The Siege of Berlin

THERE can be no denying that the situation the Russians have created in Berlin is alarming. There is, fortunately, no reason to suppose that it will lead to open war—neither side is ready to die for Berlin. It may yet end happily by the re-opening of rail and road communication between Berlin and the western zones. But if this is the outcome, it is as well to realise that it will be by courtesy of Mr Molotov—a commodity that cannot be greatly relied upon. The Russians have shown that they are both willing and able to put the three western zones of Berlin under siege. If they do not choose to press such a siege home now, they may choose to do so later. What is alarming is to discover how little the Western Powers had—apparently—foreseen such a siege or prepared for it. They have apparently for weeks been playing poker with the Kremlin without properly examining their own hands.

The essential facts in this situation were predictable six months ago, after the four Foreign Ministers failed to agree about the future of Germany in their London meeting. The details were predictable three months ago. The Russians made it clear, by one piece of obstruction after another, that they were ready to hinder, reduce or stop all traffic coming into Berlin from the West by road, rail, canal and even air. There was dangerous tension on this account as long ago as April 1st, when new traffic regulations were introduced by the Russians at 36 hours' notice. The Russians also made it clear that their measures to restrict traffic into Berlin would keep pace with the progress of the three Western Powers towards an agreed plan for the political and economic reconstruction of their zones of Germany. Currency reform would mark for the Russians the climax of the Western challenge to their policy in Germany, the point at which they would retort by challenging both the right and the power of the Americans, British and French to remain in effective occupation of three quarters of Berlin. That climax came on June 18th.

The responsible leaders of Western policy have also been at pains to declare how ready they were for such a trial of strength. Mr Bevin has several times publicly announced the British determination to stay in Berlin. He told the Labour Party Conference that he would stay, "regardless of the provocation offered"; he told the House of Commons the same. General Clay said that nothing short of war would be able to move the Americans. On each occasion these declarations have been applauded, not just for the Palmerston touch but because the public assumed that methods of maintaining the Western position in the city had been examined and prepared. They assumed that the dangers of bluffing would be obvious both to the Foreign Office and to the State Department, that the Russians were being taken at their word. Yet in spite of all this, there are unmistakable signs of both Britain and America being taken by surprise and compelled to improvise methods of supplying Berlin.

Mr Bevin's carefully weighed but firm statement on Wednesday left no room for doubt about the Western determination to do everything possible to keep Berlin supplied. But it still leaves some doubt whether it can in fact be accomplished. Over 2,000,000 Germans, as well as three garrisons, have to be fed. That is the minimum task, demanding

men. And in this later crisis of excommunication it seems that his Communist party has not split wide open as Moscow clearly expected it to do. Tito's followers still look to Belgrade, not to the Kremlin. If, however, the technique of internal disintegration fails, what weapon is left to the Russians save that of open force? Yet there are no Russian garrisons in Jugoslavia, and Tito is well armed. Thus, for the moment, Russian policy seems to have reached an impasse.

The Western Powers are in a happier state, for in the short run at least they need do nothing. Marshal Tito is no friend of theirs. On the contrary, his first pronouncement of policy since "excommunication" includes a violent attack on the "imperialist West." It would be a diplomatic *gaffe* of the first order if the Western Powers were to begin making him advances simply because he has turned his back on the Kremlin. They have time to reflect, to weigh the case, to wait on developments.

Nevertheless, the rift in the monolithic East raises one question which the Western Governments would do well to consider. Much in their attitude and policy towards the East has been determined by the belief that Russian control over East European policy was both welcome and complete. The underlying assumption has been that the West must expect a solid, undifferentiated *bloc* stretching from the Oder eastwards and that any policy put forward by a "satellite" would necessarily have Moscow's approval and would probably give Russia some advantage. This assumption is no longer self-evident. There is thus a case for re-examining some aspect of the Western Powers' relations with Eastern Europe on their own merits without reference to the supposed advantage or disadvantage of the Soviet Union. Where in the past a policy, otherwise advantageous, has been rejected simply on the possibility that it could strengthen the Soviet Union, it might now be reconsidered. In particular, trade relations might be reviewed in this light. Clearly, such a revaluation hardly amounts to a change of policy. At first, at least, it represents no more than a change of attitude, a new attention, a greater flexibility. But it might secure certain concrete advantages to the West and it would certainly do nothing to dispel the belief made evident by Tito's defiance—that Eastern Europe has more to resent and fear in domination by the East than in any pressure, real or supposed, from the West.

The World and the Dollar—II

Dollars—An American Problem

THE first article of this series pointed out that there is a fundamental divergence between American and European views of the future course of economic relations between the nations. The Americans believe in the possibility of a return to a multilateral, more or less freely trading world, in which there will be no general dollar shortage, but all currencies will be freely convertible into each other, so that anyone who holds any other currency will be able to get dollars for it if he wishes to, and in which there will consequently be no need for the United States Government to make any special supplies of dollars available. On the other side stand the Europeans, who find it very difficult indeed to believe that, in four years' time—or, indeed, at any time in the 1950's—they will be able to possess themselves of as many dollars as they would like to use. In short, it is a divergence of view between those who believe the dollar problem is temporary and those who fear it is likely to be permanent.

It is very important that the European forecast of an everlasting dollar shortage should not be misunderstood. It does not, for example, mean that Europe will never be self-supporting—that is, that ERP will fail. In American ears, it is true, the two things sound identical, because to be short of dollars is to be short of money, which is to be dependent on charity. Fully three-quarters of the difficulties that arise in the mutual understanding by different peoples of each other's economic problems arise from the natural tendency of every country to identify its own currency with "money." In the days of the old German Reparations controversy, twenty years ago, the man in the street was genuinely puzzled to understand how Germany could be so prosperous internally and yet have difficulty in paying the reparations bill. If the German Government was short of "money," why could it not increase taxes? Similarly, it is reported that the showing in New York of the coloured film of Princess Elizabeth's wedding presents left on the American audience the impression that all the talk of a scarcity of dollars in England must be nonsense. The truth is that, in the present international financial crisis there are two quite separate problems. One is the specifically European problem, that the nations of Western Europe cannot at present pay for the supplies they need from the outside world. This problem, it is reasonable to hope, will be solved by 1952. As European production revives and as the terms of trade swing back, the balance of payments of Europe with the rest of the world, regarded as a whole, will come back into equilibrium. There is every reason to suppose that, by 1952, Western Europe will be paying its way, and that it will be able to earn as much as it needs of every currency in the world except the dollar (and possibly the Canadian dollar).

But the second problem is that the balance of payments of the United States is also out of equilibrium, though on the other side, and it is very much more difficult to see grounds for hoping that it will right itself by 1952. The dollar shortage may not then be so acute. It may then even be possible for the European nations to earn enough dollars to cover their irreducible minimum purchases in the United States, so that no further grants or loans may be necessary. But it seems most unlikely that the European nations will be able to balance their dollar accounts without maintaining the most rigid economy in purchases from North America and practising the strictest husbandry of any dollars they can earn. In 1948 it is possible to regard the dollar shortage as something for which the remedy must be sought in Europe. By 1952 it will probably be clear that it is an American problem.

The forecast that there will still be a dollar problem in 1952 could be supported by an elaborate statistical argument based on the recorded figures of the American balance of payments. But no statistics, however elaborate, can provide absolute proof of what lies in the future. And no very elaborate statistics are required to establish the fact that there is at least a strong risk that the American balance of payments will still be out of equilibrium, on the credit side, in four years' time—or, to use language more strictly, that it would be out of equilibrium if there were then a return to multilateral, non-discriminating, unrestricted trade as envisaged in the ITO Charter. It is enough for the argument of these articles to establish the risk, not the certainty. It is enough to establish the conclusion that it is safer to base plan-making for the world of the 1950's on the assumption that there will be a dollar shortage than on the assumption that there will not.

What, after all, is it that is to be relied upon to balance the American accounts? The dollar was strong enough in the 1920's and the 1930's, and clearly everything that has happened since has made it relatively stronger. It is true that the present extreme shortage of dollars may well be mitigated. As production elsewhere in the world recovers, there will be alternative sources of supply for many of the things for which America now has a virtual monopoly. It is true that America's need to import some raw materials is rising; oil is the prime example. But the oil reserves of the world are to a great extent American-owned, so that the dollars provided for the rest of the world by their exploitation are many fewer than might appear. It is true also that there is much talk in America of foreign lending operations; but loans merely postpone the shortage of dollars, since they have to be repaid eventually, and in the meantime interest has to be paid on them. Moreover, the difficulty about relying on loans as a cure for the shortage of dollars is that the very same shortage makes it doubtful whether the borrower will be able to meet his obligations and thus scares off all private lenders.

There is also the possibility—of which much has been heard from America in recent months—of a series of devaluations of the European currencies—that is, a rise in the exchange value of the dollar. But it is doubtful whether this, though it would help, would do the trick. We have learned in Britain in the last few years how little we can dispense with American goods, however expensive they become. And what exactly are the British goods of which billions of dollars' worth could be sold in America if the pound were cheaper? Perhaps if there were willingness to let the dollar rise sky-high and to admit unlimited amounts of European goods at low prices without any increase of tariffs—perhaps if these processes were free to continue indefinitely, a point would eventually be reached at which the accounts would be balanced. But this is quite chimerical; it is certain that neither the American nor the European Governments would contemplate such very wide movements. Within the range that Governments will allow, it is very difficult, even after all these allowances have been made, to see how the United States is going to purchase so much from the rest of the world as to create the supply of dollars that the rest of the world would need to pay for what it would buy from the United States if it were free to buy as much as it would like to. The European nations may not be so cruelly embarrassed by their lack of dollars as they are now. But it is overwhelmingly probable that they will have to watch their dollar expenditure very carefully—much more carefully than they will need to watch their expenditure of any other currency.

Clearly, however—and this is another misunderstanding that needs to be clarified—this state of affairs cannot fairly be imputed to the United States for blame. It is not—it will not be—America's fault. It is true that the American tariff is still high, and that though praiseworthy efforts to lower it have been made in the past fifteen years, they have all been part of carefully calculated bargaining to increase American exports *pari passu* with American imports, so that no net relief has been given to the balance-of-payments problem. But the dislocation between the dollar and the other currencies of the world is far larger than can be explained by any mistakes of political action. It might even be that if the American tariff were abandoned completely, the problem would still remain. It is fashionable, on this side of the Atlantic, to contrast the skill with which Britain managed the international currency system in the last century with America's refusal to "behave like a creditor." But these complacent comparisons are really quite unjustified. It was easy for nineteenth-century Britain to behave like a creditor; it is difficult for America. There is no precedent in economic history for the phenomenon of the United States, a country whose needs to buy from the rest of the world are relatively so elastic, and the urgency of the world's demands for whose products is so great, that a natural balance is almost impossible of attainment. It is nobody's fault, but a position that has to be accepted and allowed for. It is foolish to utter preachments at a country which, with all its faults, has shown itself generous beyond all precedent. But it would also be foolish to pretend that the facts are other than they are.

The most important of these facts for everybody to grasp is that the shortage of dollars is—or very soon will be—an American problem. Europe can make itself once more self-supporting. But if, when that has been done, there is still, as seems likely, a shortage of dollars, that will be a problem that it will be beyond Europe's power to solve. Europe will nevertheless have to take account of its existence, and the concluding article of this series will discuss some of the consequences for long-range policy that would follow.

Science and Planning

(By a Correspondent)

THE polite and seemingly esoteric deliberations of the Royal Society's Conference on Scientific Information may seem at first sight to have only a specialist interest. This Conference, at which the Dominions and the United States were represented, was summoned in response to a general desire for consultation upon methods of improving the flow of scientific information. In many fields of science the research worker finds it increasingly difficult to keep abreast of the growing volume of highly specialised papers published in hundreds of periodicals throughout the world. The development of library and information services demands co-ordination, and even some standardisation, of publication. Three of the four sections of the agenda dealt with such innocuous topics as improvements in abstracting, indexing and reviewing services. The fourth, however, was concerned with the production and distribution of scientific papers which is the foundation of the whole system, and in which any proposal for drastic change is inevitably controversial.

The organisation of scientific publication is based at present upon a wide diffusion of responsibility and control among a large number of societies. The societies have grown over the years, in response to the needs of scientists and scholars, and the cement which keeps the system together is precisely that "overlapping" of functions which all planners abhor. The integrity and independence of these societies and their publications constitute a guarantee of scientific freedom, since the research worker has that liberty of choice between two or more journals for the publication of his results which is the only final safeguard against scientific censorship.

The proposals put forward by Professor J. D. Bernal had already been favourably considered at a conference of the Association of Scientific Workers (which is not a learned society, as is sometimes supposed, but a trade union with a left-wing leadership), and provided in effect for a form of nationalisation of the machinery of scientific publication. They were based on a quantitative and statistical analysis of the situation, completely ignoring such qualitative factors as the initiative, devotion and competitive zeal of editors (who are mostly unpaid)—qualities which could hardly survive the transplantation to a bureaucratic regime. The essence of the scheme was that the individual paper, and not the bound-up journal, should henceforth be the unit of publication; that "National Distributing Authorities" should be set up to receive manuscripts, send them for reference

NOTES OF THE WEEK

Economic Vandalism

The end of the London dock strike closes one of the most senseless and regrettable episodes in British industrial history. A dispute over the disciplinary action taken by the Dock Labour Board, using machinery which had been fully agreed to by the trades union, brought the port of London to a standstill for over a fortnight and nearly succeeded in creating a sympathetic strike at every port in the country. The decision to proclaim a State of Emergency, backed up by the best broadcast ever made by Mr Attlee, and the pinch of the empty pay packet, undoubtedly contributed to the strike's collapse. But probably the most important reason was the united hostility to the unofficial strike on the part of the Government, of organised labour and of the unorganised consumer who will bear the brunt of this *jeu d'esprit*.

The reasons for its flare-up cannot be explained in terms of Communist plots. It is highly doubtful if Moscow wishes attention to be directed to British Communism at this moment or could have engineered this strike had it wished. Once begun, the leadership of the unofficial strike undoubtedly passed to the Communists, but that does not explain why the dockers preferred to follow them rather than press for revision of the disciplinary clauses of the dock labour scheme through their union which had originally negotiated it. The underlying causes were, first, a lack of confidence between the dockers and the higher officials of the Transport and General Workers Union and a general feeling that the latter had deserted to the "boss class" and could no longer be relied on to represent the men's interests. Secondly, there was an inchoate feeling of resentment at the discipline imposed by the dock labour scheme as against the old days of casual labour. Consequently, once a lead had been given, the dockers preferred the dramatic course of direct action to the slow process of negotiation through their union for the vindication of their eleven mates.

The dock strike has raised two major issues. First, if the Transport and General Workers Union is too large and amorphous to retain the confidence and represent the interests of the various trades who compose it, ought it not seriously to consider putting its house in order? If it cannot participate in the running of industry without its officials losing touch with the men, there is a strong case either for getting new officials or for introducing better methods of keeping them in touch with the feeling of diverse interests which they represent. No union which has a sense of its responsibility, to the nation and to its own members, ought to be able to witness—without severe self-analysis—the deplorable spectacle of the failure of its General Secretary to carry any weight with the dockers.

The strike has raised an even wider question. In the postwar British economy, stripped of all its reserves, such a stoppage creates far graver problems than in any previous era. It is, therefore, vital to discover what safeguards the nation can erect against the recurrence of such wilful acts of economic vandalism. To outlaw the right to strike would be unthinkable under the present or any other British Government, and a half measure would, as the Taft-Hartley Bill in the United States has shown, be worse than useless. The answer is surely that in Great Britain, where the machinery of industrial conciliation has become so highly involved, the strike, whatever its value as an ultimate sanction, has become a clumsy and obsolescent weapon, a rusty bludgeon used where a surgeon's probe is needed. The dockers gained nothing by this strike (they actually lost some £250,000 worth of wages) that they could not have achieved by other means. Only the leaders of the Labour movement can educate the mass of the workers to the realities of modern industrial organisation, and instead of searching for scapegoats they would do well to take their coats off to the job.

* * *

Master Pact for ERP

The negotiations on the master pact for ERP have been successfully completed and in the House of Commons on Tuesday, Sir Stafford Cripps was able to announce the Government's readiness to accept the terms. The most unacceptable provision—which appeared to remove from Britain the power to regulate its own exchange rates—has been removed, others are modified (the details are discussed in a Note on page 27) and altogether the Americans have clearly gone almost all the way to meet legitimate British objections presented by Sir Oliver Franks.

Since this is so, it is to be hoped—but hardly perhaps to be expected—that the debate on the agreement, fixed for next week in the House of Commons, will be both discreet and informed. Few subjects rouse such parliamentary diatribes as the wrongdoing, real or supposed, of the Americans. The lunatic fringe on the Left are always ready with cries of "capitalist bloodsuckers," while the Right goes off into a passionate and resentful defence of Empire directed against a nation of Colonel McCormicks. And in between the two extremes, the number of Members who can match sobriety of approach with real information on international monetary and commercial policy is unhappily limited. It is therefore possible that American policy may come in for some rough handling next week, which would be not only injudicious but unjust.

The negotiations have shown once again that the first thoughts of the American Administration are usually very different from its final conclusions. The original draft is often prepared by "enthusiastic lawyers" with a passion for precision and for guarding against all eventualities. This precision is sometimes wounding since it tends to assume that America's partners in the world are twisters and must be tied hand and foot. But subsequent discussion invariably produces an acceptable text, and Members of Parliament would do well to remember that the pact before them is not the first thoughts of three weeks ago but a fair and reasonable negotiated agreement. Uninformed mudslinging does nothing but harm from whichever side of the Atlantic it may come.

* * *

July 5, 1948

Next week there comes into force in this country the most comprehensive social security scheme that the world has yet seen. Any one of its four parts is a major administrative measure: by national insurance virtually the whole population is covered against the normal hazards of life; by industrial injuries insurance the whole working population is covered against accidents or disease attributable to their employment; by national assistance the old poor law is finally broken up and a minimum income is guaranteed by the State to every person who can prove his need; by the national health service all medical, hospital, dental and ancillary services are to be available, free, to every man, woman and child in the land.

When, just over a year ago, July 5, 1948, was declared to be the appointed day for these four measures, the dollar crisis was at hand, and Mr Dalton was shortly to announce the cuts in the import programme. But if the announcement of the date seemed unpropitious then, how much more so does the date itself seem now—with the worsening of Britain's terms of trade and the heavy blow dealt at its whole economy by the dock strike. It is possible to argue that the worse a country's economic position, the more necessary a scheme of social security to look after the unemployed. It is fashionable to argue that, in any case, social security places no new burden on the national income, but merely redistributes it; Mr Bevan is never tired of arguing that the shorter the country's supply of doctors, nurses and hospital beds, the more necessary is a national health service to ensure that they go to those who need them most. These arguments are far too comfortable. They encourage people to believe that social security need not be worked for and involves no abstention from consumption. As for the health service, one has only to look at the daily advertisements of posts to be filled in it to see what a heavy additional burden its organisation alone is placing on the country's manpower.

The Beveridge Report captured the imagination of the country by the simplicity of its aim—the abolition of want. But it appeared when the people were united by war and were working, as never before, to win it. The social security scheme, which is based on the report, is launched in far less auspicious circumstances; yet the very difficulties of the time make it a test of the people's will to work and ability to practise self-denial. If these are forthcoming, the scheme is large enough and bold enough to arouse the admiration and envy of other democracies. It will not do so if it becomes merely one more liability of a bankrupt, pensioned nation.

* * *

Warsaw Manifesto

Mr Molotov appears to have found it anything but plain sailing in Warsaw last week, whither he had summoned the seven Foreign Ministers of eastern Europe to meet him. His purpose was to produce an Eastern reply to the Western statement of what

had been agreed in London about the political and economic rehabilitation of western Germany. What eventually emerged was the communique of June 24th, four newspaper columns long, which reflected all the embarrassments of Moscow. What was put in to please the eastern capitals could not fail to irritate the Germans. What was put in to please the Germans could not fail to arouse the suspicions of the Czechs, Poles and Jugoslavs. It is probably this divided loyalty which accounts for the absence of any positive evidence of Russian intention to set up in eastern Germany a rival to the promised government in Frankfurt.

Nine-tenths of the Warsaw communique was indictment of the Western governments on all the old counts, but with heaviest emphasis on their aggressive intention in reviving the industry of the Ruhr and allowing "German Chauvinism to rear its head." Mr Bevin and his colleagues of the six-power conference are accused of violating Potsdam, desiring to liquidate the Control Council and the Council of Foreign Ministers, of stopping the demilitarisation of Germany, of splitting the country's economy, of imposing a government and constitution on the western Germans in undemocratic fashion, and of ignoring completely the claim of Germany's victims to reparations.

This is all old stuff, and there is not the slightest doubt that the Russians—and their satellites—believe some of it to be true; or at least they are afraid that much of it might become true in time. Russia's strongest card in eastern Europe is the genuine fear of German revival; yet its strongest card in Germany is the bait of frontier revision that it can offer to the nationalists east and west of the Elbe.

*

For the moment that bait has been taken off the hook. The Warsaw communique says firmly that the Oder-Neisse line on which the new Poland faces Germany is "an inviolable frontier, a frontier of peace." But another bait has taken its place. In the fourth of the five points which the communique puts forward as a policy for Germany the demand is for

> conclusion of a peace treaty . . . in order to withdraw occupation troops of all Powers from Germany one year after the conclusion of the peace treaty.

The full implications of this demand have to be carefully thought about by anyone who advocates resumption of Four-Power talks on Germany. They mean, in fact, the abandonment of Western Europe by American and British forces—for what would be left in Austria would be unimportant. Russian troops would be withdrawn a short distance, American troops a vast distance. Is this really desired by the western Germans or by their French and Benelux neighbours? What price would the Russians pay in such a bargain?

Otherwise, the Warsaw communique restates Russian terms for a Four-Power settlement in Germany much as they always have been: Russian share in joint control of the Ruhr "for a definite period," agreed establishment of a "provisional, democratic, all-German government consisting of representatives of democratic parties and organisations," and agreement on ways of completing Germany's demilitarisation and the fulfilment of its reparations obligations. Not a word about economic unity, about the rights to be guaranteed by a future German constitution, about the organisation of economic recovery or about the immense value in reparations already taken out of the Russian Zone. In fact, the Warsaw statement belies the peaceful talk of Mr Stalin and Mr Molotov, and is just another move in the Berlin blackmail.

* * *

Communist Anxieties in Palestine

Communist propaganda has been taking an aggressive line about Count Bernadotte and his efforts as United Nations mediator for Palestine. This is probably Russia's answer to the Security Council's refusal of its request to be represented there, like the United States, France and Belgium, by a contingent of military observers. Mikunas, the secretary of the Israeli Communist Party, who is touring eastern Europe in search of unspecified help for the Palestine Jews, told a press conference in Prague that the Count was an emissary of Anglo-American imperialism. Dr. Moshe Sneh, leader of the group that wants a Soviet orientation in Israel, has been more specific. As quoted by Tass, he told a correspondent of the New York *Daily Worker* in Tel Aviv that the Count was "most likely preparing a new Munich for the state of Israel." He accused him of partiality to the Arabs and predicted that he would

> conduct political negotiations in the spirit of the new Anglo-American compromise, under which the Jews were to yield the Negeb and Israel was to be incorporated into a federation of an enlarged kingdom under Abdullah, while Haifa was to become a joint harbour. At this price the Arabs were to recognise the Jewish State as an accomplished fact.

The scheme referred to is a new version of a line of thinking once popular among Zionists, and has therefore a plausible ring. Moreover, an Anglo-American agreement is feared, not only by the Russians and their friends but also by many Jews, who naturally prefer their Truman in a mood of Zionism unchastened by the thought of American world interests. Count Bernadotte's royal background alone makes him suspect to east European Jews, traditional levellers who are still the dominant force in Israel.

Territorially, the Negeb is in fact, apart from the small garrisons cut off by the Egyptians—the occasion this week of a reported violation of the truce—lost to Israel. It is mostly desert and not worth fighting about. As for Haifa, the Jews, as their recent formal complaint on this subject shows, are vitally concerned that the Kirkuk oil should begin to flow again through the pipeline to the refineries. In order to secure this, they will certainly have to make concessions. If it comes to bargaining they are bound to consider King Abdullah's need for a commercial outlet to the sea.

On the political side, the suggested concession of a titular sovereignty to King Abdullah may seem far-fetched, and there is yet no evidence that such an idea would appeal to either party. But as Dr Sneh has pointed out, "actual control would probably be divided between Britain and the United States; Britain would continue to dominate Transjordan and the United States the state of Israel." This again is no more than a recognition of present facts, and is the main reason why neither Britain nor the United States, can easily tolerate a resumption of fighting. Jewish prospects are inevitably bounded by the extent of America's willingness to support them.

*

Divisions in Israel

A broad settlement of this kind, however little it departs from the actual situation produced by six months' fighting, would raise more problems than it solves. First, there is the fate of the hundreds of thousands of Arabs who have been terrorised into leaving their homes. The United Nations, which precipitated this violence, has a duty to them as much as to the Jews. It will be hard for the Arab kings to persuade Arab public opinion, exploited by the Mufti, to acquiesce in their permanent expatriation.

Secondly, in Israel the position of Mr Ben Gurion and his government is not enviable. On its right is the Irgun, which had every reason until last week to expect the co-operation of the Palmach—the Government's commando force—in so small a matter as breaking an Anglo-American truce. When the Palmach instead was ordered to liquidate the Irgun, there was a moment of doubt whether it would do so, since it had itself successfully resisted an attempt of Mr Ben Gurion a month previously to dissolve it. It did, however, remain loyal, and the Irgun men either came quietly or went underground, thus avoiding an immediate civil war.

On the left is the Sneh group, which wants to turn Israel into a militant outpost of Soviet Russia. Left and Right mean very little in Israel today, and it is by no means impossible that the Irgun will join up with the Sovietising opposition. Things are now being made more difficult for them in their principal western strongholds, America and South Africa. American-Jewish papers have been refusing their advertisements, and they have been hindered from collecting funds—if the American authorities had done this during the Mandate, terrorism would have ceased. In South Africa, Revisionist offices have been raided by the police. Despite these symptoms of American responsibility for Israel, there will be a great deal of world Jewish sentiment in favour both of Irgun and Sneh. If economic conditions in Israel are adverse—and they can hardly be favourable in the immediate future—this sentiment will combine with social discontent to make things difficult for Mr Ben Gurion and his third force.

A Palestine settlement is much more likely to founder on these more direct issues, the uprooted and homeless Arab refugees, the internal Jewish pressures, than on broader questions of recognition and sovereignty.

The Monopoly Bill

Close and constructive committee work has considerably improved the Monopoly Bill, which passed its third reading on Tuesday. A useful addition to the original draft is the definition

in broad terms, to which experience will add a more definite content, of the "national interest" which it is the Monopoly Commission's business to safeguard. Its educative value will be enhanced by the provision that "reports of a general character, based on accumulated experience," should be published from time to time on particular types of restrictive practice. There is virtue, also, in the new provision that the Board of Trade should report annually on the activities of the Commission and on the requests and suggestions received.

Two major weaknesses remain. The Commission is to have no power to inquire into, or comment upon, the behaviour of statutory monopolies; and restrictive labour practices remain outside its scope. On the face of it this is obviously a pity. But there is some force (even though not as much as Government spokesmen make out) in the contention that public interest in nationalised industries has a statutory safeguard, and that trade union bargains call for a different approach. Moreover, the Commission looks like being quite sufficiently burdened for the time being. Mr Belcher told the House that the Board of Trade had already received enough *prima facie* information to provide "several alternative programmes" for the first year's work; which is another way of saying that the Commission cannot possibly get through all that it should get through in the time. To postpone the logically desirable extension of its competence until some other Government sees fit to pass an amending Act may not really be a bad thing.

In the end, it is the spirit in which the Commission works, and the response which it receives, rather than the letter of its constitution, which will be important. Mr Wilson's closing speech indicated at once the strength and the weakness of the project. It might, he said, expose one or two rackets, but it would be applied particularly to "rooting out" the lack of enterprise which might be associated with restrictive practices. There is the rub. One cannot "root out" anything so essentially negative as lack of enterprise. It is the rackets which need rooting out, and the lack of enterprise which should be pilloried. If the unenterprising are indifferent to the pillory, there is nothing the Government can do about it—except to brandish that threat of nationalisation which Dr Dalton has already indicated as the proper punishment, not for sluggishness, but for enterprise crowned with undue success. The Labour party has still a lot of thinking to do on the subject of business and commercial enterprise.

* * *

All Carrots, No Sticks

The Agricultural Charter is one of the sorriest efforts ever to emanate from the Conservative Central Office. As an attempt to win back any wavering voters among the agricultural community, it may have some temporary success—unless, indeed, the farmers remember that fine words butter no parsnips. As an attempt to draft a workable agricultural policy for a beleaguered Britain, the Charter never once comes to grips with economic realities.

The Conservatives, of course, would indignantly deny this. They would say that they are the economic realists in demanding a 50 per cent increase (over prewar) in the output of British agriculture and in declaring their readiness to give the highest priority in materials and financial aid for all schemes of rural development. But targets, as the Labour Government, too, would do well to realise, do not by themselves constitute a policy—especially targets such as these whose practicality is not backed by a single scrap of evidence, either technical or economic. With such a wealth of agricultural talent in the House of Lords, it is strange that the prospects for British farming are not better analysed and expounded.

Can Britain actually manage to grow 50 per cent more food than prewar? There are those in high places who would say that it cannot be done at all, and there are others who would say that it could only be done at a prohibitive cost which would grievously hurt the whole economy, and not least the export drive. Again, is it economically justifiable to give schemes for agricultural development and the improvement of rural amenities a still higher priority than that which they already receive? Only in a political pamphlet is it possible to give a strong affirmative answer without bothering about the effect on other urgent claims for scarce resources. Finally, what is the size of the bill which consumer and taxpayer must pay between them for implementing the Conservatives' grandiose schemes? And how is the payment of this bill, which must in any case be extremely large, to be squared with the Tories' other plans for reduced taxation?

These questions are not answered—are not even asked. In one sense, perhaps, this does not matter, since the output targets which the Conservatives propose cannot in any case be achieved by the policy laid down elsewhere in the Charter. This policy amounts to extending the Labour Government's guarantee of assured prices and markets to farmers so as to make it virtually unlimited, whilst stripping away such safeguards as exist for raising agricultural efficiency. The Agriculture Act rightly limits the taxpayers' obligation to pay a guaranteed price for farm produce to such amounts "as in the national interest it is desirable to produce in the United Kingdom." This qualification the Conservatives would remove in order to give the British farmer "real confidence." But how, under a Tory dispensation, is the farmer to be persuaded to produce the types of food which the nation needs at a price which it can afford? Certainly not, it seems, by direct compulsion—for under their proposals Government supervision would be curtailed, the activities of county agricultural committees restricted, and the use of compulsory cropping directions permanently abandoned. Certainly not by the use of new marketing machinery—for the Charter would reinstate the prewar producer-controlled Marketing Boards, despite the emphatic insistence of the Lucas Committee that farm produce which has become in effect "the taxpayer's property" should on no account be marketed by sectional interests. But how then? The one other possible safeguard of the public interest—and it is a very good one—would be the intelligent and firm use of the price mechanism so as to steer production in the right directions and raise efficiency; but it is a possibility of which the Tories seem totally unaware.

The Conservatives' idea of securing a productive and efficient agriculture seems to be to write the farmers a blank cheque, sit back and hope for the best. There is no reason to believe that this attitude would even produce much increase in output—certainly the present Government's efforts along the same lines are not being conspicuously successful. Since the interests of taxpayers and consumers are not considered at all, there is every reason to expect the result to be extremely costly to an impoverished nation. For agriculture, however, the policy is one of all carrots and no sticks.

Children Out of School

The Report of the Central Advisory Council for Education on the out-of-school activities of schoolchildren contains some sensible generalisations about the needs of children and the environment in which these needs can be served. When dealing with the deficiencies in the environment it is sympathetic and realistic, but when it outlines its recommendations for reform it leaves reality far behind. "The need is so urgent," say the Council, "that a special effort must be made without delay to provide facilities at least comparable to those which are already in existence for the use of the older age group"—i.e., those provided by the Youth Service. Education authorities are to "increase and improve by every possible means facilities for the play and recreation of children outside of school hours," setting up special sub-committees for the purpose; voluntary bodies should receive official grants, a paid or trained staff should be recruited, sites, equipment and material should be acquired, libraries developed, concerts, plays, exhibitions fostered by the Arts Council. . . . Very nice, too. But from what other uses are the manpower, the materials, the sites, the books and so forth to be diverted?—a more pertinent enquiry than the old cynical cry of "Where's the money to come from?" Creches, nursery schools, hospitals, home help services, clinics are all desperately understaffed; schools are short not only of teachers, but of space, of furniture and equipment, of books, materials and tools; indeed, the whole educational system, in the throes of reform, is as messy as a half-rebuilt house—a description which might also be applied to the national economy in general. This is hardly the moment to launch an ambitious new social service.

Plenty could, of course, be done in a small way, and the time may come when the whole programme will be possible. But in the last resort children's out-of-school activities depend more on their parents than on anything else. The proper scope of civic action is the long-run provision of an environment in which family units can flourish; not in a desperate and expensive attempt to do the family's job for it.

First Fortnight of Currency Reform

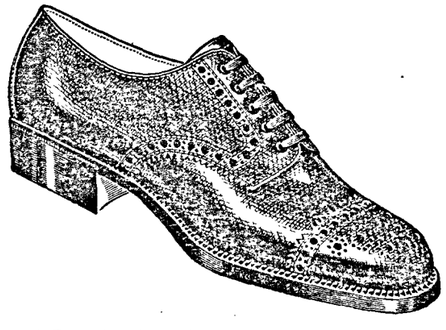
The success of currency reform in the western zones of Germany in its initial economic purpose was devastatingly abrupt. On the second working day after the announcement of the new currency, a manufacturer at Erlangen stated that out of his 900 workers, only one was sick. He had been accustomed to a sickness rate of about 15 per cent. On the third day, manufacturers at Nuremberg said that absence from factories from all causes had fallen from 18 or 20 per cent to 2 or 3 per cent. Makers of heavy engineering products, which could not be used for payment of wages in kind and were difficult things to barter with, had been starved of labour in the days of the cigarette currency; within the first week of the new money, a manufacturer of heavy transformers and electric motors was getting a steady trickle of applicants for jobs. Works managers in many towns reported that timekeeping and works discipline had suddenly improved.

Producers and traders had in the same moment become anxious to sell their goods. In a Westphalian town, men's suits were seen in a shop-window for the first time since the fall of Hitler—for sale on July 1st when the clothes ration comes into force. Housewives strolled down the streets gazing in astonishment at the shopwindows—at shoes, leather handbags, tools, perambulators, bicycles, cherries in baskets, young carrots tied in neat bundles. In the early morning, farmers had been seen making their unaccustomed way into town with produce for sale, a little uncertain what were the legal channels for selling it. In Düsseldorf, the *Land* Ministry of Economics was considering a plan for cutting its staff by a third. Firms, worried about their bank balances, were thinking on the same lines, but were studying too how to increase production. At Göttingen and other overcrowded universities, students with wives and families were writing to former employers whom they had left for the career of student a year or two ago. Clearly the reform of the currency in the western zones is having painful effects for large numbers of people. But it is bringing out goods and making people anxious to work. It remains to be seen whether the work can be provided for them.

The third currency reform law was put out on Saturday with one hitch. In Frankfurt, and perhaps elsewhere, the banks failed to deal with the queues before the law appeared. For eight hours, therefore, some cool-headed men had the opportunity to unload money after the terms of conversion were known. This was the less fortunate as the amount convertible without inquisition was fixed at 5,000 marks instead of 3,000, as was at first expected. It could not do any decisive damage, and the whole operation was, as the surgeons say, successful. The patient's recovery will now depend to some extent on the German authorities, to whom it is left to prepare detailed measures for the "spreading of burdens." They will be responsible for taxing capital assets and increments. They will have the first voice in industrial credit policy. Their task will require a difficult mixture of imagination and self-restraint.

* * *

Strike Tactics in Italy



Recent strikes in northern Italy are like the first sparks that fly from a steel cutter. They have been struck by the Christian Democrat government's attempt to tackle the appalling problem of surplus labour in industry. But they would have caused little alarm at this stage if the Communists had not determined to prevent workers being dismissed, however overloaded with labour employers may find themselves in a period of limited raw materials and sticky markets. This extra labour on their payrolls is a legacy of the liberation period, when dismissals owing to lack of available work had to be forbidden if the unemployed were not to grow to vast numbers. Now, however Italian exports are competing with those of other nations, and one of the contributory causes of high industrial costs is excessive staffing.

There are over two million unemployed in Italy, and probably at least as many more redundantly employed. While the only long-term solution is increased emigration, Signor De Gasperi's new government also recognises that a change—at least in interpreting the present labour laws—is essential for industrial health. Whatever is to be done needs courage, and it is for this reason that no government has dared to make a final move until now, when a strong and fresh mandate from the people has been obtained. Signor De Gasperi knows that the boldest measures are expected of him.

From the point of view of local Communist tactics, these strikes represent the first major action since the electoral defeat last April. But orders to strike have undoubtedly come from the Cominform,

and they fit in with the main line of Communist policy as outlined by Pietro Secchia, Deputy General Secretary of the Italian Communist Party, in the Cominform journal on June 15th. He pointed out that the battle had reached a new and tougher phase. There must be "no concession to those who advocate 'the worse things get, the better it will be for us,' but a resolute struggle against the opportunist influences of Social Democracy." In other words, war with the capitalists must be intensified, and revolution will be a method of carrying out policy.

A notable new development in the tussle between Communists and non-Communists within the Italian trade unions is the formation on June 17th of an Independent Trade Union Alliance. This embraces Christian Democrat, Right-wing Socialist, and Republican members, and has drawn up a seven point programme to fight the Communist policy of political strikes. For the time being the Alliance will remain within the CGIL (Italian TUC). But its formation shows that the Communists will not get things all their own way with the workers.

Brussels Touch for Africa

The Anglo-Belgian talks on colonial problems which ended this week in London have opened up yet another field for the practical co-operation envisaged in the Brussels Pact. No miracles such as doubling colonial production overnight have resulted, but officials of the Colonial Offices of both countries have met and prepared the way for continuous routine contact in future. As a method of co-operation it is sound and sure, though it is bound to seem humdrum to the hasty.

The object of this co-operation between the Powers of the Brussels Pact is to make the relationship between the colonial departments of the five countries as close as the relationship now existing between different departments in one country. In other words, the head of the African section in the Colonial Office here should, when the need arises, consult his colleague in Brussels as readily as he now discusses problems with the Board of Trade or the Foreign Office. By this means co-operation becomes almost a matter of routine, stripped of the fuss and paraphernalia of diplomatic negotiations. The talks with Belgium and earlier talks with France have gone a long way towards bringing about this new relationship.

The great danger of grandiose schemes for joint international projects in the colonies—and particularly in Africa—is that they foment charges of "super-exploitation" now prevalent among colonial peoples. The Africans see the European powers combining together to rob them of their land and their natural wealth. Political unrest follows, jeopardising the administration of the colonial governments and making the many benefits the Africans have received go sour on them. If such schemes had any real chance of producing quick returns there would be some purpose in the new imperialism. As they have in fact only the remotest chance of early success, it is senseless, as well as wrong, to incur the wrath of colonial nationalists by even suggesting them.

The type of co-operation which Britain, France and Belgium are now arranging between themselves has no such purpose. Its aim is to improve the administration and services in the different colonies. Production may eventually increase, but it will be the result of better conditions and not of exploitation.

Old Answers on Civil Defence

Lord Hall's reply to a debate on civil defence in the House of Lords last week had some good new points as well as some bad old ones. He revealed that the Government's policy for securing a balanced distribution of industry through the country is watched and contributed to by advisers from the Air Ministry; that the Civil Defence Committee has representatives of the Chiefs of Staff on it; that the battle of the Exchequer with the local authorities over the cost of civil defence has been joined after long preliminary skirmishing—as in 1938—and that a start will be made in training instructors next January.

But to the major criticisms offered by the debate the Government spokesman had really no reply. Consultation with industry has not begun; there is no sign that the civil defence service will get its own staff college and foothold in the Ministry of Defence; and the tempo of organisation and research is not—to use Lord Bridgeman's phrase—"operational." The chain of command in Whitehall still reflects the now out-dated assumption that civil defence is less important than the running of an army or an air force. That assumption is likely to continue so long as its

organisation is only one of the multifarious interests of the Home Office, and so long as the Minister responsible is not a full member of the Defence Committee of the Cabinet.

The stock reply to this argument—used again by Lord Hall—is that the Minister attends the meetings of the Committee "when civil defence is discussed." This reply reveals again the refusal to acknowledge, what members of the fighting services now admit, that there is hardly a single question of defence organisation or planning which is not affected by the capacity of this country to withstand air attack at short notice. The Opposition should continue to raise this point again and again. Until it is conceded, the subject will get neither the attention nor the priority that it deserves. It was pointed out in the debate that in the United States the recently formed civil defence department is under a Minister of Cabinet rank reporting directly to the Secretary of Defence, and it is known that this arrangement was decided on after a close study of British experience.

* * *

Risks on Rail

Last year, 121 people were killed in train accidents—the worst record since 1915. Sir Alan Mount's annual report on this sorry year is detailed and candid. Between the wars, 32 people on the average were killed in train accidents. How has it happened that the risk has increased four-fold during 1947? Inquiries into last year's train accidents showed that the human factor accounted for most of the accidents and casualties. Eleven out of the thirteen accidents into which formal inquiry was made—they caused 98 out of the 110 deaths—might have been avoided by greater care and stricter attention to duty by the railwaymen immediately concerned.

Last year was indeed a trying one for railway staffs, hampered by shortage of skilled operating men, poor coal and arrears of maintenance work. But Sir Alan finds the main cause in "a lessening of concentration" arising from unsettled times after the strain of six years of war. Lower physical fitness and slower mental reactions, he finds, have played their part in this lack of vigilance. Some of the accidents were caused by want of care or disregard of rules in fog working. But the report shows that three of last year's train accidents, involving 35 fatalities, were due to the failure of drivers to obey semaphore signals, and it reopens the question—stressed in more than one of last year's accident reports—of automatic train control, which would have prevented these disasters. A survey of accidents since 1912 shows that 24 per cent of the fatalities of the past 36 years might have been saved by automatic train control, which protects the driver against failure to act upon signals by giving him audible warning and by applying the brake automatically if he does not acknowledge it.

The simplest form of automatic train control has long been in operation on the high-speed lines of what, until the end of last year, was the Great Western Railway. In railway circles, there has always been argument whether this system was necessarily the best, and whether expenditure on other improvements, such as colour light signalling and track circuiting (a technical means of avoiding signalmen's errors) might not be preferable to the development of automatic train control. Whether these controversies have disappeared with the nationalisation of the railways is perhaps doubtful. But there are signs that railway officers are more single-minded than they used to be on the question of automatic train control. It was recommended by two committees, in 1922 and in 1930, and Sir Alan puts the cost of the system at "hundreds" of pounds per track mile, compared with "several thousands" for colour light signalling and track-circuiting. The difference in cost is striking; although the more expensive systems would hardly be justified in open country, automatic train control, as last year's accidents so largely showed, is valuable on all sections of main running track. A fuller investigation of present costs and possibilities of installing automatic train control equipment seems to be desirable. Meanwhile, the Chief Inspecting Officer has made out a strong interim case.

* * *

Trade Unionism Run Mad

The Wages Boards set up under the Catering Wages Act are gradually issuing their Orders fixing wages rates and conditions of service in the different sections of the very complex catering trades. Under pressure from the skilled advocacy of the trade unions concerned, they appear to be drawing up very rigid rules which are likely to have surprising results in some branches of the hotel and restaurant trades.

At the annual meeting of Gordon Hotels, Ltd., Major-General G. P. Dawnay gave some examples of the working of the Orders so far as hotels are concerned. It has been decided that overtime rates must be paid for any excess of hours worked over 8 per day, not over 48 per week. In a hotel, which inevitably has slack days and busy days, such a rigid arrangement must inevitably lead to much overtime being paid, even when total hours worked are in fact low. General Dawnay estimates that in his company's hotels, the result is to require over 25 per cent more pay for no more work. Secondly, the new Orders prescribe heavy penalties when the hours of work are "spread over" a large part of the day—as is, of course, inevitable in a hotel. A worker whose basic wage is 16s. 4d. a day may, on a busy day at the weekend, have to be paid 51s. for the day "in spite of the fact that the total work done during the week does not exceed the statutory 48 hours, and that on the long weekend days the worker may have four or five hours completely off duty each day." Thirdly, at Bank holidays, when every hotel worker expects to have to work hard, triple rates have to be paid. The 51s. mentioned in the second example would become 75s. 9½d. (for one day's work) if it were a a Bank holiday. The chairman of another hotel company has given some even more fantastic examples. In a small country hotel where no night staff is kept, the worker who opens the front door in answer to a ring after it has been closed for the night would have to be paid 2s. 10d. if it was after midnight and therefore an emergency. But if it happened before midnight the opening of the door would be reckoned part of the day's work, would be subject to the overtime and "spread over" clauses and might therefore cost as much as 16s. 2½d.

*

This is trade unionism run mad, and sanctified with the force of law. If the result were likely to be only a transfer of money from the pockets of hotel proprietors—or their customers—to those of their employees, it could be written off merely as one more example of the present day tendency to demand much more money for much less work. But in fact the result is likely to be a great falling-off in the standard of service in the British catering trades, already none too high. Staff will be instructed not to answer bells except at stated hours, meal times will become rigid, hotels will restrict themselves at Bank holiday times to the bare minimum of their legal obligations of service—that is, a glass of beer and a desiccated sandwich to *bona fide* travellers only. For those who want to prove that trade unionism means economic reaction, here is some magnificent evidence.

It is doubly unfortunate that these disabilities should be forced on the hotel industry just at a time when a campaign is being waged to attract the tourist to this country. According to the annual report of the Travel Association, the tourist trade in 1947 "represented the largest single item of Britain's export trade with America, and exceeded in value the export of any single manufactured commodity to the United States." "It will, therefore," the report concludes, "be more than ever necessary to redouble our efforts to attract visitors from the Americas." It would seem to be a case for a little planning or co-ordination between the Board of Trade and the Ministry of Labour—or just for common sense in the Wages Boards.

* * *

Warfare in Malaya

The outbreak of Communist guerilla terrorism in Malaya has certainly been a carefully prepared and planned revolt. Yet it appears to have taken the authorities by surprise far more than it should have done. Malayan officials knew well that there were hidden away in the country large stocks of arms and ammunition, both from Japanese dumps and from supplies provided by SEAC to anti-Japanese guerillas during the war; they knew also, or should have known, that the Chinese Communist organisation was firmly established and was committed to a revolutionary line. But no serious steps seem to have been taken to deal with the situation until the organised killings had begun, and even now the local press shows the alarm of European residents at the lack of any assurance that reinforcements for the small force available in Malaya have been called for.

There seems, indeed, to have been a return of Malayan officialdom to that peculiar complacency which was so characteristic of it before the war, when anybody who suggested taking precautions against a Japanese invasion was told that he was losing his nerve and had better take sick leave. The brave pooh-poohing of impending dangers is not so difficult for high officials, who in any case will enjoy whatever police protection there is; but it is quite another matter for a scattered European population who have to take the consequences of the campaign of violence carried on by roaming armed bands. There is nothing to show that there is anything like a national rising; the Malays seem to be taking no part in it at all, and Chinese who adhere to the cause of the Kuomintang are as much targets for the Communist sub-machine-guns as the European planters, foresters and mining engineers.

The rebels are said to number no more than 5,000, but these are well organised, well armed and trained in guerilla tactics; it will not be at all easy to round them up, and if order is not re-established quickly there will be a heavy drain on the finances of Malaya and prolonged disruption of its economic life—which it is an object of Communist policy to bring about. It would be far more economical in the long run to send immediately a strong force to Malaya and use it to make an end of the terrorism before it becomes a permanent institution. Even then military measures are not enough; every effort must be made to enlist the active support of all elements of the population not involved in the revolt, and to remedy any genuine grievances which may have contributed to popular discontent. The Colonial Secretary would do well to make a trip by air to Kuala Lumpur and report directly to the Cabinet.

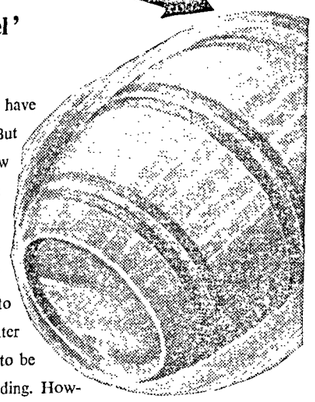
* * *

World Health Campaign

Ethiopia has one native doctor to look after twelve million people; Great Britain has 62,000 doctors to look after 46 million people. It is to create the permanent machinery whereby such discrepancies can be removed and all peoples everywhere can be given "the highest attainable standard of health" that the World Health Organisation met at Geneva on June 24th. It is the first time that it has met as a fully-fledged specialised agency of Uno.

The Interim Commission of the WHO was established nearly two years ago, after more than sixty nations had signed the constitution of the organisation at the United Nations International Health Conference at New York. In April, the twenty-sixth member state of the United Nations ratified the constitution, thereby making it possible for invitations to the first assembly to be sent to 73 governments, eighteen United Nations specialised agencies and non-governmental agencies, and the occupation authorities in Germany, Japan and Korea.

The WHO is much more comprehensive, both in its aims and in the powers it possesses, than any of its predecessors in the field of international health co-operation, such as the Paris *Office Internationale d'Hygiène Publique* and the Pan-American Sanitary Bureau. Their work was largely restricted to preventing the spread of infectious diseases; they had no executive powers, but could only advise, collect and distribute technical information and act as liaison organisations between national health administrations. The constitution of the WHO states that "health is a state of complete physical, mental and social well-being, and not merely the absence of disease and infirmity." To make this conception of health a reality all over the world, the WHO is empowered "to take all necessary action."



The lines upon which the WHO will work have already been laid down by the interim commission. It has created eleven expert committees for pioneering work in the control and prevention of disease, and has undertaken an extensive field services programme under which aid has been extended to fourteen countries. The campaign against malaria—to take but one of the four priority programmes proposed for the WHO—has already been well begun by the interim commission. In Italy and Sicily, where during the war people thought that DDT meant *domani dormiamo tranquilli* (tomorrow we'll be able to sleep soundly), the commission has been carrying on the work begun by Unrra. As a result only thirty deaths from malaria were recorded during 1947, compared with 250 in 1946 and 360 in 1945. In Greece, after the commission had last year sprayed about 65,000 houses with DDT, the incidence of the disease dropped from as much as 80 to 85 per cent in some areas to as little as five per cent. The WHO proposes to carry on this campaign by promoting production and distribution of insecticides and drugs and by collecting and distributing technical information.

It is refreshing to note that Russia and its satellites have been thoroughly helpful in the work of the interim commission. It is to be hoped that this co-operation will be continued in every one of the forty-eight fields in which the WHO proposes to operate; and, equally, that the United States will not allow groundless fears of the policy of the Organisation to deter it from making the great contribution which it undoubtedly could make.

Beetle Cement—a product of B.I.P. research—enables barrels to be made more quickly from laminated staves.

A BEETLE IMPROVED PRODUCT

We 'Roll out the barrel' a new way

For centuries barrel staves have been cut from solid oak. But oak is scarce. Staves are now made of several thin layers of birch with oak face laminations, the whole being bonded with 'Beetle' Cement and pressed into shape. The staves have greater uniformity and don't have to be shaped by steaming and bending. However plastics not only help the cooper. There's the tinker and tailor and anyone else who's awake to quicker and better production methods. Our research and development men are constantly employed working out time and money-saving notions. Why not call them in?

Colonel Lancaster's Proposals

With only a few weeks to go until the publication of the first annual report of the Coal Board the debate last week on its performance was necessarily unfruitful. Only Mr Gaitskell had marshalled facts and figures behind him; the Opposition speakers, with the exception of Colonel Lancaster, wallowed in speculation and recrimination. Colonel Lancaster's proposals were, however, shrewd and specific, and deserve careful consideration.

The organisation of the Coal Board is over-centralised and top-heavy. A swollen headquarters staff creates its own labours instead of reducing those at the periphery; like South American armies the proportion of generals to NCOs is hardly designed for efficiency. Colonel Lancaster outlined a new system of organisation to overcome these difficulties. Instead of nine elaborate Divisional Boards reproducing the National Board in miniature, and controlling 49 areas, he proposed 30 Area Boards, each representing a capital of £10 million to £15 million, with their own boards of management. These would be the real centres of organisation with full responsibility for their affairs. To ensure a free flow of information from areas to headquarters there would be four provincial centres, at which the chairmen of the Area Boards would meet regularly. Lastly, but by no means least, the staff of the Coal Board would be halved. The details of this scheme require more investigation, but the two main principles behind it deserve attention. The first is that the getting of coal is essentially a problem of local management and responsibility must be devolved to the maximum extent consistent with central planning; secondly, the Central Board's functions should be limited to planning and the allocation of priorities.

* * *

Monopoly in Limbs

Even before the new health service formally comes into being, an issue, small in itself but one that raises a principle of great importance, has arisen. Early this year, the Ministry of Health, appalled at the responsibilities imposed on it by the National Health Service Act, asked the Surgical Instruments Manufacturers' Association for its co-operation in seeing that patients, entitled under the Act to free surgical appliances and artificial limbs, would obtain them. The Ministry pointed out that it had no organisation of its own for carrying out its obligations, and that the help of private firms making appliances and limbs was therefore essential. Not long afterwards, however, the Ministry seems suddenly to have awoken to the fact that another Government Department, the Ministry of Pensions, has a large organisation for supplying artificial limbs to Service patients and to those civilian patients who are referred to it by the Ministry of Labour. Without further discussion, therefore, it appointed the Ministry of Pensions its agent for buying all appliances and limbs needed by health service patients. It was later announced, again without discussion, that all supplies of artificial limbs would be obtained from the contractors to the Ministry of Pensions.

Three points of importance emerge from this decision. First, it is a matter of policy that ought never to have been decided without reference to the Central Health Services Advisory Council, and the fact that this body is only now being appointed does not justify the Ministry of Health's precipitate action. Secondly, it flouts the principle of a patient's free choice, for the Ministry of Pensions' surgeon will prescribe the type of limb required, and must prescribe the model made by one contractor. Thirdly, it establishes a very unhealthy monopoly in the production of limbs, for although the other limb-makers will still in theory have private trade, in practice under the health service this will be so small that it will not be worth their while to carry on. No one disputes that the limb supplied by the Ministry of Pensions contractor is a good one or that the utmost care is taken to fit individual requirements—this was indeed the conclusion of the Cohen Committee in 1945. But the Committee also considered that limb-making and fitting was a process capable of infinite improvement, and it is this ceaseless experimenting in new devices and designs that is now threatened.

Recently Mr Bevan told deaf people that it is easy for people to go on suffering if they suffer in silence. "You must make a row," he said, "or no one will take any notice of you." The twenty thousand maimed patients of one private limb-making firm which is being forced out of business have protested most vociferously. Is Mr Bevan going to take any notice?

Letters to the Editor

Truce in Palestine

SIR,—You may care to know how Jewish opinion, which you would probably call "moderate," reacts to the sort of article appearing in your June 5th number, p. 918. The idea that the truncation of Israel by the excision of Upper Galilee and the Negeb offers the slightest basis of any negotiation with any Jews at all is entirely grotesque. Indeed, the whole comment rests on the arrogant assumption that the Arabs must be granted peacefully what they ignominiously failed to achieve in war. Since they do not recognise the November resolution and have put their trust in the arbitrament of military action, it is the results of that action which must be the starting point of discussion.

As you know, the effects of Arab invasion of five armies for four weeks have yielded the following result: The State of Israel is in possession of its entire territory, of the whole of Western Galilee and of Jaffa, of the new city of Jerusalem and of the greater part of the road between Jaffa and Jerusalem.

In the circumstances, to persuade Israel to revert to the November 29th resolution will require a major diplomatic effort likely to succeed only if there is a genuine Arab attempt to recognise facts and to show some respect for the international award. Some weeks ago, the British press was unanimous in declaring that the basis for partition must be the *de facto* situation arising from the interplay of military forces. No doubt they did so in the expectation that the *de facto* position reached after Arab invasion would be more favourable to Arab interests than the terms of the November resolution. That is not the case. Even in the Negeb, Egyptian forces are operating exclusively in Arab-held territory, and even in that territory, their situation is becoming increasingly difficult and embarrassing. In the Jewish-assigned Negeb, there is no Egyptian foothold at all. In other words, if the November demarcation deviated from the true balance of force, it did not do so in favour of the Jews; and Arab opinion may come to look back wistfully to the genuinely pro-Arab elements of the November resolution which gave the Arabs a territory in advance of their military capacity to defend, a new unit of Arab independence, and a system of economic and social union which went far to redress the balance in their favour.

Surely it must appear obvious to any realist that you cannot wage a war of aggression, ignominiously lose that war, and then expect the fruits of victory. It is to live in a real wonderland to imagine the Jews giving up the entire Galilee and the entire Negeb, which they have held without major difficulty against the invaders. If they give up anything, it will be purely in accordance with the November resolution. Speaking as one of those most anxious for compromise and for an Arab-Jewish settlement,

From *The Economist* of 1848

July 1, 1848

CONSTITUENTS who regard and treat their members as "mere acoustic tubes, through which their commands are blown to the legislative chamber," and who endeavour to reduce them to this level, must be content to be served by an inferior order of men. No man fit to be a *representative* will submit to be a *delegate*. He will not choose to perform a service which might be as adequately performed by a letter, or a paid agent. He goes to Parliament as an integral portion of the collective wisdom of the nation—to consult with others how the welfare of the state may be best promoted; and if he is worthy of this high position, he will not allow himself to be degraded into the minor and the medium of the changing passions, or the shallow caprices of any section of the people. If the people wish to be well and honestly served, they must be careful not to convert their service into one which no man with a due regard to his own character can render. They must treat their representatives in such a manner as to render the position one of honour, not one of invidious, closely-watched laborious slavery. Otherwise, they may rely upon it, the connexion will be sought by none but the servile, the incompetent, and the interested. "Gentlemen," said Mr Burke, "we must not be peevish with those who serve the people. For none will serve us while there is a court to serve, but those who are of a nice and jealous honour. . . ."

I must tell you that I personally would not remain in a room in which your line from Samakh to Majdal was even discussed.—Yours faithfully,

AUBREY S. EBAN

Office of the Acting Representative to the United Nations, Provisional Government of Israel, 16 East 66th Street, New York, N.Y.

[Mr Eban begs more questions than could be answered in a page of type.—EDITOR.]

Communism in South-East Asia

SIR,—The article "Communism in South-East Asia" appearing in the current edition of *The Economist* underlines the concern which is being felt with regard to Communist influence in the region.

In that article, however, you describe the nationalist struggle in the East for independence—especially in Indonesia—as being largely influenced by ideological and world-political considerations. You also say that Communist influence in Indonesia has prevented the success of solutions by negotiation with the Dutch.

May I remind you that, from the very beginning, non-Communist nationalists such as Soekarno, Hatta, Sjahrir and Amir Sjarifoeddin have held the reins in Indonesia. Without support from the outside world, they have imprisoned Communist insurgents such as Tan Malakka.

It is to be regretted that these leaders have not been supported in their pursuit of a non-Communist, independent Indonesia by the Netherlands in particular, and by the West in general. Instead, the Netherlands policy has been, from the commencement, directed against the Republic, which it has attempted to dismember and dislocate—with the aim of creating chaos in Republican territory.

One after the other, Sjahrir and Sjarifoeddin have been forced to resign as a result of the undue claims of the Netherlands Government. Hatta now remains, and if he, too, fails to arrive at a satisfactory agreement with the Dutch, it may be assumed that the non-Communist leaders of Indonesia have not succeeded in leading their people to independence.

Note should be taken that in the recent Economic Conference the Republican application for associate membership was supported by almost all Asiatic countries. Has this gesture of sympathy been made because the Republic is "Communist made"? I hope that the West will understand that, unless the nationalist demands of Eastern countries are satisfied, Communism will flourish. Communism should be combated by non-Communist strength in the country itself, supported by the Western countries.

Western democracy should not attempt to combat Communism by oppressing the struggle for independence. If it does, in the long run it will be the West itself which will be harmed.—Yours faithfully,

O. SOETRISNO

Coupons for Sale

SIR,—Your recent article under this heading leads one to consider the general problem of rationing and whether it is still a merely temporary institution, as is usually supposed. There would seem to be at least two possible arguments indicating that some form of rationing is likely to remain as a permanent feature of the economy.

1. Since scarcity is a relative concept, there will presumably always be scarce goods. If the idea becomes widely accepted, as seems at least possible, that scarce goods should not be rationed "by the purse," then there will always be a case for rationing by law.

2. The implications of full employment do not seem to me (speaking with some diffidence as one not really competent to analyse the matter) to be completely appreciated. The "new" economics has shown that unemployment is the result of the failure of demand to be effective enough to absorb all the available goods. Full employment on the other hand depends on the maintenance of a level of effective demand sufficient to consume all the goods which can be placed on the market. It seems as though the high percentage of unemployment between the wars was part of the price paid to secure plenty in the shops, and that full employment implies chronic shortage (i.e., a high level of effective demand). This argument, of course, is not entirely separate from the first, but is of a more theoretical nature.

The practical problem of abolishing rationing appears to depend on the answer to the question: When does a commodity cease to be scarce? The answer must surely be an arbitrary one.—Yours faithfully,

R. J. HEATHORN

Too Much Equality

SIR,—The article "Too Much Equality" in the June 5th issue of *The Economist* recalls the following quotation from de Tocqueville:—

> There is, in fact, a manly and lawful passion for equality that incites men to wish all to be powerful and honoured. This passion tends to elevate the humble to the rank of the great; but there exists also in the human heart a depraved taste for equality, which impels the weak to attempt to lower the powerful to their own level and reduces men to prefer equality in slavery to inequality with freedom. Not that those nations whose social condition is democratic naturally despise liberty; on the contrary, they have an instinctive love of it. But liberty is not the chief and constant object of their desires; equality is their idol: they make rapid and sudden efforts to obtain liberty and, if they miss their aim, resign themselves to their disappointment; but nothing can satisfy them without equality, and they would rather perish than lose it.—Yours faithfully,

The Supply of Capital

SIR,—As a maker of capital equipment for practically every industry, I have read with rather special interest your three articles on the need for increasing the rate at which such equipment is installed.

Needless to say, I am in complete agreement with this vital necessity. On the other hand, if a policy of economic restriction is again pursued, as before the war, what possible incentive can there be for any one to install more efficient equipment to produce more, when more cannot be purchased? Had our monetary policy been so geared that the full resources of the nation were used instead of about 80 per cent, there is little doubt that engineering concerns could have greatly improved and increased the productive equipment of Britain.—Yours faithfully,

ANTONY VICKERS.

AMERICAN SURVEY

The Republican Ticket

(From Our US Editorial Staff)

"THE international bankers," the *Chicago Tribune* complained last Friday, "have taken the Republican Party for the third successive time." The defeat of the Old Guard was, in fact, more decisive this year than in 1944. At that time Mr Dewey was saddled with Mr John Bricker to keep him company. Last week the attempts of the isolationists to capture the Vice-Presidency were shattered by the indignation of the delegates and the choice of Mr Warren, the Governor of California, was received with enthusiasm by the convention (except for a few neighbouring States now engaged in a private war with California) and by the press.

In almost all respects Mr Dewey's nomination for President was the result of careful playing of the game according to the accepted rules, with the significant addition of techniques—impossible before the days of radio—borrowed from Goebbels and the science of psychological warfare. The organising genius was Mr Herbert Brownell, a ruthless political scientist in a position where tradition expects the false *bonhomie* of a hard-drinking ward-heeler. Mr Brownell uses threats where Jim Farley would have used promises. There was, perhaps, some unconscious symbolism in the fact that refrigerators were given away in the Dewey headquarters—not cigars.

One example will show his methods. It had been known, for some time, that the block in the Pennsylvania delegation controlled by Senator Martin would vote for Governor Dewey on the third, if not the second, ballot. The news that the Senator would withdraw from his "favourite son" position and come out for Mr Dewey in the first ballot would not, therefore, by itself, have made much stir or improved the New Yorker's ultimate chances. But Mr Brownell made it a sensation. He called a press conference on some unrelated subject and dropped into his remarks the statement that "You'll be surprised when you hear who's going to make the nominating speech." Then he left the kettle of rumour to boil for a few hours to such effect that, when the Senator announced that he, Edward Martin of Pennsylvania, would nominate Mr Dewey, the news was accepted as a fresh triumph and the beginning of a rush to the bandwagon.

*

While the "Dewey Blitz" (as Messrs Stassen and Taft were careful to call it on all occasions) was going ruthlessly on to victory in the city, those who attended Convention Hall were paying nostalgic tribute to the Loved Ones. It is the function of a conservative party to maintain a warm feeling for the past, but the Grand Old Party certainly gave exceptional evidence of attachment to the middle section of its name. Until late in the evening of the second day no reference was made to any Republican President except Abraham Lincoln and Theodore Roosevelt. Then it was that the Speaker of the House, Joseph Martin, closing his speech with the stirring words: "In our maturity, with the help of God, let us greet the future," turned to greet—Herbert Hoover.

Mr Hoover, as it turned out, provided the only glimmer of quality during the first three days—until Representative Judd made the nominating speech for Harold Stassen at two o'clock on Thursday morning. Mr Hoover's appearance on the platform provoked the first genuine applause and he did what the mellow elder statesman of a party should do—he told his audience what they faced when coming into power and warned them that "If you follow the counsel of those who believe that politics is only a game to be played for personal advantage, you are wasting your time and effort." The election and the Democratic Party (except once—in an approving phrase) were never mentioned in his speech, which dragged the whole proceedings out of the squalor in which they had settled.

Before Mr Hoover, in speech after speech there had been nothing but unoriginal attack on the New Deal, or Harry Hopkins, or Franklin Roosevelt (by implication rather than by name—and by some remarkably ineffective attempts at mimicry), on Mr Truman's off-the-cuff comment "I like Old Joe" and on the Communist inspiration of the Democratic Party. There were no verbal infidelities to be spotted. Never once was a noun found in bed with an adjective to which it had not been married for centuries. Foundations were firm, solidarity unshakable; partisanship was narrow—and there was no place for it; taxes were oppressive, unemployment was chronic and the fringe was lunatic.

The crudity of the circus showmanship of the meetings in the Hall, inevitable to some extent with such masses of men, was heightened by the concentrated candlepower of the mammoth searchlights (five on each side of the hall) and the battery of floodlights above and to the front of the platform which the newsreels and television demand. This was the first convention followed, on television, by the public as far west as Chicago and the effect on the speakers was not edifying. They neglected their immediate audience, the delegates they had supposedly come to impress, in favour of the unseen, but larger, audience which television gave them. They spoke to the cameras, dressed for the cameras and gestured to the cameras. Governor Green even spent a week experimenting with make-up for the cameras. In the end, when he was temporary chairman, he gave the queer impression of being, not the chairman of a convention, but a popular film actor playing the part of chairman. He used the gavel to provide action for the watchers—not to bring the meeting to order.

*

To go from Convention Hall—where experienced observers were shaking their heads and beginning to remark that, if this went on, the Democrats could win after all—into the hotels in the city was to leave dreamland for a more tangible world. Nostalgia for the Hooverian period was certainly indicated in the sign at Mr. Taft's headquarters urging delegates to "save what's Left, with Taft" (though it may be pardonably assumed that they meant to save what's right) but the Senator himself would have seemed (and been considered by the National Committee) a dangerous revolutionary had he gone to the Hall and expressed his ideas. Though his machine, surprisingly enough, turned out to be inefficient and the vulgarity of the displays out of keeping with the candidate's personality, Senator Taft's own dignity and character were most impressive. There were many who, though never before in sympathy with his policies, began to hope that he could somehow defeat the inhuman efficiency of the Dewey machine.

Mr Stassen emerged from the convention a bigger man than he went into it. During the gruelling five days he seemed to resolve the doubts which had ruined the later stages of his campaign. His following was young and idealistic. The minor demonstrations at his hotel headquarters and the major effort at the Convention Hall when his name was put in nomination had much of the atmosphere of a college football game. The boos from the gallery that greeted the placing of Mr Dewey's name in nomination, the tears and cries of "No" at the motion, a day later, for his nomination to be made unanimous, and the applause that greeted Representative Judd's nominating speech for Mr Stassen showed the fervour of his support, which had

a quality usually reserved for third-party candidates (Mr La Follete in 1924 and Mr Wallace this year, for example) and not seen in a major party since the days of Woodrow Wilson. It was Mr Stassen's duty to see that his supporters were not disillusioned and that they kept their ideals intact. He succeeded. He was the most wooed man of the convention. Every other candidate was trying to buy him with the Vice-Presidency, but he remained unbought. He was so afraid that he would be suspected of a deal that he refused Mr Dewey's support for the second post even after the Presidential nomination had been made.

All conventions are founded on geography, physical and economic. They exist to permit the necessary brokerage among regions and interests. In the prayers that open, the singers that entertain, and the speakers that address the convention, there is proportional representation of denomination, race, sex and residence. And, in the choice of a Vice-Presidential candidate to run with a New Yorker, only the Middle and Far West could be considered. The Middle West offered (apart from Mr Stassen) a variety of isolationists—all willing and eager—some of whom believed themselves to be the holders of firm promises. But an isolationist would only have weakened the ticket. Mr Dewey wanted it strengthened. Only Mr Stassen or Mr Warren could do that. In the end Mr Warren was persuaded on the understanding that he would be given a real job. He will bring the votes of many independents who would have been scared away by a Dewey-Halleck or Dewey-Bricker combination.

Mr Dewey's international position will be subjected to some strains. With Mr John Foster Dulles at the State Department and Senator Vandenberg still Chairman of the Foreign Relations Committee, continuity of foreign policy should be assured. But Senator Martin must be repaid for his timely renunciation and Senator Martin is the representative of the Grundy faction in Pennsylvania politics, the strongest high-tariff group in the country. The party platform throws no light on the subject. For all the excellent work put in by Senator Lodge, it finished up with enough escape clauses to allow almost any policy to find justification in its pages, even if, unlike party platforms in the past, it is taken seriously. But Mr Dewey has been moving steadily over the past five years—ever since his speech at the Governors' Conference at Mackinac Island—away from isolationism and he is an able enough politician to realise as well that it has no political future.

If Mr Dewey is elected, his administration will be efficient—even ruthlessly efficient. If its intentions are less liberal than those of Mr Truman, they will certainly be more predictable. Policy will not change on the advice of the last caller and programmes will not be thrown wistfully on the waters of Congress—never to return. The new birth of the Republican Party, for which some hoped, the return to the ideals of Lincoln, has not taken place. Equally, the party has not, as it might easily have done, and as the Old Guard would have had it do, committed suicide by choosing a Bricker or a Joe Martin to lead it, if elected, to destruction. Mr Dewey will solidify and strengthen the party without taking it into any new paths. In eight years' time, presuming that he has a second term, he will be able to hand it on in good shape to his successor.

Monopolies and Movies

[FROM A CORRESPONDENT IN CALIFORNIA]

THE judgments recently delivered by the Supreme Court, condemning the selling activities and practices of the major motion picture companies, are likely to lead to a new set of manœuvres in the rearguard action that those companies have now been fighting for more than ten years. The more optimistic of the interests likely to profit by these decisions—the independent theatre owners—are already claiming some of the fruits of victory, but many more decisions are likely to have to be won at many more appellate stages, before the complexities and ramifications of the corporate structures of the major companies are fully revealed and, after disclosure, forced into some conformity with the Sherman Anti-trust Act.

The eight companies under attack have not all been found equally guilty of the monopolistic activities with which they have been charged, but the degree of their guilt seems roughly to be measured by the extent of their theatre holdings and leads to the cynical conclusion that the suspect operations vary in direct ratio with the opportunity to indulge in them.

Of the 18,000 cinema theatres in the United States, 17 per cent are owned, either wholly or in part, by one or other of the Big Five—Paramount, Loews, (Warner Brothers, Twentieth-Century-Fox or RKO. Superficially this seems to be a reasonable percentage; but when the earnings of these 3,000 theatres are revealed as accounting for at least 45 per cent of the gross box-office take, it seems clear that mere consideration of the size and modernity of the "trust" theatres cannot account for the discrepancy between their earning ability and that of those that are independently owned. The Supreme Court has borne out this reasoning by its finding that the independent exhibitors have been the victims of "discriminatory practices and predatory activities."

The recent decisions seem likely to affect the position and policy of the major companies in two distinct ways. First, a succession of civil actions is threatened by independent theatre owners who claim to have been adversely affected by the monopolistic activities of the Big Five. Under the Sherman Act a successful plaintiff can recover exemplary damages and, in one of the decisions upheld by the Supreme Court, damages of $375,000 were awarded to an independent exhibitor who had proved loss of only $125,000. There are said to be some sixty such actions already filed, in one of which damages to the tune of $8,000,000 are being claimed. Under the stimulus of the Supreme Court decisions, it is probable that this is only the beginning of a nation-wide series of such suits, although each action will have to be decided on the basis of the particular monopolistic practices alleged to be prevalent in the particular Federal District in which the case is brought. Though the sums thus involved may become enormous, it is not too much to suppose that the major companies have been forewarned for some time of the penalties which they might possibly incur and have made suitable appropriations to reserve.

*

Much more important, however, both structurally and from the point of view of policy, is the forthcoming clash between the Department of Justice and the major companies. By a judicial procedure available to a party charged under the Anti-trust Act, he can put forward a scheme of corporate re-organisation which will, he claims, cure his corporate structure of its guilt. The proceedings then become something of a bargaining match between the defendant and the Department of Justice, with the judge acting in some sense as arbitrator. This procedure of the "consent decree," which has been frequently employed by the motion picture companies, leads as can be imagined to almost infinite variations on the themes of what stock-holding constitutes control and what degree of control constitutes monopoly. It is in this direction that the ingenuity of the defendants' lawyers, both in court and in the exercise of corporate wiles and devices, has been successful in delaying the final issue and seems likely to continue that success.

The fruits of such bargains have been under fire in the Supreme Court, and, indeed, one of the appellate decisions recently delivered, which returns a crucial case to the court of first instance for what amounts to a retrial, contains the phrase, "The District Court should be allowed to make an entirely fresh start on the whole of the problem" in order to pave the way "for a more effective decree"; to which the exhausted

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

layman is apt to exclaim "This seems to be where I came in, ten years ago."

It seems, therefore, that the independent theatre owners are premature in hailing these judgments as the break-up of the theatre circuits. A valuable delay has been won by the more powerful interests, although during the interim there will, no doubt, be many real attempts to reform selling practices to avoid allegations of conspiracy and to direct theatre holdings into entities more remote from the parent companies.

While the main basis of the attack on the major companies has been that they conspired with each other in restraint of trade, they are individually under fire as perfect examples of the type of vertical trust at which the Sherman Act is specifically aimed. The five principal defenders each combine within themselves the functions of producer, distributor and exhibitor or, more explicitly, of manufacturer, wholesaler and retailer. Of the three remaining defendants, Universal and Columbia are producers and distributors, while United Artists are distributors alone.

It is only the combination of the functions of distributor and exhibitor that has been severely attacked by the Department of Justice: for while it is easy to imagine how a corporation, in its function as a distributor of motion pictures, can come to terms with itself in its function as an exhibitor, to the exclusion or detriment of third parties, in the production field, where such imponderables as stories, star values and artistic merit may come to be assessed, charges of unfair and discriminatory practices are much harder to substantiate. The independent producers have even slighter grounds for counting on judicial relief than the independent exhibitors.

At the time of the imposition of the British duty, the true independent producer, distributing in most instances through United Artists, was already in a bad way. His enforced and reluctant refusal to permit the distribution of his product in Britain as some sort of reprisal against the duty looked like his *coup de grâce*. Since then, the Johnston-Wilson Agreement, although hailed as a green light to independent production, has done nothing to improve his position, nor does it seem likely that the recent decisions will set these wheels turning once more.

Since even the major producing companies, in their more relaxed moments, admit that the competitive stimulus of a healthy independent industry is required, there is a general feeling of regret in Hollywood that the Department of Justice, however difficult the task, did not focus some of its attention on the monopolistic tendencies which are alleged to have stifled individualism in production.

American Notes

No Strike in Coal

The industrial weather seems to be set fair for the Democratic Convention and the election campaign. Judge Goldsborough's blessing for the miners' pension plan sought by Mr Lewis cleared the way at once for a new soft coal contract and relieved the Administration of the disagreeable necessity of seeking yet one more injunction against Mr Lewis under the Taft-Hartley Act, which Mr Truman attempted, unavailingly, to veto. A welfare fund of $40 million has been accumulated from royalty payments under the 1947 contract, but Mr Lewis and the owners have never reached agreement on the size of the pension and eligibility requirements. This was the cause of the strike earlier this year, which was called off when Senator Bridges was appointed a trustee of the welfare fund and supported Mr Lewis's plan. But the mineowners, through their representative among the three trustees, have been fighting a rearguard action against paying pensions on the scale endorsed by Senator Bridges and Mr Lewis.

Judge Goldsborough not only found that the Bridges-Lewis plan did not contravene the Taft-Hartley Act, as urged by Mr Van Horn, the trustee appointed by the coalowners; he also ruled that expenditures from the fund could be initiated by two of the three trustees, waved aside actuarial considerations, and approved the granting of $100 a month pensions to miners, who, at 62, had spent 20 years in the mines, even if they were no longer employees of the coal companies.

A court victory for Mr Lewis is a novelty, but in this instance it will not be begrudged. In a country where Government old age pensions are still in the rudimentary stage, the justice of the

demand for private old age security in a dangerous, essential, and dirty occupation is widely conceded, however much it may be regretted that it consolidates Mr Lewis's labour empire.

But if the contract signed last week seals Mr Lewis's victory, it also supports the owners' contention that the present contributions are insufficient to finance his ambitious welfare plans. In addition to a wage increase of 12½ cents an hour, or $1 a day, the owners' royalty payments to the welfare fund are increased from 10 to 20 cents a ton; and it is thought that the replacement of the "negative" Mr Van Horn may also form part of the settlement. The steel companies with "captive" coal mines concurred with special reluctance, in view of their hopes of avoiding any wage increases in steel. It is estimated that the settlement will add 40 to 50 cents a ton to the cost of coal, an annual total of $225 million.

The surrender to the third round of wage increases and the inevitable ensuing price increases is now virtually complete. The railroads are still technically being run by the Army, but there are rumours of a face-saving device to settle the second-round dispute which prompted Government control, and of the managements' resignation to even further rises. The other major dispute, the maritime strike, which is frozen by an 80-day injunction, may prove more intractable, for the union hiring halls, which come under the Taft-Hartley ban on the closed shop, are widely considered to be indispensable to stable industrial relations and union security in the shipping industry.

* * *

Half-Open Door for DPs

After two years of prompting, Congress at last has opened the immigration door a crack, to admit 205,000 DPs in the next two years. This is a victory for the men of good will who have worked night and day to offer the traditional American haven to Europe's homeless; it is a belated atonement for the failure even to debate the Stratton Bill last year.

But the victory has been achieved at a heavy price. The compromise between the restrictive Senate Bill and the liberal House measure has come down so heavily on the side of the Senate that four of the conferees refused to sign, and two only did so reluctantly. The Stratton Bill set 400,000 as America's fair share of the dispossessed. The total now to be admitted is made up of 200,000 DPs who were in Allied camps not later than December 22, 1945, 2,000 anti-Communist Czech refugees, and up to 3,000 European orphans under 16. In addition, 15,000 aliens already in the United States before April, 1948, will be allowed to stay permanently, but Congress must pass on each case.

The restrictions in the Senate version which only lightly veiled anti-Jewish and anti-Catholic prejudice have all survived, though they have been somewhat eased. The end date of December, 1945, bars the entry of the 10,000 to 15,000 Jews who fled from Polish pogroms in 1946. At least 30 per cent of the DPs to be admitted must be agricultural labourers, and at least 40 per cent must come from countries annexed by a foreign Power, that is the Baltic countries. Half of the regular German and Austrian quotas are set aside for the Volksdeutsche, nationals of Poland, Hungary, Czechoslovakia, Rumania, and Jugoslavia who are of German blood. Further priority is given to construction, domestic, clothing, and garment workers, but they must displace no American from his home or his job. Rigid sifting will ensure that no Communists slip through. The only liberal provision which survived allows the number of unfilled places in the first year to be carried forward into the next, but future immigration quotas will be heavily mortgaged to meet the present emergency. It has to be recognised that the call of humanity might have gone unheeded if there had not been a pressing need to replenish the vanishing farm population of the Middle West. But when to the specific restrictions of the Act are added the technical requirements with which all American immigrants must comply, it may not be very much easier for a Displaced Person to enter the United States than for a camel to go through the needle's eye.

Mr Ploeser's Steel Surprise

The discovery that the Selective Service Bill, as finally passed, gave the Administration power to allocate steel for defence orders (as well as the authority to force industry to accept such orders, which has always been included in "draft" legislation) confirmed the impression that Congress was too dazed to know what it was doing in its rush for adjournment. It is difficult to judge who was more taken aback: the Congressmen who had consistently denied the need for compulsory allocations, the Presi-

dent who had as consistently demanded them, the industrialists who had almost forgotten their earlier fears that the defence programme would necessitate such allocations, or Representative Ploeser, who had proposed the amendment. He had intended only to assure steel supplies for small businessmen who wanted to undertake defence contracts, and was as surprised as everyone else when it was pointed out that this amendment applied to steel for *all* defence requirements. Indeed, these innocent professions of ignorance arouse a suspicion that the amendment was designed not as a magnet for the votes of small businessmen, but as a mine under the President's attack on Congress for refusing him the powers which, according to his assertion, are essential. For this reason, Mr Ploeser's gift horse may not be entirely welcome to the Administration, but at least its mouth bears looking into; its teeth are available for immediate use, while the President has asked only for stand-by authority.

Industry soon recovered from the discovery that its Congressional watchdog was not only asleep but treacherous—Mr Ploeser is a Republican. Rallied by cries of "red tape" and justified by wartime experience, businessmen are indignantly insisting that if steel is allocated, allocation of other scarce metals will inevitably follow, and that Mr Ploeser has left the term "defence contract" open to wide interpretation. He has also left the duty of deciding when allocations are necessary to the Defence Department, whose ideas of necessity have always inclined to exaggeration. Industry may come to regret that the civilian National Security Resources Board has not been given more encouragement in the preparation of plans for industrial mobilisation.

In practice, a situation may well arise in which industrialists, unwilling to use for defence orders the steel which is so difficult to obtain, may press the Administration to open Mr Ploeser's surprise package, instead of leaving it on the shelf, as the Administration seems prepared to do, at least until the defence programme is expanded further. The knowledge that it is there will not be without its effect, and for the moment there is said to be sufficient steel for military purposes. Mr Ploeser may also be responsible for future friction between the Departments of Defence and of Commerce, since compulsory allocations for defence may interfere with the latter's schemes for ensuring steel supplies for certain categories of essential goods, such as freight cars, housing and atomic energy requirements. These voluntary allocations were authorised by Congress last year and, ironically enough, have just begun to get going, after much delay. But Congress has also chosen this moment to decree that they must terminate on March 15th, although steel supplies are expected to remain short for at least a year, in spite of a current production rate of nearly 90 million tons a year.

Farm Stop-Gap

Price guarantees to the farmer are one aspect of the New Deal which the Republicans, in an election year, have no desire to liquidate. Agricultural prices are still so high, in most cases, as to make the question of government support appear academic, but after President Truman's taunts it was politically unthinkable to allow the war guarantees to lapse, without putting anything in their place. The deadlock between the House and the Senate seemed almost insoluble until the very last hours of the session, but the weary conferees were sent back four times until they produced an agreed version. The Aiken Bill, which the Senate had passed, would have initiated a retreat to a somewhat lower level of guaranteed prices and a revision of the whole system. The House, every member of which is up for re-election this year, is much more sensitive to controversial reforms, and was determined merely to extend, with slight alterations, the generous wartime supports inherited from the Democrats.

The conferees eventually broke the deadlock by accepting both proposals. When the present system expires at the end of this year, price supports at 90 per cent of parity will be extended for another twelve months with the single change that supports for perishable commodities may be reduced to 60 per cent of parity. At the beginning of 1950, there will come into effect Senator Aiken's proposals to modernise the concept of parity and to stabilise the farmer's income by relating the level of support to the size of the crop. (These provisions were discussed in detail in a Note in *The Economist* of June 5, 1948.)

The Republicans will point to this synthetic Bill as proof that they have been able to combine two overriding and not always harmonious requirements of any farm programme: present assurances to the farmers which will produce both the votes the Republicans want and the food the world needs, with a recognition that in the near future (though not before the election returns are in) the parity system must be overhauled, at some pain to some farmers, to avoid a permanent freezing of production in an antiquated pattern and to prevent the government from being involved in catastrophically large liabilities when prices fall. In fact, the inclusion of the Senate proposals is viewed more as a political compromise than a firm commitment; the House, by postponing their effective date, has reserved the right to amend them, and has gambled instead that there will be no sweeping declines in food prices before 1950. A farmer in the polling booth in 1948 is worth two tax-payers in opposition in 1950.

But even the Aiken proposals mark a great increase in the guarantees extended to farmers by the New Deal before the war and once thought revolutionary. To take into account the past ten years of farm prices in determining parity will weight the whole concept even more heavily in the farmers' favour. A hungry postwar world has no reason to regret the bargain whereby the Roosevelt Administration extended the wartime level of farm price supports for two years after the end of hostilities in return for the farm lobby's support of the Price Control Act. But it is an odd reflection that the Republicans, who have eliminated every trace of controls, are gladly continuing to pay the price of their acceptance.

End of the Nickel Fare

For many years New York City boasted that its Underground system provided the longest ride in the world for five cents. (The terrors of the rush-hour, which make it the world's most uncomfortable ride, are less advertised.) The five-cent fare was part of Tammany's legacy to the city; it was implied that New Yorkers were getting something for nothing, like free coal and blankets and picnics, and for years opposition to the five-cent fare has been regarded as equivalent to political suicide.

But today Tammany has lost its teeth, and the five-cent fare has become an intolerable burden on the city's finances. Even in the old days, with the interest charges on the purchase price of the lines being met by the city budget, the cheap five-cent fare was an illusion. But the situation was bearable as long as the public's nickels paid the operating costs. In 1946, however, the nickel could no longer be stretched to cover operating expenses constantly being expanded by new wage demands. The city had to take over an operating, as well as a capital, deficit. Without an increased fare next year the city would have had to allocate $51 million at least to the operating deficit alone.

Mayor O'Dwyer decided to take the bull by the horns by raising the fare to ten cents on July 1st. If New Yorkers must now pay ten cents for a five-cent ride, it is no bad measure of inflation. (The real cost of the ride is nearer 12 cents.) For the city government is as much a victim of inflation as any of its citizens. Despite a billion dollar budget, larger than those of many sovereign states, the wealthiest city in the world is pinched to find the funds to maintain its hospitals, sanitary services, libraries and schools. There is, of course, a rising standard of the services a great city should supply, but the cost of providing them has also risen sharply. City employees demand and need higher wages. Mayor O'Dwyer has taken a long overdue step towards a "New Look" in New York City's government.

Shorter Notes

The New York newspaper *PM* has now been taken over from Mr Marshall Field by Mr Bartley Crum and Mr Joseph Barnes, who were first associated as supporters of Mr Wendell Willkie. Mr Crum is a Californian, who resigned as vice-chairman of the Progressive Citizens of America when they endorsed Mr Henry Wallace as Presidential candidate; he was a member of the Anglo-American Commission of Inquiry on Palestine. Mr Barnes was foreign editor of the *New York Herald-Tribune*. Their declared purpose is to produce a paper which gives honest news, is good to read and gives "a daily reminder of our own strength to all of us who believe that American democracy is worth fighting for." It is to be a morning paper and will be called the *New York Star*.

*

The value of United States imports dropped in April to $524,700,000 from the March total of $638,500,000; exports declined by $19.4 million to $1,111,400,000. The commodities most seriously affected by the April fall in imports were rubber, wool, coffee, cocoa, sugar, wood pulp and copper, while cotton and coal were among the exports which declined. However, during the first four months of the year, imports were coming in at an annual rate of 21 per cent above that of last year.

THE WORLD OVERSEAS

Berliners Carry On

(From our Special Correspondent)

BERLIN today has the air of urgency and resolution and the sense of taking part in decisive events that are missed so badly in Frankfurt and Düsseldorf. Mr Bevin in the Commons on Wednesday praised Berlin in terms which, three years ago, would have been inconceivable; but to have been there in the past critical week is to feel that his praise was not overdone. In Berlin people are not complacent about the threat under which they live. It confronts them at too close quarters. But neither are they disposed to yield to it.

Ten days ago, on June 23rd, industrial wages fell due and could not be paid, for it was then that the Soviet authorities called in the currency. At the beginning of this week the confusion of opposite currencies was still such that the managements were quite doubtful about being able to pay their workers during the week. The obligation to stand in endless queues at the banks and currency issue offices was another fact tending to keep people away from work. Indeed, it became known that different conversion rates from the old mark to the new Eastern mark might be obtained at different issue offices, and that the arrangements at each office changed from day to day. The most profitable way to employ time was therefore not to work but to go round from one issue office to the next; some firms sent their cashier out to reconnoitre and exploit any inconsistencies, and some individuals naturally did the same. But most of them went to work in spite of the currency war, in spite of the power cuts and the cessation of coal supplies, and in spite of the utter uncertainty of the course which politics and public finance would take in Berlin for the next twenty-four hours.

Beyond these uncertainties was the further doubt about food supplies: if the Soviet blockade of the Western sectors continued, how long would it be before the food ran out? What could the Western Allies do so that they would not have to leave Berlin in the lurch? The average worker knew no answer to questions of this kind, which were, indeed, questions to which nobody could give him an answer. But he still went to work. By Monday it was supposed among many officials (Germans and Allied) that industry in the Western sectors of Berlin had come to a general standstill, but in this they were wrong. It was a natural supposition; there seemed, in the circumstances, nothing else that could happen. One electrical equipment factory in Western Berlin on Monday had half of its usual power supply cut off; with the other half, maintained in the face of difficulty by careful planning by the city administration, the factory was keeping up considerably more than half of its normal production. Testing of finished products and other activities which could be postponed until a later day were suspended, but the lathes continued to turn. Another big factory in the same district (because it was not on a separate circuit from the surrounding quarter) was totally deprived of power, but this too did not stop working. While half the employees were out queuing for their new currency, the remaining half carried on with such hand labour as could be used, processes being reorganised to concentrate on work that could be done without power.

Total Reliance on the West

To see a great mechanised factory with its machines silent and its workers carrying on is a strange experience. One saw and felt in the workshops a grim cheerfulness, a determined calm, a unanimity of feeling, that recalled nothing so closely as the population of London at its best during the German bombings. Work in these circumstances was not a routine, but a demonstration. And, indeed, the management and works council of the factory made this clear by the plans they were preparing for the coming weeks. Productive work could not be maintained indefinitely without power, but in the once great electrical industry of Berlin there is always room, nowadays, for clearance and reconstruction; the damage left by the war, and the greater damage left by the few weeks of Russian dismantling before the Western Allies moved in, left a task of almost inestimable dimensions. In so far as the torn and littered workshops have already been cleared and restored, it has had to be done for the most part by hand. So has the piecing together of old and damaged machines on which Berlin industry has depended for its revived production.

If, therefore, industrial power remains cut off over a long period, the Berliners propose to concentrate on clearance and on the general effort to restore productive capacity for the future. All this implies a total reliance on the determination and ability of the Western Allies to stay in Berlin. That reliance underlies the whole Berlin scene today. It is the more impressive since these people do not seem to entertain any illusions about the difficulties of the Allied situation; they make the assumption because they see no other on which to act. They are, therefore, and deliberately, compromising themselves utterly with the Western cause.

A big industrial enterprise with several factories, carrying on in these conditions, last week formed an emergency finance committee which meets every morning at eight. It considers what cash it will need to carry the group through the day, and decides on ways of drawing that amount of money and no more. In the early days of this week the relation between the Eastern money and the Western money was still shifting and uncertain, and the only course seemed to be to wait and see. It was already clear that the new Eastern money was scarcely less inflated than the old, and that the exchange position of the Deutschemark was strong. What was not clear about the Deutschemark was how it was to be kept in circulation at all. Only a limited amount of the Western money had been brought to Berlin, and in view of the Western determination not to allow it to become inflated, only a limited amount could be brought. Its appreciation in terms of the newly stamped Eastern money (which began within a few hours of the issue of Western money in Berlin) was too swift to be true, and it would be a mistake to take it as purely a tribute to Western prestige.

Russians Buy Up The Deutschemark

By last Sunday it was clear that the Russian authorities, through dealers stationed around the Brandenburg Gate and in other parts of the city, were buying up every Deutschemark that was offered, and were indifferent to the price at which they bought. German business men quickly drew the conclusion that the Western money would disappear within a few weeks through the combined effects of Russian buying and German hoarding. The Western decision to extend currency reform to Berlin had become no more than a gesture which could not be made financially or economically effective. Even this week, it was doubtful if wages would be paid in full in Deutschemarks in the Western sectors.

It would be foolish, in view of these facts, to imagine that the Russians had attempted a currency reform and failed. Their handling of the currency in the past ten days has been unscrupulous; it has discriminated and shown favouritism, enriched some people unreasonably and as unreasonably impoverished some; it has added to the wasteful disorganisation of economic life and put the common man to untold inconvenience. But it was not a currency reform. The new Eastern money has been used merely as a weapon, first to exclude the invalidated old currency from the Western zones (a serious and necessary measure) and secondly to drive out the new Western currency. Whether it was deflated or inflated has clearly been of no account to the Russians, who are no doubt preparing now for an attempt at currency reform in Eastern Germany when the Western currency has gone from Berlin.

Berlin is conscious of being the centre of the stage; of all its anxieties, the greatest seems to be that the outside world should understand that what happens in Berlin is not merely a local matter but a world matter, and Berliners will explain this courteously to the foreign visitor. No such terrible alertness disturbs the west of Germany. To go from Berlin to Frankfurt this week was to leave the bracing heights for the sleepy hollow, the bright glare for the unexacting shade, the centre of the stage for the wings. Frankfurt is still a provincial town—it may be

irretrievably. It views the great world at a distance and with unshakable unconcern. The bizonal administration has from the first been infected with the atmosphere of its surroundings. Its concerns are local and strictly limited; serious though they may be, they are looked at in office hours—not too early in the morning nor too late in the afternoon—and are shelved on Friday night for the weekend. What happens in Berlin is a matter for mild interest in Frankfurt. From outside Germany it is easy to see Frankfurt as the seat of a German government and the centre from which German reconstruction is to be organised and led. In Frankfurt itself the idea rapidly blurs. And back in Berlin, where after all that has happened life is still lived with speed and intensity, it arouses incredulous laughter.

Elections in Finland

[BY A CORRESPONDENT]

A FREE and fair election on the borders of the Soviet Union is a remarkable thing to happen in 1948. The election campaign in Finland has been as democratic as any in Western Europe. All the traditional parties are in the lists, the press is uncensored, the right of public meeting untrammelled, and none of the two-million-odd voters has the faintest doubt about the secrecy of the ballot. The atmosphere during these last weeks has been calm—perhaps too calm: it may lead to a large number of abstentions, and that could do no one any good.

Each of the political parties is conducting its campaign separately—there are no electoral agreements, no blocs—and there is nothing radically new in the programme of any of them. The Conservatives are making their old appeal to the businessmen and the professional classes. Their slogans are still private enterprise and freedom from controls; it is a platform which is likely to hold their supporters but unlikely to win many new votes. As the main Opposition party they are pleasantly free from responsibility for the hardships of the last three years, but few people can feel that those hardships are the Government-parties' fault. The Agrarians are still the party of the farmers and of the farmers alone: a reduction in the prices of farm-produce is almost the only plank in their platform. The Swedish People's Party still has its appeal for a fairly large proportion of the Swedish-speaking minority, and the Liberal Party will never be without its attraction for intellectuals.

The new interest in this election centres in the duel between the Social Democrats and the Finnish People's Democratic League (SKDL), which is the polite name for the Communists and their fellow-travellers.

The Social Democrats are traditionally the largest party in Finland. At the last election, that of March, 1945, they suffered for the intransigent part they had played in the concluding months of the war against Russia, for the Russian ban on their beloved leader Tanner, and for the secession of some of their members into splinter groups and into the SKDL. The SKDL secured the play-for-safety-with-Russia votes. The result of the 1945 election was to divide the 200 parliamentary seats as follows: Conservatives 28, Agragrians 49, Swedish People's Party 15, Liberals 9, Social Democrats 50, SKDL 49.

Communist Setbacks

The question is how many seats the Communists will lose in the election of July 1st and 2nd. No one, not even the typical Communist Party member, expects it to gain. At the general election of 1945 the SKDL vote was 25 per cent; at the municipal elections of December, 1946, it was 19 per cent; at the trade union elections during the early part of this year its candidates lost more and more ground to the Social Democrats. Its worst setback came in the rumpus this May over the dismissal of the Communist Mr Leino from the post of Minister of the Interior. The Communists demanded his reinstatement. When that failed it demanded that he should be replaced by another Communist. There were deputations and demonstrations and finally a general strike was called. But the Communists' strike was a shocking failure; the most reliable estimates are that only 17 per cent or 18 per cent of the organised workers took part in it.

Yet the SKDL has some very high cards to play in a general election. Its policy of friendship with Russia cannot be gainsaid: no Finnish party dare come out into the open as being against the most cordial relations with Russia. Its rosy picture of conditions inside the Soviet Union cannot be openly contradicted: to declare in the press or on the platform that conditions in Russia are anything but rosy would be an "unfriendly act." Its advocacy of better conditions for the Finnish worker, including higher wages and lower taxes, is irresponsible but not without a strong appeal. And it has a trump card in the form of Russia's remission of reparations.

The announcement from Moscow a few weeks ago that half the outstanding debt to Russia in reparations account would be wiped out came as a great surprise. The Finnish Communists were not slow in claiming all credit for it. Had not the Communist Cabinet Ministers sent an open letter to the Cabinet—incidentally, an unparalleled occurence in Finnish constitutional history—urging that negotiations should be opened with Moscow for the remission of reparations? Had not the preliminary negotiations that followed been conducted by Finnish Communists? Did not the Finnish people owe this easing of their burden to Communist initiative and influence? Whether many Finns are impressed by this propaganda is doubtful. After all, the Communist cry for the last three and a half years has been that the reparation demands were too light, that Finland deserved to suffer more for its crime in fighting Russia, that any talk of remission would be a breach of the armistice agreement.

The general opinion in Finland on the eve of the election is that the SKDL will lose between five and ten of its seats in Parliament. Not more, because the system of proportional representation and the traditional inelasticity of party frontiers in Finland tend to keep election results stable; there has never been a big landslide in a Finnish election. But the loss of even a few SKDL seats would lead to important changes in the Finnish Government. It would mean an end of the coalition which has kept Communist members in the most important Cabinet posts.

Australia—New Zealand Trade Agreement

[BY A CORRESPONDENT]

THE Australian and New Zealand Governments have taken an important step towards the dovetailing of their economies. As a result of a conference in Canberra, which ended on June 14th, the two Dominions have agreed to co-ordinate their economic policies in order that they may become less dependent on imports from North America and Europe. The conference was a logical sequence to the Anzac Pact of 1945, when Australia and New Zealand agreed to set up a regional defence zone in the South Pacific and to promote trade between the two countries. Each Dominion is becoming complementary to the other—raw materials in New Zealand, such as timber and timber by-products, being matched by the new industrial output of Australia such as steel, cement and machinery. Both have now taken the obvious course of combining their resources to their mutual advantage.

The agreement was hastened by the fear of both Dominions that their dollar debts would continue to increase. They fully expect that they may ultimately be limited to those dollars which they can obtain from their own earnings and which are nothing like enough for their present needs. The trade agreement, therefore, aims at reducing their dollar imports by increasing the better organisation of their production at home. Its success will benefit Britain directly, for both Dominions have hitherto drawn extensively on the sterling area dollar pool.

Expansion of Secondary Industry

On a smaller scale, the developments in Australia and New Zealand have been on similar lines to developments in Europe. The lack of dollars, the need to build up strategic resources and the general desire to become less dependent on world markets have led to intensive efforts to expand secondary industries. Steel works, shipbuilding yards and factories have sprung up in Australia at a speed which says much for the vitality of the young Dominion. The population is moving from the country to the great cities, especially on the eastern seaboard, and capital investment has been on an unprecedented scale.

Industrial development in New Zealand has not been so spectacular, but its natural resources, particularly timber, are being worked, and they successfully fill the gaps in Australian production. Neither country is neglecting its main source of income—wool in Australia and dairy products in New Zealand—but both are determined to do their best to avoid the disaster which the lack of foreign exchange would bring.

But the biggest obstacle to the economic union of the two Dominions has still to be overcome: New Zealand has at present a heavy adverse balance of trade with Australia. It buys about £14 million worth of Australian goods annually and sells to Australia commodities worth only £3,000,000. Moreover, despite the high prices of export commodities, New Zealand's balance of payments with the rest of the world is also becoming unfavourable, although its sterling funds are much greater than in 1939. On the other hand, the external trade position of Australia is extremely healthy—its London funds stand at £200 million sterling—and Australia should be able to help New Zealand by loans or other means. Such an offer from one Dominion to another would not only benefit both, but it would also set a practical example of mutual aid which might well be imitated in other parts of the Commonwealth.

Joint Planning by Czechs and Poles

[FROM OUR PRAGUE CORRESPONDENT]

DISCUSSIONS have been in progress here for some time about quotas for the second year of the Czechoslovak-Polish Trade Treaty. The treaty itself lays down a provisional programme for each of the five years it covers, but also says that the annual quotas shall be reviewed each year in the light of previous developments. The trade turnover envisaged for the forthcoming period, July, 1948, to July, 1949, is roughly Kcs. 2,000 million compared with Kcs. 1,500 million during the previous twelve months. Poland as before will send Czechoslovakia mostly raw materials such as coal, zinc, foodstuffs and various chemicals in exchange for Czechoslovak machinery, chemical products and consumer goods of which the chief items will be boots, shoes, tyres, motor cars and cycles.

Of more interest, perhaps, than the actual trade are the various joint committees established under last year's treaty with the wider object of promoting economic co-operation. At the time the treaty was signed it was generally assumed that these committees were intended to pave the way for the gradual integration of the economies of the two countries. Whatever the ultimate intention, this has not been their role so far. Indeed, they have tended to function more as debating societies where mutual problems can be discussed and grievances aired. All accounts of their deliberations agree that the fun, if that is the right word, has often been more furious than fast in spite of the fraternal character of the two regimes. So far at any rate, neither country has made any capital investment on the territory of the other, nor are there any joint enterprises. The reason given is that any such development would constitute an unpermissible infringement on the sovereign rights of the individual States which, according to Slav bloc theory, must be regarded as altogether sacrosanct. It is a theory which some might consider to be at variance with the treatment meted out to individual citizens in these countries, and of course it does not always work out in practice exactly as scheduled. But the theory of the divine right of the People's Republican State has for the moment a vogue and an importance comparable only with that of the ancient theory of the divine right of kings. And it is in the orbit of this theory that the joint Czechoslovak-Polish committees are expected to revolve.

Working Parties of Experts

The main committees deal with such questions as industrial co-operation, the exchange of data on the results of scientific research and planning, how to finance not only current trade but capital investment by a proper allocation of available resources, how to deal with shortages and bottlenecks which threaten the execution of planned deliveries. Finally, and perhaps the most important of all, there is the transport committee.

All these committees set up so-called "working parties" of experts to which technical matters are referred. In the sphere of transport, for example, a working party is at present engaged in considering the many intricate problems arising out of the proposal to construct a canal between the Danube and the Oder. Preliminary indications are that the difficulties may prove insuperable. Some of the experts take the view that there is not enough water in the Oder basin, and that the only way to keep the canal filled would be either to pump water from the Danube or to build the waterway in concrete which would involve constant cleaning. Both methods are so expensive as to make it doubtful whether the proposition is economically worth while.

Transport, or more properly transit, questions provide many occasions for the most uncomradely fury. The Czechs consider rates on Polish railways and rivers too high, and have not hesitated to say so. And the recent Polish gesture in announcing the handing over to Czechoslovakia of part of the port of Stettin to be its very own would have been much more appreciated in Prague had the dues been much lower. Owing to the shortage of dollars and other foreign exchange, a large part of Czechoslovakia's imports from, and exports to, the West are routed through Poland, including practically all its iron ore imports from Sweden, which are nearly four-fifths of its total iron ore imports and about two-thirds of its total requirements of this commodity.

So far as practical results go, the most successful committee appears to be the one on industrial co-operation. The main object of this body is to prevent overlapping and competitive building in industrial development. It has, for example, arranged that the Poles should pay for the plant they are buying to produce power from the low-grade coal deposits near Oswiecim by supplying the power to Czechoslovakia where it is needed for Moravian industry. Similarly, the Czechs produce more coke than they need and the Poles have agreed to take the surplus instead of erecting new coking plant of their own.

Clash of Interests

In the short run, there can be no doubt that it is both economical and expedient to pool resources in this way. But whether the two countries will take the same view when, and if, their industrial sprints develop into marathons is not so certain. Poland is busy with many schemes of industrial development and it is more than probable that one day it will need the Oswiecim power itself. So, conversely, is Czechoslovakia likely to need all its coke if its plans to replace Germany as the industrial supplier of eastern Europe are successful even in part. Therefore, unless integration is the ultimate goal and unless permanent co-operation is now assured in spite of the past history of Czechoslovak-Polish relations, there would seem to be an element of risk in putting one's eggs in somebody else's basket. It is difficult to be inter-dependent economically and independent sovereign states politically at one and the same time.

Meanwhile there is no doubt that the economic inter-dependence of the two countries has increased, is increasing and is likely to increase still further. But even at Kcs. 2,000 million (about £10 million) a year, the volume of trade is not yet colossal. It represents about 6.5 per cent of the total turnover Czechoslovakia hopes to achieve next year. Czechoslovakia's new Government say they intend to increase the turnover with the Slav bloc until it reaches—to quote the Minister of Internal Trade, Mr Krajcir—"40-50 per cent of the total foreign trade." How they are going to achieve this result while the present vogue of the bilateral agreement continues is not explained. Czechoslovakia is still dependent on the so-called West for at least two-thirds of its imports of raw material and the first step towards Mr Krajcir's goal has been to start a big export drive in the hope of acquiring dollars and sterling. Of course if the drive were to fail, Czechoslovakia's imports from the West would have to be correspondingly reduced thus automatically raising the percentage of trade with the Slav bloc. It is to be surmised, however, that this is not what Mr Krajcir either meant or wants.

THE ECONOMIST BY AIR EXPRESS

We hope to announce during the next few months the introduction of an Air Express Service of The Economist to a number of overseas countries, similar to that already in operation across the Atlantic.

To New Zealand and Australia

We start with an Air Express Service to Australia and New Zealand as from the beginning of August next. On existing airline schedules copies will be posted in Sydney within one week of publication in London, thus reaching subscribers some five weeks earlier than by surface mail.

The cost of this service will be £6 sterling per annum. If you wish to enter a subscription to an address in Australia or New Zealand, please send your instructions to:

The Publisher,
The Economist, 22, Ryder Street, London, S.W.1.

THE BUSINESS WORLD

Housing—Programmes and Performance

SEVERAL hints have been given in the past three months —from the Minister of Health, the Minister of Works, and even from the Chancellor of the Exchequer himself—that the house building programme was again to be expanded. The review of housing policy and programmes issued by the Minister of Health last Friday was promised in the White Paper on Capital Investment last December; it represents the sixth change of policy in about eighteen months. That White Paper laid down the total of houses to be completed in 1949 (not 1948) at 140,000, a figure fixed not by reference to any detailed balancing of claims for resources of materials and manpower but strictly by reference to the amount of softwood that was expected to be imported this year. Now the programme is to be increased, even though that means taking a chance on next year's timber supplies.

In no field can plans and figures be more confusing than in house building. Last December's White Paper talked of cuts; tenders approved for new houses were indeed reduced to 6,000 a month during the winter, compared with 11,000 a month in the spring and summer last year. But output of new houses has increased; the latest returns for England and Wales and Scotland show that 20,372 permanent houses were finished in May, the highest figure since the end of the war. That does not sound like a "cut." Indeed, it is the result of reducing the huge over-expansion of work on houses in the early stages and of concentrating greater effort on finishing houses under construction. In the language of last Friday's statement, the programme has been "got into balance"—though that claim cannot yet be made for Scotland, whose programme is still seriously unbalanced. Permanent houses under construction, which reached a peak of 261,161 last October, have been reduced to 218,044; the target of 210,000 houses under construction by the end of June proposed in the White Paper has been largely achieved by cutting the number of new authorisations and by starting construction on an average of only 10,000 houses a month compared with an average of 18,000 in the middle of last summer. More houses are now being finished than are being started, and in order to maintain the present number of houses under construction in England and Wales at 180,000, new contracts have already been accelerated. The statement does not say in terms what output of finished houses is being aimed at; presumably contracts for new building will be let to tally with the output of finished houses, and presumably, too, it is hoped that the number of completed houses will, in any given period, equal the number under construction.

The new statement of policy strongly suggests that the housing programme still enjoys full absolution from the damaging cuts inflicted on the industrial investment programme. If the assumptions at the end of the last paragraph are right, the annual output of permanent houses now contemplated must be of the order of 180,000 in England and Wales, or some 200,000 if Scotland is included as well. The ratio between houses under construction and those completed in a given period depends largely on the productivity of building management and labour. During the last three years, it has been disappointingly low, and recent signs of improvement will have to go a long way before productivity can truly be called satisfactory. Before the war, between 300,000 men and 350,000 men were engaged in housebuilding, producing about 350,000 houses—one house per man per year. There are now 540,000 men in housing work of all kinds (the Capital Investment White Paper anticipated their reduction to 525,000 by June 30th) of which nearly 250,000 are employed on permanent houses. Last year's output of completed houses works out at two men to a house, though the houses were bigger than prewar and the normal ratio might now be better expressed as 1¼ men per house per year; this year something nearer the one for one ratio ought to be shown, simply because the number of houses under construction has been successfully reduced.

By the end of May, 440,235 new houses (including 150,864 temporary houses) had been completed; 223,519 houses were under construction; and 49,571 houses were projected but not begun. This gives a total of 713,325 houses built, building or projected. In addition, 265,644 "units of accommodation" had been provided by repair, or conversion of large houses. Thus 705,879 households have already been accommodated; Mr Bevan's ambition to rehouse the 750,000 families which were estimated in 1945 to lack a separate home will be achieved this autumn. Since 1945, some 2½ million people will have been rehoused. This is an important achievement, comfortably exceeding the building effort of 1920-22; but that effort was a very limited affair compared with the mobilisation of resources for house-building in 1945 and after. The Labour Government was pledged to a maximum effort; it gave housing priority over all other needs for new investment; and it encouraged and forced the local authorities to undertake so much housing work that the industry, instead of being allowed to work steadily towards increased output, became congested and costive before the programme was producing finished results.

Cuts in the rate of new approvals were first imposed in August, 1947, and held until March, 1948. The publication of the revised programme in December thus coincided with a serious lack of balance in the house-building industry. At the beginning of that month, 261,161 permanent houses were under construction, but only 15,398 were completed. The accompanying table illustrates the improvement which has since taken place, an improvement which is partly due to the running down of the temporary housing programme, with all its dislocations and unexpectedly great expense.

GREAT BRITAIN

	New Permanent Houses			Temporary Houses		
	Commenced	Under Construction	Completed	Commenced	Under Construction	Completed
April, 1946	not available	77,190	2,116	not available	21,175	5,017
Nov., „	„	180,930	7,351	„	10,014	18,515
April, 1947	16,790	225,853	9,710	4,164	8,502	4,947
Nov., „	14,049	259,932	15,272	3,510	6,998	3,236
April, 1948	12,444	225,408	18,626	1,284	6,939	2,411
May, „	11,840	218,044	20,372	580	5,475	2,124

So far, the reduction in manpower engaged in housing work has not matched the forecast given in the Capital Investment White Paper (525,000); nor does it promise the further reduction by the end of this year as forecast in the Economic Survey. Concentration on the completion of houses under construction has changed

the distribution of manpower in house building, but it has not done as much as was expected to reduce the total numbers employed. The total has fallen by a few thousands from the

HOUSE BUILDING LABOUR
(000's)

„ 1948	263	48	81	550
May, 1948	253	48	79	539

peak of 569,200 reached last September, but unauthorised building work has possibly absorbed as many of the displaced workers as have found employment in essential occupations elsewhere. If there was ever any serious intention to seek a further reduction in the building labour force the acceleration of the programme, coupled with the raising of the limit for unlicensed repairs to £100 a year, is now sufficient proof that the present volume of manpower is to be retained—without appeal to any question whether the nation can afford to devote one-fortieth of its entire labour force (and a far higher proportion of its constructional labour force) to investment work which yields only an indirect return.

Last August, Mr Bevan ordered the suspension of all licences for housebuilding by private persons, in order to give local authorities absolute right of way to accelerate work on their own schemes. He has now modified this attitude. The so-called "speculative building" of houses for sale is still anathema, but local authorities may now issue "when they think fit, some licences" to private persons to build houses for their own occupation. Private building will be limited by the four-to-one ratio which obtained until last August, but the ceiling price (£1,300 in the country and £1,400 in London) has not been reintroduced. Private builders will, therefore, be able to undertake building for owner-occupiers up to a rate of about 40,000 houses a year; houses may be built up to 1,500 feet super, compared with limits of 900 or 1,000 feet imposed by the old maximum prices; and selling prices will be fixed by local authorities on the basis of the cost of similar houses built by

BUILDING FIGURES IN MAY, 1948

	Permanent Houses Completed	Permanent Houses under Construction	War Destroyed Houses Completed	War Destroyed Houses under Construction
Local authority	190,954	187,681	7,349	1,414
Private enterprise	70,390	13,979	17,917	10,009

themselves—a formula which will certainly be open to wide interpretation by the judges in their own cause. But the greater scope for private building, coupled with exhortation to local authorities to modify their previous concentration on three-bedroom houses and to build some both smaller and larger—these changes promise to give much needed variety and flexibility to the housing programme. The present monopoly of local authority building is shown in the table in the previous column.

Private builders have built more than one quarter of the new permanent houses erected since the programme began. But with only 13,979 houses under construction, it was obvious that their independent effort must peter out very soon, unless a more generous licensing policy was adopted. Mr Bevan's concession, therefore, has come only just in time to save this effort —though of course private builders are well occupied on contract building for local authorities.

What are the lessons of recent performance and future programmes for housing? First, housing has provided a copybook example of what happens when too much is attempted in too short a time, but before the various sections of the industry and its suppliers had expanded their scale in consonance with each other. The worst of the inefficiencies which resulted from too much pressure and boost should now be past; the controlling factors in future are raw materials—of which softwood is critical—and the industry's labour force—on which, by inference from the statement, the Government has had second thoughts. In the past, plans have been made for house building which assumed that it was an industry capable of almost miraculous expansion. But changes made in policy have their impact much later; new policy determines the level of building not now, but a year or even two years hence. Every shift of direction entails changes in materials, components and labour, and the over-expansion of the industry in 1946 and its over-contraction last winter have produced chaos and uncertainty. The contraction has not indeed been sustained since the Government discovered subsequently that its decision would plunge the building materials industries into still further chaos, and this it has not had the courage to do, in spite of its planning convictions.

Broadly speaking, the lesson of the new programme is that the Government has simply determined that the present size of the house building labour force is the right size, or at least the irreducible size. More houses will be built next year than was contemplated in the Capital Investment White Paper issued last year; they will evidently have priority over industrial investment work; they will absorb far more manpower than was committed to house building before the war, and far more than can be afforded on any cold calculation of Britain's economic resources and problems. If, with its prewar labour strength, the industry could produce as many houses as it did before the war, any expenditure of dollars on timber would at least be partially offset by the increased exports produced by labour no longer needed in the building industry. These are broad questions of cost. But there are narrower aspects of financial costs for housing schemes, on which, so far, there has been much rumour and few facts. An examination of the evidence about the cost of local authority housing will appear in *The Economist* next week.

The Trade of a Trustee

(By a Correspondent)

THE uncertainties of recent years have led to a boom in will-making. Consciousness of mortality touches prospective executors as well as testators, and there has been a marked increase in the appointment of trust corporations, which legally never die, to act as trustees. The trustee departments of the banks and insurance companies worked at high pressure during the war, and the flood of new business has not abated since. On the other hand, their official competitor, the Public Trustee, whose business steadily expanded up to 1939, has, if anything, experienced some reduction of new executor and trustee cases.

The Public Trustee was set up in 1906 as paid executor and trustee, because large sums were annually misappropriated by private trustees. His office opened for business in 1908 with a staff of six; but at once five hundred letters a day came in and, after only three months, 63 trusts had been accepted. In 1911-12, for the first time, the total number of acceptances exceeded one thousand, and 1919-20 saw a peak only slightly below two thousand. After that year, when the staff stood at 1,200, there was some slackening, though the number of new cases in the next decade never fell below 900

in any year. The department was responsible at March, 1947, for nearly 43,000 (accepted) cases valued at £528 million; of these, 20,593 cases were being currently administered by a staff of 870.

When, half-way through the nineteenth century, commercial companies entered the business of trusteeship, it was said that "the law had frightened every responsible and respectable man out of being a trustee." The pamphleteers were then pressing for a Government official "with safe hands above the reach of avarice," but there appeared in *The Economist* of December 3 and 10, 1853, prospectuses of two companies to "undertake trusts on commission." At this development, an eminent lawyer was moved to outraged protest: "The trade of a trustee! The business of an executor! Fancy it written over a shop door!"—thus expressing his horror that trusteeship, which an old rule of law insisted must be unremunerated, should become an article of commerce. Nevertheless, by 1908, a dozen companies were actively engaged in this businesss, including leading banks and insurance companies. Yet the ghosts of fraudulent joint stock banks still haunted the public mind; and there were failures, though not amongst the trustee companies, after 1908. Thus, the security of the State pledged by the Public Trustee represented such an advantage that, up to 1930, the department had more cases than all its rivals put together and was expanding at a faster rate. But by then the ghosts had been laid; and by 1945, at least two of the trustee associates of the "Big Five" banks were growing at three times the speed shown by the Public Trustee. Today, his annual acceptances are now equalled by the least active of the "Big Five" trustee companies.

The companies do not publish separate details of this branch of their business and the Public Trustee's annual report to the Lord Chancellor has not appeared since 1939. But when these corporate trustees come to administer the property of deceased testators they must obtain a Grant of Probate or Administration from the High Court. The following analysis of the Probate Registry grants, gives some idea of how the executor business is shared:—

PROBATE REGISTRY GRANTS
Years to 31 December

	1913	1923	1933	1936	1945
(1) Total of all Grants issued (England)..	72,067	101,497	139,733	150,914	202,100
(2) Grants to Trust Corporations.....	290	660	2,380	3,330	8,175
(3) *Percentage of* (2) to (1) *by numbers* ...	·402	·65	1·703	2·21	4·05
(4) *Percentage of* (2) to (1) *by estimated values*	·98	1·5	4·5	9·0	..
(5) Grants to Public Trustee.....	200	450	500	500	485
(6) Grants to Other Trust Corporations.	90	210	1,880	2,830	7,690

These figures show how quickly the trustee companies have overhauled the Public Trustee. It is still the exception rather than the rule for a testator to choose a corporate executor, but whereas the average value of estates for the whole country has remained fairly steady at about £4,000, the average value of estates administered by corporations is estimated at well over £10,000; hence the proportion of property annually committed to trustees that goes into corporate care is not inconsiderable.

After the Public Trustee's peak business in 1919-20, an increase in fees slowed down the expansion of the department. This year, after another series of wartime losses (which converted a credit balance of £137,425 in 1939 into a debit of £21,053 at March, 1947), the scale of fees has again been raised. The Public Trustee is statutorily required to administer trusts at "cost price," but apparently all the independent companies have always done the same work for considerably less; the department has been frequently criticised for overcharging, and the new charges enhance the discrepancy between the two scales. It is expected that the companies will shortly announce higher

charges, but even then these are likely to be well below the Public Trustee's new fees.

COMPARATIVE ACCEPTANCE FEES
Per £100 of Gross Capital Value of Estates

Public Trustee	Old Scale	New Scale		Company I	Company II
First £5,000	1	1½	First £20,000.....	½	⅜
Next £20,000	½	1	Next £30,000.....	½	½
Next £25,000	¼	¼	Over £50,000.....	¼	¼
Next £25,000	⅛	¼			
Over £75,000	20	½			
Minimum: £10 up to £500 / £15 above £500		No Change	Minimum £10: £2 2s. up to £300. £3 3s. above £300.		

The Public Trustee's fees were already higher than the companies' before the new scale; yet forty years ago the latter were very much afraid that the former, not needing profit, would undercut their business. An estate valued for probate at £20,000 will pay now £225, when the Public Trustee accepts active duties, against £125 last year; but a number of companies will undertake responsibility for a fee of £100, and others for as little as £75. Other fees taken by Trust Corporations—such as investment or management fees charged on the value of the stocks bought and sold—are much more difficult to assess. The Public Trustee's fee revenue for 1946-47 includes £107,000 out of a total of £314,000 for investment fees, and an analysis of the gross receipts of three trustee companies shows that 45, 40 and 33⅓ per cent of their annual revenue was derived from the same source.

The various fee schedules can, in fact, be compared only by applying them to cases that have actually been administered by a Trust Corporation. This comparison has been made by an experienced trust officer of one of the companies, for a number of cases so chosen that they cover the operation of every type of fee, and an attempt has also been made to compute the costs if an unpaid personal trustee had administered them. Trust Corporations' fees do not cover solicitors' costs. In the ordinary way, to obtain probate of a will and to administer a trust require continuous legal assistance, and a private trustee leaves the business entirely to his solicitors and pays them out of the trust estate. An institutional trustee, with its expert organisation, does not need clerical assistance such as the solicitor provides for the amateur, but it still needs legal guidance; the Public Trustee is as careful as the companies to fortify himself with independent professional advice. Each letter written has, therefore, been priced at five shillings as a fair average of the charge which solicitors, having to write them all, would have made to a private trustee. From this estimated total, the costs actually paid to solicitors by the Trust Corporation have been deducted; the balance should give the "extra costs" which the Trust Corporation did not need to incur. The resultant comparison, for each of four categories of cases, is shown below:—

COMPARATIVE CHARGES FOR ADMINISTRATION

	£	£	£	£
Gross Value of Trust Estate	7,041	2,798	141,894	23,675
Public Trustee's Fees (pre-1948)	96	31	489	258
Fees of Company I	72	17	319	183
Fees of Company II.....	35	8	270	95
"Extra Costs" of Private Individual....	107	5	499	228

The comparison still weighs against the Public Trustee, but with one exception the estimated "extra costs" to a private individual are not so widely different from the Public Trustee's fees. This may lend some colour to the claim that the department works at "cost price."

Small estates are relatively more expensive to administer than large estates. It has been officially estimated that estates under £1,000 cost the Public Trustee £25,000 to administer,

against fee payments of about £3,250 in a recent year. It is no secret that the bigger trusts balance the Public Trustee's revenue account; and fortunately, although about half his cases are worth less than £5,000, the average value of 18,000 accepted probate cases is over £16,000. Yet the average value of the companies' cases has been £4,000 to £10,000 below that of the Public Trustee's cases and at least three companies accept over 50 per cent more cases under £5,000 that he does.

The record of one company presents a distinct challenge to official explanations about the cost of small estates. For many years it has acted as trustee for deceased customers whose assets rarely exceed £1,000. In 1936, it obtained 570 probate grants averaging £873 and in 1945 over 1,000, averaging £1,175. Its acceptance fees are shown under Company II in the second table, and its other fees are also markedly below those of the Public Trustee. Its minimum fee must often operate, for 20 per cent. of its cases are worth less than £300. Its representatives will not admit that it runs its trustee services at a loss; indeed, it is very doubtful whether it could afford to do so. Apologists for the Public Trustee assert that the companies can make by-profits from other trustee work, which a self-contained Public Trustee organisation cannot do. This is undoubtedly true. But such profits are quite indeterminate and, for the customer who seeks service at lower cost, the point is largely irrelevant. On any test, the companies now provide cheaper service.

These comparisons are not without their lessons. The first Public Trustee was an enemy of red-tape and he bequeathed a tradition of sympathetic and understanding administration. Relations between trustee and trust beneficiaries are intensely personal. But as the Public Trustee's organisation grew (without putting out branches except in Manchester) it hardened into a Government Department and the early tradition weakened. On the other hand, the banks, through thousands of branches, enjoy almost daily business contacts and close personal relations with their customers, which inevitably bring in trust business. The banks have also opened trustee departments in provincial centres; since the beginning of this year at least one big bank has added five more such provincial offices to its list. The insurance companies have fewer opportunities for such continuous personal contacts. They are, indeed, sharing in the rapid expansion of trust business, but whilst four individual banks took over one thousand probate grants each in 1945, the insurance companies together claimed less than two hundred. This coming "home to men's business and bosoms" has put the banks far ahead of all competitors in the trade. It is a portent which the Public Trustee has doubtless marked.

Business Notes

Uneasy Markets

The Stock Exchange this week has been trying rather unsuccessfully to trim its sails to the heavy gusts of conflicting influences—the sombre news from Berlin, the Chancellor's reaffirmation of his disinflationary policy, the fears and hopes about the dock strike and the ERP agreements. The dominant influence, inevitably, has been the international news, as may be seen from the fact that the scissors movement between Gilt-edged and equities—with the former tending to rise and the latter to fall—has been interrupted. On Monday, when all influences temporarily pressed in the same direction, there was heaviness throughout the markets. Gilt-edged showed losses ranging to half a point, and the Ordinary share index of the *Financial Times* dropped by 1.4 to 111.7—fully nine points below its post-Budget peak. These declines, however, occurred in very thin markets, and the rebound on the following day was due at least as much to the technical influence of end-account bear covering as to any general change in sentiment. But the movement showed a little momentum at the opening of the new account, thanks to the ending of the dock strike, the relatively satisfactory terms of the ERP agreement, and some hopeful interpretations of the news from Jugoslavia. Since then, uneasiness about the Berlin situation has become a more enveloping influence.

Despite these vicissitudes, the activity in the new issue market continues. Hard on the heels of the £5,000,000 Birmingham Loan came the expected New Zealand conversion operation, announced on the very day that dealings started in the Birmingham scrip—at ⅛ discount, later rising to a fractional premium. More than half this issue was absorbed by conversion applicants, and cash applications had to be scaled down. Of the £19,225,000 of New Zealand 4½ per cent Stock which is to be redeemed, the Dominion is replacing only £16 million and will repay the remainder by drawing upon accumulated sterling balances. The new issue is a 3 per cent stock, 1966-68, offered at par—virtually the same terms as the Birmingham loan, the minimum life of which is one year shorter. It is, however, two years longer than the recent Australian issue, which on the eve of the New Zealand announcement still commanded a premium of ⅛. Another notable operation is the first public issue of equity capital of the old-established business of Whitbread and Company, Ltd., which merits more propitious markets than are perhaps to be expected on Monday, when the lists open. One quarter of the equity is being offered for sale by Baring Bros. and Schröder and Co.—204,880 £1 stock units at 88s. and a similar number of 5s. units at the equivalent price of 22s. (for the two issues rank *pari passu*). The company has an excellent record, and on the basis of the well-covered 20 per cent dividend paid last year the units yield a little more than 4½ per cent at the issue prices.

The Bilateral Agreement

The text of the Economic Co-operation Agreement between the governments of the United Kingdom and the United States belies most of the alleged ferocity of the original draft. It retains the objectionable provisions regarding the use of local currencies to finance American stockpiling of strategic materials. In this respect, however, the hands of the negotiators were tied by Congress, which inserted a clause in the Appropriation Act requiring that up to 5 per cent of these local funds might be expended for such purposes. The local currency fund will also be available to meet administrative expenditure in Britain arising out of the operation of the European Recovery Programme. The resources deposited in sterling as a counterpart of the grants made to Britain will be kept in a special account at the Bank of England in the name of the British Government. There will be credited to it "amounts commensurate with the indicated dollar cost to the Government of the United States of commodities, services and technical information made available to the United Kingdom on a grant basis." The moneys in this account may also be drawn on to meet transport charges on relief supplies and packages from the point of entry into Britain to the consignee. The balance of the sterling in the special account will be used for purposes agreed between the two governments, "taking into account the need for promoting and maintaining internal and financial stabilisation." Among such expenditure the agreement specifies (a) projects for developing the productive capacity of the United Kingdom and other participating countries, (b) exploration for, and additional production of, materials in which the United States may be deficient, (c) retirement of the national debt, especially debt held by the central bank or other banking institutions.

The British Government undertakes by the agreement to "use its best endeavours" to achieve the general objectives already set forth in the agreement which the sixteen Marshall countries signed last April. These include the promotion of industrial and agricultural production "on a sound basis," the stabilisation of the currency, including the establishment or maintenance of "a valid rate of exchange," the balancing of the budget and co-operation with other countries in facilitating and increasing the interchange of goods and services among them. Sir Stafford Cripps in presenting the agreement to the House of Commons made some important interpretative comments on these commitments. The first is that "HM Government is the sole judge of how it shall use its best endeavours and as to what measures it shall adopt." Whatever suggestions of American dictation or even intrusion may have been contained in earlier drafts have been swept away. The second is that the obligation to balance the budget does not preclude deficits over short periods, but

means a budgetary policy involving the balancing of the budget in the long run (how long is not specified in the interpretative notes appended to the agreement).

* * *

Assets in USA

One of the commitments undertaken by Britain is "to locate, identify and put into appropriate use in furtherance of the joint programme for European recovery, assets and earnings therefrom which belong to nationals of the United Kingdom and which are situated within the United States." The clause adds that this "imposes no obligation on the Government of the United Kingdom to dispose of such assets" and Sir Stafford Cripps has said that he was authorised to announce that the measures now in effect in Britain were, in the view of the American Government, adequate fulfilment of this clause.

There is no hint in the agreement of the pressure to modify sterling area arrangements which at one time was being exerted by certain sections of the US administration. The agreement makes it clear that the colonial territories will accede to the ERP agreement and to that extent the sterling area machinery will hold no danger of unauthorised dissipation of American aid. As regards dissipation to other members of the sterling area, the safeguards are, first, the general undertaking of the British Government that the aid obtained from the United States shall be used "for purposes consistent with this agreement" and, secondly, the extremely detailed information which Britain undertakes to make available to enable representatives of the Economic Co-operation Administrator to "follow through" the use of materials and other forms of aid provided under the agreement.

The commitments on commercial policy do not go beyond the Charter of the International Trade Organisation signed at Havana, and even these are subject to the governing phrase limiting the duty of the British Government to "use its best endeavours" according to its own interpretation of what those endeavours should be. The only "spelling out" of these particular commitments is that given in the interpretative notes which specify the types of restrictive business practices which the British Government undertakes to prevent. These include agreements to fix prices, allocate markets, limit production, prevent the development of inventions, in fact all the "sins" against which the philosophy of the Sherman Acts is directed. This clause may conceivably give trouble later if some form of cartellisation of industry is found to be a desirable means of integrating European industry.

The agreement will be debated on Monday and Tuesday of next week in the House of Commons, and if approved will probably be signed on Tuesday evening. If things go according to plan there will, therefore, be no appreciable hiatus between the July 3rd deadline and the formal signature of the bilateral agreement, and, consequently, no period during which Britain will cease to be entitled to Marshall aid.

* * *

Disinflationary Policy Reaffirmed

The Chancellor, it is good to see, has done his best to allay the widespread fears that the Government has been retreating from the disinflationary policy. His firm speech at the final stage of the Finance Bill provided the one heartening gleam in a week-end of sombre news. He denied categorically that there has been in the past two months any change either in the conditions requiring a large budget surplus or in the policy laid down in the budget speech. The purchase tax concessions—notably those on wireless sets, clocks and watches, kitchen furniture and utility fur coats—had all been made, he said, to meet changes in the specific conditions of those particular industries, not because of any general change. "All these industries affected particularly the Development Areas and in all there had been a marked change of demand which threatened rather serious consequences." On the disinflationary policy as a whole, "we must not make any changes which will change the general direction—or even the degree—of our action in this matter."

It is a pity this reaffirmation was not made, as obviously it should have been, at the time the concessions were granted—when the debate was mainly in the hands of junior ministers. Now the Chancellor is obviously determined to make good the psychological damage that has been done. So far, he said—citing precisely the evidence noted recently in these columns—there has been "no general indication of any turn towards deflation, and nothing to show that we need have any fear of any sudden change." Bank deposits in May were £300 million above their level of May, 1947, the note circulation has recently turned slightly upwards again, and the mid-May unemployment figure was below 300,000. So far "there are only the very smallest signs" that disinflation has "accomplished anything at all—though there are signs." Those signs are the very tendencies that have produced the protests against the Government's policy—the recession of demand for certain types of goods. The success of the disinflationary policy will be demonstrated only when the tide of demand has receded sufficiently to throw up surpluses of the less essential goods and thereby to release labour for the key industries. Sir Stafford is to be congratulated on his courage in putting this point quite bluntly. The process of curtailing demand, he declared, "has got to go much further, and . . . it will create some degree of discomfort and hardship."

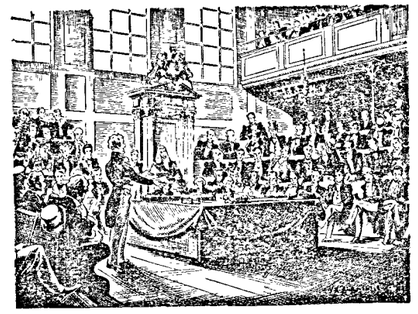
* * *

Danger of Piecemeal Relaxations

After this unambiguous statement, there is no room for doubt about the Chancellor's own determination; and that is the rock on which the Government's economic policy as a whole is founded. Unhappily, on this difficult issue—in a political sense, the difficulty is undeniable—the attitude of some of his Cabinet colleagues may be less dependable. The Chancellor said that the economy will not have been disinflated until the under-manning of the essential industries has been remedied. If that test—indisputably the right test—were rigorously applied, the disinflationary policy would certainly be followed to the bitter end; and it would be bitter. In the process, the pressure against the policy is bound to grow; it is greatly to be hoped that it will not arise inside as well as outside the Government.

Even now, there are some disquieting signs of waywardness. The unification of policy is not complete. Especially dangerous is the principle of giving relief to soften the impact of disinflation at particular points. Each concession may seem fully justified by the merits of the specific case, and each may look innocuous by itself. But the cumulative effect could easily undermine the whole policy. Indeed, the force behind Sir Stafford's arguments has already been somewhat impaired by three more specific concessions announced almost simultaneously—the abatement of the cuts originally projected in the programme for new housing, the raising of the limit on the repairs that may be undertaken without licence, and the new machinery for permitting "frustrated" export goods to be unloaded on the home market. This last concession looks, on a superficial view, to be entirely reasonable; indeed, in the eyes of the trade interests affected, any other policy would seem to be grossly unreasonable. Yet if business men can always be sure of permission to sell at home what they cannot sell abroad, the pressure upon them to seek export markets and to cater specifically for their needs will be greatly diminished. The new policy, discussed more fully in a subsequent Note, needs to be employed cautiously and with discrimination.

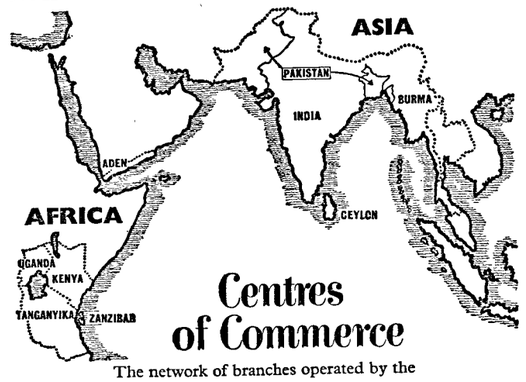
As for the housing concessions, it may be true that they will do no more than absorb resources already available. But some of those resources are needed elsewhere and would eventually be induced to move—if only the Government did not rush in to take up any slack as soon as it appears. When, eventually, there is scope for restoring the cuts in the investment programme, the first priority will undoubtedly be the re-equipment of British industry. On that matter well-informed opinion is now virtually unanimous. It should be reinforced by some calculations made in an article in the latest issue of *Lloyds Bank Review*. Mr Manning Dacey, in the course of a detailed analysis of the national balance sheet in the light of the budget, computes Britain's net investment last year as equivalent to no more than £135 million at 1938 prices, compared with actual net investment in that year of £227 million. It ought to be possible, he contends, to curb inflation without jeopardising Britain's industrial future.



* * *

Inflation in China

The inflation of the national Chinese dollar, or fapi, has ceased to be galloping and has become jet-propelled. The currency, in so far as a quotation for it can be discovered, appears to be depreciating at the rate of about 50 per cent in a fortnight. Last week the black market in Shanghai saw the price of the US dollar rising from 3,000,000 to 4,000,000 Chinese dollars. The Communist victories in the north are completing the fell work begun by the lack of effective budgetary policy of the Chinese Government, and confidence in the currency has now been shaken and destroyed beyond repair. Nothing further has been heard in the last few days of the proposals for a fundamental reform of the Chinese currency based on restoring silver to circulation. Plans for such a development can never have been more than a pipe dream given the absence of an adequate supply of silver

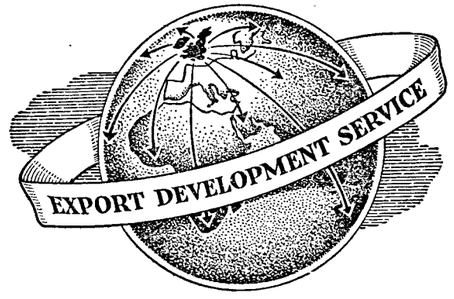


In 1831 The increasing wealth and trade of Liverpool created the necessity for greater banking facilities, and the Bank of Liverpool—Martins Bank, as it is known to-day—was founded in that year. The times were momentous; the Napoleonic wars were left well behind, we were on the threshold of those railway and great mechanical advances which were to lead in the proud progress of the Nineteenth Century, and in the House of Commons Sir Robert Peel was adding lustre to his name.

Over the course of the next fifty years the deposits of the new bank rose to £4,000,000, and to £110,000,000 within its centenary. The figure to-day is in the neighbourhood of £260,000,000, and branches number nearly six hundred.

MARTINS BANK
LIMITED
LIVERPOOL, LONDON AND 600 BRANCHES

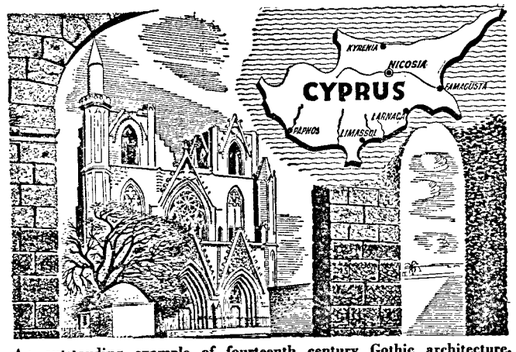
BANKING IN TWO CONTINENTS



Centres of Commerce

The network of branches operated by the
NATIONAL BANK OF INDIA LIMITED
covers INDIA, PAKISTAN, CEYLON, BURMA, KENYA, UGANDA, TANGANYIKA, ZANZIBAR and ADEN

It is the only Bank with this Geographical distribution. It is thus particularly well placed to provide market information and a full range of banking facilities for all those interested in trade or industrial development in these territories. Enquiries are welcomed at the Head Office of the Bank at the address given below.



Bankers to the Government in Aden, Kenya Colony, Zanzibar and Uganda.
HEAD OFFICE: 26, Bishopsgate, London, E.C.2.
General Manager: T. T. K. Allan. London Manager: N. W. Chisholm.

The District Bank, in world-wide touch with every important centre where British goods are marketed, co-operates with exporters in securing suitable representation in overseas markets and in bringing export enquiries to their attention.

You are invited to discuss your problems with the local Manager.

LIMITED

An outstanding example of fourteenth century Gothic architecture, comparable to Rheims cathedral, the church of St. Nicholas is the most notable of the 360 churches which lie within the boundaries of the walled city of Famagusta. Now used as a mosque for the Mohammedan population, the building is an abiding memorial to the culture and prosperity of Cyprus during the rule of the Lusignan dynasty.

Subsequent occupation by the Venetians and the Ottoman Empire reduced the fortunes of the island to a low ebb, but from the end of the nineteenth century Cyprus began to recover some of her ancient importance as a centre of Mediterranean commerce. Today the port of Famagusta handles much of the island's trade, though carobs, wines and citrus have replaced the precious stones and silks of former centuries. Full and up-to-date information from our branches in Cyprus on industrial conditions and commercial trends in the island is readily obtainable on request.

(DOMINION, COLONIAL AND OVERSEAS)
HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3 D.C.O

with which to launch an operation of this kind. With the growing disintegration of the currency system in China, there is, however, mounting evidence of an increasing volume of gold traffic with that country. Recent estimates from Hongkong suggest that on balance about a quarter of a million ounces of gold have been entering the mainland each week. A considerable part of that gold makes its way to China through Manila and Hongkong. The usual refinement and reversal of Gresham's law is once again being illustrated. Bad money, having driven out the remnants of the good, can then become so bad as to destroy all confidence in it and so stimulate the search for alternatives such as cigarettes—or even gold.

* * *

Quarter's Revenue Surplus

Meanwhile, the contrast between this year's Budgetary experience and last year's is emphasised by the quarterly Revenue Return—or would be if the account was prepared on the more rational lines employed in the pro forma statement given by the Chancellor in his Budget speech. The quarter's surplus of ordinary revenue over ordinary expenditure amounts, on the conventional basis, to £181 million, or appreciably less than the £220 million "ordinary" surplus in which Dr Dalton took such pride last year. But in fact the bulk of that surplus merely reflected his programme of "clawing back" unspent credits left over from various wartime votes. Most of these purely nominal credits were brought into the account in the first quarter of 1947-48 and were shown in the wholly abnormal contribution of no less than £143 million in that period from Miscellaneous receipts. In the past quarter this item has contributed a mere £14½ million, a difference which much more than explains the apparent decline in the ordinary surplus this year. Indeed, if all receipts from the three principal sources of abnormal revenue—the disposal of war stores, surpluses from trading services, and Miscellaneous receipts—were wholly excluded from the reckoning, the account for the past quarter would still show a surplus of £147 million, in contrast with only £27 million on a similar basis for the first three months of 1947-48.

It follows, therefore, that all the main items of revenue show substantial increases over the year, the most noteworthy being the jump of £49½ million to £183 million in Excise and increases of £22.8 million (to £209 million) in Income Tax and £16.7 million (to £22.2 million) in Profits Tax.

The quarter's experience, on the conventional basis, is summarised in the accompanying table:—

(£ million)

	1st Quarter		Estimate for Year 1948-49
	1947-48	1948-48	
Ordinary Revenue	840·0	791·8	3,765·3
Ordinary Expenditure*	619·8	613·8	2,975·7
	+220·2	+181·0	+789·6

* Excluding Sinking Fund.

Expenditure, it will be seen, shows only a fractional decline from its 1947-48 level, although the year's estimate envisaged a decline of nearly £80 million. Expenditure below the line, moreover, has been heavier than in the corresponding period last year. Loans to Local Authorities have risen from £39.8 million to £70.7 million; £18 million has been advanced to the Coal Board and £17 million issued under the Cotton (Centralised Buying) Act. War Damage payments have required £34.5 million, compared with £21.8 million.

* * *

Controversy on Commissions

The petition sponsored by twenty-six stock exchange firms asking for the withdrawal of the new rules on the sharing of stock exchange commissions, due to take effect next year, has been backed by no less than 1,660 members, including 1,118 brokers and 504 jobbers. Considering that only some 1,300 members voted at the recent election of the Council of the Stock Exchange to which the petition was presented on Thursday, the weight of opinion against the new rules certainly appears formidable. The changes in the rules were confirmed last December; they abolish the sharing of commission with solicitors, accountants and Public Trustee and the trustee departments of the banks, though business passed by the banks themselves is not affected. The new rules had a mixed reception, and representations have since been made, informally and later formally, to the Council on behalf of a group of brokers asking that the question should be reopened and fresh evidence obtained. That opposition has since developed into an effectively organised petition, sponsored by no fewer than 25 firms of brokers.

The circular which was issued on behalf of these firms put forward three main reasons for rescinding the new rules. First, it held that the abolition of sharing of commission was unfair to the agents concerned, and that its restriction to certain agents was illogical. Secondly, the critics urged that the abolition of splitting of commission in these cases will increase the cost of investment and disrupt valuable links between clients and agents; and, thirdly, they declared that the volume of business reaching the House would fall. The circular did not mince words. It brought out into the open the distinction which the new rules create between the banks and other agents—a distinction, it is suggested, which marks the fear that the banks might retaliate if their sharing of commission was abolished. It showed that the public could avoid the consequences of extra costs which were likely to arise through the abolition of shared commission by placing their business through the banks. And it declared categorically that the benefits of abolishing agency rebates would be far outweighed by a reduction in the volume of business because four out of five of the principal channels through which agency business flows to the Stock Exchange were stemmed.

To these forcibly expressed arguments the Council issued its reply last week. It answered few of the points in detail, reiterated its conviction that the new rules were in the interests of members, and emphasised—as it was fully entitled to do—its aim to raise the status of stockbroking as a profession. The general case in favour of the "rate for the job" can be argued as forcibly on the Stock Exchange as outside. But if agency is productive and enables business to be done more expeditiously, the agents are entitled to some return for services rendered. Those are the two logical extremes of the argument. Both sides—the critics with their detailed case in opposition which is sometimes a little overstressed, and the Council, with its generalities and its resort to the prefectorial touch—have, it would seem, failed to bring the extremes any closer.

Agenda for the Miners

The miners' annual conference, which opens in Whitley Bay on Monday, will be watched with special attention at this moment, with the Coal Board's first annual report due for publication within a few days, and with criticisms of the working of nationalisation more strongly heard than ever before. The miners have plenty of criticisms of their own, and the whole question of the Board's relations with its workers will be discussed on resolutions from Wales; their chief complaint is of the lack of opportunity for workers' participation. The union has itself sent out a questionnaire to local branches and lodges in an attempt to ascertain rank and file opinion of the divisional administrations. But so far the volume of evidence is said to be disappointing.

It is hard to see that the National Union of Mineworkers has serious ground for complaint against the Board. Scarcely a claim that has been advanced by the union since nationalisation has not been gained. The Miners' Charter has become an established fact. The principle of the five-day week has been conceded, minimum wages have been raised, and recently a supplementary compensation scheme for injured and disabled miners has been agreed. And the Board can hardly be accused of undue haste in taking disciplinary measures against absentees or unofficial strikers. Evidence of conflict between the interests of production and the immediate welfare of miners has been visible at every stage in the Board's career. This was the underlying reason for Sir Charles Reid's departure and for the recent resignations of so many divisional officials. The same conflict is apparent in the negotiations now proceeding about a scheme for compensating men who become "redundant" through concentration. Under an existing agreement, payment is made for 12 weeks in addition to unemployment benefit. The miners are asking for 52 weeks' payment instead—and that it should not be confined to men displaced by the concentration scheme. The Board, not surprisingly, considers this claim exaggerated; it has offered to increase the period to 16 weeks. If concentration and reorganisation are to be successfully carried out, the industry clearly cannot afford to create an army of pensioners, who would have no inducement to seek work elsewhere or to train for another trade.

The human and social problems involved in concentration should not be underestimated, and the Board is right to treat them seriously, as its experiences at Waleswood and elsewhere have shown that it must. But it would be wrong, equally, for the Board to allow itself to be deflected from its task of producing coal efficiently and cheaply. From this point of view the miners' proposals are no help, and the present stagnation of coal production can only weaken their case.

Frustrated Exports

Despite the increasing volume of British export trade, some manufactured goods can no longer find overseas markets. In some cases that is evidently due to import restrictions, but in others it results from saturation of the overseas market or from high British costs. Whatever the cause, stocks of these goods have been accumulating in this country and manufacturers are pressing for permission to sell these "frustrated exports" on the home market. Last week, Mr Harold Wilson announced the appointment of a committee of the Association of the British Chambers of Commerce to advise the Board of Trade upon each individual claim. He emphasised, however, that permission would not be granted until the exporters could show that every effort had been made to find alternative markets. Mr Wilson quoted the case of British motor car exports. Last year, forty-eight foreign markets were closed to them; yet alternative outlets had been found, and by last April Britain had established itself as the world's leading passenger motor vehicle exporter. Indiscriminate diversion of supplies to the home market will not be permitted—and quite rightly so. The committee will advise diversion only when it is assured that the goods cannot be sold at a "reasonable price."

These are unexceptionable principles, and it is to be hoped that they will be closely followed in practice. Yet such a policy will not reach the heart of the problem. More radio sets, mechanical lighters, plastic goods and "old look" clothes may have been produced than the export markets can absorb, yet if diversions of accumulated stocks to the home market are permitted without any condition that the rate of output is curtailed, the export drive will be seriously impaired. Unless there is a good chance that alternative export markets will be quickly found, the surplus productive capacity, particularly the labour, must be switched to production of more readily exportable goods or to other essential industries, despite the dislocation and short-term unemployment which might ensue. One means of enforcing such a policy would be to ensure that exporters' priorities for labour, capital equipment and raw materials are quickly revised when their exports are frustrated. It is important that such priorities should not continue to be given for production which is merely serving the less essential or even luxury demands of the home market.

In all this, a distinction must clearly be drawn between those exports which are frustrated by import restrictions and those for which no genuine overseas market exists. Import restrictions may be overcome by bilateral agreements; but exporters are complaining that the Government is not taking a firm enough stand on the inclusion of less essential exports in the trade pacts. For example, British radios may not be exported to Scandinavia whereas Dutch sets can. Where, however, the external markets are patently inadequate, there is no alternative to the diversion of productive capacity, under reasonably close supervision. Even where a large export market exists, there is apparently need for tighter administration, as the admitted leakage of "export" cars to the home market shows.

Higher Wool Reserve Prices

Wool prices have remained very firm throughout the current season, apart from a temporary break at the end of February, and increases have been particularly marked for better quality combing wools. Consumers are still insistent on quality and the Joint Organisation's stock of combing merino has dwindled rapidly. The main problem now to be solved is the disposal of the stock of medium and coarse crossbred and carbonising wools; the new schedule of reserve prices for the 1948-49 season attempts to provide at least a partial solution. The reserve prices do not pretend to represent the costs of producing wool. They are fixed by representatives of the Governments of the United Kingdom, Australia, New Zealand and South Africa in order to give some measure of stability to the woolgrower and at the same time to assist the disposal of accumulated wool stocks. If any lot of wool fails to reach the appropriate reserve price, the Joint Organisation buys it in and adds it to its stocks.

APPROXIMATE RESERVE PRICES FOR WOOL
(Pence per lb.—Clean Delivered Cost)

Qualities	Fixed Selling Price June, 1946	Approximate Reserve Prices			Current Market Price June, 1948
		Season 1946-47	Season 1947-48	Season 1948-49	
	d.	d.	d.	d.	d.
Merino (64s.)	37	37	40	51	105
Fine crossbred (58s.).....	34	34	36½	41	72
Low crossbred (46s.)	22½	22½	22½	22½	30

The adjustments which have been made bring the different reserve prices more into line with those established in the wool auctions during the past two years. Thus, they take account of the greatly increased prices for merino and fine crossbred wools, and also of the margins between wools differing in quality, length, style and fault. The average reserve prices for the better types have been raised considerably—in some cases by more than 20 per cent—while those of 50's quality and under remain unchanged. By this method it is hoped to impress upon wool growers, particularly in New Zealand where they can exert some control over the quality of the marketed product, the need to produce wool as free from fault as possible.

The Joint Organisation does not disclose its reserve prices, but it has announced that for next season the average increase over 1947-48 for Australian wool will be about 20 per cent (ex-store, greasy basis), for South African about 18 per cent and for New Zealand greasy wool about 4 per cent. It is an open secret that the reserve level for the first postwar season (1946-47) was practically identical with the final schedule of fixed selling prices in force up to June, 1946. Last season, increases of just over 10 per cent were made in the reserve prices for merino, less than 10 per cent for fine crossbreds, while medium and coarse crossbreds were unchanged. Hence, to obtain the average increases in the new schedule, reserve prices for merino must have been raised by 25 per cent, fine crossbreds by 10-12½ per cent and medium and coarse crossbreds again left virtually unaltered. Thus it is possible to calculate the approximate reserve prices for specific qualities; these are shown in the table in the adjoining column, together with the previous seasons' reserve prices and the corresponding current market prices.

On lower quality wools, there is little room for manœuvre between the current market price and the reserve level, whereas merino prices could fall by over 50 per cent before the Joint Organisation was called upon to intervene. So far, reserve prices have had little or no effect on the course of wool prices; if demand is sustained, they are likely to continue to provide only a theoretical floor to the market. But manufacturers, who are now believed to be holding 6-9 months' stock of wool have a higher minimum stock value for the coming season.

Imperial Tobacco's Short Term Finance

The suggested issue of an additional £10 million ten year notes by Imperial Tobacco has now been made at terms a good deal less favourable than those of the existing £10 million out-

MATTERS OF FACT

Ever since its earliest days, over a century ago, THE ECONOMIST has taken as its task, not merely to comment on the passing scene of events, but also to provide a permanent record of facts, both statistical and documentary.

In these days of paper shortage, this task cannot be adequately performed within THE ECONOMIST itself. Accordingly the RECORDS AND STATISTICS Supplement to THE ECONOMIST was started early last year to take over this function and perform it in a fully adequate, specialist form.

Each issue of RECORDS AND STATISTICS is the equivalent of 20 to 24 pages (and sometimes more) of THE ECONOMIST, entirely devoted to the recording of factual information. Nowhere else in the world are so many facts put so promptly on record.

RECORDS AND STATISTICS is available on postal subscription only. The subscription rates are £2 10s. a year for RECORDS AND STATISTICS alone or £5 together with THE ECONOMIST.

The Economist

22, RYDER STREET, ST. JAMES'S, LONDON, S.W.1.

standing 3 per cent ten year notes 1950-55. The new issue bears a rate of interest of 3¼ per cent and has been placed privately at 99½ per cent. This financing brings the company's total outstanding short term indebtedness up to £56,383,465 (including bank overdrafts to the extent of £26,383,465 as shown on October 31st in the most recent balance sheet). This compares with £50,420,985 of issued capital, consisting of three preference issues totalling £12,857,936 and the ordinary capital of £37,563,049.

A note in *The Economist* on June 12th pointed out that the need for a further increase in the resources of the group has arisen largely from the higher costs of stocks resulting from the increase in the Tobacco Duty last April, although the effect of the Duty has to some extent been mitigated by a reduction in the physical quantity of leaf. Indeed, consideration of the Bonus Issues Tax aside, it is the uncertainty of the future level of stocks which has presented the Board with so much difficulty in deciding on the right level of permanent capital. The problem of funding at least part of the outstanding short term debt will persist, for it is not likely that the company will make any move until the Chancellor has made up his mind on the future of the Bonus Issues Tax.

* * * *

Sugar Prospects and ECA

The international sugar market has felt the full impact of dollar shortage in the past twelve months. The major exporters—Cuba, Haiti and San Domingo—come within the US monetary area, and importing countries have had to restrict their purchases from these sources well below their current needs. Thus effective world demand has been much smaller than world production (which in the current season was only 5 per cent below the 1937-38 output) and stocks have accumulated in the exporting countries. Their weight has been partly lifted by large purchases by the American Government for its occupation areas, but they have not been sufficient to bring supply and demand into balance. Sugar exporters have therefore turned with eager expectation to the prospects for Marshall aid; but it is not at all certain at the moment that ECA grants will afford them any material relief.

The original programme of allocations made by Mr Paul Hoffman proposed that 2,300,000 tons of sugar from Western Hemisphere countries should be included in the first year's American Aid. But even if funds are specifically earmarked in the programme for the purchase of sugar, there is no guarantee that sugar supplies in the recipient countries will be any larger than they have been during the current season. Indeed, granted the probability that the appropriation of funds for ECA will be less than the total amount originally authorised, purchases of sugar are likely to be smaller than a year ago Moreover it will not follow

Source: C. Czarnikow, Ltd.

that purchases under ECA grants or loans will necessarily form an addition to the purchases which importing countries might otherwise have made independently. To some extent, Marshall Aid sugar will replace sugar which might have been paid for out of importers' own exchange resources. Only recently Mr Strachey admitted in the House that "we cannot afford the dollars for additional supplies and our stocks are only sufficient to maintain the present rate of distribution."

As Messrs C. Czarnikow, Limited, have pointed out in a recent review, the European sugar beet harvest will have an important bearing on the import requirements of these countries. Area under beet for the new season (excluding the USSR) is about 5 per cent larger than in 1947 and 14 per cent above the prewar level. Last season, European sugar production was disappointing owing to the drought; the increased sugar content due to the long spell of very fine weather only partially offset the loss of root weight. The reserve of moisture in the ground in many areas has been less than normal for the time of the year, but there is a good chance that, given favourable climatic conditions, crops may yield a full return, particularly as they have had a good start. If such conditions obtain, European production might be 9 per cent higher than in 1937-38 and 70 per cent above last year's low figure of nearly 4,500,000 tons (raw value); in which case import requirements are likely to be correspondingly reduced.

* * *

More Export Guarantee Facilities

The new Export Guarantees Bill makes no changes in the system of export credit guarantees as it has operated since the end of hostilities. Its purpose is simply to raise the limits of the amounts which the Government may have under guarantee at any one time. The limit on the total of guarantees of all kinds, which was raised from £75 million to £200 million by the Act of 1945, is now to be increased to £300 million, and increases are also proposed in the specific limits which are imposed upon certain particular kinds of guarantees. But although the new bill serves this formal purpose, its significance is more than formal. It indicates not only the growth in export business but a change in its character. In the past two years the amounts granted by policies issued by the Export Credits Guarantee Department has risen by almost 160 per cent; the total for the financial year 1947-48 was £186 million, compared with £72 million in the first postwar year. In the early phase of the export drive, effort was necessarily concentrated upon sales for cash and, indeed, when the scarcity of goods was at its height, exporters frequently found no difficulty in securing payment actually at the time the order was placed. Now, as the pressure relaxes and conditions swing steadily from a sellers' to a buyers' market, it may be presumed that Britain's customers will increasingly expect credit terms. Part of the very large increase in demands for the facilities of the Department in the past year or so may reflect changes of this kind; there is little doubt that this influence upon the demand for the facilities it offers will be increasingly apparent in future.

The policies issued by the Department are not, of course, by any means confined to insurance of credit risks. They cover most of the risks associated with international trade and, since 1945, when the changes made as emergency measures early in the war were consolidated into the peacetime arrangements, all risks have been combined in a single comprehensive policy. Exporters are not obliged to take the full cover unless they wish; they cannot, however, insure against transfer risks—that is, against the possibility that the funds due to them, though paid in foreign currency, cannot be turned into sterling—unless they also insure against the risk of the buyer's insolvency.

* * *

Trade with Chile

The Treasury-Bank of England delegation which is touring South America appears to have achieved considerable success in its negotiations with Chile in Santiago. The only detail to reach London of the new payments agreement which was signed there at the end of last week is that Chile has now entered the transferable account area and has left the group of countries operating "American accounts." This means that British trade with Chile, which hitherto has been conducted on what is virtually a dollar basis, will be conducted in sterling. The technical changes have been made and the necessary instructions sent to bankers in this country. These require that as from June 30, 1948, payments to Chile must ordinarily be made in sterling to a Chilean transferable account or to a Chilean account. The shift of trade with Chile from a dollar to a sterling basis is doubly welcome in that it refers not merely to the strictly bilateral trade between Chile and the sterling area, but to the far wider sphere of operations which Chile will be able to transact in sterling by virtue of its membership of the transferable account group. It should be noted that transferability of sterling in Chilean transferable account will be automatic and will not have to be authorised for each particular transaction. This admission of Chile into the still sizable group of transferable account countries is a significant

token of the slow climb back of sterling to the status of an international currency, from which so great a fall was suffered in August of last year when convertibility had to be suspended.

* * *

FCI's Loss

The report of the Finance Corporation for Industry for the year to March 31st last provides little evidence that the facilities of the Corporation have been used on the increasing scale which had been envisaged when it was launched, under Government auspices, three years ago. Indeed, the total commitments, which have expanded since July 17th last year from £40,733,451 to £41,275,750, are still heavily weighted by the £35 million of finance promised to the Steel Company of Wales. These figures of commitments do not, in any case, measure the volume of business actually done. This is shown in the increase of £2,875,750, to a total of only £4,737,801, in loans and acquired shares. Funds for the requirements of the Corporation have again been largely obtained from bank advances, which have been increased from £1,551,187 to £4,502,714. Owing to the writing off of £90,000 on a secured loan, operations for the year have resulted in a loss of £3,408, bringing the total deficit carried forward up to £28,636. This loss of £90,000 has arisen as a result of the assistance given to a company which had secured a substantial development contract from the Government for work of exceptional national importance. The contract had subsequently to be cancelled and a receiver was appointed to protect the Corporation's interests. The figure represents the total financial loss which must be borne by the Corporation, since the Government is to carry the remaining loss. Participation in enterprises sponsored by Government departments for which other sources of finance are not readily available is certainly an appropriate activity for the Corporation if each project can be judged on its merits. But in other cases such activity is bound to raise difficult questions about the extent of Government responsibility for any losses which may arise. It would be interesting to know on what principles the apportionment was decided in the recent case.

