser extent, for the House, the tendency is for local funds to be kept at home.

This tendency already existed as the direct result of the attempt to limit the amount of money which can be spent in an election. Under the Hatch Amendment to the Corrupt Practices Act of 1925, a campaign organisation operating in more than one state may not spend in any year more than $3,000,000—a restriction which, in the flush days of 1944, caused the Republican National Committee to refund $200,000 in order to remain within the law. Other groups, like the Dewey-Warren clubs, have therefore sprung up (each with its $3,000,000 ceiling), and more and more the getting and spending of campaign cash passes through local or state organisations which employ usefully sketchy accounting techniques. Estimates of the total amounts spent in the elections of 1940 and 1944 set the figure for the two parties in each year at over $20 million, and it may have been higher.

A Republican Congress is already showing a lively interest in alleged irregularities in the states; and it is hardly an accident that the Democratic candidates in two closely contested Senate races are accused of breaking the election law. An investigator for a Senate sub-committee accuses Mr Kerr, the favoured Democratic candidate in Oklahoma, of spending nearly $60,000 more than Oklahoma law allows in his primary election; and a House sub-committee is investigating charges that "scandalous mobilisation of employees on the Federal payroll" has supported Mr Anderson's campaign in New Mexico. Mr Lyndon Johnson, the winner (by 87 votes) of the Democratic primary for Senator from Texas, is also accused of election frauds. The Democrats, even if they win a majority in the Senate, may find the cup dashed from their lips, for an investigation into election offences would exclude the accused at the crucial moment while the organisation of the Senate was taking place, and a verdict of guilty might make new elections necessary.

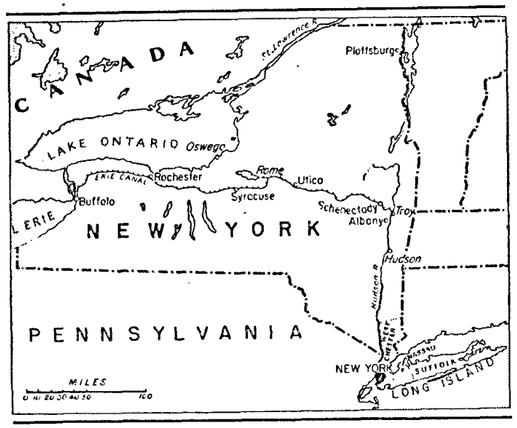
Automobile or Armadillo?

If predictions in the trade prove accurate, most drivers of medium-priced automobiles will be obliged to paint, patch and encourage their old machine (the average age is about eight years) to keep going for at least another year. Steel shortages, strikes—both past and anticipated—and an estimated back log of seven million orders have persuaded the manufacturers that they can count on a sellers' market for one to three years more. The second-hand dealers are not so optimistic. Business in unused "used" cars has hitherto flourished, with post-war models selling at almost double their list price, but now buyers' resistance and newly restored credit regulations (which require a "down payment" of one-third of the price and reduce to 18 months the time allowed to complete the instalments) has brought about a big drop in second-hand car prices.



Since the war few radical engineering changes have been made. Alterations in the body and the addition of some new gadgets have been enough to satisfy the rapacious queue. Now, however, as in former prosperous autumns, the "big three" (General Motors, Ford and Chrysler), who produce about 80 per cent of all American cars, have announced changes in next year's models, and some lines are already in production. Precise details are kept secret while titillating rumours are allowed to circulate. The stream-lined look, which incorporates fenders and headlights in the body, will be retained in the new styles. This trend makes minor repairs expensive and as troublesome as doctoring an armadillo. The emphasis is on fuel economy and engine efficiency. General Motors will feature in one of their cars a modified version of the high-compression Kettering engine, though this is not expected to become generally popular until more high octane petrol is produced. Improvements in everything except price are hinted at by such intriguing words as "monobilt," "futuramic" or "dynaflow."

Highway life is still growing as more roads are constructed and modern shopping centres and "motels" are built far out in the country. Thus the automobile industry is assured of ample prosperity in normal times, but there are two groups of potential car-owners whose goodwill might be lost to the domestic companies. One is the city dweller and the other the two-car family, which is discovering that its next car—when it gets it—will cost about double its prewar price (the average is $2,000), and that maintenance, petrol and tyres are correspondingly more expensive. Moreover, the new car may barely fit the old garage, and its increased speed is unnecessary for ordinary driving. It is in this group that British and European cars have been finding eager customers. (Fifteen thousand English cars were sold in the United States during the last eight months, while in 1947 only a few hundred foreign cars were imported.) Local dealers deprecate their popularity by attributing it to the availability and the novelty of the imported makes. However, unless the big manufacturers bring out models that are better, cheaper to run and easier to park, and do so sooner than now seems likely, they may find many of their current orders cancelled and their product reaching the market the day after the fair.

Republican Revival in New York

The exchanges between Mr Dewey and Mr Truman on the subject of Palestine might suggest that New York State is still, politically, an uncertain quantity, and the Jewish vote in New York City capable of delivering it to the highest bidder. In fact, the present ascendancy of the Republicans in New York is confirmed by the registration figures for voters. The total is slightly down from 1944, in itself an omen favourable to the Republicans. In addition, registration is down sharply in the Democratic stronghold of New York City, and in the farming counties upstate and the counties of Nassau, Westchester and Suffolk, the dormitory suburbs to which families move from the city as they rise in the economic scale, and where the prevailing political

complexion is Republican. Thanks to Mr Wallace's intervention, Mr Dewey's aides are even talking about his carrying New York City, a feat brought off by no Republican since Mr Coolidge swept all five boroughs on a platform of prosperity—a slogan as unobjectionable as most of Mr Dewey's.

Registration this year in New York City totals 3.3 million voters, and in the State outside the city 3.7 million. But the state is not, as it might look, cleanly and almost evenly divided between New Yorkers and the rest, though the tug-of-war between the state capital and the metropolis sometimes gives that impression. There is, besides Albany (where the redoubtable Democratic machine of the O'Connells has defied Mr Dewey's onslaughts) a band of industrial cities along the Erie Canal and water-level route to Buffalo, which are closer in their politics to the big city than to the surrounding countryside. Utica, like Albany, is Democratic; Syracuse and Rochester usually vote Republican; Troy and Buffalo vary. But in a good Democratic year they follow New York, thus magnifying a Democratic sweep in a state whose control is a great and not always predictable prize.

Thus, although New York State supported Mr Harding, Mr Coolidge and Mr Hoover for the Presidency in the 'twenties, it maintained the Democratic and highly progressive administrations of Mr Al Smith and Mr Roosevelt in Albany. The 'thirties were years of all-round Democratic victory, with vote-getters like Mr Roosevelt on the Presidential ticket and Mr Lehman running for Governor. But from the depths of 1934, when the Republicans lost even control of the legislature in Albany, they have had a steady Republican revival. In 1938 the Republicans became technically the majority party, though this was an empty honour as long as the American Labour Party supported the Democrats. But though Mr Roosevelt carried New York in the Presidential elections of 1940 and 1944, growing Democratic weakness and his own strength brought Mr Dewey the Governorship in 1942 and 1946, and in the latter year the Republicans sent their first Senator to Washington since 1920. Next Tuesday the ascendancy should be complete.

* * *

The Role of the ALP

Even in New York City's Congressional races, the Republicans are expected to pick up seats, largely because the American Labour Party (the instrument, in New York, of the Wallace Progressive crusade) is drawing away votes from the Democrats. The ALP was formed in 1936 to mobilise behind Mr Roosevelt's banner new voters allied with labour; it has never had any importance in any state but New York. The Democrats have come, however, to regret bitterly having given encouragement to an organisation which it has proved impossible for them to control. (The only exception is in Albany, where O'Connell Democrats have infiltrated the ALP with a success the Communists might envy.) Superficially, the election results of 1938, 1940 and 1944 suggest that the Democrats could not have carried New York State without the assistance of the ALP. But it is also true that the ALP sucked away many voters who would otherwise have remained Democrats. In addition, as the Republican cry that the ALP was Communist-controlled came, in time, to be substantiated by the facts, the alliance became something of a liability, especially among Catholic voters.

The alliance of Tammany Catholics with the ALP became so embarrassing that Mr O'Dwyer, the Mayor of New York City, has taken drastic steps to break it off. Mr Marcantonio, one of the ALP's two Congressmen in Washington, is the chief target of this offensive. A favourite of Mr LaGuardia, he has built himself a strong personal machine with city patronage, his own colourful personality, and an attention to the under-privileged Puerto Ricans, negroes, and Italians in his large and varied constituency. The Communist party-line he follows in Washington is less important to these unfortunates than his battle against their landlords and his willingness to do personal favours. Mr O'Dwyer, by ousting a number of Mr Marcantonio's followers from the city pay-roll, has made a start at undermining this machine, but the failure of the Republicans and Democrats to agree on a joint candidate suggests he is likely to retain his hold on his district.

Mr Isacson, the Progressive-ALP candidate who shook Washington, as well as the Bronx, with his victory last spring on the Palestine issue, is, on the other hand, confronted by a candidate carrying the endorsement of the Republicans, the Democrats, and the Liberal Party (a conservative splinter of the ALP), and is not likely to repeat his feat. A great deal of ALP money and energy is supporting Mr Lee Pressman, (counsel to the Congress of Industrial Organisation until its anti-Communist drive started) against Mr Multer, a liberal Republican. And the strong ALP drive in normally Democratic Brooklyn may force a number of Democratic Congressmen to give way to Republicans.

* * *

Running for Governor

Next Tuesday's election results will presumably upset the tidy balance between Democrats and Republicans in the state capitals as, at present, each party has 24 Governors. Two states —Maine and Louisiana—have already chosen their Governors and a further 32 will elect theirs on the same day as the President is chosen. This usually confuses local with national issues and Governors are apt to be swept in or out of office on the Presidential tide. This year, however, the lustreless national campaign has resulted in more excitement in the state races.

In the four politically adult and contiguous states of Illinois, Ohio, Indiana and Michigan interesting and close contests are predicted. All these states at present have Republican Governors, but the Democrats claim they have a sound chance to win if only voters can be persuaded to "split" their ballots. In Illinois the Democrats are fortunate in having as their candidate Mr Adlai E. Stevenson who has a national record (he served in the Foreign

Service and also as a delegate to the first United Nations General Assembly). Mr Stevenson is fighting a resourceful battle against Governor Green who may lose after eight years of careless administration. In Ohio, a state with a reputation for good government, the battle is between Governor Thomas J. Herbert, an apparently colourless candidate with isolationist inclinations, and former Governor Frank J. Lausche, a man of integrity, energy and attractive personality. Ohio provides the voter with separate ballot sheets for the state offices which may help to prevent Governor Herbert from riding on Mr Dewey's coat-tails. In Indiana, an ex-Governor, Mr Henry F. Schricker, is opposing Mr Hobart Creighton; the former wears a snow white hat as a symbol of clean government. The Democrats admit that it will be hard to win in Michigan where Governor Sigler is fighting Mr G. Mennen Williams who, though lacking political experience, is an ex-serviceman and is supported by labour. Connecticut and Washington are also scenes of significant races which offer hope to Democrats in a year of bleak prospects. In Washington the Democratic governor, Mr Mon C. Wallgren, a friend of Mr Truman, is struggling to hold the office from Mr Arthur B. Langlie. The Governor is the more liberal on the "wet-dry" issue which exercises the state and he also has the approval of organised labour. It is expected that unless the Republicans' plurality in the Presidential election reaches landslide proportions he will win. In Connecticut, the acting Republican Lieutenant-Governor, Mr James C. Shannon, a Catholic, is being opposed by Mr Chester Bowles, the former head of the Office of Price Administration. Despite his national reputation, thousands of roadside billboards saying "Bowles kept prices down, he can get houses up" and his own active radio campaign, he is having a hard fight.

Although the average voter may not know the name of the Governor of the state next to his own, the Governors of the 48 states (when they have not been buffoons, party hacks, or demagogues like Mr Huey Long) have supplied the chief crop of Presidential timber. The job of governing a populous state is the closest replica of the Presidency, with the exception, admittedly a great one, of foreign affairs. It is in the states that ambitious aspirants demonstrate, not only their administrative ability, but their vote-getting talents and political acumen. Their records in these spheres are the great strengths of Mr Dewey and Mr Warren.

Shorter Notes

The chief function of the Progressive party in this year's elections has been underlined by a strange alliance between Mr Wallace and Governor Green of Illinois. The Progressives have been ruled off the state-wide ballot in Illinois, one of the three states in which their strength is concentrated, because they have been unable to satisfy the requirements of the state's election law. After fruitless appeals to Illinois courts, Mr Wallace's representatives appealed to the United States Supreme Court to invalidate the law as likely to disfranchise many citizens. In this plea they were supported by the Republican assistant attorney general of Illinois. The Supreme Court has refused to intervene in a case in which the Republican motive was so clearly a hope that Progressive candidates would draw votes away from Democrats like Mr Douglas and Mr Stevenson, who are trying to unseat the worst type of Republican in Senator "Curly" Brooks and Governor Green. Mr Wallace has now appealed to Governor Green to have the law repealed.

★

Whisky seems to be the cause of rebellion from two quarters. On the one hand some domestic distillers claim that it is unfair that imported brands are not required to comply with the regulations imposed on American producers and they have urged the Alcoholic Tax Unit to insist on uniform labeling. It is said that the absence on the bottle of an exact description of the ingredients misleads the consumer who thinks that his whisky is as strong as it was before the war. On the other hand the Scottish distillers are aroused by the practice of a few American distillers who use the words "Scotch-type" on their labels. A large Scottish distiller has brought the matter before the Bureau of Internal Revenue and has asserted that only whisky actually made in Scotland should use the word "Scotch" on the bottle.

★

In March the traditionally neglected American bridegroom is to have a magazine all his own. It is calculated that male trousseaux and other wedding expenditures represent retail business worth $1,500 million annually and therefore justify a special publication every six months. This will advise the groom on such matters as clothes, travel, presents or wine. Next year's June bridegrooms thus will have every assistance in facing their matrimonial life with poise.

Economic Plateau

AMONG the early fruits of the effort towards European co-operation within the ambit of ECA has been a new and bewildering output of statistics. One incidental result of this has been to introduce into the annual series of British economic programmes for calendar years a new intermediate and overlapping programme related to the period covered by the fiscal year of the United States. The first of these British programmes for ECA, relating to the twelve months to mid-1949, was published last week as a White Paper.* It deserves closer attention than the extent of the changes it portends in the shape of Britain's economy might seem to warrant. Indeed, its significance lies precisely in the smallness of these changes. The conclusion is irresistible that Britain's economy, after climbing well for three years, is emerging into a rather flat and arid region which, when crossed eventually, may lead to still higher ground but is all too likely to prove to be a plateau.

Without ERP assistance, as the White Paper gratefully acknowledges, even the present levels of activity could not be sustained. But there is a hint of complaint in the conclusion that the $1,263 million of aid "is no more than just enough" to support the programmes: "there is no margin even for improvements of consumption which are clearly needed . . . nor is there scope to accelerate the United Kingdom investment programme." Nor, if the figures are to be believed, is there scope for further expansion of exports. Although "it is hoped that a higher level will be achieved," the total export level for 1948-49 is put at 137 per cent of 1938 volume (a typographical error in the White Paper gives this as 1948). This expected volume compares with 109 per cent in 1947 and is a little above the index for last month; yet it is actually a point below the average for the third quarter of this year and only 3 per cent above that for the past nine months.

The explanation of this prospective stagnation must be sought, of course, primarily in the trend of production. Coal output is set at 218 million metric tons, which is 4 million metric tons above the target for the calendar year—but it has since been officially admitted that that now appears unattainable, for the rate so far is equivalent to only 210 million metric tons. More disconcerting, however, is the expected performance of industrial production, for the achievement here casts its shadow a long way ahead when the prospects for other programmes, notably exports, are being surveyed. Once the immediate dislocation from last year's fuel crisis had been overcome, industrial production expanded rapidly. The White Paper notes impressively that the official index of production for the second quarter of this year was some 15 per cent above that for the whole of 1947. But it omits to point out that it exceeded the final quarter of 1947 by less than 3 per cent. The best figure, reached last June, only just surpassed the intermediate peak touched as long ago as last November; and this summer's seasonal fall has been very steep. Unless the autumn expansion is abnormally large, the basic trend through this year will appear as no more than a continuance of the level attained by the autumn of 1947.

It is becoming apparent that the steady progress until the end of last year was primarily a reflection of the increasing industrial labour force as demobilisation proceeded; and that the strong expansion of exports until the holiday season this year was in turn mainly a reflection, after the natural time-lag, of the earlier growth in production. Given the virtual impossibility of curtailing much farther the volume of goods used at home, this year's mere maintenance of production—reflecting the approximate stabilisation of the labour force—sets narrow limits to the possibilities for exports in 1949. It would be unwise, perhaps, to project the argument much farther ahead, for only the most hardened cynic would reject out of hand the chances, on a somewhat longer view, of concentrating Britain's limited resources more effectively upon the most vital tasks. But although some latitude may be found in such ways, the broad limits to the volume of exports in 1949-50 will be set by the production which takes place in the next few months. And the official estimates promise no perceptible expansion.

The White Paper estimates the level of manufacturing production for the year 1948-49, at best, at less than 4 per cent above its level for the second quarter of this year, and at worst at a shade below that level. The official expectations for particular categories are shown below for those groups for which reasonably comparable figures (compiled by *The Economist,* and shown in the final column of the table) are available of the annual rates for the current calendar year to date.

In Millions of Metric Tons†

	Pre-war	1947*	1948-49	Current Annual Rate (1948 to date)
Coarse grains output	2·9	4·6	5·3	5·5
Meat and bacon output	1·5	0·9	1·0	0·8
Solid fuel output	254·0	223·0	244·0	239·0
Of which :—Coal	233·0	201·0	218·0	210·0
Electric power output	21·3	42·6	45·0	44·8
Crude steel output	11·4	12·7	15·0	14·9
Copper used	265·6	355·7	381·0	357·7
Wool used	190·0	191·0	223·0	228·0
Timber used	13·1	6·6	7·1	6·8

* 1947-48 for food products.

† Except for copper (thousands of metric tons) and electricity (billion kW.h.)

The implication of these forecasts is plain. If the trend of production in the early future must be accepted as a limiting factor upon exports in the somewhat longer run, the chances of a significant expansion of exports are slender.

Most people will find it hard to reconcile these figures with the export targets announced this week. By contrast with the rates that were being discussed last year, the target rates for next year look meagre enough; but they represent, in most instances, a large increase on present levels. At the time of the convertibility crisis of 1947, the target rate for total exports at end-1948 was fixed at 160 per cent of 1938 volume, but was later revised to 150 per cent. Now the target rate for end-1949 is fixed at no higher a level than midway between these figures. But, modest though the objective looks on this comparison, it appears far out of reach when tested by recent achievement and by the production forecasts.

Thanks to the high point reached during the pre-holiday rush in July, the provisional volume index for the third quarter of this year was the highest yet, at 138, and the average

* European Co-operation. Cmd. 7545.

for the nine months was 130; the provisional figure for September, however, was only 132. Yet Mr Wilson declared the year-end target rate of 150 to be within sight of achievement. In the light both of recent experience and of the forecasts for 1948-49, this is a rather surprising prediction. It is now clear that even if a volume index of 150 were to be shown in the last month of the year, this technical achievement of the objective would be of no significance—because it would be far removed from the expected trend. Moreover, Mr Wilson made the anomaly more pronounced by saying, in reply to a question, that he expected the monthly average for the calendar year 1949 to be 138. In other words, the discrepancy between the end-December target rate and the level of exports in the immediately preceding months is expected to be just as wide in 1949 as it seems likely to be this year.

It only needed Mr Wilson's further comment—emphasising the effects of the seasonal factor—to reduce the present practice in calculating export targets to its ultimate absurdity. This practice of treating the rate at a year-end point in time as the effective target for the whole year's export effort should be dropped. It should be replaced by a target expressed in terms of export volume for each target period as a whole—possibly supported by supplementary targets based on a progression of quarterly averages of the expected monthly rates. If this were done, it would be clear at once that the real target for 1949 is not 50 per cent or more above the prewar volume but rather less than 40 per cent; and it would be optimistic to put the last supplementary target—i.e., for the final quarter of the year—at much above that level.

In a number of particular groups the rates projected for end-1949 are below those originally set for the end of this year. The most notable of these projected declines are those for non-ferrous metals and manufactures; manufactured textiles other than cotton, wool, silk and rayon; apparel; footwear; leather and leather goods; and rubber manufactures. In each of these categories except non-ferrous metals, however, the new target rate is still much above the present rate of performance. Some of these reductions, Mr Wilson stated, mainly reflect the severe import restrictions which have been imposed abroad and the growing competition for overseas markets. But the programme also indicates a certain change in the Government's underlying policy towards exports. The new targets have been fixed after an "intensive examination" of the problem of exporting capital equipment or retaining it for the use of British industry in order to increase productivity. In certain instances it has been decided that the optimum result would be achieved by reserving more equipment for the home market.

In view of these diversions, it might, perhaps, have been expected that the prospective virtual stabilisation of the export volume would have been accompanied by some relaxations in the restrictions upon investment outlay at home. But the investment programme for the whole of 1949 is provisionally estimated at £2,000 million, which is certainly not above, and may even be below, its present annual rate. For the current year, the official estimate was originally £1,800 million, but many unofficial observers suggested from the outset that this was an insufficient allowance—not because of any hope that the Government would relent in its decision to curtail or defer some of the larger industrial schemes which are controllable, but simply because there is always a large range of miscellaneous work which is beyond the reach of official discipline. Sir Stafford's recent admission that total investment in the current year is likely to run at some £200 million above the original estimate does not, therefore, reflect any corresponding increase in the volume of essential capital outlay. On the contrary, it merely means that the original intention to curtail outlays, officially regarded as non-essential, has never been effective at the margin. The ECA White Paper, while emphasising the importance of the investment programme for Britain's future productivity, says plainly that there is no scope for increasing it. Nor, apparently, is there any intention to curtail the housing programme. This being so, the main industrial programmes for the year 1948-49 are inevitably merely a projection of the plans already known for the year 1948—£130 million for electricity, £40 million for steel, £25 million for coal, and the programme for oil-refinery construction, expansion of capacity in the chemical industries, and maintenance of inland transport.

*

The White Paper says plainly that "very little result will flow" from these developments in the year 1948-49. But it is blandly confident about the longer-term prospect—"1948-49 and 1949-50 are the years in which the foundations will be firmly laid for the sound and self-sustaining economy which will be attained by the end of the ERP period." Given the virtual stabilisation of the levels of production, investment and exports, it is hard to discern the source of such dogmatic assurance. The immediate prospect, and even that for the medium term, plainly offers little hope of any important advance. By what means, then, does the Government so confidently expect Britain to become self-supporting by 1952? Perhaps it hopes to find the key to the puzzle in that greater "viability" which has so suddenly and so unintelligibly become the ultimate objective of all the programmes and plans. But whether "viability" has any meaning or not in this context, the Government admits that the "four major lines" towards it are expansion of production and of exports, development overseas of primary products accessible to Britain, and stimulation of import-saving production. Quite apart from the fact that progress under the last heading, and perhaps under the third too, may raise the real cost of Britain's supplies, it is hard to feel that there will be much increase in "viability" in the early future. Is it really to be believed that the graphs of British production, investment and export volume, which will be almost horizontal during the next twelve months or so, will suddenly leap far upwards in the final phase of the ERP period? Will the present industrial investment plans, so constricted by the housing programme, really suffice to perform the miracle of increased productivity in two years time? Policy would be wiser if, instead of putting its faith in miracles, it considered a means of redoubling, and then doubling again, the rather meagre efforts which have so far been made to concentrate the resources available now upon vital objectives.

European Recovery—V

Europe and the World's Oil

SINCE Europe cannot aspire to self-sufficiency in petroleum supplies the task of meeting the oil shortage raises different questions from those raised in planning for the other sources of energy. It demands outstanding flexibility, and action on a scale wider than the European; there can be no solution by local action or by restoring a status quo. The Paris plan of 1947 contained no suggestion of reducing petroleum imports or of eliminating the imports from the dollar area; to import oil, even American oil, it pointed out, was a less costly matter than importing American coal, and for this reason it supported the conversion of industrial plant to oil burning as "a not unimportant factor in assisting the general recovery of the European economy."

Petroleum, though it must come from outside Europe, was to play a bigger part than ever before in the European supply of energy, and was to make possible, in spite of the relative inelasticity of coal output, the great expansion of activity which the report envisaged over the whole field of industry and agriculture. The ratio between the sources of energy (coal, waterpower, and oil) was to swing further in favour of oil. In the United States, oil and natural gas have together already outstripped coal and have become the principal source of energy. In Europe between 1935 and 1938 they were estimated to supply 10 per cent of the total, and the Paris report at one point spoke of the share increasing by 1951 to 30 per cent—the equivalent of 300 million tons of coal. Obscure as the statistical basis for the estimate may be, the trend is real. At the same time its satisfaction has been, and is still, threatened by the interruption and distortion of trade through payments difficulties. For the moment the threat is held off largely by ECA supplies, which amounted to 68.5 million barrels (to the value of $245 million) between April and September, and which have the effect of financing the normal operations of the American companies trading in Europe. Mr Walter J. Levy, chief of the petroleum branch of ECA, claimed recently that but for ECA dollars "the flow of oil to Europe from world sources would have been completely disrupted."

Since these difficulties are not to be overcome by putting the clock back, they have to be overcome by European enterprise and investment, by developing foreign oilfields and organising their resources to supply Europe. For this the Middle East is the obvious field. This is not to say that the oil-bearing regions of the Middle East can be, or should be, harnessed to a European chariot. The development of the Middle Eastern oilfields is already a matter of world-wide concern, in which the Americans are playing an energetic part. And any attempt at a European plan must form part of the larger programme which is already in motion; it must take account of the immense changes in the world oil industry which are already becoming apparent.

These changes make it clear that the sources of European oil would still be shifting if there were no dollar shortage. Nothing has happened to shake the position of the United States as the leading oil producer of the world, but the fantastic growth of US consumption has made even US output insufficient for domestic needs. Already in the first seven months of 1948 net US imports were more than 100,000 barrels a day. The American oil companies are now developing foreign oilfields not only (as formerly) for the world trade, but also to supply their home markets. As a result the bulk of US oil exports to Europe has already dwindled away and ECA shipments are coming mainly from other sources developed by the American companies. Of the oil exports from the Caribbean, more are flowing to the United States than to Europe. With Latin American oil markets also taking more from the Caribbean, the European share, already attenuated, must continue to shrink. The only recourse is a rapid expansion of supplies from the Eastern Hemisphere, and it is in this belief that the American as well as the European companies have embarked since the war on great new projects in the Middle East, where the resources to be developed are proving even vaster than would have been estimated two or three years ago. Supplies of crude immediately available in the oilfields of Saudi Arabia, Iran, Kuwait and Iraq are far more than can be carried. To make full use of Iraq oil would require not merely the restoration to use of the pipeline to Haifa but the two new 16-inch pipelines and the 30-inch lines which are planned. To bring the crude output of the Arabian American oilfields to the Mediterranean, the Trans-Arabian Pipeline Company has started construction of a 32-inch line to take 500,000 barrels a day. This has lately been held up by the withholding of steel export licences in Washington. The Anglo-Iranian company has also been planning a line from the Persian Gulf to the Mediterranean, and there has been discussion of a third from Kuweit, to be a joint undertaking of the Shell

and Gulf groups. These three lines will each cost £50 million or more.

The oil is there if the effort can be put forth to get it, the resolution taken to hazard capital in a politically uncertain part of the world, and the decision made to devote to petroleum development resources of steel and engineering capacity for which there are many other demands. Calculation of the political risks is not easy, but it has been faced, and the oil companies have not been deterred from undertaking huge investments around the Persian Gulf. The rate of development is now limited by the difficulties of getting the great quantities of materials needed, and particularly of steel plates, pipe, forgings, pumps, and electric motors.

Success in the effort required of Europe in the oil world in the next five years will largely depend on the effort made to supply these things, and on the intelligence with which they are used. Planning needs to keep certain objectives in sight. These are to bring the oil to the refinery, turn it into the particular refined products which are wanted in the proportions in which they are wanted, and bring them to the consumer at the lowest possible cost. At the same time the opportunity should be taken to bring to the consumer the improvements in quality which are possible with modern refining technique. For economy and quality it is important to make the most intelligent use of the limited materials which are to hand.

These reasonably simple objectives are consistent with saving dollars. It is, however, possible that a programme which aimed purely at saving dollars might lose them from view, particularly if it is not an integrated programme but a loosely related series of national enterprises. Home refining, if carried to uneconomic lengths, might serve the dollar-saving purpose without serving any other. The four-year programme at present being completed in Paris may show how far this is likely to happen. The first Paris report showed that dollar expenditure was to be restricted by concentrating on the non-dollar sources for imports of refined petroleum and on dollar sources for imports of crude:

SOURCES OF PETROLEUM IMPORTS
(OEEC Countries and western Germany)

	Percentage from Dollar Sources		Percentage from Non-Dollar Sources	
	Crude	*Refined*	*Crude*	*Refined*
1938	47	42	53	58
1947	49	50	51	50
1951	55	33	45	67

These figures cannot, perhaps, be taken as more than the indication of a train of thought, for the report added: "No attempt has been made to relate these requirements to a possible world availability over the period." The train of thought is more precisely indicated by the following figures, also extracted from the first Paris report:

PROJECTED GROWTH OF HOME REFINING
(OEEC Countries and western Germany)

	Per cent. of Requirements		
	1938	1947	1951
Supplied from :—			
Indigenous oilfields	7	4	4
Refining of imported crude	33	24	41
Imports of finished products	60	72	55
	100	100	100

In home refining the United Kingdom has given a lead with a domestic programme which will add 16½ million tons or more a year to the annual throughput of British refineries. Several Continental countries had, however, embraced home refining as a policy before the war. French legislation led to the building of 15 refineries in France between 1931 and 1935. These were badly damaged during the war, but have since been largely restored to use. Further refinery expansion is an important feature of the Monnet Plan. But the French balance of payments will not even now permit of the full throughput of the French refineries being used, and a recent arrangement provides for the refining of crude on British account for export. It seems likely that France will be driven to rely on the services of her new refineries as an invisible export.

The Italian industry is likely to find itself in a similar situation. Italian requirements in petroleum this year are about 2,750,000 tons, and the Italian estimate for ERP purposes was a requirement of nearly 6,000,000 tons a year by 1952. Plans already published will raise the capacity of the Italian refineries to 5,250,000 tons. But additional projects lately put forward would add another 2,500,000 tons to Italian refining capacity; Italy, therefore, may also find itself in the export trade.

*

The German industry, through its long concentration on synthetic production from coal, is a special case. Final political decisions have still to be taken on the future of the German synthetic plants. For the present, refinery capacity damaged by the war is being repaired. It is to be supplemented by the partial services of two former synthetic plants at Gelsenkirchen and Wesseling, and by these means the petroleum requirements of the western zones will be met by imported crude refined in Germany. In Holland the Shell refinery at Rotterdam is being enlarged, and Caltex are erecting (also at Rotterdam) a new refinery to have a capacity of 1,000,000 tons a year.

These, and a number of smaller projects in other countries, make up a formidable volume of refining capacity which was summarised last week by the petroleum chief of ECA. Mr Levy estimated the capacity of the European refineries at the end of 1947 as 19 million tons a year, the expected capacity next June as 25 million tons a year, and the total capacity "scheduled" to be in operation by the end of 1952 as 50 million tons a year.

The European effort as it is shaping at present may lead to a swifter growth in refining capacity than in the production and piping of crude oil. Proposals for new refineries continue to appear; in addition to those already summarised, there is a movement to establish a home refining industry in Belgium—on which Holland, as a partner in Benelux with two large refineries building, cannot be expected to look with great approval. Greece and Turkey have lately produced proposals for entering the refinery field. The same is happening in other parts of the world, and domestic refining is talked of in India and Brazil.

The tendency is natural enough, and up to a point necessary. It carries, however, certain possible disadvantages. A multiplication of small, dispersed plants designed to serve restricted markets must carry with it some waste of capacity. Steel which is desperately needed for pipelines and tankers may, therefore, go into unnecessary refining plant instead, and the scale of the total oil effort be restricted even more than it need be. The national domestic projects tend to be served first, while the overseas development waits.

Purely technical development would lead the industry in the opposite direction—towards large refineries varying in capacity between 1,000,000 and 5,000,000 tons a year, and producing higher quality products than those of today. Modern plants of this size can carry definite advantages; among the advantages is motor spirit of higher octane, which may reach the British market in a few years. They can vary the balance between the different fractions produced (aviation spirit, motor spirit, diesel oil, fuel oil) to meet, up to a point, the varying needs of the markets. Even beyond that point, since they serve large markets, they can hope to even out the variations among different consumer groups. The oil industry tends to think in larger terms—bigger pipelines, tankers of 28,000 and 30,000 tons, large and elaborate refineries. It cannot be fitted into a too strict national pattern without distortions for which only the user can pay.

Business Notes

Inconclusive Markets

After the recent rise—both in gilt-edged and in industrial equities—stock markets seem to have reached a rather inconclusive phase, and this week's movements have done little to determine the many debates about the immediate prospect. Early in the week, it is true, it seemed at first that the gains were becoming sufficiently consolidated to permit a further advance in the general level of industrials. On Monday the industrial share index of the *Financial Times* rose by 0.7 to 119.8—nearly 2¼ points better than at the end of the last account and 10 points above the low point touched last July. Accordingly, it began to excite the interest of the chartists but, unfortunately, the fact that some of these were getting their cheque-books ready evidently left the general body of investors quite unmoved. The Vyshinsky veto, the re-opening of Parliament, and nervy discussion about the then impending Steel Bill, all combined to restrain activity; the index has since relapsed virtually to the level at which it stood last week. Among the exceptions to this general trend has been the firmness of stores equities, oblivious of the sombre implications of the latest economic White Paper.

The gilt-edged pattern has been rather similar. The great event has, of course, been the opening of dealings in the new Electricity Stock, applications for amounts over £50,000 for which were scaled down by nearly one-quarter. The Loan's debut on Monday at an opening premium of ¼, with dealings at one time at 1 3/32, seemed to justify the theory that the necessary adjustment would be achieved by a rise in the new loan to the general level of the market instead of by a moderate easing all round. This question, however, is still in doubt. The initial repercussions, exerted in very active dealings, produced declines of about ¼ in the nearest comparable securities—in particular, in 3 per cent Savings Bonds, 1965/75 and in Transport Stock. Mr. Vyshinsky's latest gesture, however, served to inhibit the reflex action for which the more optimistic had hoped, so that on Tuesday and early on Wednesday prices declined further, to the accompaniment of some suggestions about bear selling. Most of these losses have since been regained, reducing the net changes on the week to scarcely more than ⅛. These inconclusive movements hold little assurance that the weight of money, which so impresses certain people in the market, can be counted upon to produce a resumption of the rather unaccountable upward movement which the Electricity issue has arrested.

* * *

ECA Loan Terms

The terms were announced this week of the first loan to be arranged between the British Government and the Export Import Bank of Washington, acting for the Administrator for Economic Co-operation. The amount of the loan is $310 million, which represents the agreed distribution of ECA aid to the United Kingdom between grants and loans in the proportion of 3:1. The quarterly allocations of aid to Britain already announced are as follows, showing the amounts attributable to grant and loan expenditure:

	In $ million		
	Grants	Loan	Total
April-June, 1948	300	100	400
July-Sept. „	250	85	335
Sept.-Dec. „	375	125	500
Total	925	310	1,235

No difficulty will be found in matching procurement authorisations for textile, mining and agricultural machinery and for such industrial materials as steel and oil, against the loan expenditure. But the demarcation between grants and loans cannot be logically explained in terms of the types of goods on which Marshall aid is being spent. Its explanation is to be found firstly in the quite arbitrary decision of Congress that 20 per cent of the sums allocated for ERP should be made available on loan terms and secondly by the subsequent decision of ECA that for aid to Britain, this proportion should be 25 per cent.

Interest on the loan will be at the rate of 2½ per cent. Interest payments are due to begin in 1952 and the principal is to be repaid in semi-annual instalments beginning in 1956 and ending in 1983. The agreement includes the loosest of waiver clauses:

If at any time or from time to time the parties hereto determine that it would be in their common interests because of adverse economic conditions or for any other reason to postpone any instalment of interest or principal or to alter any provisions of the promissory note relating to payment of interest or principal or to modify the promissory note in any other respect, they may by mutual agreement provide for any such postponement, or alteration or other modification.

The beguilingly precise mathematics of the 1945 agreement waiver clause have been carefully avoided on this occasion, and the new waiver, unlike that of 1945, applies to capital as well as to interest payments. The 2½ per cent rate of interest was virtually fixed by the fact that ECA is paying the US Treasury about the same for the monies it is raising in respect of the loan portion of the sums authorised by Congress for ERP expenditure. On all counts this is a reasonable agreement and the contrast between its terms and those of the 1945 agreement, particularly the absence of any "strings" in the latest agreement, is a significant reflection of the change that has occurred in the Washington atmosphere over the past three years.

* * *

The Motor Show

It is too early to say that the phase of postwar transition and improvisation has ended in the British motor industry: in too many ways, as the motor manufacturers themselves are among the first to complain, the conditions in which the industry operates are still artificial. But there has by now been time for some of their plans to take effect and for some of the difficult operations of retooling and works reorganisation to be completed. So the Motor Show which opened this week at Earls Court enables the public to see, for the first time since the war, a substantial number of new British models together. They are only the first stage of the effort to make up the lost ground of the past ten years: next year and the year after should make it possible to see more clearly the trends in such key matters as engine size and ratio, body design and finish, suspension, and production costs on which the industry's future may depend. The Motor Show is an interim report.

The new products of the motor industry are being well received, and their good reception is strengthened by the general feeling that the industry has responded well to the exacting demands placed upon it in the past year. To expand its export performance at the smart pace imposed by the Government (and with which the industry has successfully kept in step) was not easy in the face of the import restrictions which have become so common in the overseas markets. To redirect the export sales effort at the same time to dollar markets, where standards of price and performance are particularly keen, has been even harder. This has been achieved to the extent that in the first three-quarters of this year 9 per cent of British motor exports went to the United States (as against 2 per cent last year) and 5 per cent went to Canada (as compared with 3 per cent last year); and the Minister of Supply said in a speech to the Society of Motor Manufacturers and Traders this week that the proportion of the exports going to hard-currency markets had risen from 7.5 per cent in the first quarter of 1938 to 26.5 per cent in July. These proportions are clearly not enough, but the redirection of effort is still proceeding. Its further success in conditions of sharpening competition will require more, and still more, of the technical improvement and redesigning of which the present Motor Show presents the first stages. For the most difficult of manufacturing operations, particularly in an engineering industry, is to prepare a new range of products without slackening the immediate productive effort on the old range.

The new products, as they come forward, will be judged not by the praise they receive at home but by their sales success abroad. To be deprived of a large and critically-disposed home market at a formative stage can only add to the planning difficulties of the industry. A manufacturer who has to rely almost entirely on overseas markets for his sales reactions must lose valuable time, or must work to a certain extent in the dark. The industry is substantially performing the task imposed upon it of exporting 75 per cent of its products, and the remaining 25 per cent is taken up all too gratefully by a home market which is no longer in a position to be critical. It is not necessary to pretend that this is

a healthy position. Mr Strauss made it clear that it must continue "for some time," and that there was no more steel for motor cars at the moment.

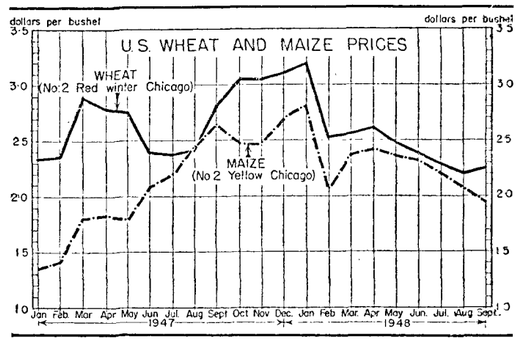
* * *

Evasive Action in South Africa

South African economic policy is still twisting and turning in its effort to avoid facing the harsh glare of realities, the most withering beam of which comes from the persistent fall in the gold reserve. Until recently the Finance Minister's avenue of escape from that was blocked by the ratio of gold cover required by the Reserve Bank Act. The latest evasive action, therefore, was to amend the Act. The amendment took effect three weeks ago, and proves to be a little more ingenious—though not less ingenuous—than appeared when the proposals were discussed in these columns early last month. The minimum legal ratio of gold cover has been reduced to 25 per cent but, in addition, this ratio is no longer to be computed as a proportion of the Bank's liabilities to the public: for the purpose of calculating the ratio, the Bank is empowered to deduct from its liabilities "an amount equal to the book value in Union currency of its assets held outside the Union." Thus defined, the deduction obviously includes the foreign exchange holding, consisting almost wholly of sterling and equivalent to roughly one quarter of the liabilities. But it is believed to be deemed to include also the £80 million gold loan to Britain, equivalent to a further 40 per cent.

Strictly within the limits of technique, there is admittedly a certain logic about this novel power, whichever way it is construed. It can be argued that a large part of the increase in deposits in the Union is in effect the counterpart of the inflow of sterling capital, the possibility of withdrawal of which is "covered" by the Reserve Bank's sterling holdings or by its right to secure additional sterling by advance repayment of the loan. At all events, the first effect of the new provisions, which showed themselves in the Bank return made up to October 15th, has been to enable the Bank to announce an increase in its gold ratio from 31.6 to 41.1 per cent—in a week in which the gold holding dropped from £66.6 million to £64.0 million and the sterling holding from £51.4 million to £49.3 million. It is clear from these figures that only the actual sterling holding, and not the sterling loan, has been treated as a deduction.

For a little while longer, therefore, the Government is enabled to avert its gaze from the repellent sight. But these shifts and devices will not serve it for long. The continuous fall in monetary reserves, no matter how it is cloaked, is as real and ominous a danger signal for the Union as the run on sterling was for Britain last year. There are, indeed, some signs that the Government is beginning to realise this, as hopes of a dollar loan grow dim. This week's reports of impending restriction of luxury dollar imports looked circumstantial. The cutting out of a few frills, unaccompanied by any general pruning of the whole range of domestic outlay, would be an excessively timid measure. But it would be a useful start.