* * *

Associated British Picture Setback

The preliminary profits statement of Associated British Picture Corporation for the year ended March 31st last reveals a fall in profits before taxation from £2,529,479 to £1,502,239. In consequence of this not unexpected result, the final dividend of the company has been reduced from 20 per cent to 15 per cent—following the warning given last February when the interim dividend was cut by 2½ per cent to 7½ per cent. Even the substantial alleviation of the taxation charge, which is provisionally given as £988,338 compared with £1,573,305 in 1946-47, has not prevented a sharp decline in earnings on the highly geared ordinary capital from 67.9 per cent to 30.1 per cent.

These figures confirm what has been patently obvious for a year or more, that cinema attendances had fallen. In fact, the chairman at the annual meeting of the company a year ago suggested that cinema audiences had passed their peak, and the fall which has since occurred has been attributed to lack of new American films and indifferent reception of re-issues, as well as to the basic economic fact of declining spending power. It remains to be seen whether the re-appearance on British screens of Hollywood films will fill the cinemas again. But this week's movement in the shares of film companies, both on the exhibiting and producing sides, have reflected apprehension about the immediate prospect of a recovery in box-office takings. In the meantime, overhead costs of exhibiting, which have been considerably increased in the past year by the new wage scales, will continue to take their toll.

Shorter Notes

The Hungarian Legation in London announced on Wednesday that the time limit for registration of shares held abroad in Hungarian nationalised companies has been extended to August 31, 1948. As a Note in these columns last week pointed out, registration of all holdings by the original date would have been impossible. Bonds, loans and debenture stocks remain exempt from registration. The time limit for registration of shares in banks and other financial institutions expired on Wednesday.

*

The Egyptian Government has decided to reopen the Alexandria cotton futures market at a date to be announced by the Minister of Finance. The new basis for contracts will be long staple (Karnak) and medium staple (Ashmouni). Both Sakel and Giza No. 7 varieties are being suppressed. The new Egyptian crop is expected to yield nearly 670 million lb., or over 10 per cent more than last season's, despite the more severe attacks of the cotton worm.

*

Production of cotton yarns (including waste yarns) in the week ended June 12th—18.44 million lb.—was greater than in any week since the end of the war. The weekly average in May was 16.52 million lb.; in 1947 it was 14.24 million. Recent increases in output will help to swell yarn exports, particularly as the proportion of their production which spinners and doublers may export in excess of their specific export allocations has been raised from 2½ to 4 per cent for the third period of the year.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Rolls-Royce; J. Lyons; Wiggins Teape; Thomas De La Rue; John Brown and Company.

THE BRITISH DRUG HOUSES, LIMITED

APPRECIABLE INCREASE IN TURNOVER

INCREASED COSTS AFFECT PROFITS

CONTINUED GROWTH OF BUSINESS

The annual general meeting of The British Drug Houses, Limited, was held on the 25th ultimo at Winchester House, Old Broad Street, London, E.C., Mr Francis H. Carr, C.B.E., D.Sc., F.R.I.C. (chairman of the company), presiding.

The secretary (Mr Antony Rendall, A.C.A.) read the notice convening the meeting and the report of the auditors was read by the representative of Messrs. Price, Waterhouse and Co.

The following is the report of the directors (enlarged so as to incorporate the chairman's statement), which was circulated with the accounts for the year ended December 31, 1947:—

The Chairman, in introducing the report of the directors, recorded with deep regret the death, on June 14th, of Mr F. C. O. Shaw. Mr Shaw joined the board in 1919 and was managing director at the time of his retirement towards the close of 1947. His whole business life was devoted to the company's interests, and it had been, to a very large measure, due to his efforts that the present great demand for its products in almost every foreign market had been built up.

The trading year under review—like its predecessor—has been a period full of difficulties. Though the fuel and power crisis in the early part of 1947 did not, to any great extent, directly hit your company, its indirect repercussions were considerable and costly. It gave rise to many new and unexpected shortages, some of which involved materials vital to wide ranges of our production and presented us with problems for which there were no easy or painless solutions. In some instances the consequent interruptions of production resulted in sharp increases in costs; while the fact that such increases were temporary precluded us from attempting fully to recover them by raising prices.

KEENER COMPETITION

In addition, expenses of many kinds, particularly the cost of labour, increased during the year and competition grew noticeably keener, especially in overseas markets, reducing margins between costs and selling prices and necessitating increased expenditure on sales promotion.

As a consequence of these factors and in spite of an appreciable increase in turnover, profits before taxation fell considerably.

Your directors have taken energetic steps to meet this situation by cutting down expenditure wherever possible and by pressing on with the company's postwar programme of reorganisation and re-equipment. They are confident that your company entered 1948 in a much improved condition to meet whatever difficulties may lie ahead.

PROGRESS OF THE FACTORIES

The re-equipment and modernisation of the London factory—which is still responsible for by far the major part of our production—has progressed well and should be substantially completed in the course of the current year. This will enable your company fully to play its part in supplying the increased quantities of medical and pharmaceutical preparations that seem likely to be required following the introduction of the National Health Service in July, 1948.

The additional premises in Kensal Road, to which we referred in our last report, are now in use and have had concentrated in them a large part of our filling and packaging work. However, the full benefit of the new organisation will only be realised towards the end of this year.

Our new factory at Poole, Dorset, for the manufacture of laboratory and industrial fine chemicals, can now be considered as having overcome its teething troubles, and we can reasonably expect that it will soon take its place as a valuable contributor to our profits. Its output increased steadily during the year and has continued to increase in 1948.

We have not yet succeeded in acquiring a suitable site outside London on which ultimately to build a new pharmaceutical works. Nevertheless, with the assistance of the Ministry of Town and Country Planning and other Ministries, investigations are proceeding. Even if we secure a site, however; it is likely to be some years before we can use it, owing to the restrictions on building and on capital expenditure generally.

OVERSEAS SUBSIDIARIES

The progress of your subsidiary companies has been satisfactory. In Canada the new factory on the outskirts of Toronto has been completed, and 1943 should witness the inauguration of a fresh phase in the life of the Canadian company. Its sales and profits advanced during 1947. Owing to the difficulty of remitting funds to Canada from this country, the Canadian company has had to finance itself by borrowing locally in recent years and, in so far as we have been permitted to do so by the authorities in this country, we have left its profits to accumulate in Canada to help with the financing of its expansion.

The sales of our Australian company also increased during 1947. Although this company's profits before taxation were virtually unchanged owing to increases in costs, its final net profit showed a substantial increase owing to reductions in Australian company taxation.

The sales of the South African company were maintained during 1947, and have been expanding encouragingly in the first months of 1948. We believe that this company, which was only formed in 1945, should soon be able to contribute satisfactorily to our profits.

Our Indian branch, in the confused and difficult circumstances of a year which witnessed greater internal stresses and changes in India than any, perhaps, since 1919, did well to maintain its sales, though with reduced profits. After careful consideration your directors have decided that the time has come to establish a company in India and the British Drug Houses (India), Limited, has been formed. It started trading on January 1, 1948.

EXPORT POLICY

Your company has concentrated during 1947 on the greatest possible increase of its exports consistent with the satisfaction of the needs of the home market, in the knowledge that this was the policy called for in the national interest. As a consequence, over 35 per cent. of our total sales arose from exports; but it must be appreciated that this policy lays us open to a wide range of risks in times like the present, in which exceptional difficulties in the transfer of currencies may arise and sudden changes occur in the

extent to which imports may be allowed into various countries.

In these circumstances it is particularly important that a conservative dividend policy should be adopted and that reserves should be built up as generously as taxation permits.

Consolidated profits before charging taxation amounted to £210,232, as against £287,139 in 1946, the decline being due to the causes described in the earlier paragraphs of this report. The total provision for taxation—assuming the approval of the 6 per cent. dividend on the Ordinary shares recommended below—was £68,067, as against £146,673 last year.

Consolidated profits after providing for taxation, deferred repairs, amortisation, depreciation and directors' fees were £90,362, as against £91,637 last year. Of these consolidated profits £16,649 has been left undistributed in the possession of the subsidiary companies—the main part in Canada.

DISTRIBUTION OF PROFITS

The distributable profit brought forward by the parent company consequently amounted to £73,713.

Including the carry-forward of £4,950 there is therefore available for distribution £78,663.

Of this sum there has been distributed by way of dividend, less tax, on the 5 per cent. Cumulative Preference shares £14,438

Your directors have appropriated to general reserve £30,000

and recommend that a dividend be paid of 6 per cent. on the Ordinary shares, less tax, amounting to £19,800

leaving a balance to be carried forward of £14,425

£78,663

Your directors regard some £13,000 of the transfer to general reserve as in the nature of a special reserve against taxation that may be incurred in some future years as a corollary to the substantial relief from taxation obtained this year in respect of initial allowances on certain capital expenditure.

In recommending a dividend of 6 per cent. on the Ordinary shares, as against 8 per cent. last year, your directors have had in mind:

(i) The decline in trading profits during the year;

(ii) The importance of still further strengthening reserves; and

(iii) The fact that its programme of reorganisation and re-equipment has involved substantial increases in its medium and short-term borrowings.

Your directors would, however, wish to record that in their view your company's trading potential has been greatly strengthened during 1947, especially by measures taken in the last half of that year.

FINANCE

In our last report reference was made to the need to raise additional funds to finance the increased scale of the business, and it was indicated that ultimately it would be necessary to issue further capital. As events have turned out it has seemed preferable to proceed, during what can only be regarded as an interim period, by means of borrowing on medium and short terms. This is reflected on the liabilities side of the parent company's balance sheet by the appearance of the new items of unsecured loans (£250,000)—repayable in 12 to 15 years—and liabilities to bankers on accepted bills (£200,000) and by the increase in the bank loan from £310,000 to £560,000.

Sooner or later part or all of this borrowing will need to be replaced by long-term borrowing and/or by the issue of fresh capital; but for the moment your directors have considered that it was preferable to proceed by using forms of finance which in altered conditions might be allowed to run off, rather than to raise money on more permanent terms with the ultimate risk of over-capitalising the business.

BORROWING POWERS

It was for this reason that your directors sought and obtained the consent of the shareholders last October to an alteration in the articles of association increasing their borrowing powers from the nominal amount of the issued share capital to the nominal amount of the authorised share capital. When obtaining that consent they indicated that they would submit a fresh resolution at the time of the annual general meeting fixing a limit to those borrowing powers that would not be linked automatically to the amount of the authorised share capital.

An extraordinary general meeting has consequently been convened to follow immediately after the annual general meeting, when a resolution will be submitted limiting the directors' borrowing powers to an aggregate amount "not exceeding £1,750,000 or the nominal amount of the issued capital of the company for the time being whichever shall be the greater." This will have the effect of breaking the link between the borrowing powers and the authorised share capital while leaving the borrowing powers at a level that should, in our opinion, be adequate for your company's foreseeable needs.

GROWTH OF BUSINESS

The continued growth of the company's business, to which reference has already been made, is reflected throughout both the consolidated and the parent company's balance sheet. Fixed assets have increased throughout the whole group by £398,416 and current assets by £445,235.

Current assets of the parent company at £2,506,264 exceeded current liabilities by £953,838.

An explanatory comment is perhaps called for on the plant item in the parent company's balance sheet. Since 1925—and up to 1947—plant has been shown at the valuation established in that year plus the cost of subsequent additions less the proceeds of assets sold. Against this accumulating assets figure an accumulating depreciation reserve was built up annually. Your directors decided to alter this method and to show in the balance sheet only those assets actually still in being and the reserves specifically provided against them. Such a change required a detailed review of the assets, and consequently we took the opportunity, when they were being surveyed for insurance purposes by a firm of professional valuers, completely to overhaul our plant register values as at December 31, 1945, and the total net book value at that date was assigned to the individual items in the revised plant registers.

As a consequence the balance sheet now before you shows the assets actually held by the company at December 31, 1947, at their written down values at December 31, 1945, with subsequent additions at cost and the reserve for depreciation provided for those assets in 1946 and 1947. This has been accomplished by reducing both the assets and the reserve for depreciation by the same amount and a similar adjustment has been made in the 1946 comparative figures. The figures for assets disposed of in 1946 and 1947 have also been eliminated. We have also separated loose tools from plant and these are now shown separately.

DIRECTORATE CHANGES

During the latter part of the year Mr G. F. Williams succeeded Mr F. C. O. Shaw as managing director and Mr Geoffrey Eley was appointed deputy chairman. Mr F. C. O. Shaw has relinquished his seat on the Board.

Your chairman and Mr R. R. Bennett, who retired from wholetime executive work with the company at the end of 1946, have acceded to the request of their colleagues to remain on the Board until the end of 1948, but have asked that they may then be released. Their colleagues wish to take this opportunity of recording their gratitude to them for having stayed on after the dates at which they had originally intended to retire and to remind you how much your company has owed to their distinguished and devoted services over more than a quarter of a century.

We would like to express our warm appreciation of the co-operation of the members of the staff at home and abroad throughout 1947 in circumstances of stress and difficulty that must often have proved extremely trying.

The report and accounts were unanimously adopted and the dividends as recommended were approved.

The retiring director, Commander Sir Hugh T. Dawson, Bt., R.N., was re-elected; and the Auditors, Messrs Price Waterhouse and Co., were reappointed.

At a subsequent extraordinary general meeting a resolution was passed altering the directors' borrowing powers.

NATIONAL BANK OF NEW ZEALAND, LIMITED

EXPANSION IN ALL DEPARTMENTS

The seventy-sixth annual general meeting of the National Bank of New Zealand, Limited, will be held on the 22nd instant in London.

Sir Sydney Parkes, the chairman, in his circulated statement refers to the further expansion in all departments of the bank's operations, particularly in the growth of deposits and advances, and the substantial increase in the number of current accounts.

Dealing with the balance-sheet, he states that the increase of £4,180,000 in deposits reflects the general trend of banking figures in the Dominion. Advances increased by £3,601,000

The net profit at £139,550 shows a satisfactory increase, arising mainly from earnings upon a higher level of advances and from tax relief as a result of the recent agreement between the United Kingdom and New Zealand Governments for the elimination of double taxation. In addition to the usual allocations to premises and pension funds a transfer of £50,000 was made to contingency account. The proposed final dividend is 3 per cent. (less tax at 9s. in the £), making 5 per cent. for the year.

Referring to general business conditions, he states that trading continues buoyant and, although there are still shortages in some lines in everyday demand, many types of goods are now in adequate supply.

The Dominion's external trade has run at record levels for the year to December 31, 1947. The net overseas assets of the Dominion stood at £NZ.84,916,000 at March 31, 1948, as against £NZ.99,508,000 a year earlier. The major factor in this reduction was the repayment in London on November 1st last of a maturing sterling loan of £NZ.14,177,000. The secondary industries of the Dominion continue to expand. The building programme, which is the key to the future development of the Dominion, is still heavily in arrear.

Dairy produce graded for export is higher than last year and it is expected that meat production for export will eclipse all previous records. The good season, coupled with high prices at present ruling for wool, will result in a record value for this year's clip.

Prices received for dairy produce and meat under the bulk buying contracts with the United Kingdom Government have in recent years shown smaller increases than have occurred in the general commodity price index. World conditions should ensure for some years a steady market at reasonable prices for dairy produce and meat, but the outlook is less certain for wool as it is a raw material of industry and is sold at auction on the open market.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

ANNUAL GENERAL MEETING

The annual general meeting of this company was held on the 30th ultimo, in London.

Sir Frederick Godber, the chairman, who presided, said: Ladies and Gentlemen, you have received a very full report this year and I have nothing to add to that report. Therefore I propose to put the resolution to the meeting and I will ask Sir Robert Waley Cohen to second it. Before putting it to the meeting, if any of you have any questions you would like to ask I should be glad to do my best to answer them. He proposed that the report and accounts be adopted and that a final dividend on the ordinary capital for the year 1947 of 1s. per share or £1 unit of stock, free of income tax, be paid on July 8, 1948, to those members whose names were on the register on June 11, 1948, and holders of bearer warrants who surrender coupon No. 89.

Sir Robert Waley Cohen, K.B.E. seconded the resolution which was carried unanimously.

Marshal of the Royal Air Force, Sir John Maitland Salmond, G.C.B., C.M.G., C.V.O., D.S.O., Major The Hon. Peter M. Samuel M.C., and the Right Hon. The Viscount Weir of Eastwood, P.C., G.C.B., LL.D., D.L. were re-elected directors. Mr J. W. Boyle, C.B.E., and Sir Kenneth B. Harper, who were appointed members of the board during the year, were re-elected. Messrs Turquand, Youngs, McAuliffe & Co., were re-appointed auditors.

Mr Thomas Borthwick said that he did not want the chairman to declare the meeting at an end before proposing a vote of thanks to him and the board. Mr R. S. Chandler seconded the vote of thanks and the motion was carried with acclamation.

Replying to the vote of thanks, the chairman thanked the members for their continued confidence and said that it was a very great pleasure in the present difficult times, and to some extent times of frustration, to feel that the work done by the board received the approval of the body of shareholders. Times were not easy and he imagined that in the years to come—the next few years in particular—they would not become particularly easier. He assured members that the board would give to their affairs the same conscientious attention which they had always endeavoured to do in the past. It was a unique occasion as it was the annual meeting following the fiftieth anniversary of the company. The company was old because oil was young. It was a young organisation and it was their constant endeavour to keep it young. He believed that the development of the industry was still to a large extent in its infancy, and it was of the utmost importance that they should keep their thoughts young, as they had done in the past, so that in the future they would be prepared to think of new things and go forward with new ideas.

He said he would like particularly to refer to their wonderful team of managing directors in the group of companies of whom they were so proud. Members would realise that a great part of the responsibilty in operating the management of their great concern and its partner the Royal Dutch rested upon the shoulders of that group of managing directors. These men had all grown up in the business and in that respect when people spoke of turning over industry to the workers this was one of the great enterprises of the world which had always been and would always be managed by the workers, because these men had worked their way up with the business and reached the top by sheer merit in the real sense of the word.

The proceedings then terminated.

ANGLO-IRANIAN OIL COMPANY, LIMITED

RECORD TRADING PROFIT

The thirty-ninth ordinary general meeting of the Anglo-Iranian Oil Company, Limited, was held in London, E.C., Sir William Fraser, C.B.E., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year 1947:—

The trading profi of £33,412,939 exceeds that of any previous year in the history of the company and after providing for United Kingdom taxation, the amount available for reserves and dividends is £18,564,857. From these figures it is evident that the payment of a larger dividend than last year on the ordinary stock would be warranted. In view, however, of the clearly expressed wish of His Majesty's Government in regard to the limitation of dividends, your directors have decided to recommend a final dividend of 25 per cent, less income-tax, making 30 per cent for the year, which is the same as for last year.

Before I describe the main events of the period under review, one outstanding feature of it deserves remark, namely, the public interest aroused in the importance of Middle East petroleum production, in which your company plays so large a role, to the world economy. The western hemisphere's consumption of oil products is now overhauling even the huge petroleum production of the Americas and the world at large looks increasingly to expanding exports from the Middle East to satisfy its needs. Europe in particular will depend mainly on the Middle East for oil supplies and this has recently brought to public attention what has been obvious to the petroleum industry for some years past, that the oil export centre of the world is likely to move from the western hemisphere to the Middle East. That area, where your company found the first oilfield forty years ago in Iran and where it is now so largely interested in various territories, is undoubtedly most richly endowed by nature with petroleum.

PRODUCTION FIGURES

Production of crude oil in Iran during 1947 was 20,194,838 tons. Abadan refinery created another record by processing 18,565,507 tons of oil, which I believe to be the largest throughput ever achieved by any refinery in a year. Our smaller refineries in the Middle East, at Kermanshah in Iran and Alwand in Iraq, have operated satisfactorily during the year at slightly higher levels than in 1946.

The company's relations with the Imperial Iranian Government remain excellent. While the Iraq Petroleum Company made good progress with the construction of the new pipeline to Haifa which I mentioned to you last year, unsettled conditions in Palestine prevent accurate estimation of its likely operation date.

In Kuwait very satisfactory progress has been made.

In our search for oil in other parts of the world, no positive indication of oil in commercial quantities has been found.

REFINERIES

Throughput at the Haifa refinery remained normal at about 4,000,000 tons per annum until December 30 last, when it had to be shut down for twenty-four days following a bomb-throwing incident. Thereafter operations were resumed until April 13 when local conditions enforced a shut-down which still continues.

Our refineries in the United Kingdom have operated satisfactorily throughout the year. Llandarcy processed 420,537 tons in 1947 against a normal capacity of 360,000 tons, this increase being due to operating adjustments, effective towards the end of the year, which will step up capacity during 1948 to the rate of 850,000 tons per annum; this figure is scheduled to rise to 3,000,000 tons per annum by the end of 1949 when the full expansion scheme for this refinery is completed. Grangemouth refinery operated at its normal maximum capacity of 360,000 tons per annum, which will be raised to the rate of 600,000 tons per annum in the current year. We have planned to increase this figure to 1,500,000 tons. In addition to these big increases in our two existing United Kingdom refineries it is our intention to construct a large new refinery in Kent; and it is to be hoped that early approval will be given to what I feel can be regarded as an important national project.

For all our new developments, involving as they do drilling wells, laying pipelines and installing production, refining, transportation and marketing equipment, housing and ancillary services on a large scale, sufficient supplies of steel are a first essential. Without such supplies these large developments, with all their beneficial results to our national economy and European recovery, cannot be achieved. Our company, despite its dollar outgoings for essential equipment and supplies, is now on balance a dollar earner; and every ton of steel we obtain is converted into equipment which can enable us to increase our earnings of foreign exchange.

Our tanker fleet, which a year ago totalled 96 ships of 1,100,000 dead-weight tons, has now increased to 106 tankers of about 1,244,000 tons. Its capacity has thus been almost doubled in the past three years and now exceeds by over a quarter of a million tons our fleet in 1939.

WORLD CONSUMPTION

World consumption of petroleum products expanded at a high rate in 1947. The rapid increase in demand since the war has exceeded the most optimistic estimates and has overtaken the industry's ability, handicapped by war damage and postwar shortages of skilled manpower and material, to augment correspondingly its producing and marketing facilities.

Conditions facing the petroleum industry in the United Kingdom, as elsewhere, continue to be difficult, and even with the resumption of business by the individual companies we shall still not be able to reintroduce our BP brands of petrol and other products for at least six months.

In comparison with prewar the consumption of petroleum products in the United Kingdom has increased mainly in respect of vaporising oil for tractors (in the supply of which our industry has played a vital part in the campaign for additional food production), diesel oil for heavy road transport and buses, and gas oil and fuel oil for industrial purposes. It is of interest to mention that the higher production of steel has been assisted in no small measure by the technical advantages offered by liquid fuel.

RESEARCH

In the important sphere of research our activities continue unremittingly. True efficiency and economy in a progressive petroleum industry require the best talent and equipment for solving present problems and forecasting future needs. Production and refining technique is under constant investigation and development both in this country and overseas, and in its work on the multifarious derivatives of crude oil our research organisation co-operates closely with principal users of our products. Investigations at Sunbury in the new field of fuels for internal combustion turbines are particularly noteworthy, and also researches into the production of valuable new chemical products from our raw materials. One of these, a synthetic soap derived from shale oil, is now being manufactured on a commercial scale in Scotland.

The report and accounts were adopted.

BOOTS PURE DRUG COMPANY, LIMITED

The sixtieth annual general meeting of Boots Pure Drug Company, Limited, was held on the 29th ultimo at Beeston, in Nottingham. The Rt. Hon. Lord Trent, chairman, presided, and in the course of his speech, said:—

We have again had a record year for sales and have beaten last year's figures by as much as 14 per cent., leaving the new shops out of account.

On the drug company balance sheet we have increased the reserve against fall in value of stock. On the opposite side of the balance sheet it will be noticed that stocks are up by over £1,000,000.

A significant point is that a million pounds is locked up in the business for purchase tax. This is a sum upon which, of course, we make no profit and upon which we make a loss if the tax is reduced. The collection of this tax adds substantially to the costs of distribution.

Turning to the profit and loss account it will be seen that the net profits of the group come out at £948,401 against £1,037,509. After deducting profits retained by the home retail companies and the amount they have paid as preference and preferred ordinary dividends, the result is a drug company net profit of £679,428 against £756,470, and there is a balance of £215,846 to be carried forward to next year. Over 65 per cent. of the increased expenditure for the year ended March 31, 1948, was due to increases in salaries and wages.

An analysis of the year's trading shows that, for every £1 we took, the allocation of expenditure was as follows:—

Cost of goods	9s 3d.
Rent, rates, depreciation, carriage, etc.	2s. 4d.
Taxation, including purchase tax	3s. 1½d.
Salaries, wages and pensions	4s. 8d.
Paid to shareholders	3½d.
Retained in the business...	4d.

What of the future? What are the company's prospects? There are far too many imponderables for anybody to be able to answer these questions. Can anyone foresee in what condition the country will find itself six, or even three months hence? Even with Marshall Aid we are living on the scanty remnants of our capital and exhausting our reserves far too rapidly. We are consuming more than we produce and the truth is still concealed from the masses of the people who feel well off because they think they can afford to pay 3s. 6d. for 20 cigarettes and £4 10s. for a ton of coal.

Meanwhile one or two breaks have appeared in the clouds, as far as your company is concerned. There are, for instance, healthy signs of much keener competition in the distributive trades and it may be taken for granted that net profits will increase only in those firms which can show expanding sales and increased efficiency.

There are two or three realists in the Government and it is to be hoped that their counsels will prevail before it is too late. They must know that there is a middle way between the State-shackling of industry and a free-for-all scramble. If that middle path is followed, the prospects for this company—and indeed for Britain itself—will in my opinion be bright.

Any shareholder desiring a copy of the chairman's speech should apply to the Secretary, Boots Pure Drug Company, Limited, Station Street, Nottingham.

J. LYONS AND COMPANY, LIMITED

ANOTHER SATISFACTORY YEAR

MR HARRY SALMON'S STATEMENT

The fifty-fourth annual general meeting of J. Lyons and Company, Limited, was held on the 29th ultimo in London.

The following is the statement of the chairman (Mr Harry Salmon) which was circulated with the report and accounts and taken as read:—

This statement accompanies the report and accounts for the Company's fifty-fourth year which ended on the 31st March, 1948. There are considerable changes in the form of the accounts, and we have included a consolidated balance sheet and profit and loss account for the company and its subsidiaries. These accounts conform to the requirements of the new companies act which comes into force on the 1st July.

YEAR'S RESULTS

The net profit for the year is £591,631, after providing for all charges as shown in the profit and loss account. The figure shown last year as balance from trading account was £985,425. In order to compare the results of the two years, that figure needs adjustment to a net profit basis. It would then become £590,806. The difference arises from a change in the method of dealing with income tax deducted from dividends. The net sum of £269,681 is absorbed by dividends on preference and preferred ordinary stocks for the year, and the net sum of £51,048 has been paid in interim dividends. As you will see in the report, we are recommending the same rate of final dividend as last year, the net amount of which will be £178,666. The unallocated balance added to the carry forward is £92,236.

The Finance (No.2) Act of 1947 imposed additional profits tax of £34,970 in respect of the year ended March 31, 1947. As this was a restrospective charge, we have taken it from last year's profit and loss account balance which was thus reduced to £93,901. The balance now carried forward is £186,137.

BALANCE SHEET ITEMS

In the new form of balance sheet, there is an appreciable amount of regrouping and rearrangement, and there are one or two points to which I should like to draw your attention. The substantial sums which, as you know, have been set aside for the purpose of conserving our resources and providing for any unexpected circumstance have hitherto borne the generic title of "Reserves." There are now separate items for capital reserves and revenue reserves, and an entirely new heading "Provisions." The term "Provisions" means, in the words of the new act, any sum "retained by way of providing for any known liability of which the amount cannot be determined with substantial accuracy." The figure of £962,287, shown under this heading, is set aside for two main purposes: the restoration of our establishments, with all their amenities, to their former first-class condition and the general resuscitation of the business. Owing to the restriction of expenditure on decoration and the difficulty of obtaining equipment, our programme of modernisation is very retarded.

On the assets side of the balance sheet, the only change of any significance is in the item "Fixed Assets." Here, we show the method used in arriving at the amount of each kind of asset, namely, cost less amounts written off or provided.

The consolidated balance sheet and profit and loss account show the position of the company and its subsidiaries regarded as a single undertaking. The majority of the subsidiary companies are wholly owned by us, but, in respect of those which are not, there are a number of items in the balance sheet and profit and loss account which show the amounts attributable to the outside shareholders' interests. The accounts closely follow the form of the holding company's accounts, and the figures do not call for separate comment.

During the year, Mr Norman Joseph was appointed an ordinary director. He has had a long and thorough training in the business, and we welcome him to the seat on the Board for which he is qualified by his ability and his devotion to the Company's interests.

I think you will agree that the results of the year are satisfactory. This does not mean that their achievement has been easy, nor that they indicate any amelioration of the conditions which have hampered us in common with industry in general. There has been little relief from the restrictions of all kinds which we have felt for so long.

In conclusion, I should like to thank our employees for their co-operation throughout the year. Our relationship with them is based on sympathy and understanding and an interest in their welfare and happiness, and there is between us and them a strong feeling of mutual respect and loyalty.

CHAIRMAN'S SPEECH

I should like to add a little to the statement which reached you with the accounts.

A great deal is being said about the need to free world trade. Our own government appears to accept this, but it does not take what we think should be the first step of granting a measure of freedom to internal trade, where the present close control so greatly hampers initiative and enterprise.

One form of freedom we urgently need is the right to make our own purchases abroad in place of the present system of government bulk buying. We know that the Government must impose some limit on the amount of money to be spent on imported food, but we think that the money could be used to greater advantage by those who, like us, can call upon the experience and judgment of a long-established buying organisation. We need also freedom from the system under which commodities are allocated to us. That system may be necessary if there is acute shortage of a particular commodity, but we think that when a substantial proportion of prewar supplies of any commodity is available, that commodity should be freed from it. This greater freedom would stimulate competition and increase efficiency and would, we are convinced, best serve the public interest.

The Government is now engaging directly in commerce and industry, including catering. As if in return for that, commerce and industry has to carry more and more of the Government's own burden. In our case this involves hundreds of thousands of hours of office work in a year—a substantial addition to our overhead charges. We have also to bear ever-increasing direct costs and charges. Our constant effort to keep down prices is handicapped by these increases.

CHALLENGE TO PRIVATE ENTERPRISE ACCEPTED

In these conditions, it becomes increasingly difficult to maintain the policy on which this business has been built up, namely, to give the highest value to our customers, to maintain the best conditions of employment for our staff and to give our stockholders a satisfactory return on their investment. All this is perhaps a challenge to us to show the resilience of private enterprise. We accept the challenge and shall do our utmost to preserve and expand the business by the same unremitting effort which has gone to the making of it.

The report and accounts were unanimously adopted.

HARLAND AND WOLFF, LIMITED

SATISFACTORY ACCOUNTS

VARIED OUTPUT OF SHIPS

SIR FREDERICK REBBECK'S SPEECH

The sixty-third annual general meeting of Harland and Wolff, Limited, was held on the 24th ultimo, at the Registered Offices of the Company, Queen's Island, Belfast.

Sir Frederick E. Rebbeck, D.Sc., D.L., Chairman and Managing Director of the Company, presided.

The Secretary, Mr A. T. Marshall, O.B.E., read the notice convening the meeting, and the report of the auditors.

The chairman referred to the report of the directors, which it was agreed could be taken as read. He felt sure the stockholders would regard the report and accounts as satisfactory.

Once again, he said, the company have headed the list for the output of ships, notwithstanding increasing difficulties in obtaining adequate supplies of steel and other materials, and the fact that, in consequence thereof, the works were not employed to anything like their full capacity. In 1947 a total of 183,509 gross tons was launched from the company's Belfast and Glasgow shipyards. The output of machinery was 307,000 I.H.P., apart altogether from 49,000 I.H.P. which was completed for land installations and auxiliary purposes.

This tonnage covers an unusually varied programme of new ship construction, consisting of large high-class passenger liners, cross-Channel vessels, cargo liners, oil tankers, and another whaling factory ship, as well as a light fleet carrier for the Royal Navy. Engines for oil pipeline work in the Middle East, for which large orders are in hand, are also now in process of being delivered.

RECONVERSION CONTRACTS

The establishments at Belfast and on the Clyde, as well as the repair works at London, Liverpool and Southampton, have also carried out important contracts in connection with the re-conversion of passenger liners now returning to their normal peace-time occupation, as well as repairs to many hundreds of merchant ships of all descriptions. The execution of this work has certainly enhanced the company's good will.

During the year there has been an almost complete absence of enquiries for new passenger liners, a class of tonnage for which the firm are especially equipped, but the existence of a considerable volume of reconditioning work has so far prevented unemployment in the finishing trades. Orders for other types of ships, particularly tankers, have been freely placed, and the general expectation is that the present state of affairs so far as new shipbuilding contracts are concerned is likely to continue for a year or two at all events.

All shipbuilding is now regarded as coming within the category of exports, and our orders for foreign countries include Norway, India, Holland and Argentina. An important contribution is therefore being made to the Nation's export trade.

MATERIAL SUPPLY PROBLEM

The major problem continues to be the question of supplies of material, the shortage of which is causing delay in the completion of work and preventing the firm from making full use of their capacity. Another cause of delay is the introduction of the shorter working week. Employment throughout the year has been very steady, the total number of workpeople averaging more than 40,000.

The company's engineering works on the Clyde are turning out as much work as is possible with the labour and material available, but they are far short of these two essential requirements, and consequently these establishments also are not being used to their full capacity.

The company's properties and plants have been maintained on a satisfactory basis throughout the year, and all the reconstruction work in connection with air raid damage is completed so far as Belfast is concerned. In this connection a final settlement has now been agreed with the War Damage Commission. There still remains a considerable amount of air raid damage to be put right at most of the Branch establishments, and it will be dealt with as opportunity presents.

PRINCESS MARGARET'S VISIT

The firm were greatly honoured in Belfast in the autumn of 1947 by a visit from Her Royal Highness The Princess Margaret to name the R.M.S. *Edinburgh Castle* under construction for The Union-Castle Mail Steamship Company, Limited, and, as is probably known, Her Royal Highness The Princess Margaret is to visit the company's Govan shipyard in September next for the purpose of launching the M.V. *British Mariner*, an oil tanker which is being built for the British Tanker Company, Limited.

The chairman took the opportunity of expressing the thanks of the Board to all those who had helped the firm in their great programme of work.

The chairman then formally moved the adoption of the report and accounts, which was seconded by Sir John Craig, and unanimously approved.

Thereafter Mr J. S. Baillie, London manager of the company who was recently appointed director, and had retired in accordance with the articles of association, was re-elected.

Mr J. Morrison, Mr F. V. Spark and Mr A. T. Marshall, the directors retiring by rotation, were also re-elected, and the auditors, Messrs Price, Waterhouse and Company, were re-appointed.

The meeting terminated with a unanimous vote of thanks to the chair.

LONDON ASIATIC RUBBER AND PRODUCE COMPANY, LIMITED

Mr H. J. WELCH'S ADDRESS

The annual general meeting of this company, was held, in London, on the 28th ultimo.

In his address, which was circulated to members with the accounts, the chairman, Mr H. J. Welch, said:—

The year's crop of 12,990,886 lb. compares with 12,216,500 lb. harvested in the last twelve months before the Japanese invasion. The manufacture of Sole Crepe has been expanded much beyond the prewar figures; the 1947 output of 1,097 tons comparing with 556 tons produced in 1941. We hope to produce at least a similar quantity in 1948.

The total of the surplus and reserves amounts to £670,783, and is more than £15,900 in excess of the comparative reserves at the end of 1946.

The credit balance of the Revenue account for the year carried to the appropriation account was £133,761, against £55,399 last year. Before arriving at this figure, £14,555 was charged by way of depreciation of buildings, machinery, etc., and no less than £178,237 had to be provided for taxation.

The directors recommend a payment of a dividend of 12½ per cent., less tax. When considering this dividend they took into account the years during the war in which no dividend was paid, the strong reserves of the company and the apparently good prospects for the current year. They understand that the request of the Government to companies not to increase dividends was not intended to apply to companies such as this, which had suffered directly from the Japanese invasion and from the consequent non-payment of dividends during the war.

The accounts were adopted unanimously.

A.P.V. COMPANY, LIMITED

INCREASED PROFIT AND TURNOVER

DR RICHARD SELIGMAN'S STATEMENT

The thirty-eighth ordinary general meeting of the A.P.V. Company, Limited, was held, in London, on the 24th ultimo.

The following is extracted from the statement by the chairman, Dr Richard Seligman, circulated with the accounts:—

I am pleased to present the directors' report and accounts of your company for the year ended December 31, 1947, which disclose a very satisfactory increase in trading profits. It has been necessary on this occasion to delay the accounts for some weeks in order that a consolidated balance-sheet might be included.

The trading profit, £196,015, is £69,489 more than for the preceding year, and a substantial increase in royalties received will also be noticed.

The net profit, £170,399, is over £58,000 more than for the preceding year, after charging a much larger amount for depreciation.

In February last I was approached by the president of the Federation of British Industries in connection with the Chancellor of the Exchequer's suggestion that dividends should be stabilised. After discussion with my colleagues on the board it was agreed that we should comply with the Chancellor's request.

PURCHASE OF PARAMOUNT ALLOYS

During the year we purchased all the shares of Paramount Alloys, Limited, which has provided us with additional foundry facilities, of which we have been much in need.

I must again draw your attention to the items for stock and work in progress, which together amount to well over £1,000,000. I touched on this subject in my statement last year, and although it is indicative of the volume of work which we have on hand, it is a matter of grave concern to your directors that these figures should be running at such a high level, and energetic measures have been introduced with the object of converting work in progress into finished products. As indicated in my previous statement, the supply position is largely responsible for this state of affairs.

Under the staff profit-sharing bonus, which required £19,018 in 1946, £28,145 is payable in respect of the year under review, this being directly related to the increased net profit earned. A substantially larger amount has also been paid to hourly workers in respect of piece work and production bonuses, which again reflects the improved production which I forecast last year.

CONSOLIDATED BALANCE-SHEET

The consolidated balance-sheet of your company and its subsidiaries indicates how your capital has been employed.

The issued capital, reserves and profits retained total £1,005,487, which has been utilised as follows:—

	£
Excess of current assets over current liabilities	689,624
Fixed assets	311,622
Investment in associated company	3,866
Preliminary expenses	375
	£1,005,487

On the next occasion we shall be able to consider a consolidated profit and loss account in addition to the balance-sheet with comparative figures, but it is apparent from the statement now presented that the group is in a very strong financial position, although the subsidiaries have not yet been able to contribute to the profitability of your company.

RECORD ORDER BOOK

As will be seen from the figures I have given you, the company's activities increased materially during 1947. In spite of the increased turnover we were left at the end of the year with a larger order book than ever before. I do not myself regard such very big order books as by any means an unmixed blessing. In so far as they imply very long delivery dates they cause dissatisfaction on the part of the customer, especially of the oversea customer, where, as is essential in a period of rising costs, an escalator clause is included in the terms of contract.

Your board, while bearing the trend of its markets in mind, is, therefore, doing whatever is possible to increase its productive capacity and considerable progress has already been made in this direction.

NATIONAL NEED FOR EXPORTS

Throughout the year your directors have had in mind the national need for exports and the activities of the whole organisation have been largely devoted to furthering your company's contribution thereto. I am pleased to report that export orders shipped in 1947 amounted to over 37 per cent. of the company's total invoiced sales, a figure well in excess of that demanded by the Government.

In conclusion, may I once more express the great satisfaction with which the Board has watched the efforts of your staff during the year. The difficulties and petty annoyances to which I referred last year have by no means ceased to trouble them, and it is all the more gratifying that they should have been able to produce the results I have laid before you.

The report and accounts were unanimously adopted.

BARRY AND STAINES LINOLEUM, LIMITED

DEMAND REMAINS HIGH

The ordinary general meeting of Barry & Staines Linoleum, Limited, was held on the 23rd ultimo in London.

Sir John N. Barran, Bt. (chairman) in the course of his speech, said: The position is one calculated to give our stockholders confidence. The main feature of the balance sheet is the increased strength shown in our reserves. Demand has continued high, but raw materials have been kept at the same high or even higher costs, and any increase in their controlled supply has been miserably meagre. Our efforts to achieve export targets have been hampered by import restrictions also. To taxation already excessively high has now been added a profits tax which makes a fierce and iniquitous attack on all profits alike, even though "ploughed back." One bright spot has been our dividend from Canada, the highest so far

Unfortunately, the industries of this country must still hack their way through the jungle of inefficiencies, delays, refusals and stintings, with which a self-satisfied bureaucracy continues to clog their path, while pressing for higher export targets and lower prices. These objects are our objects—this industry has already given voluntary and practical evidence of that. We want more abundant output, leading to reduced costs, and to the increased chance for the purchasing public to buy useful things of which they are short. But the key to all this lies in able and alert buying, in skilled and enterprising management, and in the incentive to work hard, inspiring the employees in all grades through lightening of the grevious tax burdens now lying on them and through the assurance that, having earned good money by an honest day's work, they shall be allowed to enjoy it.

The report was adopted.

Statistical Summary

GOVERNMENT RETURNS

For the 11 days ended June 30, 1948, total ordinary revenue was £93,965,000, against ordinary expenditure of £66,143,000 and issues to sinking funds £120,000. Thus, including sinking fund allocations of £2,384,458 the surplus accrued since April 1st is £178,644,373 against £217,892,455 for the corresponding period a year ago.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

Revenue	Estimate, 1948-49	Receipts into the Exchequer (£ thousand): April 1 to June 30, 1947	April 1 to June 30, 1948	9 Days ended June 30, 1947	11 Days ended June 30, 1948

Crown and Commonwealth

THE quarrels that have arisen over the Government's British Nationality Bill have blown up so suddenly that they have taken the public very largely by surprise. The Bill was passed by the House of Lords (where it made its original appearance) but only after the Government had been twice defeated during the Committee stage. The Commons have given it a second reading this week, but it was evident from the debate that the Opposition still has doubts about it.

The Bill's sponsors, in both Houses of Parliament, have protested that it was not intended to be controversial; it was the fruit of discussion among the legal experts in the United Kingdom and the Dominions, designed to tidy up, by agreement, a number of obscurities in the law of British nationality. The difficulties into which it has run are to be explained by two causes: first, the Commonwealth being largely held together by intangibles, there is a natural tendency for fierce emotions to be aroused by purely verbal and symbolic changes; and secondly, there are some much larger issues of Commonwealth structure just below the surface, upon which even a purely formal Bill might be thought to have some bearing. The debate has been dealing partly with intangibles and partly with unmentionables; there is little cause for wonder that it has seemed to be obscure.

It is clear that, if the term "Commonwealth" is to signify anything real, its member nations must have a special form of association different from the relations normally existing between independent states; likewise it is clear that all its inhabitants, as individuals, must have a common status distinguishing them from persons outside its borders. Hitherto this common status has been that of being a "British subject." This is a term which usage has established, but it has certain ambiguities. It is sometimes interpreted as meaning "subject of Britain," which is wounding to many people in the Dominions who are proud to be members of the Commonwealth but are unwilling to be subjected in any way to the United Kingdom. Its real meaning is "subject of the British King." But this is only to transpose the ambiguity. By an Act of Parliament of 1927 the monarch was declared to be king "of Great Britain, Ireland and the British Dominions beyond the Seas"; he was also Emperor of India, but has renounced this title as part of the legislation creating the Dominions of India and Pakistan. The King has been "His Britannic Majesty" ever since the Act of Union of 1707 merged both the Crowns and the Parliaments of England and Scotland and formed the political unit known as Great Britain. The King today reigns over Great Britain, but he also reigns over countries which have their own separate legislatures and ministers of the Crown.

The King, therefore, is not, except historically and by habitual residence, any more the King of Britain than he is King of Canada or King of New Zealand; he unites in himself the monarchies of these independent and co-equal countries. But unfortunately the only adjective that describes (or that hitherto has been used to describe) the whole group of countries is also the adjective that applies to one of them: the ambiguous word "British." When a Canadian was described as a

"British subject," the exact meaning was that he was a subject of the monarch who was King of Canada and also King of each of the separate countries generally described as the British Commonwealth of Nations. But there is no doubt that in dependent territories the phrase "British subject" has acquired the additional meaning of being under the control and protection of the British nation, of being ultimately governed from Westminster. This meaning tends to cling to the word even in the older Dominions, and still more in the new Dominions, and has been one of the causes of the various movements for establishing distinct national citizenships, holders of which will also have the status of British subjects throughout the Commonwealth. But the passing of special nationality legislation by one member of the Commonwealth tends to induce the others to follow suit, and leads to uncertainty about the exact meaning of the status of British subject. It was the adoption of a law for Canadian citizenship two years ago which raised this question in relations within the Commonwealth, and ultimately led to the introduction of the Nationality Bill now before Parliament.

The disadvantage of the proposed legislation is that it creates for inhabitants of this island a legal category which does not correspond to a real division of the Commonwealth—the category of "United Kingdom and Colonies citizen." This is simply a term to cover the residue of British subjects left after the various Dominion citizenships have been subtracted. They cannot simply be called British subjects so long as that term retains any usage to denote the common membership of the whole Commonwealth: the same term cannot be used indiscriminately to indicate both the common citizenship of the Commonwealth and the specific citizenship of a group of countries within it. But the conception of "United Kingdom and Colonies citizen" is hardly one to evoke a vivid sense of community; it is at once too wide and too narrow. An inhabitant of this island normally has a pride in being British; beyond this he has a sense of solidarity with all the peoples of the Commonwealth, bound together, as they are, by a common allegiance: but such a wider feeling of community does not correspond to a classification which excludes an Australian of British descent but includes a Dyak of North Borneo.

*

It is apparent that any attempt to find a path through these divergent considerations would be difficult. There are people in the Dominions who dislike "subject" as implying subjection, and there are people in this country who dislike "citizen" because they think it calls in question the supremacy of the Crown. And there is the ambiguity of the adjective "British." The Government's Bill attempted to solve the problem by creating two alternative terms, "Commonwealth citizen" and "British subject," which were both to mean exactly the same thing. But it is evident from the debates that the attempt to please everybody has failed. If the Bill really is what the Government say it was intended to be, merely a piece of lawyers' tidying up, it might be better to drop it. The lawyers would have to put up with a certain amount of obscurity and ambiguity. But these are qualities on which the Commonwealth has hitherto thrived, and it is difficult to see what practical difficulties would follow from leaving the whole subject exactly where it is.

But there are wider questions about the form and functions of the Commonwealth which are hardly yet formulated in the public mind, though they are already exercising those who are more closely in touch with Commonwealth affairs. Hitherto the history of the Commonwealth has been one of gradual relaxation of formal ties. It has been a history of successful achievement, and it is therefore tempting to take it for granted that the further history will follow the same lines. New Dominions are coming into existence—in Ceylon, in India, in Pakistan, perhaps elsewhere—and for the first time they are governed and inhabited by peoples who are not of European stock. If these peoples find even the present loose ties of the Commonwealth too binding for them, is it not right to loosen them still further if by that means the new Asiatic Dominions can be kept within the Commonwealth? That policy may be right. But at the moment it seems to be more of an instinctive reaction than a carefully thought out plan; and it is only in the last few months that it has come to be realised that a further dilution of the concept of the Commonwealth, in order to make membership in it acceptable to a wider range of states, may have unfortunate repercussions on the intimacy of relations that now exist among the nations that are already members of the Commonwealth. It is too soon to speak of an argument between the "strict construction" and the "loose construction" of the concept of the Commonwealth; but these differing schools of thought are beginning to appear, and some indication of them is to be found both in the proposals of the Nationality Bill—particularly in the proposals to drop the word "British" from "Commonwealth citizen"—and in the debates on it. It is the shadow of this wider issue, in fact, that accounts for the heat that purely technical proposals have engendered.

*

At present, the chief formal bonds of the Commonwealth are the Crown itself, the Governor-General as representative of the Crown, and the periodic Imperial Conference. All three, it is now apparent, are affected by the present discussions. The part which the Crown plays in the Commonwealth is an extension of its national function, as it has been determined by English history. But the part the Crown plays in the constitution of Eire has already been reduced almost to vanishing point, and it is apparent that if the Asiatic Dominions are to remain within the Commonwealth, republicanism will have to be accepted, not as an exception to the general rule, but as a permitted variant of Dominion status. Have the long-term implications of this for the unity of the Commonwealth been worked out?

Secondly, the title of Governor-General is beginning to be called in question. The title is an anachronism in the Dominions, for it confuses a function of the Crown, which is the same as that of the King relative to Government and Parliament in the United Kingdom, with the role of a colonial governor who has direct executive power and receives instructions from Whitehall. A Governor-General in a Dominion is simply the King's deputy as Head of the State; his proper title is Viceroy, but that word has come to be associated with even greater executive power than a Governor-General's. If it were simply a question of finding the right title, time would doubtless produce a satisfactory solution. But it is becoming apparent that some of the new Dominions find no place in their constitutional ideas for an impartial, universally respected, unifying figure such as the Governor-General has come to be in the older Dominions. If this basic conception also is abandoned, in the effort to keep Asiatic Dominions within the Commonwealth, what will be the consequences as between the United Kingdom and the Dominions? Will more be gained in the new Dominions than is lost in the old?

Finally, there is the Imperial Conference—which can be said to comprehend not only the periodic meetings of Prime Ministers but also the great volume of confidential consultation that goes on from day to day between the Prime Ministers through the High Commissioners' offices in London and the Dominion capitals. The basis of all this is complete mutual confidence and trust. But if the Commonwealth is greater than

Correction.—It was stated in a Shorter Note in The Economist of June 21st that the Government's amendment to the British Nationality Bill making the terms "British subject" and "Commonwealth citizen" synonymous had been defeated in the House of Lords. This was incorrect; the amendment was accepted.

will the system work? Suppose, for example, that Burma had become a Dominion within the Commonwealth, as it was invited to be; and suppose further, as is not impossible, that the Government of Burma falls into hands of men who are barely distinguishable from Communists. Could they be invited to an Imperial Conference and given the great mass of confidential information that is freely provided for the Governments of Canada and Australia? Or, alternatively, would it be possible to have two sorts of Dominions, standing in closer or more distant relation to the United Kingdom, without raising impossibly invidious distinctions? Might not the result be that there would be a reduction in the intimacy of contact between London and Canberra because equal intimacy between London and Rangoon proved to be impossible?

These questions are not asked in any rhetorical sense, or because the answers are obvious. But they are questions that have to be asked and answered before the future form of the Commonwealth is decided. In the past, every step in the development of the constitutional law of the Commonwealth has been most exhaustively discussed by each of its members before decisions were taken. It may be that the present Bill does not commit anybody, even inferentially, to any line of action on these wider issues. But it would be far better that this particular Bill should be held over—in default of a convincing case being made, on strictly practical grounds, for its urgency—than that anybody, here or in the Dominions, should be given any excuse for feeling that a snap decision is being taken on such very important matters.

Palestine—The Map and the Moment

"THERE is a common denominator in Palestine." That is the most important phrase, by far, in the report which the United Nations mediator, Count Bernadotte, has, after weeks of tireless work, submitted to his principals at Lake Success. That common denominator is, he goes on to say, a mutual "recognition of the necessity for peaceful relations between Arabs and Jews in Palestine, and of the principle of economic unity." The basis sounds broad enough. But it is greatly narrowed by mistrust, ill-will, over-confidence, contempt and other emotions nurtured on both sides. Can it become the starting point for negotiating a settlement and, if so, when?

At the moment of writing, Count Bernadotte's four weeks' truce, which ran from June 11 to July 9, is virtually over. And the chances of extending it do not look good. They are being subjected—as will be seen from accounts of Israeli and Arab emotions that are given below—to strain in both Tel Aviv and the Arab capitals. They are also being dallied with at Lake Success, where the Russians are branding the truce as a cover for dark Anglo-American designs, and where the Chinese and Syrians are also belittling its virtues. Indeed, the latest news is of renewed fighting.

Count Bernadotte is not the sort of man to hustle into the arena full of belief that he personally can quickly solve a conundrum that has for nearly thirty years defeated all who have tackled it. His draft suggestions were only a basis for discussion. Their principal items were: that any arrangement should cover Palestine *and* Transjordan; that the resultant "union" should consist of two "members"; that common economic services, including a customs union, should be run by a central council; that autonomy should otherwise be complete except in the control of immigration. Jewish control of immigration was to be complete for two years, but after that subject, in the event of dissatisfaction, to periodic dispassionate review by the Economic and Social Council of the United Nations. The draft also provided that minority rights and the sanctity of the Holy Places should be protected and that refugees had a right to recover possession of homes from which they had fled.

Thus far the plan had many points in common with the Assembly's partition scheme. It differed from it in two respects: it implied that Transjordan, alone of the Arab States, was directly concerned in the settlement, and it curtailed the sovereignty of the Jewish State in dealing with the contentious immigration question. It also differed in the frontier line it suggested. This eliminated the Assembly's proposed criss-cross of boundaries. It suggested that the Negeb should be Arab—which means that Transjordan should reach the sea in the south—and that "the whole or part of western Galilee" should be Jewish—which means that the Jewish coastline should continue northward to the Lebanese frontier. It proposed that Jerusalem should be in Arab territory but with safeguards for its great Jewish community. It also proposed that Lydda should be a "free airport"—a feature without precedent—and that Haifa, in order to continue handling the refining and export of oil piped from an Arab source in Iraq, should be not Jewish but a free port also.

Both parties to the dispute have rejected these suggestions. The Jews dislike the whittling down of their sovereignty in the clauses about "membership" (as opposed to statehood) and immigration; they also dislike a demarcation line less favourable to them, on balance, than the Assembly's line. The Arabs will not discuss the draft because they want a unitary state and no line at all. But is the precise boundary line, though so much discussed, now the most important element in the proceedings? The answer is No. All the years of British experience, and all the months of United Nations experience, go to show that there is no conceivable line of demarcation in Palestine that can be regarded as satisfactory. No amount of moving lines backwards and forwards will suddenly produce a solution. A plan for Palestine stands or falls not so much upon the map to which it is attached, as upon its timing—upon whether, at the moment of impact, the disputants are in the mood to settle or the mood to fight. Will they reach the mood to settle only when further fighting has brought exhaustion or are the stars in favourable conjunction now? An answer to this question is difficult to give categorically, for hazard plays such an important part. Tension in Palestine is at the moment such that the chance bursting of a paper bag can set the guns going. But any attempt to weigh the chances must take into account two factors. One is the state of mind of the Israeli and Arab leaders. The other is the degree of encouragement they are expecting and getting from outside backers.

Inside Israel the mood is, on balance, one of confidence in superior military might, despite what is, for the moment, inferiority in armour and artillery. The outlook was summarised in a letter published in *The Economist* last week from an Englishman who is speaking and working for Israel at Lake Success. Its main theme is that, by virtue of military success beyond as well as inside the boundaries set up by the Assembly, the Jews have a right to be implacable and to ask for more, not less, than the Assembly awarded. Publication of Israeli statements extolling the quality and quantity of arms imported since May 15th lend point to this argument. So does the suborning of two British soldiers who deserted, taking with them two ill-guarded Churchill tanks, on one of the last nights of the British military evacuation from Haifa. Against these portents must be set a statement made by Mr Shertok in Tel Aviv on Tuesday that Israel is still prepared to negotiate "between itself and its neighbours as free sovereign peoples."

In the Arab states also the mood is exalted, irritable and bellicose. Among their people it is traditional to wave weapons

and shout battlecries; there is no easier way to raise a cheer. Declarations that "we are now going to rely on arms," or that "we are marching to Tel Aviv," must be read in the light of tradition and custom. Those Arabs who have their heads screwed on know that their armies advanced unimpeded in May because they advanced mainly into Arab territory, that their lines of communication are now dangerously exposed, and that it would be best to negotiate while their armies are still intact. But exalted Arab crowds take some pacifying, and leaders who are ready to calm them down must be given some tools—in the shape of something to show for their armies' efforts—with which to do the job.

The question of foreign backing for either side is one of importance in the west as well as in the Middle East for, broadly speaking, no moment is the propitious one for settlement unless Great Britain and the United States agree to forgo encouragement to either side. At the same time, Israel can count with certainty upon Russian encouragement. It can also count upon Russian consistency—which some Jews compare favourably with America's waywardness and changeability—in demanding the Assembly's partition line and nothing less. At Lake Success on Tuesday Mr Manuilsky furthered this consistent line by pointing out that Count Bernadotte, in suggesting a reconsideration of the Assembly's partition scheme, had exceeded his functions. On the whole, however, the outside world is holding back from open partisanship. Neither the British nor the American Government has reversed its policy—the Republican platform at Philadelphia was as pro-Zionist as any Jew could wish—but both have seen the dangers of drifting into a war by proxy.

It is just possible, therefore, that Count Bernadotte may be able to persuade both sides to discuss his proposals and to patch up the truce again. But, if he succeeds, it will not be because of any virtue that his plan has over the many other plans that have been proposed. And similarly, if he fails, it will not be because of the line he has drawn on the map or the division of governmental powers that he has proposed. What will produce peace in Palestine is a willingness on both sides to have peace. This is a point on which British policy, for all its fumbling, has always been far more realistic than any of its critics; for the only alternative is a solution imposed by force of arms, which the world outside Palestine has at no time been prepared to carry out. When that time comes, any halfway reasonable plan will work; until it comes, even a plan that was made in Heaven will be rejected by both sides. Unfortunately, the probability is that there will have to be some more fighting before both sides will prefer a compromise to more blockades. If so, then it will be the difficult, but imperative, task of the American and British Governments to see that the outside world—which means themselves—does not get drawn into the fighting. It is a plan for this, not a plan for the government of Palestine, the details of which most urgently require elaboration.

The World and the Dollar—III

The Need for Discrimination

IN two preceding articles, certain conclusions were put forward on the likely future of the dollar as a governing factor in world trade. It was suggested that the United States is unlikely, even in the longer run, to put at the disposal of other nations, by buying their goods and services, the amount of dollars they will want to spend in the United States, that a shortage of dollars—though probably not so acute a scarcity as exists today—is therefore likely to last far beyond the year 1952 which at the moment is somewhat arbitrarily fixed as the year of equilibrium, and that as a consequence of this continuing lack of balance, the European nations will almost certainly be compelled to husband their supplies of dollars and to exercise a vigilance *vis à vis* the dollar which will be unnecessary in the case of other "softer currencies." It remains for this concluding article to draw some of the consequences of this forecast.

Having followed the argument so far, some critics may be inclined to say: "But what is all the fuss about? All you have proved with such elaboration is that nations will not be able to buy American goods if they have not the necessary dollars available. Surely, if they have no dollars, the question of buying in America does not arise. Since, however, all the dollars that are made available by America's purchases abroad will certainly be spent in America under one form or another, why complicate an issue which in essence is very simple—that nobody can spend what he does not possess?"

Unfortunately, it is not nearly so simple. If the outlook for the longer run were a mere continuance of the present position, in which Western Europe cannot pay for what it needs from the rest of the world as a whole, then indeed the matter would be very simple: Western Europe would either have to seek permanent charity or reduce its standard of living. But the position that is assumed in these articles—it cannot be predicted as a certainty, but it is at least as likely as any other—is more complex. By about 1952 Western Europe may be able not only to obtain supplies of many of the things it needs from outside the dollar area, but also to pay for them in some means of payment acceptable to the sellers—and still be short of dollars. And if the simple-minded critic says that it is easy to solve that dilemma—Western Europe can trade with the non-dollar world and cut its trade with the United States to the measure of its dollar earnings—he will be brought right up against the American doctrine of non-discrimination, which says (in substance) that no European country may trade with a non-dollar country any more freely than it does with the United States. Europe, in fact, in the circumstances here assumed, looks like being faced with a most painful dilemma. Either it restricts the whole of its trade to the measure that it can afford to do with the United States—in which case its whole recovery will be handicapped—or else it gives offence to the very nation that has most assisted it, and whose continued friendship is, on political grounds, absolutely essential to its security.

This painful dilemma is at the very centre of the problem. Ever since these matters of international trade and finance began to be discussed between the American and British Governments in the middle of the war, there has been a steady determination on the British side to pretend that it did not exist, and those critics who (like *The Economist*) were tactless enough to point out the dangers of adhering to sweeping doctrines of non-discrimination were told that they were imagining risks that would not mature. It is impossible to keep up this wishful thinking any longer. It is much more likely than not that there will permanently be a dollar shortage, and dollar shortage *plus* non-discrimination means a throttling of world trade. Non-discrimination will have to be argued out with the Americans.

It is, of course, a most delicate subject. To this day, by no means all Americans are free traders. But free traders and protectionists are at one in regarding the doctrine of non-discrimination as the most natural piece of common sense. Why should any nation be allowed to treat American goods worse than it treats other countries' goods? Why, in particular, should a country that has been a beneficiary of American generosity be allowed to treat its benefactor so scurvily? Indeed, even to raise the subject sounds to many Americans like base ingratitude, as if the reward for Marshall aid was to be treated as Europe's worst commercial enemy. It is no wonder that the European Governments have been unwilling to press the matter so long as they could find any excuse for believing that it would not, after all, be necessary. But there is no escape through wishful thinking. The European point of view will have to be stated and re-stated.

*

One way by which the argument can be got over to Americans is to lose no opportunity of giving them practical examples of what is likely to happen when non-discrimination is coupled with shortage of dollars. Suppose, for example, that Canada is accustomed to buy large quantities of chocolate from the United States. But let us also suppose that, at the same time, Canada is running short of US dollars and wishes to husband its dwindling supplies for essential imports such as oil or machinery. The only course is to limit or prohibit the import of American chocolate. But, under the workings of non-descrimination, Canada must at the same time also ban the import of British and French chocolate even though Canadian importers have sterling or francs to burn. The ban on American chocolate thus becomes a ban on chocolate as such and the volume of international trade falls more than would have been the case if the rules of non-discrimination had not been applied. And, lest anyone should think the instance fanciful, it occurred last year, when Canada was obliged by the draining away of its US dollar reserves to restrict its purchases in the United States.

It will also be necessary, in any discussions with the United States, to make the point that there is no desire to scrap the doctrine of non-discrimination entirely. It is, in general, an admirable doctrine and one of the things that prevents international trade from degenerating into mere cut-throat chaos. It is entirely reasonable that the nations of the world should accord equal treatment to American goods *so long as they have the dollars to pay for them.* All that is asked is that they should not, in the name of non-discrimination, be forced to refrain from buying each other's goods in circumstances when they could not in any case buy American goods. It should not be impossibly difficult (though it will not, admittedly, be very easy) to draw up rules to cover these contingencies. The embryo already exists in the "scarce currency" clause of the Bretton Woods Agreement, which permits the members of the International Monetary Fund to administer their exchange controls in a discriminatory manner against any member whose currency has been declared by the Fund to be scarce. It is perhaps sufficient criticism of the practical importance of this clause to point out that the dollar is not at this moment "scarce" within the technical meaning of the Fund. It is also a criticism of this clause—as it is also of the various escape clauses of the draft charter of the International Trade Organisation—that it permits departures from non-discrimination only after the emergency of scarcity—which means, in substance, the final exhaustion of the non-dollar world's reserves—has arrived, and not in anticipation of it. Nevertheless, the idea is there, and it could be built upon. What is required is not a set of exceptional escape clauses for use in emergencies, but a new doctrine of international trade which recognises that the exception is likely to be the permanent rule.

Thirdly, it will be necessary for Europeans to insist and to go on insisting that when they say they want to discriminate they do not in any way mean that they want to cut down their trade with America, to "declare economic war on the United States" or anything of the sort. On the contrary, if any prophecy is safe in international trade it is that the non-dollar world's trade with the United States will, for decades to come, be just as large as the United States itself permits. Every last cent of every last dollar that the United States makes available to the rest of the world, whether by trade, by loans or by gifts, will be spent at once on American goods and services. The argument is not that Western Europe's trade with the United States should be cut down, but that its trade with other parts of the world should be allowed to go ahead more rapidly than its trade with America can do. There is no desire that Canada should stop buying American chocolate, but only that, if Canada is prevented by dollar shortage from buying American chocolate it should be allowed to go on buying British and French chocolate.

*

The other main issue raised by the likelihood of a continuing dollar shortage requires more positive action by European powers. A continuing dollar shortage means that it will be impossible for Europe to satisfy its complete demand for American supplies, but since some of these supplies—food, for instance, or industrial raw materials or machines—are essential to the functioning of the European economy, if they cannot be bought in America, they must be found elsewhere. The question is whether they exist in sufficient quantities and, if not, what can be done to stimulate their increase or to find substitutes.

There are two reasons why it is difficult to establish the scale of the gap between European requirements and purchasable American supplies. The first is that Western Europe does not yet know how many dollars it will be able to earn in normal times by normal trade. The second is that the availability of

supplies that do not have to be paid for in dollars is still unpredictable. When the postwar inflation comes to an end and the tide of extraordinary demand recedes, it may be found that the non-dollar supplies of many commodities are more nearly sufficient than now seems likely. But though, for these reasons, the gap between what Europe needs to import to meet its minimum needs and what it will be able to pay for may be smaller than now appears, there is still likely to be a gap of some size.

What can be done to cover this gap? The question is urgent, for at most the nations have five years to develop their plans; they may have considerably less. The moment is also apposite, for in the next weeks the OEEC in Paris will embark on the drawing up of a long-term programme for the Sixteen and clearly the reasonable course in framing such a plan is to fix on one or two priorities and devote the united energies of the Sixteen to their fulfilment.

The first priority is food. Foodstuffs ran away with most of the British loan. They will be a massive part of Marshall Aid. Britain and Western Germany are both entirely dependent upon imported food. Most big towns in Europe are short of it. At present the Sixteen have no concerted long-term policy for increasing supplies of food. Britain has a ground nut scheme; France is starting up another. Governments are considering the possibility of aiming at the cultivation of more cereals and less livestock. But so far there is little forethought and no co-ordination in these various food policies. What is needed is, first, a cool assessment of the likely long-term gap in supplies (which may be much less than now appears), and then a concerted attempt to survey the possibilities of development not only in Europe itself but throughout the non-dollar world. The survey could lead to agreement on specific projects and then to a united strategy to break the bottlenecks in the production of agricultural machinery and in transport which at present are holding up the few food schemes that have been launched. Food is only the most urgent of the European priorities. Coal, steel and power—the basic raw materials of industry—are only less so, and the OEEC's main task should be to produce a combined strategy of production for these main categories.

It is perhaps too much to hope that an ambitious policy of expanding production should be balanced by a concerted effort to make the most practical use of all Europe's dollar resources either from Marshall Aid or from ordinary commercial transactions. In the Sterling Area, the existence of a central dollar pool gives some assurance that essential expenditures will take priority over the less urgent demands and even if a dollar pool for Western Europe is out of the question, and co-ordination of import programmes from hard currency countries, designed to put wheat before chinchillas and steel before Cadillacs, seems an almost essential expedient if the aim of gaining reasonable equilibrium by 1952 is accepted seriously. Admittedly, such a policy would involve some discrimination, for the producers of non-essential American exports would find that Europe's dollars were being reserved for essential American goods while Europe bought its frills and its extras probably at greater cost and with softer currencies. But this is precisely the kind of discrimination which the new rules should be designed to cover—a discrimination designed to increase stability, to restore productivity and thus ultimately to expand trade. If all these things could still be done, as in the golden age of Victorian trade, without plan or effort, America would not find Europe slow to accept America's commercial precepts. It is Europe's tragedy, not its strategy, that it must take thought for tomorrow and do painfully by planning and controlling and even discriminating what could once be left to unfettered free trade.

(Concluded)

NOTES OF THE WEEK

ERP Debated

The debate on European Economic Co-operation ended, as expected, with an enormous affirmative majority. Its range was wide and its level on the whole high, though it must be recorded as yet another missed opportunity for that galvanising lead to national endeavour which neither Sir Stafford Cripps nor any other member of the Cabinet seems, in the last resort, capable of offering. The Chancellor's opening speech was unexceptionable; so was the winding-up speech of Mr Harold Wilson; but apart from those passages which actually elucidated the Agreement both speeches had been made before, had been potted in Reports to the Nation and illustrated on hoardings, to the point of virtual public anæsthesia. The Opposition made the most of its party opportunities, following the well-beaten track—Socialism discredited by reliance on aid from a capitalist state, independence thrown away by Socialist incompetence—and drew a well-merited rebuke from Mr Douglas Jay, who pointed out the inconsistency between Tory complaints that the American Loan had been squandered on consumers' goods and Tory protests at every refusal to import more petrol or tobacco or to release more textiles and furniture. One really cannot both demand a balanced external budget and act as a mouthpiece for the Housewives' League. Equally predictable economic monstrosities emerged on the Labour side—though Labour need no longer be debited with the incredibly tortuous malevolence of Mr Platts-Mills; a new low was struck by Mr Norman Smith, whose analysis of the economics of Marshall Aid rested on the proposition that the United States is forced to give away its products externally because, if they were retained on the home market, standards of life would rise so high that the workers would refuse to work and capitalism would break down. Even Marx never dreamed up that one.

Both sides of the House showed a sober and valuable realisation that Marshall Aid in itself could only mitigate the long-term disequilibrium between the Old and the New Worlds, a disequilibrium more profound than could be accounted for even by war. Most members remained fatalistic about ultimate prospects; the most constructive speech came from Mr R. Mackay, champion of integral Western Union, who envisaged a European free-trade area able to look the United States in the face in productivity, efficiency and consequent trading power. He incidentally provided the final answer to those who offer, as an alternative to tainted dollars, closer trading relations with Russia: a brief statistical survey of Russian export resources as compared to British import needs. On the whole, the debate augurs well for the spirit in which, whatever Government is in power, ERP aid will be used and its concomitant obligations shouldered.

* * *

Beyond Berlin

The time may come when Mr Bevin will feel some gratitude to the Russians for raising the issue in Germany in the simple form that has now been grasped by the British public. So far as can be judged, Mr Bevin has their full support in declaring that neither the starvation nor the victimisation of two million Berliners dependent on the West is tolerable. And most people feel some pride and relief in the knowledge that the challenge to deliver food has enabled the democracies to stick out their jaws, to exercise power without fighting, and to put aside some of their misgivings in the excitement of a great air operation.

But the most difficult and most testing stage of policy lies ahead; and it is doubtful whether British opinion has yet grasped what the issue may become. The air operation cannot go on indefinitely; its main purpose is probably to increase by three or four the number of weeks within which Western diplomacy—now thoroughly co-ordinated between London, Paris and Washington—can wrestle with Moscow policy. If there is no yielding on the Russian side while air deliveries continue, then, as soon as they stop, the Western representations are bound sooner or later to take on the form of an ultimatum—whether that word is used or not. If there is some yielding before that stage is reached, it may well have a merely tactical purpose; for the Soviet Government clearly wishes to discuss the whole German problem again in the Council of Foreign Ministers. Before that proposal is made or entertained, the public in Western Europe and America will have to answer two questions which have been rarely discussed publicly but which cannot be any longer evaded.

The first is this: are the Western Powers prepared to consider a settlement of Germany which would take the western zones out of the European Recovery Programme and transfer the centre of economic and political power from Frankfurt to Berlin? If they are not, they should say so now and explain to the Western electorates how and why West German recovery is vital to ERP. The explanation is one that cannot be given or grasped quickly.

The second question is this: are the vital industries and trade organisation of the eastern zone so integrated with the Soviet economy through Russian-owned companies and concealed reparations arrangements that the Soviet Government is bound—whatever its public statements—to resist any genuine attempt to reorganise Germany as a political and economic unity? In other words, can the Soviet Government itself carry out the kind of settlement it was asking for last December? Will it sacrifice its interests in eastern Germany for the sake of an understanding with the West? The evidence is that it cannot, at any rate in the immediate future.

*

If the answers to both questions are negative, what is the use of pretending that a further conference to avert the division of Germany has any chances of success? Mr McNeil pointed out in last week's debate in the Commons that the problem of Germany has already taken up two out of five full sessions of the Foreign Ministers' Council, 61 meetings of their Deputies and 300 hours of discussion at the highest level. Unless Mr Molotov has something new to say, to resume that process, after the strain of "Operation Carter Paterson," would be to give the Kremlin more time for the war of nerves, precious weeks of delay between the ripening and the gathering of the European and Russian harvest. The question underlying the issues raised in Berlin has to be faced now, while public opinion in western Europe is tense with awareness of the obligations it imposes. It has never been better defined than by Mr Marshall in his speech of May 5th to the Foreign Affairs Committee of Congress:

> A fundamental task of the United Nations and of our foreign policy is to dispel the misconceptions of the Soviet leaders and to bring about a more realistic view of what is possible and what is impossible in the relationship of the Soviet Union and the world at large.

* * *

North Atlantic Pact

Action has quickly followed speech in Canadian foreign policy. On June 19th Mr St. Laurent, Secretary of State for External Affairs, spoke in favour of Canada's playing a part in a regional security pact with countries of western Europe, Britain, and the United States. Last Tuesday a Canadian representative was present when talks began between the State Department and ambassadors of the Brussels Pact Powers. This means that statesmen have come to grips sooner than was expected with the problems of a North Atlantic union—union being used in the loose sense now associated with "Western Union."

There should be no illusions about Canadian motives. It is as a neighbour of the United States and Russia that it is interested in regional security, and that interest extends as much to the Pacific as to the Atlantic. But it is also interested in the defence of west European freedom and prosperity, which has different appeals to Canadian business men and proud French-Canadians. In short, although the readiness to consider new obligations in these directions is of direct benefit to the Commonwealth, it is unlikely for the time being to lead to any closer co-operation with Britain in imperial defence. What is more important is the deep impression that Canada's action will make on the European governments which still doubt the sincerity of Mr Bevin's Western Union policy and the support that America is likely to give it.

It should not be forgotten that some advocates of an Atlantic regional arrangement would like to leave out the adjective "north." They would extend it to include South Africa and Brazil. Such sweeping developments are better left alone for the time being. Just as Mr Bevin concentrated in western Europe on the "hard core" of France and the Benelux countries, so Washington is likely to concentrate on the group which is now represented in the talks with Mr Lovett.

Uncertain Government in France

The Schuman Administration resembles a battered ship staggering from reef to reef; yet time and time again the ship avoids disaster, and the rock which should have broken its back slides from under the bows at the last moment. The Government depends upon the maintenance of the Socialist-MRP coalition, and in recent weeks restiveness among the Socialist ranks had been visibly growing. The draining away from their ranks to the Communists and—more seldom—to the parties of the Right continues. Comparisons made between membership in 1946 and today show that, with perhaps two exceptions, Socialist Party membership has fallen in every area. Thus any action, political or economic, which tends to drive away members strikes the Socialist in a mortally tender spot.

Recently, the compromise reached within the Cabinet over subsidies for religious education has been a blow to the old guard of Socialist anti-clericals. A graver threat is the general economic situation, in which, in spite of the Prime Minister's attempts to lower industrial prices, the cost of living has increased very slightly in the last month, whereas the Government had guaranteed its decline. The Communists are as usual exploiting the position and a serious seamen's strike is the latest of a series of sporadic outbursts designed to damage the Government's efficiency without directly challenging its authority.

The Left-wing Socialists are more and more despondent over their chances of resisting Communist competition. They feel that it will be possible to maintain their strength only if they can remove the stigma of coalition from the Socialist record. Accordingly, they proposed at last week's party conference to

> break with all organisations of the Third Force, fight for immediate wage increases and return to the position of a party of Socialism fighting in the ranks of the opposition

—and one more reef appeared above the water in front of M. Schuman's ship. In the event, however, a sizeable majority voted to remain within the coalition, and once again the ship slipped by.

Another reef instantly appeared. To salve the conscience of the Left wing, the Socialist Conference made continuation in the coalition dependent upon certain conditions—the control and reduction of prices, on secular education and, most urgently, on the reduction of the military budget on the morrow of the conference, the military issue came to a head in the Assembly, and the Socialists voted with the Communists by a large majority to defeat the Government project. Once more, M. Schuman's ship threatens to split from end to end.

Minerals Under the Planning Act

The Town and Country Planning Act came into force on July 1st. Its application will be particularly tricky where the working of minerals is concerned. Minerals, with the exception of coal, are affected in the same general way as other types of development which now require permission from the local authorities to be carried on, and attract the Act's provisions for payment of compensation and imposition of development charges. The more difficult problems concerning minerals have been temporarily deferred. Local authorities are being given eighteen months to decide which mineral workings they will permit to continue or to be started (it is to be hoped they will get adequate guidance on the economic factors); and mineral undertakers get what amounts to a three years' moratorium on the application of the Act's financial provisions.

The Government needs the respite to do some hard thinking—which should really have been done before legislation was introduced, and certainly before it became effective. Mr Silkin's regulations, given for the guidance of the Central Land Board and debated in Parliament recently, are no more than tentative improvisations. Consistently with the general purpose of the Act, it is intended that the development charge shall scoop off in advance the full site value attributable to intended mineral workings, and that the whole of this charge shall normally fall on the owner of the land. If the mineral undertaker is himself the owner, he will be allowed (over and above the initial three years' moratorium) to work a certain and still undetermined proportion of his holdings free of development charge; but this concession is set off against his claims out of the £300 million compensation fund, where it will reduce the amount available to other claimants. Thereafter he becomes liable to the full development charge. If, however, the undertaker is not the owner, an alteration will be necessary in the terms of his lease, which in case of dispute is to be settled by a special tribunal to be appointed by the Lord Chancellor.

This is fair enough in theory. There are very many cases,

however, especially when the lease is an old one, where the owner's royalty is less than the proper development value of the site, from which the undertaker too is drawing a profit. Can it be certain that undertakers will forgo their share of profit in such cases, or will they seek to retain it by raising prices to the consumers of minerals? If enough of them react in the same way, there is nothing to prevent this happening. Another difficulty is that it will be far from easy to assess the correct development charge in advance of the land being worked for minerals; yet, at a subsequent date, the charge may only be varied downwards, not upwards. The Central Land Board may therefore face a dilemma of either charging much less than it should, or of running a strong risk of deterring development and raising the price of minerals.

*

A further difficulty is that, owing apparently to legal complications, Mr Silkin is unable to make good his promise to stipulate that the cost of restoring land to its proper state shall be allowed for in the calculation of development charge. This is a serious matter, since in some counties, such as Northamptonshire, the havoc wrought by mineral workings is increasing very rapidly, and specific legislation on the matter is overdue. No doubt, here, as in other matters, the Central Land Board may evolve a practical technique for taking this need into account. But it is not satisfactory that an Act should depend so much on hidden ingenuities and compromises in the field.

* * *

Mr Bevan Hates

Mr Bevan has long stood high on the list of those whom the ordinary citizen, whether his politics be Opposition, non-partisan, or even (one suspects) Labour of the less militant brand, would dearly like to see psychoanalysed. What, one wonders, makes him tick? And how did he get that way? On Sunday, in a speech at Manchester to mark the third anniversary of Labour's accession to power, he answered to some extent both the proximate and the ultimate question. His driving force and inspiration, which would not yield, so he proclaimed, to any cajolery or ethical or social seduction, is a "deep burning hatred of the Tories," who, so far as he is concerned, are "lower than vermin." This may, no doubt, be regarded as a *tu quoque* to Mr Churchill's description of the speaker as a "squalid nuisance" —or was that a specimen of cajolery?—but it has a far more splendidly all-embracing quality; a quality enhanced by Mr Bevan's peculiar use of the word "Tory," which includes, evidently, not only the Conservative Party as such, but the whole system of private enterprise. There is none righteous, none. Tories are bosses and bosses are spivs, and this unholy trinity (not three reprehensibles but one reprehensible) deliberately "condemned millions of people to semi-starvation." Moreover—and here is the ultimate source of Mr Bevan's animus—it reduced him personally, in his youth, to living on the earnings of an elder sister, and exposed him to the insult of being advised to emigrate. (Wistfully, one wonders which Dominion or foreign country it was which so narrowly missed having its history altered.)

It would not be worth while paying much attention to this particular fusillade of gutter-sniping if it were not so deeply symptomatic of one of the chief ailments of the Labour Party; of the envy, malice and all uncharitableness twin-born with its generous idealism and inspiring sense of human solidarity. Other party Governments have been, in varying degrees and at different times, complacent, callous, self-interested or merely inept. None has ever yet been inspired by "burning hatred" and a positive desire to inflict suffering on the objects of that hatred; sentiments faithfully reflected (as may be seen in *Hansard*, though not in the cramped columns of "the most prostituted press in the world") by a very large proportion of the Government's supporters. The Labour Government, said Mr Bevan, would have carried out all its programme by 1950. As paper schemes go, he may be right. But even a far greater and more solid achievement would still fail to compensate for this deliberate and odious injection of personal venom into British public life.

* * *

Tito and Cominform

After a week of invective and inaction, the impression remains that the main cause of the breach between Marshal Tito and the Cominform was the insufficient servility of the Jugoslav Communists to Moscow. World Communist criticism (for instance an authoritative statement by Gheorghiu-Dej, the Rumanian leader) singles out for attack the presumptuous heresy that the puny war effort of Jugoslavia deserves comparison with that of the glorious Soviet Union. And clearly it was blasphemy for Jugoslav Communists to resent the fact that the Soviet intelligence service recruited their own agents in Jugoslavia, preferring their reports to the fraternal information supplied by the Jugoslav Party. Moscow may spy on Belgrade, but if Belgrade shadows Soviet personnel that is sacrilege.

The impression also remains that the accusations brought against the Jugoslav Communists' internal policy are either inaccurate or equally applicable to the other "popular democracies." It is true that the Jugoslav Party has differed from all other East European Communist parties in its secrecy, which has made impossible elections to party offices; but such elections as have taken place within the other parties have merely endorsed candidates put forward by the central committees. It is true that the Jugoslav Party's ranks have been swollen by a mass of recruits whose "grasp of Marxist-Leninist methodology" is elementary; but the expansion of the other parties, especially of the Rumanian and Hungarian, has been relatively much more rapid, and has taken in numbers of former Fascists ("Iron Guard" or "Arrow Cross"). It is true that the Jugoslav Party's Congress is taking place after a long delay; but the "All-Union Communist Party (*Bolsheviks*)" *itself has held no congress since 1939.* It is true that the Jugoslav People's Front contains bourgeois individuals and groups; but these are fewer, and have even less opportunity of independent action, than the similar groups and individuals in the other countries.

The accusations concerning economic policy are to some extent contradictory. The Jugoslavs may have underestimated the "class struggle in the village," but the Rumanian Party has recently publicly castigated itself for the same error, and the other East European Communists have (except perhaps the Bulgarians) done less to encourage voluntary collective farms than have the Jugoslavs. On the other hand, the Jugoslavs are blamed for over-hasty nationalisation of private trade. Here alone it seems that the Cominform has found a Jugoslav action which is out of step with neighbouring countries (though the policy of the latter can hardly be said to be indulgent to private merchants). The Jugoslavs have here gone too far towards Communism, which perhaps explains the use by the Cominform of the epithet "Trotskyist."

To sum up, it still looks as if internal policy is of secondary importance, and that international—or perhaps purely personal—factors determined Moscow's action. But what motive can have been so pressing that it justified such a public exposure of the breach in Balkan-Danubian unity, such a weakening of the Soviet position in Europe?

* * *

"Albania's Heroic Struggle"

One of the most comic documents published since the war is the statement of the Albanian Communist Party's Central Committee on the Tito-Cominform dispute. According to the Albanians, the Jugoslav Communist leaders are "notorious anti-Marxists," who have used "Fascist methods" to "promote the capitalist exploitation of Albania and its people." They have tried to "impose their own treacherous hostile Trotskis" (sic) and to "convert into a colony the country of the heroes of the Albanian National Liberation Army." But the "heroic resistance" of the Albanian Central Committee has triumphed over them. These fine examples of popular democratic rhetoric were followed up by the rupture of economic relations with Jugoslavia and the expulsion of Jugoslav "experts."

The indignation of the oppressed Albanians cannot but provoke a little mirth in the citizens of "western imperialist states" who have been so often told that in Eastern Europe "exploitation of man by man" has almost disappeared.

In fact both governments probably have solid reasons to dislike each other. The Jugoslavs have in the last three years done a great deal for Albania. "Voluntary contributions" of considerable size, wrung from the Jugoslav citizen, have been devoted to Albania's economic reconstruction. Both during and after the war Jugoslav officers helped to organise the Albanian army. Belgrade may reasonably resent this "ingratitude." On the other hand, there are still more than half a million Albanians living in Jugoslavia, in the "autonomous province" of Kosovo-Metohija within the Serbian People's Republic. Official Jugoslav claims that these Albanians enjoy complete freedom and equality of status are received with some scepticism by ordinary Albanians on either side of the frontier, many of whom doubt whether nationalist discrimination has really been abolished by decree from Belgrade. Others consider that, even if it has, dictatorship by Belgrade Communists is no improvement on dictatorship by pre-1941 Belgrade nationalists.

The opportunity of winning popularity at home by exploiting anti-Jugoslav feeling was too good for the Albanian Communists to miss. But with both Greece and Jugoslavia hostile, Albania's position will be precarious. At least in Athens there will be jubilation.

* * *

The Centre Wins in Finland

By the grace of its Russian neighbour, Finland's elections passed off quietly. The results were as expected: the Popular Democrats, composed of Communists and extreme left wing Socialists, lost eleven seats, while the two moderate parties, the Agrarians and Social Democrats, gained twelve. The Popular Democrats still hold 38 seats in the Diet of 200, but the Agrarians and Social Democrats between them hold 111, more than half the total.

The formation of the new government will be the next decisive step. It is early yet to predict who the members will be, as cabinet-making does not start until July 21st and is always a lengthy business in Finland. The next Prime Minister will almost certainly come from either the Agrarians or Social Democrats, and opinion veers at the moment towards Mr Kekkonen, the leader of the Agrarians. It is expected that the Communists will be offered one or two minor government posts, for, though the electorate has clearly swung against them their influence in the trades unions is still great. Among other unions, they control the vital transport workers and stevedores, and there should be no need to stress how much damage can be caused by a dock strike.

The Finns have kept the difficult balance between East and West by a judicious mixture of co-operation and firmness with Russia. There is no reason to change this policy. Moreover, the mere fact that the Communists within have lost ground is a positive reason for placating the Communists without. The two centre parties could, if they wished, dispense with the Communists in the government altogether, but they are keenly aware of their delicate position. There is a clause in the Peace Treaty concerning Finland's obligation to maintain a friendly and non-Fascist government which may at any time provide a plausible pretext for Russian intervention.

* * *

Retrials in Criminal Cases

The Criminal Justice Bill has now received its third reading in the House of Lords. The principal item debated in the House on the Report stage was a new clause proposed by the Government giving the Court of Criminal Appeal the power, on an appeal to it by a convicted person, to order a new trial of any charge on which he was convicted (there can, of course, be no appeal by the Crown where a man is acquitted). The Government's clause, with an amendment moved by the Lord Chancellor, would extend the powers of the Court of Criminal Appeal to order a new trial only of those charges on which the accused had been convicted. Even if he had been before the court on a series of linked charges, there would be no new trial of a charge on which there had been an acquittal.

Once again, this proposal produced divergent views from the lawyers in the House. The substance of the case for the clause was, first, that the present Lord Chief Justice and his three predecessors have all felt that this power should be added to the armoury of relief possessed by the Court. It was not suggested that a new trial was frequently required, but most of the lawyers taking part in the debate were able to put forward at least one instance in which they felt that greater justice would have been done had the Criminal Appeal Court been able to order that the whole case should be heard again. The arguments against the clause were mainly that it was out of harmony with British justice to increase the number of occasions on which an accused person could be put on trial twice. Further, that in many cases, after conviction, details of the previous convictions of the accused are made public for the first time. On the principle that a jury is supposed to try a man on the evidence, not on his criminal record, were a new trial to be ordered after that, details of these convictions would already be public knowledge, and, as a result, the second trial could never be as fair as the first.

Where lawyers disagree a layman must have hesitation in expressing an opinion, but it would seem that on balance the machinery of criminal law will be improved by the inclusion of this clause in the Bill. The fact that the Lord Chief Justice, who so often presides over the Criminal Appeal Court, recommends that this Court should have this power is a very strong argument

indeed. The second reason is that it is dangerous to deprive a court of a useful power on the grounds that the power can be misused. The powers possessed by all criminal courts can be misused. The fact that the ordinary citizen expects, and is given, justice in a criminal court depends far more on the quality of the judges than it does on the technical machinery at their disposal. If the Court of Criminal Appeal only orders a new trial in one case out of a thousand, that is still an argument for giving it the power to make such an order. So far as this country is concerned, such a clause is an experiment, but mankind progresses because experiments are made.

Haw-Haw on the Third

Last Monday night objectivity ran riot in the BBC's Third Programme. In a programme lasting half an hour listeners heard twenty minutes of almost unrelieved scurrility at the expense of the American Government and people. They learnt among other things that the standard of living of European workers is falling because of American aid and that America has been forcing capitalist clients to buy tinned pork made from pigs which died of dysentery. It was a sickening half-hour—but perhaps it was intended to be sickening as well as boring. The question is now whether this programme called "The Soviet View" should be repeated in its present form once a month—as is intended—or drastically overhauled in conception and execution.

Its purpose is to give the British public a taste of what Russians are given to hear and read in their wireless programmes and newspapers. From that taste, presumably, understanding of the "other fellow's point of view" is intended to grow. By hearing completely one-sided, distorted, abusive treatment of world events, in which Americans are alternately monsters and figures of fun, the British listener is to attain heights of understanding and objectivity hitherto beyond his reach. It is taken for granted by the producers that he knows the difference between *Trud* and *Red Fleet*, that he is aware of the relationship between the Soviet Government and the Tass News Agency, that he is able to decide for himself how much Soviet writers and readers believe in the boring, abusive stuff which passes for comment on current affairs.

The producers should think again. If it is their purpose to improve our understanding of Russia they are certain by this method to fail—for Soviet propaganda has been, is and always will be, boring to any audience brought up with a free press. If it is their purpose to show the crudity of the Communist line they are entering into hopeless competition with the skill, liveliness and dexterity of the *Daily Worker*.

Yet this half-baked experiment reminds one of what used to be a valuable and interesting feature of the British daily press in its more spacious days—the summaries and quotations from the views of reputable foreign newspapers. So long as newsprint remains scarce the BBC could do a valuable job in reviving this feature. There are newspapers in Europe such as *Le Monde*, *Svenska Dagbladet*, *Corriere della Sera*, whose comments on world—and British—affairs are always stimulating and sometimes enlightening. They should have at least an even chance of publicity on the BBC with *Pravda* and its understudies, the tone of whose comment takes the listener back to the heyday of Haw-Haw.

* * *

Book Exports

Books are both a commodity and a means of communication, and free trade in them consequently ran counter to both economic and ideological nationalism. Information recently prepared by the Publishers Association shows the extent to which the export of British books is hampered by both these forces. (Fuller details appear in the *Records and Statistics* Supplement this week.) It is to be expected that Bulgaria and Czechoslovakia (since the purge) would have rigid censorship and a virtual ban on book imports. It is

Rest of Europe	4	5	0

not altogether surprising that countries with a limited amount of sterling such as Finland, Greece and Turkey should list books among the British goods which they can only afford in limited quantities. What is quite absurd is to find protective duties used as if the writing and publishing of books was a nascent industry which would be developed by protection. For instance Persia has a 16 per cent tax on books and a rigid licensing system ; Switzerland has a tax of 4d. a pound on books (as if they were carcase meat or screws) ; and in Uruguay a single volume incurs eight shillings' worth of taxes. The United States imposes an *ad valorem* duty, varying with the class of book, of between 3¾ per cent and 10 per cent based on an arbitrary assessment of the book's value. Canada is becoming increasingly an American market while New Zealand refuses to grant supplementary import licences to booksellers.

The consequence is that, although the turnover of the British book trade has nearly trebled between 1939 and 1947 (from £10,507,204 to £30,203,763), the value of exports now accounts for only 24.5 per cent (or £7,412,905), against 30 per cent in 1939. Tariffs have twisted the direction of British book exports and therefore of the means of communicating ideas. While the four British Dominions absorbed 44.21 per cent of the 1947 book exports, the whole of Western Europe (including Scandinavia) took only 11.25 per cent and Central and South America 0.96 per cent. However, the situation will be improved this year by the resumption of book exports to Germany and Japan, two of Britain's best prewar customers. The British Government has itself pursued an honourable policy not only of attempting to obtain the removal of barriers to the export of British books, but of refusing to erect barriers to the import of foreign books except where currency shortage makes it necessary. This is a concrete problem which the British representatives to Unesco would do well to study.

* * *

Democracy Dances

Everyone now knows that democracy is of many kinds—Western and Eastern, bourgeois and popular, political and economic. In Japan, however, where there has always been a tendency for imported schools of thought to be translated into æsthetic rituals, it seems that democracy is being redefined primarily in terms of choreography. At Hiroshima, a city which is said to take a great pride in its tragic fame and to aspire to be the "peace capital" of the world, the chief of police has given orders that all policemen and policewomen must learn Western dancing on the ground that it is essential to democracy. Lessons in boogie-woogie are given in the police station and aversion to the art is considered to betray feudal, militarist and reactionary sentiments.

It is clear that, contrary to the opinions of some sceptical observers, the Japanese really are taking democracy seriously. They are going beyond the conception of it expressed by the man who, when questioned by a correspondent, defined democracy as obedience to the orders of General MacArthur. In the boogie-woogie the individual, even a policeman, will be able to develop his personality without reference to Supreme Allied Headquarters and the shackles of an authoritarian past will fall away of themselves. It is not the first time that the influence of Western civilisation has been absorbed in Japan through the medium of the dance ; more than seventy years ago the ladies of the Court were commanded to waltz so that the European diplomat in Tokyo would notice no lack of *savoir faire* in high places. But that was an aristocratic age ; the tradition of dancing which Africa transmitted to the Anglo-Saxon is better suited to the task of democratising the survivors of the first great experiment in atomic destruction.

There does not seem to be any reason why the idea should be confined to Japan. If political ideas are best embodied in popular dances, is it not possible that nations might acquire by such means a more sympathetic understanding of one another's ideologies than through the repellent motions of verbal controversy ? Perhaps even the Council of Foreign Ministers might attain greater harmony under the sweet influence of Terpsichore. Mr Marshall might bring Benny Goodman with him to conduct a jam session ; a member of Mr Molotov's famous bodyguard might expound Marxism-Leninism so attractively *v prisyadku* that Mr Bevin's heart would melt within him ; and the Soviet Foreign Minister himself might be so entranced by the tap-dancing of Mrs. Braddock that he would forget to object to the next item on the agenda. The world may yet learn wisdom from Hiroshima.

Mr. Chifley Steals a March ?

It is a pity that one of the most important problems of Commonwealth relations is being broached at the Ministerial level in individual rather than joint discussions. The Prime Minister of Australia, Mr J. B. Chifley, has arrived in Britain some four months ahead of the bigger meeting to be held with the rest of his colleagues in the other Dominions. He has brought with him a team of financial and economic experts, and he has made it clear that his chief purpose is to discuss with Britain how best to use the dwindling resources of the sterling area dollar pool. Reports from Canberra indicate that he is likely to ask Britain to guarantee a $60-70 million deficit for Australia in 1948-49. The dollars are required to buy, among other items, tinplate for the canning industry and dyes for worsted materials, both of which are expected to feature strongly in Australia's export drive. Mr Chifley will also doubtless try to discover exactly how much Australia—and New Zealand—will be affected by Britain's economic commitments in Europe and whether the two countries can provide "off-shore" purchases under ERP.

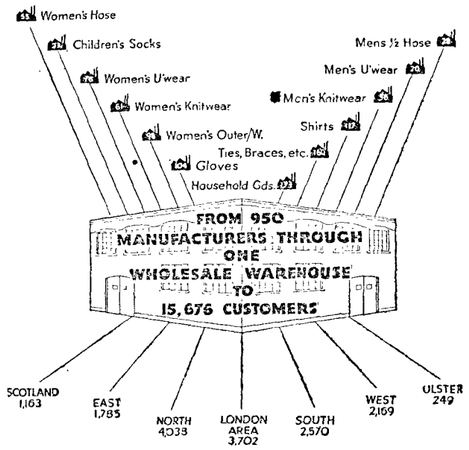
But these two questions—the dollar shortage and the effect of Britain's commitments in Europe on Commonwealth trade—by no means concern the Anzac group alone. They are questions to which the Ministers of Finance in India, Pakistan, Ceylon and, to a lesser extent, in Canada and South Africa, have also demanded an answer. They are, too, among the most important reasons for the Conference of Dominion Prime Ministers to be held in the autumn. They form points of common interest for the Dominions, and the solution of these two questions by the Dominion Prime Ministers in common council would have immeasurably strengthened the bonds of the Commonwealth.

The questions are urgent, and Mr Chifley was right to insist on early discussion. But he is wrong to imply, as he has done, that they were a matter for bilateral negotiation with Britain rather than for a multilateral settlement between all the Dominions. Bilateral talks between officials are indeed essential preliminaries to the wider Conference originally envisaged, but to take them to Prime Ministers' level may provoke the suspicion that Mr Chifley is trying to steal a march on the other Dominions.

* * *

The Neglected Child

The Children Bill passed its final stages last week. Its arrival on the statute book marks the birth of a new and complementary campaign for the neglected child in its own home.* The Curtis Committee dealt only with the child deprived of its home background ; these numbered some 124,000. The present report is concerned with the much larger number of children who, while still living with their families, are suffering from neglect, mental or physical cruelty, destitution or lack of parental control. In the year 1944-5 alone 107,312 children coming from 41,050 families were dealt with by the National Society for the Prevention of Cruelty to Children, and there is every reason for supposing that the numbers of children suffering from neglect is very much larger.



The report is in the best tradition of British social reform. The Curtis report was written with all the majesty of a Government inquiry ; this is a much more modest study, with inadequate funds, by a sub-committee of the Women's Group on Public Welfare. Nevertheless, it is a telling document and bears the stamp of authority ; the members of the Committee were almost all experts and they had the co-operation of the Ministry of Health, the Home Office and the Assistance Board in their inquiries, which included the examination of case histories of mothers serving sentences for child neglect and of widows receiving public assistance.

The report is basically an examination of the family circumstances which cause parents to neglect their children, and more particularly of the circumstances of the mother who is the lynch-pin of the family. In almost all cases the causes are complex, and poverty is frequently, but not always, a factor. The health, physical and mental, of the mother is vital ; large families, poor housing and the father's death or absence appear frequently in the case histories. Improvements in social conditions cannot solve them without much closer contact between the families, who often do not bother to use the social services, and the authorities able to help them. Like the Curtis Committee, this committee finds that there is too much overlapping between the bodies who attempt to intervene—the police, the NSPCC, health visitors, school attendance officers and voluntary bodies—and too great a tendency to remove the neglected child from his home rather than to attempt to improve the home itself. The futility of sending

NDERWOOD SUNDSTRAND

LASS 'D' ACCOUNTING MACHINE

n all-purpose, fully automatic ccounting machine equipped with vo cross-computing Registers, eight ccumulating Registers, and Front-eed Carriage. Maintains accounts in erpetual balance, and enables up-to-he-minute totals, sub-totals and alances to be obtained instantly without ext . work. Ideal for Pay Roll, tores Accounting, Costing, Analysis, ublic Utility Billing, Municipal ccounting, etc.

Two machines that, between them, supply the answer to every problem connected with the writing and simultaneous computing of accounting records, giving greater speed, simplicity, and complete mechanical control over accuracy. Both machines have extreme flexibility of operation and quickly pay for themselves in improved efficiency and lower costs.

UNDERWOOD ELLIOTT FISHER

ALL ELECTRIC ACCOUNTING MACHINE

For all records that require typing, adding, subtracting, with simultaneous accumulation of individual column totals and simultaneous cross-computation of one or more balances. All electric operation. Standard typewriter keyboard. Exclusive Flat-Writing Surface gives unequalled speed in handling forms which may be of paper or card stock, in original only or with copies alike or different in shape and size.

mothers to prison for neglecting their children is once more brought out. The committee recommends that local authorities should be made responsible for providing a comprehensive service of care for all children in their areas, and that the various services for mothers and children should be extended. If the causes could be remedied, the effects—children in institutions and homes and an increase in delinquency—would be reduced. This, together with the parallel efforts of the Family Service Units and the Stepney Pacifist Service Unit, which perform an unexampled service of direct help to problem families in their own homes, is a campaign to be supported.

* * *

A Freedom for the Civil Servant

A welcome should be given to a circular recently issued by the Treasury extending the liberty of civil servants to write, lecture and broadcast about their work, and to receive payment for it. The circular is not about the propriety—charming word—of doing so; it is assumed that in the cases in question the objections on grounds of secrecy or public policy have been settled. This is, indeed, a matter to which a good deal more thought ought to be given, but for the present the discussion centres on the more material question of cash. Shall a Crown servant who writes on a subject of which his knowledge is derived from his official experience, but which he carries on outside his official hours, be permitted to be paid for it? The answer is Yes—a yes bound round and knotted with innumerable qualifications and exceptions, but nevertheless a definite affirmative. The justification for this sensible decision is twofold: first, that an interest extended beyond the narrow requirements of official duty is likely to increase the civil servants' usefulness to the state; and, secondly, that "the creative use by some Crown servants of the experience which the Government gives to all its servants is to be encouraged." This phrase begs an awkward question about the non-creativeness of most civil service work; nevertheless the effect of the new regulations ought to mean that a civil servant who is really keen about his work and wishes to write or give talks about it can now enter the open market on more equal terms with his fellow citizens. Any step which reveals Whitehall to the world and the world to Whitehall is to be encouraged.

* * *

A Good Tale Badly Told

The Ministry of Education has published its first report since 1939.* For a story which is so full of event—the great evacuation in 1939 and its recurrent ebb and tide, the vicissitudes of wartime education, the long battle of the 1944 Education Act, and the hopes and disappointments of the postwar years—the record is quite astonishingly dully told. Surely the passage of an ambitious Act at a time when the country was fighting for survival and the great struggles to turn that Act into effect could have been told with a trace more feeling and warmth. The report barely attempts to deal with the years 1939 to 1946: only 1947 is covered fully.

The two main points of the educational contest consist on the one hand of the equalitarians, who have been given full political rein under the Labour Government, and on the other of those who believe more in the quality of education and fear that quantity may serve to level down standards. The report gives material to support both sides.

By January, 1947, there were almost exactly the same number of teachers in the schools—188,000—as in 1938; as, however, there were 500,000 fewer pupils the teacher-pupil ratio improved. The 400,000 increase in the school population, owing to the raising of the school-leaving age, has taken place slowly and has been matched by increases in staff. Numbers are still rising owing to the increase in the birthrate and will continue to do so for at least five years. In 1939 the school population in England and Wales was roughly 5,500,000; it was 5,000,000 in 1947; it is expected to be 6,000,000 in five years' time. The supply of men teachers is expected to be adequate; it is women teachers for the young children who are gravely deficient.

The capital programme for building has been cruelly hampered. The fourteen- to fifteen-year-olds have been housed mainly in prefabricated huts, for which special provision was made; the permanent programme has fared much worse. In 1946 capital expenditure totalled only £7,000,000 and by the end of 1947 there was still only £17 million worth of work under construction. In the light of, for example, the expenditure on new housing, which for 1947 must have been over £200 million, this is very low. It amply explains the complaints of overcrowding, condemned buildings and the like, which place the state schools at such a disadvantage in the eyes of parents making a choice between state and independent schools for their children.

Is it Cricket?

It will be a poor heart that does not rejoice at the stand taken by the committee of a local cricket club at the Staffordshire Assizes last week, when sued for damages. A man passing their cricket ground was struck on the head by a ball hit for six by a batsman. The injured man sued the club for damages—understandably, for few men have heads wholly resistant to descending cricket balls. The club, with that spirit of compromise which is not out of place even in cricket, offered the injured man an *ex gratia* payment to solace his damaged crown, but hotly protested that they were under no legal liability to make any payment whatsoever for that kind of mishap. In law, a man is assumed to accept the risks necessarily attendant on the playing of games in which he joins or which he watches. Neither a player nor a man who takes a stroll on a golf links can claim damages if he is injured by a ball in flight. His presence on the course is sufficient for the law to say that he has voluntarily submitted himself to the risks of such an injury. But to walk on a public highway past a cricket ground is a different matter, and it would be an interesting extension of this theory if the contention of the cricket club is well founded. An observer of English Test cricket today might well come to the conclusion that the risk of injury, either outside or even inside a cricket ground, from a ball hit for six by an English batsman is virtually non-existent. This, however, does not seem to be a Staffordshire view. Australian papers, please copy.

Shorter Notes

In the second reading of the Representation of the People Bill in the House of Lords this week, Lord Salisbury announced that the Opposition did not intend to reject or amend the Bill, as it was a measure affecting the House of Commons, not the upper House. But he and other Opposition speakers used the occasion to denounce parts of the Bill, particularly the abolition of the university seats, for what they are—"a pretty shabby affair." After reading the evidence brought up in support of the charge that a gentleman's agreement has been flagrantly broken, one feels that though the Conservatives may be vermin and even lower than vermin (*vide* a Note on an earlier page), they would not have been guilty of such a dirty trick as this.

*

It was announced last week, after *The Economist* had gone to press, that an agreement had been reached between the Ministry of Pensions and the artificial limb industry which would enable every firm making a high quality limb to continue in production. In prescribing the type of limb required the Ministry of Pensions surgeon will consult with the patient's own surgeon, and the patient will be able to choose the limb from lists of makers approved by the Ministry. If he chooses a limb such as is made by the Ministry's contractors for Service casualties, he will get it free. If he chooses another make and it costs more, he will be charged the excess.

*

In a referendum organised by the Bar Council, a majority of barristers have voted in favour of retaining the circuit system as at present in existence without substantial change. No corresponding referendum of litigants has yet been held to find out whether the additional barristers' fees payable in consequence commend themselves to those who are compelled to make use of the Courts.

*

Last week a High Court Judge suggested that it would be of public advantage if the registration book—or "log book"—issued to every car owner were made legal evidence of his ownership of the car. At present it is not, with the result that fraudulent sales of cars are rendered the more easy. The Board of Trade, or the Ministry of Transport, might well consider appointing a Departmental Committee to advise on the merits, and possible disadvantages, of such a proposal.

*

In the article on "Party Politics in Spain" which appeared in *The Economist* of June 19th (p. 1023) it was stated that Señor Angel Herrera might become a leader of a Spanish Christian Democrat Party. A correspondent points out that this reference to one who is at present Bishop of Malaga is misleading, as his religious office would preclude active participation in politics.

Letters to the Editor

The Level of Government Expenditure

SIR,—The text of articles IV and V in your series on "Long-Term Economic Problems" is that Government expenditure should not exceed 25 per cent of the national income. Although this is reiterated many times and viewed from various angles, no attempt is made to prove the validity of this proposition, based on Mr Colin Clark's observation. We are left with the suggestion "If Government expenditure ought to be only 25 per cent of national income, then it is at present excessive" and this is not very helpful.

The table on page 6 in last week's issue sets out clearly the rise or fall of each part of national taxation and shows where the increase has arisen. But it does not prove that the increase is dangerous or that a return to the prewar arrangement would improve matters. The core of the problem, surely, is not whether the nation should spend a greater or smaller proportion of its annual income communally (through its Government), but whether in so doing changes are made in the distribution of real income, and whether in consequence aggregate income will be increased or decreased? Not whether taxation should be reduced to some meaningless proportion (25 per cent or 30 per cent) found convenient by past Governments and perhaps by other countries in different circumstances, but whether in the long run the social dividend will be maximised. This I agree would be difficult to subject to precise analysis.—Yours faithfully,

W. A. COOPER

East Harting, Petersfield, Hants

[It was stated—twice—that there was no absolute justification for Mr Clark's figure of 25 per cent, and our own conclusions were based on 30 per cent. But because the danger point cannot be exactly determined, it does not follow that there is no danger point. We were trying to follow exactly the line of argument that Mr Cooper recommends, with the exception that we tried to bring it down to earth by naming a figure, empirically arrived at.—EDITOR.]

The Dentists' Grievances

SIR,—In your article on dentists' grievances, you correctly refer to differing levels of skill in relation to fees, but you omit reference to overhead costs. These overhead costs are added to not only by rent in what is called a good neighbourhood, not only by good furnishings and expensive equipment, but by a number of points such as properly spaced appointments so that the nervous patient can be carefully treated, and time allowed for the unexpected difficulty.

I can best illustrate my meaning by drawing the contrast between two extremes. Take the men who had no cost of training but were put on the dentists' register under the 1921 act, whose equipment may be just what cannot be done without, who make no appointments, have no attendant for door or surgery, and whose overhead costs are therefore reduced to a minimum; and on the other hand consider the men who have high rents, who have spared nothing to get equipment which will help towards good treatment, who make properly spaced appointments, and have the skilled surgery help which is absolutely necessary for good dental surgery, and it is clear that under the proposed scheme, the worse the dentist, the higher the remuneration. Your comments on the Estimate Board are fully justified, and I, for one, shall refuse to join in a scheme where decisions which should be my responsibility, are left to clerks in Eastbourne.—Yours faithfully,

DOROTHY SMITH

42 St. Giles', Oxford

What Are Profits?

SIR,—In your article in your issue of June 12th you have taken up an old but very important topic, the relationship between profit in the economic sense of the word and profit as defined for income tax. You have left out, however, one argument which is perhaps decisive: economic and legal definitions are bound to collide here and there; inequities have to be accepted for the sake of certainty of taxation. But inequities, unimportant or at least acceptable at a time when income tax was levied at a rate of 3s. 6d. or even 5s. in the £, have become unbearable when direct taxation is levied at the present rate. The system requires overhaul because the old machinery cannot carry the increased load.

You quote as an example of the hidden "capital levy" the failure of the Inland Revenue to take into account fluctuations of stock value and provisions for the replacement of capital assets. Unfortunately this is only one example. The present income tax system considers as capital assets which are not available for any depreciation, for instance, payments for leases which are, econbmically, rent paid in advance, thereby shifting the burden of income tax from the owner of the land on to the shoulder of the leaseholder or tenant.

You refute the well-known argument that the suggested change of the law would result in a loss for the Treasury, but this is not the whole story. The authorities have shown great reluctance to introduce legislation to avoid economic inequities, not only because this might reduce the amount of tax collected, but also because it might render obsolete the precedents decided by the Courts; they have devised new clauses to be incorporated in the Finance Acts whenever the High Court has decided an argument in favour of the taxpayer.

The accountancy profession has again and again drawn attention to various economic anomalies in our tax system and would have good reason for feeling frustrated. The failure to bring economic and legal definitions of profit in one line cannot be put at the doorstep of the profession. What is necessary is that Income Tax Reform, shelved since 1931, be taken out of its drawer and dealt with speedily, use being made of the research work done by universities and professional bodies.—Yours faithfully,

H. L. BERLAK

Raw Cotton Commission

SIR,—In your issue of June 26th you say it is now generally accepted that the Commission's new policy of fixing home issue prices at replacement costs is correct.

Having accumulated very large stocks of many growths of cotton on advancing markets the Commission suddenly decided to demand replacement prices only when those prices were at the highest level since 1920, and at very much above this cost. At the present time prices demanded are 3d. to 5d. per lb. over replacement costs in most markets—200,000 bales of Sudan cotton were bought, in bulk, at an average price of 36d. per lb. f.o.b., say 38d. cost to the mill. The average selling price demanded is 52d. per lb.—£26 per bale difference.

Russia is reported to have resold recently to America 27,000 bales of Kamak (long staple cotton), bought from Egypt by barter, at very much below present Egyptian prices, and to have offered (if not sold) 40,000 bales to the Commission also much below present quotations. What constitutes "replacement values"?

Export business in fine qualities is being paralysed because hard currency countries are refusing to pay prices which Lancashire

From *The Economist* of 1848

July 8, 1848

. . . . Again some hope arises that France may begin to recover. All the main sources of her wealth still exist as before the month of February. Her soil is untouched—the knowledge, skill, and number of her people are undiminished—her agriculture is unimpaired—her great wine cultivation as flourishing as ever—her cotton and her woollen manufactures are nearly uninjured: and it is even remarkable that cotton sold well at Havre at the very height of the Paris insurrection: only her silk manufacture, and the ornamental manufactures of Paris have been partially destroyed, and she has, therefore, still the power of recovery from her disasters. The instant that the government inspires the people with a sense of confidence and security, enterprise, which is impatient to be at work, will begin in every quarter—money, which has rather been hoarded than destroyed, will come forth—credit will revive, and all the energies of the people, if they be wise, will be directed to improve the ample means of prosperity which are yet in their hands. . . . From the terrible events of the last four months, France has gained nothing, unless it be a great mistrust of the many quacks, who pretend, by some necromantic means, to promote national welfare. To other nations, indeed, her experience has been a great lesson; they are taught to avoid her terrible errors without going through her sufferings.

is forced to ask. Also, with new crop cotton being offered for September/October shipment at 5d. per lb. below present prices, exporters are compelled to limit business, because it takes six to nine months to convert raw cotton into cloth ready for export, when competitors will establish lower values. The absolute monopoly of the Commission is fortified in the Act by penalties on merchants importing cotton (to assist exports) of a fine of £500, and for two years' imprisonment and confiscation of their cotton! Our main export hope is thus throttled by Government action and exploitation.

In any case, replacement values in the various countries from which we buy are completely out of relation to the spinning value of the respective cottons. No such thing as "world values" now exists. When the Liverpool market functioned all values of all growths and qualities were truly related daily, and accepted everywhere. The facilities for hedging ensured a free world market in an international commodity.—Yours faithfully,

A. BRYCE MUIR.

Danger Signals in South Africa

SIR,—With reference to your article in your issue of June 5th, I wish to make a few comments on some of your remarks.

One of the main reasons of the Nationalist victory is often not generally realised. This is the fact that the rate of increase of the Afrikaans-speaking section is much faster than that of the English-speaking section. According to the returns of the 1936 census the ratio between persons giving their home language as English to those giving their home language as Afrikaans was 1:1.15 for the age group over 21 years of age but 1:1.83 for the age group 7 to 21. In the past the faster rate of natural increase of the Afrikaners was to a large extent balanced by gains for the English section through immigration, but immigration virtually ceased during the war. It is also generally conceded that the United Party failed to draw much support among the thousands of young Afrikaners that voted for the first time in 1948.

Informed comment in South Africa attaches very little importance to General Smuts's recognition of Israel. Recognition of the state should they be elected was promised by certain Nationalists, and this was possibly the reason for General Smuts's action.

The election results do reveal a greater rift between the English and Afrikaans sections of the community than has existed at any time since Union, but the Nationalists enjoy very considerable support in the cities. They won five of Pretoria's eight seats and won eight seats on the Rand, besides losing four more seats in this area by very narrow majorities. Thousands of Afrikaners have trekked to the cities within the last few years. The Dutch Reformed Church recently announced that it had more members in the cities than in the rural districts.

The voting figures in total probably overestimate the strength of the United Party, as this party's votes were cast for 127 candidates while the Nationalists only had 92 candidates in the field. Allowance for this factor would still give the United Party a majority, but probably a substantially smaller one than that revealed by the figures.

It is true that farming was largely subsidised in the past, but prices received by South African farmers for wheat, sugar and maize are well below present world prices, and the effect of the subsidies is to the benefit of the South African consumer and thus indirectly to the benefit of the mines and industries, which consequently are able to pay lower wages.

Your suggestion of a coalition government is not likely to receive the support of the Nationalists, who feel confident that they will be able to increase their majority at the next election. This is based, firstly, on the fact that they can be sure of a substantial majority amongst the young people who will be registered as voters in the next five years, and, secondly, on the fact that there are signs that they are obtaining some support from English voters who have similar views on the native question.—Yours faithfully,

H. DE G. LAURIE

Books and Publications

Apple of Discord

"Apple of Discord." By C. M. Woodhouse, D.S.O. Hutchinson. 320 pages. 21s.

MR WOODHOUSE writes with authority of Greek affairs. He was one of the first British officers parachuted into enemy-occupied Greece, and was head of the British Military Mission there from August, 1943, until the Germans left Greek soil. He is a scholar of both the ancient and the modern Greek languages, and is also aware of Greece's position in the Balkans and in Europe. The book contains a great deal of valuable information on the numerous Greek resistance groups and political parties and on the attitude of Greek emigres and British military and political organisations, and summarises all important events in Greece from 1941 to 1947. It is certainly by far the best work yet published on its subject.

In spite of these merits the book leaves one unsatisfied. It is far too long, and its analysis is at once too complicated and too simple. There are mistakes of fact in the sections dealing with events in the Balkans outside Greece. There is too much imputation of motive. Statements about the intentions of the Greek Communists, the Germans, and the Soviet Government, which cannot be more than guesses, are given as facts. Similar statements about British and American intentions, which may well be based on knowledge, are given without the evidence. This may be the fault of security regulations rather than of Mr Woodhouse, but it is annoying to the reader.

Mr Woodhouse proves convincingly that the EAM-ELAS organisations were always controlled by the Communists, and that the Communists have always aimed, and still aim, at the subjection of Greece to the Soviet Union. It follows from this that British policy should oppose them. Whether the best method was adopted is a point on which opinions will always differ. Mr. Woodhouse maintains that the moderate democrats should not have let themselves be diverted, by their fear of a Royalist restoration, from the struggle against Communism. Should they then have accepted the leadership of the Royalist (Populist Party) politicians with their retinue of black marketeers and "collaborationists"? Mr Woodhouse himself shows that during the last three years the vindictiveness of the Right has driven many good Greeks back into the arms of the Communists. Mr Woodhouse's book will not cause extremists of either Left or Right to change their views. Its facts can be used to support either side. But at least it will show the unbiased reader that the problem is almost insoluble, and that British failure to solve it was not entirely due to wickedness, or even to stupidity.

Mr Woodhouse believes that the Greek problem can only be solved as part of the Balkan problem, that Greece can only enjoy security within a Balkan federation. He rightly stresses the economic, social, cultural and even ideological similarities between the Greeks and the other Balkan peoples. He is well aware how short-sighted and futile are the Greek, as also the Serb, Bulgar, Albanian and other nationalists. But the great question is whether this larger Balkan unity will spread over the Peninsula from the north, in the form of Soviet Communism, or from the south, under the leadership of American political democracy. Mr. Woodhouse wisely refrains from detailed speculation, but the question with which the book ends is the only important one.

Land Use

"The Land of Britain—Its Use and Misuse." By L. Dudley Stamp. Longman, Green and Company. 507 pages. 42s.

DR DUDLEY STAMP started in 1930 the first comprehensive survey of the utilisation of every acre of land in Britain and, in the face of recurring financial difficulties, eventually piloted it through to successful completion. Most of the work was done voluntarily, and particularly creditable was the way in which the whole educational system, from schoolchildren to undergraduates and research students, was harnessed to the task of its own free will. The actual cost was about £53,000, much of which came from private sources, whereas payment for the work at free market rates would have needed at least £200,000. This largely voluntary achievement and the 92 detailed county reports which have emerged from it, should greatly assist the planning authorities in the discharge of their new-found powers of control of land use.

Dr Stamp's book draws freely on the results of the survey to present a comprehensive description of the land of Britain—its character and history and the changing pattern of its usage. This is a solid book, not to be read at a sitting—but merely to

glance through the numerous diagrams and illustrations will fascinate anyone interested in farming or the countryside. The various types of farmland are classified and their broad distribution shown; the geographical distribution of crops and livestock is brought up to date to show wartime changes; the effect of geological and climatic factors on agriculture, of mineral workings on the soil, and of accessibility on the use made of land are among the matters analysed and discussed. The mass of material collected in one volume for the first time will make this a standard work of reference of the highest value.

Dr Stamp, however, attempts more than analysis. He gives an opinion on the basic principles which should guide land use planning—mostly sound common sense with which few would quarrel—and he adds a more controversial outline of the possible changes in land use which may prove desirable. He concedes that the land occupied by houses and other uses which are agriculturally unproductive may have to be increased from 5.5 to 10 per cent of the total area. This shows a more realistic attitude than is to be found, say, in the Conservative Agricultural Charter, although Dr Stamp rightly insists that the small area of really first class agricultural land—only 4.1 per cent of all land—should be zealously guarded. He believes that the arable acreage could suitably be increased from its 20 per cent prewar to 27.5 per cent of the surface, which would actually be a lower amount than will probably be required by the Government's present targets. At the same time, permanent grass would be considerably less than prewar, although the stock-carrying capacity of all grassland might be 40 per cent greater. These figures assume, without reference to the economic cost, the improvement of much rough grazing. Admittedly, these estimates can be no more than intelligent guesses; but it is interesting to find an expert who is proceeding on technical rather than economic considerations (and consequently might be expected to be more sanguine), implying that the possibilities of agricultural expansion are rather more circumscribed than either Government or Opposition, or general public, seem prepared to believe. Indeed, Dr. Stamp's book is now sobering, now (as over the scope for afforestation) exhilarating, in its revelation of the possibilities of land utilisation.

The Problem of Cartels

"International Cartels." A League of Nations Memorandum, 1947. 53 pages. 2s. 6d. net.

"Cartels or Competition?" By George W. Stocking and Myron W. Watkins. The Twentieth Century Fund, New York, 1948. 516 pages. $4.

At a time when the Monopoly (Inquiry and Control) Bill is before Parliament no books could be more timely than these. They are both the product of intensive and devoted study to a problem which, in spite of all that has been written about it, seems to be more open to controversy than ever. Both publications deal exhaustively with the international aspects of industrial and trade monopolies, the exclusion of which might dangerously jeopardise the scope of national anti-cartel legislation. This is another reason why these two treatises should be particularly welcomed by British economists and politicians at this juncture.

The League of Nations publication, which is the shorter, describes some of the more significant features of the development of cartels in the inter-war period, and then proceeds to more specific problems such as the relation of cartels to short-run fluctuations of the trade cycle; it also deals with long-term factors, neatly distinguishing in its argument between raw material and industrial cartels. It is interesting to find that the Report comes to the conclusion that properly operated buffer stock schemes are preferable to restriction schemes.

It is evidence of the topicality of the subject that Messrs Stocking and Watkins have also devoted large sections of their study to the same problem—how far cartelisation—national and international—could and should be used as a means of avoiding heavy fluctuations of output and trade. They do not favour the idea that restrictive organisation and control of domestic markets by private trade groups should be regarded as a means of preventing governmental control of production and distribution; nor do they approve of the restrictive aims of the World Trade Alliance.

One of the interesting features of the publication as far as it relates to regulation of cartels, in the national as well as the international sphere, is the close and critical attention which is given to the Draft Charter for the International Trade Organisation of the United Nations (ITO), of which Chapter V, which relates to restrictive business practices, is reprinted in full. As to the future of the American cartel policy it is urged that it should have two parts: action through ITO, and action taken by the United States alone or in combination with a few other countries. These policies, the authors say, need not conflict; rather they should complement one another. But they are well aware, as so many others are, that even if a policy for curbing cartels was vigorously followed, it would take time to eliminate restrictive business practices.

If, however, it is really considered that anti-cartel and anti-trust legislation of single states, or an organisation of co-operating nations is uncertain in effect and slow in results, why have the authors not dealt with such simpler action as the restoration in America and Britain of the full meaning of the common law doctrine of restraint of trade? In their chapter on Britain, which makes interesting reading, the effect of the frequent evasion of this doctrine by trade associations and price maintenance schemes should not have been ignored. By re-opening the gates of free competition more may be achieved than by control of monopoly.

An Economists' Economist

"Studies in the Theory of Welfare Economics." By Melvin Warren Reder. Columbia University Press. Published in Great Britain by Geoffrey Cumberlege, Oxford University Press. 208 pages. 16s.

Writers on the economics of welfare, particularly since Professor Robbins's "Nature and Significance of Economic Science" austerely circumscribed the economist's legitimate field, have been uncomfortably open to attack on the grounds that they mix their economics with moral and social judgments drawn from an entirely different universe of discourse—judgments possibly quite easy to sustain by non-economic argument, but as out of place in a strictly economic context as notions of colour and texture in a treatise on geometry. Dr Reder's achievement is to construct a framework of welfare theory to which such strictures cannot be applied. He keeps to the most rigid assumptions; for his theory, individual satisfactions need be neither comparable nor measurable; he builds on an unimpeachable foundation of indifference curves, making use of a "Compensation Principle" thus framed:

> Welfare will be increased, decreased or left unchanged by a given economic reorganisation depending upon whether the algebraic sum of all compensating bounties and taxes is positive, negative or zero.

It will readily be guessed from the above that Dr Reder is an economists' economist; the general reader hardly needs to be warned off a book in which almost the only relief from this sort of thing is provided by excursions into mathematics. It is not, however, an impractical book. In the fields of monopoly control—just what does the public lose by monopolistic price policy?—and of employment policy—how important, relatively, are full employment of resources and the optimum allocation of those hitherto unemployed?—it casts a light on problems of urgent day-to-day importance. And the closing chapter—a one-page "Philosophical Reflection on Waste and Welfare"—inspires both admiration for the commonsense humanity which the author has managed to preserve unimpaired through all his voyages in the theoretical stratosphere, and envy—from any British reader—for that consciousness of economic sea-room which only Americans can reasonably enjoy.

AMERICAN SURVEY

Congressional Balance Sheet

(From Our US Editorial Staff)

MR TRUMAN, in the course of his Western trip, complained that the Eightieth Congress had been the worst in history. A few days later, apparently out of gratitude for one sin left uncommitted, he revised his opinion and admitted that it was only the second worst. In the interval he had, no doubt, been reminded that the Congress which tried to impeach Andrew Johnson was—at least from the President's personal point of view—even more reprehensible.

When the President and the Congress are of different parties neither is likely to cut a very good figure. The President seems to be ineffective and grumbling; the Congress appears to be forever picking quarrels and going out of its way to render the Executive branch helpless. To an extent, this appearance is deceptive. Much that is done by both is political, not legislative, in intent. The President asks for measures which he believes to have popular appeal, in the confident hope that Congress will refuse to pass them and will leave him in undisputed possession of a block of voters. The Congress passes Bills, designed solely to annoy the President and hamper his operations, in the certainty that he will veto them. It can then accuse him of thwarting the will of the people as expressed through their elected representatives.

During such a period, it is wiser to judge the quality of a Congress by what it has done rather than by what it has left undone. Failure to grant all that the President, as head of the Opposition, requests is no misdemeanour. The House and one-third of the Senate having been elected more recently than the President, Congress can reasonably argue that it is closer to the people than is the Administration. Judged only by what has been accomplished, the Eightieth has probably a better record than any previous Congress working under the same handicap.

Had the House been as good as the Senate, or had both done as much at home as in the international field, the Eightieth Congress would be remembered as an unqualified success.

The Republican platform summarised its accomplishments or, at least, those of which it was sufficiently proud to remind the voters, as follows:

> The long trend of extravagant and ill-advised Executive action reversed; the Budget balanced; taxes reduced; limitation of Presidential tenure to two terms passed; assistance to veterans, their widows and orphans provided; elimination of the poll-tax as a requisite to soldier voting; a sensible reform of the labour-law, protecting all rights of labour while safeguarding the entire community against those breakdowns in essential industries which endanger the health and livelihood of all; a long-range farm programme enacted; unification of the armed services launched; a military manpower law enacted; the United Nations fostered; a haven for displaced persons provided; the most far-reaching measures in history adopted to aid the recovery of the free world on a basis of self-help and with prudent regard for our own resources.

The first three of these boasts, forgetting the partisan adjectives, are upheld by present facts, though only the indubitable, but not necessarily commendable, fact that taxes were reduced can be credited to the Republican Congress. It is still doubtful whether the tax reduction Bill finally passed on April 2nd (over the President's veto) will allow a balanced budget in the next fiscal year. And it is even more doubtful whether a party, which purports to be the prophet of sound finance, should be content with a policy which permits of no debt reduction in time of boom and risks an increase in the public debt should there be even a minor slump.

The constitutional amendment limiting the Presidential tenure to two terms is a measure calling for no special commendation. It was one of many proofs that the Republican Party is still engaged in an unrelenting struggle with Mr Roosevelt. A constitutional amendment must be ratified by three-quarters of the State Legislatures before it becomes effective. Only 21 (of which 19 are Republican controlled) have so far ratified this one, but, since Mr Dewey's nomination, it has been reported that a number of Democratic states, which had until now been lukewarm to the proposition, are preparing to act. By 1956 the Republicans may be feeling less triumphant at this victory over the dead.

*

There are few Congresses which do not claim (with justification) to have done something for the veterans—and for their votes. The Eightieth increased the allowances for those receiving college training, on-the-job training and part-time instruction in specialised schools, increased the compensation for disabled veterans and raised the pensions of widows and dependants of those killed in the war. The increases were necessary and were not large enough even to take care of the rise in the cost of living since the scales had first been fixed. Had the "attack on the basic causes of inflation," pledged in the section of the platform dealing with the future, been undertaken during the last session, they might not have been so urgent. "Congress," as the *Washington Post* said, "failed to cope with inflation. Indeed, its enactment of the Tax Bill and its failure to renew curbs on instalment buying stoked the fires of inflation." It is not unlikely that the veterans would have preferred the passage of such measures as the Taft-Ellender-Wagner Housing Bill (instead of the makeshift Act which only encouraged the banks to lend them more money with which to buy their over-priced homes), Federal aid to education, the expansion of Social Security and Health Insurance, and an increase in the minimum wage, to the sops which were rather negligently thrown their way.

The elimination of the poll-tax in soldier voting was an amendment to the Draft Bill for which the Congress can take credit. But other amendments, to prohibit racial discrimination in the armed forces and to withhold contracts from firms that "refuse employment because of race or colour," were defeated. The Republicans, however, will probably get the negro vote, largely by default, without having done much to deserve it. They will not get the vote of organised labour, though the Taft-Hartley Act, on which they will lose it, has proved, with the

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

exception of one or two clauses, which are being studied by a joint committee and are likely to be revised in the next Congress, to be by no means the "Slave Labour Bill" that its opponents prophesied.

The farm legislation, for which the Republicans take credit, was substantially an extension of that begun under the New Deal. A permanent and somewhat complicated method of supporting prices was accepted by the Senate, but not by the House, which only passed a stop-gap measure continuing the present programme. Finally, at the last moment, a compromise was reached by which the existing programme was extended until 1950, at which time the Senate's long-term system will begin to operate. Not mentioned in the Republican balance-sheet is the failure of the Senate to pass the Bill repealing Federal taxes on margarine. Representatives of those states which grow cottonseed and soya beans, from which American margarine is made, joined those from the cities in passing the Bill. But in the Senate the agricultural states have a proportionately higher representation and the Bill got nowhere.

The Eightieth Congress can, perhaps, take some pride in having screwed up its courage, in an election year, to the point of passing even a half-hearted conscription law, but it can get little satisfaction out of its panic decision to buy a seventy-group air force in the hope of avoiding universal military training. Unification of the armed services was, indeed, as the platform says, launched. But it sank at once with no more than its mast visible above the angry waves of inter-service rivalry.

It is a considerable exaggeration to call the Displaced Persons Act the provision of "a haven for displaced persons." Under the Act 205,000 immigrants are, in theory, to be allowed to enter the country, but a series of ingenious clauses ensures that it is Protestants from the Baltic and Eastern Poland who come in—not Jews or Catholics. Refugees from Communism are welcomed by Congress, not the victims of Fascism. And it was against Communists in the first place, and only incidently against Fascists, that the Mundt-Nixon Bill and the loyalty test legislation, both of which got lost in the scramble of the last few weeks, were directed.

*

The record of Congress in foreign affairs was as good as its performance in the domestic field was bad. During the eighteen months when it was in session, the President asked for an unusual amount of important legislation to make the Administration's foreign policy effective. With a few exceptions he got all he asked for. When the problem was—as it usually was—one of giving financial aid to other countries, his requests had to be accepted by the Appropriations Committees of both Houses as well as by those with specialised knowledge of foreign affairs. Yet, one by one, the Greek-Turkish aid programme, interim aid and the emergency addition to interim aid, the China aid and European recovery programmes, went through Congress without serious disfigurement. Finally, Mr John Taber's attempt to cripple ERP, which he supported with a series of ignorant and vindictive broadsides, was decisively beaten by the skill and patience of Senator Styles Bridges. No Congress, of either party, has ever achieved so much, and the Republicans are entitled to the credit they take in their platform.

The fostering of the United Nations, to which they refer, was also genuine. Apart from the Vandenberg Resolution, the significance of which in American politics cannot be exaggerated, there were other indications that the United States intends to expand its interest in international organisations—the Inter-American Treaty of Reciprocal Assistance, the decision to join the International Refugee and World Health Organisations within the UN and the Caribbean and South Pacific Commissions outside it, for example. The charter of the International Trade Organisation was not submitted to Congress for ratification during the session, for the reason, perhaps, that the one dangerous example of back-sliding displayed in the foreign field was the refusal to extend the Trade Agreements Act for more than one year. This was evidence that the old Adam was still alive in the Republican Party, but the total balance sheet suggests, and the decisions at Philadelphia bear it out, that he is not as hale and hearty as he used to be.

American Notes

Democrats in Distress

The opponents of Mr Truman inside the Democratic party—and the extent of last week's revolt showed how numerous they are not only in the south and the left wing, but among the city bosses whose only concern is to keep the party in office—have been fighting to keep next week's Convention "open." Delegation after delegation has been left uninstructed or bound to Mr Truman by the lightest of ties. But General Eisenhower's tardy intimation that "at this time" he could not enter "partisan political contests" or be a candidate for office, has shut the only door through which all the chief elements in the party were prepared to bolt.

The combined efforts of Mr James Roosevelt, of the southern leaders and of the party bosses have failed to convince General Eisenhower that it is his duty to salvage the Democrats this year. But the pre-convention caucus of the dissidents summoned for Saturday will find it difficult, if not impossible, to discover another alternative to Mr Truman. General Eisenhower combined two supreme attractions: a distinction and a popularity, attested by every public opinion poll, with a minimum of public views on controversial subjects, which would have made it easy for Democrats of every persuasion to rally behind him. Compared with the General, the other available candidates, from the President down, suffer from a surfeit of views and a poverty of votes. Mr William Douglas, the Supreme Court Justice, has enthusiastic supporters on the left, and might draw votes away from Mr Wallace, for he has always been among the most eminent and consistent of New Dealers, but he would be almost equally unpalatable to the South and to the party bosses, who are only interested in a winner. Mr Roosevelt's long reign blighted the careers of his possible successors.

The proceedings at Philadelphia next week promise to be as much like a wake as the Republican Convention resembled a wedding. The platform committee has hopes of building a slender bridge over the civil rights gulf between the party's southern and northern wings. This would be done merely by reprinting the pious hopes of the 1944 programme, which affirmed the belief that minorities "have the right to live, develop and vote equally with all citizens," though the South may demand an additional states' rights clause as the price of its solidarity. Although only 26 southern delegates are pledged to Mr Truman, only 69 are committed to "take a walk" if he is nominated. The remaining 282 are unpledged, and Mr Truman is counting upon these "sitters" to make up the necessary majority of 618 votes.

But the attempt, and the failure, to draft General Eisenhower cannot but have further disorganised the party and unnerved Mr Truman. For the Democrats, so recently invincible, to have tried to press the highest honour in their giving upon a man of whom it is not even known that he is a Democrat is an unparalleled public confession of political bankruptcy. If Mr Truman is nominated, he will not even be able to count upon his own party for more than apathetic support.

* * *

Setting Sail for Victory

Unlike Governor Warren, who has never lost an election, Governor Dewey is as accustomed to defeat on his first attempt as he is to victory on his second: neither candidate is likely to break his electoral habits next November. Both are comparatively young, both have attractive wives and teen-age children, both have proved their vote-getting ability. The all-important independent voters have always been attracted by Mr Warren, whose solid yet warm humanity and liberal sympathies offset at least some of the deficiencies of Mr Dewey's political personality. New York State is almost certainly in Mr Dewey's bag, California in Mr Warren's. Both are states in which the Democrats had hoped for success and under the electoral college system a Presidential candidate can hardly hope to win without the support of at least one of them. It is not surprising that the Republicans are sure that they are setting sail for victory on "this perfect dreamboat of a ticket."

There will be nothing else dreamy about Mr Dewey's campaign, as he has already shown when repaying his debt to the Republican machine in Pennsylvania. He has appointed Representative Hugh D. Scott of Philadelphia to the chairmanship of the Republican National Committee, but, contrary to all precedent, it is not Mr Scott who will manage the presidential campaign

but Mr Herbert Brownell, Mr Dewey's experienced organiser. Mr Dewey and Mr Warren are stream-lined Republicans, a type which is more noticeable outside Congress than within it, and they obviously intend to maintain their detachment from the Old Guard. On balance, this detachment will probably pay good dividends during the campaign, but it may become a liability when Mr Dewey arrives in Washington, a city of which neither he nor his advisers have much experience, and has to establish good working relations with Congress. Mr Scott, who is more progressive than might be expected from his political connections, may then come into his own.

The first serious storm which the new President has to ride may be the inflationary typhoon which neither his Democratic predecessor nor the Republican Congress has been able to stem. The clouds are once more gathering and, from present forecasts, may break with overwhelming violence next January, just in time to drown Mr Dewey's election promises. Neither he nor the Republican Party has as yet indicated what brand of lifebelts they intend to offer and the campaign may be fought on this issue. If the storm does break, Mr Dewey will have to provide more than an honest, careful and efficient administration. Imaginative leadership will be called for and no one is sure that he is capable of this.

Mr Dewey has, however, a more immediate opportunity to prove that he can meet his responsibilities. He has always taken the credit for initiating the bi-partisan approach to foreign policy and he is now doing the same for "charting details" of the Marshall plan. He might be well advised to lay the foundations for a similar claim on American policy in Germany. His adviser, Mr John Foster Dulles, differs from the Administration on this question and favours a policy based on the strengthening of France. There is, therefore, a danger that this may be the next target of the attack which Mr Dewey has already directed against the Administration's policy in China and Palestine. He has made it clear that he intends to fight his campaign on foreign as well as domestic issues, but any indication that the United States is not united in its determination to maintain a firm stand on the fundamental German question would have international repercussions that might prove very embarrassing to Mr Dewey when he arrives in the White House. The long-term advantages of allowing himself to be associated during the election campaign, this year as he was in 1944, with the formation of official foreign policy might, therefore, counteract the immediate political handicap of such an association. But the Democrats would be equally handicapped by it and so far Mr Truman has shown no more readiness to welcome it than has Mr Dewey.

* * *

Captive Coal and the Union Shop

The steel companies which operate "captive" coal mines have at the last moment refused to sign the contract won by Mr Lewis from the commercial coal companies. The captive mines produce about 10 per cent of the nation's soft coal; it is their 40,000 miners, with a certain number of sympathisers, who have not gone back to work after the miners' holiday. The wage and welfare concessions in the coal contract further undermined the case against a rise in steel wages, but the chief objection of the steel companies is that the contract, by perpetuating the union shop, violates the Taft-Hartley Act. They have accused Mr Lewis of an unfair labour practice, requested an injunction, and are evidently counting upon the need for maintaining steel production to prompt the government to ban the strike.

The Taft-Hartley Act not only forbade the closed shop, but provided that a union shop (under which employees must join the union within 30 days if they do not already belong) might be granted only after a majority of the employees had voted for it in an election held by the Labour Board. These elections have proved a costly and time-wasting burden. The Labour Board has been turned into a Board of Elections with the result usually a foregone conclusion. In virtually every case the employees have voted almost unanimously for union security. The hope of the sponsors of the Act that the taking of a vote would restore the freedom not to be unionised has been wholly disappointed. One of the earliest amendments to the Act will eliminate these elections in cases where the union is certified by the Labour Board.

Mr Lewis's miners would vote for the union shop with even more solid enthusiasm than most unions. But Mr Lewis has refused to comply with the Taft-Hartley Act by swearing that he is not a Communist and filing his financial secrets with the Department of Labour and he cannot, therefore, request an election to be held. The steel companies, which hope next year to

persuade the Steelworkers' Union to comply with the Taft-Hartley Act, evidently feel they would weaken their case by signing the coal contract without a protest. But the willingness of most of the coal companies to forgo the advantages of the letter of the law, for the sake of peace, seems likely to be matched in the shipping dispute. Officially the union hiring hall, which has brought order into a chaotic industry, has been declared illegal as another name for the closed shop. But nine shipping lines have agreed to sign a contract continuing the hiring hall and the others are expected to agree.

* * *

Testing the Labour Act

It is too early, by several years, to assess the effects of the Taft-Hartley Act on labour relations. The Act was passed in June last year, but most of its provisions did not come into effect until August, and in some cases are only coming into effect now. The automatic check-off of dues is prohibited, for example, after July 1st. Some closed shop provisions, embodied in contracts signed before the Act was passed, are legal until the contracts expire.

It is frequently pointed out that despite two costly coal strikes the Act has cut both the number of strikes and the man-hours lost. It is true that the procedure laid down for dealing with strikes against the national health and welfare has been invoked five times in coal, telephones, shipping, meat-packing, and atomic energy. Also most of the complaints brought under the Act have, contrary to expectation, been brought by unions; employers have been slow to take advantage of their new bill of rights. But the true test of the Act will come, not at present, when easy money for wages and profits lubricates industrial relations, but in leaner times when employers are forced to drive harder bargains.

Progress has been very slow in clarifying the meaning of various clauses of the Act, as it was in the case of Wagner Act ten years ago. Although a dozen injunctions have been granted against unfair labour practices, mainly against unions, none of these cases has yet been heard by the National Labour Relations Board. The Supreme Court has been almost as uncommunicative. Labour unions considered that the prohibition of political expenditure by unions was the most vulnerable clause in the Act, because it could be argued that it infringed the freedom of the press. Mr Murray therefore made a valiant effort to infringe the law in order to hasten a decision. In a 5-to-4 decision, however, the Court has held Mr Murray innocent, on the grounds that the law, however loosely drawn, was not intended to prohibit political articles in regularly issued union newspapers. In effect, it declared the law, as well as Mr Murray, innocent. But the majority refused to rule on the validity of other types of union political expenditure, such as radio broadcasts or free distribution of campaign material to the general public.

The Court has upheld the constitutionality of the requirement that unions file their financial statements with the Department of Labour before they can enjoy the services of the Labour Board, but it has not yet passed on the non-Communist oath required of union officials. At present, the chief hold-outs are Mr Lewis's Mineworkers, the Steelworkers, and a dozen left-wing unions affiliated with the Congress of Industrial Organisations. But with the exception of Mr Lewis, they are finding the position increasingly untenable. Local unions resent being barred from the advantages of recourse to the Labour Board, and there is a steady flow of refugees to the complying unions. On the left, this is denounced as "raiding"; on the right it is defended as "giving asylum"; but under either name it exerts a constant pressure toward compliance.

* * *

Attacks on Anti-Trust

Congress has not neglected its usual election year pastime of befriending small businessmen; during the summer, members of the House Small Business Committeee will pass such time as they can spare from electioneering in investigating ways of tightening the anti-trust laws, and a sub-committee of the Senate Commerce Committee has been authorised to study both the increasing concentration of economic power in the United States and the impact of the basing-point freight system on prices. The first and wider aspect of this inquiry would presumably have brought up to date the exhaustive researches into monopoly carried out by the Temporary National Economic Committee just before the war. But the sub-committee has announced that, for the present at least, it will devote itself to the second part of the investigation, which was proposed by Senator Capehart as the result of the Supreme Court's recent basing-point decision, discussed in *The Economist* of May 15th.

The Court ruled that the multiple basing-point system, under which prices, including freight charges, are set at certain agreed places rather than at actual shipping points, was illegal. The decision applied to cement manufacturers, but the Federal Trade Commission hopes that industry in general will avail itself of the opportunity to conform voluntarily to the decision, and has reinforced its hope by issuing a restraining order against tile and brick manufacturers who are accused of similar practices. Industry's chief concern is that the decision may have made it unlawful to pursue the common system by which the seller absorbs freight costs; the members of the FTC disagree among themselves on this point. The majority hold that the cement case has no revolutionary effect but is a simple re-affirmation of the basic anti-trust provision that conspiracy to fix prices is contrary to the American system. The Commission has refused to advise on the legality of the existing systems of pricing, and the consequent uncertainty throughout industry, from steel to sugar, has resulted in an appeal to Congress for relief from the disruptive effects of the decision. Senator Capehart's inquiry is presumably an answer to this appeal, but, in the opinion of the chairman of the FTC, it would be impossible to legalise the practices prohibited by the Supreme Court decision and also preserve the anti-trust laws.

Just before its adjournment Congress won a minor victory against these laws by passing, over the President's veto, the Reed-Bulwinkle Bill which had been before it for several years. This Bill exempts railroads and other common carriers from anti-trust prosecution in connection with rate agreements, provided these are approved, as being in the public interest, by the Interstate Commerce Commission. This independent authority has practically unlimited control over railroad rates, and the new Bill does not alter existing practices to any radical extent. The President in his veto message declared that the Bill gave immunity from the anti-trust laws without providing adequate safeguards for the public interest, but the protection which it offers the railroads against anti-trust prosecutions, now pending in the Courts, seems to be a greater objection to it. The Bill's supporters, however, claim that it removes the uncertainty into which these cases have thrown the railroad industry and strengthens the position of the ICC.

The Supreme Court itself, by a vote of 5 to 4, has recently refused to be persuaded by the Department of Justice that the Sherman Act would be violated and competition eliminated if the United States Steel Corporation was allowed to purchase the Columbia Steel Company, the largest steel fabricator on the Pacific Coast. But the minority opinion of the Court held that great size, a menace in any industry, was especially serious in steel, because of its importance in the national economy, and that the acquisition of this plant would give the United States Steel Corporation, which already owns the huge Geneva producing plant in Utah, unquestioned domination in the west coast area and would protect it against the growth of independent firms in that area.

* * *

Segregation Without Discrimination?

Two days after President Truman signed the Selective Service Bill, Mr Philip Randolph, of the Brotherhood of Sleeping Car Porters, announced the formation of a League for Non-Violent Civil Disobedience against Military Segregation, and said that, unless Mr Truman has issued an executive order against racial segregation in the Armed Forces before August 16th, the League will urge non-compliance with the new draft law upon both whites and negroes. Mr Randolph warned a Congressional Committee last March that he would take such action if a draft law was passed which did not abolish segregation. The Act does not contain such a provision; nor does it, however, contain the amendment, proposed by Southerners in both Houses, which would have increased segregation. Mr Randolph is well aware that he and his supporters face imprisonment and fines, but he believes that legislation which violates "the sacred worth and personality of the individual" ought itself to be violated. "Negroes are in no mood to shoulder a gun for democracy abroad as long as they are denied democracy at home."

It is doubtful whether Mr Randolph has assessed the negro mood correctly or whether his "bargain with patriotism" will win wide support. But there is much sympathy, not confined to negroes alone, with his protest against the failure of the Armed Services to implement the instruction, published in Mr Truman's Civil Rights Message at the beginning of the year, that they eliminate discrimination as soon as possible. The negroes put the chief responsibility for this failure on the Secretary of the Army, Mr Royall from North Carolina. He takes his stand on the assertion that segregation, as practised in the Army, is not discriminatory; Mr Truman has refused to commit himself on this point, but the

Republicans definitely oppose such segregation in their platform. *Present Army* procedure follows the recommendations of the Gillem Report, made soon after the war; negroes are separated from whites at the company and battalion level, but the segregated companies are included in the same regiments. The Army contends that complete integration of the two races would in fact be discriminatory, since the average intelligence of negro recruits is below that of whites, and therefore in mixed units negroes would be unlikely to win promotion.

Such a contention will hardly appeal to the negroes, by whom in any case segregation and discrimination are indivisibly linked. This link is the basis of their opposition to the scheme for regional colleges for negroes, proposed by the Southern States as their answer to the Supreme Court's insistence that equal educational facilities must be offered to whites and negroes (described in *The Economist* of February 21, 1948). The Southern request for Congressional approval of this scheme confirmed the suspicion that its purpose was the perpetuation for segregation rather than better education for negroes. Since education is a State, not a Federal, concern, such approval was not believed to be necessary, but it would have given Federal authority for the segregation which is an essential part of the scheme, and thus might have strengthened the Southern case in future legal battles. The Bill was passed by the House, but the Senate rejected it by one vote.

Shorter Notes

The fiscal year which closed on June 30th brought a Budget surplus of $8.4 billion, by far the largest on record, and one which compares with a Presidential estimate of $7.5 billion in January last. Expenditures, mainly on foreign relief and defence accounts, fell by $1.4 billion on January estimates. From the nominal surplus for 1947-48, $3 billion will be charged against expenditures on the European recovery programme during 1948-49.

★

The two Weichel Bills passed by the House to increase shipping subsidies and extend them to lines in domestic as well as foreign traffic were not even brought to a vote in the Senate, and the attempt to write a more limited Senate measure on shipping was abandoned.

★

The United States exported about 580 million bushels of grain and flour in the past twelve months. This was an all-time record and surpassed by 10 million bushels the goal set by the President. It is expected that the United States will need to export only 480 million bushels of grain in 1948-49.

★

A liaison committee between the Maritime Commission and the Military Establishment has been set up to integrate merchant ship construction with the defence programme. A subsidy of $178 million was authorised this year by Congress, to provide 18 passenger-cargo vessels, 20 tankers and two passenger trailer vessels. Discussions on this programme will start immediately with builders, who are permitted a subsidy under the 1936 Merchant Marine Act to compensate them for the lower prices prevailing in British and European yards.

★

Idlewild, New York's international airport, opened officially on July 2nd without the blessing of several domestic airlines. The disagreement over leases between the Port of New York Authority and the airlines has yet to be settled, and both sides are apparently involved in negotiations with the Teterboro Air Terminal in New Jersey. Whatever the results of the battle, it is unlikely that passengers will benefit.

THE WORLD OVERSEAS

Peasants Under Tito

(From a Correspondent recently in Jugoslavia)

FEW if any of the foreign visitors to Jugoslavia this summer can have guessed that there was going to be trouble between Tito and the Cominform. But in the past few months it had been evident that there was some trouble inside the country. This was thought to be an internal struggle over policy and power which would settle itself. It was also clear that great strain was being caused by the efforts to achieve the high aims of the Five Year Plan. Neither of these things was secret. The latter was a problem openly discussed by leaders and people alike. Both were dealt with in two illuminating speeches made in April by Edward Kardelj, Deputy President of the Federal Government, and by Boris Kidric, chairman of the Economic Council.

It was Kardelj—one of those denounced in the Cominform attack on Tito—who made public the basic disagreement between Jugoslav leaders on the policy to be adopted towards the peasants and agriculture. Kardelj declared that the role played by the countryside in the economic structure had been ignored by leading planners; the state had not done enough for co-operative farms owing to the obstinate opposition of the finance and planning committee. This incorrect attitude was reflected in this year's budget, and for the future there must be a new attitude towards socialisation of agriculture. As neither Hebrang nor Zhujovitch was present at the budget assembly when his speech was made, and as they were shortly afterwards dismissed and expelled from the party, it was assumed that it was they who had taken this "incorrect attitude." They had obviously opposed the encouragement of co-operative farms and it was thought at the time that they were criticised for supporting individual peasant farming. The Cominform statement implies that they were all for even stronger measures in socialisation.

In Jugoslavia today one thing is clear: most peasants are doing well under the present regime and it is obviously so far government policy to allow this. *In most parts of the country*, and especially in the rich farming areas north and south of Belgrade, the peasants look prosperous. They have new clothes, new household goods and rolls of banknotes. In the market they fix their price and refuse to bargain. Only a very small number have so far joined the scheme for co-operative farming, and co-operative farms still represent a very small percentage—probably not much more than 5 per cent of the country's agricultural economy. Even this summer it has been repeatedly stated that Government policy on this matter is to encourage the peasants to go in for co-operative farming by persuasion and not by pressure.

The new linked prices system for marketing peasant produce which was launched in April of this year was an excellent example of the Government's careful handling of the villages. By this system peasants can sell their produce to the state at low fixed price and, in addition to the money payment, they receive coupons which enable them to buy industrial goods from state shops at a "lower uniform price." Peasants who do not wish to do this can sell on the free market, where prices are anything from three to six times higher than those offered by the Government; but in that case they have to buy their industrial goods also at a high free market price. There are big differences between these two prices; for instance, a pair of shoes bought against coupons costs 500 dinars, without coupons 3-4,000 dinars. Textiles on coupons cost between 140 and 280 dinars per metre, without coupons 250 to 2,500 dinars per metre. The scheme is weighted in favour of the Government to some extent, because certain industrial goods can, in fact, only be bought against coupons. The peasants are still trying this scheme out. Most of them seem to be trying to work out a method of selling both to the Government and on the free market.

The reason for the Jugoslav Government's kid-glove treatment of the peasants is clear. They still represent nearly 70 per cent of the total population of the country; the food they produce is necessary not only to feed 15 million people, but also to provide a substantial part of Jugoslavia's exports. Surpluses from a stable agriculture form the basis on which the industrial economy of the country is to be developed in the next five years.

Basis of the Five Year Plan

The Five-Year Plan, which has already been working for a year and a quarter, aims at a very rapid industrial development whilst agriculture is to remain comparatively undeveloped.

Over 5 years more than 115 milliard dinars is to be invested in industry and only 19.4 milliard dinars is given to agriculture. The result aimed at is a great increase in coal and metal mining, the electrification of the country through a series of power stations, a new modernised system of communications and a whole series of new industries. Both Kardelj and Kidric admitted this scheme to be highly ambitious, but defended it as possible if the Jugoslav people make an all-out effort. It certainly would not be possible if the government were trying conclusions with the peasants at the same time.

The difficulties of industrialising rapidly a country which until recently was carrying more than 50 per cent illiterates and had very little industry before the war are to be seen in Jugoslavia today, particularly in the more backward parts of the country. The shortage of trained personnel is obvious to all visitors and affects all major aspects of life—economic, administrative and political. Colossal efforts are being made to fill the gap. Universities, trades unions, training colleges, schools, adult education are all concentrating on training specialists. At the same time every effort is being made to urge people to greater production: payment according to output, privileges and prizes, extra rations all play their part. Propaganda encourages voluntary labour for the building of roads, houses, schools. Buildings are springing up everywhere, so that the constructional side of the programme is going ahead.

The next stage will come shortly when new industrial buildings have to be filled with the necessary machinery and equipment. Most of this must of necessity be imported from abroad: from Sweden, Switzerland, Italy as well as from countries in the eastern bloc—Poland, Czechoslovakia, Hungary and the Soviet Union. Failure to receive capital equipment and raw materials either through inability to produce the necessary exports—minerals, timber, food—or through economic sanctions following the present disagreement with the Cominform would spell ruin to the Five Year Plan as at present conceived.

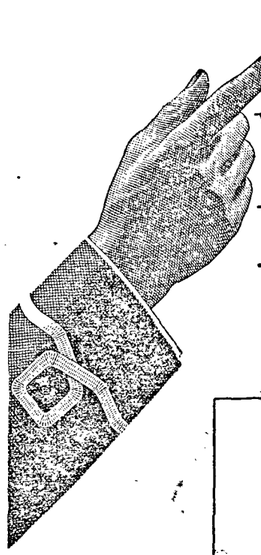
Pakistan's Prospects

[FROM A CORRESPONDENT IN KARACHI]

THE first nine months of Pakistan's existence have left the majority of observers with the impression that, while the building of the economic structure has hardly begun, the foundations have been firmly and, on the whole, wisely laid. The new Dominion has not merely survived the shocks and strains of this exceptionally difficult and hazardous period, but has given proof of the fundamental soundness and potential promise of its economy. More could hardly have been expected from an administrative machine which, though at the outset insufficiently equipped to cope with normal problems, was from the start subjected to unprecedented strains in the shape of the Punjab disturbances, the consequent refugee problem, the major political problems of Junagadh and Kashmir, economic pressure from an unfriendly India, and the hundred and one complicated issues arising out of partition. Grave administrative deficiencies and muddles there have been, but the miracle is that there have not been more; the success that has been achieved has been largely due to the talent for improvisation displayed by a handful of capable officers in key positions.

It was commonly predicted at the time of partition that Pakistan, while comparatively well supplied with foreign exchange, would be in desperate straits for revenue, and would have to face a series of deficit budgets in its early years. It was no small achievement on the part of Mr Ghulam Mohammed, the Finance Minister, to have succeeded in presenting a balanced budget for the first full year of Pakistan's existence. Admittedly, this was done at a cost; perhaps, for reasons which will appear later, at too great a cost. But the psychological effect was remarkable, especially in the neighbour Dominion, where the tone of the economic experts, who had till then been almost derisive about Pakistan's financial viability, took on a new note of respect—the more so since India's own budget showed a deficit. Nevertheless, few would claim that the finances of the State are in a sound position. In the first place, the balancing of the Central budget was partly achieved at the expense of the Provinces, all of which, except Sind, showed deficits; secondly, an unduly large proportion of the revenue is at present derived from high export duties, which can only be continued at their present rate so long as commodity prices remain inflated in the world markets. On the whole, however, the Pakistan Finance Ministry has handled its problems with shrewdness and foresight. The Pakistan Government loans have been fairly successful and a market in gilt-edged established. Currency autonomy has been secured and the State Bank has come into being under favourable auspices. So far as foreign exchange earnings are concerned, the trade balance has been even better than was expected; exports in the first nine months amounted in value to Rs. 23 crores, and imports to only Rs. 12½ crores.

Raw Material Shortage



But shortages certainly exist, and some of them are sufficiently serious to menace the whole of Pakistan's economy. In the industrial field, the main items are coal, iron, steel, cotton textiles and paper. These shortages can be made good by co-operation with India, and to secure that co-operation Pakistan has the necessary bargaining counters in the shape of the raw materials for India's two main industries, jute and cotton. At one time, it appeared that the bitterness engendered by the Punjab disturbances and later by the Kashmir dispute would serve to prevent any sort of economic collaboration between the two countries and, though a standstill agreement governing free movement of goods prevailed, something not far short of economic warfare developed. Happily, the sheer force of economic pressure (combined perhaps with a residuum of good will between old Secretariat colleagues) seems to have induced both parties to overcome political prejudices and to recognise that their national economies are complementary and inter-dependent. A series of satisfactory agreements on financial and commercial problems has recently culminated in an agreement for exchange of essential commodities which, if properly implemented—as it should be, unless the Kashmir dispute, which is now the only major issue of difference between the two countries, leads to open war—will do much to ensure the prosperity and industrial development of both India and Pakistan in the coming twelve months. Pakistan, which has no jute mills as yet, but produces 73.4 per cent of the total jute production of pre-partition India, is to supply India with five million bales of raw jute, which is only half a million bales short of India's requirements. The Pakistan Government has also agreed to supply India with 6½ lakhs of bales of raw cotton, out of a total production of 13 lakhs, and large quantities of wheat, rice, hides and skins, gypsum, soda ash and other commodities. In return, Pakistan will get about two-thirds of its total requirements of coal from India, its full requirements (apart from other imports) of cotton textiles, and some quantities of steel, paper and other products.

All this is encouraging and it looks as if the stage is set for an era of development in the youngest Dominion. The growth of commercial activity during the past six months has, indeed, been remarkable. After an initial period of dislocation caused by the sudden exodus of the Hindu business community from Western Pakistan, trade and commerce have fully revived—a process in which British business interests have taken a leading part. Many of the old-established companies of Calcutta and Bombay have opened branches or subsidiaries to handle their Pakistan business; British manufacturers have been exploring the market and are either opening their own offices or setting up agencies; banks and insurance houses have established new branches.

Need for Foreign Capital

The Pakistan authorities, however, are not entirely satisfied with the direction of progress. While they recognise the importance of commerce and its ancillary services, and welcome and appreciate the foreign entry into this field, they would like to see more foreign capital flowing into industrial development. It is their industrial backwardness of which they are most conscious, and there is a feeling that, on the other hand, the commerce of the country could be looked after by Pakistan nationals without much foreign assistance. The Muslim community is ready enough to undertake business which gives a quick return for small investments, but is, generally speaking, not prepared to invest capital in industrial undertakings where profits belong to the more distant future. It is thus in the industrial field that foreign capital and, even more, leadership and technical skill, is primarily required.

Attractive as the prospects of industrial development appear to be, there has as yet been no response from foreign capital other than British, and even British capital has not shown any hurry to come forward, except in a few instances. American

capital appears to have been holding back from a want of confidence in Pakistan's political future, which is certainly not shared in British circles. The Industrial Policy Statement published in April is partly to blame as it imposed certain conditions on the entry of foreign capital; in particular, in thirteen specified industries the promoter is required to offer 51 per cent of the capital to Pakistan nationals, and in the remaining industries 30 per cent. It is, however, doubtful whether these stipulations (which are now likely to be modified) were really deterrent to British capital generally and the big managing agency houses of Calcutta and Bombay in particular. The truth of the matter probably is—and the Pakistan Finance Ministry does not appear to have grasped *this point*—that the present level of taxation is prohibitive. There are, no doubt, some concessions in favour of newly established industries, but Mr Ghulam Mohammed's budget gave no relief to the higher income groups and this means that an individual recipient of an income exceeding Rs.1½ lakhs per annum retains only *half* an anna in the rupee, the remaining 15½ annas going to the Government. If the Pakistan Government wishes to encourage private enterprise, it should not remove the incentive.

Communist Defeat in Finland

[FROM OUR SPECIAL CORRESPONDENT IN HELSINKI]

THE Finns have inflicted another defeat on their Communists. Final results of the general elections which were held on July 1st and 2nd were: Agrarians, 56 (gain seven); Social Democrats, 55 (gain five); the Communist-dominated Popular Democrats, 38 (*loss 11*); Conservatives, 32 (gain four); Swedes, 14 (loss one); and Progressives, 5 (*loss four*). The loss of 11 seats is a severe blow to the Communists—almost a landslide for the slow processes of Finnish electoral opinion—which the success of their main opponents can only intensify. The gain for the Conservatives is the most surprising result: they undoubtedly benefited from their original opposition to the Russo-Finnish treaty and, more recently, from *unintentionally effecting* the dismissal of Leino, the Communist Minister of the Interior.

The extent of the Communist losses only became apparent in the latter stages of the election. Realisation of what was happening added much interest and some excitement to what had hitherto been a quiet and most matter-of-fact affair. At least this was the reaction of four dozen foreign journalists in Helsinki. Those Finns who had voted early had mostly gone on holiday—the Chief of Police went up North to a summer hut without a telephone—or resumed their discussion of the fine weather and the Olympic games. But this calm most certainly did not betoken apathy. More than 75 per cent of the electorate voted—without any form of compulsion beyond the dictates of a democratic conscience. In Helsinki, where the Social Democrat vote increased by 17,000 to 49,000 and the Communists fell by 5,000, there was an 85 per cent poll compared with 82 per cent in 1945. There is therefore no doubt that the changed pattern of voting is due almost entirely to a change in electoral opinion and not to a mass awakening of sleeping voters. The steady run of Communist setbacks is thus confirmed—from their losses in the local elections last October to the failure a few weeks ago of the strikes they organised in an attempt to prevent the dismissal of the Communist Minister of the Interior.

The very confirmation of this trend, however, raises awkward problems. "The Communists have lost too many seats" is a remark often heard. Their apparent acceptance of western procedures and the comparative good grace with which the Communists have suffered defeat appear ominous. It seems impossible that the process can go on much longer without evoking a positive, perhaps a violent reaction. Rumours abound on the form which this will take: the Communists in industry, for example, are reported to have been ordered not to take their holidays in July, and so on. But there are no good reasons for paying much attention to the rumours. The probability of Communist action to offset defeat was the main topic of conversation before the elections. The severity of their losses has merely given a keener edge to speculation.

The basic situation has not changed. The Finnish Communists can take effective action only if they are wholeheartedly supported by the Russians, and present considerations of Russian policy make this support no more likely now than a month ago. In particular, the coercion of Finland would virtually end all prospects of Scandinavian—or rather Swedish—neutrality, which is undoubtedly the major Russian interest in the North.

Political Trials in Portugal

[BY A SPECIAL CORRESPONDENT]

ON June 17th the Military Court gave sentence, after a public trial in the Santa Clara Hall in Lisbon lasting nine days, on Vice Admiral Jose Mendes Cabeçadas and the other military and civilian rebels implicated in the "plot" of April 10, 1947. The rebels were charged with attempting to overthrow the existing Salazar regime and to install a military junta pledged to restore the liberties of the Portuguese nation. Sixteen of those *inculpated—they* were arrested by the International Police in July last year, a number of officers having been dismissed the service a month previously—had been released at the end of April, and one, General Godinho, had died in prison. The Court awarded penalties of little more than a year's imprisonment, with corresponding fines, for most of the remainder, one officer and one civilian being acquitted. Because of the time already spent in prison this means an early release. The judgment also involves the forfeiting of political rights for three years, and in the case of serving officers, presumably loss of rank and pension. Seven officers gave notice of appeal to the Supreme Military Court.

There were special circumstances, as was indicated in the article in *The Economist* on March 20th last, making this trial an important episode in the career of the *Estado Novo*. First of all, there was the prestige attaching to Admiral Cabeçadas himself, as the man who headed the original military directorate, and to Generals Gomes da Costa and Oscar Carmona, who was President of Portugal for the last twenty years. A man of known *liberal-democratic sentiments* and complete probity, Admiral Cabeçadas had never lost touch with the Head of the State, and was known more than once to have voiced his misgivings. One of the documents in the present case was a "round-robin" memorial to President Carmona with which the latter was popularly supposed to have expressed agreement. The political quidnuncs were thus last year descanting upon a serious rift between the Head of the State and the Head of the Government. Left to himself, Salazar, undoubtedly, would have preferred to pass a sponge over the whole episode. But the zeal of his own police, and, still more, the determination of his fierce little Minister of War, Senhor Santos Costa, who is obsessed by the bogy of Communism, made that impossible. The object of the trial, then, was to make an example; but the Government was much more concerned to "clear" the President than to harry the defendants.

The case for the prosecution was that the chief accused, Admiral Cabeçadas, had been parading his subversive ideas since 1944, and that this incitement to disaffection had provoked two earlier small-scale military plots. While it was not suggested that the authors of the April 10th conspiracy were acting in collusion with Communist agitators responsible for acts of sabotage and violence at about the same time, the Government had proof that the Communists had infiltrated into the political party of which Cabeçadas's group was the military wing.

Honour Now Satisfied

Admiral Cabeçadas, ably defended by Major Jorge Botelho Moniz (brother of the former Minister of War), was able to testify that there had been no conspiracy—the lawyers had a fine time discussing the exact connotation of the term "pact" at the head of one of the documents—though he certainly had sought to make representations to the President. He stoutly affirmed, however, that the President had never agreed to any modification of the regime, and his assertion was supported by the word of one of the highest ranking naval officials, Admiral Barbosa Carmona.

This honour is satisfied among gentlemen, and the skeleton can go back into the cupboard. If, as has been alleged, Senhor Santos Costa hoped by staging the trial to force President Carmona to resign and so secure Salazar's translation to the Presidency and his own succession to the premiership, he has failed. Dr Salazar had "come clean," himself, it may be recalled, in his speech of November 25th last with his sally about the dignity of the Government being incompatible with any slighting of the President. He did not need the rattling of the bones in Santa Clara to realise that certain practices of the regime do not commend themselves to the estimable remnant of liberal Portugal. The nominal sentences are a good enough advertisement for the "humane" Portuguese dictatorship; what better proof, indeed of the stability of the regime, in the year 1948, than the fact that the trial should have been held at all?

Marry lead to glass, and the result is . . . better glass. Strange! Add still more lead, and the glass is better still, within certain limits. Some glass contains as much as **seventy-five per cent lead**—and that, for some special purposes, is the best glass of all. The gifts of lead-oxide to glass are toughness, brilliancy and maximum refraction of light (which almost compare with that of a natural diamond). Lead-glass is used whenever these qualities are important, for optical lenses, cut crystal, good tableware. Lead for glass and every other purpose is provided largely by a group of firms combined in

THE BUSINESS WORLD

Housebuilding Costs

AN article in *The Economist* last week measured the progress of the Government's housing policy. Next year, the country is to build 200,000 houses, compared with 140,000 originally set down in the Capital Investment White Paper—an increase which, on broad calculations of economic cost, is not easy to justify. This article is devoted to the narrower question of examining the cost of new houses built since the war. It is widely, and rightly, assumed that housing schemes are costing far more in the event than was expected when the housing campaign began. For this rise in costs, there are some obvious explanations—violent changes in the housing programme, interruptions to work caused by shortages of materials and bad weather, and the over-rapid expansion of the labour force employed on housebuilding.

The Ministry of Health has a Committee investigating the problem, but its report has only just been completed and is not yet published. A recent paper* by Mr A. R. Wood (who spoke independently, but with authority as Comptroller of the London County Council) shows that the contributions from the Exchequer to local authorities are already inadequate, owing to higher costs of building ; the following table is extracted from his paper:

HOUSING COSTS AND SUBSIDIES

	Subsidy Data £	Current Costs (April, 1948) £
Cottage (three-bedroom)—		
Capital costs—		
Site, roads and sewers	85	110
Buildings	1,015	1,220
	1,100	1,330
Rate of interest	3½%	3%
Annual deficiencies—	£ s.	£ s.
Loan charges	40 12	47 18
Maintenance and management including repairs	7 8	15 0
	48 0	62 18
Less—Rent	26 0 (10s. a week)	29 18 (11s. 6d. a week)
	22 0	33 0
Annual contributions to be made by—		
Exchequer	16 10	16 10
Local rates : Statutory contribution	5 10	5 10
Do. Supplementary contribution	...	11 0

These figures show that the cost of building a three-bedroom house, originally put at £1,015 for purposes of the subsidy under the 1946 Act, has increased to £1,220. The total cost, including land, site preparation and drains, has increased from £1,100 to £1,330. The result, in this typical case, is that loan charges and management cost £62 18s. a year (compared with £48 on which the Exchequer subsidy is based) against which rent brings in only £29 18s.—a mere 47½ per cent of the total cost, of which the balance is met from subsidy and, to a far larger extent than was intended, from local rates.

Mr Wood's example is put forward as a typical case representative of house building costs in England generally ; he used it to pose the question whether, with existing rents covering only one-half, and in extreme cases, only one-third, of the very high annual cost of new dwellings, the fortunate tenants should not make a contribution more attuned to their much increased resources today. The facts about the high cost of housebuilding urgently need ventilating. No official figures have been published—on the ground that full particulars of tender prices and final costs would encourage lower-cost builders to put in tenders closer to the average price. Whether this policy is wise is open to doubt ; it certainly encourages the circulation of rumour about inflated building costs. The Ministry of Health, however, is prepared to assert from the figures in its possession that the final cost of houses built by local authorities is below the ceiling price hitherto imposed on private buildings—that is, an all-in price of £1,300 (in London £1,400), including land and site preparation. Outside the Ministry of Health there is a general impression that costs are often well above these limits, and it is sometimes suggested that the Ministry's average figure owes something to the skill of the accountant and to the omission of certain expensive fitments.

On this subject, it is easy to generalise from particular cases, and the bad cases get more than their share of public attention. Local authority houses sometimes cost £1,600 or £1,700 to build. But are such cases common? In an attempt to find reliable evidence, *The Economist* recently invited a number of local authorities to provide figures of costs for their housing schemes. The authorities varied widely in size, character, and local conditions, and from their replies the following summary table has been prepared:

HOUSING COSTS OF SEVEN AUTHORITIES

Type of County Boroughs:	Contract Price, 3-Bedroomed House	Extras	Building Cost, including Extras	Total Cost including Land & Site Preparation	Completion Date
	£	£	£	£	
1. Large	950	142	1,092	1,200	Nov., '46
	991	67	1,058	1,212	Feb., '47
	1,102	16	1,118	1,279	Nov., '47
2. „	1,278	162	1,448	1,675	June, '48
3. „	1,260	...	...	1,400	„
4. Medium	1,200	100	1,300	1,610	Mar., '48
5. Small	1,192	190	1,382	1,487	1947
	1,327	217	1,544	1,729	1948
6. „	1,117	65	1,182	Not given	Mar., '47
7. Eight County Boroughs and 46 District Councils in Wales (average)	1,191	105	1,259	Not given	...

NOTE.—Each set of figures relates to a separate housing scheme of 100 or more houses. Special features, such as an additional £60 a house for extra foundations in scheme 4, have been excluded.

The table requires a few words of explanation. Most of the authorities asked that they should not be named, but their broad character is indicated in the table. Secondly, some selection has been necessary in order to provide reasonably comparable figures among the different authorities. Thirdly—and this is an important point—full costs are generally available only for the earlier schemes.

A range from £1,200 to £1,729 is very startling. In these comparisons, much depends on the relative efficiency of the authorities' housing departments, on local conditions and local difficulties. Some, at any rate, of the difference in costs of different schemes is properly explained by such considerations. But the major difference is due to the plain fact that costs have been rising steadily. The column headed "Extras" proves this point, and in some cases the figures make nonsense of the original contracts. All contracts contain a "rise and fall" clause to cover changes in wages and costs of materials. At the

* Read to the Institute of Municipal Treasurers and Accountants.

beginning of the housing campaign, there were doubts about specifications, substitution of materials and the like. Thus in the first scheme completed by Authority 1 in November, 1946, "extras" cost £142 per house. But in the scheme completed a year later, "extras" had fallen to £16, although the contract price had risen by over £150 to £1,102. Such was the experience of a large city with a fully-fledged housing department. But it was not the experience of Authority 5, where extras have actually risen; this authority, in explanation of its high total costs, particularly for the second scheme, points out that the houses were more elaborate than normal. Even so, the contractor is claiming for loss of profits through bad weather last year and through the substitution of concrete for wooden floors. The figures for the 56 Welsh authorities (example 7) are particularly illuminating. All the schemes, for which average figures are given, were completed during or before 1947; yet the average building cost, with "extras" was £1,259. Since this average does not include land, or roads and sewers, it follows that the total cost must have been well above the Ministry of Health's ceiling of £1,300 and some individual schemes cost a great deal more.

*

When the Dudley Committee reported in 1944, they put the cost of the improvements which they recommended at £132, in terms of prices in 1939, and they assumed that postwar prices would be 30 per cent higher than before the war. Accordingly, a council house costing £335 before the war was expected to rise to £610 after the war, or £700 including land and site preparation. The postwar house, with Dudley improvements and more, is costing anything between £1,200 and £1,600. It may be that the peak price for new contracts has passed. Cuts in the rate of new approvals have relieved the pressure on building work and improved builders' efficiency; local authorities are now scrutinising contracts more carefully, and rejecting a larger proportion of them. And if reports are to be believed, builders' profit margins are falling, in some cases steeply; to cite one example, a large contracting firm which until a year ago was tendering on the basis of a 10 per cent profit now claims that it is tendering with no profit margin at all, being content merely to cover its overheads and to retain its labour force.

These sterner conditions will do no harm to the industry in the long run. Soon after the war, it became packed with mushroom firms, many of them small, using green labour. Small firms undertook contracts which they were quite unqualified to fill at reasonable costs; large firms undertook big schemes and found that their labour supply was inadequate. The appointment of the local authorities as agents for the housing programme was inevitable, but it placed an enormous burden on an undermanned and largely untrained staff. Specifications took months to prepare, and supervision by inexperienced clerks of works caused exasperation and delay. All these factors have added their quota of additional cost to the already high price of labour and materials.

But when allowance is made for these transitory difficulties, there remain four principal causes of the rise in the cost of building postwar houses—labour, materials, housing standards, and planning. In 1939, average wage rates were 1s. 7d. an hour for craftsmen and 1s. 2d. an hour for labourers; average weekly earnings were 66s. In 1947, the corresponding figures were 2s. 9d. and 2s. 2d. an hour and 117s. a week. These increases are not out of line with wage rates and earnings in other industries, but they have been accompanied, as last week's article showed, by a fall in productivity which can be roughly summarised by the statement that two men are now necessary to produce the results that one produced before the war. That is not merely the result of reduced effort (though the reduction is not negligible); it is also due to the frustration of effort by shortages and by attempting too much. Moreover, part of the labour force supposedly occupied on the housing programme has slipped away into uncontrollable and often illegal work. The remedy for this melting away of the labour force lies not in controls, but in the Chancellor's financial policy which should do something to check the demand for repairs and decoration.

*

Nor is the rise in prices of building materials out of line with the movement of prices generally. If prices in 1939 are taken as 100, building materials in May cost 210, but industrial materials and manufactures together cost 235. But the maldistribution of building materials—particularly in the two years after the war—has been notorious, and attempts to control them in detail have broken down. Interruptions and delays to supplies have together played as important a part in the increased cost of new houses as rises in the prices of such materials. As for standards of housing, it is estimated that £400 out of a house costing, say, £1,350 represents improvements in standards compared with prewar—extra floor space, better fittings, the outside shed and the second water closet. Such improvements may be eminently desirable, but they use extra resources which are urgently needed for industrial building and extensions, and they cost more money—as the ratepayer is now discovering. The Dudley Committee was content to recommend a house of 900 feet super; and even for houses of this type, its estimates of costs would have been well below the actual postwar figures. But this standard has been exceeded: the three bedroom house is now 950 feet super, as a minimum, and often 1,000 feet super, compared with 750-850 feet super before 1939. The average house built between the wars represented an enormous advance upon anything that had gone before; but in turn it has been dwarfed by the new standard of accommodation set up since the war. These improvements have been made for broad social ends, and have not resulted from any economic calculation whether they can be afforded. They are already imposing strains on the finances of central and local authorities, and that strain will be greatly increased unless there is an appreciable fall in the cost of building. Perhaps the worst phase of rising costs is now over; but there is little promise as yet of any material reduction. Sooner or later, the country will have to build according to its means, and if it elects for a higher standard of housing, tenants must be expected to pay the economic cost of the improvement.

The New Oil Refineries

THE petroleum companies have begun work on building new oil refineries in Great Britain, and there seems no reasonable doubt that the huge programme will at last be carried out. But it has not entirely lost—and can hardly lose—its controversial character: the political approach, and the attitude of the average member of the general public, to any question involving oil is quite different from the approach of the petroleum trader or technician. For the industry (as the chairman's speech of any of the big oil companies will show at a glance) is a world-wide industry, and each of the big units in it thinks automatically of production, processing and distribution of petroleum in world-wide terms. The two attitudes—the local or consumer's attitude and the world-wide or producer's attitude—do not so much clash as pass each other by. The words of the Minister of Fuel and Power, in a Commons debate on oil supplies are worth considering as an example of the local, political approach. Mr Gaitskell spoke thus of the refinery programme:

> It is on a gigantic scale, and when hon. Members opposite ask why we do not do more, I would say that, in view of their absolute failure to do anything in this field before the war, this was one of the most discreditable features of their administration.

Was it? The assumption appears to be that political steps should have been taken before the war to ensure that petroleum for British use was refined in this country—and that not to do so was "discreditable." The professional would answer: "Why?" To him the obvious place to put an oil refinery is at some point conveniently near to the oilfields. It was largely on this assumption that great refining industries were built on the Caribbean and the Persian Gulf, and it was because of this assumption that the efforts of the Germans to create an autarkic oil industry at any cost were regarded as expensive folly, to be watched but not imitated.

The professionals have not changed their ideas, but they have changed their plans. What considerations brought about the change? Lord Bearsted, as recently as 1946, dismissed as "completely uneconomic" the idea of full-scale refining in the United Kingdom. In his statement to stockholders of "Shell" Transport and Trading he said then that no crude oil, or hardly any, met the exact requirements of any one market. Refineries at the point of production could supply each market with the various petroleum products in the proportions in which it needed them. The cost of transport and the heavy consumption of fuel by the refineries themselves made it uneconomic to refine in the consuming country. Further, the countries producing crude oil such as Venezuela were insisting that refining should be done at the point of production, and this was not an unnatural or an unreasonable demand. The petroleum industry could not afford the cost of multiplying refineries.

This was in July, 1946. Since then the cost of building refineries has gone up, but the petroleum industry has resigned itself to bearing it. Indeed, it had become evident before the end of 1946 that nothing else could be done. The first consideration pointing to this conclusion was the change in world supplies. World demand could not be satisfied from the existing refineries. American consumption was outstripping American production; in consequence, the United States were not only supplying less but indeed were taking more from Latin America and the Caribbean. Europe, it was becoming clear, would have to rely more on Middle East petroleum, and new refineries would have to be built somewhere. Where should they be built? The great oil companies considered the idea of putting more money into the Middle East basket, and turned it down. The Middle East looked none too safe. It would be better, they decided, to build refineries in Europe, to design them primarily for Middle East crude, but to make them flexible enough to handle Latin American or other crude should it prove necessary. Crude oils from the different producing areas of the world have different compositions—that is, they contain light, middle and heavy oils in different proportions—and no refinery manager likes switching from one to the other. But it can be done, and by extra expenditure refineries can be given extra flexibility.

This—to the professional—is the meaning of the oil refinery programme. British refineries are to be built, capable of refining petroleum from start to finish in quantities sufficient to supply the entire oil needs of the United Kingdom as far ahead as can at the moment be foreseen. They are to be flexible enough to meet any shifting of the source of supply that seems likely. They will be expensive, and their cost will have to come out of the price which the consumer will have to pay. In a "normal" world (in which the trader had to take account of economic considerations only) they would not be built in the United Kingdom at all; but the world has ceased to be "normal."

The White Paper on Capital Expenditure last December put the matter in quite another way, and is worth quoting as another example of the local political approach:

> An extensive programme for establishing oil refineries in the United Kingdom has been prepared, the object being to save large amounts of dollar exchange by refining crude oil in this country instead of importing refined products mainly from dollar sources. . . . The ultimate cost of the programme will be about £95 million (including about £60 million on plant of all kinds) for capacity capable of handling 20 million tons of oil a year. The value of the dollar saving depends partly on the speed with which the oil refineries can be built.

It is hardly an exaggeration to describe the refineries programme as the building of a new industry in the United Kingdom. Complete refining from crude oil to finished petroleum products is not unknown in the United Kingdom. It has been done, for instance, at the Anglo-American plant at Fawley and at the Heysham plant, which has been brought back into full production by Shell to replace the missing output of Haifa. But these have not, in the past, undertaken complete refining on anything like the scale now contemplated. Most of the petroleum used in the United Kingdom has been imported in the finished state, and plants such as Stanlow have dealt only with limited processes receiving "top crude" to be made into lubricants and bitumen. At a still later stage in the handling of petroleum come the new chemicals-from-oil plants which will be discussed in a later article.

Under the new programme, complete refining will become the general rule. The Shell group has started the construction of refineries at Stanlow and on the Thames, each of which

will produce from crude oil all the major petroleum products. These two refineries will take 6,250,000 tons of crude oil a year. The chairman of Anglo-Iranian Oil stated recently that the refinery at Llandarcy, which had a rated capacity of 360,000 tons, but processed 420,500 tons in 1947, was to be expanded by the end of 1949 to a capacity of 3,000,000 tons a year. Immediate operating adjustments will raise the throughput at Llandarcy this year to a rate of 840,000 tons a year. At the Grangemouth refinery of the Anglo-Iranian Oil Company capacity is to be raised this year from 360,000 tons a year to 600,000 tons, and an eventual increase to 1,500,000 tons a year is planned. Enough steel has already been allocated to allow a start to be made on these projects, which together account for half of the entire programme. The Anglo-Iranian Company also proposes to build a large new refinery on the Medway; and Sir William Fraser, in his chairman's speech this month, expressed the hope that "early approval will be given to what I feel can be regarded as an important national project." The biggest single project, that of Anglo-American Oil at Fawley, has not yet got beyond the planning stage. The plan is to build a refinery at Fawley capable of handling 6,000,000 tons a year—a scale which suggests that the parent company, Standard Oil (New Jersey), is contemplating production in Britain for export to other European countries.

In the White Paper on Capital Expenditure, the total cost of the refineries programme was estimated at about £95 million. It is early to say how wide of the mark this estimate will prove to be. Since the war the cost of building a refinery has been going up at the rate of about 10 per cent a year. Perhaps the Government's policy of discouraging increases in wages will check this rise; if not, costs in the later stages of the refinery schemes (some of which can hardly take less than five years to complete, and may take more) are likely to be well in excess of the original estimates.

The cost of building a refinery is not absolute or static, but one of the main British oil companies gives a private estimate of the present cost at £2,000 to £2,500 per ton of daily throughput. Assuming a cost of £2,250 per ton-day, it should be possible to add 15,500,000 tons a year to the refinery capacity of the country for about £95 million. The Government's estimate, therefore, appears to depend on the avoidance of any substantial further increase in costs. Much will also depend on the degree of elasticity which the new refineries are to have. Technical improvement is expensive. In a recent article in the *Times Review of Industry*, Dr. G. Tugendhat, of Manchester Oil Refineries, gave 12,000 to 15,000 dollars a ton-day as the probable cost of a modern refinery; if this is so, then the entire refineries scheme could cost very much more than the estimate. The question is important; most of the cost will have to be borne eventually by the user, even though the companies may hope to find the bulk of the finance out of profits during the next few years.

One difficulty to be overcome in the prosecution of these schemes is the supply of steel. In the early stages they will require structural steel in substantial quantities, and in the middle and later stages special plant, most of which (given the steel allocations) the expanding British petroleum equipment industry is capable of providing. Exact time-tables are simple to work out, but less simple to put into effect; for the steel is allocated in instalments, and the later instalments will no doubt depend on the pressure of other demands for steel and on the progress which the steel industry is able to make in the next few years. Whether important results from the first stages of the new programme will be achieved by next year (or even by 1950) may in the circumstances be doubtful. By 1951, at least, the new refineries should be making a substantial contribution to the oil supplies of the United Kingdom; by 1952, supplies of home-refined petroleum products should almost equal the demand, and by 1954 it should be possible for the new refineries to earn dollars from exports. But the bulk of their output must of necessity be taken up by home demand. The accompanying table shows the trend of home consumption. It does not show the full trend of home demand, for in the two critical groups—aviation and motor spirit, and black oils for the home trade—demand is at present artificially restricted. The full satisfaction of the motorist's demand for motor spirit and the demand of industry for fuel oil is not at present possible. It may become possible to satisfy it when the refineries programme reaches completion; for the world shortage is not in crude oil, but in the means of handling and refining it.

CONSUMPTION OF PETROLEUM PRODUCTS IN THE U.K.
(Tons)

	1933	1938	1947
Aviation and motor spirit	3,790,000	4,980,000	4,930,000*
Kerosene			
Burning	740,000	540,000	620,000

Bitumen	440,000	610,000	420,000
Paraffin wax	50,000	50,000	40,000

* Includes aviation turbine fuels.

Business Notes

Gold and Dollar Reserves

Even without making any detailed re-examination of the nature of Britain's economic plight, the Chancellor had no difficulty in this week's debate—the wider implications of which are discussed on an earlier page—in convincing Parliament of the indispensability of ERP. His masterly exposition of the intricacies of the bilateral pact, some of the more technical aspects of which are examined below, left no room for the mid-year stocktaking for which some had hoped. On domestic policy, the Chancellor contented himself with a brief reiteration of the need for firm adherence to the programme of disinflation, even though it involves some "unpleasant consequences," as it undoubtedly will do. The most important new facts which came to light were the details of the past quarter's drain on the central reserve of gold and dollars, the figures for which are now being published only quarterly. Viewed in the light of the very heavy demands in the first quarter, and of the fact that the reduction in the total external deficit has been much below what was forecast, these latest gold figures are reasonably reassuring. The net expenditure in gold and dollars during the quarter was £107 million, or £40 million less than in the first quarter when, however, the demands on the pool were temporarily increased by the fact that several Sterling Area countries elected to withdraw their hard currency quotas at once. The fact that they did so must partly explain the decline in external demands on the pool in the second quarter. The Chancellor stated that the Sterling Area countries as a whole had considerably reduced their drawings since 1947, and thanked them for the "understanding and co-operative way" in which they had done so.

Despite this more reassuring trend, the total expenditure of reserves for the half year, at £254 million, was substantially larger than that contemplated in the "Economic Survey." The drain of £222 million envisaged in that document did not allow for any further purchases of hard currency from the International Monetary Fund by Britain or by any Sterling Area country; and it was specifically stated that, if any such drawings were made, they should be regarded as reducing correspondingly the estimated net reduction in reserves of gold and dollars. Actually, during the half year, Britain and India, as the following table shows, together bought £26 million of dollars from the Fund, so that the half year's actual net expenditure of £254 million really compares with an estimate of £196 million:—

The actual level of reserves at end-June, it will be seen, has not felt the full impact of the heavy rate of expenditure during the half year, because at the end of the period the Treasury received the first dollar payment on account of the ERP allocation for the initial period, i.e. April-June. For this period Britain has been allocated £75 million in the form of ERP grants and has been offered £25 million in ERP loans. When the remainder of the quarter's grant is received and the terms of the loan have been negotiated—it is not yet clear whether the negotiations will relate to the amount and terms of the loan only, or whether they may also affect the amount of the grant—the total reserves should be raised above £500 million—a figure which the Chancellor regards as the minimum that Britain must retain throughout the ERP period.

In future, therefore, the Government apparently intends to adjust the whole basis of its economic planning to ensure that the reserve is kept around this level. Without an adequate reserve at the end of the ERP period, the Chancellor emphasised, it would be impossible "to support the international position of sterling" and Britain would slip into the position where it could "no longer function as the centre of what is today the only large multilateral trading group in the world." The necessary adjustments, as Sir Stafford hinted recently and reiterated this week, are likely to require a further cut in dollar imports, and the programme is already being reviewed to see "how far, if at all, that can be further pruned down without damage to our production." The final decision, however, will not be taken until the Government knows how much it can expect to get under ERP next year, both under grant and loan—and "these figures have not yet been settled."

* * *

The Earmarked Sterling Account

On the confusing and technical question of the procedure for segregating the sterling counterpart of the grant portion of ERP aid, the Chancellor added little to the information given in the agreement itself. He did say, however, that the balance on the Special Account at the Bank of England will be shown week by week as a separate item in the Bank return. Although the agreement was ratified before the date of this week's return, and although £22 million has already been received, no such entry has yet appeared, because the precise procedure to be followed has still to be settled. In the meantime, the funds are being held by the Paymaster-General on suspense account. Under the terms of the agreement, British withdrawals from the Special Account for purposes of the kind prescribed require the assent "from time to time" of the US Government; but to ensure the maximum smoothness in operation Britain is planning to establish "a close link" between the machinery for deposits and that for withdrawals.

It is reassuring to know that the Americans share the view that, of the prescribed purposes for which the funds may be used, priority should be given to debt redemption. In fact, any use for the other purposes contemplated in the agreement could, in certain circumstances, tend to defeat the main object which the United States had in mind in requesting segregation—the object of ensuring that Marshall aid was not made a means of supporting inflationary budget or credit policies. Despite the Chancellor's austere disinflationary policy, Britain's economy is still fully extended. If, while this condition lasts, the United States were to press for the segregated funds (or, for that matter, any other British funds) to be used for the "projects, programmes, explorations or developments" envisaged in the agreement, the effect would be to impose a new inflationary pressure upon Britain—unless such projects were in fact already included in Britain's own programme for current capital outlay. To this extent, the effects of the Chancellor's drive for disinflation would be neutralised—no matter how desirable the new projects might look on a longer view.

For the time being, it seems, these risks will not arise. A formula invented to support disinflation will not be used to impede it. The bulk of the funds, as the Chancellor said, is bound to be applied to debt redemption—"either short-term or long-term, according as the internal monetary situation may require." The Americans have agreed that the Special Account "should be managed from the start so as to give continuous and continuing effect to this policy," and are likely to assent promptly to any proposals for the purpose of cancelling, in present circumstances, the floating debt. This will obviate any undue accumulation of funds at the Bank of England and any undesirable repercussions on the credit structure. In other words, as *The Economist* has repeatedly emphasised, this complicated procedure for segregation will not of itself introduce any new factor into the gilt-edged situation or into the domestic banking position.

* * *

ECA and Stockpiling

The text of the European Co-operation Agreement gives no clear indication of the effect of ECA on purchases of materials by the United States for stockpiling. Under Article V, Britain undertakes to help the United States to purchase materials, originating in the United Kingdom or in those colonies which adhere to the Agreement, for stockpiling and other purposes. Many commodities, including copper, could be covered by this clause, but perhaps the two of major importance are tin and natural rubber. Under Article IV, the United States may use up to five per cent of the "Special Account" for such purchases, though the sterling cost of supervising the whole programme has also to be found from the same source. Sir Stafford Cripps announced on Monday that $300 million in grants had been offered for the first quarter. At this rate, credits to the Special Account for the first year would total £300 million, from which the United States would be entitled to use up to £15 million (less the general administrative costs of the ECA missions located within the British area) to pay for commodities bought in the United Kingdom and the colonies. Thus the residual sum of sterling available for stockpiling purchases would be something lower than £15 million.

This is not, on the face of it, an overwhelming sum; it represents, for example, only 25 per cent of the total value of natural rubber shipped to the United States last year. Moreover, certain safeguards have been incorporated in the Agreement. Quantities, periods of delivery and the terms of sale or transfer are to be agreed by both Governments. Moreover, "due regard" will be given to "the reasonable requirements of the United Kingdom for domestic use and the commercial export of such materials"; the latter phrase includes barter transactions, while "domestic use" covers the maintenance of reasonable stocks. These reservations seem virtually to reduce the sale of commodities which Britain must facilitate to rubber and tin, although at a later stage other commodities may be included in the "schedule of minimum availabilities" which is intended to make good deficiencies in the resources of the United States. But normally it would follow that the United States will make stockpiling purchases only when there are surplus supplies to be bought. But if stockpiling is for strategic purposes, will it wait for surpluses—at a time when Russia is an active buyer in the rubber and wool markets?

*

In 1947 the United States imported 561,000 tons of crude rubber from Malaya valued at about £62 million (cif) and 13,400 tons of tin metal valued at almost £6,000,000 (cif). The sterling available in the Special Account would not suffice to cover more than a fraction of last year's dollar purchases. Moreover, output of rubber and tin has not expanded sufficiently above the level of world consumption to create "burdensome" surpluses. World production of natural rubber amounted to 340,000 tons in the first quarter of 1948, against world consumption of 335,00 tons. Malayan output is running at a rate of 685,000 tons a year compared with 646,000 tons last year, whilst consumption in Britain has risen from 154,000 tons in 1947 to a current annual rate of nearly 200,000 tons. In the United States consumption has also

shown a sharp increase compared with a year ago—654,000 tons (annual rate) against 563,000 tons—and there is scope for further expansion.

Nor are tin supplies abundant. In the period January-April, 1948, world tin production amounted to 46,900 tons and apparent consumption to 45,400 tons. Compared with a year ago, British consumption of virgin tin has increased by 4 per cent, and American consumption could also increase if available supplies were sufficient to permit larger allocations. Obviously for these two commodities at least, there are no surpluses at the moment, and to carry out an active stockpiling programme would involve special allocations. Under conditions of freer supply, American purchases would form a bulwark for the market; now they might involve the reduction of normal consumption below "reasonable requirements."

New Look in Company Accounts

Shareholders this week have had their first view of the new company accounts—fuller and longer, like contemporary fashion. The spate of reports which was thrust out during June, in order to escape the full rigour of the new Companies Act, has been easily compensated by the high quality of the group reports which have appeared in new form this week—from Courtaulds, Richard Thomas and Baldwins, British Insulated and Callender's Cables and the Beecham Group. To do justice to these reports would require far more space than is available in the *Records and Statistics* supplement, and an attempt is made to remedy this deficiency in two following notes on Courtaulds and Richard Thomas and Baldwins.

The new form of accounts has enabled *The Economist* to undertake major improvements in the recording and analysis of company profits. When this work was first undertaken in 1908, company profit and loss accounts were more remarkable for what they concealed than for what they revealed. In that year, accounts were received from 775 companies; in recent years, the total has usually been well above 2,000. But although the number of companies has grown, the figures shown in their accounts have required increasingly careful interpretation. Considerable time and labour has long been expended by *The Economist* on the published figures, to ensure that income tax is treated consistently—a point, often explained in these columns, which can best be summarised as the adjustment of profits shown "net" to their equivalent "gross" basis, before deducting standard income tax. The recommendations of the Institute of Chartered Accountants and the requirements of the new Act will save much detailed work on tax adjustment.

The Economist's profits figures have been defective, too, because while they made the best attempt to summarise and analyse the results shown in the old statutory accounts of parent companies, they have hitherto not included group profits. An increasing number of companies published group profit and loss accounts before the new Act was passed, but it was obviously preferable to wait until all groups were required by law to provide group accounts before attempting to measure consolidated profits. Certain changes have also been made in the summary of company results (which appears in *Records and Statistics* each week) to give regular information about group profits. At the same time, much more detailed analyses of profits than have appeared regularly in *The Economist* itself are to be published in future, beginning with the July-September quarter.

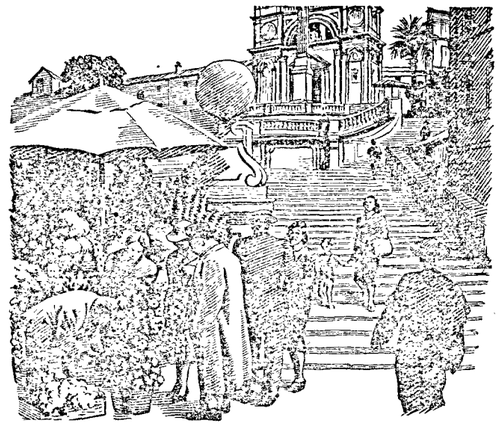
A detailed explanation of these changes must await a later occasion. In addition, an entirely new system of recording and analysing consolidated balance-sheets is being undertaken. In the course of time, this should provide much valuable information about the financial structure of British industry, its capital and reserves, and the all-important, but hitherto unmeasured, movement in current trading items, like stocks, debtors, cash and investments. By a system of mechanical recording and analysing, it is hoped to provide rapid information on the profits and finances of British industry, quarter by quarter. Thus the work begun in a tentative way forty years ago should reach new standards of comprehensiveness and accuracy. *The Economist* looks forward, with some enthusiasm, to being able to provide "a true and fair view" of the state of affairs of British industry in the years to come.

* * *

The Banks' Half-year

The bank interim dividend season, which this week has been in full swing, has followed its customary course. The clearing banks have stabilised their distributions for so long that officially-inspired dividend limitation is of no account in any analysis of bank share prospects. Earnings experience, however, has probably been more favourable during the half-year than most banks at first expected. A larger volume of resources has been available for employment, and the total has been employed more remuneratively than in the corresponding period of 1947. The half-yearly balance sheets so far available all show a larger total of deposits than at mid-1947, though not in all cases above the level of end-1947. The movement of deposits in recent months, however, has been distorted by the Argentine pay-out, so that the experience of particular banks may be an unreliable guide to that of the clearing banks as a whole. From the earnings standpoint, however, the average level of deposits during the period is much more important than their net change, and this average has generally been perceptibly higher even than the high figure of the first half of last year. For the clearing banks as a whole, the average level of resources employed in the first five months of this year—taking the average of "net" deposits—was £200 million above the corresponding figure for 1947, at £5,594 million—an increase of 3.7 per cent.

This is a much smaller rate of growth than occurred in the phase of Daltonian inflation, but it means that the disinflationary policy will have to go a good deal further before it becomes the limiting factor upon bank earnings which some people envisaged. Moreover, although average resources have risen by this relatively modest £200 million, the expansion of advances—always the most remunerative avenue for the employment of bank funds—has been accelerated. In these same five months the average level of advances was no less than £252 million, or 24 per cent, better than in the similar period of last year. The second most remunerative earning asset—the investment portfolio—has also shown a significant further rise on the average (by £32 million), although in this case the income benefit has been neutralised, at least temporarily, by the need to provide for book losses.



The fact that the banks have been able to employ on the average more than £280 million of additional funds in these relatively profitable channels, although their total resources have risen by only £200 million, is explained by the substantial reduction in the average scale of their lendings to the Government—a change which results, in this period, rather from the Treasury's large receipts from drafts on dollar credits and gold reserves than from the approach of the budget to equilibrium. These influences produced an average fall in the banks' lendings against Treasury deposit receipts by £199 million—a movement only partially offset by the £109 million increase in the holdings of, or loans against, other forms of floating debt. The banks' balance sheet structure is therefore much more favourable, from an earnings point of view, than it was at the end of the war. But much of the gain has certainly been counterbalanced by rising costs, especially staff costs. And this year, for the first time since the early phase of the war, the banks will have to look with particular care at the quality of their advances. The recession—both actual and prospective—in the luxury trades can hardly fail to leave some trail of bad debts for the banks.

* * *

Miners in Conference

Mr Arthur Horner, at the conference of the National Union of Mineworkers, dealt with the need for reorganisation of the mining industry and for the concentration of work on efficient pits in a speech which was a model of good sense. He left no doubt that the leadership, at least, of the Union is prepared to face the necessity of closing uneconomic pits. This is satisfactory. It remains to be seen whether the miners who are personally affected by the schemes will react in the same way, or whether the experience of Waleswood will be repeated throughout the coalfields. The Coal Board's offer to pay 26 weeks' compensation to displaced miners (though less than the miners' original claim for 52 weeks) is generous—it could be called lavish—and the miners can say that in this respect, as in so many others, they are favoured beyond the run of ordinary industrial workers. Indeed, the main theme of the conference has been the appeal to the men to face their responsibilities and to show due recognition of the very substantial benefits they have gained through nationalisation. Mr Bevin put this most forcefully. But it is the response—not the appeal—that will count.

Mr Horner would perhaps be more convincing when he refers to the National Coal Board's losses if he laid more emphasis on the urgent need to reduce costs, and did not put forward fresh claims for advances. The projected new wages structure has taken a long time to take shape, and is even now indefinite. But it is clear that if uniformity between districts is the object it will lead to the general raising of the level of wages. The more prosperous and better-paid districts would resist any levelling-down to the average of the unprofitable and lower-paid regions such as South Wales and Durham. It would be difficult to devise a

A Flower Market, Rome.

Rome, Paris and the Riviera . . . New sights, new sounds, new horizons. But the colour and bustle of foreign shops and markets remain the most vivid memory of our continental holiday. And the money with which we bought those honey sweet oranges, that lovely length of silk and those ingenious toys? Well, we took Travellers Cheques issued by Barclays Bank. We got them from our local branch, as easily as buying a stamp, and we changed them whenever the need for money arose. The Bank took care of all the financial technicalities, and left us free to plan the perfect holiday. The Manager of your local branch would do the same for you.

Eastern Enterprise.

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

formula which will satisfy all the districts without adding enormously to the price of coal.

Output of deep-mined coal fell by 79,700 tons last week to 3,839,600 tons; this seasonal decline normally lasts until the holidays are over and winter approaches. The total coal output of 106,060,000 tons in the first 26 weeks of 1948 slightly exceeds the half-way mark towards the year's target of 211 million tons. But there is little reassurance there; output in the second half of the year is invariably more affected by holidays than in the first half. Mr Bevin's appeal to the miners for a further 200,000 tons a week was timely and urgent.

* * *

Steel Subsidies and Prices

Mr G. R. Strauss, the Minister of Supply, took exception recently to certain observations in the monthly statistical bulletin of the British Iron and Steel Federation. Last week he stated in Parliament that steel production was enjoying the benefit of subsidies from public funds to the extent of £22 million a year—a figure to which much publicity has recently been given by supporters of the Government, in the press and in radio discussion. The latest issue of the bulletin issued by the Federation contains a detailed examination of the subsidy arrangements and their effect on steel prices—to which Mr Strauss's reactions will be particularly interesting.

The subsidy arrangements cover three separate matters: imported iron ore, imported steel, and imported scrap. On imported ore, the subsidy arises through the freight stabilisation scheme. Freights are still 240 per cent over the prewar level (partly because outward coal cargoes are not yet sufficient to fill the iron ore ships sailing to foreign ports); until recently, the Government had kept the charge for freight to the iron industry to 50 per cent over prewar, but now the formula has been changed to 100 per cent, with a consequent increase in prices of pig iron and semi-finished steel, though not in finished steel. The subsidy on iron ore imports, therefore, relates to the extra 140 per cent in freight rates over the prewar level, and it is equivalent to about 14s. per ton of ore. The total cost is put at £7,000,000 a year, though this appears to be something of an overestimate, since ore imports are running at about 9,000,000 tons a year and freights are falling. If this extra cost were added to steel prices, instead of being met from public funds, it would represent, according to the Federation's calculations, about 10s. 6d. a ton, or about 3 per cent on the price of steel. Presumably the Federation (which has recently absorbed £2,250,000 of the cost) would not oppose the charging of the full landed cost of ore, coupled with a consequent readjustment of steel prices, if the Government were to adopt that changed course.

Mr Strauss showed that £9,000,000 out of £22 million arises from imports of iron and steel—at prices higher than domestic prices. This appears to assume a higher rate of import than is now arriving—say 600,000 tons a year, compared with the present rate of 500,000 tons—and a higher gross loss per ton. At present, the difference between imported and home prices, including the import duty which accrues to the Exchequer, is £10 7s. 6d. a ton, or £6 17s. 6d. a ton if the import duty is excluded. Thus the "subsidy" (which is a subsidy to steel consumers, and not to the industry) for 1948-49 would appear to postulate a further increase in the loss per ton to something like £15 including import duty.

Thirdly, a sum of £5,000,000 appears to have been reckoned for equalising the cost of imported scrap. The faded expectations of obtaining 1,000,000 tons of commercial scrap from Germany may be revived as a result of the currency reform. The calculation is that the cost of German scrap would be £6 10s. a ton f.o.b. and £9 a ton delivered to British steel works. Thus, it would cost some £5 a ton more than domestic scrap, which is coming forward very freely at the rate of 4,500,000 tons a year at £3 10s. to £4 a ton. But there is still a good deal of uncertainty about the supplies which are likely to arrive from Germany during the coming year, and about the estimate of £5,000,000 for the cost of equalising imported and home scrap prices. If the full charge were in fact incurred, and if it was taken into account in the price of steel ingots, it would involve a 2 per cent increase in British steel prices.

*

An informative table in the bulletin compares British, Dominion and foreign prices for various steel products entering into home trade, from which British prices emerge by no means unfavourably. Australian costs are the lowest in the world, thanks to the exceptionally low cost of coal and iron ore. Angles of the size quoted in the table cost £14 12s. 6d. (sterling) per ton in Australia, compared with £16 18s. per ton in Britain and £17 0s. 2d. a ton in the United States. Prices of the less highly finished products in this country are often below the corresponding American home price (4-inch heavy bars, for example, cost £17 18s. a ton here, and £21 13s. 7d. in America) but in sheets and tinplates the comparison is markedly unfavourable. It is, of course, on these products that the British steel industry is now making a strenuous effort to draw abreast of the best American practice.

* * *

Film Quota Dispute

Mr Harold Wilson said on March 25th, in an answer to Mr Ivor Thomas in the Commons, that in the negotiations which led to the American film agreement the British side gave no undertaking of any kind about the quota under the new Films Act. He added that he intended to fix the quota "at the highest practicable level." At that time the American Agreement had been signed, but the schedules to it were still under discussion. Mr. Wilson could not have made himself more clear. But this did not prevent the American film industry complaining bitterly when the new quota for first features proved to be as high as 45 per cent. The American film producers have no formal ground for complaint, and they are showing a special aptitude for ruining their case by the unreasonable terms in which they state it; so that in the public correspondence between Sir Henry French (speaking for the British film producers) and Mr Allport (of the Motion Picture Association of America) Sir Henry has held his own with ease. But this does not entirely dispose of the matter. The Americans feel their grievance to be genuine; clearly they had been thinking of the agreement as a guarantee that their films could be fairly freely shown in this country, and it is going to be hard to persuade them that they have not been let down. Can the British film industry afford to ignore American feeling altogether? If it does, what will be its prospects of developing a United States market for British films, and how will it fare if the expansion of American finance in the film business of this country (which is hardly to be avoided, given the terms of the Agreement) takes place against a background of hostility and distrust?

The Film Quota evidently means different things to different people. Substantially, the American reproach is that it has been fixed higher than is practicable, and that this amounts to an unreasonable restraint of trade; the British industry cannot, they say, produce enough films of reasonable quality to fill 45 per cent of the first-feature playing time. The British producers maintain that they can; their contention can be proved only by trial. But when the Films Council recommended that the first-feature quota should be 45 per cent, they did so not on the basis of current production alone. The decisive evidence was an estimate by the British Film Producers' Association of the number of films which could be generally released in the first quota year, together with films still in circulation from the previous year and a number of re-issues. This does not seem to have been understood by Mr Allport, who accuses the British industry of over-stating its productive capacity. It does not appear that the British industry, for this purpose, stated its productive capacity at all; it stated what films it could get together, from current production and otherwise, for circulation in the twelve months which open in October. On the narrow question it is probably right. A bigger question remains to be answered: can the quantity required be provided in the future, over a period of years, without loss of quality? If it cannot, what is to happen to the quota? If the facts should require that the quota be reduced in a year's time, will reduction be politically possible? Political pressure, as the Parliamentary debates on the Films Bill showed, will be the other way. It may yet prove unwise to have set the first quota so high.

World Bank Loans

Mr Robert Garner, Vice-President of the International Bank for Reconstruction and Development, took the opportunity of a recent passing visit to London to discuss some of the problems that face this institution. One point which he made crystal clear was that it had no legal link with the European Recovery Programme and that none of the Marshall Aid loans would be made through its agency. He added, however, that the effect of ERP on Europe should be to make the continent safer for World Bank loans and that the bank would certainly not take the same view as had been taken by the International Monetary Fund in excluding participants in the programme from its facilities.

Mr Garner said that discussions had taken place with Britain, France and other European countries on the possibility of raising Bank loans for colonial development. It can be assumed that these discussions were concerned with general principles only and that no specific projects have been considered so far. It can even be said that on the British side the prospective borrower will need as much persuasion as the lender for such projects. The scope for further loans by the International Bank is becoming decidedly limited. So far it has made loans of $513 million, almost the whole of which has been advanced in US dollars. The resources out of which these loans have been made were provided as to $750 million from that part of the members' subscriptions which has been payable in gold or dollars and as to $250 million by the proceeds of the two bond issues made in the US capital market last year. It follows that rather less than $500 million is now available for lending, unless the bank can issue more bonds in the United States or finds it possible to make loans in currencies other than dollars. The Belgian Government has given its permission for utilisation of its local currency subscription to the Bank in order to make a small loan to Luxemburg, and a modest amount of Swiss francs needed by the Dutch Government has been raised by a direct bond issue by the International Bank to the Bank for International Settlements in Basle. These, however, are the only exceptions to the exclusive use of dollars in the Bank's operations so far, and Mr Garner expressed the hope that one day the British Government might find it possible to release its sterling quota to the Bank's capital to allow that institution to make sterling loans.

Mr Garner's visit to Britain was made on his return to Washington from a tour of the continent. The main impression he appeared to have brought back from that tour was the contrast between the recovery in production and the serious decline in intra-European trade. He stressed that the release of the now paralysed payments machinery in Europe should be given the highest priority in the work of the Office for European Economic Co-operation, and added that one of the representatives of the International Bank had attended the Paris meeting at which this problem was under discussion. This, however, is a matter in which the Fund, rather than the Bank, is designed to help.

* * *

Capital to South Africa

Further regulations have been issued by South Africa to control the movement of capital to the Union from other parts of the sterling area. Until recently the restrictions on such movements of capital affected only bank to bank transfers. They left the field wide open to easy evasions through deals in securities. The simplest way of evading the restriction on bank to bank transfers was for a resident in a country outside South Africa to buy South African shares in his own market, sell them in South Africa and keep the proceeds in that country. An attempt was made to enlist the help of the commercial banks in repelling such capital by requiring them to compel non-resident depositors either to invest or to repatriate their funds. The banks, however, appear to have pleaded their inability to tackle this task, which would have given them unwanted initiative in interpreting what was and what was not "hot" money.

The Union Treasury has accepted this plea and this week has issued regulations to cover this particular problem. South African securities purchased with funds received from residents of sterling area countries other than South Africa must in future be held under the control of an authorised dealer in South Africa. The sale of such securities will be permitted only provided the proceeds are held by the authorised dealer concerned for reinvestment in other quoted securities within a period of 30 days. If the proceeds are not so reinvested the funds must be repatriated to the sterling area country from which they were originally received. The regulation covers all South African securities held by residents of the sterling area outside the Union. In so far as it is meant to check the further inflow of capital from outside, it is merely flogging a dead donkey, effectively killed by the recent political changes in the Union. The regulation should, however, have some effect in hastening the departure of the really "hot" money which remains in the Union in the guise of bank deposits.

* * *

The Drachma

The Governor of the Bank of Greece, Mr George Mantzavinos, who is making a routine call on the Treasury and the Bank of England, has given some illuminating information about the economic position in Greece this week. He admitted that the drachma had lost a third of its purchasing power in 1947, but this, he affirmed, was due mainly to increased taxation and to the rise in dollar prices. It was not a reflection of inflation, even though he admitted that the fiduciary circulation had risen by 80 per cent over the same period. This increase in the note

July

July is the month when the farmer surveys his crops and prospects. Between seed time and harvest he reviews his position; forecasts of grain and root crops are made; hay harvesting begins. In all seasons the modern farmer calls on his banker for some necessary service—he can always turn to his bank for counsel and help in the day-to-day transactions of this basic yet ever changing industry. The Midland Bank, so intimately concerned in agricultural conditions throughout England and Wales, is ever ready to give the farmer the specialised service he may require.

MIDLAND BANK LIMITED

issue, he contended, was not inflationary because there has been a fall in the velocity of circulation, and also because the additional notes "were secured by advances for productive purposes." The Greek budget is in a state of considerable disequilibrium if military expenditure is included in it, but in spite of this fact the advances of the Bank of Greece to the Exchequer have fallen over the past year from 420 billion to 178 billion drachmas. The paradox is explained by the comparatively large outside assistance received by Greece, and also by the sales of gold coins through which the Bank of Greece has attempted to check the progress of inflation. The inflow of American funds into Greece has been the largest per head of population into any country in the world. In 1946 Unrra alone spent $210 million in Greece. In the same year the Bank of Greece lost $112 million of its reserves. In 1947 US assistance amounted to $300 million. In 1948 there have been emergency grants from the United States for military purposes, and as from last April Marshall aid has begun to flow. The drachma proceeds of this comparatively large inflow of external assistance have put at the disposal of the Greek authorities resources adequate not only to meet their current budget deficit but also to repay advances of the state to the Bank of Greece. The sales of gold coins to the public have had the same effect.

Most of the gold is now provided by the United States. The form in which it commands the best price in Greece is sovereigns, which are quoted at a wholly irrational premium in terms of French napoleons. The amount of gold now circulating in Greece has reached extraordinary proportions per head of population. A large range of goods bought and sold in Greece is quoted only in terms of gold, and rents, for example, are usually expressed in this way. The gold circulation has been fed in part from sales of the Bank of Greece's reserves, from substantial quantities of coins dropped by both sides during the period of hostilities to help the guerrillas, and finally by sales of gold acquired first from the British Government and then the United States. These details do not make up a picture of a stable and healthy economy. It is, however, a picture fully in keeping with the devastating background of civil war in which the Greek economy has been called upon to evolve since the end of official hostilities.

* * *

Courtaulds on Replacement Costs

Apart from the omission, for this year only, of comparative figures—which Mr Hanbury-Williams suggests might be accepted as reasonable in view of the many changes in the arrangement and composition of the figures—the Courtaulds accounts are a model of the new form under the Companies Act. The accounts themselves are analysed in some detail in the *Records and Statistics* Supplement, but the chairman's statement raises in addition a question of major importance, to which attention was recently directed in *The Economist*. This is the rising cost of replacement of assets.

The balance-sheet of the parent company includes fixed assets at a total value of £30,632,242, measured by replacement values immediately before the war and by cost of additions since. From this total there is deducted provisions for depreciation and obsolescence amounting in all to £18,787,688. The chairman states that the cost of replacing these assets at current prices would be much greater than the total value, before depreciation, at which they stand in the books. The difference arises, not from any increase in the value of the assets, but from the depreciation in the value of money, which presents the company with a serious problem in providing for depreciation on plant and buildings. Such provisions, which are based on book values of the assets concerned (and not on their current replacement values) leave the company "a long way short" of the annual amount necessary at current price levels to provide for replacement of plant when it is worn out.

Admittedly, the company has total reserves of £24,095,842, which have been accumulated to provide for the development and expansion of the business. But evidently a large part of these reserves must now be regarded as likely to be required to meet the ultimate cost of replacing fixed assets (since the accumulated depreciation funds will be insufficient for that purpose), the chairman does not, indeed, rule out the possibility even that further substantial sums may be required. These general reserves, of course, have to be accumulated largely out of taxed profits; the authorities will not admit them as relevant to the calculation of controlled prices (which means that the company has to sell its products below the real price), and, of course, the revenue authorities will not admit them as a deduction from taxed profits (which means that Courtaulds, like so many other companies, is being taxed on so-called "profits" which really reflect inadequate maintenance of capital assets). The chairman's observation that "this whole question of plant replacement is perhaps the greatest problem facing industry today" is no exaggeration; some Chancellor, some day, will have to take notice of it.

* * *

Richard Thomas and Baldwins

The accounts of Richard Thomas and Baldwins, set out with much technical elegance, conform to the new standards required by the Companies Act. A company note in the *Records and Statistics* Supplement attempts within its limited space to bring out some of the salient changes in the accounts themselves. Mr. E. H. Lever's statement accompanying the accounts is concerned chiefly with developments by Steel Company of Wales, and with the threat of nationalisation of the steel industry. At the end of September last year, Richard Thomas and Baldwins transferred 14 of its tinplate works to Steel Company of Wales, together with sufficient working capital to operate them, in return for £1,175,000 £1 shares in Steel Company of Wales. The main task of that concern is, of course, to complete the new steel works and strip mill at Margam, for which the first public issue of £15 million of 3 per cent debenture stock, 1952-57, was raised last year. Richard Thomas and Baldwins has subscribed for 3,000,000 £1 ordinary shares in the new company, on which 1s. per share has been called, leaving £2,850,000 to be called, it is expected, by July, 1952. Relations between the two companies will obviously be close; Mr Lever is chairman of both concerns, and Richard Thomas and Baldwins will act as selling agents for flat rolled products produced by Steel Company of Wales, which will represent the bulk of its output.

On the threat of nationalisation, Mr Lever is quite unequivocal. He points out that those responsible for the company are running its business to the best of their ability, despite the impediments of politics on administrative problems; and he declares forthrightly that "there seems no justification whatever for tampering with the structure of the iron and steel industry at the present moment. . . ." This warning is not less important because it comes from one whose knowledge of the industry is fresher and more recently acquired than the "political ideologies" of which he complains.

* * *

Hard Going for New Issues

As July 1st approached, and with it the new requirements of the Companies Act, new issue activity sharply increased. But investors have proved distinctly unreceptive to this last-minute rush, and underwriters were called upon last week to fulfil their obligations in respect of three issues—Bambergers, R. Hudson and N. Hingley. The Bambergers preference issue, however, was fully subscribed, which is indicative of the investor's present state of mind. A week earlier, underwriters of the Mabie Todd issue had to take up 75 per cent, those of Mayfair Products 84 per cent and British Tap and Die 66 per cent of the shares offered. But, despite unfavourable market conditions, when an outstanding equity like Whitbread was offered on Monday—as the table below shows, on a considerably lower dividend yield basis than any of the other companies except Hingley—the investing public was interested enough. The Whitbread issue was four times over-subscribed. The "A" shares have since risen to over 4s. premium and the "B" ordinary shares to 1s.

TERMS OF NEW ISSUES

Issue	June-July, 1947: Earnings Yield on Issue Price Gross %	June-July, 1947: Dividend Yield on Issue Price Gross %	Issue	June, 1948: Earnings Yield on Issue Price Gross %	June, 1948: Dividend Yield on Issue Price Gross %
Midland Iron and Hardware	18·0	11·7	Robert Hudson	11·9	5·9
			Stormgard	19·0	8·0
			Bambergers	18·5	8·5
Balstone Cooke and Rayonese	9·8	5·5	British Tap & Die	18·5	10·0
R. Wylie Hull	11·3	6·8	N. Hingley	33·1	4·6
Sussex Rubber	11·4	6·3	Tozer Kemsley	11·9	7·5
Burrell	21·8	5·7	Mabie Todd	15·9	6·3
Jenson & Nicholson	13·2	5·0	R. A. Brand	16·7	8·0
Thomas C. Wild	14·0	7·0	H. Ledgard	27·0	10·0
			Mayfair Products	19·8	7·2
			Whitbread & Co.	21·4	4·5

Investors now closely scrutinise the yield basis on which shares in established concerns formerly in private hands are offered to them. Out of 40 new issues made in recent weeks, 25 are quoted at a discount, 13 stand at a premium and three remain at their opening price. Given the general trend of the market, this situation is hardly surprising. A year ago, when markets were on a very different level, 11 new issues were higher than their opening price, five lower and three unchanged; for every two issues at a premium, one fell to a discount, while the proportions now are almost exactly reversed. The market pattern has, of course, changed; the *Financial Times* industrial ordinary share index fell in June and July, 1947, from 135 to 131; last month it fell from 120 to 113. This change in the equity market has found its reflection in new issue terms, of which a summary is given above. Yet, measured by results, the adjustment of new issue terms has not gone far enough. Last summer, a gross dividend yield of 6 to 7 per cent and an earnings yield of 15 per cent on a new issue was sufficient, as a rule, to ensure success. In recent weeks, much higher yields have failed to attract the public to the shares of estimable companies. Perhaps the success of the Whitbread offer, in contrast to this sequence of recent failures, is a portent of what lies in store for the important industrial issues—among them Imperial Chemical Industries—which are in an advanced stage of preparation.

* * *

No Preference for Tin Ore

The Malayan preferential export duty on tin ore, always a bone of contention with America, has been lifted as from June 30th. This duty amounted to about £61 a ton and was levied on all ore shipped for smelting to destinations other than the Straits Settlements, Australia and the United Kingdom. It meant in fact that smelters within the Commonwealth bought Malayan ore £61 a ton cheaper than foreign smelters. In addition to this preferential tax, there is also a revenue duty of approximately £60 a ton for ore of 70 per cent tin content which still remains in force, and is levied on all shipments.

With the abolition of the preferential duty, America will be able to import high grade Malayan ore to "sweeten" the low-grade Bolivian ore used in its Texas smelter. But there is unlikely to be any immediate change in the sources of supply, since current contracts run to the end of year, while the international allocation of tin is not due to expire until June next year. America could perhaps convince the Combined Tin Committee that it should import more Malayan ore rather than Malayan tin-metal, but the real effect of increased American demand must await a freer tin market. Under the Geneva Tariff Agreement signed last November, Britain agreed to abolish the preferential export duty only on condition that the Texas smelter should not be subsidised by the American Government. But reports from Washington state that the Reconstruction Finance Corporation has been empowered to maintain the smelter in operation until June, 1950.

The latest action is not due solely to American representations. It has also been required by the changed political status of Singapore. The exclusion of Singapore from the Federation of Malaya would have meant that under the preferential duty system its smelter would have to pay the second export duty and would, therefore, have to operate at a considerable disadvantage compared with the Penang smelter. The important point now, however, is whether America is now running its smelter on a commercial basis. It could, of course, be argued—how effectively still remains to be seen—that under Article V of the Economic Co-operation Agreement, Britain was obliged to remove the preferential duty as it agreed to "the removal of any hindrances to the transfer of such materials (for stockpiling or other purposes) to the United States." In that case, has America no reciprocal commitment?

Investments in South America

The process of clearing up the sale of British investments in South America continues on its inglorious, untidy way. In some cases, the prospect of purchase is still uncertain, which is perhaps as invidious as a knockdown price in an agreed sale. For example, the likelihood of the eventual purchase of British-owned railways and utilities in Brazil has not been greatly altered since the publication of the Trade and Payments Agreement last month. This week's rally in Leopoldina seems to have been prompted more by vague hopes that a "take over" may be arranged than by any point of substance in the latest statement from the company. In fact, the directors have no information to give about overcoming the difficulties of this and other railways in Brazil; stockholders know only that the "possibility and desirability" of taking over the railway is among the terms of reference of a committee recently appointed by the Brazilian Minister of Transport to inquire into the situation of the railway.

Prospects of compensation for expropriated properties of other British companies in Brazil have also receded. It is reported that Para Electric has no further funds in Brazil to pursue its case for restoration of its properties seized last February, but action is apparently under consideration by the British authorities. Ceara Tramway, Light and Power, also dispossessed, received the doubtful assurance that a local municipality had been commissioned by the central authorities to pay an indemnity to the company; it now finds that the municipality is quite unwilling to do so. The eventual payment in sterling to San Paulo (Brazilian) Railway of compensation for its "recognised capital" of £6,638,803 plus accrued interest at 7 per cent has advanced one stage further this week by the approval of the Public Works Committee of the Senate. But since the measure has still to obtain the consent of the Finance Committee of the Senate, the Finance Ministry, a plenary session of Congress and finally of President Dutra, many months are likely to elapse before the money is available to stockholders in London; meanwhile, a decision about the company's other claims in respect of "unrecognised capital" is not yet in sight.

There are occasional difficulties in London, even when purchase prices are provisionally agreed. Last week, the universal approval demanded by the Uruguay railway companies for their schemes of settlement was not forthcoming. The second debenture stockholders of Central Uruguay Railway refused to support the directors' proposals by the required majority of seventy-five per cent of the value of stock voted—indeed holders of some £864,701 of stock voted against and £1,065,861 for the proposals. The objections of these dissenters, which have been well ventilated since the announcement of the scheme, must now be resolved either by mutual arrangement between second debenture holders and ordinary stock holders or by the submission of new terms of compensation by the company.

Postwar Record in Rubber

The spot price for rubber in London reached 1s. 2¾d. a lb. on Tuesday, the highest level since the reopening of the free market last year, and the highest recorded price under free market conditions since 1928. Several factors have contributed to the recent firmness of the market. Supplies are relatively scarce in London owing to the diversion of shipments to America last May. The political troubles in Malaya, while not yet directly affecting output, are expected to reduce the quantities marketed in the near future. Mr Rees-Williams, Under-Secretary of State for the

Colonies, stated in the House of Commons on Wednesday that firm action is being taken against the terrorists, but only if the present unrest is quickly dispelled will rubber production and available supplies be adequate.

These political difficulties have had less effect on the rubber market than American and Russian buying. Russia has purchased large quantities from Malaya and has also agreed to buy further supplies from Siam and Indonesia. Russian imports for the whole of 1947 amounted to 35,000 tons; in the first quarter of 1948 they rose to 13,000 tons, and subsequent shipments are expected to be more than double that rate. American purchases for stockpiling have not been on such a large scale. The reported intention of the American Government is to accumulate 700,000 tons of natural rubber, and stocks at the moment are believed to be less than half that figure. Moreover, natural rubber has assumed greater strategic importance in the United States owing to the shortage of petroleum which provides the raw material for synthetic rubber. Under present political conditions, American purchases are almost certain to expand. Rubber output from the Indonesian estates is increasing, but it is less than a third of that of 1938, which was a poor year. The improvement which has taken place in recent months promises a fairly rapid increase in production, but not to the extent that surplus supplies are likely to arise during the current year.

Settling Anglo-Italian Debts

Agreement has now been reached between the representative of the Italian Treasury in London and the Council of Foreign Bondholders on the terms and conditions for the settlement of part of the outstanding sterling Italian bonded indebtedness. So far holders of two issues are to receive payments. Holders of Italian Credit Consortium 7 per cent bonds are to receive a capital repayment in full and arrears of interest up to March 1, 1947. Interest on the Royal Sardinian Railway 3 per cent bonds is to be paid up to September 15, 1947, from which date the Italian Treasury will resume interest payments in full while reserving the right to redeem the bonds at par. The payments will be made in lire transferable at the rate of exchange on the day of maturity, with the exception that in the case of Italian nationals the payment of interest will be effected in lire in Italy.

Further discussions are being held on the terms of settlement of the Maremmana 5 per cent Railway Loan, 1862, as well as on the Italian Government's share of the guarantee for the Austrian Government Guaranteed Conversion Loan, 1934-39. No indication has yet been given of any change in attitude of the Italian Government following the protest lodged earlier by the British authorities on the Italian refusal to fulfil its share of the guarantee on the Austrian loan, on the grounds that Austria had not proved its incapacity to service the loan.

Persons with debts due to them from Italy arising from contracts or agreements entered into before the outbreak of war (June 11, 1940) may also shortly expect to receive payment. The arrangements for settlement contemplated in the inter-Governmental Financial Agreements of April, 1947, have now been concluded, and payment to creditors in the United Kingdom of old claims against, and debts due from, Italy has now begun. It is being made through the Midland Bank, Limited (Overseas Branch), which will communicate with the creditor when his debt is about to be paid. The payments now being made, however, relate only to cases in which the debtor has made a corresponding deposit of lire in Italy. Any creditor, therefore, who has not been informed that his debtor made such a deposit before or during the war should draw the debtor's attention to the need for making the payment in lire. In any case, it is desirable that creditors should get into touch with their debtors to agree the amount and other particulars of the debts involved. The inter-Governmental Agreement does not provide machinery for settlement of any disputes between debtor and creditor; these will have to be settled through the normal processes of the Italian Courts.

Falling Property Values

In the last three months, there has been a noticeable fall in the cost of living accommodation in or around London. Price movements of house property and flats are never uniform and it is dangerous to generalise about the various types of living accommodation. Some particular illustrations, however, do suggest that the highest prices belong to the past. In the home counties, modern houses with four to six bedrooms which at the beginning of the year cost £4,750 to £9,000 can be bought for £500-£1,000 less. It seems the peak in prices was reached at about three times the prewar level. London estate agents do not as yet complain that the number of transactions in this type of property is falling, but agents are now more frequently moved to persuade their selling clients to modify their expectations and property remains longer on agents' books. Prices of houses with 6-10 bedrooms are holding rather better, partly because this size is one stage further removed from the possibility of competition from new construction, but more often because it is easily adaptable for separate accommodation, at least when the house is old-fashioned. Local agents handling smaller property below £3,000 at 1947 prices declare that they have experienced an actual reduction in business and that prices have fallen by some 10 per cent. This type of property forms the mainstay of the building societies' business. Before the war the American concept that a man lived in a house worth 2 years of his income was applicable for this country too. It seems hardly conceivable that the majority of people living in a £3,000 house have an income of £1,500. Furthermore, before the war a second-hand house invariably fetched less than a new house, and £2,750, even at present building prices, is in excess of replacement cost. Thus the current level of prices can be none too secure.

House property in London has fluctuated even more widely than in the country. According to agents' experience, activity and prices are closely bound up with the stock markets. Houses of the non-basement or modernised period type situated within a radius of 2 miles from Hyde Park Corner fell during the war to below half their prewar value; by 1946 they had risen to twice or three times the 1939 level. Such a house is unlikely to fetch more than twice its prewar value today, and even at that level there is some evidence of reduced sales.

Premium payments to purchase leases of flats became prevalent at the beginning of 1945. The type of 6 roomed flat which could often only be acquired by paying a premium of £2,500 in 1946 or 1947, cannot be easily let today even if the premium is reduced by £1,000. The chief problem of agents at present is to persuade outgoing tenants that the prices demanded for premiums are still too high. The only exception to this fall in prices and premiums is of old leases not subject to rent restriction which have reverted to the landlord. Such leases are rarely renewed at rents increased by less than 75-100 per cent above the prewar level.

"We're a family business, of course, but we had to look about for new blood"

"OUR BUSINESS has been a one-family concern since it started. I can't remember that any of our key-positions has ever been filled by someone outside the family or friends.

"On balance this method has served pretty well. But we hadn't foreseen what we'd come up against these last two years. Almost at once we needed to double output with nothing like the requisite new plant in sight. That meant revising schedules, reorganizing, speeding the works up generally. And it meant a good new man to do it.

"I didn't think of the Appointments Office at first, and then when I'd come near believing the right man didn't exist, I remembered them. In a matter of days they found us a first-rate man, already handling a similar job up North. You see, the 14 Regional Offices are linked by teleprinter. And, incidentally, we interviewed only half a dozen applicants—the preliminary sifting had all been done for us!"

Hundreds of employers have commended the service given by the 14 Regional Appointments Offices, whether the need is for men and women already experienced and who are sometimes holding responsible posts, or for promising younger candidates to train.

Since VE-day, the Appointments Department has successfully filled over 68,000 responsible posts. If you have a staffing problem, your Regional Appointments Office is ready to help.

For highly qualified technical and scientific personnel—engineers, scientists, architects, etc.—appointments are dealt with centrally, in London, by the specialist staff of the Technical and Scientific Register, York House, Kingsway, W.C.2. Temple Bar 8020.

14 linked Appointments Offices cover the Nation's potential executive manpower

COMPANY MEETINGS

PINCHIN, JOHNSON AND ASSOCIATES, LIMITED

AN OUTSTANDING PERIOD

WORLD-WIDE ACTIVITY

RECORD TRADING

MR C. G. HEYWOOD'S REVIEW

The annual general meeting of Pinchin, Johnson and Associates, Limited, was held on 29th ultimo at Tigbourne Court, Witley, Surrey. MR C. G. HEYWOOD (the Chairman) presided.

The directors' report stated that the accounts were for a trading period of fifteen months, but dividends on all overseas and subsidiary companies were for twelve months. The net profit and total value of sales for the period under review both constituted a record in the history of the company, while the volume of production of the home factories showed a substantial increase.

Direct exports showed a very considerable increase and all overseas units continued to operate successfully and their total sales and profits have reached a record mark.

The Chairman's statement was as follows:—

The period under review may be said to be one of remarkable importance in the annals of our old-established undertaking.

NEW CAPITAL ISSUE

Regarding the increase of the company's capital, the Treasury have agreed, with the Capital Issues Committee, that we may issue 730,500 additional ordinary shares producing some £1,500,000. I would say that this is not entirely as we had desired. However, the powers-that-be have considered that we are not entitled, under the stress of national emergency, to complete, as we had planned, our rehabilitation. We have represented to the authorities that this is not satisfactory and not just. As you know, our principal works in the United Kingdom—three out of eight—suffered grievous damage from enemy attack from the air. I am happy to announce that one of our principal works has had its rehabilitation completed, but two others, one of them the largest, still have much to be done.

I profoundly disagree with the authorities in their attitude. Only by taking advantage of our—I am inspired to say unique—knowledge and experience of paint factory planning can we offer, as we would wish, a service for super-type industrial surface coating materials which it is our aim and intention to provide.

In the past three years our experts have examined throughout the world current technique and production methods before we finalised our rehabilitation planning. Our missions were undertaken because we recognised the supreme value, not of our restoring our capacity and methods to a *status quo ante*, but on replanning of our building and the installation of such machinery as would ensure the highest degree of mechanised control. This would naturally lower the cost of production and thereby enable us to continue paying wages at a level, which represents one of the four decencies previously postulated together with many privileges which go beyond mere wage.

We believe in a balance between the return to the shareholder and the reward to the human element, by whose co-operation we run our machines and material.

We believe that, in operating the money, machines, material and men to provide an efficient service to our clientele, if we motivate increased effort by means of incentives, we are good economists.

The price of 42s. per share represents four and one-fifth times the nominal value of the new issue. Assuming the 25 per cent. dividend is maintained on the total Ordinary capital, the gross yield is at the rate of 5⅛ per cent., or, net, 3¼ per cent., while at the market price of the Ordinary shares ruling on March 31, 1948, the income yield was approximately 4½ per cent. gross and 2⅞ per cent. net.

CURRENT VALUE OF ASSETS

During the year a revaluation of our buildings, land and plant has been completed and it is interesting to note that such valuation is over two and a-half times the figure at which these assets appear in the books. I would mention that depreciation is now carried on the higher valuation.

Analysis of the balance sheet further shows considerable increase of capital absorbed (1) in overseas enterprises and (2) in home investments. It is interesting for you to note that the appreciation of home and overseas investments, in the period under review, is in excess of £1,000,000. This appreciation, of course, is not reflected in any way in our book values.

It is also to be noted that we have now, in plastic enterprises, which includes our own manufacturing operation in the plastic resin field, a sum exceeding £800,000 sterling.

Inventories are in excess of the preceding period by £550,000. The inventory is mainly reflected by commodity values, the prices of which, in many cases, are not controlled by us. Much of our material is allocated to us at prices determined by Government departments.

Although our trading figure is an all-time record the sales show a 4 per cent. decrease in gross profit, and our consumers have benefited thereby.

WIDESPREAD SHAREHOLDINGS

I would like also to give you very interesting aspects of our organisation. Over 35,000 people derive salaries, wages or dividends from P.J.A. and its ramifications. Half of that number are operatives, and half shareholders. Of the shareholders it is very interesting to note that 50 per cent. of the entire shareholding is held by small shareholders, and that of such small shareholders, half are women. Large individual shareholders own 10 per cent. of the company's capital, and institutions, banks and other companies 23 per cent.

The net return to the shareholder is less than he obtained pre-war. Commodity prices, compared to pre-war, have advanced from 200 per cent. to 800 per cent. Power, coal, package, transportation—all show sharp increases over pre-war. Basic wages for labour show an average increase of over 100 per cent.

Shareholders will be pleased to learn that we can hope for a return of our headquarters building, 4, Carlton-gardens, in the very near future.

WORLD-WIDE OPERATIONS

P.J.A. derives its revenue from a multiplicity of operations. Precisely, we have thirty-six companies operating in fifteen countries in five continents. We have, in all, thirty factories. We claim to be in the forefront of the supply of industrial surface coatings. I would refer briefly to the dominating position of some of our units. The Pinchin, Johnson trading company in the insulating field, with its important effect on the electrical energy supply of the nation; to the service offered in the field of transportation, maintenance by Docker Brothers, who, like our Yorkshire unit, Robert Kearsley and Company, are famous the world over for road and rail transportation finishes. It is gratifying that the Docker Brothers unit in our group, to whom we look for progress in aircraft finishing material, can claim to have evolved and supplied the surface coatings for the record jet propelled 'plane. The Red Hand Compositions Company, a name famous in the marine field the world over for ships' bottom coatings, continues to develop in a most satisfactory manner. Our American Red Hand subsidiary is moving its plant to a new location, where a model factory is in course of erection, to cater for the American trade. I would also like to make reference to the work of the Robt. Ingham Clark and Company unit, especially in the can coating trade. Can coatings are of immense value in the service of food supplies. All our other units add their quota to this picture of progress.

It has been my privilege to have travelled considerable distances during the past fifteen months. I have visited India, Australia, China, Canada, U.S.A., and Latin America and Africa, and development and expansion plans have been agreed to all these points.

Reviewing the period behind us, that which is covered by the accounts, I see it, in retrospect, as a period of great activity, achievement, consolidation and development. We are fettered only by circumstances that are beyond our control. Our determination is to press more and more for the easement and the abolition of much that clutters us up unnecessarily. We are not disposed to be content with second best.

I am pleased to report that Mr Horace W. Clarke, noted light alloy metallurgist, has consented to join our Board. Together with our valuable interests in plastics, the resins of which, as I have often stated, are closely allied to the resins needed in the surface coating industry for use in paint, we now have a direct link with an expert in the light alloy field. Therefore, in these two new fields of plastics and light alloys we know that we are not at a disadvantage.

DEVELOPMENT AHEAD

We entertain no fears regarding a possible diminution in the demand for surface coatings. Neither plastics not light alloys will out-mode the use of surface coatings, which will remain the most flexible and individualistic means of ensuring protection and beautification of so much that makes up our design for better living for today and tomorrow.

I have referred to our close connection with plastics. We are also very interested in petroleum technology, by which it is possible to introduce more man-made and controlled ingredients which, together with developments of processing oils to which I referred last year, give interesting promise.

I am by no means against control, and I am very much in favour of the stabilisation of raw material prices, because an economy that is unstable is not good business. Surface coatings are complex products, and not the result of one or two simple commodities blended together. Real cost is not merely a commodity ingredient cost. Real cost includes research formulation control and other factors that are needed when a product is being offered that has great technical merit and outstanding performance, and we rate our service to industry and transport maintenance as the highest priority that we can offer to national recovery.

It is a matter of satisfaction that our indirect exports show a great increase over the previous period, and these could be further increased if the necessary materials were

available to us. This is a valuable contribution to the national economy, as many of the articles that are finished or treated with our products are exported to the hard-currency areas.

FUTURE CONFIDENCE

Regarding the future, I consider your company has little fear that the products it manufactures and supplies to every branch of the industrial, public utility, building and home user will not meet with full demand for a considerable time to come, and it is interesting to note that the sales for the first period of our new year are in excess of those of last year.

TRIBUTE TO STAFF

In conclusion, I feel sure that shareholders would like to associate themselves with me in extending our appreciative recognition to all workers, staff and management, by whose efforts the results now shown have been obtained.

The report and accounts for the 15 months' period ended March 31, 1948, were adopted and a final dividend of 23⅓ per cent., less tax, was declared on the Ordinary shares, making 31⅓ per cent., less tax, for the 15 months' period.

The retiring directors were re-elected and the auditors reappointed.

PURNELL AND SONS, LIMITED

SATISFACTORY OUTLOOK

The annual general meeting of Purnell and Sons, Limited, was held, on the 30th ultimo, at the Waldorf Hotel, London.

In the course of his speech, Mr W. Harvey, chairman and managing director, said:—

The accounts which are being submitted to you have been prepared as far as practicable, having regard to the provisions of the Companies Act, 1947. As promised a consolidated balance-sheet has been prepared, but it has been found impossible to give comparative figures. Also, having regard to the factors that the closing of the accounts of the subsidiary companies on the same day as the parent company has resulted in trading periods of varying durations, and the accounts of the earlier periods have not been prepared on a uniform basis, it was impracticable to prepare a consolidated profit and loss account which would not be misleading. It is, however, your directors' intention to submit with the accounts at the end of the current period a consolidated profit and loss account.

May I remind you, when making comparisons, that the period covered by the present accounts is for 15 months, whereas the previous accounts only covered 12 months.

PROFIT FIGURES

The profit for fifteen months, before providing for taxation, is £1,219,595, equal to an annual profit of £983,676; the comparable figure for 1946 being £988,005. Taxation has absorbed £650,000, leaving a net balance of £569,595, equal to £463,676 for a year as compared with £188,005 in 1946.

No provision for deferred repairs was necessary in the current period, but it will be observed that depreciation shows a substantial increase, due to the factor that your directors have provided in the accounts under review for depreciation, including the amounts for initial allowances allowed by the revenue on new plant, in computing profits for taxation under the provision of the Income Tax Act, 1945.

After providing £75,000 for contingencies, transferring £219,057 to general reserve, and providing for the dividends paid and recommended, there is a balance to be carried forward of £240,124.

I should now like to draw your attention to the balance sheet. Surplus and reserves total £843,560, and when added to the premium on shares, make a total of £1,197,782. This excludes provision for future taxation of £400,000. Current assets show an excess over liabilities of £175,052.

The consolidated balance sheet confirms the strength of your company as shown by the balance sheet of the parent company. The current assets, when added to the post-war refund, total £2,429,037, and as the current liabilities are £1,823,454, there is a surplus of current assets over current liabilities of £605,583.

CURRENT YEAR'S TRADING

In regard to the current year's trading, I have to report that increasing costs in regard to wages and other revenue expenditure have to be met, but I anticipate another satisfactory year.

I should like to mention here that your directors gave consideration to the suggestion put forward at the last annual meeting that the shares of the company should be subdivided into 1s. units, but, having regard to all circumstances, they decided that it was not in the interests of the company to make this change.

I would, once again, like to pay tribute to the work of my colleagues on the board, the staff and the workpeople, who have, throughout the period, given their wholehearted support and co-operation, without which the excellent results shown by the accounts could not have been attained.

The report and accounts were adopted.

THE VITAMINS GROUP

A.F.P. LTD., BEMAX SALES LTD., VITAMINS LTD.

At the recent general meeting of Vitamins Limited, the chairman, Mr H. C. H. Graves, said the accounts now had a revealing "new look," not only in substantial compliance with the 1948 Companies Act, but also in the style of presentation, which he commended as a model. Trading profits at £72,948 showed a gross increase of 75 per cent. and a net increase of 100 per cent.—reflecting the heavily increased turnover of all departments.

They had acquired £65,000 net of new fixed assets during the year and still showed a very liquid cash position. Additional finance might be needed within the next year or two—especially if they found the "long term" home they were seeking for their manufacturing activities.

The balance sheet showed a "net worth" of about a quarter million sterling against issued capital of £77,800. Plant and machinery, costing £110,000, had been written down to £24,000, freehold land and buildings to £45,000.

Exports had constituted a record—as had sales of Vitamealo through their Agricultural Division and of their Vitamin preparations through their Pharmaceutical Division.

Their range of ethical medical products included not only all the standard pharmacopœial vitamin preparations, but also their well-known specialities, Bemax, Befortiss, Complevite, Fertilol, Pregnavite, which offered advantages which the medical profession had long recognised, as proven by the increasing volume of prescriptions.

DEVELOPMENTS IN RESEARCH

The great expansion in their turnover made extensions of premises—especially on the agricultural side—most urgent, but some improvement had been effected by securing additional office accommodation, wharfage space and a new training headquarters. They had recently purchased new Research Headquarters at Walton Oaks.

Sited on the main Banstead-Dorking Road, only 18 miles from their Hammersmith factories, Walton Oaks provided nearly 300 acres of excellent freehold land, two farms and 17 subsidiary cottages, and seemed ideal for conversion into one of the leading experimental stations of its kind in the country.

G.R.A. TRUST, LIMITED

MR F. S. GENTLE ON UNFAIR DISCRIMINATION

The twentieth ordinary general meeting of this company was held on the 29th ultimo in London.

Mr Francis S. Gentle, the chairman, in the course of his speech, said: The profit and loss account shows profit and sundry income of £1,010,000 for 15 months, as against £2,125,000 for the preceding 12 months. The 1946 results were quite exceptional. The comparable figure of profit before taxation in 1938, the last prewar year, was £350,000 in round figures. The Trust then paid a dividend of 40 per cent. and we all felt that we had had a pretty good year. The directors now recommend a final ordinary dividend of 50 per cent., making a total of 90 per cent. for the 15 months, which is equivalent to an annual rate of 72 per cent.

RESTRICTIONS

From July 1, 1948, there will be some amelioration of restrictions inasmuch as mid-week racing will be permissible—but only on the basis that all licensed tracks in the country have been grouped in geographical areas and that all mid-week racing in each particular area must take place on the same day and in the evening only. Therefore, although we can now look forward to a resumption of mid-week racing, each track must operate at practically the same time as neighbouring tracks are operating and, because of this enforced inter-track competition, the probable benefits of this relaxation in the restrictions are difficult to estimate.

As from January 4, 1948, the Government imposed a crippling and invidious levy of 10 per cent. on the Totalisator turnover at greyhound tracks.

This taxation on totalisators at greyhound racecourses only, has resulted in driving revenue to untaxed sources.

This discriminatory and unjust taxation of one of the most popular of the public sports, while other betting sports go free, cannot be defended on a point of equity or revenue planning.

In your Board's opinion there is only one fair and equitable solution before this piecemeal betting legislation defeats its own ends and that is to defer taxation of totalisators and bookmakers on greyhound racecourses until the whole problem of betting on and off the course at horse races, pony races and greyhound races can be dealt with together.

A DIFFICULT PERIOD

The period has been one of many difficulties. Vexatious restrictions, discriminatory taxation, the fall in spending power of the public and rising costs have all contributed to a severe drop in gross profits, the full effect of which has not been felt by the shareholders because such a large portion of the 1946 profits went in excess profits tax. Moreover, while the present accounts included a period of nearly six weeks when all greyhound racing was stopped, we must bear in mind the very substantial and progressive fall in Totalisator revenue resulting from the imposition of the 10 per cent. pool betting duty and the fact that this duty was in operation for only the last three out of the 15 months which we have been reviewing. How far this fall will be offset by the restricted resumption of mid-week racing at the beginning of next month it is quite impossible to say.

I obviously cannot give you any useful forecast of the results for the current year, but, troubled as is the immediate outlook for the industry, the popularity of the sport and your company's good repute with our staunch friends the greyhound racing patrons give me quiet confidence in the longer view.

The report was adopted.

ULTRAMAR COMPANY, LIMITED

A REMARKABLE ACHIEVEMENT

SIR EDWIN HERBERT ON PRODUCTION PLANS

The twelfth ordinary general meeting of Ultramar Company, Limited, was held, on the 28th ultimo, in London.

Sir Edwin Herbert, the chairman, in the course of his speech, said: I do not think that I need make any special comment on the accounts. They show that during the period advances to subsidiary companies have risen by £4,888,794 to £7,830,268. Since December 31, 1947, a further £1,232,364 has been remitted abroad. This sum represents the remaining proceeds of our issue of Loan Stock and F.C.I. loans (less an adequate balance retained in London). These remittances have all been sent to our subsidiary company, Caracas Petroleum S.A. and utilised by that company mainly in making advances to S.A.P. Las Mercedes, in which it and our friends the Texas Company are equally interested, but partly in carrying on its own operations. S.A.P. Las Mercedes, which has carried out the principal part of the operating work, has spent the monies advanced to it in the development of its properties, the construction of a pipeline and deep sea terminal, and in exploration. The monies so advanced amount, as you will see, in all to over £10 million, a very large sum to be spent before the stage of commercial production is reached.

During the past few weeks we have passed a milestone in the history of the undertakings in which your company is interested. On March 15, 1948, the first group of producing wells in the Mercedes field was connected to the storage tanks at Guasimito, close to the Mercedes camp, and other groups have been connected since as the field gathering systems have been completed. There are three of these tanks, each with a capacity of 130,000 barrels. On May 5th the last joint in the 157-mile pipeline from Guasimito to our sea terminal at Pamatacual was welded. The inevitable minor defects in so long a new line running over rough and, in many parts, virgin territory appeared while the line was being tested with water, but on Thursday, June 17th, pumping oil into the line from the storage tanks began. The line is now filled, the storage tanks at the sea terminal are filling up, and as I speak to you the first tanker is en route for loading. The hope we expressed in our prospectus of a year ago that we would get the Mercedes field into production and the pipeline into operation during the second quarter of 1948 has been fulfilled with a few days to spare.

I think you will agree that this is a remarkable achievement, especially when one remembers the world shortage of steel and other materials and the consequent need to obtain permits and licences, which. I can assure you, are not exclusively British institutions.

PRODUCTION POSITION

In our prospectus of a year ago we ventured the hope that by the second quarter of 1948 there would be enough wells to give an initial potential production of 25,000 barrels a day. That hope has been more than fulfilled. A year ago we had 32 wells in the Mercedes and Palacio fields. Today we have 90 wells with an initial potential production of about 32,000 barrels a day. Not all of them have yet been actually connected to the storage tanks owing to a few shortages in the field gathering system. Some are situated on national reserves and cannot be brought into operation until certain arrangements have been completed under Venezuelan Law. These temporary difficulties are in process of being rapidly overcome. Some 17 wells require workover, a rather high percentage, but not a very surprising one when one bears in mind the great rapidity with which drilling has been going on and also the fact that long production tests had necessarily to await the completion of the tank farm and pipeline. During the early months of this year wells were being completed at the rate of two a week and many were completed in three weeks from spudding to completion.

But when these temporary difficulties have been overcome it must not be supposed that the actual rate of production will be as high as the figures of initial potential production I have mentioned. Not so many years ago they would have been. The wells would have been allowed to flow at their own rate. But since those days the art and science of petroleum engineering have advanced. Much more is known of the proper method of conserving gas pressures and thus prolonging the flowing life of the wells. The field will therefore be brought into production in a conservative manner, each well being started with a choke of small diameter. The behaviour of the gas oil ratio in each well will be studied with care. The production rate will be restricted until the behaviour of the gas and oil reservoirs is fully understood. I feel sure that you will approve of this prudent policy both in your own interest and in the interests of the conservation of natural resources. These are too precious to waste, as they might be wasted if we allowed ourselves to fall into the temptation of producing at more than the optimum rate.

FURTHER DRILLING

It seems probable that during the next twelve months the main effort will be to expand production by further drilling in the Mercedes and Palacio fields, where locations for numerous further wells exist, and in extending the boundaries of those fields. But exploration must not be neglected and must certainly be pushed forward in the area between the Mercedes and Palacio fields and the Punzon area which can be conveniently worked from our Mercedes camp. This area contains a number of interesting and promising structures shown up in the geophysical survey. I am happy to tell you that during the past week a new well, M.43, has proved the existence of oil-bearing sands in one of these structures. The well is approximately 15 kilometres south-west of the Mercedes field and 9 kilometres north-west of the Palacio field. This discovery may well lead to the development of a new field. In some of our outlying areas there is a number of wells which have produced oil or gas and in all of them geophysical surveys have revealed structures that in due course ought to be tested with the drill. On the boundaries of some of our areas other companies are drilling and with them we have arrangements for exchange of information.

The settlement of the next year's programme is an important matter and is at present being studied in the field by the Mercedes Company with the aid of a mission from C.P.S.A. and our friends the Texas Company. Not until this has been completed, and a budget framed, can we know what our further commitments will be and to what extent they can be financed out of the proceeds of current production.

AN OUTSTANDING EVENT

On the financial side the outstanding event of the year has been the successful issue in London of £3,500,000 4½ per cent. unsecured loan stock and the borrowing of £1,750,000 from the F.C.I. Most of this money has gone into completing the Mercedes permanent camp, constructing the pipeline and sea terminal, and drilling wells for production. The equity stockholders had up to that time put up all the money. As these additional sums were going into permanent productive physical assets we felt justified in borrowing.

The capital assets so created will suffice to deal with a much greater volume of production than our present production and provide a means of carrying on further drilling. As each new well is brought in it can be at once connected up. While the cost of new producing wells and further exploration is bound to be expensive, it is also true that the major capital assets have already been installed and paid for and from now on, as production is stepped up, the capital cost per barrel produced will decline sharply.

CONTRACT WITH TEXAS COMPANY

During the year a contract was negotiated with the Texas Company under which the output of the Mercedes Company will be sold to them for a period of five years. The price arrangements are satisfactory, the income will be in dollars, and we gain a number of advantages in that we are relieved of certain financial and operational burdens at a time when the main effort must be to establish and extend the producing fields. This period will give us time to study and prepare for our ultimate marketing arrangements, including consideration of the question of refining. We have to consider these matters against the background of the present world oil situation. This position is one of a rapidly growing demand with a less rapidly growing supply. The rise in prices which has continued over the last few years and is still continuing is the natural consequence of this. When supply will catch up with demand it is impossible to say. In the meantime our task is to see to it that we get the benefit of present high prices and at the same time build up a strong position against the day when supply and demand will be more evenly balanced.

The report and accounts were adopted.

THE ANGLO-DUTCH PLANTATIONS OF JAVA, LIMITED

PROPOSED CAPITAL ISSUE

The thirty-eighth ordinary general meeting of this Company was held, on the 29th ultimo, in London, Mr W. H. Daukes, chairman and managing director, presiding.

The following is an extract from his circulated statement for the year 1947:—

We were faced with many problems in deciding the immediate policy to be pursued in the process of rehabilitation. The chief problem is whether to restore our former position, so far as it can be attained, in a minimum space of time or whether to spread the process over a longer period, to cut our coat in accordance with our cloth as we see what money is available. Last year I hazarded an opinion that rehabilitation might cost the company in the region of £1,000,000. I see no reason to change my views in this respect; owing, however, to the considerable quantity of our produce harvested and manufactured during the time of the Japanese and Indonesian occupation, which was found not only on the estates but also at various ports awaiting shipment, some millions of guilders were available on which, originally, we had not reckoned. With this windfall I hope that £500,000 of permanent finance will see us through our immediate needs. The progress that has been made in the ten months since August last is really magnificent.

With a company of our size and wide interests it is imperative to keep a strong sterling position. We have, therefore, applied to the Capital Issues Committee for permission to make an immediate issue of £500,000. As soon as this permission is granted stockholders will be informed of the terms of the issue.

The report was adopted.

AMALGAMATED PRESS, LIMITED

RECORD PROFITS

VISCOUNT CAMROSE ON THE NEWSPRINT SITUATION

The annual general meeting of The Amalgamated Press Limited was held on the 29th ultimo in London, Viscount Camrose, the chairman, presiding.

The chairman, in the course of his speech, said:—

This is the twenty-first annual report of the Amalgamated Press in its present form. Our company dates back to 1926. The business itself is, of course, much older.

I have had the honour of being chairman since the formation of the new company, and I look back with considerable pride on its satisfactory record over this long period of 21 years. Only once—in the first year of the recent war—have we not made a distribution on our Ordinary shares, and even on that occasion it was only a sense of caution and a desire to make provision for perils which might be in store, that made the board withhold the customary dividend.

The accounts before you reveal that the profits for the year, including the dividends from our subsidiary companies and other investments, total £1,676,511, which is a record in the history of the company.

These profits do not come from the business of the Amalgamated Press alone or indeed from the other publishing companies which it controls. Our interests in papermaking are considerable and we also receive a substantial income from other investments of various kinds in this country and outside it.

The interim dividend of 7 per cent. absorbed £46,200, and the final distribution of 15 per cent. takes another £99,000. Normally we should have been amply justified in recommending to you a reasonably substantial increase in the final dividend. Earnings as disclosed to you in the accounts are equal to 88 per cent on the Ordinary stock, out of which we are proposing to pay 22 per cent.

It is the custom nowadays of critics of private enterprise to point to the total profits made by a company, and to ignore the fact that in all well-ordered trading concerns a large proportion of this money must be ploughed back into the working of the business to ensure its stability and capacity to carry on its affairs in an efficient manner. A large part of these profits indeed never reaches the shareholders directly, and the remainder only over a long period of years. The earnings of tomorrow can only be safeguarded if a company is conducted in a conservative way, and the directors have a full sense of their duty to make adequate provision against those losses and misadventures which every company has to face however sound the judgment of its administrators.

PERIODICALS

I have not thought it profitable for several years past to deal in detail with the position of the many periodicals owned by the company, for the obvious reason that affairs in the publishing world have been, and continue to be, of a static order. I can tell you most confidently that we have not lost ground anywhere, and that we continue to hold the dominating position in the field which has been occupied by the Amalgamated Press for so many years.

Recently, and since the close of our financial year, intimation has been made by the authorities that periodicals of a popular character will be allowed to obtain 35 per cent. of their prewar consumption of paper. This is an increase of 3½ per cent.—that is, from 31½ to 35 per cent.—and it restores the basis of consumption to that which obtained in the earlier part of 1947. In this connection it is to be noted that only one-third of the paper used by periodicals is what is called newsprint, the rest is paper of a different character. This increase does not mean that publishers can necessarily increase sizes or circulations by that amount. That depends on the amount of newsprint and other paper procurable or owned in the way of stock.

Beyond this possible increase there is no present indication that the periodicals and newspapers of this country can hope for any additional newsprint for a long time to come. The matter rests entirely with the Government. No one is unaware of the serious economic position in which we find ourselves as a nation today—our shortage of dollars and other hard currencies needs no emphasis. Newsprint itself, as well as materials for making it here, comes from Canada and other countries in the hard currency area. Upon our limited resources in these currencies the purchase of food must obviously be a first charge. But food is not the only thing for which our money is utilised. There are many other commodities which we purchase, and our complaint against the Government is that among these other goods newsprint is given such a low priority.

DANGER TO NEWSPRINT SUPPLIES

It is a peril which exists not only for the moment. Canada has been our main supplier during the past nine years. The manufacturers there have shown every disposition to help this country and have kept contracts open in our favour despite orders eagerly offered them from the United States and elsewhere. But this cannot obtain for ever, and it has been made plain to the Government that if they continue in their present policy of severely restricting and even decreasing our purchase of newsprint from that country, future supplies under long-term contracts are bound to be diverted to other countries. True we have our home mills, but their production is governed by the amount of pulp and other raw materials which we are allowed to import, and, in any case, when these mills were working fully there was nevertheless a substantial amount of newsprint imported from Canada. Closure of that market to this country would have a serious effect on the publishing industry.

It is not a question of profit-making which causes proprietors constantly to draw attention to shortage of newsprint. Speaking with a wide experience I can say that a substantial increase in paper supplies would, in most cases, lead not to a greater profit but to a lesser one. Increased consumption would lead to the removal of restricted and uncompetitive sales, and to an all-round effort to supply the public with better newspapers and better periodicals. Once competition is reintroduced, costs are bound to go up.

Those responsible for the publishing industry have a lively sense of the fact that they are not serving the nation in the way that they would like to do, and would welcome the opportunity to play their traditional part in the life of the country, whatever commercial risks such a policy might involve.

Under present circumstances it is, of course, impossible to enter confidently on any predictions of the future. It would seem that without any abnormal happenings in the world, things are so static in the publishing field that the figures of the current year, of which four months have gone, are not likely to be very different from those before you today. I would like to underline also, as I have on several occasions before, that the interests of your company are now so well spread that if we suffer disappointment in one direction we are likely to find compensation in another; and our financial strength is such that we can hope to weather successfully all likely difficulties short of national catastrophe.

The report was adopted.

THE ZINC CORPORATION, LIMITED

SATISFACTORY TRADING RESULTS

The thirty-seventh annual general meeting of the Zinc Corporation, Limited, was held, on the 30th ultimo, in London.

The following is an extract from the circulated statement of the chairman, Mr John R. Govett:

The final dividend which your board recommends, after allowing for the interim paid in February last, amounts to a total of 10s. per share, compared with a total of 7s. 6d. paid in respect of last year.

In recommending this increase, which is a modest one in view of the very satisfactory results of the year's trading, consideration has been given to the fact, firstly, that the operations of your corporation are conducted overseas, its profits being derived entirely outside the United Kingdom, and secondly, that a substantial proportion of the corporation's capital is held by Australians on the Dominion Register.

During the year under review, we were gratified to hear of the decision of the Commonwealth Parliament to abolish Wartime (Company) Tax. This was a graduated tax, and the Corporation was liable to pay at the rate of 78 per cent. on a substantial proportion of its income.

On the other hand, in the Finance (No. 2) Act of 1947, the United Kingdom authorities doubled the profits tax to 25 per cent. on distributed profits and 10 per cent. on undistributed profits. As a result, on the profits of 1947, our total taxes amount to approximately 12s. 6d., in the pound as compared with 10s. 6d. in 1946.

SALES AND PRICES

The sales of lead to Britain during the year represented 55 per cent. to 60 per cent. of overall production and about 80 per cent. of total exports, and the prices accepted therefore, while showing some increase over the previous year, were less than those ruling in other export markets. This policy, I am certain, has the full support of all who are conscious of the extent and gravity of the war damage suffered by Britain.

Under the stimulus of a domestic price which is now far less than cost, there has been a substantial increase in the Australian demands. The current "ceiling" price of £A22, at which level it has remained unchanged since it was fixed on February 8, 1940, is much less than half the current cost of production and is now less than 20 per cent. of the export price.

The average price of lead sold to export markets in 1947 was £71 7s. 9d. sterling, while the overall average price, including domestic sales at the ceiling price, was £61 17s. 9d. sterling.

We have during the year examined several other mining areas in Australia in association with the Newmont Mining Corporation and the St. Joseph Lead Company of New York.

Our search for oil and natural gas was continued energetically throughout the year and the work of the current year should enable us to determine what sections (if any) of the areas justify major exploration.

CONCLUSION

Whatever may be the developments in the world at large, I look with confidence to a continuance of the present stability at Broken Hill, which provides an excellent illustration of the harmony which results from co-operation. We have the utmost confidence in the future of Australia. The prices of our products are ruling at high levels, and so far as can be seen at the moment there appears to be no reason for any immediate important change in metal values.

All things considered, I am confident the net result of this year's operations will be satisfactory to all concerned.

THE BRITISH SHAREHOLDERS TRUST LIMITED

SATISFACTORY RESULTS

The twenty-sixth ordinary general meeting of The British Shareholders Trust Limited, was held in London on the 29th ultimo.

Mr B. H. Binder, F.C.A., the chairman, in the course of his speech, said:—

I am glad to be able to report a continuation of satisfactory profits and a further strengthening of the financial position. During the year we have underwritten new issues of capital which have all proved successful, and have also undertaken arrangements for the reorganisation and marketing of shares of concerns which hitherto did not have a quotation on a Stock Exchange.

The gross profit at £117,666, shows a modest increase of £6,069 over the previous year but this small improvement has been more than eliminated chiefly by the amount it has been necessary to set aside for taxation with the result that the net profit is £46,194, compared with £48,929 for 1947. As usual full provision has been made for all taxation, including the estimated liability for 1948/49.

Out of the profits for the year your directors have allocated £3,000 to the staff pension fund and transferred £10,000 to general reserve, leaving a sum of £33,194 on the year's working to be dealt with. The interim dividend of 3 per cent., less income tax, paid last December, absorbs £8,880, and the final dividend of 4½ per cent. and bonus of 2½ per cent., both less income tax, now proposed, require £20,721, and it is recommended that the balance of £3,593 be added to the amount carried forward at the credit of the profit and loss account which will then stand at £85,363.

APPRECIATION OF INVESTMENTS

The appreciation in value of our quoted investments on March 31st last over their cost was £209,842, being an advance of £38,300 over 1947, and while this improvement may be regarded as gratifying, I must again warn you that values of securities in these unsettled times are inevitably liable to considerable fluctuation. As you will have seen from the balance sheet, the total invested in unquoted securities has been reduced by approximately £103,000 during the year. In a business such as ours, holdings in unquoted securities are bound to vary from time to time but as far as possible we try to keep our position liquid.

The accounts of our subsidiary company, The Record Electrical Company, Limited, have been received for the year to March 31, 1947, and the results were not as satisfactory as those for the previous year—a small net profit being shown but only after taking account of a recovery of E.P.T. No dividend has been received from our holding of shares in that company during the year under review. In July, 1947, the board of The Record Electrical Company, Limited, appointed a new managing director and under his guidance progress is being made on the road to recovery. The accounts for the year to March 31, 1948, have not yet been completed but, so far as can be ascertained, they should show some improvement over the previous year.

At the present time, while there is every indication that there are large sums available for investment, there are growing signs that the spending power of the public is not running at the high level which obtained until a few months ago. This factor must be borne in mind in considering the type of securities which we sponsor and also in which our funds are invested.

Many of you may be in touch with owners of substantial private undertakings. The problems which the new levy on investment income raise for owners of private businesses are such that some of them may contemplate the desirability of converting their undertakings into public companies. In any cases of this nature which are of sufficient size to be marketable, we should be very pleased to give assistance in formulating proposals for a conservative scheme of capitalisation and in placing some of the capital.

Nowadays when politics, both national and international, introduce so many uncertain factors which influence the lives and actions of all of us, it would perhaps be unwise to attempt to look too far ahead. In view of this I will content myself with saying that if the uncertainties with which we are now surrounded are cleared away we hope to be able to report satisfactory results to you at our next annual meeting.

The report was adopted.

THE ORION INSURANCE COMPANY, LIMITED

INCREASE OF CAPITAL—EXTENDED ACTIVITIES

SIR STRATI RALLI'S REVIEW

The eighteenth ordinary general meeting of the Orion Insurance Company, Limited, was held on June 30, 1948, at 70/72, King William Street, London, E.C.4.

The following is an extract from a statement by the chairman, Sir Strati Ralli, Bt., M.C., on the report and accounts for the year ended December 31, 1947.

FUTURE DEVELOPMENT

Your directors are of the opinion that the best interests of the company lie in its gradual development along "composite office" lines as an organisation capable of handling all classes of marine, fire and accident business, both at home and overseas, and the course of the company has for some time been set in that direction.

It was considered desirable, however, that such development should be accompanied by a further strengthening of the company's general financial position, and it was with this in mind that, following the extraordinary general meeting on March 16, 1948, when the authorised capital of the company was increased from £251,500 (the whole of which was fully paid) to £500,000, the board decided to issue 98,500 new ordinary shares of £1 each, at a price of 50/- per share, of which, as you are aware, 48,500 shares were offered to shareholders in proportion to their existing shareholdings.

PURPOSE OF ISSUE

The primary purpose of this issue was to augment the paid-up capital and reserve position of the company by the sum of £246,250, which, it is considered, will serve as an adequate support for the further expansion of the business at present contemplated. Linked with the above considerations, the directors also wished to strengthen the existing association between the company and its chief underwriting agents, Alexr. Howden & Company, Limited, who have already contributed so largely to the company's development and will, I am sure, prove of equal assistance to us in the fulfilment of our future plans.

The board accordingly came to an arrangement with certain directors of Alexr. Howden & Company, Limited, whereby, in consideration of the offer to them of the remaining 50,000 new ordinary shares in issue, at the same price and on the same terms and conditions as the shares offered to existing shareholders, the company acquired an interest in the business of Alexr. Howden & Company, Limited. The control and administration, however, of that company remains unchanged.

The issued and paid-up capital of the "Orion" is now £350,000.

AUSTRALIA

We have for some time been anxious to secure for the company a share in the growing volume of insurance business in Australia, and arrangements have now been concluded for "British Underwriters (Insurance) Proprietary, Limited," of Sydney and Melbourne, to act as underwriting agents of the company throughout New South Wales and Victoria for marine, fire and accident business.

DRAKE INSURANCE COMPANY

Another interesting development is the arrangement concluded with the Drake Insurance Company, Limited, whereby we have agreed to act as sole marine underwriting agents of that company, a function we consider we can conveniently perform, to the advantage of both concerns, in conjunction with our own marine activities.

MARINE DEPARTMENT

The net premiums in 1947 were £588,290 against £432,654 in the previous year.

Total claims paid amount to 79 per cent. of net premiums, against 56 per cent. for 1946. These percentages, however, are not strictly comparable, the 1947 ratio being inflated by reason of the fact that the cost of reinsuring the outstanding liability and ultimate "run-off" of the 1940 to 1945 underwriting accounts has been charged against premiums.

Our 1945 underwriting account closed with a satisfactory profit, of which £35,000 has been transferred to profit and loss account. The marine fund now stands at £686,049 (117 per cent.), and having regard to the fact that no reserves are now required in respect of outstanding liability on the 1940 to 1945 underwriting accounts, this position is regarded as satisfactory.

NON-MARINE DEPARTMENT

The aggregate premium income from all classes of business in the Non-Marine department amounted to £286,577 compared with £242,761 for 1946.

The losses arising out of the Texas City disaster in the early months of 1947 were severe, and claims incurred work out at 79 per cent. as compared with 70 per cent. in 1946. However, despite the heavier settlements and the necessity, owing to the increase in premium income, of providing an additional £21,908 in the 50 per cent. unexpired risks reserve, the account has produced a small profit of £3,119.

The contingencies reserve of £5,000, originally set up in 1943, is no longer required and has, therefore, been included in the total of £8,119 transferred to profit and loss account.

DISTRIBUTABLE PROFIT AND BALANCE SHEET

To the balance of £32,992 brought forward from 1946 has been added net investment income of £20,760 and the transfers from underwriting accounts of £43,119. After charging directors' fees of £2,000 and other expenses of £5,493, and after transferring a further sum of £2,000 to staff contingency fund, there remains a balance of £87,378 available for distribution.

Your directors again recommend the payment of a dividend of 10 per cent., less income tax, for the year 1947. After making a net provision for the dividend of £19,250 there remains a balance of £68,128 to be carried forward to the next account.

The total of invested funds is shown in the balance sheet at £1,040,861 and, of this figure, approximately 87 per cent. consists of British Government securities, a large proportion of which is in short-dated stocks. Cash has increased from £81,872 to £255,642. The total assets of the company stand at £1,779,380 compared with £1,621,204 last year.

In closing, I would again tender our thanks to the company's friends in the London market and to our agents, at home and abroad, for their valued support and their efforts on behalf of the company throughout the past year.

The report and accounts were adopted.

PHILIP HILL INVESTMENT TRUST, LIMITED

DIVIDEND AGAIN 25 PER CENT.

The sixteenth ordinary general meeting of this Company was held on the 29th ultimo in London. Sir Brian Mountain, Bart., the chairman, who presided, after paying tribute to the late chairman, Sir Edward M. Mountain, Bart., said:—

Gentlemen,—You will have read in the directors' report that income received by the Investment Trust from investments, less office and management expenses, amounted to £201,940 and interest received on advances to subsidiary company £34,623—a total of £236,563, which compares with a total of £223,569 for the previous year.

With regard to the activities of our wholly-owned subsidiary, Philip Hill and Partners, Limited, the Chairman pointed out last year that the period then under review was an exceptional one as, owing to the practical cessation of industrial issues during the war years, there were accumulated arrears of this class of business to be then dealt with. But, despite the fact that for several months during the past year market conditions were unfavourable for any new issue business, the results achieved by Philip Hill and Partners, Limited, for that period must be considered satisfactory.

DIVIDEND POLICY

As the amount of undistributed profits in the Investment Trust in the form of carry-forward has already reached the substantial amount of £634,987, your directors, as explained in their report, have deemed it prudent this year to depart from their previous custom of transferring practically all the profits from the wholly-owned subsidiaries to the Investment Trust in the form of dividends and instead to build up additional reserves in these companies. As a result, they have only paid in dividends to the parent company the sum of £104,000, which is sufficient (together with income from its investments and interest from advances) to pay the dividend on its preference shares and maintain the 25 per cent. dividend on its ordinary shares, leaving £338 to be added to the carry-forward, bringing the total of undistributed profits up to £635,325.

The balance of the undistributed profits of the subsidiary companies for the year has been left in the accounts of those companies, thus increasing, after taxation, the amount of their undistributed profits by £70,588, bringing this figure up to £136,317.

The sum of £91,298, being surplus on realisation of investments by your company during the year, has been added to capital reserves, bringing the total up to £2,269,825. In addition, the total market value of the quoted investments held by your company and its subsidiaries at March 31, 1948, as shown by the consolidated balance-sheet was £1,201,447 in excess of their book value of £4,601,882. Unquoted securities held by the Trust and its subsidiaries stand in the consolidated balance-sheet at £1,327,318, which in the opinion of your directors is a conservative valuation.

THE SOUTH AFRICAN COMPANY

With a view to increasing the spread of your company's investments, and also of broadening the scope of the activities of Philip Hill and Partners, Limited, Philip Hill African Investments, Limited, which will operate as an investment trust in South Africa and in which your company has a substantial interest, has been incorporated during the year. Philip Hill African Investments, Limited, holds the entire capital of Philip Hill Securities Corperation, Limited, which has also recently been registered in South Africa to function as a finance and issuing house.

The report was adopted.

RICHARD THOMAS AND BALDWINS, LIMITED

SATISFACTORY RESULTS

The annual general meeting of Richard Thomas & Baldwins, Limited, will be held in London on the 28th instant.

The following is an extract from the statement by the chairman, Mr E. H. Lever:—

The year has again been a difficult one; shortages of raw material and labour have affected production. We have made our full contribution to the outstanding production figures of the iron and steel industry, and I feel sure that you will agree that the results are satisfactory.

The profit and loss accounts, both of the parent company and of the group, show that the balances of the trading accounts were substantially higher than the corresponding figures for the previous year. The profits for the year 1948 are not, however, entirely attributable to normal trading, as the group figures for that year include £505,000 extraneous and non-recurring profits, less losses and profits of £338,000 realised on stocks in hand as a result of price increases in the course of the year, whereas in the previous year the corresponding figures were approximately £12,000 (loss) and £120,000 respectively. The accounts also include an extra working week. On the other hand, only half a year's profit is included from the assets transferred to The Steel Company of Wales.

Out of each 20s. of gross income we expended on raw materials, material for maintenance work and other expenses 12s. 2d., wages, salaries and remuneration generally 4s. 8d., debenture and loan stock interest 2d., making 17s., which leaves 3s. Taxation requires 1s. 6d.; debenture and loan stock redemption absorbs 3d.; there is retained in the business 11d.; dividends absorb 4d. The company's works are being maintained and kept up to date, and further amounts have been expended on modernisation of the company's plants. At Ebbw Vale the chief event of the year on the technical side was the starting up in July, 1947, of the new electrolytic tinning plant. This plant, which is the only one of its kind in this country, is proving highly successful and is turning out excellent quality plates.

THE FUTURE

The main economic problem facing the nation at the present time is that of achieving equilibrium between exports and imports by the time that the aid provided under the Marshall Plan comes to an end, and it is obviously desirable that this problem should be solved, if possible, by increasing exports rather than by cutting down imports. The solution of the export problem will not, however, in itself ensure for the population of this country an adequate standard of life. This can only come through increased production per head, and even increased production will fail in its purpose, particularly in view of the approaching end of the sellers' market unless, in addition to satisfying essential home demands, we make products that other nations want at a price which they are prepared to pay.

It is extraordinary that at a time when the British iron and steel industry is acquitting itself so well, it is still apparently the intention of His Majesty's Government to introduce some form of nationalisation of the industry during the lifetime of the present Parliament. So far as our own company is concerned, we are consistently adhering to the policy of running our business to the best of our ability while we are still in authority, but our administrative problems are not made easier by politics, and there seems no justification whatever for tampering with the structure of the iron and steel industry at the present moment.

DUFAY-CHROMEX

SIR HERBERT MORGAN'S SPEECH

At the meeting of Dufay-Chromex Limited, held in London, the chairman, Sir Herbert Morgan, K.B.E., said:—

The accounts show that the company made a trading loss of £14,222. As we made a capital profit of £18,954, there has been a net increase in assets of some £4,750, subject to the dividend on the first preference stock. Agreement having been reached on certain taxation matters, we have transferred £100,000 to general reserve accounts. The reasons for the loss are to be found in the fuel crisis of 1947.

1947 saw a general upheaval in world economic conditions, and we experienced the disappointment of seeing export markets closed to us on account of the inability of our customers to secure import licences.

There exists a market ready to consume all available supplies of Dufaycolor material. Production of cameras manufactured by Coronet, Limited, and Standard Cameras, Limited, is highly satisfactory. Realising the desirability of manufacturing finished articles from our own materials, we are now manufacturing from cellulose acetate sheeting, containers for the pharmaceutical and allied trades.

We have in our favour the world-wide demand for photographic goods, and we are prudently optimistic on the future of our business, the field of which is enormous and one we hope to develop.

I should like to express our appreciation of the services rendered by our managing director, Mr Demetre Daponte. We have had to face problems giving cause for great anxiety. To tackle these successfully has required all his courage and determination, but his example is an inspiration to the staff.

The report and accounts were adopted.

NEW BROKEN HILL CONSOLIDATED, LIMITED

MAIDEN DIVIDEND

The twelfth annual general meeting of this Company was held on the 30th ultimo, in London, Mr John R. Govett (the chairman) presiding.

The following is an extract from his circulated statement:—Last year I indicated that with a continuance of the high range of metal prices then ruling, you might expect your company to be in a position to pay a dividend in respect of 1947. The accounts now presented to you fully justify a dividend of 1s. per share, the first which your directors have recommended for your approval. In 1947 ore production from our own leases totalled 62,367 tons, of which 47,511 tons came from the zinc lode and 14,856 tons from the lead lode.

Considerable progress has been made with the surface works. Surveys have been completed and work commenced on the railway, power and permanent compressed air mains to the shaft area.

In all respects the developments in the mine during the year have been well up to our expectations, and the progress of our programme generally satisfactory. So far as the mine is concerned, we have no doubts that developments will continue to justify our confidence in its future as a substantial producer of lead and zinc over a long period. I must, however, again emphasise the dependence of our programme on being able to obtain, as and when required, the necessary manpower and deliveries of materials and equipment. In the circumstances, I will not attempt to look further ahead than the current year, in which, with a continuance of present metal prices, it is reasonable to expect satisfactory results.

The report and accounts were adopted.

TELEPHONE RENTALS, LIMITED

YEAR OF CONSOLIDATION

Mr FRED T. JACKSON ON THE OUTLOOK

The nineteenth annual general meeting of Telephone Rentals, Limited, was held on the 29th ultimo at the Livingstone Hall, Broadway, Westminster, S.W., Mr Fred T. Jackson, O.B.E., Comp.I.E.E. (the chairman and joint managing director), presiding.

The chairman in the course of his speech said: Our rental revenue for the year was £711,645, an increase of some £112,395 over the previous year, and the profit on trading, and miscellaneous receipts at £118,596 shows an increase of £51,863 over last year. The dividends on sundry investments and interest receivable show a decrease due to our having realised certain of our British securities. Dividends from our subsidiary companies are roughly the same as in the previous year.

Now, turning to the other side, you will observe that the operating costs and general and administrative expenses have increased in proportion to our increased revenue to an amount of £422,153 as compared with £344,273 last year. Depreciation of the capital cost of revenue-producing installations and the usual depreciation of our fixed assets amounting in all to £154,882 has been provided for.

RESULT OF YEAR'S OPERATIONS

The net profit arising from the year's operations is £264,381 as compared with £198,258 last year. The rate of dividend is 10 per cent. for the year, but you will appreciate the amount increases over last year by reason of the increase in the issued share capital.

The year we are now reviewing has been a year in which we have concentrated on consolidating the business we have. In response to the Government request to all advertisers we ceased to advertise in the national press for the time being, but when restrictions are withdrawn we shall once more publicise Telephone Rentals.

In connection with advertising, it is of interest that a very considerable volume of new business has come our way quite unsought, very largely through recommendations from existing subscribers and partly as a result of our advertising in the national press in the past. I think I can claim, without taking undue credit for your company, that we are recognised by industrialists as the leaders in our particular class of telecommunication and time control.

The shortage in the supply of raw materials and equipment, to which I referred last year, is not now so acute, but after careful consideration, not only of the material position of 1947, but of the possible trend of trade during the next few years, we felt convinced that the policy of the company should be to concentrate on the needs of existing subscribers.

We therefore decided to concentrate the bulk of our available material and man power resources on existing subscribers whose businesses have existed for many years and which were steadily expanding, doing at the same time such work as is necessary to replace obsolescent equipment with recently developed apparatus which has been evolved on our past experience of subscribers' requirements. The directors are convinced that this is the wisest policy, for we recognise that the solidity of our business is based on the satisfaction of the largest possible number of subscribers to our service.

THE ORGANISATION DESCRIBED

I think it might be of interest to give you a broad outline of the organisation which your company has set up and which covers the whole of the British Isles and Ireland; particularly as this organisation deals with the maintenance of installations the rental for which, including contracts not yet installed at the present date, amounts to over £1,000,000 per annum. We have subscribers all over the country and in order to provide them with quick and efficient service it has been found necessary to extend our network of resident engineers, which in some cases, owing to the shortage of housing accommodation, has necessitated the purchase of houses for these engineers to live in.

The total number of employees at the present time is approximately 1,500. These are divided up into various categories. We have over 800 installation and maintenance engineers, 60 district engineers, 30 section engineers, 14 area engineers, 11 branch engineers and 3 regional engineers. These all come under the control of a technical engineer and an equipment engineer under a chief engineer. The chief engineer's headquarters are in London, but he is constantly visiting the provincial branches.

NEED FOR FURTHER CAPITAL

You will also appreciate that a business such as ours, which is supplying capital equipment to a large number of subscribers, necessitates considerable finance, but you have only to look at the accounts now before you to realise how profitably this capital has been employed. With the existing penal taxation it is not possible to plough back into the business profits earned to the extent which your Board of directors desires. On the one hand the Government urges all companies to plough back profits, but on the other hand takes away from them the major part of the profits earned, which is another example of the complete financial ignorance with which we have to contend at the present time.

It must be obvious that we shall need further capital to finance the rapid growth of your company. Your directors therefore propose to issue 500,000 4½ per cent Cumulative Preference shares and application is being made to the Capital Issues Committee for the necessary permission.

As far as the future is concerned, I have every confidence in the progress of your company. The most optimistic could not say that the industrial barometer is anywhere near set "fair" and I feel that the great majority of the British public does not yet realise the critical times through which we are passing; until events bring that realisation home there is not much chance of a continuance of steady trade and full employment.

RISKS WELL SPREAD

In our business our risks are well spread, the bulk being with subscribers who have successfully weathered financial storms and built up reserves in past years during periods when our Government realised the importance of industrialists earning profits to be utilised for investment abroad and further development in this country.

In the past the making of profits was encouraged and as a consequence we were able to invest vast sums abroad, the interest on which went a long way towards paying for imported food and raw materials. Today making profits is almost regarded as a crime and every imaginable difficulty is placed in the path of the industrialist. I am quite sure that until we have a Government which will leave economic planning to individual firms within their own businesses we shall never have the opportunity of achieving the greatness which our forefathers did before us.

The report and accounts were unanimously adopted.

FORESTAL LAND, TIMBER AND RAILWAYS COMPANY, LIMITED

DIVIDEND OF 12 PER CENT.

The forty-second ordinary general meeting of this Company, was held on 30th ultimo, in London.

Mr John B. Sullivan (the chairman and managing director) in the course of his speech, said:

As the world's largest producers of both quebracho extract and wattle extract since the earliest days of these industries, we have been greatly assisted in dealing with our problems by the fact these extracts are of such vital importance for the tanning of heavy leather, that they have always been in constant and growing demand.

The net profit for the year £253,273 shows a considerable reduction, in comparison with the £853,519 for the year 1946, but we have been unable to bring in this year the dividend of 12 per cent. paid by La Forestal Argentina out of its 1947 profits.

I now have reason to hope that the remittances of the dividend received by us from La Forestal Argentina will be authorised in the not too distant future.

We have received no dividend during the year under review from The Natal Tanning Extract Company, it having been decided to capitalise the profits earned in South Africa in order to satisfy that company's requirements of additional capital.

The profit for the year of £253,373, together with the amount brought in of £210,255 and part of the provision for taxation made in previous years, £150,000, give an available total of £613,528. We now propose a final ordinary dividend of nine per cent., totalling 12 per cent. for the year.

The trading results of La Forestal Argentina for 1947 are again very satisfactory.

The report was adopted.

BRITISH MATCH CORPORATION, LIMITED

DIFFICULT CONDITIONS

The twenty-first ordinary general meeting of this Company was held on the 29th ultimo in London, Mr Arthur Hacking, O.B.E., the chairman, presiding.

The following is an extract from the statement by the chairman for the year ended April 30, 1948:—

The year under review has been a most difficult one, and all our manufacturing subsidiaries have been faced with steadily increasing costs, whereas there has been no change in the Matches (Control of Prices) Order which came into force on July 31, 1940.

Last year I did issue a warning that difficulties in regard to supplies of raw materials were getting worse. This has been the case during this year and, unfortunately, has had considerable effect on trading profits. Also quite a number of essential raw materials used in the industry are subject to control.

The basis of distribution is today 75 per cent. based on deliveries during the year from April 1, 1939, to March 31, 1940. This is an increase of approximately 8 per cent. on the rate of distribution at this time last year. The increase has been almost entirely in imported matches, so that your subsidiary manufacturing companies have not benefited.

The return from the corporation's investments in Australia and New Zealand has again been disappointing. Generally speaking, our overseas investments have again produced very good figures.

Your board has decided to transfer £30,000 from dividend reserve fund to profit and loss account. This will enable the corporation to pay the same dividend and bonus as last year and to carry forward an increase of some £14,000.

The report was adopted.

UNITED KINGDOM GAS CORPORATION

BIG DEVELOPMENT SCHEMES AUTHORISED

The thirteenth annual general meeting of the Corporation was held in London on the 29th ultimo.

Colonel W. Moncrieff Carr, O.B.E., T.D., the chairman, who presided said: The net revenue for the year amounted to £165,387, being £5,297 more than the net revenue for the previous year.

The net amount available for distribution is £99,417, out of which we have felt justified in recommending a final dividend of 4 per cent. on the ordinary stock, making 7 per cent for the year, leaving to be carried forward the sum of £54,877.

Before passing from the accounts I should inform you that we have had to go to outside sources for capital to finance your gas meter manufacturing subsidiary, Begwaco Meters, Ltd., and when this capital comes to be issued this company will no longer be controlled by your corporation.

ACHIEVEMENTS

In view of the Bill for the nationalisation of the gas industry now before Parliament it may be fitting to give an account of our stewardship during the thirteen years of your corporation's existence.

In that short period, the corporation—largest of the gas holding companies—has become the fourth largest gas enterprise in the Kingdom in gas production, second largest in number of consumers served. It controls today 76 undertakings, serving a total of 442,165 consumers.

Sales of gas have increased by 110½ per cent. since 1936—namely, from 31,243,344 therms to 68,887,900 therms in 1947.

The capital employed by the undertakings per million cubic feet of gas sold, notwithstanding very considerable reconstruction and extension of plant, has been reduced from £815 per million cubic feet sold in 1938 to £469 per million cubic feet sold in 1947, and the incidence of interest and dividend charges has been reduced by more than 40 per cent., falling from 2.689 pence per therm sold in 1938 to 1.521 pence per therm in 1946.

Finally, in spite of the astronomic rises in the costs of raw coal and all materials, and the increases in salaries and wages which have followed, the average price which our consumers have had to pay for gas has risen from 9.3 pence per therm in 1938 to only 11.2 pence per therm in 1947.

The provisions in the Gas Bill for compensation are not only unfair but also exceedingly impractical.

Stock Exchange values, the basis of compensation which the Bill provides, are determined by dividend yields, and for many years the dividends of statutory gas companies have been controlled by Parliament. In the vast majority of companies working under basic of sliding scale provision, none of which has been revised since before the war, shareholders have been the losers through the increase in the cost of wages and materials which has increased the price of gas and commensurately diminished dividends.

THE FUTURE

With regard to the future, I am confident of one thing; the gas industry should exercise an all-important influence in restoring economic health to this great industrial country of ours, if it is permitted to do so.

The only justification for the existence of the gas industry is an economic one; it converts coal, our principal source of wealth, into fuels that are approximately twice as efficient as raw coal and it markets these fuels at the lowest possible prices in free competition with electricity, oil and coal itself.

The report was adopted.

SPURLING MOTOR BODIES, LIMITED

FULL ORDER BOOKS

The eleventh annual ordinary general meeting of Spurling Motor Bodies, Limited, was held at Hendon, N.W., on the 30th ultimo.

Mr W. F. Spurling (managing director), who presided, in the course of his speech said: We have every reason to be proud of the way things have gone during the year, and of the way the staff have overcome difficulties. What of the future? Well, there is little I can add to what is already said in the last section of our report. I am sure that nothing can prevent the development of the motor industry, and that taking the long-term view, the story of Spurling Motor Bodies will be one of continual and steady expansion.

The motorisation of the world has not yet seriously begun; some countries are almost ignorant of what motor cars and trucks can do. Even here, where the roads seem pretty congested at times, motoring is only in its infancy. The people want cars, and what the people want they ultimately get. As for trucks, there is no system of transport so versatile as road transport. This growth that I forecast implies immense programmes of road construction. I am sure we shall see them.

THE FUTURE

All that, however, is taking a long-term view. Taking a shorter view, all I can say is that, with the next few years in mind, your directors have provided for the "Known." They have made their plans, and are ready to meet all the eventualities they can foresee. They are not, however, omniscient. They have no crystals into which to gaze, and they cannot predict the unpredictable.

I have to mention that because, although it would perhaps be undesirable for me to indulge in a political speech, one must say that it is not always easy to forecast, or even imagine, what those who govern us will do next. They have their own ideas of how the country should be run, and of what the people want. Whether they are the right ideas or not you are as well able to judge as I am. What matters is that, at the moment, they have the power to call the tune, and we in management have to do the best we can to dance to it.

There is, too, the International outlook. Reading the papers is not a cheerful occupation these days, no matter whether our interests be foreign affairs or cricket. (Laughter.) One never knows what is going to happen next, and the best we can hope for, when dealing with the "Unknown" is that whatever may happen, we may not be found entirely unprepared.

STEADY DEMAND

I cannot and will not try to prophesy with certainty the results for the coming year. We, in common with many other companies, find trading getting more difficult, but it is pleasing to note that in spite of a recession in the buying of consumer goods—which may be due to a falling-off in incomes, or to increased taxation—the demand for motor transport remains steady and our order books are full.

It is possible that, due to the short supply of new vehicles, plus the dearth of petrol, turnover may temporarily recede. Nevertheless, I am confident that your company will not be numbered amongst those who have to apologise for showing losses, and hard as the going may be, our target will be to achieve results at least as favourable as those now before you.

In the meantime, we can only plan ahead on the assumption that life will continue to be reasonably normal, and that we are doing. And who knows? Perhaps this time next year we shall be looking into the future with far more hope and optimism than any of us dare do today.

The report was adopted

HENDERSON'S TRANSVAAL ESTATES, LIMITED

DIVIDEND MAINTAINED AT 15 PER CENT.

The thirty-sixth ordinary general meeting of Henderson's Transvaal Estates, Limited, was held, on the 28th ultimo, in London

Sir Joseph Ball, K.B.E. (the chairman), presided, and in the course of his speech said: A comparison between the book value of our investments with the prices at which they were quoted on the Stock Exchange as at March 31, 1948, again reveals a further substantial appreciation: while a valuation of those of our securities which are not normally quoted also shows a large increase in values; and generally our investments stand at considerably higher figures than those at which they are shown in the books of the company. Our reserve for depreciation in investments stands at £100,000, while that for contingencies, equalisation of dividends, etc., has been increased from £245,000 to £280,000.

The directors recommend that the dividend be maintained at the rate to which it was raised last year, viz., 15 per cent.

Last year I referred to the negotiations for the transfer of the Delagoa Bay Development Corporation, Limited's, electrical plant and installation to the Portuguese Municipal Authorities. These negotiations were brought to a satisfactory conclusion.

The Tweefontein United Collieries, Limited, in which we are so largely interested, continues to prosper. Coal despatched from the mine during the year to December 31st last showed a reduction of 72,176 tons as compared with the previous year, the fall being due entirely to a persistent shortage of railway trucks. Recently, however, there has been a decided improvement in this respect; and, in addition, the price of coal at the pit mouth has now been substantially increased.

The report was unanimously adopted.

FORSTER'S GLASS COMPANY, LIMITED

A SATISFACTORY RESULT

The twenty-ninth annual general meeting of Forster's Glass Company, Limited, was held on the 28th ultimo in London, Col. Charles E. Ponsonby, T.D., D.L., M.P. (the chairman), presiding.

The following is an extract from his circulated review:

The profit for the year, after providing £27,960 for depreciation as against £22,729, but before making provision for taxation, amounted to £137,813 as against £68,554 for the previous year. This is a satisfactory result.

The year saw an improvement in the supply position of raw materials and while this has enabled us to make up some of the ground lost during the electricity cuts in February, 1947, the present position is still far from satisfactory. During the year all costs increased considerably, but nevertheless the sales for the year have again reached record levels.

Every effort has been made to continue our policy of developing and modernising our plant and machinery by replacing old machinery with new and maintaining in first-class condition the machinery we have.

The accounts show how each pound we have received from our customers has been spent: Wages, holiday pay, etc., 7s. 10½d.; raw materials and fuel, 4s. 7d.; materials for maintenance and packing, road and rail transport, electricity, gas and water, and all other operating expenses, 5s. 4d.; taxation, 1s. 0½d.; depreciation and reserves, 10½d.; and dividends on capital (i.e., amount paid to shareholders after deducting income tax), 3½d.

The demand for your company's products continues to be heavy, but in view of the present economic situation of the country I prefer not to prophesy about the future.

The report was adopted.

GOLD AND SILVER

The Bank of England's Official buying price for gold remained at 172s. 3d. per fine ounce throughout the week. Spot cash prices were as follows:—

1948	Silver: London per ounce	Silver: New York per ounce	Silver: Bombay per 100 tolas	Gold: Bombay per tola

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (a) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (g) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (l) To latest redemption date. (m) 15 months. Yield Basis 25%. † Free of tax.

SERVICE

Founded over a century ago, The Union Bank of Australia, at its Branches throughout Australia and New Zealand, offers a comprehensive Banking Service covering every modern requirement.

This extensive organisation is placed at the disposal of visitors desirous of transacting any description of banking business.

We invite you to discuss your travel and banking problems with our specialised departments.

Established 1837

Head Office: 71, CORNHILL, LONDON, E.C.3.

Branches throughout Australia and New Zealand.

The UNION BANK OF AUSTRALIA LIMITED

AGGREGATE ASSETS at 31st March, 1947 £67,034,037

Established over 80 years.

BANK of NEW ZEALAND

Incorporated with limited liability in New Zealand

Represented at over 240 points in New Zealand and at Melbourne, Victoria; Sydney, New South Wales; Suva, Fiji; Apia, Samoa.

London Office: 1, Queen Victoria St., E.C.4 O. M. Samuel, Manager

Head Office: WELLINGTON, N.Z. P. L. Porter, General Manager

NATIONAL BANK OF EGYPT

Ltd., and when this ... Egypt. ... Limited ... trucks ... ile as ... ion.

Incorporated ... Liability of Members is L...

Head Office - - - CAIRO

Commercial Register No. 1 Cairo.

FULLY PAID CAPITAL ... £3,000,000

RESERVE FUND ... £3,000,000

London Office:

6 & 7 King William Street, E.C.4.

Branches in all the Principal Towns in EGYPT and the SUDAN

THE NATIONAL BANK OF SCOTLAND LIMITED

Head Office: EDINBURGH

Branches throughout SCOTLAND

ESTD. 1825

LONDON OFFICES: 37, Nicholas Lane, E.C.4; and 18/20, Regent Street, Piccadilly Circus, S.W.1.

Every description of Banking Service undertaken.

REFUGE ASSURANCE COMPANY, LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £17,500,000
ASSETS EXCEED £102,000,000
CLAIMS PAID EXCEED £189,000,000
(1947 Accounts)

COMMONWEALTH OF AUSTRALIA

DEPARTMENT OF POST-WAR RECONSTRUCTION

Applications are invited for permanent appointment to the Commonwealth Public Service at Canberra, in the Division of Economic Policy, as follows:—

ECONOMIST, with actual salary £A966-1,056*, and SENIOR RESEARCH OFFICER (three positions), £A733-876.*

The duties involve the conduct of investigations and research into problems of economic policy, including employment industrial and commercial policy; analysis of economic trends and development, and supervision of research staff.

Applicants should be qualified to conduct research activities, to supervise research staff and conduct policy discussions. They should have practical experience in economic and research problems and possess University degree with major in Economics or related social and institutional studies or equivalent training.

(* The purchasing power of the Australian Pound is roughly equivalent to that of the £1 Sterling in England.)

Appointees after confirmation of appointments will be eligible for benefits under the Commonwealth Superannuation Scheme. Applications giving full personal details and experience by August 19, 1948, to Director-General of Post-War Reconstruction, Box 10 G.P.O. Canberra, Australia, or to Deputy High Commissioner, Australia House (Room 115), Strand, London, from whom details of appointment available.

CITY OF LONDON COLLEGE

Director: L. A. TERRY, B.Com.

The Governors invite applications from men for appointment as a full-time teacher of *Commerce, Accounting* and Economics in the Day and Evening Departments of the College. Applicants should have a degree *in Economics or Commerce, or an equivalent* professional qualification, but teaching or business experience, though desirable, are not essential. Willingness to assist in the social activities of the College will be an advantage. Salary will be in accordance with the Burnham (Technical) Award with London Allowance. The successful applicant will be required to take up duties on September 1, 1948. Application forms may be obtained by forwarding a stamped addressed foolscap envelope to the Secretary, City of London College, *Moorgate, E.C.2, and* should be returned within 14 days of the appearance of this advertisement.

ASSISTANT Accountant, first class man, required for West African Gold Mine. Must be qualified, about 35 years of age and practical costing experience with mining concern or modern engineering firm would be an advantage. Salary £60 to £65 per month, according to experience. Overseas tours 15 months followed by three months leave *on full pay. Bungalow accommodation with simple furniture* provided, also travelling expenses and first class passages. Free medical attention.—Write, giving details of experience, to Box 3615, c/o Whites, Ltd., 72-78, Fleet Street, London, E.C.4.

MALE *administrative assistant B.Com, or similar degree*, 25-30, required by Export Manager world-wide manufacturers pharmaceutical *and toilet products, to organise and control export* sales and advertising statistical records, render reports on sales and expenses, check merchandising and agents' manufacturing costs and expenses. Able to control staff; French essential and extra language an advantage; willing travel abroad.—Write, stating age, experience and salary required, to Box 749.

EX-SENIOR Government Officer, recently returned to this country; 23 years with Unilever; specialised in marketing proprietary articles; intimate knowledge of Central European and Middle East markets, seeks responsible position as sales manager.—Box 761.

STAFFORDSHIRE EDUCATION COMMITTEE

COUNTY TECHNICAL COLLEGE, STAFFORD

Applications are invited for the post of full-time teacher of ECONOMICS, COMMERCE and GENERAL COMMERCIAL subjects. Applicants should possess a Degree in Commerce or Economics or equivalent qualifications. Experience in Commerce, Industry or Local Government will be an additional recommendation and will be taken into account when assessing the salary, which will be in accordance with the current Burnham Technical Scales. Stop, Look, Listen

THE first Annual Report of the National Coal Board is summarised and discussed on another page. It is undoubtedly a sad misfortune for the Labour Government that the first year of their first big nationalisation scheme should have to disclose such a very large financial loss on the year's working. The deficit will be exploited to the full by the Opposition; from a thousand platforms it will be pointed to as proof that nationalisation is a failure. That, of course, is nonsense. No conclusions at all can be drawn from one year's working; and if they could, it would be on the statistics of output, of productivity and of capital expenditure, rather than on the financial results by themselves, that they would have to be based. It will take something more like five years before any fair-minded person will think of making up his mind about the success or failure of nationalisation as a system of organising industry.

Nevertheless, the public will scrutinise the report with close attention for signs of how coal nationalisation is going. A cricket match may not be decided until the end of the fourth innings, and yet it is possible to feel pleased or depressed by the middle of the first innings. It is only in this sense that any judgment can properly be expressed on the first Report; and in that sense the judgment must be that it is not very reassuring. The first innings is not going very well.

Nationalisation has become so much of an instinct to the Labour Party that it is necessary to keep on asking them what they do it for. When the present Government was formed, it was suggested in these columns that what this country most urgently needed was not so much a change in the ownership of its basic industries as a change in the way they are conducted. Nationalisation is good if, but only if, it opens the way to Rationalisation. Whenever there is something that clearly needs to be done to an industry, and where public ownership is necessary to do it, then the central core of public opinion will support a proposal of nationalisation—provided that the nationalised Board, when put in charge, does in fact get on with the job. What is somewhat disconcerting about the progress of the nationalisation schemes is not the presence of any portents of disaster but the absence of any signs that anybody knows what purpose they are intended to serve.

Perhaps this is a little less than fair to the nationalisation of coal, since there was, in the Reid Report, a clear statement of the way ahead. Two of the requirements were met: there clearly was a job to be done, and only a publicly owned industry could do it. But is the third requirement being met? Is the job in fact being done? Is the Board, having lost Sir Charles Reid, still devoted to the principles of his Report? It is difficult to be sure. Yet assurance on this will make all the difference between a judgment of success and one of failure. The debit items on the nationalisation account are very clearly visible in coal: the cumbrousness of administration that afflicts so gigantic a structure run inevitably on bureaucratic lines; and the sensitiveness to political pressure, as witnessed by the acceptance of that costly disaster, the five-day week. It will take a very large credit item, in the shape of really effective technical reorganisation,

to offset these debits; and the credit item is (to put it at the lowest) being much slower in making its appearance.

In some of the other nationalisation schemes, there is not even a Reid Report to go on. Transport nationalisation, for example, has brought no disasters. And, though the organisation at the top is very cumbrous, less harm has been done lower down than in the coal mines, because less has had to be altered. Indeed, one is tempted to suppose that more of the energies of the Transport Commission and its Executives have been devoted to finding new titles for old offices, new names for old organisations and new colours for old trains than to thinking of any fundamental changes. But it is no defence of a nationalisation scheme to say that it has changed nothing and done no harm. To be worth while, it must have some positive purpose. And so far as transport is concerned, not the first breath of a hint of what it is all for has yet reached the public.

The Government have probably hitherto carried a majority of the public with them in their nationalisation schemes. But this public support cannot indefinitely repose on Faith alone, Works are needed. So far, the books show a debit balance in more than a narrowly financial sense. It may be that, like the National Coal Board's deficit, this debit will be made good in the later years. Let us hope so; but the onus of proof is now very definitely on the nationalisers.

In these circumstances, even a Government with a mandate may reasonably be asked to stop, to look and to listen before driving on. The next on the list is steel. There are various possible reasons for nationalising the steel industry. It will serve to show Mr Bevan's influence on policy. It was mentioned in "Let Us Face The Future." It will infuriate the Tories. It will meet the desire of many Socialists to hurt the fortunate and the successful. It will satisfy others that they are capturing one of the citadels of economic power. All these are reasons that may convince members of the Labour Party. But there is only one reason that would be likely to convince enough of the general public to provide an electoral majority, and that is if it could be shown that a nationalised steel industry would produce better steel more cheaply than a privately owned steel industry. It may be possible to make out a theoretical case for thinking so. But before a theoretical case could be accepted, it would surely be wise to ask whether nationalised Boards do in fact act in such a way as to turn potential advantages into realised achievements. And the answer can only be, as yet, that though there is a theoretical case for the nationalisation of transport, the Transport Commission and its Executives act as if they had never heard of it.

Is it not elementary prudence to make an undoubted success of at least one nationalisation scheme—success being defined as the actual achievement of something that could not have been done without public ownership—before passing on to more doubtful, more difficult and technically far more complex schemes? More than prudence—is it not the only course that responsible Ministers can reconcile with their duty to the community?

Suspicions of Union

THREE months have passed since the European Recovery Programme was launched in Washington and the Sixteen Nations set to work to create an organisation able to carry the programme into effect. During the preliminary discussions in Paris a certain divergence of view became obvious, between the Americans, backed by the French, on the one hand, and the British on the other. The Americans would have preferred to see established a strong multi-national secretariat as the chief agency of the Sixteen in Europe. The British, believing that such a body would not carry sufficient weight with the governments it was supposed to represent, proposed instead the establishment of sixteen national delegations in Paris, served by a small secretariat and charged with the task of negotiating agreements and persuading the governments to accept them.

It will be recalled that the final arrangement reached in Paris in April was based on compromise. A three-headed organisation was established, with a council and an executive committee based on national delegations and flanked by an international secretariat. The Americans appointed Mr. Averell Harriman as the opposite number to this organisation, while Mr Hoffman presided over the whole Economic Cooperation Administration from Washington and sent special commissioners to each of the sixteen capitals to oversee the local development of the programme.

This is in general outline the administration that has now been at work in Europe and Washington for some weeks. In Washington the days have been largely filled, first with the struggle to prevent Mr Taber from cutting a large slice out of the first Congressional appropriation, then by the negotiation of the bilateral treaties laying down the conditions of aid. In Paris the programme of European needs for the second and third quarters of 1948 has been drawn up and some useful progress has been made towards an agreed scheme for increasing intra-European trade. In a word, the preliminaries are over and at this week's meeting of the Council, the Sixteen and their American colleagues are genuinely beginning to get to grips with the problem of European reconstruction. It is all the more unfortunate that this first encounter should have started with a collision between American and British views on how the Recovery Programme should be run.

The essence of the Anglo-American dispute is simple. The Americans wish the future work of allocating American supplies between the Sixteen Nations to be worked out by the nations themselves in Paris. Hitherto, Mr Hoffman has allocated materials, and the only direct way in which the governments could affect the size of their quotas was presumably by pressing their needs in Washington itself. Now, however, the Americans wish to hand on the task of allocation. The British have opposed this proposal on the grounds that neither the strength of multi-national cooperation nor the administrative resources of the Paris organisation are strong enough to make the experiment anything but a failure. The British, it appears, have had to give way on this point and the allocation will be done in Paris. But British acquiescence on this point will not put an end to misunderstanding, for it is not primarily the question of allocation that is at stake. The disagreement is rather a symptom of a deeper cleavage of opinion, one which may threaten the future of the recovery programme as a whole.

The Americans tend to see the aid they are giving Europe as part of a wider strategy—a strategy of bulding up a front of nations against Communist infiltration, politically and economically stable enough to stand on its own feet and to cooperate with the United States in the task of maintaining the free world. Judging by their own federal experience in the past, most Americans are inclined to believe that a divided, unorganised western fringe of Europe can neither hold up the Russians nor rebuild its own prosperity. They have, therefore, thought of Marshall aid more and more as an economic means for bringing about closer integration in Western Europe, and "Marshall Plan" and "Western Union" have been discussed in the same breath, the one leading to the other.

Already, in the first weeks of the programme, these hopes have been shaken. American opinion was upset by the way in which the creation of national delegations in Paris seemed to have built up the idea of separate national sovereignties which, in the American view, did not need any reinforcement. The relatively subordinate role of the new secretariat also disappointed them. But, above all, they were disillusioned by the appointments made to the new structure. The United States Government, they felt, had shown its own view of the vital importance of the venture by appointing, in Mr Hoffman, a leading industrialist of nation-wide reputation to the post of administrator. For the Ambassador-at-Large in Europe, Mr Truman had taken the unprecedented step of releasing his own Secretary of Commerce. But what happened in Europe? Nobody of Cabinet rank was appointed. No leading industrialists were called in. The posts were allotted to civil servants, able and devoted without a doubt, but not, in the American view, in any way equivalent to the American appointments. The one striking assignment—the despatch of Sir Oliver Franks as Ambassador to Washington—welcome though it might be to the Americans on general grounds, also aroused a certain amount of suspicion. To send the successful chairman of the committee which drew up the first Paris report to any post save that of European head of ECA seemed, in Washington, to prove the British government's underlying indifference to the task of European cooperation.

In all this, the British government has been the chief target of criticism. It is not simply that the British have appeared to rank Washington above Paris in the development of the Marshall Plan. Their failure to appoint their most outstanding men for Paris is held to have set the tone for the behaviour of the other Powers. The obvious fact that, alone among the Sixteen, Britain can exercise leadership inevitably places upon British shoulders the blame for the failures in leadership which Americans believe to be occurring. If the Paris organisation appears bogged down under paper work, if there is no sign of any long-term cooperative plans, if Mr Harriman has to fly to London to explain to the Chancellor of the Exchequer that Paris must be the centre of allocation, if any incident occurs to increase America's suspicions—then the British take the blame. Nor is it only in America that questions about Britain's real intentions are being asked. In Europe, the mood of criticism is strong, not only among those who are delighted to use Britain's supposed shortcomings as a cover for their own, but also among men genuinely anxious that the Marshall Plan and Western Union should succeed.

This volume of criticism of British policy is such that it cannot be neglected, and the first question to consider is why dissatisfaction has risen to such a pitch. It need hardly be pointed out that British policy during the last six months has not resembled in any way the Macchiavellian double-dealing of which it stands accused. Nobody can maintain that Mr Bevin and his advisers have gathered together behind closed doors in the Foreign Office to plan a campaign of securing American aid by bogus support of a European union in which they do not believe. But, if calculated dishonesty is ruled out—as it must be—what is the explanation?

The probable reason is that the Foreign Office has been exposed to two strong and contrary pressures. On the one hand are the Americans with their strong idealist belief in the virtues of federal union and their understandable demands that aid given by them should be used for acceptable political purposes. The American view is, moreover, strongly supported by vocal groups in Britain and in Europe maintaining that, with the advance of Russia to the Elbe, the old order has vanished and that in the post-war world Britain and Western Europe can find salvation only through closer association.

On the other hand, however, the Foreign Office must listen to all the voices advising caution. The economic situation, so difficult today, may improve as the seller's market comes to an end all over the world and primary products again become available at reasonable prices. Why risk costly experiments in economic pooling and development which may be unnecessary in three years' time? The risks of political association with Western Europe can be painted in even darker colours. May not Western Union weaken Britain's ties with the Commonwealth? What contagion may not spread to Britain from French and Italian Communism? Is it wise to risk German revival in any shape? Is Western Union possible without it?

All these doubts are obviously reinforced by a fact revealed by experience: for hundreds of years policy making and planning have been accomplished by the separate national governments, and the effort to make policy or plans by any other agency is almost unmanageable. The impetus of a great war can lead to a Shaef. But this is peace and all the peacetime inhibitions in favour of separate sovereignty are at work. Caution is therefore reinforced at every turn by inertia, and decisions which could and should be reached on an international basis drift back inevitably from Paris to the old centres of authority—to London, to Brussels, to Rome.

The combination of the pressures making for closer association and those working against it is quite sufficient to explain Britain's present policy—a policy which is not dishonest but confused. The general support for the ideal of Western Union was no doubt clear in Mr Bevin's mind when he pledged Britain to it last January. But neither he nor his advisers had thought out the implications of such a commitment and it is these implications than now clog Britain's thought and effort. Even if the confused state of British policy is understandable, it is none the less highly dangerous, and on few other aspects of foreign policy is it as necessary to let in the light.

The British Government should urgently try to end a situation in which under one set of pressures it enunciates a policy—Western Union—and under another set of pressures puts the

brake on the steps necessary to carry it out. *The Economist* has consistently argued that, in spite of all the obvious risks and difficulties, the balance of argument lies heavily in favour of making Western Union a genuine priority and of pursuing with real energy the various policies—political, strategic, economic—necessary to carry it out. Such a decision would involve the appointment to Paris of a man of outstanding authority and virtually manifestly of Cabinet calibre. It would involve staffing the Paris Secretariat not only with competent Civil Servants but with men drawn from the business world and the Services who understand the running of large-scale economic operations. Most difficult of all, it would involve agreement that on certain key points of economic and strategic policy the power to take decisions would pass from London to the new international agency. The risks of such a policy are obvious. The advantages could be the creation of a new spirit in Western Europe, a greater likelihood of full American aid throughout the proposed period of ERP and the chance that the strategic and political consolidation of Europe would have gone so far by 1952 that Russia, not the West, would be fairly and squarely on the defensive.

If, on the other hand, the British Government believes the risks inherent in a genuine policy of Western Union to outweigh these potential advantages, and if it believes that much more modest measures—for instance, a European payments agreement, a conventional military alliance, commercial agreements and cultural conventions, all on the basis of unimpaired national sovereignty—are in reality sufficient to meet a situation which may look much less desperate in two years' time, then the reasons for such an approach should be made clear and the more grandiose ideas conjured up by "Western Union" should be disavowed. There is after all nothing shameful or necessarily unreasonable in a policy which says in effect, "Ideas of western association which entail the pooling of sovereignty, extensive economic integration and the creation of full political union are too extreme. They cannot, in our view, be achieved and in any case involve risks disproportionate to any advantages that might be gained. Our own version of western association is admittedly more modest, but we believe it to be both workable and possible."

It is true that the enunciation of such an attitude would perhaps reduce the chances of continuing American aid and for a time it might even be regarded as betrayal. These risks would presumably be weighed in the balance before the more modest version of Western Union were officially proposed. But, in the long run, Britain would only gain by making its intentions clear. The worst of all policies is to proclaim one purpose and pursue another. Since it is into this danger that British policy shows signs of slipping today, the first need is a clarification of British aims. The best course would undoubtedly be to make a full western association the overriding end of the European Recovery Programme. To propose a more modest version of the policy would be at least an honest course. But the worse course of all would be, by a policy of half measures, to ensure the breakdown of both Western Union and of any more limited alternative. Half measures are the enemy of achievement, the grave of reputation. Today, Britain stands in danger on both counts.

How Many Bursars?

AT the beginning of June the Minister of Education announced the formation of a Working Party to consider the number of university scholarships which should be made available from public funds when the present large number of Further Education and Training Grants cease to be awarded to ex-service students. In 1946/47, 12,500 of these awards were offered in England and Wales and in 1947/48, 13,500; together they cover 40 per cent of the places available in the universities. Since the Working Party is due to make its report in September it is important that some further thought should be devoted to this subject outside the Ministry.

The terms of reference of the Working Party are as follows:

> On the basis of the present system of State Scholarships and Major Awards to advise on any administrative or other changes that may be desirable, particularly having regard to (a) the increased numbers at universities; (b) the termination of the Further Education and Training Scheme; (c) the probable abolition of four-year grants for intending teachers.

In any consideration of the numbers and type of university awards that it is proper to give four questions must be answered: first, how many awards ought there to be; secondly, what will they cost; thirdly, who should make the awards; fourthly, how should the students be selected? It is to be presumed that the Working Party is considering all four.

Before the war there were 50,000 students in the universities of Great Britain, and the annual entry was 15,000. To assist the 12,488 students who entered the universities of England and Wales there were 4,588 scholarships and grants available annually, covering about 37 per cent of the places. In Scotland the proportion of awards was much greater. In 1938-39, 2,090 awards were available and 2,665 students entered the universities; almost 80 per cent of the students could thus receive assistance, though the amount of that assistance was often very small. In addition to these public awards, there was an unknown number of scholarships and grants provided by schools and private bodies. With this volume of assistance, the universities kept reasonably full.

Ten years later the picture is very different. Not only has there been an increase of 50 per cent in the numbers of students, but the proportion of assisted students has increased still more. In the academic year 1947/48, 21,677 new awards were available in England and Wales—that is, more awards than entrants. Comparable figures are not available for Scotland, but it is probable that some 5,000 awards were available, as against 4,128 entrants. The discrepancy between the number of awards available and the number of students actually receiving grants, shown in Table II, is due to the demands of military service and the competition for places, which prevented a number of students from taking up their awards. The figures in Table II refer only to England and Wales, and show that about two-thirds of the students in these universities were grant-aided. At present only estimates can be made for Scotland, but on the basis of these it is probable that about 12,000 students out of a total of 15,795—or 75 per cent—were receiving grants. As, however, the Scottish figures are uncertain, and the Working Party's recommendations are confined to

TABLE I—NUMBERS OF UNIVERSITY STUDENTS

	1938-9	1947-8
Annual Entry :—		
England and Wales	12,488	18,002
Scotland	2,665	4,128
Total	15,153	22,130
Total Numbers :—		
England and Wales	40,212	60,969
Scotland	10,034	15,795
Total	50,246	76,764

England and Wales; most of the comments which follow will be equally circumscribed.

The principal reason for the great increase in awards is the large number of grants made to ex-service students from October, 1946, onwards. In the academic year 1947/48, 22,612 students were receiving these grants, at a cost of nearly £10 million a year. Next October the number is likely to be smaller, since the majority of ex-Service men have started in their university courses already; thereafter the number will fall sharply, since conscripts are not eligible for these grants.

TABLE II—NUMBER AND COST OF AWARDS, ENGLAND AND WALES

	1937–38*		1947–48*		1947–48
	Number of new awards available annually	Cost of all awards current £(000)	Number of new awards available annually	Cost of all awards current £(000)	Number of current awards
1. *State Awards :—*					
Further education & training grants (ex-service)	...	...	13,500	9,764	22,612
State scholarships	360	129	870	185	1,152
Open scholarships	1,200	§	1,200	138	1,118
Teacher training grants	1,298	627	1,775	400	4,607
Science awards	30	11	31	8	61
State bursaries	...	...	†	146	400
Total	2,880	767	17,377	10,641	29,950
2. *Local Authority awards*	1,700	340	4,300‡	500‡	12,097‡
Grand Total	4,588	1,007	21,677	11,141	42,057

* For state awards the cost is related to financial years and the numbers of students to academic years. † None were awarded in these years, but 420 were current in 1947–48. ‡ Estimate. § These scholarships, which are awarded by colleges or universities, were not state-aided before the war.

What the Minister of Education has now to decide is how *many places should permanently* be financed by grants of one kind or another, in order to maintain both the number and the quality of the students at the universities. There is no certain method of arriving at the solution of this equation. The cost of a university education has risen since 1939; the net incomes of the middle classes, in terms of 1939 prices, have fallen; the number of university places has increased. Therefore it is reasonably certain that if only the same proportion of students were assisted by grants as in 1939, either the average standard of the universities would fall, or more probably they would not be able to keep up their numbers. To maintain the prewar ratios, some 6,700 scholarships or bursaries would be required in England and Wales each year. This is the irreducible minimum. On the other hand, there is no reason why the number of grants should equal the number of places available. A third of the students at present at the universities in England and Wales are not receiving grants either from the Ministry or the Local Education Authorities. At least until such time as a tendency for numbers at the universities to fall below capacity begins to appear, there would seem to be no reason to provide awards for more than 70 per cent of each year's entry. Somewhere between 60 and 70 per cent is probably about right.

★

There are, indeed, very strong arguments in favour of leaving a recognisable number of paying students. Parents who pay are usually more careful about their children's academic courses and their future careers than those who do not. And until the methods of selecting state scholars are a great deal better than they are now, there is much to be said for leaving universities free to choose people not only for their examination-passing capacity. This freedom may be invidious, but it is at least better than filling the universities with only the "poor scholars," whose blinkered careers deprive a university education of most of its meaning.

If it can be assumed that two-thirds of the total of university students will in future receive grants from public funds, what is the cost likely to be? In 1938-39 the state and local education authorities were spending just over £1,000,000 a year. In 1947-48 they were spending over £12 million. This increase in expenditure is out of all proportion to the increase in numbers of grants, owing to the fact that maintenance grants to ex-Service students with wives and children are much larger than is normally necessary. Such extra grants will not continue. Nevertheless, it would be wise to contemplate expenditure at the rate of, say, £200 per annum for perhaps 55,000 students, which makes a total of £11 million. A means test might bring this figure down by a million or so, but it would be unlikely to be less. This expenditure, coupled with the very large increase in grants made direct by the Treasury to the universities (Table III), reveals the startling rise in public expenditure on university education.

TABLE III COSTS

	1938-9 £ million	1948-9 £ million
(a) State Grants :—		
Direct grants by the UGC to universities	2·50	11·88
State scholarships to students in England and Wales	0·76	10·64
State scholarships to students in Scotland		1·32
	3·26	23·84
(b) LEA Scholarships :—		
In England and Wales	0·34	0·50*
In Scotland	0·04	0·05*
GRAND TOTAL	3·64	24·39

* Estimate.

The next question to decide is, who should make these grants? There is widespread dissatisfaction about the inequalities in the size and number of university awards made by local education authorities. The richer authorities are more generous, but inequalities also arise from other causes. In an urban area where there are several grammar schools the competition is severe; in rural areas a bright boy has few competitors. Those who have seen the injustices of this system inveigh against it, and urge that all awards should be made by the state. But there are great objections to this. The method of making state awards by examination only is very imperfect. The personal interest taken by local education authorities, particularly by those who have efficient arrangements for school reports and the interviewing of candidates, is extremely important. And the very variety of methods used is itself an advantage, in order to encourage and benefit from experience. Until a much stronger case can be made against it, it would appear better that local authorities should continue to give a proportion of the awards, perhaps half—which would

THE ECONOMIST BY AIR EXPRESS

As already announced, it is our intention to extend the scope of the Air Express Service of The Economist so that more of our readers overseas may have the advantages of an air service at a reasonable cost. An Air Express Service to Australia and New Zealand will start in August.

And Now to South Africa. . . .

This Air Express Service will start with our first issue in September. On existing schedules, copies will be landed each week in Johannesburg for posting on the Monday after publication in London. The cost of an annual subscription will be £5. 5. 0.

If you wish to enter a subscription to an address in South Africa please send your instructions to :

The Publisher,
The Economist, 22 Ryder Street, London, S.W.1.

only be slightly more than at present—and that the Ministry of Education should encourage the authorities to act with greater uniformity about the number and amounts of awards.

There is, finally, the question of methods of selection, which will now have to undergo some alteration. Hitherto state and county scholars have been selected on the basis of the Higher School Certificate Examination. This is an imperfect enough test, but it is at least admissible for the 850 state scholars and rather less so for the 5,000 county scholars in England and Wales who are selected by this method. These are the cream of the HSC candidates who can be separated from the skim with reasonable ease and fairness. But when it comes to choosing two-thirds of the university population by this method, instead of one-third, the problem becomes completely different. Before the war only about 5,000 students in England and Wales took honours degrees, as against 7,000 who took ordinary degrees or diplomas. The proportion will probably be the same in the future, and if so, state and county grants will be made to non-honours students. For students of this kind the HSC examination, or such modification of it as will emerge from the new examination proposals, is hardly suitable, certainly not by itself. Some very careful thought will have to be devoted to the subject of selection, and unfortunately, nearly all experts favour methods which are extremely expensive in terms of cash and interviewing time. As a *minimum* the Ministry should encourage some experiments in varieties of methods of selection, particularly those which permit of personal interviews.