* * *

Cheaper Grain

The excellent grain harvests throughout the Northern Hemisphere are bringing the American prices of wheat and maize down to the levels at which the American price support policy is effective. Indeed, maize futures are below support levels. But there is still no sign of a "break" in the market. The market has been orderly, and the fall in prices, if anything, less sharp than was generally expected—the rise in wheat during September was due primarily to a temporary shortage in available supplies. The general trend of wheat prices is still downward, and the price seems likely to settle between $2.00 and $2.25 a bushel. December wheat is $2.29⅞ a bushel and its support price $2.22. Maize is now $1.37⅝ a bushel for December delivery, while the support price is around $1.40. Large harvests are imposing a severe strain on the existing storage facilities. Unless grain is stored in suitable barns or warehouses, the Commodity Credit Corporation has no obligation to pay the support price to farmers. Hence there is a possibility that in certain areas, at any rate, the price of maize may fall below the support level.

It is now confidently estimated that between 300 and 500 million bushels of maize will be available for export from the United States alone. If such a quantity were to materialise, the Commodity Credit Corporation might declare maize a "surplus commodity," in which case supplies for the European Recovery Programme might be obtained at only half the support level of 70 cents a bushel, leaving the deficit to be met by CCC as an export subsidy. Thus American farmers would still receive their guaranteed minimum prices. The possibility of such a scheme is already influencing the policy of western European buyers. Most of their requirements will be met by North American supplies paid for in Marshall dollars, and the price at which these supplies could be bought under such an arrangement would be almost as low as its prewar level. The Economic Co-operation Administration in Washington will not sanction "off-shore" purchases from Argentina until the latter's prices are reduced to the American level. Given such a scheme, would Argentine maize have to be sold at 70 cents a bushel, or would the American level for this purpose be the support price?

Broadly similar considerations apply to Canadian wheat. So long as the British contract price (now at $2.00 a bushel) is not above the corresponding American price, ECA funds can be used for "off-shore" purchases from Canada. In fact, during the

first year, 1948-49, some $300 million has been allocated for the purchase of Canadian wheat. But if ECA dollars are to be used in payment for future supplies, then the British contract price for Canadian wheat must clearly be limited by the course of wheat prices and policy in the United States. From January, 1950, a new formula will be applied for determining American support prices, the effect of which will be to make grain prices relatively cheaper than they are now. The Canadian contract expires in July, 1950, but it seems highly probable that next season's price may have to take into consideration the new American support level, although it will be operative for only six months of the contract. In this case the Canadian price is likely to be fixed below $2.00 a bushel.

* * *

Back to Normal in Cotton?

The Raw Cotton Commission has taken yet another step towards reinstating the practice of "the good old days"—a step which has been acclaimed in Lancashire as being "in the right direction." From the beginning of November, the Commission will buy Brazilian cotton through shippers' agents in Liverpool and Manchester, and the same arrangements will apply to Peruvian cotton from the beginning of 1949. Hitherto the Commission bought these cottons through its own offices in the exporting countries. There has, of course, been much speculation whether the previous system proved to be unprofitable. During the war, at any rate, this method was successful in securing cotton supplies for Britain at reasonable prices. The reason for the change, however, is more likely to be an administrative one. Since its inception the Commission has been short of experienced men, and the present move may imply a concentration of talent at headquarters.

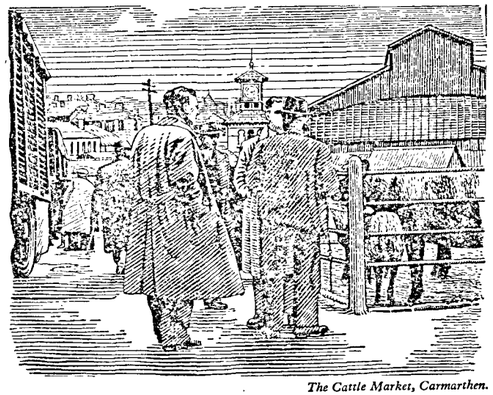
American and Indian cotton has for some time past been purchased by the Commission through shippers' agents. With the inclusion of Brazilian and Peruvian cotton, nearly two-thirds of the Commission's annual supplies will be bought by this method, leaving only 16 per cent bought in bulk, 2 per cent under long-term contract and about 15 per cent through its office in Alexandria. The question naturally arises whether the Alexandria office will be maintained for any length of time. The official announcement states that Egyptian cotton will continue to be purchased through the Commission's office "owing to unsettled conditions in the Middle East." Presumably there is little chance of more settled conditions in these parts in the immediate future.

From Lancashire's standpoint, the new buying arrangements are unlikely to yield any marked advantage. It is just possible that they may provide a greater variety of types of cotton for the spinners, but no significant fall in price can be expected. The change reveals rather a political retreat. The Raw Cotton Commission has undertaken to give spinners and weavers the best possible service. In carrying out this promise, it has not considered itself bound by political arguments put forward during the passage of the Bill through Parliament in favour of centralised purchase of cotton. The use of shippers' agents merely renounces another avowed advantage of bulk purchase.

* * *

Stabilised Prices for Oil?

At the beginning of October the Phillips Petroleum Company raised its price to Texas oil producers by 35 cents a barrel—a move which was followed by a few "independents," but resisted by the major oil companies. Last week, however, the Southern Minerals Corporation, which had followed the price increase, decided to return its price to the old level. This may be regarded as an omen that the recent increase cannot be maintained, although Phillips has reaffirmed its conviction that its policy is sound. If past experience is any guide, the fact that a month has passed without an all-round increase suggests that resistance may have been successful.



It is possible that the strength of feeling which this matter seems to have aroused is caused less by differences about an increase in prices than about the best time for making it. Given the vast capital expansion in the world oil industry, rising costs of materials and construction may eventually cause producers to seek higher prices to cover their investment costs. But a general increase in oil prices—although it may be inevitable later on—would at the moment cause political repercussions in the United States which the major American companies would prefer to avoid. So far as Europe is concerned, it would reduce the quantity of oil to be expected from ECA funds. There are signs that the sustained rise in commodity prices during the past year or more is losing impetus. Grain prices have been falling and cotton, wool and other agricultural raw materials are also lower. The stabilisation of oil prices might therefore be an important factor in the general stabilising of prices, particularly since world supplies of oil have recently shown some expansion. If the end of the rise in commodity prices is in fact in sight, the policy of stabilisation would certainly be justified. But if inflationary pressure should again force world prices upwards, then even the major oil companies would have to conform to the renewed rising trend.

"Orderly" Marketing for Tin

The Tin Study Group is holding its third meeting at The Hague this week. The most important item on the agenda is undoubtedly the report of the working party set up at the Washington meeting last April to consider the desirability of an international commodity scheme. It is well known that tin producers, fearing surplus production by 1950, are anxious that some form of regulation should come into force at an early date. They also want to abolish the international allocation of tin, on the grounds that under "free" market conditions the price of tin would be higher than it is now. These two proposals would, of course, have little chance of acceptance by the Study Group as a whole, since it includes both producer and consumer interests. Perhaps that is the reason for the persistent rumour that certain countries would like to see the Study Group wound up. If all rumours are to be believed, it would seem that the producers would like to institute a central selling agency which could bargain with countries indulging in bulk buying.

It is unwise to prejudge the issue, particularly as the proposals put before the Study Group have not yet been published. But it is clear that the problem of orderly marketing will have to be given serious consideration. Where the production of commodities cannot be regulated so as to conform to changes in demand, a case for a commodity scheme can be made out. But according to the principles of the International Trade Organisation, any scheme which is restrictive in character is not permitted. The Wheat Agreement guaranteed import and export quotas for the major wheat consuming and producing countries, but there was no control of output. Nor did the quotas cover total world supplies. Nevertheless, the main disadvantage of that scheme was that price stability was assured at too high a level to commend it to consumers for any period of time.

It is, indeed, difficult to achieve a satisfactory compromise between both producer and consumer interests on any commodity. In the case of tin, however, a further difficulty arises. There is still a relative world shortage of non-ferrous metals, so that consumers cannot readily substitute other metals for tin, should they consider its price too high. Moreover, in present circumstances, re-armament and stockpiling claims must be given weighty consideration. It is reported from The Hague that the American delegation will seek approval of its plans to expand tin production in Indonesia with the help of ECA funds to the Netherlands.

The Cattle Market, Carmarthen.

In spite of the modern trend towards centralisation and uniformity, many of us still believe that local traditions count for a great deal in the conduct of business. We like to deal with local men who understand local problems and conditions, rather than with some remote authority, however well-intentioned. It is the knowledge of this deep-seated preference for familiar things and people that underlies the development by Barclays Bank of their unique system of Local Head Offices, covering England and Wales. The Local Directors of these offices are well acquainted with the districts they serve; their experience is at the disposal of all customers of the Bank, whether their accounts are large or small.

BARCLAYS BANK LIMITED

THE

STANDARD LIFE

ASSURANCE COMPANY

For Mutual Assurance

Established 1825 *Assets exceed £54,000,000*

SPECIAL ATTENTION IS DRAWN TO THE FOLLOWING CONTRACTS:—

1. BUSINESS MAN'S POLICY Inexpensive Life Assurance with options to convert at a later date to an endowment assurance either with or without profits.

2. FAMILY INCOME POLICY The ideal contract for a young married man: maximum life cover at minimum cost.

3. POLICIES FOR CHILDREN (*a*) "Public Schools" Policy. Provision for education by means of premiums spread over the early years of a child's life.

(*b*) "Early Thrift" Policy. Should be effected as soon after birth as possible to provide a splendid life or endowment assurance policy when the child attains the age of 21.

(*c*) "Family Protection" Policy. A policy on the life of a parent incorporating valuable options on the life of his child at age 21. Income tax rebate is allowed on the premiums.

An enquiry will bring full particulars.

HEAD OFFICE: 3 GEORGE STREET, EDINBURGH

LONDON OFFICES: 3 Abchurch Yard, Cannon St., E.C.4, 15a Pall Mall, S.W.1.

Under the Bilateral Agreement this would be regarded as the development of colonial resources for American strategic purposes. But how could such a development be integrated within a commodity scheme? Perhaps the Study Group will conclude after all that the time has not yet arrived to go much further with a commodity scheme for tin.

* * *

Lancashire Discusses Redeployment

In organising its conference on production, quality, and costs at Harrogate last weekend the Cotton Board set a good example to other industries and made some progress in reducing the gap between the men who evolve policy and the men who operate the mills. The discussions which took place were not free from acrimony or from the airing of old prejudices, but their general level gives greater hope than has previously appeared for a serious, concerted attempt to improve productivity in the cotton industry. Unreserved agreement on the methods of redeployment was perhaps too much to expect, but the area of common ground between the trade union representatives and the more enlightened employers was shown to be large; at times only the stop-watch—still the symbol, to many trade unions, of merciless exploitation—separated the two. It may not be beyond the resources of industrial consultants to measure work-loads without mechanical aid; in some Lancashire mills the feat has already been performed. Further meetings of interested people in the trade are to be held to find ways of speeding up the pace at which redeployment is adopted.

Figures given in the *Cotton Bulletin* show the pace in the spinning section to be accelerating already. Redeployment has been accepted as permissible by the trade unions in about half the cotton spinning districts, with about 14 million spindles. The firms which have already started work on schemes of redeployment own between them 10 millilon spindles, and firms which have shown an interest but "are not yet actively engaged" own another 1,250,000 spindles. These figures are supplied by the Federation of Master Cotton Spinners' Associations, and relate to its members. They need a good deal of qualification, for a number of big spinning firms have started redeployment in some of their plants but not in others. Redeployment schemes actually begun apply, therefore, to much less than 10 million spindles; and the remainder who have not yet begun include many firms owning single mills, who can only be converted one by one.

The President of the Board of Trade, when he addressed the conference, gave figures showing that in spite of its recruitment and production difficulties the industry was "within measurable distance of the end-year (export) target of £13 million a month." Improved yarn production had contributed to this result. In May and June, yarn production was 15 per cent greater than a year previously, though cotton cloth production had increased by only 10 per cent. The rate of export had risen much more quickly, but two devices by which this had been made possible rendered the picture less cheerful. The present exports (said Mr Wilson) included large re-exports of imported grey cloth finished in Britain. In the twelve months to June, 166 million square yards of grey cloth were imported, mainly for re-export.

He also made it unpleasantly clear that the supplies to the home market had been very greatly cut down to allow for export requirements to be met. The current figures of stocks in shops and warehouses do not tell the story; it appears, however, from the figures of deliveries of yarn against home and export allocations which Mr Wilson quoted:

YARN DELIVERIES (TONS)

	2nd quarter 1947	2nd quarter 1948	3rd quarter 1948
Home civilian allocation ...	28,000	22,000	19,000
Export allocation	17,400	36,000	37,000

Yarn deliveries for home civilian purposes in the last quarter, said Mr Wilson, were the lowest since 1945.

Anglo-Dutch Double Taxation Convention

The Double Taxation Convention between Great Britain and the Netherlands now awaits ratification by the two Governments. No time limit has been set to the duration of the agreement, but in 1952 one year's notice may be given by either side to terminate it. The provisions referring to income arising in Great Britain will be retrospective to April 6, 1948, for income tax and to April 6, 1947, for surtax. In respect of income originating in the Netherlands the provisions of the Convention will be retrospective to December 31, 1947. Apart from affording taxation relief on currently earned income the Convention ends the present anomalous position by which the estate of a deceased person is liable to taxation in both countries.

Under present Dutch taxation law a company is liable for two taxes. It has to pay 33⅓ per cent on its gross profits, and in addition a separate tax of 15 per cent on dividends distributed to shareholders. Dutch residents offset the tax on dividends against their earned income tax liability as individuals, but up to now British shareholders in Dutch companies such as Unilever NV and Royal Dutch have not enjoyed the same right. The 15 per cent Dutch tax has in effect been a special tax on non-resident shareholders. It is this tax and not the 33⅓ per cent company profits tax which is eliminated by the Double Taxation Convention. Articles VI and XV of the Convention make this point perfectly clear. The possibility of an offset by British shareholders of both Dutch company and dividend taxes against their taxation liability to the Inland Revenue has recently been actively canvassed in some quarters in London—taking the UK-Australian double taxation agreement as a precedent. The advance in Unilever NV ordinary shares from 51s. 6d. to 53s. 6d. over the past week appears to have been partly a reflection of such hopes.

New Capital for General Electric?

Company chairmen of late have devoted much of their remarks to shareholders to the fundamental principles of capital replacement. Sir Geoffrey Heyworth led the shareholders of Unilever over the full stretch of this chapter of basic economics some months ago. The same broad ground has been covered by Sir Harry Railing at the General Electric Company ten days ago, in words which deserve quotation:

> Whenever costs rise, either through rises in primary commodities or services or wage demands, and when they are not compensated by increased output per man-hour, the result can either be an increase in price or a reduction in profit, and therefore in the money that becomes available for plant replacement. . . . Any selling prices which do not take into consideration present replacement costs are fallacious. The same applies to all forecasts for future capital replacement. Companies who have not done their utmost in the past to depreciate on a more generous scale than that which is allowed by the Government for taxation . . . will find themselves in a difficult position.

The writing on the General Electric wall is not so obvious as it is for many of the smaller engineering companies which, despite inflation, have lately found trading difficult and in some cases unprofitable. Out of GEC's aggregate group profit—it amounted to £5,476,053 for the year ended March 31, 1948—depreciation of fixed assets and plant replacement reserve have absorbed £748,656; in addition, £858,050 was transferred to reserve against stock depreciation and some £2,372,558 was earmarked for taxation. These calls on the profits of the group were comfortably met last year. But the time may be approaching when even General Electric may find that rising costs, coupled with a sufficient slackening of demand to make any general rise in selling prices inexpedient, may affect the company's capacity to provide adequately for capital replacement and to bear a heavy burden of taxation at the same time.

The GEC accounts provide evidence of another familiar development in company finance. A balance of cash and near cash items of £1,996,466 at March 31, 1947, has given place during the following year to net bank indebtedness of nearly double that amount. In other words, about £6,000,000 has been absorbed in the business during the year. The group balance sheet figure for raw materials and for partly or wholly manufactured goods has risen from £11,939,030 to £20,210,005—for the familiar reasons: "increased turnover, the building up of stocks to pre-war levels, the higher ratio of capital goods in course of production and the rise in prices and consequent increased cost of replacement." Hence, apart from the finance required for capital projects—the group's outstanding capital commitments at March 31, 1948, amounted to £633,909—the need for additional permanent capital is growing more acute. The further warning by the chairman that "at some future date" General Electric may have to undertake a further permanent increase in capital is obviously justified by the latest figures.

Another Hitch with Jugoslavia

A fortnight ago hopes were running high that agreement would at last be reached with Jugoslavia after two years' negotiations. Another hitch, however, has occurred. The Jugoslav delegation was instructed to agree to a total compensation figure nearer the British demand of £7,000,000; previously, the Jugoslav offer had been only for £3,000,000. Thus the conclusion of both the financial and the trade agreement seemed imminent. But a postponement has occurred during the working out of the details of the compensation scheme. Jugoslavia's estrangement with the Soviet Union has obviously strengthened Britain's bargaining position. But Britain is in fact asking for no better treatment in this matter of compensation than Jugoslavia has already accorded to Sweden, Switzerland and Belgium.

The trade agreement which was originally intended to be for 5 years, is now to be only for twelve months. Britain is to get sawn timber, pitprops and sleepers, poultry, eggs, fresh and dried fruit and tobacco. The total value of trade is estimated at £15 million. The Jugoslavs will buy in return crude oil, raw wool, cotton yarn, motor tyres and machinery. As Jugoslavia's exports to Britain will be larger than its imports, the resultant sterling balance will presumably be available for the compensation payments. It is also reported from Belgrade that Britain is negotiating, quite separately from the trade agreement, to buy 200,000 tons of coarse grain. Last year, this item was included in the agenda of the trade negotiations, but then there was a world shortage of feed grains.

Anglo-Portuguese Trade Negotiations

The fruits of the trade negotiations between this country and Portugal in July and August are only now becoming known. The lifetime of the results of the negotiations is somewhat limited as the course of trade between the United Kingdom and the Portuguese monetary area in 1949 will need to be discussed in further talks at an early date.

The gist of Portugal's representations at the talks this summer was that Britain is importing essential food and raw materials but is not ready to take the less necessary commodities which Portugal is anxious to export, in particular fruit and wines. Some concessions appear to have been made to Portugal's point of view, though they were smaller than the Portuguese delegation had hoped for. In return for Britain's undertaking to increase its purchases of less essential goods, Portugal has itself agreed to lift restrictions on the imports of British manufactures of a less essential nature. Imports from Portugal include considerable quantities of cork, wolfram, pit props and timber and some tin. On the other hand, Portugal's imports include many essential items. Portugal has received from this country a number of ocean-going ships, the two biggest being of 12,500 tons; further ships of over 5,000 tons are soon to be completed, payment on account having already been received. Two important engineering contracts were recently signed, one with English Electric Company and Metropolitan-Vickers, and the other with Dorman Long, involving several million pounds. The Portuguese market for British motor cars has made headway at the expense of motor car imports from the United States.

Visible trade between this country and the Portuguese monetary area shows a large favourable surplus which has increased since 1938 out of proportion to the intervening rise in prices. But purchases from the Portuguese monetary area by the rest of the sterling area—in particular by South Africa from the Portuguese African possessions—have resulted in an unfavourable balance of payments—on visible and invisible account together, between the two monetary areas. As a consequence gold has had to be shipped to Portugal running into six figures to cover the deficit of the past two years.

ANGLO-PORTUGUESE TRADE

	1938	1946	1947	8 Months 1948
Imports from Portugal:—				
Metropolitan (*a*)	3,892,186	8,585,554	7,754,700	6,437,690
Colonial	159,648	193,287	369,544	1,007,845
Exports to Portugal:—				
Metropolitan (*a*)	3,222,559	10,408,567	11,520,953	15,325,920
Colonial	1,937,531	2,062,659	2,751,764	2,752,145
Re-exports to Portugal:—				
Both areas	315,063	205,831	369,768	84,921
Surplus on visible account..	1,423,319	3,998,216	6,518,241	10,717,451

(*a*) Including Madeira and Azores.

The implication of the gold shipments is not that Portugal has proved itself an unreasonable trader, or indeed an unwilling holder of sterling. Portugal holds £80 million of wartime sterling balances. Trade relations are still based on the financial agreement of 1946 in which each party agreed to hold up to £5,000,000 of the other's currency, beyond which any excess has to be met in gold. There is, however, an aspect of trade between the two countries on which the Portuguese authorities felt strongly at the talks this summer. The United Kingdom has bought some commodities in Portugal which, the Portuguese claim, it has resold against dollars. Diamonds, both industrial and gems, are the most important items. Portugal has recently imposed severe restrictions on its dollar imports—from these restrictions this country's exports to Portugal have indirectly benefited—and shows some concern because re-exports of Portuguese goods have enabled the sterling area to earn dollars which Portugal would like to earn itself. If this concern is justified, it may well be asked why Portugal is unable to export such articles directly against dollars.

Discount Company's Recovery

The accounts of Allen Harvey and Ross, Ltd., although it is one of the smaller discount houses, are of particular interest because they may now be regarded as opening the discount market year, which runs through accounting dates varying from end-September to end-April. Twelve months ago, moreover, Allen Harvey's early balance-sheet date proved rather embarrassing, for it almost coincided with the nadir of the gilt-edged slump which followed the collapse of Mr Dalton's campaign. For the year 1946-47 the company was obliged to provide a sum of £275,650 to write down the book value of its bond portfolio, a provision which more than absorbed the year's gross profit (including the amount brought in from contingencies fund). To meet the deficiency and to finance the dividend payments (the ordinary shares received 5 per cent), nearly £40,000 had to be drawn from reserves and carry-forward. During the past year, thanks to the absence of any further depreciation and to the good running profits which have been obtained on bonds, last year's inroad has been fully made good. The published net profit, after an undisclosed transfer to contingencies, is £74,682, in contrast with a net loss of £14,972. After paying 10 per cent on the ordinary shares, rather more than £41,000 is added to reserves and carry-forward.

This recovery, moreover, has been achieved without any net increase in the bond portfolio, and despite a significant shortening of its average life; all the securities now have a final redemption date of 1951 or earlier. The bill portfolio has expanded by nearly £4,000,000 to £31¼ million which, with the bonds, gives a total portfolio of rather more than £41 million; this contrasts with less than £23 million before the increase in capital in 1946. At its present level, the position seems to be sufficiently extended, especially if account is taken of the contingent liabilities on bills rediscounted. These have shown a large and welcome rise from £4,900,000 to £7,600,000, reflecting the recent heartening recovery of the traditional commercial functions of the discount market. Allen Harvey have evidently secured their full share of this business, for it is stated that the year's purchases of commercial bills have risen by 43 per cent.

* * *

Commercial Bill Rates Adjusted

The discount market decided this week to take up another notch in the leverage which it is exerting to widen the narrow margin of gross profit obtainable on commercial bills. Ever since the early days of cheap money the rate at which the discount market secures Treasury bills has been forced down to a level which leaves it only an exiguous gross margin over the cost of the short money by which its portfolio is financed. This depression of the Treasury bill rate inevitably carried with it the discount rate for fine commercial bills, and when the shortage of these became acute, the margin between the two bill rates almost disappeared. So, too, did the customary difference between the rates charged for commercial bills of short and long usances. Until early this year the discount rate for three months' bank bills was ⅜ per cent per annum, compared with the clearing banks' charge of ½ per cent for short loans secured by bills.

The discount houses had long complained at the inadequacy of this margin, but last January the increasing supplies of commercial paper gave them an opportunity to take concerted action to improve it slightly. Accordingly, the rate for two and three months' bank bills was raised to ⅝ per cent and that for four and six months' bills to ¾ per cent. It was generally understood at the time that the market hoped to carry the process further, but

this week's adjustment is more modest than some people had expected. It relates only to six months' bills, the rate for which is raised to ⅛ per cent, and thus duly recognises the greater risk which a longer usance involves. The change is therefore no more than a minor technical adjustment, and is not to be regarded as any sign of an impending stiffening of basic money rates.

Silent Discussion in the Coal World

The effort being made to organise the coal-mining industry for higher production is no doubt real, but it is unfortunate that so much of it is conducted in the dark. At the first press conference of the Anglo-American Council on Productivity on Monday (an occasion on which masterpieces of reticence were performed on a number of subjects) some of the more embarrassing questions were directed to getting an explanation of the omission of coal from the Council's agenda. The joint special committee of the Coal Board and the National Union of Mineworkers has completed its inquiries and reported to Mr Gaitskell, and on Thursday the mineworkers' representatives reported to their own union executive. The next step on the labour side will be a special delegate conference at which the attempt will be made to secure the co-operation of the districts and branches, particularly on the proposed disciplinary measures to reduce absenteeism.

Little that was original or surprising seems to have come before the committee from the mining areas, beyond a set of proposals from Durham which included the organisation of underground workers in "teams" under a "captain" whose concern would be to see that the rhythm of production was maintained. This is an interesting variant on the suggestion, often made but never acted upon, that the mining deputies who are now charged with responsibility for safety should be made responsible for production as well. Any measure designed to make more use of the deputies would have only doubtful prospects of success unless the deputy's status could at the same time be raised and his pay put on a new basis. In one way the Durham proposal seeks to achieve the object with less disturbance of the customary pay relationships; but unless the "captain" were given pay to match his responsibilities it would be doubtful how far he, too, would make any striking difference. The subject is one which would benefit from being discussed more publicly.

The organisation of the Coal Board itself is another part of the same subject, for it was over the Board's structural incapacity to put production first that the doubts largely arose which led to the Burrows Committee being set up. Lord Hyndley said at the weekend that the committee had "endorsed" the main structure by which the collieries were grouped into areas and the coalfields organised under divisional boards. But it appeared from Lord Hyndley's remarks that the committee had had a good deal more to say as well; some of its recommendations would be accepted, he said, others would be modified, and others "we may have good reasons for not accepting." He reiterated the intention of publishing the recommendations, and the action proposed by the Coal Board, "in due course." This does not seem to be good enough. There is no evident reason why publication should not be made fully and at once.

Shorter Notes

The decision of the Ministry of Labour's National Joint Advisory Council to recommend that the Control of Engagement Order should be kept on at least until the end of 1949 is sensible, in view of the slow progress so far made in reaching the manpower targets of the various undermanned industries. This Order has not worked miracles but the distribution of manpower might have been even more unsatisfactory without it. The Council has also agreed that it is necessary to defer the restoration of prewar trade practices, and at the same time has undertaken to review the whole question of restrictive practices and impediments to full production. Six months have elapsed since Mr Morrison told the House of Commons that both sides of industry would examine this problem. The delay, presumably due to the reluctance of any industry or trade union to admit that such practices exist, in itself almost falls within the category of an "impediment to production."

*

The National Union of Railwaymen is to hold a special delegate conference as soon as possible to consider the next steps in its wage negotiations. Nothing has yet been said officially, but it is generally believed that the three claims put forward on behalf of railwaymen, London Transport workers and hotel and catering staffs have all been rejected, although the Railway Executive is said to have agreed to some levelling up of the wages of the lowest paid sections. It is expected that the claims will be submitted to arbitration.

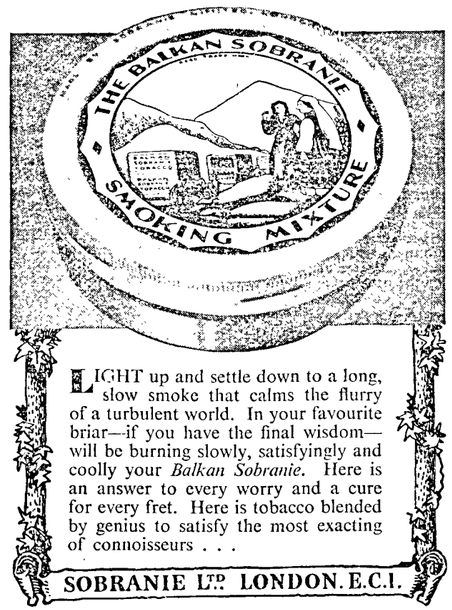
*

The Board of Trade has agreed to abandon the cost-plus method of controlling prices of utility clothing manufacture which was first introduced with the utility scheme eight years ago. On November 1st the cost-plus system will be replaced by price control on the basis of maximum prices. This decision will be widely welcomed. The old system proved a positive disincentive to the low-cost producer, since it gave him a lower profit margin than the dear producer, who could add the same percentage to a higher cost basis.

*

British firms which had, before the war, a controlling interest in companies operating in Japan will, under a recent ruling from General MacArthur's headquarters, be able to reassume full control of their Japanese subsidiaries.

SECURITY PRICES AND YIELDS



A fuller list containing 371 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: United Steel Companies; Calico Printers' Association; N'Changa Consolidated Copper Mines; Horlicks.

LIGHT up and settle down to a long, slow smoke that calms the flurry of a turbulent world. In your favourite briar—if you have the final wisdom—will be burning slowly, satisfyingly and coolly your *Balkan Sobranie*. Here is an answer to every worry and a cure for every fret. Here is tobacco blended by genius to satisfy the most exacting of connoisseurs . . .

SOBRANIE LTD. LONDON. E.C.1.

Pity about young Arnold . .

'The plans his Dad had for him! But, instead of going away to school and 'varsity, the lad was sweeping floors and packing parcels not long after his father died. Old Dr. Armstrong did his best—he was trustee of the estate. But an overworked doctor with little or no financial judgment is not an ideal trustee. The estate shrank seriously, and that put paid to young Arnold's chances. Wise trusteeship could have changed that boy's whole life . . .'

Peace of mind costs very little

The cost of expert trusteeship through the 'General' Trustee Department is very small. The benefits may make all the difference to the well-being of your dependants. Find out more about this way to ensure permanent, reliable administration of your estate—write today. 7/6

Tygan

THE NEW WOVEN FABRIC
is tops where treatment is tough

Tygan is probably the nearest approach to an everlasting fabric which has yet been devised. Its resilience, toughness and abrasion resistance ensure excellent wearing qualities, where treatment is particularly severe. It can be used out-of-doors as it has excellent weathering properties. It can be cleaned by sponging with water. It is unaffected by a wide range of chemicals. And it is smart and colourful.
Tygan is suggested for the upholstery of seats in cars, buses and trains; for theatre and cinema seats; for garden furniture; for chairs in cafés, bars, hotels; for fly screens in the tropics, and for larder windows and meat safes.

Anybody having trouble with the post-book?

There's usually some trouble with the Post-book. If it's not 2½d. *in* it's 7½d. *out*. It is a symptom of an out-of-date way of dealing with the post. A Neopost Franking machine eliminates stamps. The P.M.G. sanctions it, the accountant blesses it and the mail is speeded up because it goes straight to the sorters, from your own post-room. The Neopost can show advantages even to the smallest business. Send for particulars now.

ODEON THEATRES, LIMITED AND SUBSIDIARY COMPANIES

SATISFACTORY RESULTS IN A DIFFICULT YEAR

The eleventh annual general meeting of Odeon Theatres, Limited, was held on the 27th instant, in London, Mr. J. Arthur Rank (chairman of the company) presiding.

The following is an extract from his statement circulated with the report and accounts for the 52 weeks ended June 26, 1948:—

The results of Odeon Theatres, Limited, for the year are, I hope you will agree, satisfactory, in that the profit, subject to taxation, amounts to £1,194,232 as compared with £1,137,257 last year. The year has been a difficult trading period for this industry. I feel that the results achieved draw particular attention to the important part British films play in the successful operation of theatres in this country when they are played consistently and regularly.

The satisfactory results enable us to transfer to general reserve approximately the same amount as last year—that is £300,000—to increase our carry-forward by £17,868 and to pay the same dividend on our ordinary shares—that is 17½ per cent., free of tax.

The results of Gaumont-British Picture Corporation, Limited, cover a period of 15 months to June 26, 1948, and show some falling off in profits which has necessitated a reduction in the rate of the dividend from 12½ per cent. per annum to 7½ per cent. per annum. We did not consider it prudent to maintain our dividend at the expense of a transfer to general reserve in the sum of £174,437. I anticipate that the profits for the current year will show an improvement, particularly as your company's theatres are being operated now by Circuits Management Association, Limited.

British and Dominions Film Corporation, Limited, has had a most successful year; its studios have been kept fully occupied with the production of British films. We have still further improved the equipment and facilities for film production at Denham and Pinewood, and are satisfied that the film makers who use them now have facilities for the production of films which are comparable to those of any country in the world. The laboratories continue to work efficiently and steadily to expand their output.

Odeon Properties, Limited, and Odeon Associated Theatres, Limited, have had a successful year.

I and my colleagues have adopted a policy of consolidation. It is our intention to cut out all wasteful and unnecessary expenditure and to do all we can to simplify and strengthen the financial structure of the group. We do not intend to embark upon any new ventures, nor to increase our dividends beyond those paid in respect of the periods ending in 1947, but aim to place the maximum sums to reserve each year until we have materially improved our liquid position.

EXHIBITION RESULTS

The exhibition results of the Odeon Theatre Circuit are particularly gratifying and have undoubtedly been brought about by the full exploitation of British films. I am hopeful that under the management of Circuits Management Association, Limited, the results of both Odeon and Gaumont will show a substantial improvement during the current year. We are desirous of showing not only British films but the best of the American ones.

I have referred previously to the success of British films in this country, the average takings per week per theatre of British films on the Odeon Circuit being £587 as against all foreign films £566. These figures are encouraging and show that if British films are consistently and regularly shown, the public appreciate and enjoy them; the ultimate proof being their success at the box office. The theatre companies have been faced with heavy increases in expenditure during the year without any corresponding increase in income or any alleviation of the Entertainments Tax.

Our overseas theatres are continuing to make progress. In some territories there have been difficulties, but we are satisfied that the investments which we have made will be profitable and materially assist in the development of our organisation and, at the same time, ensure an ever-widening outlet for British films.

DISTRIBUTION AND PRODUCTION

Our domestic distribution company, General Film Distributors, Ltd., has made steady progress during the period, handling the films delivered by our British studios, by Ealing Studios and the American product of Universal and Eagle Lion Films Incorporated.

The company has been faced with some measure of criticism by independent exhibitors. I suggested to the General Council of the Cinematograph Exhibitors' Association that, to ensure that there is fair dealing on both sides, a tribunal be available to deal with a case where an exhibitor and General Film Distributors, Ltd., fail to agree. The Association have not yet decided whether they will accept this proposal. I hope they will, as it will do much to eliminate some of the problems of the industry. I am very hopeful that, during the coming year, the business of General Film Distributors, Ltd., will expand still further and that we shall improve our relationship with independent exhibitors.

BUILDING A WORLD ORGANISATION

The building up of a world distribution organisation is a slow and expensive business as, in its initial stages, substantial costs must be incurred for which there is not a corresponding revenue until a sufficient volume of films is in distribution. These costs have been allowed for in the consolidated accounts of General Cinema Finance Corporation, Ltd. Now that the initial expense has been incurred, I believe we can look forward to our overseas distribution companies operating successfully and profitably. We are incurring substantial sterling expenditure in respect of the distribution of our films in Austria, Germany, Italy, Japan, Korea and China, where, owing to the present financial controls, we are unable to remit to this country the revenue which we earn in these territories. We charge such expenditure to revenue in the accounts of the G.C.F. group. We do this as a matter of long-term policy to build up an appreciation of British films in those territories, against the time when we hope economic conditions will improve so that it will be possible for us to receive our earnings from those territories.

The experience which we have had from the playing of British films in this country is being repeated in the Overseas territories, namely, that where we have made arrangements, either through the medium of the theatres we have acquired or through the far-sighted policy of individual exhibitors, for the regular showing of British films, then, over a relatively short period of time, the earnings materially increase.

Your organisation, in addition to showing the British way of life to the peoples of the countries concerned, helps to conserve the dollar expenditure of these countries and increases our overseas trade, also adding to the hard and soft currencies which are remitted to this country.

We have made progress in reducing the cost of our films, but there has been no reduction in quality and there has been increased box office appeal. The group of ten films which have been delivered by our studios in the last three months are, I believe, some of the finest turned out by any studio in the world and are certainly the finest group which we have produced.

BOARD'S POLICY

We encourage young producers, directors, technicians, etc., but we have adopted the policy that, until a producer or director has proved his worth, he makes our smaller pictures and, as he shows his ability, he has increasing opportunities to make larger and more important pictures.

This policy may cause us on occasion to lose the services of a potentially valuable person who is not prepared to move forward slowly. We appreciate that we run this risk, but I am satisfied that our policy leads to stability in the organisation, and eliminates unnecessary risk. We do not intend to embark upon the production of a film for which we cannot see, based upon our past experience, a reasonable opportunity of recovering its cost from this market and the overseas markets which are available to us.

BRITISH QUOTA

During the year the Cinematograph Films Act, 1948, was placed on the Statute Book. The Act, in my opinion, is a good Act and, as time passes, some of its present critics will appreciate the benefits which will accrue to this country and to this industry as a result of it. I have been criticised because I wholeheartedly supported the proposals made by the British Films Council to the President of the Board of Trade for a quota of 50 per cent., because I had previously said I was opposed to all quotas. I altered my opinion as the result of two events. In August, 1948, the Government introduced the *Ad Valorem* duty of 75 per cent. on all foreign films entering this country. Immediately following this, the American companies stopped sending us their new films. The second event was that I had been examining very carefully the distribution and exhibitors' position in this country. This convinced me that there were far too many exhibitors in this country who did not realise the country's economic position or our need to conserve our overseas expenditure and were not sufficiently far-sighted to see that it was in their own interests to support British films.

I intend to persevere in my efforts to secure reasonable playing time in the U.S.A. for the best of our films, as I am convinced that it is in the interests of our two nations that we should see the best of each country's films.

We are working hard to continue to maintain the organization at the highest standard of efficiency; we are alive to new developments; we aim to keep abreast with them and to do our utmost to get on with our business to the best of our ability. We look to the future with confidence, having a sound organization of good heart with a loyal personnel who will tackle energetically whatever problems may arise.

The report was adopted, and at meetings of the subsidiary companies their reports were adopted.

POWELL DUFFRYN LIMITED

CHAIRMAN ON COAL COMPENSATION

The annual general meeting of Powell Duffryn Limited was held on the 27th instant. The following is an extract from the chairman's statement.

The consolidated profit and loss account shows the profit on trading for the year after meeting in full the losses of those companies which incurred losses, and the amount carried to the appropriation account is the portion of profits attributable to Powell Duffryn Limited and its investment in its subsidiary companies. We have retained in the accounts of the subsidiary companies a substantial part of their profits, but we have brought into the accounts of the parent company sufficient to enable us to recommend a total distribution of 8 per cent. for the year on its ordinary capital.

Since the Coal Industry Nationalisation Act, 1946, was passed well over two years ago, very little progress has been made in the payment of compensation. The book value of the vested assets exceeds £12 million or more than one-third of the total book value of the group assets. As a group we are in receipt of interim income of about £540,000 per annum, which broadly speaking, represents 50 per cent of the annual profits earned by those vested assets immediately prior to nationalisation. Under the present arrangements this interim income ceases on the 31st December next. Interest is payable thereafter on the compensation ultimately to be received, but such interest will only be payable when the amount of such compensation has been determined. Therefore an extension of the period during which interim income will be payable is the only fair and practicable way of bridging the gap.

We cannot carry the burden of our present share capital of more than £13¼ million with assets of book value of over £12 million completely immobilised, and the board intends submitting to you a scheme of capital reconstruction as soon as it is possible to do so. Meanwhile, our subsidiary company, Stephenson, Clarke Limited, proposes to repay its own debenture stock and preference shares, out of the compensation of some £3,500,000 received for its main line wagons taken over by the transport commission.

I am pleased to report considerable improvement in the business of handling of oil products through Cory Brothers & Co. Limited.

Stephenson Clarke Limited, is making substantial progress in replacing its wartime shipping losses and has placed orders for the construction of a further seven ships. When these ships are in commission, the total tonnage owned by the company will be in excess of the prewar figure.

We have acquired, jointly with Wm. Cory & Son Limited, the share capital of John Kelly Limited, shipowners and coal factors in Northern Ireland and Eire.

Last year I referred at some length to the formation of a new company—Powell Duffryn Technical Services Limited. We have found that there is a real need for an organisation of this nature.

Surveys and reports have been undertaken for the British Government on the coal resources of Nigeria, British North Borneo and Labuan, Sarawak and Brunei. The Government of Queensland, Australia, have entrusted us with a commission under wide terms of reference to investigate and report upon their valuable and varied coal resources. The Southern Rhodesian Government have recently entrusted the company with the preparation of a preliminary report on the production of oil from coal.

Important progress has been made by our new subsidiary, Powell Duffryn Carbon Producers Limited, in the applications of our new processes for the manufacture of carbon, and we hope to make rapid progress in the near future in the production of carbon.

The report and accounts were adopted.

GENERAL ELECTRIC COMPANY, LIMITED

INCREASED TURNOVER

The annual general meeting of the General Electric Company, Limited, was held, on the 21st instant, in London.

Sir Harry Railing, the chairman, said that the trading profits disclosed were substantially higher than those of the previous year. That satisfactory result was due to increased turnover, a return to more normal production and the fact that the 1947 profits were adversely affected by the fuel crisis in February of that year. To maintain those figures during the current year would be a difficult task, in view of the continuing rise in cost of wages, raw materials and services.

The consolidated profit and loss account showed that the aggregate profit before taxation and proportion attributable to minority shareholders amounted to £4,190,657. Taxation absorbed £2,372,558, a crippling amount. They recommended a dividend of ten per cent. per annum and a bonus of 7½ per cent. per annum on the ordinary stock. In the consolidated balance sheet the strength of the company was fully disclosed. They showed that their current assets exceeded current liabilities by £11,400,000. The total reserves now amounted to £12,469,397, giving a total capital employed in the business of £22,267,769.

It was axiomatic that if they wished to maintain the present standard of living, let alone improve it, national production must be increased. They must produce the maximum quantity of goods for which they could find a market and must do so at the minimum cost. They must have ample means available to provide more research facilities, more modern machinery and more horsepower for each worker. The amount which prudent companies had always saved and ploughed back into their business was now heavily taxed and it was, therefore, becoming increasingly difficult to provide out of the company's savings the reserves which would be ultimately necessary for capital replacement let alone modernisation.

EFFICIENCY NULLIFIED

That heavy taxation, therefore, constituted, in fact, a tax on capital and a brake on modernisation. Unless altered, it would more and more tend to nullify the measures for increased efficiency, for reduced costs and for closing the gap in external trade which industry was so valiantly striving to carry out.

An analysis showing how the total income of the company, including its subsidiaries, was distributed brought out that about 34.7 per cent. was spent on materials, 32.2 per cent. on wages and salaries, 20 per cent. on operating expenses, 6.4 per cent. on taxation, 1.9 per cent. on depreciation, 3.3 per cent. was retained in the business and 1.5 per cent. paid out in dividends. They therefore paid the Government in taxation more than four times the amount paid out in dividends.

The company had passed through a year full of difficult production problems connected with the supply of raw materials and putting new plants into operation. They had successfully overcome them and had increased their production and sales both in value and in volume. Those remarks applied to the home and especially to the export market.

Their increased turnover had been achieved both by increased production in the existing works as well as in the company's new works in Lancashire, Durham, Yorkshire and Walsall. As to exports, their total shipments in 1946-47 represented an advance of 83 per cent. over 1938, and those for 1947-48 an advance of 177 per cent. Their present monthly average rate of shipment represented an advance of 247 per cent. over 1938, which was considerably higher than the task set them.

The report was adopted.

SOUTH AFRICAN DISTILLERIES AND WINES, LIMITED

REASONABLY GOOD PROSPECTS

The fourteenth annual ordinary general meeting of this company was held, on 26th instant, in London, Mr H. R. Mosenthal, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:

The consolidated trading profits of the subsidiary companies for the year ended February 29, 1948, amounted, before providing for taxation, to £901,911, the comparable figure last year being £764,365, an increase of £137,546.

The total estimated liability to South African taxation on the profits earned during the year is £228,412, compared with £194,726 last year. The liability to United Kingdom excess profits tax has not yet been finally computed, but from the information at present available it appears that the estimated liability will not exceed the £185,000 mentioned in the note on the balance-sheet.

Dividends declared by the subsidiary companies amounted to £287,151, as compared with £213,754 in the preceding year. After charging salaries, rent, general expenses and directors' fees, and after providing for United Kingdom taxation, the balance of net profit available for distribution amounts to £152,479

DIVIDEND MAINTAINED

After providing for the Preference dividend the directors propose to distribute a final dividend on the Ordinary stock of 15 per cent., less income-tax, making, with the interim dividend of 6 per cent., already paid, a total of 21 per cent. for the year. This is the same as was paid last year.

Last year I informed you that our subsidiary companies were not able to maintain their sales at the same volume because it had become necessary to ration many of their products owing to the difficulty of building up their maturing stocks. The same difficulty has been experienced in the year under review, but due to careful anticipation of the problems ahead the boards of your subsidiary companies were able to increase the sales of certain of their products with the very satisfactory result now disclosed.

I also informed you last year of the laying down of additional maturing stocks with the object of eventually overcoming conditions which have enforced the rationing of sales. Stocks held by our subsidiary companies show an increase in value at February 29, 1948, of £253,375 sterling over last year's figure.

SHORTAGES OF WINES AND BRANDIES

The directors of the subsidiary companies inform me that trading prospects are reasonably good, sales for the first five months of their current year being roughly on a par with those of the corresponding period of last year, but they are still much handicapped by shortages of wines and brandies, due in part to reduced vintages in the past few years because of droughts, but also to the shortage of fertilisers, producing vintages far below the normal demand.

Brandy stocks in particular are short of their requirements, and the position is further aggravated by the introduction by the Government of quotas to all merchants whereby the company's allocation has been considerably reduced in comparison with that received previously. The matter has been taken up with the Ministry concerned, and it is hoped that there will be a readjustment of allocations.

It will be noted that the South African and British Treasuries have received just under twenty times as much as our stockholders.

The report was adopted.

THE FAIREY AVIATION COMPANY, LIMITED

DEVELOPMENT PROGRESS

The twentieth ordinary general meeting of The Fairey Aviation Company, Limited, was held on the 27th instant in London.

Sir Richard Fairey, M.B.E., F.R.Ae.S., chairman and managing director, in the course of his speech, said: Our considerable expenditure on research and development will have been noted, and this, you will appreciate, is an essential feature of our business. Ours is a progressive industry, and to fall behind in technical progress would seriously damage our future prospects. When one reflects that such successful aircraft as, for example, the "Fox," the famous "Swordfish," our more recent Helicopter and the "Primer," were all private ventures conceived within our organisation, and were all financed from our own resources, it is a little bewildering to learn that it has been stated in the House of Commons from official sources that there is no such thing as private enterprise in the British aircraft industry.

NEW AND NOVEL TYPES

We have some new and novel types in the prototype stage and on the drawing board. Our latest contribution to the Fleet Air Arm will shortly take the air.

Following successful pioneer efforts we are being encouraged by the Ministry of Supply to extend our activities in the guided weapon field. Our Helicopter has been flying for some months. Indeed it has already broken the world's speed record for rotary wing aircraft—a remarkable feat. We have produced a very promising type of training plane—the "Primer"—of particularly cheap construction.

Our principal product continues to be our very successful "Firefly" naval aircraft, now in use by the Royal Navy, the Royal Canadian, the Royal Australian and the Royal Netherlands Navies. A new and improved mark has been introduced recently, and the indications are that our production programme for this aircraft will be maintained for at least another two years. The repair and maintenance of our own and other aircraft form a considerable part of our turnover, and in this connection I believe that our rapid servicing of large aircraft for the Berlin air lift has given great satisfaction.

Reporting briefly on our subsidiaries, Air Survey Company, Limited, is now a considerable organisation, both at home and abroad. It includes Air Survey Company of India, Limited, at Calcutta, and Aero Surveys, Limited, of Vancouver, while its mapping resources have been added to by the acquisition of Aerographic Surveys, Limited. This group is now operating its own fleet of aircraft and its scope has been extended to cover the whole field of aerial survey and mapping. Such maps are of the utmost utility for every kind of land development work, and we are hopeful that this particular branch of our activities will be of growing importance in future years.

I have mentioned previously the necessity of servicing our products overseas, which, coupled with the national need for dispersal of industries throughout the Empire, has prompted us to take certain further steps. I am now able to report two important developments that have been achieved in the past year.

In conjunction with the Clyde Engineering Company of Sydney, Australia, we have formed the Fairey Clyde Aviation Company in that country. We have recently, with the consent of the Treasury, formed the Fairey Aviation Company of Canada, Limited, and have acquired for that company a factory at Halifax, Nova Scotia. In this case we are providing the majority of the capital, and as with the Australian Company, we are giving the new concern our full backing.

The report was adopted.

PETER BROTHERHOOD, LIMITED

HIGHLY SATISFACTORY RESULTS
DIVIDEND MAINTAINED AT 20 PER CENT

The forty-first annual general meeting of Peter Brotherhood, Limited, was held, on the 26th instant, at Winchester House, London, E.C.

Mr Alexander Marcus Neal, J.P., A.C.G.I., A.M.Inst.C.E. (the chairman), who presided, said:

On the liability side, I will refer to the item "Capital Reserve," which shows under Excess Profits Tax Post-war Refund a figure of £98,214 to have been received during the year. This sum is available for capital purposes only; indeed, as will be seen by referring to the penultimate item on the asset side, £36,092 had already been spent by March 31st this year; the remainder will probably have been absorbed by the acquisition of machinery to keep our works up to date by the time next year's accounts are in your hands.

Referring to "Revenue Reserves and Surplus," it will be seen that sundry provisions made in previous years, now no longer required, amounting to £8,500 have been transferred direct to General Reserve, which, with £10,000 transferred from Profit and Loss Account for the year under review, now stands at a figure of £68,500.

Cash at bankers at March 31, 1948, stood at £61,643, compared with £70,031 last year, which I think you will agree, in view of the increasing proportion of commercial work which must be financed, as opposed to Government work on which instalments are usually paid, to be satisfactory.

SALES 20 PER CENT. LARGER

The value of our sales for the year was over 20 per cent. larger than last year's figure, and the nett trading profit for the year, before provision for taxation, amounts to £174,842, against a comparable figure for last year of £66,850. Provision for taxation absorbs £99,325, against £37,900, leaving us, after addition of Provisions now no longer required and other credits of a non-recurring nature, with a nett profit for the year, available for distribution, of £105,662.

The question of a final dividend has been before your Board who, after full consideration, have felt it to be their duty to fall into line with the expressed wish of the Chancellor of the Exchequer that dividends should not be increased at this time Accordingly, your Board recommend the payment of the same total dividend as during the past eight years, namely 20 per cent., less tax, for the year, of which 8 per cent., less tax, has already been paid, leaving 12 per cent., less tax, for immediate distribution.

Your Board propose to strengthen the structure of the company by allocating £50,000 to Reserve for Replacement of Fixed Assets (this we consider to be prudent in view of the largely increased cost of machine tools and other capital items) and also to transfer the sum of £10,000 to General Reserve and to write off completely the value of drawings and patterns. The balance of the nett profit, a sum of £9,057, will increase the carry forward to a figure of £139,742.

At last year's meeting I reported that the Company's business was proceeding in a satisfactory manner. The result of this year's trading has been highly satisfactory reflecting credit on all who have been concerned in carrying on the business of the firm.

As to the future, it might perhaps be as well to remind shareholders that the specially favourable results of this year's trading may not always recur, but we have an excellent order book and, in the absence of unforeseen circumstances, we see no reason why we should not look forward to a continuance of prosperity for some time.

The report and accounts were unanimously adopted.

THE TRUSTEES CORPORATION LIMITED

REVENUE WELL MAINTAINED

The 60th ordinary general meeting of The Trustees Corporation, Limited, was held on 27th instant in London.

Mr Lionel A. Stride (the chairman), in the course of his speech, said: Revenue reserves and unappropriated profits total more than £678,000. The total balance-sheet figure of investments is £3,326,032. The total valuation figure is £5,495,971, showing a market appreciation of 65.24 per cent. as against an appreciation of 71.81 per cent. at May 31, 1947. At May, 1939, more than 44 per cent. of our portfolio consisted of fixed interest-bearing securities such as bonds, debentures, and preference stocks and shares. Last May (including £178,000 nominal held in 3 per cent. Transport and Electricity Stocks as a result of nationalisation) this percentage figure had become reduced to 32 per cent. In May, 1939, some 34 per cent. of our portfolio was represented by investments outside Great Britain and the Dominions and Dependencies. By last May this percentage had become reduced to about 12 per cent.

The total revenue for the year amounted to £298,751, out of which taxation, including profits tax, takes £101,188. Net revenue amounted to £125,287—an increase of £15,179. The dividend for the year, less income tax, on the Preference Stock took £21,656 and an interim dividend of 5 per cent., less tax, paid in January on the Ordinary Stock took £24,063. In view of the postponement of the annual general meeting the directors declared a second interim dividend of 5 per cent. with a 2 per cent. bonus on the Ordinary Stock. This was paid on July 28th and made a total of 12 per cent. in respect of the year to May 31, 1948.

The report was adopted.

NOTICES

RESEARCH Institute requires a number of research assistants for an investigation into the control of monopolies. An Honours degree in Economics or kindred subjects required. Salaries £350-£600, according to age, qualifications and experience.—Applications should be sent immediately to Box 870.

MARKET RESEARCH. Man required for training to take over this development function in large industrial organisation in the Manchester area. Previous experience not essential but an analytical training and tenacious approach to difficult research problems is essential. Send details of experience, training, age, etc. to Box 868.

EXPORT TRADE. Young Dutchman with British born wife, University education, perfect Dutch, English, German, fluent French, Czech, seeks permanent business career with British firm. Knowledge textile trade, adaptable, widely travelled in Europe. Minimum salary acceptable provided prospects for future. Box 866.

APPLICATIONS are invited from men and women for post in Central Office of Information as economic and political editor. Good academic qualifications in economics, sound journalistic experience and an appreciation of the requirements of publications in Eastern Europe are required.

Salary scale: Men £675-£800 p.a. Women £550-£675 p.a.

Written applications, giving date of birth, full details of qualifications and experience, including dates, should be addressed to the London Appointments Officer, 1-6, Tavistock Square, London, W.C.1, quoting reference K.Q. 455. Original references should not be forwarded. Only candidates selected for interview will be advised.

INTELLIGENT woman, graduated this year in mathematics and chemistry, requires an interesting post. Possesses driving licence. Willing to travel.—Box 882.

FOR SALE: *Economist*, last quarter 1946; 1947; offers? Box 850.

FOR SALE: *Economist*, 14/9/46 to 18/9/48. £2. Box 876.

Statistical Summary

GOVERNMENT RETURNS

For the week ended October 23, 1948, total ordinary revenue was £51,085,000, against ordinary expenditure of £57,819,000 and issues to sinking funds £382,000. Thus, including sinking fund allocations of £5,413,000, the surplus accrued since April 1st is £223,618,468 against £229,917,980 for the corresponding period a year ago.

The Steel Bill

THE Prime Minister was justified, in replying to Mr Churchill in the debate on the Address last week, in making fun of the Opposition's complaint that the Steel Bill is badly timed. For Conservatives, no time would be a good time to nationalise steel. Similarly, for many Socialists, it would appear, any scheme of nationalisation of any industry, at any time, is good. But for the great mass of people who are neither committed Socialists nor hardened Tories, there are two quite distinct questions. Is it a good thing to "bring under public ownership" the industry of making iron and steel? And if it is a good thing in general, is this a good time to do it?

To the second of these questions it is surely possible to give a wholly unequivocal reply. There could hardly be a worse time to introduce a measure of this character. Within the industry, the prospect of nationalisation must have some unsettling effect and the clauses of the Bill that are designed to prevent the dissipation of assets between now and its coming into force, however necessary and reasonable their intent, are calculated—at least without the most sweeping and emphatic assurances—certainly to delay decisions and most probably to inhibit them altogether. A time when the industry is working to capacity and when every ton of steel it can turn out is urgently needed is not the time to impose these preoccupations on it. Secondly, within the country at large, the passage of the Bill through Parliament will inevitably embitter political passions and distract attention from far more urgent matters of fundamental policy. The country does not even yet begin to realise the difficulty of the economic adjustments that lie before it, and deliberately to court disunity on a matter that is not urgent is irresponsible folly. Thirdly, the only reason why the British people are not being daily brought up, in their individual lives, against the painful realities of their country's economic position is that Britain is still living on lend-lease. The Americans have been meticulous in not interfering in domestic political concerns; but they have not concealed their dislike of the project of nationalising the steel industry. It is surely only common prudence not to do anything, if it is not strictly necessary, that might compromise the future prospects of the Marshall Plan.

These three reasons are so conclusive against the timing of the Bill that it is hardly necessary to add that it is also politically foolish. Among the doubtful electors who make or break a Government, it is almost certain that there is a strong majority against the Bill. It will lose the Labour Party seats at the General Election, and many Ministers know it. Why, then, do they do it? The answer is by now well known: because a handful of Ministers who know their minds have established a moral ascendancy over the majority of their colleagues who lack the moral courage to tell their supporters a few unpleasant truths about the party doctrines. The introduction of the Steel Bill is the clearest example west of the iron curtain of the way in which a minority within a minority can achieve its aims.

If the question of timing could be set aside (as, of course, it cannot) and the debate concentrated on the substance of the proposal,

then the issues become much more complex. In the years before the war, a large number of articles appeared in *The Economist* criticising both the structure and the policies of the steel industry, and the Centenary Number of this journal proposed, as one of the tasks of the future, a far-reaching technical reorganisation of the industry (though it also said "there could hardly be an industry less suited to nationalisation in any of the accepted meanings of the word"). The structure of the steel industry is still much the same as it was in the 1930s, a tightly organised cartel. It is true that a great deal of technical progress has been made in the last decade, that the industry is working efficiently for a moderate reward and that British steel prices are no longer, as they used to be, largely in advance of those prevailing in other countries. But these are the phenomena of prosperity; it is not in the years of good trade that the defects of a cartel show themselves. The changes that have occurred since 1938 have been not so much in the steel industry itself as in the circumstances surrounding it, and if those circumstances were to change again, the present steel industry would doubtless slip back to the policies to which so much objection was taken before the war.

It is, for these reasons, impossible to agree with those who seek to oppose the present Bill by asserting that all is well with the iron and steel industry. The Government would be entirely justified (at a more propitious juncture) in concerning itself with the organisation and policies of the industry. As with the Transport Bill two years ago, so with the Iron and Steel Bill, the independent spectator, admitting that it is right for the state to have a policy about the industry, has to ask himself the question whether the purpose for which the Bill is brought forward is to advance a sound policy, and whether the structure laid down in the Bill is in fact likely to assist in that object. In the case of the Transport Bill, the conclusion reached in these columns was that it was nationalisation for nationalisation's sake and that nobody had begun to think about what was to be done with the industry once it was nationalised. Everything that has happened since—or, more accurately, everything that has not happened since—has served to confirm that judgment. Must it be repeated in the case of steel?

★

The text of the Bill (which is discussed in detail in an article on page 756) suggests at least that somebody has been doing some thinking about the particular problems of steel. Some of the proposals are familiar from past essays in the art of nationalisation. The compensation clauses, for example, are as objectionable as ever. Indeed, they are more so, for not only is the steel industry one that lends itself particularly badly to valuation by the prices that the Stock Exchange happens to set on those marginal amounts of stock that happen to be in the market on a particular day or days, there is also a new factor in the shape of the limitation of dividends that has been applied since the last nationalisation Bill went through. To rig the market first and then to make compulsory purchases at the market price is more than sharp practice, it is plain dishonesty. In other respects, however, an effort has clearly been made to avoid following precedent at all slavishly. This is particularly true of the decision to keep the acquired businesses in existence as separate companies, each trading for its own account. There can be no doubt that this is a great improvement on the usual pattern—though it has the disadvantage of leading the Government also to purchase a whole array of subsidiaries trading in all sorts of fields.

A refinement of structure, however, tells very little about the purpose of the whole proceeding. Can one feel assured that the Government knows what it is doing in purchasing the steel industry? More than that, can one feel assured that its purpose is a good one? It is astonishing how little evidence there is, in respect of any of the Government's nationalisation plans, of why they are brought forward in the first place. The reasons that are usually given in public—and steel is no exception—are either nonsense or else wholly unworthy. There is undoubtedly a great deal of the sheer malicious envy that makes men with a grievance against society want to pull down the mighty from their seats, without thought of the consequences of so doing. The public utterances of Mr Aneurin Bevan, the chief instigator of the present Bill, would lead one to suppose that this is his main reason. There is also a lot of talk along the general line that the owners and managers of the steel industry have so much power that they challenge the authority of the state. What sort of power, and when has it been exercised, outside the steel industry itself? It is said that "overall planning" is impossible without public ownership of so crucial an industry. But what plans has the steel industry refused to abide by? This sort of talk is too obviously *post facto* rationalisation of something already decided on for reasons of doctrine and emotion to cut any ice with the general public.

The only rational way of approaching the matter is to ask what are the chief faults of the present (or, more strictly, of the prewar) organisation of the steel industry, and what prospect there is that the enactment of the present Bill would put them right. The main charge in the indictment of the tight steel cartel of prewar years was that it operated in such a way as to keep costs of production far too high. It is not that profits were rapacious, for they were not. But those firms that were lucky enough to be in the charmed circle were virtually guaranteed against serious loss, no matter how inefficient they were, and outsiders, who might have been more efficient, were kept on the outside. The policy was not restrictive in the sense of keeping productive capacity below demand; but it achieved the same result by keeping costs, and therefore prices, too high. Bad trade was not allowed to have its natural effect of killing off the inefficient producers, and good trade was not allowed to have its natural effect of attracting new men with new ideas.

★

What reason is there to believe that the proposed organisation of the industry will remedy these defects? So far as the forcing out of inefficient plant is concerned, the new Corporation will surely be even tenderer to the laggards than the Federation. The Corporation will be able (as the Federation hardly is) to subsidise the inefficient out of the dividends it receives from the efficient, and being able to do so, it will inevitably be under strong political pressure to do so. The record of public ownership is one of slower, not of faster, scrapping of inefficient plant than private enterprise.

Nor is there very much apparent reason to believe that public ownership would lead to lower costs. There are both general and specific reasons for saying this. The general reasons are to be found in the nature of large public monopolies, with their extreme sensitiveness to trade union pressure and the great difficulty they experience in cutting down overheads and effecting economies. This judgment is beginning to be more than amply borne out by the experience of the earlier nationalisation schemes.

The specific reason for suspecting that nationalised steel would be dear steel is connected with the argument that rages round the figures of capacity that the industry should aim at. The present capacity is, in round figures, about 14½ million ingot tons a year and the development programmes which the industry has produced would increase it to about 16 million tons. The Labour Party evidently believes that the proper figure should be higher than this. The Minister of Supply has used language that would imply a belief that the figure should be 18 or 20 million tons. Unofficial but influential Labour pamphleteers have put it at as high as 23 million tons.

It is important to realise where this argument leads. It is quite true that there is a shortage of steel today—though possibly not nearly as acute a shortage as appears on the surface. But so there should be in a time of over-full employment and heavy investment programmes. Steel is the boom-and-slump industry *par excellence*, and the policy it pursues (in so far as any policy is conscious) is to adjust its capacity to the average demand. In the occasional year of very good trade, not all the demand can be met; some of it has to be postponed, or go abroad. But in the years of less-than-normal demand there is less surplus capacity to carry. Within reasonable limits, this is surely the right policy. Certainly, if the industry equipped itself to meet the peak demand, then its costs of production, averaged over good and bad years together, would be very high indeed. Yet this is what the Labour ideas of expansion seem to involve. For when the Socialists talk of 18 or 20 or 23 million tons a year, the only way in which sense can be made of the figures is to suppose that they are intended to be estimates of the peak demand for British steel. If they are intended to be estimates of average demand (or of the rather-more-than-average for which it is reasonable to provide capacity), then they are probably far too high—certainly for a community which has not yet discovered how it is going to do any saving to finance capital expansion. If nationalised steel means the provision of a great deal of surplus capacity purchased at today's mountainous costs, and if all this burden is to be thrust on to a Corporation that is enjoined not to run at a loss, then the risk is that nationalised steel will not only be dearer, but very much dearer, than private enterprise steel. And if so, the Government's policy for steel will, in the end, be much more restrictive than the present cartel's.

In any case, these arguments that start with a figure of desirable capacity, pulled out of some planner's imagination, are topsy-turvy; they put the cart before the horse. The demand for steel is not a quantity that can be estimated independently of the price of steel. If steel is dear, there will be very little demand for it, partly because domestic projects of capital creation will be too expensive, partly because the steel-using industries will not be able to compete in the world market. Instead of arguing that such-and-such an increase of capacity is necessary, regardless of what it may cost, the right approach is to concentrate all efforts on cutting down the cost of producing the present quantities. The capital investment should be directed, in general, to improving the techniques of the present industry rather than to expanding it. When it has been discovered at what cost a reorganised and partially re-equipped British steel industry can produce steel, then—and then only—will it be possible—and by trial and error only, not by planner's estimate—to discover how much demand there is, on the average of good years and bad. What one waits for, and waits so far in vain, is some attempt from the Socialist benches to establish that the state can do this sort of thing better than the private industrialist. Perhaps it can; but nobody has yet been given a reason for believing so.

★

The debates of the next few weeks will range over a very wide field, from the loftiest planes of principle to the most complex technical details. But the heart of the matter is simple. The public interest in the steel industry lies overwhelmingly in one thing: that it should produce cheap steel. Nothing else comes within a hundred miles of that in importance, for if that is secured, most, if not all, of the other things that are desired, such as a large production, will follow. The first and the last test of the Bill is therefore this: will it produce steel at lower prices than would otherwise be charged? The balance of evidence is that it will not. It has not been introduced for that purpose but for reasons of the merest power politics. It is accompanied by half-baked ideas of "planned abundance" that would certainly tend to increase costs. And the experience of nationalisation in general to date is that it makes for high prices at the expense of a helpless consumer.

For these reasons, and not from any opposition in principle, the Bill should be rejected, if not by Parliament, then by the electors. But when it has been rejected, the problem of what to do about steel will remain.

Mr Truman's Triumph

NEVER have the prophets been more confounded. The American Presidential election, the results of which were thought to be so assured that it was hardly interesting, has gone the other way. Mr Truman, who was written off as a nonentity, has scored a personal triumph and deserves the world-wide tribute that has been paid to his cheerful, indomitable, never-say-die courage. Mr Dewey, who was so sure of election that he self-consciously donned the mantle of statesmanship, is left looking very foolish; but his face is not nearly so red as those of the poll-takers, the professional prophets and the whole regiment of political experts. Surely never in history can a result of "no change" have been so sensational.

The more purely American repercussions of the election are given a provisional assessment in the "American Survey" section on a later page—provisional only, for it will be many weeks before so unexpected an event will have been fully analysed and a deliberate judgment formed on the motives of the American electorate. But some readjustment of perspectives is needed in Europe, too, where also it had been taken for granted that on January 20th next Mr Dewey would become President and Mr Foster Dulles Secretary of State. There can be no denying the fact that the first reaction on this side of the Atlantic is pleasure that the changes in personnel will be kept to a minimum. Mr Marshall himself is believed to want to retire, but his deputies and coadjutors will remain. The European governments and peoples are not so insensible of the merits of recent American foreign policy that they would actively wish to see its authors removed.

This does not mean, however, that there was any fear in Europe about the consequences of the Republican victory that was expected. To the American elector, no doubt, there are considerable differences between Republicans and Democrats. But in the two great areas in which Europeans have an interest in American policies, the differences are barely discernible, at this distance, to the naked eye. The first of these is, of course, the great issue of foreign policy which is conveniently (but most misleadingly) described as that of Isolation *versus* Participation. On this, the candidates, and very largely their parties, stood together, and the vote can properly be taken as an emphatic endorsement of the "bipartisan" policy.

The second issue is that of economic policy. Here there are indeed shades of difference between the parties. These are perhaps most notable in the field of international trade, where the Republicans do not like Mr Cordell Hull's Reciprocal Trade Agreements as much as the Democrats do. But the practical effect of these detailed differences is usually exaggerated. On the main issue—whether the attempt is to be made to bring the American economy, which dominates the world economy, under conscious control—the differences of view between Republicans and Democrats are far less important than their virtual unanimity in answering No. In the early postwar days the Democratic Administration was inclined to believe that econo-

mic controls were both desirable and necessary. The Congressional elections of 1946 showed that they were not desirable to the American people, while the continuance of amazing prosperity has inevitably made them seem less necessary. Today, in practice, there is very little difference between the parties in their views on economic policy.

From this far-reaching agreement on the main issues the conclusion is being widely drawn that the policies of the United States are now stabilised and set and can be relied upon not to change in broad outline in the years that are to come. But this is a very hazardous conclusion. For if there is one thing that is more characteristic of latter-day Americans than their tendency at any moment all to think alike on great issues, it is their tendency all to change their minds. An article on another page recalls the fact that the Truman Administration, which three years ago was preaching the doctrines of the Morgenthau plan for the "pastoralisation" of Germany, is now asking for an end to all dismantlement in Germany and granting for Germans what almost amounts to preferred status within the Marshall Plan. American opinion, which is now the chief advocate of Western European Union, was once, not so long ago, the chief obstacle to it. A similar reversal can be seen in the contrast between the unrelenting hostility of the American delegations at Geneva and Havana to any form of control over international trade and the high degree of planning that is now required of the beneficiaries of the Marshall Plan.

*

It should not be thought that these things are set down in criticism. But they do illustrate how very rash it would be to assume, because the two American parties are agreed today on the main issues both of diplomacy and of economics, that those policies will not change. Indeed, they certainly will change. When the economic tide turns in the United States (as it surely will, though no one can predict when and how strongly), there will be a revision of views and a renewal of controversy about the possibility and desirability of controlling the trade cycle. And it is too much to hope that there will be no reaction, during the first period of international quiet, away from the present very high pitch of interest in the affairs of the outside world. Isolationism, no doubt, is dead for good and all. But a time will come when there are once again differences of view among Americans about the range and intensity of participation in the world's affairs that is worth America's while.

When these changes come, will it still be a matter of such indifference to Europeans as it has seemed to be in 1948 whether a Republican or a Democrat sits in the White House and whether one party or the other controls Congress? The guess may be hazarded that it will never make as much difference as between Yes or No, or as between black and white, or as between war and peace. There is, as has already been remarked, a tendency for American opinion, at least on external issues, to swing in the mass from one view to another, and both the parties tend to swing with it. And when great issues of divergence do arise, they tend to cut across the party lines. There was a majority in both parties for neutrality in 1939, for aid to the Allies in 1941, for the United Nations and "One World" in 1945, and for a firm front to Russia in 1948.

*

Nevertheless there are perceptible differences in the backgrounds and instincts of the two parties, which Europeans might well take into account in assessing where their interest lies. Their interest in foreign policy is obvious; and it is a fact that, though both parties are anti-isolationist now, the Democrats are far more firmly based in that creed than the Republicans. Partly because of the bases of their voting strength—in the more recently immigrated populations of the great cities and in the traditionally outward-looking South—and partly because of the double historical accident that it has fallen to them to be in office in both the wars and to be led by statesmen such as Woodrow Wilson and Franklin Roosevelt, the Democrats are firmly committed to the policies of participation in a way that cannot possibly be claimed for the Republicans. If the tide of opinion should set back towards indifference, a Democratic President and Congress will not be unaffected by it; but they can be expected to put up a stronger resistance to the tide than the Republicans.

On the economic plane, the European interest surely is that the American economy should not be allowed to run amok—and also that the temptation to stabilise it at the expense of the foreigner, by higher protection and other such devices, should be resisted. Here, too, as it happens, the record of the Democrats speaks in their favour. It would be wrong to say that they believe in the conscious management of the economy; but at least they are not so heavily committed against it as are the Republicans with their close link to Big Business; and the Democrats are traditionally the low-tariff party.

Perhaps it is only on the very morrow of an election that these sentiments can be expressed in a European journal without giving offence. And the conclusion to which they point should not be pushed very far. Certainly at the moment there is no great partisanship, as between the American parties, on this side of the Atlantic. Indeed, after the breathless suspense of 1940—and the hardly less clear preference of 1944—British and European observers have been enjoying the luxury of watching the show without feeling any real concern about how it would turn out. The pleasure that Mr Truman's victory has undoubtedly caused is mainly the sporting emotion of seeing a gallant fighter win against the odds. But there may, nevertheless, be more solid grounds for satisfaction before Mr Truman's four years are over.

No Policy in Germany

THE late Andrei Zhdanov, explaining how to wreck the Marshall Plan at the foundation of the Cominform last year, pointed out that the western Powers were bound to fall out over the future of the Ruhr. It would be a graceful tribute to his memory if his words were read out at the conference table round which the United States, Britain, France and the Benelux group will shortly gather to work out an international statute for the Ruhr. Their task will be to implement one of the main decisions reached at the London Six-Power conference last spring. That gathering, which began with optimistic hopes that the western nations could easily agree among themselves, dragged on with as many narrowly averted breakdowns as if Mr Vyshinsky himself were present. And it was only with the greatest difficulty that the French Government of the day could be induced to ratify the final agreement.

Since June, there have been many other indications that no common policy for western Germany exists among the western Powers. The point has now been reached when the first objective of the United States and Britain—to extract "Bizonia" from the intolerable slough in which it lay—has been reached, by means of currency reform and a vast flow of American imports. But it is now apparent that the Powers, having set the country on its feet, do not know what to do with it. For weeks the work of the Organisation for European Economic Co-operation was held up over the allocation of Germany's Marshall aid, and the matter was only settled after Mr Harriman had intervened on the German behalf. There are constant reports of dissensions over the forthcoming Occupation Statute. And only last week, the British Military Governor in Germany, General Sir Brian Robertson, apparently forgot that the Six Powers had signed a solemn undertaking not to withdraw their forces from Germany until peace in Europe was assured. This pledge was given to satisfy the French, and is of importance, despite its vague form, for the reason that any undertaking which keeps American forces in Germany is important. Moreover, any suggestion of a deal with the Russians causes the German constitution-makers at Bonn to pause nervously with a constricted feeling round the throat. General Robertson made it clear that, in approving the all-round eventual withdrawal of occupation forces, he was expressing a personal opinion on a hypothetical question. Nevertheless, it was a most unfortunate episode.

But General Robertson's most revealing remark was that he had no idea what the policy of the British Government was. This is understandable, even for the British Military Governor. For it has been apparent ever since the Potsdam Agreement of 1945, which laid down a number of self-contradictory propositions, that the British Government has had not one policy towards Germany, but several, pursued simultaneously. One has been to build Germany up, the other to keep it down; one to make it democratic, and the other to have a British official in control of every aspect of German life; one to acquiesce in the Polish annexation of one-quarter of Germany, with the eviction of the population, and the other to stimulate revisionism in Germany by encouraging the belief that Britain will one day claim the lost territories back for a new Reich.

Such contradictions are not confined to British policy. It may, in fact, be said for the British that, although they have followed several conflicting policies, they have done so consistently. The latest interim agreement on dismantlement of German industry shows that Britain is (with some unwilling concessions to the ERP Administrator, Mr Paul Hoffman) still doggedly persisting in a policy which, though it has been modified in detail, still clearly traces its ancestry back to Potsdam. The Americans, on the other hand, have nearly boxed the compass. They, too, have had two German policies, but they have, by and large, abandoned one in favour of the other. The "goat-pasture" Morgenthau plan, which appeared in modified form at Potsdam, almost wholly disappeared with the concept of the Marshall Plan. At Potsdam, the United States delegate considered that a German steel capacity of more than 3½ million tons a year would constitute a menace to security; now, though Washington has not yet formally abandoned the present ceiling of 10.7 million tons on steel production, General Clay has made it clear in practice that there is little short of actual armament that he would prohibit today. The United States signed a revised level-of-industry plan with Britain last year, limiting Germany in many fields, and thereby freeing quite a large amount of German industrial plant for dismantlement. But the current American conception of the dismantlement programme is that, while it may possibly be legitimate to shift to other ERP countries plant that cannot in any case be used in Germany today, it is not a penal programme and does not impose permanent ceilings on German production. If German industries find it practicable to re-equip themselves, they may do so. This differing view of the level-of-industry agreement leads to some confusion. For example, while the German Economic Council is still petitioning the ERP Administrator for the right for Germany to have a ball-bearing industry, the Bavarian Ministry of Economics has already got to the point of ordering 220 machines for re-equipping the famous Kugel-Fischer ball-bearing works at Schweinfurt, now totally dismantled and half delivered as reparations to Russia.

*

The third partner in western Germany, France, has pursued a consistent policy throughout. True, M. Schuman made a remarkable declaration at Koblenz recently, to the effect that France, unlike Britain, did not have its own interests in mind when dismantling German factories, and had taken the initiative in proposing that the programme should be revised. Nevertheless, it is clear that French policy has been, as it always will be, purely straightforward and instinctive—to weaken Germany as effectively and as permanently as possible. How dangerous French intransigence can be to western European recovery was shown in the recent decision made by the three military Governors in connection with the final step in German currency reform. General Koenig showed enough obstinacy at Frankfurt to secure the adoption, in the main, of his proposal for the disposal of German blocked accounts. By reinflating and undermining confidence in the new Deutschemark, the decision has halted progress towards stability; according to the overdramatic declaration of the German Minister of Finance, it has even dealt a "serious, if not fatal blow" to the work at Bonn. If the results of bringing the French into Anglo-American counsels are all to be of this nature, it would have been better to continue without them.

The British, American and French Governments at the moment all disagree with each other on the important question of the Occupation Statute, which will define the rights to be retained by the Powers, after the German Government is constituted. The Germans may be expected to add their disagreement after the occupation Powers have composed their differences. A main point at issue is whether the whole "Trizonia" shall be controlled only at the centre by a joint Anglo-American-French body on the model of Shaef, or whether each Power shall retain its local Control Commission. The Americans propose a new Shaef, while the British are clinging to their independent regional controls.

On the horizon loom still bigger questions which call for

clear and co-ordinated policies to be thought out now. If the Russians propose a joint withdrawal from Berlin, and arrest all the leading western sympathisers, what is the answer? If Germany is to be included in Western Union, should Germans be allowed to possess arms? Should they be allowed to manufacture them? Is it not worse than useless to build up the Ruhr, if in case of war, the supreme strategy is to abandon Germany to the Russians?

*

Yet the German problem, though it has taken on this appearance of complexity—and is indeed complex in its details—is fundamentally simple. For the aims of western policy are plain. They are, first, to secure Germany for the west—the two-thirds of Germany that is already in our hands, and the remainder if and when a world settlement of differences with Russia takes place—and, secondly, to ensure that the Germans never again plunge the world into war on their own account. There is no necessary contradiction between these two aims.

If the aims are simple, so are the basic propositions which should guide British policy. Firstly, it should be borne in mind that a divided Germany, linked by common interests to the west, is not likely to be a menace to security. Therefore, nothing should be allowed to stand in the way of the recovery of the Ruhr—neither French fears of another invasion nor British industry's fears of competition. A much greater fear should override both, namely, that the United States Congress should one day tire of supporting Western Germany with money and defence forces. The Russians describe Berlin as a side-issue, which could be settled as soon as the establishment of Western Germany were abandoned. For once, the Russians are right. So was Professor Reuter, the Social Democrat leader from Berlin, who urged the western constitution-makers to go ahead, since only if they could look to a firm base in the west could the Germans in the east maintain their struggle against Russian bribes and terror.

Secondly, responsibility should be handed over to the Germans quickly and fully. The 15,000 officials of the British Control Commission should finally face the fact that in reality they control almost nothing. Even the Anglo-American Bipartite Control Board in Frankfurt is largely futile, attempting to control German authorities who are adepts in passive resistance, and have, generally speaking, no intention of controlling their own people. This is a situation which brings the west into contempt and involves the Germans in occupation costs which they do not intend to raise taxes to pay.

The Control Commission, and the Bipartite Board, should, therefore, be whittled down to a single Shaef-type control, with the sole functions of guiding German foreign policy into Western Union and providing a protection for Germans whose civil liberties may be threatened by their own countrymen. Germany should be put, for Marshall Plan purposes, on a par with the other countries. It should plead its own case—not through the mouths of American protectors—and should accept a mission of the American Economic Co-operation Administration, with the same task of supervising the use of ERP funds that it has in other countries joined in the OEEC.

To say that the Control Commission should be abolished is not, of course, at all the same thing as to say that the armies of occupation should be withdrawn. On the contrary, they must stay for a long time yet. The Germans themselves are clear about the distinction. They do not want to pay for their own defence, but they do not at any time suggest that the American and British troops should be withdrawn, leaving them at the mercy of the Russians. Should the idea spread that such a move was contemplated, it would be the end of all reconstruction in the west. The line from Lübeck to Trieste must certainly be held. But behind it, the object should be to reconstruct a Germany that is fully self-governing as well as fully self-supporting. Once the western Powers turned aside from the policy of destroying Germany, they committed themselves irrevocably (though few of them realised it) to the alternative policy of allowing Germany to rise again. That being so, the overriding object of policy must be to see that when the Germans rise again, they rise as convinced westerners, not as nationalists willing to ally themselves with any eastern adventurer for revenge and the remedy of grievances. That does not mean that no restrictions at all can be placed on the free exercise of German sovereignty—in the matter of the production of armaments, for example. But it does mean that the restrictions should be kept to an absolute minimum of those for which the justification is overwhelmingly apparent. And it also means that western policy should move promptly and cheerfully to its goal, not with the bewildered costive reluctance that it has shown and is still showing. "Eventually, so why not at once?" should be the motto to hang on the wall alongside Zhdanov's warning.

Almanach de Moscou

THERE was a time not so very long ago when the most useful knowledge for a diplomat was of the kind contained in the Almanach de Gotha. When ambassadors were for the most part envoys of kings and diplomacy was enveloped in the elaborate etiquette of royal courts and an aristocratic society, it was essential to be well informed about royal and princely families, their genealogies, their actual and possible marriages and their apparent and presumptive heirs. Outside the narrow circle of royalty and nobility enfolding the *corps diplomatique* in a monarchically governed country it was seldom necessary to have a knowledge of personalities for purposes of diplomatic relations. For republics a somewhat wider range of information was required, but republics were in any case rare outside Latin America before 1917 and their leading politicians usually came from well-known families or had had long public careers before reaching high office. As democratic politics broadened out and as diplomats had to take notice of economics, and even of culture, keeping track of important people became a more difficult business; but in almost every country publishers provided comprehensive directories in which the stars of the local firmament could be identified and their courses traced.

Since the coming of the Bolsheviks the observer of world affairs, whether diplomat, politician, journalist or interested citizen, has been confronted with a new world of personalities about which it has been extremely difficult to obtain full and reliable information. It is not at all because this is a levelling ultra-democratic *milieu*, in which personal qualities are at a discount and the multitude swallows up the individual leader. On the contrary, here is a system of rigid hierarchy, of living saints and heroes whose pictures, magnified to colossal dimensions, are publicly displayed to their adoring followers. But these great men have neither been princes from their birth nor have they arrived through the normal public careers of a democratic society, gradually emerging into the daylight of national awareness and inspection. They arise suddenly like Aphrodite from the foam of the sea; professional revolutionaries, secret men of many aliases and alibis, they start up from their "underground" like scorpions from under a displaced rock; they arrive without warning from nowhere like V.2 rockets.