It is understood that the Minister of Education is prepared to face a very large extension in the numbers of grants. The question is how large, and how administered. It is to be hoped that before he reaches any final decision he will give more weight to university opinion than has been given in the Working Party, where only three out of fifteen members are drawn from university circles. This is not a matter primarily for local education authorities or for the Ministry. It is all very well to say that the universities still have the power to reject candidates who bring state or county awards in their pockets. But the possession of an award must always be two-thirds of the battle, since the university cannot provide alternative finance for its own candidates. The universities should, therefore, be consulted both on the methods of selection and the proportion of grants which they themselves consider appropriate to achieve a proper balance.

Food and the Future

MONDAY'S debate on the estimate for the Ministry of Food threw little fresh light on major questions of policy. There was Mr Strachey's shocking revelation of the current cost of food subsidies (which is discussed in a Note on another page); there was by-play with snoek, plums and canned horse-meat; there was the expected onslaught, rather ineffectively sidestepped, on bread rationing; there was the usual, by now distinctly perfunctory, controversy about how well or badly, in terms of calories, the people of Britain are being fed. But only once, in Mr Clement Davies's speech, was there any serious attempt to place British food policy against the world background and to outline the major strategy of a war against want; and that was fatally marred by unrealism.

So far as the past is concerned, most people probably realise in their heart of hearts that no postwar Government could have pursued a food policy very different from that of the Labour Government, and that no different food policy would have been likely to yield much better results; but this debate, at all events, provided little evidence of any attempt to answer the question which is most important for the future. Has there occurred, or has there not, so radical a change in world food prospects as to call for a complete reversal of British economic policy—the policy on which Britain throve and rose to greatness over the last century? Such a reversal is certainly implied in what one may call the Chifley prescription for emigration—a 30 per cent reduction in the United Kingdom's population—or in Lord Portsmouth's plan for virtual self-sufficiency in food supplies.

Support for these plans assumes certain conditions in the demand for, and supply of, foodstuffs; an indefinitely prolonged and probably increasing physical shortage of food all over the world, confronted by an ever more urgent demand for it. Sir John Boyd Orr, the foremost upholder of this view, stresses the loss of fertility by erosion, the growth of world population, and the inadequate nutrition of the great majority of even the present human race. Three thousand million tons of topsoil are annually blown or washed off American farms alone. There are a hundred and fifty million more human mouths to be fed than in 1938—twelve million of them in devastated Europe. Moreover, both processes are continuing. Even at this strictly technical level, however, the evidence is less conclusive than it looks. On the supply side, soil erosion is a menace and can be a catastrophe, as Northern Africa and Mesopotamia witness from antiquity and China from yesterday. But alarmist judgments of a few years ago on the North American "dust-bowls" look foolish in the light of the record crops subsequently harvested from these doomed areas. Three of the worst "dust-bowl" states—Kansas, Oklahoma and Texas—produced 210 million bushels of wheat a year on the average of the 1930s and 349 million bushels a year on the average of the three years 1944-46. The alarmist prophecies may look somewhat less foolish in the next cycle of dry years. But that is conjectural; the fact is that production has not gone down, it has gone up very sharply. No vast new continents wait to confute a new Malthus—to "stub up" African jungle for groundnuts is a very different matter from ploughing the prairies for wheat—but on the other hand the possibilities of technical improvements on land that is already under cultivation have, in some respectable opinions, been scarcely scratched. Better seeds and better fertilisers, better livestock, equipment and methods, may falsify Malthusian pessimism all over again. Their possibilities are not unlimited—the law of diminishing returns is not subject to repeal—but there is no need to assume that the limits are near. One need not, because there are walls to one's room, behave as though one were confined in a straitjacket.

Even if it were granted, on the inconclusive evidence, that supplies are strictly limited and that the numerical proportion between human mouths and necessary calories is destined radically and inevitably to worsen, it would not follow that the parent sellers' market for foodstuffs, with all its inconvenient implications for this country, would continue indefinitely, especially at its present intensity. The demand that counts is effective demand. The effective demand of the would-be eaters consists overwhelmingly in their capacity to supply things for which the food producers are willing to exchange food, and only to a minimal extent in their ability to indicate their needs to the world and eloquently to invoke the Atlantic Charter. Mr Clement Davies denounced as cynical Mr Strachey's assertion that the raising of nutritional standards in Asia was primarily a job for the Asiatic peoples; but FAO or no FAO, Atlantic Charter or no Atlantic Charter, it is certain that the citizens of the United States, Canada, Argentina, and the other food-producing countries are not going to tax themselves year in year out to buy food from their farmers and supply it to Asia gratis. It is already remarkable enough that the United States should be willing to make a once-for-all four-year donation to Western Europe, where a solid return in economic recovery and political stability can be expected; to do much more, to go on doing it indefinitely, and to achieve no better result than to make two malnourished Malthusians grow where one malnourished Malthusian grew before, is a prospect which no degree of idealism is likely to stomach. It may or may not be the duty of the West to assist the East to a higher standard of living. But permanent charity is neither a wise nor a practicable method of doing so. This is not cynicism but ordinary common sense.

*

To "marry agriculture and nutrition" is in fact not enough; trade is like an electrical circuit—the current will not flow unless there is a return route. It is not enough to establish a channel of trade from the wheat fields to the empty stomach; the hands attached to the empty stomach must also be able to produce something that can flow back, by no matter how roundabout a route, to the wheat farmer. In the last resort the British food problem is, as Mr Strachey pointed out, a question not of the availability of food in the world but of Britain's ability to pay for it; and the same holds for all other importing or would-be importing countries. It is not the absolute scarcity of foodstuffs, but the terms on which Britain can buy them, that matters. How are these terms likely to move in the future? Food cannot be sold indefinitely for prices that the consumer cannot pay. At present the food price level is paradoxically held up by successive American grants-in-aid bolstering European demand, as well as by boom conditions leading to lavish home consumption in the food-producing countries. One need not postulate, after the Russian manner, an inevitable and ruinous American slump, in order to see the likelihood that there will be some fall in world food prices—some increase in supplies relative to effective demand—some time within the next few years. Whether it will go so far as to restore the pre-war surfeit of food, no one can tell. Nor—it need hardly be added—should anybody desire a return to the slump conditions of the early 1930s or to thirty-cent wheat. But it is virtually certain that the present conditions will not be permanent and it is quite possible that, when the dust of wartime dislocation finally settles, the long secular downtrend of food prices, relatively to the prices of manufactures, will be resumed. General world productivity, shattered by war and hampered by political division, is rising again, and there is no reason to suppose that humanity has altered its well-established propensity to take out the benefits of increased production less in extra food than in extra manufactures and services. It would be pleasant to be able to set a date for the end of the present scarcities, just as it would be pleasant to know when July will stop acting like December; but uncertainty in timing is not the same thing as intrinsic improbability.

It would be wrong to be dogmatic. There is a strong probability that more abundant and cheaper supplies of food will be available for Britain to buy some time before very long; and there is some possibility that food will again become as cheap as it was. But no one can be sure of these things: the factors that determine effective supply and effective demand are very elusive, and it would be wrong to base an irrevocable policy on one particular reading of them—which is what, in their different ways, Sir John Boyd Orr, Mr Chifley and Lord Portsmouth ask the public to do. The only sensible policy, however much it may disappoint the cosmic planners, is to wait and see.

This does not, of course, mean that nothing at all can be done. It is so probable—on any reading of the future—that Britain's balance of payments will still be intractable that it is clearly right to plan for some increase in home production of food—that is to say, for such an increase as can be achieved without entirely upsetting the whole economic organism of the country. The most that can be done for the next five years, under the Government's agricultural plan, will be none too much, from this point of view. Merely to bring the average standards of farming practice in this country up to the level now reached by the best farmers, to develop grass-drying and silage, to raise the quality of stock, to cut out the physical as well as the financial wastes of distribution, to provide the housing and amenities needed to stop the present drain of manpower from the countryside, is a formidable and formidably expensive job; while in the field of colonial development the matter of the missing West African locomotives, for lack of which crops actually harvested cannot be brought out, may stand as a symbol of the kind of unsensational but highly and immediately productive improvement for which there is plenty of room—and not too much funds.

*

But action on the scale envisaged by the autarkists and depopulationists is a totally different matter. It cannot produce, in the next five years or so, any greater benefits than the more modest but already frighteningly costly programme now under way. It could, in time and at enormous cost, diminish the British people's dependence on imported foodstuffs; but at the same time it would make it increasingly hard for them to produce the means of importing that residue which—short of a reversion to almost medieval conditions—they would still have to obtain from abroad. These wider projects would do so much damage to the present foundations of British wealth that, even if they looked like being necessary, it would be wise to wait for some certainty before embarking on them. But the probabilities run the other way. If, contrary to what all economic history would lead one to expect, the change touched off by the war and by world-wide adherence to full employment policy turns out to be permanent, irreversible, and cumulative, then indeed autarky and mass emigration may be the only answers to a situation in which Britain's status not only as a Great Power but as a high-standard economic entity, would be irretrievably lost. But one should be very certain that the house is on fire before throwing the baby out of the top-floor window.

US Business Bulletin, *a publication of The Economist Intelligence Unit, provides a fortnightly digest and analysis of business and economic conditions in the United States.*

It is designed for exporters and other business men who need to be well-informed on American affairs, but who can afford neither the time to read American publications nor the dollars to buy them.

US Business Bulletin *is available by direct subscription only; it is sent by surface mail to readers in the British Isles, by air to the rest of the world.*

NOTES OF THE WEEK

Berlin Impasse

The Russian reply to the American, British and French Notes about the blockade of Berlin amounts to this: that Mr Stalin has sat back in his chair, put his legs on the desk and said: "What Sokolovsky has been doing in Berlin is quite right. There is no hurry in this affair. As we've said all along, the restrictions on traffic are temporary. You Western Powers have forfeited your right to be in what was intended to be the capital of a Germany under Four-Power control. That control has now broken down. The tension and pressure of which you complain is of your own making. The Germans need not starve—we don't object to feeding Greater Berlin. By all means let the four of us have talks; but they must be about the whole German problem of which the Berlin problem is only one aspect. And I cannot guarantee that traffic restrictions will be lifted before they begin. Incidentally don't forget that the position in Vienna is rather like that in Berlin."

In short the Russian Note leaves things precisely where they were; the situation is neither worse nor better than it was. Mr Stalin is content to see time marching on. The next move now lies with the Western Powers. Do they now put forward proposals for dealing with the Berlin situation within a given time—in other words do they frame an ultimatum and take precautionary measures which will frighten people in Western Europe as much as they will impress the Russians? Or do they explore cautiously the one or two openings which the Russian Note offers for a long diplomatic haggle? The main purpose of the relief operation by air, which is proving so costly and strenuous, is to give them time to take either course. And it has to be remembered that it is only quite recently that the Berlin question has been taken out of the hands of generals into those of foreign ministers.

The war of nerves may go on for weeks, bringing nearer every week the date when the European harvest is gathered and air deliveries are hampered by autumn weather. Western statesmen have to realise two things: that stern warnings to Moscow will be useless if unaccompanied by stern warnings to their own peoples; and that clear readiness to face the possibility of war is the one thing of which totalitarian statesmen believe the western democracies incapable. Are they to be disillusioned now or later on?

Attempt on Togliatti

The attempted assassination of Togliatti was the work of a single man, inspired by the vindictive personal hatred of traditional Italian politics and formed in the anarchic jungle of fascist violence still frequented by the extreme Right of the Italian parties. But the reaction to the *attentat* is the reaction of a whole organised class. Within an hour, strike orders were issuing from the Chambers of Labour and with a completeness that suggests that a fully prepared strategy for a general strike had been laid down in advance. True, the strike is only for a day, and nothing suggests that there was any immediate intention of ordering a longer one. But if the "readiness is all," the Italian Communists are not to be dismissed as a defeated force.

The strength of the Communist-led reaction is a salutary reminder to those who jubilantly accepted the April elections as a final defeat for the Communist Party. It was a defeat in so far as Signor Togliatti's followers failed to achieve the majority they had expected. But the total of votes given to the parties of the Left hardly fell, and the Left bloc emerged still in conrol of 30 per cent of the nation's votes and in virtually unchallenged control of the trade unions. Not a single contest at the ballot-box, but a long campaign to win over the masses can give Signor de Gasperi the genuine victory some observers were too quick to concede him in April.

* * *

Death Penalty Muddle

Trying to achieve a compromise in the controversy over capital punishment, the Government has only succeeded in getting itself into a bigger muddle than ever. The clause proposed as a substitute for the one thrown out by the House of Lords tries to distinguish two degrees of murder, one of which would attract the death penalty—though the Home Secretary would still have the power of reprieve—and the other imprisonment for life. The Government has, in fact, made the bad mistake of trying to put into legislative form the popular emotions of the moment. People are alarmed at the murders of policemen on duty and at murders committed during burglaries and robberies. Therefore, such murderers and gangster murderers are to be hanged. People are morbidly fascinated by the sexual murderer, and their fascination is to be pandered to by the retention of all the sickening paraphernalia of hanging for the man who commits murder in the course of rape (though, since the victim is dead, how can rape be proved?) and other sexual offences. A similar deference to what is supposed to be popular opinion is shown in the retention of the death penalty for murder by the systematic administration of poison—though when poisoning is to be considered systematic and when not has not yet been made clear. For a murderer to be sentenced to death, the jury will also have to find that the murder was committed with "express malice."

The clause was being debated in the House of Commons as *The Economist* was going to press, and doubtless the law officers will explain how some of the apparent anomalies will be resolved in practice. But it is impossible not to feel that a big blunder has been made in what is, after all, a very serious matter. One of three courses ought to have been taken: either the death penalty ought to be retained, with the Home Secretary gradually extending his use of the prerogative of mercy until hanging should wither away; or abolition for an experimental period as proposed; or abolition to be brought into force at some future date to be determined by Order-in-Council. The present compromise, so far as capital punishment is concerned, achieves nothing. There are almost as many degrees of murder as there are murderers, and to attempt to divide them into two classes—"more heinous" and "less heinous"—is futile.

*

Nor does the compromise look like removing the political difficulties which gave rise to it. It appears that the abolitionists in the Labour Party have been won over, and the clause will go through the Commons with the Opposition voting against it. But what will happen when the Bill returns to the Lords? Doubtless feeling that they might as well be hanged for a sheep as for a lamb—if the metaphor is not in the circumstances too inappropriate—the Lords are quite likely to reject the compromise clause, although there is another political difficulty here, since such a prominent Conservative as Lord Templewood is in favour of abolishing the death penalty altogether. The Lords are even, it seems, ready to insist at the expense of holding up the whole Criminal Justice Bill. But if the Government wishes to use the machinery of the Parliament Act to pass the Bill, it will have to reinsert the original clause abolishing the death penalty. Or it may remove the clause from the Bill altogether, introduce it as a separate Bill in the autumn and get it through under the retrospective clause of the new Parliament Bill. Whatever course is taken, it is clear that capital punishment, which was originally treated, rightly, as a non-party issue, has become, through Government bungling, inextricably caught up in the toils of party politics.

* * *

Food Subsidies for Ever?

Mr Strachey's admission that the food subsidies "are running at the moment at a rate of something like £470 million a year" is shocking from several points of view. There is, first, the light that it sheds on the Government's methods of forecasting and planning. In March last, Mr Strachey said that the cost of subsidies in 1947-48 was £395 million; but he did not say what the rate of expenditure was at that moment, and Sir Stafford Cripps, in his Budget speech, put the cost for the new year "in round figures" at £400 million. But it was not very difficult to calculate that they were then running much higher; in a leading article in *The Economist* of February 28, 1948, the figure was put at "over £460 million a year." As food is purchased on contracts and no new contracts have been signed in these months, there is no reason why the rate of expenditure should have risen. In short, it looks as if the Government has been indulging in false optimism once again. Moreover, the cost is going to go up still further. The higher Canadian wheat price from July 1st will add over £16 million and other new contracts now being discussed are likely to add another £20 million—unless retail prices are allowed to rise. The £470 million will soon be £500 million, and it looks as if £100 million of Sir Stafford Cripps's surplus will have disappeared—in fact, £70 million of it was never really there at all.

Perhaps even more frightening than the figures were Mr Strachey's excuses for them. "If people ask what value they are getting for their money, I ask them, first and foremost, to look at the children of this country." But Mr Strachey must know that this is not true. It would be true only if the subsidies enabled the families of this country to eat more food than they would otherwise do. With one or two exceptions, this has not hitherto been the case. Food consumption has not been limited by prices, but by rations. The subsidies have not enabled the working people to buy more food; they are the main source of the colossal sums that are spent on beer and tobacco. "There is no doubt" says Mr Strachey "that the steep rise in food prices which would take place immediately [if the subsidies were removed] would sharply cut down working-class consumption of food." But there is most serious doubt whether this is so, and it is certain that working-class expenditure on food would not be reduced by anything like the proportion that the subsidies bear to the total cost of the food now consumed.

Moreover, even if it were completely true, the implications require some examination. Even if the subsidies were abolished, the rate of real earnings would still be above the prewar level. Even if the abolition of the subsidies produced some reduction in the consumption of food by the working class, it would still be above the prewar level. In short, food subsidies, as defended by Mr Strachey, are a new and gigantic social service, a new device, in addition to all the others, for transferring income from the better-off to the worse-off. The social services, which cost some £450 million a year before the war, are apparently to cost, not £1,100 million, but £1,600 million a year. Even the most benevolent humanitarian ought to stop and ask himself whether the national economy can support so large a transfer.

Actually, of course, the great majority of the subsidies were not put on, and are not maintained, for any fine reasons of deliberate policy. They are maintained because the Trades Union Congress says they must be. The average wage-earner must preserve the 20 to 40 per cent gain in real income that he was enabled to secure during the war. If there were a 20 to 40 per cent gain in the real consumable income of the whole community, this might be all right. But as there is not, the other classes of the community are entitled to ask what they have done wrong.

* * *

Housing Debated

Mr Bevan cannot resist fireworks and obviously revelled in his own display in the housing debate on Wednesday. No new facts were, however, revealed, which is the more the pity since the basic problems of the Government's housing policy badly need to be thrashed out in public, and Mr Bevan had an admirable opportunity to give a constructive and statesmanlike review of them. The problems of costs, productivity of labour, housing needs, subsidies and rents, and the long-term balance between private enterprise and local authority work all need to be debated fully and if possible frankly.

It is, indeed, almost frightening that the Parliamentary Secretary should cling to the excuse that the decision to restrict the number of new housing contracts was not a decision to cut down the housing programme, but simply a necessary step to secure the rapid completion of houses already under construction or contract. Either the Minister is so frightened of the building unions and public opinion that he dare not admit to the economic pressures which force a reduction of house construction; or he is such a political monomaniac that he will not take his fair share of the disinflationary burden. It is difficult to know which is worse.

The Opposition made here and there a few glancing attacks on the present costs of house building, and their effects upon rents, but the only penetrating criticism came from Lt.-Col. Walter Elliot, who opened the debate. He rightly rebuked the Minister for the rising cost of house building and for the inadequacy of public information about this, and quoted examples of final costs which he has himself obtained privately, and which bore out those quoted in *The Economist* last week. Neither Minister made any effective answer to the charge of highly inflated costs. Mr Edwards, indeed, provided some new and interesting figures about tender prices, which are now running at 24s. per foot super as compared to 24s. 8d. in March, and 20s. 10d. in October, 1945. But tender prices are not final costs.

* * *

Government for Western Zones

The crisis in Berlin is delaying the evolution of organised German government in the Western Zones. It has been the aim of the Americans, backed by the British, to ensure that, if talks with Russia are to begin again, as much as possible of the political and economic reorganisation of Western Germany shall have already been accomplished. This strategy simply repeats Moscow's methods of the last three years, during which time the Russians, making parrot cries about Potsdam, have organised and exploited their zone just as they pleased. Accordingly, as soon as currency reform had been introduced in the West, the Military Governors followed it up by issuing three basic documents on Western Germany's political reorganisation and requesting the eleven Minister-Presidents of the Western *Länder* to consider the proposals with all speed.

The first document embodies the agreement on constitutional development reached in London between the British, American and French Governments. By September 1st a constituent assembly is to come together to draw up a constitution for Western Germany. The *Länder* governments may choose representatives or have them popularly elected on the basis of one delegate for every 750,000 voters. The constitution they draft must be democratic and federal, it must provide a suitable central body and must safeguard the individual citizen's rights and freedoms. Otherwise the Germans have virtually a free hand.

The second document requests the Germans to work out *Länder* frontiers in such a way as to ensure that each Land is roughly the same size. The third document is the "Occupation Statute," which defines the powers which Military Government intends to reserve to itself while transferring all other political, economic and administrative responsibility to the Germans. The reserved powers are strictly confined to those necessary for maintaining the occupation, and include control over foreign policy and some control over foreign trade, the continuance of internationally agreed measures for supervision—such as the international control of the Ruhr—reparations, the level of industry plan, demilitarisation and disarmament. The statute also safeguards the needs and the security of the occupation forces, and finally gives the occupying Powers the right to secure German observance of the new constitution.

* * *

Reluctant Germans

These proposals have run into two kinds of trouble. The first springs from France's usual doubts and hesitations. Shaken at home, fearful abroad, the French Government has from the start lagged anxiously and even resentfully behind the Americans and the British in their attempts to organise Western Germany. The second centre of criticism lies with the Germans themselves. Like the French, the Western Germans have an uneasy feeling that they are being asked to stick their necks out. They do not wish to have pinned upon them the responsibility of "splitting Germany," and still at the back of their minds lurks the possibility that the Russians may after all end by taking over control. Their first reactions therefore were hostile. The three documents received a cold reception and complaints of every sort were raised, including such ridiculous criticisms as that the Occupation Statute only defined the rights of the Occupying Powers.

When, however, the Minister-Presidents met at Coblenz on July 2nd a more moderate spirit seemed to prevail. After two days' discussions, they announced general acceptance of the project with certain strong reservations; for instance, they claimed that the Allies should accept full responsibility for continued occupation and for the division of Germany. Again, they demanded that the split between East and West should not be aggravated by suggestions that the political arrangements in the West are anything but provisional. Accordingly they proposed that the autumn assembly should not be "constituent" but "representative," that it should draw up not a constitution but an *Organisationsstatut*, and that the governing body which results from the Assembly should be an administration, not a government. The second document—on frontiers—was rejected because such boundaries could not be drawn "while Germany is still divided." The Germans also made various other demands such as freedom to control their own trade, to set up consular representation abroad and to limit occupation costs to a fixed percentage of the States' incomes. In general, it can be said that the German aim was to secure the maximum amount of effective power, particularly in the economic field, while delaying as long as possible the outward acceptance of political responsibility.

Since the Germans issued their qualified acceptance, the situation has, however, changed once again. The French have chosen to interpret the German qualifications as refusals and have seized on the chance to delay once again developments which they fear more and more as the crisis deepens in Berlin. They have refused to allow the three Minister-Presidents from their Zone to attend further talks planned for this week and the Americans are left with their strategy for speed in the West hanging in mid-air.

Tito Not Out

What one Jugoslav has called the "unprincipled struggle for principles" goes on merrily between Belgrade and the representatives of the Cominform in neighbouring capitals. Hungarian Communists, who pushed their way into the forefront of the Party onslaught on Marshal Tito, have been quickly slapped back with charges of persecuting the Jugoslav minority in their own country. Polish and Czech Communists who joined in the harrying have been sharply reminded that they are every bit as anxious to trade with the West as Tito has been. And when it comes to exchanges about past records of party and patriotic devotion, the Jugoslavs surpass their scandalised neighbours in invective and home thrusts. Mr Alexander Werth has described in the *Manchester Guardian* how Mr Pijade—a veteran Jugoslav Bolshevik—has trounced the leaders of the new democracies who after the war "reached their countries in aeroplanes, smoking their pipes, after talking to their people over the radio," while others were fighting the Germans.

The Tito affair has gone on now for over three weeks, and it remains as uncertain as ever what disciplinary action Moscow will take. If there is much more delay Mr Stalin and Mr Zhdanov —who may not see eye to eye in this matter—must be prepared for the Party Congress in Jugoslavia next week to support by acclamation the stand taken against the Cominform. That would mean the formal assertion of certain "reactionary" principles which would give new shapes to the eastern monolith if they were observed by the Russians in their policy towards the seven satellites. For the Jugoslav replies to the Cominform have asserted the right of east European governments to retain some diversity in their Communist unity, to make allowance for differences in tradition and economic development, to make agreements among themselves voluntarily and not under compulsion. Co-operation, say Tito's men, is taken for granted; the question is how to co-operate—as national governments or as Communist parties.

It must be a sad spectacle for the founders of the Cominform to see their organisation approaching its first anniversary, not as a discreet and well-drilled team, but as a quarrelsome and uncertain set of individuals, accused by one of their leading personalities of destroying the integrity of the international working class movement.

Mr Chifley's Satisfactory Visit

Mr Chifley returns to Australia after a week of strenuous activity. He saw most of the Cabinet Ministers and appears to have discussed every aspect of economic and political activity. No news has yet been released of any specific agreements he might have made, but there is little doubt that both he and the Ministers whom he saw were well pleased with their discussions.

His visit to Berlin was also well timed, and at Gatow airport he said bluntly:

> No question arises where Australia stands in regard to Berlin. We stand with the Western Allies. Any other attitude would be unthinkable.

This statement, coupled with his excellent broadcast last Monday night when he reaffirmed Australia's ties with Britain—"for hard practical reasons"—should remove any hesitations which the British Government may still feel over the attitude of the Dominions to Western Union. Canada, New Zealand and South Africa have already given their blessings; the lead now rests with Britain.

On the question of large-scale emigration to Australia, Mr Chifley also showed sound common sense. Whatever the rights or wrongs of moving whole towns, as has been irresponsibly suggested, there are practical obstacles which cannot be quickly overcome. Ships have to be found to take the emigrants away and houses have to be built for them to live in when they arrive. Mr Chifley stressed these difficulties and announced that, all being well, Australia might be able to receive about 70,000 people this year. This annual intake may be increased in later years, but it will obviously be a long, long time before the millions, for which Mr Calwell and Mr Dalton are so light-heartedly planning, can be moved.

Planning in the Colonies

"This is not planning." In this admirably brief sentence the Select Committee on Estimates sums up the Nigerian ten-year development and welfare plan. The committee was examining colonial development and welfare estimates in general, but made a first-hand study of development and welfare in Nigeria in the belief that from it principles of wider application would be disclosed. These principles are not new. It has often been pointed out that the colonial ten-year development and welfare plans, though an improvement on anything that had gone before, are really nothing more than departmental programmes for spending money. It was inevitable that this should have happened, for as the Select Committee itself points out, all of the proposed expenditure under the heads of water supply, education, agriculture, veterinary services and so on, is desirable, and most of it is urgent. The point is that if Nigeria's plan were completed overnight the impact on the mass of the people would be barely perceptible.

But it cannot be said that the Select Committee gets very far in constructive criticism. It has some useful suggestions to make for improving the machinery of planning—its account of the 11 locomotives needed for moving Nigeria's groundnuts, which were asked for in October, 1943, and finally shipped in May this year, reflects poorly on the machinery for determining priorities in London—but it does not really get to the heart of the matter. Can colonies which have no mineral resources ever attract capital on a large enough scale to have any marked effect on their standard of living? The ten-year development and welfare plans are clearly inadequate. But is it enough to add to them the £165 million capital of the two development corporations and the £10 million a year which, according to the Select Committee, is expected from private investment?

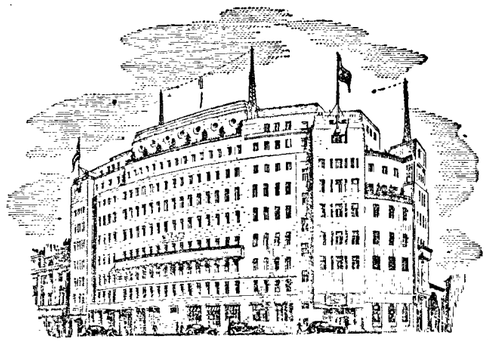
The Select Committee recommends a survey of capital requirements, by governments, corporations and private enterprise, in the colonies in the next five years. What is even more urgently needed is an estimate of how many people each colony can support out of its present resources at a tolerable standard of living, and then to estimate how much capital would be necessary to make it possible for the colonies to support, at this standard, their rapidly increasing populations. At present, for all the effort that has gone into colonial development in the last eight years, there is still no sign that the danger of an ever-falling standard of living has been averted.

* * *

New Champion for Africa

Fears lest the substitution of the Trusteeship Council for the old Mandates Commission would allow an undesirable political element to enter into international discussions on trust territories were strengthened by reports from Lake Success this week. The Mandates Commission was composed of experts who could be counted upon to view the administration of a territory with an expert's eye—coloured, perhaps, by the principles of colonial rule practised by their own countries, but undistorted by the foreign policies of their respective governments. Now, it seems, this impartiality has gone. In the Trusteeship Council this week there was criticism by most of the non-colonial Powers of the very modified administrative union of Tanganyika with Kenya and Uganda for fear lest it should gradually lead to the extinction of Tanganyika as a political entity. But it was left to the Soviet Union's delegate to demand that the British Government should abandon the scheme altogether and in future to submit for the Council's approval any laws or ordinances which might affect Tanganyika's legal status.

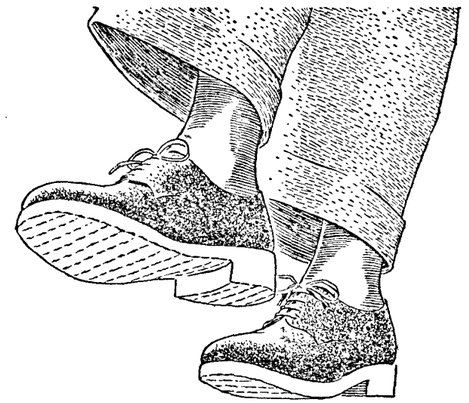
Even cruder, however, was the same delegate's denunciation of the East African groundnut scheme as sucking the lifeblood of Africa and the Africans to revivify the ageing arteries of the metropolitan Power. This statement shows such a complete disregard for the policy of development and welfare that lies behind the scheme and was expressly set out in the White Paper proposing it, that it was obviously calculated to stir up trouble for Britain among the Africans, who are only too ready to believe that any development and welfare project is exploitation. In this country it is easy to see the real purpose of the Soviet delegate's criticism. But there is a grave danger that the Africans will take it at its face value and feel that the Soviet Union is standing as their champion against a British attempt to deprive them of their land.



* * *

Prime Minister of Jamaica

A year ago Mr Azikiwe, commonly known as Zik, was in this country to protest, on behalf of his fellow Ibos, against Nigeria's new constitution. This July another colourful personality from the colonies is visiting England—Mr Bustamante, first holder of what is virtually the office of Prime Minister in Jamaica. Mr Bustamante is ostensibly on a private visit, and the rumour that he has come to angle for the governorship of Jamaica can probably



METAL WINDOWS

A crêpe sole is the only finished product made from pure rubber

Normally, to make rubber articles tough, resilient and enduring enough for every day use the rubber must be compounded with special chemicals. Of the many chemicals used by the rubber industry the most important are included in a group known as accelerators. Monsanto are the largest manufacturers of rubber accelerators in the world.

MONSANTO CHEMICALS

SERVING INDUSTRY . . . WHICH SERVES MANKIND

To till, sow, reap —yet starve

The farmers of the world are fighting a losing battle. Why? Because the methods of production on most of the world's farms today are hopelessly antiquated. The farmer's equipment has not kept pace with the mechanisation of industry. It is substantially as it was hundreds of years ago.

The majority of farmers in the world are still only scratching the earth's surface with implements *trailing* behind animals or vehicles. So millions face starvation while two-thirds of the people of the world are engaged in producing food. Despite the mass killings of war, the world's population has swelled by nearly 200 million more people since 1939. How can enough food be produced to feed them?

THE SOLUTION

With the Ferguson System of *complete* farm mechanisation, farmers can produce *more* food from every available acre at *less* cost. They can actually produce as much as *ten times* more food from some areas of the land. And by producing more food more efficiently and at less cost, the Ferguson System can help to check the present world-wide increase in the cost of living.

*Every week more than 1,000 Ferguson Tractors are produced by The Standard Motor Co. Ltd. Every week more than 5,000 Ferguson Implements are produced by the foremost British manufacturers. Every week more than 100,000 acres somewhere in the world are beginning to produce *more food at less cost.*

Inserted in the public interest by Harry Ferguson Ltd., Coventry

B3

be discounted. Nevertheless, his visit has some political significance. There were signs, when Jamaica's local government elections were held last autumn, that some of the popularity which swept Mr Bustamante into power in 1945 was waning. Next year at the general election he may have a hard fight to remain in office. But next year, too, is the end of the experimental five-year period of the constitution granted to Jamaica in 1944. At the time it seemed to many people to give Jamaicans too large a measure of responsible government, and these doubts were strengthened when Mr Bustamante was returned at the first election held under universal suffrage, because his extravagant utterances and behaviour hardly inspired confidence in his ability to govern. But the constitutional advances made throughout the colonial empire since 1944 make a further advance in Jamaica almost certain. It will strengthen Mr Bustamante's position at next year's election if he can associate fuller self-government with his visit to London.

For all his demagogic tactics, Mr Bustamante is a shrewd man. He knows that the popular emotions which secured his election in 1945 would not be proof against a breakdown in administration. Perhaps he has come to England to learn—to learn something of the responsibilities of office. But this country also has something to learn from him. People here, if they show any interest in the colonies at all, are inclined to smile tolerantly at the extravagances of Zik and Bustamante. They fail to appreciate that Zikism —which may be summed up as a dislike of British colonial rule even at its most benevolent—is an increasingly potent force in the colonies. The British have long preached that they are in the colonies to lead them to self-government. But they fail to appreciate how reluctant they appear, in the eyes of colonial peoples, to grant it. It is this impatience with Britain which men like Zik and Mr Bustamante play upon to their own advantage, and it is no answer merely to point out the virtues of British rule and how unready, by British standards, the colonial peoples are for self-government.

* * *

Lag in Coal Exports

Throughout the annual conference of the National Union of Mineworkers last week there was a steady procession to the platform of Ministers, Coal Board officials and union leaders, pleading for more coal so that Britain could meet its export targets. Once again Mr Bevin reminded the men that Britain's ability to fulfil its side of international trade agreements and to acquire food and raw materials depended on increased coal output. And the report of the National Coal Board published on Wednesday makes it clear how small is the increase in each man's output that is required.

The unanimity and plain-speaking on this point were novel and significant. The Government is anxious lest Britain's promises, especially to the ERP countries, are not fulfilled. Half the year is already gone, the holidays will soon take their toll and the bad summer weather has delayed any build-up of stocks for next winter.

What were the promises and what is the performance to date? To ERP countries Britain has promised 6,900,000 tons of coal in 1948; other countries with whom trade agreements have been concluded are expecting 2,660,000 tons—making a total of 9,560,000. For the first five months of this year Britain's total coal exports came to 2,750,000. If performance is no better in the remaining seven months of the year Britain would seem unable to fulfil much more than two-thirds of its coal commitments.

The deficit has hit some countries harder than others. So far the ERP nations have fared better than such countries as Argentina and Spain. If shipments to the ERP group were to be spread evenly throughout the year, Britain should have delivered 2,900,000 by the end of May. Actual deliveries were just under two million, or two-thirds of the target. Non-ERP countries are much further behind. Using the same basis of calculation, they had received by the end of May only 30 per cent of what had been promised them.

* * *

Digging for Dollars

Mr Bevin has already emphasised the harm this does to his international bargaining power; but just as important is the additional dollar burden failure might throw on the dollar-famished ERP countries. During 1947—a year when British coal exports to Europe were negligible—these countries spent $570 million on American coal. One of the assumptions made at the Marshall Plan Conference in Paris last summer was that in 1948 western Europe would be able to cut coal imports from the United States. Early this year European experts estimated this cut at nine million tons—from nearly 34 million in 1947 to 25 million in the current year. Such a reduction would at current prices save ERP nations about $150 million.

The basis of this estimate was expectation of a continued increase in coal exports from Poland and the Ruhr and the fulfilment of Britain's coal export pledges. During 1947 deliveries from western Germany averaged 900,000 tons a month; this year they have shown an increase of just over 20 per cent. Polish coal exports to ERP nations in 1947 averaged 600,000 tons per month; so far this year they have shown a 67 per cent increase. Both areas will almost certainly fulfil the expectations of the European coal experts. Britain cannot afford to fall short in its first important contribution to ERP and the solution of Europe's dollar problem.

* * *

Uno, Jews and Arabs

Four out of the Big Five have agreed at Lake Success to an American resolution calling for action under Article 39 of the Charter, which is the Article that provides for stopping threats to peace, by force if necessary. Unfortunately, they have done so for divergent motives. The Americans and the French both have experience of supplying umpires, and are ready to augment their supplies; the British, in the pass things have reached, now see no other way out; the Russians seem anxious to commit the British and the Americans to taking action against the Arabs. China, the dissident Fifth, holds that to freeze matters as they now stand would be to produce a one-sided peace favourable to Israel. This is a fact, but the longer the fighting continues, the more irreversible it will become.

The Israelis are conscious of it, and show it by their faces and their very inflexions of voice. They have a fatal gift for irking even their well-wishers. The tones in which their representative at Lake Success—Mr Aubrey Eban, who is as fully as British a subject as is Brigadier Glubb—has been addressing the Security Council do not promise well for their future entry into the councils of the nations. But they know where they are going. They are arguing with confidence the two not exactly compatible points that the Arabs have committed aggression, and that the Jews are entitled to their winnings outside the boundaries that the Assembly assigned to them. Militarily, their forces are on the offensive and at an advantage, and this fact is reflected in Jewish voices and faces all over the world.

The Arabs are at sixes and sevens. A majority of them are hotheads who have listened to nothing but success stories and are still clamouring for war to the death. A few soberer minds perceive the dangers of the military situation, and hope to be able to engineer a resumption of the truce. This, presumably, was the thought in King Abdullah's mind when he quieted street demonstrators in Amman on Wednesday with the advice that "demonstrations have brought misery to Palestine. . . . I know what I am doing and I know my way. . . . If you want success you must obey." Rather naturally not all Arabs think like him, because not all stand to gain what he stands to gain out of a peaceful settlement. This fact, however, affords no excuse for the present irresponsible behaviour of Azzam Pasha, Secretary-General of the Arab League, who is speeding from capital to capital uttering war cries mixed with dark hints about the arms obtainable from "another Great Power" and prophecies of "surprising" consequences. His position and role have never been easy. He moves among kings, but without their powers. His present activities give the impression that he is striking out wildly in order to keep his own head above water.

The Arab League is to meet again this week-end. The agenda will be gloomy. Will the *de facto* situation be recognised? The odds are that it will not, for Arabs when roused to exaltation or disgust cast aside all material considerations. But, unless they start taking these into account, even their best friends cannot help them further.

* * *

Kidnapped

Just over a week ago gunmen of Irgun Zvai Leumi raided the power-house in Jerusalem, and kidnapped five Britons who were at work there. They were Mr T. W. Bryant, the acting general manager of the Jerusalem Electric and Public Service Corporation, and four of its employees. Mr Bryant is also secretary of the British Community Council. The building, serving a vital need for all the inhabitants of Jerusalem, was under the flags of the United Nations and the three members of the truce commission, the U.S.A., France, and Belgium. The truce was still in force. The corporation, a British company, has a separate concession for the supply of electricity to Jerusalem and the surrounding area. The concessions which supply the rest of Palestine are Jewish. By heroic efforts, the staff of the corporation have kept Jerusalem going with a certain minimum of current throughout most of the past few months. But they were British-run and British-led, and for the Irgun, trying to regain some of its lost credit with the Zionist public, baiting the British is a form of self-advertisement which their experience under the Mandate suggests can be indulged in with impunity.

The mandate is ended, but nothing that has happened since the Irgun exploit suggests that things have changed. Mr Hector McNeil had no stronger words for it last Friday than "this incident," which he told the Commons that Sir Alexander Cadogan had been instructed to bring to the attention of the Security Council. This formally correct but all too mild reaction has had the consequences one might expect. The Irgun announced that they were going to try the five Britons for "espionage." Now, far from being concerned to show that they are really masters in Israel, the Tel Aviv government is reported as having let it be known that they were ready to compound with the act of banditry by taking delivery of the Britons themselves, for "trial" on some unknown charge.

The policy of turning the other cheek can be pushed too far. It is right for a Great Power not to be carried away by its passions, not to use violent methods where quiet ones will do, but a government has a duty to its citizens in circumstances where they have every right to its protection. The British Government still has means to enforce respect for its nationals legitimately and peacefully occupied in Palestine, and the United Nations, as its past record shows, will do nothing that Britain does not do for itself. There are five British public servants to be rescued, and their instant and unconditional release should be demanded in language which even the Irgun will understand. If, as has happened in the past, the Israeli authorities are ready to deplore the action but unready to call the Irgun to heel, the deduction is that they have not full control within their frontiers, and that Israel is in no fit state to be "recognised" by any foreign government.

A Brake on Men Teachers

As announced last Sunday the decision to delay the training of 10,000 men who have applied to enter the teaching profession came as a shock. Few people have realised the success of the recruiting campaign for men teachers, and many remember the creaks and groans with which the emergency training scheme got under way in 1945 and 1946, and the many tales of hardship and delay which were then current. Most of the mechanical difficulties were overcome in time, and very few complaints of red tape have been heard for the past eighteen months. Nevertheless this apparent calm has masked many individual stories of hardship and uncertainty. Acceptance for training has usually necessitated a long wait, which has been fitted in by whatever temporary job the applicant could find; this period of waiting is now to be prolonged another six to twelve months. Disappointment will be acute, and many men will now give up the whole attempt in despair.

The reason for the change in plans is the shortage of women teachers, for whom a big recruiting campaign is starting. Men's emergency training colleges are to be turned over to training women teachers, mainly for the infant and junior classes where they are urgently needed. But the shortage was seen to be coming a year or more ago. Indeed, the divergent trends in the birth rate and in the supply of women volunteering for teaching should have been visible to the Ministry of Education by the end of 1946. Why has action been so belated?

War Pensions

There were two points at issue in the adjournment debate last week on the pensions paid to those disabled by war service. The first was whether the amount of the pension was adequate. The second was whether war pensions should be brought into line with disability pensions paid under the new industrial injuries scheme.

On the first point, it was argued that the rise in the cost of living and in wages justified an increase in the basic pension of 45s. a week for a war pensioner whose disability is assessed at 100 per cent. The argument is logical. On the other hand, it is always dangerous to claim that pensions, whose chief virtue is that they are a certain, regular source of income, should be related to something so fluctuating as the cost of living or wages. Rightly or wrongly, the Royal Warrant lays down that the basis of a pension is not compensation for loss of earnings, but compensation for disability—the comparison, that is, is not between what a man formerly earned and what he can earn after his disability, but between a normal fit person and a person suffering from a varying degree of disability. Only a minority of war pensioners are solely dependent on their pensions. Replying to the debate, Mr Marquand, the new Minister of Pensions, said that over 80 per cent of all war pensioners are at work, and that of those whose disability is assessed at 100 per cent—about 50,000 —40 per cent are at work. The very factor—inflation—that reduces the value of the war pension makes it much easier for pensioners to find employment. Since the total sum which the state can find for war pensions must have a limit somewhere, it is surely better to do what Mr Marquand claimed his Ministry was doing—concentrate on improving the position of those who are so severely disabled as to be unemployable. Any additional money which the state votes for war pensions would be better spent on increasing the unemployability and constant attendance allowances than on a general increase in the basic pension.

The second point was left in the air. The industrial injuries scheme is already very much in line with the war pensions scheme since it is based on it in almost every respect. But the miners now have a supplementary insurance scheme for their disabled which will give them £1 a week more than disabled soldiers, and Mr Marquand promised to consider how this will react on war pensions. If, however, war pensions are assimilated with industrial injury payments, it will put an end to any hope that disabled industrial injuries can ever be brought within the main national insurance scheme. The right course would be to leave war pensions alone, as deserving more generous treatment, and to try to bring—somehow, sometime—the two insurance schemes into line.

Dutch Elections and Indonesia

In changing the distribution of seats a little, the Dutch elections have not made the outcome of the constitutional dispute any easier to settle. The results show the government coalition of Catholic People's Party with 32 seats and Labour with 27 holding 59 seats out of 100, instead of 61 as in the previous parliament. The losers are Labour. The only other party to lose seats were the Communists, who dropped from 10 to 8; if Amsterdam is excluded, this represents a voting drop of 30 per cent. It was largely due to a loss of Communist following in the trades unions. In so far as any broad deduction can be drawn, the elections thus show a very slight shift to the Right.

The main issue behind the elections was Indonesia, and the need to alter its constitutional position in view of the existing and proposed status of the Indonesian Republic. The Beel cabinet's intention has been to construct a new constitutional framework into which the United States of Indonesia of the Linggadjati Agreement may be fitted when it is formed. To do this a constitutional bill was passed by a simple majority in the old parliament. Now, after elections have been held, a two-thirds majority is required in the new parliament to make it effective. That, however, means 67 government votes, when only 59 are certain. Consequently interest centres on whether the government will broaden its basis to carry this through. The difficulty is the slight gain by the Right-wing opposition parties, who, of course, oppose the Government's Indonesian policy, coupled with the known intransigence of Labour.

With the Brussels Pact likely to be much in the public eye in the next few weeks, it is worth remembering that the elections have stirred up some of the anti-British feeling which the subject of Indonesia always raises. This take two forms: memories of the six weeks' delay in re-occupying Java and Sumatra after the Japanese withdrawal in 1945, for which the British were blamed, and resentment at the embargo on arms for the Dutch forces in Indonesia imposed by London last year. However, the irritation caused by this regrettable thorn in the side of Western Union is now partly soothed by stories in the Dutch press of British difficulties in Malaya. The Dutch are wondering what difference there is between police action against Indonesians and Spitfires strafing Chinese in the Malayan jungle.

Letters to the Editor

Science and Planning

SIR,—On page 6 of *The Economist* for July 3rd your correspondent writes of the doctrines that "pure" science is worthless, that science does not exist for its own sake, and that all scientific research should be organised according to a master plan. It is then stated that the spread of these doctrines throughout the thirties may be traced in the Reports of the British Association.

Lest this may be construed by your readers as meaning that the British Association supports and advocates such doctrines I should be glad if you would publish a disclaimer. The British Association provides an open platform for the discussion of science, and views of the kind mentioned may have been reported in the proceedings of the Association; but the Association does not accept responsibility for the views expressed by individual members at its meetings and the policy of the Association is not based on the doctrines referred to by your correspondent.—Yours faithfully,

D. N. LOWE, Secretary,
British Association for the Advancement of Science

Burlington House, W.1

The World and the Dollar

SIR,—Your articles are interesting not only for what they say but for what they leave out. Their argument seems to lead irresistibly to the position that if the United States wants to sell goods to Europe without lending the wherewithal to buy them, the dollar will have to be given a lower value in terms of European currencies (in other words, the goods will have to be cheaper). Yet this possible expedient is not even mentioned by your contributor. Mr Hawtrey, in recent letters to *The Times*, has put the case for raising the dollar value of the pound, and has dealt with some of the arguments against this course. Obviously there is material for discussion. One would like to know why, in a series of articles in *The Economist* purporting to deal with the dollar problem comprehensively, the case for raising dollar values of the pound and other currencies is not so much rejected as ignored.—Yours faithfully, MYRA CURTIS

Newnham College, Cambridge

[Mr. Hawtrey's arguments—so far as we understand them (which is not very far)—relate to the immediate position, in which dangers are to be apprehended from inflation in the United States. Our articles were concerned, as they frequently stated, with the longer-term prospect after the Marshall Plan is over. We considered the effect of a *lowering* of the dollar value of sterling and other currencies, but it never occurred to us to consider an *increase*. If the long-term problem is that, in a relatively free market, the United States will always tend to sell more to the rest of the world than it buys from the rest of the world, how could a *fall* in the dollar—which would make the world want to buy still more from America and enable it to sell still less—conceivably do anything but make the problem worse?—EDITOR.]

SIR,—Your timely article on the necessity for putting across to the Americans the need for a measure of European discrimination might have also made the following point. Such discrimination was made inevitable the moment the Bretton Woods agreement was signed, for the only way multilateral, non-discriminating trade could in the present circumstances be carried on in the way desired across the Atlantic would be within a system of freely fluctuating international exchange rates. Such a system, agreed by the Americans as much as anyone to be impractical and undesirable, is nevertheless a logical complement to their economic ideal and would, through a general fall of European currencies in the face of the dollar, render US export prices so high to European buyers as to cut foreign purchases of American products far more effectively than the degree of discrimination now impending.—Yours faithfully, A. JOHN WHITESIDE

Rickmansworth

SIR,—Your article "The Need to Discriminate" in the issue of July 10th concludes that Europe "must . . . do painfully by . . . discriminating what could once be left to unfettered free trade," on the grounds that "dollar shortage plus non-discrimination means a throttling of world trade."

Discrimination in accordance with internationally agreed rules may, as you suggest, be the proper remedy. You appear to suggest that it is the only conceivable solution, that the solution cannot nowadays "be left to unfettered free trade." The solution that would be produced in circumstances of unfettered free trade, including either free exchange rates or suitably fixed exchange rates, is an appreciation of the dollar relatively to other currencies sufficient to allow "Western Europe's trade with other parts of the world . . . to go ahead more rapidly than its trade with America can do."

Such an appreciation might not in all conceivable circumstances achieve this result, nor might it be necessarily desirable. It is as well, however, to recognise that the advocates of non-discrimination are not all quite so obtuse as an innocent reader of your article would suppose.—Yours faithfully,

F. J. ATKINSON

Jesus College, Oxford

Incentives for Housewives

SIR,—There is at the moment in Great Britain and Northern Ireland less than 2 per cent of unemployment, principally concentrated in a few pools; but in an active industrial area such as Birmingham and the Black Country the numbers registered as unemployed are down to 6,000 or so out of a total insured population of 850,000. The money paid for a five-day week comfortably exceeds the sum required to buy the accustomed physical and conventional necessities of life, and overtime is (or was) penalised by the high rate at which tax is levied on additional earnings. The wage earner has a secure job, plenty of money, and certainly sufficient after covering his artificially lowered cost of living to provide him with all his simple pleasures—smokes, beer, a flutter on the dogs and Saturday mornings free to follow (in a coach) the fortunes of the team he fancies to their out-of-town engagements.

The root of the problem of the incentive to work may lie just in this: that the ordinary Briton's pleasures are all too simple and all too easily satisfied. In this he is singularly unlike his North American opposite, who is driven to work by an infinity of insatiable and expensive desires—with consequences to the gross national product of the United States which all the world may see and admire.

Our circumstances could certainly be improved by harder and longer work on the part of paterfamilias. But, in so far as he does not and will not so do, shortages continue, and it is upon the housewife that the burden of dealing with them principally falls. It would not, indeed, be more than a pardonable exaggeration to say that the five-day week is being made possible by the willingness of our women to forgo those improvements in the material standard of life which could be bought at the cost of additional effort by their menfolk and to add queues, mending and making-do to their prolonged and unpaid labours in the home at a time when men are working shorter hours and earning more money than ever before.

Sir, we must look to the wives. The usual English kitchen, relegated as a rule to the back premises, is badly planned, often ill-lit and lacking in almost every modern convenience. The conditions under which a housewife works offend every principle of industrial welfare and motion study. Our domestic offices remain one of the last strongholds of unassisted and inefficiently applied handwork, an unenviable distinction which they share with the older coal pits. Can we not persuade housewives to demand, not necessarily payment for their services (though this would help), but a little thought for the layout of their kitchens, a lick of paint and a reasonable provision of mechanical equipment to lighten the never-ending tasks of housework? The British working man complains that the horsepower and machinery at his disposal falls far short of the standards set by North American industry—but his wife can with even more justice make exactly the same point about her kitchen!

If the English wife could be induced to insist upon the quantity and quality of mechanical aids which are in common use in North America, her husband's demand for income would soon rise. His incentive to work and earn would be correspondingly strengthened and our problem rapidly resolved. Of course, Sir, a demand from the housewife for more machinery as a preliminary no doubt to a claim for shorter hours and improved conditions of domestic work will be resisted by reactionary husbands exactly as their own demands in the past were resisted by hard-bitten and unsympathetic employers. Women may have to resort to direct action to coerce the recalcitrant male. But there need not necessarily be a strike. Lysistrata deployed forces vastly more formidable!—Yours faithfully,

GILBERT WALKER

University of Birmingham

From *The Economist* of 1848

July 15, 1848

THE TENANT OF WILDFELL HALL. By ACTON BELL. T. C. Newby, Mortimer Street, Cavendish Square

IT was said when "Jane Eyre" appeared, that this charming novel was written by a lady; we never believed, nor wished to believe it, for some of its peculiarities, which were called faults by many, and a little objectionable by most readers, but which were far outweighed by the interest of the story, and overlooked if supposed to issue from the pen of a man, would have been odious in the writings of a woman. Some months later, a second novel, by a "Bell," though with a different prenom, "Wuthering Heights," was currently attributed to the author of "Jane Eyre"; and now we have "The Tenant of Wildfell Hall" by a third "Bell," and they all seem to belong to one family. "Wuthering Heights" certainly possessed all the faults of "Jane Eyre," but in a more aggravated form, and had none of its beautiful freshness. It was sometimes striking and certainly never commonplace, but it was not agreeable. The plot of "The Tenant of Wildfell Hall," like the characters, come nearer "Wuthering Heights" than "Jane Eyre." It might be all true, yet it is not the less objectionable. Wilful, unthinking young ladies, who love and marry young handsome rakes, in despite of the advice of their friends, who find themselves introduced to worse than doubtful society, and placed in situations revolting to their feelings and degrading to their character, are frequently met with in the world, but they are not suitable heroines for novels, still less are the scenes and the language appropriate to such situations fit to be introduced in the pages of a book intended for the perusal of young persons of either sex. . . .

THE WORLD OVERSEAS

Food From Eastern Europe—I

(From a Special Correspondent)

THE suspicion is spreading that estimates of the contribution in food that may be made by Eastern Europe to the economic recovery of the West have been too hopeful. It has become important to consider whether the former pattern of trade in Europe will or can be restored to any large extent. Even before the war, the European economy, taken by itself, was in disequilibrium. Its industrial production was too great, and its agricultural production too small, and it was necessary to call in the New World to redress the balance of the Old. Had it not been for the peasants of Eastern Europe this disequilibrium would have been greater still, for it was from East Prussia, Poland, Hungary and the Balkans that Western Europe drew a large part of its food, and to these countries it sent a large part of its industrial products. Alone among Eastern European countries Czechoslovakia could lay some claim to being regarded as industrial; but even here imports of food and beverages amounted to 1,706 million crowns in 1937, while exports of food and beverages totalled 978 million crowns.

Taking the other countries singly: Poland imported virtually no food in 1936, but exported 392 million zlotys' worth out of a total of nearly 1,200 million zlotys; Hungary's agricultural production, valued in 1938 at over 10,000 million forints, was sufficient to supply all the needs of the country, and make up about 35 per cent of the country's exports; Rumania in 1937 exported nearly 9,000,000 tons of agricultural products more than she imported; Bulgaria had agricultural exports in 1937 valued at 4,728 million leva compared with imports of 36 million leva; while in Jugoslavia the average annual agricultural exports, between 1933 and 1937 were 61 per cent of total exports, agricultural imports for the same period averaging only 5.2 per cent of the total imports.

A further producing area of importance was the area east of the Oder-Neisse line. This district was able to send 1 to 1½ million tons of flour equivalents to the Western Zones of Germany, in addition to meeting all its own requirements.

The supplies that came westward from these sources have now either been cut off altogether or drastically curtailed. The causes of this fall under two headings—physical and political. The former, broadly speaking, are non-recurrent. In particular they are the unfavourable weather of the last three years, the movement of populations caused by the war, and the destruction of livestock, machinery and buildings which took place during the German retreat. The political causes are more enduring, and arise in part from the strengthening of economic ties between the Soviet Union and the countries of Eastern Europe, and in part from the natural antagonism between peasant agriculture and Communism. Both causes are reflected in the plans that these countries have made for their agriculture, plans that have certain objectives in common even if their methods differ.

Poland in common with the other eastern European countries has a published economic plan; but, so far as agriculture is concerned, its economy is the nearest approach to nineteenth century *laisser-faire* that one is likely to find in Europe. The Polish farmer is free to grow any crops that he likes and to dispose of them in whatever way seems to him most profitable—although some of this freedom is more apparent than real owing to the virtual monopoly in some spheres of the co-operative marketing organisation. For certain crops such as flax and sugar beet, he may make contracts with local factories; but no compulsion is placed on him to make these contracts; he is guided entirely by whether he thinks the price offered is sufficiently attractive. Last year, for instance, insufficient flax was grown to meet the state's requirements; but, instead of fixing a flax quota for every district or farm—as those used to Western democratic procedure might have expected—the only step taken by the Polish Government was to increase the contract price of flax four-fold, with highly satisfactory results.

In spite of this lack of control there is a direction in which the Polish Government wishes to guide agricultural production, and that is towards the increased cultivation of industrial crops and livestock products. The low wages prevailing make it impossible for the industrial worker to pay the high prices needed to encourage the farmer to enlarge his head of livestock. But the demand is supplied by the Government, which is a willing buyer for the export market, at prices sufficiently high to give the farmer the incentive he requires. The Government is thus in effect competing with its own workers for agricultural produce, and because it has the power to keep wages low it is able to outbid the worker. So the farmer finds it more profitable to process his grain into bacon and eggs for export to England than to sell it in its natural state to the miller. How far the Government has succeeded by these means in encouraging the production of livestock at the expense of grains for direct human consumption can be seen by the fact that Poland has undertaken to export to Britain 14,000 tons of bacon, 250,000 boxes of eggs and 3,000 tons of poultry in the twelve months covered by the latest trade agreement. In point of fact, rather too much grain was used for animal feeding, and it was found necessary to import 600,000 tons of grain from Russia in order to meet Poland's bread requirements.

Poland is going ahead fast with its agricultural expansion, and the retarding effect of land reform is being minimised by the Government's policy of retaining as state farms a large proportion of the estates acquired from dispossessed owners. The former German territories are also being resettled, partly with families from Central Poland, and partly with refugees from the East. All of the most fertile land is already cultivated, and in a few years not only will every field be ploughed, but yield per acre will rise

as the new farmers become accustomed to the soil. Although Western Europe is likely to benefit from this increased production, it is already clear that most of Poland's food exports will be expensive processed products with little, if any, grain.

(To be continued)

What is Wrong with Malaya?

[FROM A CORRESPONDENT IN SINGAPORE]

THAT insurgents are causing immense trouble as well as damage and loss of life is notorious. Why they have been able to attain such a high nuisance value is a question of even greater importance. At the moment these insurgents—they should be called insurgents, for though they include professional gangsters they are more than a collection of bandits—number less than ten thousand, of whom perhaps less than half are armed. Their headquarters and habitation are in the jungle. Malaya is a ridge of land with a high backbone under dense tropical jungle. The lower ribs, cleared and fertile along the coastal plains, produce all the great dollar-getting wealth. In this backbone, travel is difficult but it is easy for lightly armed men to establish their camp and to strike widely where they will. To extirpate such men requires determination and continued effort. The insurgents have mobilised and are calling in Communist sympathisers, gangsters, survivors of the old Malayan Anti-Japanese People's Army, guerillas from the war and discontented men who are bored with civil life, and join up as to the cave of Adullam. The ordinary Malayan wants to know why what has been done against them is so little and so late. They can be dealt with by a planned effort of the Civilian Government and the Services. Their numbers are small and they dwell uneasily in tropical rain-forest. Serious though their activities are, they have not materially lowered production, and the local stock market shows no symptoms of alarm. The chief mistake will be to underrate them. They must be suppressed now, so that periodic recurrence of like insurgence will not be possible.

Government Without Ideas

That they were allowed to exist and expand is due to administrative failure. The administration is over-strained, over-loaded, and over-confident. A civilisation depends on a creative minority leading uncreative masses. The uncreative masses accept and follow the leadership. When the leadership fails, when the piper has lost his magic and can no longer conjure the feet of the multitude to follow in joyful dance, he is apt to convert himself into a drill sergeant or into a slave-driver, and to coerce by force the multitude that no longer responds to his old magnetic charm. In Malaya a creative minority of Europeans, Malays, Chinese and Indians in little more than two generations turned Malaya from a wilderness into a land of peace and plenty. The inspiration of the creative minority grew dim, and from being a creative minority it became a dominant minority which maintained by force a position that it had ceased to merit.

The liberation of Malaya saw a rapturous welcome to the returning Government but there were significant areas where bands of guerillas proclaimed a small republic. The incoming Government had few ideas and those it had were as unimaginative as red tape could make them. A pullulation of departments and files of officials caring nothing for the colourful *sarong* and *baju* of the country, clothed it in the utility garments of ready-made and mass-produced policies.

The policies had to be sold. They were not attractive, and large central offices worked overtime to pass the necessary legislation. The laws were duly enacted but the planter and the miner and the peasant and the trader were forgotten. The laws existed but no staff executed them. Administration bogged down and was regarded as of little authority. Land settlement fell into appalling arrears; prices soared while price-control officials submitted reports; tuberculosis increased alarmingly while a housing and hospital programme scarcely emerged from the blue-print stage; crime increased while the police were not recruited to establishment.

The policies were sound enough but they were as unattractive as unleavened bread. They will eventually be adopted but at the moment they have to be imposed from above and have struck no root.

Need for a New Raffles

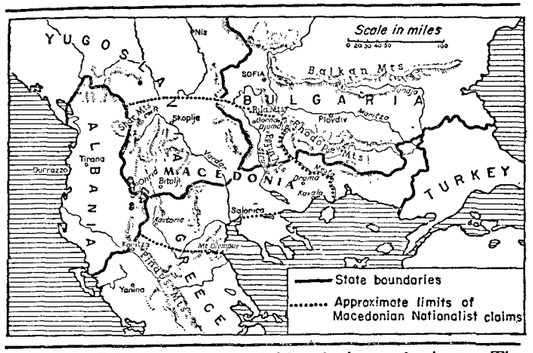
The situation in Malaya will deteriorate and it is necessary for prolonged and concerted action to be taken against the insurgents. It will deteriorate still more unless a wise and far-seeing administrator like Raffles can be found who will restore confidence by a policy easily recognisable as just, firm, intelligible and farsighted.

Even in Singapore, where administration in a compacter area has kept closer contact with realities, the housing situation is appalling. The Singapore Annual Report states that most of the poorer classes live within one thousand acres in the city. In some blocks the density of the population is over one thousand persons per acre. Those who cannot share rooms live underneath stairways or in cubicles without direct contact with the open air. The dirt and stench are appalling. . . . "A goodly apple rotten at the core."

Action is being taken. Funds subscribed to the Princess Elizabeth Wedding Fund were devoted to house-building, but the drive to build must acquire a dynamic even greater than the anti-insurgent drive. The insurgents are mobilised and mobile, and their terrorism will increase. It must be conquered by force, but it can be countered only by the efficient administration of social reform. Malaya has taken on far too many liabilities and suffers from acute indigestion. Reforms must be translated from Secretariat plans to practical execution.

Rivalries in Macedonia

[BY A CORRESPONDENT]



EVEN before the outbreak of the Tito-Cominform quarrel several articles in the Jugoslav press and speeches by prominent Jugoslav Macedonian politicians (Vice-President Vlahov and Macedonian Premier Kulishevsky) attacking the Government of Bulgaria, had shown that relations between the Republics of Tito and Dimitrov were still not free from all friction, and that Macedonia, for so long the most coveted of all Balkan apples of discord, had not yet lost its power to confuse and to embroil.

"Macedonia" has had different meanings in different periods of history, but can be most conveniently described as the central part of the European territory still left to the Ottoman Empire by the 1878 Congress of Berlin. Its approximate boundaries are shown on the attached map, and its centre is the valley of the Vardar. Its ethnical composition is so confused as to give French cooks a word for fruit salads. The territorial settlements of 1913, 1918 and 1944 have confirmed its division between the three Balkan neighbour states. The three divisions are sometimes known as "Vardar" (Jugoslav), "Pirin" (Bulgarian) and "Aegean" (Greek).

Three main conflicts have existed within Macedonia during the present century—Christian against Moslem, Slav against Greek, and Slav against Slav. The first was greatly reduced by the expulsion of the Turks in 1912, but survives to some extent in the distrust of the Slavs and Greeks towards the Albanian minority. The bitter attack by the Albanian Government on Tito is good proof of this. The second conflict is as strong as ever, and has been made the more dangerous by the fact that the frontiers of Jugoslavia and Bulgaria with Greece are also the southern land frontiers of Soviet Europe. The third is more complicated and requires analysis.

The Macedonian Slavs speak various dialects which differ from both Bulgarian and Serbian but are much nearer to the former than to the latter. For the last forty years there have been three nationalist tendencies among them—Greater Bulgarian, Greater Serb, and Macedonian Autonomist. Under Serbia (1912-1915) and Jugoslavia (1918-1941) bureaucrats, merchants and schoolteachers sent from Belgrade exploited Macedonia as a Serbian colony and called its people "South Serbs." Those who objected received short shrift. Under Bulgaria (1915-1918 and 1941-1944) a similar policy was pursued, with no less brutal methods but with rather more local support, by the emissaries of Sofia. After thirty years of such treatment, there was a genuine desire among Macedonians not to be a colony of either country, but to rule themselves. The movement for "Macedonian nationality" had a genuine local tradition going back to the popular revolt of 1903 against the Turks. Macedonian nationality and autonomy had also been supported by the Jugoslav Communists and by the Comintern since 1919. Therefore the victory of Tito inevitably brought a reorganisation of Jugoslavia into a pseudo-federation of the Soviet type, one of whose six constituent republics was Macedonia.

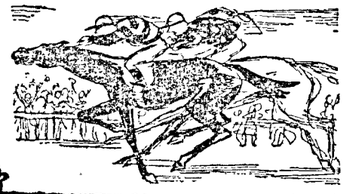
The practical value of this pseudo-federal status is a little uncertain, but there is no doubt that it was well received by the Macedonians, that it released a great deal of pent-up Macedonian nationalist energy, and that this caused embarrassment to the Belgrade government. For the Macedonian leaders began to cast hungry eyes not only towards Greece but also to "Pirin Macedonia," which since 1913 has "groaned under the Bulgarian yoke." In Belgrade, good relations with Sofia have a high priority, but in Skoplje (capital of Jugoslavia's "Macedonian People's Republic") the "unity of Macedonia" comes before all else.

At first, Belgrade discouraged Macedonian enthusiasm. The first President of the "Macedonian People's Assembly," Antonov-Chento, was accused of intriguing with Vanche Mihailov, a former tool of Fascist Italy and organiser of the assassination in 1934 of King Alexander of Jugoslavia. It was suggested that Mihailov, who disappeared at the end of the war, is now being groomed for the role of Macedonian quisling of the Western Imperialist Powers. But Belgrade cannot afford to antagonise the Macedonians, whose help is essential in the plans for the disruption or invasion of Greece. In the new outbreak of polemics between Skoplje and Sofia, Belgrade were therefore silent. Skoplje's accusation against Dimitrov's government was that it is tolerating the activity of "anti-popular" elements who hope, with the aid of the same versatile Western Imperialists, to reincorporate "Vardar Macedonia" in Bulgaria, and are meanwhile oppressing the "Pirin Macedonians," forcing them to call themselves Bulgarians.

This quarrel would in any case have been an obstacle to immediate realisation of a Jugoslav-Bulgarian Federation, which Dimitrov (in an interview in Warsaw to the United Press on June 2nd) has repeated as his aim. Until recently, one would have expected that disputes of this kind would be overcome within the framework of the Cominform—with such kind advice and pressure from Moscow as may be needed. Besides, Jugoslav-Bulgarian unity was never more than a step towards the greater goal of a Balkan Federation, to include a "democratic Greece" under Mr Zahariades and General Markos. Care will have to be taken not to offend the patriotic feelings of those Greeks whom it is still hoped to win over to the "New Popular Democracy." The incorporation of all Greece, with Crete and the islands, in the Soviet *bloc* is a great prize, for which the Cominform will be prepared to make sacrifices and to wait. Until it is secured, quarrels between Slavs about Macedonia will not be allowed to go far.

The Cominform's denunciation of Tito makes these issues more real than ever. The discrediting of Jugoslav nationalism in Moscow's eyes may help the Communist cause in Greece. It is understandable that Markos has lined up with the Cominform, though that may cost him valuable help from Belgrade. On the other hand, the wriggling of the Bulgarian Communist Party is explained by unwillingness to quarrel with Belgrade and opportunity to gain support at home by resisting Jugoslav territorial claims. In any case, the gainer from all these quarrels can only be the Greek Government.

Spain and Marshall Aid



[BY A SPANISH CORRESPONDENT]

AT least for the time being, Spain has been left out of the European Recovery Programme. Yet no other Western country in Europe needs help more. Spanish recovery is not only stagnating, but even the present low standard of living of the Spanish people is threatened. Agricultural production in 1947 was lower

than in 1946, except for wine and olive oil. Industrial output was barely above that of the previous year, the official index for 1947 showing 134.1 (1940—100) against 133.2 for 1946. And the balance of overseas payments has not recovered from the drop in exports, which took place when Spanish raw materials were no longer needed for military purposes after the war.

A new development since the autumn of 1947 has been the monetary policy of the Bank of Spain. Credit has been restricted by increasing the bank rate, establishing minimum reserves of government securities against bank deposits, and penalising all forms of private credit. One result of this has been to put an end to the boom on the stock exchange, which reached its peak in April. Since then the value of industrial shares has been reduced by nearly half, and dearer money has compelled many firms, lacking funds for development, to issue debentures at 4½ per cent and more.

This rise in the interest rate has been accompanied by a general expectation that prices would fall, which has in turn led to diminished activity in certain industries. Patches of unemployment are already beginning to appear. At the same time the main danger still probably lies ahead. On the one hand, the government has raised the controlled maximum prices of coal, iron ore, cement, pig iron, steel and railway rates. And, on the other, it has done nothing to revise its financial policy in the realm of public expenditure. Nor has any attention yet been paid to the national wages policy, which is in need of a thorough overhaul. All this means that the main springs of inflation have been left active, and the only result so far has been that the state has benefited at the expense of the nation's general economy.

In view of its difficulties, the government received with joy, not unmingled with surprise, the vote of the United States House of Representatives, at the end of March, proposing to include Spain in Marshall aid. The hopes which this vote raised were as quickly dispelled when President Truman had it reversed. But the reaction of some critics of the regime was to share the government's disappointment, though for different reasons. They had hoped that outside financial help and economic co-operation with western Europe might have permitted Madrid to relax. An air of liberty might have filtered across the frontiers, even if only in small quantities.

Argentina to the Rescue

When Marshall aid was refused, Franco hastened to conclude a new Trade Agreement with the Argentine as a substitute. Known as the Franco-Peron Protocol, this contained little new in the way of Spanish imports from Argentina, except the fact that they were ensured on credit for another four years. The Protocol, however, did contain a novelty on the Spanish side, the leasing of a free zone in Cadiz and the granting of similar facilities in Barcelona and other ports. Further, the currency proceeds of Spanish imports from Argentina were to be invested in Spanish firms, either already existing or to be formed. The criticism of the Protocol is that it is not easy to see how exports of railway rolling stock, and other capital equipment, are to take place without seriously detracting from the greatly needed reconstruction at home. Wheat and meat cannot replace coal and iron in building up a higher output from heavy industry.

The process of open inflation and the difficulty of balancing overseas payments have long been recognised both in Spain and abroad. But it is only recently that the even more fundamental problem of the obsolescence of capital equipment has been given its full due. Accidents and delays on the railways have now served to draw increasing attention to it. In other industries, deterioration of quality and higher real costs have been masked by inflation, and by the relative isolation of the Spanish economy.

Spanish needs, that have to be covered in the main with foreign help, are those of agriculture and the key industries; here investment ever since the civil war has been less than necessary even to meet replacement requirements. Fertilisers, draught cattle, tractors, coal and scrap iron are by common consent the most urgently needed imports. The lack of fertilisers—mainly nitrogenous—and of agricultural machinery have played an important part in reducing crops since 1939. In contrast, the population has increased during that time by ten per cent. The result is that to recover the level of pre-civil war days would only be a first step. Yet, so long as the safety valve of emigration remains practically closed, as it is at present, the shortages are bound to remain until major changes are effected in the technique of Spanish agriculture.

Worn-out Equipment

Increased imports of coal and scrap iron would enable heavy industry to work at full capacity, doubling, that is, the present meagre output of something less than 600,000 tons of steel. At present, the supplies of coal to be obtained by Spain, under the Agreements made recently with the British and the French, will help the railways but will not make much difference to the metallurgical industry. But even small increases in supplies of steel to the Spanish engineering industry may make a considerable difference in replacing worn out and obsolete equipment. Other priority requirements are the completion of hydro-electric power stations, and of plants built since the civil war to produce nitrogen fertilisers and artificial fibres.

It is evident that Spanish import needs can only be met by means of loans from foreign countries. In this connection a great deal is said about private credits to Spain; but it is most doubtful whether any loans of this sort could be large enough to affect the issue. What is needed is foreign help on the scale of Marshall aid. At the same time foreign loans without some overhaul of internal economic policy would probably be wasted. The points which receive attention in public utterances are a reduction of military expenditure, economies in the public administration—including the autonomous public bodies which have been a feature of the regime's economic policy—and revision of the amount of investment started by the National Institute of Industry. And a new wages policy is required, first, to stabilise the cost of living, and second, to re-establish the incentive to work.

The blunders that have been committed in the conduct of economic affairs are perhaps inseparable from any strongly controlled economy in which there is no free discussion, whatever the label one may put on the present political system. The absence of unified purpose and of logical consistency in economic policy are not the least peculiar features of the Spanish situation. The recognition of such errors goes back a long way, but only recently has it had much publicity.

What needs special attention is the fundamental problem of the high costs of production in Spain, which cripple exports and reduce the standard of living. So long as this is not tackled, the Spanish economy cannot be adjusted to fit within the framework of any economic region, whether Western Union or anything else.

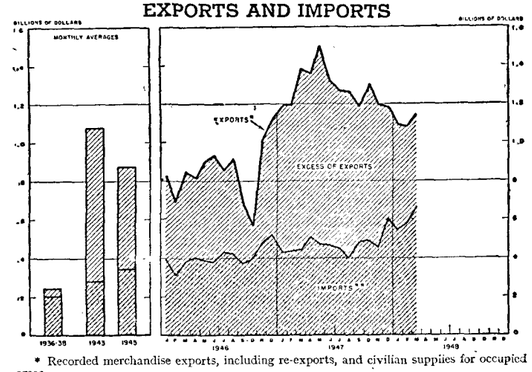
AMERICAN SURVEY

Foreign Trade in Transition

(From Our US Editorial Staff)

AMERICAN merchandise imports reached a record level in the first quarter of 1948, exceeding the last three months of 1947 by 16 per cent. In April they dipped sharply, to a figure 21 per cent under the March peak, following an earlier, and smaller, drop in the index of domestic industrial production. In May imports righted themselves again and turned slightly up. Through all these undulations, however, and through the twelve months which preceded them, the volume of American purchases from abroad was still much less than might have been expected from the prewar relationship between imports and industrial production. It has been estimated, for example, that if 1935-1939 patterns had been restored, imports in 1947 would have reached $10 billion, instead of the actual $5.7 billion. And yet agreement is general that in the long run the economic health of the world demands an increase in American imports far greater even than that indicated by prewar standards. The European Recovery Programme assumed that in the first year imports from the participating countries would increase by 40 per cent over 1947; the rise in the first quarter was approximately 30 per cent.



Exports for the first quarter were 5 per cent below the fourth quarter of last year and 16 per cent below the postwar high reached in the second quarter of 1947; they declined again in April and May after a temporary jog upward in March. At an annual rate of $13.2 billion in the first quarter, however, they were still far in excess of any peacetime year prior to 1947 and, in relation to the flow of imports, they were excessive by prewar standards. In this perspective, if imports are high, exports are still higher. Nevertheless, because of the difference in direction of change for the two, the gap for the first quarter narrowed to an annual rate of $6 billion, in contrast to the rate of $10 billion which was reached during the second quarter of 1947. The gap was somewhat wider again in April and May, since imports fell more than exports during those months.

★

Thus progress toward a more normal and salutary balance is made by taking two steps forward and one backward. Perhaps one-third of the first quarter rise in the value of imports was accounted for by an increase in prices. The remainder can be explained by a variety of factors. The high level of American business activity has been important, and the recent reinforcement of the inflationary boom should help to maintain or increase imports over the next year. Some of the current increase is explained by the pressure on foreign suppliers to sell, and their greater ability to do so as their productive machinery creaks slowly into operation. But the import totals are still restricted by European inability to produce. Prewar Europe provided about 30 per cent of American commodity purchases from overseas; in 1947 the figure was only 15 per cent, and the first quarter of 1948 showed no improvement. The tariff concessions made in January have as yet produced little effect except, perhaps, in the case of wool imports. The inability of foreign countries to export is infinitely more important in an era when domestic demand approaches insatiability for many items. This condition and the January reductions mean that the extension of the Reciprocal Trade Agreements Act with modifications and for one year only, should have no immediate effects for good or for evil, especially since no major negotiations are pending.

The chief factor in the decline of exports has been the exhaustion of foreign gold and dollar reserves which financed 23 per cent of American exports of goods and services in 1947, but only 8 per cent in the first quarter of this year. The difference was made up, but only partially, by an expansion in the use of US Government loans and grants, including the last drawing on the British loan, interim aid, and increases in civilian supplies for occupied countries. Here again, the fundamental problem is not a shortage of dollars, but of goods. The shortage of foreign means of payment is the obverse side of America's deficiency in imports. Both arise from the limitations on productive capacity abroad. Nor are non-commodity items in the balance of payments likely to right the difficulty. For example, although American tourist expenditures in 1947 were the highest in history, these were spent in nearby areas rather than in Europe, which had the greatest need for additional means of payment. Furthermore, not all of the funds flowing to other countries were freely available for the most pressing needs. Funds available to foreigners in the first

quarter appeared to exceed by a sizeable amount their actual payments to the United States on known merchandise, service and capital transactions. This discrepancy might possibly indicate a flight of capital; in any case these unrecorded transactions are one further symptom of international financial disequilibrium.

The commodity and geographical patterns of imports and exports reflect the distortions of the reconstruction period through which the world is now passing, as well as longer-run trends which are just becoming apparent. In imports, the effects of war are evident in the relatively small amounts of finished products coming from Europe. The high American paycheck as well as higher prices explain coffee imports more than six times as large as in 1940. The using up of natural resources during the war, together with the urge for the open road and the convenience of oil heating, lie behind a more than five-fold expansion in the value of petroleum imports. Conversely, the failure of rubber imports to expand in volume indicates difficulties ahead for the eastern rubber-producing areas as the result of the development of synthetics. Silk-producing areas already know what this means. Associated with these shifts, there has been a marked increase in the pro-

portion of American imports coming from Central and South America, and from *Australia and New Zealand*.

The distribution of exports has been affected by the efforts of European countries to husband their resources. The largest cuts in the first quarter were in such products as coal, dairy products, tobacco, paper, steel mill products, industrial chemicals and copper products. These are for the most part the commodities which are becoming more available in Europe, or are subject to import restrictions to conserve dollars. At the present time it is estimated that about 50 per cent of all exports, excluding those to Canada, will come under the European Recovery Programme, but the effects of the control which this will involve are not yet apparent.

In short, the international accounts of the United States register clearly the confused state of a world which is in a transitional state, halfway between war and peace, a world where gold flows and government loans once again, as in the 1920s, provide a precarious and uncertain substitute for that balanced expansion of world trade which is a very distant goal. No one believes it possible—or even desirable—to reach such a goal immediately. ERP would be undermined, for example, if the participating countries forced exports to the United States at the expense of needed domestic rebuilding. But many believe there is still danger that the transitional state may become the permanent one and that the goal may be lost sight of on the way. Not the least of the dangers is the possibility that long-needed permanent tariff reform may be postponed indefinitely, using as an excuse the *valid fact*, but *invalid argument*, that this is not the worm at the core of the world's present difficulties.

Warren of California

[FROM A CORRESPONDENT IN SAN FRANCISCO]

By all signs, the popular enthusiasm for Governor Warren in his native State, far exceeding that felt for Mr Dewey, will ensure that California's 25 votes in the electoral college—almost one-tenth of the 266 which the winning ticket will need—go to the Republicans in November. There has been no such swing to the Republicans since 1928, but California seems safe for Dewey and Warren, in spite of the fact that the State's 4,633,129 registered voters are nearly 60 per cent Democratic by formal affiliation. President Truman's chances are estimated by the poll-takers today at less than 40 per cent of the State's vote and Mr Henry Wallace's at around 14 per cent. The remaining 46 per cent, given to the Dewey-Warren team, would be enough and to spare.

With any other running-mate but Mr Warren, except possibly Mr Stassen, Mr Dewey's ability to carry California against Mr Truman might have been doubtful, even with the Democrats weakened by Mr Wallace's independent campaign. But Mr Warren is a powerful vote-getter. This is the first time he has run for national office, but he has never been defeated in California. In the opinion of local observers, his undisputed political mastery in his own State rests not so much on the exertions of his machine as on the force of his character, the progressiveness of his attitude and policy, the attraction of his personality, and the soundness of his sense of timing in political manœuvre. Governor Warren's friendly smile has some of the warmth of Roosevelt's, and his brain some of the cunning.

President Truman, during his rather unenthusiastically received visit to California in June, remarked expansively at Sacramento: "Warren is really a good Democrat, only he doesn't know it." There is some truth in this. Were he younger, Mr Warren might well have entered politics on the side of Franklin D. Roosevelt and the New Deal. But he is now 57, and it was almost 30 years ago that he made his choice of party in what must then have seemed an irrevocably Republican America. He rose through various offices to become a wartime Governor of California in 1943. That was a time when Californians were inclined to feel that "their" war in the Pacific was being sidetracked in favour of faraway descents on the shores of North Africa. Governor Warren unified and organised the State's war effort with exceptional administrative skill. The problems of labour supply and of housing were enormous. Millions of working men poured into the State, with the result that today nearly one-third of the present population of 10,000,000 has never known any governor of California except Mr Warren. It is significant that in 1946 he captured the votes of thousands of these newcomers, many of whom had migrated to California from the Democratic Southwest. In his campaign for re-election in 1946, Mr Warren sought the Democratic as well as the Republican nomination and won both, for it is a peculiarity of Californian electoral procedure that candidates of one party can take part in the primary elections of the other. In this uncommon feat, Mr Warren secured more Democratic votes than his opponent, Mr Robert W. Kenny, the Attorney-General, and the State's leading Democratic vote-getter.

*

In the eyes of most Californians, Mr Warren will be the satellite who, because of his familiarity and gravitational pull, will eclipse the planet, represented by Mr Dewey. By all testimony, his contribution to the popularity of the Republican ticket throughout the country will be immense. Nor will he be ignored as Vice-President by Mr Dewey, as Mr Truman was by President Roosevelt. The conditions which he attached to his acceptance of the Vice-Presidential nomination may indeed turn out to have long-range constitutional importance. Mr Dewey's promise that in his administration the Vice-President will have specific executive responsibilities and Cabinet status may put to rest permanently the *canard* that a man may accept nomination to the Vice-Presidency safe in the certainty that his mother will never hear about it.

As yet the country knows relatively little about Mr Warren's international views. Mr Robert Sproul, President of the University of California, assured the Republicans at Philadelphia that he is "neither an isolationist nor an internationalist; he is a modern American who is intelligently aware of a world in which space and time have been almost eliminated; yet he never forgets that his allegiance belongs to the United States of America." This says nothing that can be converted into any table of weights and measures, but it is reassuring that in the dying days of the Eightieth Congress (of which he had been critical) Mr Warren supported unstinted Marshall Aid, as opposed to "Taberism." Many Westerners are of the opinion that the Republican ticket would be stronger if the candidates' positions were reversed. Mr Warren wanted to be President, but he declined to campaign for support outside his own State. He could have had the Oregon delegation for the asking; refused permission to endorse him, the voters of Oregon made their choice between Mr Stassen and Governor Dewey. Choosing the latter late in May, it is now clear that they stopped the Stassen boom, and thus made the New Yorker's command of the convention certain and unassailable.

The Democrats of California have served as their own Jeremiahs. Long before their convention, the enthusiasm for General Eisenhower of Mr James Roosevelt, the late President's eldest son and the Democratic State Chairman, was a measure of the party's estimate of its chances of losing California with the President as the Democratic candidate.

Mr Henry Wallace is the man most responsible for the Democrats' gloom. The best informed observers agree with the prophecy that his Third Party will "net between 400,000 and 500,000 votes and that would be the end of Truman in California." Los Angeles county, which includes Hollywood, will supply the bulk of Mr Wallace's support. It is the historic seed-bed of California's plentiful crop of visionaries who will reach for the rainbow with anyone who promises it.

American Notes

The Democrats Face the Facts

By the time the Democrats arrived in Philadelphia last Monday, they could no longer avoid facing the facts of their political life. Mr Truman was their inevitable candidate for the Presidency and, in the opinion of most of them, defeat would as inevitably follow. To ensure that defeat did not involve personal annihilation became the main purpose of the Democrats.

For the Southerners this means the maintenance of their influence in the party; they are resigned to the absence of a Democratic banquet this year; but they will not want to miss their invitation in 1952. For this reason their protest "walk-out" from the convention will not necessarily become a permanent "bolt" from the party, even though their efforts to intimidate it have failed. On the party platform, their rout has been complete. Not only did they lose their amendment affirming the party's belief in States' Rights, which would have nullified the civil rights section, but the convention itself strengthened that section and outraged the Southerners, by inserting a summary of Mr Truman's programme, calling for Federal guarantees of equal opportunities in employment and political life for negroes, and for Federal protection against lynching. Nor can the pledge to repeal the Taft-Hartley Labour Act be anything but embarrassing to the Southerners whose votes helped to pass it.

But these two planks will enhance the Democratic appeal in the North, where the negro vote must be drawn away from the Republicans and where labour must be roused from its present apathy, if local victories are to be won. The future of the Northern party machines depends upon achieving success at this level and to the city bosses nothing else is worth considering at present. They have evidently decided, and they are probably right, that a liberal approach will induce many of those who will vote for a Republican President to vote for Democrats nearer home.

The South may have been defeated on the platform, but its susceptibilities have not been overlooked in the selection of a Vice-Presidential candidate. Senator Barkley was not the choice of the Northerners, and his age, and the fact that his home State, Kentucky, is very near Mr Truman's Missouri, would not make him the ideal partner on a ticket that had a chance of winning. But he is at least a candidate on whom the Democrats have been able to demonstrate that they are still capable of unity; his nostalgic association with the great days of the party and his recent experience of its difficulties, as liaison officer between the President and the Senate, qualify him for the task of digging the foundations on which it can rebuild after defeat. Above all, he puts party loyalty before personal interest: so does Mr Truman and this team at least represents the common denominator of the party, the hard core which never deserts.

* * *

Seeking Salvation

The enthusiasm with which Senator Barkley's fighting speech was received by the convention, perhaps, even more, the ovation with which the delegates found strength to greet Mr Truman's nomination, after a gruelling—and grilling—day and night's work, proved that the Democrats still have plenty of vitality. They may be depressed but they are by no means dead. Their speeches were more inspiring than those of the Republicans, the speed with which they got through their business more efficient. The convention did much to prove that Mr Truman's conviction that his party can still win in November is based on more than wishful thinking and the desire to inspire his followers to meet disaster bravely. A recent public opinion poll has shown that, during the last four years, the number of voters who consider themselves Democrats has been consistently higher than those who consider themselves Republicans. But the balance is held by the independent voters, whose numbers have grown steadily. Nothing could have been more repellent to them than the pre-convention manœuvres of the Democratic party. If the party had faced the facts sooner and had devoted its energies to saving itself, instead of to a panic-stricken search for a saviour, salvation might have been in sight today.

Mr Truman, by summoning a special session of Congress for July 26th, is making a courageous effort to bring that salvation above the horizon. He had already made it clear, and the speeches at the convention made it even clearer, that the Democrats intend to fight their campaign on the record of the Republican Congress in general, and on its failure to control prices and pass housing legislation in particular. Mr Truman is giving Congress a chance to improve that record and to demonstrate the solidity of the Republican platform in the hope that it will fail to do either. He is trying to widen the gaps in the platform into an abyss in which the Republican victory will be engulfed, and he is evidently not afraid of the pitfalls which the Republicans will certainly set for his own party during the special session. Nor can Governor Dewey continue to dissociate himself from the record of his party in Congress as, until now, he has been able to do, to his great political advantage.

* * *

A Democratic Senate?

Not even the more optimistic Democrats can believe that their chances of winning the Presidential race are more than slight, but there is a real possibility that they may score an ironic comeback in the Senate. In 1946 the Republicans, somewhat to their own discomfiture, captured the Senate as well as the House, and thereby were committed to full responsibility for Congressional policy. In the House there are 245 Republicans to 185 Democrats; the victory of Mr Dewey and Mr Warren would certainly increase the Republican majority. But in the Senate the Republican margin is slim, with 51 Republicans and 45 Democrats, and the Democrats start with advantages which in any normal year would result in a Democratic majority. Thirty-three Senate seats are at stake this year, the 32 which represent the third of the membership vacated every two years and one to be filled because of death. Of these, 15 are now held by Democrats, 18 by Republicans.

Eleven of the Senatorial races are in the Solid South, which, whatever its feelings about Mr Truman on the national stage, is unlikely to defeat its own brand of native Democrats. The four seats now held by Democrats which are to be contested outside the South are in New Mexico, Colorado, Montana and Rhode Island, and only one of these seems to be in much danger. The Republicans, on the other hand, concede a serious Democratic challenge in six states now represented by Republicans: Oklahoma, Kentucky, West Virginia, Minnesota, Idaho and Illinois (where Senator Brooks is strongly challenged by Mr Paul Douglas).

A landslide for Mr Dewey would sweep most of these contested states into the Republican bag, though the Democrats would still have a strong minority in the Senate. But Mr Truman may well put up a better fight than now appears possible; and Democrats who feel that the national campaign is as good as lost are likely to concentrate their energies on the local contests. Labour, for example, is more concerned with the complexion of Congress than with the apparently hopeless task of stopping Mr Dewey.

It would sweeten the Democrats' defeat if Governor Dewey, as President, had to suffer even part of the affliction of Congressional opposition endured by Mr Truman. Republican appointments would have to submit to Democratic scrutiny; Republican giants like Senator Vandenberg and Senator Taft would be submerged in a Democratic organisation of the Senate Committees. But, more important, a Democratic Senate would constitute a brake on the victors, the very function for which its staggered terms were devised. On many issues the Southern Democrats, who now form the bulk of the party's Senators, vote with the Republicans. But a Democratic check might prove invaluable, for example, in case the Republicans, despite all Mr Dewey's protestations, move to destroy the trade treaties programme and return to a high tariff policy.

* * *

Steel Appeals to Congress

By abandoning its 50-year-old system of delivered prices and basing points, the US Steel Corporation has bowed to the Supreme Court cement decision with a speed and thoroughness unusual in anti-trust cases. The Federal Trade Commission may well wonder whether it has not won a Pyrrhic victory. Well before the 90-day deadline for conformity, six cement firms have abandoned their basing-point systems, and the US Steel Corporation and Bethlehem Steel, the two largest producers of steel, have followed suit, although there was no necessity to do so until the FTC, at present holding hearings on steel pricing policy, obtained a specific decision from the Supreme Court.

The steel and cement industries have not only hastened to order a revolution in selling practices which even opponents of the system feel should be brought about gradually, but they have accepted an interpretation of the decision denied both by the Supreme Court itself and four of the five members of the FTC. Industries using the basing-points system argue that only by absorbing freight charges can they compete in distant markets with more favourably placed producers; freight absorption, they argue, enlarges, rather than restricts, competition and prevents local monopoly. But the Supreme Court was at great pains to insist that the ban was placed, not on the absorption of freight charges by individual companies to extend competition, but on

collusion between two or more companies to use the basing-point system to fix prices and hence restrain competition.

The hasty compliance of the steel companies will result in lower prices when steel is bought from a nearby mill, and higher prices when it is bought from a distant supplier, and the consumer must pay the freight. Steel consumers, in most cases, will not be able to change over to nearby mills; with steel order books bulging, the only assurance of obtaining steel is by clinging to the usual supplier at whatever cost. It is the spectre of future, not present, competition which alarms the steel industry.

*

It is hard to avoid the suspicion that the steel companies feel a time may never come again when delivered prices may be abandoned with so little pain to those who employ them and so much financial anguish to those who pay them. Those buyers of steel who find they must pay more will form a powerful lobby for the legalisation of the basing-point system by Act of Congress which the steel companies seek. What part of the rising prices for steel and cement can properly be laid to the elimination of the basing-point system will be exceedingly difficult to judge. Steel costs are being increased by the 10 per cent rise in the cost of coal, higher freight charges and the wage rise which the steel industry has reluctantly concluded it must concede now that its lonely experiment in controlling inflation has failed. In Washington a sub-committee is already holding hearings under the leadership of Senator Capehart, who views with alarm the end of the basing-point system and can hardly be wholly impartial. Congressmen may find the Bill to exempt the system from the anti-trust laws on the Capitol door-step when they return; and a Republican President in the White House who will be far less likely than Mr Truman to veto it.

The Federal Trade Commission has been fighting the basing-point system for 25 years. The test of whether its elimination promotes more efficient location of industry, reduces cross-hauls and lowers prices can hardly be concluded in a few months. The chief hope must be that if the anti-trust laws are to be limited in their application, and the basing-point system recognised, some degree of public control will be instituted to prevent exploitation of the consumer.

* * *

Strike Settlements by Injunction

Two months after the Government seized the railroads and eight days after the injunction forbidding the engineers, switchmen and firemen to strike against the Government was made permanent, the operators and the three dissatisfied unions reached a settlement and the railroads were returned to their owners. One week after the commercial miners began to drift back to work from their annual holiday—some spent it fishing in Canada—and one day before the hearing of the injunction against the failure of their "captive" colleagues to follow suit, Mr Lewis reached a settlement with the steel companies which own the captive mines. Both settlements were compromises, but both were on balance less favourable to the unions than to the employers. The union leaders would probably be indignant at any suggestion that their new tractability was a growth forced with the heat of the injunctions, but the suggestion does not seem entirely unjustified.

The owners of the captive coal mines have swallowed their scruples against signing an agreement which, in their opinion, contravenes the "union shop" provisions of the Taft-Hartley Act and their workers will now get the wage rise of about $1 a day and the increased welfare contributions, which were given to the other miners last week. But Mr Lewis has agreed to modify the union shop clause in the new contract if it is ruled to be illegal by the National Labour Relations Board. Novel as it is to find Mr Lewis agreeing to modify anything, it is too soon to welcome this as a sign that he is mellowing in his old age.

Judge Goldsborough's decision on the railroad injunction repeated his judgment, first made in connection with last year's mine strike and upheld by the Supreme Court, that strikes against the Government could be enjoined, in spite of the prohibition against injunctions in the Norris-La Guardia Act, and added that in any case a railroad strike would have created an extreme situation which society is not required to tolerate under that Act. The railroad unions had always hoped that the Government would assume the bargaining responsibilities of management, but it became clear during the hearings that this was unlikely to happen. The unions then agreed to a settlement, virtually the same as that recommended at the end of March by the President's fact-finding board, on which the companies had always taken their stand, for an increase of 15½ cents an hour and for changes in working rules. The faces of the engineers, switchmen and firemen were saved by the exchange of one suggested alteration in working rules for another, and even more by a concession which put them in line with the other rail unions at the starting gate for the race for the third round of wage increases, for which the others had been preparing while they were contesting the decision on the second round.

But there is one decrease in wages to report: duck pluckers on Long Island are only to receive eight, instead of ten, cents for each duck plucked. The effect on the prices of duck soup and eiderdowns has not yet been announced.

Two-Dollar Wheat

Railroad box cars are once more "terribly tight" and mountains of wheat are again piling up beside the railway terminals in Kansas and Nebraska. The mountains will be near to last year's record heights if the expected 1,542 million bushels of wheat are harvested. More important is this month's forecast of a record maize crop of 3,329 million bushels. Even if there is another drought this August, American hogs should have all the maize they can eat this year. The good crop prospects at home and abroad have brought the price of wheat down to $2.11, 11 cents below "parity." But the cost of the things the farmer buys continues to rise and the support price for the new wheat crop, 90 per cent of "parity," will be $2 a bushel at the farm, compared with $1.84 last July. It is not many years since dollar wheat was the farmer's ideal, but it is even fewer months since he was being paid three dollars.

Nevertheless, the maximum price of $2 a bushel proposed in the international wheat agreement probably does not seem unfair to those American farmers who have heard of the agreement. They certainly share the regret of the Administration that the Congressional failure to ratify the agreement, which was not the fault of the farm organisations, has denied them the assurance of a stable export market. There seems to be justification for the Administration's fear that it may not be possible to obtain such a favourable agreement again, but the fact that the collapse of the agreement may force a reduction in American wheat acreage this winter has more immediate relevance for the farmer.

In presenting the agreement to Congress, the Government offered no explanation of how it proposed to meet its losses if, as seemed probable sooner or later, its support price for wheat was higher than the prices provided under the agreement. A similar problem may arise before long in connection with the European Recovery Programme: European buyers of wheat may be found to have some sympathy for the suggestion that ERP is an indirect way of forcing them to subsidise the American farmer. The wheat agreement was also criticised on the grounds that it would become unworkable if its prices were undercut by Russia and Argentina. For the present, however, the excessive prices demanded by Argentina have led the Economic Co-operation Administration to declare that no dollars will be made available as yet for purchases from that country, a declaration which has gained strength from the good crop prospects elsewhere, and which is intended also to bring pressure on Argentina to pay its commercial debts to the United States and to establish a more favourable climate for American business.

*

ECA has assured American farmers that exports of wheat to Europe will not necessarily be reduced as a result of the good harvest there, since European diets need improvement. Present estimates, which are tentative, are for wheat exports during the coming year of at least 375 million bushels, compared with 486 million in the past twelve months. These exports will probably once more be handled by private traders, except when they are to the occupied areas, since it was to arrange the return to private channels that Mr Harold Sandford of the National Grain Trade Council was appointed ECA consultant on grain. He had protested that the grain industry was being threatened by the concentration of export purchases in the hands of the Commodity Credit Corporation. In spite of this and other criticisms, the CCC has been given a permanent Federal charter, with substantially the same powers as it had before; its primary purpose is to stabilise farm prices. The President was not entirely satisfied with this victory, even though it was one of the few which the Administration won in the last Congress.

The main opposition to the wheat agreement came also from the grain traders and on the same grounds—that it would involve unavoidable and permanent government interference in their business. Passage of the agreement by the Senate, which had been asked to approve it as a treaty, had been confidently expected, but in the rush to adjourn, time could only be found for measures for which there was real enthusiasm. As a result the agreement was not ratified and it has now lapsed.

THE BUSINESS WORLD

Coal and the Nation

On Tuesday, the report of the National Coal Board on its first year's working was presented to Parliament. It is a document which defies quick reading or brief summary; it comprises 143 pages of text (enough to fill three issues of The Economist*) and 112 pages of financial accounts, explanatory appendices, and statistical tables. On the evidence assembled in this first report, the Coal Board can certainly be acquitted of any charge that it has failed to submit itself to the test of public accountability. Indeed, there is so much in the report that it runs some danger of striking awe instead of encouraging a fuller understanding of the Board's problems. In the article which follows, an attempt is made to describe the more important phases of the Board's first year; to analyse its costs and financial results; and to offer some estimate of its achievement and prospects. Even granted its exceptional length, the article cannot hope to be more than a partial assessment of the first public account of the first nationalised industry.*

A Critical Beginning

WHEN the Coal Board was ordered by the Minister to take over the mines at the beginning of 1947, distributed stocks of coal were no higher than 8½ million tons. Within three weeks, the Board, already more than fully occupied with the innumerable problems of taking over and reorganising the industry, was plunged into the sharpest economic crisis that has ever assailed the British economy. By the end of the year, stocks had been built up to well over 16 million tons; exports had been belatedly resumed; the industry had attracted a net increase of 26,000 workers; absenteeism was appreciably lower, averaging 15 per cent at the coal face, compared with over 19 per cent in 1946; and output per manshift for all workers improved to 1.07 tons, against 1.03 tons in 1946. But, for all these signs of overdue improvement, 1947 was a year in which, despite the grip of the fuel crisis, the five-day week was conceded; in which, despite that concession, 1,635 unofficial strikes cost the country 1,652,000 tons of coal; and in which 714,000 tons of American and Polish coal were imported, at a loss of £1.7 million, borne by the Board.

The Board's first year was bound to be conditioned more by its inheritance than by its own efforts to change and improve it. In 1947, the British coal mines produced 187 million tons of coal, 6 million tons more than in 1946. From opencast sites, 10 million tons were produced (not for the Board, but for the Ministry of Fuel and Power), making 197 million tons, compared with the 200 million tons demanded in the "Economic Survey" for 1947. The increase of 6 million tons in the output of deep-mined coal was the resultant of four factors: increased manpower contributed 5 million tons, better attendance, 9½ million tons, and greater output per manshift, 5½ million tons; but this gross rate of improvement of 20 million tons during the year as a whole was largely offset by the loss of 14 million tons output owing to the five-day week.

The report shows that the Board regarded the five-day week as desirable, though it obviously had doubts about the right time for its introduction. The Board decided in favour of early introduction as "a gesture which might do much to improve the spirit of the industry and give an impetus to effort." Negotiations were completed in March, 1947, when fuel supplies were still gravely short; the agreement with the Union included conditions which, "if they operated fully," would safeguard coal production—among them, the acceptance of increased tasks. The Board did not expect an immediate and universal increase in tasks, because local conditions vary so widely. But its conclusion about the five-day week gamble ("the stakes were high and the Board had to play") is quite conclusive: "Taking the country as a whole, the response to the appeal by the Board and Union for greater tasks was disappointing." The Board took this risk through fear of the greater risk of disappointing the expectations which had been raised in the minds of the mine workers. It was forced, by a combination of political decision and the temper of the miners, to take a step which it regarded as premature; the consequence was a partial and one-sided observance of the five-day agreement, and a loss of output which had to be made good—though only to the extent of 2 million tons—by extra working, largely on Saturdays and at overtime rates of pay.

An important, though somewhat inconclusive, section of the report is concerned with the Board's relations with its employees. Much stress is laid on the principle that a nationalised industry "existing only to serve public ends" must set an example of fair treatment and encouragement to its workpeople. The Board recognised the inheritance of bitterness in the industry, and it hoped by meeting "just claims" to infuse a new spirit into management and men. The privileges brought new responsibilities—moderation in the demands of the men, and acceptance of new opportunities of service. And the Board, obeying the injunction of the Nationalisation Act, reached agreements with the Union for national, district and pit conciliation machinery. But the test of these principles and arrangements must be measured by the willingness of the men to accept and honour them. Many more strikes would have occurred in the absence of the conciliation schemes; but those that did occur last year were irresponsible and damaging. Indeed, the most serious of them all—the Grimethorpe strike—has yet to be brought to a satisfactory conclusion. The detailed account of this stoppage leaves no doubt where the responsibility lay; it leaves no doubt, too, of the powerlessness both of the Board and of the Union to persuade—much less to compel—the men to fulfil their part of the bargain on the five-day week.

Thus, the Board's experiment in the duties of a good public employer has so far been largely unrequited. The five-day week led to a round of claims from other workers employed in and around collieries for corresponding benefits, which the Board conceded, with the authority of the Government. Junior colliery officials, weekly-paid industrial staffs and colliery clerks have received increased pay; all members of the staff benefit from the superannuation scheme introduced by the Board, which costs about 4d. per ton of coal sold. There are, of course, many anomalies in the Board's salary scales—there is,

too, more than a suggestion of complaint in the report about the very high salaries of senior company officials, whom the Board had to retain at their old salaries or to compensate for termination of contract. Already the Board has fixed the range of salaries which are to be paid for administrative, legal and technical staff; the standardised pattern of appointment, the annual increment, and the hierarchical ladder is to be the form of the future—the "logical" system which the Board feels that it could have devised if it had started with a clean slate. But if the senior appointments in the past were sometimes excessively paid, the machinery of recruitment and promotion described in the report seems zealous, just and dull. To ensure a fair field of selection "irrespective of educational origins" may sound admirable, but it does not guarantee of itself that the right persons will be appointed to the right jobs.

That is a problem for the future. For the present, the report seems to adopt a distinctly defensive attitude about the size of administrative and non-industrial staffs built up during the past year. All told, these amount to 34,535 persons, costing approximately £14½ million a year. These employees show an increase of 4,412 during 1947, which can hardly be regarded as immoderate for the functions which the Board has taken over for research, education, and legal and technical work. The total cost represented rather over 3½ per cent of the Board's total revenue expenditure, while the total administrative expenses of the national and divisional headquarters represented no more than 0.6 per cent of the total. Whether these figures show a truly economical use of non-productive staff it is impossible to judge on the evidence of a single year; but the Board has made out, on the face of the matter, a reasonable case that its administrative costs are not extravagant.

Last year's primary task at the collieries was to increase output; the Board instructed colliery managers to focus their attention on short-term reorganisation at the expense, "if necessary," of long-term planning. Bigger tasks, more machinery at the coal face and on the haulages, upgrading of workers from haulage to the coal face, closing of unproductive pits and transfer of men to pits where their output would be higher—these were the main measures to be pursued. Many collieries came over to the Board in first-class condition; others were in "poor shape" and not a few in a "pitiable" condition. During the year 550 short-term projects, involving the application of these measures either singly or in combination, were begun and about 340 were completed. Nearly 1,500 conveyors were installed and 32 locomotives put to work—the limitations of underground haulage are well illustrated by the fact that 32 locomotives represent an increase of 55 per cent in the number at work. Seventeen pits and two drift mines were closed, displacing 2,680 men, of whom 2,136 were transferred to other collieries. But the notion that salvation is to be achieved by the use of advanced types of coal-getting machinery, like power loaders, is rather damped by the report. In the East Midlands Division, where coal seams are fairly thick and regular, such equipment has been in use for several years, and 20 out of the 30 Meco-Moore cutter loaders at work in the country operate in that division. But cutter-loading machines for narrow seams are still being tried out; moreover, the operation of these machines "has sometimes been hampered and even prevented by difficulties over wages."

The Board puts the result of purely technical measures, like the introduction of machinery and reorganisation of the pits, as an increase of 3½ million tons in coal output last year. It is not a negligible start, but the Board obviously hoped for greater improvements in productivity at the coal face than were in fact achieved. In this, it goes some way towards acknowledging the criticisms of Sir Charles Reid at the time of his resignation. Haulage work is still overmanned; co-operation and goodwill on the part of underground workers would increase the proportion of face workers to "oncost" workers. Attendance at the coal face, though better, is still poor compared with before the war.

Last year the Board lost £9.2 million on its colliery operations. But it made a profit of over £3 million from ancillaries. It has acquired 55 coking plants, producing more than two-fifths of the national output of hard coke. Many of the ovens are in need of replacement or repair, and the report goes so far as to suggest that blast furnace coke is likely to remain scarce so long as the steel industry aims at producing more than 14 million ingot tons of steel a year—a rate now being exceeded by a margin of well over a million tons. Even to maintain the present output of coke, the Board will have to build about 175 new ovens a year for many years to come; the capital costs of new ovens have trebled since 1939, and a battery of ovens carbonising 7,000 tons a week would take four years to build. Most of the other ancillaries—tar, benzole and sulphate of ammonia—are highly profitable and their products in eager demand. The Board is also a large farmer and landowner (often because it is more economical to own surface property than to meet repeated claims for subsidence); it owns 141,000 houses, including whole mining villages; it owns a cinema, a slaughter house, a holiday camp and operates retail milk rounds. It is, indeed, only a slight exaggeration to liken the listing of all the Board's assets to the making of the Domesday Book. And it has, of course, taken over the property in underground coal from the Coal Commission. It owns, works and sells virtually all the coal in the country. What were the financial results of this gigantic public monopoly last year?

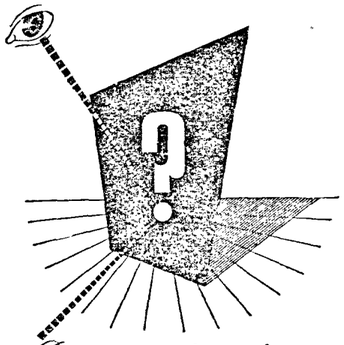
Costs, Revenues and Losses

It has been an open secret for some weeks that the losses of the Board in its first year would approach £25 million. The actual net deficit turns out to be £23,255,586. The reasons are obvious. In 1947, the average cost of producing a ton of coal increased by 4s. 3.1d. compared with 1946; of this increase, increased wages accounted for 2s. 6.4d., increased cost of materials 11.9d., and superannuation 4.2d. The Board claims that the total increase in costs of 12.8 per cent compared with 1946 was no more than the general increase in costs which British industry, as a whole, had to absorb, "despite the special expenditure which the Board had to incur." This claim would be more convincing but for the fact that the price of coal is itself a primary constituent in industrial costs.

Under the Nationalisation Act the Board is enjoined to secure that its revenues shall cover its costs "on an average of good and bad years." The period during which this average is to be struck is nowhere defined, but the Board, in deciding what increases in price should be recommended to the Minister, assumed that the loss resulting from last year's increases in costs should be recovered, not in a few months, but "over a period," on the ground that, if the whole rise in costs had been recouped in the closing months of last year, "there would probably have been surpluses in later years." The submission of price increases to the Minister appears not to flow directly from the Act (though indeed the Minister has power to issue directions of a general character on matters affecting the national interest), but in pursuance of a "gentleman's agreement" dating from the beginning of the war. The Minister elected to scale down and to delay the price increases for which the Board had asked. In September and October colliery operations showed a profit of £1 million, following the 4s. increase at the beginning of September; then when the minimum wage agreements and the extension of hours at overtime rates came into effect, November and December showed a loss of £2.7 million. On January 1st, coal prices were again raised by 2s. 6d. a ton.

The chairman of the Board has declared this week that, "by keeping the price of coal high enough, we could easily make a handsome profit." This consciousness of monopoly power, however, does not mean that it should be exercised. Nor can the Board go very far today in closing unprofitable pits—though it might save £6 million, if it could sacrifice 8 million tons of output from the least efficient collieries. But at least the Board ought to have freedom, given the level of its costs, to secure a corresponding level of prices. Last year's episodes of Ministerial interference with what the Board thought reasonable are disturbingly inconsistent with its statutory duties, and the ending of the "gentleman's agreement" which has been forecast this week will be salutary. Judged by financial results alone, coal was too cheap last year, to the extent of 1s. a ton, before meeting interest charges. The new price structure, on which the Board has been working for many months, should correct many of the glaring anomalies in prices. Flat rate additions to coal prices during the war, irrespective of grade, have made poor quality coal relatively dearer than better grade coal. It is the Board's intention to introduce a rational system of grading, and to adjust the relative prices of different quality coals, without, however, altering the average price for all grades.

Last year's deficit is summarised in the accompanying table. It is claimed that this loss is not a charge on the taxpayer, since "it has been met from the Board's resources and it must be overtaken in later years." The "Board's resources" are, of course, the taxpayer's resources, in the long run, and the long run will determine whether the balance of revenues "over good and bad years" can be achieved. The report is perhaps on more certain ground when it claims that the deficit will serve as an incentive to future economies.



Collieries and Ancillary Operations	£	£
Colliery Losses	9,203,905	
Ancillary Profits	3,016,605	
OPERATION LOSS		*6,187,300*
OTHER TRANSACTIONS		
Loss on Imported Coal		*1,697,992*
Provision for compensation for loss of office		*406,192*
Other Income		156,177
Interest and Interim Income Payable		*15,120,279*
NET DEFICIT		*23,255,586*

But one point must be made with full emphasis. In some comments on the Board's trading results, it has been suggested that all would have been well—or nearly so—if the Board had not been under the necessity of paying over £15 million for interest on compensation stock and "interim income" to be passed on to the former owners of the mines. This suggests the beginning of the slippery notion that the Board is unfairly handicapped because it has to meet interest charges on its capital. Admittedly, that capital is fixed interest capital entirely, on which interest is payable irrespective of the Board's net revenue. But it has, so far, been raised by 50-year terminable annuities bearing the extremely low rate of 2½ per cent. Whether compensation for collieries (£164.7 million), ancillaries (not yet known), stores (£39.4 million) and other items will be so financed has yet to be determined. The Board's present capital liabilities, outstanding or in suspense, amount to £331.8 million, of which more than one-third has already been financed at long-term at 2½ per cent. Clearly, there is no justification whatever for any complaint that the Board's interest charge is too high.

This is a material point in connection with the future programme of capital expenditure. Approvals for schemes costing

Many of the services supplied by the Westminster Bank cost the user little or nothing. Yet all of them help, in one way or another, to make life a little easier. Ask the Manager of your local branch about Travellers' Cheques, Bankers' Orders, and the Joint Account.

more than £100,000 total £22.7 million, of which only £2.9 million was expended last year, though the Board's total commitments on capital account amount to £36 million, to be expended over several years. Out of the total of £150 million, which may be advanced by the Minister to finance capital expenditure up to July, 1951, there is still available £109 million. But the work has been started in a period of high prices, and capital charges will represent a heavy burden—the annual charge for depreciation and interest is put at about 5s. a ton, without stating the rate of interest assumed in the calculation. The Board is quite right to demand the full co-operation of everyone in the industry to meet these charges, so that coal can be produced at competitive prices. But that argument would perhaps be rather more convincing but for the evidence that the Welsh coalfield is so far receiving the lion's share of the major capital schemes. There are plenty of technical opportunities for schemes capable of producing well over 2 tons per manshift. The task of selecting the best schemes, which may cost up to £3 million and take ten years to complete, is immense, and so far the Board has had little opportunity of carrying it very far. Last year's schemes are regarded as necessary "whatever future decisions are taken on production policy." Perhaps that is the best interim answer to the suspicion that some divisions may be given more favourable consideration for future development than their relative costs and output would justify, but it is not a final answer.

That point, however, may be left for further discussion in the final section of this review. But it is desirable, nevertheless, to make it now, because it is intimately linked with the output and operating results of the areas and divisions which are given in such profuse detail in the report. The Board is entitled to claim that these accounts accord with the best commercial standards. They include a balance sheet and profit and loss account for the undertaking as a whole, with supporting schedules of fixed assets, depreciation provisions, stocks and debtors—all analysed by Divisions—capital liabilities, provision for deferred liabilities and current liabilities (again by separate Divisions), and the most detailed colliery operating accounts for each of the 48 Areas and 8 Divisions. The Board's fiercest critic could scarcely ask for more. Indeed, they are perhaps too detailed to make one important point clear—namely, the relative performance of the separate Divisions. The table below gives only a small fraction of the information appearing in the accounts, but it may assist the reader to bring the eight Divisions into better perspective.

This table shows that total colliery profits amounted to £12.4 million, and total losses to £21.6 million. The Divisions which worked at a profit produced over 60 per cent of saleable output. The South Western Division, whose loss alone exceeded the net loss for the whole country, produced only 12 per cent of the national output. These wide variations in costs and output present the Board with its biggest problem for future development. If it is to avoid losses, it is also enjoined to eschew profits. Lord Hyndley has rightly pointed out this week that if some part of the industry makes a profit, another must be making a loss—in other words, one part is subsidising another part and consumers are paying too little for what costs much to produce (as in the South Western Division) and too much for what is produced cheaply (as in the two Midlands Divisions). The table indicates the extent to which the nation's resources could be misapplied if the present cost structure in the industry were to be perpetuated.

Lessons for the Future

FROM this welter of words and figures which compose the Board's first report, what provisional conclusions emerge? First, perhaps, an impression that the Board has done rather better than its critics had anticipated—an impression which the Board seems anxious to encourage, for at various points in the report it emphasises upon the reader the enormous complexity and weight of its task. Secondly, although 1947 was a year opening with crisis, and developing with labour difficulty and rising costs, the Board has attempted to make a start to do the right things. Much of this new work is barely in a formative stage as yet; plenty of projects have been started on research, on the classification of coals, on a solution of the problem of dirty coal on the long-term development plan, and on a new price structure (of which the first instalment has now been published).

But the reader will look in vain for any general principles on which the Board is working, either on prices or costs, or on the character of long-term development, or of its own organisation. It is too apt to take refuge in the furtherance of "the public interest in all respects"—which, in 1947 at least, turns out to have been mainly the furtherance of the interests of its employees rather than its customers. It admits that it has given hostages to future fortune in the hope that higher wages and better conditions will create a new spirit in the industry—and it equally admits its disappointment in the results of this policy to date.

The interest of the British nation in the success of the National Coal Board can be briefly stated: it is that the Board, consistent with its duty as a good employer, shall produce more coal, more cheaply. The overwhelming problem facing British industry is its future trend of costs, and coal is a determining factor over a large part of those costs. To concentrate attention on the incidental fact that the Board lost £23¼ million last year, or on the more agreeable fact that it showed a small surplus, after meeting interest charges, for the first quarter of this year, is to miss the real point. The Board could have covered its costs last year, but for the Minister's intervention. So it could in any year, by the simple exercise of its monopoly position. What it has to do is far more difficult—to reduce its costs, to reduce its prices, and balance its outgoings over the years. This report lacks a convincing demonstration of the effect of higher output,

SUMMARY OF OPERATING RESULTS AND CAPITAL EXPENDITURE

	Unit	Scottish	Northern	N. Eastern	N. Western	E. Midlands	W. Midlands	S. Western	S. Eastern	Total

improved productivity, improved attendance, and the greater transfer of "oncost" workers to the coal face, upon costs per ton. The exhortations are general; they could and should be made much sharper and specific.

The same comment is valid on the Board's long-term development programme. Indeed, it hardly exists as a development programme, at this stage. The report says that reconstruction of the mines should, in the long run, reduce costs considerably—a platitude to which no exception will be taken. But the work cannot be prepared, much less carried out, at once. The Divisional and Area staffs have only begun their tasks of setting down what they would like to do, if the Board can provide the means. But does the Board know what criterion it will adopt for its long-term development plans? Will it go for the greatest efficiency and lowest cost, quite irrespective of other considerations? Apparently not, because it claims that it must have regard to "social costs" which do not figure in its profit and loss accounts, like unemployment caused by the contraction of output in a coalfield. Yet elsewhere, the report admits that if a pit or a district runs at a loss "despite every effort to make it pay its way" then a case arises for altering the level of its output or the price of its coal.

There are dangers, long-term as well as short-term, in the argument that the Board cannot be guided by business considerations alone. The further it moves from business considerations, the less likely is it to succeed in its task of producing enough coal cheaply. The responsibility for the location of the industry and for development involving "substantial" capital outlay rests in the last resort with the Government, and the Board will only add to its troubles if it seeks to frame its policy according to the view it takes of Government policy. It will be on surer ground if it bases its development programme on good technical estimates of larger and cheaper output than upon considerations of "social costs," or responsibility to posterity. The Board is now studying the recommendations of the Areas and Divisions about long-term development. It is a question of such importance that the general comments in the report call for a supplementary statement as soon as the Board has made up its mind about the output targets to be set for each Division and the capital expenditure which each is to be allowed. The programmes authorised last year may indeed be separate from the "national plan." But the inference which they broadly suggest—that less efficient coalfields can obtain a disproportionate share of new capital funds—is not an inspiring portent for the long-term scheme.

On price policy, again, the report throws little light. The review has been begun. But can prices be related, except very generally, to costs? Does the Board intend that similar grades of coal produced at different levels of cost in different areas should be sold at different prices? Presumably not; but if not, what becomes of the doctrine that "losses and profits will suggest that the nation's resources are not being used to the best advantage"? Again, the report is almost entirely unruffled by a suggestion of strain in the Board's organisation. It does indeed explain that the organisation in the Areas was changed—and certainly for the better—towards the end of 1947. And Lord Hyndley has emphasised this week that the functional character of the Board itself has been further modified; in the near future, five out of the nine members will have no departmental responsibilities. This willingness to change and experiment is welcome, so far as it goes, and the Board would not claim that its final form has yet evolved. It is still remote, and still over-centralised. Its relations with its subordinate Divisions and Areas are immature and arbitrary. Its relations with the Government show that the Board has yet to develop autonomous power and responsibility of its own, subject to the limitations of broad Ministerial powers of direction. And its relations with labour suggest some willingness to accept with sorrow rather than anger the lack of responsibility which was reflected in last year's strikes and in this year's falling trend of output.

But when this is said, no sensible person would condemn the Board for its first year. Its achievement was at least positive; and its failures have been largely due to irresponsible action by some of its employees. Its real problems and tasks are only beginning. It has to make the right estimates of future costs, prices and output. It has to guess the trend of the world market for coal over decades rather than months. It has enormous responsibilities for investing public money to the best advantage. These are tasks for supermen, and the Board individually and collectively assumes a proper humility when it contemplates them. Compared with these tasks, the burden of the first year of nationalisation becomes almost insignificant.

Business Notes

No Retreat from Disinflation

The Chancellor, it is now beyond doubt, is not to be intimidated by the outcries of those who are beginning to feel the pinch of his disinflationary policy. That policy has not really begun to exert its effects upon the national economy as a whole, and the Chancellor is plainly determined that it shall run its course. On this vital matter Sir Stafford Cripps's statement at a press conference this week did not, it is true, add much to the re-affirmation of faith which he made at the end of the debates on the Finance Bill and, more briefly, in last week's discussions on ERP. But this latest statement has real importance, none the less; first, because of the doubts about whether other members of the Cabinet have been seeing eye to eye with the Chancellor on this issue and, secondly, because the first restatement of policy actually coincided with significant further relaxations of the retrenchment programme—notably in the field of housing. Presumably, the Chancellor would not have sought an occasion to underline his arguments again unless he had the support of at least the majority of his colleagues and also believed that the disinflationary policy both could and would be carried through despite the concessions and relaxations already made.

Except at one specific point—the question of dividend policy, discussed in a separate note on next page—this week's statement defies criticism. It presented faithfully and forcibly all the arguments for using monetary and fiscal weapons to relieve the pressures upon Britain's overstrained economy, as a means both of enforcing a concentration of productive resources upon "first things first" and of minimising the need for physical controls which "add greatly to the burden both of the administration and of industry." To those who had been contending that disinflation is already being overdone, Sir Stafford gave a forthright answer. Excessive monetary demand, which, he declared, has had to be counteracted by extensive controls, is still diverting to the home market goods which might otherwise be exported. Even though a few industries producing non-essentials are running into difficulties, the slack which is beginning to emerge has so far affected only the fringes of the economy.

* * *

Unemployment Still Falling

There could be no clearer demonstration of this than the quite astonishing figures of unemployment for June. On June 14th the total number of persons registered as unemployed was no more than 274,000—actually 16,000 less than the number shown by the return for May. Moreover, the detailed analysis of the distribution of manpower, now available for that month, still shows no perceptible progress in recruitment to the key industries. The labour force in the mines was no larger than in April, and that in agriculture was only 5,000 larger; in textiles the gain was a mere 2,000. Yet the building and civil engineering industries, which on the original programme were expected to provide a large part of the labour to be transferred to more essential work, have in five months released only 2,000 workers, while consumers services have absorbed an additional 18,000, of which 8,000 were taken in during May.

Sir Stafford drew the obvious conclusion from this situation by pointing out that the disinflationary policy has scarcely yet started to do its main work, and that its further development is bound to involve some dislocation and hardship. "But the fact is," he said, "that we are met by the choice between the temporary hardships inflicted on some thousands of people who lose their jobs in this way and the much greater hardships that would otherwise be inflicted on the whole nation if we failed to bring about disinflation and to solve our balance of payments problems." Moreover, there is no danger of excessive contraction because of the "enormous unsatisfied demand for all kinds of investment goods and because of the need to expand exports." In the last resort, an undue recession could be arrested by tax concessions and by the release of income tax postwar credits; but "there is no prospect whatever, with our continuing need to export so large a part of our production, of our having to resort to these devices."

* * *

More Drafts on Savings

Meanwhile, the effects of the disinflationary policy seem to be increasingly discernible in the figures of National Savings, which in each of the past three weeks have shown a large and rising excess of repayments over new subscriptions. Since mid-April, indeed, there have been only two weeks in which National Savings have yielded any net surplus at all, even on the basis of calculation adopted by the National Savings Committee. In the week to July 3rd—that is the week before the income tax concessions showed themselves in wage-packets computed under PAYE—there was on this basis a deficiency of £3,379,000 which, with the deficiencies of recent weeks, more than wiped out the small net receipts of early April. Hence, for the fiscal year to date, National Savings have involved net encashments of £1,653,000 before allowing for £6,290,000 of interest paid out on encashment of Savings Certificates. In addition, £35,778,000 of 3 per cent Defence Bonds issued in the early period of the war have been repaid at maturity.

The accentuation of the adverse trend of National Savings recently must certainly be mainly due to holiday spending, but the deterioration over the longer period is generally regarded as a symptom of the squeeze which is being exerted on personal budgets by the disinflationary policy and particularly by the stopping—or at least the slackening—of the rise in personal incomes. To this extent, a fall in the savings figures may not be in itself an adverse symptom, although it does tend to show that people are determined to maintain their spending power—a tendency which also seems evident from the latest figures of retail trade. The Chancellor, however, suggested an alternative explanation, the implications of which are rather more disconcerting—that drafts on past savings are increasing because of bigger expenditure on household equipment and furnishings as the rate of completion of new houses rises. This contention does not appear to be wholly consistent with the present glut of utility furniture; but, to the extent to which it is true, it further emphasises the dangers that the recent housing relaxaions may involve for the disinflationary policy.

Admittedly, the capital budget equation upon which the Chancellor's budget was based would not depend for equilibrium upon any large volume of personal savings; and although National Savings are now a negative quantity, there is no evidence that other forms of personal saving are declining similarly. But, even though the shortfall of National Savings may not be undermining the present foundation of the Chancellor's policy, it cannot be too strongly emphasised that that particular foundation was established only after drastic cuts in the capital investment programme and; despite these cuts, still rested upon a large deficit in the balance of payments.

* * *

Dividend Limitation in Practice

On one point Sir Stafford—or one of his advisers—was less than fair last Wednesday. He suggested that 25 per cent of all companies whose dividends had been announced since he asked for voluntary dividend limitation, had increased their payments, though he conceded that in some cases the increases were justified; and he offered a reminder to the recalcitrants that their refusal to co-operate might jeopardise the whole voluntary basis of the scheme. It appeared subsequently that this calculation was based on a recent analysis of dividend declarations by the *Investor's Chronicle*, which showed that while 329 companies out of 1,361 had increased their dividends in the three months to mid-June, reasonable justification could be found for all these cases save 61.

But the numerical count of increased dividend, useful no doubt for political exploitation, is really no measure of the success of the voluntary limitation policy as a component part of the Chancellor's policy of disinflation. What contribution have increased dividends made towards increased personal incomes since the Chancellor made his request? The answer is to be found in the analysis of profits of companies whose reports were published in the second quarter of this year, which appears in full in the *Records and Statistics* Supplement. The following table is extracted from the full analysis:

884 Second Quarter's Companies' Gross Profits
(All Figures Gross)

	Year 3 Preceding 1945		Year 2 Preceding 1946		Year 1 Preceding 1947		Latest Year 1948	
	£000's	%	£000's	%	£000's	%	£000's	%
All interests	5,790	4·7	5,691	4·2	5,494	3·2	5,291	2·4
Preference dividends	22,482	18·4	22,457	16·4	22,956	13·4	24,039	10·9
Equity dividends	64,271	52·5	71,196	52·2	85,592	49·8	89,854	40·8
Sub-Totals	92,543	75·6	99,344	72·8	114,042	66·4	119,157	54·1
Free reserves and carry forward	22,631	18·6	27,083	19·9	45,043	26·2	82,823	37·7
Other savings	7,152	5·8	9,906	7·3	12,753	7·4	18,055	8·2
Profits before tax	122,325	100·0	136,333	100·0	171,838	100·0	220,045	100·0
Percentage of year 3 preceding	100·0		111·4		140·5		179·9	

Here are 884 companies whose profits before tax have increased over those of the preceding financial year by no less than £48.2 million to £220 million. The return to the ordinary shareholder in dividends (before tax) has risen by a mere £4,300,000 to £89.9 million, and some part, at any rate, of this increase would be justified by the FBI's recommendations, on which Sir Stafford has previously expressed his approval. Does any serious critic suppose that a net increase in dividend incomes of, say, £2,500,000 makes any perceptible difference to the success or failure of the Chancellor's policy? Indeed, on the evidence of these figures, industry deserves praise rather than censure for its response to voluntary dividend limitation. To single out the alleged 25 per cent for censure, to make no mention of the effect of the "freezing" policy on wage claims, and to attempt no justification of the "counter-disinflationary" policy of spending on food subsidies at an annual rate £75 million higher than was assumed in the Budget—these inconsistencies do not make it easier to form a balanced view of the policy as a whole. Industry does not expect more than small thanks from some Ministers; but it will be disappointed indeed that the Chancellor has on this occasion been so ungenerous.

India's Sterling

The details of the interim agreement with India on the release of accumulated sterling balances, the allocation of hard currencies from the sterling area pool and the value of assets taken over by the Dominion Government have been published this week. Agreement with Pakistan was signed this week but the details will not be announced until next week. The agreement with India is for three years running from July 1, 1948. Over this period the sterling balances to be released to India will amount to £80 million in addition to the £80 million of freely available sterling which India carried forward into the period of the new agreement. In the first year India will have the use of the £80 million already in hand. In each of the second and third years India will be able to draw up to £40 million. The hard currency allocation has only been fixed for twelve months. In this period, i.e., up to July 1, 1949, India will be entitled to take the equivalent of £15 million in hard currencies from the sterling area pool. This quota will serve to cover India's deficit with the Western Hemisphere other than Brazil and Chile (which, being in the transferable account area, will accept sterling) and with other hard currency countries such as Belgium and Portugal. In addition to this equivalent of £15 million India will have at its disposal the equivalent of its own hard currency earnings and whatever it may draw from the International Monetary Fund.

The agreement also provides for the capitalisation of pensions payable to the British civil and military personnel previously in the employment of the Indian Government. This part of the agreement applies jointly to India and Pakistan. The pensions are to be paid in future through an annuity purchased jointly by the Indian and Pakistan Governments and financed out of the accumulated sterling balances. These balances, which at present amount to about £1,160 million, will also be used to pay for defence stores and fixed assets of the British Government which

have been handed over to the Indian and Pakistan Governments. The capital sum at which the pensions and sales of property have been valued is £275.5 million. These operations will, therefore, reduce the accumulated balances of the two dominions to about £885 million, of which at present nearly £100 million is freely available in the No. 1 accounts of India and Pakistan, and the balance of £785 million is temporarily immobilised in the No. 2 accounts. Assuming that the agreement with Pakistan will provide for releases of about £20 million over the next three years, and adding this to the additional £80 million to be released to India under the agreement announced this week, the accumulated balances in the No. 2 accounts will have fallen by a further £100 million and will thus stand at about £685 million by July 1, 1951.

The Indian agreement announced this week, and that with Pakistan for which the terms accorded to India must set an inevitable precedent, are correctly described as interim arrangements. They postpone until 1951 the problem of dealing with the bulk of the abnormal sterling balances accumulated by India and Pakistan during, and as a result of, the war. They make provisions for releases and for allocation of hard currencies that are fully in keeping with Britain's position as the banker of the sterling area. Whether they are in keeping with Britain's available resources of gold and hard currencies and with the pressure on its export capacity is perhaps more questionable.

* * *

Repercussions of the Film Quota

The indignation of American film producers against the quota figure of 45 per cent for the first year of the new Films Act was discussed in a Business Note last week. It is matched by the alarm and resentment of the British independent exhibitors (that is, exhibitors outside the three big circuits which are combined with producing interests). Much of the resentment is directed against the Rank Organisation. This was hardly to be avoided; for if the number of British films necessary to meet the quota can be produced at all, two-thirds must come from various parts of the Rank Organisation.

Exhibitors seeking British films to meet their quota obligations will, therefore, have to seek most of them from General Film Distributors, which Mr Rank controls. They see themselves threatened not by the quota alone, but by the trade policy of their main British supplier operating in conjunction with the quota. Many of them complain that the trade policy of the Rank Organisation has been hardening. Mr Rank himself met the General Council of the Cinematograph Exhibitors' Association on Wednesday. He assured them that he only wanted his renting organisation to trade on fair terms, but he observed, too, that some exhibitors had not been paying enough for their films. A good deal of the recent alarm has been aroused by the new and wider sliding scale of renting terms which General Film Distributors have been attempting to introduce. The proposal was that the proportion of box-office takings (after deduction of Entertainment Tax) to be paid to the renter should vary between 35 and 55 per cent. The Cinematograph Exhibitors' Association has steadily refused to pay more than 50 per cent for any film. Mr Rank announced on Wednesday that he had reluctantly abandoned the wider sliding scale; terms, he said, would have to be worked out for each film between the renter and the exhibitor. "We do not intend to ask any exhibitor to pay more than 50 per cent for any film on its general release."

The enforcement of the quota will clearly be full of occasions for controversy. Of the 4,500 cinemas at present open in the country, no fewer than 2,600 have applied for relief from quota obligations. Mr Rank repeated to the exhibitors on Wednesday his previous estimate of the practicability of the quota. About 1,000 cinemas in the three big circuits would, he said, be able to meet their obligations. (This is presumably so, since they are in combination with the major producing and renting organisations.) In addition, Mr Rank held that the 1,500 cinemas which had only one competitor in their locality could also fill their quota. Only some of the remainder would be properly entitled to claim relief.

Many exhibitors would not accept Mr Rank's assessment. They agree that the supply of films should be enough for those cinemas which have no immediate competitor. They are not greatly worried about houses which have two immediate competitors, for these will be able to claim relief. It is the position of the independent cinema having in its locality only one competitor who belongs to one of the three big circuits which worries them most. The supply of British films may be numerically sufficient for both, but the member of the big circuit will (they feel) get first choice; the independent cinema may be forced to accept inferior films, and may even be offered second runs. Rather than take second-run films, the independent first-run cinema will default on its quota. But before the point of default is reached quality may suffer.

* * *

First Quarter ECA Allocations

A list of most of the commodities allocated to Britain for the first quarter's programme under ECA is given in the accompanying table. Imports from the same sources for 1947 are shown, together with British import requirements based on last year's consumption. The figures in the three columns may not be exactly comparable as the allocations do not give precise definitions of the commodities. But the figures give a clear indication of the scope of the first major instalment of Marshall aid. There is, of course, no guarantee that the subsequent quarterly allocations will conform to this pattern, but if they do, a large proportion of British food and raw material imports from hard currency countries will be met by ECA dollars. Except for Canadian cheese, American tobacco, Canadian and Chilean copper, most of the first quarter allotments represent at least 25 per cent of Britain's corresponding import in 1947, and for certain commodities the proportion is much higher.

The total of the published allocations is $226 million, although the grant to Britain for the April-June period will amount to $300 million. Of the $226 million, $131 million will be spent in Canada, $57 million in the United States, and $2,750,000 in Chile. In addition $18 million will be used to buy petroleum

ALLOCATIONS OF COMMODITIES TO BRITAIN UNDER ECA
(Tons)

Commodity	Source	1st Quarter E.C.A. Allocation	Imports from Source Given 1947	Import Requirements 1947*
Wheat	Canada	1,026,700	3,439,276	3,832,000
Cheese	U.S.A.	15,000	60,267	194,000
	Canada	984	82,720

from the Netherlands West Indies, $9,750,000 for petroleum from the Middle East and $7,500,000 for inedible molasses and ethyl alcohol from Cuba.

The general authorisations to Western Europe include provisions for intra-European trade on a dollar basis. For example Austria has been allowed $4,500,000 to purchase, among other things, wheat, tin plate and tin from the United Kingdom, Belgium and the Netherlands. Bizonal Germany has been granted over $10 million for steel from Belgium, newsprint from Sweden, potatoes from Switzerland, Belgium and France, and crude glycerine, cadmium and tin from the Netherlands. These new authorisations amount to over $26 million, bringing the total ECA authorisations to date for Western Europe, Trieste and China to $789 million.

* * *

Trade Within Europe

Thus, the revival of intra-European trade has now been accepted as one of the direct objectives to be served by ERP grants. An official of the Economic Co-operation Administration in Washington announced this week that supplemental allotments to ERP participants would be made in the July-September quarter for the specific purpose of stimulating greater trade among ERP countries. This official, Mr Richard Bissell, pointed out that one of the main aims of ERP was the freeing of trade among European nations. This trade had been slowed down by the difficulty of some countries in finding markets for their products in other European countries. The consequent lagging of intra-European trade was described as a "waste of products." Under the supplemental programme, dollars will be earmarked for purchases between ERP countries. The main purpose of this innovation will be to make sure that European resources are used to the full before calling upon US sources of supply. These American proposals are to be welded into an improved scheme of intra-European clearing which is being discussed by the OEEC Trade and Payments Committee. Mr Bissell himself will go to Paris next week and participate in the discussions.

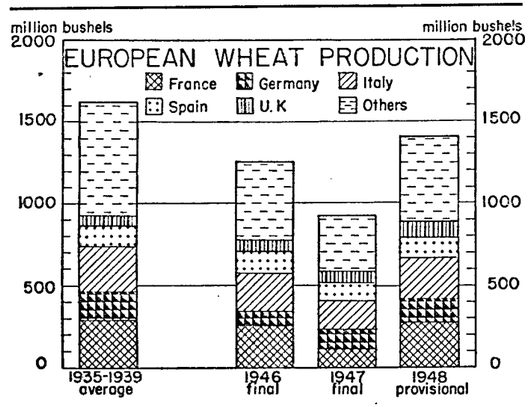
Candid reference to the intra-European payments problem was made by Mr. Harold Wilson, President of the Board of Trade, in a speech appropriately delivered this week to the Anglo-French Chamber of Commerce. Mr. Wilson cited the example of France importing farm machinery for dollars, while refusing licences for similar types manufactured in the United Kingdom, as an illustration of what the European Recovery Programme was not intended to do. Mr Wilson said that the United Kingdom would play its full part in discussing this trade and payments problem, which was now before the OEEC. He suggested that any scheme designed to increase European trade would call for contributions in the way of further credits from some of the stronger trading countries. He explained that last year Britain was roughly in balance with the rest of Western Europe on visible account. Within this global balance, however, Britain was paying gold and dollars to some European countries with which British trade was in deficit and lending money to those with whom Britain had a surplus. Mr Wilson concluded that it was imperative that in future other creditor countries should join Britain in giving credits. This exhortation was no doubt addressed to such countries as Belgium, which, however, can claim to have done fully as much in the extension of credit to other European countries as has Britain. The whole problem must be solved on a wider basis, and if American initiative in providing dollars for off-shore purchases within Europe is sufficiently bold, the most promising contribution will have been made to the solution of this crucial problem.

* * *

Spreading Next Winter's Power Load

In the coming winter, arrangements for restricting the industrial use of electric power will again be needed to reduce the peak electricity load and offset the deficiency in generating capacity. The target set by the Ministry of Labour's special sub-committee for 1948-9 is less ambitious than that set in 1947-8, when industry was asked to reduce its power load by a third during the peak hours in the six winter months. The sub-committee now recommends that there should be a reduction for industrial and commercial users as a whole of 20 per cent of the peak load next winter, during December, January and February. For October, November and March, the problem is rather different, and while there will still be a national deficiency, its extent will vary from area to area. The Regional Boards have therefore been asked to make such plans as they think fit to meet their particular circumstances during the milder months.

In any event, it will be left, as it was last year, to each individual Board to work out, with the individual firms, the detailed arrangements for spreading the load. This may take the form of staggering working hours, or transferring processes to night work, or organising a powerless day—this expedient last winter proved the most acceptable and had the least dislocating effects. The schemes are backed by powers to deal with failure to comply.



Restrictions of this kind, necessary as they may be, are not really a satisfactory solution of the problem, which can be met only by a sufficient expansion in generating capacity. It was originally hoped that capacity would have been expanded by an additional million kilowatts by the end of 1948. This would have rendered restrictions unnecessary. In fact, however, not more than 400,000-500,000 kilowatts have been added, which will be absorbed by the normal increase in electricity load. The new capacity will thus hardly alleviate the position. The slowing down of the development projects devised by the Central Electricity Board, insufficient allocations of constructional steel and delays in delivering materials and plant—these troubles will cast their shadow well beyond next winter.

In the meantime, the need for maximum domestic economies becomes increasingly urgent. The report of the Clow Committee, which has been in the hands of the Minister of Fuel and Power for some weeks and may soon be published, may suggest practical measures for reducing the non-industrial peak load, either by mechanical devices, or by differential tariffs, or by a combination of the two. But its chief effects will be mainly long-term. Given all the technical difficulties it is hard to see how such measures can be made effective quickly. The published plans for industrial and commercial users do not, indeed, suggest that any important new relief is expected through measures to reduce the domestic peak load in the coming winter. Is a mid-winter increase in domestic tariffs so repugnant to common sense and the nation's needs?

Wheat Without Agreement

The Wheat Agreement has been shelved. At last week's meeting of the International Wheat Council in Washington the British delegate announced Britain's withdrawal from the Agreement, owing to the non-participation of the United States. The United States was due to supply 37 per cent of the total guaranteed exports and the Agreement was clearly unworkable if USA did not participate, particularly as Argentina, Russia and Eastern European countries were not included in the scheme.

In its declaration of withdrawal, the British Government emphasised its desire to negotiate a new Agreement. Such an Agreement could not come into force before 1949-50 crop year. This delay has many advantages. First, it will enable amendments to be made to the administrative clauses. Secondly, if good harvest prospects materialise, much more favourable prices for importing countries are likely to result. The maximum price for the first year might conceivably be 50 cents lower than the $2 a bushel proposed last March.

This year's American wheat crop is expected to total over 1,200 million bushels against 1,400 million last summer. The maize crop will also be large, although it is not yet assured; a yield of 3,300 million bushels is expected compared with the record crop of 3,250 million bushels in 1946-47 and 2,400 million bushels in the following season, when so much damage was caused by floods. As a result the United States is expected to have at least 400 million bushels of wheat available in 1948-49 for export—its quota under the Wheat Agreement would have been 185 million bushels. News from Canada is not quite so encouraging. Some of the wheat in the Prairie States has been damaged by the drought and total acreage is smaller than last year. Nevertheless

"Knowledge is of two kinds. We know a subject ourselves, or we know where we can find information upon it." Not all Dr. Johnson's dicta are accepted to-day (e.g. Is claret the liquor for boys and must one drink brandy if one aspires to become a hero?) but few will quarrel with his views on knowledge. For example, business and other organisations requiring information outside their own subjects know that they can often find it at The Economist Intelligence Unit.

22, Ryder St., St. James's, London, S.W.1
Telephone: Whitehall 1511

the wheat carry-over for the four main exporting countries on July 1st is estimated at 350 million bushels compared with 225 million bushels at the beginning of last season.

Reports from Europe continue to be good despite the recent weather and preliminary estimates of the wheat crop are illustrated in the chart on page 119. Although it is still some 14 per cent below the prewar average, it will be larger than any crop during or since the war. Other grain crops are doing equally well. Again, wheat production in India has increased and the Asiatic rice crop is showing a welcome expansion. Provided that the harvests fulfil their promise, bread-rationing will certainly be eased in most European countries, if not discarded. But the level to which wheat prices will fall, will depend on domestic price policies, particularly in the United States. The new American support price for the 1948 crop has been announced as $2 a bushel at the farm. This is, in fact, a guaranteed minimum price to the farmers. Last year's rate was $1.84 a bushel. If the Commodity Credit Corporation has to buy large quantities of wheat at the guaranteed minimum, will it be sold to Europe under ECA at that price? Under free market conditions the price of wheat this Autumn should fall below $2 a bushel.

* * *

Cheaper Cotton and Wool?

There are at least some signs that the world cotton shortage will be eased during the coming season. The US Department of Agriculture has announced that the area under cotton in the United States amounted to 23,650,000 acres on July 1st, an increase of 10 per cent over last season. The harvested area is likely to total 23,223,000 acres compared with 21,269,000 acres last year and 17,615,000 in 1946. No official indication of the crop has yet been published but it is at least heartening to see the cotton acreage back almost to its 1940 level. And trade sources have estimated a crop of 14 million bales against 11½ million bales in 1947-48 and 8,500,000 bales in the previous season.

American domestic consumption is expected to show a slight drop on last season's figure of 9,000,000 bales, leaving over 5,000,000 bales available for export. In 1947-48, US cotton exports amounted to only 2,300,000 bales and even in the record year of 1945-46, reached only 3,900,000 bales. World stocks however, are low, being forecast at 14½ million bales on August 1st, against 25 million bales at the same date in 1938. Thus, even with the promise of a larger Egyptian crop, the cotton market is not facing a rude shock. Nevertheless, prices are likely to be significantly lower than last summer, particularly for American grown cotton—and this, despite larger European purchases under ECA. The spot price for cotton in New York has already fallen quite appreciably. On July 13th it stood at 35.35 cents a lb. compared with 38.19 cents a month earlier and 38.87 cents a year ago.

There have also been signs of some weakening in wool prices, though as yet they are not well defined. During the first half of June prices for crossbred wool in the Australian and Liverpool sales were 10 per cent lower, although merino prices were maintained. Since then, however, the closing sales at Adelaide and Brisbane have shown price falls of 10 to 15 per cent, including merino. The last sale of the season opened in London on Thursday, as this issue of *The Economist* was going to press. Bidding was still fairly keen, but prices in general were about 5 per cent below the level of the Liverpool sales, with even more marked reductions for the inferior grades.

The results of the London sale will be analysed with interest, for in recent years close-of-season prices have been fairly strong, because manufacturers and merchants bought for stock until the new clip became available late in the autumn. Wool supplies have not altered materially. There is still a dearth of the better qualities, although the merino wools should be more plentiful next season. In the past few months the wool market has been firmly supported by buying on Russian, Japanese and German account, but such large-scale purchases are unlikely to continue for any length of time. Bradford, equally, may soon feel the effect of the reduced home demand for clothing—if it has not done so already. The export market, while it lasts, may however provide an adequate bulwark.

Opposition to Development Councils

Leicester, as the centre of hosiery manufacture, is becoming also a centre of opposition to the Government's policy of establishing statutory Development Councils for industry. At the beginning of June, the Board of Trade published the draft order for the establishment of a Hosiery and Knitwear Council and asked for suggested amendments. Hosiery manufacturers held a meeting and returned a unanimous answer. They wanted no such statutory body, though they were prepared to set up an advisory council themselves on which the trade union should be represented. Last Friday the Permanent Secretary to the Board of Trade visited Leicester to dispel "misunderstandings" about the powers given to a Development Council by the Industrial Organisation Act. He met not only with continued hostility in the hosiery trade but also with a firm declaration by the boot and shoe industry on the lines of that made by the hosiery manufacturers a month before. The National Union of Boot and Shoe Operatives associated itself with the proposal to form a weaker, advisory body without statutory powers. Such a body, in the Government's view, would be too weak to live

This is the first time a union has compromised with the employers on this issue, on which TUC policy has been firm since the Conference of 1944 passed a resolution in favour of Industrial Boards. Re-affirmation of that policy at Scarborough this year was intended not only to stimulate Government action but to stiffen wavering unions and in particular the Boot and Shoe Operatives.

There have been suggestions that the President of the Board of Trade intends to force through the Hosiery Development Council Order before the next session, when the political atmosphere may well grow heated over the future of the steel industry. Perhaps this setback will cause him to go more slowly. According to the Industrial Organisation Act, the Minister may submit the Order to an affirmative resolution of both Houses after consulting "any organisation . . . representative of substantial numbers of persons carrying on business in the industry." The Act does not compel him to obtain their support. Yet the expediency of imposing a Development Council on an industry generally opposed to it may be questioned. And to choose unwilling industries first seems likely to rouse unnecessary opposition. It would seem wiser to make a start in an industry where both sides are agreed. One such industry is furniture; responsible opinion in the furniture industry would welcome a Development Council as a means of establishing recognised standards before the utility scheme ends.

Carbon Black

One of the projects to establish in Britain the manufacture of ultra-fine carbon black was announced last week by Dawnay Day and Company. It is based on an agreement with the Phillips Petroleum Company of Oklahoma, which is to lease the processes and give technical assistance. A site has been chosen for the plant; if the necessary approvals and permits are obtained, building may begin this year and the plant may be in production by 1950. The scheme has Board of Trade support, less for dollar-saving reasons than to attempt to assure the supply, at present precarious, of a vital raw material. British industry uses about 55,000 tons of carbon black, of all types, a year. Most of this (53,000 tons) goes to the rubber industry; the remainder goes mainly into printer's ink. It is the fine blacks, channel black and the various equivalent types developed in the last few years in the United States, which are critical. The life of a motor-tyre tread depends on channel black, or possibly (the tyre trade is not yet finally satisfied on the point) on its substitutes. British consumption of channel black and its equivalents is about 36,000 tons a year; all this is imported, and virtually all from the United States. Britain last year imported 40,000 tons of carbon black at a cost of $10 million. Consumption has approximately doubled since before the war, and the prices (now between 7d. and 10d. a pound according to type) have doubled too.

The approaching difficulties in the supply of channel black were anticipated by the Government three years ago, when an inter-departmental committee was set up, with Sir Charles Bruce-Gardner as chairman, to inquire into the matter. Channel black was made from natural gas in the United States oilfields. Germany made it by burning anthracene and naphthalene in a stream of coke-oven gas; this was expensive in Germany and would be excessively dear in this country. Even the American method, however, was an extravagant way of using natural gas resources, which the Americans found could be exploited in more profitable ways. As the other uses for natural gas have been developed, channel black production has declined; within a few years it may cease altogether. There have been occasions since the war when British rubber tyre factories have had to work short time for want of channel black.

The committee found that various American firms (among them the Phillips Company, the Cabot Company, and Columbian Carbon) were developing new ways of producing ultra-fine blacks. These processes vary, but are all based on the passing of oil, oil gases or oil residues through furnaces to extract the carbon. Any hydrocarbon can be made to yield carbon black, but the properties depend on the size and shape of the particle. The American companies operating the new processes claim that their ultra-fine furnace black can be used in tyre treads as a complete alternative to channel black. If this proves to be so, then the establishment of these projected factories will solve one of the most intractable supply worries of the British rubber industry. And even if the possibilities of substitution do not prove unlimited, there is little doubt that they are considerable. The plant required is expensive (to build a plant capable of producing 10,000 tons a year would cost about £300,000). It is still doubtful whether the scale of the investments now planned is large enough to supply the full British requirements.

* * *

Disinflation and Retail Sales

Since the war May has re-established itself as the peak month in the spring retailing season. On May 11th the first batch of coupon changes came into effect. But an examination of the retail statistics for May published in the *Board of Trade Journal* suggests that seasonal movement may have played a more important part than did the coupon changes in bringing about the rise of 9 per cent in the retail sales index. Sales of stockings and women's outerwear (in which the coupon concessions were substantial) were only fractionally higher than a year ago; indeed, since prices have risen over the year, physical sales were less. By contrast, sales of underwear and children's wear were 12 per cent higher than May, 1947, and of men's wear 25 per cent higher. Sales of household goods relapsed after a spurt in April, but food sales rose with the spring season. Sales of furniture continued to fall in May, and the validation of extra utility units on May 7th did little to arrest it. In one trade only was there a whole-hearted response to coupon concessions: sales of boots and shoes, at half the former coupon values, rose by 25 per cent compared with April. These returns explain why Mr Wilson found it necessary to make further concessions in clothing coupons in June.

Comparison of retail and wholesale stocks gives evidence of the highly conservative policy which buyers are pursuing, especially for the larger retail stores. Though retail sales of clothing and footwear rose, stocks decreased in May. Contrary to the general impression, stocks of women's outerwear in retail shops were actually 5 per cent less in value than in May, 1947. But wholesalers' stocks were 67 per cent higher, and many of the wholesalers themselves are now making efforts to keep their stocks down. This was the subject of a complaint addressed by the National Union of Manufacturers to the Chancellor of the Exchequer last week: "Manufacturers are finding that wholesale and retail distributors are reducing their stocks, particularly of seasonal goods, but are expecting delivery when the demand arises, and this has placed the burden of a heavy volume of stock on the manufacturer."

The biggest single deterrent to distributors from holding stocks is the fear of being caught with goods on which the purchase tax may be reduced. Under the new Finance Act the Chancellor has taken power for the first time to vary purchase tax by an Order. The National Union of Manufacturers has asked that purchase tax should not be so varied without prior consultation with the industry concerned.

* * *

Compensation for Gas

The Government was defeated in the House of Lords last week when the Opposition rejected the method proposed under the Gas Bill of assessing compensation for holders of gas stocks. In the Commons, the Government had, despite sustained criticism, decided on Stock Exchange prices as the basis of valuation. The Lords Amendment substitutes "reasonably maintainable annual income which could have been expected from those securities if this Act had not been passed, multiplied by such numbers of years purchase as may be appropriate in order to secure the payment of fair compensation." A representative of the stockholders and the Minister should, the amendment proposes, calculate maintainable revenue and years purchase, with an arbitrator available in cases of dispute.

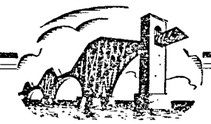
In the findings of the Heyworth Committee, in these columns, and during the Commons debate on the Gas Bill, Stock Exchange

An Annuity

will offset reductions in interest rates

For a man aged 65 (or a woman aged 70) the gross income for life from an annuity is over 10% of the purchase money.

(For residents in some countries payments are exempt from U.K. tax.)



Enquire for details at your age.

The Equitable Life Assurance Society

THE

STANDARD LIFE ASSURANCE COMPANY

For Mutual Assurance

Established 1825 *Assets exceed £54,000,000*

SPECIAL ATTENTION IS DRAWN TO THE FOLLOWING CONTRACTS:—

1. BUSINESS MAN'S POLICY Inexpensive Life Assurance with options to convert at a later date to an endowment assurance either with or without profits.

2. FAMILY INCOME POLICY The ideal contract for a young married man: maximum life cover at minimum cost.

3. POLICIES FOR CHILDREN (*a*) "Public Schools" Policy. Provision for education by means of premiums spread over the early years of a child's life.

(*b*) "Early Thrift" Policy. Should be effected as soon after birth as possible to provide a splendid life or endowment assurance policy when the child attains the age of 21.

(*c*) "Family Protection" Policy. A policy on the life of a parent incorporating valuable options on the life of his child at age 21. Income tax rebate is allowed on the premiums.

An enquiry will bring full particulars.

HEAD OFFICE: 3 GEORGE STREET, EDINBURGH

LONDON OFFICES: 3 Abchurch Yard, Cannon St., E.C.4, 15a Pall Mall, S.W.1.

prices for gas stocks have been condemned as an unsatisfactory basis for compensating the owners of the gas industry. The reasons for this criticism are two-fold. Many gas stocks are not quoted on the Stock Exchanges of the country at all, and even when they are quoted gas stocks are not active, and prices are largely notional. Secondly, the tendency for market prices to undervalue an undertaking is pronounced in the case of gas shares. The efficient gas companies, bound by the statutes under which all gas undertakings operate, have built up assets far in excess of balance sheet valuations, and market prices for gas stocks have naturally failed to reflect these increases.

The Government's reasons for preferring Stock Exchange prices for valuation are not convincing. When this method was adopted in the case of the railways and electricity, there was far less criticism, because the great majority of the undertakings involved were represented by quoted securities. As for the Government's desire to get compensation out of the way quickly, will it really be so much quicker to ascertain what valuation investors might have placed on gas securities had they been quoted, than to follow the Lords' proposals?

* * *

UK—Norwegian Payments

The payments agreement recently negotiated between Britain and Norway introduces a new feature in the financial relations between the two countries by setting a definite limit to the amount of the other's currency which each party is prepared to hold. This limit is fixed at Kr. 100 million and £5 million respectively. Thus the Bank of England, acting as agents of the British Government, will sell sterling to the Norges Bank as required by residents of Norway to make payments within the sterling area. Norwegian kroner deposited against these sales of sterling will be credited to the Bank of England No. 1 account at the Norges Bank provided that the balance standing to the credit of that account does not rise beyond the ceiling of Kr. 100 million. If the balance has reached this limit, further sales will be against gold to be set aside in the Bank of England's name at the Norges Bank. Conversely, gold will be earmarked in London on Norwegian account if the Norwegian balance in its No. 1 account with the Bank of England rises beyond the limit of £5 million. Under the new agreement, sterling held by Norwegians will only be transferable to residents outside the sterling area on an administrative basis, each operation being subject to the consent of the Bank of England and the Norges Bank. Similar arrangements have been made for the use of Norwegian kroner by sterling area residents when making payments outside Norway and the sterling area.

Shorter Notes

The Italian Government has now agreed to assume responsibility for Italy's share of 20½ per cent in the interest guarantee on the Austrian Government 4½ per cent Loan, 1934-59. Funds will be provided to meet interest payments, including arrears. To this announcement the Stock Exchange responded with a rise in the Austrian Loan on Tuesday from 65½ to 73½. The Italian Government has, however, failed so far to take similar steps in respect of the Italian share in the capital redemption guarantee.

*

British exports in June achieved a value of £134 million, which is 40 per cent in excess of the 1938 figures and ahead of the Government export target set for mid-1948. June exports increased by £4,000,000 over May, when the daily rate was 134 per cent of the prewar figures. But as the President of the Board of Trade has shown this week, there is still "no real narrowing of the gap in our overseas balance of trade." Moreover, the effects of the dock strike were not felt in June "because exporters were allowed up to 6 days after final clearance of a ship to send in returns."

*

The danger of a strike in engineering over the employers' rejection of the unions' wage claim has been averted. By an overwhelming majority (992,000 votes to 114,000) the Executives of the 37 unions represented in the Confederation of Shipbuilding and Engineering Unions decided this week to ask the Minister of Labour to set up a Court of Inquiry, under the Industrial Courts Act, to investigate the whole question of engineering wages. A separate Court will deal with the shipbuilders' claim.

*

Summary figures of steel production announced by the British Iron and Steel Federation show that the average weekly production of steel ingots and castings in June was 297,000 tons. This represents a rate of production of 15,444,000 tons a year—the highest yet recorded in any month. The previous highest rate (15,283,000 tons a year) was reached in April. The rate of production in June, 1947, was 13,206,000 tons a year. Production of pig-iron, however, fell slightly from a weekly average of 183,700 tons in May to 181,100 tons a week in June.

*

In the first 5 months of 1948 2,887,000 work people benefited from higher pay, involving a net increase in their wages bill of £831,600 per week. In the transport industry 770,000 people received increases, in textiles 518,000, the clothing industry 342,000, and metal, engineering and shipbuilding 327,000. The highest average increase per head was recorded in the distributive trades, where 56,500 workers share an additional £22,100 per week.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Associated British Pictures; British Plaster Board; British Sugar Corporation; British Timken; Pye Limited.

COMPANY MEETINGS

THE NASSAU INVESTMENT CORPORATION, LIMITED

TEN YEARS OF PROSPEROUS GROWTH
SOUNDNESS OF MANAGED INVESTMENT POLICY
INCREASE OF CAPITAL APPROVED
MR R. K. FRAAY'S ADDRESS

The tenth ordinary general meeting of the Nassau Investment Corporation, Limited, was held on the 30th ultimo, at Prudential House (adjoining Unit Security House), Fox Street, Johannesburg.

Mr R. K. Fraay, the chairman, presided and, after declaring the meeting properly constituted, said: Ladies and gentlemen,—This is the tenth annual general meeting of your corporation, and in moving the adoption of the directors' report and audited accounts for the year ended December 31, 1947, I suggest that, as these have been in your hands for some time, we take them as read. I shall, as usual, first refer briefly to the main features of the accounts before you.

PROFIT AND LOSS ACCOUNT

In order to give the fullest possible information to shareholders, compatible with the interests of the corporation, the annual accounts of the companies forming our group are now published in such a manner that the different sources of income are shown separately, instead of in one item as in the past. The accounts before you provide this detailed information, while comparative figures for the previous year are given in the margin.

The total revenue received during the year was £215,706 (last year £207,992), subdivided as follows:—

Dividends received and accrued	£112,651
Profits, less losses on investments realised	102,860
Sundry revenue	195
	£215,706

The total expenditure was £44,663 (last year £36,347), sub-divided as follows:—

Administration expenses	£13,899
Interest	25,243
Audit fees	158
Directors' fees and bonuses	5,363
	£44,663

After deducting expenditure from revenue, the net profit was £171,043, as compared with £171,645 in the previous year. You will see that the higher expenditure was mainly caused by an increase in "Interest paid."

I am sure that you have noted with pleasure that the revenue under "Dividends received and accrued" has increased by an amount of £15,588 in comparison with 1946, because an increase under this heading shows the strength of an investment company such as yours. There was a decrease under the other two headings, namely, "Profits less losses on investments realised" and "Sundry revenue," but I feel that the final result is highly gratifying.

APPROPRIATION ACCOUNT

To the net profit of £171,043 must be added £68,486, being the balance unappropriated at the beginning of the year, making a total of £239,529. The following allocations have been made:—

Dividends to shareholders (25 per cent.)	£125,000
Provision for taxation	16,500
	£141,500
Leaving a balance to be carried forward of	98,029
	£239,529

BALANCE SHEET

The amount of the authorised and issued share capital of your corporation remains unaltered at £500,000, but in terms of a special resolution of shareholders passed on May 29, 1947, each £1 fully paid-up share was divided into four fully paid shares of 5s. each. The capital of your corporation therefore now consists of 2,000,000 shares of 5s. each, all fully paid.

Your directors consider it expedient to increase the capital to £1,000,000, and an extraordinary general meeting of shareholders has been convened to follow this meeting. I will refer to the proposals to be made at this extraordinary general meeting later.