Much is now known about the lives of Lenin and his close associates before the revolution, but little could have been known at the time by the curious about the operations of the party within Russia. And today the Communists take conspiratorial precautions in all countries where they do not hold power—for even where they are legal, they always prepare to go underground whenever it may be required. Where they have come to power, they do not need to conceal themselves from the police—since they now *are* the police—but a new kind of secrecy screens the great ones from the prying eyes of the world; a censorship enforced by terror excludes all but official versions of who's who and what's what. It becomes infinitely difficult for the foreigner to find out who really has power, how decisions are reached, what occult forces determine the rise or fall of individuals in the ruling group. Nor is it only a question of knowing who has already come out on top, for the most abrupt changes may occur at any time and entirely new men appear on the scene.

In the Communist world departures are as sudden as arrivals—except in the highest rank of all, and even there a question mark is the only indication of succession to a ruler who, however godlike his other attributes, is but mortal. Only just over thirty years have passed since the Russian revolution, but the turnover in Communist leadership, both in Russia and outside, has been enormous, and it has often been bewildering even for the Communists themselves. In the days of the great purge the official biographers and historians could hardly keep up with their task of revaluing most of Lenin's companions as Fascist reptiles and Trotskyite mad dogs, and a Communist bookshop in London once displayed a pamphlet entitled "Tukhachevsky on Defence" for some time after the Marshal had been shot for alleged treason. When the faithful can thus be mistaken, it is little wonder that outsiders are apt to find the politics of the new civilisation somewhat enigmatic.

*

It is doubtless with the aim of assisting those who would like to be well informed about the contemporary world that the American House of Representatives Committee on Foreign Affairs Sub-committee No. 5 (National and International Movements) has now published as a supplement to its Report on "The Strategy and Tactics of World Communism" a directory of five hundred leading Communists of the eastern hemisphere outside the Soviet Union.* The editors modestly admit that the biographical data which they have assembled "fail of perfection," but claim that they are nevertheless "the best that can be assembled and published at this time." It is indeed a fascinating compilation; even the mere list of names whets the appetite for information and the brief notices given further stimulate curiosity without satisfying it. There must be very few, even among the most widely connected of journalists, who can honestly say this is all old stuff or, without reference to these pages, could give offhand an account of Pandi Kristo, Koci Xoxe, Idris Williams, Aaro Uusitalo, Léon Mauvais, Alice Sportisse, Chryssa Hadjivassiliou, Konstantinos Theos, Kim Tubong, Pham-Van-Khoa, Teresa Noce Longo, Harry Snitcher or Paul Schreck. But here they all are, as cosmopolitan a crowd as could ever have been found in a Riviera hotel in the days of free travel. We are not given their addresses, nor informed of their clubs and their recreations; but much is told about their political careers. From an analysis of the facts they have collected the editors have drawn the results that the average age of the five hundred is 46, that though little more than one in five of them has graduated from a university, nearly one in two has graduated from a prison, that over 10 per cent are veterans of the Spanish civil war, and that 20 per cent have today reached Cabinet rank in various Governments outside Russia. Since this handbook was published, however, events have already indicated one notable omission, and it is of a kind which illustrates the difficulty of an exhaustive treatment of the subject. In August a certain Mr Soeparto arrived in Java as the secretary of a Dr Soeripno, who had been sent on a commission to Europe by the Indonesian Republic, but had been recalled for exceeding his instructions in negotiating with Russia. After a few days Soeparto suddenly announced that he was really Musso—not the gentleman of that name who springs first to mind, but a Communist leader who had fled from Java in 1925 after being involved in a rising against the Dutch, that he had spent 23 years in Moscow and had now returned to take over the leadership of the party; this he did without more ado, and soon started the armed revolt against the Hatta Government which is still going on. But the inquirer who looks for his name in the Congressional Subcommittee's collection will not find it among the five Indonesian Communists there listed. Musso is one of those men whom Moscow holds in reserve and out of sight until the moment of using them has come. So long had Musso been in Russia that in public speeches he had to apologise for his inability to use correctly the idiom of his own language. Nevertheless the party had no hesitation in immediately accepting him as its leader.

* Published by the United States Government Printing Office, Washington, 1948. 80th Congress, 2nd Session, House Document No. 707.

*

Apart from the possibility that there are other lurking Mussos undetected by the Congressional sleuthing, there are some very interesting biographical problems about even the most eminent of the five hundred. None of them is more famous than Josip Broz Tito, yet there are strange discrepancies in accounts of his life before he was honoured by the acquaintance of Major Randolph Churchill. According to the Congressional biography he served as a private in the Austrian army, was taken prisoner by the Russians in 1915, and remained in Russia until 1920, "taking part in the Bolshevik revolution." On the other hand, Anton Ciliga, the Croat ex-Communist who spent ten years in Russia and recorded his experience in his book *The Russian Enigma*, says that Tito was a sergeant in the Austrian army and was quite "non-political" up to 1920, when he joined the Red Army, became an officer in it and continued to serve in it until 1924. The Congressional handbook describes him as "Secretary-General of Central Committee of Yugoslav Communist Party circa 1937-1946," but does not refer to the fact that he replaced Gorkitch, who was liquidated in the Great Purge, or to the fate of his first wife, a Russian, who according to Ciliga's account, was arrested in Moscow and "died in prison." Much mystery indeed still surrounds the career of Tito.

What is not manifest in the formal biographies of the five hundred is the nature of the bond which unites them. Of the atmosphere of the Communist conventicles, of the sentiments which inspire them in their relations with which other, of their code of behaviour and conflicts of conscience, there is more to be learnt from Sartre's *Crime Passionel* than from perusal of records of membership of committees or military commands. The discipline of Communism is partly voluntary, partly enforced. It is this discipline which is the strength of Communism, yet it is always in danger of breakdown and covers up deep spiritual contradictions. The foundation of Communism is in fanatical conviction, yet the man of conviction is the most likely to deviate when it seems to him that the leadership is betraying the cause. Where direct physical coercion cannot be used, reliance must be placed on unceasing vigilance and on the mustering of party loyalty against the first beginnings of deviation or backsliding. Through a vast network of spies the central authority keeps track of all its agents and their work; it is the cadres that count, as Stalin once said, but still more the dossiers about them which exist within the walls of the Kremlin. Of one thing we can be certain, that no *Almanach de Moscou* published in the bourgeois world can ever compare with the documentation whereby Moscow knows its own.

between industries. There is something to be said—more than nowadays is generally allowed—for competitive free enterprise; there is something to be said—though less than most enthusiasts believe—for the comprehensive central plan, broadly and elastically conceived. There is absolutely nothing to be said for the pull-devil-pull-baker anarchy of autonomous industrial *blocs*, especially when exclusively governed by the voices of those least qualified to take the long view.

The new London Committee might, under wiser counsels, do useful work. It becomes clearer month by month that greater production must be sought not only through the working of money incentives, or the installing of superior equipment, or such one-sided managerial improvements as can be obtained through better lay-out or time-and-motion study, but also by the reciprocal co-operation of workers and management from the bench up. The proportion either of managers or of workers who wholeheartedly support the principle of co-operation and who understand its technique remains painfully low. A body which would further the education of both, extend the area and intensity of co-operation, and so enable an increasing number of workers to qualify by experience for participation in control at higher levels, would do much more for the cause of industrial democracy than one committed to the tenets of an absolute syndicalism.

* * *

No Bonus for Overtime

No man is better qualified than Sir Stafford Cripps to speak about overtime. At time-and-a-half and tax-free, his overtime earnings would give him the highest net income of anyone in the country, and he would deserve every penny of it. When, therefore, he roundly condemned making overtime pay tax-free last week, he spoke with unrivalled personal authority as well as the weight of his office behind him.

He quoted the Civil Service, where many who work overtime hours without extra pay—this has become an occupational disease among higher civil servants—as a profession would be still further penalised because of their fixed salaries. But a still more cogent reason is the demoralising effect such an additional bonus for overtime would have on the ordinary worker. Extra pay for extra hours already exerts a subtle and surreptitious drag on the normal output of even the most conscientious worker. To increase the attractions of overtime pay increases the temptation to spin out work. Overtime must always be regarded as an evil necessity if it extends working hours beyond the optimum: it is exhausting for the worker and expensive for the employer. The real necessity is to increase output within the ordinary working day, and if any current evidence of this is needed, the failure of the Saturday shift and the extra half-hour a day in the mines provides it. The earlier proposal to treat the miners preferentially is presumably equally condemned by the Chancellor, although he did not mention them specifically.

New Crisis in China

The Truman victory in America following on the fall of Mukden has now led to the resignation of the Chinese Cabinet led by Wong Wen-hao. For some time the prospect of a Dewey Administration in Washington has been used to bolster up the failing morale of Nanking because of the belief that it would provide more support for the Chinese Government than President Truman and Mr Marshall have been so far prepared to give. Mr Dewey in his campaign attacked the Truman Administration for its "tragic neglect" of China and promised a more vigorous policy; his defeat, therefore, has been the last straw in causing the collapse of a Cabinet which was already tottering to its fall. The Prime Minister and Finance Minister had announced their wish to resign because of the failure of the recent financial reforms which were designed to halt inflation and which initially gave promise of greater success than any previous effort. The reforms were partly intended to give economic support to the Government's military effort, but it is the military situation which has been largely responsible for the failure of the reforms, for the bad news from the fronts has destroyed confidence in the survival of the Government and its currency and has led to fresh commodity hoarding and panic speculation.

All kinds of political combinations are now possible in China; there are not a few generals with long experience of intrigue who are now likely to desert President Chiang's sinking ship and bargain for terms with the Communists. There is, however, no prospect of stable government in any balanced coalition of Communists and non-Communists because the Communists in China, as elsewhere, aim at supreme power and enter coalitions only with the idea of undermining their partners and reducing them to subjection. A coalition would be likely to lead within a short time either to complete Communist domination of the whole of China or to a split followed by the renewal of civil war. If the war continues more or less on present alignments, the questions arise: first, whether Fu Tso-yi can keep the Communists out of Peiping and Tientsin, and second, whether, if north China is lost, it will be possible to maintain an anti-Communist south China regime holding Nanking, Shanghai and Canton. In any case such a regime can hardly be in future headed by the present governing clique in Nanking. There are vital political forces in China which are neither Communist nor Kuomintang Old Guard; if they can once find effective leadership, they can become decisively important. In the fluidity of the new situation, they may get their chance to emerge.

* * *

Arab Policy on Palestine—

Most Arab politicians, when they think of Palestine, seem to be putting up a mental umbrella and hoping that the cloud will go away. Thus the Arab League, meeting in ninth ordinary session and with the so-called government of Arab Palestine at its table for the first time, is discussing model air and postal conventions. Meanwhile, a combination of Israeli purposefulness and United Nations inanition is day by day whittling away the area of Palestine that is still open to negotiation. Last month the northern Negeb, last weekend Galilee have fallen to Jewish forces; their Arab defences collapsed with an ease that surprised us no more than the attackers. This week, small Jewish advances in the Bethlehem and Hebron areas are eating, like the tide at a cliff, into lands so far denied to Israeli expansion. Also this week, the Israeli government has held its first meeting in Jerusalem.

Arabs would not be Arabs if they did not lay the blame for this humiliating situation at others' door. Their chief scapegoat is, it need hardly be said, Great Britain; they like to argue that it, by observing the arms embargo, denied them of victory. They stress such points in order to gloss over their own sad follies. Of these, the greatest is their failure to pull together in any constructive policy, political or military; they are for instance so divided as to whether Arab Palestine is to be independent, or part of Transjordan, that the army of one will not help the army of another even when failure to do so exposes its own flank. A second grave shortcoming is their failure in Paris to see that owing to Jewish military strength and the supine ways of the United Nations, time is against them. Against the advice of their oldest friends, they have voted more than once for postponement of discussion and settlement. It is now, surely, plain that to snatch at a fixing of the Israeli frontiers is their only chance of saving some part of the lands they want. Lately, they have at every turn played into their rivals' hands.

—And its Implications at Home

This failure abroad is bound to react upon home politics, particularly in Egypt and Iraq. So far, the news has been concealed from the home publics in both countries by jaunty communiqués and, in Egypt, by a censorship that reduces the home press to bombast and that cuts all criticism out of imported newspapers. (*The Economist* is among the papers so mutilated.) What happens when the public discovers, as it must do in time, that the Egyptian army was beaten and is demoralised, that it hated the inhabitants of Gaza, who returned the dislike, and that the comforts funds generously subscribed in Alexandria and Cairo never reached the front, and, seemingly, disappeared on their way through the Ministry of War? Nokrashy Pasha's government has not lately been in a strong position; it has rocked, and would doubtless have fallen were any rival ready to take the unenviable office of premier while there is a military failure to be answered for. Sidky Pasha, much the cleverest man available, has always, even publicly, been against the Palestine war because he foresaw the economic damage it must entail. If Nokrashy falls it can only be to a Palace government that will try to deflect notice from the King's responsibility for the Palestine adventure by diverting public attention to some other issue—for instance, the Sudan. The false rumour, started by an Egyptian pen this week, that Great Britain was ready to abrogate the 1936 treaty and to start negotiations afresh may have been a move in this direction. Other red herrings are to be expected.

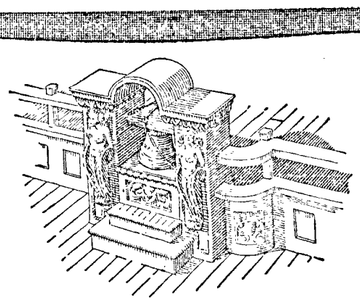
It's fun to fly by flying boat!

SHAGGY DOG STORY . . . Completely relaxed in the luxury surroundings that are the mark of flying-boat travel, these happy passengers enjoy a joke in the superbly appointed cocktail bar of the Short Solent. After their aperitifs they take a brief turn on the promenade deck.

★



OCEAN-LINER AMENITIES

When you go by Short flying boat, you find the amenities of a luxury liner. There's room to move about—you can smoke, enjoy a drink, find a book in the library and, indeed, have your most pleasant trip in *flying-boat* comfort.

Short flying boats are flying all over the globe. By B.O.A.C. from Great Britain to Egypt, Africa, India and the Far East. In Australasia T.E.A.L., in Scandinavia D.N.L., and in South America A.L.F.A. and C.A.U.S.A. are using Short flying boats, too. Your travel agent will give you details.

In Iraq, the government is even more likely to be disrupted when the army's discomfiture becomes known. This last is the greater because the Iraqi treasury is in such a plight that the soldiers are owed considerable arrears of pay. From this situation the Fascist party Golden Square, in temporary union with the Communists, is making political headway. In a word, the Palestine issue is successfully creating a series of local Arab confusions—a situation pleasing to nobody but the Jews, and to Russia.

Cold War in Italian Industry

Italian employers are now making serious efforts to reduce their staffs to reasonable proportions for the work in hand. This action has long been hanging over the already strained relations which exist in many parts of industry between employer and employee. But it is essential if excessive Italian production costs are to be reduced. The feeling is growing among employers that they are now in a stronger position to try their hand than a few weeks ago.

Workers, however, are putting up a stiff running fight. Last week the Fiat motor company's Mirafiore factory in Turin, the largest in Italy, employing 50,000 people, and of prime importance in the country's export drive, was reduced to operating on what has become known as a "non-collaboration" basis, because seven workers were dismissed. "Non-collaboration" means that a worker refuses to go one iota out of his prescribed routine. If so much as a screwdriver is needed, he will stop work until it is brought to him; he deliberately does nothing at all about getting it himself. When this system was first introduced for a week last December, production in Italian industry was estimated to have fallen by 60 per cent. The Fiat management has now retorted with a statement that the proportional loss of takings will be debited to wage-checks.

Many other big works are also suffering from resistance in this and other forms. Daily one-hour strikes are staged or planned over a period. Last week the Snia Viscosa management of the company's Pignotte works in Florence was completely frustrated by a stay-in strike of redundant workers who had been dismissed. It remains to be seen what the upshot of all this will be, but one thing seems clear. The present cold war in Italian industry will concentrate growing attention on the battle between the Communist and non-Communist trade unions.

After many weeks of indecision since they withdrew from the Communist-dominated CGIL—the Italian TUC— last July, the Christian Democrats set up a new trade union organisation of their own on October 19th. Called the LCGIL, or Italian Free General Confederation of Workers, its first Secretary-General is Signor Giulio Pastore, the former Christian Democrat Secretary on the CGIL. Under its provisional statutes, the LCGIL lays down that any strike must be preceded by a referendum among the actual workers whom it will affect. Dominant elsewhere in Italian politics, the Christian Democrats are, however, still very weak where the trade unions are concerned. They have carried their own 600,000 workers with them into their new LCGIL, but there are over 4 million workers, including Socialists and Republicans, still loyal to the CGIL.

The best hope of the Christian Democrats is perhaps that they may recruit more adherents from the large number of Italian workers who even now belong to no trade union. Yet it is hard to see them doing so, while the predominantly Christian Democrat Government sponsors the present unpopular policy of labour dismissals, however necessary that may be to the Italian economy at large.

Distribution of Building Resources

Very little is generally known about the distribution of building resources among the various claimants, and in particular the relative strength of the demands from industry and housing. Since housing is the biggest single competitor for building materials and labour, this deficiency in public knowledge leads to some serious misunderstandings about the strain of a large housing programme on the country's capital resources. A little light has been shed on this subject by the Ministry of Works' Summary Report* for the year January to December, 1947, which was issued last week. Unfortunately the report confines itself to figures for the number and value of building licences issued, by local authorities and by the Ministry itself, for new industrial projects and for repair and maintenance work to buildings of all kinds including houses. It excludes, and the exclusion is critical, the estimated expenditure on new housing projects approved for local authorities or licensed for private builders. Strictly this expenditure is within the province of the Ministry of Health, but whatever the department concerned, it would be extremely valuable to have comparable figures published for the housing programmes.

* Cmd. 7521. HMSO. 9d.

BUILDING WORK LICENSED OR APPROVED DURING 1947

	£ million	% of whole
Industrial and commercial buildings	163·9	29·5
Farms and agricultural premises	9·9	1·8
Hospitals and schools	6·5	1·2
Housing work other than new housing, including conversion and adaptations	109·8	19·8
New houses approved or licensed (estimate)	*204·0*	*36·8*
Miscellaneous work including annual maintenance and war damage repairs for both industrial and housing purposes	60·5	10·9
	554·6	100·0

In the absence of official figures it has been necessary to make a rough estimate of the resources devoted to new houses during 1947. This is difficult to calculate accurately, but assuming that the figures for tenders approved for local authority schemes and of licences issued to private builders are comparable with the licences issued by the Ministry of Works and local authorities for industrial purposes, about 170,000 new houses were approved during the year (including some 40,000 temporary houses). Taking an average cost of £1,200 a house, this gives a figure of £204 million. From the table above it can thus be seen that an expenditure of rather over £310 million was approved for housing as compared to £163 million for industrial and commercial purposes during 1947.

It has, over the past year, been becoming painfully clear that any policy for reducing the country's total building programme to provide surplus labour for the undermanned industries is a dead letter; pressure from the unions and the employers has been too strong. In December, 1946, there were 1,062,000 workers in the building industry; in December, 1947, 1,132,000, and by July, 1948, 1,150,000. The most consoling feature of this picture is the shift in the distribution of labour: by and large what house-building has lost, industry has gained. Between December, 1947, and August, 1948, labour on house building and repairs fell 44,000 (from 569,000 to 525,000), while labour in building work for industry and agriculture rose 54,000 (from 194,000 to 248,000). As far as the use of building resources for productive investment is concerned this is a real gain, even if no labour has been squeezed out into the undermanned industries.

* * *

Motor Roads

The special Roads Bill whose terms were published this week is a measure which demands technical rather than political appraisal. It is an enabling Bill designed to modify the Trunk Road Acts of 1936 and 1946 so as to provide for the construction of roads designed for specific purposes, particularly for motorways devoted solely to high speed motor traffic. In 1946, the Government announced a ten-year plan for the improvement of the main road arteries. Although much of the work has been slowed down as one of the curtailments of capital investment which it is least painful to make, it is essential that the correct methods of laying out the road communications should be accurately assessed before an acre of land is acquired or a yard of gravel laid. The cost of altering or widening inefficiently planned highways is out of all proportion to the original cost of construction.

It is proposed that out of the total road programme about 1,000 miles shall be of motorways (there are at present 4,456 miles under the classification of trunk roads). The case for motorways is a strong one. The cost of road transport is a large element in manufacturing and wholesale distributive costs, and the provision of roads connecting main centres on which commercial transport can run at a consistent high speed would do much to reduce them. According to a report prepared by the British Road Federation and other interested bodies, the operating costs on motorways, compared with those on existing all-purposes roads, would be reduced by 32.4 per cent for a 10-ton commercial vehicle and 17.4 per cent for a 3-ton vehicle. The maximum economies

are achieved by running most commercial vehicles at about 40 miles per hour, but the advantage of a motorway lies not so much in the possibility of a high speed, but of a clear run and a steady speed. The cost of constructing a motorway with a two-lane carriageway is about £150,000 per mile, a figure which may be slightly greater or slightly smaller than the cost of reconstructing an existing road to first-class all-purposes standard.

The Report urges upon the Ministry of Transport the desirability of considering special roads not only for cross-country connections, but in built-up areas and particularly London. There is a great deal to be said for this, as the success of such high-speed roads as the East River Drive and the Merritt Park-way in New York have shown. The problem in British cities is not how to enable the commuter to reach his country cottage without delay, but how to enable commercial transport to reach the commercial centres without either disrupting the normal local traffic or losing benefits of such economies in time and mechanical wear and tear as are afforded by the arterial roads. Unless the Railway Executive succeeds in arresting the current trend towards the greater use of commercial road transport, this is a problem which must be faced in the making, not only of road, but of town plans.

* * *

Midland City

Wolverhampton, that much surveyed town, is the subject of a social and industrial survey carried out by Mr Tom Brennan* with the object of aiding the Council's preparation of a development plan for its area. Mr Brennan states that "the real job of Town Planning starts where the Survey ends," and it is true that too few planning schemes are given the benefit of a preliminary investigation of this sort. There is a danger in the drawing up of neat plans of physical layout which look fine on paper, but which can easily overlook the complex tangle of social and economic relationships which a well-established town possesses. Mr Brennan has done his best to discuss what the citizens of Wolverhampton themselves want before their town is reshaped for them. For one thing, people are apparently very reluctant to use any local shopping centre which does not lie from their homes in the general direction of the centre of the town. It follows that social facilities should not necessarily be placed at the centre of a new estate—where they may be ignored by many of the inhabitants—but should rather be grouped together at a strategic point near its inner boundary.

It is also apparent that the creation of neighbourhood units, a favourite objective of town planners, may be a tricky business even if housing estates are provided with appropriate social and cultural facilities. Residents are much less willing to use these facilities if they work in a different part of the town—yet the segregation of industry in one main area is a feature of many plans, such as that for Stevenage. It seems that there is conflict between the ideals of "neighbourliness" on the one hand, and of "orderliness" and "cleanliness" on the other. What sort of town the ordinary people would prefer is unlikely to emerge clearly from this or any other survey because their opinions are too bound by existing circumstances. But studies of urban layout could be still more valuable if they made greater use of local voluntary effort. Surely many private citizens could make an active contribution to the analysis of their town's structure, and the planning of its future.

* "Midland City," Dennis Dobson, 15s.

Stalin Champion of Orthodoxy

The "reconversion" of the Uniate Church of Rumania, which was announced early this month, marks the formal annihilation of an institution which for several centuries Russian policy has sought to destroy.

The Uniate (sometimes known as "Greek Catholic") Church was established in the sixteenth century with the support of the kings of Poland and Hungary, in an area which then formed the easternmost provinces of those states—east Galicia and Transylvania. The Uniate Church was hierarchically subject to the Pope, but its services were conducted in the language of the people and its priests were allowed to marry. It is not unfair to describe its creation as a worldly manœuvre, to win away potential subjects of the Tsars. Nevertheless, in the course of time it struck roots in the peoples, and became in the nineteenth century a stronghold of Ukrainian and Rumanian nationalism, directed as much against Poland and Hungary as against Russia.

In the 1870s Tsar Alexander II, on the advice of the arch-reactionary Count Dimitri Tolstoy, suppressed the Uniate Church in the western provinces of the Russian Empire. Galicia only came under Russian control, with the help of Hitler, in September, 1939. Nothing was done in the first two years of Soviet rule, but after the recovery of Galicia from the Germans in 1945, the attack began. Possibly the problem was made urgent in the eyes of the Kremlin by the strength of anti-Soviet Ukrainian nationalism (in the form of the UPA or Ukrainian Insurgent Army) in the Uniate areas of Galicia. Whatever the motive, the Soviet authorities imprisoned all the bishops and most of the clergy, and when they had found three priests to form a "committee" to request, on behalf of the whole Church, readmission to the Orthodox fold, the question was considered settled.

The Rumanian Church came under fire at the beginning of 1948, when the Orthodox Metropolitan of Transylvania and the Patriarch both launched appeals to the misguided faithful to return to mother Orthodoxy. In October it was announced that the Uniate Church had voluntarily decided on "reunion." Who decided this, and what methods of persuasion were used, is not yet clear. It is in any case certain that the Uniate Church was never unpopular among the Rumanian people, and that none but fanatics within the Rumanian Orthodox Church had any strong desire to liquidate it. The initiative came from outside. The Kremlin cannot tolerate activity within its sphere by any body which has links with the West. Any such body which seems weak enough to be suppressed without risk is doomed.

It is curious that Stalin, while in his teens was "withdrawn by his parents for reasons of health" from a Seminary, should in his old age help one Christian Church to persecute another.

The Economist Diary

A reference book for the desk

This new diary published by Messrs. CHARLES LETTS & CO. LTD. contains many unique features: the memoranda and appointments register section is designed on entirely original lines and, in addition, there are 64 pages of facts and figures which together form a complete reference book for the man of affairs.

The reference material, which has been compiled by the research staff of THE ECONOMIST, covers a wide range of subjects, including population, national income, banking, taxation, crime, manpower, commodities, and a special section giving the basic facts on sixty principal countries in the world.

The volume is bound in red morocco-grained leather and measures 10 in. by 8 in. Price 30/- plus postage and, in the U.K., purchase tax at 6s. 8d. Full details of The Economist Diary are given in an illustrated pamphlet available from:

The Economist Intelligence Unit,

22 Ryder Street, St. James's, London, S.W.1.

intended for those who want to sell things to country folk and to bring home the fact that, with a gross annual income of over £600 million for agriculture alone, there is an increasingly worthwhile market in the countryside. It shows in detail the amount and type of equipment the farmer is using and could use, and gives an insight into the work and into the social and buying habits of country men and women.

Most important, it elicits something of the activities of that bulwark of agriculture, the rural housewife. Occasionally she emerges to get a word of public appreciation of her work, fortitude and patience, but usually her place in the news is appropriated to the glamour of the land army and the troubles of the farmer. This may be her own fault. According to the survey few agricultural housewives are members of social organisations or take part in public activities. Less than 16 per cent belong to the Women's Institute and only 22 per cent to any social organisation at all. In rural areas where there are few entertainments, where one likes to think that there is greater neighbourliness than in the towns, and where there is need for neighbourly co-operation, these figures are unexpectedly low. Perhaps she is too busy for these things. Sixty-seven per cent of farmers' wives help on the farm as well as struggle with the work in houses which would be difficult to run even if they had the gadgets usually available to the town housewife. Possibly she leaves public work to the menfolk. Four out of five farmers belong to the National Farmers' Union, and they seem to spend plenty of time at markets, technical demonstrations and the like. But perhaps the answer is that, with better communications, the urban influence of the radio, the national press and the cinema, the countrywoman is not so very different from her sister in the towns. She is a near rival in the use of cosmetics and in smoking, and few countrywomen seem to make any of their own clothes. Perhaps the individualism of English country life is something in which only the townsman believes.

* * *

The Press the People Own

On November 1st the *Daily Worker* launched its new edition, from imposing buildings in Farringdon Road, and printed on that fine product of reactionary capitalist industrialism, a Goss rotary press. Although the second issue contained an unexpected tribute to *The Economist* from the unlikely quarter of Mr Bernard Shaw, it is doubtful whether the appearance of the official organ of the British Communist Party in the same form as the other national daily newspapers will add greatly to its influence and circulation, although it expects to attract readership from the *Daily Herald*.

Apart from the problems inherent in providing any service for which demand is deficient, the *Daily Worker* has difficulties of its own making, although it is doubtless proving a constant source of strength and inspiration to overcome them. The *Daily Worker* is operated by the People's Press Printing Society, which is registered as a Friendly Society. It has never found it easy to make both ends meet. In 1947, the Society sustained a trading loss of £36,074. But this deficit was made good from the People's Press Fighting Fund which in the same year raised £37,683. However, a great deal of space had to be sacrificed to sustain the appeals for aid, which might otherwise have been devoted to advertising matter. It has apparently been a considered policy to eschew the bourgeois virtue of solvency in favour of an enthusiastic participation by its readers in the difficulties of management.

Some possible savings suggest themselves on the layout of the new *Daily Worker*. For instance, the width of the double sheets is 68 inches, as against the 66 inches adopted for the sake of economy by other daily newspapers. This, for instance, would reduce the newsprint bill (which is likely to be little short of £1,000 a week) by some 3 per cent. On a circulation basis of 120,000 copies sold daily, selling at 1½d. a copy, and 105 column inches of advertising at a basic rate of 25s. per column inch, weekly gross income can hardly exceed £3,500. On this basis, it seems possible that further operating losses will have to be made good from the Fighting Fund.

In face of all its financial problems, a more professional-looking *Daily Worker* (with a front-page format closely resembling that of the *Daily Mail*) is now being produced. Additional capital has been raised alongside the appeals for aid to balance on current expenses. Share and loan capital to finance the expansion has been, and is, offered on tap. Shares can be bought in multiples of £1, with a maximum of £200. Share capital can be withdrawn on a fortnight's notice being given, but "no payment of withdrawable capital shall be made while any claim on account of any loan is unsatisfied." Still, this method of raising capital can hardly be termed orthodox finance. Few assets of a newspaper are liquid, yet a shareholder may claim his money back at short notice. Borrowing short and lending long has often proved problematic in the end. Even if the value of the capital is nominally maintained by relying on the subsidy to balance the accounts, raising sums of the magnitude at present required to make good losses over any length of time may turn out in the end only an alternative way of having to draw on capital. It will be interesting to see how long enthusiasm can defeat the inexorable addition and subtraction sum which governs all newspaper undertakings.

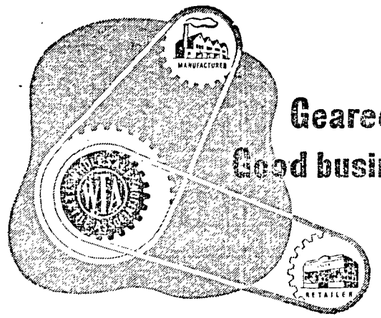
Shorter Notes

One need not agree with Mr Michael Foot to regret Mr Churchill's references in the debate on the Address to India and to the disappearance of the words "British Empire" and "Dominion." Mr Churchill has a patriarchal—were he not such a loyal subject, one might almost say a paternal—view of the areas coloured red in the atlas. He has persistently refused to recognise that the Commonwealth is capable of change and development without self-destruction, and his refusal to give the present Government any credit for its Commonwealth policy represents the less generous side of a generous nature. The tragedy is that he is building up a legacy of suspicion and dislike for the Conservative Party in India, in Burma, and, indeed, the older countries of the Commonwealth, which will rebound on those who follow him and do harm not only to a possible future Conservative Government but to Great Britain. There are many younger members of the Conservative Party who are in substantial agreement with the present developments in the Commonwealth, and who are acutely aware of the harm that their leader is doing.

*

In the course of the debate on the Address it was revealed that from September 1st the Foreign Office had "drawn a sponge across" the trials for war crimes in Germany, and that with the exception of the German generals no further trials will take place. That public opinion is still disturbed by the Government's insistence on trying the generals was made clear this week by another debate, in the House of Lords. Nobody pretends, at least nobody should pretend, that there is not a formidable indictment against them. The grounds for protest are the long delay in bringing them to trial which, it appears, cannot, even now, begin until next March and may continue for months after that. Justice so protracted as this becomes injustice and does more harm than good.

*



The dispute with Guatemala over British Honduras has come to the fore again. In a Note last week Britain rejected the Guatemalan proposal of July that the dispute should be referred to arbitration by the United States—an attempt apparently to involve Washington in a matter in which it showed little interest at the Pan-American Conference at Bogotá in April. Britain, however, is still willing to refer the case to The Hague Court for settlement on grounds of law. Guatemala's reply, of which details are not available, is unlikely to mark any change from its former acceptance of settlement at The Hague Court on grounds of equity. The next move may be a Guatemalan attempt to canvass wider Latin American support for its case. But would this bring it any nearer a solution?

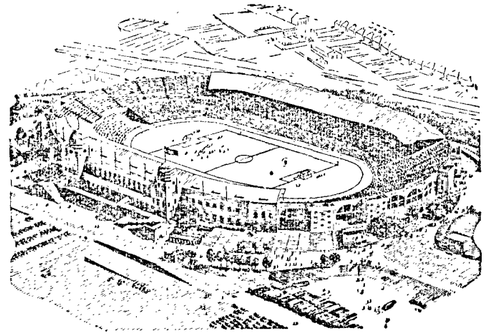
*

The cost of the British share in the air lift to Berlin up to October 26th was given by Mr Mayhew as £2,300,000. This is a cheap price to pay for such a successful undertaking, but the cost cannot be measured in terms of money alone. The commitments of the Royal Air Force in other parts of the world have been curtailed, and the sooner the United States can be persuaded to provide more of the men and the aircraft needed, the sooner will the RAF be able to resume its equally important duty of keeping open the trunk air routes of the eastern hemisphere.

*

A fuller explanation seems to be desirable in case a phrase which appeared in an article a fortnight ago, "The Enemy Within" should be misleading. "In building," the article stated, "the president of the union is a Communist." The union referred to was the Amalgamated Union of Building Trade Operatives and not, of course, the National Federation of Building Trade Operatives, of which Sir John Stephenson, KBE, who is not a Communist, is president.

Geared for Good business



The modern wholesaler has a highly geared, sweetly-tuned organisation which carries the products of the factory to thousands of retail outlets with equity, economy and efficiency. For the manufacturer this means guaranteed continuity of production through stock being regularly ordered in advance of season. For the retailer it means ready supplies of "the pick of the market" in the quantity and price range his trade demands.

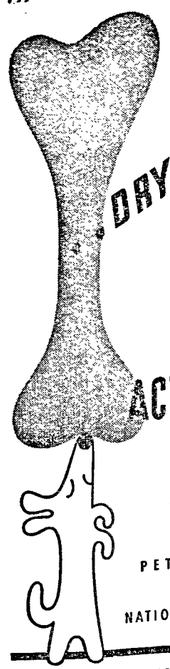
BEETLE Cement—a product of B.I.P research—enables stronger, lighter skis to be made from laminated wood.



Now Swedish Skis are better

Once upon a time the Swedes cut their skis from the solid wood. Now, they find that the better way is to use layers of timber bonded together with 'Beetle' cement and moulded to shape. Using these new-type skis, Swedish competitors won many Olympic events at St. Moritz this year. You may not work in timber, but it may sometimes happen that you can't see the wood for the trees. That's when an outside opinion on production problems can be of such value. If amino-plastics can help (and they invariably can) our research and development men, in co-operation with yours, will soon show you how.

★FOR AIR-MINDED CHAIRMEN AND DIRECTORS

Time spent by your staff in South America is precious, too

Your people can get there over the week-end

WHEN *YOU* MAKE a business trip to South America, you save time by flying. Your salesmen, service engineers and other experts should also travel by air—to save your firm from the costly disadvantage of being without their services for months at a time. In addition, such prompt and personal attention will bring you considerable prestige in the highly competitive South American markets.

Freight by Air

By sending samples and goods to South America by air, you save time and ensure delivery in perfect, factory-fresh condition. Full details of regular Commercial Freight Services can be obtained from your shipping agent, or from our offices.

From London to	*Flights per week*	*Fares Single*	*Return*
Rio de Janeiro	4	£171.4	£308.3
Buenos Aires	3	£192.6	£346.3
Santiago	2	£208.10	£375.6

Subject to alteration

Fast and frequent services also to Natal, São Paulo, Montevideo, Lima, Barranquilla and the West Indies.

S.O.S.—Spare Parts!

Recently, a British tanker developed engine trouble at Valparaiso. New cylinder heads and other parts were urgently required. Within a few days, the necessary spares, weighing nearly a ton, had been flown out by B.S.A.A. thus saving weeks of costly delay.

Letters to the Editor

Trade through the Iron Curtain

SIR,—I should like to call your attention to a misunderstanding of the facts which is contained in *The Economist* of October 23rd on page 661. You state: "One of the less satisfactory aspects of Mr Myrdal's direction of ECE is the way in which the east European governments are allowed to contribute incomplete and inadequate information to reports and studies undertaken."

The information available to ECE in its reports and studies is drawn from two sources: from published data and from data furnished by the governments in the ECE working committees. The reports and studies which have been made public—for example, the "Survey of the Economic Situation and Prospects of Europe" and the recent report on "The Potentialities of Increased Trade and Accelerated Industrial Development in Europe"—derive wholly from public data. The amount and character of the data available for such studies depend upon what the governments choose to make public outside the ECE.

The information furnished in the Technical Committees of ECE (coal, transport, steel, electric power, etc.) is given by the governments to serve certain operational purposes. These data are contained in restricted documents and are not, therefore, made public. On the experience within the ECE to date there is no evidence whatsoever that there is a regional bias with respect to the willingness of governments to present such information in the solution of particular concrete problems. The governments of eastern and western Europe alike have generally shown a willingness to furnish the information necessary to solve, on a common basis, concrete reconstruction problems. When issues have arisen, as they have, concerning the extent of the data required to solve a particular problem, reluctance to give particular types of information has been occasionally expressed by various participating governments. Such reluctance has not, I can assure you, been a particular characteristic of any group of countries participating in the work of the ECE.—Yours faithfully,

GUNNAR MYRDAL, Executive Secretary,
Economic Commission for Europe

Palais des Nations, Geneva

[Our comment related not so much to the quantity and extent of the information that is forthcoming from the east European countries as to its quality and reliability. Further inquiry has, however, convinced us that we were unjust to Mr Myrdal in implying that he was in any way personally responsible for these inadequacies or that he has not set the standards of ECE high enough. The personal reference to him is therefore withdrawn, with apologies.—EDITOR.]

Royal Designers

SIR,—In your note in *The Economist*, October 30th, you were good enough to refer with approval to the utility furniture design team with which I was connected. But with this exception you do not mention one of the industrial case histories, although you deal with the few handwork specimens in some detail.

May I point out that the whole aim of the *Design at Work* exhibition is to show how good design has been achieved in a series of varied machine-made products which have actually been produced? These include mass-produced glass, radio and packaging, textiles, television and lighting fittings.

There has never been any doubt in my mind of the paramount importance of good design for machine production today, but this is not accepted by industrialists, retailers or the public as a whole.

Such handwork as has been shown is there principally to make the point that it does have a stimulating effect on machine production. Professor Goodden, R.D.I., incidentally designed not only the small gold box for Princess Elizabeth and the Sword of Honour which you note, but also designed an excellent range of pressed glassware which has been bought by hundreds of thousands of people. In the same way, the late Eric Gill, R.D.I., is known as a sculptor and letter cutter in stone, but his influence on book production through his wood engravings and the founts of type he designed for Monotype has been widespread. I would claim that his expert knowledge of cutting large letters gave him that feeling for beauty of letter shape and arrangement which we see reduced to type size in "Gill Sans" and "Perpetua."

May I stress, Sir, that this is not an exhibition of objects as such? It is not reasonable to judge it on size or quantity. It sets out to show that everything we use has to be designed, that the industrial designer must be one of the production team from the inception of the job and that first-rate handwork can be a powerful stimulus.—Yours faithfully, GORDON RUSSELL

Master of the Faculty of Royal Designers for Industry

John Adam Street, Adelphi, W.C.2

Is it Safe to be British?

SIR,—William Joyce was found guilty of treason because it was decided that in applying for a passport he applied for protection and owed allegiance so long as that passport was still valid or so long as he did not claim the protection of another state.

If the accused can show that, by reason of his own experiences or those of others, he had good reason to believe that effective protection was unlikely to be given to him, can he claim that he owed no allegiance and hence could not be guilty of treason?

It is rather much to expect that a state should be plunged into war because of the misfortunes of one individual. On the other hand travellers abroad must have passports, if only for purposes of personal identification. Thus, in order to get out of the country, the individual is obliged to give an undertaking of allegiance in return for a protection which may well be non-existent.—Yours faithfully, L. R. H.

SIR,—British subjects abroad may be "entitled to take literally" the words of the Secretary of State printed inside the cover of their passports, but inexperienced travellers would be ill-advised to count too much in an emergency on these instructions even as far as their own British officials are concerned.

Whilst working recently as a visiting correspondent in the Balkans, I recall an episode in Salonika during a bank strike, which the authorities said might last several weeks. I urgently required money to pay my fare to Athens and to cover my subsistence and other legitimate expenses until I was able to get a seat on the plane to England. The bank manager, surrounded by pickets, flatly refused to deal with my valid letter of credit. On inquiries at

From *The Economist* of 1848

November 4, 1848.

The sole means available by the press to obtain the much-desired end [to reconcile the now warring classes] is the expression of opinion, conveying to individuals the approbation or disapprobation of the millions who speak through it. He indeed must have read little and observed less, who is not thoroughly convinced from the writings of our didactic poets, from the behaviour of children, from the means taken to promote great actions in men, from the whole stream of our literature, and the whole course of society, that the love of approbation is one of the strongest incentives, if not *the* strongest, where it is not the only incentive to social and political virtue. Under the perfect conviction of conscious rectitude, it is almost impossible for the strongest minded man to support himself against general disapproval; he will be silent on the rack, he will march calmly to the scaffold, cheered and upheld by approbation, or by the confidence that his conduct is or will be approved of; but it is not in human nature to despise general opinion. The knowledge of man is in fact bounded by his own sensations; and loving pleasure and hating pain, he is intensely and exclusively selfish; but nature has made him from the first perception of a mother's smile to the last hope on his deathbed that his children will honour his memory, exquisitely sensible to the expressed opinion of others . . . . . Respect for opinion shields the weak against the strong; it beats down the bayonet's point; it extorts gifts from avarice; it stifles vengeance, and makes cruelty humane. It is the one sentiment to which the press can appeal; and to misdirect praise, to be careless in the formation and expression of opinion, is to waste the greatest power to effect social good that is given to man.

the Consulate-General, I received the message from the Consul-General: "Under no circumstances whatsoever could any British subject be advanced money." Thanks to the courtesy and persistence of an officer in the Army Pay Corps at a time when the British Army was in no way responsible for the welfare of British civilians, the Greek bank manager was reluctantly persuaded at last to cash my letter of credit at the back door.

My rights as an individual and a British taxpayer and also those of others who have had similar experiences elsewhere are no doubt insignificant. What is important is the fact that such incidents seriously undermine British prestige abroad.—Yours faithfully,

Flat 38, 88 *Portland Place, W.* 1 NANCY CRAWSHAW

Bulgaria under the Communists

(By cable)

SIR,—Your article of October 9th on "Bulgaria Under Communists" contains series misstatements which tend to vitiate its contents and convey an altogether incorrect idea of present developments in Bulgaria. Our Brigadier movement initiated and led by the Peoples Youth Alliance is voluntary. Its spontaneous nature can be gauged from the fact that even elderly orthodox priests and Moslem Mullahs participate with enthusiasm in this venture. Our entire youth accepts physical work with joy and is proud in introducing amenities of civilisation in our hitherto backward country. It is preposterous to state that Civil Servants "are liable to be dismissed" unless they participate in brigades; as a matter of fact, they don't, except for some youths. The Labour Army has nothing to do with the Ministry of National Defence, there's no "War Ministry," and it is run by the Ministry of Public Works. Moreover, its number is just under one-half of the figure advanced by your correspondent. Today, when most nations are feverishly re-arming, Bulgaria is using its youth effectives for peaceful construction work, to which *The Economist* can hardly take exception. There's no such thing as a "harvest militia" (something wellnigh impossible to organise on a nationwide scale), and hence no "special decree" could have been issued forbidding harvesting and other farm work without its supervision. However, peasants here, as everywhere else, strive to protect their crops from incendiaries and thieves. Is this in any way reprehensible? Finally, Bulgaria's trade with Jugoslavia continues normally. Our foreign trade is, in fact, constantly increasing. It goes without saying that we are prepared to do business with any country, regardless of its geograhic position, as long as it treats us as equal partners.—Yours faithfully,

ALEXANDER RIZOV,
Editor, Free Bulgaria.

[It is reported that the Duke of Wellington on leaving a Royal levée dressed in full uniform was approached by a citizen who greeted him with "Mr Smith, I believe." "Sir," said the Duke, "If you will believe that you will believe anything."—EDITOR.]

Economic Plateau

SIR,—I am puzzled as to the meaning of the term "viable" and "viability" as used in the economic sense. The dictionary defines "viable" as "capable of living." Is it then synonymous with "self-supporting" when used in the economic sense? The article "Economic Plateau" in *The Economist* of October 30th asks by what means the Government can expect Britain to become self-supporting by 1952, and suggests that the key to the problem may be found in the greater "viability" which has become the ultimate objective of programmes and plans. But if "viability" means the state of being self-supporting, this merely re-states the problem and does not supply a key for its solution.

The same article suggests, in order to improve the possibilities for exports in 1949, the concentration of Britain's limited resources more effectively upon the most vital tasks. "Policy would be wiser if . . . it considered a means of doubling, and then doubling again, the rather meagre efforts which have so far been made to concentrate the resources available upon vital objectives." It would add to the interest of this admirably clear article if these "vital objectives" could in some way be defined.—Yours faithfully,

Seven Sisters, St. Lawrence, Isle of Wight C. MCKENZIE JOHNSTON

[Last week's reference to viability was intended to suggest just those doubts which are expressed above. Among the most vital objectives, increased production, investment and exports were in fact named.—EDITOR.]

French Difficulties

SIR,—In *The Economist* of October 9th the question is asked: "How can a country's finances be stabilised if the well-to-do consistently avoid the burden of taxation?" Now, I don't acknowledge such a criticism as pertinent and fair.

Truly, many Frenchmen boast about circumventing their fiscal duties; but it's just boasting. Most of these *fanfarons du vile* acquit themselves nevertheless quite readily and sheepishly of their dues. On the other hand, don't suppose that defrauding the French fiscal Argus to be an easy task: each time I have involuntarily committed some small mistake in *my* favour I was quickly and sternly rebuked. Of course, French profiteers, black marketeers and "spivs" don't bother about declaring their ill-gotten incomes, but, in any country where the currency is out of gear, such characters are the children of the inflation and not its fathers.

Since the French system of taxes is notoriously complicated, obsolete in many of its rules and too mild towards some categories of taxpayers, its overhaul is certainly overdue. Economically speaking, its main defect consists in the fact that the dice are heavily loaded against savers and investors, such a tendency being evidently ill-timed in a period of reconstruction and of inflation (i.e., of excessive consumption). But, I cannot agree with most economists who assert that a budgetary deficit is the main cause of the present collapse of the French currency.

Quite on the contrary, I am firmly convinced that the rises of prices, steadily forestalling the rises of public revenues, are the main cause of such permanent deficits, and that, in a country undergoing a crisis of acute inflation or hyperinflation (as the case stands unhappily in France for the time being), no budgetary equilibrium can be realised (taxes running after prices and expenditures exactly as wages do) so long as the currency has not been previously stabilised.

English and American economists have, happily for them, no direct experience of extreme inflation; therefore, their well-meant recommendations to the French or the Italian Governments miss too frequently the mark and incite the said Governments to *perseverare diabolicum* towards blind alleys.—Yours faithfully,

3 *avenue de la Porte d'Asnières, Paris* GAEL FAIN.

AMERICAN SURVEY

Victory of the Forgotten Man

THE break-up of the Democratic party seems, as Mark Twain once said of his own obituary notice, to have been greatly exaggerated. The chief casualty in this fabulous election—apart from Mr Dewey's Presidential aura and his political ambitions — has been the public opinion polls. The David from Missouri, the man whose chances were not even worth reporting, has completely routed the Republican Goliath. On the latest figures, he has captured states with 304 electoral votes, secured a popular majority of over a million and a half, and seen Democratic majorities replace the Republicans in both houses of Congress. With one result yet unknown, the Democrats hold 53 seats in the Senate, the Republicans 42. In the House, where 35 returns are still in doubt, the Democrats will have an even greater preponderance. They have already won 247 seats to the Republicans' 153. In the state races for governor the story has been the same. The unity Governor Dewey has promised has materialised—but under Democratic auspices.

It used to be said of Mr Roosevelt that everybody was against him but the voters. But this was never as true of Mr Roosevelt as it has been of his disciple. The Democrats' popular majority this year is narrower than it has been in any of the past four presidential elections. Mr Roosevelt led Mr Dewey by three and a half million in 1944; at the peak of his popularity in 1936 he won 11 million more votes than Mr Landon. But the political miracle of Mr Truman is that he won at all, despite the secession of four states in the South to Governor Thurmond; despite the loss (by a mere 50,000 or so) of New York, a result directly attributable to Mr Wallace's campaign; despite the half-hearted support of the Democratic bosses and political machines which used to roll up the big city vote—by fair means or foul —for Mr Roosevelt; and despite the unwillingness of contributors to put their money on a candidate who seemed destined to defeat.

The rules of the political game have been turned inside out. The most striking of these upsets is the fact that the Democrats won despite the small total vote always believed, by both parties, to favour the Republicans. But the similarity between the present election and that of 1916, another destroyer of the conventions, has also been underlined by Mr Truman's ability to win the Presidency without securing New York, and by the critical role of California, which Mr Truman carried although it is the home state of Mr Warren, the Republican Vice-Presidential nominee, and one of the two states in which Mr Wallace was expected to do well at the Democrats' expense.

After the event it is plain that not only have the assets of the Roosevelt legacy not been dissipated, but that the transformation in American political life brought about by the New Deal has deep and tenacious roots. In his radical crusades Mr Truman out-Roosevelted Roosevelt; and Mr Dewey's own campaign showed a shrewd awareness of how deeply Mr Roosevelt's Presidencies had changed America. He not only made it clear that he was willing to accept the reforms of the past, but that he realised the voters would not tolerate any narrowing of the responsibilities and welfare activities of the Federal Government.

In the light of the returns it is now possible to see that the victories of the Republicans in the Congressional races of 1946 were Mr Dewey's undoing. His ostentatious efforts to dissociate himself from the record of the Republicans in Congress were completely unsuccessful. The absence of any attempt to control the cost of living, the failure to provide adequate housing, and the hostility of the Republicans toward labour convinced the voters who listened to Mr Truman that Mr Dewey's party, if returned to power, would prove to have learned nothing and forgotten nothing since 1932.

On the other hand, Mr Wallace's pitiful showing of something under a million votes is testimony to the truth of at least one old adage: that prosperity favours the party in office. There was no spontaneous revolt for Mr Wallace to build on, and what support he might have reasonably counted on was dissipated by his ill-judged Russian policy and his Communist allies. For the time being, at least, the dream of a third party has been shattered, and the Democratic party has been shown to be the only practical instrument for those who wish to press ahead with social reform.

*

Mr Dewey's astonishing failure to carry states in the middle-west which he won in 1944 shows him to have been a very coastal candidate. In part this was a personal defeat. Mr Dewey's coldness, which handicapped him even inside his own party, is particularly unwestern; he suffered, as well, from the deep-rooted belief in the legend of the polished, calculating heartlessness of New York, of which Mr Dewey himself seemed so striking a personification. Mr Truman's refusal to admit defeat, his homeliness, his friendliness, even his ability to lose his way in the subtleties of foreign policy, are much more in the American tradition. Mr Dewey's failure in the farm states like Iowa, Wisconsin and Ohio also shows how effective was Mr Truman's charge that the Republicans, once they secured power, would leave the farmer to his fate, as they did under President Coolidge and President Hoover. The fact that this year there are farm surpluses for the first time since 1941, and that farm prices have gone down, made this more than an empty threat.

Two other issues were of outstanding importance in both the Presidential and the Congressional races. The determination of labour to punish Congressmen who voted for the Taft-Hartley Act and to reward the President who vetoed it, was a positive factor in inducing labour supporters to register and to vote. Purely by chance, 28 of the 32 Senate seats to be filled had been occupied by men who had voted for the Taft-Hartley Act. The American Federation of Labour has announced that no Congressional candidate who voted against the Taft-Hartley Act has been defeated whatever his party.

Less well organised than the labour vote, and for that very reason even more impressive, has been the swing toward internationalism. Foreign policy was not an issue between Mr Dewey and Mr Truman, but among the Senators whose terms expired this time were 18 of the 33 who voted against the British loan, 14 of the 31 who voted for the Taft amendment to reduce the size of Marshall aid, and 8 of the 17 who voted against the recovery plan. From this list there have gone down to defeat Senator Brooks (Illinois), Senator Robertson (Wyoming), Mr Rizley (Oklahoma) who voted against the Marshall plan in the House, Senator Ball (Minnesota) and Senator Revercomb (West Virginia) whose record was so offensive that not even Mr Dewey could afford to support him. There are two exceptions to this list of those who will not be missed. The Democratic tide saved Senator Johnson of Colorado, despite his isolationist record, and drowned Senator Cooper of Kentucky.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

How strongly the internationalist tide was flowing, even before the election, can be judged from the public recantation of Mr Harold Knutson, formerly the Republican chairman of the House Ways and Means Committee, who has decided to support the Marshall plan after 30 years of isolationism. The long and bitter Republican inquest may quite possibly conclude that they might have done better with Mr Stassen or Senator Vandenberg, who anticipated the tide instead of belatedly surrendering to it like Mr Dewey.

In the new Senate Democrats who are progressives in domestic policy as well as internationalists, like Mr Douglas, of Illinois, Mr Kefauver of Tennessee, and Mr Humphrey of Minnesota, will join the conservative Southerners who were the main survivals of the Republican victories in 1946. It was Mr Humphrey who at the Democratic convention wrote an even stronger civil rights clause into the party platform than President Truman desired, and thus forced some Southerners to walk out. The election of men of this stamp, coupled with Mr Truman's own mandate and his debt to labour support, will make Democratic policy more radical than it has been since the early days of the New Deal.

At the same time the victory is not without its embarrassments. The chairman of the all-powerful committees in both House and Senate will be, in most cases, not the men fresh from election triumphs, but Democrats from safe seats—mainly in the South—who, by virtue of the seniority rule, have an inalienable right to these rewards. The demonstration that the Democrats do not need a solid South does not, therefore, secure an automatic right of way for the civil rights programme—which may be a good thing. Labour, too, will expect drastic modification, if not outright repeal, of the Taft-Hartley Act, which Mr Truman, despite his campaign pledges, has found very useful on occasion. The new climate in Congress deprives industry of any hope of exemption from the Supreme Court's decision in the basing-point anti-trust case; and in the fields of social security, minimum wages, housing and public power the Democrats have a clear mandate for action.

One of the most significant results of the Democratic sweep is the transfusion of new blood received by a party which, only in July, seemed so short of outstanding candidates that it was forced—to its own good fortune as it has proved—to accept Mr Truman for the lack of any alternative. Not only the Senate victories, but the contests for state governorships have brought to the fore new leaders for the future. Mr Stevenson, the new Governor of Illinois, is typical of these new Democrats; his victory is accompanied, among a number of others, by those of Mr Lausche in Ohio and Mr Chester Bowles in Connecticut. A tired, dispirited party, apparently without any immediate future, has been transformed literally overnight.

Cold War on the Waterfront

[FROM A CORRESPONDENT IN SAN FRANCISCO]

THE maritime strike on the Pacific Coast has tied up all shipping except US Army transports at every port from Canada to Mexico; 253 ships are already lying idle and, as others now at sea make port, the number will eventually be 375. The strike is now in its third month with every promise of continuing for a long time yet, perhaps for as long as, or longer than, the 108-day strike of 1936.

This year's strike is advertised as a showdown against Communism on the waterfronts. With what others might consider a Californian flair for self-dramatisation, the strikebound shipowners and waterfront employers have unhesitatingly likened themselves to Generals Robertson and Clay in another theatre of non-agreement. At the outbreak of the strike, on September 2nd, they put on the gospel armour and gripped one another's hands in solemn, pledged agreement to wage a fight to the finish against "Communist party-line control" of the unions which work their ships and cargoes in Seattle, Portland, San Francisco, Los Angeles, Long Beach and San Diego.

The Pacific Coast maritime employers are firmly organised in the Waterfront Employers Association (152 stevedoring and allied interests) and the Pacific American Shipowners' Association (35 shipping lines). Maritime labour is in the main affiliated to the Congress of Industrial Organisations (the Sailors' Union of the Pacific, which belongs to the American Federation of Labour, is a notable exception and is not on strike). Habitually this CIO labour force follows the lead of Mr Harry Bridges, president of the International Longshoremen's and Warehousemen's Union. In the present battle he has united behind him in an "all sign or none" pledge the longshoremen, marine cooks and stewards, marine firemen, marine engineers, and a splinter group of AFL radio operators. A coastwide master contract, covering wages, hours and working conditions, has been under negotiation since February. Matters went from disagreement to a more or less expected stalemate on June 15th; whereupon, in accordance with the Taft-Hartley Act, the President directed the Attorney General to petition for an 80-day injunction against a strike. As this imposed midsummer "cooling off" period drew to an end, the two sides reopened negotiations, and it was thought that the prospects for a new contract were good. The employers had conceded to the unions the right to autonomous control of their hiring halls. From these, men are dispatched to jobs on the docks and on shipboard with no right of objection reserved to the employer. Further, the employers had offered the longshoremen a 10-cent hourly wage increase, which would have brought their straight-time rate to $1.77 an hour, or about $75 for the average work-week. Without going into what were called "fringe issues," it is fair to say that the two sides were only 5 cents apart on wages and nearly in agreement on all other unresolved points when the "cooling off" period ended on September 1st. That evening, Mr Bridges, as chief negotiator for the unions, presented some 30 peremptory eleventh-hour demands which, unless they were granted, would result in strike action the next day.

*

This brought the employers to a sudden, almost emotional determination to make a stand. They withdrew all offers and announced that no more negotiations would be held and no contracts signed with any union until each of its officers "filed with the National Labour Relations Board in pursuance of law (i.e., the Taft-Hartley Act), his affidavit stating that he is not a member of the Communist Party or affiliated with such party, that he does not believe in, and is not a member of or supports any organisation that believes in or teaches, the overthrow of the United States government by force or by any illegal or unconstitutional methods."

By choosing these grounds of battle, the maritime employers challenged the fixed policy of the left-wing CIO unions, which oppose the Taft-Hartley Act in all its terms but most especially in its requirement that unions which would call upon the National Labour Relations Board to force employers to bargain collectively must first compel their own officers to sign affidavits disavowing Communism.

There are estimates that about 10 per cent of the 30,000 men on the Pacific waterfronts are followers of the Communist party line. Despite the fact that the U.S. Supreme Court in 1943 found Mr Harry Bridges not a Communist and therefore declined to deport him to his native Australia as an undesirable alien, all waterfront employers consider him an aggressive, punctilious Communist party-liner. They apply the before-and-after June 22, 1941, test; before that date they say, he led demonstrations of longshoremen chanting "The Yanks are NOT Coming!," but after the Nazi invasion of Russia he abruptly changed his tune. Mr Bridges and his union have bitterly fought the Marshall Plan. His right hand man in the strike, Mr Hugh Bryson, head of the Marine Cooks' and Stewards' Association, is the California chairman of the Wallace Third Party. Disenchanted Communists have testified to a State Un-American Activities Committee that Mr Bryson and one-tenth of his 5,000-man union are card-carrying Communist party members.

Only the longshoremen's and cooks' and stewards' unions are flatly accused by the employers of being Communist-dominated. The greater the truth in this accusation, the longer the employers will probably have to wait for compliance with their conditions for renewing negotiations. Mr Truman has announced that there is nothing he can do to get the government back into the arena. He was, of course, in an awkward position, because he was campaigning for labour votes and forthrightly opposed to the Taft-Hartley Act whose terms the employers have invoked.

After several days of confusion, the Army, whose supply lines to Japan and other Pacific bases account for 20 per cent of all Pacific Coast shipping, got union clearance for loading its own ships, and longshoremen are benefiting by the work. Shipowners, however, have stood fast against coming to terms with the unions, for operating ships chartered to the Army, and this has obliged the Army Transportation Corps to take some of its own ships out of mothballs in order to keep the overseas GIs fed. At best, the Army says, it can supply occupation troops with only 80 per cent of their normal allowance of fresh food. Alaska, which is largely dependent upon imported goods and constantly expanding as a military base, has cried out for relief from the strike and is now consuming its last fresh provisions.

Assuming war with Russia should break out during the strike, it is safe to predict that the beginning of the one would mean the end of the other. No one in authority has said so, yet one is entitled to guess that known Communists and inveterate party-line followers would be swiftly picked up and perhaps even put in camps, as the Japanese were in 1941, by the Federal Bureau of Investigation. But the problem of serious fifth-column activity is not considered likely to arise in any other strategic industry on the West Coast, and if war broke out the non-Communist majority in the shipping unions would assert itself and smother all but the most elusive and forlorn conspirators.

American Notes

Mr Truman and Wall Street

The selling wave which swept Wall Street on Wednesday—with a turnover in excess of three million shares and a more than seven point fall in the Dow Jones Industrial Average—was a wholly natural reaction to Mr Truman's clear-cut election triumph. Over four weeks to October 23rd, the Dow Average had risen by 14 points to within sight of the 1947-48 peak of 193.16 reached only in June last, and with so much uncertainty still surrounding the business situation it seems altogether likely that a victory for Governor Dewey would have brought little more than formal acknowledgment in the light of the extent to which the market had discounted the potential benefits of a return to Republican rule.

Altogether, the positive gains which American business might have looked for from a Republican victory were probably quite small. Tax relief is the most obvious attraction which spokesmen for that party have stressed as a "spur for production and cure for inflation"; but apart altogether from the doubtful basis for that assumption, the Budget outlook with its grim stress on assistance for Europe and Asia, and rising arms expenditures in fact left very little room for manœuvre. No one has campaigned more actively, and more aggressively, for tax reduction than Mr Harold Knutson, the Republican chairman of the House Ways and Means Committee in the Eightieth Congress, and his successes have been followed by an insistent demand for further relief next year. But more than a week ago, Mr Knutson had reviewed his earlier estimates and reached the gloomy conclusion that no major relief is possible in 1949.

Similar considerations apply to quite a large degree in the wider field of economic policy. It is true, of course, that President Truman, and the more faithful of his followers in the Democratic Party have tried insistently to apply "selective controls" in the form of mandatory allocations, price and wage controls, and rationing, and that the Republican majority in Congress has effectively baulked those ambitions. But that political debate has now been conducted at a fierce partisan level for almost a year, and during that time the pace of the postwar inflationary wave may have slackened, but the movement has not been reversed. Both presidential candidates, in fact, were standing at a point where they were obliged to acknowledge the need for curbs against any fresh wave of expansion. Governor Dewey and his advisers might well have preferred to tackle the problem by a more direct and drastic approach in terms of purely monetary policy. But that is by no means certain, and such an approach, in any event, would have brought very little consolation to Wall Street.

In fact, the fundamental reason for the reversal of Wall Street's bull market is economic and not political. The American economy has reached a point where operations in all basic industries are at virtual capacity, and where reserves of manpower are now so low that any fresh stimulus to demand and any addition to the purchasing power of consumers can find its reflection only in terms of higher costs and prices. And such a process cannot continue indefinitely whatever the political complexion of the party in power. It is conceivable that a growing defence programme could be timed so nicely and so effectively that it did no more than to take up any slack brought about by lagging civilian demands, and thus permitted the economy to achieve stability at a level which is unprecedentedly high by any former standard. But that is not a probable development. What is much more likely is that 1949 will bring either a retreat from present levels of activity, or a pace of arms expenditure that will demand the imposition of new mandatory controls.

* * *

The Outlook for 1949

To say that Governor Dewey had little positive to offer, however, does not alter the fact that Wall Street and industry were looking for and longing for a Republican victory. Whatever controls Mr Truman now deems to be necessary (and his chance of persuading Congress should be greater than at any previous point in his career) will be sought in an atmosphere of hostility far removed from the "favourable climate" for business promised by Republican spokesmen. Mr Truman will no doubt endeavour, as he did earlier this year, to shift the incidence of any new tax burdens away from the consumer, and towards big business. Politically, he stands pledged to the repeal of the Taft-Hartley Labour Act, a measure which, whatever its defects may be, has contributed at least to some extent to union sobriety at a time when organised labour has reached its peak of industrial power. He is committed to vigorous anti-trust actions, and his Congressional majority can be expected to give short shrift to Republican moves for curbing the power of the Federal Trade Commission which, in its appeal to the Supreme Court this year, secured in the "basing-point" price decision one of the most disturbing rulings yet given for steel and other heavy industries. The Democrats too, may press for an earlier revision of farm "parity" supports, though that is not certain. And while industry is not disposed to be generous to farmers, it is sensitive to the fact that farm prices have already fallen very substantially below postwar peaks, and that farm income has been a major factor in the postwar boom.

Wall Street has been advancing simply because the persistent advance in earnings and dividend payments, coupled with "favourable" political news had focused attention upon the relative cheapness of stocks, and had temporarily obscured the adverse factors—domestic and external. Now, it has been brought back with a jolt to the realisation that security values must be very vulnerable at a time when the alternatives are declining business, or rising wages and "selective" controls, or tighter fiscal and monetary curbs. With Mr Dewey it would have hoped for the best; with Mr Truman it is expecting the worst.

* * *

Towards a North Atlantic Pact

The view that America should supplement the Marshall Plan with military aid and military commitments received its great initial impetus at the time of the Czech coup. Since then it has grown with astonishing speed. This has been a silent revolution, compared with the lengthy and acrimonious discussion which accompanied the Marshall Plan. What Mr Lovett called the "spade-work" of preliminary explorations has gone on throughout the election campaign, but far from this being a disadvantage, the ideas of military lend-lease and the North Atlantic Pact seem to have become firmly embedded in the bipartisan foreign policy.

Fear of being labelled as isolationist may have restrained many who would otherwise have been, and may still be, critical. But it is heartening to see the growing understanding of the military and political issues involved. The reaction to Senator Gurney's visit to Spain showed that Americans appreciate that a promise to liberate Europe after its occupation from bases along the European fringe is politically—and perhaps strategically—a delusion.

What Europeans must remember is that the United States has no large and balanced supply of weapons with which to equip

Europe; and such equipment as it possesses is inadequate even for American military expansion. Military lend-lease on a substantial scale will require large appropriations. With a Republican Congress a collision with the demand for a balanced budget would have been almost inevitable, and military aid might have been granted at the expense of, instead of in addition to, Marshall money for reconstruction. In addition, America's own military budget may be difficult to hold under a $15 billion ceiling, and controls more stringent than those which exist may be required. The Democrats may be more willing to accept such restrictions than the Republicans would have been, but the combination of larger foreign expenditures, with controls at home can be welcomed by neither party; at most they can be accepted as part of the price of peace.

The idea of a North Atlantic Pact, however, is to go further and make the United States a party to European defence. Such an alliance would be revolutionary, but what America will accept may be rather different from what Europe expects. The Vandenberg Resolution—the framework within which the Pact must be fitted—which was passed by 64-4 in the closing days of the last regular session was an expression of intent, and in no sense a commitment. The pattern which Mr Vandenberg had in mind for Europe was the Pan-American Defence Pact. This involves no automatic obligation to come to the defence of any member nation; the obligation is only to consult in the event of aggression against another signatory. With an American army in Europe, and American interests in Europe so clearly understood, this may be only hair-splitting; but no Congress is likely to give up its constitutional prerogative to declare war.

* * *

The Electricity Shortage

The biggest issue on which President Truman fought his campaign in the west was the right of the Government to expand its production and distribution of electric power. About 30 per cent of the electricity generated in the United States is hydro-electric, and about half of that comes from the great Government dams which, in the west and in Tennessee, are the most striking monuments to the New Deal. The Eightieth Congress insisted that new multi-purpose dams were to be built only if they were required for irrigation and flood control; the production of electricity, that is, must be merely a by-product. In addition, in cases where private lines existed, it refused appropriations for the construction of public transmission lines to take power from the dams to centres of distribution.

This, Mr Truman insisted, was the voice of the "power crowd" (the utility lobby) speaking through Congress. One of Mr Warren's achievements during the campaign was his success in obtaining from Mr Dewey assurances that he supported, not only multi-purpose works, but the public transmission lines which would make it possible for the Rural Electrification Administration and other public bodies to compete with the private utility companies for cheap power. It is not only these public agencies that favour federal electricity. Cheap power is the lifeblood of the aluminium industry, which is at odds with the private companies over their charges.

Load shedding and voltage reductions are not purely European practices, but in the United States it is industry, rather than the sheltered individual, which takes the cuts. Year-round daylight saving and "brownouts" in California, and a breakdown of air conditioning in Texas, have been the limits of consumer sacrifice. In 1947 2,000,000 new customers were taken on, 75 per cent of them in rural areas, reflecting farm prosperity. But industry at times suffered severe cuts, particularly in the west.

Although the production of electricity is well above the wartime peak, the outlook for this winter is still uncertain. Dry weather is once more threatening the output of water power. In California new steam plants have been built to counter this hazard, and private companies, which built 2,000,000 kW of new capacity in 1947, expect an increase of 5,000,000 this year. Even so, the margin of reserve capacity is likely to be narrower than it was last year, when it averaged 5 per cent. Normal reserve capacity before the war stood at between 15 and 25 per cent of total capacity. Leeway on this scale will hardly be recovered until the completion of the industry's five-year expansion plan in 1951, unless depression dries up demand.

THE WORLD OVERSEAS

Expansion of Dutch Industry

THE core of Holland's economic worries is how to close the huge gap in its balance of payments. Until that is done, the nation must rely heavily and precariously on large foreign credits and must postpone the day when it can enter fully and freely into union with its Benelux partners, Belgium and Luxemburg. Before the war Dutch exports paid for 75 per cent of the country's imports and the difference was made up by invisible exports, largely interest on investments and income from shipping. But last year exports paid for no more than 44 per cent of imports, while today invisible exports are negligible.

All schools of thought in the Netherlands hope that some day there may be a recovery in income from overseas investment, but meanwhile they are agreed that the immediate remedy is further industrialisation of what was in prewar days an economy highly dependent on unearned income and agriculture. With the exception of shipping, they place little reliance on a flow of income from invisible items. Investments in the United States now merely balance interest on current loans. Prewar investments of 4,000 million guilders* in Indonesia are not expected to produce substantial returns for some years to come, if ever. And Dutch prewar assets of about 1,500 million guilders in Germany are of no use for the present, since all efforts to reach agreement with the occupation authorities have failed. Income from international financial services and transit traffic on the prewar scale is also regarded as unlikely by Dutch planners.

Thus, assuming that they wish to avoid reducing imports, they are compelled to look almost entirely to increased exports as a means of balancing payments. Before the war agricultural produce and manufactured foodstuffs accounted for almost half of the Netherlands exports. But it is now the opinion of Dutch experts that neither Britain nor Germany, the best prewar customers for agricultural produce, will ever again resume their former importance as markets. So their plans call for maintaining the present level of agricultural production and, if necessary, seeking new markets, but no expansion is envisaged.

By this process of elimination they arrive at only one concrete hope—the possibility of making ends meet through a greater productive effort on the part of Dutch industry. To some extent this simply means harder work; more important, it entails an ambitious programme of modernising old equipment, expanding the existing plant and introducing new industries.

It is hoped that further industrialisation will help to close the payments gap in two ways—by increasing exports and at the same time by decreasing the need for imports. Between 1938 and 1947 the value of Dutch exports rose from 1,074 million guilders to 1,859 million. Because of the rise in prices, this represents a fall in the volume of exports, but the proportionate composition, with one or two exceptions, has remained remarkably stable. The fact is that little progress has so far been made in obtaining any contribution towards exports from new or expanded industries.

PERCENTAGE OF TOTAL EXPORTS

Industries	1938	1947
Agriculture, cattle breeding and fisheries	24·8	27·8
Manufacture of foodstuffs and luxuries	22·5	18·0
Metal industries (including shipbuilding)	22·0	20·0
Chemical industries	10·2	10·3
Textile industry	7·5	12·4
Mines and peat production	4·4	0·9
Other branches of industry	8·6	10·6
	100·0	100·0

* £1=10.7 guilders.

In the industrial field, only textiles have increased their share in the total exports, but even here the volume of exports, with the exception of rayon, has not yet reached the prewar level. Moreover, once the wartime dearth of textiles is made good, it is doubtful to what extent the Dutch can rely on expanding or even maintaining their present markets. The best long-term prospects appear to lie in the development of the chemical, metal and electrical industries and, to some degree, of the steel industry.

The principal obstacle to increasing the export of manufactured goods is the failure of output per man to reach prewar standards. When in 1946 the Dutch planners set down production estimates, they assumed that by 1947 the productivity of labour would rise to 95 per cent of its 1938 level and that by 1948 it would reach 102 per cent. In fact, by mid-1948 production per man hour was still only 85 per cent of the prewar rate. In part this failure is due to the lack of modern equipment, but the fault also lies with a shortage of skilled labour and competent industrial leadership. A second obstacle to expansion has been the difficulty of obtaining imports of capital quipment.

Equally serious is the problem of how to finance new industrial development. In the past, Dutch industry had no need to look beyond its own frontiers for capital, since nearly all its new capital requirements could be met by self-financing processes. The war, however, has dried up many sources of revenue which previously fed Dutch industry, and the relief offered by the liquidation of foreign assets has been temporary and inadequate. Furthermore, the tax on company profits is, by Continental standards, at a cripplingly high level: 41 per cent of net profits must be turned over to the state. The Government has established a domestic Reconstruction Bank, but its resources are limited.

This shortage of new capital is all the more disturbing in that the Netherlands is still grappling with some of the legacies of war and occupation. For example, in dealing with 1947, the report of the Central Planning Bureau estimated that of the 2,200 million guilders required for net capital formation in that year, roughly one-half would be needed for repairing damage to transport apparatus, housing and other buildings, and for the restoration of depleted stocks.

Added to these burdens is the necessity of financing new industrial programmes. All in all, it is apparent that a substantial part of Holland's capital requirements—possibly not far short of half—must be met by foreign credits. If the Marshall Plan continues on its present scale, most of the foreign credits will come from public sources. But Dutch industrialists are also looking hungrily to American private investors for the necessary funds to put new Dutch industries on their feet. They are not looking in vain. The past year has seen the establishment of several concerns with the help of private US capital—the Dutch American Tyre Factories to which Goodrich has contributed about 20 per cent of the capital, and a Kaiser-Frazer automobile assembly plant.

But from whatever source it comes, foreign credit is a basic assumption in the recovery projects of the Netherlands, and if that assumption is sound, then Dutch statistics at least look plausible. The Planning Bureau's estimates for capital requirements indicate a peak in 1948. They assume that of the net national product, roughly 20 per cent will go to gross capital formation. The initial programme drawn up for the US State Department last year gave the following figures showing the total amounts required for investment in the three years 1947-8-9 and the proportions intended for various branches of industry.

NETHERLANDS INVESTMENT PROGRAMME, 1947-48-49.

Purpose	*Guilders (millions)*
Shipping	755
Transportation	1,200
Industry (building and equipment)	800
Restoration of stocks	760
Public works	500
Residential housing	1,150
	5,105

It is from this programme that the Government hopes to ensure the domestic production of many semi-manufactured and finished products which were previously imported. This is one step towards reducing the gap in the balance of payments. But it is also hoped to bring about a large expansion in the production of electrical and radio equipment, chemicals, textiles, precision instruments, furniture, ceramics, and toys; and it is further anticipated that many of these exports will go to former German markets in the Americas and Asia.

If the Netherlands succeeds so far in carrying out the plan for industrialisation, it will have to tackle one further barrier. Under an agreement with the other Benelux countries, Holland is bound to proceed "in such a way that [its industrialisation] will not cause any prejudice to Belgium's legitimate interests." In practice, this means that there is a big list of industries in which no new establishments or extension of existing plant are permitted without previous consultation between the partners. The list includes many trades in which Dutch industry is being urged to expand: a number of chemicals, steel, certain engineering parts, furniture, coal and rubber.

At the moment Belgium is one of Holland's largest creditors. It also supplies the Dutch with many vital industrial products and it buys an appreciable share of Dutch agricultural exports. The Belgians are obviously in a strong bargaining position, but long-term self interest may well lead them to prefer a prosperous to a dependent partner in the union—even if it means increased competition from Dutch industry.

Poland's Fears for its Frontier

[BY A CORRESPONDENT]

A DISCUSSION at this moment in the British or American press of the frontiers of Poland is, or should be, of largely academic interest. As Professor Namier, the leading authority in this country on the history of those regions, has written:

> The Anglo-Saxon Powers cannot reach Poland with a view to increasing, maintaining or reducing her territory, or even to securing her real independence however desirable this might be. Therefore the less they interfere where they cannot act and do not mean to, the better for all concerned.

Nevertheless the question of Poland's new western frontier is one into which the Anglo-Saxon Powers cannot help being drawn; they are political trustees of part of Germany and are thus inevitably involved in the repercussions of frontier changes upon Germany itself. The fact that the Polish Government has thought

DRY FLY SHERRY is now available in larger quantity. A glass of this lovely sherry is a gracious welcome to your guests. From your own wine merchant or direct from:—

FINDLATER MACKIE TODD & CO. LTD.
Wigmore Street, London, W.1.

New York Agents:
Greig, Lawrence & Hoyt, Ltd.

fit to publish at this moment in London a stoutish collection of documents bearing upon this issue, suggests that the Poles are very alive to this fact, and makes it useful to see exactly where the matter stands.*

Poland's lack of natural frontiers has caused the position and shape of the country on the map of Europe to alter more than that of any other; but the westward shift in its axis that took place in 1945 has meant a reversal of a trend that seemed to be accomplished by the fourteenth century. The changes cannot in fact be justified by either history or ethnographic consideration; no amount of tinkering with spelling can retrospectively confer upon Stettin (now Szczecin) or Breslau (now Wroclaw) the character of Polish cities, to the satisfaction of anyone but an antiquarian.

Indeed, the Polish claim to have the Oder-Neisse frontier regarded as permanent, and subject only to the definition of details in an eventual peace treaty with Germany, is not to any significant degree based upon considerations of this kind. The essence of the Polish case, as revealed in the present documents, is that the change is first motivated by strategic considerations. Germany they say, has lost the base from which its attacks against the Slav nations were launched. Second, the Poles point to the contribution that the new territories can make to the economic development of Poland. They cling to the agreement reached at Potsdam that the standard of living in Germany is not to be higher than that of any of the continental allies of Great Britain and the USSR. The improvement on Poland's prewar living standard that this implies can only be achieved with the aid of the productive capacity of the new territories. They provide a net increase of between 50 and 60 per cent in Poland's industrial capacity and in agriculture a greater potential because the newly acquired lands are more fertile than those ceded to Russia.

A third argument for the frontier is implied: it is that the new Poland, unlike the old, has a relatively homogeneous racial complexion. In 1939, the population of the new territories (then German) amounted to 8,800,000; the latest Polish figures show a population in this area of 5,250,000 Poles and 100,000 Germans. Of the Poles settled in this area nearly two million are, or will be, from the territories east of the Curzon line now ceded to Russia, together with their predominantly non-Polish populations.

Dependence on Russian Protection

If these are the basic arguments from the Polish side—along with the memory of their immeasurable sufferings at the hands of the Germans—it is obvious that the dominant arguments in the minds of the statesmen of the Great Powers, who approved the frontier changes at Yalta and Potsdam, were of a different nature. For the Russians, the changes mean that the new Poland cannot resume the foreign policy followed in the interwar period —described in the preface to the present volume as "hunting for the phantom of security by an unreal 'balance of power'." Poland is now and forever tied to Russia, as the only Power that can protect it against what are bound to be the first territorial demands of a resurgent Germany. Over a recalcitrant Poland hangs the threat that Russia will once again put its policy into reverse and share with Germany in yet a fifth partition of the Polish spoils. It is Poland's gains from Germany, not Russia's gains from Poland that constituted the real triumph of Soviet diplomacy in this region of the globe.

The fact that the Poles are now bound to follow Soviet policy without public questioning is clearly shown by the documents in this volume, which faithfully echo the Soviet demands for a united and democratic Germany. In this respect, particular significance attaches to the speech of the Polish Foreign Minister Mr Modzelewski made on June 26, 1948. Here, and in Notes to the western Powers, the Polish Government's case is that only Soviet policy takes proper account of Polish interests; that the western Powers' policy in Germany can only have the effect of reviving an aggressive and powerful German nationalism, and more specifically that, in the British and American zones, too much toleration has been extended to admittedly revisionist movements among the German population expelled from the east. This latter charge was stated in detail in documents enclosed with a Note to the British Government on August 31, 1948—documents that are worth reflecting on, and would seem to show that the foundations already exist for a movement of the kind the Poles fear, and one that British and American occupation authorities should watch.

If the motives of the Soviet Government for agreeing to the changes were political, so, too, were those of the western Powers. For Mr Roosevelt and Mr Churchill at Yalta, the question to be settled was one of satisfying Soviet claims in the east with the least damage to the interests of Poland. It seemed reasonable that a Polish-Soviet agreement should be sought at Germany's expense; there is no doubt that Poland's western gains were thought of primarily as compensation for its eastern losses. An extension of territory to the Oder to include Stettin had been promised to the Polish Government in London in a letter from Sir Alexander Cadogan to Mr Mikolajczyk's Foreign Minister, dated November 2, 1944, and now printed for the first time in the original. On the other hand it is probable that, insofar as the exact area involved is concerned, it was the Eastern and not the Western Neisse that was in the minds of the western statesmen—a difference involving the fate of three million Germans.

Basis of Polish Claims

Thus Mr Churchill, speaking on June 5, 1946, declared that in his view the Curzon line was a rightful Russian frontier, and that a free Poland should receive compensation "at the expense of Germany both in the Baltic and the west, going even to the line of the Oder and the Eastern Neisse." By then, events had outstripped him: by the Potsdam Agreement of the previous August, Poland had been allowed to occupy territories as far as the Western Neisse, subject only to the provision "that the final delimitation of the western frontier of Poland should await the peace settlement." The Poles and the Russians have consistently argued—and international law would seem to give some colouring to the claim—that "delimitation" can only refer to modification in detail, and that the frontiers of Poland were finally fixed by this decision. The fact that Poland was allowed to proceed with the expulsion of Germans and the introduction of Polish settlers is of course an even more powerful argument for stating that the frontier was regarded as settled.

Nevertheless, British statesmen have never concealed their qualms about the Potsdam frontier. The British case for revision is not, however, in the first instance, based upon the injustices involved, or the economic problem created for Germany by the loss of lands that provided over a fifth of its prewar supply of food. It is rather that assent to the frontier was given at Potsdam on conditions that the Polish Government has not fulfilled. These concerned primarily the guarantee of free elections under the new Polish regime, and assurances about the proper treatment of those Poles who had fought with the western Allies. Mr Bevin declared on October 22, 1946:

> We see no reason why we should finally ratify the cession of this vast territory to Poland, without being satisfied that those assurances have been fully carried out. We should also wish to be assured that the Poles were able to develop this territory so that the economic resources were properly used, and that it did not become a wilderness from which all the Germans had been excluded, but which the Poles were unable to populate.

The reported economic progress of Poland's western territories suggests that it might be difficult to make a case out on this basis; but it looks as though the official British position is still that the matter is one for full discussion when the peace treaty with Germany is finally drawn up.