General Reserve—General reserve remains unaltered at £500,000, and as this reserve now stands at the same amount as the capital, your directors do not consider it necessary to add to it by an appropriation from the profits made during 1947. The other items on the balance sheet do not call for any special comment, with the exception of

INVESTMENTS

The investments of your corporation at December 31, 1947, consisting of shares in 28 companies, appear on the balance sheet at cost—that is to say £1,691,514, which includes brokerage. The market value of these securities, based on the ex dividend quotations on January 5, 1948 (the first business day in 1948 on the Johannesburg Stock Exchange), was £1,828,650. The market value of your holding was therefore £137,136 above cost, which is a distinct improvement in comparison with the position at the beginning of 1947, when the market value was £54,646 below cost.

This is naturally very gratifying, but as I have said so often—do not attach undue importance to market fluctuations. The strength of an investment company lies principally in a first-class investment portfolio and sound and active management.

As I advised you in my last address, a considerable part of the investment holding of your corporation consists of shares in our associated companies, and these investments have proved to be very valuable. The dividends on our holding in these companies now constitute the main portion of the dividend income of your corporation.

INCREASE OF CAPITAL

This meeting will be followed by an extraordinary general meeting of shareholders, when resolutions in regard to an increase of the capital of the corporation, and the adoption of new articles of association will be considered.

It is proposed to designate the existing shares "ordinary shares" and to create a further 1,000,000 ordinary shares of 5s. each and 250,000 five per cent. cumulative preference shares of £1 each.

The present articles of association were adopted on August 7, 1941, and do not comply with all the present-day requirements of the Johannesburg Stock Exchange. Your directors, therefore, suggest adopting a new set of articles, incorporating the latest requirements of the Committee of the Johannesburg Stock Exchange, and certain provisions which will be required in the event of an application being made to the Council of the Stock Exchange, London, for a quotation of the shares of your corporation in that financial centre. A copy of the proposed new articles of association has been open for the inspection of shareholders at the registered offices of the corporation since June 7, 1948, and I do not think, therefore, that it will be necessary for me to report further in this regard.

In connection with the proposal to increase the capital of the corporation, I have to point out to you that the accounts before you show that an amount of £554,354 was owing in respect of loans and bank overdrafts at December 31, 1947, and further capital is also required for investments which have been obtained in new concerns since the beginning of the current year. This shows the advisability of increasing the capital, thereby enabling your corporation to expand still further.

BOARD'S PROPOSALS

The notice convening the extraordinary general meeting of shareholders was sent to shareholders together with the notice of this meeting, and I am sure that the proposals to be made to you are quite clear.

Your directors are asking for authority to offer the 250,000 five per cent. cumulative preference shares of £1 each to be created, at 20s. 6d. per share, and therefore at a premium of 6d. per share, on such terms and to such persons, whether shareholders of the corporation or not, as the directors may determine, provided that no such offer of any preference shares shall be made by the directors after June 30, 1949, without the consent of shareholders in general meeting. It is the intention of your directors to place these shares as soon as possible, and to give preference in allotment to our shareholders who apply for such shares. A form of application for these cumulative preference shares was sent to shareholders together with the notice of the extraordinary general meeting, and shareholders who wish to apply were asked to complete and return the application to the corporation on or before July 21, 1948. I might mention that a number of applications, duly completed, have already been received from shareholders. If shareholders apply for more than the whole issue of 250,000 cumulative preference shares, it is the intention of your directors to allot all these shares to shareholders only, and to make a pro rata allotment.

OFFER TO ORDINARY SHAREHOLDERS

Your directors are also asking for authority to offer to ordinary shareholders registered in the books of the corporation at the close of business on December 31, 1948, the 1,000,000 new ordinary shares of 5s. each, at 15s. per share, being at a premium of 10s. per share, in the proportion of one new share for every two shares held at that date, fractions being disregarded, and for the necessary power to allot and issue any of the new shares not taken up and also the shares resulting from fractions, to such persons, whether shareholders of the corporation or not, and at such prices (not being less than 15s. per share) as the directors may from time to time deem fit. It is the intention to utilise the £500,000 which will accrue to your corporation as premium on the 1,000,000 new ordinary shares of 5s. each, for strengthening general reserve. This will then increase the general reserve to £1,000,000, while the authorised and issue capital of your corporation will then amount to £1,000,000 divided into 3,000,000 ordinary shares of 5s. each, and 250,000 five per cent. cumulative preference shares of £1 each.

I am sure that the proposals to be made at the extraordinary general meeting will meet with the full approval of shareholders, because these two issues—cumulative preference in July, 1948, and ordinary shares at the beginning of 1949—will further strengthen your corporation, enabling it to take full advantage of any new remunerative business

offering. I might add that I am confident that it will be possible to maintain the dividend of 25 per cent. per annum on the ordinary shares, even on the increased capital.

GENERAL ASPECTS OF INVESTMENT MARKET

The South African investment market has been passing through a very difficult period during the last few years. Market conditions have been rather erratic, with considerable fluctuations in prices from time to time. A few of the better known industrial shares have been on the upgrade, but most dividend-paying gold mining shares have constantly given ground.

The question is often asked whether an early improvement can be expected. It is, of course, impossible to forecast market conditions with any degree of certainty, but I feel confident that the market will improve in the not too distant future. I base my conviction on the expectation that something will have to be done by our government to assist the gold mining industry, to enable that industry not only to continue its present operations, but to expand further, to the benefit of this country as a whole; and in addition, on my often expressed opinion that the gold price must eventually rise to a figure bearing a truer relation to commodity prices and production costs than does the present figure.

The difficulties which confront investors at the moment show clearly that, more than ever before, investing is becoming a professional occupation which can best be left to investment companies and investment consultants. We in South Africa must not overlook the fact that the same difficulties are being experienced by investors in oversea countries, not only by individuals, but by trust and insurance companies, banks, etc. For instance, one American banker complained, some time ago, that his institution was subscribing to eight investment information services. All these services were unanimous in their opinion in June, 1946, that share prices would go higher, but within 90 days of that forecast, the worst decline in a decade was experienced. If professional consultants and investors admit that they have to contend with considerable difficulties, it stands to reason that these difficulties must be even greater for individuals who do not command the necessary technical information, etc., which is necessary in shaping an investment policy.

These were the considerations which led to the establishment of your corporation, which will have been in existence for 11 years on October 21 of this year.

CORPORATION'S PROSPEROUS GROWTH

Much has been written and said lately about the advantages and disadvantages of the managed investment movement, not only in this country, but overseas, I am justified, therefore, in quoting to you today some particulars obtained from the records of your corporation covering the period from its incorporation, nearly 11 years ago.

Your corporation was registered on October 21, 1937, with a nominal capital of £50,000, divided into 50,000 shares of £1 each. Only 26,000 shares were then applied for and issued, while the balance of 24,000 shares was placed privately at a later date. All these 50,000 shares were paid for in cash at par.

SUCCESSIVE CAPITAL INCREASES

On October 31, 1938, the nominal capital was increased to £250,000. In accordance with a prospectus dated November 10, 1938, 100,000 shares of £1 each were offered for public subscription at 20s. 6d. per share, but on account of the uncertain international position then prevailing it was not possible to place more than 50,000 shares. On December 31, 1938, the total issued capital of your corporation was therefore £100,000, divided into 100,000 shares of £1 each.

During 1942 a further 150,000 shares were issued to shareholders, at 30s. per share—that is, at a premium of 10s. per share, and this premium, amounting in total to £75,000, was transferred to general reserve.

In May, 1943, the nominal capital of your corporation was again increased, this time to £500,000, by the creation of a further 250,000 shares of £1 each. 125,000 of these shares were offered to shareholders registered at the close of business on June 30, 1943, at 40s. per share. Of these, 124,524 shares were taken up by shareholders, while the remaining 476 shares were placed at 74s. 6d. per share. The total premium of £125,821 resulting from this issue was added to general reserve, which at the end of 1943, stood at £220,000 while the issued capital was then £375,000, divided into 375,000 shares of £1 each.

The remaining 125,000 shares of £1 each were issued to shareholders at 60s. per share in the beginning of 1946, thereby increasing the issued capital to £500,000, while the whole of the share premium on this issue, amounting to £250,000, was added to general reserve. As already mentioned, the £1 shares were divided into four shares of 5s each in accordance with a special resolution passed on May 29, 1947.

A PIONEER UNDERTAKING

Your corporation was the first managed investment company of the unit securities group to be established, and during the years 1944 to 1948, participated in the establishment of a further seven investment companies in this group.

The history of your corporation has, in my opinion, proved the soundest of the managed investment policy. As I have said so often, managed investment companies are, in effect, nothing but partnerships with limited liability of a great number of investors, who entrust to the directors of their company part or whole of their resources in order to invest their combined funds to common advantage, and in such a manner that these companies can do better for their shareholders than individual shareholders can do.

The revenue of these companies consists of:—

(1) Dividends received,

(2) Profits less losses on investments realised, and

(3) Other revenue, such as underwriting commission, etc.

In arriving at the revenue derived from "(2)," only profits and losses on securities actually sold during the year are taken into account.

The net profits of the managed investment companies forming our group are allocated in such a manner that, whenever possible, substantial amounts are appropriated for building up strong reserves and considerable balances on the appropriation account over a period of years. The balances on appropriation account may serve as dividend equalisation funds.

VALUATION POLICY

The holdings of the companies are, at the end of each year, shown at cost, while information is also given on the balance sheets and in the directors' reports about the market value of the holdings, based on the market prices in force on the first business day on the Johannesburg Stock Exchange following the date of the balance sheets. This policy has been consistently followed by all the investment companies of our group. There is bound to be a difference between cost and market value, due to market fluctuations, and I have repeatedly told shareholders in the various companies in our group—as I have told you today—not to attach undue importance to market fluctuations. Investment companies acquire their holdings mainly for investment purposes—that is to say, to obtain an income from dividends.

Under this policy it is, of course, possible that certain investments may have a market value below cost at the end of the year, while other investments show an appreciation over cost. In the case of the holdings of your corporation, for instance, some shares held at the end of 1947 had a market value below cost, while other securities showed an appreciation above cost, but the position as a whole is always clearly shown.

Market value of investment securities is, in my opinion, not a true standard of value, subject, as these market prices are, to fluctuations due to a variety of causes which have nothing whatsoever to do with intrinsic values. That is the main reason why it was decided by the directors of your corporation and subsequently by the directors of its associated companies, to show investments on the balance sheet at cost, accompanied by a statement as to the market value, and only to take account in our profit and loss account of profits and losses when these are actually made on realisation.

SHAREHOLDERS' INTERESTS PROTECTED

It is my considered opinion that the investment policy followed by your corporation and its associates is the best policy for protecting the interests of shareholders in investment companies, because I realise that shareholders in such companies are mainly interested in obtaining regular dividends and holding investment securities which are readily marketable, while they are quite prepared to leave the management of their funds in the hands of the directors and management of the company.

It will be realised that it usually takes some considerable time before such investment companies can be firmly established. Some companies may be established and may have acquired their investment portfolios just before a temporary upward movement in the market takes place, and the results of the first year's operations disclosed in its published accounts may then give rise to exaggerated expectations. Other companies may commence business and acquire their portfolios prior to a downward trend in the market taking place, and the holdings of such companies would then naturally show a depreciation in comparison with cost. Some critics contend that companies in such a position should not distribute their income by paying dividends, but should retain such income against the depreciation of the portfolio based on market value as compared with cost. An individual holding investments whose market value was lower than cost would still regard dividends received as income, and I consider that managed investment companies, being simply partnerships with limited liability, should do the same. They should therefore distribute the major portion of their income in dividends to shareholders, and utilise the balance to build up substantial general reserves over a period of years.

Your corporation has passed through very difficult times since its inception, due to the war and the uncertainty prevailing in the prewar and postwar periods. It is therefore interesting to recall what has happened during the 11 years of its existence.

GROWTH OF DIVIDENDS

Before quoting particulars in connection with income and expenditure, etc., I would like to state that your corporation has paid regular dividends to its shareholders since its inception, at the following rates:—

Year ended December 31	Dividend per cent.
1938 (14½ months' period)	8
1939	6
1940	7
1941	12½
1942	15
1943	17½
1944	20
1945	20
1946	21¼
1947	25

while an interim dividend of 12½ per cent. in respect of the financial year ending December 31, 1948, was declared on June 19th of this year.

MARKET VALUATIONS

As could be expected, there have been considerable fluctuations in the market value of the holdings of your corporation, as compared with cost during the ten years since the inception of your corporation, as the following figures show:—

	Appreciation above cost per cent.	Depreciation below cost per cent.
1938	—	0.50
1939	—	7.83
1940	—	8.32
1941	5.09	—
1942	—	0.58
1943	1.12	—
1944	—	7.30
1945	4.80	—
1946	—	3.00
1947	8.11	—

The information quoted gives the position at the end of each financial year, but it will be realised that such fluctuations occur throughout each financial year for the reasons already stated.

Profits and losses on investments realised—from October 21, 1937, until December 31, 1947, the total profits on investments realised amounted to £602,836, and the losses on investments sold amounted to £160,649, resulting in a net profit under this heading of £442,187.

INCOME AND EXPENDITURE

Dividend Income.—During the same period, the dividend income of your corporation amounted to £472,665.

Other Income.—The other income, consisting of underwriting commission, etc., amounted to £12,106.

Total Income.—The total income for the period was £926,958.

Interest Paid.—The interest paid by your corporation on money borrowed was £113,770.

Other Expenditure.—Other expenditure, including directors' fees and bonuses, was £91,929.

Net Profit and Taxation.—The net profit was £771,259, from which amount must be deducted £73,034 for taxation, leaving £648,225.

DIVIDENDS AND RESERVE

Dividends Paid to Shareholders.—I have already given you information about the rate of annual dividends declared and paid to shareholders. These dividends absorbed £501,018 during the whole period, while £472,665 was received by the corporation as dividend income. This will show you that practically the whole amount of dividends paid to shareholders was derived from dividends received.

Appropriations to general reserve: During the period £49,179 was appropriated from the profits to general reserve, while £450,821 was received as premium on new shares issued and transferred to general reserve, thereby creating a total reserve of £500,000. During 1946 and 1947 no appropriations from the profits were made to general reserve, as it stood, during those years, at the same total as the issued capital.

BALANCE OF PROFITS

The balance of the profits made during the period were utilised to increase the balance on appropriation account, which stood at £98,029 at the end of 1947. The gradual strengthening of your corporation's position is clearly shown by giving particulars of the balances on appropriation account at the end of each financial year. These balances were as follows:—

1938	£1,428
1939	1,207
1940	2,239
1941	2,567
1942	3,414
1943	7,202
1944	7,218
1945	22,059
1946	68,486
1947	98,029

I attach very great importance to the gradual building up of the balance on appropriation account, because I consider this balance to be in the nature of a fund for the equalisation of dividends. This balance can, if the position warrants it, be utilised to maintain the same dividend if, during any one year, there should be a drop in the net profits.

INVESTMENT PORTFOLIO

The cost of the investment portfolio of your corporation also gives a clear picture of its gradual growth. The investments at cost at the end of each financial year, were as follows:—

1938	£140,626
1939	181,468
1940	144,719
1941	198,873
1942	633,568
1943	1,069,727
1944	1,169,084
1945	1,422,639
1946	1,819,328
1947	1,691,514

NUMBER OF SHAREHOLDERS

The original number of shareholders was small, but an ever-increasing number of investors was gradually attracted to invest part of their funds in your corporation. There was a period during which a number of shareholders sold their shares because they were under the impression that it would be impossible for your corporation to maintain its dividends. I am glad to be able to report, however, that the demand for the shares of your corporation has increased substantially again during recent years. As a matter of fact, during the last year alone, the number of registered shareholders in your corporation has increased by 72 per cent.

The shares of your corporation are, at the moment, dealt in on the Johannesburg Stock Exchange at 22s. 6d. per 5s. share, and they constitute one of the most attractive investment counters on the market, yielding as they do slightly under 6 per cent. on the present market price. This yield is based on the dividend at the rate of 25 per cent. per annum which your corporation has declared for each of the last three half years.

PURPOSE ACHIEVED

The information I have given to you today proves that your corporation has been able to achieve the purpose for which it was established, namely, to protect shareholders in every possible manner, and to obtain a better yield on their investments than they could obtain themselves. The inference to be drawn from the history of your corporation is that managed investment companies must remain a permanent and remunerative feature of our economy.

In conclusion, I wish to give you the assurance that your directors will continue with the present policy. I am confident that your corporation will go from strength to strength in association with the other companies in the Unit Securities group.

I am at present considering the advisability of a visit overseas, together with some of my colleagues on the boards of the associated companies, in order to lay the foundation for co-operation with oversea interests. I have every hope that such a visit will prove highly profitable to all the companies of our group.

I now propose "That the directors' report and accounts be adopted, and that all acts and undertakings done for and on behalf of the corporation by the directors be and are hereby confirmed," and I call upon Mr P. A. Leon to second this proposal.

MR P. A. LEON'S SPEECH

Mr P. A. Leon, in seconding the chairman's proposals, said: Mr Chairman, ladies and gentlemen,—Bear with me for a few minutes. It is quite some time since I have had the pleasure of being asked by you, Mr Chairman, to second one of your speeches. I have done so on previous occasions and I have always felt gratified at the honour accorded to me. I have, since the inception of this, the first managed company of our group, been a director and I therefore know and can speak of the success which has been achieved.

You have had many successes, Mr Fraay. You are chairman of eleven companies, all within the Unit Securities Group; quite something of a responsibility in itself; but this goes to show the confidence reposed in you by the public of South Africa. In addition to this, you have gathered around you a staff of senior personnel, and here I do not want to overlook the junior members of our staff, to whom I want to say "there is always plenty of room at the top." The loyalty to you, Mr Chairman, by the members of your staff has always been very apparent to us directors and it is something of which you should be, and I know are, extremely grateful and proud.

TRIBUTE TO THE BOARD

Then in addition to that you are fortunate in having further support from thirty-six directors of these companies of which you are chairman—men who I can describe as being among the finest business brains of South Africa. I, having worked with you during the last fourteen years—the years that it has taken you to build up the unit group of companies—know how much you value the co-operation, collaboration, assistance and advice which you receive from our colleagues.

Remember, Mr Fraay—or "R.K.," as we all affectionately call you—that these co-directors of yours do not give you their assistance and advice as a matter of duty. Frankly it is always a great pleasure to all of us to render you any assistance, or give you our counsel, or in fact do anything that we are able to do to relieve you in some small degree of your responsibility.

WORKING CAPITAL £1,000,000

Today you have reviewed the progress of the Nassau Investment Corporation from the time that it was formed in 1937 with a total paid up capital of £26,000 until today when the capital is £500,000, and what is more important and certainly very pleasing to us all is that the reserves of the company total a similar figure, that is, £500,000, giving us, now, a total working capital of £1,000,000. Not a bad achievement, especially when one's memory goes back to the days of 1937, when the capital was £26,000.

I was with you, Mr Fraay, when, as chairman of our group, you gave evidence before the commission appointed by the Government to make recommendations in regard to alterations in the company law, and I was gratified by the obvious importance which the members of that commission placed on what you had to say and to the suggestions and advice that you then offered.

The report and accounts were unanimously adopted.

The meeting was then followed by an extraordinary general meeting of shareholders, at which meeting proposals for the increase of the capital of the corporation, and for the adoption of new articles of association, were unanimously approved.

GENERAL MINING AND FINANCE CORPORATION, LIMITED

MARKET VALUES EXCEED BOOK FIGURES

MR C. S. McLEAN ON GOLD MINING CONDITIONS

The forty-eighth ordinary general meeting of the General Mining and Finance Corporation, Limited, was held in Johannesburg on the 29th ultimo.

In the absence of Sir George W. Albu, Bart. (chairman and managing director), Mr S. C. McLean presided and in the course of his speech said:

The profit for the year 1947 amounted to £385,345, which is £58,944 less than for the previous year. This decrease is largely accounted for by a reduction in the main source of our revenue, namely, dividends and interest on investments; and to profits from share dealings which were on a smaller scale than for 1946. Our revenue from other sources was well maintained. Dividends equivalent to 5s. per share in respect of the year have been maintained.

INVESTMENTS

Investments in stocks and shares, taken into the balance sheet at £3,094,961, show a decrease of £123,063 on last year's figures. On the other hand, land and building at £313,683 reflects an increase of £182,965 as compared with the previous year's figure of £130,718, due principally to the purchase of real estate in the Orange Free State.

Investments for which market quotations were available appear in the books at or under cost, but in no case above the market price at the close of the year. Unquoted securities have been entered in accordance with the conservative valuation made by the board at or below cost. The aggregate market value of stock and share investments greatly exceeds the value shown in the balance sheet.

He then dealt with the results of their own producing companies and with those in which they are substantially interested.

GOLD MINING INDUSTRY

Continuing, he said: Statistics produced in connection with the mining operations of the industry during the year under review unfortunately once again reveal further reductions in the tonnage milled, working revenue and working profit, while working costs indicate an increase of 1s. to 26s. 7d. per ton milled. This resulted in a decrease of over £1,500,000 in the distribution of dividends to shareholders.

Although operations were seriously affected by the strike of European miners which lasted for approximately seven weeks and which arose entirely from internal dissensions in the ranks of the Mine Workers Union, the major factors responsible for the depletion of profits were the continued increase in the high cost of production and shortages of labour and materials.

A MATTER OF GRAVE CONCERN

The requirements of secondary industries and of the non-producing mines on the Witwatersrand, the Far West Rand and in the Orange Free State aggravate the already serious shortage of European and native labour to the gold producers. This shortage —especially of native labour—is a matter of grave concern to the industry. The peak period of underground native labour in respect of the year 1942 as compared with that of this year indicates a present shortfall of approximately 21 per cent.

The shortages of materials, especially steel and cement, continue to restrict the development operations on both old and new mines alike.

DECLINE IN GOLD PRODUCTION

The continuation of the decline in gold production which last year represented a shortfall of 23 per cent. on the 1941 output, must be a matter for serious consideration.

Our gold forms the greatest proportion of our export trade and is the principal source of payment for raw materials and machinery, upon which our expanding mining activities, together with those of the country's secondary industries, are so dependent for their establishment and existence. Our internal economy is likewise dependent upon this precious metal and you will have seen that the gold reserves of this country have shown a marked decline recently. The necessity of maintaining the maximum output and also of prolonging the lives of existing mines will therefore be appreciated by all sections of our community.

The margin of payability on several mines on the Witwatersrand today is such that any small increase in working costs can only result in their premature closure and a loss to the country of many millions of tons of ore. Once again let me remind you that owing to the fixed price of its product, the industry is unable to pass on any increase in the costs of production to consumers.

TWO NEW FIELDS

The country is indeed fortunate in having two new goldfields in the process of development in the Far West Rand and in the Orange Free State. The discovery of this new goldfield in the Orange Free State with its vast potentialities as a contributor to the future economic development of this country must be recognised as an event of national importance. In these areas new mines are being opened up to replace those that are closing down on the Witwatersrand. To do this, however, takes both time and capital, and if the gold output of the country is to be maintained, the hiatus between the opening of the new and the closing of the old must be reduced to a minimum.

Financing of new mines, especially those in the Orange Free State, will require a vast amount of capital which can not be found from internal sources alone. Consequently it is essential that everything will be done, both here and abroad, to encourage the flow of capital from overseas to assist us to finance these important enterprises. In this connection the abolition of the non-resident shareholders' tax would be a welcome concession, as it must constitute a deterrent to overseas investors. I am confident that the fundamental importance of the gold mining industry to this country's economy cannot fail to be recognised, and I express the hope that further legislation will be enacted which will place gold mining on a basis comparable with that of other industries.

A report of the proceedings at this meeting will not be circulated to shareholders. Copies may be obtained on application to the head office in Johannesburg and to the London office.

The report was adopted.

VENEZUELAN OIL CONCESSIONS, LIMITED

INCREASED PROFIT

The thirty-second annual general meeting of the Venezuelan Oil Concessions, Limited, was held in London, on the 13th instant, Sir Andrew Agnew, C.B.E., the chairman, presiding.

The following is an extract from his statement, circulated with the report and accounts:—

The profit and loss account for 1947 shows a profit of £2,619,248, compared with £1,012,942 in 1946. Our gross income from oil sales has reached the large total of £35,603,679, being almost double the corresponding figure for 1946. Two main factors contribute to this increase, the first being that the company's production of crude oil exceeded the 1946 figure by some 22 per cent. and the second being the considerable increase in crude oil prices during the year.

I must draw your attention once again to the rising costs of production. Substantial new items of expenditure have been incurred, particularly in the way of social services and pensions. Labour costs in Venezuela are still climbing and material prices show an appreciable increase, even on the high levels of 1946. While the higher costs of production have been more than absorbed by our increased income, production cannot continue indefinitely to rise nor will prices remain indefinitely at the present high levels. On the other hand, operating costs, and in particular labour costs and the cost of social services, are less likely to re-act, even when the industry is faced with more difficult conditions.

The combined total of Venezuelan income tax and United Kingdom tax on profits comes to the large figure of £13,814,616. The United Kingdom tax provision depends on the amount of Venezuelan tax in that the latter is allowed as a charge in computing profits subject to the former.

RELATIONS WITH GOVERNMENT

The Venezuelan Government decided that some benefit from the situation must be reflected in the nation's revenue from oil and, after negotiation, the company agreed that for a period ending November 1, 1948, a somewhat higher price should be paid for Government royalty oil than would have been the case if this had been calculated in accordance with the formula normally employed. Under the exceptional conditions affecting the oil market, your directors are satisfied that such an arrangement is not unreasonable. All other large producing companies in Venezuela have concluded agreements on similar lines. The Venezuelan Government are considering new tax measures to secure an equalisation between the total tax payment to them and the net profits of the producer. I think it can fairly be claimed that the oil industry in Venezuela has accorded the Government an outstanding degree of co-operation. We are looking forward with confidence to continued good relations with the Government.

We have been equally active in our field operations. As regards the prospects for the current year, while the cost of our operations continues to rise, you will doubtless be aware that the larger proportion of last year's increase in crude oil prices only took effect in the latter part of 1947, and were thus only partially reflected in our last year's results. Moreover, the published figures of the volume of our production so far this year are some 27 per cent. higher than that of the corresponding period of last year and show that we have now achieved an average rate of 300,000 barrels daily. Accordingly, despite the prospect of increased payments to the Venezuelan Government and generally rising costs, we can look to the future with confidence.

The report was adopted.

Statistical Summary

GOVERNMENT RETURNS

For the 10 days ended July 10, 1948, total ordinary revenue was £87,018,000, against ordinary expenditure of £65,198,000 and issues to sinking funds £1,059,000. Thus, including sinking fund allocations of £3,443,493 the surplus accrued since April 1st is £199,405,002 against £230,978,528 for the corresponding period a year ago.

NIGERIA-GOVERNMENT STATISTICIAN

A vacancy exists for a Statistician to take charge of the newly established Statistical Department of the Government of Nigeria. Candidates should possess a first- or second-class Honours degree in Mathematics or Economics and Statistics, together with considerable practical experience of statistical work, and organising ability.

Salary, £1,200, plus £400 expatriation allowance. Higher salary would be considered in case of candidate having exceptional qualifications and/or experience. Age limit 45 (for pensionable terms). Apply to Director of Recruitment, Colonial Office, 15, Victoria Street, S.W.1.

BEDFORDSHIRE EDUCATION COMMITTEE

LUTON TECHNICAL COLLEGE.
Principal: T. HEAP, Ph.D., M.Sc., F.R.I.C.

Applications are invited for the post of full-time lecturer in the Commerce Department, duties to commence on September 1st next. Candidates should be graduates of a British University in Economics or Commerce, or hold comparable professional qualifications. Burnham Scale.

Full particulars and application form (stamped addressed envelope) may be obtained from the Principal, Technical College, Luton, Beds., by whom applications should be received within three weeks of the appearance of this advertisement.

T. S. LUCKING, M.A.,
Director of Education, Shire Hall, Bedford.

GERMAN desires agency or confidential job for British firms. Linguist English and French. High-class references. Previous experience with English firms. Communicate with Eugen Pfeiffer, Lippborg (Westphalia).

YOUNG GRADUATE (23), Honours Economics, ex-Royal Navy Officer, seeks interesting position at home or abroad, affording opportunity for exercise of initiative, drive and resource. Fluent German, French.—Box 758.

EXPERIENCED ECONOMIST, Oxford Degree, good contacts, 29, now financial journalist, seeks wider use for talents in City firm or industry.—Write Box 775.

PRESS AND THE NATION

Read how the Press serves the community, as told by Lord Camrose and other famous contributors in "THE PRESS—1898—1948," now on sale, price 2s. 6d., at all newsagents and booksellers or direct from the publishers: The Newspaper World, 154 Fleet Street, E.C.4.

ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

APPOINTMENTS REGISTER

Employers seeking the services of Certified Accountants are asked to write to the Secretary of the Association, 22, Bedford Square, London, W.C.1. (Telephone: Museum 5163.)

NORTH-WEST METROPOLITAN REGIONAL HOSPITAL BOARD

NATIONAL HEALTH SERVICE ACT, 1946

WINDSOR GROUP HOSPITAL MANAGEMENT COMMITTEE

Applications are invited for the following appointment from suitably qualified persons. The person appointed will be subject to the provisions of the National Health Service (Superannuation) Regulations, 1947, and transferable officers within the meaning of the Act may retain their existing salary and service conditions.

Applications, stating age, education, qualifications and full details of experience, with names and addresses of three referees should be forwarded to the Secretary, Windsor Group Hospital Management Committee, c/o King Edward VII Hospital, Windsor, within seven days of the appearance of this advertisement.

ACCOUNTANT: CANADIAN RED CROSS MEMORIAL HOSPITAL, Taplow, Maidenhead, Berks.

The person appointed will be responsible to the Finance Officer of the Group Management Committee and the House Committee of the Hospital for the accountancy of the Hospital. Candidates should be qualified accountants. Hospital experience is desirable. Salary will be at A.P.T. Grade VI (£505-£660 per annum). Commencing rate according to qualifications and previous hospital experience. Appointment is terminable by one month's notice on either side.

June 30, 1948.

BURSAR.—A college-trained and experienced BURSAR is required for St. Catharine's, Cumberland Lodge, The Great Park, Windsor. The Bursar will be responsible for the general domestic administration and catering. Salary: £400 p.a. resident.—Full particulars on application to Hon. Warden, St. Catharine's.

BRITISH MANUFACTURING costs must be reduced. Let us solve your tool and gauge problems—comprehensive layout undertaken for forging, milling, turning, grinding and press work operations. Write or call by appointment.—Hutton-Williams and Partners, 10, Cromwell Place, London, S.W.7. Tel.: Ken. 8059.

BUYERS.—Good opportunities for ambitious men are offered by a long-established firm of merchants for buyers in Liverpool office for overseas markets.

Applicants to be of good education with preferably a knowledge of French or other foreign language and to be between ages of 25-35.

Commencing salary according to qualifications but pay and prospects are good for the right men.

Details of age, education and experience to be stated on application, which will be treated as confidential.—Box 761.

INTELLIGENCE Officer, R.A.F. (33), Public School. University. Knowledge of Economics, Languages, World Affairs. Experienced in Accountancy Administration, Personnel Management, Lecturing, Interviews. Requires active post.—Write Box 763.

ROYAL BANK OF CANADA

DIVIDEND No. 244

Notice is hereby given that a DIVIDEND of 2½ per cent. being at the rate of 10 per cent per annum upon the paid-up Capital Stock of the Bank, has been DECLARED for the three months ending 31st August, 1948, and will be payable at the Bank and its Branches on and after 1st September, 1948, to shareholders of record 31st July, 1948.

By Order of the Board,
E. B. McINERNEY, London Manager.

6, Lothbury, London, E.C.2. July 14th, 1948.

Postal Tuition for **B.Sc. ECON.**

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees payable by instalments, if desired.

Prospectus from Dept. P17, WOLSEY HALL, OXFORD

A Bitter Choice

EVENTS in the last week have only served to underline the strength of the Russian position in Berlin. The Soviet rejection of the Allied Notes leaves the Western Powers, not the Russians, in a quandary over what to do next. The Russian offer to feed the Western sectors of Berlin in exchange for Eastern currency weakens the Allied accusation that it is Russia's aim to starve out 2½ million Germans. The Allies have been powerless to prevent the introduction of a few more minor but intensely irritating Soviet traffic controls. There are reports of railway lines to the Western Zones being taken up and removed. And Yaks are doing victory rolls over Gatow.

It is no use minimising the Russian advantage. It is a legacy of the settlements at Yalta and Potsdam which created in Berlin a small Allied enclave completely surrounded by Soviet-occupied territory and dependent upon Russian good will for all its communications, save those in the air. The vital point is to assess the implications of the Russian and Allied positions. Even the most optimistic will have to admit that the great "air-lift" cannot be maintained indefinitely on the present scale. Day by day, the Allies draw nearer to the end of the present uneasy stalemate. The essential impermanence of the effort to supply Berlin from the air is not simply a technical matter—the difficulty of bringing in sufficient supplies when November fogs and December snows make flying difficult. It is rooted in the fact that it is not enough for the population of Berlin simply to eat. They must work as well, and in the long run they cannot do so if coal and raw materials as well as food have to be brought in by air. At some point, therefore, the air-lift will cease to be enough to hold the position.

When that time comes, the Western Allies will be faced with three possibilities: to reach a compromise agreement with the Russians; to impose their own solution, if necessary by force; or to withdraw from Berlin. Perhaps the best illustration of Russia's present tactical advantage is the fact that, of these three possible courses, the path of compromise is open to the West only if the Russians choose to take it. The Western Allies can propose a raising of the blockade in return for this or that concession—the use of Eastern currency in Berlin, the revival of reparations—but if the Russians do not decide to accept a compromise, the Western Powers will still be exactly where they were before—blockaded in Berlin.

The area of their own free choice is restricted to the two remaining possibilities—a solution to their taste imposed, if necessary, by force or a withdrawal. Perhaps the most urgent need of the moment is that everybody should realise this fact. Stalin may not push the matter to the bitter end—but it is his choice. If he wishes, he can force the West to choose between the two stark alternatives. Moreover, he can do so by mere passive inaction. And since he can easily force this bitter choice upon the Western Powers, it is vital that they should be in no doubt about the consequences of either policy.

If the course of force is to be chosen, the important factor is not so much the details of the solution that the Western Allies intend to impose

as their readiness to go to war to enforce it. The ultimatum might simply cover Berlin and take the form of a demand to the Russians to raise the blockade within a specified time. But if there is to be an ultimatum, it could reasonably go further and confront the Russians with the Allied view on Germany's future as a whole—in which case it would presumably cover both the raising of the siege by the Russians and their presence at a conference table to discuss a settlement based on an Allied agenda. But the important factor would be the backing of the ultimatum by force. There should be no illusions on this point. The arrival of 60 Super-Fortresses in Britain on a "routine training mission" does not constitute a threat of force. The Allies can bring home to the Russians the seriousness of their intention to make war only if they themselves are in fact serious. They cannot expect to frighten Stalin unless they are willing to go far enough to terrify their own publics. In other words, an ultimatum backed by the threat of force demands mobilisation in Western Europe and the United States, the concentration of aircraft and armour in Western Germany, preparations for civil defence and at least the first steps towards a war economy. Bluff will not work. Either the Allies must intend war seriously or their ultimatum will have no more force than last week's Note.

There are many sober people who openly advocate this course. They are driven by the conviction that Communist aggression against Western democracy will not be halted by anything short of the ultimate firmness. Sooner or later, there will have to be a threat to fight, and the threat is much more likely to be effective now than later. Morally, it is not easy to stand and fight at the end of a long series of retreats—and even more difficult to convince the adversary that you are at last in earnest if you have always given way before. Materially, it is highly probable that the Americans still have the monopoly of the atomic bomb. By far the surest way to avoid a shooting war, it is argued, is to win the war of nerves by not being the first to flinch.

It is a courageous argument. Its risks are obvious—and perhaps rather greater than is obvious. For one thing, it is possible that the Russians are not bluffing. The war might start, after all. And if it did, it might not be either quickly or easily won. Too much reliance can easily be put in the atomic bomb. Russia is a vast country, not easy to knock out with a few well-placed bombs, as is Japan—or Great Britain. Supremacy in the air, even with the atom bomb, might not sufficiently outweigh the great Russian superiority in ground forces to prevent a Russian advance to, or even across, the Rhine. The struggle to liberate occupied peoples might have to be long, and might well be pointless, so little would be left of Western civilisation. Perhaps the only way to exorcise this nightmare is to face it without flinching. But it cannot be written off as a minor risk.

Nor is it the only risk involved in the firm policy. If the quarrel over Berlin is to be resolved by force, the responsibility for firing the first shot may lie with the West. This is one more illustration of the tactical strength of the Russian position. They can get what they want by doing nothing. To break out of the ring, to impose their will, to confront the Russians with the risk of war, the Western Powers would have to begin the shooting, to make the offensive troop movements, to say the word that would begin the carnage. Can a democratic society ever do that? Attacked, it will fight and win. But could it ever cold-bloodedly start an atomic war, no matter in how just a cause? Yet to enter on the firm course and falter at the last moment would be fatal.

Re... and oracle
sale, pur...
the publis...

If the immediate risks of the firm course are enormous, the risks of the alternative are no smaller. The consequences of withdrawal are hard to assess, for the reason that they lie in the minds of men. Europe is involved in a struggle of which millions are engaged on either side. France is as much involved as Marshal Tito's chief of staff and all these millions have the same calculation to make—whether they dare back Russia or the Western Powers. What would be the effect on all these anxious calculations of a severe diplomatic defeat for the Western Powers? Would the move be branded as a new Munich? Would that essential but intangible thing—the will to resist—be broken not only in Western Europe but among the thousands in the East who are not reconciled to Soviet *Gleichschaltung*?

It can be said, of course, that an Allied withdrawal from Berlin would not be the equivalent of a Munich. At Munich, an essential strategic advantage was thrown away—the Czech Maginot Line and the gateway to the German rear. No such sacrifice is involved in Berlin. Provided the Western Allies coupled their retreat from the exposed and untenable Berlin enclave with strenuous measures to reinforce and reinsure their frontier along the Iron Curtain, it could be argued that their position would be stronger, not weaker. If a limited withdrawal from Berlin were to coincide with the coming into force of a fully implemented Western Defence Pact, signed not only by the Western Union Powers but by the United States and the British Commonwealth, and guaranteeing the whole of Western Europe against Soviet attack, it might be the means of securing what is otherwise still only a dream. To straighten the line in Germany would give greater strategic strength—provided the essential element of confidence were not too badly shattered. For even though every Berliner who has compromised himself against the Communists could be brought out and given asylum in the West, it would still look like a betrayal, and a supreme effort would be needed to persuade the West that this was the last retreat.

*

It is, then, a very bitter choice that the Western peoples may have to make. It is not the purpose of this article to say what the choice should be. Frankly, we do not know. The Western countries have blundered into this crisis and are only just beginning to realise the intensity of the dilemma with which they are faced. They have every right to be furiously angry with the so-called leaders who put them there. But anger will not get them out. Only hard thought and high courage will do that. And it is fortunate that the air lift gives them time to think.

One thing, however, can be said at once. Neither course will work without vastly more unity and decisiveness among the Western Powers. If they are going to fight, they must have a combined strategy and a uniform will. If they are going to withdraw, they can hope to avoid a collapse of their whole policy only by a really convincing display of solidarity and purpose. Yet what do we see? We see the Foreign Ministers of Western Europe, in conference at The Hague, conducting one set of discussions on the questions of Germany while General Clay flies off to Washington to conduct another. We hear Mr Marshall talking of negotiation, while the War Department is for standing firm and remaining in Berlin at all costs. Nor is it only on Germany that there is lack of unity and of clear leadership. The wider outlook for general political stability in the Western world is equally confused and uncertain. We see the French Government falling and the American public concentrating its attention on the electoral struggle. We see Mr. Bevin damning with the faintest of praises M. Bidault's attempts to make some progress towards Western Union. It is not in this confusion of purpose and counsel that decisions can emerge clear, vigorous and convincing enough to save the cause of Western democracy.

The choice may not have to be taken at Berlin for several months yet. There is time for it to be very carefully considered. But what is urgent is that all the governments and all the peoples of the West should stop playing politics and treat a very serious situation very seriously.

The New Territorials

IN the autumn the Government will launch a campaign to attract recruits into the Territorial Army. The public has not yet understood the radical change in the functions and form of the Territorial Army that is taking place, although on such an understanding the success of the campaign depends. In the past, the Territorial Army was designed to take the field in war as a second line of defence and was reckoned to have six months in which to make ready. Now it is to be part of one national army always ready for action. In fact, neither in 1914 nor in 1939 was the Territorial Army given such a breathing space, for its best units sailed overseas within two months of general mobilisation. What was to have been a second line of defence became an integral part of the first, because the Regular Army was too small to function alone.

The lesson has now been learnt and the decision to retain conscription in peace time has brought a transformation. The original conception of two armies—the small, regular long-service Army to provide an expeditionary force and to hold the line in the opening stages of a war, backed by a Territorial Army to be trained and expanded during war—has given place to the idea of one efficient National Army. This is to be composed of three parts: a Regular cadre; a National Service element; a Territorial Army. To this end the Territorial Army, which had been allowed to die in 1945, was re-formed in May, 1947. Various new factors have had to be taken into account in planning the National Army; the withdrawal from India and the loss of the Indian Army; the introduction of National Service, carrying with it liability for six years' service as a reservist in the Territorial Army; the need for instant preparedness against methods of attack by air, which are likely to give little time for the building-up, training and despatch of the main land forces.

Certain basic principles have had to be observed by the architects of the National Army. Its foundations must be built on the high technical quality of training in the Regular Army and its improvement in the Territorial Army; on the provision of elaborate air defence for Great Britain; on a reserve of trained and disciplined men built up by instructing the largest possible number of National Servicemen; on the availability of a small, efficient and properly equipped regular force ready in peacetime to proceed overseas at short notice; and on forces which can be sent overseas on mobilisation, ahead of the main part of the National Army, without destroying the machinery for expansion of the main land forces. To fulfil these principles, all three parts of the National Army are equally important. The Regular soldier will man garrisons and communication centres abroad and provide the leadership for the Colonial forces. He will provide the cadres for the tactical and technical training of National Servicemen and Territorials. The National Serviceman will provide much of the overseas forces of occupation and contribute the bulk of the trained Territorial Army.

Clearly neither the Regular soldiers nor the annual batch of National Servicemen, during their period of colour service, can by themselves provide more than a fraction of the forces required for national, imperial and European defence. Forces on the scale needed can only be provided from a reserve on a part-time, or territorial, basis. For, on the outbreak of war, the Territorial Army must be ready to man immediately the greater part of the country's anti-aircraft defences and to provide the reinforcements in those arms required at ports and airfields overseas. It must also have a field force, properly balanced and complete with all modern technical units. It must be ready to help in civil defence at home.

These tasks and responsibilities are great; if they are not to remain mere definitions on paper, much has quickly to be done to master them. The material is to hand; just as the functions of the Territorial Army have developed, so have the types of men available. Many of those officers, warrant officers and senior non-commissioned officers who have already enlisted are men of outstanding quality, with recent wartime experience. It will always be necessary to have this element of enthusiastic volunteers to supplement the leaders and instructors who can be spared from the small Regular Army. That instruction and leadership should be of high quality is essential, because entrants into the Territorial Army will in future be men with one year of National Service behind them, not raw recruits scarcely knowing one end of a gun from the other. They must be turned in their sparetime from semi-trained into fully-trained soldiers, for whom the Army is a part-time career. It is not enough to look upon the six years in the Territorial Army as a "refresher," or even a "finishing" course.

*

The task of training that faces the Territorial Army of the future may be judged from an analysis of how little can be achieved in the National Serviceman's first year of training with the Regular forces. First, he goes through a course of basic training, during which he learns the elements of all soldiering. He must learn to march; he must be made hardy and tough, and able to look after himself. He must know how to use rifle, Sten gun and mortar, under battle conditions. In some cases his whole elementary education needs revision. At the end of his basic training he can choose which branch of the Army he wishes to enter, and the aim is to put him into an arm or unit which has a Territorial counterpart in his home town. If he chooses the infantry, he will serve 38 weeks with an infantry battalion in the British Army of the Rhine, during which he will do platoon training, company training and battalion exercises with supporting arms. Outstanding men may attend courses in one of the Guards leader-training battalions or go before a War Office Selection Board and, if they pass, be sent to an Officer Cadet Training Unit. A National Serviceman who is posted to one of the technical arms (for example, a signaller) will, when basic training is finished, be sent to BAOR and straight into a signalling job, thus becoming part of the army right away. The anti-aircraft man will probably spend the whole of his year in the United Kingdom, and the tradition of AA batteries in the last war has probably left training in this arm better than in any other.

So far, so good, but the Regular Army has yet fully to appreciate that this one year of colour service for the National Serviceman will be useless unless it is treated as part of a seven year course. The all too short year has to be made a period of interest, endeavour and enjoyment, if ex-conscripts are to emerge as keen young soldiers on the ladder to promotion. And the prospect ahead must be not a minimum number of drills and wearisome compulsion, but a chance of treating the Territorial Army as a worth-while part-time career.

Good officers and NCOs are essential for a good army; it is therefore vital that potential leaders should be picked out during their year of National Service at 18 and specially prepared for the role of leadership in the six years which follow. At present the selections of the War Office Selection Boards represent only a small proportion of the officers required to man the Territorial Army. Too many intelligent and highly educated boys are being allowed to earn stripes during their National Service year by joining the Army Education Corps or by becoming clerks; this ensures that they will reach the Terri-

torial Army with no experience as non-commissioned infantry officers and in a mood of boredom and impatience. A year of intensive and imaginative training, with the firm hope of promotion in a specialist arm, should turn out a sufficient number of National Servicemen ready to fulfil their Territorial duties with zeal and pride. That training is still to be organised.

Even then much will depend on the attitude of the people around the National Servicemen and the new Territorials. The general public will have to consider what is to be their attitude to the men performing their six years of part-time service in drill halls and summer camps. Is it to be hospitable, helpful and sympathetic as during the war? Leaders of the educational, athletic, technical and cultural life of the country will have to consider how they can contribute to the amenities the National Serviceman will need. At every turn he will have claims on the national resources. The new Territorial Army will need training areas, accommodation, equipment, generous allocations of money for pay and training, and more to eat—all on a scale unknown before the war. Accommodation so far is scarce and costly. Scattered sparsely about the country are the training centres of the Territorial Army—drill halls, huts, sheds, prisoner-of-war camps—even pigsties and morgues. Shortage of transport makes attendance at the more dispersed training centres extremely difficult. There will have to be full co-operation by local authorities and brilliant improvisation by local associations if the difficulties are to be overcome.

Then there is the old prewar problem of deficient equipment, one of the main causes of slow recruitment and inadequate training. It is time that the Territorial organisers had assurances from the War Office on this score. The same is true of pay. Each unit has to have some full-time civilian employees, such as clerks, store-men, instructors, technical mechanics, limber-gunners. Their present rates of pay compare unfavourably with civilian rates and will not attract experienced men. The training and employment of women for some of these jobs is an obvious but only partial solution.

There is the old and vexed question of grants. The commanding officer of a unit has a training grant out of which he pays his officers and men for all week-end camps and any courses which they may attend. The demands on this grant are especially heavy among rural units, for whom it is more convenient to do most training at week-end camps, which are encouraged by the War Office. Training grants this year are so small that they only allow to a unit one assembly of approximately 120 officers and men. It seems wrong that a unit which has made a promising beginning in its first year should be hamstrung by financial need at a time when the War Office is planning to spend money on a nation-wide recruiting drive.

To ensure that the Territorial Army gets off to a good start there is an immense amount to be done. There are less than eighteen months in which to do it, as the first National Servicemen will reach the Territorial Army on January 1, 1950. Important as the planned recruiting drive may be, it is certainly not more important than the preparations needed for receiving these thousands of young men. The experience of many intelligent National Servicemen is that their present training is not preparing them for the six years' further training as reservists. The impression of many experienced men in the Territorial Associations is that they will fare badly in the scramble for accommodation, money and facilities against national health, education, civil defence and other authorities. Most employers have not begun to understand what the new Territorial system may demand of them in the way of extra holidays, time off and other concessions. In fact, there is an immense amount to be done by public discussion, both national and local, to establish the claims of the new Territorials among the priorities which are regulated from Whitehall. If the National Army is to be efficient and command the loyalty and enthusiasm of its conscript officers and men, then it has to be fitted into national and local life with the greatest care and imagination. The process should be begun now.

Musicians' Strike

A STRIKE which threatens to reduce the nation's broadcasting by nearly fifty per cent clearly involves in a most direct fashion the public interest. But the issue between the BBC and the Musicians' Union is one on which in the past little information has been available and the public is left wondering whether to regard the BBC as a stony-hearted, blood-sucking public corporation "without soul to save or bottom to kick" or whether to believe that the Musicians Union in this country is now determined to follow the lead given by American musical unionism—led by the notorious Mr Petrillo—and virtually to deprive the British public of music altogether.

The immediate cause of the strike is a wages dispute. Broadly speaking, the musicians ask that the existing minimum rate for "casual" studio broadcasts should be raised from £2 to £2 10s. The BBC has refused this request on the grounds that, for the first time, the BBC would be expected to pay a higher minimum wage than is demanded of outside concert organisers. The Governors are not prepared to vary BBC minimum wages from those prevailing in the country generally and deadlock has been reached. The union has told its musicians not to broadcast after August 1st and even though orchestras employed on a full-time basis by the BBC are not affected, they may be withdrawn later. (The Musicians' Union covers 99 per cent of the orchestral and band players in the country.)

The immediate cause of the strike is not, however, the only point at issue between the BBC and the Musicians Union. The disagreement can be considered under two heads—wage disputes and disputes over the use of the mechanical reproduction of music. The differences on wages cover a number of minor points, but the two chief issues are the minimum wage rates, discussed above, and the question of payment for the relaying of outside broadcasts. In the past, the BBC has frequently put a microphone into a concert or an opera or a musical comedy which was being given under other auspices. The broadcast thus laid no extra burden on the musicians and involved no effort they would not have made in any case. For years the BBC paid each musician 12s. 6d. as a "relay fee" in return for the right to reproduce the concert—or play or opera—in which he played. After the war, however, the union demanded that the relay fee should be equivalent to the sum the player would have received, had he broadcast from a studio at the BBC's special invitation. The BBC then offered to double the relay fee, but the Union turned the offer down. The result is that since the beginning of the year, listeners have been deprived of almost all outside broadcasting of music. The effect on the broadcasting of opera has been particularly disastrous.

Wage disputes are probably of less interest to the general public than the other point at issue—the question of the technical reproduction of music over the radio. This point covers both the EBC's own recordings, made in its own studios, and the use of commercial gramophone records. The Musicians' Union are utterly opposed to music being relayed by anything except a live orchestra. They regard any mechanical reproduction as a method of depriving musicians of work they would otherwise have obtained, and they have now succeeded in reducing drastically the amount of recorded music broadcast. No BBC programme may be recorded and repeated if it contains more than twenty minutes of orchestral playing—with the incidental result that programmes such as the Promenade Concerts cannot be repeated on another wavelength—and the union has reached an agreement with the gramophone companies whereby the number of hours during which the BBC may broadcast gramophone records falls each year, to reach in the not too distant future the very small figure of ten hours a week on all programmes combined. Such restrictions limit absolutely the amount of music broadcast and do so with special effectiveness when, as is the case today, insufficient studio space is available for "live" broadcasting.

These, then, are the main points at issue—two wage disputes and two questions of mechanical reproduction. There are others, but if these chief points could be solved, the relations between the BBC and the Musicians' Union would be on a sounder basis than they have been for some time past.

★

The chances of a settlement are, however, prejudiced by the character of the two parties to the dispute. The Musicians' Union has been in existence since 1893, but it is only in the last twenty years that it has succeeded in organising the whole of the profession. This fact is important, for it helps to explain much in the attitude of the union to the two questions of wages and of the mechanical reproduction of music. Before the union became a strong bargaining body, the musical profession was undoubtedly underpaid, preyed on by employers and exposed to every sort of exploitation. Organisation has brought it great and entirely justified advantages and the loyalty of the ordinary musician to the union is considerable. At the same time, the growth of the union's real powers has coincided with the extension of mechanical musical transmission, of which the chief example is the sudden coming of the talkies which, coinciding with the onslaught of the great depression, threw thousands of musicians out of work. This memory of disaster is quite sufficient to explain the union's profound distrust of mechanical music. The belief that it deprives musicians of employment is not a myth. It is a fact of painful experience. The underlying attitude of the union is thus far from unreasonable. The question is, however, whether the union is responsible, reasonable and flexible enough to abandon these attitudes when they are no longer justified.

Unfortunately, this is not the case. There are three reasons why the union is proving an unreasonable negotiator. The first is that it recognises no wider function or responsibility than that of securing higher wages. The interests of the public, the need to increase the output of music, artistic responsibilities—these are not for one moment taken into account. The sole reason why the BBC is being asked for a higher minimum wage than the minima required from commercial companies is that commercial concerts could not now be organised if wages were higher. The economic limit has been reached. The union regards the BBC as having no economic limit. The fact that one tenth of its annual income is already spent on the musicians means little. The possibility that the BBC may need to protect the licence holders' money means even less.

The second difficulty is that the Musicians' Union—unlike the old medieval guilds such as the Master Singers—cares nothing for standards. As one distinguished musician put it ruefully "To be in the union you no longer have to be able to play the clarinet. You only need to know how to hold it." This disregard for professional capacity closely affects the union's attitude towards mechanical music. Since it takes no account of standards, it argues that a bad concert broadcast "live" is better than a good concert broadcast on records and that mechanical music robs musicians of work so long as there are any unemployed musicians on the union's books—irrespective of whether they can play with the required skill. There is thus no objective artistic standard to which negotiators can appeal.

Negotiation is also handicapped by the lack of central authority in the union itself. The General Secretary is very much the servant of the Executive Committee, composed of branch representatives from all over the country who tend to vary from year to year. This fact, coupled with the Communist tendencies of some of the most influential members, has led to a fluctuating and often irresponsible leadership.

There are also difficulties and obstacles to be overcome on the side of the BBC. The Corporation had to fight to establish itself and many of its officers still see life as a battleground with musicians, authors and dramatists as the recalcitrant foe. It should be said that the result has not been any lack of generosity. On the contrary, the rates paid by the BBC to its regular orchestras are probably the highest in the world outside the United States (the minimum wages paid for casual broadcasting are not representative since any performer of standing is in fact paid a higher rate). Something like £1,000,000 has been paid over to the musicians in the last year and the employment of musicians on "live" broadcasting has doubled since 1939. None of these facts appears to weigh with the union, but they add up to a case sufficient to discount any idea of the BBC as a skinflint employer or as a user of mechanical music to the detriment of living musicians. What is true, however, is that its mood in negotiating is not always fortunate. As one musician put it, "the BBC can give concessions as though it were a slap in the face." Relations have been olympian and remote and on some issues the BBC has not

moved with sufficient speed. For instance, since the 12s. 6d. rate for relaying can, in the BBC's view, at once be doubled, the union is not entirely unjustified in claiming that it has been too low for years past. Moods and manners can be decisive in negotiation and the BBC may not always have seemed the good employer which on its actual record it deserves to be thought.

Given these difficulties and misunderstandings on both sides, what can be said of the immediate issue—the strike which may begin on August 1st and the controversies which form its background? The first point is that the BBC can hardly be expected to give way. The musicians' demands could add another quarter of a million to the budget at once and would open the way to further demands. Moreover, concessions on this single wage issue would be particularly unwise in view of the completely negative attitude of the union on all questions of mechanical reproduction. But to say that the BBC should stand firm is not to say that the community can remain unmoved while some of its chief sources of entertainment are cut off. Since direct negotiations have failed, there is a strong case for taking the whole field of relations between the BBC and the Musicians' Union to arbitration, for what is needed is not this or that increase in wages but a *modus vivendi* between two bodies in whose peaceful co-operation the public is vitally interested. A comprehensive settlement might well include increases of pay for certain skilled categories of musician and this in itself might be an encouragement to higher professional standards among musicians. A new agreement on mechanical musical reproduction might also be based on the premise that the public must get as much music as possible and that the BBC should be empowered to satisfy this demand to the fullest degree, by both "live" and mechanical broadcasting, provided mechanical reproduction does not exceed a certain proportion of the live transmissions. A joint consultative committee might be set up to discuss matters of mutual concern and to ensure that the two bodies do not only meet when a dispute is pending. But all these possibilities, desirable in themselves, will be hard to realise unless the Musicians' Union can acquire some sense of responsibility both to the public which it serves and to the artists whose professional standards it should seek to raise. The application of restrictive trade unionism has disastrous consequences throughout the national life, but it is hard to imagine anywhere where its effects are more noxious and deadening than in the sphere of the creative arts.

Across the Iron Curtain

JUST a year ago the governments of eastern Europe came to heel at Mr Molotov's whistle, turned their backs on the offer of Marshall aid then being made in Paris and moved towards Moscow to see what might be got there instead. They have been looking over their shoulders ever since, not because the Soviet Government has been notably dilatory or hard-fisted in assisting their economic plans, but because they are ambitious and in a hurry. In ten years' time maybe, the Russians will have machinery and tools to spare for their neighbours; but only western countries like the United States, Britain and Switzerland can deliver now or in the immediate future the raw materials and equipment with which Czechs, Poles and their neighbours might fulfil the plans of reconstruction to which their governments are committed. Through trade delegations, through cautious public statements, through the Economic Commission for Europe at Geneva, through diplomatic channels come appeals to the West to help—with credits and with trade.

To such appeals the West is not nearly so indifferent as it would like to appear. The men planning the revival of West German industry ask for nothing better than to resume the prewar exchanges of its products for eastern food, which might lighten the tremendous obligation to earn dollars which will fall on German trade when the European Recovery Programme ends in 1951. British programmes for housing, livestock production, and bacon rationing could be made to depend increasingly on timber and food production in eastern Europe. More than one western country wants Polish coal, and even the United States would be glad of Balkan contributions to its stockpiling of ores and metals. In spite of the split across Europe, in spite of the political tensions of the last six months, the old pattern of trading relationships between East and West struggles to reassert itself. And the men who are to begin shortly in Paris the long-term planning of Western recovery with American aid will soon have to decide two things: how much of the pattern can, in fact, be restored, and how much of it they—and the East European Governments—want to restore. They have to start from the fact that a renewal of east-west trade within Europe was one of the central assumptions of the original Marshall Plan, and that even the later Harriman Report staked great hopes on increased European food production, in which the East would play the principal role.

That the whole prewar pattern will not be restored in the predictable future is as certain as anything can be. Eastern Europe has new hopes and ambitions, fired not only by Russian and Communist encouragement, but by a widespread fear of German revival and determination never to return to the dependence on the German market which grew up in the 'thirties. How far these ambitions and hopes can take the seven states situated between Germany and Russia it is still hard to judge. But the main trends are already appearing, and one of the most important of them stands out clearly from the series of articles on food production in eastern Europe which is concluded in this week's issue (p. 148). The writer of these articles visited all the Communist-governed countries except Rumania and Albania, and everywhere he found the same leading aim: to industrialise, to raise standards of living, to bring the best administrative and technical brains into the towns, to work away from growing cheap primary foodstuffs towards the processing of more expensive farm products and the sowing of industrial crops.

This aim comes out clearly in the various national plans. In every case the targets for industrial production, capital equipment, development of power and urban building are higher than those for sowing, breeding, equipment and mechanisation in the countryside. In fact, it is difficult to avoid the conclusion that the East European governments may postpone for some years—if not indefinitely—any special effort to produce important grain surpluses for export. It is bound to come as a shock to those who have counted on those surpluses to reduce Western Europe's dollar expenditure and have been thinking in terms of the position in 1938, when fifty per cent or more of the exports of every east European country (except Czechoslovakia and Austria) consisted of agricultural produce and only twenty per cent or less of manufactured goods and machinery. It is true, of course, that efforts will be made to improve yields per acre; but on present plans such improvements will take second or third place to what is planned for the towns and the factories.

Here then is a factor to be weighed and judged by the West European planners in Paris. Is Eastern Europe likely to disappear, permanently or temporarily, as an important producer of food for the West? Are the present trends in this direction reversible or open to modification? If so, by what means

could the Western Governments make it worth while for the Eastern Governments to take a European view of their agricultural policies? These are questions which ERP delegates and their Foreign Ministers should tackle without delay.

There is another trend visible in the economic development of Eastern Europe which makes such action desirable. The Russians have developed their economic relations with the seven satellite countries on an unprecedented scale. Occupation in the closing stages of the war, the role of Communist Parties in the new regimes, the organisation of reparations from Hungary, Rumania and Bulgaria—all provided opportunities for the Soviet Government to influence the framing of national policies. In the last year, the progress of ERP in the West has made it politic to offer some comparable benefits from Moscow. The result has been a marked expansion in Russian trade with the satellites, which before the war was insignificant.

Lately, the expansion of trade with the West has caught up with this movement and Russia's share in Eastern Europe's growing exports and imports has been decreasing. But in 1946—the year when most of the present national economic plans were being drawn up—Hungary was taking 49 per cent, Poland 63 per cent and Bulgaria 81 per cent of its imports from the Soviet Union; the proportion of exports going to the Soviet Union was for Hungary 45 per cent, for Poland 50 per cent, and for Bulgaria 64 per cent. And this eastward trend has been strengthened by a series of short-term bilateral trade agreements between Russia's neighbours. The result in 1947 was that last year Bulgaria sent 87 per cent, Czechoslovakia 18 per cent, Poland 40 per cent and Rumania 90 per cent of all exports to Russia and satellite neighbours.

Some features of what would seem at first sight to be a movement towards autarky within a Russian-controlled Eastern sphere can, in fact, be explained by the special circumstances of the postwar years. In 1945 the German buyer and provider had disappeared and there was no one to take his place. Russia could fill the gap only to a very limited degree. Trade and production could be revived only by strenuous regional efforts culminating in a network of bilateral pacts. There was no currency available for multilateral trade. Reconstruction needs and the aspirations of the populations made improvisation inevitable.

*

In short, many of the present economic trends in Eastern Europe can still be explained without assuming that there yet exists a master plan to make the whole area subservient to the long-term needs of the Soviet Union. On the contrary, evident though it is that the plans of Prague, Warsaw, Belgrade and Budapest are being roughly coordinated in certain respects, it seems likely that Russian long-term intentions are not yet fixed. Trade by the satellites with the West—notably by Czechoslovakia—is encouraged as the only means of bringing eastwards the desperately needed machinery and raw materials for industrialisation. The picture is of the Soviet Union and its neighbours intent on getting as smoothly as possible through the next five years, leaving the permanent shape of east-west trade relations to be worked out later.

The weakness of Eastern Europe in the present stage is only too apparent. It is buying from the West much more than it can sell. Together with the Soviet Union, it is sending about $700,000,000 worth of exports westward against $1,250,000,000 worth of imports. To meet that deficit it needs to export greater food and mineral surpluses. But to devote the necessary manpower, capital, transport and machinery to producing those surpluses would mean reversing the priorities laid down in the national plans. The resulting dilemma is a baffling one: without imports from the West—no industrialisation; without surpluses of food and raw materials for export—no imports from the West.

There are some who argue that this dilemma is a weakness in the Russian position which should be exploited for political purposes. They regard all machinery and manufactured goods sent behind the Iron Curtain as increasing the military strength of the Eastern bloc. They urge Western Governments to put the screw on these countries and let them see all what they lost by not joining the Marshall Plan. The argument is dangerous; if such a policy were tried, the Communist Governments of the East—Russia included—have the power and the will to face the consequences and make their populations accept them. National plans would not be abandoned but stuck to with grim obstinacy. There might be a real effort towards the regional autarky which it is in the interest of the Western Powers to prevent.

*

There are cogent reasons for arguing that the strong economic cards held by the West should be played in a more patient and long-sighted way. But they cannot be so played until there is an attempt to plan a West European policy for trade with the Eastern group. Each group has now the machinery for joint planning and consultation, more advanced in the West than in the East. Each needs the help of the other in its production and import programmes for the next four years. OEEC in Paris needs detailed assurances about East European food and raw material supplies; the Eastern delegates at ECE in Geneva want detailed assurances about the West European machinery, fertilisers, chemicals, raw material that will be available. This being so, is it out of the question that the planners of ERP should invite the planners of Eastern Europe to confer on matters of common interest? Why should not a delegation from the Sixteen in Paris ascertain from Eastern Europe what food will be on offer between now and 1952, and discuss the possibility of long-term contracts and purchases between the ERP countries as a group and the Eastern countries as a group? And why should not delegations from Eastern Europe ascertain from OEEC what surpluses in capital equipment, steel, oil, chemicals, cotton and wool might be made available against the promise of food supplies?

Politically, as well as economically, such a method of working offers obvious advantages. No Western Power—not even America or Britain—can hope alone to influence internal economic policies in eastern Europe by negotiation with each individual capital. The Sixteen Western governments working together could. If there is to be any serious attempt to restore what was good in the prewar economic pattern of Europe and to find good substitutes for what was bad, it can hardly be done under a system which makes the allocation of American food deliveries and raw materials the business of sixteen governments working in council, and the allocation of East European deliveries a matter for individual governments competing against each other through dozens of short-term barter arrangements.

If no such concerted approach to Eastern Europe is undertaken, the trends which have been described may harden into fixed policies harmful to the economy of all Europe. If the trend of agricultural policy is to be away from large food exports, then one of the main assumptions of ERP will have to be re-cast—and that is surely urgent business for OEEC. If the trend of economic policy generally is to be towards closer association with Russia—perhaps eventually towards virtual self-sufficiency—then the problem of making Western Europe (and above all, Germany) independent of dollar aid would be immeasurably increased. Both the political and the economic situation in Eastern Europe now offer opportunities for imaginative and long-sighted statesmanship by America, Britain and their associates in ERP.

NOTES OF THE WEEK

Western Union Marks Time

No conference should be judged by the communique put out at its conclusion, but it must be admitted that the note issued after the Five Power Conference at The Hague was more than usually disappointing. Of the five points covered, two were the great bromides of international conference—the Five Nations' determination to defend their independence and to work together within the framework of the United Nations; a third simply mentioned the fact that they had reviewed the work of the permanent commissions set up under the Western Union Pact, and a fourth referred to their determination to carry economic and financial co-operation further. One point only left the field of generalities. The Foreign Ministers announced that their attitude was "completely at one" on a number of current problems, "including Germany."

If there were no more to be said of the conference than that its communique is, even for routine communiques, remarkably barren, its results would not necessarily lead to disappointment and alarm. More light has, however, been thrown on the real content of the discussions by M. Bidault's attempts to compel his fellow Foreign Ministers to advance more rapidly and more courageously along the path of Western Union. M. Bidault brought to their attention proposals some of which had been advocated at the unofficial Hague Conference on European federation. He asked them to consider whether they might not support the establishment of a federal parliament for Europe and create a sub-committee of the five Western Union Powers to work within the Organisation for European Economic Co-operation at Paris, in order to bring about an economic and customs union as a kernel of later European union.

One cannot blame the other Foreign Ministers for approaching cautiously the question of summoning federal parliaments. What seems inexcusable is their almost completely negative reaction to M. Bidault's second proposal which, if there is any meaning at all in the often proclaimed ideal of closer economic integration, is eminently sensible. European economic co-operation has hardly left its swaddling clothes. If any of the advances to which the five nations subscribe are to be secured, joint action within OEEC is obviously the most hopeful way of setting to work. Mr Bevin's cold reception is particularly hard to defend. Does he or does he not take seriously his own support for the idea of Western Union? Hitherto it has been possible to attribute the uncertainty in the British reaction to confused thinking. The rebuff to M. Bidault suggests that the sincerity as well as the clarity of British policy is open to doubt.

* * *

France in Search of a Government

President Auriol has declared that the authority of the Republican State must be restored and that a "limited and concrete programme of action" must be carried out by "men of rigid will," but there is little likelihood of France receiving for the summer holiday anything like a strong coalition government. The best that can be hoped for is another Third Force Cabinet, patched together in a slightly different pattern from the last and undermined by the resentment which the MRP feels against the Socialists on many counts. At the moment it looks as if the job will have to be done by the Radicals.

It is difficult to comment with moderation on the action of the Socialists in forcing a government crisis on France at this moment. The blame must be passed right back to their party congress which, well aware of what the international situation might demand of the French forces, thought it might court favour with its dwindling supporters by insisting on cuts in the defence estimates of 313 billion francs. The estimates are of course huge and form a third of the total budget, but if France is to play the role which its statesmen demand an effort of this scale has to be made. Moreover, the Socialists must see quite clearly that only the extremists to Right and Left gain by a quarrel on such an inappropriate issue between the two parties of moderation. As it turned out, the Socialist action left M. Bidault out on a limb at The Hague conference of the Brussels Powers, broke up efforts to settle the civil servants' strike, and coincided both with the final attempt to secure political agreement and action from the West German Prime Ministers and with a difficult stage in the development of ERP. Irresponsibility could go no further.

Fly Commonwealth

Fly Commonwealth has temporarily replaced Fly British as the basic policy for British civil aviation. This is the essence of Lord Pakenham's comprehensive survey in the House of Lords on Wednesday. The Tudor II has finally been rejected as a passenger aircraft for the British Air Corporations. Twenty-two Canadair IV's—an American Skymaster airframe built in Canada and fitted with Rolls-Royce engines—are to be acquired to fill the gap the Tudor should have filled. Flight trials of the Tudor II by the Experimental Establishment at Boscombe Down have shown "unexpected and disappointing" results.

This gloomy verdict tallies with the final report of the Committee of Enquiry into the Tudor aircraft* which was published on Tuesday and makes even more melancholy reading than the earlier report of the same committee. Delay in the production of the Tudor II, it is considered, arose from three main causes. It was necessary to await the completion of aerodynamic investigations into the Tudor I, so that any improvements desired could be incorporated in the Tudor II. Secondly, there was a failure to determine in good time financial responsibility for the project as a whole and particularly for the alterations required by BOAC. Thirdly, changes in requirements imposed by BOAC resulted in loss of much time. The Corporation showed an exasperating fickleness and total incapacity to comprehend that the function of an interim type is to operate as soon as possible even if the windows are round instead of square, which passengers apparently prefer, or if the furnishings are less tasteful than desired.

The Report does not entirely acquit A. V. Roe, Ltd. The aerodynamic soundness of the original design was open to question and the structural weight of the aircraft was under-estimated. That being so, it is all the more regrettable that the makers did not more strenuously resist the continual alterations and modifications put forward by the operators. For they all increased the weight of a machine which was in any case considerably heavier than planned. It is astounding that none of the parties concerned—the operators, the constructors and the Ministries of Supply and of Civil Aviation—faced the implications of the obvious fact that, as weight increased, so performance would suffer. If this had been done and precise requirements drawn up, the designers would have been better able to calculate the endurance and type of aircraft most suitable for the proposed routes, and a limit set to permissible design changes and weight increases.

In the event, not only was the development of the Tudor II delayed an unconscionable time, but the changes that caused this also made it too heavy to operate with reasonable efficiency on the routes for which it was designed. Of the 43 Tudor IIs under construction, up to 21 will be converted into Tudor IVs for use as freighters by BOAC and BSAAC and 3 will be used for research. Thus all the work will not be wasted and fewer workers will have to be dismissed than once seemed likely.

*

Thus ends a melancholy chapter in the history of British civil aviation. But its main theme will only unfold as the modified fleets of the long-range Corporations come into operation, as all BSAA's 19 Tudor IVs take the air, and as BOAC's 11 Constellations are joined by 22 Canadair IVs, 25 Handley-Page Hermes and 6 Boeing Stratocruisers. Yet this next chapter, too, will amount to little more than an extended preface. The real story will begin only when the postwar British types take the air in the middle 1950s. What guarantee is there that it will begin even then? The Tudor fiasco is only the symptom of faulty organisation. Unless this is remedied, the sorry tale may be repeated. The main lesson is that civil aviation cannot be run by bureaucracy, and it is not yet apparent that this lesson has been learned. The recommendations of the committee of independent experts under Mr Hanbury Williams will be awaited with interest.

* * *

Reprieve for Hanging

As was expected, the House of Lords on Tuesday rejected the Government's compromise clause attempting to classify murder into two degrees—more heinous, which would attract the death penalty, and less heinous, which would be punishable with imprisonment for life. The general opinion of the law lords was that the clause would be quite unworkable and would create great uncertainty in the minds of juries.

* Cmd. 7478.

The Government have apparently been impressed by the learned arguments used in the House of Lords and particularly by the assurance that the Upper House did not wish to sacrifice the whole of the Criminal Justice Bill because of the controversy over capital punishment. After a sharp tussle with the abolitionists in the Labour Party and in the Cabinet, Mr Morrison has succeeded in shelving the question of capital punishment until some unspecified future date. The abolitionists must rest content with the fact that the controversy has thoroughly aired the pros and cons of abolishing hanging, and of the state of public opinion on the subject. They can draw some satisfaction from the assurance that until a Bill is again introduced (which will not, presumably, be until the abolitionist movement has grown considerably stronger) Home Secretaries will use the prerogative of reprieve more readily.

*

On the Criminal Justice Bill as a whole, the fate of three of the Lords' amendments when the Bill returned to the Commons is worth notice. The proposal to retain the birch while abolishing the cat-o'-nine-tails as a punishment for certain offences was defeated. So, too, was the proposal, discussed in *The Economist* of July 10, to allow the Court of Criminal Appeal the power to order a retrial in certain cases. The Government accepted, however, an interesting proposal, which appeared in the Bill of 1938, that as an experiment young offenders, who have not previously been sentenced to prison, Borstal, detention or been sent to an approved school, may be required to attend for three hours at a time at attendance centres. The purpose is to bring home to a young offender the seriousness of his offence without taking the drastic step of sending him away from home to a place where he may be contaminated by more hardened offenders. It is an experiment well worth trying.

Uno Falters on Palestine

By forcing the Arabs and Zionists to accept a cease-fire in Palestine, the United Nations have assumed a responsibility for direct intervention in the question. Instead, they show every sign of relapsing into a further period of comfortable irresponsibility. Even Count Bernadotte's modest proposal that a force of 2,000 should be sent to guarantee the international sanctity of Jerusalem appears to have found no support in the Security Council.

It cannot be pretended that the well-being of Arabs and Zionists was the principal object of Britain and America in bringing about the cease fire. The main reason was that they could not look on at the development of a situation in which they would seem to be fighting one another. The Arabs—and their view is endorsed by Count Bernadotte—conceive that a truce is on the whole disadvantageous to them. Whether this is because they have misjudged the situation, or because they are ready to face immediate military setbacks in the interests of a long-term struggle of attrition, is hard to say. Perhaps both may be true. The Zionists, too, have declared in Tel Aviv that they have no intention of accepting a truce for an indefinite period, during which their army would have to remain on a war footing and the economy of their State would remain disrupted.

Thus, apart from their duty to Palestine, America and the other Powers have not much time if they want to save something from the wreck. Count Bernadotte has done as much to re-establish the prestige of the United Nations as one man could do. His achievement deserves to be followed up. America and the United Nations have been trying to solve the Palestine problem on the cheap. By gestures of recognition, empty resolutions, threats of sanctions and diplomatic pressure, they have produced a situation in which nobody believes that anything counts except force. As the Arabs see it, the Zionists are being armed by America to hold them down by force. Among the Zionists, the Irgun Zvai Leumi, whose exploit of abducting the five British public servants from under the noses of the United Nations Commission has not yet drawn even a rebuke from Lake Success, appear to have justified their battle emblem—a fist grasping a rifle with the legend "Only Thus." Mr Shertok, the Israel Foreign Minister, could only refer to them, respectfully, this week as an "irresponsible but patriotic organisation."

Unless they can get a better grasp of their responsibilities, the Security Council will have lost any claim to be other than a façade for old power politics.

In the Arab camp, the Arab League has not yet fallen apart, as its ill-wishers are hoping it will. But its divisions have come out into the open. These are now less serious, however, than they might have been two months ago. On one side is most of the effective armed strength the Arabs possess, in Egypt and Transjordan, backed by King Ibn Saud. These, with Lebanon and Yemen, on the cease-fire issue voted down Iraq and Syria, the "activists" who wanted to defy the Security Council. This new alignment, cutting right across the Hashimite axis, is due to two things. First, there is the key position of the Arab Legion, as the Arab force on the spot, ready and anxious to liberate some part of Palestine for King Abdullah. King Ibn Saud, tied hand and foot to American oil interests and with no real army of his own, found himself in agreement with King Abdullah in wanting a more cautious line on Palestine, though the ultimate objective of liquidating the Zionist State was probably the same for all. There followed the momentous Saudi-Hashimite reconciliation at Riyadh, where the two kings met for the first time for 27 years.

In Iraq, on the other hand, a would-be anti-British, and therefore anti-Abdullah, Government felt obliged to take a strong nationalist line. The Syrian Republicans fear an enlarged Transjordan as much as a Zionist State. In either case, with no serious troops of their own, they are in danger of being swallowed up. One of the cease-fire violations complained of by the Jews since July 18th took place on Syrian territory. A continuance of hostilities, with the Arab League still in charge, is their best hope of balancing off some of these threats to their future. Azzam Pasha, both temperamentally and materially committed to a militant and united Arab League, seems to have been on their side. The Mufti, too, sees his only hope of a come-back in this group. For the moment the kings have it. But if they behave well, it is not because they like the way they have been treated.

* * *

Turkish or Virginian?

Those who sit in at ERP meetings in Paris, and who are not especially interested in tobacco, complain of the insistence with which the Turks and Greeks bring up their glut of this commodity. It is Europe's only serious surplus, but should questions of its disposal take precedence over problems of food and industrial raw materials? After a couple of weeks during which it was daily brought to the committees' notice, some members began to question whether Greece and Turkey were not, as far as the West was concerned, merely a strategic commitment, and out of place in the recovery plan. But the decision has been otherwise. Turkey is forthwith to receive $10 million as a first three months' contribution under the Marshall aid programme, and is to devote the sum to the purchase of agricultural implements and mining plant. The allocation raises the whole question of the future orientation of Turkish agriculture.

Seventeen out of Turkey's nineteen million inhabitants are agricultural producrs or potentially so, and tobacco represents between 20 and 30 per cent of Turkish exports. But old markets have disappeared. All over the world the connoisseur who used to smoke the high-grade qualities has given place to the chain-smoker of Virginians; Germany and South-Eastern Europe, who used to smoke the lower grades, are no longer the market they used to be. As a result, Turkish sheds are full to overflowing; 70 per cent of the last harvest is unsold; a good crop for 1948 is on the way. A Turkish mission, full of hopes of regaining at least the Western German market, recently visited Frankfurt. It hoped to acquire dollars by offshore purchase of the ample stocks it had for disposal. It left empty-handed, and fulminating against the Americans. For these objected to the higher prices asked by the Turks and, in order to break the cigarette currency in Western Germany, provided the area with 20 billion American cigarettes for $12 million. The Turks complained, and with reason, that a main purpose of ERP was European self-help, and that here was America, breaking the ring in order to save United States growers from loss of exports caused by dollar shortage in importing countries. But it should be noted that the fault was not all America's. The Turkish mission, still living, it seems, in the dream days of wartime prices for their products appeared to be oblivious of the fact that the sellers market is over, that American and Rhodesian competition will take a deal of countering, and that it is better to offload their surplus at a small loss now than at a big one later. Their problem of disposal remains.

* * *

Tobacco or Foodstuffs?

There are several ways out of their dilemma. One is to alter their price, or alternatively, their quality—that is, to turn seriously to considering what leaf the world wants to smoke instead of what

leaf the Turkish peasant has always grown. If Florida and Rhodesia can grow "Turkish blends," cannot Turkey also vary its aromas? Another is to place economic necessity before political predilection and to sell chiefly to the Russian-controlled part of Europe. Some trade with this area is of course taking place. Commercial talks with the Poles and others are already covering supplies at low prices from former German factories in Silesia—notably for hardware—whose products were liked before the war and are badly needed now. A third and more drastic possibility is to devote Marshall aid and other funds to organising a switch of Turkish agriculture from its reliance upon tobacco, and to developing the production of the wheat, meat and dairy produce that the western Europeans used to buy from the Danubian basin, and can probably never buy there again. This is a long term proposition. It is handicapped by the backwardness and conservatism of the Turkish peasant. But it would pay a sure dividend. A fourth and a shorter-term expedient is to insist upon American help with Turkey's sales of tobacco. A pinch of Turkish, it is said, rolled into the so-called Virginian cigarette would pass unnoticed by the western smoker but would spell Turkey's salvation, especially if sold in dollars.

But in making any such arrangement the United States Government comes up against its own home growers. The rich man's burden of today, like the white man's burden of yesterday, is turning out to be the same old job of seeing that this hemisphere's meat is not that hemisphere's poison.

* * *

War in Malaya

There is now little doubt that the Communist rebels in Malaya are trying to cripple the Government. The insurrection is changing from single attacks against isolated units to concerted attacks against the Government police and troops. Last Saturday a police station was attacked at Gua Musang, and on Tuesday a small military convoy, which was going to the relief of the police, was ambushed in the jungle and forced to retreat. The insurgents number between five and ten thousand, composed mostly of wartime guerillas, bandits and survivors from the Malayan Anti-Japanese People's Army. They are led by Chinese Communists, and their insurrection is in no way a national rising yet. Their objectives appear to have been, first to terrorise the population by gangster attacks on individuals in widely scattered parts of the country, and then to set about a methodical campaign against the Government forces.

The situation could hardly be more serious. The police are undermanned and the army, though it recently received reinforcements, seems to have been unprepared for the extent and violence of the insurrection. The complacency of high officials has been uncomfortably similar to the complacency which preceded the fall of Singapore. Some measures have been taken against the insurgents, but they are still inadequate. The army must be reinforced, and the campaign against the insurgents must be carried out with vigour and determination. It is not only British prestige which is at stake, but the well-being of Malayans themselves.

As a correspondent pointed out in *The Economist* last week, however, it will not be enough to conquer the insurgents. The administration is overstaffed and bogged down with unimaginative legislation; the dynamic leadership which the people so hopefully expected when the Government returned after the Japanese capitulation is lacking. A new Raffles has so far been looked for in vain, but he must be found if the rot in Malaya is to be stopped.

* * *

Lord Woolton is Helpful

Ever since Mr Churchill raised the slogan of "Set the People Free!" Labour spokesmen have been challenging the Opposition to specify those controls which could without disaster and dislocation be abolished or loosened. The answer, at the height of the inflationary pressure, was not easy, since any fresh outlet would bear the full brunt of pent-up demand; the first prerequisite of any movement for decontrol was a reversal of the inflationary spiral. It is, as Sir Stafford Cripps has lately pointed out, far too early to hail a definite victory over inflation; but the emphasis has shifted from swollen incomes to swollen costs, and from every quarter comes evidence that too much money is no longer chasing too few goods. The time is, in fact, ripe for a survey and pruning of controls.

While Lord Woolton's advice, in his speech at the Conservative College, Swinton, last week, was certainly not offered in any kindly spirit, it was the sort of advice to which the Government ought to listen. His criticism of bread rationing was answered this week by Mr Strachey's announcement of its abolition in favour of controlling the supply of flour to the millers. The excuse of good harvest prospects is a very thin one. Mr Strachey has waited until the BU system had brought the whole of rationing into contempt before thinking out a better form of control. The leather control typifies those innumerable instances where a case exists for control of some kind, but not for the particular controls now in force—particularly when these were framed to deal with wartime conditions and with reference to prewar quotas. The suggested downpointing of household linen is more debatable—the present "hump" in textiles is likely to be matched by a "trough" in the autumn.

A new attitude to controls is imperative; a propensity to ask not "Why lift it?" but "Why not?" The Government has to overcome, in order to accomplish this, not merely its own Fabian predeliction for bureaucracy but a good deal of passive resistance from its own advisers. It is always more tempting to a Department to buttress a wobbly control by new Statutory Rules and Orders than to abolish or loosen one which, however useless or actively harmful, is giving no administrative trouble. But sympathy for the harassed bureaucrat, and distaste for the prospect of Lord Woolton's approval, are both luxuries whose indulgence should, in the national interest, be strictly controlled.

Agriculture in the Commons

Two debates in the Commons this week were concerned with the rate of agricultural expansion towards the Government's targets. On Monday, the Commons divided against a Ministerial Order which empowers the County Agricultural Committees to prevent a farmer putting too much of his land under grass. The insufficient use of the plough by some individual farmers is certainly a problem; so, incidentally, is the failure of others to attain good standards of grassland management. The Government's aim is to get the million extra acres of tillage which it believes to be desirable, and to do this, the Minister is prepared to use the compulsion which he had previously sought to avoid.

Mr Williams was optimistic about the progress of expansion to date and argued that, given good weather (an important qualification), output for 1948-49 might equal that of the peak year 1943-44. However, his actions do not wholly support his words. The growth of the livestock population is still retarded, and will apparently continue to be so, by shortage of imported feeding stuffs. According to Mr Williams

> The age of the small intensive producer relying entirely on the corn merchant, has gone for a long time ahead. The basic principle of the rationing scheme is that farmers shall be as self-sufficient as possible for feeding stuffs.

He is at last going to allow a small ration of feeding stuffs to prospective pig and poultry producers who are not at the moment getting any, but it will be restricted to approximately half their total requirements. Producers may also get, one day, a small extra bonus of rations and, as already announced, they can keep this year for feeding purposes one-fifth of their own production of wheat and barley.

Mr Williams is trying hard to increase the self-sufficiency of British agriculture. It is clear, however, that livestock production cannot be built up to a high and efficient level without considerably larger imports of feeding stuffs, particularly high protein feeds. Is the Government doing all it can to secure these? Its recent pronouncements leave some doubt. Mr Strachey has apparently claimed that it costs more to import coarse grains for meat production here than to buy carcase meat direct. What truth there is in it would seem to constitute a serious criticism of British farming and a short term view of the problem. Highly expensive as this type of import is today, feeding stuffs from overseas will in the long run pay for themselves several times over by the expansion of domestic livestock production which is vital to a balanced agriculture. Bearing in mind the price incentives offered to farmers last summer, the livestock programme is not proceeding so quickly or so smoothly as it should. Mr Williams, as usual, is too complacent.

University Expansion Questioned

The first concerted attack on the policy of university expansion has appeared in a report* published by Nuffield College. The problem facing the universities is to preserve their character and yet meet the demands being made upon them, and the authors of the report, who are a group of distinguished Oxford dons and administrators, are rightly anxious that this dilemma should be faced. Unfortunately, after marshalling 106 pages of facts and figures, the conclusions they reach in the remaining twenty-four pages are more defeatist than otherwise. Coming as they do at the turn of the tide in the number of ex-service students, these fears will certainly be used as an excuse by those who wish to retreat from the position taken up at the time of the Barlow Report, when plans for the doubling of university numbers were infectious and the difficulties were less apparent.

* "The Problem Facing British Universities." OUP. 5s.

The report rightly emphasises that the demands now being made on the universities are the result of unco-ordinated and conflicting pressures. Committee after committee has invoked the aid of the universities to produce more doctors, dentists, scientists, veterinary surgeons or agricultural experts; no one has got down to considering how all these demands can be met simultaneously without fundamentally altering the character and purposes of university education, particularly in the next ten years when the shortage of teaching staff is the most critical danger. Better planning and more thought about both the aims and the fruits of a university education are required. But some of the solutions suggested by the Nuffield report are curious and will meet strong opposition. One of them is to push down into the schools a good deal of the instruction now given in the universities—a suggestion which runs directly counter to the widespread complaint that the schools are already over specialising and covering work more proper to the universities. Another proposal designed to avoid "professionalising" the universities is to thrust vocational courses out of the universities proper and to develop more specialist institutions on the lines of the technical institutes in America and Germany—a policy for which there is something to be said, but which risks sacrificing the liberalising influence of university life on technicians.

The report casts few doubts on the employability of more graduates; it is about the sanctity of university life that it is concerned. Even so, the anxieties of Oxford dons are not the same as those of the provincial universities. The difficulties of rapid expansion are visible everywhere. It would nevertheless be an immense loss to the nation if over-caution and conservatism were allowed to restrict the larger prospects to which the universities are now becoming accustomed.

Two Clamours in Italy

With the Togliatti outrage past and with Government prestige increased by its handling of a tricky situation (described by our Rome Correspondent on page 150) the Italian people are scrutinising the prospects for a more peaceful period of reconstruction. In the three months that have passed since the elections, economic stagnation has got worse. The Government faces a clamour for work for over 2,250,000 persons. According to the round official figures these included on March 31st, 400,000 agricultural workers, 540,000 in the building trade, 540,000 mechanics and 185,000 textile workers. There is also from the employers' side a clamour that they should be free to discard the redundant labour which, under pressure from parties and trade unions, they have been carrying on their books for years. Conflicting voices call too for the raising and the reduction of wages.

It was unfortunate that the date fixed—after long negotiation—for an authoritative meeting between industrialists and trade union representatives was the day on which the assassination of Togliatti was attempted and followed up by a general strike. In any case, the employers had shown little enthusiasm for agreements likely to be reached with the representatives of labour in their prevailing mood. Symptomatic of that mood was the denunciation early this month by the dominant elements in the Confederation of Labour of the Government's favourite measure for dealing with unemployment—the "Fanfani Plan," named after Signor Togliatti's Minister of Labour. This plan proposed financing of the construction of 1,200,000 habitable rooms in the years 1948-52, partly by compulsory lending to the state of variable percentages of the "thirteenth month bonus" enjoyed by all wage earners at Christmas time. Labour representatives of the Left showed determination to oppose to the uttermost any measure affecting the spending-power of the wage earner.

In the present atmosphere there seems to be little hope of remedying the nation's economic maladjustment, revealed in the excessive costs of production, the immobility of mislocated labour and the heavy deficits of public finance. Signor De Gasperi has still to find the touch of statesmanship which will convince employers that he means business and employees that he aims at social justice. And if he uses strength to break a trade union leadership which makes a political issue of every attempt at two-sided adjustment, he should also use strength to make a reality of direct taxation.

* * *

Cold War from Whitehall

It is high time that Whitehall took the theory and practice of "cold war" more seriously. For there is no reason to suppose that the blend of propaganda, economic pressure, filibustering and party agitation which has received this name has not come to stay. "Cold war" is nothing new; it has a very ancient tradition and among its past masters was our own Queen Elizabeth. All that is new is the scale on which it is waged and the organisation, thought and ingenuity that goes into it—in Russia.

The last few months have made it painfully obvious how ill-designed is the defence organisation of Whitehall to deal with such methods used by a foreign Power. The same questions and the same demands for counter-action come in from all areas where British interests are under attack—from Europe, from south-east Asia, from the Middle East, from Africa. Again and again they are brought to the attention of joint service committees of senior officers of the fighting services, who pass these unfamiliar problems on to relatively junior members of the Foreign Office, whence they reach the overloaded desks and limited talents of the so-called information organisations. Attempts to set up special machinery to deal with these problems have been resisted by the Foreign Office for the same reason that it resisted the adequate planning of political warfare in 1939-40—for fear of losing "control over policy."

It has become clear to the younger generation in the Service Ministries and in the Defence Ministry that a planning and intelligence staff is badly needed to deal with the urgent questions and opportunities that arise out of daily events. The Tito-Cominform quarrel, rich in propaganda, economic and political possibilities, is only one example of recent opportunities which have not been fully used. There appears to be no body in which the political, economic, intelligence and propaganda experts can be quickly brought together to pool their ideas and information, frame a policy and follow through its execution. And there appears to be no attempt to co-ordinate such activities either with the Americans or with the Western allies. These shortcomings should receive the attention of the Chiefs of Staff and Mr Alexander.

* * *

Youth Without Politics

On exactly the same day towards the middle of August one international youth conference will meet in London under the auspices of the National Council of Social Services to discuss "Work and Leisure—Youth's Opportunities and Responsibilities," and in Warsaw the World Federation of Democratic Youth will hold another "conference of working youth." The Executive Committee of the WFDY has been meeting in London this week with Mr Bogatyrev, its vice-president and a member of the Supreme Soviet, attending.

Since the war youth organisations all over the world have wanted an international organisation through which they could both learn about each other and also discuss their common problems. Granting the need, is it necessary to have two organisations for the purpose? The Russians would say that it is not. They have declined an invitation to the London Conference because they say the WFDY, which was formed in 1945, already covers the same ground. But it was precisely because the WFDY had become little more than a vehicle for Communist propaganda that the conference in London next month has been organised.

Not only does the WFDY preach a political creed alien to the majority of democratic youth organisations, but it occupies itself with politics to the exclusion of all else. Neither the gymnastic clubs of Denmark, nor the All-Pakistan Boy Scouts Association see the point of passing resolutions denouncing the rapacious imperialism of the colonial Powers. They would much rather discuss (as the first commission of the London Conference will do) whether existing facilities meet the need for general education, vocational guidance, apprenticeship and technical training. Or they would prefer to discuss (as the eighth commission will do) how far the young are benefiting from existing opportunities for

travel, how far these could be increased, and how far existing schemes for exchanges between different countries help and promote international understanding.

That is probably as far as the delegates will get towards discussing politics, and their best contribution towards promoting international good will certainly lies in fostering understanding of other points of view. The sponsors of the London Conference have done their best to ignore the fact that one iron curtain already exists by sending invitations to countries behind it. It was right to invite the Russians and their satellites, but it was a mistake to placate them by restricting invitations to members of the United Nations. Thereby are shut out not only supporters of General Franco but also, among others, the Austrians, the Italians and the Germans.

* * *

Dilemma of the Atomists

The Atomic Scientists' Association, which was founded in 1946, has just issued a statement which deserves consideration by all those who do not forget that atomic explosions and rays constitute the greatest single danger to human life and civilisation on our planet. The Association's report is a sober and weighty document, commendably free from political bias, and it frankly recognises that the attempt to achieve international control of atomic energy, advocated by the Association since its inception, "has, for the time being, failed." The report considers that "without a substantial change in international relations," the positions of the United States and Russia are irreconcilable. The former will not abandon its lead in atomic weapons without a complete system of inspection to ensure that no other country secretly takes advantage of the renunciation, while Russia will not accept complete inspection because of fear that, being with its allies in a minority, Russia would have to submit to hostile control of its economic development and disclosures of the location of its strategic industries.

Can anything then be done to remedy the situation? Apart from the platitudinous argument that the best way to prevent atomic bombs being used is not to have any war, the main proposal of the Atomic Scientists is that "in view of recent political developments we believe it important to maintain and improve contacts between the scientists of countries in the East of Europe and those of Western Europe and America." Such collaboration is recommended "both in the interests of science itself and as a contribution towards international understanding."

Yet this advocacy raises an issue of acute difficulty. No principle became more firmly established during the nineteenth century than that of the international character of knowledge and the free exchange of scientific information. But the scientist in the modern totalitarian state, though he may have social status and emoluments such as to provoke the envy of his colleagues in democratic countries, is essentially a servant of the state, so that it is treason for him to divulge any knowledge whatever, save as the state allows. In this age, moreover, science has entered fields where secrecy or disclosure may decide the destiny of nations, and the nervousness of Western military authorities about international scientific discussions is understandable. British and American scientists have been reared in the full tradition of scientific freedom, they are impatient at every restriction imposed on them for the sake of security, and even though they have no will to do harm, they lack instinctive inhibitions in talking freely to men trained under police terror to be ever wary in speech. It is difficult to see how anything could come of such "collaboration" except a one-way traffic to the disadvantage of the Western democracies. It seems, indeed, that only an improvement in political relations can really reopen the door to cultural intercourse.

Supplementary Insurance Scheme for Miners

Some doubts were expressed in the House of Lords last week about the wisdom of the supplementary insurance scheme for miners. It has been made by virtue of Section 83 of the National Insurance (Industrial Injuries) Act, which allows, subject to the Minister's approval, representatives of workers and employers to draw up a scheme for supplementing the benefits conferred by the Act. This section was incorporated in the Act largely as a result of pressure from the National Union of Mineworkers, and it is not surprising that the mining industry, with its high rate of accidents and industrial diseases, should have wanted the power to make supplementary schemes and be the first industry to produce one. But, as Lord Beveridge and others pointed out in the Lords debate, the implications of this scheme may be very important, and the House of Commons ought not to pass over them in silence. First it raises the question whether it will not push the level of benefits up to a point where it may discourage a return to work. A payment under the Act of 45s. a week plus 16s. for a wife plus, possibly, 20s. unemployability supplement and now 20s. under this supplementary scheme all add up to a sum not much below the minimum wage. More important, however, is the question of whether the method of financing the supplementary scheme is justifiable. The miner is to pay 4d. a week and the Coal Board 4d. a ton of coal mined, which means that roughly five-sixths of the contributions will be payable by the employer and only one-sixth by the worker.

The basis of contributory insurance in this country, said Lord Beveridge, is that the contribution should be fairly equally divided between employer and worker. The division proposed in this scheme is, therefore, a blow at the principle of contributory insurance, and it removes one of the barriers to the pressure to increase benefits—that formed by the insured person's obligation to pay for the increase. Moreover, it will be the consumer of coal who will really pay the employer's contribution. If the taxpayer can subsidise a scheme in this way can Sir Ian Fraser's argument that the taxpayer can also pay higher pensions to the ex-Service disabled be denied? Could any private industry be asked to operate an insurance scheme where the employer pays five-sixths of the cost? The case of merchant shipping, which also has a high accident rate, was raised in the Lords debate. The miners' argument that the employers in the coal industry were paying more under workmen's compensation is irrelevant because it is agreed that workmen's compensation worked badly and should be superseded. The Minister of Pensions has already promised that the reactions of the miners' scheme on war pensions will be studied. The likely reactions in other industries should be assessed before the Commons are asked to approve it next week.

Examination Changes

There is a gathering weight of criticism against the Minister's decision to fix 16 (and subsequently 17) as the minimum age at which boys and girls can take the new version of the School Certificate Examination. This decision was criticised at the time it was made in an article in these pages on May 1st. Since then objections have appeared at conferences and in the press; defenders have been few, the attackers many and convincing. The extraordinary thing is that the objections should have been so late—too late to make a change of decision easy, and probably too late to make it possible at all. Why did the protesters not raise their voices months earlier, between the publication of the Report in which the proposals were first put forward in September, 1947, and the acceptance of that report in April, 1948? During that six months interval there were plenty of scurryings behind the scenes, but no one dared to come into the open. Why have the teachers in the public and secondary grammar schools been so timid?

The burden of the criticism rests on two main points. The first is that the age of 16 corresponds to no known assessment of mental age. One boy may be intellectually mature enough at 14 to take the examination without cramming; another may not be ready until 17. To fix the minimum age at 16 is to accept an administrative and political convenience on a matter which is essentially human and individual; every school has its faults, but the individual master knows his boys better than someone in London. The second focus of criticism centres on the requirements of scholarships; if a boy or girl must follow half a dozen subjects up to 16 he will only have two years of undivided attention on his sixth form work, and its quality will in consequence suffer. The solution of this difficulty rests partly in the hands of the universities, since they can modify their matriculation requirements. But they must insist on a minimum breadth of education before specialisation starts; they cannot weakly submit to schoolboys specialising even earlier than they do now, and it is difficult to secure this minimum competence without an examination.

The new regulations do not come into effect until after 1950, and it would be theoretically possible for a Conservative Government to change the age limit then. But as the National Union of Teachers is strongly entrenched on this issue—as a matter of trade unionism more than of party politics—the prospects of change are poor unless the next Minister of Education is both clear-sighted and courageous.

Letters to the Editor

Crown and Commonwealth

SIR,—The reflections of a British subject on your leading article of July 10, 1948, suggests the following classification:—

Political Divisions:	United Kingdom	United Kingdom; Dominions; Colonies	United Kingdom; Dominions; Colonies; Republican Dominions (if any)
Adjectives:	British Irish	Britannic	(Great) Commonwealth
Collective Noun:	Great Britain & Northern Ireland	Britannic Empire	Great Commonwealth
Legal Status:	British subject	Britannic subject or citizen (either, as preferred).	Great Commonwealth citizen

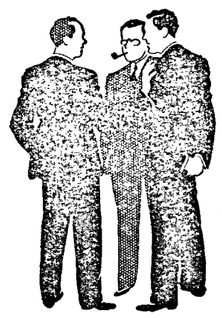
Perhaps it would be a pity legally to abolish the "British Empire"; but "Britannic" seems to have the wider connotation, and the category of persons indicated are subjects of His Britannic Majesty (or citizens of His Britannic Majesty's Dominions). "British" and "Britannic" could be interchanged, of course, if that were preferable.

Why "Great" Commonwealth? Partly because it is great, and because the adjective suggests inclusiveness; and partly because "Commonwealth" alone would be lacking in particularity. We have succeeded in having "Great Britain" translated into other languages; "Commonwealth" does not translate happily in any case; "Great Commonwealth" would make that problem no worse.

But perhaps a more important thought is that implied by your leading article, that it may not be prudent to seek precision in these matters.—Yours faithfully, W. A. L. COULBORN

Oglethorpe University, Georgia

Food and the Future



SIR,—The admirably objective tone of your article of July 17th will not, I am afraid, suffice to convince the ordinary reader that its conclusion—"the only sensible policy . . . is to wait and see"—*is* essentially different from the "false optimism" which is legitimately laid at the Government's door in the accompanying Notes of the Week. For does not such a policy, like the food-subsidy and exports-first policies, depend for its validity upon the wishful thought that a return to a "normality" of cheap food is close at hand?

If indeed there are more solid grounds for such a thought than a run of good seasons in the US, it would be interesting to have them. Otherwise, a waiting policy, far from being sensible, is in fact a desperate gamble, seeing that no community, least of all one accustomed to a relatively high rate of consumption, can long endure even a moderate degree of sub-nutrition without progressive deterioration in its well-being and productive efficiency.

But all that the article has to set against the acknowledged factors making for continued food-scarcity—expanding human populations and shrinking soil fertility—is the rather dogmatic statement that "it is virtually certain that . . . the long secular downtrend of food prices, relatively to the prices of manufactures, will be resumed." This pronouncement, for which no real evidence is adduced, appears to disregard altogether the transient nature of the conditions under which the downtrend developed.

During the 19th and early 20th centuries, the first few countries to become industrialised (Britain among them) enjoyed a virtual monopoly for their manufactures, while at the same time an extremely rapid exploitation of the last easily-tapped reserves of virgin soil fertility threw upon world markets an unprecedented volume of foodstuffs. In other words, soil-products fell in price relatively to factory-products because soil capital was being treated as income while industrial capital was being built up.

But clearly such a trend would develop within itself the

Valenta

the luxury cigar from Jamaica

Among men who appreciate the distinctive qualities of a fine cigar, Valenta is recognised as the foremost imported brand of today. Skilfully rolled, sumptuous in flavour and aroma, Valenta is a cigar to linger over with supreme enjoyment. Available from your usual cigar merchant in any of three favourite sizes, *all* in boxes of 25 and the handy 'Fives' pocket carton. To secure these luxury cigars, ask for your Valenta *by name.*

Guaranteed by the Government of Jamaica

mechanism for its own reversal. And so it has happened. Manufacturing industry, because of its attractions as a source of profits and power, has expanded rapidly and is becoming universalised. Agriculture, because of its steady impoverishment, has lost and is still losing both manpower and natural capital.

Here the article, in assuming that soil fertility is lost *by* erosion, underestimates the seriousness of the situation. For erosion is not a cause bu. a *result* of fertility depletion—the mechanical removal by wind or water of soil that can no longer hold together because it is dead or dying. It is in fact the *end-phase* of a process of soil debilitation which is now almost worldwide, and which is largely attributable to the inability of low produce prices (combined with general economic insecurity) to support balanced systems of farming. There is general agreement among soil experts that the one hope of reversing the downtrend of soil fertility, so that it may more nearly conform to the uptrend in human fertility, lies in the restoration or evolution of such systems, which are of course much more costly in labour and materials than is the mere extraction of commodities without regard to the well-being of the land. In other words, the industrial communities, having eaten their cake in the form of favourable terms of trade, must now help the farmers of the world to reorganise agriculture on the basis of good husbandry.

The cost of developing British agriculture, say to the productive level of Danish or Dutch agriculture, seems "enormous" only by comparison with the sub-cost prices of foodstuffs during the inter-war period. Actually, it will be found, in the final analysis, to consist overwhelmingly of labour; and if a country which has a mere 7 per cent of its working population in agriculture is unable to divert to essential food production any larger proportion of its man-power, its economy must indeed be in a parlous plight—much too parlous for any policy of "wait and see."—Yours faithfully,

JORIAN E. F. JENKS

West View, Horseshoe Road, Pangbourne, Berks

Palestine

SIR,—In an editorial note you say that territorially the Negeb is "in fact," apart from the small garrisons cut off by the Egyptians, lost to Israel. This is pure invention. The Negeb is no more lost to Israel today than it was on November 29th last, when this region was allotted to the Jews as part of their state. True it is that "it is mostly desert"; but the Jews have already established between 20 and 30 settlements therein and large tracts open up important prospects for future settlement. For the Arabs the Negeb is perhaps not worth fighting for: under their rule it is likely to remain desert. But the Jews have every reason to defend this territory against Arab aggression.—Yours faithfully,

41 Queen's Road, Richmond, Surrey R. S. DOUGAN

Cartels or Competition

SIR,—In your issue of July 10th there is a review of "Cartels or Competition" by George W. Stocking and Myron W. Watkins. Your reviewer says that the authors do not "approve of the restrictive aims of the World Trade Alliance." If those aims were restrictive I should be the first person to agree with the authors' disapproval. However, the main aim of the World Trade Alliance is to achieve an all-round expansion in international trade. Further, the W.T.A.'s plan for a world development commission is ample evidence of the fact that our aims are the very opposite of restrictive.

I agree with your reviewer that the whole problem of international cartels and international agreements for production and distribution is very much open to controversy. But I feel it would be as well to get the premises straight before the argument begins. Expansion, not restriction, is our keynote.—Yours faithfully,

W. P. BRIDGE, Director,
World Trade Alliance Association

Books and Publications

The Science of War

"The Second World War." By Major-General J. F. C. Fuller, CB, CBE, DSO. Eyre and Spottiswoode. 431 pages. 21s.

THIS is an outstanding book. It is not only a brilliant analysis of military tactics but also a discourse on the science of war by a military historian who knows his business better than most. He has condensed into one volume a detailed description of all the important campaigns of the Second World War. The descriptions are technical; yet they are presented in such a way as to be intelligible to the layman, and the lessons to be learnt are set out with deceptively simple clarity. As a history, it is a balanced and unemotional account of what happened; as a criticism of the conduct of the war, it is dogmatic but always interesting. Major-General Fuller is, as he says, being wise after the event, but his wisdom is thereby all the more penetrating.

By far the greater part of the book is taken up with the strategy and tactics of each of the belligerents during the war. The German, Italian, Japanese, Russian, British and American campaigns are impartially examined and held up to the reader as examples of good, bad or indifferent generalship. Numerous authorities, ranging from Alexander the Great to the US Strategic Bombing Survey, are quoted in support of his judgments and arguments, and throughout the book runs the central theme of the use of war as a means to an end and not as an end in itself.

The fundamental premise of this discourse on war is that war is iniquitous, but that if man cannot learn virtue, he must at least learn how to use war—or else iniquity will breed calamity. War is the instrument of politicians; if, therefore, war is to be used at all, it must be subordinated to policy. Where there is no policy, or where the policy is stupid, then war will take charge of the politicians and annihilation will follow.

> What the scalpel is to the surgeon, war should be to the statesman. Whatever the causes of war may be, if the aim of the statesman is purely destructive, then clearly the activities of the soldier become those of the slaughterhouse. But if, instead, the aim is constructive and curative, then these activites become those of the surgery. Due to mischance or misunderstanding, or to lack of skill, or of judgment, or of knowledge, a surgical operation may fail—it sometimes does; but when the aim of the slaughterer becomes the aim of the surgeon, it (the operation) must fail, no other alternative is possible.

Hitler's aim, intolerable though it was to the West, was constructive. The skill of the Germans in waging war was also great, and Major-General Fuller shows how in all the early campaigns—in Poland, in Denmark and Norway, in the Low Countries and France—Hitler used the instrument of war so successfully that he was able to seize the western half of the continent with the minimum loss of life and damage.

Major-General Fuller maintains that the policy of Britain and its Allies should also have been constructive not destructive—to restore the balance of power, not to annihilate Germany and Japan. Had the Allies used war as an instrument to achieve such a policy, then destruction would have been limited to purely military objectives and the world would not have been reduced to its present chaotic state. Instead, the leaders of the West were blinded by emotional hatred against the Nazis. Strategical bombing was adopted as the primary method of warfare, and the bug of "unconditional surrender" corrupted the judgment of the War Cabinets and the Chiefs of Staff.

The result was that unlimited warfare was carried to its ultimate end. Germany and Japan were annihilated; the balance of power was destroyed, and the way was paved for a much more powerful and brutal hegemony over Europe than the German. The bottom was knocked out of traditional British foreign policy, and, above all, the British Empire, which rested upon the balance of power, was placed in jeopardy.

A Frenchman's View

"Problèmes de l'Angleterre Socialiste." By Bertrand de Jouvenel. La Table Ronde. (Distributors: Anglo-French Literary Services, Limited). 354 pages. 9s. 6d.

THIS is a brilliant essay in international interpretation. M. de Jouvenel offers in his matter a blend of first-rate journalism and serious social, political and economic analysis, in his attitude a nice balance of sympathy and detachment, in his style an example of that effortless felicity which is the enviable hallmark of French civilisation. "Problèmes de l'Angleterre Socialiste" falls into four sections. The first consists of a masterly summing-up of the situation as it stood in the autumn of 1946, together with an analysis of the influences—economic, political, moral, psychological—which had converged to produce it. In part, it is frankly journalistic, as in the brilliant reporting of the Conservative Party conference at Blackpool; in part, it is more-than-competent narrative summary, for the benefit of his compatriots, of events naturally less familiar to them than to ourselves; in part, and this part is perhaps the most valuable as it is certainly the most stimulating, it is a marshalling of generalisations concerning liberty and authority, the genesis of British political traditions, the nature and antecedents of the present climate of British opinion, and Britain's place in the high strategy of international affairs. One resists with difficulty and regret the temptation to quote *in extenso*.

The second section, entitled *Les grands problèmes matériels*, deals more closely with the economic data of the British dilemma; dependence on foreign trade, balance of payments difficulties, the problem of coal, the arrears of industrial reorganisation, inflationary pressure, mis-allocation of national resources. To the English reader, much of this section is common knowledge, though it has rarely been so well summed up; but the close and luminous argument of its last chapter lifts it to a level rarely touched in such discussions, and recalls, in current non-academic language, the force and elegance of Professor Robbins' *Economic Problems in Peace and War*.

The third section outlines and comments on the corresponding politico-moral problems; equality, incentive, class structure, particular and general interests, the formation of popular opinion, the concentration of power. It is full of shrewd observation, wisdom, and objectivity tempered with affection; it abounds in pithy sayings:

> Modern democracies display this paradox, indefensible in the long run; that of allowing fewer and fewer *material and moral* advantages to exceptional talents and of needing these talents more and more.
>
> . . . the "new spirit" which affirms much less the right of ability to rise than the right of lack of ability not to be outstripped. (Socialism) has been an emotion; now it must be a technique.

Here, were only English readers concerned, the book might well stop; unless indeed the last section—on the summer crisis of 1947—were to be recast and brought up to date. The lapse of seven months between publication in Paris and distribution in Great Britain has not, indeed, falsified to any significant extent either M. de Jouvenel's account of this crisis or the conclusions which he draws; but the perspective is "out"—up-to-the-minute reporting does not wear like history. This comparative tailing-off, however, is a very minor defect. It is not too much to say that the English reader seeking to understand his own times can turn as confidently to M. de Jouvenel as, seeking to understand the Britain of the nineteenth century, he would turn to Professor Halévy.

Industry and the Universities

"The Graduate in Industry." By Percy Dunsheath. Hutchinson. 276 pages. 10s. 6d.

THIS book attempts too much. In the space of 276 pages, one cannot easily combine matters of high policy such as the functions of universities in an industrial society, the demand for graduates and the national requirements of research with a description of the structure of industry and a detailed job analysis of what appear a random sample of industrial occupations ranging from professional engineers, metallurgists and industrial chemists to personnel managers, patent agents and works' padres. The book contains a wealth of useful information and interesting comment, but it is so mixed up with large generalisations and small details that it is difficult to keep any sense of the direction in which the argument is leading.

This is the more the pity since the subject of the book is important and represents a gap in existing knowledge. One of the main deterrents to the entry of graduates into industry is the general ignorance of what happens inside the factory gates or the doors of the headquarter's office; by comparison entry to the civil service or teaching seems straightforward, and many avoid careers in industry from sheer inability to discover what happens there. A book about the functions of industry, its methods and the careers within it, is therefore timely, and Mr Dunsheath should find a wide audience for his book, particularly among the young men and women now leaving the universities. It is regrettable that in the face of such an eager public he should not have marshalled his ideas to better effect.

Nor has he got his sights adjusted quite right. On the one hand as an engineer he devotes insufficient attention to the possibilities of employing arts graduates in industry—he only gives one short chapter to this subject. On the other he does not seem sufficiently to appreciate the difference between the graduates of Redbrick and those of Oxbridge: in the future the big battalions will be coming from the provincial universities, and it is necessary to convert industrialists to taking not only technicians and high-grade trainees, but the more modest men who need at present to be recruited straight from school at eighteen, but who will in future be passing through the universities. Many of these men do not aspire to be directors and £800 or £900 a year would appear to them as an adequate ultimate goal.

Shorter Notice

"Shall We Reform the House of Lords." By Martin Lindsay, DSO, MP. The Falcon Press Limited. 71 pages. 4s. 6d.

THIS useful little book appeared just too late to make its contribution to the dispute over the Parliament Bill, 1947. Colonel Lindsay has not attempted to propound a new solution to the problem of Lords Reform, but has performed a more useful function—the condensation of most of the existing arguments into a form where they can be studied by the weariest of legislators or citizens. He favours the Conservative proposal—retention of the powers granted by the 1911 Bill with a drastic reform of the composition of the Upper House—but he presents the argument with commendable detachment. Those who disagree with him might do well to ponder his reason for desiring a two-year period of delay:—

> "An Upper House which commanded sufficient confidence to be able to check some of the more headstrong actions of the present Government would certainly be of value today, as it might well be in the not far distant future in restraining its successor from galloping off too far to the Right. And it is by no means impossible that the present leaders of the Labour Party might themselves one day be grateful for the delaying functions of an Upper House, should some new political alignment to the Left of them secure temporary success at the polls."

Appended to the text are two tables, one of which tabulates the 23 proposals for Reform between 1834 and 1947, while the other compares the powers and composition of the House of Lords with the Upper Houses of other countries.

From *The Economist* of 1848

July 22, 1848

THE very important truth, that most of the evils of society are more economical than political, and to be remedied rather by ascertaining and observing the economic laws than by making political changes, is fast gaining ground with the public. We see a profound homage paid to it almost every day in the columns of some one or other of our daily contemporaries. If, in addition to this—as we took occasion to show in our article on the Increase of Pauperism and Crime, on the 17th ult.—the physical condition of the people is far more influential over criminality than penal laws or the best devised systems of punishment, it is now, above all things, incumbent on those who aspire . . . to guide society, to study the means of insuring a continual stream of prosperity. Though Mr Mill in his late work—"Principles of Political Economy"—has declared that the stationary condition of society is not undesirable, it cannot, we think, be doubted that the stationary condition involves great social misery, and that the natural and normal condition of society is progressive. The general instinct which induces each one to strive for improvement carries with it the progress of the whole. We want not merely, as Mr Mill justly says, an improved distribution of wealth, but we want also, though he thinks we do not, a large production and a rapid increase, that shall be both permanent and go on in an accelerating ratio, in order to meet the demands of an increasing population. If that cannot be obtained, or if population cannot be prudentially and wisely kept within limits by the care of individuals honestly to provide for themselves and families, there can be, we are afraid, no means devised of conducting society in peace, and of avoiding those convulsions which it is now admitted have their origin in social rather than political causes.

not need Mr Truman to tell them that this is their most vulnerable flank and that their foreign policy record has much more appeal for the voters. The summoning of the special session of Congress has ensured that the Presidential campaign will be a bitter fight to the finish and that there will be little temptation for either party to put national unity before political profit.

* * *

Half-hearted Revolt in Dixie

The Mississippi and Alabama delegations which marched defiantly out of the Democratic convention into the pouring rain have met again at Birmingham, Alabama, to set up a Fourth Party. Its relation to Mr Wallace's Third Party is clear; it was the fear that Mr Wallace would appeal successfully to the minorities in the big cities which forced an uncompromising stand upon civil rights on the Democratic convention. The Southerners have nominated Governor Thurmond of South Carolina for President and Governor Wright of Mississippi for Vice-President on a States' rights platform. Governor Thurmond, unlike Governor Wright, has a liberal record on the race issue; he opposes the poll tax and displayed unusual energy in bringing the Greenville lynchers to trial last year, but, like almost all Southerners, he believes that racial issues can best be solved by the States.

The hope at Birmingham was to bring pressure to bear to forestall the passage of civil rights legislation, but the dream is to capture the entire 127 electoral votes of the South and demonstrate to the Democrats that they cannot trample upon Southern views to win local victories in the North and West. This threat would be more effective if the South could deprive Mr Truman of victory rather than merely deepen his defeat. But even in the South the rebellion is regarded with suspicion and alarm. Senator Russell, for whom the Southern States voted at the Convention, refused to stand at Birmingham; Senator George has announced that the convention, in his view, can accomplish nothing. The refusal to join the bolt is not because the other Southern States do not fully share the indignation against Mr Truman, but because a Southern party, launched even without the present taint of tidelands oil and race suppression, promises so little in the way of present rewards and so much in the way of future retaliation and loss of patronage when the Democrats return to power. It is thought that Governor Thurmond may carry only his own State of South Carolina, Alabama and Mississippi.

* * *

Progress in the South

The impressive unanimity of Mr Truman, Mr Dewey and Mr Wallace on the need for Federal authority to protect the economic and political rights of the negro is more a tribute to the strength of the negro vote than conclusive evidence that nothing is being done in the South to improve race relations. In fact the pace in recent years has been rapid; and it is the fear of Southern liberals that making the civil rights issue a political football may set back the cause of progress in the Southern States by as much as twenty years.

The Federal courts have, in one case after another, outlawed the efforts to keep the negro disfranchised. Only last week, in South Carolina, a Federal Judge issued a temporary injunction to force the Democratic party to accept negro members, and to keep its books open until July 31st to enable the negroes to enroll. The Southern Regional Council reports that the number of qualified negro voters has tripled since 1940, and though the number of white voters has increased even faster in many States, it is revolutionary that negroes may register to vote in most Southern cities with the same ease that they do in the North. In only three of the seven States which retain the poll tax is it found to be a real barrier to negro participation. There are negro police in forty Southern cities; negroes have been elected to city governments. There is a danger that Federal interference to hasten the pace of emancipation may, by arousing Southern fears and ancient hostilities, blight these efforts and give the advocates of white supremacy a new cause and a new lease of life.

* * *

The Housing Paradox

The failure of the Republicans in Congress to act on housing legislation was their outstanding political blunder; it is one of Mr Truman's few strong cards. But this does not mean that few houses are being built; on the contrary, there has been an unprecedented building boom, concentrated in residential construction. In the first five months of the year, 356,000 dwelling units were started, 28 per cent more than in the same months last year. If this rate is maintained, with the usual seasonal increase, the year's total would exceed not only last year's total, but the record established in 1925 when 937,000 units were put in hand. But these houses were floated largely on an ocean of government credit through the war-time programme of insuring mortgage loans to veterans and the ordinary public.

Congress, more by accident than design, partially shut off the tap of easy credit and unexpectedly won the approval of the economists, who have long argued that excessive government credit for housing was one of the main causes of high prices not only of homes, but throughout the economy. Stiffer credit terms, they have argued, would reduce prices and in time revive demand on a sounder basis. Easy credit could not produce more houses; it only succeeds in raising prices. The motives of Congress diverged somewhat from this high plane of economic purity. Both the Taft-Ellender-Wagner Bill, passed by the Senate, and the Wolcott Bill, passed by the House, would have extended Title VI of the Housing Act, which has been the major source of government funds for private builders of flats and houses. But the Senate Bill authorised Federal funds for slum clearance and urban redevelopment, for modernising farm housing, for housing research and for 500,000 units of public low-cost housing to be built by state authorities for those unable to pay the prices of private enterprise. These attempts to use Federal money to divert materials and labour into the under-privileged and blighted areas were opposed both as extravagant and "socialistic" by the House; its Rules Committee, by a vote of 6 to 2, refused even to allow the Senate Bill to come before the House. Mr Wolcott's Bill, which was equally unacceptable to the Senate, merely offered more liberal depreciation allowances for tax purposes, and a Federal guarantee of yields and investments in rental projects, as baits to private enterprise.

In the end, the only Bill passed which, by the widest stretch even of Republican imagination, could be called a housing measure merely provided a very limited secondary market for insured mortgages. The unintended effect of this stalemate between the Senate and the House has been to tighten credit, for while Federal funds are still available under Title II of the Housing Act, it is on substantially less liberal terms, and some slowing up in the application for new building permits is already reflecting the chill felt by the builders.

The special session provides the Republicans with the opportunity, and a strong incentive, to sink their differences and secure a stronger housing plank for their platform than that devised at Philadelphia. Mr Truman is counting heavily on the intransigence of the House, and certainly his support for the Taft proposals will not make them appear any less "socialistic" to the House. At the very end of the regular session the Senate refused to accept a Housing Bill merely extending Title VI, which was favoured by the real estate lobby, in the hope that the House would accept the whole Taft-Ellender-Wagner Bill. Should the Senate now give way, a revival of easy credit terms for housing would help to defeat another major purpose of the special session, the reduction of the high cost of living.

Shorter Notes

The Atomic Energy Commission has investigated the charges that Dr Edward Condon, head of the Bureau of Standards, is a poor security risk, has pronounced them totally unfounded, and has asked him to resume his work in connection with atomic energy. This step was taken because Dr Condon voluntarily resigned after the House Committee on Un-American Activities refused to accept the clean bill of health given him by the Department of Commerce.

*

Mr Henry Wallace and the *New Republic* (the liberal weekly) have parted company. In December Mr Wallace resigned as editor, although his name remained on the masthead as contributing editor and he continued his weekly column. Mr Wallace's official reason for retiring altogether is that he feels that he must devote all his time to his election campaign but his departure from the magazine—just before the Third Party's convention—cannot fail to ease a situation of mutual embarrassment. The *New Republic* was rather in the position of a chef who refused his own dish, for, while Mr Michael Straight, the present editor, is in agreement with some of Mr Wallace's liberal ideas, they do not see eye to eye on the European Recovery Programme or the new Party's flirtation with Communism.

THE WORLD OVERSEAS

Break-up of the German Trusts

(By a Correspondent)

THE problem of the future of the great industrial combines of the Ruhr and Rhineland is now entering a new stage in which fresh decisions must be taken. It shows unwelcome divergencies between British and American views, which may develop unless the situation is clarified in time.

As part of the Potsdam policy of smashing Germany's war-making power, Britain, America and Russia undertook to break up all excessive industrial concentrations. This process has been misleadingly termed "decartelisation"; it involved not only the dissolution of horizontal sales cartels, but also the break-up of vertical trusts. According to the laws passed by both the British and the American Military Governments, any undertaking employing more than 10,000 persons was considered to be *prima facie* an "excessive concentration." In practice, however, the combines which have been tackled to a greater or lesser extent are the giants —the I.G. Farbenindustrie in the American zone, and in the British zone the eight big complexes of the Ruhr-Rhineland—the Vereinigte Stahlwerke, the Otto Wolff concern, Kloecknerwerke, Krupps, Mannesmann, Hoesch, Gutehoffnungshütte and the Thyssen group.

With the same dogged adherence to Potsdam doctrine that they show over dismantlement, the British have gone much further in decartelisation in the Ruhr than the Americans with the I.G. Farbenindustrie. At the beginning of 1947, British action against the trusts, which had previously been placed under control, began under the name of "Operation Severance," with the aim of breaking up the iron and steel industry into separate units, "under entirely new management." A clean cut was to be made with the past. At the same time, nothing was to be done to prejudice the steps which, it was thought at that time, were being taken to bringing the industry under German public ownership.

Execution of "Operation Severance" was placed in the hands of a Trustee Administration, a German organisation formed under the (British) North German Iron and Steel Control. At its head is Herr Dinkelbach, who had been in the past a leading figure in the Vereinigte Stahlwerke. Controversy over Herr Dinkelbach rages between the school that believes the burglar makes the best policeman, and that which holds that leopards cannot change their spots. The evidence of what has been done speaks for the Trustee's objectivity, since the break-up of the combines has gone far.

The first operation, removal of the steel companies from the industrial complexes, has now been completed. Twenty-five separate companies have been formed, mainly out of the Vereinigte Stahlwerke. Their share capital is in the hands of the Trustee Administration; their property has been either bought for cash (now reduced by ninety per cent by the currency reform) or on lease from the original companies. The Trustee Administration retains control over the rump complexes.

The management and supervisory boards of the new companies show a regard for the interests of labour which is reassuring in view of the good record of the trade union leadership and the unrest which is inevitably coming as a result of rising prices. On each supervisory board five out of eleven members represent the workers' interests, including a public official, such as the local mayor; one—the chairman—who is in ten companies, Herr Dinkelbach himself, represents the Trustee Administration, and five (usually experienced directors of the old combines) represent industry. On the management boards, one is a technician, one a commercial expert, and one a labour representative, nominated not by the works council but by the TU Federation. Herr Dinkelbach has stressed, in taking the chairmanship of so many companies, that his intention is not to build up another giant combine, but to see that treatment is uniform.

American Second Thoughts

Now that the European Recovery Programme is in force, decartelisation in the British zone has become a matter in which the Americans take a direct and critical interest. Hitherto, their own ranks have been torn; but now the most ardent trustbusters have gone home in sorrow and anger, leaving the field clear for the efficiency experts, who ask only whether smashing the combines hampers production. A commission, consisting largely of experts from the US Steel Corporation, is at present investigating the steel industry from all angles, including that of decartelisation. In the American view, the British have done more than break up the combines; they have atomised them. A partial re-grouping will probably be recommended.

From the German industrialists violent opposition has been expressed from the start, and ample propaganda data is available for impressing the American investigators. As usual, the Germans overstate their case. They try to exonerate the industry from any share in war preparation or execution; the combines were, they declare, merely helpless branches of Hitler's State controlling organisations. A major part of the German case consists in an irrefutable, but irrelevant, account of the admirable integration of the Ruhr-Rhineland coal, coke, gas, iron and steel production and consuming industries, which ensures the maximum use of coke. Legal objections, based on the British violation of the rights of private property, form another chapter of complaints. The crux of the German industrialists' opposition, however, is their fear that the break-up will go further, and end in State ownership. In German political circles, however, decartelisation has the support of the trade unions, the Social-Democrats, and the Left wing of the Christian Democrats.

The British case is based on practical as well as political reasoning. When Military Government took over, the Ruhr was at a standstill. The companies had in any case to be reorganised after drastic losses. Were they to be set up on the old lines, under the old management? Everything spoke against such a course.

The combines represented vast concentrations of power. At their head stood the Vereinigte Stahlwerke, responsible for 47 per cent of Germany's entire prewar steel output. The holding company, which had an issued capital of RM 460 million (£36,800,000 at the prewar rate), controlled 12 steel companies and hundreds of subsidiaries, ranging from coalmines and engineering plants to hardware shops, farms and hotels. More than economic necessity, the German love of organisation and of power for power's sake, led to this vast conglomeration which had absorbed dozens of small businesses. In the combines the small shareholder had no voice owing to the German system of bearer shares, which gave the banks, apart from their own holdings, the right to exercise proxy votes. The selling company, in which the profit for the whole trust was concentrated, was often in the hands of a single family, notably, the Krupps, Thyssens, Haniels and Flicks—a fact which justifies the peculiarly personal way in which the German combines are usually described, and the trial of the family heads as war criminals.

Effects on Future Production

From the economic point of view, the trusts were largely formed with the idea of evading the turnover tax, by placing all stages of production under one ownership. The policy was to run the basic and intermediate companies at a loss, channelling all the profits into the end product. Decartelisation has broken up this structure by cutting the steel companies out of the combines. It has not, however, destroyed the working integration of the Ruhr production and consuming industries; the change is simply that, instead of being under single ownership, the individual companies now buy each other's goods or services under contract.

In general, it can be said that no harm has as yet been done to production by the break-up. But the future is another matter. In the first ERP year, steel production has to be raised to 6,000,000 tons and every branch of Ruhr production with it. The argument against dislocation of any kind can be used as strongly against decartelisation as against dismantlement.

Even more important than the structure of the combines is the question of their future ownership. Here, too, the Germans are divided into Left and Right, with the Right holding the reins.

A final decision will not be made for some time; but changes are coming soon in the organisation of control, which will place complete operative authority and trusteeship of the shareholdings of the iron and steel combines in the hands of the German Economic Committee in Frankfurt. This body is wholly anti-Socialist and will be in effective control of policy on the German side for at least a year to come. The Americans, though pledged to respect a German decision, are too firmly convinced that Socialism impedes production not to object to any practical steps which lead in that direction. The British Government, on the other hand, is still bound by Mr Bevin's word to support public ownership for the Ruhr industries.

Food from Eastern Europe—II

[FROM A SPECIAL CORRESPONDENT]

IN the preceding article it was argued that the agricultural production of Poland was being directed on lines which suggest that grain exports to western Europe of the kind and on the scale encouraged before the war were unlikely in future. The same trend can be seen in Czechoslovakia, Hungary, Bulgaria and Jugoslavia.

In Czechoslovakia, as in Poland, the main agricultural increase is to be in livestock products:—for instance under the Two Year Plan pork production is to be doubled, milk increased by 75 per cent, eggs by 50 per cent, and beef by 35 per cent.

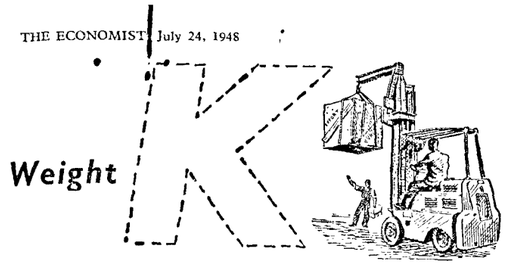
Industrial crops, too, are to be increased, in particular oil seeds by 43 per cent. So far the plan has met with little success, due largely to last year's disastrous drought. Bread grain production in 1947 totalled 1.85 million metric tons compared with the 1935-1937 average of 2.99 million metric tons. Fodder grains, including maize, amounted last year to 1.58 million metric tons, compared with 1935-37 average of 2.41, while potatoes in 1947 yielded 4.68 million metric tons compared with 9.85 in 1935-37. There was, however, another factor at work, of more lasting effect than the weather, and that was the movement of population which has occurred, especially in the former Sudeten areas. In some districts not more than one farmer in six is cultivating the same holding as he had before the war; and the general uncertainty which is felt, partly as a result of this shift of population and partly because of land reform, is a serious handicap to the plans for increased production.

Czechoslovakia, as has already been said, has always imported more food than it has exported; in the future it is unlikely to have any significant increase in its agricultural exports, and it will certainly require more from its neighbours than in the past.

Hungary is another country where in 1947 there was a disastrous decline in production. The wheat harvest, for instance, yielded 1.13 million metric tons in 1946-47 compared with 2.48 million metric tons in 1938-39. Reductions of a similar order took place with rye, maize and potatoes. The final figures for 1946-47 are not yet available, but bread grains are not expected to show any significant rise over the previous year, potatoes should reach nearly 90 per cent of 1938-39, and maize may show a slight increase over the pre-war figures. But even the Three Year Plan, the last year of which is 1949-50, looks forward to yields of wheat and rye well below prewar—1.8 million and 0.45 million tons respectively; a maize yield of 2.46 million tons compared with a prewar figure of 2.34, and a potato yield of approximately the same as prewar. It is in industrial crops where the greatest rise in production is to take place; sugar beet is to increase nearly tenfold, and the number of pigs will, according to the plan, be double the prewar figure by 1950.

But the emphasis of Hungary's economic plan is on the industrial side; this is shown by the fact that agricultural production is planned to yield 10 per cent less in value that it did in 1938—9,500 million forints compared with 10.4 million; while industrial production is to increase by 4,000 million forints over the 1938 figure of 14,700 million forints. Therefore, even if the plan succeeds, Hungary's agricultural exports will be greatly reduced; indeed it is probable that its grain exports will disappear entirely, since the reduced crop will have to feed not only a growing human population, but a much enlarged animal population also.

There are, however, great difficulties in the way of executing even such a modest plan as this, because in Hungary—alone of Eastern European countries—the Government has not been content to dispossess the former large land-owners, but has continued to distribute this land among the peasants. Out of a total agricultural area of 18 million acres, the state obtained by its land reform 7 million acres, and a further 1½ million acres of forest land. By far the largest proportion of the agricultural land has already been divided between former peasants and farm workers, and only a very small area has been retained as state farms or experimental farms. What is more, so great is the mistrust of the peasant for any form of co-operation or collectivisation, that no attempt has been made to increase production or facilitate marketing by co-operative means. The absence of co-operation will make itself felt particularly in Hungary's seed trade, which formerly accounted for 15 per cent of its agricultural exports or 5 per cent of its total exports. The technical problems of isolation to prevent contamination by other varieties and of inspection for purity are such that peasant farmers will not be able to grow seeds of sufficient quality unless they co-operate. Nor will they be able to preserve, pack and grade their animal products, fruit and vegetables in a manner suitable for export if they insist on operating as single individuals. It therefore seems certain that Hungary's value to Western Europe as an exporter of agricultural produce in any form has largely disappeared.



Like Poland and Czechoslovakia, Jugoslavia, too, is trying to become an industrial country. Agricultural production is to increase, but to a far lesser extent than industrial production; while the agricultural increase is to be in industrial crops and livestock. The Five Year Plan, which is due to be completed in 1951, aims at a reduction of the total grain area from the 1939 figure of 6.24 million hectares to 5.71 million hectares by 1951, while industrial plants are to be increased by 245 per cent—from 204,000 hectares to 1½ million hectares. The greatest increase will take place with soya beans (715 per cent), cotton (415 per cent), sunflower (381 per cent) and flax (268 per cent).

Jugoslavia's Difficulties

But, in spite of reductions in the area of Jugoslavia's grain crops, total production is to be increased, according to the plan, by a higher yield per hectare, with the result that the total grain yield is to rise by 113 per cent. In all, agricultural production will grow from the 1939 value of 63.8 milliard dinars to 96.7 milliard in 1951. A variety of means is to be adopted to bring this about. A comprehensive cropping plan is drawn up year by year by the Federal Government for each of the People's Republics, and this plan is broken down by the Ministries of Agriculture of each Republic for each district. Here and in the villages People's Committees continue the work, so that eventually every farmer receives his quota of crops to be grown and cattle to be delivered. Up to date methods are to be applied, and to this end agricultural technicians are to be trained and sent round the countryside. State farms are to breed good seeds and livestock and to carry out research. Agricultural machinery and fertilisers are to be produced on a far greater scale than prewar—nine times as many ploughs as in 1939 and 4.8 times the prewar fertiliser production. Finally, co-operation is to be encouraged in every way, both by co-operative farms and by co-operative marketing and buying.

However, in spite of these comprehensive plans and statistics, the Federated People's Republics of Jugoslavia are likely to have many headaches before success crowns their efforts. Before technicians can be sent round the countryside they must be trained; and before they can be trained, faculties at universities must be enlarged to cope with the increased number of students. Before agriculture can be adequately mechanised, supply depots for spare parts must be established throughout the country, and it must be possible for the farmer to get in touch with these depots without delay if a machine is broken. Mechanised farming requires modern roads and communications, and it does not need more than a short drive through the Bosnian countryside to show the lack that there is of these. Before modern methods in any form can be adopted, the farmer himself must be prepared to accept them; and the very type of man who is most likely to adopt new methods is to be enticed away from agriculture in order to build up the industrial power of Jugoslavia—that is to say, to help in the planned increase of crude oil production to 45,000 per cent of its prewar level, railway trucks to nearly 30,000 per cent, machine tools to 75,000 per cent and electrical machinery to over 3,000 per cent.

Jugoslavia can certainly spare a large number of its 5½ million people who are engaged in agriculture without lowering production, but the most go-ahead men must remain if the planned increase is to be achieved. This will mean stern competition for good labour between agriculture and industry, and, in view of the predominant emphasis placed upon the latter, it is unlikely that agriculture will win. Jugoslavia will undergo in a short space of time the drain of good workers from the countryside which has been taking place in England for the last hundred years; and this is to take place at the very moment when

a greater intensity and mechanisation of agricultural production is contemplated.

Finally, as in all the other eastern countries, the Jugoslav peasant lacks confidence in his Government. Although land reform is not an important factor—only 1,750,000 hectares of agricultural land have been expropriated since 1945—the peasant sees all round him, and particularly in the replacement of the village shops with the state and co-operative shops, evidence of the Government's feeling towards private ownership. He feels no security, and for this reason lacks goodwill towards the Government; therefore he will not co-operate.

Bulgaria Imports Food

In Bulgaria before the war the agricultural exports (including tobacco) accounted for over 90 per cent of total exports, while imports of food were almost insignificant. By 1946 tobacco and cigarettes accounted for over 75 per cent of the total agricultural exports (compared with approximately 50 per cent prewar), while food imports amounted to two-thirds of the value of food exports. In 1947 the relative importance of tobacco and cigarettes had risen still higher, so that they totalled over 85 per cent of agricultural exports, and for the first time food imports were higher than food exports—an extraordinary state of affairs for a country where over 80 per cent of the people are dependent upon agriculture for their livelihood.

Official pronouncements talk of the encouragement of "important farm products for trade and industry." But at the moment all energies are being directed towards increasing general agricultural output, regardless of whether it is for industry or for food. However, it is probable that, as soon as the immediate food shortage is over (which should be by the end of this harvest), there will be a renewed emphasis upon industrial crops. The immediate plan is to increase production to 160 per cent of last year by mechanisation and through co-operative farms. But it must be remembered that co-operative and state farms between them do not cover more than 4 per cent of the total agricultural area of the country. In the immediate future, therefore, it is impossible for these to play a large part in any increased production.

Here, as in so many other things, Bulgaria is following in the footsteps of Jugoslavia. The plan, though not worked out in the same detail, is likely to be the same, the means for achieving the plan are also the same, and the difficulties which stand in the way of such achievement are the same. The Bulgarian farmer, like his Jugoslav neighbour, is a small capitalist and, what is more, he has learnt through generations of occupation how to defeat the plans of a Government which he does not like. In spite of this, it is certain that Bulgaria will soon no longer need imports of grain from Jugoslavia or Rumania, and will be in a position to export food elsewhere. But this export will never reach the heights that it did before the war, because of the tendency towards increased livestock production. In any case it is probable that a considerable part of the exportable surplus will go to Czechoslovakia, and possibly to Hungary and Poland, in return for industrial products.

(Concluded)

Aftermath to Violence

[FROM OUR ROME CORRESPONDENT]

THE attempted assassination of a man, who claims to be a national leader, at the moment when he was casting round for an escape from embarrassment and eclipse, may be expected to act as a strong, if temporary, tonic to his politics. The last parliamentary speech of Palmiro Togliatti before the shocking act which appears, happily, to have spared his life, was judged to have been his weakest. After an exordium to the effect that peaceful coexistence of capitalist and communist economies is not impossible—which is what Stalin has said to Stassen and other visiting Americans for months past—Togliatti spoke at great length against the Marshall Plan. He ended with a pledge to meet imperialist war by an insurrection in the name of peace.

According to alleged minutes of the Bucharest meeting of the Cominform a month ago, Togliatti and his companion Secchia suffered a sharp reprimand and were ordered to resume the struggle against the bourgeois state and not to wince at insurrectionary methods. Authentic or false, the alleged instruction was borne out by Togliatti's speech of July 10th, by his party's actions on July 14th after the attempted assassination, and by the harsh post-strike article, "The struggle continues," in which Luigi Longo, operational chief, second in command, and incorruptible confessor of the purest Muscovite word, issued instructions to Italian Communists. There can be no doubt of Togliatti's courage, energy and brilliance, and probably no doubt of his readiness to serve the cause, if necessary, as a commander in direct action. But he has stood from first to last, since 1943 (and earlier as a broadcaster from Moscow) as the protagonist of rhetorical, insinuating, propagandising Communism. And the scope for that sort of activity seems to have vanished, with the eclipse of the Popular Front, under two impacts—the election failure, and the Cominform's Menetekel to fellow travellers. What scope is there now for marching towards Communism by direct action? Much, no doubt, for work as a fifth column, if Italy became involved in a Crusade of the West. But if Italy enjoys external peace for a while, then insurrectionary Marxism, like evangelising Marxism, seems to face dim days.

Insurrection According to Plan

The attempted assassination offered possibilities for the Italian Communists and their friends to recover some political influence, had they been free agents. There was genuine national indignation at the crime. This might have been exploited both by weakening the Christian and Third Force separatism which has long been at work in the General Confederation of Labour, and by obliging Premier de Gasperi to take the opposition into consultation on questions of public order. Pietro Nenni, indeed, made gestures in this sense to de Gasperi, but they were spoilt by the Communist "Plan K" or "Plan Z" which was put into operation immediately after the crime.

In Genoa, almost immediately, about 50,000 workmen, pouring from the industrial suburbs to the centre of the town, disarmed the police on their route, seized four armoured cars from the military, and established road blocks with machine guns. Unsuccessful attempts were made to occupy the telephone exchange and a generating station. In Milan, the local Chamber of Labour ordered all workers to stand by at their factory posts, suspending work. Later, two factories, the Motta confectionery works and the Bezzi engineering works, both of which in recent days have been cleared by police of sitdown strikers, were entered by force.

In Turin, according to the Government, the Managing Director of Fiat, Signor Valletta, and a number of the higher personnel, were seized and held at the works. A later statement by Signor Valletta indicates (perhaps for diplomatic motives) that they remained in the factory for two days of their own accord. A kind of Committee of Public Safety was formed in Turin, headed by Moscatelli, one of the romantic figures of the Communist Partisan Army of 1945, now a Senator. There was extensive sabotage to railway lines in North and Central Italy; according to the radio this took place at over a hundred places. The Communist argument is that a great many scattered operations, unconnected with the order for a general strike, demonstrated the spontaneous wrath of the workers at the assault upon Togliatti. The Government thesis is that the acts had a planned insurrectionary character. Possibly they were parts of a Plan requiring a cue, and young Pallante's shots were a not quite definite cue on which only partial action ensued.

Split Labour Leadership

In any case, the Government has emerged from its trial with enhanced prestige. The attempted assassination, followed by three days of what might be termed syndical insurrection, has brought the question of labour leadership suddenly to a head. The formation, nominally inside the General Confederation of Labour, of a separate Christian Democratic leadership has been proceeding more or less quietly for many months. During the winter the Christian Democrat minority won for itself the right to express and to explain its dissent from decisions taken by the Confederation's executive, without such dissent being regarded as treachery. This right has been freely used in connection with national and local strikes. The syndical insurrection of mid-July has, however, spurred large numbers of Christian syndical organisers to demand what their chief guide, Giulio Pastore, has hitherto avoided—repudiation of the syndical unity established in 1944. This would mean a return to the regime of a separate Christian Confederation such as existed, and at times competed powerfully with, the "Red" Confederation before both were suppressed by Fascism.

At the moment it is not clear whether the dispute between Marxist and Christian syndicalists will result in this clear breach. For their part, the "Third Force" syndicalists, hopeful of swaying the old organisation towards their own gradualist purposes at the expense of the Communists and Nenni Socialists, are striving hard to avoid it.

"Glad you like this sherry —it's South African

It's extremely good. I got some South African wine the other day . . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

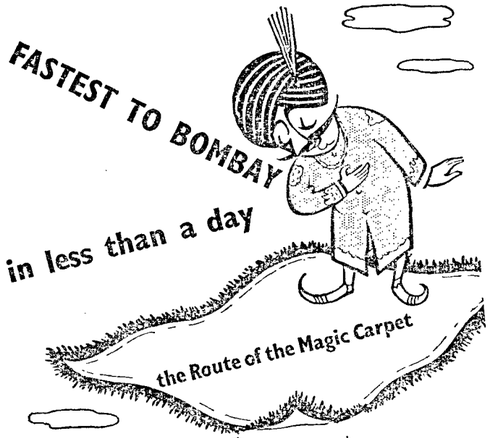
Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.



Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too."

Britain's Food Stocks

INFORMED discussion on Britain's food policy is almost impossible because no official figures of British food stocks are published. This difficulty was voiced during the debate on food supplies in the House of Commons a fortnight ago. But Mr Strachey gave no ground; indeed he even refrained from pressing into service the old argument that publication of stock figures would weaken Britain's bargaining power in bilateral trade negotiations. This doctrine has always been difficult to swallow. If it had any force, it might be expected that publication of non-ferrous metal stocks would damage Britain's bargaining power with producers of non-ferrous metals, but there is no evidence that it does. Mr Strachey offered to the House the innocuous assurance that "the stock figures are, if anything, a little higher"—that is, compared with a year ago. The Ministry of Food's trading accounts—the latest relate to 1946/47—seem to be designed to shed as little light as possible on its operations. Commodities are grouped together in such a manner as to defy statistical investigation; for example, "cereals" form one category, "milk products" another, "meat and livestock" a third. Moreover, the value of stocks given in these accounts is said to be calculated on "a cost basis," but it is impossible to correlate these stock figures with the average costs (excluding subsidies) of the foodstuffs concerned, as given in Parliament from time to time.

This policy of secrecy certainly prevents constructive discussion of the Ministry's operations. Nevertheless, it is possible to get some impression of the size of Britain's food stocks. An arduous and lengthy method is involved*, and though the results may not be absolutely accurate at any given date, they should give a fairly reliable indication of trends. A calculation based on the same method was published in *The Economist* of May 17th last year and the figures have now been brought up to date. Table I shows the estimated bulk stocks (excluding wholesale and retail stocks) for eleven rationed foodstuffs on April 1, 1948, with comparative figures for the two previous years. Stocks last year were known to be low—for some foods dangerously low. But the high rate of imports during the summer months materially increased the level of stocks, and by October 1st, wheat stocks, for example, were probably about three times the April level. The figures in the table are in line with Mr Strachey's recent statement. Stocks, if anything, are a little higher; indeed, for certain foodstuffs, that may even seem an understatement, but Mr Strachey may have been referring to the figures for July 1st and not April 1st.

But, if these figures are reasonably accurate, they do not suggest any ground for complacency. Of canned corned meat—the one food which few people like in any quantity—there was just over a year's stock. Stocks of dried egg—another food which also has a limited sale—amounted to over thirty-three weeks' supply, at current rates of consumption, while there was more than three months' supply of sugar and tea. For other foodstuffs, stocks are much tighter, ranging from two and a-half weeks' supply of butter to over eight weeks' supply of wheat. For many items a fortnight's supply must represent the lowest working margin. Perhaps the stocks on April 1st were not quite so low as Table I would suggest because the Easter holidays at the end of March tended to reduce the published import figures below actual arrivals—a discrepancy which would, of course, be balanced out in April. Movements of stocks in the second quarter cannot yet be assessed with any accuracy, and the last column of Table I gives at best only a rough indication of what may have happened to food stocks in the second quarter. All the foods listed, except flour, butter, bacon and sugar, appear to have declined, but the changes are not exceptional and seem largely to reflect seasonal fluctuations in imports.

If these figures give a reliable indication of food stocks, what inferences do they suggest about British food policy? First, despite heavy expenditure on food imports during the past year, there have been no excessive increases in stocks. Supplies of wheat, flour, margarine, cheese, carcase meat, dried eggs and sugar at the beginning of April were all larger than two years ago, whereas stocks of butter, canned corned meat, bacon and hams and tea have been reduced. The Minister of Food has admitted that stocks of sugar are large, but has refused to increase the ration; instead overseas purchases will be reduced (with some saving of dollars) and stocks will be used to meet current needs. This policy is sound, but it covers a previous mistake in buying, for stocks were accumulated when the sugar was at or near its peak, and the cuts in sugar imports are now to be made when sugar is becoming cheaper. The increased stocks of dried eggs in April, 1947, perhaps provide another example of openhanded expenditure of dollars on a food for which the public has only a second preference. Yet, apart from these examples, the stock figures suggest little ground for criticism of the Ministry's policy, so far as the staple rations are concerned.

But examination of the balance of payments shows that, although the quantities of food imported in 1947 were in general much lower than in 1938, Britain could ill afford them. If dollars from ECA had not been available this year, a sharp reduction in rations would have been inescapable, with serious repercussions on British recovery. Despite repeated affirmations by Government spokesmen that food policy took no account of the possibility of Marshall Aid, it is obvious now that a high level of consumption—relatively to what the country could afford from its own

* Stocks have been computed by deducting total disposals in the United Kingdom (including exports and re-exports) from the aggregate of home production and imports for each year and relating the series backwards to prewar stock figures.

resources—was maintained on the hope that dollars, in one form or another, would be provided by America. The changing pattern of British food imports is shown in Table II. Wheat imports in 1947 were 83 per cent of the 1938 figure, though imports of flour were two and a half times heavier. Canada is the main source of supply. More Argentine wheat, however, was purchased than before the war, but the expansion of grain production in Australia suggests that imports from South America will be reduced in future. Imports of butter were less than half the prewar level, largely because smaller quantities arrived from Denmark, though neither New Zealand nor Australian shipments are yet as large as in 1938. Cheese imports, on the other hand, have increased by over 30 per cent and the United States has become the second most important source of supply. Meat imports, calculated by carcase weight, show little change compared with 1938, but they no longer include large quantities of chilled beef; instead there is more frozen beef and mutton. Nevertheless, Argentina remains the largest supplier. Bacon and ham imports were much smaller in 1947 than in 1938, but over three-quarters of the total quantity came from Canada, compared with one-fifth before the war. This reflects the great efforts of the Canadian farmer to help to feed Britain during the war. Large imports of dried eggs for direct consumption were another wartime development, which has persisted at a significant cost in dollars. India and Ceylon remain the chief suppliers of tea, but the quantities received from each is less than before the war. Sugar imports, on the other hand, are smaller than in 1938 and, moreover, they are now derived to a greater extent than formerly from dollar countries, such as Cuba and St Domingo, instead of Australia, Mauritius and South Africa.

The Government did not begin to switch from dollar to sterling sources of food supply until last August. In 1947, a greater proportion of Britain's staple food imports came from hard currency countries than before the war. And figures for the first six months of 1948 show only a slight change towards sterling sources; the only foodstuffs affected are cheese and sugar. Indeed, there can be no immediate saving in dollars for food imports unless the level of home consumption is reduced. The new long-term contracts may be more successful in future in securing larger quantities of food, particularly from sterling areas. Contracts have been signed with Australia and New Zealand for meat, butter and cheese, and with other Commonwealth countries for sugar, coffee, vegetable oils and fats. But past experience shows that in few cases has the existence of a long-term contract encouraged a large-scale expansion in output. Again, where contracts have been made with hard currency countries—such as the Canadian contract for wheat, beef, bacon and eggs, and the Argentine contract for meat—first intentions have been greatly affected by exchange difficulties. In the case of Canada, the contractual quantities had to be reduced to conform to Britain's ability to pay dollars, while two separate attempts in 1946 and 1947 to find a basis for regular supplies of Argentine meat over a period of years have failed. These difficulties do not necessarily mean that the notion of a long-term contract is worthless. But they do demonstrate that the contracts so far negotiated by the Ministry of Food have yet to succeed in one of their avowed purposes—to secure an expanding supply of foodstuffs for Britain.

The Commonwealth producers require a guaranteed market for their produce. If they will accept sterling, Britain can certainly give that guarantee, but price still plays an important part. The contract for butter and cheese signed with New Zealand last week is an attempt to give farmers there some measure of price stability; negotiations are also proceeding with Australia and Canada. Britain has agreed to purchase New Zealand's exportable surpluses for the next seven years until July 31, 1955. The initial price for butter is 235s. a cwt., against 205s. in 1947/48, and for cheese 133s. a cwt., against 118s. last season. These are sharp increases and they bring New Zealand prices more in line with Danish prices. They will, incidentally, also raise the cost of food subsidies close to £500 million a year. But the contract stipulates that at the annual price review, prices are not to be altered by more than 7½ per cent in either direction. Thus in 1955, New Zealand butter and cheese cannot cost Britain less than 147s. and 83s. a cwt. respectively—and these prices would show an advance of little less than 50 per cent above the prewar level. Such

prices may or may not prove to be too high, but the limited correction of prices each year should afford some stability to both Britain and New Zealand, although Britain would prefer to have this stability nearer the bottom of the market, rather than at the peak. The main weakness of the new contract, however, is the lack of a specific guarantee to increase output. It is hoped that over the next seven years, New Zealand production will expand by between 20 and 25 per cent. But it is no more than a hope. From Britain's point of view, the success of any long-term contract must depend partly on the extent to which it encourages a larger output when that output is required.

The development of new sources of food is fraught with its own difficulties, apart from any question of long-term contracts. So far little headway has been made, even with the East African groundnuts scheme and the Queensland project. To expand agricultural production for the British market in those countries with which Britain has a serious trade deficit—even a sterling deficit, unless it is likely to be temporary—only postpones the problem to the future. Suppose that increased industrialisation of a particular Dominion causes Britain's trade balance with it to become permanently adverse, because British manufactures no longer find an adequate market there. Unless such a deficit can be balanced multilaterally, there is little point in allowing it to rise by exporting more food and raw materials to Britain. This consideration may encourage new development projects in colonial areas where the likelihood of rapid industrialisation is smaller. Such projects, however, involve large capital investment, the resettlement of natives and will take many years to mature. They promise no relief in the short run for Britain's food supplies.

Bill Market Documentary

UNTIL quite recently, one of the peculiarities of the London Money market has been the paucity of precise information about the scale of its operations. Traditionally, a high proportion of its members comprised firms or private companies which published only very meagre and inadequate balance sheets, or none at all. As a result, unofficial investigators had to rely upon estimates—and often mere guesses—of the activities of an important part of the whole mechanism. This is still true of a large segment of the acceptance market, but is fortunately no longer true of the discount market. When hostilities ended in 1945, the eleven London discount houses envisaged great opportunities for expansion by providing facilities for smoothing the course of reconversion finance, as well as the ex-Chancellor's cheaper money programme, in the short bond market. Encouraged by the central authorities, they were quickly released from the postwar queue of applicants to the Capital Issues Committee, and during 1946 and early 1947 succeeded in increasing their aggregate capital resources by some 50 per cent—raising them to about £34 million. This financing, traced in some detail in these columns at the time, involved the conversion of a number of firms and private companies into public companies, and a series of introductions of discount market shares to the Stock Exchange. Of the eleven discount houses in existence in 1945, nine are now required to publish balance sheets. Including one new private company, formed early last year, the segment of the market whose operations are still undisclosed now represents one eighth or less of the whole.

For the first time, therefore, it is possible to obtain an authentic picture of the bulk of the market's operations. Unfortunately, the several accounts are compiled on diverse accounting principles and the spread in accounting dates is very wide, so that no instantaneous photograph is possible. For the purpose of aggregating the figures of the nine houses, even the minimum spread ranges from a balance sheet dated as early as September 30, 1947, to one dated April 30th last. This is the spread adopted in all the aggregates which follow, but it should be noted that the centre of gravity in each falls early in the calendar year, because the "Big Three" companies all make up their accounts on December 31st. To some extent, however, the spread has the advantage of reducing the distortion due to seasonal factors, which are strongly marked on the Treasury bill side of Lombard Street's activities. The resultant composite balance sheet is on the next page, with comparisons for the two preceding years. The comparative figures of the new public companies are mainly drawn from the statements published for Stock Exchange purposes, but one or two have had to be estimated.

To people unfamiliar with the technicalities of Lombard Street's operations, the size of this account may come as a surprise. These nine houses, it will be seen, together commanded loans and deposits totalling no less than £736 million. If figures were available for the three discount houses which do not publish accounts, as well as for the four "running brokers" which also carry a small portfolio on borrowed money, the total for the discount market as a whole would be fully £825 million. The significance of this figure will perhaps be more readily grasped if it is compared with the level of ordinary bank deposits: it is appreciably bigger than the whole volume of clearing bank deposits on the eve of the 1914-18 war, and is equivalent to about one seventh of average bank deposits during the past year.

This deposit comparison is given purely as an indication of size, for the character of the discount market's borrowed funds is radically different from that of the banks' resources. Some of the discount houses do, indeed, attract a moderate volume of deposits from the public (mainly from large business undertakings at home and abroad), since they pay interest even on balances which are withdrawable without notice, but by far the greater part of the market's borrowed resources comprises loans at call or short notice from the banking system. This call money from the banks is invested in, and is secured by the deposit of, Treasury bills, commercial bills of exchange and short-dated Government bonds. Because of the special nature of this business, and particularly of the risks inherent in dealing in the gilt-edged market on the basis of borrowed funds, much of which may be withdrawn by the banks at a moment's notice, the discount market's own capital resources play a pivotal role in its operations. They determine the size of market commitments in much the same way as the cash reserves of the banks govern the size of bank deposits.

It follows, therefore, that the total of discount market portfolios of bills and bonds is appreciably larger than its loans and deposits. The composite balance sheet for the nine houses shows an aggregate portfolio of nearly £750 million—just under thirty times the published capital resources of £25½ million, including all disclosed reserves and the free balances on profit and loss accounts. The three remaining discount houses have an aggregate paid-up capital of about £3,250,000, but do not publish any figures of reserves. If, therefore, these three houses work on the same average capital ratio as the nine, the total portfolio of the twelve houses would be rather more than £845 million. These figures show that in the past ten years the London discount market has expanded even more rapidly than has the business of the banks. The total portfolio of the market before the war is generally put at rather under £250 million, so that it has been multiplied nearly three and a half

times, whereas the volume of bank deposits has been multiplied less than two and three quarter times. This more rapid growth of Lombard Street business is to a large extent due to greatly increased operations in the short bond market, in which the jobbing activities of the discount houses now perform an important shock-absorbing function. The technical nature of this function has been fully described in several earlier articles in *The Economist*, and need not be detailed on this occasion.

Unfortunately, the published balance sheets are a rather unreliable guide to the scale of this business, because several of the discount houses still follow the practice, which used to be general, of including their shortest bonds in the balance sheet item for bills—and bonds with up to three years to run are sometimes included under this heading. The aggregate of £183 million for disclosed bond holdings shown in the accompanying table is therefore an understatement. The true average ratio of bonds to published capital resources is certainly higher than the 7:1 proportion given in the table. If the aggregate bond portfolio of the twelve houses is estimated on the basis of the figures of those houses which do show all their bonds separately, the total, computed proportionately to disclosed capital resources, would be about £250 million.

NINE DISCOUNT HOUSES: COMBINED BALANCE SHEET, 1946-48*

Loans and Deposits	517·50	33·4	712·48	30·0	736·0	29·0

* Balance sheet dates in each period range from Sept. 30th to April 30th.

Because of this partial concealment of the bond portfolio in some balance sheets, the true holding of bills by the nine houses is, of course, appreciably smaller than the figure shown in the table. But it will be seen that, on the basis of the estimate of £250 million of bonds for the market as a whole, the true aggregate bill portfolio would be rather under £600 million, compared with, say, £350 million or less two years ago. The earliest year shown in the table relates to the period just before the wave of capital expansions, and, subject to the qualification already mentioned about bonds, the comparison gives a fairly reliable indication of the resultant expansion of bill portfolios. But it does not measure the corresponding growth of bond portfolios, because these rose very fast during the opening of the cheaper money drive during the autumn of 1945, and this expansion was virtually an anticipation of the new capital resources—in the sense that the subsequent permission to the discount houses to raise new money was specifically designed to enable them to take in bonds on approximately the scale of 1945 when their shock-absorbing function in the gilt-edged market so required.

In one particular, however, the comparison strikingly measures a significant trend of the past two years. The biggest proportionate expansion is in the item "re-discounts," which represents the amount of commercial bills of exchange re-sold by the discount houses to the banks and still outstanding at the dates of the accounts. As the discount houses generally have the greater part, and a roughly consistent part, of their commercial paper under re-discount, this impressive increase, from £19 million to £68 million, is a good index to the scale of the revival which has occurred in the use of bills of exchange for business financing. If allowance is made for the three houses whose accounts are not made public and also for the further expansion in this type of business since the average date of this composite balance sheet, it is clear that the volume of commercial paper in the discount market may now be approaching £100 million. This is only a modest fraction of the volume in existence twenty years ago, but it reflects a much more vigorous postwar revival than many had dared to hope for during the war.

The period embraced by the latest accounts of course covered the months of collapse in the gilt-edged market—a phase which confronted the discount houses with the first real test of their new-style bond business under adverse conditions. Unfortunately, the accounts are only a poor guide to their experience in this important matter, partly because of diverse methods of treating depreciation and especially because the published profits of the discount houses are peculiarly subject to the intricate vagaries of divergent incidence of taxation—not to mention inner reserve policy. For this reason, no attempt has been made to compile a composite table of profits. One company, the first to make up its balance sheet after the gilt-edged slump, did indeed show an actual loss after provision for depreciation; other companies, whose accounts were made up later, showed lower but still substantial profits after charging their depreciation against them; and one large company actually showed increased profits but drew upon its inner contingency reserves for the purpose of writing off investment depreciation.

Unless the gilt-edged market again turns sharply downwards, the financial effects of the slump will be gradually obliterated in Lombard Street, for the yield margins now obtainable on bonds, by comparison with the cost of financing them, are relatively generous, thus enabling the discount market steadily to replenish the sums it has had to withdraw from internal reserves. Meanwhile, the change in the gilt-edged market has induced the discount houses to shorten sail. Their shock-absorbing role drove them to buy large quantities of bonds during the pressure of public selling last summer. Their portfolios now are smaller than the bloated size they then assumed, and they are also concentrated almost entirely upon the shortest bonds. After years of easy money from bond-dealing in a rising gilt-edged market, there was always the risk that the capital increases of 1946 and early 1947 might induce an excessive expansion. On a long view, perhaps last year's gilt-edged collapse was a good thing for Lombard Street. It has certainly driven home the first principle of sound dealing for bond-jobbers working on borrowed money: Keep short—if you can.

"THE YIELD STRUCTURE"

Let an investment adviser loose with his technical jargon, and it will not be long before he is discoursing learnedly about the compression of the yield structure. And what does that mean? In plainer English it means that securities yield less than they did, and the difference between the best and the not-so-good is smaller than it was. If you like slide rules and hard labour, you can work out yields for yourself. But most investors find it easier to rely on the two-page table which appears each week in the RECORDS AND STATISTICS Supplement to THE ECONOMIST. This (unless we have miscounted) gives the prices, dividends, and yields of 371 gilt-edged and industrial securities, to say nothing of new issues and unit trust prices. For something less than a shilling a week, this feature of RECORDS AND STATISTICS alone is worth the investor's money.

RECORDS AND STATISTICS is available on postal subscription only. The subscription rates are £2 10s. a year for RECORDS AND STATISTICS alone or £5 together with THE ECONOMIST.

Business Notes

London and Wall Street

In London, the reaction of the Stock Exchange to the Berlin crisis has been one of almost complete aplomb; on Wall Street, nerves have not been so strong. The difference in behaviour does not arise from any sharp contrast between the assessment of the Berlin problem in the two centres. It reflects rather the fact that London was already oversold, and Wall Street overbought, before the crisis broke. For several weeks, the British investor has been trying to assess the balance of forces between the Chancellor's policy of disinflation and the accumulated inflationary strain which must be contained or released if that policy is to succeed. The evidence of still rising costs, of growing strain on capital resources, and of dividend limitation has led him to take a cautionary view of market prospects. In Wall Street, since the break in prices last February, the condition has been almost the reverse—a renewed rise in prices, no sign of disturbance to the high level of industrial activity, and the reinforcing effects of ECA expenditure on a market which is fully occupied in meeting domestic demand.

Thus, London was relatively proof against any major disturbance, so long as the volume of business remained subnormal. The past week, indeed, has demonstrated the occasional advantage which a narrow market and a "short" position may provide. On Friday last week, the market wavered, largely as a reflection of the critical political situation, but partly in vicarious sympathy with New York. The *Financial Times* industrial ordinary share index dropped by a full point to 109.7. This week, the opening declines in prices were quite modest, and by Wednesday the better tone produced a fractional rise in the index to 109.4. The private investor seems convinced that his best policy is to "stay put"; but despite the inert appearance of the market, with its quite subnormal turnover, there is evidence of institutional support for the leading equities, whose yields are now fully half of one per cent more favourable than they were three months ago.

* * *

Exports and the Gap

Exports in June achieved a new postwar record. The daily rate was 3 per cent higher than in May—the previous postwar record—and the total value of £134 million was only £3,000,000 below the figure for July, 1920, when the highest exports of all time were recorded. The effect of the London dock strike is not yet evident in the trade accounts owing to the time-lag in compiling the figures, but it is likely to be marked enough in the July returns. The volume of exports for June has been provisionally estimated at 138 per cent of the 1938 level—2 points below the mid-year target of 140 per cent set by the Government. Those who require statistical comfort may allow for June having only 25 working days instead of the usual 26, and recalculate the volume of exports at 144 per cent—an exercise reminiscent of counting 53 weeks coal output in 1947. But apart from such spurious target-shooting, the export drive initiated by Sir Stafford Cripps last September is going fully as well as could have been expected. The following table recalculates the monthly figures on the standard basis of 26 working days.

BRITISH EXPORTS
£ million

October	104	January	115	April	126½
November	106½	February	122½	May	135
December	114½	March	126	June	139½

The volume of exports in the second quarter is estimated at 134 per cent of 1938 compared with 126 per cent in the first quarter and 118 per cent in the last quarter of 1947. In fixing the end-of-year target at 150 per cent, the Government set out to achieve an average volume of 125 per cent for the first six months and 136 per cent for the second. At least the first objective has been attained—indeed, the average volume was in fact 130 per cent of the prewar level. But it will be no easy matter to raise the average rate by a further six points during the second *half* of the year.

Imports in June increased by £1,100,000 to £177 million. Exceptionally large quantities of raw cotton were received—mainly from Egypt and the Sudan—and their value (£13½ million) was the highest since 1925. There was also a record import of paper-making materials, largely woodpulp, from Sweden Canada, Newfoundland and the United States. Nevertheless the adverse balance, without allowing for insurance and freight, fell by £2,200,000 to £38 million. The excess of imports (valued c.i.f.) over exports and re-exports (valued f.o.b.) for the first half of the year amounted to £251 million against £267 million in the same period of 1947. Deducting the customary 10 per cent from the import figures to allow for insurance and freight, the visible adverse balance for the first six months would be about £150 million compared with £185 million for the first half of 1947. But the deficit is not being reduced quickly enough to satisfy the Government's planning in the "Economic Survey" which put the deficit for the whole year at £250 million.

* * *

Towards the Targets

Machinery and vehicle exports—the two main groups—are already very close to the end-year targets. Shipments of machinery have been at a record level and in recent months have been running at double the rate in 1938. Sales of agricultural machinery—tractor exports, for example, were two and a half times larger than a year ago—textile machinery and internal combustion engines have been particularly good. In the vehicle group, exports of both private cars (115,800 in six months) and commercial vehicles (34,000) have increased appreciably, and greater numbers have been shipped to hard currency countries. Some 8,300 cars were exported to the United States in the first half of the year compared with 185 twelve months ago, and 9,280 to Belgium against 3,186. It is estimated that over three quarters of the national output of cars and more than a half that of commercial vehicles are being exported.

The main weakness of the export drive lies in textiles. Exports of cotton goods in June were only £10 million against an end-year target of £13 million; piece-goods and other manufactures are the farthest from their target. There has been a small but steady rise in manpower in the cotton textile industry since the beginning of the year which has been reflected in a significant expansion in yarn production—at the beginning of June it reached a postwar record. Cloth production, however, has lagged behind, and if the export target is to be achieved the home market will have to go short. The export of wool goods, especially piece-goods and blankets, is even more disappointing. The June figure of over £7½ million compares with an end-of-year target of nearly £12½ million. The one bright spot here is the export of tops, which is almost up to the target; production has expanded continuously and is now above the average for 1937, itself a year of high output. Worsted yarn production has also increased, but the expansion in deliveries of finished cloth has been much slower owing to the difficulty of switching from utility to fine quality cloths. And the export market has still a very definite preference for fine worsteds.

Stock Exchange Commissions

The Council of the London Stock Exchange have rejected the recent petition which asked that the new rules governing the sharing of commissions, which are due to be introduced next January, should be rescinded. Their decision has been supported by a detailed statement, which discloses at the outset that the Council sought for means of a compromise; but "the rules form part of one integrated policy" and the Council have been unable to find any middle course that they could recommend. Again, they rejected the idea of a referendum, on the ground that the issues were too complicated for a simple decision, yes or no.

That disposes, in the Council's evident view, of the petition, "which raised no points which had not received the fullest consideration." But the Council then proceed to set out the historical course of changes in agency rebates, from 1912 onwards, with the intention of demonstrating that the new rules are in line with the long-term policy of the Stock Exchange. The alterations in the rules at the critical dates 1912, 1932 and 1941 were opposed at the time, but "contributed materially to the interests of members." The Council reaffirm their opinion that the new rules equally will prove advantageous. The opposition will be no less convinced that the agency system brings its own contribution of business to the Stock Exchange, that not all of this business comes "automatically" and that the logic of the Council's case would be enhanced if the banks' agency business (and, incidentally, that of investment trust managers) was treated on all fours with that produced by other agents.

Even with the assertion of their own high authority, the Council are unlikely to convince the opposition. The numbers supporting the petition reflected a large element of dissatisfaction with the new rules; and since the Council (unlike some sovereign bodies) do not trade in mandates, they might have been expected to pursue further the elucidation of the exact opinion of members about the changes. The Council are on safe ground when they claim that the new rules will not raise the cost of doing direct business on the Stock Exchange; but conceivably the result may be to raise the cost of doing business through an agent. In one form or another, the investor who deals through an agent may have to pay more, and since perhaps one-quarter or one-third of the total volume of business reaching the Stock Exchange comes via agents, the possible consequences of this rise in costs are not lightly to be dismissed. Nor are the Council wholly convincing in their arguments that there are only two ways of relieving members from the rising costs of carrying on this business—by reducing rebates or increasing commissions. Stockbrokers, indeed, have no general ground for complaint that commissions are too low, for they have moved in step with the general rise in the value of securities. It is less certain that brokers have gone as far as they could in reducing the clerical costs of dealing by central arrangements for delivery and clearing. Should not the Council really fortify itself with something more than the exercise, so to say, of their casting vote to resolve the balance of honestly-held opinion for and against the new rules?

* * *

Imperial Chemical Issue Terms

Two months elapsed between Lord McGowan's disclosure to I.C.I. stockholders that application had been made to the Capital Issues Committee for a new share issue, and the publication of the terms last Tuesday. As expected, the issue consists of one new ordinary share of £1 for every £5 ordinary stock held; but, as the equity market has since waned, the price has been scaled down, well below original expectations, to 40s. 6d. When Lord McGowan made his announcement at the general meeting, the stock units stood at 48s. 9d., and an issue price of 45s. seemed plausible. At the close of business last Monday, the units stood at 44s. 3d.—the lowest of the year.

In all, slightly over 10 million new shares will be issued, and the total capital and premiums will amount to £20.4 million. Provisional allotment letters will be sent to ordinary stockholders registered last Tuesday, on August 18th, and both classes of stockholders will have the opportunity to apply for any shares which are not taken up as of right. The issue has been underwritten by a group of four leading firms of brokers—Hoare and Company, Panmure Gordon and Company, Rowe and Pitman, and J. and A. Scrimgeour—for total commission of 7½d. per share. Acceptance must be made by September 14th, with a payment of 20s. per share, and the final payment will be due by October 28th. The new shares will not rank for interim dividend this year, but will be entitled to the final dividend.

A statement on future earnings and dividends, for all its justifiable emphasis on rising costs, Government pressure to reduce prices and dividend limitation, "confidently expects" that the present rates of earnings and dividend will be maintained in the future on the increased capital. On the basis of a 10 per cent dividend, the new shares offer £4 18s. 9d. per cent, which should be attractive enough, for an issue of this quality, to ensure a favourable response unless markets deteriorate most markedly. Seven weeks is a long period at the best of times, and these certainly are not the best. Whatever the outcome of the issue—and there is no reason, despite the clouded horizon, for expecting it to be other than satisfactory—the underwriters will certainly be entitled to their commission.

Pakistan's Sterling Releases

The details of the financial agreement with Pakistan announced this week concern only the releases from accumulated sterling balances and the allocation of hard currency. The other aspects of the negotiations that have recently taken place in London referred to the sale of assets to Pakistan and the capitalisation of pensions. These particular points were discussed and agreed jointly with India and the details of the Indian agreement covered the arrangements made with Pakistan. On the question of releases and hard currency allocations the agreement with Pakistan covers only the twelve months from July 1, 1948. Over this period Pakistan will be allowed to draw the sum of £5,000,000 from its accumulated balances to be transferred to the freely available sterling in the No. 1 Account. An additional £5,000,000 may be released to meet Pakistan's external expenditure for resettlement of refugees. Of the balance in Pakistan's No. 1 Account, £2,000,000 is to be regarded as an additional working balance, supplementing the £10 million made available for this purpose earlier this year. The British Government has also undertaken to make releases of not less than £5,000,000 in each of the two succeeding years, to enable the Pakistan Government to prepare its plans, though the precise releases will be negotiated later. The hard currency quota for the next twelve months will be the equivalent of £5,000,000. In addition, Pakistan will have at its disposal its direct hard currency earnings and any such currencies as it may purchase from the International Monetary Fund.

The Hongkong Leak

Ever since the end of the war Hongkong has been one of the most temperamental members of the sterling area family—valuable, but exasperating. The decision was made on the liberation of the Colony to regard it as a member of the sterling area, though it had not been so from the establishment of exchange control in 1939 until the Japanese occupation. The intention was to apply to Hongkong the same mechanism of exchange control as was operated in Britain and other parts of the sterling area. This was soon found impracticable and indeed undesirable. Hongkong has developed and subsists largely on entrepot trade, and for this trade requires comparative freedom of exchange operations. In any case the geographical position of the Colony, close to the Chinese mainland, and the presence in it of the elite of Chinese merchants and exchange dealers, would have defeated any attempt to operate control on the British lines. The actual policy followed was to give the exchange control authorities in Hongkong all the powers wielded by their counterpart in Britain but to leave it to their judgment and knowledge of local conditions to decide, how much of this power should be used. This discretion has been applied with considerable latitude, but the success of the experiment has been evident in the immense trade handled by Hongkong and the prosperity it has created.

Among other matters, latitude has been allowed to exporters from Hongkong about remitting the proceeds of their sales to the authorities. The general rule has been to require exporters to remit only 25 per cent of the hard currency export proceeds, which must be sold at the official rate, leaving them free to deal as they wish with the remaining 75 per cent. This balance has been dealt with in an unashamedly open and free market in which the cross rate between sterling and dollars has recently been quoted at around $3.20. This toleration of a free market is the second main contrast between London and Hongkong practice in exchange control and again shows the latitude which has been given to the exchange control authorities in the colony.

The experiment has undoubtedly justified itself but it has also involved certain risks. It is notorious that Hongkong has proved one of the main leaks through which capital and resources have left the sterling area. There is a danger that the entrepot trade of Hongkong may be abused to an extent which would more than offset the beneficial results of the freedom granted to that market. The kind of operation which the authorities have had specially in mind is the re-export through Hongkong of com-

modities from other parts of the sterling area which would in any case have gone to a hard currency destination. Because of this diversion of trade the sterling area pool, instead of receiving 100 per cent of the hard currency proceeds, has received only 25 per cent of them, leaving the rest to feed the free market in Hongkong and those who thrive on it.

The matter was raised in Parliament this week and the Chancellor of the Exchequer announced that changes in the exchange control arrangements in Hongkong were imminent. In particular, the exchange proceeds of exports from Hongkong other than Chinese goods sold for dollars and goods destined for China will in future have to be surrendered to the sterling area pool in full. There will also be a tightening up of the import licensing system so that imports of sterling area goods for re-export will be better controlled. Hongkong has also introduced a control of exchange from sterling into Hongkong dollars and *vice versa*. These represent drastic changes. It remains to be seen whether they will achieve their object and whether, in the long run, they will not do more damage than good.

* * *

Adjustments in Coal Prices

On Monday, the National Coal Board introduced the first instalment of the new price structure on which it has been working during the past year. This problem, as the Board's report showed last week, is intensely complicated, and the interim changes now introduced, though broadly commendable to common sense, are far from being a complete solution of the problem of fixing coal prices in accordance with grades and quality, costs of production, differences in transport charges and in size of consignments. The adjustments in fact merely go some distance towards removing the grosser anomalies and distortions in coal prices which have resulted from the wartime (and postwar) practice of applying flat increases to all grades of coal—with the result that bad quality coal became ludicrously costly, and good quality coal relatively (though not absolutely) cheap.

From Monday last, lower grades of coal, mainly "untreated smalls," have been reduced by amounts varying from a few pence to 15s. a ton, while prices of higher grades (mainly large and graded coals) will be raised by amounts varying between a few pence and 3s. a ton, with exceptional increases for the highest grades of "a shilling or two" more. Other grades of coal, including domestic supplies, will remain unchanged. Thus the changes in prices apply largely at the two extremes of the quality scale; they will remove the worst anomalies, but plenty will remain for later adjustment. There is, in particular, the problem of how far future adjustments can be introduced within the limits that the Coal Board has set itself on this occasion—namely to secure broadly that increases are offset by decreases in prices. Moreover, while the reduction in price of low quality coal may be of some help to the electric power industry, the raising of high quality coals, for gas, or coking, or railway operation, will further increase the costs of several important sectors of the economy.

These are unavoidable consequences, however, of any attempt to rid the coal industry of the distorted price structure which has developed since 1939. If good coal is too cheap, industry will tend to use too much of it. If poor coal is too dear, complaints about "dirty coal" are multiplied and industry is discouraged from using it.

* * *

Scarce Oils and Fats

The shortage of oils and fats is the most serious food problem which the world has to solve. Hopes that supplies might increase significantly within the next four years were recently dashed by Mr J. C. A. Faure, of Lever Bros. and Unilever, in an address to the International Association of Seed Crushers' Congress. Mr Faure showed, with a complete array of statistics, that in 1951 world exports of the principal oil-yielding products, oils and fats would still be 900,000 tons below the 1938 level. Despite increased butter production in Europe this summer, and a heavier olive oil crop, exportable surpluses of oils and fats from sources outside Europe will be smaller than anticipated. Moreover, the United States has become a net importer and the rising standard of living in Eastern countries has increased their domestic consumption.

The effect of the war on the world output of oils and fats is also revealed in two surveys published by the Commonwealth Economic Committee.* In 1946 the production of the main oilseed crops amounted to 11,491,000 tons (oil equivalent), compared with the 1934-38 average of 13,378,000 tons—a reduction of 11 per cent. The main decline has occurred in tree crops, particularly coconut and palm. Among the field crops, groundnuts, soya beans, rapeseed and sunflower seed each showed an output larger than before the war. But despite these increases, exports have fallen significantly—largely because the producers of vegetable oils have greatly increased their domestic consumption. In 1946 exports totalled 1,877,000 tons compared with an average of 4,141,000 tons between 1934 and 1938—a reduction of 55 per cent. And of all the oil-bearing crops, sunflower seed was the only one of which exports were larger than before the war. The only countries whose exports of vegetable oils and oilseeds in 1946 were above the 1934-38 average were the Philippines, the Belgian Congo, the United States and Canada. And in each case the increase was only moderate. Tables showing world production and export of oilseeds by crops and countries are published in this week's issue of the *Records and Statistics* Supplement.

World butter production was similarly affected by the war. In 1946 output was some 25 per cent lower than before the war—production in Commonwealth countries had fallen by 16 per cent—while exports were less than half. Some recovery has since taken place, but the main limitations to a large expansion in the world's butter production are the reduced number of dairy cows and the increased consumption of liquid milk and milk products other than butter.

The prospects for increased supplies of oils and fats for Europe are not therefore very encouraging. If inflationary policies throughout the world were successfully curbed, there might indeed be more than a chance that exports from the primary producing countries might increase. But the necessary reduction in prices could only come about if importing countries generally (including Britain) kept their requirements within the limits set by their balance of payments. Moreover, the political consequences of such a "deflationary" effect might be important for the primary producing countries. The prospect for supplies of fats and oils based on purely physical factors is rather disappointing; but a change in the economic climate might overcome present shortages quicker than is sometimes anticipated.

Peru Chooses Sterling

The Treasury-Bank of England Mission which has been touring South America ended its labours in Lima with another minor victory for sterling. The agreement reached with Peru re-establishes sterling as the currency in which trade between that country and the sterling area is to be conducted in the future. Throughout the war trade with Peru was, in fact, conducted in sterling, but was maintained in approximate balance. In 1947, as part of the preparations for making sterling convertible, Peru was classed among American account countries, which meant in effect that any surplus or deficit on that trade had to be covered in dollars. After the suspension of convertibility of sterling the arrangements were found to be highly restrictive in their effect on the trade between the two countries. Peru's shortage of dollars on the one hand and Britain's unwillingness to incur a deficit in trade with Peru, since this would be convertible into dollars, had put a considerable brake on this trade. Under the new arrangements Peru will leave the American account group, and will, as from August 1st, finance its trade with sterling area countries in sterling. To begin with, these will be strictly bilateral arrangements, though wider use of sterling by Chile may be developed administratively, with the consent of the authorities in each country for each payment when sterling is used between Chile and non-sterling countries. In due course, it is hoped that Peru will, like Chile, enter the fold of the fully transferable account countries.

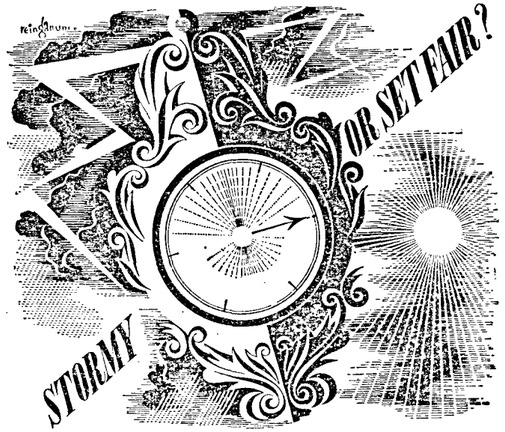
Switching in Sterling Securities

The freedom of non-residents to "switch" in sterling securities has been severely curtailed by three regulations issued by the Bank of England. The first order divides all British securities into thirteen compartments, broadly following the classification of securities in the Stock Exchange List. With one important exception, switching between these groups is now disallowed; if a non-resident sells an industrial share he must re-invest the proceeds in another industrial issue, domiciled in the same country. For some oil and mining issues this stipulation about fixed domicile may prove very restricting. The one important exception is to permit switching from any group into British

The fable of the well-dressed man

A Visitor from another land once exclaimed in admiration at the spartan way of life he found in a certain isle. 'Ah!' he cried, 'I fear you must despise the superior elegance of my attire!' His hosts discreetly forbore to point out that his suit had come from their own best tailors, his sword from their own armourers, his hat and boots from their native hatters and cordwainers. They wisely preferred things that way round.



Britain's best merchandise is the quality of her manufacture, which is still the envy of other nations. TI is busily selling British skill in the form of wrought light-alloys, precision steel tubes, bicycles, ski-sticks, electrical equipment and automobile parts. Every dollar which can be made that way is needed, and every softer coin.

STABILITY IN CHANGING CONDITIONS

A customer of the Three Banks Group has the comforting knowledge that however rapidly trade conditions may change either at home or overseas, he has at his disposal the combined skill and wide experience of a Group in touch with financial and business interests in all parts of the world, and the benefits of a Banking Service that is adaptable, individual and complete in every detail.

ROYAL BANK OF SCOTLAND
Founded 1727 Edinburgh, London & Branches
GLYN, MILLS & CO.
Founded 1753 London
WILLIAMS DEACON'S BANK LTD.
Founded 1771 Manchester, London & Branches

THE CONDITIONS which interest the modern exporter are those prevailing in his market, the 'commercial weather' in which he must trade. British products will always sell in Australia and New Zealand provided they are adapted in both quality and price to the Dominion markets. The Overseas Department of The Bank of Australasia can put at the disposal of the British exporter accurate up-to-date information from the Bank's Branches 'down under' giving him a picture of prevailing conditions upon which he can base his export programme.

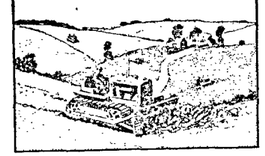
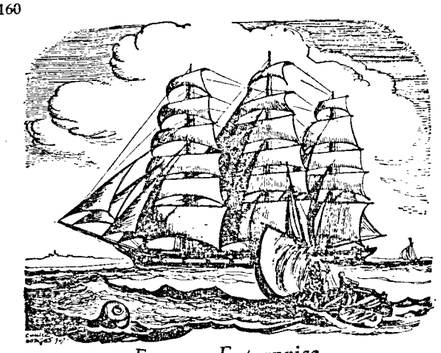
RECLAIMING 30,000 ACRES



1. For 1,000 years the turf of the Sussex Downs lay undisturbed, except by grazing sheep. But war forced the authorities in 1942 to take great stretches for battle training.

2. For four years troops fired thousands of tons of ammunition into the slopes, and covered their surface with wire and concrete, trenches and gun-pits.

3. 'Caterpillar' Diesel Tractors are now speedily clearing the Downs of their dangerous litter, so that the urgent job of food production may begin again.



Before the Sussex Agricultural Committees could begin reclaiming the downland, miles of rough roads had to be cleared by 'Caterpillar' Bulldozers. Before ploughing could begin, innumerable shell and bomb craters had to be filled in, and undergrowth, wire, and defence works had to be uprooted. Once again, 'Caterpillar' equipment, provided and serviced by the Jack Olding organization, has saved precious time, manpower and money.

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

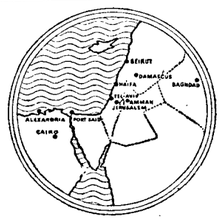
LEVER BROTHERS & UNILEVER LIMITED

AND

LEVER BROTHERS & UNILEVER N.V.



The Boards of Lever Brothers & Unilever Limited and Lever Brothers & Unilever N.V. RESOLVED to-day to RECOMMEND to the Annual General Meetings of their respective Companies which will be held on 26th August, 1948, the DECLARATION of DIVIDENDS on the Ordinary Capital in respect of the year 1947 payable on the 3rd September, 1948, as set out below :—

In the case of *Lever Brothers & Unilever Limited* a DIVIDEND of 10 per cent. (2/- per £1 of Stock), less Income Tax at 9/- in the £ (same as for 1946) PAYABLE to Stockholders registered in the books of the Company on the 31st July, 1948. Consolidated profit was £17,497,459 (1946, £16,979,742) after charging £2,000,000 (1946, nil) reserve for replacement of fixed assets and £3,235,000 (1946, £639,362) reserve for stocks but before charging taxation on profits. Consolidated net profit was £5,286,818 (1946, £7,769,870) after taxation and excluding the proportion attributable to outside shareholders' interests in subsidiaries. Net profit in the Parent Company's accounts before appropriations was £4,757,132 (1946, £6,187,647, out of which £2,500,000 was set aside to build up the future Tax Reserve).

In the case of Lever Brothers & Unilever N.V. a corresponding DIVIDEND calculated in accordance with the Equalisation Agreement converted at the rate of exchange of Fl. 10·691 to £1 sterling of 8.9% (Fl. 89 per share of Fl. 1,000), less 15% dividend tax (same as for 1946), PAYABLE on PRESENTATION of the appropriate DIVIDEND COUPON. Consolidated profit was Fl. 94,077,552 (1946, Fl. 64,132,865) after charging Fl. 17,500,000 (1946, nil) reserve for replacement of fixed assets and Fl. 10,000,000 (1946, Fl. 6,000,000) reserve for stocks but before charging taxation on profits. Consolidated net profit was Fl. 34,481,962 (1946, Fl. 32,050,898) after taxation and excluding the proportion attributable to outside shareholders' interests in subsidiary companies. Net profit in the Parent Company's accounts before appropriations was Fl. 28,391,926 (1946, Fl. 27,402,722).

The Reports and Accounts of both Companies will be issued on 3rd August, 1948.

22*nd July*, 1948.

Com. Reg. Cairo No. 47926

Government securities (though not *vice versa*) and as hitherto, no gilt-edged stock with less than ten years' life may be bought; nor may non-residents exchange gilt-edged stocks already held for shorter dated stocks.

The second order requires that before a licence to switch is granted, "satisfactory evidence" must be submitted to the Bank of England to show 'that the security to be sold has been in the possession of a resident in the country of the present beneficial owner since May 1, 1947.' The intention is clearly to prevent securities from changing hands between non-residents so that dividends hitherto payable in, say, French francs, have to be remitted in dollars; dividends and interest, being currently earned sterling, have of course to be remitted in the currency of the country of the beneficial owner. The additional burden on Britain's hard currency funds caused by this drift of beneficial ownership from soft to hard currency areas be simply illustrated: in 1945 dividends remitted to Switzerland amounted to SF.30-40 million but by 1947 the sum had risen to SF.176 million, though some of the increase was doubtless attributable to payments on old coupons. The third order forbids the export of sterling bearer securities of any type.

The limits of effectiveness of the second order are suggested by the third. "Satisfactory evidence" regarding the beneficial ownership of registered stocks can often be checked, but for bearer securities there is no means of checking, as earlier experience has shown. The third regulation should effectively stop any further additions to bearer shares in non-resident ownership, but evidence about the ownership of the large amounts already held abroad will have to be obtained and assessed as before. As a sequel to these orders a further regulation issued last week limits the investment of blocked sterling funds to purchases of British government or government guaranteed securities.

Activity on the London Stock Exchange by non-residents—and that means mainly Americans—will be severely curtailed. Such dealings have taken place in New York against so-called "security sterling" which was recently quoted at $2 to the £. The rate had at one time been as high as $3.25 but the immediate result of the new regulation has been a fall from $2 to about $1.85. In theory there might be 13 different rates of "security sterling"; in fact, there are at present three rates, one for gilt-edged at $1.83; one for industrials at $1.85; and one for Rhodesian shares at $1.90. It is ironical that last week's action should have reduced the price, in terms of dollars, at which Government stock can be bought.

★ ★ ★

Switzerland's Nominee Assets

The conflict between Switzerland's highly developed and traditional business as the nominee repository of foreign capital, and its unwillingness to accumulate the foreign currency proceeds on such capital, is illustrated by new Bank of England instructions sent to bankers this week. This deals with the treatment of proceeds of coupons remitted to this country by Swiss banks on account of clients who are not residents in Switzerland. Hitherto the proceeds of all coupons remitted and encashed here by Swiss banks have been credited to Swiss accounts. The Swiss authorities have, however, shown some dislike of the resulting accumulation of sterling on non-resident accounts, a position which might conceivably involve the accumulation of assets in one currency against liabilities in another, with the consequent exchange risk. In future, therefore, the proceeds of such coupons are not to be credited to Swiss accounts, but to a sterling account appropriate to the residence of the beneficiary. The move implies that the Swiss banks concerned will be prepared to divulge the identity or at least the residence of the nominees for whom they are acting. Since the initiative in this matter has come from the Swiss authorities, it is to be presumed that no untoward sensitiveness will be felt on this score.

Shipbuilding Activity Sustained

A further rise in the tonnage of ships under construction in Great Britain and Northern Ireland at the end of June is recorded by Lloyd's Register of Shipping. The total now stands at 2,243,703 tons gross, an increase of 105,668 tons since the end of March. Apart from a slight setback in the previous quarter, the total has been increasing steadily since the beginning of 1944 and it now stands higher than at any time since December 1921, when the tonnage was 2,638,679. Ships completed during the quarter totalled 374,323 tons gross, bringing the figure for the first six months of 1948 up to 507,962 tons. If this rate is maintained therefore, output for the year will exceed 1,000,000 tons, a slight improvement on 1947. Shipbuilders maintain, however, that if they could obtain enough steel the industry could build more than half as much again—perhaps an extreme claim which puts insufficient emphasis on shortages of other materials. There is no indication, moreover, of the extent to which steel, produced in excess of the "Economic Survey's" budgeting is reaching the shipyards. Launchings during the last three months totalled 301,730 tons, compared with only 181,168 tons for the previous quarter while work was begun on 375,000 tons, compared with 213,451 tons gross.

The proportion of tankers under construction is still rising. Tankers of 1,000 tons gross and over now under construction number 61 of 579,205 tons, compared with 54 of 493,155 tons at the end of March. Of the 2,500,000 gross tons of ships still on order but not yet laid down, more than half are tankers, which tend to use a greater proportion of steel in their construction than other ships. Ships being built for export also continue to increase; they have risen from about 100,000 tons in March, 1946, to as much as 711,455 tons gross, or 31.7 per cent of the total.

There was a slight fall in the tonnage of ships building abroad, which now total 1,778,186 tons gross, although the British contribution has masked this fall and increased the world total from 3,919,374 tons to 4,021,889 tons. The only important shipbuilding countries abroad to show an increase are France, Italy, Spain and the United States. The greater part of the US total of 162,672 tons under construction consists of eight tankers, totalling 114,940 tons gross. Of the world total, 99 ships of 964,312 tons gross are ocean-going tankers. When these are completed, they will have added some 1,500,000 tons deadweight to the carrying capacity of the world's tanker fleet, which is already estimated at more than 23 million tons d.w., compared with 16 million tons in 1939.

Big Rise in Bank Deposits

The latest banking figures underline the Chancellor's remark last week that the greatest care is needed when trying to use purely monetary indices as a measure of the progress (or lack of progress) of the disinflationary policy. Certainly, there is no trace of disinflation in the end-June deposits of the clearing banks. The net figure, at the new record level of £5,736 million, is no less than £94 million above that shown by the May make-up. This is disappointing. During March and April the effects upon the level of deposits of the earlier phase of record budget surpluses were largely obliterated by the credit created in connection with the Argentine rail purchase. This, however, was an abnormal operation, and it was expected that part of the new credit would gradually be cancelled as the funds were reinvested. Some heartening signs of this process did, indeed, become visible during May, when the disbursements were being made to the Argentine debenture stockholders; net bank deposits then dropped by £32 million, a figure well below the amount disbursed. The latest rise, however, carries net deposits to some £54 million above the end-1947 level.

CLEARING BANKS, 1947–48

(£ mns.)

	At June 30		Average of Six Months, Jan.–June	
	1947	1948	1947	1948
Deposits	5,658	5,955	5,586	5,816
Net deposits	5,446	5,736	5,402	5,617
Cash	464 (8·21)	492 (8·27)	468 (8·39)	479 (8·25)
Call money	451 (8·0)	473 (8·0)	435 (7·8)	460 (7·9)
Bills	672 (11·9)	659 (11·0)	679 (12·1)	746 (12·8)
T.D.R.s	1,330 (23·5)	1,361 (22·8)	1,399 (24·9)	1,229 (21·1)
Investments	1,479 (26·2)	1,478 (24·8)	1,455 (26·1)	1,481 (25·5)
Advances	1,119 (19·8)	1,340 (22·5)	1,047 (18·8)	1,294 (22·3)

Italic figures in brackets are percentages of deposits.

This experience demonstrates once again the fallacy of the still common belief that the large prospective budget surplus of 1948-49, plus Marshall aid, must necessarily involve an approximately corresponding repayment of floating borrowings by the Government. The budget surplus is a surplus on current account

—before allowing for the Exchequer share in the nation's investment programme. And the finance available to the Government from the external deficit (including Marshall aid) is declining as the deficit slowly narrows. In fact, most of the credit created in June seems to have been for the purposes of the Government, though it is hard to see why so large a sum should have been required. Bank advances rose in June by £15½ million—the rise would have been much bigger but for a sharp, and probably temporary, fall in the advances of the National Provincial Bank—while investment holdings were fractionally larger.

Ostensibly, therefore, some £77 million of the increase in bank deposits seems to have resulted from the Government's financial operations. During the period most nearly corresponding to the banking figures the Exchequer returns showed an above-line surplus of £40 million, but heavy outgoings "below the line" converted this into a final deficit of at least £50 million—before allowing, however, for the sterling proceeds of drafts on the gold reserve, which in May and June are believed to have been rather smaller than the recent average rate of depletion. The fact that the first ERP refund of dollars was not received until the end of the month and was not at once brought into the accounts does not, it should be noted, explain the apparent discrepancy in the banking figures. These ERP dollars 70 to replenish the exchange reserves, but bring in no sterling to the Treasury unless and until they are sold.

* * *

After the Leather Subsidy

The third and last of a series of Leather Charges Orders last week brought to a close nearly nine months of negotiations. When the leather subsidy was removed at the beginning of the year, the value of stocks in tanners' hands naturally rose. Hides and skins had been bought below cost from the Leather Control, but the finished leather produced from them could be sold at a price related to the current cost of hides. By Order No. 1 the Government proposed to charge the tanning industry with the full value of this gain, put at £8,500,000. Tanners protested that since they would lose if hide prices fell—and they are traditionally unsteady—it was unfair that they should gain no advantage when prices rose. Moreover, with the ending of the subsidy, the Government's liability to meet any fall of prices to the 1942 level was ended. Accordingly, Order No. 2 postponed the operation of the first Order, and an agreement was then reached, the terms of which comprise Order No. 3. The Treasury receives one-third of the appreciation in value, and the remaining two-thirds (less tax) is to be placed in a special account kept by each company where the appreciation of stocks exceeds £1,000. Future losses on stocks resulting from lower prices can be met, with the Board of Trade's permission, from these funds.

The agreement is well-timed, for it is possible that stock losses may be just round the corner. Prices of hides and skins remain outwardly firm, but several overseas sellers are having difficulty in disposing of stocks. Argentina in particular is reported to hold two million hides of all types. Madras shippers have been holding out for higher prices without success, and in France prices at the July sales fell by 10 to 30 per cent below the high level reached in June after decontrol. The limited buying power of the French consumer accounted for this setback in prices. Tanners in this country also are watching the retail trade for footwear more anxiously. Better quality leather is scarce, but when it is unobtainable the market is very quiet. So far, footwear sales have responded well to coupon concessions in May. But shoe manufacturers hold large stocks; and they may be rather reluctant buyers when the autumn trade starts.

* * *

Dundee's Jute Supplies

The new jute crop is now being harvested and preliminary reports suggest that the yield will be a little higher than last season's—about 1,550,000 tons. Despite this encouraging news, supplies are still short and prices have remained high, with Daisee (seed marks) at £101 a ton, compared with £82 a ton a year ago. Although three-quarters of the crop is grown in Pakistan, only 25,000 tons were exported through Chittagong last season. But even if Chittagong handles an average of 18,000 tons a month during the next year, a large part of the export trade is bound to go through Calcutta especially as only a single export duty is now payable. Export quotas have not yet been issued either by India or Pakistan but the Indian Government has announced that no raw jute will be available for shipment during the July-September quarter and only 45,000 tons for all destinations during the following three months. Dundee is expected to get a quarter of this quantity. Total consumption of raw jute in the United Kingdom in 1947 amounted to little over 97,000 tons. But weekly consumption during the first five months of 1948 averaged 2,000 tons against 1,850 tons in the same period last year. Stocks at the end of June were about 42,000 tons—or 21 weeks' supply, whereas a year ago they totalled 59,000 tons.

Despite the Jute Controller's recent visit to Calcutta, it is still problematical whether larger supplies of raw jute will be sold to Britain. The promise of good grain harvests in the Northern Hemisphere and of another bumper crop in Australia, has heightened the demand for jute cloth, and India naturally prefers to export woven jute rather than raw jute. But the Calcutta mills are not working to full capacity; one of the limiting factors is the shortage of labour. Their productive poiential, if it were fully utilised, would be more than sufficient to cover the world's demand for jute manufactures. If, however, Indian consumption shows no marked increase on last year, some 400,000 tons from the new crop should be available for export. Unrestricted export of raw jute to hard currency countries is now permitted and it is impossible at the moment to estimate how large such exports might be. If, however, Dundee received 100,000 tons, it could maintain its current consumption throughout the season, without drawing further on stocks which are already low.

* * *

Cost of Higher Management

Under Section 196 of the new Companies Act directors' emoluments from parent and subsidiary companies have to be disclosed. Emoluments "include fees and percentages, any sums paid by way of expense allowances in so far as those sums are charged to United Kingdom income tax, any contribution paid in respect of a director under any pensions scheme, and the estimated money value of any other benefits received other than in cash," as well as compensation paid for loss of office.

Other people's money is always a popular topic. What useful purpose is served by thus making public directors' emoluments? The shareholder is given further facts about his company which he has every right to know, and prospective investors, when forming an opinion about a company, may in time be able to use this information about directors' emoluments as a yardstick to the cost and efficiency of management of particular companies. But the new figures also have a wider economic importance, for they measure the cost of industrial policy-making.

COST OF BOARDS OF DIRECTORS

Company	Directors' Emoluments	Number of Directors	Average Emoluments per Director	Cost of Board per £'000 Assets	Cost of Board per £'000 Gross Profit
	£		£	£	£
Dunlop	309,463	10	30,946	5·22	32·85
Imperial Chemical Industries	306,225	22	13,920	1·93	12·15
Whitehead Iron & Steel	61,993	5	12,400	15·80	158·40
J. Lyons	200,759	18	11,170	9·19	82·40
Lever Bros.	260,195	24	10,850	1·37	9·14
Boots	122,777	12	10,230	14·26	42·70
Beecham Group	89,755	12	7,480	4·01	37·80
Courtaulds	148,640	17	8,740	2·48	20·55
JR. Thomas and Baldwins	73,395	10	7,339	2·08	11·28
British Insulated Cables	65,872	11	5,990	2·03	14·74
A.B. Pictures	19,000	5	3,200	8·71	93·80
Pye	20,570	7	2,940	9·82	72·80
Total	1,386,339	12½	10,440	6·42	49·05

Publication of directors' emoluments may suggest some provisional answers to a number of important questions. At what point do higher payments to individuals, or the increased total cost of enlarging a board of directors, absorb more revenue than they contribute by way of more efficient management? In textbook language, where do diminishing returns on the expense of management set in? The question poses the further problem of how cost of management should be measured. In the accompanying table particulars of directors' remuneration are given for twelve companies. The table shows total emoluments, the average emolument per director, and the cost of total emoluments expressed per thousand pounds of group assets and per thousand pounds of group gross profits. The list is arranged in descending order of the average sum paid to each director. But this, clearly, is not the criterion of directorial efficiency. That can be better measured in the two last columns—which reflect the size of the undertaking which the directors administer and the gross profits which it earns. These latter calculations show that the directorial costs of Dunlop and Pye (to take two companies quite arbitrarily because they appear at the head and the foot of the table respectively) cannot be measured by total costs or averages per head. Whether the recalculation of directors' emoluments in terms of assets or gross profits is the final test of value for shareholders' money may be open to further argument. The table provides no final conclusions about the relation between the size of a business and costs of management. It suggests that cost of management tends to be higher in the distributive trades than in industry, and that, within broad limits, the bigger unit spreads cost more economically than the smaller one.

* * *

Workers' Control

Claims for the greater participation of workers' representatives in the management of industry have recently been heard from three powerful trade unions. Mr Arthur Horner, at the miners' conference, hinted that the time might come for the National Union of Mineworkers to seek direct representation on the Coal Board, including chairmanships of Divisional Boards. It is true that Mr Horner was not stating NUM policy, and the president of the union stated at the same conference its intention of remaining independent of the Board. The current *Journal* of the Amalgamated Engineering Union advocates that trade unionists should be trained for management since, in its view, many able and experienced union organisers could, with training, easily qualify for managerial posts. But the claim for workers' control put forward by the National Union of Railwaymen is the most immediate and definite of the three.

As long ago as 1914, the NUR conference passed a resolution calling for nationalisation and demanding for organised railwaymen "a due measure of control and responsibility in the safe and efficient working of the railway system." Last week, its General Secretary, Mr J. B. Figgins, urged that three more union representatives should be appointed to the Transport Commission in order to "put forward the workers' point of view," and suggested that the union should have a voice in matters of promotion. The men wanted to be "not beggars, but partners." They complained that too many opponents of nationalisation were in positions of authority. The union was seeking an interview with the Minister of Transport to press its case.

Mr John Benstead, the former secretary of the union who is now a member of the Commission, reminded the conference that public ownership did not exist merely to provide better conditions for the employees, important though that was, but that the interests of the community must come first. Mr Benstead stressed the importance of developing consultation at all levels. Effective consultative machinery has been singularly lacking on the railways and even the General Secretary admits in his report that "little enthusiasm has been displayed in the past, particularly among the lower-paid grades, for participation in the local negotiating machinery." There seems to be a clear need for greater education and co-operation on the part of the men, and for a more liberal attitude on the part of managements, if joint consultation on the railways is to be effective.

* * *

Tea Imports and the Ration

Tea imports from India and Ceylon together with purchases from the smaller overseas suppliers should be sufficient to cover a ration of 2 oz. a week for the rest of 1948. There was little surprise when earlier this year the Ministry of Food failed to obtain the full 150 million lb. of tea which it had hoped to purchase in Ceylon—at by no means ungenerous prices. The Ministry received tenders for only 96½ million lb.—5 million lb. more than in 1947. Indian tea production is forecast at 550 million lb. this year, or 10 per cent. more than last season. Though no accurate estimates are available for Pakistan, it is expected to produce 80 million lb. From India the Ministry of Food will purchase 300 million lb. of tea this year and from Pakistan about 25 million lb. African supplies, coming chiefly from Kenya and Nyasaland, where production was greatly expanded during the war, should again provide about 14 million lb. With small quantities from various other countries, including China, imports should thus amount to at least 435 million lb.—a useful increase over last year's supplies, but still well below the prewar figure. In addition some open market purchases are not out of the question.

At the present level of consumption, it should be possible to replenish stocks. Yet the margin is not excessive. A temporary increase in the ration, say over Christmas, could be justified but any addition to stocks this year might prove more useful as a bargaining counter in later price negotiations with the suppliers.

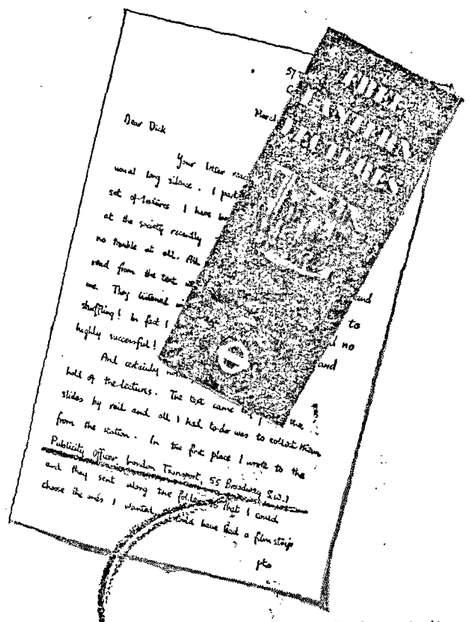
TEA CONSUMPTION AND IMPORTS IN GREAT BRITAIN
(in million lb.)

	1938	1947	1948(a)
Imports	526·7	388·7	435·0
Consumption	510·0	436·0	401·2
Re-exports	66·0	14·3	14·3
Change in stocks	−49·3	−61·6	+19·5

(a) Assuming 2 oz. ration for the whole year.

Until the Netherlands East Indies can raise their exports from the present purely nominal level, the Ministry of Food is bound to be in a weak bargaining position against other growers. There are signs that greater supplies may soon be forthcoming from Indonesia, though exports from that area to Britain cannot be expected to approach their 1938 figure of 30.2 million lb. for some time. A sizeable, or even promising, resumption of exports from the Netherlands East Indies, not only welcome in itself, might also make the Ceylon growers more responsive to this country's needs. At present, by selling only 60 per cent of its prewar exports to Britain, Ceylon's contribution has been lowered by 60 million lb., and even a partial filling of this gap would make the British tea position relatively comfortable.

SECURITY PRICES AND YIELDS



A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Hudson's Bay Company; Lewis Berger; Renold and Coventry Chain.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'c'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (b) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (g) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (l) To latest redemption date. (m) 15 months Basis 25% † Free of tax.

Titles of the lectures include, *London on the Move, The Story of the Underground, The Story of the London Bus, How London's Tube Railways are Built, A Night with London Transport.* For details, write to the Publicity Officer, London Transport, 55 Broadway, S.W.1.

Investing money

WITHOUT ANXIETY

WITHOUT trouble to you, and without charge, your Bank is now able to make it easy for you to invest money towards your own future security—and your country's prosperity. Your signature on a Banker's Order form will ensure for you either a single purchase of a number of National Savings Certificates, or the regular monthly inflow of as many Certificates as you like—up to the total of 1,000 which you may hold. In ten years' time each 10s. Certificate will be worth 13s.—your £500 will have grown to £650 tax free—a very worthwhile investment indeed. To the surtax payer the Savings Certificate is even more profitable. *See your Bank Manager about it today.*

Your customers for life if you act in time

The under 35's

War conditions have created a unique generation of under 35's—a generation which, owing to service in the forces and to shortages, has grown up without the opportunity to form brand preferences. Now, with money to spend, these younger men and women are eagerly forming buying habits which may remain unchanged for the rest of their lives. From this vast fluid market (over a third of our adult population is aged under 35), the Daily Mirror, with a net sale of over 3,700,000 daily, draws nearly half a million more adult readers than any other daily paper. The under-35's are the key to your future prosperity. Talk to them through the advertisement columns of the Daily Mirror.

470,000 more adult readers under 35 than any other national daily paper (vide independent Hulton Survey)

Cost of advertisement space (per column inch per thousand readers) lower than any other national daily

COMPANY MEETINGS

BLEACHERS' ASSOCIATION, LIMITED

SIR ALAN SYKES' REVIEW

The forty-ninth ordinary general meeting of Bleachers' Association, Limited, was held at the Midland Hotel, Manchester, on Monday, the 19th instant. Sir Alan Sykes, Bt. (the chairman), presided.

In proposing the motion for the adoption of the report and accounts, Sir Alan said: The report of the directors and the statement of accounts have been circulated, and as they have been in your hands for some time now, you will, no doubt, agree that they shall be taken as read. (Agreed.)

Before dealing with the accounts I should like to refer to the loss which we have suffered through the death of Colonel H. M. Hardcastle. He had been a member of the board for more than forty years, and was always ready to place his knowledge and experience at our service. He was deeply interested in the advancement and well-being of the Association, and we shall miss his genial presence and his abounding faith in the future of our company.

As you will have learned from the report, the accounts are presented this year in the form now required by the Companies' Act, 1948, and for that reason they are in many respects not comparable with the accounts for previous years. There is one item in particular where the change of method is not unlikely to lead to incorrect conclusions, and to which I feel that I should direct your attention at once. This is in the amount of the net trading profit this year compared with the figure which appeared in the accounts for the previous year. In the past we have always shown the dividends payable at the gross amount before deduction of income tax, and the provision for taxes charged against the profits of the year was less than it otherwise would have been by the amount of tax deductible from the dividends on payment. The Companies' Act now requires dividends to be shown at the net figure payable, and, therefore, the provision for taxes charged against profits is increased by an amount equivalent to the tax deducted from the dividends.

INCREASE IN PROFITS

In the accounts under review, the tax on dividends amounts to £90,731, and in comparing the net trading profit, after providing for depreciation and the payment of debenture interest, which appears in the report and in the profit and loss account this year at £188,023 with that of last year, which was £233,679, we must increase this year's figure by £90,731 to obtain a correct comparison. The net trading profit this year is therefore £45,075 higher than that of last year—not £45,656 less, as might be assumed from a superficial comparison of the published figures.

As I have referred to the net trading profit, it will perhaps be more convenient if I deal now with the profit and loss account and the proposed distribution of profits before explaining the few changes that appear in the balance-sheet.

The profit and loss account is presented as a consolidated account in the form now required by the Companies' Act, and this precludes any detailed comparison with the consolidated account published last year. The figures which relate to the Association's balance sheet—as distinct from the consolidated balance sheet—are shown in heavier type.

The item described as "Trading Profits Available"—£763,299—which appears on the credit side of the account is, of course, not a true profit, since it is charged on the debit side with directors' fees, salaries of management and auditors' remuneration, which are now required to be shown separately. Neither does it include the income from investments which appears at £86,922.

PROFIT ON SALE OF INVESTMENTS

The profit on the sale of investments—£166,299—has been transferred to the depreciation and obsolescence fund, as shown by the entry on the other side of the account, and there used for writing down the value of certain works properties, which were closed under concentration and which are not likely to operate again. Also, on the debit side of the account, provision has been made to the extent of £35,000 for the cost of reopening concentrated works.

Apart from the items to which I have already referred and the provisions for taxation, which amount to £319,927, and which are now required to be shown separately, the remaining items on the debit side of the account are in all respects comparable with last year and show no material change.

The net profit amounts to £219,862, of which £188,023 constitutes the profit of Bleachers' Association, Limited, and this amount appears in the report of the directors, together with our recommendations as to its distribution.

Including the amount brought forward from the last year's accounts—£156,488—we have available a total of £344,511, out of which we have paid an interim dividend on the preference stock for the six months ended September 30, 1947, which after deduction of income tax amounted to £37,623, and interest on that portion of the funding certificates redeemed on October 31, 1947, which required £1,098.

REDEMPTION OF FUNDING CERTIFICATES

Our recommendations cover the payment of interest on the funding certificates for the year to March 31st last, amounting to £3,043, and the final dividend on the preference stock amounting, after deduction of income tax, to £37,623. We propose to redeem the whole of the outstanding funding certificates in October next, and for that purpose we are providing out of the year's profits a sum of £20,000, in accordance with the conditions under which the certificates were issued. The remainder of the amount required for this purpose—£118,368, is being taken from the available revenue reserves. Finally, we propose the payment of a dividend on the ordinary stock at the rate of 3 per cent., which is the same as last year, and to increase the amount carried forward by £57,132 to a total of £213,620.

We had every intention of paying an increased dividend this year if trading conditions permitted—which they certainly have done—but in view of the Government's exhortation to limit dividends to the amount distributed in the previous year, we feel that this injunction must be observed. In these circumstances, we have thought it best to take the opportunity to redeem the whole of the outstanding funding certificates, and thereby greatly to improve the prospects for the ordinary stockholders when the present ban on increased dividends is removed.

BALANCE SHEET

Such changes as have taken place as a result of the year's operations are shown more clearly by the Association's balance sheet than by the consolidated balance sheet, and my remarks will relate therefore to the former account.

Here again, the balance sheet is drawn up to conform to the requirements of the new Companies Act, and since this involves some reclassification of assets, it is not possible in all cases to make direct comparison with the figures for the previous year.

The net addition to the value of fixed assets, which appears at £6,105, does not represent the full expenditure on capital account during the year—the total was very much larger than that, but it has been offset by an almost equivalent amount derived from sales of property.

We have written off during the year a sum of £201,355 in respect of renewals and replacements charged against the depreciation and obsolescence fund, and in respect of works properties which have been closed under concentration, and which are unlikely to be reopened. The greater part of this amount has been provided by the profit on the sale of investments, which has been transferred from the profit and loss account to the depreciation fund.

Under the modified definition of a subsidiary company introduced into the Companies Act, the item appearing under the heading of shares in subsidiary companies—£137,252 is substantially less than the corresponding item in the previous balance sheet. The difference is included in the item trade investments, which are now separated from quoted investments. The changes are merely in the classification and the aggregate of the three items is little different from the previous year's total.

INCREASE IN WORKING CAPITAL

Advances to subsidiary companies at £1,348,255 are considerably higher than last year—the increase being almost £500,000. This item represents the working capital of our subsidiary companies, and the increase is attributable to the increased volume of trade and to the higher cost of all materials used in production.

On the liabilities side of the balance sheet, the principal changes are in the separation of provisions for taxation and sundry revenue reserves, which previously were included under the heading of trade creditors and provisional accounts. We have utilised a part of the revenue reserves to round off the general reserve fund and the contingencies fund to £500,000 and £175,000 respectively, and we have withdrawn the sum of £118,368 to complete the redemption of the funding certificates.

I do not propose to take you through the consolidated balance sheet, since it merely reflects the changes to which I have referred in the Association's balance sheet, together with the balances in the accounts of our fully controlled subsidiary companies. The consolidation involves some further rearrangement of the assets and liabilities, mainly by the breaking down of the working capital of the subsidiary companies into its component parts, which in the Association's balance sheet, were shown as advances to subsidiary companies. The effect of the consolidation otherwise is not important, and the totals of the two balance sheets differ by less than £500,000.

IMPROVED TRADING RESULTS

You will have judged from the figures I have given you that the trading results of the past year were better than those of the previous year. Primarily, this was due to the increased volume of trade. Such advantage as we derived from the belated increase in prices, approved by the Board of Trade in March, 1947, to cover increased costs which we had borne since early in 1946, was neutralised by the further increase in costs which accumulated during the ensuing year.

The increased profits derived from the increased volume of trade would have enabled us to pay, as I have intimated earlier, a higher rate of dividend on the ordinary stock, and having regard to the past dividend

record under the depressed conditions which have governed our trade for so many years, I believe that we could have justified the non-observance of the Government's request to limit the rate of dividend to that of the previous year. Nevertheless, we felt that the right course of action was to support the Government in its policy of disinflation.

I believe you will agree that we have done right in shaping our policy to what we believe to be the national interest, and, though it presses somewhat hardly on the ordinary stockholders, they have the satisfaction of knowing that we have created a more solid foundation for a beter return on their capital than they have been able to contemplate for a long time past.

Sir William Clare Lees, Bt., seconded the resolution, and the meeting approved the report and accounts.

The secretary announced that transfers of the 4 per cent. funding certificates due for redemption on October 30th will be accepted (accompanied by the certificates) on or before September 30th.

A vote of thanks to Sir Alan Sykes for presiding was moved by Mr. J. G. Gray and carried unanimously.

HUDSON'S BAY COMPANY

RECORD RETAIL SALES

The two hundred and seventy-ninth annual general court of the governor and company of Adventurers of England trading into Hudson's Bay will be held, in London, on the 6th proximo.

The following is an extract from the circulated statement of the Governor, Sir Patrick Ashley Cooper: The company's working capital requirements during the year to January 31, 1948, fluctuated considerably in the economic conditions and even now are such that it is not possible to predict what may be required, but we believe our financial arrangements are sufficient for the immediate future. The year's pattern in retailing has been a strong demand for consumer goods, vagaries in the flow of merchandise, and many price increases. Nevertheless, 1947 must be classed as a good, although difficult, year in retailing

The retail stores department is of primary importance and makes the greatest revenue contribution in our organisation. During the year under review the total sales constituted a record in value—although not in volume. In a difficult year we have every reason to be pleased with the results of this department, and we expect that with the continuance of our policy of modernisation its future activities and results will improve.

The activities of our fur trade department, viewed as a whole, were successful and resulted in a substantial profit on the year's operations, despite increases in operating costs attributable largely to higher wage levels and the rise in cost of all essential equipment. In London our fur sales organisation can fairly claim to have successfully re-established London as an international fur market, and the great entrepot trade which has been built up is making a valuable contribution to the national economy.

THE WHITEHEAD IRON AND STEEL COMPANY, LIMITED

IMPROVING SUPPLY POSITION

The forty-first annual ordinary general meeting of the Whitehead Iron and Steel Company, Limited, was held on the 20th instant at the Westgate Hotel, Newport, Mon., Mr G. H. Latham, chairman and managing director, presiding.

The chairman, in the course of his speech, said:—

During the past few years, certain changes have been made in the form of our accounts in order to bring them into line with modern accountancy practice. The Companies Bill has now reached the Statute Book and became operative on July 1, 1948. To comply with the requirements of the Act, some further changes have been made this year. Consequently, we are submitting a consolidated balance sheet and profit and loss account for the parent company and its subsidiaries. In that balance sheet it is shown that the net assets, i.e., after deducting all liabilities, amount to £2,914,298. The current assets, including Government and other securities (£766,976) total £2,408,730, and exceed by £1,401,674 the amount of current liabilities (£1,007,056). The liquid position of the group is therefore exceptionally strong.

THE ACCOUNTS

Dealing with the accounts of the parent company, it will be noted, with satisfaction, that during the past year we have paid off the balance of the 5½ per cent. first mortgage debenture stock, so that there are now no prior charges of any kind.

The total amount of £300,000 provided for special depreciation during the war years, instead of being applied to the reduction of the value of fixed assets, has now been transferred to depreciation reserve. This transfer has the effect of contributing to the increase of the book value of the net assets, which now stand at £2,618,391, compared with £2,110,681 as at March 31, 1947.

The profit and loss account shows that the trading profit for the year to March 31st last amounted to £627,843, a decrease of £36,090, compared with the previous year. Income from dividends and interest amounts to £63,166, representing an increase of £15,311.

After making full provision for taxation liability and depreciation, the net profit of £292,106 is £33,407 less than the corresponding figure of last year; adding the sum of £60,846 brought forward from 1946-47, the total amount available for the year is £352,952, out of which an interim dividend of 12½ per cent., absorbing £53,888 (net) has been paid, leaving a balance of £299,064.

Your directors propose to transfer £150,000 to general reserve, and to recommend the payment of a final dividend of 17½ per cent., less tax, making a total distribution for the year of 30 per cent. (less tax), and to carry forward a balance of £73,620. The general reserve, after making this transfer, will stand at £1,200,000.

A DIFFICULT YEAR

During the year the whole of our plant, which is of the latest design, has been efficiently maintained. The year under review has been an extremely difficult one very largely due to an acute shortage of semi-finished steel, which is the raw material required by these works. This has led to the plant being used for the manufacture of sizes and sections of steel which are by no means suitable. This policy has, however, enabled us to keep our men employed to a greater extent that we could have done otherwise. With adequate supplies of suitable raw material, we could easily have doubled our output during the year. I am pleased to say the position is now showing distinct signs of improvement which I sincerely hope will be maintained.

Geographically, our works is in an excellent position to cater for the export trade which normally represents approximately 40 per cent. of our output. Having regard, however, to the enormous unfulfilled requirements of the home trade and the limited quantities of raw material placed at our disposal, the bulk of our production is readily absorbed by the home market and only a very small proportion of our output can be spared for export. Our products happen to be those which are in very great demand, but are in short supply. Nevertheless, I am happy to say that once we can settle down to more normal trading conditions we have a plant which enables us to compete by selling our products in a suitable quality at competitive prices in the overseas markets.

Welfare.—The welfare of our ever-increasing number of employees is taken care of in every respect. We have a full-time welfare officer, and our sports ground at Bassaleg is well used and caters for every kind of sport. Our medical services are efficient, and our surgeries in the various works are staffed by an excellent body of trained nurses.

SPECIAL DIRECTORS

An extraordinary meeting will be held immediately after the annual general meeting for the purpose of passing a special resolution to amend the company's articles so as to give the board power to appoint special directors. The text of the resolution shows where the status and responsibilities of the special directors will differ from those of full members of the board.

The aim of the board in creating this special class of directors is to draw into more intimate association with the formulation of policy certain senior officials responsible for the conduct of particular spheres of the firm's activities. The creation of special directors may be regarded as recognition of the responsible character of the work done by the officials concerned, and achieving the most effective integration of the company's varied interests.

I should like to pay a warm tribute to our staff and employees, both of the Whitehead Iron & Steel Company, Limited, and its subsidiary companies, for their loyal services during the year. I am sure you would wish me to accord to them the thanks of stockholders represented at this meeting.

The report and accounts were adopted.

At a subsequent extraordinary general meeting the proposed alterations in the Articles of Association were approved.

NOTICES

AN ASSISTANT to the Financial Controller is required by a firm of light engineers in the London area, manufacturing well-known office machinery. Responsibilities would include the supervision of the accounting, budgetary control and standard costing in the Works. Candidates must be qualified and must have held an executive position in industry. A knowledge of budgetary control and standard costs, and some experience in the engineering industry is desirable. Age not over 40. Four-figure commencing salary. Applications, giving age, full details of education, qualifications, experience, positions held and salaries earned, should be addressed to Robson, Morrow & Co., 59, New Cavendish Street, London, W.1, marked "Application."

OPPORTUNITY for Business Concerns. Gentleman, F.S.S., M.I.E.E., with the following experience, seeks permanent position or single task: International negotiations (Export and Finance), economic, statistical and legal University Training, Linguist, modern Production Planning (Time and Motion Study, etc.). Good connections in most continental countries.—Write Box 771.

S. RHODESIA or S. AFRICA—Active Partnership or Directorship wanted in some established farming or industrial enterprise by business executive with 13 years' experience in Far East preceding 5 years in Indian Army (Lt.-Col., D.S.O.) and 2 years in Germany, age 43, very fit and energetic, willing to invest up to £12,000.—Write Box 770.

Terms for Mr Molotov

THE Western Allies will negotiate on the German question provided the Russians agree to raise the blockade of Berlin as a preliminary. This is the substance of this week's communication to Mr Molotov. It is, of course, possible that the Russians are now intent on driving the Western Powers from Berlin as an end in itself and not simply as a means of bringing them to the conference table. In which case, it is difficult to see how the talks can even begin. But there is at least a chance that the Western offer of talks will be accepted, that the siege will be temporarily lifted and negotiations between the Western Powers and Russia will begin.

Beyond that point, however, all is dark, for whether the conference is confined to the limited question of Berlin's future or widened to cover the development of Allied policy in Germany as a whole, there seems no genuine basis for a settlement. The disagreements and deep divergences which have mined such a chasm between Russia and the West in the last three years cannot be conjured away simply because Russia holds an awkward trump in Berlin. Nothing has developed in the German situation since last November to make agreement easier—on the contrary, the cleavage is worse. What is new is the element of crisis and the risk of war introduced by the Russian blockade.

On this immediate issue the Western Allies virtually know the Russian position. The blockade will be raised permanently if the Allies abandon their political and economic plans for Western Germany. All attempt to establish Frankfurt as a federal capital must be abandoned, and the Western Powers must drop their economic objective of including Western Germany in the Marshall Plan and in an eventual Western Union. These are the terms. Should they be accepted? The Allies are not completely unanimous on this point. French hesitations have been notorious and M. Bidault's acceptance of the settlement for Western Germany, finally dragged from him at the London Conference in June, has cost him his post as Foreign Minister, even though the new French Government is prepared to honour the commitments he undertook. In the United States, Mr Walter Lippmann has conducted a sustained campaign against the settlement—"this plan that nobody wants"—and like the French appears to favour a return to a Four Power military government for the whole of Germany. One of the strongest arguments put forward both by the French and by those who accept Mr Lippmann's thesis has hitherto been that even the Western Germans themselves disliked both the idea of a government at Frankfurt and the proposal to include them in the Marshall Plan. But now this argument has become out of date. In the last fortnight, the surprising success of currency reform on the one hand and the increasing resentment at Russian pressure on the other have led to a change of mood among the Western German leaders. At this week's meetings they have shown a completely new spirit. All are prepared to go ahead with the arrangements for a provisional assembly in September and the idea of drafting a constitutional document is accepted. To abandon the whole Western plan at this point, under Russian pressure, would be a diplomatic defeat fully

equivalent to—indeed, far more permanent in its effect than—any withdrawal from Berlin.

For this, surely, is the point forgotten by French and American critics: the Western Allies took separate measures in Bizonia only after the Russians' separate measures in the East and their general obstruction had come to threaten Western Germany with total collapse. That a recognisable policy for Western Germany is only emerging now after three years of occupation is one more proof of how slowly and unwillingly the Western Allies have been forced to adopt their separate measures. If now, in return for Allied abandonment of their separate policy in the West, the Russians offer nothing more than the lifting of the Berlin blockade, the Allies will be back in precisely the political and economic chaos from which the Western plan has been a belated attempt to escape. To call such a deal a genuine bargain is to do violence to language. It would simply be an unvarnished Allied collapse.

*

There can be no swapping of Frankfurt for Berlin. So much is clear. But it does not necessarily follow that a wider settlement is ruled out. The Russians have given hints from time to time that they are ready to take up again the talks on a peace settlement for Germany which were broken off in December last year. Since no limited negotiation can solve the Berlin crisis, there is in theory everything to be said for seeking to resolve the dilemma by incorporating both Berlin and Frankfurt in a settlement which covers all Germany. The difficulty is to find general terms upon which all four occupying Powers can agree.

The fundamental obstacle is the fact that Europe, in the main by Russian action, is divided into two camps. If there were a neutral area to which both sides could consign the German people, the outlook both for agreement and for peace would be brighter. But from Stettin to Trieste the line runs dividing the Continent in fixed ideological terms. Any shift in the line must, therefore, raise the question of Germany's future adherence to one or the other. Swing the line westwards to the Rhine and the Germans enter the Soviet fold. Swing it eastwards to the Oder (or beyond), and they become potential partners in a Western association. This is a fact which no negotiator can ignore and the terms he proposes will inevitably be designed to swing the line in the sense favourable to his side.

So it is with the Russian terms for a general settlement proposed last year. The four main points—Four-Power control of the Ruhr, $10 billion worth of reparations from current production, elections for a central government in Berlin and the withdrawal of troops—are, with the exception of the reparations clause, reasonable enough at least to consider. But the Western Allies must take into account their further implications. Four-Power control of the Ruhr, coupled with reparations, would draw West German production away to Russia. One of the pillars of the Marshall Plan would fall. Direct Russian control in the Ruhr would be used to stimulate Communism and anti-Western feeling by all means possible. Central elections for a Berlin Government would mean that one-third of the vote would be Soviet-controlled through the Socialist Unity Party. And the parity of Allied and Russian military withdrawals sounds complete only until it is remembered that Russia withdraws across the Oder and America across the Atlantic.

These dangers give the clue to the conditions which the Allies would need to secure in reaching a settlement satisfactory to their interests. In the first place, there can be no compromise on the issue of reparations or the Ruhr. The Ruhr basin is essentially a foundation of European prosperity and no permanent settlement can be envisaged for it which involves control by extra-European Powers. Even American participation is an anomaly which should end in 1952. Russian control is not admissible even for a limited period. This veto need not necessarily be extended to joint schemes of disarmament control. There the Russian interest is direct. But the folly of attempting to control rearmament by a tight supervision of whole industries, as distinct from the prohibition of the manufacture of certain dangerous end-products (such as guns, tanks and aircraft) is becoming more and more generally recognised. Once it is accepted, the last argument for Russian intervention in the Ruhr disappears.

*

The proposals for free elections and for the withdrawal of troops cannot be rejected out of hand. In the long run, both are desirable. But the Allies face a situation in which the realisation of either cannot be secured safely under present conditions. The removal of troops from the Soviet Zone is not simply a question of withdrawing Russian combat troops across the Oder. The Zone contains a network of armed Soviet police organised by the MVD, and far more responsible than the army of occupation for the police terror in the Eastern Zone. It would, therefore, be necessary to secure a total withdrawal of all extra-German forces, to have the move supervised by a neutral body and, moreover, to reorganise the German police which is now a totally Communist body (and threatens to become so even in Berlin). On the Allied side, too, the withdrawal of the occupation forces would need to be carefully arranged and even more carefully timed. It should in no case precede the signature of a close, binding Western Defence Pact which, among other things, envisaged periods of training in Western Europe for the armed forces of the United States and Canada. Such a pact and such arrangements would provide the element of forceful guarantee without which any agreement with a dictatorship is worthless, and without which any hint of a total Allied withdrawal might throw German opinion into hopeless and demoralised alarm. Only when a total clearance had been made of Russian troops and Russian police, could there be any question of free elections. Provided they were free, the Western Powers would have nothing to fear. A genuinely free vote would show the Communists up as the tiny minority they are throughout Germany. Then, provided the future constitution were given a federal form, the political future of Germany would be reasonably assured.

The mere enumeration of the conditions which would make a general German settlement safe and acceptable to the West suggests the high unlikelihood of the Russians accepting them. Yet an outright rejection may not be inevitable. Indeed, in some ways, a Russian acceptance would entail grave inconvenience to the Western Powers. Economically, as its Two Year plan shows, the stripped and ruined Eastern Zone is a liability. If Germany as a whole were now to be drawn into the Marshall Plan, very many of the assumptions upon which it is based would have to be drastically revised, and the need for outside assistance would be considerably larger than is calculated at present. The political difficulties are possibly even graver. The fears of Europe—both Western and Eastern Europe—might be dangerously reinforced if a united Germany of over 60 million souls became a founder member of a scheme for Western Association. Yet to leave a reunited Germany out of the plans for Western Union would be impossible, since a Soviet German Reich would be an even more dangerous proposition.

If this account of the possibilities of negotiation is anything like accurate and exhaustive, it must be admitted that the prospects of an agreed settlement are small, and that the talks are likely to end in deadlock. The Western Powers must therefore accompany any discussion with the Russians at the conference table with private discussions to decide what their policy is to be if the Berlin blockade is not lifted. Negotiations may only give both sides breathing space. The Western Powers should come out of it more lucid and more united than they went in.

Production at Any Cost

EVIDENCE continues to accumulate that the too-much-money-chasing-too-few-goods phase of the inflationary problem is waning, even though it is not yet nearly over. Queues are shorter, theatres, restaurants and seaside hotels emptier; prices rather than coupon values restrict the demand for an increasing range of goods. While unemployment remains fantastically low, there can be observed a significant lengthening of the Appointments Wanted columns on the classified advertisement pages, and a corresponding shrinkage of the Situations Vacant. The amount of purchasing power on the home market is still, by any standard, excessive in relation to the amount of goods which Britain can afford to consume; and ominous rumblings from the engineering industry and elsewhere show that a new round of wage increases may begin at any time, in the absence of the firmness and skill needed to prevent it; but with all due caution one can aver that the tide has turned.

Income inflation, however—"too much money chasing too few goods"—is only half the story. Ever since the beginning of the war, but with increasing momentum between 1945 and the eclipse of Dr Dalton, prices have been, as it were, sucked upwards by demand; and the obstacles imposed by controls on essential goods merely concentrated the sucking force of surplus purchasing power on inessentials, thus throwing the whole weight of the profit motive into that distortion of economic activity vainly lamented in successive Economic Surveys. But this process, drearily obvious to every sensible observer, was accompanied by another, less obvious in the past, but now perceptibly moving into the spotlight; the inflation of costs, the pushing upwards, as against the sucking upwards, of selling prices. Throughout the war, throughout the coal crisis, the food crisis, the housing crisis, the national demand has been, loudly and uncritically, for production at all costs; and the harvest of costs has been even more impressive than the harvest of production.

The tide of income inflation can be reversed comparatively easily; the tide of costs is a very different matter. The never-lifted depression which hung like a fog over Britain between the two World Wars was, in part, the product of just such an incomplete reversal of inflation—incomes deflated, costs relatively immovable. Both for obvious political reasons and because there has, after all, been some increase of economic knowledge over the past quarter of a century, the exact situation of the twenties and thirties is unlikely to recur; but some of the factors which went to its making are recognisably present once again. The most obvious example of the typical post-inflation dilemma is, of course, provided by the wireless industry, where the margin between costs and selling prices has dwindled, for the less well-placed firms, to nothing or less; and the troubles of the wireless makers are shared to the full, for no very obvious reason, by the jobbing engineers. Hosiery and woollen textiles face the same dilemma in a form only less acute, and wails of distress are arising from a catering industry which finds its costs not merely irreducible but, under the terms of the Catering Wages Act, rocketing upwards just when demand is unmistakably falling away. The level of demand does not, of course, subside evenly as the tidal metaphor misleadingly suggests. It has local subsidences, local resistances, even local reactions against the downward trend. But the experience of the wireless and hosiery industries is likely to be shared by many others. Pressure for reduction in costs will soon be a universal problem.

The rigidity of costs is a very relative matter. Such price-slashing as has occurred since Sir Stafford Cripps's appeal in the spring has come less out of production costs than out of profit margins, whether of manufacturers, wholesalers or retailers. There is room for a great deal more on these lines, but it would be rash to expect much reduction in costs merely from the process of squeezing margins. For one thing, the psychological atmosphere is hardly favourable. The production-at-any-cost attitude still understandably governs policy in coal and in agriculture, and the example thus set is not conducive to cost-mindedness elsewhere. But this is not the most important influence working against resolution in cost-cutting. The level of costs has been for so long dependent on Government action or inaction that business men have lost much of their sense of personal responsibility. In one industry it is impossible to shop around for cheaper raw materials because the sole supplier is the Government bulk importer; in another, a minor but essential readjustment must be fought for tooth and nail in a three-months' correspondence campaign with stonewalling Departments; in another, controls prescribe the rake-off to be taken by successive supernumeraries; in another, economy depends on steady capacity operation which in turn depends entirely on allocations of fuel or material which are wholly outside the firm's control. The way to thrive, too often, is to know which way the official cat will jump; the most profitably applied efforts of the business man are those directed to making it jump the right way. If these fail, fatalism is a more usual reaction than resolve to do what one can in the field still open to individual initiative.

This supineness, fostered by six years of this-that-and-the-other-at-all-costs, and three more of trimming to the official winds, is not, of course, universal; but unfortunately there are other psychological obstacles to cost reduction. There is the profound national conviction, far antedating the war, that competition is immoral and mobility—whether from place to place, from technique to technique, or from job to job—a detestable last resort; a conviction found in its full flower in the trade union movement, but enthusiastically shared by a very large proportion of business men. Costs, in these circumstances, are not something to be tackled but something to be taken for granted: a datum like the number of weeks in the year or the temperature of boiling water at sea level.

No psychological revolution would, of course, make cost reduction easy. The biggest item in most firms' costs is wages, and no serious cut in wage rates is economically conceivable under a regime of full employment or politically conceivable under almost any regime at all. One can cut expense accounts, tighten up on sundries, and prune overheads, but that does not take one very far. To reduce labour costs by the installation of better equipment, by improved factory and office layout, and so forth, is an avenue too often blocked by the resistance of the unions or by the impossibility of getting the necessary machines or the necessary building; and this is, indeed, as well-worn an excuse for inaction as the obstructiveness or arbitrary behaviour of officialdom. In all industries there are firms which, refusing to be discouraged by these difficulties, have in fact kept their costs down or, after a rise, drastically reduced them; but no single, universally applicable recipe for success emerges from their experience. In a sense, such a recipe is summed up in the words "good management"; but management, like housewifery, comprises a vast number of different skills, ranging from a thorough familiarity with the relevant productive techniques to a diplomatic knack for eliciting the co-operation of bright Red shop-stewards. Deficiencies in management, such as undeniably exist over the bulk of British industry and help to account for the rigidity of its costs, are at once harder and easier to remedy than deficiencies of equipment or buildings. Installing a machine, providing that it is available, is a fairly straightforward business; breeding a race of diplomat-technicians is a

good deal trickier, particularly when the problem is seen in its present-day context of elephantine public-enterprise organisms and of aspirations for workers' control. Emphasis on good management as a means of reducing costs does, however, remain within the competence of the individual firm. Bulk purchase, material and price controls, rationing, licence requirements, and union regulations have removed from that competence, temporarily or permanently, much of the matter on which business ability has traditionally exerted itself; it has not removed the art and science of management, concentration on which has become more rather than less important with the narrowing of other possibilities of cost-reduction.

Even given the utmost ruthlessness in squeezing superfluous water out of squeezable margins, the utmost concentration on good management, the utmost skill in disentangling the red-tape cat's cradle of controls, the most forbearing, public-spirited and constructive attitude on the part of the unions, and the maximum of economic statesmanship in the handling of money, credit and foreign trade relations during the next few years—if all these, and the maintenance of world peace, can be assured, the establishment of a post-inflation equilibrium is bound to be extremely difficult. Inflation, whether overt or partially suppressed, does not merely distort the relationship between costs in general and prices in general, but those between particular costs and particular prices; between the prices of capital goods and consumer goods, of luxuries and essentials; of export and home products, between the costs of more and less heavily capitalised industries, between old-established firms and newcomers, between the sheltered and unsheltered types of enterprise. For as long as the process of inflation—both of prices and of costs—is going on, business works without a reliable yardstick, accountancy is a distorting mirror, and errors are inevitable. Some of these come to light early; the radio industry is already paying the price of undue reliance on the continuation of inflationary luxury spending. Others may take decades to reveal their full consequences. When everything possible has been done to cut costs, there is certain to remain a residue of business problems which can only be solved by the less congenial method of cutting losses.

There is a sense in which "production at any cost" remains obviously essential, a matter of life and death to the impoverished British economy. But it is not a cost to be reckoned in internally devalued pounds. It is the cost of renouncing fatalism, nostalgia for the good old days, and attachment to the privileges embodied in prewar quotas or wartime margins. It must be paid in acceptance of adaptation, of mobility, of the inconvenience of risk-bearing and the grim realities of individual bankruptcy. It must be paid, in short, by the cultivation of a positive, resilient, and strictly realistic attitude to economic affairs, an attitude almost lost in twentieth-century British industry. The lead in willingness to pay it can only be given by private business, which can thus justify its existence at the same time as it lays the foundations of a more solid prosperity.

Bread and the Vote

IS there something wrong with colonial policy? It cannot be denied that there is a widely held belief to that effect—so much was apparent in last week's debate on economic development and in the earlier, more superficial and routine debate on the colonial estimates. The uneasiness is partly due to events in Malaya, where the situation seems to have got beyond the control of the local government in a way only too reminiscent of the Arab revolt of 1936 in Palestine. It is clearly far more serious than the sporadic outbreaks against colonial rule or European employers, which turn up with unhappy regularity throughout the colonial empire. There is, therefore, a fear that the story of Malaya may be repeated elsewhere.

Yet to any unprejudiced eye, British colonial policy since the war is surely outstanding for its aims and achievements. Compared with the nineteen-thirties, which saw Newfoundland fall from dominion status and Malta and Cyprus have their constitutions suspended, and also saw all the symptoms of deep economic distress almost throughout the colonies, the years 1945-48 have marked a big advance. Ceylon has peacefully crossed over the boundary between dependent Empire and independent Commonwealth. Malta has had responsible government in internal affairs restored to it. The promotion of Cyprus is under discussion. The West African colonies now have unofficial majorities in their Legislative Councils. In Kenya and Northern Rhodesia, there is what would have hardly even have been thought of in the prewar years—direct African representation, along with European, on the Legislative Councils. There can hardly be a colony which has not, since the war, had its constitution reviewed and modified in the direction of more self-government.

Has the pace been too fast? Is the rebellion in Malaya, where a most painstaking attempt was made to frame a constitution which would satisfy political aspirations without harming the less advanced communities, to be typical of progress towards self-government? Has British policy fallen into the old mistake of thinking too much of political progress and not enough of the economic and social progress, without which self-government cannot succeed?

Again, the answer must be that economic policy in the colonies since the war has been on a scale quite inconceivable in the 'thirties. Successive Secretaries of State, from 1940 onwards, have emphasised that economic development is no less essential than the grant of new constitutions—not because it is an end in itself, but because it is the only sure means of achieving responsible government in the colonies. The Colonial Development and Welfare Acts of 1940 and 1945, and the Overseas Resources Development Act of this year, have all been inspired by this one aim—that economic development must keep pace with political progress, that the vote is no use to people whose first need is bread.

But in spite of all the energy that has gone into development and welfare, both at home where, as Mr Creech Jones showed in a parliamentary answer last week, the Colonial Office has been reorganised to meet the new demands made on it, and in the colonies, economic development has not proceeded anything like so quickly as has the grant of more responsible government. It is still for the most part a matter of paper schemes, of machinery and organisation, of the appointment of development officers (and, now, development liaison officers), of aims rather than achievements. This was clearly brought out in the recent report on colonial development by the Select Committee on Estimates—and, even more, in the evidence given to the committee. In the year 1946-47, the first year of the ten-year plans drawn up under the 1945 Act, the development and welfare vote amounted to £9,340,000—but only £3,546,688 was actually spent. In 1947-48, the vote was reduced to £7,510,500, but actual expenditure still fell below it — at £5,326,278. In the present year, the vote has again been reduced, to £4,310,000.

The reasons for this underspending are shown in the Select Committee's report. First there is the delay inherent in the division of responsibility for the ten-year plans between the colonial government and the Colonial Office. Consultation locally, consultation centrally and all the to-and-froing between departments that characterise civil service methods must take place before a plan is finally approved. Sir Sidney Caine, until recently a deputy Under-Secretary of the Colonial Office, claimed that the review and approval of a plan in London took place with the minimum of delay. But it took two years for a forestry scheme in Nyasaland to reach the final stage of approval by the Colonial Office.

A much more important reason for the slow progress of the development and welfare schemes is, however, the shortage of manpower and materials—constitutions can be framed without steel. Throughout the evidence given to the Select Committee, the prevailing shortages crop up. "There is a world shortage of tractors," said Sir Edwin Plowden, with reference to the East African Groundnuts Scheme. "We are all," said Sir Geoffrey Heyworth, discussing the relations between private enterprise and Government activity in the colonies, "trying to get hold of the same screw or nail." And a member of the board of the Overseas Food Corporation said that the demand for spare parts for tractors was "immense from all countries in the world." The Colonial Development Corporation and the Overseas Food Corporation are to have more freedom in executing their projects than the colonial governments have for their ten-year plans. But they, too, are frustrated by the lack of supplies.

A third reason for the lack of progress is that colonial development has become caught up in the toils of the United Kingdom's balance of payments. Some of the badly-needed equipment could be had—from America. More labour would be available if more consumer goods could be sent to the colonies instead of to hard currency areas. More important, however, is the effect of the balance-of-payments crisis on the whole strategy of development. When this strategy first took shape, it was assumed that the first and foremost, if not the sole, aim of colonial development was to raise colonial standards of living and thereby strengthen their political advance. This is, in fact, still the view of the Colonial Office. The Nigerian development and welfare plan, said an Assistant Under-Secretary of State to the Select Committee, was not designed with an eye to the United Kingdom's balance of payments. "It was designed for the development of Nigeria."

But the practical effect of this policy was, quite naturally, that development began all over the colonial empire at the same time. What supplies of capital equipment and technicians were obtained were consequently scattered. The question now being asked, therefore, is whether a few schemes ought not to be completed rather than many started. Ought we not — the question was raised in last week's debate—to get the groundnut scheme well going before we move on to the waters of the Nile? Let us finish at Kongwa before we move on to Jinja. Moreover, in selecting colonies for rapid intensive development, ought we not to have an eye to their dollar-earning capacities? Would it not have been better to put the effort that has gone into the groundnuts scheme into rehabilitating Malaya, whose tin and rubber are wanted in the United States? As it is, by concentrating on Malaya's constitution and hastening on its political progress before its shattered economy was restored, the Colonial Office—so the argument goes—is in danger of losing this dollar-earning colony altogether.

These are weighty arguments. And now that colonial development has been drawn into the orbit of the Central Planning Staff under Sir Edwin Plowden, some selection will, it seems, take place. Development, actual development as distinct from the framing of plans, will be more intensive in the future—and will be carried out with an eye to the balance of payments. But what will be the effect on those colonies which are told that their schemes will have to wait? Will it not lead us to as much trouble as the premature grant of a new constitution? It may be possible to restrict development to a few attainable schemes. It is quite impossible to restrict constitutional progress to colonies whose economic future is assured. The demand for more responsible government is infectious, and all experience shows that it cannot be indefinitely withstood.

The difficulty, as Mr Rees-Williams pointed out in last week's debate, is that successful development may need tight control from Whitehall, whereas political progress means that that control becomes looser and looser. The dilemma seems inescapable, but there is at least a partial solution which was recommended in the Select Committee's report. For all its emphasis on the need for better planning at the centre and a stricter system of allocations, the committee did not fall into the mistake of thinking that "well-meant authoritarianism" was the right answer.

> Even at the risk of apparent inefficiency, it is essential that the work undertaken should spring from the desires of the people themselves, and that they should be partners in it at every step.

It therefore recommended—with reference to Nigeria, but the proposal is equally applicable in other parts of the colonial empire—that there should be a great extension of the practice of communal development (on the lines, perhaps, of development at Gezira in the Sudan), that is, "an upward movement of the people to meet the downward movement of Government-provided services." Whole villages are encouraged to practise better methods of agriculture and better ways of living; they are encouraged to think of ways in which their money, collected in taxes, can be usefully spent; they are encouraged to build their own schools, possibly with local materials. In this way a mass movement towards economic and social betterment may be initiated, which would be a surer foundation for constitutional progress than grandiose schemes that cannot be begun. Thus,

It costs less

to effect a With-Profit Endowment Assurance as you may now take advantage of the reduced rates of premium recently announced. The Society's With-Profit Policies provide OUTSTANDING VALUE IN LIFE ASSURANCE.

LIFE ASSURANCE SOCIETY
20 LINCOLN'S INN FIELDS, LONDON, W.C.2

although such schemes, needing scarce materials and equipment, may in future be subject to tighter control from this country, there is still a vast amount of development, needing energy and faith rather than tractors and steel, which can be done at once.

What is wrong with colonial policy is not its aims nor, except in detail, its methods, but the circumstances in which it is being carried out. The colonies are inflammable material, and whatever course is pursued, some stick will be found for beating Great Britain. But it takes a strong country to receive all the vile abuse that is hurled by the Ziks of the colonies and yet remain in control, and Great Britain at present is not strong enough. "What we have we hold," once declared Mr Churchill. But can we hold it? If we can, then the Third Colonial System is one of which we may be justly proud. If not, then the colonies will move, not forward to self-government, but to disaster.

Caleb Diplock Decd.

ON July 5th the Court of Appeal handed down a judgment of nearly 50,000 words in the case of Caleb Diplock's will, and thus one of the most remarkable law suits of the century approaches its last lap. The will has been before the courts since 1939. It has given rise to not less than 123 actions, of which 20 have been brought to trial. Twice it has had a full dress show in the Court of first instance, and twice in the Court of Appeal. Once it has been before the Lords, and its second appearance there cannot be far distant. Expensive researches without end have been conducted here and in the Dominions. At least two men have been killed by the worry of it. And as it nears its end it has come head on into collision with the National Health Service Act. And all this litigation, research, lavish expenditure, labour and sorrow sprang from one verbal mistake—the use in the will of "or" instead of "and."

The history of the Diplock family started with David Duplock, who was born in 1796 and spent his life in Sussex—at Jevington. Assisted by two wives he begat 31 children, of whom some emigrated and some remained in East Sussex. With a single exception none of them seems to have improved his worldly condition; and that one exception was not an emigrant but a stay at home, who acquired a substantial fortune in the rising town of Eastbourne. Beginning as a gentleman's gentleman, he somehow opened a wine shop and brewery in Terminus Road—the wine shop is still there, but the brewery is now the 'bus depôt—and he died in 1884, leaving £67,000 to his three children, of whom the eldest was Caleb, the testator of the unfortunate will. This Caleb—an unpleasant person—sold the family business and took to the profession of miser, with such success that he left, when he died in 1936, a sum of £520,000.

Seventeen years before he died Caleb had a heart attack, which so frightened him that he sent for a lawyer to prepare his will. He chose an Eastbourne solicitor, and explained to him that he did not care a fig for his relatives and wanted his money to go to charity; but he could not choose the charities himself and he would leave it to his executors to distribute the assets among whatever institutions appeared to be the most deserving. To a layman it might seem a fairly simple job to draft a watertight will on those instructions; but the Law has its own pits and quagmires, and the solicitor, himself named as an executor, fell headfirst into one of them. Following an unhappy precedent he made Caleb leave his residue to be divided among "such charitable institutions or other charitable *or* benevolent object or objects as his executors might in their absolute discretion select." It was those two words "or benevolent" that started the trouble and dissipated a very substantial part of Caleb's hard gathered wealth. By saying "or" when he should have said "and" the solicitor gave to the executors the option of endowing benevolence or of endowing charity; and because charity and benevolence in legal terminology are different things, the will (so far as the residue was concerned) was void for uncertainty and so much waste paper. The next of kin were entitled and the executors had no right to distribute the money to charities.

If the lawyer's mistake had been recognised immediately on Caleb's death, the executors would doubtless have had much trouble in tracing the next of kin; but they would have escaped the anxiety that actually killed two of them out of three. And discovered it very nearly was. One of the executors, Caleb's own doctor, was flabbergasted by the size of the estate and suggested to his colleague, Caleb's lawyer, that he would like to have counsel's opinion before distributing; but the lawyer resented the implicit criticism of his draftsmanship and they decided not to go to counsel. An admirable list of charities was made out and by 1939 all the money was gone. Then the will was challenged. The executors had to go to counsel.

Here we come to one of the queerest incidents in the whole story. The local miser's £520,000 naturally made some sensation in Eastbourne and, when it was published in 1936, a reporter sent the story up to a news agency, seasoning it with an amusing example of Caleb's meanness. That bit of meanness caught the eye of a news-editor in Newcastle, N.S.W., and the *Newcastle Sun* splashed it under the headline "Meanest man. Surprise will." This paragraph was noticed by an Australian cousin of Caleb's who was living in a neighbouring state. He was an injured miner existing on a pension of £1 a week, too old and infirm himself to be much interested, but blessed with a granddaughter, Thelma—a girl of character who decided that, if it were humanly possible for Grandpa to get something out of the will, that something should be got. Thelma first tried a direct appeal to the executors—unsuccessfully. She asked Australian lawyers to get the will upset on the ground of incompetence, and none of them would touch it. But after three years a lawyer in Melbourne, noticing the word "or," spotted the mistake and told her that the bequests to charity were void for uncertainty, and the next of kin—including Grandpa—were entitled to the money. After three years of ineffectual sparring Thelma had got the lawyers groggy.

The battle that Thelma and the relatives now had to fight was a two-round contest (1) to prove that the bequests were void and (2) to prove that the charities which had had the money were bound to pay it back. Unless they could win on both issues they would be no better off.

They won the first round after fighting the action up to the Lords. The details of this struggle have already been discussed in *The Economist* (September 8, 1945)—but when they came to round two they had to fight their way through a jungle of legal obscurity too dense for any layman to penetrate. All that can be said is that in the Court of Appeal they have won a victory that is very nearly complete and, unless the judgment is reversed by the Lords, most of the charities, if they still existed, would have to disgorge.

But most of the charities were the governing bodies of hospitals, and on July 5th they no longer existed. Dissolved by the National Health Service Act they have had their day and ceased to be. Against whom then would the anticipated judgment be enforced?

One would naturally expect the Act to provide for this contingency and arrange for all liabilities of the old bodies to be transferred to the new board. That seems to be obvious and sensible, but it is not the way in which we are governed. The Act did provide that the liabilities of non-teaching hospitals "incurred for the purpose of carrying on the hospitals" should be vested in the Minister of Health; and it may be, though it is far from clear, that that provision would enable the relations to go for the Government in respect of the non-teaching hospitals. But as regards teaching hospitals there appears not to be a word in the Act to make either the Government or the new boards liable to the next of kin for a penny of the Diplock money. The old board was dissolved into thin air and is unusable. The new board seemed to have no liability. That was how the Act left it.

At some undiscovered moment a whisper of the Diplock case must have penetrated into the cloistral recesses of the Ministry, for on June 16th, three weeks before the judgment was delivered, Mr Bevan made a regulation with Diplock stamped all over it:—

> If immediately before the appointed day any action is existing against a dissolved authority, the same may be continued against the successors of the dissolved authority.

As the action was still "existing" on July 4th the regulation seems to cover it.

This is a good example of contemporary legislation. Parliament half bakes a Bill and calls it an Act. A civil servant finds a bit of it that is underdone. It is pushed, unobtrusively, back into the oven, re-emerges for a moment and returns for another cooking when the next chunk of raw dough is discovered. The silly thing about a document like this National Health Act is that, for all its omission and ambiguity, it cannot be adjudged void for uncertainty.

NOTES OF THE WEEK

Nothing to Learn?

Sir Stafford Cripps's artless—or was it artful?—disclosure in Paris about the formation of an Anglo-American Council to encourage the increase of industrial productivity in Britain has caused an astonishing volume of protest. Unsupported by any of his colleagues, Sir Stafford experienced a most uncomfortable half-hour in Parliament on Wednesday under fire from Conservatives, Labour back benchers and, of course, the Communists, and the question was being further debated as *The Economist* went to press. The purists say that Parliament should have been told about the Council before Mr Hoffman. Conservative criticism springs from a mixture of wounded pride at any suggestion that the best sections of British industry should need any technical assistance from America and from a realisation, not so openly admitted, that management in other sectors is open to criticism. Those who complain that in return for Marshall Aid Britain has sold its birthright profess to see in the proposed Council the confirmation of all their fears—the arrival of the banker's supervisor, armed with full powers to give orders and to bend British industry to American ways.

It is possible to see in this political tenderness the psychological reaction to dependence on American assistance—a demonstration against any suggestion that there is a natural superiority in American methods or any defects in British industry which can only be put right with outside assistance. But the argument is not really concerned with such extremes. It is concerned quite simply with the value of an exchange of information about industrial methods between America and Britain. For the best industrial concerns in this country it will obviously have little value—their links with American industry and their knowledge of American practice are already close. For the more backward industries, again, the direct fruits of such a committee should not be exaggerated; the problems of industrial inefficiency are deep-rooted, and to point them out in international discussion between industrial bureaucrats is not to solve them.

When all this is said, the outburst of criticism and suspicion which the formation of the new Council has caused is remarkably childish. There are two main reasons for welcoming such a body. First, it is an earnest that Britain is taking the problem of industrial efficiency seriously—and not before it is time. That will count in Britain's favour when the time comes for Congress to discuss the second year's programme of aid. It will also rob the criticisms of independent American observers—not all of them remarkable for their objectivity—of some of *their* sting. That is a point which the Trades Union Congress, in a guarded acceptance of the new Council, has been at pains to emphasise. The second reason is the chance that American viewpoints on increased output and the co-operation of labour in achieving it may stir British labour—and British managements, too—to greater effort, and towards the lifting of restrictive practices. It needs no Anglo-American Council to demonstrate what is wrong with a large section of British industry—backward technique, inadequate capital equipment, and the frequent insistence of labour that technical improvement must on no account be matched by a reduction in the manpower employed in particular processes. But to suppose that the Council will have no uses for the improvement of British industrial efficiency is arrogant self-deception.

Mr Hoffman in Paris

Mr Hoffman, head of the Economic Co-operation Administration, is a man of vigorous and sanguine temperament, and he has from the first thought of Europe's Recovery Programme as a great combined operation through which, in a short time—perhaps in a shorter time than is strictly possible—the shape of a new Europe would begin to emerge from the morass of postwar dislocation. His is a courageous and creative vision. As he remarked to Sir Stafford Cripps, "If the people are once inspired, the results may surprise you."

It is this background of American optimism and achievement that helps to account for some of the reservations in Mr Hoffman's mind when he arrived in Paris for his first discussions with the participating nations, represented in Paris for the occasion by their Foreign Secretaries or Finance Ministers. He clearly had doubts about the speed and vision with which both recovery and joint action were being pursued. He was also perturbed by the fact that the European administration in Paris was in the hands of officials, not of men of Cabinet rank—as is Mr Averell Harriman. And on both counts he appears to have had a suspicion that the British Government were not exercising the leadership which could only be given by them.

It is difficult to say whether these suspicions have been dissipated by the week-end's discussions. The Sixteen were able to produce an agreed plan on increasing intra-European trade (its general working is discussed in a Note on page 194), and Mr Hoffman also persuaded them to accept the principle of a Four-Year Plan of action on which, year by year, a progress report in the shape of a One-Year Plan could be presented to Congress. To those who protested—not unreasonably—at the amount of paper work such schemes would involve, he replied:

> I want to make clear as crystal the fact that what I have in mind is a programme of action, not a rigid and ponderous five year plan which tries to compress the life processes of a nation into a set of formulæ and a sheaf of statistical tables.

It is clear that it is co-ordinated action, not scrupulous programming, that he had in mind.

★

A compromise was reached on the question of appointing more influential figures to the Paris organisation. A proposal to have regular meetings of the Foreign Secretaries and other Ministers who are on the Council of the OEEC was modified, at the request of the British, to the suggestion that such meetings should be called at the discretion of M. Spaak, the chairman of the Council.

It fell to Sir Stafford Cripps to propose modifications on more than one occasion—all in a more modest sense. Indeed, the paradox was reached of Mr Hoffman, the American business man, urging the virtue of plans upon a reluctant Socialist Chancellor of the Exchequer. But Sir Stafford appears to have used his readiness to accept American technical advice and co-operation as a lightning conductor to deflect American criticisms of "British timidity."

All in all, it seems that Mr Hoffman has left Paris partially reassured. But the suspicions remain, and were there to be six months of relatively small achievement in the next phase of ERP, all the old criticisms would revive.

M. Marie's Uneasy Team

The latest French political crisis was the direct creation of the Socialists. By refusing to vote against the proposal to make a relatively small reduction in the military budget, they overthrew the Schuman Government which, led by a member of the Catholic MRP and composed in the main of Catholics and Socialists, could claim to be a post-liberation, centre-of-the-road government. By this irresponsible action—which incidentally deprived France of a government at a time of crucial discussions on Western association and defence—the Socialists hoped apparently to strengthen their position *vis à vis* the electorate; for, they argued, a period out of office, free from complicity in unwelcome policies, might recoup some of the popularity steadily lost in the last three years.

The calculation could hardly have been more mistaken. Faced with a prolonged cabinet crisis, the Socialists could not push irresponsibility to the pitch of leaving M. Vincent Auriol with no alternative but to call on M. Thorez or General de Gaulle to form a government. Counselled and encouraged by M. Blum, they agreed to join the new Cabinet formed by M. Marie—a Cabinet which is in every way less favourable to them. It is led by a Radical-Socialist, who in spite of a heroic war record in Buchenwald, is nevertheless a man of the Third Republic. It is politically further to the Right than the Schuman administration since it includes representatives of all the parties of the Right, short of the Gaullists. Above all, it is likely to follow, under the direction of M. Paul Reynaud (another figure from the Third Republic) a conservative economic policy of "saving the franc" at whatever risk of unemployment. The Socialists will become the first targets of Communist attack for having sold out to the *bourgeoisie*. At the same time, their hapless manœuvre has given the Gaullists one more whip with which to beat the Constitution.

In these circumstances, M. Marie's new coalition must be an uncertain affair. It is held together by the negative desire to keep others out and not by any positive plan for co-operation. M. Reynaud's economic measures will be unpopular. There is no popular way of dealing with the tremendous budgetary deficit which threatens France with a new wave of inflation. On one point only is there some unanimity—the project of European federation. But here it is a question not of persuading colleagues but of overcoming the cold reception given the project by Britain and Benelux.

* * *

Long Vacation?

Despite the Berlin crisis, the closing weeks of the summer Parliamentary term have been marked by little of that tension which characterised the corresponding period last July, when the economic crisis was reaching its climax. Weariness may account in part for this. The Members have dealt in all with sixty-eight public Bills since last November, and the sixty-ninth—the Parliament Bill—will be ready for its second treatment when the Houses reassemble for the special session in six weeks' time. Some of these, such as the Criminal Justice Bill and the Representation of the People Bill, were not only complicated but also proved to be much more controversial than had been expected, and on the Gas Bill the Opposition waged a struggle even more bitter and protracted than on earlier nationalisation measures. It is not surprising that in these circumstances the Commons in the heat of Monday evening should have failed to find the subject of the sale of poisons sufficiently interesting to keep a quorum in the Chamber, causing the House to be counted out at a quarter to midnight. There had been one or two bursts of absenteeism a little earlier, particularly when the food situation was debated a fortnight ago to a very thin House. But to judge by columns of Hansard spoken, and the volume of legislation passed, the Members can adjourn without feeling too acutely concerned that in a recent Gallup Poll the job of a politician was classed as the "most consistently overpaid."

Although not destined for such an exciting summer holiday as their American counterparts, Members of Parliament will be anxiously testing opinion in their constituencies. The Conservatives will be concerned to discover whether the Industrial Charter is really more than their less sophisticated supporters can stomach, and upon what lines to construct their Party Conference in the autumn. The Socialists will be watching even more anxiously to discern whether Mr Morrison or Mr Bevan is proving the doughtier warrior in the battle for the middle classes, and to what extent the electorate can be interested in a battle over steel nationalisation. One thing is certain—that the approaching election has temporarily healed the growing rupture within the Labour Party itself. If the late session has ended in torpor, it is because the Labour Party has decided to close its ranks at whatever cost to the individual.

* * *

The Fate of a Free Vote

The Government's decision not to proceed with the compromise clause abolishing the death penalty was in the circumstances the only thing it could do. To have insisted on it would have meant losing the whole of the Criminal Justice Bill, and it was for this reason that the Government was able to obtain the support of some prominent abolitionists for its decision. Yet there were many who were unconvinced and resented Mr Morrison's refusal to pledge the Government to introduce a bill dealing with the death penalty in a future session. An analysis of the voting shows that though only 33 Labour members voted against the Government, there were well over a hundred abstentions, among them 7 Cabinet Ministers.

There are good reasons for this lack of support. The controversy over abolition has left the use of the death penalty in a very unsatisfactory position. The drafting of the compromise clause has given an indication of the way the Home Secretary's mind may be expected to work when he has to decide whether to reprieve. But it may well be unfortunate that this indication has been given; for a separate decision will still have to be made in each case, and the partial lifting of the veil will only create confusion and uncertainty.

Another reason for the lack of support from the Labour Party is that the future of the death penalty was, after all, left to a free vote of the House, and by a free vote the House abolished it. It would be a great pity if the fate of this free vote meant that nothing in future can be decided as a non-party issue. The trouble, however, in the case of the death penalty arose because, first, the vote was not altogether free—the Government collectively had one view and Ministers were not allowed to vote against it. Secondly, the Government made the great mistake of allowing a free vote on one clause of what was otherwise a Government bill and of arranging for the vote to take place only as that Bill reached its last stages in the Commons. If the proposal to abolish the death penalty had been incorporated in a private member's bill—here if ever was a case for restoring private members' time—and had been given publicity before the free vote was taken, the political tangles might well have been avoided.

* * *

Challenge to BOAC

The purchase of the Canadairs has put BOAC on its mettle, since the lack of economic machines will soon no longer be acceptable as an explanation of heavy losses. The Corporation is now promised the tools, and has begun to organise itself for the job. Some changes had been made even before last week's developments; and this implicitly acknowledges that not all shortcomings were due to unsatisfactory aircraft. Considerable reductions in staff have been made over the last few months. Last August BOAC employed 23,200 persons. By January the figure had fallen to 22,500 and by mid-June to 20,800.

But the new changes amount to much more than adjustments to the old system. Decentralisation is their keynote. The London head office is to have its size reduced and its functions limited to policy and advice. There will be a Western Division in Montreal, responsible for the area westwards from London to Australasia, and an Eastern Division in Cairo, responsible for the area eastwards from London to Australasia and Japan. The divisional managers will have full responsibility for the success of their divisions. Each division will be split up administratively into Lines, which will fly the routes through the divisional area, and into Areas, which will provide the traffic and facilities for the Lines. Each component part of the organisation will be expected to operate at competitive rates. The same principle will govern the operations of the Corporation's ancillaries. If the repair and maintenance division cannot do its job at least as cheaply as an organisation outside BOAC could, it will go out of business. Happily this division is so competitive that it attracts outside, and even foreign, custom.

It is this spirit and the fact that on the North Atlantic route, where BOAC already operate modern aircraft, it shows the highest profits of any airline—which enables one to share to some extent the Corporation's confidence. Since it has also centralised the ordering of new aircraft, it should in future avoid the lengthy and costly vacillations which earned it bad marks from the Courtney Committee.

It will obviously be some time before judgment can be passed on these new methods and new machines. The act that has just ended was a flop—and was received as such. There are good hopes that the act on which the curtain is now rising may provide much better value. The audience and critics—and management—should give the players a fair chance to show what they can do.

In Tito's Capital

The control of the Danube is an old bone of contention between East and West. The conference at Belgrade which begins today between Britain, the United States, Russia, France and the riparian countries is partly a continuation of the earlier attempts to solve the problem, and partly yet another attempt to find some common ground between East and West. Ever since the Congress of Vienna in 1815, efforts have been made to prevent individual nations from denying free rights of navigation to the other countries concerned. The European Commission of 1856 established the principle of unrestricted navigation on the lower reaches of the Danube, and, after the First World War, the International Commission extended the principle to cover the rest of the river's navigable course. But, after the Second World War, Russia closed the section of the Danube under its control—from near Linz to the Black Sea—to all non-Soviet shipping. Some 700 ships were affected, with the result that trade with Eastern Europe has been much reduced.

The interest of the Western Powers in the Danube is to increase the trade between East and West by restoring the right of unrestricted navigation over the whole length of the river. The Western Powers maintain that, by shutting off half the river, Russia is harming the interests of both the riparian countries and the West. The purpose of the conference at Belgrade is to end the present restrictions on river traffic and to establish an international authority to ensure that the Danube is kept open for all who need to use it.

Russia has, from the time of the Peace Conference in Paris of 1946, shown itself to be against the principle of the free use of the Danube. Mr Molotov, when the question was raised at Paris, made the uncomfortable suggestion that if the Danube was to be thrown open to an international authority then so should the Panama and Suez canals be subject to outside control. The same suggestion may well be made again. But with Russia agreeing to the Belgrade Conference and the riparian countries standing to gain much more than they lose from removing the restrictions on Danube traffic, there may be some slight hope of breaking the deadlock between East and West on this particular issue.

In any case it is a remarkable and welcome fact that East and West should be meeting at this moment in Belgrade, the centre of the Communists' bitter family quarrel. Opportunities for ministerial visits behind the iron curtain are so rare that it is a pity that Mr McNeil has preferred to visit Geneva. Part of the art of diplomacy consists in looking for unexpected opportunities to talk with one's opponents, and the Minister of State is wasting his time exchanging all the old battle-cries with the Soviet delegate in Switzerland.

* * *

Palestine and the Middle East

The Palestine news this week has been a patchwork of odds and ends, symptomatic of nothing but the lack of any conscience or clear purpose in the counsels of the Powers. In opposing any action by the Security Council in the affair of the kidnapped Britons, America has again demonstrated that it is only concerned to uphold the authority of the United Nations if that coincides with Zionist interests. A motion by Syria, which in present international circumstances could have had no more than a propaganda value, to ask the International Court for an opinion on the status of Palestine, was defeated. It had British support, but got one short of the necessary seven votes. In Jerusalem, the Zionists have declared the New City "Israeli-occupied territory," which is thought to be a preliminary to asserting some sort of authority over the Irgun Zvai Leumi there.

The worst feature of the affair is the complete lack of support for Count Bernadotte. He must rely to a great extent on the United States to give him the men and the materials necessary to enforce his authority. The other two Powers concerned—France and Belgium—cannot lead where America may not even be prepared to follow. Yet American policy is apparently completely spineless and dilatory, and as a result Count Bernadotte is making slow progress in his attempts to demilitarise Jerusalem. The Arab League has agreed, ignoring the protests from Damascus of the futile Palestine Arab Higher Committee. But the Zionists, relying on their American sponsors and armed strength, are treating him with increasing truculence. They take ill his evident belief that the Arabs have a claim to some consideration. The Tel Aviv Government has let it be known that it does not propose to allow the 300,000 Arab refugees to return to their homes. This is one of the principal problems that Count Bernadotte is trying to solve. It is said that Syria would be quite glad to have them to settle some of its sparsely populated agricultural areas. They are a serious burden on the Lebanon, where so many of them are now crowded. And any scheme of resettlement will require more funds than the Arabs can easily muster.

There are yet no real signs of heart-searching in the Arab countries. In Egypt, a country which gives its population as 19 million and failed even to dent a Zionist enclave of some 700,000, there has been an ugly series of attacks on individual foreigners and Jews. But these misdirected outbreaks are so far the only hint of an actional awareness that something is wrong. The criticism of the old order is there, but it has not yet found any really effective expression.

* * *

Japan's Recovery Plan

The occupation of Japan is costing the American taxpayer close to $400 million a year. This drain accounts for the fact that the past six months have seen the publication of three major reports on the economic future of Japan. The first two reports were drawn up by visiting American experts—the "Strike" and "Johnston" committees—the third, and most recent, now being discussed in Tokyo, purports to represent the views of the Japanese Government.

All three surveys emphasise the need for increased industrial production, for greater exports, and for a stabilised currency in order to make Japan self-supporting. The American documents, while recognising that some US assistance will be required, tend to stress the need for Japanese self-help. This is not reflected in the Japanese proposals. Where the Johnston group recommends that America finance a reconstruction loan of only ½ billion dollars spread over four years, the Japanese scheme envisages a 1½ billion dollar US contribution to Japanese recovery, and in general its authors throw most of the responsibility for this task on the United States.

In some ways General MacArthur's pronouncements since August, 1945, have encouraged the Japanese in this attitude of complacent dependency. But it is not a view shared by the US Congress. Even the modest request of the Johnston group has failed to pass the Committee stage in the House of Representatives.

The approaching Congressional battle over rising prices will undoubtedly revive the popular argument that American overseas loans are forcing up the cost of living at home. In such an atmosphere the US War Department will find it extremely difficult to wheedle out of Congress a grant of a billion dollars or even half a billion for MacArthur's protegees.

The Marshall Plan has been the answer of the US Administration to the similar problem in Western Europe—the resuscitation of Germany; but it is impossible to fit Japan into such an imaginative project because of the gigantic chaos which now envelops the Far East.

Undoubtedly the War Department will resume its crusade at a more propitious moment. Meanwhile, the occupation authorities in Tokyo have embarked on a seemingly hopeless attempt to make the Japanese economy more attractive to US private investors. In fact, some American authorities anticipate that private lending will take the place entirely of US Government loans for Japan's reconstruction. They are trying to get acceptance from the Far Eastern Control Commission for a greatly reduced level of reparations. They are making renewed efforts to fight inflation and industrial paralysis by stabilising wages and prices, suppressing the black market and balancing the Japanese budget.

One of their biggest tasks, however, will be to obtain wholehearted efforts from the Japanese, who are suspected of holding back in the hope that America will do the job for them. At the moment US officials seem to be confronted by an army of beaming limpets.

* * *

Commission on Justices

Anyone who expected revolutionary proposals from the Report of the Royal Commission on Justices of the Peace will be disappointed. The majority of recommendations offer no more

than minor renovations to the existing structure. Blind or deaf persons should not be appointed; nor should Ministers of religion, persons engaged in the licensing trade nor pawnbrokers be regarded as barred from appointment as justices solely on the grounds of their occupations. The only *ex officio* appointments to the Bench which the Report suggests should be retained are those of mayors of boroughs during their term of office (thus removing chairmen of county and district councils from the list of *ex officio* magistrates). For juvenile courts the upper age-limit of appointment should be 50 and the retiring age 65. Magistrates should be paid travelling expenses and lodging, but should not be reimbursed for loss of remunerative time. The existing system of appointment of stipendiary magistrates should be retained (which means that the decision to appoint a stipendiary is left to borough councils themselves), and solicitors should be qualified for appointment as well as barristers.

The most controversial issue with regard to the appointment of magistrates is the working of the Advisory Committees which assist the Lord Chancellor through the Lord Lieutenant of counties in making appointments (except in the Duchy of Lancaster). The majority report makes no recommendation for any substantial change, and is apparently prepared to accept, in the absence of any other, the present system by which the political parties play a predominating part in the appointments to these advisory committees and so in the appointments of magistrates themselves. But the minority report, submitted by Lord Merthyr, and supported, on the question of advisory committees, by Mr A. F. Stapleton Cotton and Mr J. A. F. Watson, does not shrink from the main issues. They regard political appointments to the Bench as undesirable, they consider them to be largely the result of political appointments to the advisory committees and as a result they deprecate any continuance of the existing system. Lord Merthyr alone goes farther. He sees no justification for *ex officio* appointments, and continues: "I think it is merely a question of time before lay justices depart. It is a question not of whether but of when they should be replaced by professionals." He considers that the cost of paying some 17,000 justices their expenses would be no more than paying a very much smaller number of stipendiaries a proper salary, and he concludes: "I think there should be a gradual transition from lay to professional magistrates. . . . It may be found that the inclusion of two lay 'assessors' to decide upon questions of fact would prove the best tribunal of all."

Probably the cynical will conclude that the Report of this Royal Commission will follow the fate of so many other reports of Royal Commissions. A few of the more obvious recommendations of the majority report will be embodied in a Statute within the next two years. In about twenty years' time, action will be taken on the lines of the minority report.

* * *

Critics on the Air

On Monday the Court of Appeal gave judgment in the appeal by Metro-Goldwyn-Mayer Pictures, Ltd., from the decision under which Mrs. Turner (Miss E. Arnot Robertson) was awarded damages for libel and slander. The Court allowed the appeal.

Miss Arnot Robertson in 1946 was a regular film critic for the BBC, and in September of that year the film company wrote to the Director of Talks at the BBC stating that in its judgment Miss Robertson was completely out of touch with the tastes and entertainment requirements of the picture-going millions, that the company proposed not to invite her to review their pictures in future and requesting that the BBC should co-operate in restraining her from doing so in BBC broadcasts. The substance of that letter was repeated over the telephone to a third person; that constituted the alleged slander. The jury at the trial found that the wording of the letter, in its natural and ordinary meaning, was libellous, that the company was actuated by "malice" in writing it and assessed the damages at £1,500. Mr Justice Hilbery, the trial judge, accepted the jury's findings and awarded judgment for £1,500.

On appeal, the three judges of the Court of Appeal were not unanimous. Lord Justice Cohen held that the words were libellous and thought that there was evidence for the jury to find that "malice" was present, but on other grounds he thought there should be a new trial. Lords Justice Scott and Asquith agreed as to the libellous nature of the words, but thought that there was no evidence of "malice." As a result, since the occasion was protected legally by what is called "qualified privilege," and in the absence of malice, the film company was entitled to a verdict.

The result is disquieting. The view of the law taken by the majority of the Court of Appeal may be sound—it is worth noting that two of the four judges who have considered the case have thought otherwise—but the public will be dismayed at the result. Lord Justice Asquith in his judgment said that he did not think it evidence of "malice" that one powerful corporation should write to another powerful corporation and say, in effect, "Don't employ X any more. Her talks are damaging to my business." Any adverse criticism on the radio may be damaging to the business under review. It looks as though either a critic must always be pleasant to commercial interests or that he or she must depend entirely on the moral strength of their employer to resist the behind-the-back approach to get rid of the offending voice. The law seems to leave the critic himself no direct remedy.

It is over the air, of all places, that the public is entitled to expect honest and direct expression of opinion. It is the duty of the BBC to choose its critics carefully: if they are libellous they—and the BBC—can be sued. If they are not, then it is up to the BBC to protect its employees from the sniping of those whom they may offend, especially as the snipers by this decision appear to enjoy legal immunity.

* * *

Hyderabad under Pressure

Against a background of frenzied clamour for war against Hyderabad from Indian ultra-nationalists, the Indian Government has got as far in armed action as the seizure of a village within Hyderabad territory. The fact that a general invasion has not yet been launched suggests that the Government is not as anxious as are many of its supporters to undertake the forcible annexation of the only one of the former Indian states which has not yet acceded either to India or to Pakistan. It appears, nevertheless, that the authorities in Delhi, whatever their own inclinations, find it politically necessary to keep on rattling the sabre and even prod with it; for failure to break down the resistance of Hyderabad to Indian demands might greatly weaken the existing Indian Government and expose it to successful attack from rival factions.

Hyderabad can expect little or no help from outside, for Britain is no longer either able or willing to intervene in the conflict, and even Pakistan, though naturally sympathetic to the Nizam's cause, is anxious to avoid any entanglement in southern India. There has been discussion of an appeal to Uno and it is stated that Syria would be willing to sponsor such an appeal, Hyderabad not being a member. Publicity for the history of the India-Hyderabad negotiations through a debate in the Assembly would certainly be damaging for India, for there has been far too much bullying in the Indian policy towards Hyderabad to make a good record for international inspection. But as the Kashmir story has shown, Uno is unlikely to do anything to stop military operations, if they have once been seriously started, and India may reckon that an irreversible *fait accompli* could quickly be created.

What may be perhaps a greater deterrent than the possible judgment of Uno, at any rate for the more prudent and far-sighted among India's rulers, is the risk that it might prove easier to sweep away the Nizam than to restore order in a country of 17 million inhabitants after his authority had been forcibly destroyed. Hindu-Moslem fighting and massacres starting in Hyderabad might renew communal riots in India and start them in areas which have hitherto been free from them. Armed Communist bands from Madras are already active in Hyderabad and an Indian invasion would give them their chance to develop a formidable power and even occupy certain areas. Finally, the "Andhra movement" for unification of the speakers of Telugu (who inhabit northern Madras and most of Hyderabad) would present a difficult problem if Hyderabad State were dissolved; it would involve the partition of Madras as well as of Hyderabad. With all these troubles likely to ensue from a victorious march into the Nizam's capital, second thoughts may still prompt Indian Ministers to work for a genuinely agreed settlement.

* * *

Newfoundland Votes for Canada

With all but a few votes from Labrador as yet uncounted, the Newfoundland referendum shows a narrow victory for confederation with Canada of 77,814 votes as against 71,258 votes for a return to responsible government. This is the result of eliminating the third choice of a continuance of the present Commission Government.

With so small a majority for Canadian Confederation, Newfoundland's future is unlikely to be settled quickly. Canada has enough minority problems already without being anxious to incorporate a body of dissident Newfoundlanders. Moreover, the leaders of the opposition to confederation may feel that they have ample support for demanding special privileges for Newfoundland as Canada's tenth province. Much negotiation will obviously be necessary before a satisfactory solution can be found.

The opposition to confederation comes largely from St. Johns. It is headed by the powerful commercial oligarchy of the island, who see in confederation the danger of severe business competition, a loss of protective tariffs, higher taxation of the upper income groups and the end of their hold, through indebtedness, on the fishing industry. But now that there is a definite majority for confederation, it is probable that this opposition will begin to wither.

The Canadian Government would very much like to see Newfoundland within the Dominion. It would round off their strategic position, give them additional supplies of pulp and newsprint with which to earn US dollars, and enable Montreal to develop the iron ore deposits in Labrador before the American steel interests can outbid them. Canada has offered Newfoundland complete parity with the other provinces as well as generous terms for shouldering its still large debt. However, having failed through over-eagerness in the past, it is certain that Canada will make sure of its ground before taking any further steps.

It is also very much in Britain's interest that the oldest British colony should be merged with the oldest Dominion. Newfoundland as an island inside the dollar area and with North American problems could never form an integral part of the United Kingdom, and is quite unsuited to colonial administration.

Fifty Labours of ECOSOC

"The need of the Security Council is in inverse proportion to the success of the Economic and Social Council." Mr Malik of the Lebanon spoke these words when he opened the seventh session of the Economic and Social Council at Geneva on July 19th. The size and diversity of the agenda confronting the delegates should have made them wonder whether they were not jeopardizing the success of the Council by attempting to do too much too quickly.

Its function is to get adequate and just economic and social standards established throughout the world. It involves making studies, reports, and recommendations on international economic, social, cultural and educational matters, covering such a vast field that members can hardly stop the agenda of its meetings from piling up into vast mounds. The Council must supervise the work of the nine functional commissions, five sub-commissions and three regional commissions, through which it works. It must also consider the reports of more than half-a-dozen specialised agencies, whose work is closely involved with its own. In fact, as the commissions, committees and agencies multiply—the Council will consider the setting up of a fourth regional commission—the task of the Council as the coordinator of the work of all becomes even more essential, if much wasteful duplication is to be avoided. It is all the more important that matters of secondary importance should not be allowed to hamper it in the fulfilment of this task.

The provisional agenda contained a grand total of fifty items. The social and economic items consist chiefly of the reports of the various commissions, such as the Population, Social, and Human Rights Commissions dealing with social matters, and the Economic and Employment Commission and the Statistical Commission dealing with economic affairs. Reports from all the specialised agencies, such as the Food and Agriculture Organisation, statements on the progress of the resettlement of displaced persons, on the special Uno appeal for children, and on the recent scientific conference on the utilisation of resources, are a few of the other matters before the Council.

When it came to consider the programme before it, the Council seems to have been well aware of the immensity of its task. All the same, it managed to delete only five and a half items, and that after long and bitter discussion on two of them. These, being concerned with forced labour and the violation of trade union rights were patently political, one being aimed at Soviet Russia and the other at certain of the Western colonial Powers. It rightly decided not to run the risk of holding up the proceedings with political bickering. But it is difficult to follow the train of reasoning which led to the shelving of such a live issue as the principle of equal pay for men and women, but refused to defer consideration of a report on international facilities for the promotion of training in public administration: which allowed an item on the enforcement of trade union rights to be removed, but retained another on the translation of the classics.

* * *

Control of Advertisements

The Control of Advertisement Regulations, which Mr Silkin has issued under powers given him by the Town and Country Planning Act, are on the whole sensibly conceived. There will be no control over indoor advertisements (save in some cases when they are illuminated), or over advertisements on vehicles and railway stations and on enclosed land where they are not readily visible from outside. Otherwise, all advertisements, including after a short period of grace existing ones, will have to conform to a standard code, which is not in the least onerous but which requires them to be maintained in a clean, tidy and safe manner. In addition, new advertisements require permission from the local planning authority before being erected, which will normally be given for three years. There are, however, a number of important classes which do not require this permission—such as advertisements relating to the land on which they are displayed—and its main impact will be on commercial hoardings.

Apart from the enforcement of the standard code, the main control over these exempt classes, over existing advertisements and over advertisements whose three-year period of permission has expired, will be the right of the local planning authority to "challenge" at any time their right to exist. Existing advertisements cannot, however, be challenged for the next three years or, in some cases, one year. To make the local authority take the initiative in this matter is an excellent arrangement, which will free advertisers from too many automatic obligations and should keep local councils up to the mark—although some are likely to be zealous and others just the opposite. In addition, areas of special control will be designated—including, no doubt, parts of the countryside and historic cities—where control will be much stricter and wider. There is a right of appeal to the Minister against the local authority's decision; it is a pity though that no place is found for tribunals and advisory committees of ordinary citizens.

It has been made clear that the control relates only to sites and appearance and not to the subject matter of the advertisements. The matter of many advertisements is extremely ugly—but standards of taste can perhaps hardly be profitably laid down by a Ministry. On this subject, the advertisers themselves should make every effort to speed up the improvement which has started.

Shorter Notes

Sir Stafford Cripps, speaking in County Durham last Saturday, took the occasion of correcting—to the relief of everyone concerned with the success of Western Union—Mr Gaitskell's remark of six weeks ago that if coal production were below the target the level of exports would have to suffer. Sir Stafford not only insisted on the necessity of exporting coal, but of high-quality deep-mined coal, with—if necessary—the home consumer taking second best.

*

Last Friday's adjournment debate in the House of Commons took the form of a strenuous attempt to force Mr Aneurin Bevan to give evidence to the Royal Commission on the press in view of his earlier attack upon it as "the most prostituted press in the world." The chief interest of the debate lay in the fact that Mr Bevan himself was silent. Having attacked a body whose case is at present *sub judice*, he was so obviously and so hopelessly in the wrong that, for once, he had to rely upon others to conduct his defence. The Prime Minister's statement that he had prevented Mr Bevan from giving evidence out of constitutional scruples is a measure not of Mr Bevan's innocence but of Mr Attlee's kindliness and generosity—or should it be weakness—towards his colleagues.

*

It is only two months since Mr Harold Wilson, President of the Board of Trade, last announced some concessions in the clothes ration. He was then anxious, or appeared to be anxious, to give the impression that no more concessions were to be made; in particular, he said that the changes in pointing were to be considered permanent—frequent changes led to uncertainty and interfered with the natural course of demand. Yet here he is announcing more cuts in pointing and the removal from the ration altogether of more clothes and fabrics, including boots and shoes. These concessions are coupled with a warning that next summer the total ration may have to be cut because by then the diversion to the export trade may be making new demands on total production. For the moment, although these concessions will be welcomed, they are largely offset by the fact that clothes are being rationed more and more by price rather than by coupons.

Letters to the Editor

Film Quota Dispute

SIR,—I should like to comment on the article in *The Economist* of July 10, 1948, entitled "Film Quota Dispute."

The Film Agreement and the Schedules were negotiated and completed by March 12, 1948. Certain additional clarifying text was subsequently discussed, but neither the Agreement nor the Schedules were "still under consideration" on March 25th, as you state. Hence it was not open to us to challenge the new quota percentages in the course of the Agreement negotiations. Moreover, during the entire period the Agreement was under discussion the Quota Bill was before Parliament. It would have been quite improper for us to have attempted any stipulation with respect to quota at that time, and we did not do so. It was our understanding that the new quota would start just where the old quota left off. This was not based on any official undertaking, as none was asked or given, for the reason noted. It was, however, the impression we gained, and were permitted to gain, throughout the Agreement discussions.

Mr Wilson's statements in Parliament toward the end of March were the first official intimation we received that he intended to use the quota to increase materially the sacrifice that the American industry had already made in accepting the Film Agreement itself.

Our complaint does not therefore rest on "formal grounds"—to which we attach little importance—but on our contention that the quota percentages adopted by the Board of Trade, after the Film Agreement had been signed and the Quota Act passed, violate the spirit of an Agreement we negotiated with the Board of Trade in good faith. That is a far more serious indictment.

I do not know what Sir Henry French sought to prove in our recent exchange of correspondence except that British film producers *hope* to treble or quadruple their production of first-feature films during the coming year. That, however, is the aim of *every* film producer the world over. If sincere, it bespeaks the triumph of optimism over experience. But I doubt that anyone, including Sir Henry, really expects such a miracle.

The truth is that the present quota is designed in practice to force British cinemas to show *every* British feature film *as first feature*, regardless whether it is actually a first, second or third feature in quality. The consequences of such a policy are far-reaching and destructive in the extreme.

British film producers may, for a time, benefit at the expense of British cinemas—and the cinemas may, for a time, survive at the expense of the public. Eventually they will perish together if the present policy is adhered to. It can, in my view, lead only to a repetition of the 1936-37 disaster.

Now the British Film Producers' Association has not only placed the future of British film production in jeopardy, but has created a genuinely difficult situation in Anglo-American affairs just when it can do the most harm. None of these things need have happened. No one was more prepared to co-operate in solving the Anglo-American film problem than the American industry itself.—Yours faithfully,

F. W. ALLPORT, European manager,
Motion Picture Association of America, Inc.

15 New Burlington Street, London, W.1

From *The Economist* of 1848

July 29, 1848

THE vast subject of our Colonial Empire was brought before the House of Commons, in an able speech by Sir William Molesworth, on Tuesday evening. His resolution, "that the colonial expenditure demands inquiry, with a view to reduction," and that "the colonies ought to be entrusted with large powers for the administration of their local affairs," was assented to by the Government, and Mr. Hawes declared that it only carries out the course of policy already adopted by the Colonial Office. Between his views and those of the Government there seems to be rather a difference in degree than in principle. He is more anxious to carry out his reforms than the Colonial Office, which is incumbered with details and responsibility, finds convenient. By continued attention to the subject, the desire to improve it fills his mind, and he probably sees none of the practical difficulties that beset the Minister. . . . The murmurs, the complaints, the distant grumblings, coming from many quarters, indicate demands for reform, and it is only rational to adopt means at once to prepare both the colonies and the mother country for a change that seems in the order of nature. Mr. Hawes indicated that the policy of the Colonial Office really contemplates that, by introducing as speedily as convenient the principle of self-government into the colonies, gradually preparing them to administer their own affairs, and gradually relinquishing our political control over them. Sir W. Molesworth contemplates this as the ultimate end of his motion, but he proposes to accelerate it by the agency of the House of Commons, and by influencing public opinion.

Food and the Future

SIR,—Your article on Food and the Future is likely to leave many readers in a dangerously complacent frame of mind, or at least with a fatalistic attitude towards the world food problem. Your counsel is "to wait and see," although you modify this by advising an increase in home food production so long as it can be achieved "without entirely upsetting" the country's economy. But without a precise definition of the word "entire" this gets us nowhere. The decision as to how much we must upset our economy is one which must be taken now if it is to have an effect on the events of the next ten years. There can be no question of "wait and see."

You mention several of the factors that must be taken into account in arriving at this decision, but there are three that you omit. The first is the convertibility of grain—a factor in many ways even more important than the convertibility of sterling. So long as people are content to obtain their calories direct from wheat and maize, there is little fear of world starvation, but the higher standard of living which has come about mainly as a result of the more even distribution of wealth throughout the world has resulted in a large number of people, who formerly could afford only bread and potatoes, now eating meat and dairy products instead. To meet this demand farmers of the world are converting their staple crops to livestock products with a consequent loss of nine calories out of every ten.

The second reason results from the higher relative prices obtained for agricultural as compared with non-agricultural products. Before the war farmers were forced to sell much food that they would have preferred to eat themselves, simply in order to obtain money with which to meet their essential outgoings. Today's increased prices enable them to sell a smaller amount and still be able to meet these outgoings; the balance they use to improve their own standard of feeding. Since for every non-food producer there are at least two producers of food, it follows that a rise in consumption of 5 per cent among all food producers must result in a decrease of 10 per cent for the food available for non-producers.

These reasons, added to those given in your article, are not enough to warrant throwing the baby out of the top-floor window. But they are surely enough to make the prudent man place an order for a fire escape.—Yours faithfully, H. D. WALSTON

6, St. James's Street, S.W.1

[Each of Mr Walston's points may be reversed when the world-wide war-bred inflation comes to an end, as it surely will. Many people all over the world who now eat meat will be unable to afford to continue. Food producers will once again be interested in money. Nobody can say to what extent these things will happen. But that they will happen to some extent is certain.—EDITOR.]

Deflation in Italy

SIR,—In your issue of July 24th you paint a gloomy picture of conditions in Italy. But Italy has been applying in an almost ruthless manner (the adjective is the *Statist's*) precisely those measures of credit restriction which you are frequently recommending to our own government. Signor Einaudi appears to be an unashamed disciple of Lord Overstone. Italy's Bank Rate was raised from 4 to 5½ per cent; commercial banks were compelled to place with the Central Bank or in gilt-edged securities a considerable proportion of their deposits, and were ordered to be parsimonious in financing industry and commerce. The result is that from the 3,000 level of April, 1947, the share index fell by December to 1,000, and unemployment has increased proportionately.

Yet both Italy and we need to increase production. Industry and commerce should surely be encouraged rather than repressed by credit deflation. If the Government would but cut down its vast expenditure on trade control, food subsidies and social services, taxation could be substantially reduced, and this would provide such a stimulus to enterprise in production as would astonish Sir Stafford Cripps.—Yours faithfully,

HENRY MEULEN

31 Parkside Gardens, S.W.19

[So far from "frequently" recommending high interest rates and credit restriction to the present British Government, *The Economist* has never done so. It is true that we have often pointed to the dangers of artificially forcing interest rates down, at the cost of indefinite credit expansion. But that is a different story.—EDITOR.]

Nothing to Live For?

SIR,—Professor Gilbert Walker, in his letter in *The Economist* of July 17th, "Incentives for Housewives," suggests that the average Englishman's tastes are too simple. May I add to this the suggestion that it is the high level of indirect taxation in this country that has for generations fostered our artless tastes? Everything that in happier lands makes life worth living for the wage-earning classes is denied them in this country by the Treasury's rapacious quest for revenue. Cigars, in Switzerland, the Balkans and Germany a frequent pleasure of any tramdriver or factory hand, are here and always have been so taxed as to be the emblems of plutocracy. Wine, to every Frenchman, Spaniard or Italian the normal accompaniment of any meal, is practically unknown to the masses in this country, thanks to duties decreed by our "brewerocracy." Perfume, a gift with which a Frenchman may seek and win a lady's love, is virtually forbidden to the English suitor. Delicate foodstuffs, by which I mean any food that our rulers do not regard as essential to the continued coexistence of body and soul, have always been taxed out of the reach of our wage-earners.

If a few little luxuries like these were relieved of some of their present load of taxation and brought within the range of the average worker's ambition, we might hear less talk about lack of incentive.—Yours faithfully,

GERARD TALLACK

44 Pine Avenue, Gravesend, Kent

Musicians' Strike

SIR,—You do not quite understand the nature of the musical profession, and therefore its attitude to such matters as fees, mechanical reproduction and musical standards. Unlike other occupations, most musicians depend upon casual engagements to earn a living, and even when in regular employment have no lengthy tenure of employment. Hence, any increase in fees merely helps to maintain an appropriate standard of living.

On the question of "relay" fees, the musical services obtained by the BBC are equal to those obtained from casual studio broadcasts, but at a lower cost. In other words, less pay for equal services received by the BBC. The same applies to mechanical reproduction. No musician would argue that records of our leading orchestras and bands should not be broadcast, but it is another matter when (a) such records have a large slice of broadcasting time, or (b) when a casual studio broadcast is recorded and then broadcast on subsequent occasions. Here again the BBC receives equal services at a lower cost.

You argue that, as about £1,000,000 was paid to musicians last year, the BBC cannot be regarded "as a skinflint employer." But what proportion of total fees and wages paid for broadcasting does this £1,000,000 represent? And what proportion of total broadcasting time was filled by musical services? Surely, these two questions should be the criterion as to whether or not the BBC is a "skinflint employer."

The question of musical standards is fraught with controversy. A balance must be struck between broadcasting records of first-class musicians and "live" performances of second- and third-class musicians. But it is not true that there is not an adequate supply of competent musicians. The argument that: "One only needs to know how to hold a clarinet to be able to join the Musicians' Union" is silly. The MU does not engage musicians. This is the function of conductors and leaders of orchestras and bands. All the MU does is to insist that those who receive fees for playing should be members of the MU. Further, it would not be in the interest of the community if the MU insisted on an adequate standard of musical ability before a person could obtain membership. Some of our finest instrumentalists were poor players at the beginning of their careers.—Yours faithfully,

8 Ray Court, Shrewsbury Road, W.2 JOE MILLER

AMERICAN SURVEY

Can Inflation be Checked?

(From Our US Editorial Staff)

NO responsible observer here challenges President Truman's diagnosis of the damage and the dangers arising from present inflationary trends. An inflationary movement such as the present leads inevitably to a crash, the depth and duration of which it is impossible to predict. And a world making painful progress on the path of trade and currency stabilisation might then be faced with the prospect of a return to the "protective" devices adopted by frightened and bewildered people, with political consequences which no one can assess.

So far the rise in American prices lags behind that of many other countries. But the rise has been accelerated in recent weeks, with significant changes in such basic industrial products as coal and steel, and the movement is by no means finished. The immediate damage is serious enough. The stock-piling programme for strategic materials has been much delayed, the real value of the funds appropriated for military needs, and for the European Recovery Programme, is dwindling almost daily, and the extent to which the pattern of ERP purchases is now being distorted to supply the materials which can be spared with the least discomfort, rather than those which are most needed, is an unpleasant foretaste of debates which are still to come. To some American politicians, the obvious solution is to stop sending so much abroad. To many more, at some later stage, the solution may seem to lie in the reduction of defence expenditures. In the meantime, important sections of the community are cruelly pinched by food costs; labour dissatisfaction is pronounced, and unorganised groups believe themselves to be the victims of the organised workers, who in turn have found that wage advances give only illusory benefits, with the real gains of the "third round" melting steadily away.

Proposals for exorcising this devil of inflation are numerous and vehement. President Truman has for some months been consistently demanding price controls and rationing powers. The Democratic Party's platform repeated those demands. Labour wants lower prices—at the expense of profits. Business wants lower wages—or lower wage costs. Financial pundits demand reduced consumption and less Government expenditure. The Republicans demand higher production, lower expenditures, and what they describe as "a sound currency." Each group tries to blame another group and to avoid its own share of responsibility.

The President's own demands to the Special Session of Congress follow faithfully along the lines of his appeals for action in November last. He is asking for higher company taxes, consumer credit controls, regulation of bank credit, regulation of speculation, the allocation of scarce materials, rationing powers and price, rent and limited wage controls. But none of these proposals, with the single exception of bank credit control—and the President is once again ominously silent about specific legislation on this point—can touch the basic cause of the inflationary movement which he now seeks to reverse.

The cause of this, and any other, inflation is simply that the flow of demand, expressed in money, is far above the present capacity of the nation to produce goods and services. For some time past, the total supply of money, enormously expanded by war finance, has remained fairly stable. But the community has been increasingly ready to spend its available resources, in cash or credit, and with the Treasury no longer in a position to curtail purchasing power, bank credit is once again expanding, and with it, the total money supply.

Mr Truman's remedies, for the most part, neglect these basic facts. There is an arguable case for the control of some key materials, though in peacetime the acknowledged price of all such measures is the establishment of a "disequilibrium economy," with all its waste of resources and misallocation of materials. But no controls of this type can have permanent value unless they are accompanied by a determination to reduce the pressure of effective demand to a level consistent with the point at which they are imposed.

It is at this stage that the Presidential programme becomes meaningless. For, side by side with the list of measures solemnly proposed as alternatives to the evils of inflationary drift are further measures which, however desirable they may be under more normal conditions, could only aggravate the problems facing the Government in 1948. This is especially true of the housing proposals, where Mr Truman fails to recognise that whatever "stand-by" powers may be justifiable for use in the event of a business collapse, there is no present urgency for the restoration of provisions for Federal finance which would heavily reinforce the building activity which is, even now, so prominent a feature of the boom. Some of his other proposals, for higher minimum wage rates and further funds for regional development, can be met with the same objection—that the President has failed utterly to discriminate between anti-inflationary policy and future needs.

*

In fact, the duty of taking corrective action now rests squarely on the monetary authorities, and the Treasury must bear a heavy responsibility not only for its past failure to check inflation, but for its quite recent decision to obstruct the Federal Reserve Board in its modest efforts to apply the mildest curbs.

It is, of course, true to say that the Reserve Board itself has been at all times unwilling to make a vigorous use of its powers to enforce credit restriction by the traditional procedure of discount policy and open market operations. Inhibited by Daltonian dogmas concerning interest rates, and by what many regard as predilections for unnecessary and impracticable controls, it has held consistently to the view that parity is a sacrosanct and minimum value for US government securities, and that no government could afford to face the loss of "moral prestige" which would follow a fall below par, even though every bondholder sees his income falling steadily in terms of purchasing power.

But the Reserve Board generally, and Mr Marriner Eccles notably, has stood for the restriction of credit by the revision of bank reserve requirements, the only fundamental feature in the President's programme—and the only one on which he has so far refused to make specific recommendations to Congress, or to support the Reserve Board experts in their evidence before Congressional committees.

The irresistible conclusion must be that, while Mr Truman is no doubt genuinely worried by the progress of inflation, he is worried much more by the need for putting the spotlight on Congress, and distracting attention from the strength of the Republican team for the Presidential elections in November. Perhaps the most fitting (and thus the most damning) verdict upon the Message to Congress is the comment made by Mr John Taber: "It looks like he is in favour of increased inflation, higher prices and greater scarcity." On this occasion, right or wrong, Mr Taber presumably speaks for the Congressional majority in both Houses.

The Supreme Court's 1947 Term

[FROM A CORRESPONDENT IN WASHINGTON]

LORD BRYCE, in his commentary on the American system of government, begins his study of the Supreme Court with the observation that:

> No feature of the Government of the United States has awakened so much curiosity in the European mind, caused so much discussion, received so much admiration and been more frequently misunderstood, than the duties assigned to the Supreme Court. Yet there is really no mystery about the matter. . . . It is the simplest thing in the world if approached from the right side.

And the right side, according to Lord Bryce, is through an understanding that the Americans have embodied their fundamental law in a written Constitution which is superior to mere legislative enactments. The Supreme Court interprets this Constitution and may declare unconstitutional statutes which conflict with it. Hence the Court's function is one of commanding importance, both political and judicial; its decisions are published and discussed throughout the country to an extent quite unknown abroad.

Last month the Supreme Court concluded its 1947 term, in which it disposed of over 1,300 cases and handed down 108 written majority opinions, together with 38 concurring and 81 dissenting opinions. It was a notable term, especially for the number and importance of the decisions on civil rights and racial discrimination. No decision in recent years has excited more widespread interest than that on the Restrictive Covenants cases, in which the issue was whether private covenants, forbidding the ownership or occupancy of land by negroes or other minorities could, within the Constitution, be enforced by the courts. The spread of restrictive covenants in the last twenty-five years, in Northern cities particularly, was dramatised in this very case by the withdrawal of three Justices, presumably on the ground that they owned covenanted property. The other six Justices decided unanimously that the judicial enforcement of the covenants was state action denying "the equal protection of the laws"—*hence in violation* of the Fourteenth Amendment to the Constitution—and that, when done by Federal Courts, it was contrary to Federal public policy as well. The cases were argued to a packed courtroom with striking ability by a trio of negro lawyers, and the result has been acclaimed as a great constitutional victory for the negro leaders in their struggle for equality.

*

Two other civil rights cases dealt with the rights of Japanese aliens residing in California. Under the Federal naturalisation laws, Japanese aliens are ineligible to become United States citizens. Nevertheless, in the Takahashi case the Court declared unconstitutional a California statute which in effect prohibited Japanese aliens resident in the State from fishing commercially in the waters of that State or in the open sea. The denial of the means of livelihood to such lawful residents was deemed a denial of "equal protection" and, furthermore, an infringement of the Federal control over immigration.

In the Oyama case the Court handed down an even more important decision in favour of Japanese aliens. The State of California, which has had more Japanese immigrants than any other, passed a statute as long ago as 1913 which made it unlawful for any person "ineligible to citizenship" to own agricultural land. Of course, this operated directly against the Japanese aliens. What the Supreme Court did in the Oyama case was not to declare the California law invalid—though four of the nine Justices favoured such action—but rather to invalidate certain procedural devices which put teeth in the statute and without which the state of California can scarcely hope to enforce it. In fact, efforts at enforcement have since been abandoned.

It is interesting to note that the problem dealt with in the Oyama case was argued in England by Coke and Bacon in 1609 in Calvin's case, which established the right of certain Scotsmen to own land in England. However, it was not until 1870 that Parliament removed all restrictions on alien ownership of land. The Americans appear to be only one Justice removed from attaining the same result.

The case of McCollum *v.* Board of Education throws new light—possibly new darkness—on a favourite constitutional controversy in America, the division between Church and State. The Constitution provides that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof," and the same prohibition has been held to apply against the states. The plaintiff, an avowed atheist with the half-Biblical name of Vashti McCollum, asked the Courts to ban the teaching of religious education in the state schools, and specifically to proscribe the teaching of the scriptures. She objected to a programme under which the school authorities released pupils during school hours to attend religious instruction classes for half or three-quarters of an hour a week. The classes were conducted in the school buildings by instructors furnished by an interdenominational council on religious education, and attendance was optional. Thus, the only support which the taxpayers gave the programme consisted in the furnishing of classrooms, the release of school time and incidental co-operation from school officials in organising the classes by groups.

This co-operative programme the Supreme Court declared unconstitutional. Similar programmes have been in existence throughout the country for years, and it is estimated that as many as two million children have been participating in them. The decision has been widely criticised and has drawn forth bitter comment from the Journal of the American Bar Association. If the rule is applied to Federal institutions with the same severity as to Illinois schools, there must be an end to the long-standing practice of providing chaplains at the Military and Naval Academies where Chapel services are not only tax-supported but also compulsory.

*

The effect of the anti-trust decisions handed down by the Supreme Court, in the term just ended, on the industries and economy of the country can hardly be overstated. From a legal standpoint, the most important case of the recent term was probably Federal Trade Commission *v.* Cement Institute. This case, which declared unlawful, as a violation of the anti-trust laws, the multiple basing point system, has already been discussed in *The Economist* (on May 15th and July 17th), as has the most impressive anti-trust case from the standpoint of legal talent, wealth of litigants, and complexity of issues—United States *v.* Paramount Pictures (on July 3rd).

Of special interest in England and abroad is the holding of the Supreme Court that Scophony, Ltd., a British corporation organised to exploit television patents, was subject to the jurisdiction of Federal Courts by virtue of the fact that it carried on continuous negotiations in New York, even though it did not have any tangible assets in the United States.

Amongst the other interesting cases decided by the Court were two involving wartime legislation, enacted by Congress under its constitutional power to wage war. The Renegotiation Act, which permitted the government to recapture "excessive profits" from war contractors, was finally held constitutional. So was the Rent Control Act, which had been extended from time to time since the end of the war. It has been challenged on the ground that the power of Congress to regulate rents ended when the President proclaimed the end of hostilities on December 31, 1946. But the Court concluded that the war power might be exercised to correct war-engendered evils still persisting after the end of hostilities.

On the last day of the term the Court ruled on one of the most controversial aspects of the Taft-Hartley Labour Act, holding that the ban on political expenditures by labour unions does not forbid a labour union from publishing a newspaper in which it urges the election of a favourite candidate to Congress. By placing this interpretation on the Act, the Court avoided a decision on the even more controversial constitutional issue whether the Act deprived labour unions of the right to free speech. The political repercussions of such a decision on the eve of the national election would have been incalculable.

American Notes

Wallace or War

Last weekend "the people of America came to convention" in Philadelphia to choose Mr Henry Wallace as their Presidential candidate and to found their new party. They at once destroyed much of its novelty by christening it with the traditional name of American new parties—the Progressive Party—and by following the traditional ceremonial of American political conventions. But their disregard of the formalities of debate and roll-call voting removed much of the tedium from that ceremonial, and their fervour, swinging violently between extremes of approval and aversion, gave it the inspiration of a revivalist meeting. The inevitable singing interludes were longer, more frequent and more original than usual, as might have been expected from a party whose Vice-Presidential candidate, Senator Glen Taylor, is known as "the singing cowboy." However, the high musical standard of the convention was set not by him, but by Mr Wallace's negro supporters, led by Mr Paul Robeson.

The negroes were accompanied by the left-wing intellectuals, by the pacifists, by the Jews, by trade unionists (but not by the official leaders of the labour movement), and, above all, by young people. They came from the cities far more than from the farms, but there were few who could be called business men. This sample of the American people was less representative than that provided by the Republicans and Democrats when they came to Philadelphia, but it was united as they are unlikely ever to be, and as it will probably never be again. These Progressives had come not to choose a leader and to build a platform, but to declare their faith in a leader already chosen and in the ideals he had already put before them.

"The choice," they were told, "is Wallace or war," and the choice was illuminated as they met by the growing intensity of the Berlin crisis. Mr Wallace and his producers made good use of this providential spotlight on his thesis that the present foreign policy of the United States is a war policy, and that he, as President, could settle all difficulties with Russia and the other wartime Allies, without sacrificing either American principles or interests. "Peace, freedom and abundance" are his goals, and at home his main pledge is to end racial discrimination. He also promises effective price control, cheap new houses, health insurance, old-age pensions, higher minimum wages, repeal of the Taft-Hartley Labour Act and the planned economy of "progressive capitalism," which does not preclude nationalisation, or at least Government control, of certain important industries.

This programme follows the custom of spreading wide the net of its appeal, and it therefore bears many resemblances to the platforms of the other parties, even though Mr Wallace attacks them both indiscriminately. He alleges that they are both dominated by big business, and that the falseness of their promises is proved by their failure to use the opportunities, which both have had, to practise what they preach. President Truman, by recalling Congress, is giving them a chance to repair this omission, and he has also this week put his own house in order by decreeing the end of racial discrimination in the armed forces and in the Federal service. His failure to do this had been attacked with particular bitterness by the Progressives, but he has probably chosen this moment to act rather because the split in the Democratic Party has at last left him free to ignore the susceptibilities of his Southern supporters.

* * *

A Passage for the Communists

Mr Wallace himself has given little indication of how he would keep his promises, apart from meeting Marshal Stalin, but even the most visionary of his supporters can hardly expect that he will have to do so. The most that any Progressive Party has accomplished in the past has been to ensure the defeat of one of its opponents by the other, before collapsing itself. But Mr Wallace and his friends are looking towards 1952: this year they ask only for sufficient success in the Congressional elections to give them a base on which to build. They claim to have secured a place on the ballot—not everywhere easy for a new party—in at least 40 states. It is thought they will get about 3,500,000 votes: about six per cent of the voters support them, in Dr Gallup's opinion. These estimates have hardly changed since Mr Wallace's party was formed six months ago, an unsatisfactory situation for a new party which should be constantly adding to its strength. But much of that strength is concentrated at strategic points in the big cities, where its influence on the results may be decisive. The Progressives are relying on the "protest" vote, and, from their point of view, the more there is

to protest about, at home and abroad, during the next three months, the better.

Mr Wallace has announced that he will oppose Congressional candidates who voted for the revival of selective service, the Taft-Hartley Act and the European Recovery Programme, with particular emphasis on the latter. The Progressives might have been expected to attack reactionary candidates from both parties, but they appear to be directing their main effort, for the present at least, against those liberal Democrats who have refused to join them and who, if elected, could form a rallying point for a resuscitated Democratic Party. Lack of a strong liberal opposition would strengthen the conservative influences in the Republican Party and would ensure that the tide of popular opinion flows strongly to the left with the depression which, Mr Wallace insists, is inevitable under a Republican Administration. His purpose is apparently to make it certain that his is the only progressive ship ready to take advantage of that tide.

It is obviously good tactics for the Communists not only to reserve a passage on the ship but to supply the pilots, and it is this, as much as his pro-Russian foreign policy, that has attracted them to Mr Wallace. He may not appreciate the full deadliness of the Communist kiss, but it is a liability with which he would gladly dispense. It (and his opposition to the European Recovery Programme) has cost him the support of the labour leaders and of the New Dealers, whose Crown Prince he claims to be. It may alienate many independent voters, particularly those whose pacifism has its roots in isolationism. It is on this issue, too, that his party may at any time lose its remarkable unity, but Mr Wallace has declared that he will not repudiate any support which comes to him on the basis of interest in peace. Nor are the Communists prepared to oblige him by running their own candidate for the Presidency or by allowing themselves to be prevented from taking their share in "this great new coalition."

Mr Wallace and his organisers repudiate any suggestion that they are dominated by the Communists, but the number of those organisers who have been splashed by the red paint of Communism is so high that it is difficult to believe that none of them deserve the stigma, even though the Un-American Activities Committee has certainly waved the paint brush with uncontrolled abandon. The Communists are very ready to remain in the background for the present, but the speeches and the platform, the cheers and boos at the Progressive convention followed the Communist line with a regularity leaving little doubt that the absence of the professional politicians had given the Communists a welcome opportunity to use their long experience of steering the prejudices and idealism of youth into their own channels.

Cotton in Transition

At a recent meeting in Texas of the Cotton Research Congress, Mr Charles F. Brannan, the Secretary of Agriculture, said that the immediate cotton outlook was better than it had been for twenty years. The Secretary, however, may have been talking with election-year optimism; the professional cotton men believe that their trade is in a transition period and that the future may not be so bright.

Before the days of scientific irrigation cotton ruled only the South, but now the pretty pink and white fields of blooming cotton are spreading over the Southwest as far as Southern California. The boundaries of cotton's kingdom are expanding, although within those boundaries cotton no longer reigns supreme. In the South, farmers are escaping from their dependence on cotton; even the casual observer can see the signs of their experiments with livestock and alternative cash crops. The decline of the one-crop system means that, if and when the cotton depression comes, the situation may not be so serious as it was in the past.

Cotton is selling at 33.5 cents a pound, while the support price will be around 31 cents, over three times the prewar figure. When the new farm programme is introduced next January, the support price will be reduced from the present 92.5 to 90 per cent of "parity." Although cotton is thus losing its privileged

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

position in comparison with other crops, it is not surprising that the Administration is concerned about the commitment which even the lower support price may involve, since in the decade before the war the Government was left holding the bag to the average tune of 10 million bales annually. Such a surplus is not yet in sight but the carry-over is increasing; in 1947 it was about 2,000,000 bales, in 1948 about 3,000,000, and next year 4,000,000 bales are predicted. Bad weather can always change the picture before the crop is picked, but to date the cotton men anticipate a bumper crop of as much as 14 million bales (since 1937 the average crop has been 11 million bales). The acreage has been increased by 10 per cent over 1947 and, at over 23 million acres, is the largest planting since 1940; and favourable weather so far suggests a greater yield per acre than last year.

Consumption at home is falling, exports too are down and high costs will add to the difficulties a dollar-poor world will have in buying American cotton. It is already being sold to Germany and Japan, by means of Export-Import Bank loans, and exporters are encouraged to expect that, through the European Co-operation Administration, other markets will be assured them. They anticipate exporting about 2,000,000 bales yearly under ECA, but 2,000,000 bales is considerably less than they sold abroad in 1947 and is only approximately one-third of prewar exports. There are indications too that world cotton production, reduced enormously by the war, is on its way back to normal and perhaps will be expanded if cheaper fibre does not become available from the United States.

* * *

Communist Round-up

Two days before the Progressive Party's convention, and one week before Mr Truman reinforced his demand for legislation to check inflation, with the assertion that "Communists both here and abroad are counting on our present prosperity turning into a depression," a Federal Grand Jury, after investigations lasting for thirteen months, issued indictments which led to the arrest of the twelve leading Communists in the United States, and which were, in effect, an indictment of the whole party. The timing was perhaps fortuitous, but the coincidence was a helpful and forceful reminder that there is in the United States a Communist organisation ready and able to take advantage of every opportunity offered it, whether by Mr Wallace or by an economic collapse.

The indictments will also remind the public that there are grounds for believing that the Communists advocate the overthrow of the United States Government by force, since the charges were brought under the section of the Alien Registration Act of 1940 (the Smith Act) which forbids such advocacy. It is not suggested that violence has in fact been employed, and the American Communists themselves have always denied that they even advocate its use. This is the first time that any attempt has been made to test the truth of their denial in the Courts, and the case may show whether there is any need for the further legislation to restrict Communist activities which recently caused so much controversy. The charges are based on the record of the party since the end of the war, when it resumed its unrelenting hostility to capitalism, but details will not be available until hearings open on August 23rd.

The Communists themselves are, of course, eagerly claiming the crown of martyrdom, and Mr Wallace hastened to share it with them, insisting that the arrests were an attack on his party, and were intended to divert attention from the more serious aspects of the political scene. Others, who are far less favourably inclined than he towards the Communists, nevertheless see in the indictments a dangerous threat to the political liberties of the American people. It has also been pointed out that, if the experience of other countries is any guide, the arrested men are probably only screens for the real and under-cover leaders of the party, and that its power will not therefore be seriously undermined even if they are found guilty. However, little harm can be done by discovering whether the Smith Act can be applied to the Communists, and, in the process, the public should gain a valuable insight into their activities, even though the hearings will provide the Communists with a propaganda platform which they may find very profitable.

There will at least have been a fair and open trial, which is infinitely preferable to witchhunts of the type that have recently become increasingly prevalent, especially in Congressional Committees. The latest example is the allegation, by an official of the Visa Commission of the State Department, that many United Nations employees are secret Communist agents. This allegation naturally received more publicity than did the subsequent denial by Mr Marshall, who does not believe that the security of the

United States is endangered by any of these Communists, whose presence is in any case unavoidable as long as the United States contains the headquarters of the United Nations. The loan for the construction of these headquarters may come up for consideration during the Special Session of Congress and might be unfavourably affected if any suspicion remains that these allegations are correct. This is probably why Mr Marshall has now appointed a committee to investigate the matter.

Getting Results from ECA

One of the reasons for the Economic Co-operation Administrator's visit to Paris (also discussed on p. 175 of this issue) was to give the people of the participating countries a "real understanding" of the American purpose in setting up the programme. That purpose is to help Europe to help itself and, during the first three months of the programme, the first kind of help has been more noticeable to Americans than the second. In less than six months' time the new Congress will be asking for proof that America's money is getting results. That Congress will be elected by voters who have been told, by Government economists, that one of the main causes of the recent rise in the prices of 900 basic commodities, to a new postwar high, is the foreign aid programme. The rise is expected to continue and the economists also point out that the programme is costing each American taxpayer an average of $163.

Most of this sum will be a free gift, but about 20 per cent is to be in the form of repayable loans and it is hardly surprising that ECA is anxious that the use of these loans on a substantial scale should begin at once. The first, $2,300,000 to Iceland, is expected to set the pattern for others to follow shortly; interest is at the usual Export-Import Bank rate of 3 per cent and the loan is repayable in ten years. Its purpose is to expand the country's ability to produce and export fish oil and meal, for the benefit of the other participants in the European Recovery Programme. The same idea is behind the recent allotments of ECA dollars for use in intra-European trade, which will help to establish the new trade patterns which Mr Hoffman insists are indispensable to a sound economic reorganisation.

*

ECA has taken a step which will be of direct assistance to American businessmen: it will guarantee the convertibility into dollars, at the current rate of exchange, of any foreign currency which may be earned by private investments in the participating countries, provided those investments are approved both by ECA and the country concerned as fostering the programme of economic recovery. It is emphasised that this is an insurance, not of profit or against business risks, but of convertibility, and that it will last only until 1962. Sound business practices are still needed, and the sooner they are put to work the better.

This desire to encourage a favourable climate for private enterprise is also one of the main considerations which will guide ECA's strategic materials division in its work, work which can make a useful, and topical, contribution to the safety of the United States. This division is to see that an "open door" is maintained for American capital in the expansion of the output of materials in which the United States is deficient. This expansion is to be encouraged in order that a surplus over the needs of the producing countries may be available for the United States.

ECA has found a way to alleviate the condition that 50 per cent of the goods purchased in the United States should be transported in American vessels "to the extent such vessels are available at market rates." This condition had caused widespread alarm among American shipping companies, whose costs and rates are higher than those of foreign vessels and who feared that this "joker" would squeeze them out of the running. ECA has now decided to substitute for "market" rate a "reasonable" rate. The rule of reason means higher rates for American than for foreign ships, but this is defended on the ground that to deprive American shipping companies of their share of ECA shipments would lead them to return the vessels they have chartered from the Maritime Commission, and would result in an acute shipping shortage.

Shorter Note

Civilian employment in June reached the record level of 61,296,000; unemployment also increased by 400,000 over May, to a total of 2,184,000. Both of these trends are normal seasonal developments, resulting largely from the entry of young people into the labour force as the schools close for the summer. Farm employment at 9,400,000, one of the lowest June figures on record, reflected the continuing trend away from agriculture.

THE WORLD OVERSEAS

Latest Lessons of Benelux

OVER six months have passed since the tariff barriers came clattering down on the Dutch-Belgian frontier. That was the first stage in the economic union between the two countries, the plans for which had been signed in September, 1944, when their respective governments were still in exile in London. The second stage, set very provisionally for the end of this year but now almost certain to be postponed, was the unification of excise duties and sales tax in the two countries. The third, lying in the distant and unspecified future, was to be their complete economic union, involving unfettered freedom in the movement of goods, people and money between the two countries.

The six months that have passed have provided a valuable experience of the kind of difficulties which any customs union, however modest in its scope, is bound to encounter. For that reason there are important lessons to be drawn for Europe as a whole from this experiment. Benelux has a great deal to teach on the negative as well as the positive side. It is an example of the kind of objective for which Europe should be aiming. It also provides abundant illustrations of what should be done and not done if the wider integration of the economies of politically independent countries is to be secured.

The first main lesson of the experience of Benelux to date is the need to proceed logically. The first essential of a customs union is that there should be some broad sympathy or similarity between economic conditions in the various parts that are to be welded together.

Like with like must be joined together. Belgium, or rather the Belgo-Luxemburg union, is not like the Netherlands. It is a country with a free economy, where the law of the market is allowed relatively unfettered scope, where the incentives of well-filled shops (at high prices) take the place of the ordered distribution of rationing and the egalitarian principle of a subsidised cost of living. The Netherlands, on the other hand, is a country of which the economy has been deliberately planned since the end of hostilities, with a strictly enforced system of rationing, a considerable intrusion of subsidies in the prevailing level of prices, and a centrally conceived investment plan, with all the physical controls and the preventions of non-authorised investment this entails.