No Clear Agreement at Potsdam

Such, even more emphatically, is the American viewpoint. Mr Byrnes, in his Stuttgart speech on September 6, 1946, made the first categoric denial that any specific changes, other than those in East Prussia, had been agreed on at Potsdam. At the Moscow Conference in April, 1947, Mr Bevin supported Mr Marshall's view that a settlement of the question must take into account its likely effect on the German economy. The other lands claimed by Poland, which were mainly agricultural, should be divided with an eye to the needs of the Polish and German peoples, and of Europe as a whole. Mr Marshall also pointed out the desirability of doing nothing to discredit democratic German forces and give weight to the propaganda of militant national groups. In the long run, it would not help Poland to be given frontiers which would create disorder later on. Mr Bevin added a pertinent question: Was it likely to improve the prospects of peace if they forced Germany to industrialise itself still further to make up for its increased density of population? In his statement on the London conference in December, 1947, Mr Marshall placed it on record that Germany's eastern frontier was among the subjects upon which no agreement had been reached. Only France of the western Powers seems to have accepted the Potsdam frontier as more or less definitive.

Recent activities and statements by the Polish Government have

Something in the City

Yours to hand

The glove situation is particularly healthy just now. We have all types—chamois, cape and real hogskin gloves—hand and machine stitched, with and without buttons, in every degree of warmth from the unlined to those lined in lamb's wool. Prices from 21/- to 75/3. (No coupons.)

Stiff White Collars

The demand for stiff white collars in the City is persistently higher than can be met from current supply. Nevertheless, we have a small stock which is supplemented from time to time. As with many other things, it's a matter of being quick off the mark.

MADE IN FIVE SIZES

shown two things: First, that Warsaw does all it can to maintain both the appearance and reality of independence in its German policy; second, that the dread of German nationalism, directed at the western frontier, is never far from its thoughts. A question that has almost been forgotten by the common man in western Europe is frighteningly alive in eastern Europe. Now that Germans are being wooed by all the Great Powers, it is bound to come to the front again. Any attempt to draw up a peace treaty with Germany would run straight into conflict over the frontier question, and the Polish Government is pushing its case before the British public in anticipation.

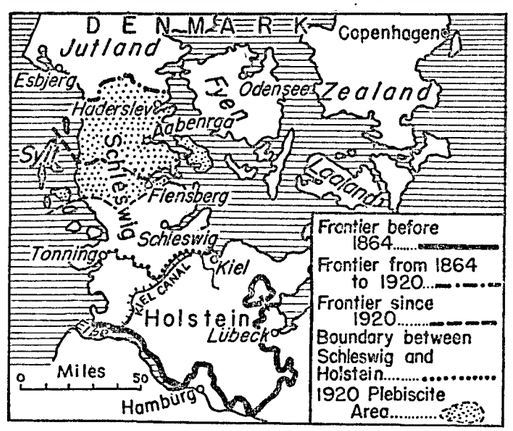
Talks on South Schleswig

BRITAIN has little realisation of what it means to be the small neighbour of a big, efficient and disgruntled Power. This failing may account for a certain awkwardness and lack of sympathy in dealing with Danish representations concerning South Schleswig in the last two years. But, equally, on the Danish side there has been some difficulty in understanding the position and responsibilities of the British Military Administration in Germany. Recent informal talks between the British Government, represented by Lord Henderson, and an all-party Parliamentary delegation from Denmark led by the Foreign Minister, Mr Gustav Rasmussen, seem happily to have led to a much better appreciation of the parties' respective positions.

The British Government has undertaken both to investigate the possibility of securing the equitable distribution in Germany of the east German refugees now in South Schleswig and, secondly, in consultation with all directly concerned to give urgent consideration to practical proposals to secure for the Danish-minded population of South Schleswig the freedom, in addition to their normal civic rights, to enjoy their ancient Danish culture.

There is no reference to the third demand the Danes have consistently made, that South Schleswig should become administratively independent of Holstein as a new *Land* Süd Schleswig within the British zone of Germany, with its own *Landtag* and its own government, directly responsible to the occupation authorities. Nor would it require the skill of a lawyer to pick holes in the phrasing of the undertaking the British Government has agreed to. The important thing is that the conflict between the British and Danish attitudes has been largely resolved.

But the problems of South Schleswig are little nearer solution. The most serious is the presence of 394,000 refugees from other parts of Germany, mainly East Prussia. Their vigour and efficiency is fast gaining for them control of the province, which has a total population of some 800,000. The German Government of *Land* Schleswig-Holstein at Kiel has actively fostered the process. On April 4, 1948, it issued an order that, other things being equal, a refugee soliciting an official post is to be preferred to a native. In the last two years 300 out of 350 official appointments made have gone to refugees. No wonder the Prussians say that in five years time they will be "running the place." The Danes do not relish the prospect of a Prussianised and over-populated South Schleswig over the frontier from the thinly populated Danish North Schleswig.



This in the long run is a much more important problem than the securing of various concessions for the Danish minority. For, quite apart from the Prussian element, the Danish section, whose birth-rate is lower than the German, is being increasingly outnumbered. Nor is the swift growth of the *Syd Slesvig Forening* (South Schleswig Association) a cause for unqualified satisfaction. In Flensberg, for example, it had about 9,000 members in the early 1920's: last June it had over 28,000. Its total membership is now about 75,000. But this great increase in support is commonly considered to include a fair number of people who wish to get away from Germany rather than to return to Denmark. The improvement in conditions in the western zones—and the German reaction against the Danish attitude—seems to be reversing this trend. In the local elections on October 24th the Association lost considerable ground. It would clearly be unwise to build future Danish policy towards South Schleswig on the apparent strength of the South Schleswig Association.

The British Military Administration at first viewed the problem of the Danish minority simply as one more administrative nuisance in Germany. In this spirit the British memorandum of September 6, 1946, suggested three solutions, all quick ones. The German sympathisers in North Schleswig, which is in Denmark, should be exchanged for the Danish adherents in South Schleswig. There should be a plebiscite in South Schleswig followed by a frontier adjustment: the present frontier was fixed in this way in 1920. Thirdly, the frontier should be adjusted without a plebiscite and by agreement between Denmark and Britain.

The Danes in a Note of October 19, 1946, rejected all three proposed solutions. Transfers of population or adjustment to the frontier were considered inopportune. Their counter-proposals aimed therefore at reinforcing the position of the Danish minority so that, when conditions became more propitious for change, it would have had the time and opportunity to build up its national identity. Three proposals were advanced to this end. The Danish-minded population should "on a basis of self-determination" be ensured common civic rights, including free cultural and political expression on an equal footing with other permanent residents in South Schleswig. The refugees from eastern Germany should be removed. South Schleswig should become administratively independent of Holstein within the framework of the German state.

The British rejected them. The administrative independence of South Schleswig was not considered feasible. There was nowhere else in the British zone where the refugees could be housed. The rights accorded to the Danish minority represented the maximum concession at present feasible, since no group of German citizens could be singled out for special treatment.

This reply caused considerable annoyance and disappointment in Denmark. Memories of what was called Britain's blindness in failing to rally to Denmark when, in 1864, Prussia seized from her the Duchies of Holstein and South Schleswig were revived. Inside Denmark there were stormy scenes and bitter disputes. The supporters of an active policy towards South Schleswig, among whom in a purely personal capacity—as he continually reminded his audiences—was the Liberal Prime Minister, Mr Knud Kristensen, clashed with the advocates of the official and gradual solution. And it was on this issue that Mr Kristensen was forced to resign just over a year ago.

The Social Democrat Government which succeeded him made no new moves. Negotiations were revived by the British action early in December in insisting that the South Schleswig Association must decide whether its role was political or cultural. If political, it must abide by the same rules as other German political parties and cease to work for the administrative separation of the territory and to rely on help from abroad. At the end of December a further Note amplified the above standpoint, and made it clear that Britain considered the debate about frontiers adjustments as closed. The Danes replied in March through their Ambassador in London, who asked again for the creation of a separate *Land* Süd Schleswig and for further measures to alleviate the pressure of refugees.

No British reaction to this *démarche* was made public; but, in a debate in the *Rigsdag* early in June, the Danish Government spokesman foreshadowed the change both in the British and the Danish attitudes which reports of the recent talks reveal. No decisions were taken in the London talks: the problem is not ready for that. But it has been clarified and set in perspective. These actions in themselves should facilitate its solution. They should also mark the end of an unnecessarily embittered chapter in Anglo-Danish relations.

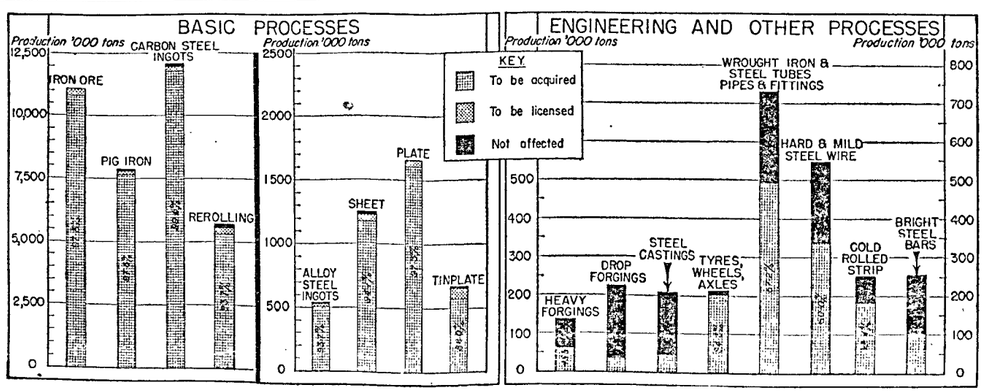
THE BUSINESS WORLD

The Steel Bill Examined



AN earlier article surveys several of the matters of principle which arise from the Government's Iron and Steel Bill. This article has the more limited aim of examining the means which the Government proposes to employ "to bring under public ownership the main producing undertakings in certain sections of the iron and steel industry." In a Bill of this size, with its 58 clauses and 8 schedules, there is more than enough matter for comment. But there are three broad heads under which useful discussion can fall: the definition of the industry to be taken over; the terms on which the state will pay for it; and the interest of the consumer in the future financial arrangements of the industry.

The first of these three topics is broadly illustrated in the chart accompanying this article. The Bill sets up a public authority, to be called the Iron and Steel Corporation of Great Britain, which will consist of a chairman and four to ten other members, all appointed by the Minister of Supply. The Corporation will acquire the debenture and share capital of 107 major companies concerned with getting iron ore, smelting pig iron, producing steel ingots, or the hot rolling of steel. Companies which produce at least 50,000 tons of iron ore, or 20,000 tons of pig iron, ingot steel, or hot rolled products will be compulsorily acquired. Those which produce less than those tonnages, but more than 5,000 tons, will require a licence from the Minister. But in acquiring the securities of the major companies engaged in these basic processes, the Corporation will also take over their interests in subsidiary companies and activities. Thus the Corporation's interests will stretch well beyond the strict confines of the iron and steel industry; they will include important sections of the engineering industries, finished products like tubes (of which two-thirds of the capacity at work in 1947 will be taken over), tyres, wheels and axles (virtually the whole), wire (60 per cent) and cold rolled strip (nearly three-quarters). This is not all. The ancillary activities of the companies to be acquired range into general manufacture of chemicals, fertilisers, building products, and every kind of steel manufacture from a giant bridge to an umbrella frame.

Although the Bill makes provision, under certain conditions, for the Minister to direct the Corporation to divest itself of any of its assets (thus making it possible, to put forward a rather extreme example, for Dorman Long's engineering interests to be sold by the Corporation to some outside purchaser) it is fairly clear that the guiding principle of the Bill in providing for the acquisition of the subsidiaries is the very simple one that "what was good for the industry must be good for the Corporation." But there will now be an important difference, since the state-controlled undertakings, with access to state-produced raw materials, will be competing in many steel using industries with privately-owned concerns. A close watch will need to be kept on both Government-controlled and privately-owned sectors, to make sure that competition between the two is fair. The fact that the Corporation will control a major share of these ancillary activities while in all it will have complete power over supplies of raw materials illustrates one of the risks of defining in such vague terms what "certain sections of the iron and steel industry" really means.

The total issued capital of the 107 companies to be taken over is estimated at about £195 million, and its acquisition will involve the issue of about £300 million worth of Treasury-guaranteed compensation stock. In addition, the Corporation will have power to issue (though not necessarily under Treasury guarantee) up to £350 million of further capital. In terms of capital obligations, the Corporation promises in time to be the second in size of the nationalised industries. It will, however, be very differently organised from its forerunners. The companies which are taken over will be preserved intact, together with their own managements and selling organisations. There is to be no taking over of physical properties, but only of securities. The Corporation will merely replace the existing holders of steel company capital. Thus on vesting day (May 1, 1950, at the earliest, and possibly as late as November, 1951) there will be no perceptible difference in the appearance of the industry—only in its share registers, which thereafter will have only one entry.

There is a good case in political and commercial expediency for leaving the existing companies in being—even a state-controlled steel industry may want to make the best of both worlds, particularly since the goodwill of many steel companies in the

outside world is high. But there is no acceptable case at all for the method of compensation, which, once again, is by reference to the Stock Exchange values of the securities, taken during the month of October, or on six mid-monthly dates before the General Election in 1945. It will be said, of course, that since the 1948 prices are generally higher than those of 1945, stockholders are being fairly treated. Nothing could be further from the truth. Equities as a whole are higher than they were in 1945, owing partly to Daltonian inflation. Steel shares have, in fact, been kept lower than they would otherwise have been for three reasons. Nationalisation itself has been overhanging the market. The industry has been prospering, but its dividends have almost without exception been fixed by dividend limitation—a piece of market rigging which at least transport stockholders were spared. And thirdly, there are several steel companies which, but for Dr Dalton's penal and unjustified bonus issues tax would have restored their issued capital to match the expansion of their real capital since the depression and capital cuts of the 'thirties. In terms of current and prospective earning power, in terms of fair current values for the fixed and floating assets which are being taken over, the Government is once again nationalising on the cheap. Such loading of the dice by the Government in its own favour as a buyer calls for the most emphatic protest.

★

To mention only one anomaly out of many, Steel Company of Wales 3 per cent debenture stock, which is finally redeemable in nine years' time at 101 and was issued only sixteen months ago at par, is to be acquired at £98 18s. 7d. per cent. It is no fault of the issuers, or the company, or the holders that this stock has been a difficult market since July last year. It is grossly unfair that the holders, who were prepared to adventure £15 million of their money in a promising undertaking at a low rate of interest for ten years, should be penalised for their enterprise. This is a somewhat special case. There are others which are as bad. Half an hour with a handful of consolidated balance sheets shows that the Corporation will be picking up undertakings which are so well endowed with current assets that the value to be imputed to their fixed assets—given the limitation of total compensation to Stock Exchange values—will be a small fraction of their true value, reckoned either by earning power or replacement cost. Dorman Long is one case in point, and there are many others.

Not all securities, however, have a Stock Exchange quotation. This is a point which applies to English Steel, which is to be torn from its parent company, Vickers. The value of unquoted securities may be settled by agreement or by arbitration. But the arbitrators are instructed to determine their value as that which the "securities would have had . . . if they had been quoted in the Stock Exchange Official Daily List" on the relevant dates, regard being had to "securities which, as regards all matters affecting their value, are most nearly comparable to the (unquoted) securities." Thus, even in the cases where valuation by reference to assets or prospective earning power would have been natural and convenient, there is a provision, failing agreement, to set up the wholly artificial concept of a notional market value for securities which have always been held in private hands. No words are too strong to condemn the inequity, the lazy-mindedness, and the sheer opportunism of using artificially depressed Stock Exchange prices for buying out an industry whose true asset value far exceeds what will be paid.

The third general question for comment is the future financial organisation and management of the industry. The Minister takes the now familiar powers to issue directions on matters "which appear to him to affect the national interest" and the Corporation must give effect to them. He will also supervise the general programme of development; he can compel the Corporation to shed part of its interests or activities; he can require information and reports; he may appoint committees to represent the interests of consumers, and define their functions. Thus in the broader questions of policy, the Minister will be all-powerful. He will say, in the last resort, what the future size of the steel industry shall be; he will determine (with Treasury approval) what subsidies are to be paid to the Corporation in respect of imported raw materials. It is true that the Corporation is charged with the general duty of securing that iron ore, pig iron, steel ingots and hot rolled products (the Bill says nothing of its other steel and ancillary products) "are available in such quantities, and are of such types, qualities and sizes, and are available at such prices *as may seem to the Corporation best calculated to further the public interest in all respects.*" Whatever this obligation may mean—

and the words almost defy interpretation—there is one thing which it cannot mean, namely the supply of steel at the lowest possible price, consistent with the Corporation's costs. It is for the Corporation to judge what is good for the consumer "in all respects," and the Corporation's conception of "public interest" might well prompt it to charge differential prices for the same products to different consumers. The state already owns coal, electricity, gas, and public transport—all heavy users of steel. It controls the investment programmes of other industries like petroleum and shipbuilding and the export programmes of innumerable trades which use steel. There is nothing in the Bill which suggests—much less proves—that the Corporation's attempts to further the public interest in all respects and hold a fair balance between all consumers will be infallible, or even impeccable.

To leave the Corporation virtually in sole charge of price policy is to hold a child-like faith in the virtues of public monopoly as opposed to the present system of private monopoly under Government supervision. Any system of differential prices in the home market, of concealed subsidies and price premiums, and the equalisation of prices by the use of reserve funds is bound to have arbitrary and uneconomic results. A similar objection applies to the taking of power under the Bill to continue the present system of subsidies on imported raw materials. The estimated cost of these subsidies in the current year is £22 million. The taxpayer finds this sum so that the steel consumer can get steel below the true price—about 5 per cent below on the staple products. The system has little in its favour. It is a burden on the revenue, it encourages part of the very excess of demand for steel of which the Government continually complains, and it results in an unduly cheap price for exports of steel manufactures. Its preservation in the Bill, as if it were inherently desirable or an integral element in a rational system of steel economics, is open to the most serious objection.

Another feature of the Bill which requires careful scrutiny is the protection to be afforded to the consumer. The Minister must appoint one or more committees representative of consumers' interests (after consulting with the Corporation and including perhaps some of their nominees), but he has discretion to define their functions. Consultation with consumers has been the weakest feature in the development of nationalisation to date. The consumers' councils are typically worthy, windy, and weak. As a corrective to the power of a public monopoly to charge what it decides for quality which it determines, the councils so far have had very limited value. It is necessary to insist, yet again, that nationalisation must be judged not by the size of its surplus, or more frequently its deficit, but by service and cheapness to the consumer. Mr Strauss will be wise to demonstrate how the consumers' committees can secure these ends.

Multiple Exchange Practices

RECENT events in France and others impending in Italy provide some basis for the hope that the resort to multiple exchange practices is on the wane. Admittedly, as an article in these columns a fortnight ago showed, there is still room for doubt about the way in which the new French exchange arrangement will work, but, at least for the time being, the pattern of commercial rates at which the bulk of French external trade is transacted is governed by the official parities notified to the International Monetary Fund. In Italy the toleration of disorderly cross rates in the commercial foreign exchange structure is of longer standing than in France. But here, too, the abuse is likely to be removed by arrangements acceptable to Italy, to the International Monetary Fund, and to the countries most seriously injured by the system—that is, Britain, and the other members of the sterling area.

It might, perhaps, be thought that these welcome developments, coming so soon after the meetings of Governors of the IMF in Washington, arise from decisions taken there. Such a conclusion would probably exaggerate the role which the IMF has played. The subject was certainly mentioned during the Washington discussions, and the annual report of the executive directors of the IMF makes some sensible references to it. As it points out

> The practical effects of deviations from an orderly pattern of cross rates are particularly serious when the country concerned plays a major role in international trade. In any country where the cross rates place a premium on the dollar, there is an inducement for traders to purchase goods from other countries for resale in the United States, and thus divert part of the dollar receipts which would otherwise accrue to the countries of origin.
>
> Export and import restrictions may limit the scope of such transactions, but it will be difficult to check them entirely when the goods diverted are raw materials which can be converted into manufactured goods for which the United States offer a market. To avoid further inroads upon their dollar resources by operations of this kind, countries may be obliged to impose still more stringent trade restrictions.

For these and other reasons, the IMF attaches importance to the maintenance of orderly cross rates as a means of protecting its members and encouraging an appropriate redirection of international trade.

The references in the IMF report to multiple currency practices as such, however, were rather more tolerant. The directors emphasised that certain countries, particularly in Latin-America, had used such practices as a means of restricting imports without resort to complicated administrative machinery and without giving the recipients of import licences opportunities for large windfall profits. The gist of the recommendations on this particular issue was that since these practices were mainly a product and symptom of domestic inflation the main remedy was to be found in measures to halt inflation and to achieve such an adjustment of local costs to prices as would facilitate the establishment of a genuine rate of exchange.

It seems from these passages that the IMF discussions in Washington are not likely to have provided the driving force toward the new remedial measures. A much more likely explanation is probably to be found in the Paris negotiations which preceded the launching of the intra-European payments scheme, with its substantial interchange of contributions and drawing rights between European recipients of Marshall aid. The main contributions came from Britain. The largest recipient was France; but Italy, too, will enjoy drawing rights against the sterling area. In the give and take that preceded agreement on this mutual aid, it would not be unreasonable to assume that Britain imposed certain conditions on the taker—notably the requirement that exchange arrangements providing opportunities for disorderly cross rates should be abandoned, since these rates did considerable harm to commercial interests in the sterling area.

Assuming, however, that the cross rates in France will henceforth conform to the official parities and that a similar conformity will before long be established in Italy, it still does not follow that the problem of abnormal and damaging distortions of international trade arising from commercial rates for sterling which diverge from the official parity will have been solved. It is true that some of the more glaring and annoying of the "irregularities" are likely to be stopped. For example, circumstances ought not to arise again in which British fur dealers find in the New York market the very pelts previously purchased on French account at fur sales in London—indicating a loss of dollars for Britain. Similarly, an end should be put to the recent practice by which French manufacturers of certain types of soda, although offered a market for part of their output in Britain, decided instead to sell the whole to Swiss firms, compelling British buyers to make their purchases from Swiss sources—in one of the hardest of hard currencies. Nor should the cross-rate issue again be presented in such blatant terms as those offered when French cloth required in this country for making up was offered at two prices, one expressed in dollars, one in sterling, the two being related by a cross rate diverging widely from the official parity. If the arrangements with Italy are satisfactorily concluded, there should also be an end to the recent highly attractive offers made by Italian merchants to Indian tea exporters to sell, through Genoa, the whole of the tea shipments destined for the United States and with the freight paid for the comparatively short voyage to Italy.

In all these cases, merchants in the countries in question could make an abnormal profit by buying in sterling, which they obtained at the official rate, and selling in hard currencies which they could then sell partly at the official, partly at the free, rate, or at an average of the two. The amount of trade diverted from its normal course by these devices may not have been so large as to do really serious damage to the balance of payments of the countries adversely affected, principally those of the sterling area. But the damage done to individual traders and to long established merchanting relations between individual firms and their agents overseas was, in certain cases, considerable. For instance, a tea importer in the United States, who had always dealt satisfactorily through a London firm, suddenly found that competitors were getting their tea 10 to 20 per cent cheaper by buying through Italian merchants; the damage done to the goodwill of the London firms in such a case will take a great deal of reparation.

*

But, although such abuses as these may be stopped, there is another aspect of the problem of disorderly or unofficial cross rates which is far less susceptible of remedial action, whether by the IMF or under pressure of Britain's strong bargaining position through the intra-European payments scheme. This is the much more intangible manifestation of cross rates which merely emerge by implication from international transactions veiled as barter or commodity compensation deals. An example, not wholly devoid of verisimilitude, will illustrate the complexity of these deals. Wool is bought in Australia on Dutch account and put on board ship with documents duly attesting the transaction cif Rotterdam. At a convenient point in the course of the voyage the wool is transhipped, sent on to New York and the documents duly amended. The wool is sold for dollars. These dollars are then used to buy a commodity in short supply in Europe—say newsprint. This is then sold for sterling to a European country, preferably in the transferable account group, which has enough sterling but not enough dollars and will be prepared to pay a higher sterling price for this dollar commodity than the current dollar price converted into sterling at the official rate. This side of the transaction having been completed by the sale of the newsprint to, say, Denmark, it remains to transfer the sterling from a Danish to a Dutch account. This can be done without the slightest difficulty, since Denmark and the Netherlands are in the transferable account group. The transaction, therefore, does not even need to be referred to, much less authorised by, the Bank of England. The Dutch firm which originated the cycle of these operations, probably on the basis of a sterling credit opened by a Dutch bank, reimburses the credit and, into the bargain, hands over to a gratified Netherlands Bank a much larger sterling profit on the transaction than the custom of the trade would warrant. Almost everyone is happy. The Netherlands has gained valuable sterling from merchanting transactions, Denmark has obtained scarce dollar newsprint by a sterling payment. The sufferers—and they are scarcely conscious of their loss—are sterling area countries, namely Australia which has lost a direct dollar export of wool and Britain which has seen Denmark using sterling to buy a dollar commodity. At no time has any monetary authority sanctioned a transaction in sterling at unofficial rates, though some laxity somewhere must have conduced first to the diversion of the wool from its Dutch to an American destination and secondly to the relatively high sterling price paid for the import of newsprint into Denmark.

The transferable account system can also lend itself to abuse where the authorities of a country within this group are prepared to deal in sterling at other than the official rates. The most significant example of such transactions has been provided by Russian bidding for transferable account sterling. At the moment, Russia is reasonably well supplied with US dollars, partly because of sales of furs to the United States and also by reason of the slow strangulation of US exports to Russia. But while reasonably well supplied with dollars, Russia is short of sterling, which it has been using in substantial amounts to pay for sterling area rubber and other commodities. The Russian authorities, of course, could buy sterling from the Bank of England against dollars at the official rate—and the red carpet would be rolled out for them. But that would be too tame a deal; instead, the Russians have in fact been bidding for cheap sterling in the New York market—a market handled not by the recognised banks but by a group of security houses whose names are well known in official quarters in London. The sellers are holders of sterling in transferable accounts in London. A Norwegian holder of sterling, for example, might be prepared

CHRISTIANIA BANK

to sell his sterling for US dollars at the rate of $3.50. If the transaction was done with a Russian buyer there would be no way of checking or preventing it since both countries are in the transferable account group and a payment from a Norwegian to a Russian account in London needs no official scrutiny.

Some loss undoubtedly falls upon Britain as a result of such transactions. But it would be easy to exaggerate their magnitude. Whether they arise from complicated commodity arbitrage or from use of the well and astutely organised unofficial market in commercial sterling, they are the result of the scarcity of dollars and of certain commodities for which buyers are prepared to pay a fancy price if that price is payable in sterling. It would be a retrograde step to attempt to counter such operations by devising stricter restrictions on the use of sterling for multilateral payments. One or two expulsions from the transferable account club, and the relegation of the countries concerned to "administrative transferability," should be the limit of the restrictive defensive measures taken by Britain. Agreements such as those made with France and Italy are in no way restrictive of the international use of sterling. On the contrary, they will help to promote it. For the rest, the emphasis in British policy should be placed on raising the respectability and status of sterling by working indefatigably towards the goal of solvency with the dollar area. One day that goal may be brought much nearer—not only for Britain but for the whole world outside the United States—by a revaluation of the dollar in terms of all other currencies. But the time for that is not yet.

Business Notes

A Satisfied Chancellor?

It is not often that Sir Stafford Cripps's speeches are disappointing, but that was certainly true of his contribution to this week's debate on the Address. For M.P.s who had not found time to study the intricate documentation of the recent efforts of the OEEC, his factual summary no doubt provided a useful guide. But the only significant fact which had not previously been officially stated (although it was already generally known), is that, despite the intra-European payments scheme, the Government expects to have to make some further gold payments to Belgium and Switzerland. In his comments on the domestic situation, the Chancellor closely paralleled his Mansion House speech of a fortnight ago. Thus, while giving warning that it was too soon to make "any confident judgment" on the effects of the disinflationary policy, he reiterated that revenue is coming in satisfactorily and is likely to reach estimate; that expenditure has been increased by the rising costs of subsidies and defence; and that these changes, though they will involve "some reduction" in the surplus, are not large enough "to counteract the main policies of the Budget." This conclusion was subject to the important reservation that any substantial further increase in defence outlays would "make it necessary to reconsider the whole of the rest of our economic programme."

This possibility apart, the Chancellor appeared tolerably well satisfied with his disinflationary formula, pointing out that although personal savings are still disappointing, and although "we have not done all that we wished to do," the trend towards "a more comfortable position" is clearly marked. Moreover, the Chancellor cited Britain's programme for 1948-49—as set out in the recent White Paper, discussed in these columns last week—as evidence that "a substantial degree of recovery" was expected. This, he declared,

> shows a progress in the right direction which, by 1952, should enable us to be wholly independent of any further exceptional external aid.

There is about all this an air of satisfaction which comes most unexpectedly from the lips of Sir Stafford Cripps. Although he emphasised again the need for hard work, singleness of purpose, and restraint in consumption, there was no hint in this speech of awareness of the changing character of Britain's problem. The critical problem now is quite evidently the levelling of the trend of production and exports, a change which belies all facile forecasts that self-sufficiency definitely can be achieved by 1952. Sir Stafford avoided this critical issue altogether. Indeed, he actually remarked that the added strain caused by the miscalculation of the level of investment had been "partly offset by increased production"—surely a highly debatable proposition.

* * *

Six Billions of Bank Deposits

Restrained though it is, this note of complacence in Sir Stafford's recent comments on the domestic scene is more disspiriting than it would be from any other Minister. Coming from him, and at a time when all the evidence points to the need for a stiffer dose of disinflation, it raises inevitably the suspicion that austere frankness is being dropped because the desirable corrective policies are either regarded as impracticable or are not politically acceptable to the Government as a whole. But the opportunist tactics of pretending that all is well on the home financial front will not long withstand such shocks as that created by the October banking figures published this week. These disclosed a leap in deposits by almost £90 million, a magnitude all too reminiscent of the Daltonian phase, and one which has attracted particular attention because it carried the total beyond £6,000 million for the first time—almost £40 million beyond it. The significance of the experience of a single month should not, of course, be exaggerated; but this expansion follows one of £40 million (net) in September, and occurs at a time when it had been hoped that the growth of deposits, if not arrested by disinflation, would at least be retarded by the delayed effects of the absorption of the Argentine rail moneys which, though involving credit creation last March, have only gradually become available for effective use. Moreover, the reasons for so large a movement are not self-evident.

The £13½ million rise in advances was actually a little smaller than that for September, and at only half the corresponding 1947 rate. Investments rose by £2,500,000. If, say, £5,000,000 of the very large increase in bill portfolios (by £96 million) is presumed to reflect commercial discounts, this means that not more than £21 million of the month's new credit was needed for the private sector of the economy. In other words, at least £63 million of the £84 million expansion of net deposits was required for the Governmental sector, compared with about £27 million in September. In the nearest comparable period covered by the Exchequer returns, below-line net expenditure was larger than usual; after crediting receipts from savings, etc., it required about £38 million, compared with some £17 million in August-September. But this deterioration was more than offset by the items "above" the line, which showed a surplus of £9,000,000 compared with a deficit of £41 million. Allowing for the reflux of notes from circulation (which in effect increases the Government's need for bank finance), the Treasury's total disclosed requirements would be about £41 million—at least £25 million less than in the previous month—before taking credit for the sterling receipts from sales of dollars and any net borrowings of overseas sterling balances on account of the external deficit, now running at, say, £25 million a month. In other words, the finance ostensibly required was no more than £15 to £20 million, in contrast with over £60 million apparently raised.

* * *

Plus ça Change . . .

Unfortunately, the reasons for this wide discrepancy can only be conjectured. In part, it results from the three-day difference between the (five-week) periods covered by the two series of figures, a difference which probably means that, this time, the banking figures were affected by two months' disbursements of certain regular mid-monthly payments whereas the Exchequer returns reflected only one. It is likely, too, that the Treasury had to meet unusual demands from overseas monetary authorities for conversion of bills into cash. Finally, the heavy cost of the health service is presumably involving extra-budgetary demands for finance.

To some extent, therefore, the latest rise in deposits is not representative of the underlying trend. But, when all has been said, it is evident that the present disinflation formula would be insufficient to prevent a rising trend of deposits even if there were no extraneous factors making for expansion. Most important of these factors must be the public's desire for increased liquidity—and the Government's willingness to satisfy it lest new pressures be put upon interest rates. Both the scale of the problem and the tactics employed to meet it are radically different from those of the Daltonian phase. But the principle involved is identical. If the disinflation policy is to be maintained, the Government sooner or later will have to face this conflict between its budgetary and its monetary objectives.

* * *

The Struggle for Coal Production

No sharper reminder could have been given of the realities of the struggle to revive coal output than the rejection by the Yorkshire mineworkers' representatives of the proposals of the joint committee on coal production. Mr Gaitskell, when he commented on the joint committee's recommendations in Parliament on Wednesday, did not claim for them any great inventiveness or novelty of conception. What was important, he suggested, was that they had the backing of the National Union of Mineworkers; the recommendations on recruiting foreign workers and upgrading men for face-work "were matters upon which no progress would have been made without the fullest co-operation of union and management." The recommendations for dealing with persistent absenteeism he described as "a remarkable development which would have been utterly impossible had the mines not been nationalised."

These were fair comments, but only on the assumption that the co-operation was really full and that the remarkable development had in fact taken place. Until, however, the approval given by the mineworkers' national executive is endorsed by the areas and the lodges, it is too early to make any such assumptions. The Yorkshire area council of the NUM, also meeting on Wednesday, decided against the proposals; there were objections, it seems, to the recruitment of foreign workers, to the extended working week, and to the participation of union officials in disciplinary measures against absentees. That the Yorkshire area council should be the first to make difficulties is not in itself surprising; but it is a serious setback, and seems the more irresponsible because the areas are directly represented on the national executive and had the opportunity to make their opinions felt at an earlier stage.

It can be hoped that other area councils will be more helpful. Their helpfulness will not, however, clinch the matter automatically; from the nature of the recommendations it is clear that the results will depend on thorough and detailed application by the miners' lodges. The development of face room, the speedier upgrading of men for face work, the admission of foreigners, and the serious enforcement of attendance discipline—it is only by determined local action, supported by the body of opinion in the pits, that these measures can be made to produce the results which are needed. Both the Saturday shift and the extra half-hour have been frustrated not by opposition from the national leaders but by tacit agreement in the coalfields that they should be taken lightly. The five-day week agreement provided for an appropriate reassessment of tasks, but here above all there can be no effective rule of thumb—only co-operation or obstruction by the men to whom the tasks will fall. And up to now, obstruction has prevailed. The recommendations of the joint committee are sensible enough, and it is a tactical advance to have got them recognised in an unequivocal way by the national leadership of the mineworkers. What remains to be bridged is the hiatus between policy and performance; this is as evident in the NUM as in the Coal Board itself.

* * *

Redeployment and Modernisation in Lancashire

Among the evidences of the Cotton Board's patient efforts to organise opinion in the cotton industry in favour of higher productive efficiency, the collection of papers prepared for the conference of directors, managers and trade union officials at Harrogate last month, and published by the Labour Department of the Cotton Board, is the most encouraging yet seen. The attempt to recruit more workers continues to have no more than modest results, and the cotton employer seeking to improve his production is left with two resources—the redeployment of his labour and the modernisation of his plant. Large projects of complete re-equipment of the kind envisaged in the Cotton Spinning (Re-equipment) Act tend to get less attention, while the possibilities of quick and reasonably inexpensive improvement of existing machinery get more. In weaving, the case for automatic looms continues to be strong, and grows stronger as Lancashire (with still only 5 or 6 per cent of automatic looms) is faced with the competition of foreign weaving industries which are almost completely automatic. Conversion of existing looms must, however, be a radical operation to produce a machine which can give satisfactory performance by existing foreign standards. Mr H. L. Muschamp, in a paper on "The Case for Conversion to Automatic Weaving," mentioned a set of looms the conversion of which had cost 60 per cent of the cost of new automatic looms; but the resulting machine would give, he said, the performance of a new automatic loom. In spinning, the room for minor improvement is greater; Mr B. A. P. Dobson described particularly a number of devices and modifications to be fitted in the card room; because of its greater variety of machines and number of processes, it was in the card room (he argued) that the most substantial savings in yarn output per man-hour by mechanical improvements were possible.

An account of the redeployment carried out in a coarse counts spinning mill showed that redeployment gave best results in the ring room, since the card room operatives were already on piece rates, while the ring room operatives were not. The general outlines of redeployment as described in these papers do not vary greatly from mill to mill. Such principles as the withdrawal from skilled workers of cleaning and other unskilled duties, leaving the skilled man free to mind his machines, are becoming standard, as are also the methods of recasting the wage structure in order to associate reward with effort. But the detailed application, and the methods of enlisting the support and interest of the workpeople, are separately worked out for each mill; they depend, indeed, as much on psychological as on physical conditions.

It was made clear repeatedly how greatly the uniform payments systems in force in Lancashire obstruct these attempts to make better use of labour. Mr Harold Wilson, who presided at the opening session, referred to the recommendations of the Moelwyn Hughes Commission for a new wage structure in cotton weaving—"a system of recommendations which, with such minor changes as you may feel it necessary to make in them, holds the key to the future." He could not have said much more plainly that major changes or further prolonged delays would not be welcome to the Government.

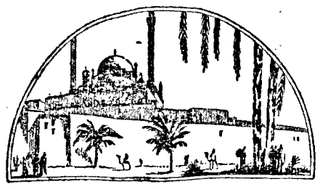
Anglo-Soviet Trade

There is still no official news about the new Anglo-Soviet trade negotiations. This week Mr Bottomley, Secretary for Overseas Trade, had another meeting with Mr Klenstov, the head of the Soviet trade delegation in the United Kingdom, but the new agreement is apparently no nearer conclusion. Both countries have submitted lists of goods available and required and some time must obviously elapse while these are studied. Russia has already sent Britain the full consignment of grain under last December's trade pact, in fact some 14,000 tons more—764,000 metric tons against the scheduled 750,000 metric tons. The total includes 470,000 tons of barley against the planned 450,000 tons; 190,000 tons of maize against 200,000 tons and 104,000 tons of oats against 100,000 tons. It has not resorted to the escape clause of the agreement which stated that if by May 31, 1948, the total value of orders placed did not reach half the whole value of the equipment agreed to, Russia would have the right to withhold the last 200,000 tons of grain. It is believed that only £6,500,000 worth of orders have been placed to date out of a total of £20 million. So far Britain has sent 13,000 tons of surplus steel rails and 2,200 tons of new steel rails, while a further 3,100 tons of new rails are being loaded or awaiting shipment. This makes a total of 18,300 tons compared with the agreed 25,000 tons of rails, of which not less than 10,000 tons would be from new production.

But the main contention over the last Anglo-Soviet trade agreement has been about the grain prices. Despite all the official secrecy maintained on this topic, the monthly trade returns have now revealed the c.i.f. prices. According to the December protocol "the prices charged . . . shall be based on world prices. . . . Prices shall in every case be calculated f.o.b. port of shipment." During the discussion in Parliament Mr Harold Wilson said that "the prices agreed on were very fair and reasonable in relation to the present price ruling in the world markets." It now appears however that the c.i.f. import price has risen each quarter. The maize price for arrivals in the first quarter averaged nearly £31 16s. a ton, in the second quarter £32 5s. a ton and in the third quarter £33 7s. a ton. The quarterly average price for maize at Chicago—which can be taken as a guide to the world market price—fell from £24 a ton for January-March to £23 10s. a ton for April-June to £20 12s. a ton for July-September. Even if £3 a ton is allowed for insurance and freight from the Black Sea to the United Kingdom, there is still a wide discrepancy between the British import price and the Chicago price. And, moreover, the American price has fallen during the year while the British import price has risen. The average Chicago price for maize in December, when the agreement was signed, was only £26 14s. a ton.



For barley, the initial discrepancy between the British import price and the American level was not so great. The first quarter's import price was £30 16s. a ton rising each three months to £31 4s. a ton and £33 7s. a ton. The corresponding US average prices were £28 16s. a ton, £27 a ton and £18 15s. a ton. In this instance after allowing for freight and insurance, it might be true to say that the initial Russian price was "very fair and reasonable." But it seems that Britain bought only 25,000 tons of barley at this price, out of a total of 470,000 tons. If this analysis is correct, is not the British public entitled to a fuller explanation of the cost of Russian grain?

* * *

Proposed Tin Agreement

As was expected, the third meeting of the International Tin Study Group, which concluded at The Hague last weekend, was chiefly concerned with the advisability of a world tin agreement. A working party was set up at the Washington meeting last April to consider this matter, and it reported to the Study Group that it would be both "appropriate and practicable" to conclude such an agreement, and at the same time it put forward a proposed outline. After considerable discussion, the proposals were modified, but the Study Group accepted the general idea of an inter-Government Agreement. It further decided to circularise member Governments to see whether they would be in favour of such a commodity scheme for tin. The skeleton scheme has not yet been published, but it is believed to concentrate more on marketing than on regulating output. If a sufficient number of member Governments approve of the proposals, a new conference would be convened next spring under the ægis of the United Nations, to work out the details of the scheme.

The Malayan producers have already stated that they would welcome "a practicable and equitable arrangement to ensure long-

THE
UNITED COMMERCIAL BANK LIMITED

(*Incorporated in India. Liability of Members is limited*)

Head Office

2 ROYAL EXCHANGE PLACE, CALCUTTA

G. D. BIRLA, Esq., Chairman.

AUTHORISED CAPITAL . Rs. 80,000,000
SUBSCRIBED CAPITAL . Rs. 40,000,000
PAID-UP CAPITAL: . . Rs. 20,000,000
RESERVE FUND: . . . Rs. 4,000,000

With over 60 Branches at the leading centres of Industry and Commerce in India, Pakistan and Burma, The United Commercial Bank is well equipped to serve Banks, Commercial Institutions and individuals carrying on business with India or intending to open connections with that country.

B. T. THAKUR, General Manager.

term stability in the industry." But what does "stability" mean? Do producers want stability of prices, or stability of profits, or stability of sales? Stable prices can be secured by long-term contracts, though they have been something of an embarrassment to tin producers in a period of rising costs. Stability of profit margins would have much greater attraction for producers, but would be administratively difficult to operate and would shelter the high cost producers. The guarantee of a market for a definite quantity would also be attractive to producers if at the same time the movement of prices were restricted. But in such a case, would there be any control of output? Without restriction, output could be expanded under the impetus of the "free" market price, that is, the price for tin over and above the agreed marketing quotas. Such a scheme might permit the orderly marketing of a large part of the world's output of tin, and it would also possess a reasonable degree of flexibility. But it is not known whether the proposed agreement will take this form.