The Dutch Move Half-way

This basic contrast between the two economies has already led to the emergence of many difficult, specific problems. It has created disparities in price levels which have militated against opening completely the common frontier to goods moving between the two countries. But, apart from specific difficulties of this kind, the contrast has obstructed all efforts to launch the common economic policy which must be an essential condition of achieving the wider objective of the Benelux union. This basic problem received a great deal of attention at the recent meeting of representatives of the three Benelux countries at the Chateau d'Ardennes. The result of this meeting seems to have been an undertaking by the Dutch to go a good deal more than half-way towards meeting the Belgian system, gradually to abandon its *dirigiste* policy and to adopt the more liberal economic policy maintained with such glittering and alluring success by its southern neighbours.

Another basically important dissimilarity between the two economies lies in their relative price structures. Broadly speaking, prices and wages in the Netherlands are at 170 per cent of what they were before the war. In Belgium they are well over 300 per cent. In the Netherlands there has been a conscious endeavour to keep prices low on the domestic market so as to give producers an incentive to sell abroad. Rationing has held in check the consequent stimulant to consumption in the domestic market. The disparity in price levels has important monetary causes. The reinflation in Belgium following the Plan Gutt of 1944 has been far more marked than in Holland, following their comparable monetary purge of 1945. The "good time policy" followed in Belgium has provided a freedom for prices to move and for inflation to reflect itself in prices and costs of production. This problem was also considered at the Chateau d'Ardennes conference. The main contribution to its solution appears to have been an undertaking by the Netherlands Government to reduce its subsidies both to consumers and producers, and thus remove this artificial element in the Dutch cost and prices structure. This alone will be quite inadequate to remove the disparity between prices in the two countries.

Concessions on Excise Duties

A third difference between conditions in the two countries is the widely varying range of excise duties on similar products. The purchase tax in Belgium, levied on each transaction, amounts to 4.5 per cent. and yields 19 milliard Belgian francs, or more than a third of the total revenue of the Government. In the Netherlands the comparable tax is levied at the source and yields only the equivalent of 8 milliard francs. Many goods, such as matches and vinegar, have to bear duty in the Belgo-Luxemburg union and are free in the Netherlands. Conversely, salt is free in Belgium and dutiable in the Netherlands. Alcohol bears a duty of 200 francs per litre in Belgium and the equivalent of 91 francs in the Netherlands. On the other hand, Belgium only taxes sugar at 60 francs per hundred kilos, while in the Netherlands the excise duty amounts to the equivalent of 480 francs. The tax on petrol in Belgium amounts to 3.12 francs per litre, in the Netherlands it is only 1.25 francs. These examples of disparity could be multiplied over almost the whole range of articles subject to excise duties. Though it had been hoped that these differences might disappear at the end of this year it has been decided that such rapidity of progress will not be feasible, because the prevailing duties are too deeply imbedded in the budgetary and social policies of the two countries.

The result of these basic differences has been that the climax of the first chapter in the Union of Benelux, namely the abolition of the tariff frontier, has proved more apparent than real. The customs duties may have disappeared, but the quantitative restrictions remain. There are still rigid import quotas on most of the goods that cross this frontier in either direction. The main reason for the maintenance of these quotas is wide disparity in price levels and in excise duties in the two countries. Apart from quotas, which are a far more limiting factor to Dutch-Belgian trade than were the former customs duties, special measures have also been taken to ensure that agricultural producers in either country are not penalised by lower priced goods produced in the other. It has, therefore, been agreed that Dutch agricultural produce may not be sold in Belgium below the price fixed for comparable domestic products by the Belgian Government. The same condition applies in the other direction, though only for the sake of appearances since it is not required for the protection of low cost Dutch agriculture.

Disparity in Price Levels

The main obstacle to the real opening of the frontier between the two countries is, therefore, the disparity of their price levels. Some progress towards equalisation of these prices will be made as a result of the withdrawal of subsidies in the Netherlands and the gradual unification of excise duties. But these will do no more than touch the fringes of the problem, which is essentially of a monetary character and is due to the fact that Belgian currency is inflated in relation to the Dutch and the Belgian franc overvalued in terms of the guilder. The remedy would be some form of exchange adjustment, a devaluation of the Belgian franc. At this point, however, logic clashes with reality; for though the Belgian franc may appear overvalued, it is in fact

a much harder currency than the guilder and is quoted at a substantial premium on the guilder in the black market. The guilder is now unofficially quoted at about 9 Belgian francs as compared with the official quotation of 16.52 Belgian francs. The relation of the two currencies then bears some resemblance to that of sterling and the dollar. It should be added that the commercial and monetary frontier between the two main partners of Benelux is today one of the strictest in Europe. This is no doubt due to the close proximity of big shopping centres in each country and to the ease with which unauthorised currency operations and the traffic in goods with differential excise taxes can, therefore, be conducted. Nonetheless, this relative severity of control which has struck many foreign visitors as the height of paradox emphasises the underlying difficulties that hamper progress towards full achievement of the economic union between the two countries.

A Time for Boldness

The lessons hitherto noted are of essentially technical character and concern divergencies of economic policy and conditions. There is also a lesson of psychological character which is in no way inferior in importance to those already mentioned. It is that in a project of this kind the primary need is for boldness. Most of the complaints that are now being encountered among the partners of Benelux Union come from vested interests which are only gradually becoming aware of the thorns that are to be found on the stem of this lovely bloom. The earlier decision to allow separate and divergent excise and purchases taxes to persist has allowed vested interests to revive, and these interests provide most of the vocal criticism of Benelux which is to be heard today. It must be frankly admitted that for some time past the idea of the Benelux customs union has become less popular among its members, and particularly in Belgium.

A little more boldness by the two exiled governments when they signed their agreements in 1944 might have silenced that opposition from the start. If, in 1944, the two governments had agreed to equalise their excise duties they would have made this decision in the vacuum created by the German occupation. The agreement would have been accepted without demur after liberation, when the whole fiscal system of the two countries had to be reintroduced to economic realities. Had such initiative been taken in 1944 there is no doubt that Benelux would today be a good deal nearer its objective.

The lessons of the first half-year's experience of Benelux can thus be summarised under two broad heads. First there is the need to establish relative stability in the domestic finances of any would-be participant in a customs union. Having secured relative stability, prices and costs in the various countries must be put into some semblance of equilibrium. This will have to be done by adjustments of exchange rates and adopting the "valid rates of exchange" demanded by the Economic Co-operation agreements. Having achieved this balance and homogeneity of economic conditions in the various countries the next need is to act boldly. If countries are sufficiently convinced that their economic union is desirable (and in the case of Europe desirable is surely an understatement for what is a matter of survival), then they must be prepared to make subsidiary sacrifices in order to obtain the greater good. If these lessons can be learnt the Benelux experiment will have earned its laurels not only for the example it has given to the rest of Europe but for its revelation of some of the basic mistakes that must be avoided.

Exploiting the Nile

[BY A CORRESPONDENT]

"EGYPT," said Herodotus, "is the gift of the Nile." The quotation is trite but it remains true. Egypt is wholly dependent upon the waters of the Nile for its existence. The annual floods, beginning in July and ending in December, are watched for as anxiously now as they were three thousand years ago, and the possibility of lean years or fat years depends still as it did in the days of Joseph on the extent of the floods, which vary between half and twice the average flow of water. Egyptians, therefore, regard their claim on the Nile to be paramount, and they have continued through the centuries to devise plans for minimising the effect of the bad years and for benefiting from the good.

But in the past fifty years other claimants for the gifts of the Nile have sprung up. The Sudan, which depends almost as much as Egypt upon the Nile for cash crops, has insisted on its share. In 1929, by the Nile Waters Agreement, its claims were legally recognised in return for its admission that Egypt should have the major say in the control of the Nile throughout its long course through the Sudan. Now Uganda, which embraces the sources of the White Nile—Lake Victoria and Lake Albert, has put in a claim to harness the headwaters of the Victoria Nile to provide electric power for the secondary industries which it intends to develop. There is also a possibility that some time in the future Ethiopia may put in a similar claim to harness the headwaters of the Blue Nile where it emerges from Lake Tana.

Can these various claims be reconciled? Can the Nile indeed, meet them all? The answer depends first on the extent of the different claims and second on technical difficulties. Over a period of twenty years the Egyptian Ministry of Works aided by the British scientists, Hurst and Black and the Egyptian, Simaika, carried out detailed researches on the hydrology of the Nile and on the question of what was the maximum area of Egypt which could be cultivated. They investigated the flow of water, the silting of the river beds and the evaporation over the entire course of the Nile and its sources. In particular, they made detailed calculations about the extreme limits of the good and bad flood years. When all their investigations were completed, they were able to produce a formula to estimate how much water must be stored in reservoirs to ensure that in every year, whether the flood is high or low, a specified volume of water will be available for irrigating the crops. Further, they were able to calculate how much water would be required to irrigate any given crop over any given area.

Egypt's Claim for Water

Meanwhile, other investigations had shown what was the maximum "crop" area in Egypt. This is greater than the actual area of cultivable land, for, in Egypt, some lands are cropped three times in every two years. The limit of the ultimate cultivable area is fairly sharply defined by the borders of the desert, and works out at 7,100,000 feddans (1 feddan = 1.038 acres). Assuming that the whole area is harvested three times in every two years, the maximum crop area would thus be 10,650,000 feddans. The present crop area of Egypt is 8,474,000 feddans.

Egypt's claim, therefore, can be exactly calculated. It has been estimated that it will require its maximum crop area within about 35 years in order to meet the demands of its expanding population.

The claims of the Sudan on the Nile affect one of the primary sources of its livelihood and its most promising source of revenue.

ANNUITIES

(Single lives: Last survivor: "Capital-protected": "Capital-redemption": Reversionary: Certain: Deferred, etc.)

Circumstances have made annuities an attractive proposition to an increasingly large number of people, particularly now that the capital invested in them can be safeguarded against loss due to premature death. Very considerable loss (up to £1,000 and over in individual cases) has been and is being sustained by the public due to their entrusting the purchase of their annuities to inexperienced and unrepresentative part-time agents. The undersigned has specialised for many years in every kind of annuity issued by the various Life Offices (for all of which he acts impartially and in the sole interests of his clients), and is therefore in a position to advise on those giving the highest NET yield with complete safety.

Unlike Egypt, the cultivable area cannot be so exactly calculated. By far the major portion of its land under irrigation is in the Gezira plain, the triangle of land between the White and Blue Niles with its apex at Khartoum. The Gezira scheme, which has some points in common with the Tennessee Valley Administration, now comprises some 900,000 feddans. The limits of its expansion are difficult to estimate exactly, but approximate calculations show that altogether about 2,000,000 feddans, depending on water from the Nile, may eventually be cultivated here. Other lands irrigated from the river may eventually total 500,000 feddans. But the greatest part of the Sudan in which the food crops are grown is not accessible to irrigation, and its people will always be dependent upon capricious rainfall.

The claims of Uganda and the possible future claims of Ethiopia are not so vital as those of Egypt and the Sudan. Uganda's chief interest in the Nile is for the secondary purpose of obtaining electric power rather than for the primary needs of life. Nevertheless, Uganda's need is real, for its population is developing fast and without the labour and products which the secondary industries represent its people would be condemned to poverty. Solid fuels are scarce and expensive; it was inevitable that the Government of Uganda should have turned to the Nile for the comparatively cheaper possibilities of hydro-electric power. The Nile begins its 3,500-mile course by tumbling out of Lake Victoria over the Owen Falls just west of Jinja, and on July 1st two firms of consulting engineers presented a scheme to the Uganda Government for harnessing the water at this point at a cost of £7,000,000. The importance of the scheme to other users of the Nile is that it would involve some control over the flow of water, though this could easily be co-ordinated with the requirements for irrigation.

The foreseeable demands on the Nile can thus be calculated fairly accurately, and various solutions have been put forward to the problem of how to make the Nile satisfy these demands. There are two deciding factors: the incidence of high floods and silt. The investigations of the Egyptian Ministry of Works showed that in order to be certain of having enough water in the driest years to meet the requirements of Egypt and the Sudan a much greater volume of water would have to be stored than at present. The three existing dams at Aswan, Gebel Aulia and Senner store water only year by year, and in an exceptionally lean year or if more land is to be cultivated they will be insufficient. Moreover, their control over the flow of the Nile is inadequate for preventing the disaster of exceptional floods.

The second factor—silt—has shown itself in the past thirty years to be almost as serious a problem as the uncertainty of regular water supplies. During the flood season each year, the waters of the Blue Nile and the Atbara are heavily laden with silt. If these silty waters are stored, the silt would drop and in time would seriously reduce the capacity of the reservoirs. Every year much valuable water has to pass to the sea for this reason. On the other hand, the waters of the White Nile are practically free from silt, and this is one of the reasons why schemes for conserving water tend to be concentrated on the White rather than the Blue Nile.

Hurst, Black and Simaika, after they had completed their monumental survey, put forward a number of schemes for exploiting the Nile. The first, amended by suggestions from the Uganda Government, was to dam the Victoria Nile at its exit from Lake Victoria and to raise the level of the lake, which is roughly the size of Eire, by three feet. The storage thus obtained in Lake Victoria was also to be supplemented by a smaller dam on Lake Albert. By their calculations this scheme would go far to meeting the present and future requirements of Egypt and the Sudan. It also fits in with Uganda's scheme for a hydro-electric power station. Second, they suggested enlarging the earlier Jonglei canal scheme to enable the White Nile to bypass the vast swamp in the southern part of the Sudan, the Sudd, where much water is dissipated by evaporation. And third, they suggested that the earlier proposition for a dam on Lake Tana, the source of the Blue Nile, should be greater than originally planned. These schemes, together with an extra reservoir in the Northern Sudan designed to protect Egypt against high floods such as those of 1946, would be sufficient to meet all demands on the Nile. They calculated that they would take about 35 years to complete.

Technically, then, the demands on the Nile can be met and practical schemes have been put forward for doing so. Politically, the problem is very different. The dams at the various points along the Nile give the country in which they are situated great powers over the countries lower down the river. Egypt, for example, already depends to an uncomfortable extent on the goodwill of the Sudan. It could not be deprived of water altogether, but, should the Sudanese so choose, the flow of water could be so regulated in the Gebel Aulia or Senner dams as to seriously affect the Egyptian harvests, either by flooding at the wrong time or by failing to store water during the lean years. The Nile Waters Agreement of 1929, of course, makes this extremely unlikely, and in point of fact any hostile action by the Sudanese would harm the Sudan as much as Egypt. But the fact that these political fears are very much alive, even over the limited schemes which already exist, point out the chief obstacles to the greater schemes which have been proposed. A dam on Lake Victoria or Lake Tana would give power to countries which, unlike the Sudan, do not depend on the Nile for their existence. There would thus be no self-interest to restrain them from hostile action. No one imagines that Uganda or Ethiopia would attempt anything so disastrous, but Egyptian—and Sudanese—statesmen look into the distant future when the threat, remote as it is now, may eventually become real. The problem can only be solved by an International Authority or by separate agreements in which Egypt and the Sudan in particular can put their lasting trust. The schemes are urgent, but until the political problem is solved, the further exploitation of the Nile must wait, and the age-old perennial anxiety over too much or too little water must continue.

Europe's Food in Five Years

A CALL to produce a "master plan for action" for full European recovery by June, 1952, was made in Paris last Sunday by Mr Hoffman, the head of the Economic Co-operation Administration, to the representatives of the countries receiving Marshall aid. One of the most vital programmes contained in the master plan must be concerned with food production. Some indications of how far it will be possible for Europe to achieve adequate standards of nutrition by 1952 is contained in a report just issued by the Food and Agriculture Organisation of the United Nations.

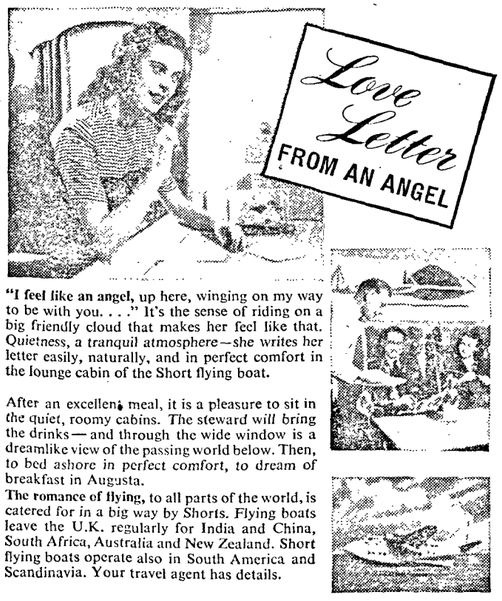
This report, which examines the programmes of agricultural reconstruction and development of all European countries except the Soviet Union, gives a general picture of what Europe is expected to be eating in 1951 if all goes according to plan. The average food consumption that year in the countries of north-west Europe should not only be far above present levels, but will also show considerable improvement in the nutritional value of the food eaten. But elsewhere in Europe, while there will be a considerable increase over the present low levels in the quantity of food eaten, there will be little improvement—if any—in its nutritional value.

In some countries disorganisation of farming caused by the war precludes any return to prewar standards, either in quantity or quality. The total amount of bread grains available is expected to exceed the prewar quantity. In some countries, such as

Germany and Austria, consumption will be increased, and in others such as Jugoslavia and Poland it will be reduced. Both the imports and the production of oils and fats will be less than prewar standards, but the resulting decrease in consumption will be confined to Germany, which in 1951 will be consuming 1,000,000 tons less than before the war. In eastern Europe and Turkey consumption is expected to show a considerable increase, largely owing to increased local production of oilseeds. Meat supplies will probably be less than before the war, even if the large import programme is fulfilled. Consumption will be heavily reduced in Germany and Finland, and slightly reduced in some countries of north-west Europe, but in eastern Europe it is expected to be above prewar standards.

More Mouths to Feed

On the basis of the individual import and production programmes, the report considers how far the need for specific types of food will be met. For instance it estimates that although the area devoted to the cultivation of bread grains will by 1950 be as large as the prewar area, the actual production will probably not be so great. This is because a partial shift in the zones of production from the industrial countries of north-west Europe to south-east Europe and Turkey will result in a decreased average yield. This shift emphasises the difference already existing before the war between the industrial countries, which were large importers of bread grains, and the predominantly agricultural regions of south-east Europe. A possible counter balance to this shift not mentioned in the report, is the change now being worked out in the original Monnet Plan, whereby France will revive primary cereal cultivation, not only in order to free itself from the necessity of importing from America, but also in order to enable it to export regularly to Britain and western Germany.



Since European production of bread grains in 1951 is expected to be 2,300,000 tons less than before the war, and the population will be 5 per cent larger, Europe will need to import about 15.5 million tons of grain, which is 6,100,000 tons more than before the war. The total exports of bread grain available from the United States, Canada, Australia, Argentina, and Russia, may vary from 16 to 24 million metric tons, of which non-European importers will probably need at least 6,000,000 tons. Thus, in favourable circumstances, Europe's needs will be met: but since two-thirds of the possible world exports will come from North America a failure of the harvest there in any year might gravely reduce the supplies available. In unfavourable circumstances Europe might have to readjust its grain production goals, its livestock policy and even its standards of food consumption.

In spite of attempts to develop the cultivation of oilseed crops, the production of fats in Europe remains low. It is estimated that in 1951 production in Europe, excluding Turkey, will be 97 per cent of prewar production. Before the war European imports of 4,700,000 metric tons of oils and fats represented 40 per cent of its supply, and half a dozen western European and Scandinavian countries exported, or re-exported 1,300,000 tons. By 1951 it is hoped that both imports and exports will be restored to a level not far below that of before the war.

The report emphasises that in all the programmes submitted, covering not only production of cereals and oils and fats, but also coarse grains, meat, dairy produce, and fruit and vegetables, it is assumed that a very rapid recovery will be accomplished in a very short time. After the First World War Europe needed seven years to recover its crop production and ten years to recover its livestock. This time, although the losses have been greater, it is proposed to recover both in five or six years. Moreover, the successful fulfilment of the programmes presupposes a very great deal. It assumes that the means of production—fertilisers, machines, foodstuffs and labour—will be adequate. But will there be enough coal and electric power for the manufacture of fertilisers, enough steel to make machinery, enough manpower to work on the land? Will the weather be propitious or will there be more seasons like 1947? Above all, will it be possible to make satisfactory international financial arrangements to enable countries to obtain the necessary imports of fertilisers, machinery and foodstuffs?

Threat to Standard of Living

The report states quite frankly that it would be outside its terms of reference to consider how far the countries of Europe will be able to pay for their import requirements. The calculations it makes assume that they will be able to do so regardless of the currencies in which payment must be made. But it points out that the production goals assume the revival of food and fuel

"I feel like an angel, up here, winging on my way to be with you. . . ." It's the sense of riding on a big friendly cloud that makes her feel like that. Quietness, a tranquil atmosphere—she writes her letter easily, naturally, and in perfect comfort in the lounge cabin of the Short flying boat.

After an excellent meal, it is a pleasure to sit in the quiet, roomy cabins. The steward will bring the drinks—and through the wide window is a dreamlike view of the passing world below. Then, to bed ashore in perfect comfort, to dream of breakfast in Augusta.

The romance of flying, to all parts of the world, is catered for in a big way by Shorts. Flying boats leave the U.K. regularly for India and China, South Africa, Australia and New Zealand. Short flying boats operate also in South America and Scandinavia. Your travel agent has details.

It's fun to fly by flying boat!

imports on a scale which many of the countries concerned might not be able to finance. In brief, Europe's agricultural programme might easily fall far short of fulfilment. In that case "either Europe's food supply would have to be maintained by steadily increasing imports and indebtedness; or the diet, the productivity of labour, and the whole standard of life would enter on a downward spiral of deterioration leading to widespread social disorder."

The report stresses the need for consultation and action on an international scale, in order to secure the best possible distribution of whatever food and agricultural materials are available. It mentions the organs for co-operation which already exist in the Economic Commission for Europe as well, of course, as in the FAO. But although it acknowledges its debt to the reports of the Committee of Economic Co-operation, it makes no mention of the necessity of co-operating with the sixteen Marshall Governments working in Paris on ERP. Here is the nucleus of that European co-operation in agricultural reconstruction which the report calls for. It is surely a strange omission to make no mention of it.

Sweden Marks Time

[FROM OUR SPECIAL CORRESPONDENT IN STOCKHOLM]

"AWAY in the country" is where one's Swedish friends invariably are in summer. Then indeed are routine tasks rejected for the sun, the mountains and the sea. Public life is almost at a standstill. So it is this summer in spite of tension in Berlin, a family quarrel with Norway and an intractably adverse balance of trade. But when the holidays are over, fresh elections for the Second Chamber will be held. Pre-election caution is thus allied to the carefree spirit of summer to postpone the day when outstanding problems are faced and perhaps painful decisions taken until after September 19th when the electors have voted for the new *Riksdag*.

Negotiations with Norway on a joint defence policy for Scandinavia must in any case go slowly while a new formula for agreement is sought and Norwegian susceptibilities soothed: the original formula, although accepted by the Norwegian negotiators, was rejected with some asperity by their colleagues at home. Present events, while increasing the urgency of agreement, tend to intensify the differences between the two countries. For Sweden this implies confirmation in the policy of neutrality, with or without Norway as a fellow-neutral. This attitude is consistently criticised by an influential and vocal section of opinion, yet it is difficult to deny that it is supported by most Swedes. To them it is instinctive. Therefore arguments purporting to expose its impossibility or undesirability appear irrelevant. They appeal to, and may even be accepted by, reason. But they will not be acted upon, for they run counter to the deep emotions which are the mainspring of action.

Nor does reason, it must be admitted, entirely commend such arguments at the present stage of development of Western Union. If Sweden were forced to chose, it would certainly join the West. But successful neutrality depends on avoiding definite decisions, on maintaining the maximum freedom of action, so that policy can be adjusted as rapidly as possible to varying circumstances. By the definite step of entering into commitments with the West that freedom would be circumscribed. Sweden would therefore expect stronger guarantees than the Brussels Powers—of which Britain alone now has a greater military strength than Sweden—could at present offer.

To the Swedes, therefore, the issue is simple. Either they keep their neutrality—a well-armed neutrality—and thereby help to protect Finland and Norway, or they ally themselves with the West, expose Finland to the risks of a Russian occupation and Sweden to the certainty of a Russian invasion should another war start. In any case, by binding themselves beforehand by an alliance, they not only declare themselves potential enemies of Russia, thereby increasing Russian suspicions and the chances of war, but also increase the definite commitments of the West.

In choosing the first alternative, they have no illusions about their chances of withstanding a Russian attack. Informed estimates of the endurance of their resistance vary from about three months to one month. But, as long as they were not definitely committed, they consider that there is a reasonable chance that they would not be attacked. It is on the probability of first, any war at all and, second, a Russian attack regardless of neutrality that the main cleavage exists. It is fruitless for holders of opposing views on these vital points to do more than agree to differ. But it may be noted that the General Staff is on the whole less sanguine than the politicians.

Yet among the politicians there are signs of what the Communist paper *Ny Dag* calls "slipping westwards." At any rate, the references the Foreign Minister, Hr Unden, made about ERP and Western Union during the debate at the end of June when Sweden adhered to ERP were less aloof than usual. His remarks on Scandinavian co-operation for defence, though cautious, did reflect the important change in foreign policy that occurred at the end of April when it was decided to open discussions on this matter. Some observers accordingly consider that the main parties are prepared eventually to go much further west than they dare advocate before the elections. This is very doubtful unless events enforce such a course of action.

How much Socialism?

Foreign policy, however, will be of slight importance in the election campaign. The main struggle will centre on what the Social Democrats call democracy and their opponents, except the Communists, the lack of it. In other words, how much Socialism is to be retained? Are controls to go or be intensified? This second issue is the more important because more specific. The dilemma of the bourgeois parties here is that, with the exception of a few extremists, they frankly admit that some controls are at present essential. The question is which controls? And it is difficult to go to the country opposed to the present controls which a Social Democrat Government thinks necessary but advocating different ones to be imposed by a new Government. To be exact, different controls are not now advocated. Only the Government controls are attacked.

Yet in truth their chief weakness is not that they are unnecessary, but that they are sometimes misdirected, inadequate in important essentials, and often inefficiently administered. The Government will be chary of taking the strong measures the situation demands nor do its opponents advocate them. But both sides know that after the elections they are likely to form a coalition with the express purpose of adopting the more drastic remedies which the country's intractably adverse balance of trade demands. The surprisingly large volume of imports from Britain contributes to this situation. Nor has there been the general reduction in imports which was expected to result from various restrictive programmes, although the enormous influx of cosmetics, fountain pens and so forth has ended. The gravity of the situation is reflected in Sweden's finances. Holdings of foreign currency and gold at the end of June were only 476 million kronor—about the same as for the two previous months, but well below the March figure of 568 million. Various special supplies of foreign currency have been drawn on, and, in addition, Sweden is running into debt with Britain at a rate of about £12 million a year. This could easily be paid off by the release of part of Sweden's £25 million blocked sterling and by the normal autumn increase in earnings of sterling. The cutting down last weekend of US imports for the current half year to Kr. 180 million compared with over Kr. 400 million in the first six months of this year should help to remedy the dollar deficit. But the root problem of increasing Sweden's exports would remain.

Austerity Ahead

The greatest contribution to its solution would be a drastic restriction of home consumption. To do this now would cost too many votes. There is a faint possibility that the normal summer increase in exports may improve the position sufficiently to avoid really serious measures. The Government also appears to place some hope in the cumulative effect of restrictions already imposed. But these are not big enough: even after the building programme, for example, has been cut, Sweden still produces 84 houses per 10,000 persons compared with 47 in the United States or 35 in the United Kingdom. The level of consumption generally remains very high and firmly supported on full employment, cheap money and an ambitious scheme of family allowances and pensions.

Incomes are rising faster than production, although the abolition of electricity rationing, better supplies of coal and improved organisation should increase production slightly above last year's level. But it will not be high enough to compensate for reduced imports of consumer goods. More effective measures to neutralise excess purchasing power will therefore be necessary if the pressure to close the gap between supply and demand is not to upset the price-stabilisation measures which are a cardinal feature of Social Democrat policy. Additional measures will be needed to cut home consumption still further in the interests of increased exports. It will be distasteful medicine which the new Government must administer to the body politic.

THE BUSINESS WORLD

Film Finance

WHEN the President of the Board of Trade disclosed on April 15th that he had been studying the question of "affording improved access to finance to qualified independent film producers," he expected to be able to announce the arrangements in "the very near future." It has proved a more difficult task than Mr Wilson supposed. On Thursday last week, *fourteen weeks to the day, the promised announcement* was made. A Film Finance Corporation is, after all, to be set up by the Government; it will have power to lend a sum, "fixed provisionally at £5,000,000" to film distributors, who in turn will use it to finance the production of films; the setting up of the new Corporation will require legislation, so, as an interim measure, a company is to be formed with power to raise £2,500,000 by Treasury guarantee under Section 2 of the Borrowing Act of 1946.

Apparently, the Government consider that the lending of public money to finance film production should cease after five years, since the money is "required to meet the difficulties of postwar transition." This theme of temporary difficulty appears at several points in Mr Wilson's statement. The present position is "abnormal," particularly for the independent producers "who are building up their production and have not yet had a chance to establish the necessary working capital after the dislocation of war." The City of London "so mindful of their unfortunate prewar experience of the film industry as to be regardless of the national interest at the present time" is unwilling, or unable, to finance an industry "now producing for a safe and assured home market with a high quota."

The protection already given by a quota of 45 per cent for first feature films—a quota which must be regarded as excessively high—is now to be buttressed by added finance sufficient in itself to produce, say, 25 films of adequate but not extravagant standard, with the presumption of further films as the Corporation's funds are turned over and its first advances for production costs are recouped. To make any closer estimate of the increase in production which the funds of the Film Finance Corporation may encourage is scarcely possible. But to free the channels of finance by *Government action is one thing*; to provide adequate studio space for independent film production is another. Existing studios are largely controlled by the Rank Organisation and by American film companies—a point which has been seized by advocates of an additional film studio under state ownership or management, to cater for the independent producer. A committee has now been set up to examine this question, with terms of reference based on the assumption that an additional studio is to be erected. Even with Government support, it is difficult to frame convincing arguments that such a project should enjoy any form of priority over other no less urgent schemes of industrial investment which have been cut or postponed.

It would be a mistake to regard the new Finance Corporation as being designed solely to meet the financial needs of the independent producer. That indeed is its primary function and the one which Mr Wilson emphasised most strongly in his statement—it is to cover "the whole group of independent producers outside the Rank Organisation, which so far has been able to finance its full programme of production." The decision to lend, however, will rest with the Corporation; its powers have not yet been strictly defined, save that it must observe "reasonable commercial terms." And evidently the definition of "independent film production" is flexible, for it will apparently be open to the Corporation to extend finance to the Rank Organisation "if they so thought fit, and they applied for such assistance." The possibility that public funds might be employed to assist the production programme of the Rank Organisation is thus not ruled out; and once that possibility is admitted, the way is open to the application of public funds in film production in a much wider field than a hasty reading of Mr Wilson's statement might suggest. Opinions about this potential development may differ, according to the estimate of the hazard which is involved. For his part, Mr Wilson evidently feels that the degree of hazard can easily be exaggerated: "This is an industry which, as a result of measures recently taken, is one which can look forward to a long period of prosperity in this country." But it is one thing to fix a quota for British first feature films as high as 45 per cent, and quite another to fulfil that quota by a greatly increased supply of films which the public will support at the box-office. The recent successes in British film production have consisted largely of those films which have cost appreciably more than can possibly be recouped from the gross takings at British cinemas—the "frustrated exports" of the British film industry. If the policy of fixing a high quota is to succeed, not merely next year, but also in later years, British film producers have somehow to learn to make films which are economical but not cheap; in which story and presentation, rather than "star values" and spectacle receive greater emphasis; and which consume far less time in the studios and the cutting room than has often been squandered in the past.

It may be that considerations of this kind will be present in the mind of the new Corporation when it comes to discuss the "reasonable commercial terms" on which it is prepared to lend to distributors. In the heyday of the prewar film boom, money could be borrowed for film production merely by putting a distributor's contract on the banker's table, without reference to choice of subject, or the ability of the producing concern to make a good film economically. But even if the new Corporation is prepared to look behind its contracts with the distributors to the technical capacity and commercial judgment of the individual film producers who will in fact use the money, it is bound to make some mistakes and bound to have some losses. The risk of a steady deterioration in the quality of British film productions will almost certainly be increased as a result of the pressure to make enough British films to fill the quota—the emphasis is likely to be on numbers first and on quality second.

There is room for argument about the increase in output of first feature British films which is required. The exhibitors—admittedly they are partisans—have attempted to break down the future requirements of such films, and to compare them with the present annual figure of 49 films, which though counted as first features often fall (as they claim) within the category of medium to poor. The new quota is based, it is generally understood in the trade, on the expectation that British producers will be able to make 90 first feature films. Whether there is sufficient studio space to produce this number of films is uncertain, and past performance suggests that its achievement is improbable. But let it be assumed that 90 films is a possi-

bility. There would be no difficulty, as an exercise in arithmetic, in filling the quota requirements of cinemas with a weekly change of programme. For cinemas in a "competitive area," however, and particularly where programmes are changed twice or even three times a week, a 45 per cent quota is quite impossible to fulfil. The Cinematograph Films Act makes certain provisions for relief (not so extensive as the exhibitors would like) and of approximately 4,000 cinemas in the country, as many as 2,500 have applied for relief from the full quota obligations.

It is hardly surprising, therefore, that the independent exhibitors are concerned at the prospect of the supply and quality of British films. Their experience, they declare, does not accord with Mr Rank's claim that British films on his circuits take more money than American films. They detect a deterioration in the average quality of British films—which, inevitably, is largely a reflection of their view, as commercial exhibitors, of the average quality of the films produced, and/or distributed by the Rank Organisation. They complain of the attempt by General Film Distributors (the big renting concern in the Rank Organisation) to force up the rentals for British films—a controversy on which Mr Rank met the exhibitors ten days ago and appeared to give them some satisfaction. They have been affronted by the tactless suggestion from the British Film Producers' Association that it should set up a department to ensure that exhibitors are fulfilling their quota, which would report, apparently before the end of a quota period, any case of default to the Board of Trade. Thus it is not surprising that the independent exhibitors now look to their old antagonists, the American film renters, for new films and for a new counterpoise to the integrated structure of the Rank Organisation.

It remains to consider the reaction of these decisions on the international standing of the British film industry. The American market, if it could ever be counted upon, has gone. The temper of the American film industry can be gauged from a letter on another page from Mr Fay Allport, the European representative of the Motion Picture Association of America. Mr Allport is apparently unwilling to concede that the British Government had any right to fix the quota to please itself; sovereignty, for him, lies in Hollywood, and he is so angry with *The Economist* for conceding this right, that he entirely overlooks the criticisms that have been made in these columns of the wisdom of fixing a quota of as high as 45 per cent. Clearly the American film industry feels cheated about the quota, and its diagnosis about the effects of a high quota on British production may well turn out to be uncomfortably close to the truth. Much of this is fair comment. An indigenous film industry could only be established with some element of protection, for British films had only limited chances of earning their profit in overseas markets as American films have always done. The integration of an important sector of British film production, renting and exhibiting under the control of Mr Rank was founded essentially on profits from cinemas, earned largely by showing American films. Then came the dollar shortage, the ludicrously unsuccessful tax of 75 per cent on new American films, the reissue of old American and British films and the concentration of Rank-controlled cinemas on Rank-produced and Rank-distributed films. The Rank Organisation is heavily committed in film production, and is anxious to sell its product at good prices to the independent exhibitor. It now has a completely assured market, so long as the public will pay to see what it has to show. For this reason alone, financial assistance to genuinely independent film production is justified on the broad ground that the important distributing and exhibiting outlets are largely under single control. But if some element of competition is to be introduced to check the element of monopolistic power already wielded by the Rank interests, it can only be provided by genuine independent production—production, that is, which is given free rein for its technical talents, which enjoys a reasonable assurance of an adequate British market, and can obtain access to either the independent cinemas or the big circuits. It is possible to state the conditions without expressing any confidence that they will be easy to fulfil. To that extent, the reluctance of the City to come to the aid of an industry which is desperately short of funds, but is being forced to expand in a kind of economic hothouse, is at least understandable. And if private finance is not forthcoming, public financing becomes the only alternative to the disappearance of independent production. Mr Wilson's decision may well have been inevitable. Nevertheless, the experiment of adventuring public funds in this endeavour will be watched with care and concern.

Chemicals From Petroleum

THE expansion of oil refining in the United Kingdom was discussed in *The Economist* on July 10th. That article was the first instalment in the story of the expanding part played by petroleum in British industrial life; for in addition to the refineries programme, work is proceeding on a number of projects for the manufacture of chemicals from petroleum. These projects will eventually derive their starting materials from the new refineries. They are the frontier country between the petroleum industry and the chemical industry—a frontier which the rapid development of each industry tends to blur. Twenty-five years ago it would have been a sharp and unmistakable line, for at that time (in the early nineteen-twenties, when a small petroleum chemical industry began to appear in the United States) oil refining was still almost wholly a physical operation—the separation of crude oil into its fractions by physical means. An oil refinery today is substantially a chemical plant; the development of catalytic cracking processes alone warrants the term. The processes are different in kind from the processes of 25 years ago; there is a sharper separation of the oil fractions, followed by further processes which break down and rebuild their molecular structure. Both fuels and lubricants are tailored to fit their specific uses. Indeed, one reason for the interest which the oil companies have shown in developing petroleum chemical plants has been the need to assure the supply of "additives" for petroleum products. The extensive use of additives (apart from tetra-ethyl-lead) did not begin until the early nineteen-thirties. It has developed far, and the engineering industries are learning to expect that lubricants (for instance) will be designed exactly, and not merely roughly, for their purposes. This has had, in turn, far-reaching effects on engineering technique. The petroleum chemical industry in the United States supplies many industries with many products, but among the most important are treatment chemicals for the use of the refining industry itself. It also has the advantage to the oil companies of helping them to dispose profitably of oil fractions (particularly the oil gases and heavy residues of the refineries) which might otherwise be unsaleable. The combination of these two reasons gave the American oil industry a strong interest in the development of petroleum chemicals. In Britain, where until the present expansion scheme refining took only limited forms, the same problem did not arise, or not on the same scale. Nor, indeed, could its solution be handled on the same scale; for American industry as a whole can absorb petroleum-derived chemicals in vastly greater quantity than can British industry. As an illustration, American production of isopropyl alcohol (now the principal source of acetone) began in small quantities about fifteen years ago, and the product could not at first be sold at a lower price than $6.50 a gallon. By 1939 it was being sold at about 20 cents a gallon; the reduction in cost was due mainly to the economies of large scale. Similar enterprises in the United Kingdom have to reckon with smaller markets. Factors of this kind delayed the industrial application of petroleum chemistry in Great Britain until technique developed and until changes in the pattern of the chemical industry began to expand the market.

Various industrial planners, working from their different viewpoints, have by now come to the conclusion that the conditions necessary to successful enterprise in petroleum chemicals have been created in this country also. The great oil companies themselves are by no means the only—indeed, they are not even the boldest—advocates. This is not so unnatural as it would appear; by habit, the oil trader is mainly interested in procuring, handling and selling oil, and these functions offer sufficient employment for his energies and his capital. Naturally he likes to sell the whole product of his refineries, and to sell it profitably. But neither in bulk nor in value is the proportion of the oil which he might hope to use in the manufacture of chemicals of decisive importance: a few days' production of crude oil would supply the world's petroleum chemical industry for a year. While, therefore, the great oil companies have been ready to welcome fresh outlets into the chemical industry, and while much of their research has been directed to demonstrating the existence of those outlets, they have not been precipitate in committing themselves heavily to actual enterprise. They are not unhappy that the chemical industry itself should take the plunge. This is not a wholly unreasonable view, and the farther the petroleum product gets from its original form the more reasonable it appears. The actual projects now under construction involve the orthodox petroleum industry, the chemical industry, and an enterprising group that stands in between the two. It is, however, from the chemical side that the largest of the new projects has come; for the group of plants now being built by Imperial Chemical Industries at Wilton, near Billingham (at an estimated initial cost of £17 million) will be largely based on petroleum. The Wilton works will begin with plants to produce Perspex sheets and phenolic mouldings for the plastics industry, which are to be in production by the end of the year. Work will then be concentrated on a petroleum cracking plant, on which will be based the production of a wide range of organic chemicals. The other main section of the works will be an electrolytic caustic soda and chlorine plant, which may remove one of the main shortages which face the petroleum chemicals industry. The statement issued by Imperial Chemical Industries in April about the Wilton project is worth quoting:—

> In the past twenty-five years the use of synthetic organic chemicals in everyday life has grown enormously. Examples are such substances as solvents for paints, cellulose lacquers for cars, saccharin, drugs such as aspirin and the sulphonamides, the anti-malarial "Paludrine," the raw materials for plastics, fibres such as nylon, and dyestuffs. There are three possible sources from which these organic chemicals can be made—vegetable products, coal and petroleum. The state of world economy, agricultural development and technical knowledge is such that petroleum, for the present at least, is the most versatile and attractive of these raw materials.

The Wilton cracking plant (it was announced) would produce simple hydrocarbon gases for conversion into more complicated liquid or solid products. From ethylene gas (for example) would come the important new plastic polythene. From another hydrocarbon gas, propylene, would come acetone for use both as a solvent for paint and as a material for the manufacture of Perspex. Both ethylene and propylene were important in the manufacture of new detergents which, if their production could be speeded up, would help to relieve the fat shortage. The plant will be complementary in many ways to its neighbour Billingham, where organic chemicals are already made from coal, coke and creosote; tail gases from the Wilton plant, carried to Billingham by pipe-line under the Tees, will replace some of the coke at present used in vast quantities for the production of ammonia, methanol and petrol. The Billingham plant will, in fact, also become to a certain extent petroleum-based.

The developments planned at Wilton and Billingham suggest, at first sight, an important shift in the organic chemical industry away from coal and towards petroleum as a basic raw material; a survey of some of the other projects which are in the field confirms that impression. Synthetic soaps (detergents and wetting agents) formerly supplied largely by the coal-based organic chemical industry of Germany have for some years now been made by the Shell group at its Teepol plant at Stanlow. This is claimed to have been the first industrial venture in the United Kingdom into petroleum-based synthetic chemical production. The Teepol products are manufactured from the higher olefines produced by the cracking of vapourised petroleum wax. Synthetic washing agents are not merely substitutes for soap; they have properties of their own. But the world fat shortage must of necessity give them a special interest at present. With the expansion already in progress, their production at Stanlow will reach 50,000 tons a year. By the end of this year production will also have begun at the Shell chemical plant at Thornton, near Stanlow. This will supply the wax, at present imported, which is the raw material of the synthetic soap production. It will also produce a wide range of industrial solvents at present imported for the most part from the United States. The lacquer, paint, plastics, photographic film, rayon, cosmetics, pharmaceutical and oilseed industries are large users of these solvents.

*

Petroleum Chemicals, Ltd., the joint undertaking formed by Anglo-Iranian Oil Company and the Distillers Company, has acquired a site near the Anglo-Iranian refinery (itself to be largely expanded) at Grangemouth. This also will produce solvents and alcohols for industrial use. The chairman of Anglo-Iranian Oil stated in June that construction would begin at an early date, and drew attention to the saving in imports of petroleum-based chemicals which would result.

The formation of a new and specialised undertaking in petroleum chemistry, Styrene Co-Polymers, Ltd., was announced last month. This also is a joint undertaking. The petroleum partner is the Petrochemicals Group, which will shortly be producing monomeric styrene at the Catarole plant at Partington, near Manchester; the other partner is the Lewis Berger paint group, which has for some years been seeking improved synthetic materials for paint manufacture. The Lewis Berger group holds patents for the co-polymerisation of styrene and oil which, industrially exploited, should partially replace the scarce natural materials (principally linseed oil and resin) which have limited paint and varnish supplies in recent years. It is also claimed for these processes that they will produce paints and enamels which are in many respects superior to those made by the present processes. The Petrochemicals concern, on its side, will be able to supply pure monomeric styrene in quantity.

The Catarole plant of Petrochemicals, Ltd., at Partington, which it is hoped to bring partially into production this year and more fully in 1949, is the work of a group of technicians who have been pursuing this aim for more than ten years—since a time, in fact, when the subject was still unfashionable. For their basic process, the Catarole process, much is claimed. Its main feature is that it produces aromatic and olefinic hydrocarbons simultaneously from a single charging stock. It should

therefore, not only offer alternatives to certain of the coal tar aromatics at present in industrial use, but should also provide other chemicals of high industrial value which have not previously been produced in this country on a commercial scale. Not only the paint and varnish industry but the dyestuffs, pharmaceutical, rayon, plastics, and rubber industries may be expected to benefit. The Petrochemicals undertaking has had difficulties from the rising cost of construction and from the material shortages (particularly of steel) which have held up new enterprises in the past two years; and these difficulties have necessitated a recasting of its financial plans this year. Advantage has been taken of the delays to expand and improve the original design; the estimated capacity of the plant now under construction is 75,000 tons a year.

Less impressive in sheer bulk than the petroleum industry itself, the petroleum chemical industry has abundant technical novelty to catch the imagination, and the attraction of barely explored possibilities to which no end can yet be seen. For in organic chemistry there is, it seems, little that the chemist cannot do with petroleum derivatives as his starting material. Pure research can be relied upon to keep steadily ahead of commercial application; it is on the shrewdness and ingenuity of commercial application, together with the given conditions of supply and marketing, that immediate progress must turn. Among the objects to be kept steadily in view is the highest possible flexibility in the new plants. Flexibility is possible, but it is expensive; it may still be necessary if the needs of the chemical industry are to be fully—but not mere than fully—served at all points. The present industrial ventures in petroleum chemistry, entering as they do on a new field for British industry, are watched the more closely because of the further fields which their success may open up.

Business Notes

Marshall Dollars for Intra-European Trade

It is now fairly certain that one of the results of Mr Hoffman's talks in Paris last weekend with the Council of the Organisation for European Economic Co-operation will be the earmarking of ERP dollars to underpin a European payments scheme. Such a scheme has been under consideration for some time. Its need has, however, grown more urgent ever since the inadequacy of the multilateral monetary compensation agreement (for which the Bank of International Settlements acted as agent and which was confined to Benelux, Italy, France and the Bi-zone of Germany) became manifest. Under the present system of European bilateral agreements, intra-European trade has steadily declined. The limit to which the countries of Western Europe can extend credits to each other has been reached for all practical purposes. They are now at the point where no country is willing to export against payment in a currency that can be turned neither into the right kind of goods nor into the currency of a country that has the right kind of goods available.

The prime object of the new payments plan, whatever the machinery used to put it into operation, must be to stimulate intra-European trade; that is, to remove the reluctance of countries with essential goods available (for example, Belgium with its steel or Norway with its ships) to sell to countries which can offer only their own inconvertible currencies in exchange. This reluctance will be overcome by what is virtually a US promise to buy such inconvertible currencies against payment in US dollars, and thus give the selling countries the wherewithal to obtain the goods that they require.

The success of the scheme will depend upon the fulfilment of a number of basic conditions. First, the supply of dollars to be made available must be adequate for the purpose: that is to say, it must be big enough to allow European productive capacity to expand so as to lead to a reduction in the demand for goods from the Western Hemisphere. Secondly, the recipient countries must pursue financial and economic policies at home calculated to bring about the necessary redeployment of their resources. Fortunately, a number of countries have already initiated policies designed to combat inflation and to stimulate production. The receipt of Marshall aid in this new form must not be used as a pretext for backsliding.

The American administrators of ECA have been puzzled, as was Mr Garner of the International Bank in his recent visit to Europe, by the fact that certain European countries have been asking the United States for goods that are already available in Europe itself. Hence the American emphasis on greater co-operation between the countries of Western Europe. But this attitude tends to be a little too *simpliste*. Britain may well refuse to sell agricultural machinery to France against payment in inconvertible francs for the good and sufficient reason that it can put the steel involved to better use at home, either to earn or to save dollars. France may well prefer to husband its scarce hard currencies because the agricultural machinery may, under Marshall aid, be had for the mere asking. This state of affairs is not due to a dose of original sin in the Western European countries; it is a symptom of their dollar anæmia. The new payments plan can play its part in restoring economic health by a judicious injection of dollars into Europe's body economic. Whether it will suffice to cure the disease is dependent upon the rigorous treatment to which those countries must continue to subject themselves.

* * *

Britain, America and Wheat

President Truman has again asked Congress, now in special session, to ratify the International Wheat Agreement, which it had failed to do by the stipulated date, July 1st. Owing to this failure, Britain withdrew its acceptance, on the ground that the Agreement would be unworkable if the United States, which was to be responsible for 37 per cent of the total wheat exports covered by the scheme, were not, in fact, to participate in it. The United States is now fairly well assured of a bumper grain harvest—1,250 million bushels of wheat and over 3,300 million bushels of maize—and under normal conditions farmers would be fearing some fall in grain prices in the Autumn. The US Government, however, has already guaranteed a minimum price of $2.00 a bushel for wheat to producers, while ECA grants will no doubt help Western Europe to absorb a large part of the United States export surplus. A cynic might, therefore, associate the President's move to revive the wheat agreement with a desire to maintain external prices for wheat at the level already guaranteed to the American farmer.

It is not yet clear what action, if any, Congress will be prepared to take in response to the President's request. But even if America ratifies the Agreement, it cannot become operative until Britain rescinds its withdrawal. And if there were good arguments for regarding the Agreement with reserve when it was first published four months ago, there are even better reasons for doing so now. The prices to be paid by importers for 1948-49 ranged from a minimum of $1.50 a bushel to a maximum of $2.00 a bushel; and this range was agreed to when wheat prices had lately been above $3.00. If negotiations were to be reopened next spring, the revised schedule of prices might well be 50 cents lower. The importance of such a reduction in wheat prices to importing countries—already short of dollars—needs no emphasis. This is perhaps the strongest argument against the revival of the present Agreement, quite apart from the technical fact that it did not provide for late ratification by exporting countries.

There is, however, a further consideration. Clause 9 of Article VI states that:

> . . . the contracting Governments, while reserving to themselves complete liberty of action in the determination and administration of their internal agricultural and price policies, undertake not to operate those policies in such a way as to impede the free movement of prices between the maximum price and the minimum price in respect of transactions in wheat into which the contracting Governments are prepared to enter.

In the light of the American guaranteed minimum price of $2.00 a bushel to domestic producers, this clause might have one of two meanings. It might mean that bargaining must be between Governments and that where the agreed price is less than $2.00 a bushel, the US Government would pay the difference to its farmers in the form of a subsidy. Or, it might imply that the American system of guaranteed prices to farmers must be amended to conform to the Agreement. An unequivocal interpretation of this clause seems to be necessary if the scheme is to work satisfactorily. Otherwise the US Government would be able to keep the world export price of wheat at its maximum point of $2.00 a bushel and enjoy the best of both worlds—a high internal price and a high export price. Britain's case on this score might be regarded as weakened by the fact that it is buying Canadian wheat under long-term contract at $2.00 a bushel. But this was already known when the Agreement was signed. Britain honoured its signature on July 1st. Now that this acceptance has been withdrawn, has it any obligation to countermand that decision?

Dearer Electricity in Winter

In recommending higher charges for electricity in winter than in summer the Clow Committee has taken a courageous and logical line, but one that cannot be politically popular. Nor can it be popular with the electricity industry itself, which traditionally uses the tariff as an encouragement to the use of electricity, not as a deterrent. But (as the Clow Committee has conclusively found) no other way of inducing domestic and commercial consumers to relax peak demand at the worst time of the year could offer immediate results on a substantial scale without disproportionate cost. This is not to say that high winter charges will solve the peak load problem; clearly they will not do more than alleviate it. As the Committee recognises, they will increase charges at all times of the day and on every day during the period in which they operate, and not merely at times of peak load. The domestic or commercial user will therefore be able to seek economy at the times and on the days most inconvenient to himself, and those times are not likely to coincide with the peak load on the electricity system. In the coldest weather, when saving is most necessary, the deterrent effect of higher charges will be at its weakest.

There are expedients to which this objection would not apply, and the Clow Committee considered them. The difficulty is that the promising ones require new equipment: maximum demand meters, time switches, central control switches. These are too costly, and the scale of production which they would require would be too large, to justify them merely as short-term measures:

> Only if they contribute to the long-term economy of the industry can the various devices, with which we propose experiments, justify their extensive application. We believe that these experiments have considerable promise.

The Committee does propose that trials should be carried out in districts where central control systems are already in existence. The trials should be concerned with the central control of water-heaters; differential tariffs for "firm" and "non-firm" supplies; time-of-day tariffs for the larger domestic consumers; and the application of load limiters at peak times, on the lines of an experiment now proceeding in Paris. Research on apparatus with thermal storage characteristics is also suggested. These are all ways by which loads may be spread in the future, and in that they are important; but they can hardly affect the critical next two years. For the present purpose, something may be done by applying maximum demand tariffs (already used in industry) to large commercial consumers. But the main immediate measure is the higher winter rate. This, the Committee thinks—"if associated with vigorous publicity as to the reason for it"—may make a significant contribution in spite of its drawbacks. It should be added that the contribution will only be significant if the new price differential is a substantial one. A half-measure will merely irritate the public without achieving its purpose.

Putting on the Brake in South Africa

Dr de Kock, the Governor of the South African Reserve Bank, in his annual address last Wednesday was brutally frank in his assessment of South Africa's present economic plight. He attributed the growing deterioration in the Union's terms of trade primarily to the fact that the price of its principal export, gold, had remained practically unaltered since September, 1939, in terms of the currencies of the Union's principal suppliers. On the other hand, the prices of goods supplied to the Union had risen very considerably. The other causes he recited were the abnormal import requirements arising out of the opening of the new gold-fields, the establishment of new industries and the expansion of old ones. All these factors, as is now widely recognised, would long ago have placed an intolerable strain on South Africa's currency reserves, but for the record capital influx (which Dr de Kock put at £180 million) from the rest of the sterling area. Now that the influx has stopped—indeed, capital is beginning to flow out—the dangers of the situation are more readily appreciated.

According to Dr de Kock, there might be a substantial decline in imports from the dollar area and the reimposition of import controls may be unavoidable if adequate relief is not obtained soon. He did not, however, appear to rate very high the chances of obtaining such relief. He mentioned that the USA and Switzerland had shown signs of growing interest in industrial and mining investment in the Union, and capital from these sources might be attracted. But he thought it doubtful whether, owing to the growing scarcity of investible funds in America, capital in adequate amounts could be raised there to cover the Union's expenditure in the dollar area during the next few years, unless that expenditure was much reduced. The Union's deficit on current account with countries outside the sterling area (excluding the export of gold) exceeded the gold output by £40 million in 1947. In the first half of 1948 the deficit continued at an even higher rate—at an average of over £5,000,000 monthly in excess of the gold output. The Union's reserves, which stood at £110 million last February, had declined to £88 million by July 16, 1948.

The South African dilemma is that a solution of the present difficulties can come only from an increase in gold production. Little or nothing in this respect can, however, be expected from the old Rand Mines, and everything hinges upon the opening up of the OFS properties; but that in turn requires enormous foreign investment, and, as Dr de Kock pointed out, there was a growing shortage of capital all over the world, and the Union could not expect to receive from overseas all the risk capital it could employ. Then came words which must fall unpleasantly on the ears of investors whether in South Africa or in Britain: "The obvious remedies for the maladjustment of the Union's balance of payments are to slow down the tempo of expansion and to accept a lower standard of living until capital expenditure on new mines and industries is bearing fruit. . . . We shall have to rely more on our own capital resources and consume a smaller part of our national income. . . . Restrictive credit and fiscal policies may have to be followed deliberately in order to reduce the volume of purchasing power in the Union."

* * *

Wages Merry-go-round

Although Sir Stafford Cripps can claim with justification that the White Paper on Personal Incomes has had some stabilising effect, there are mounting signs of trade union restlessness and increasing pressure for new wage increases. The unions are particularly concerned about the rise in the index of retail prices, which is now 10 per cent above the level of June last year, though the increase since last February, which is more relevant to the issue, is much smaller. The TUC's original acceptance of the White Paper policy was conditional upon the stabilisation of prices, and it will certainly be argued that this premise has not been fulfilled. Thus the TUC finds itself in a somewhat embarrassing position, and it is uncertain whether it will be able to resist the pressure of its members for release from its undertaking. No decision was reached at this week's meeting of the General Council, but the issue is bound to be prominent at the Margate conference in September.

Wage claims are now pending in engineering, railway transport, building and agriculture. The Minister of Labour has set up a court of enquiry into the engineers' claim (a second court will have to deal with the shipbuilders). The terms of reference have been limited to the application itself, and the enquiry will not cover the wider issue of "anomalies" and profits as desired by the unions, although these considerations are bound to arise. In Sir John Forster, Mr Isaacs has picked a chairman with knowledge of industrial negotiations and ability to master the complexities of engineering wages.

Railwaymen have declared their intention of pressing for a further wage increase, to supplement what they regard as a "first instalment" of 7s. 6d. granted last year. The claim has not yet been presented, but the figure of 12s. 6d., which has been mentioned, would add another £20 million to the railway wages bill, and saddle the Transport Commission in its first year with very much the same kind of problems as have beset the Coal Board. Building trade operatives at their annual conference resolved to

ask for an increase of 3d. an hour. Last year they received 3d. increase on condition that they accepted a scheme for payment by results. Agricultural workers have also a claim in preparation, and the miners are embarking on a new wages structure and adjustments to meet the cost of living, which threaten to add further to the industry's wages bill.

* * *

Malayan Unrest and Rubber Supplies

There is so far little concrete evidence that the disturbances in Malaya are reducing rubber production. The latest figures relate to June; they show that output from estates (excluding Singapore) amounted to 33,246 tons compared with 33,294 tons in May and production by smallholders indeed showed a notable expansion from 16,313 tons in May to 27,348 tons in June. The high price for rubber—last week the London spot quotation achieved a postwar record at 1s. 3½d. a lb., and this week it has been at around 1s. 2¾d.—and the improved supplies of rice, which are helping to lower the cost of living, seem to have offset the effect of terrorist outrages, and on some estates native workers are seeking the security of plantation buildings instead of returning home each day. There has been no significant exodus of labour or planters from those areas affected by terrorist activities, though that may be a risk for the future unless prompt measures are taken to restore the security of both estates and smallholders. The greatest danger at present is interference in the transport of rubber from the producing areas.

More stable conditions in Indonesia have encouraged some expansion of rubber production, though the total is still very small compared with prewar years. Estate production increased from 3,685 tons in January to 7,335 tons in May; the total for the first five months of the year is 27,663 tons. Exports during the same period amounted to 88,503 tons, of which 27,636 tons went to Malaya, 27,290 tons to the United States, 15,998 tons to the Netherlands and 3,296 tons to the United Kingdom. If this rate of improvement can be maintained—and there are chances that it might even be increased—Indonesia may again become an important supplier of rubber in 1949.

The Economist
—by air express

The aim of our Air Express Service is to provide more and more overseas readers of The Economist with the advantages of an air subscription at a reasonable cost.

The means of achieving this is by air-freighting copies in bulk to distribution points all over the world for onward transmission by normal mail in the countries of destination.

The result, to date, is that subscriptions by Air Express are, or shortly will be, available at the following annual rates (starting dates for new services are shown in each case):

U.S.A. and Canada $24.00 (in operation)
Hongkong £5.15 or HK $93 (August 21st)
Agents: The Advertising & Publicity Bureau Ltd., 511-514 Marina House, Hongkong.
Australia £6 stg. (August 7th)
New Zealand £10.10 stg. (August 7th)
South Africa £5.5. (September 4th)

The prospect is that there will be services to India and Pakistan, Nigeria and the Gold Coast, Egypt and the Sudan.

The Publisher will be glad to deal with enquiries, addressed to:

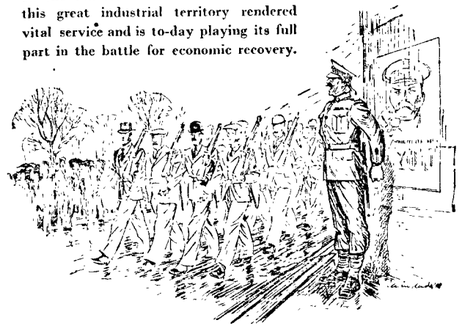
The Economist
22, Ryder Street, St. James's, London, S.W.1.

The United States and Russia are both busy building strategic stocks. Secrecy naturally surrounds such purchases, but the firmness of rubber prices in recent months has been due in no small measure to official American buying supported by sporadic Russian purchases. If international tension continues, these purchases can be expected to increase. Russian requirements of natural rubber are not known—even estimates are no better than guesses—but the USSR has a large synthetic rubber industry and has recently dismantled German plants for transhipment to Russia. Russian purchases are unlikely to approach the American in size. But even if, as reports suggest, they amount to 100,000 tons during the current year, they would entail the withdrawal of a significant quantity of natural rubber from normal industrial consumption.

* * *

Cable and Wireless Under Nationalisation

The first annual report of Cable and Wireless since it was taken over by the state at the beginning of last year discloses a decline in consolidated profits from £3,530,854 to £1,724,090 for 1947. This has naturally been seized upon as another poor advertisement for nationalisation. Yet in this case the report presents a reasonable explanation for the inability of the company to match its performance in 1946, the last year under private management. In the first place, direct comparison of the figures with 1946 is vitiated because a sum of £530,000 was credited in 1946 for message receipts attributable to previous years—a difference which goes a long way to explain the reduction of £857,152 in message and other receipts in the past year. Revenue has also been lost through nationalisation of the Indian and South African interests by their respective governments. Total receipts have increased in the Near and Far East and in South America, but have fallen in North America, Europe and the West Indies, with the result that total traffic shows a decrease of 3.3 per cent. The main decline in receipts is attributed to Government, press and social traffic since there has been an increase of 5 per cent in commercial traffic. Reductions in operating rates have benefited users to the extent of £176,000.



It is too early to measure the effect of these reductions in rates on the prospective volume of traffic. On the long view, the policy of reducing rates is wise, and it is to the credit of Cable and Wireless that the temptation to increase charges has been resisted. On the other hand certain countries, particularly the United States, have increased their cable charges in the past year; from the narrow point of view of maximising overseas revenue it may be that the policy of rate reduction adopted by Cable and Wireless has simply resulted in loss of revenue without the certainty of long-term advantages. Since receipts from commercial traffic have increased there might have been some argument for charging what the traffic would bear now, and keeping the competitive weapon of rate reductions for a later day.

That, however, is a commercial calculation which only Cable and Wireless can make. Meanwhile, the group has suffered, like industry generally, from increasing prices, shortages of materials and demands for higher wages It has also exhibited the usual propensity of state-run concerns to increase their staffs above those required under private enterprise. Increased staff remuneration was responsible for £290,000 out of the £430,292 increase in the working expenses at stations. Only part of this was required for wage adjustments, for staffs were increased by 500 in 1947, following an increase of 600 in 1946. While some part of the increased labour costs might have been avoided—though extensive regrading of staff has been accepted by the new management as being inescapable—there has been no escape from rising costs of replacements and capital extensions nor from the obligation to make up the leeway in repairs and renewals arising from the war. An increased allocation amounting to £98,967 has been made from revenue for cable maintenance while £450,000 has been provided for depreciation of cables and ships. Here again the company has suffered, like industry at large, from the consequences of rising costs. There are, then, cogent reasons for the fall in profits shown in the first report of Cable and Wireless under national ownership. The report only lifts a corner of the curtain on an undertaking which has 12,600 employees—the majority of which are overseas—operating 155,000 nautical miles of submarine cables and 150 wireless circuits. Much of it is taken up with a review of the financial results, which are clearly set out in the consolidated accounts. It ends with a protestation that "the public interest demands the most rapid possible restora-

In 1914 . . .

On the eve of the first World War, when the lanes of England were already resounding with the tramp of marching men, the Bank of Liverpool, now Martins Bank Ltd., took one of the most important steps in its steady progress by the acquisition of the North-Eastern Banking Company, whose activities covered the counties of Northumberland, Durham and adjoining districts.

In the conflict which followed and in the more recent war, this great industrial territory rendered vital service and is to-day playing its full part in the battle for economic recovery.

An attractive legend still circulates in Nigeria concerning the foundation of Kano. The story goes that a mighty hunter of the early days named Berhushay put the seal on his fame by killing an elephant with his spear and then carrying the carcase many miles upon his head. On the spot where he finally laid down his notable burden the city of Kano was founded to commemorate the achievement.

So runs the legend. Whatever the truth may be about the foundation of Kano it is beyond dispute that it has existed for centuries as a trading centre and port of call on the great caravan routes. Ancient industries, including the preparation of "Morocco" leather, still survive in the locality although today the prosperity of Kano depends far more upon its position as the recognised centre of the Nigerian ground nut industry. Full and up-to-date information from our branches in Nigeria on the industries of the Colony and the present trend of local markets is readily obtainable on request.

Wool Prices and Bulk Purchase

The last wool sale of the season closed in London last week and prices generally declined. Merino prices fell between 2½ per cent and 17½ per cent—those of inferior style and containing more impurities being affected most. Medium crossbreds, on the other hand, were only 5 per cent down. The most interesting feature of the sale was the disparity between combing and clothing wools. While combing wools used by the worsted section of the industry became cheaper, clothing wools used for woollen manufactures (particularly blankets) remained firm, and were sometimes dearer. Yet both the home and overseas markets have a distinct preference for worsteds. Perhaps the chief reason for this disparity is that prices for clothing wools were already at relatively lower levels, since the break in prices last March. The present movement is tending to restore the prewar price margins between clothing and combing wools, but there is still a wide gap between them.

The weakness of prices in the last London sales was basically due to technical factors. In June, Czechoslovakia, Poland and Russia seemed determined to buy finer wools at any cost, and at times were bidding actively against one another. Bulk buying is certainly a boon to the seller, as the Joint Organisation now knows. These countries, however, were virtually absent from the London sales and Bradford buyers were not willing to bid so high. Secondly, all the wool offered came from the Joint Organisation's stock and a large proportion of it was "burry"—that is, containing impurities—which home buyers would take only at lower prices, since it entails extra care in converting to high-grade cloth.

If European buying, particularly from countries other than the "Marshall Sixteen," follows the same pattern next season, wool prices are likely to fluctuate according to whether the Russians and their protegés are in or out of the market. Bulk purchase, whether operated by Poles, Russians or Britons, apparently suffers from the same defects for a buyer in seller's market. In the case of wool, the Joint Organisation has been able to dispose of more of its accumulated stocks at a satisfactory price. But the more astute Bradford buyers have been able to cover their requirements at lower prices by timing their buying to coincide with the absence of foreign competition.

Dearer Nickel

Because the world supply of nickel is largely controlled by a single concern, it is not surprising that any rise in nickel prices should be regarded with close attention. The International Nickel Company recently raised the British price of nickel from £190 a ton to £224 and the US price from 33⅓ cents a lb. to 44 cents. Nickel production costs are not published—they are, indeed, impossible to separate from the costs of mining copper, which is a joint product with nickel—and it is therefore impossible to measure the increase in nickel prices against costs. But it must be emphasised that this is the first increase in nickel prices since 1939, and, judging from mining costs for other metals, average production costs have conceivably doubled since then. If, then, it was true that nickel prices were "too high" before the war—as some critics used to claim—they are certainly less so now.

The new price increase amounts to 20 per cent. The policy of the International Nickel Company has been to keep its prices stable over long periods in order to help nickel users and to encourage increased consumption. The present price increase, which is stated to be "the lowest possible limit," suggests that the company is pursuing the same policy, so far as it is able to do so within a framework of rising costs. During the war, world consumption of nickel expanded and reached a peak of 160,000 tons compared with under 120,000 tons in 1937. And despite the subsequent decline, it recovered sufficiently last year to achieve a new peace-time record of about 135,000 tons. It is highly probable that during the current year, world production will have to expand to meet this increased demand from industry, as already a large part of the stocks, which accumulated when hostilities ceased, have been absorbed.

The International Nickel Company of Canada started some years ago to mine a higher proportion of low-grade ore, and this policy is to be intensified by developing the new low-grade ore deposit found at considerable depth in the Sudbury basin in Canada. This policy will, of course, tend to increase production costs, but it appears that these costs have been taken into consideration in fixing the new prices. It follows, therefore, that these prices are likely to remain effective for some time to come. Known nickel resources in the world are limited, and a policy of ore conservation is impossible to criticise on broad economic grounds, so long as the company adheres to its policy of relatively stable prices by following and not anticipating the rising trend of costs.

Commons and Gas Compensation

The Commons on Monday rejected the recent Lords amendment which sought to change the basis of compensation for gas stocks from Stock Exchange valuation to reasonably maintainable annual income multiplied by an appropriate number of years' purchase. The amendment was itself something of a gesture of despair, which the Government was committed to resist. But the Lords certainly had the best of the argument. Last Monday, Government spokesmen did little more than to repeat earlier arguments in support of using Stock Exchange prices for compensation. This was the method for transport and electricity; why change it for gas? The Opposition—in company with numerous independent critics—has consistently argued that, apart from questions of principle whether Stock Exchange prices should be used for compensation purposes at all, there are particular reasons which make them open to objection in the case of gas. The bulk of the gas undertakings in the country are not quoted on the stock exchanges; the market in quoted gas shares is narrow; prices undervalue the considerable hidden reserves of some undertakings; and to value unquoted stock is unlikely to be any speedier than to calculate net maintainable revenue. But in the discussion on the same point in the House of Lords on Wednesday, the Government accepted the principle of compensation by reference to net maintainable revenue for those stocks which, though quoted, had not been dealt in for a period of six months before the dates specified in the Bill.

The Government accepted a number of Lords' amendments of a technical nature. But the Lords' proposal that one worker should be elected to each Area Board was turned down in favour of appointing the workers' representatives. This proposal perhaps contained as much provocation as principle—it is an odd echo of the demands of some trades union members for a direct voice in the management of nationalised industries—and it is better disposed of without examining the arguments of either side too closely.

Mexico Devalues

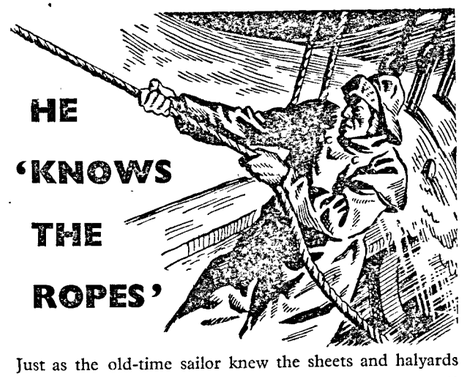
The course of industrialisation, to which so many Latin American countries are committed, is not running smooth. Excessive imports of capital equipment of all kinds are leading to the rapid exhaustion of the substantial wartime accumulations of gold and US dollars. The latest country to hoist distress signals is Mexico, which is abandoning the exchange rate of 4.85-4.86 pesos per US dollar. That rate has been held since 1941, but the loss of currency reserves, aggravated in part by a flight of capital, has assumed such serious proportions that drastic action was inevitable. The Government was also, no doubt, moved to this step by the requirement of Mexican law that the currency must be backed by a reserve of 25 per cent of gold, or its dollar equivalent. The margin would now seem perilously narrow. A new rate for the peso has not yet been announced, and consultations to this end are being held with the International Monetary Fund. Unofficially, dealings have been taking place in New York on a rather restricted scale between 6 and 6 50 pesos per dollar. This rate, if officially adopted, would be equivalent to a devaluation of around 25 per cent, and would therefore require the consent of the Fund in accordance with Article IV (5) of the Bretton Woods' Agreement. Reports have not been lacking that the delay in announcing the new parity arises from the difficulty of persuading the Fund that a devaluation of this magnitude is inevitable.

The deterioration in Mexican foreign trade since the war is shown in the following table:

	(Mn Pesos)		
	Imports	Exports	Visible Deficit
1945.....	1,603	1,236	367
1946.....	2,637	1,544	1,093
1947.....	3,208	1.970	1.238

In an attempt to halt the loss of exchange, Mexican tariffs were raised sharply last year, and import licensing was introduced. The results are reflected in the present year's foreign trade figures: for the first 5 months, the adverse balance was only 100 million pesos, against 760 million pesos for the corresponding period of the previous year. The restrictions were aimed chiefly at excluding a large variety of consumer goods, but the main cause of the trade deficit has undoubtedly been the import of a vast volume of capital equipment needed for the programme of modernising industry and agriculture. The resultant running down of gold and dollar reserves (from $380 million in August, 1945, to $120 million in February this year), has been aggravated by the facilities provided by the Mexican Central Bank for the purchase of gold coin. Mexicans, no doubt with a weather-eye on the threat which the growing trade deficit represented to the stability of the currency, have been taking refuge in gold benevolently provided by the Central Bank. That institution's gold holdings in December, 1946, were US $180 million; in February, 1948, they were down to US $86 million. Although there has been some official talk of this gold forming a hidden reserve, the emphasis would appear to be more on "hidden" than on "reserve."

* * *



Imperial Tobacco Interim

The maintenance of the interim dividend of Imperial Tobacco at the previous rate of 13½ per cent has been interpreted in some quarters as evidence that the company's earnings will be sufficient to pay the same final dividend as last year. This assumption is, of course, hopeful anticipation. The best that can be said of the latest interim dividend is that it is in line with tradition. For many years up to 1946 an interim of 7½ per cent free of tax was paid and in 1947 the interim of 13½ per cent gross was the nearest equivalent, to half a point, of 7½ per cent free of tax. Until 1947, the interim had been regularly followed by a final dividend of 7½ per cent free of tax plus a bonus which varied from 10 per cent free of tax paid in 1938 to 2½ per cent free of tax in 1941-45 and 4.25 per cent free of tax in 1946. In 1947 the interim of 13.5 per cent gross was followed by a final of 19.5 per cent gross, which is equivalent to 10.7 per cent free of tax. Clearly, there has been little uniformity in the total rate of the final dividend plus bonus paid in recent years. Thus any relief occasioned by this week's announcement must be tempered by consideration of the trend of consumption and the level of leaf stocks. The recent reduction of one-sixth in the permitted rate of withdrawal of tobacco from bond provides further evidence of official policy to reduce consumption; the laying off of staffs in certain factories shows that this measure has had its effect. While the level of leaf stocks is sufficient to maintain consumption at the present rate until the beginning of 1950, the reduction in overseas purchases has now had time to make its imprint on the import figures. In the first six months of this year imports of tobacco from the United States were less than one-third of the level for the corresponding period of 1947 and imports from Canada have been halved. Only a small part of the fall in supplies of dollar tobacco is being made up from Empire sources. Although the quantity of tobacco imported from Southern Rhodesia for the first six months of this year was five times the quantity for the first half of 1947, it still represented only 16 per cent of total imports which were themselves reduced by 54 per cent in the first half of 1948. It is not yet clear how far this reduction in total imports will be tempered by ECA supplies. Until that is known it would be premature to anticipate the decision of the directors of Imperial Tobacco about the final dividend.

Representing the Coal User

In the conduct of a nationalised industry, besides the State and the productive worker, a third group is concerned: the user of the product, whose direct interest is not always identical with the first two. The consumer's right to take an interest in the coal industry was recognised by the Coal Industry Nationalisation Act, which set up an Industrial Coal Consumers' Council and a Domestic Coal Consumers' Council. Little has so far been heard of either body; they have, indeed, appeared to avoid publicity, and have taken the view that their deliberations should be conducted in private. Their first annual reports, published last week, show the constitutional difficulty of making the consumer's voice heard. Both councils show an enlightened and entirely praise-

Just as the old-time sailor knew the sheets and halyards of his ship, so the Trustee Department of the 'General' knows the inner meaning of Executorship and Trusteeship. Consult the 'General' and be confident that your dependants will be faithfully served.

CLUBLAND WHITE · FINEST OLD PORT

worthy understanding for the Government position and the trade union position: the Government must maintain restrictions, the trade unions legitimately desire to improve the workers' lot. But these points of view are adequately represented already. As to the consumer, neither report goes much beyond expressing disappointment that he has not had better luck.

Sir Ernest Smith's report for the Industrial Coal Consumers' Council puts the matter neatly:

> From the outset we took the view that the effectiveness of the Council would depend on the establishment of frank relations with the Board. . . . We conceive it to be our duty to serve the consumer interest, not merely by dealing impartially with such complaints as may from time to time be made to us, but by supporting the Board in their efforts to give improved service in every direction.

Nobody can object to these sentiments, but a consumers' council might well have taken the view that its relations with the Board were only the second condition of its effectiveness; the first should be the authority and strength with which it represents the user's point of view. A consumers' council might be forgiven for feeling that improved service "in every direction" simultaneously was too much to hope, and might limit itself to getting improved service for the consumer. It is not reassuring that the Industrial Coal Consumers' Council "have not yet been called upon to deal with any specific complaints," although (as the Council recognises) "this does not imply general satisfaction with either the quality or the price of coal now supplied."

For the Domestic Coal Consumers' Council the problem of keeping in touch with the consumer whose problems it is designed to represent must be even more difficult. But its report clearly discourages consumers from addressing complaints to the Council; they are to go on addressing their complaints to the retailer and follow them up with the Local Fuel Overseer. The Council will deal with individual complaints "only if there is evidence of unfair discrimination or if any question of principle is involved." The consumer's most important complaint relates not to discrimination or to questions of principle, but (as the Council recognises) to the quality and price of coal and coke. No one would suggest that these Councils themselves can meet it. But the question of giving adequate expression to the consumer's interest still remains to be solved.

Japanese Trade in Sterling

Britain has won its point in the payments negotiations with the Supreme Commander for Allied Powers in Tokyo regarding the sterling payment for Japanese textiles. Under the general payments arrangements, Japanese cotton textiles were offered to the sterling area against payment of 50 per cent in dollars and 50 per cent in sterling, apart from 100 million yards of port stocks which were recently offered for sale against sterling. Japanese cotton manufactures are made from American cotton which was purchased for dollars, and to recoup this expenditure SCAP originally decided to sell the finished textiles for dollars. After discussion, the compromise of half-dollar and half-sterling payment was reached, but during subsequent trade talks SCAP admitted the British request, and cotton textiles were offered for full payment in sterling, like other Japanese exports. Representatives of the United Kingdom, Australia, New Zealand, and South Africa and the British colonies emphasised that if Japanese textiles could be bought for sterling, large purchases would be made. Thus Japan would expand its export trade and would also be able to buy larger quantities of goods from the sterling area.

Japanese trade with the sterling area is now operating under payments arrangements similar to those which govern German trade. Goods can be purchased with sterling up to the limit of SCAP's sterling requirements, and any surplus either way is convertible in dollars. The size of Japan's sterling requirements is not yet known, but there should be ample scope for expanding its imports from the sterling area, particularly of raw materials. Discussions are also taking place on the possibility of a sterling loan to Japan, for which the United Kingdom would be responsible. This loan would be additional to any credits granted by the Dominions, such as the recent Australian credit for wool. How such a loan would fit in with the new bilateral arrangements has not been disclosed, but it would obviously enable Japan to import more from the sterling area than the sterling area could import from Japan without resorting to dollar expenditure.

Negotiations are also proceeding on a general Japan-Sterling Area trade plan in which, presumably, both the payments agreement and the loan would be dovetailed. The list of goods which each side is prepared to buy suggests no lack of opportunity for an expansion in the volume of trade. Japan wants salt, iron ore, crude rubber, wool, tin, sago flour, coconut oil and industrial chemicals. The sterling area, on the other hand, is willing to purchase cotton textiles, raw silk, dried fruits, machinery, bicycles, paper, pottery, glassware and drugs. Like Germany, Japan has much to live down politically, but again, like Germany, it occupies a pivotal position in the recovery of world trade.

* * *

West African Gold Export Duty

The Gold Coast Government has now published its proposals for the substitution of a sliding scale tax for the existing export duty which was a flat rate of 17s. 5½d. on all gold exported from the colony. The proposals are now to be considered by the representatives of the West African gold industry in London preparatory to being introduced as a Bill in the September session of the Gold Coast Legislative Council. The new tax is framed to assist the low-grade producing mines, and is graded in accordance with the ratio of profits to revenue. The following table illustrates the benefits which may accrue to low-grade producers:—

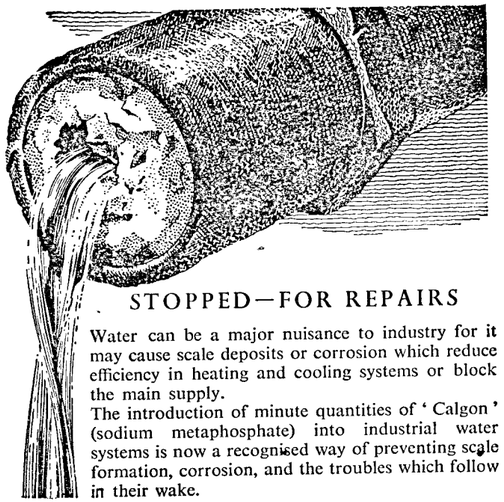
I Rates of Profit computed in accordance with Section 8 to Gross Proceeds	II Net Effective Rate of Present Gold Export Duty per Fine Ounce	III Rate of Proposed Gold Duty per Fine Ounce
Per cent.	s. d.	s. d.
0	4 4·4	Nil
5	5 7·9	Nil
10	6 11·5	Nil
15	8 2·9	1 3
20	9 6	3 9
25	10 9·6	8 9
30	12 1·2	13 9
35	13 3·6	16 3
40	14 7·2	17 6
45	16 0	18 9
50	17 2·4	20 0

The rate of profit in column I is to be determined by section 8 (1) of the Bill, which provides that, subject to certain provisos, "the rate of duty shall be that set forth in the schedule where x is equal to the ratio expressed as a percentage which the profit for the basis year ended next before the period during which the gold was won, bears to the gross value of all gold won during that basis year." It is also proposed to enable mines to allow for past losses in calculating their liability for taxation. The proposals are broadly in line with the formulæ used for assessing taxation on South African gold output.

* * *

Cotton Futures Market in Alexandria

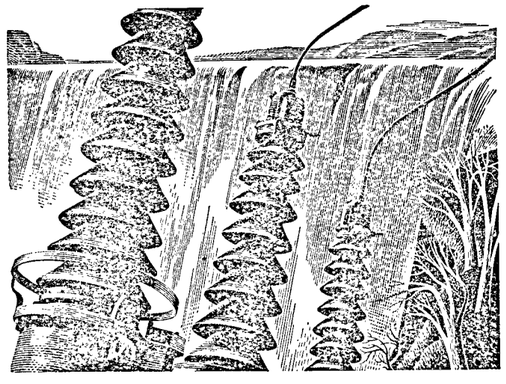
The reopening of the Alexandrian cotton futures market has been fixed for September 1st. The new basis for contracts will be Karnak for long staple cotton and Ashmouni for medium staple—the prewar varieties, Sakel and Giza 7, have been suppressed. Fundamentally, there is little difference between the new market and its prewar counterpart. Stricter rules have been drawn up to prevent outside speculation and the Egyptian Government is appointing three additional members to the Committee of 12 to see that the regulations are enforced. The main difference, however, is the nationality bar. Although prewar members retain their place in the market irrespective of nationality, all new entrants must be Egyptians. Moreover, one half of the staff of any agency operating in the market must be Egyptian and this proportion is to be raised to three-quarters within two years. Price changes will be limited to 3 per cent of the last closing quotation and each contract will require a 10 per cent margin.



After the closing of the Liverpool futures' market, Alexandria may well assume world importance, particularly if its operations are not hampered by currency restrictions. Before the war, it was of a more local character, and if it is to fill part of the gap left by the closing of the Liverpool exchange, it will first have to prove itself in the eyes of the world cotton trade. And it remains to be seen what effect the enforcement of regulations to restrict speculation will have on its operations. Again, the Egyptian Government owns half of the available supply of long staple

Stephen Hales, vicar of Teddington in Middlesex, made the important discovery that plants absorb part of their food from the air. Hales invented artificial ventilators and numerous other mechanical contrivances as well as studying animal and plant physiology. From this, he turned his attention to chemistry, and in his principal book, "Vegetable Staticks", published in 1727, he stressed the importance of accurate weighing and measuring in chemical operations. Unfortunately, his quickness to see the need for accurate measurement restricted his vision in other directions. Having observed that plants breathe in large quantities of air, he concluded that this air could be recovered, and proceeded to distil, in a gun barrel, a great number of miscellaneous substances including tallow, hog's blood, peas, oyster shells, tobacco, a fallow deer's horn, camphor, beeswax and honey.

He collected the gases he obtained and made accurate calculations to show the proportion they bore by weight to the original substances. There is no doubt that Hales unwittingly prepared crude samples of many important chemicals, but he was so engrossed in weighing and measuring, at the expense of accurately observing the substances under experiment, that he failed entirely to appreciate the significance of much of his own work. He dismissed the various gases he had prepared as "air". He died in 1761, and was honoured by being buried in Westminster Abbey.



ICI

STOPPED—FOR REPAIRS

Water can be a major nuisance to industry for it may cause scale deposits or corrosion which reduce efficiency in heating and cooling systems or block the main supply.
The introduction of minute quantities of 'Calgon' (sodium metaphosphate) into industrial water systems is now a recognised way of preventing scale formation, corrosion, and the troubles which follow in their wake.

cotton, including the new crop, and its dealings may have some repercussions on the market.

The present area under cotton in Egypt is officially estimated at 1,494,000 acres compared with 1,302,000 acres a year ago. Despite the scarcity of fertilisers and rather serious damage by the cotton worm, this season's output is expected to yield between 650 and 700 million lb. against 604 million lb. a year ago. This is a sizeable increase. But stocks at the end of the current season are estimated to be some 225 million lb. smaller than a year ago. Thus total available supplies for the coming season may be reduced by 150 million lb. No official details have been published about the area planted to the different varieties, but reports from Cairo suggest that long-staple cotton may account for 25 per cent of the crop compared with 23 per cent last year. The future trend of Egyptian cotton prices will depend, however, as much on the Egyptian Government barter deals as on total supplies. Another important factor will be the Government's loan policy to cotton-growers. If, as happened last season, inadequate credit facilities are provided, a larger proportion of the crop will be marketed in the opening months of the season.

* * *

New Union

The efforts of the judicial managers of New Union Goldfields to obtain relief from their responsibilities reached a further stage this week. At the meeting of the company in Johannesburg on July 29th they were to submit a report suggesting that the management had served its purpose and should be replaced by a properly constituted new Board of Directors representing both creditors and shareholders. No copy of this report has yet reached London, but it is stated to include recommendations for a scheme of reconstruction.

At this distance and at this early stage in the work of the judicial managers it seems premature to interrupt the extensive inquiries they are undertaking. From the outset, these tasks were fully expected to be protracted and painful. It is perhaps natural that there may be less inclination in Johannesburg than in London to pursue the investigation of the inter-group transactions of those formerly responsible for the company to their starting point, but nothing short of this inquiry will erase the memory of the affair, at least in London. Meanwhile 4,000 out of 7,000 British shareholders in the company have rallied to the support of the committee formed in London to look after their interests. Their shareholdings represent more than 26 per cent of the total share capital. It is satisfactory that this committee is now to be represented in Johannesburg. The preliminary examination of allegations of theft and fraud against the former managers which began some months ago is proceeding slowly and has now been adjourned until August 4th. The proceedings have so far introduced little new evidence about the specific charges, and at this rate of progress many months may elapse before the postwar activities of the accused are fully examined by the Court.

* * *

Cost of Higher Management

A Business Note under this title in last week's issue of *The Economist* discussed the problem of measuring directors' emoluments for use as a yardstick to the cost and efficiency of management. The Note suggested no final answer to this problem. But it did show conclusively that the absolute total of directors' remuneration and the average remuneration per head were not reliable measures of the cost of higher management, and that a better answer might lie in expressing the cost of directors' emoluments as a proportion of the assets of the group for which they were responsible or its gross profits. Unfortunately, in demonstrating the unreliability of measuring the costs of higher management per head of the board, an error appeared in the figures relating to the Dunlop Rubber Company. The total of directors' emoluments given for this company was set down at £309,463. It should be made quite clear that this total relates to the directors' emoluments of the whole group, including subsidiary companies: The figures for the directors of the Dunlop Rubber Company alone in 1947 were £119,251, and the average per head—for what that calculation is worth in the context of last week's Note—was accordingly rather under £12,000, and not £31,000. It should be pointed out that the last two columns of the table, on which attention was focused in the discussion, are not affected by this correction, since they relate the cost of directorial services for the whole group to its assets and profits. Figures for the other companies in the table appear, broadly speaking, to be free from such distortion, though the average costs per head of the Lever group of directors may be smaller than the table suggested. It may also be somewhat austere to load the cost of pensions to past directors on the individual shoulders of the present boards, as was done in last week's calculations; but clearly these charges do represent part of the total cost of the function of management, and should be taken into account in measuring its results.

Shorter Note

The Ministry of Food concluded a second seven year contract with New Zealand this week. The new one covers lamb, mutton, veal, beef and pigmeat. Like the dairy produce contract, it will run until 1955 except for pigmeat which will run only up to 1952. The contract also provides for annual price reviews with a maximum variation each year of 7½ per cent. Britain is guaranteed New Zealand's exportable surplus and the New Zealand Government has agreed to take definite measures to increase its agricultural production. No details of the new meat prices have been published, but they are believed to be higher than last season's. Contract negotiations are also proceeding with Australian representatives for dairy produce and meat..

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Unilever Group; Distillers; British Sugar Corporation; Metal Industries.

COMPANY MEETINGS

ROLLS-ROYCE LIMITED

A SUCCESSFUL YEAR

NEED FOR FURTHER WORKING CAPITAL

MR E. C. ERIC SMITH ON EXPANSION IN OVERSEAS BUSINESS

The forty-first annual general meeting of Rolls-Royce, Ltd., was held on the 21st instant at the Midland Hotel, Derby, Mr E. C. Eric Smith, M.C. (chairman of the company) presiding.

The Secretary (Mr R. B. Wilson) read the notice convening the meeting and the report of the auditors.

The following is the Chairman's statement which had been circulated with the report and accounts for the year ended December 31, 1947, and was taken as read:—

The accounts for the year ended December 31, 1947, are presented in the form demanded by the new Companies Act, and include consolidated accounts which incorporate the figures of subsidiary companies. The method of presentation of the company's balance-sheet shows no substantial changes although the figures reveal the need for further working capital. It will be remembered that last year the Board foresaw this situation when it recommended an increasee in the nominal capital.

BALANCE SHEET ITEMS

An overdraft of £692,395 and the absorption of last year's cash balance and tax reserve certificates have provided £1,280,000, which has been used to provide further working capital for the subsidiary and associated companies, to reduce obligations to creditors, and to finance increased debtors. The Board does not, however, consider that conditions are yet sufficiently stable for arrangements to be made to give this additional finance a more permanent form. The increase in debtors reflects the widening field of the company's sales activities, which brings in its train increased responsibilities in the matter of credit facilities.

Stocks and work in progress have increased but are offset by increased progress payments. Our obligations to creditors are now shown separately from taxation liabilities and are substantially reduced. The excess of current assets over current liabilities remains substantially the same as last year at approximately £2,000,000. Under the heading of deferred liabilities we now group provision for all liabilities which are known to exist, but which are difficult of exact ascertainment. The increase during the year is attributable to further amounts provided for work under guarantee on the increased number of our products now in service.

AVAILABLE PROFIT

The profit and loss account appears in a new form and reveals a net available profit for 1947 of £590,578, which compares with the corresponding figure of £671,191 for 1946. It should be borne in mind that non-productive expenditure amounting to £171,505, incurred during the fuel crisis, has been charged against a reserve specifically provided last year. In the absence of this provision, the profits for this year would have been correspondingly less.

The peculiar incidence of the various forms of taxation results in a heavier liability for 1947 than for 1946 when the company was helped by a refund of E.P.T. Your directors recommend the payment of a dividend of 20 per cent. and a transfer of £150,000 to general reserve, £8,891 from the profits of the year and £141,109 from reserves no longer required.

CONSOLIDATED ACCOUNTS

The consolidated accounts include the figures of our various subsidiary companies, of which only Bentley Motors (1931), Ltd., Park Ward and Co., Ltd., and Rolls-Royce, Montreal, Ltd., have actively traded during the year. These accounts indicate that our investments in these companies are conservatively valued.

Bentley Motors (1931), Ltd., derives its revenue from the marketing and servicing of its cars which are manufactured by your company. Its fortunes are, therefore, closely linked to that of the company's motor car division. The company has operated at a small profit and the order book is very satisfactory. The rate at which these orders can be fulfilled, governed, as it is, by the supply position and other circumstances over which we have no control, will decide their profitability.

COACH BUILDING

The coach building subsidiary, Park Ward and Co., Ltd., has made further progress during the year in the design and production of bodies for both Rolls-Royce and Bentley cars. The difficult conditions referred to last year, the shortage of craftsmen and material, still persist, and the consequent difficulty of maintaining an economic output of bodies of the quality the company demands must have its influence on future results.

Rolls-Royce Montreal, Ltd., a new subsidiary, has been formed to provide service in its widest aspect to users in Canada, of our aircraft engines. It is operating profitably and the engineering and spare parts service is much appreciated by our customers. The provision of working capital for this company accounts for the major part of the increase in the company's balance-sheet under the heading "Investments and loans to subsidiary companies."

The figures relating to associated companies are not, of course, included in the consolidated accounts, as the company does not hold the major share of the equity.

Rotol, Ltd., is now settling down to its postwar programme, and the future prospects for both propellers and other products are satisfactory. This company, as you know, plays an important part in the development of projects of common interest to your company and our partners in this enterprise, the Bristol Aeroplane Company, Ltd.

It has been possible during the year to make a more accurate assessment of the working capital required by Rotol, Ltd., for the fulfilment of their future programme. The additional capital shown to be required has been provided by way of loan, on which interest is being paid, by the parent companies. The company has traded at a profit in 1947, but no dividend has been distributed.

Renfrew Foundries, Ltd., has taken longer than we originally hoped and anticipated to settle down to the changed conditions which have entirely altered the demand for its product. The plant has been adapted as quickly as possible to meet these changes, but inevitably has been operating uneconomically in the interim. The company has traded at a loss during 1947 and it has been necessary to make a further provision against the value of your company's investment.

DIFFICULT CONDITIONS

The year has been a difficult one. The fuel crisis provided an inauspicious start which, as far as was humanly possible, was minimised by the ingenuity and enterprise shown by the management of your company.

Increases in purchase tax and abolition of the basic petrol ration contributed to the disadvantage under which the company's motor-car division laboured, and an uncertain and temperamental supply position was a continual source of anxiety.

In spite of this, the company has had a successful year. The excellent design and quality of the company's motor-cars have enhanced our reputation, both at home and abroad, and the demand for the product has been most satisfactory. Every effort has been made to increase our overseas business and, in the face of import restrictions imposed by many foreign Governments, considerable success has been attained.

Development, particularly in respect of those features peculiar to export business, is being constantly pursued and there is no reason to doubt that it will create an increased inquiry for our cars.

In addition to their activities with the present range of motor-cars, the motor-car division are developing engines of wider application, which are attracting great interest, and from which there should be sound business.

The Glasgow factory, which is engaged in the overhaul and reconditioning of aero engines, was acquired during the year, and has made a satisfactory contribution to the company's business.

REPRESENTATION OVERSEAS

The year has seen a very large expansion in overseas business. A network of commercial representation throughout the world has been built up and Rolls-Royce technicians, well qualified to deal with the special problems of particular countries, pay regular visits to the users and prospective users of our engines.

Although the gas turbine engine has established itself, limitations, entirely outside the scope of the engine builder, such as navigational and traffic handling problems at airports, will keep piston engines in the picture for a long time to come.

In this connection, it is interesting that the Merlin engine is the only British power plant operating in regular service on the trans-Atlantic run. It is even more interesting that during 1947 Merlin engines, on the civil air routes of the world, flew a hundred million miles.

DEVELOPMENT OF GAS TURBINE

Recognition of the company's position in the development of the gas turbine is shown by the negotiation of manufacturing licences in the U.S.A., South America and Australia.

The company cannot stand still, it cannot afford to, it must be forever pioneering, improving, searching for the unattainable ideal. By this means alone can it maintain its position. Nor can it afford mistakes. Its reputation is such that a statement by Rolls-Royce is fact, not conjecture, and this is the position it is our duty to maintain.

It is pleasant to be able to record that continuance of Rolls-Royce esprit de corps which has produced the results of 1947, and to thank each individual for the part he has played in their achievement.

The Royal Aeronautical Society has presented the Gold Medal to your managing director in recognition of his contribution to the development of aircraft engines, a well-merited recognition of which we are justly proud.

Lastly, Battles of Britain may vary—Hurricanes and Spitfires have gone down in history. The battle now is being fought in the field of export, and your company engines, a well-merited recognition of which we are justly proud.

Lastly, Battles of Britain may vary—Hurricanes and Spitfires have gone down in history. The battle now is being fought in the field of export, and your company engines, a well-merited recognition of which we are justly proud.

Lastly, Battles of Britain may vary—Hurricanes and Spitfires have gone down in history. The battle now is being fought in the field of export, and your company has no reason to feel ashamed of its contribution which, during the last year, amounted to five million pounds.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring directors, Mr Harold Peake and Dr F. Llewellyn Smith, were re-elected; and the auditors, Messrs George A. Touche and Company, having been reappointed, the proceedings terminated.

STANDARD BANK OF SOUTH AFRICA, LIMITED

FURTHER INCREASE IN ACTIVITY

LORD HARLECH'S SURVEY

The one hundred and thirty-fifth ordinary general meeting of the Standard Bank of South Africa, Limited (being the annual general meeting for the year 1948), was held, on the 28th instant, in London, the Rt Hon. Lord Harlech, K.G., P.C., G.C.M.G., the chairman, presiding

The following is an extract from his statement circulated with the report and accounts as at March 31, 1948:—

The position disclosed in the balance sheet is most satisfactory Most of the items again reflect a further pronounced increase in activity in all the territories in which we operate.

For several years prior to 1947 there had been a steep rise in the accumulation of cash balances by commercial and industrial concerns in Africa who had been unable to employ their resources in renewing stocks. In last year's report, however, it was noted that the pace of this movement had slackened. Traders' cash balances were used to buy stocks and our deposits increased by only £12 million, as against £35 million in the previous year. It then appeared likely that, as the readjustment to more normal conditions developed in the manufacturing countries of the world, the curve of our deposits would tend to flatten out, but, contrary to expectation, I have to report that this item has again moved up steeply, the figure being approximately £50 million more than last year. This movement is some reflection of the very large monetary transfers to South Africa during the year.

DEMAND FOR LOANS

During the year, increasing quantities of goods from overseas have become available, and in the payment for these imports traders' resources have been absorbed and a demand has arisen for loans.

That a considerable demand has arisen for financial assistance is evidenced by the rise that has taken place in the total amounts lent by the bank. "Advances to customers and other accounts" amounted to £53 million on March 31, 1947, and have now further increased by £14 million to £67 million. You will be gratified to know that this achievement indicates that the bank has played its full part in the maintenance and development of trade and industry in the countries in which it is interested.

Our position continues to be very liquid. While deposits have increased by £50 million, cash in hand and at call and short notice has improved by £34 million and reflects a ratio of almost 38 per cent. to deposit and current and other accounts, compared with a ratio of slightly more than 31 per cent. a year ago. Little change is recorded in the amount of our investments.

ANOTHER MILESTONE

This year I have to record the passing of a further milestone in the history of the bank, for the sum of the items of the balance sheet has increased by no less than £70 million, reaching a total sum of £327 million. This last figure is indicative of the very substantial increase in the business of our institution which has been taking place.

Having regard to the much larger amount of customers' deposits, the directors have decided to augment the reserve fund by a transfer of £1,000,000 from contingencies account. The reserve fund now amounts to £5,000,000, exactly twice the amount of the paid-up capital.

It would seem at first sight that the balance of profit, amounting to £672,691 compared unfavourably with that shown last year—that is, £819,014. If, however, this latter figure were shown after deduction of income tax on the dividends and bonus paid to shareholders, it would have amounted to £594,014, from which it will be seen that the balance of profit has in fact risen by £78,677.

After adding the amount of £179,307 brought forward from last year there is £851,998 for disposal. The interim dividend of 7s. per share paid on January 31st last absorbed £175,000, which, after deduction of income tax, amounted to £96,250. After appropriating £125,000 to bank premises a balance of £630,748 remains, and it is recommended that an allocation of £250,000 to officers' pension fund be made and that a final dividend of 9s. per share be paid, together with a bonus of 4s. per share, making a total of 20 per cent. for the year, leaving a sum of £201,998 to be carried forward.

In the Union of South Africa the year under review has been one of great activity and increasing development in most branches of its economic life. Conditions in Europe where the political situation and future course of events have presented a prospect of so much uncertainty have helped to bring the Union and its potentialities into further prominence.

In the commercial and distributive trades turnovers have continued to rise steadily. A noticeable feature in the developments of the past year has been the extent of the interest that has again been displayed by British commercial and industrial concerns in securing a foothold in the country. A good maize crop was harvested in the 1946-47 season.

THE RHODESIAS

In Southern Rhodesia business activity has improved steadily and turnovers in practically all trades have increased sharply. Costs have continued their upward trend, but trading results have been generally satisfactory and activity was stimulated by the steady flow of immigrants. Very substantial imports of foodstuffs were necessary as a result of the serious drought experienced throughout the country.

The most important export is tobacco. The acreage planted and the crop gathered was considerably larger, and demand being strong, prices were carried to record high levels. Gold production continued to decline.

At least one-quarter of the European population of Northern Rhodesia is employed in the mining industry. The territory's prospects continue to depend upon the maintenance of the prosperity of the copper companies, copper accounting for almost the whole mineral production. The outlook for the copper mines continues to be very favourable.

OTHER COUNTRIES

Exports of the three main crops grown in Nyasaland, namely, tobacco, tea and cotton, again improved during 1947, but nevertheless the territory's external trade yielded an adverse balance of about £750,000 for the year. Heavy and prolonged rains affected the quality of much of the tobacco grown, and caused a reduction in the maize crop.

Business activity in South-West Africa has continued to increase steadily, being stimulated by the returns received by the Karakul farming industry.

Climatic conditions during the year in the East African territories were not generally favourable, with the exception of those in Tanganyika, where good and well-distributed rains occurred and resulted in one of the best years for agriculture for some time. The labour position continues to cause concern, and the lack of agricultural machinery is a handicap to farming operations.

The report was adopted.

BRITISH SUGAR CORPORATION, LIMITED

FAVOURABLE PROSPECTS

The annual general meeting of the British Sugar Corporation, Limited, was held, on the 27th instant, in London, Lt.-Colonel Sir Francis H. Humphrys, G.C.M.G., G.C.V.O., K.B.E., C.I.E., the chairman, presiding.

The following is an extract from his circulated statement:—

Last year I informed you that the prospects for the 1947-48 season had been seriously affected by a late spring, followed by a severe drought, especially in East Anglia, and that a crop of about 3,000,000 tons of beet with a higher average sugar content than in 1946 could reasonably be looked for. The corporation's agricultural experts are usually not far wrong with their estimates, which this year have been almost exactly fulfilled. The beet crop of 2,959 564 tons is, with the exception of the years 1937-38 and 1938-39, the lowest in the corporation's history. On the other hand, the average sugar content, which is approximately 18 per cent. (against 16 per cent. last year), has only once been exceeded—in 1940-41.

HIGHER EXTRACTION

The early completion of the cereal harvest facilitated the opening of the sugar beet campaign, and the almost ideal weather conditions which prevailed from the beginning of October to the end of December enabled the growers to finish delivering their beet, with a very low dirt tare, to the factories before the middle of January. Thus for the first time since 1941-42 the corporation's factories were not strained beyond their normal capacity, and, aided by up-to-date machinery which had been installed wherever possible, our technical staff succeeded in achieving a higher degree of extraction than had been practicable during recent years.

These favourable circumstances—good weather, absence of the need for rushing through a crop much too large for the present capacity of the factories conveniently to handle, and increased efficiency—have combined to bring about a remarkable drop in the deficiency payment (in other words, the grant made to the corporation by the Exchequer) from £2,749,780 last year to £569,000 in 1947-48, against a Budget estimate of £3,000,000. This is by far the lowest figure ever recorded, and if the corporation had been allowed to receive a fair market price for the molasses which it sold under control to the Board of Trade, no assistance whatever would have been required from the Exchequer.

DIVIDEND AGAIN 4½ PER CENT.

The net addition to our taxation liability brought about by the profits tax, which presses with particular severity on a semi-public utility like the corporation, is about £33,000, all of which has to be found out of the net proceeds of the incentive earnings. Out of the remaining £214,118 your directors have repeated last year's allocation of £50,000 to special depreciation reserve and have made provision of £28,223 for debenture redemption, leaving a balance of £135,895. They recommend a dividend of 4½ per cent., less tax (£123,750) for the ninth successive year, which will admit of an addition of about £12,000 to the carry-forward, raising it to £66,063.

Prospects for the coming season are more favourable than last year, though it is too early to make a reliable forecast. At one time it appeared likely that the partial failure of the sugar beet seed crop in this country and throughout Western Europe in 1947 would prevent the attainment of the 1948 target. Fortunately, however, with the help of the corporation's reserve stocks, there has been sufficient seed to cover re-sowings that are rather heavier than usual.

The report was adopted.

BRITISH TIMKEN, LIMITED

SATISFACTORY RESULTS

Mr Michael Dewar, chairman of the British Timken, Limited, stated at the annual general meeting on the 28th instant:—

For the past ten years we have paid the same dividend of 15 per cent. on our ordinary shares. On all counts of fairness, the ordinary shareholders should this year have received a larger dividend. The wage bill in 1947 was nearly £1,000,000, compared with £250,000 in 1938, yet the gross dividend has remained the same, but for the small increase in capital in 1940. In line with most of the larger industrial companies, we decided to follow the Chancellor's request not to increase our dividend.

It is 21 years since the control of your company passed into the hands of the present board and to-day, with our subsidiary company, we are consuming 15 times the tonnage of steel consumed in 1927 and the number of employees has increased eight times. We have reserves totalling over £400,000, which indicates the amount ploughed back into the business during past years, and is a clear indication that we have acted in the best interests, not only of the shareholders, but of the country. With these large reserves, the shareholders are entitled to some certificate of ownership. This we should have certainly have issued in the form of bonus shares but for the unreasonable attitude of the authorities.

GREATLY INCREASED PROFITS

The greatly increased profits for 1947 have been achieved by your company's factories, including those of Fischer Bearings Company, Limited, working day and night over the year, and not only at full pressure, but with the most modern and up-to-date equipment. These results are also due to your board having preserved with assiduity, and no little success, the development of improved manufacturing technique. The parent company's physical output, with the same number of employees, was in 1947 20 per cent. higher than in 1946, and your board has no hesitation in ascribing this very largely to efficient management.

In April, 1948, we announced a 5 per cent. reduction of prices of bearings delivered in this country. Your directors are confident that, but for the inevitable coming rise in cost of power, fuel and raw material, the work now proceeding in our development departments would permit us to reduce prices still further.

We have already taken steps to ensure we shall not only fully supply the demands in this country, but shall be ready to fight again for the very considerable export trade which we think can be obtained by determined competition. At present, more than half your company's output is exported indirectly as component parts.

THE FUTURE

It is difficult to speak of the future except to say that, although we have sufficient confidence to proceed with our expansion programme, there are signs of a slackening of trade activity. One thing we can say with certainty is as fast as industries are nationalised, so their efficiency will fall and their costs increase with a lessening of competitive power.

In extending your company's activities, not only have we to take a business risk, but we have the almost heartbreaking task of persuading Government departments to permit our extensions to go forward without unreasonable delay.

We have endeavoured to carry on as best we can under a Government which, in spite of soothing remarks from its right wing, continues unabated in its hostility to private enterprise and in its belief, contrary to the teachings of all history, that man in general has any interest in work when that work is divorced from the incentive of personal gain.

AMALGAMATED ROADSTONE CORPORATION, LIMITED

ANTICIPATED PROFITS EXCEEDED

MR J. S. KILLICK'S STATEM

The twelfth annual general meeting of the Amalgamated Roadstone Corporation, Limited, was held, on the 28th instant, at Winchester House, Old Broad Street, London, E.C., Mr G. F. Nalder (chairman of the company) presiding.

The secretary (Mr D. Mallett) read the notice convening the meeting and Mr S. R. Hogg, FCA, of Messrs Hogg, Bullimore & Company, read the report of the auditors.

The following is the statement of the vice-chairman, Mr J. S. Killick, C.B.E., M.Inst.C.E., circulated with the report and accounts for the year to October 31, 1947:—

Your chairman, last year, pointed out that the benefits of the amalgamation with British Quarrying Company would be only partially effective in the year ended October 31, 1947, now under review. In the prospectus issued on November 1, 1947, one of the primary objects of which was the provision of funds for the repayment of prior charges of the British Quarrying Company and thereby the completion of that amalgamation, your directors made the statement that they were satisfied that the net trading profits for the then completed financial year would exceed £200,000.

From the annual report now before you, you will note that the sum of £223,000 was actually earned, in spite of the abnormally adverse conditions prevailing during the early months of 1947.

APPROPRIATIONS

Of the various appropriations therefrom set out in the report, there are three to which I should like to draw your attention:—

No. (1) initial allowances in respect of all capital expenditure incurred during the two and a-half years from April, 1944, to October, 1946, amounts to £57,331; it is gratifying now to be able to write off the whole of this amount out of the year's profits.

No. (7) transfer to capital reserve of £4,965 relates to that proportion of the profits of the Pyx group, accrued before the date of purchase.

No. (8) proportion of net profit for the year attributable to outside shareholders, £12,032. Of this, approximately £2,000 relates to Preference dividends of a subsidiary company still outstanding; approximately £10,000 relates to shareholdings in the British Quarrying Company held externally at October 31, 1947, but acquired by this company early in November.

DIVIDENDS

As regards dividends on our Ordinary share capital, the interim dividend at the rate of 4 per cent., paid in December, compared with 3 per cent. the previous year; the final dividend at the rate of 5 per cent. now recommended is the same as last year's final in conformity with the present national policy of dividend limitation.

During the current year the results of our amalgamation are becoming more effective; our capital programme of re-equipment proceeds satisfactorily; and, given continuance of normal conditions during the last four months of the year, your directors are satisfied that the profits for 1948 will show a considerable increase over the year to October 31, 1947.

The report and accounts were adopted; the proposed dividends were approved; and Mr K. G. Foster, J.P., who retired by rotation, was re-elected a director.

At a subsequent extra general meeting resolutions were passed converting the Ordinary shares into Ordinary stock and approving an alteration in the Articles of Association.

The proceedings terminated with a vote of thanks to the chairman.

RICHARD THOMAS AND BALDWINS

ANNUAL GENERAL MEETING

The annual general meeting of Richard Thomas and Baldwins, Limited, was held on the 28th instant, at Grosvenor House, Park Lane, London, W., Mr E. H. Lever (chairman and joint managing director) presiding.

The chairman moved the adoption of the report and accounts for the year ended April 3, 1948 and the payment of a final dividend of 10 per cent., less income tax, making 15 per cent. for the year, and in doing so said: We have in course of preparation a booklet which contains facts and figures and by diagram and illustration gives a somewhat more comprehensive view of the company's affairs than can be gained by a perusal of the accounts and my statement, comprehensive though these are. The booklet will be in publication, I hope, in a few weeks' time, and will be available for shareholders. Those shareholders who would like to have a copy, therefore, are asked to notify the secretary.

Lt.-Col. J. B. Neilson, C.M.G., D.S.O., C.A. (joint managing director), seconded the resolution and it was carried unanimously.

The retiring directors, Mr Leslie J. Davies, the Rt. Hon. the Earl of Dudley, M.C., and Sir Andrew Agnew, C.B.E., were re-elected and the auditors, Messrs. Peat, Marwick, Mitchell and Company, were reappointed.

Mr Fred W. Sibley, in thanking the chairman and the board for their services during the past year, expressed strong opposition to the Government's proposed nationalisation of the steel industry.

This view was unanimously supported by the assembled shareholders.

At a subsequent extraordinary general meeting a resolution was passed adopting new articles of association to bring them into line with the requirements of the Companies Act, 1948.

BEECHAM GROUP, LIMITED

LARGER NET SURPLUS

The twentieth annual general meeting of the Beecham Group, Limited, was held, on the 28th instant, in London, Sir J. Stanley Holmes, M.P., chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts:—

The net result of the Group's trading for the year ended March 31, 1948, is a net surplus of £751,511 available for dividend on the deferred shares and for reserves, as compared with £502,659 in the previous year. It is proposed to declare a final dividend of 4 per cent., making 40 per cent. for the year, the same as last year The trading profits and sundry revenue earned by the 118 companies and branches of the group amount to £2,370,181, compared with £2,688,522 in the previous year.

Although home sales showed an increase of nearly 18 per cent., the home trading profits have shown a decrease of £208,088, due to the steeply rising costs of raw materials, containers, consumable stores and wages, without any compensating increases in selling prices. Our export trade has again shown satisfactory results in spite of increasing costs. The total charge for United Kingdom taxation amounted to £1,157,366, compared with £1,656,114.

Our food sales have increased in total by over 25 per cent., while the sales of foodstuffs manufactured and canned in our own factories have increased by 65 per cent. compared with last year.

It is difficult to make prophecies with regard to the future, but we have so continually broadened the basis of our business and our interests all over the world are so far-flung that we can face the future with confidence.

The report was adopted.

Statistical Summary

GOVERNMENT RETURNS

For the week ended July 24, 1948, total ordinary revenue was £46,534,000, against ordinary expenditure of £38,536,000 and issues to sinking funds £130,000. Thus, including sinking fund allocations of £3,603,493 the surplus accrued since April 1st is £192,515,831, against £280,538,906 for the corresponding period a year ago.

The Councils of the Colleges propose jointly to appoint a Director of Extra-Mural Studies. Salary £1,200 per annum. Applications should be received as soon as possible by the Registrar of either College, from whom further particulars may be obtained.

LOUIS S. THOMAS, Registrar, Cardiff College.
EDWIN DREW, Registrar, Swansea College.

July, 1948.

STATISTICIAN—EAST AFRICA HIGH COMMISSION

A vacancy exists for a Statistician to open and control a statistical office probably at either Entebbe or Dar-es-Salaam on behalf of the East Africa High Commission. Candidates should be men possessing a first or second class Honours degree in Mathematics or Economics and Statistics, together with practical experience of statistical work and organising ability.

Salary: At a point on the scale £400, £450 x £25—£600 : £660 x £30—£840, according to qualifications and experience.

A review of East African salaries has recently been undertaken, and it is expected that the report of the Salaries Commission will be published in the near future.

Age limit 45 for permanent and pensionable terms.

Apply in writing to Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1.

LANCASHIRE COUNTY COUNCIL

COUNTY PLANNING DEPARTMENT

Applications are invited from University graduates with degrees in Geology, Geography, Economics and the Social Sciences, for two appointments on the Research Staff of the County Planning Department at the County Offices, Preston.

The appointments will be subject to the National Joint Council's Scheme of Conditions of Service for Local Authorities' Administrative, Professional, Technical and Clerical Services, and to the Local Government Superannuation Act, 1937.

(a) Senior Planning Assistant (Research), A.P.T. Grade VII (consolidated salary £635 x £25 to £710 per annum). Duties will include enquiries into various aspects of land use, mineral development and estimates of Urban congestion. Candidates should possess experience in a Government Department, or with a Local Authority, or with an estimated research organisation.

(b) Planning Assistant (Research), A.P.T. Grade V (consolidated salary £520 to £570 per annum). Duties will include maintenance of comprehensive statistical records and investigations into problems connected with industry and housing.

Testimonials are not required, but applicants should give the names of two persons to whom reference may be made.

Applications, stating age, qualifications and experience, should be received by the undersigned not later than Saturday, August 14, 1948.

R. H. ADCOCK,
Clerk of the County Council.

County Offices, Preston. July 14, 1948.

UNIVERSITY COLLEGE OF HULL

The College proposes to award a Post-graduate Studentship in the Faculty of Arts for full-time research in Arts, Commerce, Economics or Law. The value of the award is £200 for one academic year, renewable for a second year.—Further particulars from the Registrar, to whom applications (three copies) should be sent by August 30th.

MERCHANT VENTURERS' TECHNICAL COLLEGE, BRISTOL

DEPARTMENT OF COMMERCE

Required, to commence in September, a full-time LECTURER in ACCOUNTANCY. Preference will be given to Chartered or Incorporated Accountants with practical and teaching experience.

The post carries the status of Senior Assistant and the salary is in accordance with the Burnham Technical Report (Senior Assistants' Scale) for men: £700 by £25 to £800; women £560 by £20 to £640, plus allowances for qualifications and training.

Application forms (to be returned within two weeks of appearance of this advertisement), obtainable with further particulars from Registrar, Merchant Venturers' Technical College, Unity Street, Bristol, 1.

ANDREW ROBERTSON, D.Sc., F.R.S., Principal.

UNIVERSITY OF THE WITWATERSRAND, JOHANNESBURG, SOUTH AFRICA

Applications are invited for a LECTURER IN THE DEPARTMENT OF COMMERCE. Qualifications required are a degree in Commerce or in Economics. A knowledge of Accounting would be desirable and business and teaching experience would be a strong recommendation. Salary scale £550 x 25—£800 per annum, plus a temporary cost of living allowance which at present is £75 per annum in the case of a married man and £46 16s. in the case of a single officer. A higher initial salary may be paid on the grounds of special qualifications and experience. The appointment is subject to two years' probation in the first instance. Membership of the University Teachers' Provident Fund is compulsory.

Further particulars and information as to the method of application are obtainable from The Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1. The closing date for the receipt of applications is August 31, 1948.

AMERICAN PUBLIC ACCOUNTANT with many years' legal experience in Germany desires responsible position in this country.—Box 767.

UNIVERSITY OF EDINBURGH

ASSISTANTSHIP IN POLITICAL ECONOMY

The University Court invites applications for appointment to an Assistantship in Political Economy. The salary will be £400 per annum, and the Assistant will be expected to take up duty on October 1st. The University Court will be prepared to consider making a grant towards the expenses of removal.

Applications, with the names of two referees, should be sent to the Secretary to the University by August 31st.

UNIVERSITY OF ABERDEEN

LECTURESHIP IN INTERNATIONAL RELATIONS

The University Court will shortly proceed to appoint a Lecturer in International Relations. Salary £600-£750 according to qualifications and experience F.S.S.U. and Family Allowance. The Lecturer will be required to give instruction in the history of International Relations from 1871 to the present, with special reference to the development of International institutions during the period and to the relations of the Great Powers from 1919 onwards. Further particulars can be obtained from H. J. Butchart, Secretary, The University, Aberdeen.

NATAL UNIVERSITY COLLEGE, DURBAN

LECTURESHIP IN POLITICS

Applications are invited for the above post at a salary on the scale:
Men: £550 x £25-£725 per annum.
Women: £425 x £25-£600 per annum.
To this will be added a cost of living allowance.
A suitable applicant may be appointed at any point of the scale, in accordance with his qualifications.
The successful applicant will be required to lecture in Politics to B.A., B.Econ., and B.Com. students, at all stages.
Membership of the University Teachers' Pension and Provident Fund is compulsory.
The appointment will be in the first instance for a probationary period of two years. The successful candidate will be expected to take up duties not later than March 1, 1949.
Further particulars and information as to the method of application may be obtained from The Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1. The closing date for the receipt of applications is September 30, 1948.

ASSOCIATION, representing an important national industry, requires SECRETARY, London. Previous experience association work, and central wage negotiating machinery, preferred. Salary £900-£1200, according to experience and qualifications.
Reply stating age and other personal details, professional qualifications, if any, training and experience, positions held, etc., to—Box 785.

PRODUCTION control. Deputy (aged 30-40) to manager of large department is required by North London Company engaged in the manufacture of furniture and woodware. Applicants should have had either theoretical or practical training in statistical methods and some experience in the production control department of a large organisation, or have been employed on work of similar nature. The outstanding characteristics required are a clear appreciation of production statistics and an ability to control staff. The position is a pensionable one and the commencing salary will be £600 upwards according to qualifications and experience.—Box 788.

OTHER NOTICES APPEAR ON PAGE 207.

GOVERNMENT OF NORTHERN IRELAND

CIVIL SERVICE COMMISSION

Applications are invited from British Subjects for the post of STATISTICAL OFFICER in the Ministry of Labour and National Insurance. Candidates must be normally resident in the United Kingdom and in the case of women must be unmarried or widowed.

QUALIFICATIONS: Candidates must possess an Honours University degree in statistics, or in mathematics, economics or other appropriate main subject combined with statistics, or having obtained an Honours degree without statistics, must have been employed wholetime for at least a year on statistical work.

Preference will be given to suitably qualified candidates who served with H.M. Forces during the 1914-18 or the 1939-45 War, providing the Commissioners are satisfied that such candidates can, or within a reasonable time will be able to, discharge the duties efficiently.

REMUNERATION: The Consolidated scale of salary is £700 x £25—£900 per annum. Superannuation provision will be made under the Federated Superannuation System for Universities.

APPLICATION must be made on the prescribed form which may be obtained from the Secretary, Civil Service Commission, Stormont, Belfast, and must be returned, with copies of two recent testimonials, so as to reach him not later than August 20, 1948.

CAMBRIDGESHIRE EDUCATION COMMITTEE

CAMBRIDGESHIRE TECHNICAL COLLEGE AND SCHOOL OF ART

Applications are invited for the post of Lecturer in Commerce and Industrial Administration required in January, 1949. Candidates should possess a degree in Commerce or Economics or hold an equivalent professional qualification. Business experience would be a recommendation and teaching experience is desirable but not essential. The post involves day and evening work, mainly of a senior character.

Salary will be in accordance with the Burnham Scale for Assistants in Establishments for Further Education, 1948. Allowance will be made for professional or industrial experience where applicable. Further particulars and application forms will be forwarded on receipt of a stamped addressed foolscap envelope by the Chief Education Officer, (T), Shire Hall, Cambridge. First inquiry should be endorsed "Commerce."

HIS MAJESTY'S COLONIAL SERVICE

A vacancy exists in Jamaica for a Secretary of Economic Affairs. Candidates should possess governmental or commercial administrative experience in responsible positions, and some academic qualifications are also desirable, such as a First or Second Class Honours Degree in Economics or a Bachelor of Commerce Degree. Salary £1500 per annum, free passages (on appointment), but not quarters, for officers and families are provided. The age limit for the appointment is 55 but pensionable terms would only be offered to applicants under the age of 45, who have completed three years of probation. Intending applicants should submit brief particulars of age, qualifications and experience to the Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, S.W.1.

NUNDYDROOG MINES, LIMITED

At a Meeting of the Board of the Company held to-day, the undermentioned dividend was declared, subject to audit:—

First and Final for the year ended December 31, 1947, of 9d. (Ninepence) per share (7½%), free of Income Tax at 9s. in the £, payable on September 3, 1948, to the shareholders on the books of the Company at the close of business on July 22, 1948.

The profit on Revenue Account (Provisional) including £238,565 refund of Gold Duty, was £82,863 (comparative figure for 1946, £32,397).

By Order of the Board,
J. A. WHITE,
Secretary.

BENDIX Home Appliances, Ltd., requires a London Sales Manager with the following qualifications. First class selling ability; capacity to control a sales and service organisation and thorough knowledge of, and experience in, distributor and dealer practice. A good salary and excellent prospects are offered to the right man. Applicants of the right calibre and with the highest credentials are invited to reply to The Chairman, 99a, Park Lane.

Twilight Sleep

SO far as the House of Commons is concerned, the debates that arose last week over Sir Stafford Cripps's proposal of a British-American Council of Productivity can doubtless be regarded as a storm in a tea-cup. By the second day, calmer reflections had already allayed some of the passions shown on the Wednesday and only two speeches were downright hostile to the project. There was a general disposition to regard it as at least harmless, and nobody reflected Mr Platts-Mills's fears of the previous day that it was "an affront to the dignity of our people and a threat to our economic security." Objection can, indeed, be raised to some of the particular circumstances of Sir Stafford Cripps's proposal. He would have been wiser not to have announced it at a press conference, and there is ground for scepticism about what can be accomplished by another high-level committee staffed by the bureaucrats of industry, when the lessons have to be learned on the workshop floor. The project will now presumably pursue its course and in due season results will appear. It has already received more public attention than it inherently deserves, and the best course for the Council to take when it meets will be to resolve to work in silence.

What does, however, deserve further comment is the general attitude of mind of the British public, as reflected by its elected representatives, towards its economic position and prospects. That attitude was one of horrifying complacency. It was shown by Tories—Mr Eden refused to accept "that our industry is in a position where we require advice from any country, however eminent, in the conduct of our industrial enterprises"—and by Socialists, by those who attacked the proposal and by those who, like Sir Peter Bennett, accepted it as a means whereby the Americans could be shown how good British industry is. Apart from Sir Stafford Cripps himself, there was hardly a member who was ready to admit that there was anything wrong with British industry—or, if there was, that could not be put right by native methods. If this were merely an exhibition of national pride, it would be a matter for a tolerant smile. But it is more than that. It provides a sudden flash of illumination upon the basic assumptions of the British mind. This nation has never really accepted that anything truly drastic or permanent has happened to it. "We have, it is true (runs the subconscious national credo), been blown off our course by the gales of war, and if we are slower than others in getting back to it, that is because we fought first, because we fought longest and because we fought hardest. That being so, it is our right to expect temporary assistance from the more fortunate as part of the unexpressed wartime bargain to pool resources. Give us time and we shall pull through. The present very difficult conditions must pass sometime and then we shall be able to get back to prewar—or if it is not exactly prewar, certainly no very drastic changes in our national way of life are called for. There is no reason why we should not be able to live a little better and a little easier. And if in the meantime those who are so generously helping us desire to see some progress towards the objects of their idealism, such as greater economic efficiency or the integration of Western Europe, there is no harm in making

the necessary gestures. But our real recipe is the time-honoured one of muddling through." Can anyone say, in his heart, that this is a caricature?

But the prewar world—in economic matters, if in no others—has gone with the wind. It is not so much that it would be difficult for Britain to get back to 1938—though that would be a difficult enough task—as that the world of 1938 no longer exists to get back to. The inter-war years were in many respects a time of frustration for the British people. But though they did not realise it at the time, they were enjoying peculiar and uncovenanted economic advantages. Indeed, their good fortune at that time is a large part of their misfortune now, since it bred in them a belief that life is far easier than it really is. The nineteenth century had firmly believed in the doctrine that production was everything, and that the standard of living of a people—as of a person—depended on what it—or he—could produce. But, by the peculiar paradox that always happens in wartime, the destruction and dislocation of the years 1914-18 gave birth, not to a desire to work harder to make up for lost time, but to the doctrines of the welfare state, to the belief that there was some magic of economics by which everybody could make a smaller productive effort and still consume more. This illusion should have been shattered at once by events. But the peculiar misfortune of Britain was that, for two decades, the miracle worked—largely owing to the quite fortuitous circumstance that the primary producers of the world were passing through a severe crisis which led to them offering their products cheaply in exchange for manufactures. As a result the British people were confirmed in habits of economic improvidence. They failed to notice the signs of the times, or to take alarm from the fact that they were steadily exporting less and importing more. Now the effects of these long-continued trends are painfully apparent. It is true that—as has often been argued in these columns—some relief from the present excessively unfavourable terms of trade can be expected. But it would be too much to expect a second miracle. We cannot hope this time to be relieved of the necessity for facing the consequences of our changed position in the world. Indeed, it is not merely the adjustments of the second world war that will have to be made in the next few years but in all probability the delayed adjustments of the first as well. These cruel pressures have not yet been fully felt, thanks almost entirely to the continuance of American assistance. But they are on their way, and the time is short. Yet British industry—both sides of it—is apparently sunk so deep in its twilight sleep of complacency that not even this peril can arouse it.

*

The only means of escape is a rapid increase in productivity. This has become a cliché. And yet it is still radically understood. For what is so urgently needed is not that the British economy should produce *more*—it is already doing well in sheer volume—but that it should produce more efficiently—which means at lower real cost in man-hours and material. The effort that is needed is not so much one of physical endurance, on Dunkirk lines, but one of the mind and the imagination, to accept new and different ways of doing things. And what was so discouraging about last week's debate was the small evidence it provided of any willingness to make this effort.

It is really absurd to say that Britain has nothing to learn from America about productive efficiency. All the hoary old fallacies were trotted out—that British industry has always been based on quality (as if American industry were incapable of fine production), that America has an advantage only where its large market permits mass production (although the British market is large enough to reap virtually all the technical advantages of mass production in virtually all lines of manufacture). No doubt British industry can show some examples of productive efficiency as good as any that are to be found in America. But that the average standard of productivity in the United States is considerably higher than in this country is really beyond dispute. How else do the Americans maintain their undeniably higher material standard of living?

Not all of the methods that have given American industry its astonishing productivity could be exported to Britain. But enough of them to make quite a difference could be adopted here—if both sides of British industry were willing to accept them. There is the difficulty, for, as Mr Mikardo said in a speech that was an astonishing mixture of common-sense and prejudice, that

> the real secret of extra productivity in the United States is not that they know more than we do, but that they more freely apply what they do know.

But even so, direct American counsel could be of the greatest benefit. Shortly before the war an American manufacturing company which had developed with great success a well-known line of consumer goods, entered into an arrangement for the manufacture of its products by a British firm. Let the American manufacturer describe the results.

> As the business has developed, it has resulted in an intimate, grass-roots, bench-level exchange of experience between the British factory and our factories in the United States, and between the British selling organisation and our selling organisation in the United States. As a result of it, the British economy now possesses considerably more [of the particular article concerned] for an equivalent amount of labour as it would have possessed if the arrangement had not been in existence. In other words, where 100 workers in a British factory were producing say, 400 units per day, these same workers are now producing considerably more per day. This additional production is an actual addition to the economic wealth existing within the British economy. . . .
>
> [In a planned economy] elaborate plans for increased production are made at the top level. The trouble is that very little happens at the bench level. Everybody recognises the need for increased production; everybody realises that the standard of living can be raised only by increasing the productivity of labour. The whole thing can be spelled out beautifully in words, but the fatal weakness is that the men and women sitting at the machines do not find out how to produce a greater volume of goods or learn to appreciate the reasons why they should, which is possibly even more important. Under our company's system, "increased production" actually begins *not* as a directive, but at the machine itself. When we get finished with the British worker he is producing more than he formerly produced, and what is more, he understands the *reasons* for time and motion studies, hourly production standards, wage differentials, group incentive bonuses, and the entire complex of what is known as industrial relations. *And* he is working shorter hours and making more money.
>
> The people at the bench level in the United States do not come into actual contact with the people at the bench level in the British factory, but the actual factory superintendents *do* come into actual contact. They meet each other, work together in the factories, and get to know each other; eventually they actually arrive at an understanding of each other's problems.
>
> The important thing is that this result is accomplished by bringing the two sets of factory superintendents into actual physical contact at the bench level. It is not something that they read about in words on a printed page.

It is a fair criticism of Sir Stafford Cripps's proposal that his Council will be separated by several layers of officialdom from the "bench level." But it is a far stronger criticism of his opponents that they blindly will not see how much could be learned from America if only British industry and labour would make up their minds to learn. The truest words in last week's debate fell from Mr Stanley Evans.

> The fact of the matter is that we shall either make intelligence our headmaster or return to the school of experience for a refresher course. Either we shall learn through intelligence or we shall learn once more through our stomachs.

The Economist
—by air express

The aim of our Air Express Service is to provide more and more overseas readers of THE ECONOMIST with the advantages of an air subscription at a reasonable cost.

The means of achieving this is by air-freighting copies in bulk to distribution points all over the world for onward transmission by normal mail in the countries of destination.

The result, to date, is that subscriptions by Air Express are, or shortly will be, available at the following annual rates (starting dates for new services are shown in each case):

U.S.A. and Canada $24.00 (in operation).
Hongkong £5 . 15 or HK.$93 (August 21st).
Agents: The Advertising & Publicity Bureau Ltd., 511-514 Marina House, Hongkong.
Australia £6 stg. (August 7th).
New Zealand £10 . 10 stg. (August 7th).
South Africa £5 . 5. (September 4th).

The prospect is that there will be services to India and Pakistan, Nigeria and the Gold Coast, Egypt and the Sudan.

The Publisher will be glad to deal with enquiries addressed to:

Kashmir and Hyderabad

NOT quite a year has passed since the final renunciation of the British Raj in India. On August 15th the first anniversary of Independence Day is due to be celebrated by both the inheriting Dominions, but it is to be feared that not much will be left of the mutual goodwill which was then manifest after Congress and the Moslem League had reached agreement on partition. It has now been openly admitted that regular troops of Pakistan have been operating in Kashmir against the Indian forces sent there after the Maharaja's formal accession to India, and this means that war is actually being waged between the armies of India and Pakistan, though it is so far undeclared and confined to the territory of Kashmir. The situation is a serious one and, if a settlement of the conflict is not soon reached, it can produce a conflagration far more extensive than the struggle in Palestine. Britain's concern with it is not merely the alarm which is naturally felt at a breach of the peace anywhere or even regret at the unhappy turn of events in a region of the world for which Britain so recently bore responsibility; it arises also from the fact that both India and Pakistan are within the Commonwealth and that this is the first case of warfare between two Dominions.

While the gravity of the situation ought to be fully recognised—and with attention inevitably focused on Europe during the last few weeks it has not been sufficiently appreciated—it must not be allowed to obscure the solid achievement of the months since last August in making an orderly transformation of the former structure of British rule. There is still no good reason for doubting the fundamental wisdom of last year's British decision both to transfer power immediately and also to permit partition. Any attempt to hand over India *en bloc* to Hindu Raj would most certainly have involved more bloodshed and confusion than has actually taken place, and a policy of trying to prolong British rule—or merely drifting from fear of grasping the nettle—would have committed this country to burdens and liabilities which it could no longer have borne, but from which it would have soon been too late to withdraw without great humiliation and loss. History may well regard the manner and timing of the British departure from India as the outstanding achievement of Mr Attlee's administration. If the sequel has included much violence and conflict, this has been the result of underlying tensions bound to break out in some acute form with the passing of the power which had for so long imposed unity over the vast area between the Himalayas and the Indian Ocean.

The purpose of partition was to enable the Hindu and Moslem communities—or nations, as the Moslem League leaders insist that they are—to separate by agreement and have their own sovereign states in the territories in which each respectively was in a majority of the population. Partition was the alternative to a "united" India with the virtual certainty of Moslem rebellion and unlimited civil war. It enormously reduced the risk of a general breakdown of all constituted authority and administration such as threatened otherwise to occur. But it left two serious potential causes of trouble. One was the existence of minorities of each community in the territory of the other's state, the Moslem minority in India, widely scattered over the whole country, being much more numerous than the Hindu-Sikh minority in Pakistan. The second was the question of the Indian States, in the two largest of which the ruling prince belonged to the opposite community to the majority of his subjects.

The minority problem became acute in the Punjab immediately after the announcement of partition and led to massacres and expulsions which emptied each half of the divided province of members of the weaker community. This violent and lawless exchange of populations did not close the account even in the Punjab, for it has left a legacy of intense bitterness among the refugees on both sides in addition to

It costs less

creating extremely difficult problems of resettlement. But India and Pakistan refrained from any direct military action on behalf of their co-religionists; they prevented a general spread of the rioting outside the Punjab, apart from sporadic outbreaks; and they completed an agreed demarcation of frontiers in spite of the strain on their mutual relations. Had it been only a question of the minorities, it seems that India and Pakistan would have settled down to an effective, if uneasy, partnership in pursuit of their substantial common interests, and that they would have shown almost as much solidarity in relation to the outside world as if the political unity of the sub-continent had been preserved. It is the crises over Kashmir and Hyderabad which have proved so far too intractable for any such reconciliation. Both cases are similar in that they are basically Hindu-Moslem communal conflicts, though it is only in Kashmir that India and Pakistan officially confront each other.

It must be emphasised that neither in Kashmir nor in Hyderabad is the issue primarily one between princely autocracy and democratic rights. By last year's settlement it was legally possible for any of the princes to claim full independence and refuse accession to either India or Pakistan; this right was implicit in the principle that the former paramountcy of the British Raj over the princely states could not be transferred to the new Dominions and that accession of the States could only be voluntary. But in fact, wherever the prince and his people have been of the same religious faith, there has been little, if any, resistance to accession or to sweeping reforms which have divested the princes of their governing powers in favour partly of the central government and partly of elective parliaments within the States. Most of the States, moreover, have now been either merged together to form wider units for administrative purposes or incorporated in neighbouring provinces. The urge of the peoples of the States for constitutional government and their growing sense of Indian (or Pakistan) nationalism have been decisive factors in these rapid changes; from the side of the Indian and Pakistan Governments the way has been made easy for the princes by offers of terms which assure them retention of their titles, ceremonial dignities and substantial incomes. Most of them have long been accustomed to leave the actual tasks of government to Ministers and to look to the paramount power both for protection and for guidance, so that they have had little inclination to fight against a settlement which relieves them of the anxieties aroused by the prospect of revolutionary change.

*

But in Kashmir and Hyderabad—which happen to be the two largest States—the relative status of the Hindu and Moslem communities is at stake, and the question of accession has been necessarily considered by the rulers from this point of view. Kashmir has a Moslem majority and a Hindu prince, Hyderabad a Hindu majority and a Moslem prince. In both realms the important offices of state have traditionally been held by adherents of the ruler's own religion, and the growth of political democracy in either case would have the effect of ending this system of privilege. If such a change were introduced gradually, adjustment could take place without violence or proscription, but if it comes abruptly, it can hardly fail to produce—given the circumstances of Indian life and sentiment—a sanguinary upheaval threatening the dominant community with the loss of much more than its privileges. Hence the rulers of Kashmir and Hyderabad were at the outset unwilling to give up the independence of their States in any way which would admit intervention of a federal authority in their internal affairs. The Nizam of Hyderabad has maintained this position up to now, but the Maharaja of Kashmir, confronted with a Moslem revolt which was being supported from Pakistan, declared his accession to India and was given the protection of Indian regular troops.

India, by appealing to Uno against Pakistan for its alleged aggression against Kashmir, brought the Kashmir question into the forum of world politics, and a Uno Commission is now trying to deal with the matter, though there has so far been no cessation of the fighting. The case of Hyderabad has not yet been brought before Uno, but the blockade applied by India has received considerable publicity and has inevitably provoked comparison with the Russian use of blockade as an instrument of policy in Berlin. In spite of the strong position which India originally had in protesting against Pakistan's collusion in the Pathan invasion of Kashmir, the two cases together have now placed India in a very unfavourable light before world opinion. Perfect consistency is seldom to be found in politics, but it is seldom that a nation which claims to base its actions on moral grounds tries to justify its aggrandisement with such diametrically opposite arguments. India wants both Kashmir and Hyderabad, but the principle of princely right which gave legal sanction for Indian action in Kashmir condemns Indian policy towards Hyderabad, while the arguments from geography and communal majority which India invokes in Hyderabad go against the Indian case in Kashmir.

The reasonable settlement has been from the beginning that Kashmir should accede to Pakistan and that Hyderabad should accede to India, but that in each case, in view of the explosiveness of the communal situation, the internal transition should by consent be made gradually. Unfortunately neither Pakistan nor India has had the patience for the diplomacy which could have brought about such a result without force or threat of force. Pakistan, by backing the Azad revolt in Kashmir, hoped to snatch the State quickly and utterly sweep away the Hindu ascendancy; India, by demanding immediate Hindu predominance in the government of Hyderabad, has tried to enforce there a similar abrupt reversal of the established order.

Even now it is not too late for a settlement to be made between Delhi and Karachi which would clear up once and for all the problems left by the lapse of paramountcy. What is now chiefly needed is a more reasonable frame of mind in Delhi, for though Pakistan was chiefly to blame in the first stage of the Kashmir crisis, the intransigence is now more on the Indian side. After all that has happened in Kashmir, the best solution is probably to be found in a partition of the State with a directed population exchange; since India as well as Pakistan has a common frontier with Kashmir, this is geographically feasible. If India, for reasons of prestige, refuses any settlement along these lines, the danger of general hostilities between India and Pakistan will continue to grow, and with the Hyderabad issue unresolved, southern India would also be involved in the fighting and attendant communal disorders. Such a war would mean the dissolution of the massive structure which was handed over to the successors of the British Raj, a volume of human suffering beyond all computation, an unparalleled opportunity for the malignant infiltrations of international Communism and a major threat to world peace. The British Government is anxious to avoid any appearance of intervention in these affairs which might expose it to the charge of trying to restore the imperial power which it has renounced, and Mr Attlee rebuked Mr Churchill for talking in the House of Commons as though this country were still pledged to maintain or defend the independence of any Indian State. But whatever influence Britain, or British public opinion or the Commonwealth as a whole, still retains in India and Pakistan should be used strenuously for the restoration of peace between the two Dominions and for a settlement based on moderation and common sense. In this cause the friends of India would be indeed carrying on the work of Gandhi, who sacrificed his life for the reconciliation which is now threatened by open war. Failure to avert the armed struggle would mean that Gandhi's assassin had triumphed. But the devotion of India's leaders to his memory and to the ideals for which he stood gives grounds for hope that reason and goodwill may yet prevail.

Tito's Defiance

SIX weeks have passed since the Cominform denounced the Jugoslav Communist leaders. Yet these heretics of Marxism are still firmly entrenched and quite unrepentant. The recent Congress of the Jugoslav Communist Party, held last month after an interval of twenty years, expressed complete confidence in Tito, and elected as secretaries of the party and members of its Politburo the very men whom the Cominform had singled out for attack. All the delegates must have understood that the Russian Communist Party, led by Zhdanov and Malenkov, and master alike of the Cominform and of the Soviet Union, was at the head of their East European critics. But this knowledge did not deter speakers from hurling back bitter taunts at the accusers—sparing only the names of the Soviet leaders—nor the delegates from "prolonged, stormy applause," amounting at one point to a "long, unanimous chant of 'Hero Tito.'" Tito's defiance seems likely to continue.

The majority of the delegates in Belgrade were party members before 1941, that is to say they were those with the firmest grasp of "Marxist-Leninist ideology," and therefore most susceptible to an appeal from the Communist Pope and Cardinals in Moscow. If they remain loyal to Tito, it is unlikely that the wartime and postwar recruits to the party, who were mainly attracted by Tito's personality and by the Communists' war record, will desert the "People's hero." Moreover, the army and police are thoroughly reliable. The generals are Tito's men, and "OZNA" (the secret political police) is controlled by Rankovic, one of the three colleagues of Tito whom the Cominform denounced by name. As for the mass of the Jugoslav people outside the Communist Party, they may hate Tito and the OZNA, but they will not prefer Stalin and his secret police—the MVD.

There are, of course, precedents for such party quarrels. In the years between the World Wars, the Comintern from time to time denounced the leadership of foreign Communist parties. One of the most recent instances was the excommunication of the entire leadership of the Polish Communist Party in 1937—a step made easier by the fact that all the chief figures were in exile in Russia at the time. Invariably, sometimes, after a brief interval, the parties have prostrated themselves and discarded their leaders. But all those parties were in opposition in their own countries, with little hope of gaining power, and depended on material support from Moscow for the "sinews of the class war." Tito's party is in absolute control of the machinery of a comparatively strong, modern State—its army, police, factories, food supplies and labour force. The Marshal cannot be so easily brought to heel as a Brandler, a Thälmann or a Pollitt.

*

Tito's career presents an interesting contrast. For twenty years he was a reliable Comintern agent in various parts of Europe. In 1937, he returned to Jugoslavia as the Comintern's emissary to reorganise the Jugoslav party, and especially to clear it of Trotskyites and other "sectarians." Four years later Hitler's invasion cast him for a quite different role—leader of a people's resistance movement against foreign conquerors and their local quislings. In the first role, he had shown himself quite competent, in the second, he showed courage and the gift of leadership, including a personal magnetism that attracted to him thousands indifferent or hostile to Communism. When the war of liberation was over, Moscow required him to revert to the functions of a patient Comintern stooge. But people's leader is a more attractive part to play, and one in which he was kept by pressure both from the military pride of a large part of the Jugoslav people and from the party organisers who wished to exploit this pride to popularise their policy.

The speeches made at last month's Congress paid little attention to the Cominform's charges on economic and social policy, which were simply dismissed as ridiculous. Their emphasis was on the organisation of the party in the State and on the charge of "nationalism." Rankovic, the police chief, gave a mass of information, proving that four-fifths of Parliament were party members, and that the People's Front and the People's Committees—regional government authorities—were dominated by Communists. (This detailed statement has special point for Western fellow-travellers, who have long sought to show that the People's Front is a broad coalition, and for Western correspondents who have been called Fascist beasts for pointing out the fact of Communist control.) Great pride was shown in Jugoslavia's war effort, from which the Soviets derived more help than they gave in return. Moreover, since the war, Jugoslavia has given generous economic help to Albania, has renounced £25 million of reparations due from Bulgaria, has supplied grain to Rumania and Czechoslovakia in their years of crop failure, and has sent supplies to General Markos (here again the fellow-travellers are disproved from an unimpeachable source). "Is all this narrow nationalism?" the indignant Jugoslav Communists demanded.

*

Now that the Jugoslav Communists have dispersed, how do the results of the quarrel look to Moscow? Albania has been isolated. This small country, dominating the eastern side of the Adriatic at its narrowest point, which the Jugoslavs were busy linking with the Balkan Peninsula—and so with Russia—by the construction of its first railway, now has not a single friendly neighbour, and will be hard put to it to carry on any trade at all, let alone supply Markos now that he has quarrelled with Belgrade. Bulgaria is now openly hostile to Jugoslavia, and has formally repudiated a secret clause in last year's alliance which had provided for an exchange of "Pirin Macedonia" for some frontier districts in eastern Serbia. The revival of the quarrel between Slavs for Macedonia will be an obstacle not only to plans for a future Balkan Federation, but also to common action against Greece. The Jugoslav Congress recognised this by a resolution which, in effect, repudiated any intention of closer relations with Bulgaria and Albania.

So much for the Balkans. The central European Communist parties are variously affected by Tito's defiance. The Rumanian Communists have so little following in their country that they may have cynically resigned themselves to acting as foreign puppets. The Hungarian Communists, who have always been stronger as peacetime theorists than as wartime resisters of popular tribunes, may welcome the chance of gaining prestige in the eyes of Moscow at the expense of a neighbouring country which was on the right side during the war. The Czech Communists fear any success by Hungary and regret any rebuff to Jugoslavia, their country's traditional friend. Moreover, the belief that Tito is standing up to Moscow has encouraged Czech anti-Communists to raise their heads. Finally, the Polish Communists, who have had the hardest task of all owing to the age-long Polish hatred of Russia, must be dismayed at the proof given to the whole world that subservience to Moscow is the first of the duties of every Communist.

It is still difficult to see what imperative reason can have driven the Soviet leaders into an action which must cause them such great embarrassment. The best answer still seems to be that it was a combination of overweening personal arrogance and

papal abhorrence of heresy. What action will Moscow now take? Retreat is impossible without a costly purge of nine "mistaken" parties, including the Soviet. For Tito, retreat is equally difficult. He will not provoke Moscow, for he is well aware of the danger of relying on the non-Communist and even the anti-Communist sections of his own people. But equally, he cannot afford to lose face by admitting himself wrong after such a resounding public exhibition of confidence has been given him by his people. Since political action presents such difficulties, will Moscow impose economic sanctions? Dependence on foreign oil supplies is a weak spot in Tito's plans. But economic pressure from the east will only drive him into closer relations with the west—first with harmless "bourgeois" like the Swedes and Swiss, but in the end with the "imperialist powers" themselves.

While Moscow's policy remains uncertain, what use can the western powers make of the conflict? First, the isolation of Albania should be exploited. Now is surely the time to exert the strongest pressure to put an end to Albania's continuing military support for Markos, and to demand the compensation due for the destruction of British ships by Albanian mines. Secondly, if Tito requires western economic help to survive against an eastern boycott, the western governments should consider what they can do. Tito's frequent statements that no "strings" will be accepted can be taken for the bluff that they are. No help should be given without concrete returns. Tito's career shows clearly that it is a mistake to count on future goodwill for services rendered. Finally, if there were to be signs of Soviet military preparations, the western governments should consider what they can and should do, and in particular whether they can afford to let Russian troops occupy Greece's northern frontier from the Adriatic to the Maritsa. The strategy that brought American aid to Greece and kept British troops there cannot ignore the Jugoslav situation.

But the western governments have a more general task of the highest priority—propaganda; better called, in view of Moscow's implacable hostility to the west, political warfare. Its aim should be to widen every crack in the eastern monolith. The Moscow-trained satraps may be impervious, but thousands of influential bureaucrats, army officers and even Communist Party officials can be affected. To these men, propaganda from London should expose the nature of Soviet exploitation of their countries and of all eastern Europe. It was refreshing to see that at the Danube Conference this week Sir Charles Peake fired back at Mr Vyshinsky the epithet "imperialist" now used with such monotonous regularity by Soviet spokesmen in relation to the western powers. Sir Charles rightly pointed out that the Soviets have obtained for themselves an effective monopoly of Danube transport in three riparian states. But western propaganda should go further than this. It should point out that Soviet policy in eastern Europe and Germany is a systematic combination of economic, political and national imperialism, based on Soviet-controlled "joint companies," unequal commercial treaties, recruitment of spies by Soviet "technical advisers" in each country, and the flooding of bookshops and cinemas with Soviet books and films, to the profit of the Soviet publishing and cinema trusts. It should lay special stress on the inculcation of school-children with ready-made Soviet ideas, whose ultimate aim is nothing less than the complete absorption of every national culture by an amorphous, colourless Eurasian Moloch.

It should lose no opportunity to point out that the western powers do not object to the principle of social revolution in eastern Europe, still less to the aim of social justice for the peasants and workers; that they object only to the conversion of eastern Europe into a Soviet fortified base for attack on the west. Finally, since the point on which more than any other eastern Europeans are vulnerable is the fear of a German revival, propaganda should constantly remind them how in Prussia, with the eager help of Feldmarschall von Paulus and Comrades Pieck, Ulbricht and Co. a new *Grossdeutschland* is being prepared, how the supreme aim of Soviet policy in Europe is to reunite one *Volk* in one *Reich* under one *Führer*—the "genial teacher of all progressive humanity," Generalissimo Stalin.

These are only some of the themes that could, with great effect, be pressed home to the peoples of eastern Europe every day in their own languages. It is time that appeasement on the air, and Mr Bevin's rulings on the subject, came to an end. The radio station of Moscow and its satellites have not spared this country since 1945. Their audiences are far more vulnerable to such attack than ours. This is a matter of the highest importance, which should be thoroughly considered by the Foreign Office, the Defence departments and all other bodies concerned. For Tito's defiance has offered the first real opening for counter-attack in eastern Europe.

The Deplorable Generation

(By a Correspondent)

"Be ashamed of yourself," said the frog. "When I was a tadpole, I had no tail."

"Just what I thought," said the tadpole. "You never were a tadpole."

TIMES have changed since Robert Louis Stevenson summed up, in his admirable fable, the pattern of recrimination between the mature and the young; but it still remains apposite. Nowadays, indeed, the frog is apt to be humbler; he is quite as likely to condole with the tadpole as to blame him—diagnosing, perhaps, like Field-Marshal Lord Montgomery, a "disease of uncertainty"—and he may even occasionally be found lamenting the loss of his own tail, preaching the ideal of an enduring and transcendant tadpolehood, or beseeching the tadpoles of his day to develop, since develop they can and must, into something quite different from himself. All these themes, with an accompanying lament for the decline of religious teaching and of family responsibility, are stated and orchestrated with especial vigour at this time of year, the season of speech days and of scholastic stocktaking. There has never, except perhaps for a brief period during the 'twenties, been so much tacit support for the proposition that every man over forty is a scoundrel; on the other hand there has probably never been a time when such fervent echoes were sounded (by probation officers, magistrates, authority in general and an outraged public) to the opening complaint of the Shepherd in the *Winter's Tale*:

> I would that there were no age between ten and three-and-twenty, or that youth would sleep out the rest; for there is nothing in the between but getting wenches with child, wronging the ancientry, stealing, fighting. .

This is not really very surprising. The mature naturally have a bad conscience about the state of the world, for which the rising generation cannot possibly be held responsible. That inward uneasiness only needs the admixture of a little natural sentimentality to give rise to the repulsive phenomenon of youth-worship. At the same time the ethical deterioration of postwar society naturally affects the young more than their elders, since the abnormal, the uncertain, the temporary and makeshift life of wartime and postwar reshuffle has filled the greater part of their brief experience.

The specific problem of youth is today what it has always been: that of adaptation to a complex social order by a creature which is itself changing so fast that it can barely keep track of its own disconcerting interior developments; only today the social order is even more complicated than it used to be, and the interior developments have taken place in an atmosphere of uncertainty and upheaval. Apart from that central problem—which one may fairly claim to be far better handled nowadays than in Robert Louis Stevenson's time—young people are simply people who are young. If they suffer, in addition to the normal disorientation of tadpolehood, from a "disease of uncertainty," so do their elders; if they are disinclined to do a fair day's work and are short on discipline, so, regrettably, are most people; if they are capable, nevertheless, of responding magnificently to leadership, so is the nation at large. But the frog is always tempted mentally to segregate the tadpoles and, justly enough imputing to them the characteristics of the society in which they live, to call the result the Problem of Contemporary Youth.

This is not, perhaps, a particularly serious form of human folly. It is certainly a good deal less serious than the opposite folly of ignoring all that distinguishes the tadpole from the frog and framing a society—or allowing a society to develop—entirely without provision for the needs which these distinctive characteristics imply. The nineteenth century, even when it was not using up three generations of pauper apprentices in one with the lavishness appropriate to an astronomical birth-rate, built its cities to be barely endurable purgatories for the mature, and unmitigated hell for the young. It completed the swing-over from the family to the factory as the economic unit, thus destroying the natural gradations between the complete dependence of the small child and the complete economic responsibility of the adult, and leaving next to nothing in its place. It did indeed stop transporting ten-year-olds to Botany Bay for firing hayricks or stealing tablenapkins, but it imposed on the young a code of behaviour which condemned almost every specifically youthful activity and characteristic. It is hardly too much to say that the revolution in the relation between parents and children has done more for the increase of ordinary human happiness than any other social change of the last hundred years.

*

But a mere change of attitude, whether private or public, does not solve the problem of fitting young people into society and fitting society for young people to live in. Nor does the twentieth-century consciousness of youth and its proliferation of remedial bodies, of boys' clubs and girls' clubs and the like, constitute much more than a palliative for a deep-seated ailment—the dislocation between childhood and adolescence, adolescence and maturity, in any modern industrial state. Indeed, in some ways the greater respect for youth, the fine determination that it shall not be economically exploited and stunted, has aggravated this dislocation. It is shocking that a youngster of fourteen or fifteen, with his mind and capacity just opening out, should be thrown out of school and set to full-time wage-earning possibly at a repetition job fit only for an imbecile. But it is nearly as shocking that that growing proportion of each generation which goes on to secondary or university education should emerge on the world hardly better fitted to cope with life outside the classroom than they were at ten. Life outside the classroom and the youth club is still unsuited to youth as it is; life inside them is unsuited to youth as a transition to maturity.

The principle that one learns by doing (however unsatisfactorily it may have been interpreted by Mr Squeers) is pretty universally accepted by teachers; but there is considerable repugnance to the corollary that one learns to live by living. One learns to earn by earning—a fact much more clearly recognised on the other side of the Atlantic, where legal school-leaving ages, which for years have stood far above the British level, are accompanied by an eagerness of youngsters of all classes to take spare-time jobs, and a readiness by employers to make room for them in conditions suitable to their age. By the same token citizens learn their rights and duties by taking part in civic activities—which does not mean passing somewhat flatulent resolutions about international politics at youth conferences, but genuine participation in the real thing, from organising salvage collections to distributing election literature or helping in surveys. One learns to be a civilised person by associating with civilised people—which is certainly not possible in organisations which encourage the survival of the gang instinct, in however sublimated a form, for years beyond its natural period. The club is better than the street-corner gang, the long economic irresponsibility is better than the sweated blind-alley job, the earnest hearty communal culture is better than a passive mopping-up of bookstall or cinema slush or yawning idleness beside an everlasting radio. The selfless and untiring devotion which has gone into the Scout and Guide movements, the boys' and girls' clubs, the campaigns for protective legislation, have been rewarded with great and genuine achievement. But at best these things do little to satisfy that hunger of the young which is one of the first things forgotten by their elders—the hunger for reality, the real job, the real victory over circumstances, the real friendship.

*

It follows that neither exhortation, generalised reproof, nor even the ever-more-lavish pyramiding of "youth services" designed to rescue the young from the destructive effect of their environment, really go to the root of the matter. They all have their value—even the occasional reproof, if it can be administered without irritating the victims into a further frenzy of wrongdoing. But the long-run solution of the problem of youth (in so far as it is soluble at all, and not an inevitable ingredient of the general imperfection of man) is one, in the last resort, with the solution of the general social problem; the problem of framing a legal and economic and social setting in which normal human impulses will lead to decent behaviour and harmony with a minimum of restriction. It is a matter of solidarity between government and governed. The perennial spectacle of Us reviling, circumventing and often without compunction breaking outright the innumerable regulations imposed by Them is unedifying enough to account for quite a fair proportion of juvenile delinquency. More immediately, it is a matter of housing, of community planning, of the revival of the neighbourhood—that is to say of a social unit not segregated by age-groups, but forming, with old and young together, an organic whole in which the child, the adolescent, the young adult, finds at each stage of his life an appropriate and recognised place. Apart from anything that the state can do, it is a matter for individual parents, family by family, a problem of the grass-roots, as far beyond the competence of the best-intentioned and most enlightened authority as the restoration of eroded topsoil is beyond the competence of a bulldozer.

Meanwhile, in a demoralised, ill-housed, automatic and culturally muck-fed society, the "service of youth" has its indispensable role. Some role it will always have, since so many valuable and enjoyable activities can only be carried on in organised groups, and few very young people are skilled enough organisers to be wholly independent of trained, or at least experienced, adult help. A less useful future can be predicted for the croakings, whether sentimental or recriminatory, of the frogs. In Utopia, as in present-day Britain, one can be fairly sure that the tadpoles will continue to answer, with a flick of their deplorable tails, that they couldn't care less.

NOTES OF THE WEEK

Secrets of Moscow

What passed last Monday night in the Kremlin between Mr Stalin and the three Western envoys was to have been kept a close secret. So far the Foreign Offices have done their best to keep the security dam intact, but French and American journalists have also done their best to pierce it. As a result the usual leaks have occurred in the usual places, and one or two news editors can again congratulate themselves on telling half or less of the story regardless of the diplomatic consequences. The chief regular offenders are well known, and it is time that the professional associations to which they belong in Paris and London considered whether persistent efforts to make secret diplomacy impossible are in the public interest.

It would be worth someone's while to study how these leaks spread and stain the public mind with vague but ineffaceable patterns. For instance, this week it has been said, first, that the envoys left the Kremlin looking cheerful and took the stairs at the American Embassy two at a time; secondly, that Mr Stalin had been conciliatory; thirdly, that there was prudent optimism; fourthly, that Mr Stalin's terms for lifting the Berlin blockade were that the Western Powers should postpone execution of the London agreement on the policy to be followed in Western Germany. The first three points may well be true, but if the fourth is true, or even partly true, then they must be treated with great reserve. Yet already the general impression is that the international situation is easier.

Two vital points are liable to be forgotten at a time when relaxation of tension is what the average newspaper reader is looking for. First, the Western Governments' line so far has been to insist that the lifting of the Berlin blockade must precede wider negotiations. To allow the Russians to make that concession conditional on a modification of policy in Western Germany would mean that the Western Governments had already begun a diplomatic retreat. That may or may not be necessary, but the fact should be faced. Secondly, it should be realised that, on a long view, there is a vital British, as well as European and American, interest in building up as quickly as possible the productive power and political stability of Western Germany—a stake far more valuable than the Western position in Berlin. The Germans in Frankfurt now understand this and are pressing the view as strongly as they can.

* * *

Shape of the Master Plan

The chief legacy of Mr Hoffman's visit to Paris is the obligation laid on the Sixteen Nations to produce a Four Year Plan. It is to be, according to the Americans, "not a mass of statistics, but a plan of action." Any repetition of the Paris Report, which was, in the last analysis, an account of the nations' needs, rather than of their intentions, is thus ruled out. Mr Hoffman is in fact asking to be given the outline of the Sixteen Nations' general strategy to reach solvency and stability by 1952.

The first question, therefore, is how the OEEC should go about this task. The method most frequently discussed is that each nation should produce its own plans for the next four years and that the OEEC should then attempt to subtract from them certain common lines of action and to smooth over any very obvious clashes of interest. This method has obvious disadvantages. There is no natural law whereby the separate plans of sixteen nations will end in any sort of harmony. Even if rough edges could be sawn off here and there from the separate jig-saw pieces, no picture would necessarily emerge in the jig-saw puzzle as a whole. And the juxtaposition of sixteen different projects might well give the points of conflict instant prominence while the solid work of national reconstruction would remain in the background.

For these reasons it is at least worth considering whether a quite different type of planning might not be adopted—planning not by the national unit but by various commodities and services. If the OEEC were to confine its planning to five key sectors—coal, steel, transport, power and grain—and leave every other activity to find its own level, it might have a more manageable proposition in its hands. All successful international planning hitherto has tended to be on a commodity basis. The postwar allocation of coal is a recent and notable example. In the sphere of transport and public utilities, there are certain common international interests which naturally transcend frontiers. The two key commodities, coal and steel, are very scarce and desperately needed, both conditions which underline the desirability of allocation and planning. The "commodity approach" is for some reason out of favour and none will pretend that it presents no difficulties, but on all past experience, it offers more chance of forming the basis of a flexible master plan than the patching together of sixteen separate national projects.