Any commodity scheme introduced within the next year or so will, however, be faced with the problem of strategic purchases. Tin producers, quite reasonably, do not want to expand output to meet a large but temporary demand. Yet if these new strategic requirements are to be covered without restricting normal commercial consumption, production must expand. And the new agreement would have to allow not only for such an expansion, but also for a corresponding contraction when the strategic purchases had been completed. Any commodity scheme is certain to be controversial; and a scheme for tin would be no exception if only because of memories of the prewar restriction schemes. It is therefore all the more desirable that the scheme worked out last week should be published without delay so that adequate consideration can be given to it before the new conference is convened.

Prospectus and Performance

There have fortunately been few instances in the past year where the performances of companies have belied their prospectus estimates of profits by a wide margin, but the few have nevertheless attracted a great deal of attention. Among them, the case of Richard Crittall is exceptionally unhappy. In the prospectus for the issue of 450,000 5 per cent cumulative £1 preference shares at par made on December 22, 1947, the directors estimated that net profits of the group before all taxation for the year ending December 31, 1947, would not be less than £100,000. As is now well known, the consolidated accounts revealed a loss for the year of £607,841. The difference seems too large to be accounted for by mistake or inadvertence, and it is reported that official inquiries are being made to discover the reasons for this serious discrepancy, which clearly involves questions regarding the accountability of the former directors.

The provisions of the Companies Act, 1947, about directors' liability for the contents of a prospectus do not apply to the Richard Crittall issue, since it was made before the Act came into effect. Their actions must be judged by the Companies Act, 1929, which provides that it is not merely a statement that is false, but one made with guilty knowledge which must be proved against directors in proceedings. The Cohen Committee recommended that the law should be amended on the lines of Section 84 of the Larceny Act, 1861. Under Section 66 of the new Act provision has been made for criminal proceedings. The onus has been placed on persons authorising the issue of a prospectus to prove either that an untrue statement was immaterial or that they had reasonable grounds for believing up to the time of the issue of the prospectus that a false statement was true. This test cannot be applied in the present case. Moreover, under Section 65 of the new Act, in the case of an untrue statement made by an expert, and included in a prospectus, persons authorising the prospectus cannot rely on the fact that the statement was made by an expert unless they can prove reasonable grounds for their belief, up to the time of the issue of the prospectus, that the expert was competent. Under the 1929 Act it had to be established that directors had no reasonable ground for believing that an expert was incompetent.

The shifting of the burden of proof in any action arising from an untrue statement on to the shoulders of the persons authorising a prospectus seems to have provided an effective instrument against the wilful insertion of such statements. Of course, no provision can be incorporated in the law fully to guard against the publication of misinformation resulting from negligence or incompetence. But the Companies Act, 1947, should go a long way as a deterrent against the publication of information about future prospects and estimates of profit which have not been given full consideration.

* * *

Shortage of Refractory Linings

Shortages of silica bricks and other refractory lining materials have persistently hampered revival in the European steel and coke-oven industries since the war. This has been evident from the experiences of firms seeking to repair or expand their plants; but there have been no reliable statistics on which a general survey of the position could be based, and this has made more difficult the work of the Geneva working party which has been attempting in the past year to solve the shortage of silica bricks, tamping mass, and their principal raw material, quartzite. A great deal of the working party's time has therefore had to be given to persuading the countries concerned to notify their consumption, production, and plans more completely and with reasonable uniformity.

In spite of this, a good deal of success has been achieved in expanding production and in confining requirements within practicable bounds. Britain, with an estimated production for 1948 of 413,000 metric tons of quartzite, 59,000 of tamping mass, and 294,000 of silica bricks, is still considerably the largest European producer of refractory materials for industry. But production in the Bizone of Germany has shown a sharp improvement since currency reform, and is now estimated at 105,000 metric tons of silica bricks and 65,000 tons of tamping mass for the current year. Bizonal production is particularly important for coke-oven bricks; the estimated output of 32,000 tons this year will have been almost entirely used up in the maintenance and reconditioning of the Ruhr coke ovens, but this is itself important to maintain the coke supplies from the Ruhr to the steel industries of western Europe; and exports of 12,000 tons of coke-oven bricks from the Bizone are now thought possible in 1949. Quartzite production in western Germany, hardly less important, is about equally divided between the Bizone and the French Zone, at about 75,000 tons each this year. Its expansion depends partly on increasing the labour force, which is still inadequate in spite of the improvement since currency reform. The French Zone authorities have been discussing with the Italian Government the possibility of bringing

THE "COMING HOME" POLICY

is specially designed to meet the present urgent need for a flexible contract.

NATIONAL PROVIDENT INSTITUTION

FOR MUTUAL LIFE ASSURANCE

—ESTABLISHED 1835—

48 Gracechurch Street, London, E.C.3

3/296

"I feel sure she found **peace** in her last hours"

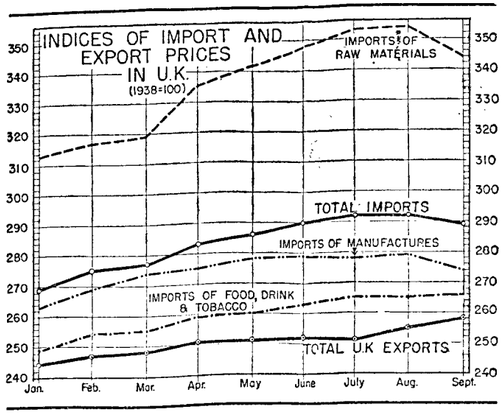
So ends the report of a Deep Sea Mission superintendent asked to pray with a fisherman's dying wife. She left seven children when she died.

Providing fishermen's families with spiritual comfort, advice, often material aid—not only in bereavement but also all through their hard lives—is a vital part of the Deep Sea Mission's work in fishing ports. Donations or requests for further details are welcomed by the Secretary:—

DEEP SEA MISSION

(ROYAL NATIONAL MISSION TO DEEP SEA FISHERMEN)

44 R.N.M.D.S.F. HOUSE, 43 NOTTINGHAM PLACE, LONDON, W.1



Italian workers to the quartzite quarries in the French Zone, and something may come of their discussions by the spring. The other necessity is material for quarrying—trucks, tractors, and light railway—and the vehicle industry of the Bizone should be able to expand its production sufficiently to meet the purpose; but other demands make an improved supply of railway material unlikely in the next few months.

The Working Party on Refractory Materials for Industry is taking a more optimistic view of the prospects of removing this particular shortage than it has taken so far; a further modest improvement in the main producing countries can remove the deficit. Indeed, doubts have been expressed at Geneva whether there is still a deficit; but the latest suggestion made to the member countries—that they should negotiate for the exchange of quarrying and transport equipment against silica bricks and quartzite—suggests that there is. Another suggestion made, that the working party should undertake the allocation of silica bricks for export, has been turned down.

* * *

Better Terms of Trade?

For the first time since the beginning of 1946, the index of import prices declined in September. The fall was slight—barely one per cent—but as the accompanying graph shows, import prices apparently reached a peak in July and August and started to decline in September. Yet it would be wrong to read too much into this change of direction. The food and drink component of the index resumed its rise, being one point higher than in August, but raw material prices fell by 2½ per cent, owing mainly to cheaper cotton and wool. World cotton prices have fallen, but the lower import prices for wool reflect a transference of wool stocks from the Dominions to this country rather

than any improvement in the terms of trade for Britain—although admittedly wool prices did fall in September. Wool and cotton together have a weight in the component index of 25 per cent and therefore exert a considerable influence on the total.

But the index of import prices is based on c.i.f. import prices and is therefore not a very accurate reflection of world commodity prices. Thus, a reduction in freight and insurance could reduce the index without any corresponding fall in world prices, although there is no evidence that this has happened during September. For this same reason great care has to be taken in measuring the change in the terms of trade. Until there is better evidence that Britain is now purchasing its food and raw materials cheaper than in the past—what facts have already been published about long term contracts and bulk purchases show that prices for 1948-49 have generally tended to increase—the downward trend in import prices may be illusory.

More heartening, however, is the trend of export prices, which being calculated on an f.o.b. basis reflect more closely the trend in world markets. The index in September rose by a further one per cent making the total increase since July almost three per cent. Prices for exported raw materials were nearly one per cent higher than in August and those for manufactures more than one per cent higher. This time it was metal goods prices which jumped, while textiles prices remained stationary. If the current rise in export prices can be maintained to the end of the year, without reducing the volume of exports sold, the balance of payments will be assisted. The dollar drain, however, is more dependent on the terms of trade of the sterling area rather than of the United Kingdom and they appear to be more favourable.

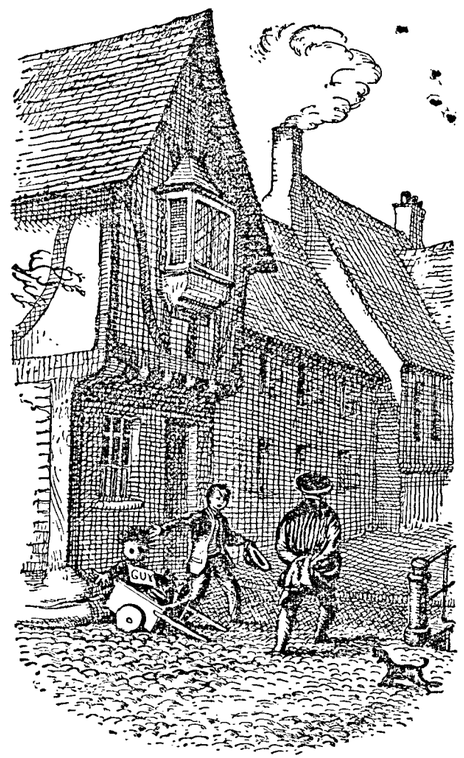
* * *

Oil Dock for Big Tankers

The port of Manchester has handled oil traffic since the Ship Canal was opened in 1894, but the development of the trade is making it necessary to provide for the handling of oil in larger bulk than before. The new dock scheme announced by the Manchester Ship Canal Company on Monday, which will cost about £4,000,000 and will require the authority of a Parliamentary Bill, should meet this necessity. It is designed primarily for the unloading of crude oil for the new refinery which the Shell group is building at Stanlow as part of the national home refinery programme. It will, however, mean that tankers will be unloaded nearer the sea than at present. The new dock will be at Eastham, at the entrance to the canal. Tankers now dock at Stanlow, on the canal itself, but this limits the size of tanker which can be handled to about 12,500 tons, though larger tankers of up to 16,000 tons have occasionally been taken up to Stanlow after partly unloading elsewhere. In the future tankers of up to 30,000 tons will be accommodated in an oil dock at Eastham, and their cargo will be carried by pipeline to Stanlow, about nine miles away. Oil traffic at Stanlow has increased steadily during and since the war, and the new Shell refinery will have a throughput of 2,500,000 tons a year—about five times the quantity which has so far been handled by the same group's specialised plant there.

The canal company is not proposing to raise new capital immediately. It will, however, seek to extend its borrowing powers by £2,500,000, and this provision will be incorporated in the Bill which, before it is brought before Parliament, will have to be approved by a meeting of shareholders in February. The Corporation of Manchester is the largest shareholder. Work at Eastham will begin immediately Parliamentary approval has been obtained, and will take about three years; the new dock should, therefore, be ready for use towards the end of 1952, when the refinery should already be partly in operation.

The plan, which includes an entrance lock 800 feet long and 100 feet wide, is an indication that the trend towards very large tankers is expected to be permanent. At least one tanker of 30,000 tons is building in the United States. The Shell group has two tankers of 28,000 tons already building in British yards, and the keel of a third is to be laid next week.



* * *

Film Renting Disagreements

Negotiations have been going on through the summer about the film renting terms charged by General Film Distributors (the main distributor for the Rank Organisation), and they seemed a fortnight ago to be approaching settlement. They have now, however, assumed "national importance" (in the view of the British Film Producers' Association) and have been broken off, to be restarted on an all-industry basis. Mr J. Arthur Rank, who is president of the British Film Producers' Association, notified the Cinematograph Exhibitors' Association of this decision in a letter last week. He explained that the BFPA had decided to set up a special committee to consider distribution policy, and that this would take "a little while." When he resumed the discussions with the CEA he would be accompanied by members of the executive council of the producers' association.

The delay is the more unfortunate since the dispute about rental terms has done a great deal to sour the internal relations of the trade at the outset of the attempt to apply the new Films Act. That the renting terms of the major British distributing organisation might concern the whole industry might well have been thought of earlier in the day; it was, however, made evident to the producers when one or two exhibitors became sufficiently confident of easier terms from Mr Rank to begin to ask easier terms for British films from other studios as well.

The exhibitors have always claimed that they regard Mr Rank's terms as too high, but their main complaint is not against the highest rates, which are charged for successful films, but against the lower rates charged for films which do not do so well at the box-office. A box-office success may well be worth the 50 per cent of takings which the exhibitor has to pay. If takings fail to reach a certain figure the exhibitor pays only 45 per cent, and if they fail to reach a still lower figure he pays 40 per cent. But in the last case he does not get from General Film Distributors a "programme" (that is, a first and second feature, or a first feature with a money allowance to enable him to rent a second feature), but only one film. This again raises his total payment

November

By November manufacturers have completed delivery of their Christmas orders and, when the large demand for exports has been met, the children at home are not forgotten. Christmas stocks are being delivered to retailers, a great nation of shopkeepers is preparing to put goods into its shop windows, and bankers make ready to meet heavy seasonal demands upon their services. Whichever side of the counter will be your concern during the Christmas shopping season, you can depend upon assistance from the Midland Bank, whose wide commercial experience is available at 2000 branches throughout England and Wales.

MIDLAND BANK LIMITED

COURTAULDS

IN THE UNITED KINGDOM

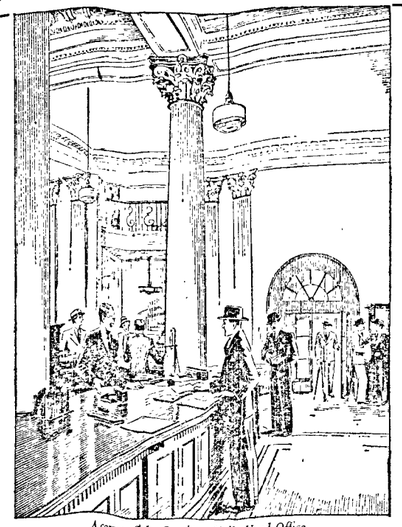
No 8 THE WEST RIDING

COURTAULDS' associations with the West Riding of Yorkshire go back to the time when black silk mourning crape was the firm's speciality, and rayon was only a dream of science.

It was from a famous Yorkshire textile firm that the late Henry Greenwood Tetley joined Courtaulds in 1893, later to play the leading part in establishing the British rayon industry and laying the foundations of the Company as it is today.

In 1917 Courtaulds purchased Spring Hall Mills, Halifax, where they began to use rayon on a large scale for making furnishing fabrics. Then, buying their yarn from Courtaulds, other manufacturers soon followed the Halifax example.

Next, in 1937, the Company acquired Westcroft Mill, Bradford, then at a standstill, and equipped it with worsted combing and spinning machinery. There Courtaulds showed how their "Fibro" rayon staple could be spun into yarns for use in weaving the kind of cloth for which Yorkshire is famous, thus widening the use of rayon in the worsted industry.

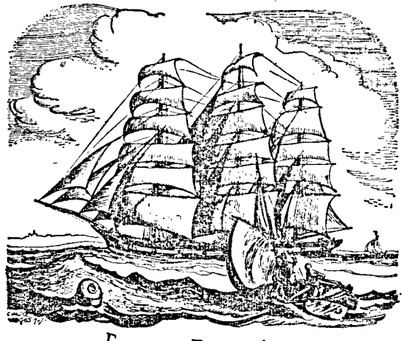


During the Second World War Westcroft Mill provided yarn for Service blankets and garments, and Spring Hall Mills wove cloths for West Africa whence Britain obtained rubber, palm kernels and oil.

Finally, Courtaulds recently opened Bull Royd Mill, Girlington, Bradford, acquired in 1944. Here they are weaving, on the most modern automatic machinery, Yorkshire suitings and dress fabrics in which rayon staple is blended with wool.

Of over 25,000 people employed by Courtaulds in the United Kingdom about 400 are engaged in the Company's three West Riding Mills, each of which demonstrates under commercial conditions how rayon can best be used in one form or another.

This is one of a series of statements to inform the public of some part of the contribution made by Courtaulds' industrial enterprise to economic well-being in various districts of the United Kingdom.



Issued by Courtaulds Ltd., 16 St. Martins-le-Grand, London, E.C.1

A corner of the Banking Hall, Head Office

● Men and money, in and out; the friendly nod, the expert touch; such are characteristic of the Banking Hall. Here routine and order reign supreme. It's all very swift and safe and sure, this cavalcade of currency, yet all very human — on both sides of the counter.

LIMITED

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

for the programme to, perhaps, 42.5 per cent. It is for this reason that the reputedly high proportion of "mediocre to poor" films in the British output has played a prominent part lately in arguments within the trade. (The criteria of quality are for this purpose not æsthetic but financial.) At the time the discussions began the exhibitors were openly worried about deteriorating quality. They have lately noticed an improvement in quality. But at the same time the return of American films has improved their bargaining position. And the exhibitor who finds the rental for a particular film scaled in an uneconomic way can invoke the relief clause of the Act, sometimes with hope of success.

* * *

More ECA Loans

The ECA loan agreement with Britain has opened the gates to all others in the queue. During the past week loan agreements have been signed or prepared for signature with Denmark, Eire, Sweden, France and the Netherlands. They all carry substantially the same terms as those negotiated with Britain, namely, 2½ per cent interest with no interest payment due until 1952, and capital repayments beginning in 1956. Some urgency in signing these loan agreements was provided by an announcement by ECA in Washington that no further grants would be made to the participating countries until they had signed their loan agreements. ECA probably felt that it had to apply the spur in order to protect its position with Congress, which has placed on ECA the compulsion to make $1 billion out of the $5 billion voted for Marshall aid in 1948-49 available in the form of loans.

On his return from his European trip the Economic Co-operation Administrator, Mr Paul Hoffman, announced that he would ask the President for a further $1 billion to keep the European Recovery Programme going between April and June of next year. As finally agreed by Congress, the ECA appropriation of $5 billion was to last for fifteen months—until June 30, 1949—but with discretion left to the President of the United States to spend it over a period of twelve months—by March 30, 1949—if he deemed it necessary. At the rate at which procurement authorisations have been granted by ECA, it is clear that the amount will in fact be exhausted by the end of March. It will, therefore, be one of the first tasks of the new Congress to decide whether ERP is to be kept going after that date.

* * *

November Franc Rate

The first of the monthly recalculations of the commercial rate for the French franc in accordance with the new arrangements announced on October 17th was made last week-end. It leaves the rate for November unchanged at the level which obtained since the latest realignment. The commercial rate for sterling thus remains at 1061-1063 francs. The announcement by the Bank of France last weekend adds that the rates of exchange for all currencies will remain unchanged for the current month unless the free dollar rate moves by more than 5 per cent in relation to the average on which the current month's rate has been calculated. The free market rate for the dollar remains rigidly held at around 313 francs, and its stability bears every trace of effective official control. Meanwhile the rates for bank notes, which are both free and unofficial, continue to show a very substantial discount on the tolerated free rates, the latest quotation for dollar notes being 460 francs as against the free exchange rate of 313.80 francs.

* * *

Stock Exchange Commissions

Action taken this week by the group of stock exchange members who last July petitioned the Stock Exchange Council to rescind the new agency rules is expected to result in an ordinary meeting of members to vote on a resolution to defer the implementation of the rules for at least one year from January 1, 1949. The new rules (which increase registration fees and provide for the abolition of rebates on commission to outside agencies) are due to come into effect on that date. The rejection of the original petition to the Council in July was perhaps surprising, for no less than 1,667 out of 3,922 members had signed it. Nor did the counter-arguments put forward by the council at the time appear very convincing. Certainly they have not convinced the opposition, and in the meantime it is likely that more support has been mustered. While neither party to this friendly dispute has changed its ground, the petitioners in their latest letter to the Council particularly stress that any further diminution of business might have grave consequences for many firms. In view of the low level of Stock Exchange business this autumn it will be hard for members to resist this argument. For both the Council and the petitioners seem to agree that the possible effect of the changes on business is difficult to measure.

This is the first occasion in living memory when members have sought to call a meeting of the House for such a purpose. It is emphasised that no constitutional issue will be raised at the meeting. If, indeed, it were the intention to effect a change in the Deed of Settlement it would be necessary to pass a special resolution for which twenty-one days' notice and a 75 per cent majority vote are required. It is understood that the proposed meeting will be convened next week. A minimum of only seven days' notice must be given. A resolution from the floor of the House must be supported by nine members and can be carried by a simple majority of those present. While the Council are not bound to abide by the result, should it be in favour of the resolution they would be bound to take serious notice of it. The next step would probably be a referendum for or against the new rules. The dissenting group may well be satisfied by deferment for a year, but there is a strong body of opinion in favour of complete rescission. Indeed a clear-cut decision one way or the other seems to be desirable.

* * *

Mutual Assistance among Trustee Savings Banks

With one or two exceptions, the changes proposed in the new Savings Banks Bill are of mainly formal significance. Most of them were in contemplation before the war, designed to correct anomalies or remove minor technical difficulties. From the point of view of the depositor, perhaps the most notable change is the repeal of the limit of £500 on the sum in the name of any one depositor in the special investment department and the power given to the Treasury to impose new limits. More important, however, for the future of the Trustee Savings Bank movement itself are the provisions in Clause I which authorise a trustee savings bank to make, subject to the approval of the Commissioners, grants to other trustee savings banks. For the purpose of dealing with grants made for the benefit of unspecified banks, the Commissioners are required to maintain, as part of the Fund for the Banks for Savings, a separate mutual assistance account. This provision, for the establishment of what is in effect a central pool, apparently derives from the delayed effects of cheap money upon the earnings of the banks, and enables banks with large running surpluses to provide funds for others which are still in the development stage. The Trustee Savings Bank movement has a large postwar development programme, and in the financial year just ending 100 new branches have been opened. Any surplus on the earnings of the funds employed by the National Debt Commissioners in the Fund for the Banks for Savings over the interest payments made to the individual banks is, of course, payable to the Exchequer. Last year, it will be recalled, the Finance Act incorporated a corresponding provision that any deficiency should be made good from the consolidated fund.

* * *

Getting Rid of Cost-Plus

The important changes in the mechanism of price control of certain types of clothing, which became effective this week, have naturally been warmly welcomed in trade circles, notably, of course, in the sections directly affected—principally, men's woollen outerwear and all waterproofs. But the new arrangements are of significance over a much wider range of trade than this, for they mark the first really important step in the process of discarding the anomalous principle of controlling prices by reference to the cost of production of individual firms. The clothing trade has this year been particularly vocal in its protests against the unfair effects of this system, and its defects have also been underlined by instances of prosecutions of firms for exceeding the prices dictated by their own costs even though these prices were well below the overriding ceiling prices prescribed in the price control orders. Under this system, an efficient manufacturer had not only an incentive to inflate his costs but suffered the frustration of knowing that the less efficient members of the trade were entitled to sell at higher prices than he, just because they were less efficient.

Now, at last, this demoralising system is diminishing in scope. The goods affected by this week's changes are now subject to price control only by the method of prescription of uniform selling prices for all goods within the scope of the order, regardless of the varying costs of the firms who make or sell them. During the past two years a similar simplification of the price control system has been made for knitted goods, braces and women's rayon underwear. It is to be expected that the range of goods

over which the objectionable "cost-plus" principle operates will be further reduced as the buyers' market subsides and brings a relaxation of pressure upon productive capacity. Under conditions of acute shortage, when there is need to encourage even the marginal producers, the cost-plus formula has at least the justification, in principle, that it makes it possible for the average price to the consumer to be kept below that which has to be offered to the marginal firm. Conversely, the abandonment of the principle now leaves room for an increase in prices at present charged by the more efficient firms, and it will be surprising if some increase does not occur—within the limits, of course, set by the ceiling prices.

* * *

Free Tea Auctions?

The question of reopening the London tea market has again been raised, but this time the move has apparently come from the Ministry of Food. Twelve months ago tea producers approached the Ministry with a similar proposal, but at that time it asked for a guarantee that sufficient supplies would come to the London market to maintain the British ration. Such a guarantee was not forthcoming. This year, however, there has been little delay in shipments from Calcutta, and tea stocks have been accumulating in this country so that the ration should not be affected by the change over to auctions. But the Ministry must first get the approval of the Indian and Ceylon Governments. The proposed scheme, it is understood, would provide for auction in London, at the same time maintaining the domestic ration system and subsidised home prices.

Indian and Ceylon growers may need some convincing that the London market will in the long run favour their interests. In recent months tea prices in Colombo have been below the Ministry of Food's contract price and those producers who did not tender to the Ministry have suffered. This experience has undoubtedly inspired the Ceylon Government to suggest a new contract for 1949. In Calcutta, on the other hand, prices have tended to be above the Ministry's price, but this was due largely to the fact that the Ministry had already bought a sizeable proportion of the crop and also to local transport difficulties which created temporary shortages. Thus it is doubtful if London prices would remain at the high levels registered in Calcutta. On the other hand, they would give the producers a truer picture of long-term market trends.

Since Indonesia, China, Japan and Formosa are again becoming important exporters, a single international market is clearly needed, and Calcutta is unable to fill that role. It has few facilities for storage, sampling and blending and little expert staff. During and since the end of the war, India and Ceylon have enjoyed a good export trade with the United States, but now it is possible for the United States to import green teas again; moreover, India may soon have to compete again with Indonesia.

One major obstacle to the reopening of the London market is the export duties in both India and Ceylon. Producers, sending their teas to be sold in London, would have to pay these export duties when shipment took place. Now, by selling in Calcutta or Colombo they can pass them on to the buyer. Should this scheme be accepted, the main advantage the British public is likely to enjoy is a wider selection of teas.. Brokers would be able to bid freely at the auctions, but they would have to come within the controlled prices in their sales to the home market.

* * *

Agricultural Wages

The claim of the National Union of Agricultural Workers for a "substantial increase" in wages is based mainly on the increase in the cost of living since their minimum wage was raised to £4 10s. in August last year. The union also refers to the need for increased recruitment, in view of the likelihood that the manpower target set in the "Economic Survey" will not be reached. The suggestion that the manpower problem can largely be met by employing foreign workers is indignantly rejected—indeed, there is already considerable pressure in some districts to get rid of the Poles—on the ground that these constitute only a temporary addition to the labour force.

The Agricultural Wages Board, which heard the claim this week, has not yet given its reply. It is a difficult claim to determine. The farm workers' minimum, though more than double its prewar rate, is still low in relation to that in other industries, but, at the same time, agricultural workers have had more increases since the war than most others. The question of comparative cost of living in town and country has never been seriously studied, but farm workers have certain advantages, such as low rents, and are probably less affected by fluctuations in the cost of living than town dwellers.

The case for shorter hours and longer holidays has probably better hopes of success. The 44-hour week, which the union is claiming, is now the general practice in British industry, and most unions are seeking a fortnight's holiday. Shorter hours will add largely to costs in an occupation which will require a great deal of overtime in the summer months, but it may be that the claim cannot be resisted.

Another current claim is that of the Post Office engineers for improvements in their wages scale, ranging from 7s. to 18s. a week. Their chief grievance is the Postmaster-General's delay in replying to their claim, which was lodged last April. The Government is certainly placed in something of a dilemma. It was recognised in the White Paper on Personal Incomes that it would give a lead to private industry in promoting wage stabilisation and—apart from the astonishing decision to increase the wages of Government-employed engineers—this has so far been the practice. Post office engineers claim that they are underpaid in relation to their skill and are threatening a "go-slow" movement which in some cases might lead to strike action. Threats of that kind can hardly be taken lightly.

SECURITY PRICES AND YIELDS

A fuller list containing 371 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: British Celanese; Eastwoods; Ferranti; Calico Printers.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yield on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked *e), and those paying 3 per cent or less will be repaid at the latest date (marked *l). (a) Net yields are calculated after allowing for tax at 9s. in the £. (d) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly (e) To earliest redemption date (f) To latest redemption date (m) 15 months. Yield Basis 25%. † Free of tax.

Petrol post

SHELL is different from the Post Office.

You can't get stamps from SHELL.

But, like the Post Office,

SHELL reaches every corner

of the British Isles.

From strategic centres SHELL, too,

can serve every town,

village and farm in Britain.

Delivering SHELL petroleum products are

17 ocean installations,

20 sub-installations,

500 depots,

2,500 lorries,

7,000 rail tank cars—

and 15,000 employees.

It works out at 2 tons per head per day.

you can be sure of SHELL

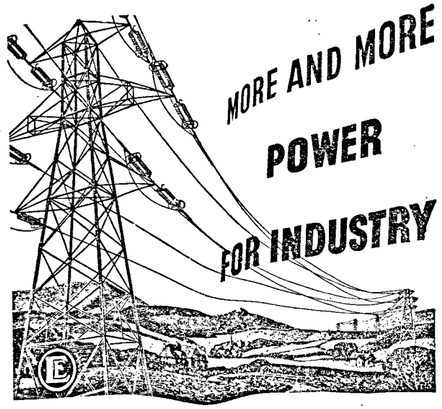
Bury Felts under textile looms and other heavy machines decrease shock, cut maintenance costs and protect the building.

BASE FOR NYLONS



BURY FELT, the fabric that takes any shape, plays a thousand parts in our key industries. Machine base felts, anti-vibration felts, felt washers, gaskets, strips and carriers all classes of felt cut and fabricated to customers' specifications. Bury Felt can be as hard as nails or as soft as silk, for besides felts for every heavy industrial purpose there are fascinating felts for the lighter side of life, notably 'Carmilla' Carpeting and 'Felbury' Fabrics for colourful home furnishings.

The design and equipment of flour mills, on which hundreds of millions of people depend for their daily bread, is a highly specialised industry in which British engineering leads the world. Henry Simon Ltd, with factories in Britain, Europe and Australia, are the largest flour milling engineering organisation in existence and export machinery to some forty countries. Since the war Henry Simon Ltd have undertaken contracts for the equipment of more than fifty new flour mills, and an equal number of mill reconstructions, in nearly every part of the globe.

COMPANY MEETINGS

TRINIDAD PETROLEUM DEVELOPMENT COMPANY, LIMITED

A SATISFACTORY YEAR

PROJECTED NEW ISSUE

MR KENNETH MOORE ON EFFECTS OF TAXATION

The annual ordinary general meeting of the Trinidad Petroleum Development Company, Limited, was held, on the 2nd instant, at the registered office of the company, River Plate House, Finsbury Circus, London, E.C., Mr Kenneth A. E. Moore, F.C.A., the chairman, presiding.

The secretary (Mr J. Mytton) having read the notice convening the meeting and the report of the auditors,

The chairman said:—Gentlemen, As you will have observed from the accounts and from the directors' report, the company has had an active and satisfactory year. The production of crude oil has been well maintained and drilling operations have been substantially expanded. Even with the most careful management, however, costs have continued to rise, but as Gulf Coast export prices for oil products have shown a proportionately greater advance, the trading profit at nearly £600,000 is a record in the company's history.

To retain perspective, however, we should remember the many years of the pioneer and development work and risk-taking persisted in despite early setbacks. We should remember, too, the work of our geologists and of those responsible for management in the earlier and more difficult years; it is to their foresight, tenacity and ability and, may I add, to you as shareholders who ventured your savings to provide the necessary capital, that we as a company, and indeed the whole community of Trinidad, today owe thanks.

"DALLEY" VILLAGE

In this connection, a most notable contribution was made by the late Mr Christopher Dalley, joint managing director from 1927 to the time of his death in 1944. We have recently honoured his memory by naming after him the model village which, as mentioned in the directors' report, was in course of construction during the past year.

Dalley Village was declared open at a ceremony held on September 13, 1948, and I cannot do better than quote from the speech made by His Excellency the Acting Governor (The Hon. Patrick M. Renison) on that occasion:—

"It is very good to see in Trinidad an industry which is able and willing to plan and spend money on this scale for the happiness and welfare of the staff and the workers on which its prosperity depends. During the short time I have been here I have heard quite a lot of jealous things about the profits of the oil industry, but nothing of these houses and the health centre. I think it is correct to say that several oil companies well established in Trinidad have fallen by the way. More money has been put into the oil industry in Trinidad than has ever come out of it. From every barrel of oil that is produced, the government of this colony, that is the people of Trinidad, get more than the shareholders of the company."

DIVIDEND LIMITED TO 16¼ PER CENT. TAX FREE

To return to more mundane matters, the directors recommend that the total dividend should be limited to that paid last year, namely 16¼ per cent. free of tax, and that all that remains after provision for taxation should be ploughed in, as to £50,000 in the shape of an addition to our general reserve account and as to £45,680 as an addition to the amount carried forward on profit and loss appropriation account.

If these recommendations are approved, the allocation of the year's profit, amounting to £595,078, will be as follows:—

Taxation	£327,798
Dividends	171,600
Ploughed in	95,680
	£595,078

You may be interested to know that of the above item for taxation about two-thirds goes to the Trinidad Government and the remainder to the United Kingdom Government in the form of profits tax. In addition, of course, the Trinidad Government receives from us a substantial sum each year for rents and royalties (the figure for the year to July 31, 1948, was £157,962). Quite apart from this, the revenues of both Governments benefit in various ways from our activities. For example, some of you no doubt pay surtax.

EFFECTS OF PROFITS TAX

It is a matter for regret that, even in so successful a year as that just past and even though we are limiting our dividend to that paid in the previous year, we are able to add so comparatively little to the financial resources of the company. I would blame in particular the profits tax which has taken no less than £107,000 this year. This additional tax, both by its nature and severity, seriously reduces the ability of the normal well-conducted company to add to its capital resources by ploughing in a reasonable proportion of its profits. On top of other taxation and in combination with the present inflated cost of capital equipment, it has practically brought to a standstill the normal healthy process by which until recent times the growth of productive enterprise was financed largely from within.

Our own record in this matter is not without interest—during the eleven years that I have been your chairman we have withheld from distribution profits amounting in all to well over £1,000,000, resulting, after payment of taxation thereon, in a net addition of £719,000 to our capital resources.

During this period, and thanks in no small measure to this gradual accretion to our resources, we have succeeded in doubling our production of oil, have greatly extended our proven reserves and have both improved and extended our field organisation in Trinidad and the plant and equipment and housing and other amenities that go with it.

STRONG FINANCIAL POSITION

As you will have observed from the balance sheet, the conservative financial policy which has been pursued has resulted in an extremely strong financial position judged by all the orthodox tests—for example, current assets (including nearly £700,000 of cash assets) exceed current liabilities by £534,000.

It is well that we should have built up this strong position, since the development of our proven areas is already absorbing additional capital—replacements of plant and equipment are now costing two or three times the prewar figure—and there is the further consideration that there are reasons for thinking that the long-term future of the oil industry in Trinidad depends to some extent on drilling ever deeper, involving extremely expensive equipment. In this connection you will be interested to know that we are negotiating for a heavy drilling rig capable of going down to hitherto unattainable depths.

MAJOR DEVELOPMENT PROGRAMME

I mentioned last year that our present productive operations cover about one-third of the mainland area over which we hold oil rights and that geological and gravimetric surveys of what we call the Moruga area—an outlying area of some 10,000 acres—led us to think that a major development effort should be undertaken there.

We have already made a start with the preliminary work—the making of roads, the clearing of jungle and the ordering of equipment—and we estimate that development work in the Moruga area to the point where we shall have drilled six exploratory wells will cost not less than £500,000.

PROPOSED NEW CAPITAL ISSUE

Of course, not all this expenditure will have to be faced at once, if only because of the delays in the delivery of plant and equipment, but having regard to the incidence of current taxation on undistributed profits and to the other factors already referred to, the board feel that it would be imprudent to attempt to carry through this substantial extension of our present activities without first securing a suitable increase in our capital resources. We have therefore decided to make the appropriate approach to the capital issues committee at an early date and in due course hope to be able to send to shareholders a communication on the subject. An extraordinary general meeting will be necessary to sanction any increase in capital.

The issue in contemplation will be calculated to see us through the next stage in the development of our reserve resources, though none can say at the present time what work ultimately lies ahead of us. In this connection, you will be glad to know that, as the years go by and the experience gained from drilling operations accumulates, our geologists have progressively enlarged their earlier estimates of our reserves, with the result that those reserves are thought to be substantially greater today than was the case ten years ago, in spite of all the oil we have taken out of the ground in the meantime.

PROGRESS IN TRINIDAD

I have again been out to Trinidad this year with your managing director, Mr Tweed, and once again was impressed with the progress visible on every side. The company's field organisation, its camps, and the housing and amenities provided for staff and workpeople are indeed something to be proud of and, while they are yielding a return to those who risked their savings in the search for oil, they are also yielding immense benefits to the general community in Trinidad and to the economic position of the sterling area—since oil is the equivalent of dollars.

You will, I am sure, wish to join with your directors in expressing sincere thanks to our staff and workpeople at home and abroad for a strenuous year's work well done. Our appreciation of their services is reflected in tangible form *inter alia* in the improved health and housing services and club and other amenities on the field which better times have enabled us to provide. We look forward to continuing progress in this and other directions.

The chairman concluded by moving the adoption of the report and accounts.

Mr Richard R. Tweed, F. Inst.Pet., managing director, seconded the resolution and it was carried unanimously.

The retiring director, Sir Claud Hollis, G.C.M.G., C.B.E., J.P., was re-elected; the fee of the auditors, Messrs Josolyne, Miles, Page and Co., waz fixed and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

FURNESS, WITHY AND COMPANY, LIMITED

SHIPOWNERS' PROBLEMS

The fifty-seventh annual general meeting of Furness, Withy and Company, Limited, was held on the 29th ultimo in London.

Sir Ernest H. Murrant, K.C.M.G., M.B.E., presided, and, in the course of his speech, said: The profit on vessels' trading, plus agencies, stevedoring operations, finance and other ancillary businesses of the company and its subsidiaries—and after charging depreciation as well as provision for deferred repairs, amounts to £2,300,863. In addition there are the dividends received on trade and other investments, totalling £545,779, making a grand total on the profit side of the account of £2,846,642.

DIVIDEND OF 8 PER CENT

Your directors recommend that £150,000 be transferred to the insurance reserve; that a dividend of 8 per cent. per annum less tax be paid on the ordinary share capital—the same as a year ago—and that there be carried forward the increased amount of £244,525.

Finally, we have the consolidated balance sheet, which in form follows the changes made in the presentation of the parent company's accounts. The figures are impressive, but I don't pretend that they speak for themselves. They do, however, show that apart from the small amount of debentures outstanding in the British Maritime Trust there are no charges upon any of the assets; the investments stand in the books at values substantially below market values where such values are available, and generally our resources are ample to take care of our commitments.

TAXATION

On the subject of taxation, it will have been noted that within the group we have had to set aside no less than £1,696,385, the bulk of which represents United Kingdom taxation, and this liability represents a charge against the profits for the year. Shareholders, who have provided the capital of the company and who, because of the modest dividends which have been distributed in the course of the years, have acquiesced in the building up of reserves aggregating £12 million, receive only some £300,000. Superficially it may be thought that there is nothing much wrong with these figures, but I submit that the present basis of taxation is quite inequitable so far as shipping is concerned, and has the effect not only of taking a large share of the profits of the business but actually of taking capital as well. It is to be hoped that the Chancellor will show some practical realisation of this fact in his next Annual Spring Number.

Everyone engaged in the shipping industry is aware of the problems involved in building new ships at current costs. These problems need much anxious consideration and call for no small measure of courage to make decisions. But your directors feel that the primary business of this company and its associates is to own ships; to maintain the goodwill which is chiefly represented by the services in which we are engaged; to keep the various sections of our business in proper balance and to ensure that the organisation as a whole is occupied to the fullest possible extent and in full vigour. In answer to anyone who may feel inclined to suggest that there are already now, or shortly will be, sufficient ships to cover the world's requirements, it merely needs to be pointed out that one ship cannot necessarily serve the same purpose as another ship. In fact, the ships we have built since the war, and still have under construction, are mostly specialised types adapted to particular trades, and I feel satisfied that shareholders will endorse the policy which has been pursued after mature consideration of all the issues involved so far as they can be foreseen.

WAR LOSSES REPLACED

So far, I have confined my remarks to domestic matters directly concerning our own group of companies, and have endeavoured to show that we have played an adequate part in the postwar rehabilitation of the Mercantile Marine, but it would be foolish to ignore the fact that shipping is the same hazardous business that it has always been. It is common knowledge that approximately half the British Mercantile fleet was destroyed during the war; it is equally common knowledge that the values recovered under War Risk insurance policies fell far short of the cost of replacement. Nevertheless, by means of new building; by purchase of war-built ships from the Government and from the United States, etc., those huge war losses have pretty well been made good by the industry out of its own resources. In the process of building new ships huge liabilities have been met, or incurred, in the belief that it was the industry's right as well as its obligation to rebuild the Merchant Fleet in spite of the hazards involved. Let there be no doubt that what has been achieved has been achieved despite many discouragements.

In the period which has elapsed since the release of British shipping from requisition gross earnings have appeared superficially to be satisfactory, and the great majority of owners, knowing the hazards involved in their undertaking, have retained the bulk of such earnings as the Chancellor has left in their hands. In the case of the Furness group of companies, as I have already shown, shareholders have received an infinitesimal amount compared with what has been paid in taxation, and compared with what has been retained in the business. But it is abundantly clear that whilst the Chancellor seeks to restrict dividend distributions, there is no restriction on his taxation requirements.

"UNBOUNDED FAITH"

Shipowners are now more than ever concerned to see that overseas world trade develops and expands in order to provide full and remunerative employment. The problem of currency exchanges still creates considerable difficulty, but to my mind it appears that a substantial expansion of coal exports, and an all-round reduction in the cost of producing everything we do produce—including as a start the cost of Government administration—would go a long way towards putting our general economy on a more competitive level than it is at present. However, these things don't appear likely to happen so long as more and more is expected to be paid for less and less. In earlier days we were encouraged to think that the way to achieve improvement, whether it was in the matter of the standard of living or building up great industries, was to strive our utmost and with all the means at our disposal to achieve the objectives; we did not expect these things to happen simply through the use of the ballot-box. However that may be, and whether old ideas are better than new, or vice versa, the shipping industry has once again shown itself to be sufficiently virile to recover in a comparatively short space of time from unprecedented blows; our faith in the future is unbounded, but a mere possession of ships is not sufficient—we need and must have sufficient overseas trade to keep the ships adequately employed both in our own interest and in the ultimate interests of the nation as a whole.

The report was adopted.

HAMPTON TIMBER COMPANY, LIMITED

PROFIT ESTIMATES EXCEEDED

The twentieth ordinary general meeting of the Hampton Timber Company, Limited, was held on 2nd instant in London.

Mr. C. J. F. Savill, M.Inst.B.E. (the chairman), in the course of his speech, said: The consolidated net profit of the parent and subsidiary companies, after charging all expenses and providing for depreciation, amounted to £32,273, as compared with £24,255 for the previous year, being an increase of over £8,000.

The directors estimated in the statement published preparatory to Stock Exchange quotation, that the profits would be no less than £30,000; this estimate has been exceeded and your subsidiary companies, Hamco Metal Pressings, Limited, and the Durham Timber Company, Limited, have contributed their full share to the general satisfactory results. They also forecast a dividend of 87½ per cent. on the Ordinary shares, against a proposed full dividend of 80 per cent. This slight change of financial policy will, without doubt, be to the ultimate benefit of shareholders and will enable the company to take better advantage of the opportunities which present themselves at the present time.

During the past few months your directors have been actively engaged in extending your company's activities in East and South Africa. It is a little premature to give precise details, but I feel confident that in the not too distant future these efforts will be well rewarded. We have acquired industrial property for the further development of the subsidiary companies which I am of the opinion will play its part in maintaining and improving the strong position in which your company is to-day. I am optimistic of the future development in this direction.

The report was adopted.

INDUSTRIAL FINANCE AND INVESTMENT CORPORATION, LIMITED

A STRONG POSITION

The twenty-third annual general meeting of The Industrial Finance and Investment Corporation, Limited, will be held, on the 26th instant, in London.

The following is an extract from the statement of the chairman (Mr J. N. Buchanan, D.S.O., M.C.), circulated with the report and accounts for the year ended June 30, 1948:—

The accounts again present a strong position, revenue from all sources showing a considerable increase on last year. The form of the accounts has been brought into line with the provisions of the new Companies Act, and the opportunity taken to make certain other alterations.

Although the year's results would have permitted an increased ordinary dividend, in present circumstances the board has decided to recommend the same dividend as last year—namely, 9 per cent., less tax. The balance of the profits, less taxation, has been used to strengthen the reserves, mainly by the transfer of £50,000 to investment fluctuation reserve, which it will be noted now stands at £200,000.

Projects from a variety of industries continue to reach us, showing that our services in helping constructive development are widely appreciated; some of those now under study will, no doubt, be solved with benefit to all concerned. Under existing conditions, however, it is not anticipated that the large increase in profits of the last two years will continue; indeed, the current year's revenue may well show some decrease from the high figures of the year under review. For these outstanding results our thanks are tendered to our managing director and all his team, without whose loyal service to the company they could not have been achieved.

COVENT GARDEN PROPERTIES COMPANY, LIMITED

RECORD PROFITS

The twenty-fourth ordinary general meeting of this company was held, on the 3rd instant, in London, Mr Louis Nicholas, J.P., F.C.A. (the chairman), presiding.

The following is an extract from his statement circulated with the report and accounts:—

The aggregate profits in the consolidated profit and loss account show an increase over those of last year and are the highest in the history of the company. Part of this increase arises from the Covent Garden markets and surrounding property, the return from which was equal to that of prewar years, largely due to the greater amount of produce handled in the markets, while the balance was derived from the company's other investments and properties including those belonging to its subsidiaries. Unfortunately in common with most other businesses, our expenses are still on the upgrade, particularly wages, rates and cost of repairs.

After deducting debenture and mortgage interest, income tax, profits tax, etc., the balance of profits available for your company, including dividends receivable from its subsidiaries, is £85,975. The charge for taxation in respect of the year under review shows an increase of £21,164 made up of an increase in profits tax of £28,564 less a decrease of £7,400 in income tax. In addition provision has been made of an additional £9,500 to cover the profits tax on the further three years' dividends on the 8 per cent. cumulative preferred ordinary shares, making a total charge for profits tax of £53,700. This tax bears most harshly upon the ordinary shareholders, whose income through circumstances beyond the company's control was very much reduced during the war, resulting in a considerable accumulation of preferential dividends.

DEBENTURE CONVERSION

During the year your directors converted the outstanding debenture issues of £2,500,000 and £1,000,000, both bearing interest at 4 per cent. per annum into one issue bearing interest at 3½ per cent. This conversion will effect a saving of £17,500 per annum. Your directors have paid or provided the dividend on the 7 per cent. cumulative preference shares and two years' dividend on account of the arrears on the 8 per cent. cumulative preferred ordinary shares and propose on November 30th to pay a further three years' dividend on the 8 per cent. preferred ordinary, thus bringing these dividends up to June 30, 1945, leaving to be carried forward unappropriated £61,027.

The provisions of the Town and Country Planning Act, 1947, are very involved and it will be some little time before their full effect is felt. As your company's properties are in the main fully developed, it is unlikely that its interests will be materially affected at least for some years to come, and such steps as are possible are being taken to protect these. It is the opinion of those interested in land, developed or otherwise, that this Act will seriously restrict the future development of land and the alteration for more advantageous use of buildings now erected thereon. The Government has given notice of its intention to acquire the Royal Opera House. Your directors are advised that no loss should be sustained in the event of the Government proceeding with the acquisition. It would be unwise to express an opinion as to future results, but up to the present the profits of the company and its subsidiaries compare satisfactorily with those for the corresponding period of last year.

The report was adopted.

WILLIAM DOXFORD AND SONS, LIMITED

AN EXCEPTIONALLY GOOD YEAR

The fifty-sixth annual general meeting of William Doxford and Sons, Limited, was held on the 29th ultimo in London.

Mr E. P. Andreae, Ph.D., the chairman, in the course of his speech said: The financial year ended last June was an exceptionally good one. The improvement, compared with the previous year's results, strikingly emphasises the effect of the difficulties and handicaps to which I had to draw attention last year. The winter was mild, and generally more normal conditions prevailed this year, although shortages of materials and certain classes of labour caused, and indeed continue to cause, us much trouble and anxiety. As a result, in spite of the betterment noted, output was not up to the full capacity of our installations, and I regret that, at the moment, we are unable to foresee the realisation of our hopes for a peacetime output comparable to our achievements during the war. Nevertheless, the experiences we gained during a long period of frustration have taught us to adapt ourselves more realistically to inevitable circumstances, and thus avoid the losses inherent in a more ambitious programme, which would be subject to the continual interruptions such as it was our misfortune to endure last year.

We are recommending the same final dividend as was paid last year, and, although it is apparent that the profits for the year under review would have amply justified the restoration of the cut in the bonus which we felt it prudent to make last year, your Board decided that the principle of voluntary limitation of dividends should be observed.

Seven ships were completed and delivered, and all were powered by Doxford Oil Engines. In addition, several sets of oil engines were delivered to other shipbuilders. It is pleasing to note that two of our ships and three sets of engines, built for other shipbuilders, were for foreign clients. Our company, therefore, has made a material contribution to the nation's exports.

DOXFORD OIL ENGINE

The popularity of our oil engines, and the consequent demand for them, grows continuously. In addition to the 11 licensees in Great Britain, and the four abroad, reported in my last year's address, the Australian Government has, this year, been granted a licence, and building in Australia has already commenced.

Over 500 ships, powered by Doxford engines, have been put into service since the first ship thus equipped was launched some 27 years ago. Approximately 250 more such ships, totalling about 1,350,000 I.H.P. are now either in the course of construction or on order. These figures are impressive, and we are fully alive to the responsibilities devolving upon us, as the pioneers and sponsors of our own designs, which have met with such universal approval.

The department for research and development set up with the intention of encouraging closer contact and exchange of views between ourselves and our many licensees is already operating successfully.

Further orders have been obtained for ships and machinery which should keep our works fully employed for the next few years. We are especially pleased to report the receipt of orders for four large oil tankers for friends in the United States. It would be futile to attempt to forecast conditions which may exist after the completion of the orders now on our books. Present costs are undoubtedly very high and tend rather to increase than diminish, with the result that many shipowners are reluctant to place new orders. Any further increases are bound to have a most serious effect.

The report was adopted.

BEKOH CONSOLIDATED RUBBER ESTATES, LIMITED

DIVIDEND OF 5 PER CENT

The twenty-eighth annual general meeting of Bekoh Consolidated Rubber Estates, Limited, was held, on the 2nd instant, in London, Mr E. G. Estall (the chairman), presiding.

The following is an extract from his circulated review:—

On August 12th last the Coronation Estate was raided by armed insurgents, which resulted in three deaths, the burning of two smoke houses, the packing shed and damage to the factory engine and approximately 15 tons of rubber. The company had, of course, taken the precauton of taking out an insurance for riots and civil commotion and we are hopeful that our claims will be met.

The combined crop harvested exceeded the estimates by some 145,000 lb. Costs were a shade lower, but unfortunately the selling price of the commodity was approximately 2d. per lb. lower. Taking everything into consideration I feel sure you will consider the results satisfactory, and the board is able to recommend a dividend of 5 per cent., less tax, the same as the previous year. Dealing with the current year, the estimated crop is 2,860,000 lb., the reduction being due to the fact that 352 acres are being cut out for replanting purposes.

Addressing the meeting, the chairman said that they were doing everything possible to protect the estates and the personnel. They had a fairly satisfactory number of guards who were being added to as and when possible, barbed wire had been erected around the factory and buildings and the managers' bungalows, and they were contemplating installing flood lighting. So far, they had had no trouble on Bekoh estate.

The report and accounts were unanimously adopted.

GOLD COAST SELECTION TRUST, LIMITED

TAX APPEAL REJECTED

The eighteenth annual general meeting of the Gold Coast Selection Trust, Limited, was held, on the 2nd instant, in London, Sir Joseph Ball, K.B.E., the chairman, presiding.

The following is an extract from the chairman's circulated statement:—

We have deferred the presentation of the directors' report and the accounts until we were in a position to inform stockholders of the result of the company's appeals to the House of Lords against those additional assessments for income-tax in respect of the years 1934-38, to which reference has been made annually for some years past in the chairman's review.

I regret to say that, by a majority vote, judgment went against the company. At the same time, the case was referred back to the Commissioners of Income-Tax with instructions to reassess, on principles laid down by the court, the value of the assets which the company received in return for the properties.

It is a great disappointment to the board that we are unable to recommend the payment of a dividend in connection with the accounts now before us. We are carrying forward a large credit balance which in ordinary circumstances would have been available for distribution. The whole of our liquid resources have, however, been taken up in discharging our taxation liability and taking up the new shares which were offered to members "as of right" in Gold Coast Main Reef, Limited, Ariston Gold Mines (1929), Limited, and two years ago, the Amalgamated Banket Areas, Limited. These additional share investments were, of course, necessary in order to ensure the success of programmes of expansion being developed by these companies, and so to safeguard our existing large interests in them.

The report was adopted.

CHAMBERS WHARF AND COLD STORES, LIMITED

LARGER PROFIT

The twenty-first annual general meeting of Chambers Wharf and Cold Stores, Limited, was held, on the 28th ultimo, in London, Mr Charles Goldrei, chairman and managing director, presiding.

The following is his statement circulated with the report and accounts:—

In presenting the accounts of the company for the financial period ended June 25, 1948, I desire to make the following observations regarding the company's affairs. The trading results for the period under review continue to be satisfactory, the accounts disclose a trading profit for the 52 weeks ended June 25th (after providing for payments to the Ministry of Food Cold Storage Control of the excess over the maximum allowed to be retained by the company) of £94,844, against £81,787 for the previous period, an increase of £13,057. The net balance of profit for the period after providing for the directors' remuneration, depreciation, taxation and war damage contribution amounts to £33,635, against £29,845 for the previous period.

Of the balance of profit available, taking into account the amount brought forward from the previous year of £6,344, after payment of preference dividends for the year to May 31, 1948, and the interim dividend of 15 per cent. on the ordinary shares, your directors have transferred £5,287 to general reserve, £1,000 to staff pension and benevolent reserve and recommend a final dividend of 25 per cent., leaving a carry-forward to next year of £7,445.

BALANCE SHEET

It will be observed that in order to comply with the provisions of the Companies (Consolidation) Act, 1948, the balance sheet of the company has been rearranged. The provision for future taxation is shown separately as a revenue reserve and includes a provision of £2,500 (£1,000 this period) against the time when wear and tear together with the allowances granted under the Income Tax Act, 1945, will be less than the company's normal depreciation provision in the profit and loss account. Share premiums received from the formation of the company up to May 31, 1937, less allocations therefrom previously included in the general reserve have now been transferred to share premium account and reserves for depreciation are now shown separately as deductions from their respective assets.

In my previous year's report, I referred to the purchase by the company of East Lane Wharf, which adjoins the western boundary of the company's riverside property; buildings were erected on the site early this year, and the full benefit of this additional storage accommodation should be felt next year.

STEAMER TRAFFIC

During the period under review the company has increased its steamer traffic and your directors are taking further steps to improve the existing riverside facilities in this direction. Arrangements were made with the Ministry of Food as from February 26, 1948, to decontrol certain sub-zero temperature space, representing about half of the company's total cold storage capacity. The company has always been pre-eminent in the sub-zero storage of quick frozen fruit, vegetables and fish, and further new ground has now been broken in this class of storage, the results of which have been very gratifying to your directors. The volume of business since the commencement of the current year has been very satisfactory and your directors look forward with confidence to the results of the trading period just commenced.

The board consider it advisable that the maximum number of directors should be increased to 10 instead of the limit of seven now imposed by the company's articles. The appropriate resolution will be submitted to the shareholders at an extraordinary general meeting to be held immediately following the conclusion of the annual general meeting and the notice convening such extraordinary meeting is being sent herewith to ordinary shareholders, together with a form of proxy. I wish to thank my colleagues and express the board's appreciation of the good work of the executives and staff during the past year and I look forward to their continued co-operation and loyalty in the future.

The report and accounts were unanimously adopted, the retiring directors, Mr H. G. Jaeger, M.Inst.R., and Mr W. P. Power, were re-elected and the fee of the auditors, Messrs Nevill Hovey Gardner and Company, was fixed.

At a subsequent extraordinary general meeting the proposed increase in the maximum number of directors was approved.

GOODE DURRANT AND MURRAY, LIMITED

AN ENCOURAGING RESULT

MR G. P. SCHOOLAR'S STATEMENT

The fiftieth annual general meeting of Goode Durrant and Murray, Ltd., was held on 27th ultimo at 197, Great Portland Street, London, W., Mr. George P. Schoolar (chairman of the company) presiding.

The following is the statement by the Chairman which had been circulated with the report and accounts and was taken as read:—

The directors have pleasure in presenting their report and balance-sheet for the financial year ended July 20, 1948, the conclusion of the fiftieth year since the incorporation of the company.

DEMAND WELL SUSTAINED

The demand for merchandise was well sustained throughout the year, but customers became more discriminating and were not prepared to accept stuff unless it approximated to their inquiry. Australian turnover shows a substantial increase on last year, partly due to higher prices, but mainly to output of goods. Rates of gross profit show further reductions due to prices orders affecting margins.

Shipments from London to all parts of the world continued at a satisfactory level in spite of racial and political conflicts in so many places where we have business connections. In fact, the company is materially assisting the export drive.

The result of the year's trading is encouraging, and compares favourably with recent years.

DIVIDEND AND BONUS

Ample provision has been made for doubtful debts, contingencies and taxation on the profit of the year. Exchange on the net current assets in Australia is provided in full. From the profit of £59,777 (against £53,378) we propose to transfer the sum of £4,000 to the superannuation fund for employees, making the fund up to £15,000, and to recommend a dividend of 10 per cent. and, in addition, to commemorate the fiftieth anniversary, a bonus of 5 per cent. on the Ordinary shares of the company.

Properties, fixtures, fittings and plant are shown in the accounts at conservative values, and are maintained in good order and condition.

THE BALANCE SHEET

In other respects, the balance-sheet is drawn up in conformity with the new Companies Act, but, in order to enable shareholders to more easily evaluate their holding and to assist in assessing the financial position of the company, we have adopted what is called the vertical form. On this occasion, comparisons with last year's figures are not available, but it will be noticed that current assets and liabilities are slightly greater. The increase, however, is not comparable with the actual rise in cost of stocks, from which fact it is possible to deduce that we were running the business on less stock. How long this condition will last we cannot say, for although prices of goods are still holding at a high level, and in general display strong features, this is not the case with all lines, and we can detect easier tendencies in some cases, which can be expected to extend when the hunger for goods is satisfied.

Deliveries are deferred to meet the convenience of customers, instead of being at our option. Shipments to certain markets are held up due to import restrictions, particularly in South America.

HOUSEWIVES AND PRICES

There is a definite demand by housewives for reductions in household goods, and we are searching for values to meet the situation, and passing offers which are beyond a reasonable figure.

The inquiry for British goods continues, but the effect of foreign competition is having its influence on purchases from the United Kingdom. This needs watching if we are to maintain the volume of United Kingdom exports.

Australian production is adversely affected by the introduction of the 40-hour week, and leaves the way open to overseas competition.

It is not easy to forecast for the coming year. Prospects appear promising and demand is strong for wheat, meat, wool, butter and other primary products.

There has been a valuable increase in local manufactures, but Australia is handicapped by the intransigent attitude of labour, particularly among coal miners and waterside workers, with the result that golden opportunities are passing by.

Gold mining is languishing as a result of rising costs, without any compensating advance in price of the metal. Mining of lead, asbestos and other minerals is expanding. It is claimed that West Australia possesses the richest known belt of minerals, both rare and base, awaiting exploitation.

Our factories and workrooms turn out a useful quota of stock, but dearth of labour limits production.

AGRICULTURAL OUTLOOK

The agricultural outlook in both States gave very serious concern for some months, but it is greatly improved as the result of useful rains in late July and August. Very fair harvests are expected.

The unsettled state of the world does not encourage confidence, and we cannot overlook the position, particularly in those markets that concern us. It would be futile to indulge in promises of continued progress until the volume of production reaches a higher level at a cost which will successfully meet foreign competition. Output is the solution, and the efforts of all concerned should be strained in that direction.

The report and accounts were unanimously adopted and the dividend and bonus as recommended were approved.

Statistical Summary

GOVERNMENT RETURNS

For the week ended October 30, 1948, total ordinary revenue was £81,311,000, against ordinary expenditure of £62,829,000 and issues to sinking funds £30,000. Thus, including sinking fund allocations of £9,443,000, the surplus accrued since April 1st is £242,070,606 against £214,522,549 for the corresponding period a year ago.

Votes and Votaries

THE success of the Democratic party in the American elections is reported to have given great confidence to the Labour party in Great Britain. The directness with which the American electorate repudiated the activities of the Republican party in the 80th Congress, coupled with the fact that Mr Truman drew much of his strength from the adherence of organised labour, has tempted Transport House to see in the epic events of November 2nd a presage of victory in 1950 for the British Labour party. To certain enthusiastic journalists of the Left—who were, no doubt, preparing to prove the irrelevance to British politics of Mr Dewey's election—Mr Truman's victory has appeared as a further step on the road towards the century of the Common Man—even though its original prophet, Mr Henry Wallace, seems to be engaged on a flank march. It seems that the workers of the world, in their own queer way, are uniting after all. The Forgotten Man, it would appear, has been forgotten even by the public opinion polls, which have been predicting victory for Republicans and Tories. He can be relied upon, when the day comes, to emerge from his unpollable obscurity and do the right thing by the Left, in Oldham as in Ohio.

It is not surprising that the defeat of the Republican party—which, if it is no more fervent in its praise of private enterprise than the Democrats, is certainly more closely identified with Big Business—should have given satisfaction to Socialists in Britain. But it would be unwise for them to put too much weight upon any possible analogy between British and American politics. In the first place, the structure of the American Constitution created in this instance a political situation which could never occur in Britain, namely a Republican Congress pitted against a Democratic President. It would be impossible in Britain for the party in office to make electoral capital out of the legislative misdeeds of its opponents, for the simple reason that the Opposition in Britain can have no responsibility whatever for current policy.

In the second place, Mr Truman's election is, by universal consent, a victory for the New Deal; it is Roosevelt's fifth term. The Labour party has no leader, now or in its history, who could possibly be put alongside the giant figure of Franklin Roosevelt. He has taken his place, rightly or wrongly, temporarily or permanently, as a symbol whose influence on the imaginations of ordinary Americans can be compared only with that of Abraham Lincoln. If the Democrats found to their surprise that Roosevelt's social and political philosophy had penetrated deeply into the consciousness of the American electorate, and enabled a President of only modest talents to carry the country, the British Socialists have no such backing. The leaders of the Labour party will go to the country as an ordinary government of ordinary capacities—as Truman without the shadow of Roosevelt—and they will be judged on their own merits and their own policy without any legacy of inherited greatness to assist them.

In the third place, there is no direct analogy between the Democratic party in the United States and the Labour party in Britain. The Democrats are, it is true, of the two major parties the one that has the greater belief in the intervention of government in social and economic matters—

though their interventionism is still much weaker than that of most British Tories. They are the party most concerned—a fact clearly recognised by the electorate—with providing a minimum of social security, curbing the cost of living, and influencing the course of investment and development. They are the party most committed to the reduction of social inequalities by taxation, by social services and by minimum wage laws, and, in spite of the bipartisan agreement on immediate foreign policy, to a more effective policy of international commitments. But this is not to say that the Democrats are a party of the Left in any European sense; it is merely to say that the Republicans have a view of the ends of government which is very far to the Right by the standards of any country except the United States. It places the Democratic programme (if, indeed, there can be said to be such a thing) somewhere between the Toryism of Mr Butler and the beliefs of the Liberal party. Certainly, nobody would be more surprised—and shocked—to be hailed by the Labour party as a comrade than Mr Truman himself.

It is, in fact, quite fruitless to attempt to trace any exact comparison between British and American politics. The social climate from which they spring is entirely different. Civil liberty is a burning issue in the United States but hardly raises a cheer in Britain. Public ownership, in the sense of ownership of land and of public services, is probably more widely developed in the United States for historical reasons than even in Socialist Britain. Organised labour and the organised employers in the United States have never handed over their loyalty to one political party—though the recent campaign and its results suggest that this may not always be the case.

Finally, there is no historical evidence to show that movements of opinion transcend the width of the Atlantic. The depression of the nineteen-thirties, which produced the New Deal in America, resulted in a "National" (that is, Conservative) coalition in Great Britain, a government of much the same hue in Australia and a straight Conservative government even in Canada. There is at present some similarity in the trend of elections in western Europe, but that is because all those countries are reacting to identical pressure from Communism—and, in any case, the reaction is towards the Right. If the party managers of Transport House are prepared to make optimistic deductions from the result of the American elections, they must explain why they are not similarly cast down by the success of General de Gaulle in last Sunday's French elections.

*

But nevertheless, by inference rather than by direct comparison, there are certain lessons which those who scan the picture of British politics can learn from the American elections. In the first place, the analogy of the swing of the pendulum can be as misleading as any other analogy. There is no law of experience which dictates that parties shall change places at regular intervals either in Britain or in America. Change places they must if parliamentary democracy is to be preserved, but the political history of Britain between the two Great Wars is clear evidence that there is no automatic rhythm about the process. If there is a law of international application, it is that prosperity favours the ins. The Conservative party will be desperately unwise if it depends upon the mere passage of time to waft it into office. Conservatives cannot rely upon absorbing political strength from the inevitable dislike which affects any government in office. They cannot count upon being *tertius gaudens* to the conflict between the Government's policy of austerity and the desire of the people for a higher standard of living. Those who are disillusioned with Labour will by no means necessarily vote Conservative: they may vote for a smaller party or, more likely still, they will not bother to vote at all. The phenomenally low vote recorded in the American elections should remind both the major British parties that political support does not pass from side to side, but can easily evaporate into mere indifference.

Secondly, the Conservatives are in a position not unlike that of the Republicans in that they are concerned more with opposing the present regime than with the advocacy of a positive political programme. Except in times of crisis, the electorate demands something more of a political party than a promise to govern well and to do its best in the light of circumstances. It is neither necessary nor even possible for the Opposition to present an alternative policy in all its details; only those who have the Civil Service behind them can draw up exact proposals. But at least it must convince the electors that it is capable of working out a coherent alternative policy if entrusted with office. It must, that is to say, have a clear alternative set of principles, and towards that the Conservatives, like the Republicans, are still only groping their way. They must explain what there is in their policy which would lead to greater solvency and security for the nation and a happier and more prosperous life for the individual. Merely to say that they are in favour of these things is not enough.

Finally, the Conservatives have a difficulty which presents itself more acutely to them than to the Republicans—that of being the rich man's party. Although all rich men are not Tories, and certainly all Tories are not rich men, it is undeniable that over the last two generations the Conservative party has gathered to it, in addition to the farmers and the shopkeepers, the majority of businessmen and almost the whole of the rentier class. While it is perfectly true that the Labour party is equally the representative of sectional interests, every bit as parochial as those which support the Tories, they have the definite advantage that these interests are not individually wealthy, that in the past they have had an unsatisfied claim upon society, and, above all, that they are far more numerous than the middle and upper classes. The Tory party can only too easily be identified with the "boss" class, and while this, in view of the voting record and of the domestic legislation of past Conservative governments, is an unjust imputation, the party's readiness to admit big business to its counsels makes it hard to shake off. Moreover, it gives to the more progressive policies that its liberal wing fathers a ring of paternalism which, while no more distasteful than the self-righteous assumptions of Socialist propaganda, is politically damaging.

*

But the Conservatives have no monopoly of political problems and difficulties. If they are in search of a policy for the nineteen-fifties, so also is the Socialist party. With the nationalisation of iron and steel, the programme put forward in 1945 will come to an end. They could go forward at the insistence of their radical wing to propose the nationalisation of insurance, banking, shipbuilding, and perhaps the land. But the party managers are well aware that nationalisation is steadily becoming an emptier issue, and an unpopular one too, not because it is thought to be wrong, but because it is seen to be pointless. On the other hand, the other great prop of Labour policy—the steady advance of the social services—cannot, for some time to come, be pressed any further without wrecking the national economy.

The fact is that British politics are dangerously close to a vacuum. Neither party has a set of principles—still less a detailed policy—adapted to the world in which postwar Britain has to live. If the Tories are still nostalgic for the 1920's, the Socialists are still facing a future that existed only in the imagination of the same era. The American election has demonstrated the hazardous nature of all electoral prediction, but we will nevertheless venture one: the party will win the votes of the British electorate that shows most realism in facing the truth of the position the nation is in and most courage in basing its policy on the necessities that a searching scrutiny of the facts reveals.

Crisis in China

THERE have been signs for some time that the storm-centre of world politics might shift from Europe to the Far East. In Europe, in spite of the continuing tension over Berlin, there has been a certain consolidation of positions on both sides, a transition in the cold war from a campaign of movement to a vigilant defence of fortified lines. It is only in China that at the present moment Communism is advancing victoriously by force of arms. The destiny of a country which holds a fifth of the world's population is at stake in a far-ranging civil war in which both America and Russia are involved, at least morally, as backers of the opposing sides. Britain is relatively uninvolved, having withdrawn from active concern with Chinese affairs ever since China was declared an American "strategic sphere" during the Pacific war. But no nation can remain unaffected by a threat to the peace of the world such as may at any time arise out of the Chinese civil war, and Britain has already felt its repercussions in the Communist revolt in Malaya, for this rising is almost entirely Chinese and has been partly a projection of the Chinese civil war into Malaya; many more non-Communist Chinese than Europeans have been killed by the rebels.

The situation which has existed in China since the fall of Mukden to the Communists cannot be merely an internal concern of China, nor in its international implications can it be confined to the interests of America and Russia. There would, indeed, be ample justification for bringing it before the United Nations—were there any ground at all for believing that the United Nations could do anything about it. But whether within the framework of the United Nations or outside it, the Western nations will have to do some hard thinking about China. Their concern with the Chinese crisis, it need hardly be added does not arise out of any assumption of right to supervise China's internal political or economic development or decide what China's national policy is to be. Nor is it primarily because of anxiety over the fate of foreign-owned properties in China; these are legitimate interests to be defended by diplomatic means, but they are not a ground for intervention in China's domestic politics. The reason for alarm at the military advances of the Chinese Communists lies in their fanatical hostility to America and the Western World and in the probability that a Communist China would be inseparably combined, like Poland or Czechoslovakia, with Russia in an anti-Western bloc, thus bringing about a profoundly important alteration in the world balance of power and opening the way for fresh advances and excursions of militant Communism.

Communism, triumphant in China, would hardly be contained by China's borders. The wave would pass on into south-east Asia, where there are large Chinese communities in each country; it is significant that the Chinese Communists have followed the example of the Kuomintang in taking special measures for organising the "Overseas Chinese," and they have the advantage of a doctrine which, unlike pure Chinese nationalism, can influence the native inhabitants while retaining leadership in Chinese hands. Thus, not merely Manchuria or even North China, but the whole Far East from the Amur to Timor and the Bay of Bengal is at stake in the struggle for the Chinese capital which is now developing.

There has been much controversy about the Chinese Communists, the character and aims of their movement and their relation to the Soviet Union. There has been a great vogue for the view that the Chinese Communists are "not really Communists," but merely radical agrarian reformers with a Chinese version of the faith having little except the name in common with the Moscow brand. It has been inferred as a corollary of this interpretation that a Communist victory in China would make little or no difference to China's foreign relations and that the western nations would be able to do business with the new regime simply on the basis of China's national interests and need for foreign economic aid. Unfortunately this view hardly squares with a scrutiny of Chinese Communist propaganda for home consumption or with the writings in which Chinese Communist leaders have expressed their attitude to world affairs.

*

There is nothing to show that the Communists in China, any more than elsewhere—at any rate, as far as their higher leadership is concerned—are merely practical reformers, indifferent to Marxist-Leninist dogma; on the contrary, it is the fanaticism of belief in a revealed doctrine which, combined with a supple tactical skill in the manipulation of social forces, has been the secret of their success. Because of the economic backwardness of China and the course of events which in 1927 drove them from their original bases in the coastal cities, the Communists in China have become more specially identified than in any other country with peasant revolt; they have also gone very far in temporary compromise with capitalism in order to win support among middle-class elements disgusted with the corrupt rule of the Kuomintang.

But in their world outlook, and therefore in their foreign policy, as and when control of it can be obtained, the Chinese Communists are fully orthodox. They know from their

Marxist-Leninist bible that imperialism is the final stage of capitalism; America is the strongest of the capitalist states and must therefore be planning the conquest of the world, including the subjection of China. All the denunciations of American imperialism and the "instigators of war" which pour from the radios of Moscow or Warsaw are echoed in Chinese Communist broadcasting with, if that is possible, even greater venom. If Britain figures less prominently than America among the infernal powers threatening the hard-won independence of the Chinese people, it is not because of any sympathy for the efforts of the British Labour Government to carry out a programme rather more socialist than that put forward currently by the Communists for China, but because from a Chinese angle Britain and Europe are hardly in the picture at all.

It may be said that the rabid anti-Americanism of the Chinese Communists is due only to American support for President Chiang Kai-shek and that it would disappear if American policy were to abandon the Nanking regime. However, the Chinese Communist line on foreign policy did not start with the American aid given to the Chinese Government after the surrender of Japan; in 1940 the Communists in China were faithfully following the Moscow directives on the "imperialist war" which Britain was then waging against Hitler, and Mao Tse-tung's book *The New Democracy*, which laid down the principles of Communist political strategy in China, made clear the fundamental alignment of the party on the side of the Soviet Union against all capitalist states. It is possible, indeed, that the Chinese Communists, if once in control of all China, might succumb to "Titoism" and forget their proper devotion to the highest authority of the brave new world; the size of China and the instinctive Chinese ethnic pride would make for insubordination. But western policy cannot safely be based on such a remote chance. It is impossible for the leaders of a state to hold definite *a priori* convictions about the inevitable imperialism of certain other states, and to instil such convictions into the whole people through a monopoly of propaganda, without their foreign policy becoming, in a large degree, the prisoner of these ideas.

In these circumstances can there be any doubt that the western Powers, and above all the United States, have an overwhelming interest in sustaining any government which is friendly to the west and opposed to the absorption of China into the Russian orbit? It is not the virtues of Nanking that make support for it imperative. The western Powers have indeed no reason at all to be satisfied with the record of the government which today is attempting to stem the Communist advance. But the nature of the struggle leaves the western Powers no choice. In the circumstances which exist, support for the anti-Communist forces is legitimate and should be inevitable.

★

But even if the need to reinforce Nanking is admitted—which is far from the case in Washington where the "plague on both your houses" pronounced by General Marshall eighteen months ago still checks the "China firsters" in Congress and the popular press—and even if the decision were taken to give the Nanking Government sufficient backing to maintain its position, the problem remains of finding some means of doing so. The issue is urgent. It is not a question of long-term support but of stopping the Communist flood within the next few weeks and checking the advance which today threatens the whole Yangtse valley. Clearly, therefore, it is in this first instance a problem of military supplies and food for the threatened cities. But fundamentally it is a political initiative which is needed. It is manifestly impossible for any situation to be retrieved if the present Nanking regime continues unaltered. Its record of corruption and incompetence is such that it can no longer maintain popular leadership against the Communists. Moreover, it has failed in what is both in the immediate future and in the long run the crucial issue in China—the attitude of the peasant. Military resistance now and stability in the future depend upon agrarian reform. The total failure of the present Government at Nanking to recognise this necessity has ruled it out as a rallying point for Chinese resistance.

Is the situation, therefore, hopeless? Far from it. Upheavals in the Nanking Government may well come, of themselves, as a result of the military defeats of recent months. But the Americans can accelerate the process by making their aid conditional upon the broadening of the Government by inclusion of some of the liberal statesmen who for the last eighteen months have been seeking to break the limpet hold on the power of the Kuomintang Old Guard and chief among them the notorious "CC clique." The creation of a new cabinet would permit the Americans to press forward with the two chief needs of the present situation—the distribution of arms not only to the regular forces but also to local armies and defence organisations together with the announcement and where possible the enforcement of drastic changes in the relations between landlord and tenant.

★

In the south and west of China there are vast areas where Communism as yet appears hardly to have gained a foothold and where resistance under local leadership could certainly be organized if military supplies were available and initiative were no longer cramped by the jealous obstruction of the Nanking bureaucracy. A traveller in Szechwan this summer found considerable enthusiasm for the local "self-defence" organization —a kind of Home Guard—but was told it could obtain no arms or ammunition from the higher military authorities. This seems to be a common story throughout China and applies not only to local militia units, but also to certain generals who have been effective in fighting the Communists but are not regarded by the Kuomintang ruling clique as quite reliable upholders of the Nanking regime. The time has now come when the American Government, in extending aid to Nanking, should insist that the arms sent are properly distributed to those who are prepared to use them against the Communists.

The pledge of agrarian reform is as urgent as the proper control of arms distribution. The Communists' sweeping advances are in large part due to the support they have gained as the champion of the peasant at a time when in Kuomintang China the grip of landlord and moneylender has grown more grievous with the combination of food shortages and inflation. The Americans have already recognised this fact by setting up a joint Chinese-American board for agricultural rehabilitation which attempts to bypass the corrupt central authorities. This step is, however, only a modest beginning. The new situation offers the opportunity for more drastic reforms.

These are the immediate issues. They are urgent. They present the United States with as delicate a problem of negotiation as has ever confronted the State Department, and doubtless if events in China were not taking so tragic a turn for the Government, the Chinese would reject out of hand the coupling of assistance with direct intervention—however beneficial—in China's domestic concerns. But the situation now has slipped far beyond squabbles over sovereignty. The issue in Nanking is bare survival, and in such a crisis, it is hard to believe that instincts of self-preservation are so slight that they cannot bring the interested parties together and do it speedily. Consultations have already begun in Washington on the next stage in China, and it would clearly be an advantage to place whatever weight there is in British and Commonwealth influence behind the Americans in devising an emergency programme to hold the Chinese line. But the first responsibility falls inevitably on the United States and the whole future of western influence in the Far East may depend upon whether American policy can move fast enough and far enough in the decisive days ahead.

Latter-Day Luddites

NOTHING could show in clearer contrast the two faces of British trade unionism than the juxtaposition, within the last week, of the Trade Union Congress's report on Productivity (on which, together with other aspects of the general issue of productivity, more is said on later pages) and the strike of a number of dockers at Butler's Wharf, Bermondsey, against the use of labour-saving machinery. Simultaneously also, the Anglo-American Council on Productivity, on which representatives of British labour and industry met their opposite numbers from the United States, published an agreed statement issuing from their first session. The Council could hardly be expected to be critical of any of the interests represented on it. But it is a little odd, to say the least, that the attitude of the workers towards productivity should be wholly omitted, and that only the management side of industry should be called upon to "keep abreast with, and to apply, the best practices and most modern equipment."

Opposition to labour-saving machinery is, of course, as old as trade unionism itself, if not older. On the short view, and from the exclusively sectional standpoint, it is perfectly understandable. Whatever the obvious and permanent gain of having better tools to work with, the reshuffling of workers called for by the introduction of those tools is unpleasant to those most closely concerned. The impulse of the worker to stick like a limpet to what he regards as his freehold is neither unnatural nor discreditable. A bird in the hand is worth two in the bush of a more prosperous, better-equipped future; next year's increased national production is a dim vision, next week's pay envelope is reality.

Even on a somewhat longer view than next week, there are some trade union groups that have every reason, except the public interest, for fighting labour-saving devices. If—by chance or contrivance—one finds oneself in a really lucrative monopoly position, the by-passing of that bottleneck is a real disaster, fully as unwelcome when the monopolist is a trade union as when it is a trade association. To varying degrees, all trade unions are monopoly bodies, whose commodity is manpower. For most of them, their monopoly power is as strictly limited, and, therefore, innocuous, as that of any seller whose customers, when pushed, will satisfy their needs elsewhere. But for some unions, their strategic advantage is an established gold mine. No compositor could be expected to welcome the advent of the varityper, whose use has kept the Chicago newspapers going through a compositors' strike with the disconcerting, if expensive effectiveness of an air-lift.

But even when a trade union has a real stake in stagnation, that is no reason why it should be treated with any particular tenderness. And so far as the ordinary worker is concerned the stake is, of course, quite illusory. The establishment of a rule that no one's job shall ever be taken from him by a machine would hit him far harder than the inconvenience of adapting his economic life to technical progress; in so far as such a rule is enforced, he suffers from it now. The docker is ill-housed partly because of the job-safeguarding restrictive practices of bricklayers, carpenters, and plumbers; his clothing is rationed and expensive partly because his trade union comrades in the textile industries have objected to automatic looms; his children's schools lack textbooks partly because of the restrictions imposed by printers and binders; his whole standard of living is held down and endangered by his country's insolvency, to the cure of which the shipping industry could make a perceptibly larger contribution but for the slow turn-round imposed by his own actions.

The general break-up of the limpet tradition, the spread of a new spirit of welcome to better equipment and methods, would benefit each group out of all proportion to any sacrifices of immediate security which it would entail. This is no mere theoretical calculation or guess at probabilities. Nation by nation, the countries of the world can be classified in order of capital per head—of the amount of equipment backing each worker's labour—and of income per head; and the two classifications are the same. Those workers who have a team of mechanical slaves to assist them not unnaturally produce more and, producing more, get more pay wherewith to buy the production of others. Those who reject the machine, or have never had the choice, producing less, consume less too. One may reject machinery as Ruskin and William Morris rejected it, because one believes a mechanised life not worth living; one cannot reject it while simultaneously claiming material standards which only the machine can give.

★

The American worker's attitude to labour-saving machinery is, with a few exceptions, radically different from that of his British counterpart. The exceptions exist—nothing could be more Luddite than Mr Petrillo of the Musicians' Union—and an enlightened view of the benefits of up-to-date equipment need not deter a union from the most violently anti-social practices in other directions. The demarcation rules in the American building trades, the punitive initiation fees charged by many unions to new entrants, and the ways of union strong-arm squads with non-union labour, are decidedly not features of a universally superior system. But American workers do know what machines are for—that is, higher production; and they do know what higher production is for—that is, higher wages. The connection is as clear and obvious to their minds as the connection for the frontiersman between a sharper axe and a better cabin, or a better plough and a bigger crop. Mr John L. Lewis, who is hardly the employer's *beau ideal* of a trade union leader, is accustomed to boast of the initiatives that his union has taken to introduce labour-saving machinery into the coalmines.

The American worker's willingness to move over to let in the machine which is his long-run ally is matched by the American employer's willingness to reward increased production with higher pay. The American business tradition, not universal but preponderant, is to boast as loudly of high wages paid as of high production figures or technical excellence. This tacit bargain between employer and employee has served the Americans well. It is not a panacea; they have had economic troubles enough. But they have never fallen into that state of wary and suspicious stagnation, that spider's web of mutual stranglehold, which for the last quarter-century has frustrated British brains and energy; nor, while this positive attitude towards everything making for high production lasts, are they likely to. It is significant that the state of affairs known on this side of the Atlantic as "full employment" is called "full production" in America. The specific study of American "know-hows" could be profitable enough to British industry, but nothing like as profitable as an infusion—on both sides of British industry—of the American attitude to technical progress and cost-cutting.

The infusion has begun—had begun well before Sir Stafford Cripps announced the formation of his Anglo-American Council on Productivity. Responsibility in the face of crisis has taught the trade union leaders, in the teeth of all their traditions and preconceptions, to seek higher working-class standards in higher production rather than in the expropriation of the expropriators; it has even brought them to face that problem of industrial