* * *

French Electoral Fever

The first issue upon which M. Marie will have to face the French Assembly is the date of the next round of local elections. At present, they are fixed for October, but one partner in the Government coalition—the Socialist Party—is exceedingly anxious to secure a postponement. The reason is simple. The Socialists are strong in the present *Conseils Généraux*, and they fear that if a vote is taken before the effects of a good harvest and of Marshall aid have made themselves felt, the voting may give a sweeping advantage to the extreme parties—Gaullist and Communist. And since the *Conseils Généraux* are among the electors for France's Second Chamber, an increase in the extremist vote there would involve the already compromised constitution of the Fourth Republic in a disastrous conflict between the two Assemblies.

It was this Socialist desire to secure a postponement of the elections that played a decisive part in the crisis which brought down the Schuman Government. It was suggested in last week's issue of *The Economist* that the Socialists precipitated the fall of the coalition so as to avoid further participation in the Government and to face the October elections in a less compromised state. In fact, the issue was more complex. The Socialists did not, in fact, intend to leave the Coalition. They sought to make their return conditional upon two points—the appointment of a non-Catholic figure as Prime Minister and an agreement to postpone the October elections. In the event, they secured in M. Marie a politician unconnected with Catholic politics (although they would have preferred one of their own ranks to a Radical). But M. Marie has refused to sanction a postponement of the elections on the Government's authority, and the issue will be put to the vote in the Assembly in the next few days. If the two parties which hope to gain from the elections—the Communists and the Gaullists—can carry enough of the Chamber with them in a vote to hold to the October date, the Centre parties will be faced with an electoral trial of strength (or demonstration of weakness) within four months. The Socialists' reaction in that event is unpredictable. It is still possible that they might withdraw their Ministers and, while not opposing M. Marie in the Chamber, dissociate themselves from his policies.

*

It is precisely this type of instability, this manœuvring and calculating and wavering that daily adds new force to the electoral campaign which General de Gaulle has already opened, stumping the countryside in the cause of personal rule and strong Government. Of concrete programmes, there appears to be less trace than ever. The General's style is reported to have changed. Oratory is giving way to melodrama, and a new feature in his mass rallies at Nancy and Metz was the emergence of a species of dramatic dialogue between the leader and his supporters. When he explained his withdrawal in January, 1946, by the fact that, faced with the choice between staging a *coup d'état* and becoming involved in party politics, he preferred to withdraw, he asked the crowd whether he had not by that means "preserved his integrity," the crowd yelled back its belief in his political purity and chanted "*De Gaulle au pouvoir*" in the tones of a litany.

No one will deny the need in France for coherent government. It is equally impossible to feel anything but distress at the record of the shuffling, dozing, nagging, raging Assembly. But the new techniques of the General are bound to revive old memories of what *mystique* and emotion combined with nationalism and anti-Communism can produce in the way of government. General de Gaulle may not be a Mussolini, but he is going out of his way to suggest to everyone that he is.

The Gold Coast Riots

The Commission of Inquiry into the disturbances in the Gold Coast, which took place on February 28th and on subsequent days, had a twofold task. It had first to disentangle the truth about the shooting and looting that occurred at Accra from the mass of rumours and prejudiced statements that were put about after the incidents; and, secondly, to inquire into the underlying political, social and economic causes for the disturbances. At the time of the disturbances *The Economist* received criticisms of an article it printed from a correspondent in Accra, which implied among other things that the Governor had agreed to allow a body of ex-servicemen to present a petition to him in person and that the procession was proceeding in an orderly manner until it was stopped by the police, who shot an ex-serviceman without provocation. The report of the Commission [Colonial No. 231] makes it quite clear that the procession had never been given permission to see the Governor, that it deviated from the prescribed route and attempted to reach the Governor's residence after all, and that in firing upon it the police superintendent should be commended for averting a very ugly situation. We gladly accept this authoritative correction.

So much for the shooting. As for the looting in the shops, the Commission finds that it had already begun before the ex-servicemen's incident took place and was independent of it, though doubtless that incident increased the fury of the looters. But on the causes for the looting the Commission finds—as did our correspondent—the Gold Coast Government to blame for allowing the temper of the Africans to rise as it did. For some time, the rising prices and short supplies had been a source of constant complaint, and at the end of January a boycott had been imposed on the purchase by Africans of European imported goods, with the object of forcing the hated Association of West African Merchants to lower their prices. The effect of such a boycott seems to have been discounted by the Government—even with the story of the 1937 cocoa hold-up behind it. In fact, its whole attitude towards the dangerous inflationary situation that was developing as the ever higher price realised for Gold Coast cocoa failed to be offset by increased imports of consumer goods seems to have been far too happy-go-lucky. (It is only fair to add that the Colonial Office considers that the Gold Coast Government had done what it could.) In addition, the Government failed to keep the only too easily misled and suspicious Africans informed of what the price agreement eventually reached between AWAM and the chiefs really amounted to. This failure was responsible for the disappointment that greeted the reopening of the shops on February 28th, when it was found that prices had hardly dropped at all. Hence the looting.

*

On some of the wider issues the Commission seems on less sure ground. It is unfortunate that it has interpreted its terms of reference so widely that it has indulged in the luxury of constitution-making for a colony to which it paid only a brief visit. Such presumption has drawn a rebuke from the Colonial Office in its accompanying statement [Colonial No. 232] and can only detract from the merits of the report in laying bare the facts behind the disturbances. Similarly, its views on the decline of the chiefs seem far too sweeping. After all, it was a sub-chief who, with the support of other chiefs, organised the boycott, and its success hardly argues that they are not respected. But on its pleas for a thorough overhaul of the system of trading, with its innumerable middlemen, or rather middlewomen, each taking a rake-off, there will—if it is practicable—be universal agreement. The difficulties, however, are formidable, for not the least significant feature of the report is its disclosure of the intense suspicion which greets any proposed economic reform. Can anything fundamental be done to a colony whose inhabitants allow their biggest asset, the cocoa trees, to be ruined by swollen shoot disease and then refuse to co-operate with their government in stamping it out?

* * *

Action in Malaya

Mr Malcolm MacDonald's spirited broadcast from Singapore on Tuesday evening should do much to restore confidence in Britain's power to protect the citizens of Malaya. The police force has been increased by 30 per cent to its present total of 10,000; the Army has been reinforced; large additional supplies of arms and ammunition have arrived from Britain and Australia; and the RAF have sufficient crews and aircraft to be able to continue taking an effective toll of the Communist insurgents. Former members of the Palestine police are also to be used and 300 officers and men are to be flown out within the next few weeks. Mr MacDonald further emphasised that the expansion of the police force was to be permanent.

It is a relief to learn that the Government are at last acting with decision against the very serious Communist threat to seize Malaya. For too long Britain's laudable desire to allow its colonial subjects to follow their own bent has been taken as a sign of weakness. The evacuation from Burma, from Palestine and from India has encouraged trouble-makers to believe that they only have to use a little violence to unseat British authority and to seize power for themselves. More dangerous still, this belief has spread from the trouble-maker inspired by a personal thirst for local power to world-wide organisations inspired by the wish to overthrow the Anglo-Saxon "capitalist imperialism."

The progress of the offensive against the insurgents in Malaya will be watched throughout the world—no less in Washington than in Moscow—as a measure of Britain's ability to hold what it has. The evidence available in Kuala Lumpur and Singapore, as revealed by Mr MacDonald, is clear proof of the Communist determination to set up a Communist Republic of Malaya. The present campaign is, in fact, the first full-scale Communist effort to seize a British colony. Mr MacDonald has held out hopes that it will be defeated "not next year, but this year—within the next few months." He must continue to receive all help possible to make good that promise.

Breaking the News

The last-minute row in the Commons before the summer recess concerning the announcement in Paris of a joint Anglo-American Production Council brings to the fore one problem which is likely to crop up again and again under the European Recovery Programme—that of the simultaneous publication of information in this country and in other countries, especially in the United States. What made the Commons so suspicious of the new Council was not only its nature but also its announcement in a foreign country before any details had been communicated to them.

The question of the publication of news affecting a number of different countries led to constant friction during the war, and is still a potent cause of trouble. In many cases it is the result of Whitehall's unnecessary attachment to an ostrich-like policy of security, which, for instance, inhibits the Ministry of Food from publishing the details of food contracts with the Dominions, although these are promptly given to the press in the Dominion capital concerned. But in the case of ERP the problem is fundamental to the organisation. Not only is the State Department by no means as "secure" about non-military information as British Ministries (as Mr Drew Pearson has demonstrated from time to time), but the structure of the European Recovery Programme means that some information about European countries may be available to the United States before it is available here. For instance, the British import-export programme for the next twelve months has now been submitted to the OEEC in Paris. It is under discussion there, as part of the programme for the Sixteen but has not been disclosed to Parliament here. In due course the programme of the Sixteen will go on to the United States Administrator. It is within the power of Congress, in checking the work of Mr Hoffman, to ask him to produce any relevant documents, and it is quite possible that this practice will mean that the British import programme may be called for by and presented to a Congressional Committee before it has come before Parliament.

This may be unfortunate, but it is in fact one of those elements of sovereignty which must be surrendered in the interests of European co-operation. MPs can make too much of their right to be informed at the very minute anyone else is informed. At the same time the oldest of Parliaments has a certain pride which it is pointless to insult. Ministers would do well to remember, in cases where they appear to neglect their responsibility to Parliament, that the corporate dignity of that body will—reasonably or unreasonably—assert itself and make things highly uncomfortable for them.

* * *

British Nationality Bill

The House of Lords stood firm on the death penalty clause of the Criminal Justice Bill, but yielded on the British Nationality Bill. Thus, while one ancient British tradition—the gallows—remains intact, another and finer tradition—that any of the King's subjects are full citizens of the particular realm of Britain—disappears. The Nationality Bill resolves the Commonwealth into a group of distinct nationalities having in common only an alle-

giance to the same King, and a mysterious citizenship which accords no particular rights and imposes no particular duties. It has carried a step further the process begun long ago, and originally formalised by the Statute of Westminster, of transmuting the Commonwealth into a congerie of sympathetically inclined independent nations, whose unity is symbolised by the Crown. Its effect is to make the Crown more important than ever, and it underlines the fact that all the nations of the Commonwealth have an equal claim upon the attention of the Crown, not as of grace but of right.

It is sometimes difficult to believe that the Court of St. James is fully alive to this situation. For instance, representatives of the press of the United Kingdom are accredited to Buckingham Palace, a privilege accorded to no other nation of which His Majesty is sovereign. Again, the staff of His Majesty, apart from honorary officers, is drawn almost entirely from the United Kingdom. This is a problem to which both Buckingham Palace and the Commonwealth Relations Office should devote some thought. Rightly or wrongly, it is difficult for any outside observer not to believe that His Majesty is King of Great Britain in a wholly different sense to that in which he is King of Canada or Australia. And the fostering of that belief would be of great disservice to the Commonwealth.

The House of Windsor has played a very important part in the development of the Empire and its transformation into Commonwealth. With the end of the common status of British subject it has a much more difficult role to play, since the Crown loses its all-embracing allegiance, and must express not only the unity of the Commonwealth, but also the national unity of Australia to Australians, of Ceylon to the Ceylonese, and so on. In the process, the traditional pattern of the Crown's activities in Britain may be profoundly modified, but then the United Kingdom is only one of the Dominions with a claim upon the services of the Crown.

* * *

"Miracle" Currency Reform

The "miracle" currency reform in Western Germany is now six weeks old, and the new spirit of optimism which swept over the country after June 20th is still strong, particularly among business men. Ordinary citizens are still enjoying the sight of goods in shop windows. The first rush for food has been largely satisfied. A glut of vegetables, as well as fruit and some decontrolled eggs, fills the markets to supplement a ration which has now reached the record height of 2,000 calories a day for the lowest category of consumer. Now the extreme shortage of money has slackened the buying craze, and even food is taking second place to clothes and shoes. The restaurants, selling eggnogs and omelettes, and the finest Rhine wine at 5s. a bottle (a price which the Germans complain is monstrously high) are no longer crowded; and the railways, once crammed to the buffers, are reducing passenger rates to attract traffic.

Workers, previously occupied in black marketing, started applying to the labour exchanges immediately the three zones went back to a money economy. With better food and the incentive of real money wages, the individual worker's output has also risen. In the tool industry, to name one case, the existing capacity can now be utilised to the extent of 50 per cent, compared with only 20 per cent before June 20th.

At the same time, state control, which had reached impotent absurdity, has been drastically reduced except on a few key products. The fictional price stop was abolished with currency reform, and fresh controls are not being imposed. Paper, building materials and eggs are among the products which Germans can now buy free from any restrictions. With hoards unloaded, and $18 million worth of American tobacco on its way, rationing of "smokes" will be ended next month. Already, black market cigarettes, and smuggled coffee, are undercutting the legal market.

* * *

Green Light for Industrialists

It is still too soon, however, to say that the D-mark is safe, or that the demolition of state controls will not lead to social unrest. Credit problems must be solved. Before the situation is healthy, a vast number of speculators and manufacturers of shoddy luxury goods who have been saved by lavish initial advances, must go bankrupt, and a means must be found of providing medium and long-term credits for the manufacturers of producer goods. So far, the Germans have evolved no real credit policy.

Prices on the black market—practically the only market upon which goods could previously be bought—have come down, and legal prices have risen from their previous level. Some have soared up to one hundred per cent above the June level, particularly—since Western Germany is mainly back on a price mechanism—prices of those goods which the people most demand. Wages were to be raised by a maximum of 15 per cent, according to a decree of the Anglo-American authorities; but employers are stalling and hardly any new agreements have been concluded.

Moreover, with an eye to continuing price rises, some manufacturers and spivs are hoarding once more. Stocks were ample to meet the first rush, but heads are now being shaken about the capacity of the clothes and shoe industry to go on meeting demand. Speculators are pointing out that, after all, the D-mark has no backing; respectable industrial and business circles naturally say America must do more to help.

The mark has certainly become a sound internal currency for the time being, but the Germans point out this is not enough; it must become an international "*Kultur* currency" backed by the dollar, and German manufacturers who find themselves short of goods must be able to go trading with it in world markets without the interference of the Anglo-American Joint Export-Import Agency. All the signs are that the German industrial world sees the green light ahead and will continue to extract the maximum benefit from its key position in the European Recovery Programme and the struggle between East and West.

* * *

After Krupp?

There are urgent reasons why the future of the great complex of heavy industry in the Ruhr should be given serious study by the Western Powers. It is clear that the industrial strength represented by the Ruhr will play a decisive part in any European Recovery Programme. The question of the kind of part it can be made to play is, however, inseparable from the type of organisation which will be set up to run it. But on this issue, all is doubt.

One point seems reasonably clear. There can be no return to the old pattern of ownership. The trial of Krupp and his fellow directors has given evidence of a mentality in prewar German industrial leadership which forfeits once and for all any right to future power. It may be that other firms cannot be convicted of Krupp's grosser crimes—of starving and ill-treating thousands of slave workers and prisoners of war, of condemning them to unspeakable living conditions and providing them with no protection against the Allies' shattering air attack. But practically all the great industrial combines of Germany stand convicted on Krupp's second count—that of profiting eagerly and unhesitatingly from the economic conquest of Europe which Hitler's armies had made possible. Willingness to exploit the Continent for the further expansion of German big business is a charge which virtually none can escape.

A change, then, is inevitable. But in which direction? At present the argument appears to be chiefly engaged between those who favour private enterprise and those who are committed to public ownership. Roughly speaking, the Americans tend to the former in the name of efficiency and are supported by the German Right (entrenched in the key economic positions at Frankfurt), while the British and the German trade unions are so far committed to the latter. There is, however, one escape from this apparent impasse which is insufficiently discussed—the possibility of linking the Ruhr to a wider integration of the Western European steel industry. That such an integration would be technically possible is proved by the prewar experience of the *Entente Internationale de l'Acier* and the European Steel Cartel. The aims of these organisations were admittedly restrictive, but they proved the technical possibility of closer co-ordination. A solution on international lines would have the political advantage of stilling France's fears and of ensuring that at no time in the future could German industrial leaders, private or official, exploit the Ruhr for purely German purposes. The drawing up of an international plan would offer stubborn difficulties. On closer examination, it might even prove impracticable. But that a study of the possibilities should enjoy a high priority with the OEEC none can doubt.

* * *

Women in Industry

The inevitable failure of the Government's present drive to get more women into industry and the social services, particularly full-time workers, is clearly shown in a recent PEP Broadsheet (No. 285) on the "Employment of Women." This illustrates that the untapped reserve of unemployed but employable women is now very low indeed and that this meagre reserve is bound to diminish as the population ages. Full-time teachers, nurses and textile workers cannot be sucked in from some as yet untouched female reservoir; their appearance here can only mean their disappearance elsewhere.

The table below, taken from the broadsheet, shows that there are only some 420,000 single women and girls between 16 and 60 who are fit for work but not gainfully employed. Of these between 100,000 and 250,000 are likely to have full-time domestic responsibilities. The proportion of widows free for employment is probably very much smaller than this, and the vast majority of the married women not gainfully occupied are fully occupied in their homes. The broadsheet estimates that even with the strongest governmental pressure—a degree of pressure which would probably not be politically possible—it would only be feasible to attract an additional 200,000 full-time and from 250,000 to 500,000 part-time workers into employment.

NUMBERS OF EMPLOYABLE WOMEN IN GREAT BRITAIN
(December, 1947)

Aged 15-60	Married		Widowed and Divorced		Single		Total	
	No.	%	No.	%	No.	%	No.	%
Gainfully occupied women	1,750,000	18	320,000	42	4,550,000	92	6,620,000	44
Other women	7,720,000	82	440,000	58	420,000	8	8,580,000	56
TOTAL	9,470,000	100	760,000	100	4,970,000	100	15,200,000	100

The prospects for the future are worse. It is estimated that between 1944 and 1949 the number of women will have fallen by 500,000, and more striking still, that the number between 15 and 45, who supply 75 to 85 per cent of the female labour force, will have fallen by 1,150,000. Under "natural" conditions a declining population should, with the exception of the care of the aged, have equally declining demands upon itself. What is now so paradoxical is that the country should have chosen the same turning-point to extend its health services, raise the school-leaving age, diminish the size of classes and generally to increase the demand for women's services. These demands can only be met by drawing women from elsewhere, where their special aptitudes are less essential and by inducing the over-sixties to return to or continue at work.

* * *

The ILO Conference

The recent conference of the International Labour Organisation at San Francisco might have passed unnoticed in the British press had it not been for the agitation about Mr Isaacs's whereabouts. It was, however, a workmanlike conference, getting through an inordinately long agenda and reaching agreement on a number of important issues. The fact that the conference included delegates with such varying views as those of American industrialists and Bulgarian workers is an indication of the value of confining such discussions to practical matters.

The conference discussed wage regulation, protection of women and children, night work, vocational guidance and a host of other labour topics: it adopted a convention on public employment service, regularising the systems of placing; it went farther in clarifying its relations with such international organisations as the ITO and with non-governmental agencies. But the most important issue discussed was the convention on freedom of association. This convention, which had been the subject of sharp controversy at Geneva in 1947, is surprisingly elementary. Indeed, M. Jouhaux, for the French workers, declared that it did not go nearly far enough and should have taken account of the position won by the unions in the more advanced industrial countries. All the convention does is to safeguard the rights of employers and workers to form voluntary associations, without interference from the state. This seems elementary. Nevertheless, in countries where there have been attempts to form state-sponsored organisations or where elementary trade union rights are denied, the existence of such a convention may provide some basis for resisting infringements of liberty.

The proposals put forward by the committee on "the right to organise and bargain collectively" will prove to be more controversial when they come up for discussion at the 1949 session. While most civilised countries regard collective bargaining as the best form of determining industrial conditions the clause relating to anti-union discrimination (which protects workers against dismissal because of union activities) will inevitably be held by some countries to limit the employer's rights.

The weakness of the ILO is that while the representatives of Governments, employers and workers may meet, discuss and agree, there is no real guarantee that the conventions adopted in the balmy atmosphere of San Francisco or Geneva will in fact be ratified and implemented. There has been some tightening up of the procedure for notifying the Office of governmental action, but if a Government is unwilling to translate principles into practice, there is nothing the ILO can do about it.

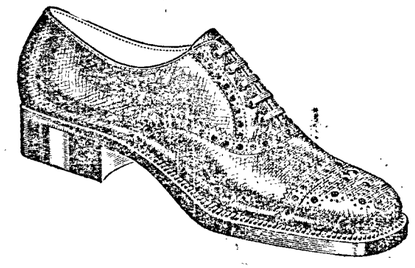
Bloodstock and the Stud Book

Messrs Weatherby, who own the General Stud Book, have persuaded the Jockey Club to review the possibility of admitting to it certain lines of bloodstock which are at present excluded. This is the result of developments over the past forty years. After the passage of the American anti-gambling laws in 1908, the depressed American racing industry exported a number of impure thoroughbreds to this country which were accepted for registration, while similarly doubtful English and Irish horses remained excluded. Consequently, in 1913 the Jockey Club passed the Jersey Act, which refused admission to the Stud Book for any animal which could not trace its pedigree without flaw on both sides "to a strain already accepted in the earlier volumes of the book." Since England was the recognised leader of the world in thoroughbred breeding, the effect of this was to render all bloodstock which by English standards was not thoroughbred virtually valueless. In particular, it knocked the bottom out of the export of American horses—a fact for which Kentucky has never forgiven Newmarket. The new policy proved, however, extremely successful and the standards of the British Stud Book became accepted all over the world.

In the last ten years, however, the French have produced the Tourbillon "half-bred" line (thoroughbred by their standards but not by ours), which is not only of outstanding racing merit and stamina, but has endured so far through three generations. One British classic after another has fallen to French horses. The immediate effect of this has been, first, to divert many American buyers to the French market, and, second, for British breeders to send their mares to Tourbillon stallions, although the offspring are regarded as *déclassé* by the Stud Book. Even if foaled in this country, they have no export value, however many races they may have won from less successful thoroughbred English horses.

For the Jockey Club to let matters drift would be to take a gamble on the revival of British thoroughbred lines, which if it failed would permanently lower the world status of the British Stud Book and hence the value of British bloodstock exports. To open the Stud Book to all horses considered thoroughbred in their own countries would also devalue British bloodstock, since it would give recognition to American strains which can be more cheaply imported by South America and other countries. The third possibility, and the one which the Jockey Club will most probably pursue, is to admit the Tourbillon line only, in view of its outstanding racing success. This would strengthen British bloodstock and safeguard not only the status of the British Stud Book, but also an export industry which in 1947 earned over £3,000,000. Such equine common citizenship might be regarded as the first fruits of closer political union in Western Europe.

* * *



Liquidating the Kulaks

Recent developments in Eastern Europe, taken in conjunction with well-known facts about Soviet agricultural policy in the twenties, make it easier to understand what the Cominform really wishes agricultural policy in Eastern Europe to be. The Jugoslav Communists have been blamed not so much because they had not yet collectivised agriculture, but because they had treated the peasants, instead of the urban proletariat, as the foundation of the state, and paid too little attention to the class struggle in the villages. The nature of these sins can best be understood by reference to Soviet experience.

Communist authorities usually admit that three mistakes were made in Stalin's collectivisation policy of 1929 (though, of course, Stalin himself is not held responsible for them). The first was that, during the ten years following the redistribution of the big estates, the Soviet regime allowed a class of *kulaks* to entrench themselves firmly in the villages. These were a section of the peasantry which succeeded in buying up land from their less fortunate neighbours and so obtained political as well as economic supremacy in the countryside. The second mistake was that

UNDERWOOD SUNDSTRAND
CLASS 'D' ACCOUNTING MACHINE

An all-purpose, fully automatic Accounting machine equipped with two cross-computing Registers, eight accumulating Registers, and Front-Feed Carriage. Maintains accounts in perpetual balance, and enables up-to-the-minute totals, sub-totals and balances to be obtained instantly without extra work. Ideal for Pay Roll, Stores Accounting, Costing, Analysis, Public Utility Billing, Municipal Accounting, etc.

Two machines that, between them, supply the answer to every problem connected with the writing and simultaneous computing of accounting records, giving greater speed, simplicity, and complete mechanical control over accuracy. Both machines have extreme flexibility of operation and quickly pay for themselves in improved efficiency and lower costs.

UNDERWOOD ELLIOTT FISHER
ALL ELECTRIC
ACCOUNTING MACHINE

For all records that require typing, adding, subtracting, with simultaneous accumulation of individual column totals and simultaneous cross-computation of one or more balances. All electric operation. Standard typewriter keyboard. Exclusive Flat-Writing Surface gives unequalled speed in handling forms which may be of paper or card stock, in original only or with copies alike or different in shape and size.

the Communists, when they went out into the villages to carry out collectivisation, failed to obey their instructions, which were to base themselves on the support of the poor peasants, to win over as many as possible of the medium peasants, and to isolate as objects of attack the rich peasants. Instead, they too often antagonised the peasantry as a whole, uniting against themselves whole populations in many villages, with the result that cattle were slaughtered and even armed resistance was offered. The third mistake was the failure to have ready a sufficient stock of agricultural machinery. When cattle and horses were slaughtered the land could not be ploughed. These mistakes are considered by Communists to be due to a basic failure to study beforehand the facts of the class struggle in the countryside.

There can be little doubt that the ultimate intention of the Soviet Government and of the local Communist parties is that agriculture shall be collectivised throughout Eastern Europe. But the ground has first to be prepared. The Jugoslavs have, in fact gone further towards collectivisation than any others, by giving strong encouragement to the formation of voluntary co-operative farms. Bulgaria has done the same, but the other "popular democracies" have gone no further than paper projects. The Jugoslav experiment deserves little praise, in Cominform eyes, because it has not been accompanied by a systematic preliminary study of the class struggle.

* * *

Cominform Cracks the Whip

Since the Cominform's denunciation of Tito the various Communist parties have announced their intention of redeeming their failure in the villages. But, contrary to some Western commentators' statements, nothing has yet been done to speed up actual collectivisation. The main effort has been to tighten up regulations for deliveries by peasants to the state, and especially to increase the obligations of the richer peasants and lighten those of the poorer. In fact, the "battle against the *kulak*" has started, but only in the field of grain delivery, not in that of ownership. This development is most marked in Hungary and Rumania.

In Rumania a new State Commission for the collection of cereals has been set up. In Hungary detailed measures have been passed, and there has been a much publicised purge at the Ministry of Agriculture. It is alleged that officials have spent public funds on Catholic propaganda instead of on machinery. At the same time the arrest of the son-in-law of M. Tildy, the President of the Republic, for espionage has been made the excuse to get rid of the President who is one of the few remaining figures in the much-purged Small Farmers' Party. The only notable reference to collectivisation in Hungary has been a speech by the prominent Communist Gerö (Minister of Communications), in which he favoured Government support to co-operative farms in the future. Finally, the temporary eclipse of Gomulka, Secretary of the Polish Communist Party, attributed by some observers to his opposition to collectivisation, may well be due to other causes—for instance, a more general dismay at the effects on Polish opinion of the Tito case.

In general, it seems that Eastern Europe's period of NEP is not yet over, though the Cominform is undoubtedly quickening the pace.

* * *

Half-a-Million Arab Refugees

The problem of the Arab refugees has three aspects. It is first an international humanitarian problem; secondly, an internal Arab test; and thirdly, a key issue in any possible *de facto* settlement.

The international aspect was put before the Security Council by Sir Alexander Cadogan on Monday, when he pointed out that the United Nations, in seeking to push off on to the Arab world the solution of the European problem of Jewish DPs, has created a new and larger class of Arab DPs. The Jewish DPs are generally estimated at 200,000, but the displaced Arabs may number anything up to half a million. The Jewish DPs may be blamed on Hitler, but the Arab DPs are directly the victims of the Assembly's partition resolution. Britain has made a good start on the humanitarian side by its offer of £100,000 for immediate relief and thereafter to contribute its share of any sum voted internationally. It is to be hoped that this initiative at least will gain some support from America.

But equally, the Arab DPs are a test of the capacity of Arab society to make any kind of showing in the modern world. To see how far they have failed at this test they have only to ask themselves what the Zionists would have done in their place. The young men of military age would have been conscripted and trained, with or without arms. The women and children and old men would have been housed and fed, and absorbed into a community waiting and preparing for the moment when it could go to war again. If Arab society were anything but rotten, the Arab States would not be waiting for international charity to do something about their refugees They might even have refused such help when offered.

The Arab ruling minority have gone about this business in the same way as they fought in Palestine, without public spirit, or personal sacrifice or common effort. And now they dare not tell their peoples what has happened. This is the problem for the Arabs today, a more real one than their immediate relations with the Zionist State.

*

Whatever *de facto* settlement Count Bernadotte may achieve, it cannot be expected to end the Palestine conflict. It will merely pass over into a new phase, of which the outcome will depend on the ability of the Arabs to transform their society into something more effective. In such a settlement, the Arab refugees are a political and military pawn. It might have been better for the Arabs, if they meant business, that their refugees should not return to the Zionist-held areas. Properly used, they might have more potential value outside. Count Bernadotte, however, is reported to have asked the Security Council to order the Zionists to let them go back. But the women and children, most of them country folk, could hardly exist there without their men, and the Zionists claim that these would endanger their internal security. Moreover, they want the Arab lands and villages for new Jewish immigrants.

The other main questions involved in a settlement are Jerusalem and the port of Haifa. Count Bernadotte still seems optimistic, despite some belligerent pronouncements from Tel Aviv on the inclusion of Jerusalem in Israel, that he can get agreement to a demilitarisation scheme there. A measure of internationalisation for Haifa, too, would be preferred by the Powers. The Zionists have seized and are operating the oil refineries with some remnants of pipeline crude. No doubt, they are hoping to play off American against British oil interests. But, whoever owns the oil, it must come—if the refineries are to serve their purpose—from and through Arab countries. Thus Arab consent has to be obtained, and with an all-Zionist Haifa this would be difficult. As the Zionist State, too, will need oil, there are compelling reasons for a special regime in Haifa.

Shorter Notes

A correspondent in Berlin points out how ineffective have been so far the retaliatory measures used by the Western governments in the duel within the city. The attempt to hold up Russian trade with the West by stopping freight trains through Bizonia to and from Switzerland, Belgium, Holland and Denmark has had little effect. Road services are not affected, and goods are moving freely by sea. The Russian Export Department is also enjoying to the full the spectacle of the British Board of Trade transferring its purchases of potash from the Russian zone to the sea route via Rostock and Wismar. Likewise fully laden trains run daily to and from the western part of the Russian zone within 300 yards of the British Military Governor's residence. No one seems to have thought of closing these lines through the Western sectors.

*

The British and Canadian Governments have taken specdier action on the Newfoundland plebiscite than Mr Mackenzie King's habitual caution made it seem likely. With a total voting strength of approximately 177,000, there is a majority of just under 7,000 for confederation with Canada. Both governments have now agreed to go forward with negotiations, which, as far as the British Government is concerned, means the nomination and dispatch of Newfoundland representatives to negotiate in Ottawa. That the negotiators will be nominated rather than elected may be a cause of some resentment, but the machinery of election in Newfoundland is too expensive and cumbrous to be set in motion for such a purpose. Until such time as the negotiations are completed the Commission of Government will continue to administer Newfoundland under the Act of 1933.

*

For sheer audacity Mr Vishinsky takes the prize. In Tito's own capital, among the Balkan people who have recently complained most loudly and doggedly of Russian interference, he has declared that in the prewar days the Danubian states were treated as a cook treats potatoes. They of course still are, the only difference being that Mr Vishinsky and Mr Molotov prefer them mashed.

THE NAME SPENCE IS A household word in the world of heavy chemicals. SPENCE dates back to 1846 and its chemicals have always been respected for their high and consistent quality. Recently some interesting new products have been introduced, including materials for pharmaceutical specialities. An abridged booklet will gladly be sent to you giving a brief survey of SPENCE products, including:

Alum, Aluminium Sulphate, Aluminium Chloride, Aluminium Nitrate, Alumina White, Activated Alumina, Calcium Carbonate, Detergents, Pharmaceutical Alumina, Sodium Aluminate, Sulphuric Acid, Titanium salts, Silica, etc.

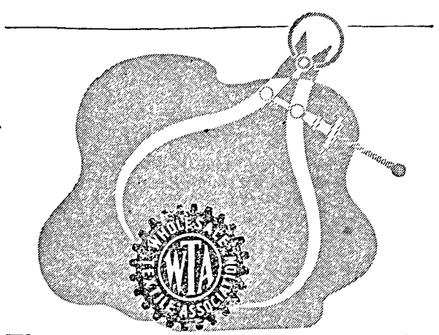
Beetle urea and melamine resins—products of B.I.P. research—give textile fabrics permanent finishes and new values.

A BEETLE IMPROVED PRODUCT

Fabrics with honest faces



Until recent years the finish on many textiles was far from permanent; more often than not it all came out in the wash, as the housewife found, to her cost. Today B.I.P. provides the textile trade with 'BEETLE' resins for *permanent finishes* which resist creasing and shrinking, preserve colour, prevent felting and last as long as the material itself. This is but one of the many applications for versatile Beetle, used also in paint preparation and paper manufacture, in the form of cements for woodwork; and of course, in the production of the well-known Beetle moulding powders.

In one form or another, Beetle can almost certainly be gainfully employed in some phase of your business. Our research and development men will be glad to collaborate with yours on new applications and in solving existing production problems.

Letters to the Editor

Development Councils

SIR,—I have read, with interest, your "Business Note" on Development Councils. I fully share your view that the Government would have been wiser to make a start in industries where both sides support the establishment of a Development Council than to endeavour to force through such a body for the Hosiery and Knitwear Industry, in which the employers are almost unanimously opposed to this course. I must, however, question your suggestion that a Joint Advisory Council is necessarily weaker than a Development Council though it has no statutory powers.

The compulsory powers given statutorily to a Development Council are very limited. Insofar as finance for research and for export promotion and similar work is concerned, it is quite possible for the Board of Trade to invoke Section 9 of the Industrial Organisation and Development Act, and by those means raise a levy from the industry to finance the work which would be carried out on the advice of a Joint Advisory Council.

The opposition to Development Councils mainly springs from one fact. They are to be constituted of individuals appointed by the Minister who have no responsibility to the industry for which they are to act. This unrepresentative and undemocratic Council is given an official status which is bound to establish it as spokesman of the industry to the Government. Where there are well organised Trade Associations competent to carry out the measures recommended by the Working Parties, and willing to join with the appropriate Trade Union to form a Joint Council, working, if thought desirable, under an independent chairman, the employers believe that this machinery should first be given a trial before a statutory body is set up.—Yours faithfully,

FREDERICK BAIN,
President, Federation of British Industries

Film Quota Dispute

SIR,—Will you kindly point to a line or word of my published letter of July 31, 1948, that warrants your assertion that

> "Mr Allport is apparently unwilling to concede that the British Government has any right to fix the quota to please itself; sovereignty, for him, lies in Hollywood, and he is . . . angry with *The Economist* for conceding this right. . . ."

The facts are that in *The Economist* of July 10th you implied we could have used the Film Agreement to block the quota. In my letter to you I pointed out that it would have been quite improper for us to have attempted any stipulation at that time with respect to quota, and explained the reasons. In point of fact, therefore, it was we who conceded and *The Economist* who questioned the Government's right to fix the quota as it saw fit.

My letter to you questioned the wisdom of the quota arrangements; your articles have done the same. Wherein, then, is *The Economist* right and the American industry wrong?—Yours faithfully,

F. W. ALLPORT
Motion Picture Association of America, Inc.,
15 *New Burlington Street, London, W.1*

[*The Economist* has never questioned the right of the Government to fix the film quota as it sees fit. It has questioned the wisdom of fixing the quota as high as 45 per cent. Equally it has questioned the right of the American film industry to dispute the power of the British Government to fix the quota without tacit agreement, prior consultation or understanding with Hollywood. Mr Allport's letter suggested a breach of faith and a "violation of the spirit of the agreement." In other words, what he was saying was that the British Government had no right to fix the film quota as high as 45 per cent without consulting Hollywood.—EDITOR.]

A Bitter Choice

SIR,—In your leading article "A Bitter Choice" of July 24, 1948, you give an illuminating analysis of the Berlin crisis. As you pointed out, the dilemma facing the three Western Powers is of an intricate and risky nature. Whether a compromise can be reached with the Russians nobody can foretell.

To seek, however, a solution by force, the second alternative mentioned by the article, involves, in all probability, the gravest risks we may take in our efforts to meet the requirements of the situation. It is obvious from your article that you do not underrate the implication of such a course. In this context I cannot help but recall Grotius' wise counsel in his famous book "De Jure Pacis et Belli" (book 2, chap. XXIV):

> . . . we must obviate a certain mistake, lest any one should be persuaded, that whenever he has just cause given him, he is thereupon immediately obliged to declare war, or that it is warrantable at any time for him to do so. On the contrary, it happens that it is commonly a greater piece of goodness and much more commendable to abate somewhat of our Right, than rigorously to pursue it.

Applied to the impact in Berlin the "ultimate firmness" may not be the *ultima ratio*.—Yours faithfully,

W. KLEIN

51 *Lancaster Gate, London, W.2*

Caleb Diplock

SIR,—The article in your issue of July 31st and the judgment of the Court of Appeal must have caused some renewed searching of heart among lawyers as to whether justice, which is after all the end of the law, has been achieved. Many of them will share the distaste of Lord Goddard, who expressed in his judgment the hope that a private Act of Parliament would restore to the charities what Diplock had meant them to have and to keep.

The plain man can understand that wills must be construed in accordance with the words actually used by the testator, so that the fatal words "charitable or benevolent" must be given their true legal effect. He can understand that the word benevolent is too vague for enforcement, and that the House of Lords, looking at the will as a whole, was right to reject the view that there was an over-riding charitable intention.

But the plain man finds it hard to see why the whole gift should be void for uncertainty merely because the trustees, who did not in fact endow benevolences, had been given the option to do so.

From *The Economist* of 1848

August 5, 1848

MOST householders, we believe, feel the advantages of the present general, and, for some time, almost uniform, cheapness of most of the necessaries and conveniences of life. Good bread is not more than sixpence the four-pound loaf. . . . To mention another almost equally important item of household expenditure—the best coals are now bought in London at 24s. per ton, and have not through the whole year been above 26s. . . .

We may refer, too, amongst many other things, to sugar and coffee. The latter, that used to cost 3s. per lb., is now purchased for 2s., and that which cost 1s. 8d. or 1s. 10d. is now purchased for 1s. The refined sugar, that used to be 10d., 12d. or 14d. per lb., is now 6d. or 8d. . . .

In many articles on which there has been no other reduction of duties except in their raw materials, nearly as great a reduction of prices has taken place as in coffee and sugar. Most articles of clothing, for example, are now much cheaper than they were. Hats, shoes and boots may all be bought at reduced prices, and they are made more convenient than formerly. Both hats and shoes are lighter, and better adapted to the head and the feet. More skill and ingenuity are employed in constructing them. We have a greater variety of leather in use, and a great choice of materials for hats, while formerly there was little or nothing but heavy calf-skin for the feet, and felt, with a little beaver, for the head. Fustian, broad cloth and kerseymere were the chief materials of men's clothing a few years ago; but now the choice is distracted by the variety of woollen substances appropriate for dress. . . . We are not knowing in the drapers' nomenclature, but we can see that the woven tissues with which ladies are now clothed are even more varied in their quality than reduced in price. The process does not stop with clothing. It extends to the furniture of our houses and to everything we require. The general reduction in price is accompanied by an improvement in quality and form. There is a perpetual exertion on the part of the industrious classes not only to supply society cheaply, but tastefully, elegantly and substantially.

He will think the sensible line would be to allow the money to go to charities but prevent it from going to benevolences.

It is too late to alter the law except by legislation, but for such a change there is a precedent in the very state of Victoria from which the Diplock plaintiffs come. The effect of the Victorian law is that in such cases as this the trustees must ignore the trusts other than those which are strictly charitable.—Yours faithfully,

TEMPLE BAR

The World and the Dollar

SIR,—In the editorial note on page 102 of *The Economist* of July 17th you say that it never occurred to you to consider an increase in the dollar value of sterling and other currencies. You go on to ask how, if the United States will always tend to sell abroad more than it buys abroad, can "a fall in the dollar—which would make the world want to buy still more from America and enable it to sell still less—conceivably do anything but make the problem worse?"

But if A is trying to sell a lot for the little he wants, while B, C and D are anxious to buy a lot for the little they have, how can a fall in the prices at which A sells to B, C and D do anything but gratify *pro tanto* the desires of all parties?

It occurs to me that the discussion might be conducted in terms of elasticities of supply and demand—with more precision, if in less "plain English." The merits of following logic in this sphere are another matter.—Yours faithfully,

25 Hillcroft Crescent, Ealing, W.5 HUGH TOWNSHEND

[Mr Townshend is right—*on the assumption that quantities are controlled*. But we were arguing, as we pointed out several times, about what would happen in a relatively free market.—EDITOR.]

Books and Publications

Marxism *versus* Socialism

"Communist Manifesto—Socialist Landmark." A new Appreciation written for the Labour Party by Harold J. Laski. Allen and Unwin. 7s. 6d.

"Makers of the Labour Movement." Margaret Cole. Longmans. 15s.

PROFESSOR LASKI writes his appreciation of the *Communist Manifesto* as a convinced Marxist. He accepts without question the thesis of the *Manifesto* and his "new appreciation" does not include any examination of the correctness or otherwise of the Marxist analysis. But at the same time, he is a Western democrat. The dogmatism, the tyranny, the lies and the distortion of Communist practice today revolt him. His problem, therefore, is to reconcile the Marxism of Marx and the Marxism of the latter-day followers of Marx and the whole appreciation has really only one aim—to prove that Marx's approach was far removed from the dogmatic claim of modern Communism to be the only truth and also from the driving urge for power and domination shown by every Communist party.

Marx, says Professor Laski, never sought to found separate Communist movements, nor to dominate progressive groups working towards the same goal. He quotes Marx's speeches in favour of workers' brotherhood and their "fraternal concurrence," and makes a point of the fact that when Lasalle organised the first workers' party in Germany Marx made no attempt to found a rival one. Where, then, did the drive for power, the heresy hunting, the whole modern effort of Communist domination come from? Not from Marx, says Professor Laski. It comes apparently from a series of strategic manœuvres made by Lenin in his attempt to keep control of the Communist central committee between 1904 and 1907—manœuvres which were repeated in the years before the 1917 Revolution and all of which tended to impose the dominant ruthless minority on the major part of the movement—a danger foreseen with perfect clarity by Rosa Luxemburg. By the time the successful revolution had put the seal on these tactics, they had become accepted as the Marxist method *par excellence*. But, Professor Laski argues, they have nothing to do with the real Marx.

It is a difficult thesis to maintain. In the first place, few writings in history are as sweepingly dogmatic as the *Communist Manifesto*. For another, in the *Manifesto* itself, Marx devotes a long and vindictive section to attacking breeds of Socialism which differ from his own—a section to which Professor Laski devotes some careful but on the whole inconclusive attention. But, above all, the thesis belies much of what is known of Marx's habits of thought and action. Professor Laski conveys by a few hints the picture of a venerable leader growing old in wisdom and counselling working-class unity to the end. But Marx was a virulent, intransigent character whose whole career was one long fight with men who sought to work beside him in the labour movement—with Weitling, with Lasalle, with Bakunin—and whom he tried by every trick, intrigue and calumny at his disposal to displace. Unity he sought only under his own strict control. When control threatened to pass to others—as it did in the Communist League and later in the First International—he broke the movement rather than lose the leadership. When Professor Laski writes that neither Marx nor Engels

> pretended to the kind of infallibility so absolute that it is entitled to establish an inquisition to enforce their dogmas,

he is simply setting on one side an important section of the *Manifesto* and a large part of Marx's life.

This is no side issue. If there is continuity of outlook and method from Marx to Zhdanov, it is reasonable to ask whether part at least of the trouble does not lie not in later aberrations but in Marxism itself. If the Communist parties today do so many things Professor Laski deplores with consequences so fraught with disaster for the world, is it not a hypothesis at least worth entertaining that Marxism is in many ways a false guide both to history and to progress? Professor Laski sweeps away this possibility in one remarkable statement:

> a century after its [the Manifesto's] publication, no one has been able seriously to controvert any of its major positions.

Yet the major premise—that the passage of all power, economic and political, to a state governing in the name of the working class will solve every political, economic and moral problem—is one of the most hotly debated issues of the day. It is one thing to accept Marx's prophecy that capitalism will create great upheavals. It is quite another to believe that Marxist Communism is the cure. And so much has happened since the 1917 Revolution to suggest the contrary that the fact can gravely trouble as convinced a Marxist as Professor Laski himself.

That dogmatic Marxism, with its clearcut ideas, its vast hypotheses built on Hegelian abstractions, its prophecies of inevitable class war and of the inevitable collapse of the *bourgeoisie* is not the recipe for overcoming the defects and contradictions in industrial society is suggested by Mrs Cole's useful summary of the lives of fifteen precursors and pioneers of the British Labour Party. One of its most striking points is that there is hardly an ideologue among them, another that they retained their obstinate affection for the ideals of truth, justice and fair dealing which Marx contemptuously dismisses in the *Manifesto* as bourgeois claptrap. These men created a movement which by peaceful means, without violence or torture or secret police, has helped to transform the "bourgeois society" of Marx's day to an unrecognisable extent. The gap between them and the stormy visionary of the *Communist Manifesto* is as wide as belief and outlook and tradition can make it, and today the Communist inheritors of Marx's bitter, narrow and dogmatic faith would be the first to sweep away the work and achievements of these more moderate men. In the event, "idealistic" and "bourgeois" Socialism, to which many of Mrs Cole's fifteen leaders belonged, has done more to create a decent and just society than scientific Marxism. Professor Laski is aware of this dilemma, but, a Marxist himself, he cannot admit that it is rooted in the *Communist Manifesto* itself.

Advice to the Restless

"Shall I Emigrate?" By Roy Lewis and Arthur Frazer. Phoenix House. 284 pages. 15s.

THIS is a highly practical, comprehensive, well-written and sensible compendium of information for the would-be emigrant of any class, economic status and qualification. It deals successively with Australia, New Zealand, Canada, South Africa and Southern Rhodesia; for each, it provides an overall sketch of economic and social conditions, an assessment of general prospects, and a discussion of particular industries and of agriculture, together with scales of wages, social security provisions, houserents and taxation, advice on the purchase of property, full data concerning immigration regulations, assistance schemes, and transport costs, a bibliography for further reading, and—an admirable thought—the names and London addresses of the chief newspapers. Only those who have themselves not only travelled but actually lived in each of the Dominions could accurately check all the authors' facts, judge their opinions, and pronounce on the fidelity with which they convey to the hitherto untravelled the intangibles which make so much for the happiness or unhappiness of the new settler. Such a check as is possible to the present reviewer results in the award of high but not quite maximum marks; no one would guess from the authors' account that oppressive Low-Church-and-high-tea provincialism which so oddly deadens the freedom and energy of the Canadian atmosphere, or the tension and mutual intolerance between the seventeenth-century French Canadian mind and the twentieth-century Anglo-Saxon. On the other hand, nothing could be better than their account of the life of the Canadian farmer, the perspective in which they set Canadian industry, or their advice to the would-be purchaser of a small-town business.

Anyone opening this book with the notion that the Dominions are lands of limitless and easily-grasped opportunity, freedom and spaciousness will certainly be disillusioned. Opportunities and space are there, but only for those who are willing to work for them a good deal harder than is customary in the homeland—unless, of course, one can find oneself a niche in one of the antipodean trade-unionists' paradises, and enjoy the benefits of a slow-motion five-day week, together with the certainty that if a kitchen pipe bursts at one minute past five on Friday it will have to go on spouting till Monday morning. On the whole, those likely to succeed in the Dominions are those likely to succeed at home; those in especial demand in the Dominions are those in especial demand at home; the advantages of emigration lie mostly in escape from the stratification of English society, from the climate, from ration books—and perhaps from the uncomfortable neighbourhood of Europe. These are advantages indeed; and if they are offset for some people by the deoxygenated mental life of New-Balham-in-the-Great-Open-Spaces, well, the professional classes are notoriously discontented nowadays wherever they may find themselves, and need only stay and do their grumbling at home.

History on the Spot

"Berlin Reparations Assignment." By B. U. Ratchford and William D. Ross. Chapel Hill. University of North Carolina Press (London: Geoffrey Cumberlege). 260 pages.

EVERYONE concerned at the present crisis in Berlin should read this extraordinarily honest book. The authors were members of the American Reparations team in Berlin. They set out simply to give a personal account of the negotiations leading up to the Agreement on the Level of Industry to be retained in Germany. But in doing so they have produced an entirely authentic account of the workings of quadripartite government. Their book catches history on the spot before it has hardened into generalisations.

The opening chapters give an unsensational but vivid picture of Berlin in 1945, and a classic account of the confusion which is a Control Commission (be it British, French or American—or even perhaps Russian). The State Department was unwilling to take responsibility for OMGUS, instructions from Washington came too seldom and too late, liaison was nebulous. Practically every unit was "overstaffed, understaffed or poorly staffed" and changes in organisation were never ending. VIPs came and went, distracting officials in Germany, and disseminating half-truths on their return home.

The authors take up the story of American work on reparations before Potsdam, more especially the effect of the much-publicised Morgenthau Plan and the influence of the ambiguous Mr Pauley, which foreshadowed the still greater ambiguity of the Potsdam Declaration. "The major issues on reparations had gone to the Potsdam Conference for settlement—but Potsdam had not settled them." Instead the whole question was passed on to the newly established Control Council with the rider that a plan should be drawn up in six months. The politicians having found the problem too thorny, it was left to technicians quite unused to handling such issues.

The main body of the book deals with the negotiations which followed. On the whole the British and Americans put forward figures for each industry based on technical judgments; the Russians produced figures for bargaining purposes aimed at obtaining the largest possible amount of reparations; and the French came down on either side as their interests dictated. Finally, the still widely different figures of Western and Russian proposals were "married" with much horse trading. Agreement had been reached, but to what purpose? If the final figures were to be taken seriously, they were intolerably low and unbalanced. If not, the agreement was meaningless, and the issue had merely been evaded again.

Inevitably, the Western Powers found themselves unwilling to see reparations taken from Germany on this scale. General Clay discovered that the prewar production of steel in Germany was about twice as large as he had thought when leading the negotiations on steel. (Not the least interesting feature of the book is the clear picture of the General which emerges). Some reason had to be found for abrogating the agreement. Fortunately the plan had stated as one of its assumptions "that Germany will be treated as a single economic unit." This provided General Clay with a justification for discontinuing reparations deliveries from the American zone on his own responsibility only two months after the agreement was signed.

The authors are not concerned to point the moral, which surely is that major political decisions should be taken in the right place and at the right time. The ordinary reader would perhaps prefer fewer figures and more generalisations, but there is no need to cavil at a book which gives such an excellent account of how things really happened.

Shorter Notices

"The Structure of Industry." By J. H. Jones. (Britain in the Future Series). Sampson Low. 158 pages. 7s. 6d.

FOLLOWING as it does on Professor Victor Morgan's excellent "Conquest of Unemployment," this is a disappointing book. It provides a competent factual summary of modern economic organisation and of its development since the early Industrial Revolution, it makes some good points about the control of industry under the joint-stock system, about the position of Trade Unions under free capitalism and under collectivism, about the basic changes in Britain's economic position since the prewar era, and about the differences between peacetime and wartime economic objectives and standards. But a great part of Mr Jones's space is taken up by a jejune and superficial statement of the standard case against collectivism (this has been done so often that it needs to be very well done to be worth doing at all); he dismisses the whole of Keynesian economics in six lines, along with technocracy and the Social Credit movement, as a temporary fad born of depression-psychology, and accepts the trade cycle as at once inexplicable and inevitable; he shrugs aside as totally unimportant the notion that monopolistic organisation or agreements have had anything to do with Britain's technical backwardness; and he displays throughout an unaccountable hankering for a return to the policies of prewar Conservatism. This was a book that needed writing—it is a long time since the subject was last tackled at the general reader's level—and for want of anything better it will certainly be found useful; but it represents an opportunity missed.

"Economic Analysis." By Kenneth E. Boulding. Hamish Hamilton. 873 pages.

THIS new edition of a standard textbook which has won universal appreciation among both students and teachers has been substantially revised to meet criticisms which greeted it on its first publication. The major criticism—that, regarded as an introductory study, it was really a good deal too stiff—remains valid; but arrangement has been improved, several sticky points cleared up, and a useful bibliographical chapter added.

AMERICAN SURVEY

Labour's Political Plans

(From Our US Editorial Staff)

"IN this election," said a member of the Congress of Industrial Organisations' political staff, "our members are not going to be for or against people as much as they are for or against things. They're not as interested in presidential candidates as they are in questions like: What can be done about prices? When do we get housing? Is there going to be war?"

The offices of the CIO's Political Action Committee are full of activity. So is the brownstone mansion in Lafayette Square opposite the White House, the headquarters of the American Federation of Labour's political agency, Labour's League for Political Education. At the moment, in each case, the activity is centred on the Congressional districts rather than on the Presidential contest.

The difference between the labour sections of the Republican and Democratic platforms is very considerable. The Republicans, in their review of their Congressional accomplishment, point with pride to the achievement of "a sensible reform of the labour law"; in labour matters, their pledges for the future are confined to a promise of "continuing study to improve labour-management legislation in the light of experience and changing conditions," presumably by the Congressional Committee, set up at the time of the passage of the Taft-Hartley Labour Act, which has Senator Joseph Ball as its present chairman. The Democrats, by contrast, advocate repeal of the Taft-Hartley Act, proposing in its stead legislation "to establish a just body of rules to assure free and effective collective bargaining, to determine, in the public interest, the rights of employees and employers, to reduce to a minimum their conflict of interests, and to enable unions to keep their membership free from Communistic influences." In addition, they urge restoration of the recent cuts in the Labour Department's budget and functions, extension of the coverage of the Fair Labour Standards Act, minimum wages raised to at least 75 cents an hour, equal pay for equal work regardless of sex, and the extension of the social security programme.

In view of these contrasts, it seems hardly rash to conjecture that most of labour will be in the Democratic camp by November, supporting the national candidates for the Presidency as well as the local tickets for State officers and representatives in the Congress. But this support will probably be given without too much preliminary fanfare. Even now, on the Executive Committee of the AFL League, it would be hard to name members who are not for Mr Truman. Mr Jack Kroll, head of CIO-PAC, told an audience in his first speech after the Democratic convention: "It may be that they (the people) have found another champion. It may be that President Truman has found himself. At any rate he is wearing a new look, and I must say that the new look becomes him." But the rumour of Republican victory is in the air, and both union officers and the rank and file share the rueful opinion that too public a backing of what may be the wrong horse could look foolish and might prove costly on the morrow of the election.

No such inhibitions take the edge off participation in the Congressional contests. Moreover, under today's conditions, labour's concentration on the legislative arm of the Government illustrates what every schoolboy is told by every political scientist. When an American President has imagination, and the capacity to capture the imagination of others, he can impose his will on Congress. Otherwise, a decentralisation of initiative takes place; what happens in Congress in the next session will depend far more on the predilections of the individuals who are sent there than on any party discipline. Mr Truman's troubles with Congress are a matter of record, and even men far surer than are most labour leaders that Mr Dewey's programme would be one they could support, are doubtful whether he will get co-operation from a House whose dominant personalities include Mr Martin, the unrewarded Mr Halleck, Mr Allen, Mr Wolcott and Mr Taber. That is why labour thinks it better to try to get what it wants directly, and to concentrate on the races for the Senate and the House.

*

The whole of the House (435 seats) and a third of the Senate (32 seats) are being contested. At present 245 seats in the House are held by Republicans, 185 by Democrats, 4 are vacant, and there is the independent Mr Marcantonio. In spite of rock-ribbed Maine and the solid South, at least a fourth of the seats are tenuously held. In the Congressional elections two years ago, the Republican candidate received 50 to 54 per cent of the major party vote in 56 districts in 23 states, and 40 to 49.9 per cent in 52 districts in 22 states—a total of 108 districts in 32 states where contests were close.

This year, the CIO estimates that there are 99 districts where the normal vote is close enough to make the district transferable and where there is at least some CIO strength. The AFL is more concentrated in its claims; it plans to take action in approximately 45 areas. Both offices (and the AFL structure includes an overlapping arrangement with a number of the railway brotherhoods) will supply their affiliates with get-out-the-vote publicity, manuals for precinct workers, cartoons and a news service for union papers, and details of candidates' records, as well as financial help and aid of a confidential nature. The AFL League recommends that a candidate's fitness for labour support should be tested by his record on 14 key votes in the Senate, and 16 in the House; among these the vote on the Taft-Hartley Act ranks far ahead in importance, followed by those on other labour questions, on price and rent control, on reductions in income and excess profits taxes, on Federal aid to schools, on housing and social security and on the European Recovery Programme.

Only the staunchest of Democratic partisans predict enough change in the composition of the House to put the Republicans in the minority next January. But the special session of Congress has concentrated people's attention on the "things" that most workers and their families think need attention; Congressional failure to give them adequate attention will be persistently pointed out by Mr Truman and will undoubtedly sharpen the Congressional races. It may save Mr Dewey from having to deal with a majority so large as to be unwieldy.

But in the Senate the contest for control is real. The present membership is 51 Republicans and 45 Democrats. Of the 32 seats up for consideration at this time, 18 are held by Republicans and 14 by Democrats. A shift of 4 would change the organisation of the upper House; a shift of 3 would produce an historic tie. Ten of the 14 Democratic seats are beyond Republican reach in the still solid South. The remaining 4 are in Colorado, Montana, New Mexico and Rhode Island. Of the 18 Republican seats, the party admits that it is concerned over its hold on Oklahoma, Kentucky, West Virginia, Wyoming, Idaho and Delaware, and its opponents claim that Illinois, Minnesota and, possibly, Iowa should be added to the list.

In some of these states, the Western ones particularly, labour has little strength; the force it can muster will be vigorously applied, but its effect will only be marginal. In some states, as in Kentucky, labour's interest is in the primary contest for the Democratic candidate, and the degree of its effort in November will depend on the outcome of that race. (Primaries are held as late as September in a number of states.) In other states, notably in West Virginia, the extent of the labour turnout will be a major factor.

*

Mr Henry Wallace's Progressive Party is now on the ballot in 44 states, so the Wallace-for-President poll will be nearly as complete as that for the major party candidates. The number of districts in which the new party will run Congressional candidates, however, is likely to be much more limited. Final dates for nominations are still to come in a good many states, but contests are now assured in twelve districts of California, in the Pittsburgh and Philadelphia areas of Pennsylvania, in all except two districts in New Jersey, in the Baltimore area of Maryland, and in New York. Senatorial candidacies are certain in New Jersey and Illinois and possible in Minnesota. While there will be scattered support for Mr Wallace from individual trade unionists and some top officials of unions dominated by the left wing, labour as a whole is not likely to be friendly to the Progressive nominees for Congress. A number of them have been placed in constituencies where their success would contribute to the return of a reactionary: the Senate races between Professor Paul Douglas and the present Senator, Mr "Curly" Brooks, in Illinois and between Mayor Hubert Humphrey and Senator Joseph Ball in Minnesota are cases in point, as well as the fight in California for Mrs. Helen Gahagan Douglas' seat in the House. In the New York district where Mr Lee Pressman, former CIO counsel, is planning to run as a Progressive candidate, Republicans and Democrats have agreed on a coalition to block him.

The main reason why feeling against the new party is not more intense around labour's political headquarters is the conviction that it has not enough strength to count. The Republicans think they can win in Illinois and Minnesota against the Democrats and Progressives combined, and the Democrats fear they may be right. Nationally, the Wallace vote is assumed to be marginal. Of course, estimates of the total vote in November, at this stage, are more than dubious. There are some 94 million people of voting age in the population. The popular vote for the Presidency in 1944, when much of the population was, owing to wartime circumstances, far from its home base, was 48,025,684. If the campaign gets really hot this year, it might not be unreasonable to expect a total of some 60 million votes.

Just what percentage will go to Mr Wallace will depend on the state of the "things" that people are interested in, outstandingly on the prospects for war or peace. The Wallace demonstration in Philadelphia was an event of great political potentialities, staged at the wrong time and with the wrong man. The Neo-Nuremberg design of the spectacular rally at Shibe Park was ominously familiar: emotion roused through oversimplification, music, lights, a great majority that was idealistic and naive, a skilfully deployed minority that was neither. But in July, 1948, two essential elements were lacking. The sounding board which gives resonance to such a summons is an unhappy people. The week when average factory wages reach an all-time high of $52.81, and when 61.5 million people are employed, is a poor week for such a summons, even if the speaker says that purchasing power is being destroyed by inflation. Secondly, Mr Wallace's performance was that of a speaker, not a leader. The ovation he got when he drove around the field was climactic, but at the microphone the Vice-Presidential candidate, the crooning Mr Taylor, did better. What Huey Long could have done in that setting, even in these times, is another matter altogether.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

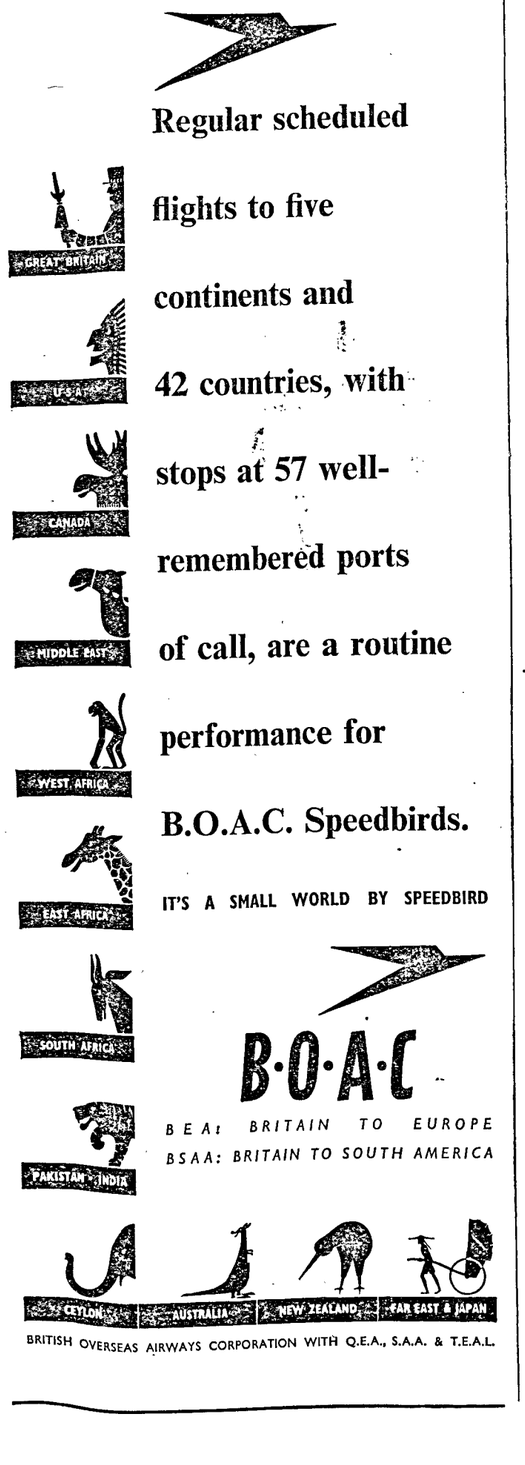
American Notes

Political Answer for the President

Once President Truman had presented his Message to the special session of Congress, the initiative passed to the Republican majority. He had been greeted with sullen bitterness by all but his own supporters, and it is not surprising that his frankly political summons has received an equally political answer. One of the eleven points on which he asked for action was civil rights legislation and, most opportunely, the only Bill ready for consideration by the Senate was the anti-poll tax Bill, forbidding the state taxes which have restricted negro voting in the South. The Southern Democrats have been filibustering—refusing to allow a vote to be taken—not on the Bill itself, but on the motion that it should be debated while Committees are considering the President's other requests. It has been ruled that the closure is not applicable in these circumstances and the Southerners have also filibustered against the attempt to appeal against this ruling. The Republican leaders, who rejected a compromise suggested by the Democrats, could hardly have hoped for a more convenient development, since it gives them an adequate alibi for their failure not only to fulfil the civil rights promises in their platform but to act on the President's other requests. They have the additional satisfaction of knowing that the breach in the Democratic Party has been widened.

An immediate return home was suggested in some quarters, but the Republicans decided to stay for a short session and to put up an appearance of considering the President's programme constructively. Mr Dewey favoured this approach, but he does not wish attention to be diverted for long to the Congressional aspect of Republicanism, so much less attractive than that which he presents. Nor does want to take a stand on the issues raised by the President, since on some of them at least his position is embarrassingly nearer to Mr Truman's than to that of the Republicans in Congress; the unity of the party might thus be imperilled. Mr Dewey is therefore holding himself firmly aloof from the special session, but his campaign manager, Mr Brownell, has hastened to establish a link by opening his headquarters in Washington.

President Truman did not suggest that the foreign situation was sufficiently critical to justify his emergency call to Congress, but this situation nevertheless forms a background to much of the comment on the special session. It is feared that the apparent indecision and political ineptness of both parties may give a false impression abroad of American strength and determination. Mr Dewey has done his best to banish this by his statement, which carries the weight of official Republican policy, that the United States must not surrender its rights in Berlin under duress. The situation is, in his view, critical largely because of the Administration's incompetence, but "the present duty of Americans is not to be divided by past lapses, but to unite to surmount present dangers."



* * *

Pandora's Box Stays Shut

The Republican leaders have now abandoned the attempt to pass the anti-poll tax Bill at this session, in order that the Senate may deal with other legislation before adjourning at, or shortly after, the end of this week. Congress does not apparently intend to do much, apart from perhaps approving the credit controls discussed in a later note, although some Republicans regret that it is not making better use of its opportunity to fill some of the gaps in its record. There is, however, a good chance that the loan for the United Nations headquarters may be approved and the displaced persons legislation may be reconsidered. The ratification of the international wheat agreement, for which the President also asked, may be held to be too complicated and too controversial for anything to be done at present. This is the feeling of the Republican leaders about most of the President's programme. They say, with justification, that it is a programme for a full session of a new Congress with a fresh electoral mandate. Only urgent legislation is suitable for an emergency session and Mr Truman can hardly have thought that he would be taken seriously. Certainly the Republicans have no intention of "opening the Pandora's box of the legislative calendar."

The President is not expected to recall Congress again, as he has power to do, but he will appeal to the voters to condemn the Republicans for its failures. The refusal to alter the Taft-Hartley Labour Act and to increase minimum wages will pay him as good dividends in labour votes as will the half-heartedness of his request for wage controls. Congress itself is aware of the criticisms which will be aroused by lack of housing legislation and may do something in this direction, but it has evidently been

deterred from going on with the Taft-Ellender-Wagner Housing Bill by the belated realisation that this would add to inflationary pressures. This weakness of the Bill is at last a matter of fairly general discussion, but it is doubtful if it will carry much weight with the voters who are looking for somewhere to live.

The Republican readiness to assume these political liabilities is proof that the party is still certain of victory in November. It has not, however, found it wise to take so lightly the rise in the cost of living, the emergency by which Mr Truman justified his recall of Congress, asserting that it could not be allowed to go unchecked for another eight months. The full impact of recent increases in wages and in the price of metals has not yet been felt, but the consumer price index has reached a new high, 170 per cent of the 1935-39 average, nearly ten per cent above a year ago. The chief rises are in meat and eggs, but automobiles and "Lucky Strike" cigarettes are also up. According to Dr Gallup city families are spending an average of $25 a week on food, compared with $11 in August, 1942.

These statistics reinforced the President's case, as did the mid-year report of his Council of Economic Advisers, although it is suggested that the latter may have been adjusted to suit current political requirements. There are many in Congress who believe that the price peak has been reached and who insist that the present situation is largely the result of the Administration's own policies and that sufficient powers to deal with it already exist. These arguments justify, to some extent, the view that Mr Truman has turned the spotlight on high prices for purely political reasons. For these same reasons, the Republicans can hardly afford to adjourn without some attempt to deal with the situation, although they are determined to ignore the President's requests for excess profits taxes, for price and wage controls and for rationing powers.

* * *

Inflation and Bank Credit

The most striking feature of the Congressional hearings so far, however, is the reluctant admission by Mr John Snyder, Secretary to the Treasury, that the situation now demands a closer control of consumer (instalment) credits, and, more important, higher reserve requirements for member banks in the Federal Reserve system. A measure now before Congress calls for a flat percentage addition to the minimum reserves required to be held against net demand deposits, from 14 to 24 per cent for country banks, from 20 to 30 per cent for reserve city banks, and from 26 to 36 per cent for banks in New York and Chicago. Coupled with these increases, there would be an increase in requirements for time deposits from 6 to 10 per cent. (The British banks work to a ratio of 8 per cent against the total of demand and time deposits.)

At the time of writing, there seems to be at least an even chance that this measure will be pushed through Congress. If it goes through, it will be important, not only because of the additional powers which will then be held by the Reserve Board (this weapon, held in reserve, might alone be sufficient to impose sufficient restraint), but because it will mark the close of the Treasury's brief-lived bout of expansionist policy in the face of continuing boom. Mr Marriner Eccles would like higher reserve requirements for all commercial banks on a scale which would add $12 billion to present reserve requirements. But if applied only to the member banks in the Reserve system, the addition would be at least $8 billion: this is not an altogether insurmountable barrier to the process of credit expansion through "debt monetisation"—the commercial banks held $66 billion of government securities in April—but it is a formidable, and unprecedented, addition to monetary controls, and would surely impose sufficient restraint over the measurable future. At the end of June the member banks had total reserves of $17.4 billion, and they held "excess" reserves (i.e., in excess of requirements) amounting to $700 million only.

If such a measure passes, President Truman's decision to hold an emergency session will be justified. But, assuming that he and his advisers are determined to use these powers, it must be admitted that he is luckier than he deserves, for initial testimony in Congress showed all the sorry pattern of muddle and confusion in the Administration so clearly in evidence eight months ago. Mr Snyder praised the voluntary efforts made by commercial banks to restrain inflation, and only grudgingly admitted the need for official restraint. Mr Paul Porter, former Price Administrator, reappeared with something like his old crusading fervour, to plead for price controls and for powers to allocate and ration, and even found the courage to advocate the dreaded "roll-back" of price levels to a point at some undetermined date in the past. He was met naturally (and quite erroneously) with howls from the Republican ranks suggesting that the police state and the Office of Price Administration were just around the corner. Mr Porter, however, carries no conviction in 1948: he may take his duties seriously, but Congress certainly does not.

It was left, as usual, to Mr Marriner Eccles to provide something like a cogent argument, which incidentally dismissed Mr Porter as a "futile" advocate, and which denounced the Treasury's policy with the blunt assertion that Mr Truman's battle is not so much with the legislative as within the executive branch. A new and far more courageous Administration will be needed to resolve the conflict between the Treasury and the Reserve Board. But that conflict and Mr Porter's palliatives can be disregarded if Congress gives new powers to the Reserve Board on the scale now suggested by Mr Eccles.

* * *

DP Delays

Mr Truman has finally chosen the men who will be responsible for moving displaced persons from European camps to the United States. The Commission includes Mr Ugo Carusi, former Commissioner of Immigration, who has been working with the State Department on DP affairs. Although the nominations are unlikely to be approved by the Senate before the new Congress assembles in January, the Commission will presumably proceed meanwhile with the arrangements for transferring the refugees. There is still a possibility that Congress may do something at the special session to improve the discriminatory Displaced Persons Act which it passed before adjourning in June. Not only did it emasculate the Bill but it reduced by half the Administration's request for $4,000,000 to operate the plan. President Truman has now asked for the restoration of this cut but, as the Republican leaders have declared that no appropriations will be voted at the special session, it looks as if Mr Truman was speaking more for his political record than for the refugees.

If sufficient money had been voted to operate the original plan, 205,000 DPs could have expected to start a new life in the United States by 1950. It is now thought that only about 50,000 refugees can emigrate to the New World in the next 12 months. Shortage of shipping space is one of the chief problems and this is largely due to inadequate funds.

Meanwhile the State Department and other agencies are being inundated by letters offering all sorts of jobs to DPs, ranging from baby sitters to bakers. Many states have set up local organisations and the New York State Committee estimates that up to 50,000 could be employed in that state alone; because New York is the centre of the clothing industry, openings for skilled garment workers are plentiful, while in other parts of the country agricultural workers are needed. It would be well if the refugees could be moved quickly into these jobs while they are still available, but at present it does not look as if even a first contingent would arrive for some months; should the programme drag or be mishandled, enthusiasm might shrink in proportion to housing and other difficulties, and should there be even the hint of a depression, the goodwill and good opportunities might evaporate rapidly.

* * *

Midsummer Spy-Scare

A Republican Congress, recalled to Washington in the heat of summer and of an election year, was sure to seek some quick means of subjecting the Democratic Administration to even more extreme heat. Almost unbelievably suitable fuel was available: Washington was full of rumours of a blonde bombshell, who had been assisting the Federal Grand Jury in the inquiry which led to the recent indictments against the twelve leading American Communists. She turned out to be a brunette bluestocking, but in every other way Miss Elisabeth Bentley was better than anything that even the Un-American Activities Committee could have hoped for. Her evidence was made up of casual references to aircraft plans, the date of D-Day, cover names, secret trysts, microfilms, Communist networks and financial links with Hollywood (which must now be longing to establish a contractual link with Miss Bentley personally).

The privilege and publicity of appearing before two Congressional Committees simultaneously in the silly season—the Senate Committee on Expenditures was the other—seems to have gone to Miss Bentley's head and she splashed the mud of her Communist associations on leading Washington figures with a liberality that shocked even some of the members of the Un-American Activities Committee. Her connections with Mr Lauchlin Currie and Mr Harry White were extremely vague and Mr Lippmann's ex-secretary had only given her access to his files when he was out of town. Miss Bentley became involved in the Communist spy system through her love life rather than her convictions, but her evidence had ramifications spreading all

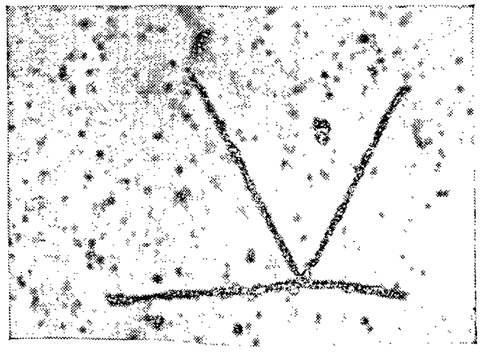
through the Government service and leading to at least thirty officials, many of them in important positions. Her efforts to implicate them were presumably an attempt to atone for her past misdeeds and to repair the damage she had done. There is said to be independent evidence in support of many of her charges and some of them were also repeated by Mr Louis Budenz, the reformed editor of the *Daily Worker,* and by Mr Whittaker Chambers, a senior editor of *Time* magazine, who saw the error of his Communist ways in 1939. Both of them followed Miss Bentley on the witness stand and their reasons for giving evidence were probably the same as hers.

Mr Chambers' particular target was Mr Alger Hiss, late of the United States delegation to the United Nations and now of the Carnegie Endowment for International Peace. Mr Currie was Mr Roosevelt's personal representative in China, Mr Harry White was American representative on the International Monetary Fund, Mr Lippmann is of course inseparable from his internationalist views. It looks as if this latest Communist scare may bring into disrepute not merely, as usual, the efficiency of the Government's methods of checking the loyalty of its employees, but American participation in international organisations. "The biggest witch hunt of all time" is promised and it should comfort Colonel McCormick and Mr William Randolph Hearst in their declining years.

Shorter Notes

The President signed the Bill extending the terms of all the Atomic Energy Commissioners for two years, since, if he had vetoed it, their appointments would have lapsed on August 1st and he felt that even the limited continuity in the present Bill was better than nothing. Under the original Atomic Energy Act, the Commissioners were to serve for staggered terms of from one to five years and Mr Truman felt that the new measure, which in effect gives the next President the right to make full term appointments, was not in the public interest "since it invests the atomic energy programme with an aura of uncertainty and of partisan politics."

★



In its preliminary recommendations for 1949 to state agricultural councils the Department of Agriculture set a goal for wheat of 71,500,000 acres, 8 per cent below this year. The wheat goal —though still the second largest on record—has been reduced because it is hoped that farmers will return their marginal acreage to grazing lands in order to reduce the dangers of soil erosion. In an attempt to balance current meat demands with the preservation of adequate stocks for the future, the Department has recommended the slaughter of 32 million head of beef cattle by mid-1949 and a reduction this year of 500,000 in the number of beef cows.

★

Judge Hincks, of a Federal District Court in Connecticut, has upheld the clause in the Taft-Hartley Act which forbids expenditures by labour unions for political ends. A local American Federation of Labour union had challenged the law by using union funds for newspaper advertisements and the purchase of radio time for a political broadcast. The Judge emphasised that the case differed from the one recently before the Supreme Court because in that case the moneys involved had been used to publish a union periodical instead of advertising in a newspaper of general circulation. The union hopes to take the case to the Supreme Court, but it is doubtful if a final test case can be made before the election.

★

The State Department is to take full responsibility for the "Voice of America" broadcasts from next October, but will lease the necessary facilities from the broadcasting companies, which have been preparing 74 per cent of the scripts. This change of policy is the result of the trouble with Congress in May over a programme beamed to Latin-America, in which sections of the United States were critically described. It is expected that there will be a reduction in the number of broadcasts, at least to areas outside the Russian propaganda orbit, although Congress voted substantially the funds requested by the State Department for the fiscal year. The Department will itself prepare and broadcast all news programmes, but it will arrange with private agencies for the production of feature programmes. Until October the department will supervise all programmes "farmed out."

TRACKING THE ATOM

You see here the disintegration of a single radio-active atom. The arms of this curious hieroglyphic are the tracks made on a special 'Kodak' photographic plate by the particles emitted by the atom. This is just one example of how applied photography is aiding research; in science and industry, photography is often the only possible way of recording phenomena.

Two-Year Plan for the Russian Zone

(From Our Special Correspondent)

A LONG-TERM production plan for the British economy, announced at a Labour party conference, would be considered merely as that party's view of how the country's economic problems should be tackled. If such a plan were represented as the official programme for the future, by virtue of its announcement at the congress of the leading political party, there would be a constitutional uproar. Things are different in the Russian zone of Germany. There the Two-Year Plan for economic development was announced at the meeting of the Central Committee of the Communist-controlled Socialist Unity Party (SED). The Committee's Chairman, Otto Grotewohl, launched it with a statement that it was no imaginary popular power which supported this plan, but solely the power of the SED which was in a position to mobilise the energy of the people, to direct it and to bring it to its maximum usefulness. The people would stand helpless in face of the economic problem. Not only must this plan be considered as official, but its execution by all German administrative and political bodies is intended forthwith.

The experts of the German Economic Commission, the highest German administrative authority in the zone (described in *The Economist* of June 12, p. 973) were called in to submit details of plans for the various spheres of the economy. They worked under repeated directives from the SED emphasising that members of the party occupying administrative positions must consider themselves primarily as its political executives. So the German Economic Commission is committed to this plan through its many SED members who assisted in its preparation. It must be assumed that the plan also has the full support and backing of the Russians who ordered its preparation.

Figures *versus* Facts

This is, of course, by no means the first plan. Both the occupation authority (SMA) and its subordinate German organisation have long been indulging in an orgy of planning. Thus the annual balance sheet of each department in the Economic Commission contains three plan figures for each figure of actual production; the figures of the SMA plan, of the central administration plan and of the plans of the provinces. In 1947 the plan of the SMA called for a total industrial production to the value of 4,165,542,000 RM (1944 prices), the central administration plan for a total of 4,651,457,000 RM, and the sum of the provincial plans for a total of 5,128,918,000 RM. Actual production during the year 1947, according to the statistics of the German Economic Commission, was to the value of 4,085,499,000 RM. This figure represents the many duplications of a gross valuation. Moreover, deterioration of quality, transport difficulties and the many shortages of secondary products in consumer industries would reduce the market value in 1944 prices considerably. Thus, in the tool industry the shortage of certain steels made impossible the production of finished machine tools, yet the resultant excess of component parts was still counted at its full value. The makers of the Two-Year Plan have not only three years' experience of copious planning, but have already acquired a technique of using figures to hide facts.

As a document of economic planning, this is a sorry effort. Production figures are rarely given and future plans are stated almost exclusively as percentages of present or past production. Such percentages entirely ignore important qualitative differences, particularly in agriculture. Even without actual figures discrepancies are evident. Thus the total level of production is to be raised to 135 per cent of 1947, while coal production is to be raised only to 121 per cent. Coal shortage has been one of the main problems confronting the Russian zone. So since the Two-Year Plan calls for large-scale expansion of mines, factories and heavy industrial equipment, the relative increase in coal production would have to be much larger than the estimated rise in total industrial output. In order to achieve a 35 per cent increase of production, the output of coal would have to be raised by between 50 and 60 per cent, particularly as 95 per cent of coal produced in the Soviet zone is brown coal, which is wasteful when used in transport and industry.

Two questions have to be asked about the plan. First, is the planned increase in production really possible; second, if so, is it sufficient to meet the minimum needs of the zone? It must be remembered that, generally speaking, production in 1947 was rather lower than production in 1946, owing to the disastrous winter weather and the intensified dismantling during the latter part of 1946. Thus an increase in brown coal production to 123 million tons in 1950 represents an increase of 23 per cent over 1947, but an increase of only 11 per cent over 1946, and would still only be 83 per cent of 1943. The intended production of briquettes (32 million tons in 1950) does, indeed, represent an increase of 23 per cent over 1947, but it requires a large building programme for briquette-making plants, heavily reduced by dismantling. The quality of briquettes—not mentioned in the plan at all—has also deteriorated since the war by an increase of water content from 15 to 22 per cent.

Similar difficulties arise over steel production, which is at present stated to be 400,000 tons. This figure is exaggerated, actual output being nearer 300,000 tons. New building and enlargement of the zone's three steel foundries is to produce another 400,000 tons of steel by 1950. Again this figure is on the large side. Yet the total production by 1950 is to be 875,000 tons, leaving a mysterious gap of 75,000 tons unexplained. The remaining few small foundries have a maximum yearly production of only 25,000 to 30,000 tons.

The planned increase in production of cellulose seems particularly striking at 250 per cent over 1947. In 1946 production totalled 38,000 tons, compared to the 1947 production of 35,000 tons, of which 17,000 tons were produced by the Russian-owned firm of Agfa-Wolfen. Yet it must be remembered that in 1942 the zone produced 125,000 tons, or half the production of all Germany. Thus this wonderful increase of 250 per cent would still only be 67 per cent of 1943. It may further be doubted whether the figure of 84,000 tons for 1950 can, indeed, be reached. For dismantlings have been heavy and half the present plant is owned by the Russians, who may deny its product to the German market.

In consumer industries the position is equally acute. Here the plan gives repeated warnings of continuing and irremediable shortages. Not only has their capacity been much reduced by dismantling, but the whole programme is dependent on imports of raw materials. Where the raw materials are to come from and how they are to be paid for is not mentioned. Presumably commission manufacturing cannot be included in the total production programme. In the leather industry, for example, production has fallen from 18,000 tons in 1946 to 16,500 in 1947, and is estimated at between 15,000 to 16,000 tons in 1948, since the zone is now entirely dependent on home produced skins. Significantly not even percentage increases are given for these industries. The plan confines itself to ifs, buts and pious hopes.

Drain of Reparations

Of the total output planned for 1950, 50 to 60 per cent of the total value would go for reparations if the present programme were continued. Apart from a promise that the quantities of wool, cotton and rags to be imported from the Soviet Union will not be used for reparations goods, this large chunk out of the German economic cake is not mentioned at all. As the SED would be the first to emphasise the reduction of reparations as a sign of Russian generosity, it is safe to assume that the flow of raw materials and manufactured goods to the East will continue unabated. This would mean that over half the value of the total output of 1950 would be lost to the German economy. In addition, all imported raw materials which go into reparations goods would continue to be paid for—as at present—out of German exports. As materials such as leather, which are in shortest supply in Germany, are scarce elsewhere, the demands of the reparations programme will be particularly heavy on such scarce consumer goods.

According to the plan each person in the zone is to receive one pair of shoes of substitute material in 1950. This means using 25 per cent of the total artificial rubber production only for soles. Even if this can be achieved, the needs of footwear would still

greatly exceed the supply. The only import figures actually mentioned in the plan are the 18,000 tons of cotton, 2,000 tons of wool and 7,500 tons of rags expected from the Soviet Union in 1950. As these quantities are required not only for home consumption, but also for re-export of finished goods, the amounts seem woefully insufficient when it is born in mind that over 20,000 tons of wool alone were imported into Bizonia in 1947.

The whole question of imports has perforce to be left vague in striking contrast to western Germany, where German planners can count upon imports of about $1,700,000 during the first ERP year. The fulfilment of the plan itself requires large quantities of imports, but even this would be unable to provide the necessary raw materials for industry and a reasonable standard of living for the population. The three staple exports of the Russian zone are to be wood, potash and sugar. Apart from a certain quantity of pit-props sent to Poland, the prewar German export of wood was negligible—in fact, timber was imported. Since the war, reparation demands in this field have been particularly heavy. The afforestation programme announced in the Two-Year Plan is estimated to replace only some 35 per cent of the losses since the war. Potash production has been pushed as far as possible during the last three years, and although representing one of the steadiest export commodities of the zone since the war, any further important increase may be difficult to achieve. The Russian zone was before the war the sugar-producing area of Germany (Magdeburg). But, since at present sugar is issued to the population in lieu of most scarce edible commodities such as meat and fats, its availability for export depends entirely on maintaining the supply of these scarce foods or on a further drastic reduction in the sugar ration. In any case, these three export staples can in no way replace the bulk of Germany's prewar exports, industrial products and machinery.

The food target for 1950 is so low that it must have been based on the assumption that, apart from commercial exports. Russian requisitioning will continue. Indigenous production, it is estimated, will provide only 2,000 calories a day in 1950. Berlin is assumed to be part of the Soviet zone for planning purposes, by order of the SMA.

One is finally forced to two conclusions: that except in agriculture, the achievement of the planned figures for the years 1948-50 is impossible, and even achievement of the production figures would by no means satisfy the needs of the Russian zone's economy. As usual, it is the consumer who suffers most. A perusal of the Two-Year Plan makes this so obvious that one is at times inclined to doubt the seriousness of its authors. Apart from the actual industrial figures, the productive capacity of the workers is a dubious quantity, and can be expected to decrease rather than increase. At present it is estimated at only about 35 per cent of prewar, and industries accustomed to a single shift are working two or three shifts a day. Even members of the German Economic Commission have already stated that it may be impossible to fulfil this plan as it stands.

New Horizons for Eire

[FROM OUR DUBLIN CORRESPONDENT]

THE Inter-Party Government, a coalition of all the political groups in Eire with the exception of Mr de Valera's party, has completed six months of office. Contrary to the predictions of its critics, it has shown no signs of disintegration. Indeed, it presents the appearance of a very happy family which promises to remain united for quite a long while. Undoubtedly the country is satisfied with the new experiment. Even members of the Opposition admit that a change of administration was due, if not overdue. The Government's political prestige is very high, largely because of the excellent result of the Anglo-Irish trade talks whereby Irish farmers have secured great advantages. The upward revision of agricultural prices in the British market has been the most important contribution of the new coalition to the prosperity of the country. The Minister for Agriculture, Mr Dillon, one of the ablest members of the Government, has very sound and enlightened views on agricultural policy, and there is every reason to hope that the principal industry of the country will enjoy a period of reconstruction and progress under his wise direction.

Another important achievement was the conclusion of the Marshall Aid agreement with the United States. Eire was one of the first countries to receive assistance from ERP. There should be no undue shortage of the imports from the dollar area required for the programme of agricultural development. Eire has the right to participate to an agreed amount in the sterling area dollar reserves and has a certain dollar income arising from tourist receipts and other sources. In the internal economic field a drastic curtailment of unnecessary capital expenditure has enabled the budget to be balanced and has aided the process of disinflation. Extensive additions to social services have insured the welfare of many categories of the poor. A commission has been established to study every aspect of emigration, the central problem of Irish economic life. A critical examination of the transport system with a view to its rationalisation, has been undertaken by an eminent English expert. The Government's economic policy generally has been a cautious mixture of conservatism and measured progress. The only continuing cause for anxiety is the grave disequilibrium in the balance of payments. The cure for this, in the long run, depends upon the development of agricultural production, but, in the short run, a drastic reduction of imports may become necessary.

The pressure of events in the postwar world has forced Irish politicians to take a growing part in international affairs. The precise relation between Eire and its nearest and most intimate neighbours has therefore taken on a new significance. Its position in relation to the British Commonwealth raises some interesting questions of constitutional law. The Irish attitude on neutrality during the war demonstrated that it does not necessarily become involved in a British declaration of war. As a result of neutrality Eire has failed to secure admission to Uno. It is, however, one of the sixteen nations participating in the Organisation for European Economic Co-operation. Mr MacBride, the Minister for External Affairs, has taken a prominent part in the meetings in Paris. He has declared that, while favourable to the project in principle, he cannot co-operate in the formation of a Western Union as long as the partition of Ireland is retained. The Prime Minister, Mr Costello, has stated that the interests of Great Britain, the United States and western Europe and the interests of maintaining Christian principles demand that there should be a united Ireland to face the menacing situation in the world. The importance of Ireland in any scheme of defence of the Atlantic renders its participation in Western European Union of peculiar value. It will be interesting to observe what use, in connection with the vexed problem of partition, the Irish Government will make of the strong hand which it appears to hold.

Relations with the Commonwealth

Relations between Great Britain and Eire have never been more cordial than they are today. The statesmen of both countries are on excellent personal terms and Irish ministers have, on many occasions, expressed their goodwill towards the people of Great Britain and the principles for which they stand. It is curious that the constitutional relations of the two countries should be so obscure. It may be that the empirical working out of new relationships, without undue regard for legal consistency, may be the best method for arriving at a basis for realistic friendly co-operation. Under the Treaty of 1921, the Irish Free State became a Dominion. This status was changed by the Constitution of 1937 which proclaimed that "Ireland is a sovereign, independent, democratic State." Mr de Valera has expressed the opinion that, under this section of the Constitution, Ireland is a Republic, in which case the head of the British Commonwealth has ceased to be King of Ireland. Whatever tie binds Eire to the Commonwealth, it is certainly not the "golden link" of the Crown. Under the External Relations Act of 1936, it is provided that as long as Ireland is "associated with" the countries of the British Commonwealth, the King may, on the advice of the Irish Executive Council, act as the agent for the appointment of diplomatic representatives. Mr Costello has recently stated that Eire is not a member of the Commonwealth of Nations but still remains associated with it. He explained that "the process by which Ireland ceased formally to be a member of the Commonwealth has been one of gradual development." Possibly, the next step in this development will be the repeal of the External Relations Act which would finally banish the transient and embarrassed royal phantom from the Irish statute book.

These issues have been revived by the British Nationality Bill. The central feature of this Bill appears to be that it recognises the local legislation of the Dominions as decisive on questions of Commonwealth citizenship. The definition of Irish citizenship is contained in an Act of 1935 which makes provision for the special treatment of British subjects in Eire. The British Nationality Bill contains similar provisions in regard to Irish citizens in Great Britain. Up to the present, the British Courts would have probably regarded Irish citizens as British subjects, although the Irish judges would have probably decided otherwise. After the British Nationality Bill becomes law, Irish citizens will not be British subjects but will be treated as if they were as long as they remain in the United Kingdom. They will apparently be regarded as aliens in other parts of the Commonwealth.

It is hard to see precisely how the new provisions regarding citizenship will affect the relations between Eire and Northern Ireland. The loss of British citizenship in the event of any union between North and South would provide an additional argument for those who are opposed to any change in the existing situation. It is probable, however, that some compromise could be reached if the numerous other obstacles in the way of reunion could be removed. The Irish Government has expressed its willingness to grant special treatment to Ulster in respect of the Irish language revival and religious discrimination and it would, doubtless, be willing also to go a long way to satisfy it on other issues. Ever since the Treaty, Irish politicians have been fertile in the provision of formulas which enabled awkward constitutional corners to be turned without anybody apparently sacrificing any essential principle.

War Against Markos

[FROM A SPECIAL CORRESPONDENT]

ALL events in Greece are dominated by the guerrilla war. The total strength of the guerrilla forces in Greece is estimated at roughly 25,000. These guerrillas have been the means by which the Kremlin has carried out a thinly-camouflaged aggression against the independence of Greece. The long-term objective is so to disrupt and disorganise normal life in Greece that, in the process of time, the Greek economy would collapse automatically. In this respect, Markos has come very close to success. In areas threatened by the guerrilla bands, ordinary day to day movement is paralysed. Mines are laid by the guerrillas with persistent regularity on roads during the hours of darkness, telephone wires are cut and outlying villages raided. No journey can be undertaken from one town to another except by convoy with a mine-detector attached to the leading vehicle, and railway locomotives are preceded by two trucks filled with sand or rubble.

A month ago, the Greek Army began what is intended to be a final drive against Markos' HQ in the Grammos Mountains, where the main centre of resistance is located. Probably between 8,000 and 10,000 guerrillas are concentrated in this area. Six Greek divisions are attempting to execute a horse-shoe encircling movement, with one tip of the horse-shoe resting on Kastoria and the other on Konitsa. The close proximity of the Albanian frontier greatly hinders the task of the Greek troops and, conversely, facilitates "General" Markos' tactics.

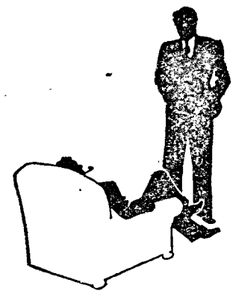
Although no guerrilla prisoner has yet been taken who could be proved to be of non-Greek nationality, there is an overwhelming volume of evidence indicating that Markos has been receiving much material assistance from Greece's northern neighbours. There are signs, however, that this assistance has in recent months been falling off. Markos appears to be fighting in his mountain stronghold upon a last-man-last-round basis. His positions are strongly fortified, well-camouflaged and sited, and false optimism as to the speed with which these operations can be conducted by the Greek Army should be discounted. The guerrillas are well-provided with light automatics, chiefly of German origin, and there is no dearth of small arms ammunition. Mines, both Teller and anti-personnel, are plentiful. They have a few 75 mm. batteries, though their shelling, which is very intermittent, suggests a shortage of ammunition. They also have a quantity of heavy mortars, and Spitfires of the Royal Hellenic Air Force have been fired at by light AA guns.

It is clear that Markos could not have amassed the amount of ammunition of all types which he is now using without considerable outside assistance in the past. Convoys, including ambulances, have been observed on a number of occasions on roads just over the Albanian and Jugoslav frontiers, and there were confirmed reports in the earlier stages of the present operation that two batteries of 105 mm. guns were shelling Greek positions from Albanian territory.

The Greek Army of today is a very different army from that of 1940-41. In those days, it bore the imprint of French General Staff influence. Its infantry divisional artillery was of mountain type (i.e., carried on packs). Most of it was very old and had been through the Balkan Wars in 1912 and 1913. Nearly all the transport was on a horse-cum-pack basis. During the Italian campaign of 1940-41 it certainly showed a very high standard of mobility in difficult mountainous country, though lack of adequate mechanised transport increased the defects of administration. At the end of war, the Army was reorganised on British lines with artillery and transport on an all-mechanised basis, similar to that of any ordinary British infantry division, although some account was taken of the need for mountain warfare equipment. Last year's operations against the guerrillas were very disappointing and comparatively little progress was made. It may be that too much reliance was placed upon the effect of artillery and too little emphasis upon the need for Greek infantry to get to close grips. Pack artillery and other equipment more suited to mountain warfare has now been introduced. Mules are once more to be seen wending their way along mountain paths. Morale is very high and the Greek Army is fighting with great determination.

In spite of an overwhelming preponderance of artillery, together with effective support from the Hellenic Air Force, it is not easy to dislodge determined guerrillas from well dug-in positions in very mountainous country, the lower slopes of which are often thickly wooded. Unless these positions can be accurately pinpointed, the effect of shellfire upon them is similar to attempts to swot a fly with a sledgehammer in a dark cellar. Many shells can be fired into the side of a mountain without causing any casualties. The main burden of the assault falls, therefore, naturally upon the Greek infantry. Casualties have not been light on either side. During the hours of darkness, the guerrillas appear to hold the initiative and harass the Greek lines of communication by small raids and by mine-laying operations.

The British and American Military Missions are rendering valuable assistance to the Greek Army. About 90 per cent of the equipment is still of British origin, though this proportion will alter as the full effect of American aid begins to make itself felt. Broadly speaking, the British Military Mission concerns itself with organisation and training and the American Military Mission with supplies and operations. Although this clearly constitutes dual control, the liaison and the personal relations between the two Missions are extremely good. Overriding both missions is Mr Griswold, head of the American Economic Mission. Holding the purse-strings, he is the final arbiter of the apportionment of dollar expenditure between military and economic needs. Consequently, he is the most powerful man in Greece today.

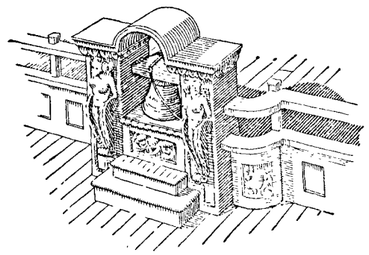


So far, the operations have progressed slowly but surely. If the operational plan of the Greek General Staff is successful, and if Markos' main forces are defeated before winter, the task of clearing up the remaining guerrilla bands in Greece should not present insuperable difficulties, since these are split up into small units and do not operate upon any co-ordinated plan. If, on the other hand, Markos succeeds in holding out for yet another winter, the effect upon morale in Greece will be serious and the disorganisation of normal life will be prolonged dangerously.

700 000 Refugees to Resettle

The economic structure of Greece is extremely precarious. As in most Balkan countries, that structure is built largely upon the village unit, and it is this unit which the guerrillas have come so close to destroying. There are 700,000 refugees, evacuated by the Greek authorities from villages in areas where the guerrillas have been operating, in camps near the larger towns. These refugees must be persuaded, as soon as the military situation permits, to return to their villages and to cultivate the soil. The process of rehabilitation will be both costly and difficult. In the first place, they will require an assurance that no further attacks by guerrillas will be made upon them, an assurance that is not easy to give, since there can be no guarantee, even if Markos is completely defeated, that fresh raids will not be made next summer from over the Albanian frontier.

If the village unit has been largely broken up, so also has the smaller unit, the family. A mother and two children may be in a refugee camp near Athens; the father may have been murdered by the guerrillas; the two elder children kidnapped and taken away to Albania or Czechoslovakia. The number of children removed by the guerrillas is estimated at about 10,000. It is extremely doubtful whether many of these families will be united again, and the break-up both of village and family life has brought immense social, as well as economic, difficulties in its wake.



The enormous problems of reconstruction can only be tackled on a reduced scale until the guerrillas have been exterminated, but it would be a mistake to assume that the threat to the independence of Greece will be removed by the surrender or capture of Markos. With American aid, the Greeks must tackle their economic problems with the same determination as they are showing in their operations against the guerrillas. Complete recovery, however, is a Balkan—indeed an international—and not exclusively a Greek problem. So long as its northern neighbours feel protected by encouragement or approval of the Cominform, the danger of a relapse will always remain. Greece can easily be used for indirect and inexpensive attack on British and American interests in the Near East.

BRITISH EUROPEAN AIRWAYS

THE BUSINESS WORLD

Unilever in Perspective

IF the report and accounts of the Lever Brothers and Unilever group have a fault, it lies in the difficulty of distinguishing, among all their riches of information, those factors which have played a predominant part in the results of the past year, and those which cast their influence forward into 1948 and beyond. Beauty, it is said, lies in the eye of the beholder. To some readers—small in number, perhaps, but fortunately growing each year—accounts of such model precision have a technical elegance of their own. At the other extreme, many stockholders will be content to accept the nineteen closely printed pages of the group's report and accounts as read, and consider their duty done with an examination of the "Salient Points" with which the report opens. Under every head—save net profits and dividends—they will find, in this intentionally simple summary, evidence of further expansion during the past year. Turnover increased by 41½ per cent, from £338.5 million to £479.3 million; the group's net current assets increased by £12.2 million to £82.6 million, largely owing to an increase in the value of stocks; fixed assets were higher by £6.7 million; and taxation by over £5½ million; special reserves against stocks and fixed assets absorbed no less than £7.8 million (in 1946 only £1,200,000 had to be provided); but consolidated net profit totalled £8.5 million against £10.8 million in the previous year.

But such a flat statement of totals gives no hint of the effect of inflation and rising prices on the group's trading activities. The table below, showing the physical volume and value of turnover in the principal commodities handled by the group, throws an illuminating light on this price factor:—

TURNOVER OF PRINCIPAL COMMODITIES

	'000 Metric Tons		£000's	
	1946	1947	1946	1947
Margarine, edible fats, etc.	560	606	53,752	70,150
Other human foods	...	...	29,237	34,055
Other oils and fats	1,479	1,552	94,854	152,184
Animal feeding stuffs	1,256	1,288	16,845	18,187
Soap and detergents	750	811	57,396	84,634
Toilet preparations	...	...	8,601	10,484
Miscellaneous manufactures	...	...	9,725	14,230
Produce*	891	942	28,356	37,805
Merchandise*	...	...	35,695	50,731
Services and transport	...	...	4,037	6,852
TOTAL VALUE	...	...	338,498	479,312

* Mainly handled by the United Africa Group.

Total weights given for five of the groups show an increase of 5½ per cent from 4.9 million metric tons to 5.2 million metric tons. But the corresponding value figures of the same groups increased by no less than 44½ per cent from £251 million to £363 million. The comparison of weights and prices may not be very precise, but it illustrates, nevertheless, the predominant part which rising prices have played in the figures for turnover and profits. The physical expansion of trade has, indeed, been important, particularly in Western Europe, where there has been a steady recovery from grievous shortage of edible fats, though there is still a substantial surplus of productive capacity which could be used if raw materials were more plentiful. In other markets, including apparently the American continent, the increase in physical turnover was relatively less, and the increase in prices relatively more, important. This may explain why the cash value of turnover increased by 46 per cent in Western Europe, and by 39 per cent in North and South America, which includes the group's biggest single market, the United States.

In these circumstances, the increase in the group's aggregate profit from £28.5 million to £40.1 million is no matter for surprise. Turnover and profits have both increased by a little over 40 per cent. The price inflation in the one is faithfully reflected in the increase of the other. And the Unilever directors have recognised the impact of rising prices by making special provisions of a character which is rapidly becoming familiar to shareholders in large industrial concerns. In addition to the normal provision for depreciation (£3.4 million) they have specifically set aside £3.6 million to reserve for replacement of fixed assets. Thus, the directors have taken the view that, where allowances of depreciation for taxation purposes are based on the historical cost of the assets (as in Britain and most other countries) they have a duty to supplement such legal allowances by adequate sums from taxed profits to meet the higher cost of replacing those assets today. This point is, of course, recognised in certain countries where the group does business—France and Belgium among them. From the viewpoint of directorial policy—to say nothing of the larger question of maintaining industrial capital intact—provisions based on replacement cost provide the only satisfactory method of keeping the real cost of physical capital and the unreal size of paper profits in proper perspective.

But the policy is costly, in the sense that adequate provision for replacement involves the payment of tax on any profits set aside, beyond the legal allowances for depreciation. Thus the full cost of depreciation for the Lever group could be roughly put, not at £3.4 million, but nearer £10 million. The net provision (just over £7 million disregarding taxation), it may be presumed, represents the board's view of the total cost, at current prices, of replacing assets which have been used up in the current trading of the group during 1947. The extra provision, that is, relates only to the addition to the legal allowances which the directors consider to be necessary for that single year; it does nothing to bring the provisions which have been made in the past into line with current replacement costs. The first point for Unilever stockholders to seize is the likelihood that this new item providing for the replacement of fixed assets has taken a permanent place in the accounts.

There is a second special item—not, indeed, new for it appeared in 1946—which has made an even greater impact on profits. In 1946, the group set aside £1.2 million to reserve against stock values; for 1947, this provision has been raised to £4.2 million. The need for this provision is clearly explained in the directors' report:

> . . . Profits have again risen in 1947 on the turnover of stocks purchased at prices considerably below replacement cost and, having regard to present high prices, it has been considered prudent further to increase the reserves for stocks from current revenue. The necessity for the continuation of this charge will depend on the future trend of raw material and merchandise prices.

Throughout this article, "group" relates to the combined activities of Lever Brothers and Unilever Limited and Lever Brothers and Unilever NV (usually known for short as "Limited" and "NV" respectively). A commentary on the accounts, with fuller extracts of the figures, appears in this week's *Records and Statistics* Supplement. The combined figures are described in the accounts as "a guide, and no more" to the trend of results of both Limited and NV, and they should be read with currency restrictions in mind.

The value of the group's stocks has, indeed, risen from £49.5 million at the end of 1946 to almost £85 million at the end of last year. The composition of the stocks is not identical from year to year—for instance, changes occur from time to time in the method of trading in different countries, and in the stocks respectively held by the group on its own account and those which are owned by various Governments. But almost certainly the biggest element in the increase is the rise in prices. The Unilever group, indeed, is faced with this dilemma: it is vulnerable, at present levels of prices, to any sharp setback; but a setback in prices would reflect a fall in trade. It wants very much what the British Government hopes for in the improvement of the terms of trade—some recession in prices to reduce the high cost of its stocks, but not so dramatic that the volume of its trade would be affected. A total reserve of £5.7 million against stock values standing in the balance sheet at £85 million cannot be regarded as excessive in these circumstances.

These two special provisions, coupled with the high level of taxation (which absorbed £16.8 million net last year, compared with £11.3 million in 1946) should certainly impress upon stockholders that token increases in aggregate profits are unlikely to be matched by corresponding increases in net profits and dividends. In any event, the dividend equalisation agreement between Limited and NV effectively limits the dividend of the former to 10 per cent, for any increase in NV's dividend of 8.9 per cent (to which Limited's 10 per cent corresponds) could only be made at the cost of paying the 300 per cent Dutch tax on excess dividends. The group suffers enough from the weight of taxation all over the world to avoid any further increase of that kind. But there are other reasons, apart from the technical complexities of the dividend equalisation agreement, for expecting the directors to pursue a policy of stabilisation. While the group's net current assets have increased during the past year from £70.4 million to £82.6 million, the bulk of this increase is represented by the higher value of stocks, and the reverse of the medal is a fall in the group's quick cash assets from £47.3 million to £32 million, and a rise in its bank overdrafts by £5 million to £12.4 million.

There is, therefore, the same evidence of increased financial strain in the Unilever accounts as in many recent company reports; the degree of pressure on current resources may not be so acute, perhaps, but even Unilever cannot indefinitely finance the ever-growing cost of stocks and capital replacement from its own resources and from its own provisions from profits. That it will do so as long as possible can be taken as axiomatic, but investment in stock on last year's scale, coupled with gross capital expenditure of £9,400,000 involved a specially heavy burden which could not be repeated without resort to new financing. Such is the prospect before Unilever stockholders. They cannot expect any increase in dividends until the prices fall (but not too much), until dividend limitation is a thing of the past, and until the weight of taxation, particularly on the Dutch partner, is lifted. To mention these factors is to expose the total lack of dynamism in Unilever ordinary stock under present conditions. But it is not, of course, to dispute the merits of the stock conceived, as it should be, essentially as a long-term holding. Only a catastrophe in prices and world trade could seriously affect the group's ability to pay steady dividends. Unilever is an equity in the economy of the whole world. And that world, during the period over which investors are entitled to take views in these days, is more likely to be an inflating world than the reverse.

Burdens on the Revenue

(By a Correspondent)

THE security of the revenue is the foundation of good government. In the past, the British people have always astonished the world by their willingness to pay taxes, and by their genius for public administration which has produced a service so efficient and so incorruptible as the Inland Revenue. Undoubtedly the enormous revenue extracted from the British taxpayer by personal assessment is still an outstanding testament to his capacity for social discipline; in this, he is not as some of his European neighbours are. Nor does he yet rebel against the principle that the present experiment in social services must be paid for largely from current revenue—which implies the indefinite continuance of a high rate of taxation. As a tax-paying subject, the British citizen is one of the most remarkable economic phenomena of all time.

But, if he ever felt any virtue at this state of affairs, he has rarely shared his moral satisfaction with the Inland Revenue authorities, and in particular with the Inspectorate of Taxes. The tax inspector is not a popular figure; he may not be hated with the same liberality that is the mark of the average Frenchman's attitude towards *le fisc*, but he is certainly more feared. He is a member of a small, highly-trained administrative cadre; but he is also one of the keepers of the financial conscience of the individual, and hence of the attitude of the public at large towards taxation. High taxation and the laxity which is always encouraged by inflation have, nevertheless, done some harm to the integrity of certain sections of the public towards taxation matters. How far have these lapses resulted from the burden of work which the inspectorate now has to handle?

Ten years ago the standard rate of income tax was 5s. in the £; in 1937-38 £298 million was paid by 3,700,000 income tax payers; for 1946-47, the standard rate was 9s.; the number of taxpayers was as high as 12¼ million and they paid £1,156 million. These total figures give some impression of the extra work which the inspectorate now has to carry out. In 1938, a married man with an income of £250 and a moderate amount of life insurance was not liable for tax. His case called for a routine check of a few minutes every year or two. The same man today may entail an hour's work a year, owing to the rise in his money income. Every point gained by the taxpayer is now worth far more, in cash, than it would have been worth in 1938; matters that would not have been pressed then, because they were not worth the time and effort involved, are now pursued to their conclusion, while matters that were worth raising in 1938 are now argued on both sides at greater length and with greater force. Businesses which are conducting the same physical volume of trade as they did before the war represent a far greater taxation problem today, because greater money values are involved, and provisions for allowances are more complicated. The transfer of farms from a rental basis to a profits basis of assessment has perhaps doubled the amount of work on tax accounts in the average country district.

This, indeed, is only the beginning. Many employers regard PAYE as the perfect device for passing the burden of tax collection from the Revenue to the employer. But there are far more incomes to be taxed, and far more administrative work to be carried out, in the tax offices. There is an intimate connection between what happens in the tax office and the contents of the Friday pay packet: therefore correspondence must be handled

quickly; tax tables must be issued on time, and code numbers accurately determined and promptly changed when necessary. Failure in any one of these directions might easily promote grievance and industrial trouble. Again EPT and Profits Tax have brought new burdens. A high proportion of EPT cases have still to be finally settled; and both taxes involve numerous adjustments to traders' accounts as agreed for income tax purposes. Double Taxation Relief has replaced Dominion Income Tax Relief, and has thus extended over the whole world the obscurities and complexities of the old scheme and the improvements—from the taxpayer's point of view—in the new scheme. Finally, the welcome if limited concessions of the Income Tax Act of 1945 have added a further array of extra work in dealing with initial allowances, balancing allowances and charges, allowances for agricultural and industrial buildings, and for expenditure on patents and research.

These additional duties have not been accompanied by a corresponding increase in the number of inspectors. There has certainly been an increase in the number of clerks—though they, being subordinate staff, have also to be supervised—but the force of tax inspectors has actually shrunk since 1938. In that year, there were some 1,800 inspectors trained to deal with business cases; since then, the force has dwindled to 1,600, of whom 100 are over 60 years old. Direct recruitment to the rank of inspector was suspended during the war, and only 60 clerks were selected by the Board of Inland Revenue for promotion to inspector. Nor was recruitment very happily managed before 1938. The Board foresaw, in the closing years of the 1914-18 war, that income tax was to become a permanently increased commitment; so it hurriedly took on staff in two large blocks, instead of gradually over a period. As a result, promotion in certain grades was disheartenedly slow during the inter-war years. Certainly, the coincidence of a dwindling expert staff with an increasing volume of work has meant a great burden on the revenue machine. That it has not broken down is due partly to the remarkable response of the inspectors to an emergency scarcely understood outside their immediate circle, and to a more selective approach to their ever-increasing work.

★

That selective approach, of course, has necessitated greater concentration on current cases, and the deferring of much work undertaken in normal times to stop leaks in the revenue. It is no accident that three years after the end of the war no special attack has yet been started on "back duty" cases; by 1921, the work of uncovering evasion of EPD was in full swing, and producing salutary results. Under-assessment of tax is, of course, a direct consequence of overwork and undermanning of the service. Even more serious is the coincidence of the maximum incentive to evade tax with weakened power of the taxation machine to detect evasion. The plight of the inspectorate seems to be well enough known to certain sections of the trading community. Evasion is necessarily a better risk—to the evader—during a regime of high taxation. The understatement of profits by £1,000 in 1938 might have been worth £300 in income tax and surtax; last year, it might have been worth up to £900 in EPT, income tax and surtax, and the new capital levy might even have raised its value to, say, £1,500. Tax inspectors take a cynical view of human nature, and their estimates of evasion and unpaid back duty tend to run high—probably much too high, for some of their guesses suggest that there might be well over half a year's revenue awaiting collection if evasion could be detected and arrears vigorously pursued.

To enforce the full rigour of tax obligations would entail a considerable increase in trained staff—perhaps by as many as 2,500. The average district inspector has a working year of about 2,000 hours (45½ hours a week, less 5½ for lunch hours, and six weeks' leave annually). In that time, he must direct the running of his district, supervise a staff of 30 to 150 subordinate officers (often twice as many as in 1938), examine 600 to 1,500 accounts, according to the size of the cases (again often twice as many as before the war), handle perhaps 60 EPT and profits tax cases, and represent the Revenue at up to twelve Local and Special Commissioners' meetings. If the proper administration of the district, including Commissioners' meetings, with attendant travelling and preparatory work, can be put at 1,400 hours, the inspector is left with 600 hours for work on accounts, including the submission of statistical returns which may take as long as the actual work of agreeing the taxpayer's liability. It is hardly surprising that he has little or no time for the pursuit of suspected evasion or underpayment of tax. Inspectors are a cautious, taciturn and perhaps even embittered guild of experts; they would welcome more encouragement than they sometimes get from above, and they are human enough to enjoy the incentive of successful prosecution when, after mature consideration, a bad case is brought before the Courts.

The Board of Inland Revenue proposes during the next four years to admit to the service 200 direct recruits to the tax inspectorate and to train 400 others by promotion for clerkships. For a time, however, this expansion will involve a further strain on existing staffs, some of whom take the view that not more than 100 inspectors can be effectively trained in their exacting discipline under a four-year scheme. Certainly, it is necessary that the new entrants should be trained in an atmosphere of purpose and realism. Moreover, older men may require an incentive, psychological as well as financial, to remain in an invigorated service. At present, it is hardly too much to say that overwork and frustration threaten the morale of the service. Offices are often overcrowded, poorly equipped, and the work—particularly on PAYE—is harassing. To main-

tain *esprit de corps* under such conditions, when the same men who are expected to maintain it are trying to perform their own urgent case work, is a feat that cannot be indefinitely sustained.

This feeling of disillusionment among the tax inspectors is reflected in the steady loss of trained officers who leave the service to take up outside appointments in which their qualifications ensure them a ready welcome. Tax evasion, in the eyes of some inspectors, is no longer a risky proceeding so much as a standard trade practice. They would agree with the dictum that Schedules D and E are not so much two different schedules of the same tax as two different taxes, under which the taxation of salaries and wages is remorselessly carried out, while there is a variable margin of profits, particularly those obtained by the smaller trader and the none too scrupulous manufacturing business, which escapes due taxation by systematic understatement or evasion. And they hold that once the trading community in any district realises that the Revenue is imbued with an active spirit, an improvement will promptly show itself in assessments —with a consequential improvement in business efficiency, for tax evasion on any material scale puts a premium on profligacy and inefficiency and handicaps the normal competitive power of the honest business man.

Such risks are inseparable from a regime of crushing taxation, and one of the best means of checking evasion would undoubtedly be to reduce the burden. The scope for reduction is inevitably limited, however, by the large-scale expenditure to which the state is committed on social services; for several years, at least, the need for an efficient and active inspectorate will be as great as it has ever been in the long history of the income tax. The tax inspector has hitherto won the ungrudging respect of those whose opinion is most valuable—those tax-paying subjects who have crossed swords with him. Inflation, high taxes and new taxes have greatly increased his burden of work; and he feels, rightly or wrongly, a certain lack of encouragement to pursue his function of protecting the revenue against dishonesty and evasion. He may, to be sure, exaggerate the extent of evasion—or at least the loss of revenue which occurs. But it would be dangerous to disregard his judgment on such matters. Modern states enjoy political and economic stability in direct measure as they can assess the liability of their citizens for taxation and collect the revenue. Britain has hitherto set an example to the world both in the efficiency of its taxing machine and the long-suffering consent of its people to be taxed. The two factors are inseparably associated, and the link between them is the capacity of the tax inspector and the respect in which the public hold him.

Business Notes

The Treasury Special Account

It has taken the American and British authorities rather longer than had been expected to decide on the form of bookkeeping to meet the provisions of the ERP agreement for segregation of the sterling proceeds of ERP grants. Now, however, a formula has been devised which suits both parties, and the result is reflected in the Bank return, which this week exhibits one of its very rare changes in form. Under the terms of the agreement, the sterling to be deposited represents, not the actual cash which the British Government receives from reselling Marshall goods or dollars, but the sterling equivalent of America's own dollar outgoings on such grants, as notified by them from time to time. It was laid down that each amount thus notified would be transferred to a segregated account in the name of the British Government at the Bank of England. Accordingly the new "Special Account" figures in the Bank return as a sub-division of the item "Public Deposits." The first visible credit to the account is for an amount of £33.4 million—appreciably more than the £22 million which, as the Chancellor recently announced, was received towards the end of June as the first reimbursement of Britain's eligible dollar expenditure during the previous three months.

This divergence between the figures, however, has no special significance. It has been agreed between the two Governments that the amount accumulated on the new account shall be kept as low as possible and that, at the outset at least, the bulk of the fund is to be used for redemption of floating debt. In fact, whatever redemption of domestic indebtedness takes place as a result of the Government's receipts from borrowing overseas (i.e. from the external deficit as a whole) occurs at the moment when the sterling is received in cash by the Exchequer. Redemption therefore proceeds quite independently of the accounting arrangements for the segregation of ERP sterling. Hence it follows that when each transfer to the Special Account is made, the Treasury will have no unemployed cash available for the purpose. Each transfer will therefore have to be financed by new borrowing; but, to the extent that the funds are used to redeem debt, the amounts transferred will be only nominally borrowed. Shortly after each transfer has been made, the American authorities will give their approval for the "use" of an appropriate part of the balance of the account for debt redemption—whereupon a corresponding amount of the nominal credit will be offset and cancelled against the nominal debt which has been created to finance it.

More precisely, the Treasury will finance each transfer by borrowing from the Bank of England (apparently against a new category of floating debt specifically designed for the purpose, but not separated in the Bank return item of "Government Securities"); each time the American authorities permit it to do so, the Treasury will "use" the special sterling to repay these borrowings. The Bank return, therefore, will show from week to week, not the aggregate of transfers to the account, but only the residual sums of which the "use" has not yet been authorised. This complicated accounting faithfully follows the requirements of the agreement. Yet so long as the money is "used" only for the purpose which the Americans had in mind when they first devised this segregation procedure, it has no effect whatsoever. It will have an effect—and that a debt-creating and an inflationary one—only when it is employed for real expenditures which Britain would not otherwise have embarked upon. Even the finance for the European clearing scheme, if it results in unrequited British exports which would not otherwise have been made, falls into this category, desirable though such lubrication of the European payments mechanism may be.

* * *

TUC on Productivity

The General Council of the Trades Union Congress received distinctly cautiously the idea of an Anglo-American Council to study productivity, but the fact that it appointed six leading trade unionists to serve marks an important psychological advance. A statement issued by the TUC last weekend shows that arrangements are already in hand through the National Production Advisory Council (the body to which Sir Stafford Cripps made his original suggestion) for a team of "official" American representatives to visit British industry, and the TUC's general attitude can be summed up in its own words that "if there is anything to be learned from our visitors, it would be churlish and short-sighted to reject the offer."

The TUC is certainly moving in the right direction, although its progress may appear to be slow. It is at any rate no longer taking a purely negative attitude on productivity. It has endorsed the idea of an Anglo-American Council, admittedly after some searching of hearts; it has decided to co-operate in a series of experiments by the National Institute of Industrial Psychology, to examine the effects on labour turnover of the simplification of industrial processes; it has also established links with such organisations as the British Institute of Management, the Government's Industrial Productivity Committee and the Administrative Staff College.

These wider horizons are most welcome, though understanding and good advice from Transport House are neither so frequent nor so forceful that they invariably percolate to the member in the factory. In this process the joint consultative machinery, which is now being encouraged, may act as a useful channel. The report on the development of consultation prepared for the Ministry of Labour's National Joint Advisory Committee suggests that considerable progress has been made, at any rate statistically, in recent

months. In 38 out of 54 industries (excluding nationalised industries) there is some form of consultation. There is, however, no indication of the number of establishments within these industries which have such arrangements, or of their effectiveness. The Amalgamated Engineering Union is now conducting its own enquiry into the operation of Joint Production Committees. This will inevitably be a one-sided document, but the union's enquiries into wartime JPCs were useful, and a parallel analysis of the peacetime machinery should throw useful light on the workers' attitude towards industrial co-operation.

* * *

Imports Still Dearer

Despite the hopes raised by the shortlived setback in American primary prices last February, Britain has been paying progressively more for its imports since the beginning of 1948. And the increase has been both absolute and relative—that is, import prices have been rising at a faster rate than export prices. During the first six months of the current year, the average price of British imports has risen by 10 per cent while the average price of British exports has risen by only 3 per cent. The Board of Trade estimates that during the second quarter, the terms of trade have deteriorated by 6 per cent compared with the average for 1947.

The main rise in the cost of imports has been due to higher prices for raw materials; these have increased by 14 per cent since the beginning of 1948 and by 48 per cent since the beginning of 1947. The extent of this rise is disquieting because raw materials must be bought at almost any price if production in Britain is to be maintained. The cost of imported manufactures showed the next largest rise (8 per cent) during the six months; prices for this class of imports rose rapidly in the first nine months of 1947, but thereafter they rose more gradually. The cost of imported food and tobacco was fairly stable in the second half of 1947 after a moderate rise during the first six months; since the beginning of 1948, the trend has again been upwards, although the rise has not been steep.

During the first half of the year, raw materials accounted for about 32 per cent of Britain's retained imports and slightly exceeded 90 per cent of the prewar volume. Food and tobacco imports, which were 72 per cent of their 1938 volume, accounted for 43 per cent of total imports. There are further price rises in prospect. An increase of 30 per cent for Canadian wheat came into force on July 1st though it will probably not be reflected in the trade accounts until October. Moreover, new long-term contracts for dairy produce and meat suggest that next season's prices for these foods may, on the average, cost 15 per cent more than last season's. But grain supplies not purchased under contract should be cheaper than a year ago; so should cotton and perhaps wool. Lead and zinc prices, on the other hand, will undoubtedly respond to the higher American level and other metals are also likely to become dearer. The omens, therefore, suggest that the cost of British imports during the next twelve months may increase still further, despite good harvest prospects in the Northern Hemisphere.

*

But the movement of the terms of trade against Britain depends in some part on the value of British exports. The rate of increase in export prices has slowed down considerably since about the middle of 1947. In the past three months raw material prices—mainly coal—have shown no increase. The slight increase in the value of exports between March and June of this year is almost entirely due to higher prices for manufactured goods. Of these, the main item was textiles, prices of which rose by 4 per cent during the second quarter; moreover, textile prices are rising at an increasing rate, whereas prices of metal goods and other manufactures are, if anything, rising at a declining rate. But it is precisely the textile group which has not been able to expand its volume of output or of exports to the scale envisaged in the export drive. It may be that textile exports are relatively dear (at one period they were almost certainly too cheap) and that metal goods and other manufactures could be further raised without affecting demand. But that is guesswork, and it makes little difference to the basic problem of the terms of trade, and little contribution towards their improvement.

* * *

"Frustrated Exports"

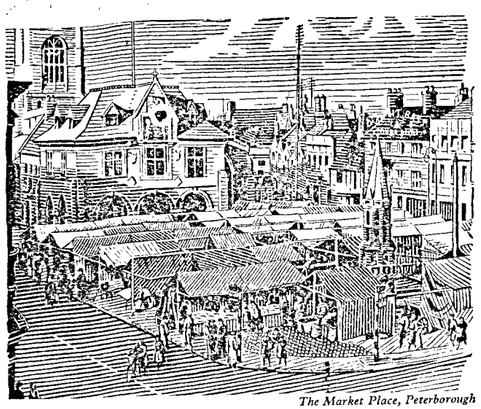
Frustrated exports are causing embarrassment not only to manufacturers who find their overseas markets suddenly closed to them, but also to those who are maintaining a large export trade. Two months ago the President of the Board of Trade set up a committee of the Association of British Chambers of Commerce to examine requests from manufacturers for permission to dispose of frustrated exports on the home market and to make recommendations to him. The committee has already met, but no information is available about its deliberations. Clearly, however, it could not possibly have finished its task in so short a time. Meanwhile, goods originally intended for overseas markets are appearing in British shops, with or without official sanction. For many articles, it is no easy matter to determine whether the goods on sale were originally intended for the export market. But for a few, such as decorated pottery, there is no such doubt.

The basic problem is to find a satisfactory definition of "frustrated exports." If goods have been specially produced for a particular market which is suddenly closed by import restrictions, a reasonable case can be made out for allowing them to be sold on the home market, provided that there is no alternative export market for them. But what of goods intended for export the quality of which turns out to be too low and the price too high? Can these be treated as genuine frustrated exports? There may or may not have been a firm foreign order for them in the first place; in any event, such goods will be least likely to attract new buyers overseas, and pressure to release them on the home market will therefore be the stronger. The home market is just as profitable as the export market—and for certain goods more profitable. Hence there is little economic incentive, in these circumstances, to make every effort to export, though the controls do what they can to guide production towards the export market. Moreover, once the general idea of frustrated exports is conceded, or even export rejects are allowed on the home market, the door is pushed ajar, if not wide open, for evasion, unless the Board of Trade goes in for a large and costly system of inspection.

Repercussions on those manufacturers who are actively engaged on export business are no less important. Before the war, most of them were well established in the home trade; now their prewar customers take second place to overseas buyers. Yet they sometimes find, to their mortification, that other producers, some of whom may have started production since the war, can sell on the home market goods which are scarce, command a high price, and may be of inferior quality. The faithful exporters can be excused for asking if this is a fair reward for maximum effort.

* * *

Anglo-Italian Trade Dilemma



The second meeting of the Anglo-Italian Joint Standing Economic Committee closed rather inauspiciously in Rome last Saturday. The full report is not yet available, but it is known that the discussions achieved little success. Italy has been anxious about the recent depletion of its sterling reserves; it has a marked deficit with the sterling area. If the present rate of expenditure continues, its available sterling would fall within twelve months below the level required for a minimum working balance. Italy, therefore, wanted to export more so-called non-essential goods to Britain: the availability of essential exports on either side is limited. Britain, on the other hand, was not willing to import larger quantities of peaches and other luxuries, unless the Italian Government was in turn willing to guarantee the sterling-dollar crossrate on its free market at parity. If the free foreign exchange market was to be kept open, such a guarantee could only be effective if the Italian Government purchased sterling as might be necessary, and that it was not willing to do.

In such circumstances, agreement was not possible. The official communiqué announced that the question of the sterling-dollar crossrate was reserved for further discussion, while modifications were made to the trade programme agreed last January to effect a "considerably higher level of trade between the two countries during the second half of the year." In fact, it is estimated that trade between Italy and the sterling area should increase by between £2,500,000 and £3,000,000 each way. Most of this increase, however, is represented by essential exports. Final judgment on the talks must be reserved until full details are made known. But the difficulties encountered clearly emphasise once more the need for a proper multilateral trading and payments system in Western Europe. It is high time that the contrast between "essential" and "non-essential" trade disappeared from the vocabulary of such negotiations. One day it may be used, not by Britain, but against Britain.

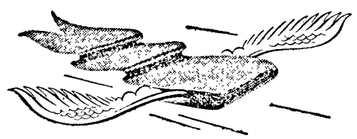
Base Metal Prices Again Raised



The anticipated increases in American lead and zinc prices were announced at the end of last week. Lead is 2 cents dearer at 19.50 cents a lb. and zinc 3 cents dearer at 15 cents a lb.; the

The Market Place, Peterborough

Local markets give an accurate picture of the produce and the needs of the agricultural areas they serve. These may differ very widely with the district, and it is the task of the banker to ensure that he is fully acquainted with the special conditions affecting farming in his area. The varying needs of the farming community are particularly well served by Barclays Bank, who have developed a unique system of Local Head Offices covering England and Wales. The Local Directors of these Offices are men with an intimate knowledge of the districts they serve. Thus they are in a position to deal quicky and effectively with all the varied problems on which farmers may wish for information and assistance.

BARCLAYS BANK LIMITED

Export of
British Cotton Textiles

The urgency of increasing exports of British Textile goods to the hard currency countries needs no emphasis. How can such exports be financed? What Foreign Exchange regulations are involved? How can the exporter ensure prompt reimbursement? Our intimate knowledge of international trade enables us to offer expert and up-to-date guidance on these and similar questions.

NOW READY *FIRST MONTHLY ISSUE*

THE BRITISH BUREAU OF NON-FERROUS METAL STATISTICS

The British Bureau of Non-Ferrous Metal Statistics announces the first issue, covering June, 1948, of a monthly Bulletin which contains more than fifty tables dealing with the production, movement, consumption and stocks of copper, lead and zinc throughout the British Commonwealth. The Bulletin also contains ten tables giving details of consumption of tin, antimony and cadmium in Great Britain.

Later issues will be extended to include other non-ferrous metals. Each Bulletin will be published within four weeks of the end of the month to which its contents refer, and will cover all stages of the industry in proper sequence—mining, smelting, refining, fabricating and shipment.

It will be essential to everyone interested in world trade and the supply of vital raw materials—merchants, bankers, brokers, manufacturers, governments and research organizations.

The Bureau has been founded as a non-profit-making organization by the British Overseas Mining Association, the British Non-Ferrous Smelters Association and the British Non-Ferrous Metals Federation. It has the active support of the Ministry of Supply and of all the important non-ferrous metal producers and consumers in the British Commonwealth.

The subscription to the Bulletin, which covers twelve monthly issues, is £10 10*s.* 0*d.* ($42.00 for subscribers in Canada and the U.S.), plus cost of air or surface mail to addresses outside the United Kingdom. Subscription forms and any further information can be obtained from the

BRITISH BUREAU OF NON-FERROUS METAL STATISTICS,
132, HAGLEY ROAD, BIRMINGHAM, 16, ENGLAND

sterling equivalents of the new prices are approximately £108 10*s.* a ton for lead, compared with the British price of £90, and £83 10*s.* a ton for zinc against £75. It seems extremely likely that the copper price will also be raised by 2 cents to 23½ cents a lb., or £131 a ton, compared with the British price of £132. Both the Phelps Dodge Corporation and the Anaconda Copper Mining Company have already increased their prices for September deliveries to this level. American non-ferrous metal producers have hitherto been reluctant to raise their prices in order to encourage long-term demand. But for many months past marginal requirements have been covered at prices nearer the new levels. The recent increases undoubtedly reflect increasing inflationary pressure in the United States.

American consumption of non-ferrous metals has been maintained at a high level this year, and a significant proportion of demand has been met by imports. The United States is using more than half the world's output of copper and nearly half the world's lead and zinc. In the short run, therefore, the only respite for other users of non-ferrous metals is a decline in American industrial activity. Zinc, which was in much freer supply last year, became short when the American subsidy on home produced metal was abolished and a number of high-cost mines had to close down. But there has also been an expansion in zinc consumption, and its use has been extended in many directions. Copper production has increased, but it is still thought to be below world requirements, and lead holds the palm as the base metal in shortest supply. Non-ferrous metal producers have so far been relatively free from labour troubles, although the Mexican strike in April reduced the output of both lead and zinc, and at the moment strikes in the United States are likewise affecting the output of these metals. The new prices—they are peak prices for lead and zinc—should stimulate world production so long as production costs do not expand still further. Nevertheless, as past experience has shown, expansion may take a long time.

The New York market is only a guide to world prices, but in the absence of the London Metal Exchange there is no better guide, and producers outside the United States will undoubtedly tend to follow New York's lead. In the past, British manufacturers have had to pay more for copper and zinc than the official New York quotations, but less for lead, which comes mainly from Australia. Yet, despite this discrepancy, British lead and zinc prices have followed changes in American prices fairly closely. The Ministry of Supply has never disclosed its pricing policy. It obviously averages out its profits and losses, but it is not known whether it balances a current profit on one metal against a current loss on another, or whether it averages out its profit and loss for each metal separately over a specified period. Nor is it known what profit is in hand or what contracts have still to run. It is believed that nearly 24,000 tons of Canadian zinc have been purchased up to the end of the year at an average price of approximately £64 a ton. But Britain's main source of supply is the United States, and unless this year's requirements have already been covered, the British zinc price is likely to be raised. Again, although Britain's lead imports come largely from Australia, it is probable that the lead price will also be increased on the expiration of current contracts, but not necessarily to the full extent of the New York quotations. On the other hand, the Ministry has already covered its copper requirements for 1948 and even partially for the first half of next year. Home consumption has averaged 31,000 tons a month between January and June, which is not much above the scheduled monthly rate of 30,000 tons, particularly as in January alone consumption totalled over 37,000 tons. The chances, therefore, are that the copper price may not be increased unless the Ministry decides to fix home prices on the basis of current replacement costs. That depends, presumably, on its view about future price trends—in which its judgment has been wrong more often than it has been right.

* * *

"Shortfall" or "Failure" in Cotton?

One of the conditions which had to be achieved if the cotton industry was to play the part required of it in the national economic effort was (as the "Economic Survey" explained) an increase of 58,000 in the labour force by the end of 1948. Another was the redeployment of labour; this, the President of the Board of Trade told the Lancashire cotton industry in March, would be the keynote of the production drive. Neither of these conditions seems to be making rapid progress towards fulfilment. Mr Ness Edwards admitted in Parliament last week that there would be, at the rate of recruitment up to May, a "shortfall in relation to the manpower target"; but he denied that the "shortfall" amounted to a "failure" of the recruiting campaign. In fact, as the *Cotton Bulletin* for June showed, the cotton industry by the end of May had gained 9,881 workers since December. This left 48,000 to be found during the rest of the year.

The other arm of the pincer, redeployment, does not seem to be doing any better. In the cotton weaving trade it has come to be identified with the question of applying the recommendations made by the Moelwyn Hughes Report on methods of payment. Those recommendations were examined in *The Economist* on June 12th; it was then stated that the manufacturers' association and the trade unions had agreed on a twelve weeks' trial to ascertain how they would work. The trial agreed upon was not of a particularly valuable kind, since the sheds conducting it would not actually work the new system, but would merely keep records of what the earnings might have been if the system had been in force. But even this experiment has only just started, and there is still ample room for delay before it leads to any material results.

The trial has, indeed, produced as much disquiet as hope. There is uneasiness not only over the delay, but also over the way the negotiations for its introduction may go within the industry. The Moelwyn Hughes recommendations were based on a scheme prepared by Associated Industrial Consultants, Ltd., which implied not only a recasting of the out-of-date wage system but also a recalculation of the work-load in each shed. If the first is done without the second, then the essential incentive to effort may be missed, and the trade may merely be presented with a new Uniform List based on a generalised time schedule for each type of operation in the industry. This uneasiness was reflected in a letter published in the *Manchester Guardian* this week from a director of Associated Industrial Consultants, Ltd., Mr R. J. Gigli. The trade, in Mr Gigli's view, is chasing the shadow and losing the substance of the Moelwyn Hughes report. Mr Gigli's letter helped to show the extent to which redeployment is entangled in the wage structure. Industrial consultants have applied the new system of payment in a number of sheds, but they cannot apply them generally: the Uniform List still has statutory authority, and experiments can in practice only be attempted where they do not happen to conflict with it. The urgency of the matter is underlined by the conclusions drawn by the Nelson weaving industry from its "Beat the Crisis" campaign. This effort to achieve an increase of 10 per cent over a twelve-week period succeeded only in achieving an 8 per cent increase in its best week. The Nelson manufacturers concluded in their report that more could not be done so long as the wage structure remained unchanged.

* * *

Dearer Electricity in Winter

The Minister of Fuel and Power told the Commons last week that he had "asked" the British Electricity Authority and the Area Boards to put into effect certain of the recommendations of the Clow Committee. Among these were the proposal for higher charges in the winter months, to be offset by reduced charges in the rest of the year. The process which now begins may throw some light on the degree of independence of the new nationalised industries from political control. The Electricity Authority has to consider what it will do in response to the Ministry's request—which is, as yet, no more than a request. Assuming that it agrees with the proposal, there will be two main problems for consideration. The first is the period of the year during which the higher tariff shall operate. The Clow Committee preferred a three months' period to a six months' period; consumers, it thought, would be more likely to pay attention to the shorter period. But it has to be remembered that meters are not all read on one day; meter-reading is continuous, and it is quite impracticable to change the meter-reading method for this purpose.

If, therefore, the aim is to achieve the maximum deterrent effect between December 1st and February 28th, it would seem necessary to start with the group of meters which is read on January 15th. Consumers in that group would pay the higher rate on all the current they used between October 15th (their previous reading) and January 15th. The operation would conclude with the meter readings on April 14th or 15th, and would by then have covered all consumers; but the last group, like the first, would get a good deal more warm weather in their high-tariff period than the groups in between. Only one group out of 90 or so would pay the higher rate on the whole of the three months from December 1st to February 28th.

This suggests that, in deterring consumers from using current in the months when peak demand is greatest, the Electricity Authority may also have to deter them from using current in months when peak demand is not so great; and it is not to be

supposed that this will be any more palatable to the electricity industry than it is to the consumer. A similar consideration applies to the crucial point of the whole scheme—the extent of the price differential to be established between the winter tariff and the tariff for the rest of the year. A winter tariff so high as to be really deterrent may produce economy first in off-peak hours, and only secondarily at the peak periods themselves. On the other hand, a slight differential can hardly have any useful effect at all.

* * *

Remitting Profits from Argentina

The normal resumption of remittances of earnings from Argentina to Britain is now to be permitted, according to a message this week from Buenos Aires. This is apparently the result of the settlement of a number of questions arising out of the Andes agreement, principally concerning the quantities of meat by-products to be purchased by Britain. Experience teaches that all announcements emanating from Argentina regarding agreements with the government of that country require to be scrutinised with the utmost care. On the occasion of the announcement at the end of June, the official communiqué stated that a remittance of earnings on old capital would be authorised "in accordance with the availability of foreign exchange." Presumably this qualification still applies, and may still operate at the behest of the Argentine authorities to put a stop at any time to any remittances that may now be authorised. However, it is to be presumed that the British negotiators did extract some concessions in return for the agreement on meat by-products, but until the British companies concerned have succeeded in their applications to remit it would be as well to withhold judgment. In London, there is some confidence that the Argentine attitude on this question will be satisfactory, not least owing to the unwillingness of the American Government to ease Argentina's present dollar difficulties.

Anglo-Argentine trade is still heavily in Argentina's favour, so that there should be ample supplies of sterling to enable these remittances to be effected. No official estimate of the amounts involved has been made available, but a figure of up to £10 million has been mentioned. This is no unconsidered trifle, and it is therefore inexplicable that the question of sterling remittances should have been put so low on the agenda for discussion between the two countries. Is this one more example of Foreign Office indifference to British overseas investments?

In a comment (page 1079 of *The Economist* of June 26th) on the Argentine Government's decision to establish a more favourable rate of exchange for new foreign capital in Argentina, it was suggested that this would give unqualified help to the export from Argentina of a wide range of goods to which the new free rate would apply. A correspondent in Buenos Aires writes to point out that, in fact, this new rate applies exclusively to financial services, remission of profits, etc., and that, in practice, any Argentine manufactures to which the new, and quite separate, export rate might apply, such as books and leather goods, have now priced themselves out of the market. It was thought that the relaxation of import licensing which was announced at the same time for goods from soft currency countries represented a real change in Senor Miranda's attitude, and that "inessentials" such as whisky and motor cars would be imported without restriction into Argentina. This correspondent points out that no exchange permits have, in fact, been issued, at least through direct channels, for textiles, automobiles and the vast majority of so-called "inessentials," and that in Buenos Aires it is difficult to see the reason for the optimism expressed in the British press regarding prospects for increased exports to Argentina.

* * *

Mexican Peso in Suspense

No new official exchange rate has yet been fixed for the Mexican peso since the announcement a fortnight ago that the official rate of 4.85-4.86 pesos to the US $ was being abandoned. It is clear from a statement made by the Mexican Finance Minister, Senor Ramon Beteta, at the beginning of this week that a flight of capital precipitated the Government's move. According to Senor Beteta, sales of dollars during the first 21 days of July totalled more than $19½ million, and reduced the reserve to $114 million. The latter figure presumably refers to the official holdings of gold, dollars and silver. Senor Beteta added that it was impossible to predict when the new exchange rate would be fixed, but reports from Washington intimate that this may happen within the next 15 days.

These reports also speak of a rate which has been agreed with the International Monetary Fund of one Mexican peso to equal 15 US cents. This would be equivalent to a rate of 6.66⅔ pesos to the $ US, or a depreciation of more than 25 per cent, and the approval of the International Monetary Fund would accordingly be necessary. Meanwhile, the peso has changed hands at 7 to the $ in unofficial dealings, and the Finance Ministry has issued a decree fixing a provisional exchange rate of 6.50 pesos to the $ for payment of Mexican taxes by foreign corporations. A complete embargo has been placed upon all exports of gold until the new official rate is fixed, but it is not clear whether internal sales of gold have also been stopped.

* * *

Development Councils

Parliament adjourned without reaching any conclusion in the protracted skirmish over Development Councils for industry. Trade union dissatisfaction with the slow progress made was expressed again by Mr Vincent Tewson, general secretary of the TUC, in a circular reproduced in the July issue of *Labour*. Ten months (the circular pointed out) had already passed since the Industrial Organisation Act received the Royal Assent. Yet the only Development Council so far set up was the Cotton Board, for which "there were specially favourable circumstances"; that is to say, the Cotton Board already existed before the Act was passed, and needed no more than a new constitution. Mr Tewson discussed the proposals of employers for non-statutory bodies, and warned trade unions that

> since the negotiations are being closely watched by employers' organisations generally, a departure from the Development Council form in one industry can be expected to prejudice the establishment of Development Councils elsewhere.

The Board of Trade (through Mr Belcher) was pressed in the House last week for a statement of its intentions, but Mr Belcher gave nothing away. He refused to say what would be done in the pottery industry. He would not promise that no development council would be set up against the wishes of industry; at the same time the reception he gave to assurances of support from organised labour could hardly have been more guarded. He made it clear that patience was not yet exhausted:

> The intention of the Government is to secure the agreement of industries to the setting up of development councils, and we are proceeding towards that end, but it involves negotiations, and I am afraid that the negotiations are taking rather a long time.

Clearly it is sensible to cling to the hope of agreement; the advantages of Development Councils imposed on unwilling industries are hard to see. It is worth noting that in the course of the negotiations the attitude of industry has become a good deal more clear-cut, as a letter on another page from Sir Frederick Bain, President of the Federation of British Industries, shows. The opposition is not to central bodies, but to bodies appointed by the Government and not responsible to the industry. Sir Frederick Bain has stated elsewhere that industry is prepared to accept "an independent element"; as to the size and responsibility of the independent element there is still room for clarification. But it may be that if the Government is prepared to apply the Industrial Organisation Act with discretion and flexibility, the dispute may yet be settled without using the steamroller. Considered in the light of that possibility, Mr Belcher's reticence is intelligible.

Records and Statistics

Ever since its earliest days, over a century ago, THE ECONOMIST has taken as its task, not merely to comment on the passing scene of events, but also to provide a permanent record of facts, both statistical and documentary.

In these days of paper shortage, this task cannot be adequately performed within THE ECONOMIST itself. Accordingly the RECORDS AND STATISTICS Supplement to THE ECONOMIST was started early last year to take over this function and perform it in a fully adequate, specialist form.

The subscriber to RECORDS AND STATISTICS who preserves his copies has available a rich storehouse of current information. Not only can he build up a continuous series of several hundred statistical items, he also has access to all important public documents, conveniently digested.

For those who look back or forward beyond the current week, RECORDS AND STATISTICS is the indispensable complement of THE ECONOMIST.

RECORDS AND STATISTICS is available on postal subscription only. The subscription rates are £2 10s. a year for RECORDS AND STATISTICS alone or £5 together with THE ECONOMIST.

Assistance for Vactric

The Distribution of Industry Act, 1945, sought to provide inducements to industrial firms to place their new factories in Development Areas. Successful persuasion sometimes brings responsibilities in its train; the Treasury's advance of £500,000 to Vactric Limited (announced last week), illustrates the process. The Vactric loan is the biggest yet made under Section 4 of the Act; this authorised the Treasury to advance money to firms, operating or proposing to operate in Development Areas, which were short of funds but which otherwise had good prospects eventually of standing on their own feet. It is made on the recommendation of the Development Areas Treasury Advisory Committee; there have previously been sixteen such loans, totalling £852,700. Seven loans went to firms operating in South Wales, six to firms in the north-east, and three to firms in Scotland.

The Distribution of Industry Bill (not a Labour Government measure, but one introduced by Mr Churchill's Government) obliged firms to notify the Board of Trade of their intention to erect any industrial building with a floor space of more than 10,000 square feet. It also empowered the Board of Trade to prohibit industrial building if it appeared that "the provision of further industrial premises in any area would be seriously detrimental to the proper distribution of industry."

Vactric Limited began in 1944 to seek a new factory; they agreed to place it in Scotland, and occupied a temporary factory at Chapelhall pending construction of a new building. "In embarking on the new programme of production in Scotland," to quote from the chairman's speech last year, "we were deliberately and willingly serving one of the main economic purposes of the Government, both of the (then) National Government and of the present Labour Government." A factory was built to their specification on the Newhouse Industrial Estate, and was leased to them by Scottish Industrial Estates, Limited—which is controlled and supported by the Board of Trade. They expected it to be ready by December, 1945, but this proved optimistic, and they were not able to move in until two months ago.

In the meantime it had become clear that finance in the post-war world was not so plentiful as industrialists had naturally hoped. The company sought additional finance last year for the purpose of extending its production and occupying the new factory, but its efforts were not successful. At the same time it found itself with far larger stocks than had been expected. The burden of stocks was aggravated, as last week's statement said, by "the free delivery of raw materials for which substantial orders had been placed during periods of severe market restriction"—a phrase which serves as a reminder that shortages of industrial materials are not always as great as they may appear on paper. In the last few months the case was put before the Treasury Advisory Committee, which found the company's trading prospects good enough to justify the advance of £500,000. (It will also have the advantage of overdraft facilities up to £250,000 from its bankers.) The terms of the advance make it clear, however, that this is no easy path to expansion. The loan is repayable within 5 years, and is elaborately secured on the company's assets and goodwill. No ordinary dividends are to be paid without the previous consent in writing of the Treasury. The company accepts a financial adviser nominated by the Treasury, and three directors, including the chairman, are to be Treasury nominees. It reflects no little faith in the ultimate prospects of the company that its 5s. shares should have risen from 5s. 7½d. a fortnight ago to a nominal level of 6s. 3d.

SE Centralised Delivery

The opening of the new Stock Exchange department for the centralised delivery of registered securities has been favoured by the quietest week in Throgmorton Street in the past three years. A full test of the machinery may not come until after the next settlement, but so far it has worked with expected smoothness. This new department results from prolonged discussion and there is general agreement that it will effect worthwhile economies in brokers' office overheads and staffs. The proposed machinery appears to be well devised for its purpose. Members are obliged to collect securities from the department although it is left optional for them to make deliveries. Transfer deeds may be delivered between the hours of 9.45 a.m. and 12.45 p.m., collections must be made daily before 1.15 p.m. and cheques may be delivered up to 1.50 p.m. and collected up to 3 p.m. One interesting departure from the original scheme, as announced in June, involves a change in principle. In consequence of representations from the gilt-edged market, it has been decided to exclude gilt-edged securities (dealt in for cash) from the scheme for the present. It was feared by members that the confidential nature of major transactions for cash in the gilt-edged market might be exposed to undue scrutiny as a result of canalising delivery through the new department.

* * *

Colliery Preference Capital

By a majority decision the Court of Appeal has granted permission to Chatterley-Whitfield Collieries of Manchester to repay its entire preference capital of £200,000, thus reversing an earlier order of the Palatine Court, Liverpool, which restrained the company from doing so. The issue, which may have important consequences for preference shareholders in some colliery companies, is associated with Section 25 of the Coal Industry Nationalisation Act, 1946, which sets out to adjust claims "as between classes of debenture and shareholders of companies having assets transferred" under the Act. In this case, an important section of the shareholders opposed the repayment plan on the ground that there was a reasonable expectation that they might obtain greater benefit, eventually, under Section 25 than they would by repayment at present. The colliery company argued that, having been deprived of much of its business by coal nationalisation, its capital structure had become top heavy and that the preference issue should therefore be repaid.

The Master of the Rolls, in his judgment, linked the effect of Section 25 of the Coal Act with Section 55 of the Companies Act, 1929, which deals with the Court's powers to reduce a company's capital. Lord Greene took the view that the existing capital of the company was excessive in the new circumstances. Therefore "a company would be guilty of gross financial ineptitude if, finding itself in possession of preference capital that was not earning its keep, it did not take steps to reduce the capital." It might be that the terms reached at some future date by a tribunal not yet set up might be less favourable for the preference holders than the terms now offered.

Lord Justice Evershed, however, supported the decision of the lower Court and argued that "ordinary shareholders ought not to regard the preference shareholders as a burden to be got rid of as soon as sufficient funds were available for the purpose."

This is not the first case on the point; indeed earlier litigation in other instances has shown similar disagreement about the presumptive rights of preference shareholders under Section 25. It is, however, the first case arising from the Section which has come before the Court of Appeal. Leave to appeal to the House of Lords having been granted, it rests with the litigants to seek a final decision from that august tribunal.

*

It is not only the capital of colliery companies which has become excessive by reason of nationalisation. This week, Stephenson Clarke, the coal distributors, have announced that £3,500,000 which the company has received as compensation for railway wagons will be applied in repayment of the company's debenture and preference capital. The principle is the same as in the case of the colliery companies, but in this case, of course, Section 25 of the Coal Industry Nationalisation Act does not apply. Under the scheme to be submitted to the court, £1,261,267 debentures are to be repaid at 104 and £675,000 12 per cent 10s. preference shares at 23s. per share, both prices excluding accrued interest and dividend. The terms are, in fact, somewhat better than the strict entitlement of the two classes in the event of liquidation; furthermore the problem is simplified in this instance as all the ordinary capital is in the hands of Powell Duffryn.

Transport Securities Valuations

There have been few cases of opposition by stockholders to the valuations fixed by the Transport Commission for the 81 stocks of the 35 railway and canal undertakings whose value was left undetermined under the terms of the Transport Act. It has been part of the duties of the Transport Tribunal to hear and adjudicate on the evidence submitted by stockholders against the rulings of the Commission. The Tribunal has, in addition,

revised the valuations of the stocks of four companies set by the Commission although stockholders had not opposed them. Of the nine cases recently reviewed by the Tribunal only two were the subject of opposition by stockholders. The Tribunal has agreed to revise the value of the £160,000 of stock of Calder and Hebble Navigation from £20 per cent to £32 per cent after the stockholders had suggested £40 per cent on the basis of the rental figure. And in the case of Aire and Calder Navigation the opposition succeeded in obtaining a higher value for two out of four of the stocks of the company, although the final award for the ordinary stock was unchanged from the Tribunal's original figure of 66⅔ per cent after a revision to 83 had been sought. The case for the higher figure had been based on the not unreasonable submission that the annual average dividend on the ordinary stock over the past 44 years had been 4.31 per cent. After an adjournment from July 20th, when fresh evidence was demanded from the Transport Commission, the case of Lee Conservancy Board was closed on July 28th and the findings announced some days later. Here the rulings of the Commission had not been contested by stockholders, but the Tribunal itself had differed from the Commission in its valuation of the 3½ per cent Debenture stock which it raised from £110 per cent to £101 10s. per cent.

The Transport Commission has recently announced its intention to pay a half-year's interest at the rate of 1½ per cent on the stocks of such securities whose value is not decided by August 7th. On present reckoning, it seems likely that six stocks will qualify for this payment, which will be on the basis of 80 per cent of the provisional valuation placed on the stocks by the Commission. Where a dividend has not been paid on an issue in recent years and the stock has only a nominal value, the interest payment will be postponed until a final valuation has been fixed and the stock converted into 3 per cent Transport Stock. Subject to this latter proviso, interest payments should be forthcoming on the stocks of Easton and Church Hope Railway, East Kent Light Railways, Kent and East Sussex Light Railway, King's Lynn Docks and Railway, Trent Navigation and Hereford and Gloucester Canal.

EMI Note Issue

The placing of £2,000,000 4 per cent ten year notes at par by Electric and Musical Industries announced at the end of last week is intended to replace a bank loan of £1,313,000 which has arisen since June 30, 1947, the date of the latest published accounts of the company. Together with the recent issue of 500,000 1s. ordinary shares of Decca Record at 17s. 6d. a share, this note issue reflects the deterioration over the past year of the cash position of radio and electronic companies, an experience which has been shared by most industrial concerns. Few companies have escaped, least of all the biggest, as is evident from the latest accounts of the Unilever group—which is the subject of a leading article on page 235 of this issue—and from the current issue of capital by Imperial Chemical Industries. Although only a provisional balance sheet for the year to June 30, 1948, is available for EMI, it is clear from the rise in the value of stocks from £4,135,598 to £6,250,000 that the working capital requirements of the group have increased well beyond the capacity of its permanent capital plus reserves to carry them. In a memorandum to shareholders explaining the need for the issue of notes, the company points to the increase in turnover in 1948 to £8,000,000 (one-quarter of which is accounted for by exports) "at costs and prices much above prewar levels." In addition there were outstanding capital commitments amounting to £500,000 at June 30, 1947.

The directors of EMI somewhat naturally express a preference for obtaining additional capital by means of an issue of notes; these are indeed dog days in the capital issue market, which has in front of it the task of absorbing the big ICI issue. They have also been at pains to indicate that the issue of notes does not preclude them from obtaining further bank accommodation. A similar case of acute capital shortage is provided by the latest accounts of Patons and Baldwins which are analysed this week in the *Records and Statistics* Supplement. Ordinary shareholders must view such developments with concern, since its logical end must surely be reduced dividends. Despite the burden of taxation, it is becoming more than ever inescapable for companies to provide a greater part of their additional new capital and replacement requirements out of profits.

Shorter Notes

The Board of Trade interim index of industrial production fell from 124 per cent of the 1946 average in April, to 118 per cent in May—a provisional calculation. This fall is due to the incidence of Whitsun holidays. The index for May was still appreciably above the figure of 110 per cent for May, 1947. The largest proportionate decline occurred in the mining and quarrying group.

*

The United States Department of Agriculture has recommended that American farmers should sow only 71,500,000 acres of wheat in 1949, or 8 per cent less than this year. The Department has estimated that the reduced area would produce 1,100 million bushels, compared with the current crop of 1,242 million bushels. This prospective loss of exports to Europe can be made good by a further expansion in European production, given an adequate supply of fertilisers and equipment—and favourable weather.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Unilever Group; Patons and Baldwins; Canadian Eagle.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked '+'), and those paying 3 per cent or less will be repaid at the latest date (marked '−'). (n) Net yields are calculated after allowing for tax at 9s. 6d. in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (g) Also a capital bonus of 2½ per cent free of income tax worked on 15 per cent basis. (l) To latest redemption date. (m) 15 months Yield Basis 25%. † Free of tax.

COMPANY MEETINGS

BRITISH PLASTER BOARD, LIMITED

VARIETY OF PRODUCTS

THE RT. HON. LORD BELPER'S SPEECH

The thirty-first annual general meeting of the British Plaster Board, Limited, was held on the 29th ultimo at 20, St. James's Square, London, S.W., the Rt. Hon. Lord Belper (chairman of the company) presiding.

The chairman said: Ladies and gentlemen,—There have been certain changes among the members of the board since our last annual general meeting.

Mr W. G. Allen and Mr B. J. Cafferata both retired during the financial year under review after many years of service. By mutual arrangement Mr Allen has kindly agreed to be available to render advice and Mr Cafferata is acting in a consultative capacity and is doing much useful work for the company.

A few weeks ago, Mr Harry Ford also resigned from the board, in view of his advancing years. I am sure we all wish him every happiness in his retirement.

Mr Durham has been connected with the company for a long time and it was with much pleasure that we welcomed him to the board almost a year ago. His wide knowledge of mining and his all-round industrial experience is proving of great benefit.

SCOPE OF GROUP'S ACTIVITIES

It is not always appreciated that the British Plaster Board, Ltd., and its subsidiary companies supply the building industry not only with plaster board, but with many other important materials. In addition, a wide range of trades and professions, apart from those connected with building, are supplied with a variety of products, and I draw your attention to the list of the main users, as set out with the names of your company's subsidiaries on the last page of the report and accounts for the year to March 31, 1948. In view of the number of these products, I shall only comment upon a selected few of particular importance and interest.

GYPSUM INTERESTS

The rate of extraction of gypsum rock from our mines has reached the level aimed at, and the total for the year under review is therefore very considerably above anything achieved before.

The mechanisation of the mines has been completed to the degree planned and is the main factor in securing the tonnages won. There is now therefore mining capacity sufficient to meet the full gypsum requirements of Great Britain, without recourse to importation from abroad, as was the practice to a large degree in prewar days.

In the production of plaster, we have been severely handicapped through slow delivery of essential machinery in the race to provide our share of the country's full needs. Outputs, however, have been substantially increased. A new unit, of considerable size relative to the total outputs, has been brought into production recently by Cafferata & Co., Ltd., and the rest of our new projects for the production of plaster should be completed early next year.

In the case of plasterboard, there have been improvements in the rate of production at all our factories, and our two new units are now in operation. The arrears of outstanding orders have been steadily reduced for some months past, and this rate will be accelerated as the new units are tuned up to full output. Many of you will be aware that there are still restrictions imposed by the authorities upon the use of plasterboard in the building of houses, but this matter is now being reviewed with the departments concerned.

ROOFING FELT GROUP

Your two companies producing felts and other products have had a successful year in supplying far more than ever before, and of a quality which is second to none.

These organisations are keenly alive, as is the rest of your group, to the imperative needs of the country for large outputs, in relation to available raw materials and manpower, of the right goods at a reasonable price.

There are some difficulties over the supply of essential raw materials, which require constant attention in collaboration with the Government, and it is to be hoped that this problem can be eased

PAPER

I am able to report that the output from your paper company has also been increased and that the total for the year is satisfactory for the size of the installation. Here, particularly, the obtaining of raw materials is difficult, especially in regard to the right quality.

DIE STAMPINGS, PRESSINGS, ETC.

During the year, Gill Stampings, Ltd., completed the transfer to their new and enlarged premises in Birmingham, and a substantial quantity of new machinery has been introduced. The organisation of the transfer was carried out successfully, and production was maintained at a high level throughout. The number of different industries supplied is considerable, and the prospects of the company under its keen management are good.

In the last few weeks of the company's financial year we acquired J. Perks and Son (Forgings), Ltd., who manufacture steel drop forgings and allied products, near Birmingham, it being the opinion of your directors that this new acquisition forms a useful expansion of the group's interest in the same broad field as that occupied by Gill Stampings, Ltd.

EXPORTS

Considerable attention has been paid throughout the group to exports and, as mentioned above in the case of Gypsum Rock, to the elimination of imports. Progress has been made in direct exports, and there have been large increases in the supply of materials entering into the manufacture of goods exported by other concerns.

VISITS ABROAD

In the earlier part of this year your joint managing director, Mr W. S. Trimble, and I paid a visit to South Africa, to consult with our colleagues there on a number of problems in connection with our associate company, Gypsum Industries, Ltd.

The new Plaster Mill at Cape Town has recently come into production and the new plasterboard plant will be in operation within the next month or so.

The potentialities for the company's products are undoubtedly considerable, and we look forward to a promising future for this concern.

We are happy to have with us several members of Gypsum Industries, Limited, who are studying the operation of our group. The chairman and secretary of that company propose to visit us in October of this year.

With the easing of travel restrictions visits are being made by several of our executive directors to Canada and the USA as well as South Africa.

There is no doubt that it is becoming increasingly important to maintain and increase our contacts in other countries, to gain new ideas, to study the needs of foreign markets, and generally to promote our export trade.

NEW PRODUCTS

Recently there has been appointed a development manager for the group in order more rapidly to promote full-scale manufacture of new products. The central laboratory and its organisation are being enlarged to encourage still more active research.

Last year a full-time personnel officer, with considerable experience of personnel relations, was appointed to look after the many problems involved in providing proper working conditions and satisfactory rates of pay.

It is with satisfaction that a letter was received recently from the Ministry of Works, thanking those within our industry for the work in running the voluntary control of plasterboard. You will be glad to know that since its inception in the early days of the war your company has taken a leading part in operating this voluntary control.

BRITISH INDUSTRIES FAIR, BIRMINGHAM, 1948

Your company decided to exhibit at the Birmingham section of the recent British Industries Fair, especially in relation to the export market.

We were greatly honoured by a visit from Their Majesties, with whom many of the exhibits on our stand were discussed.

THE DIRECTORS' REPORT, BALANCE-SHEET AND ACCOUNTS

As in past years, I assume it is your wish that the directors' report, the balance sheet and the accounts be taken as read, since they have been in your hands for the prescribed period.

You will, no doubt, observe that the form of the accounts has been altered, in order fully to meet the requirements of the new Companies Act.

I feel the consolidated balance sheet requires little explanation and such remarks as I make will also cover the parent company's balance sheet.

The net value of the fixed assets has been increased by approximately £400,000 and you will note that the cost of acquisition of John Perks and Son (Forgings), Limited, to which I have already referred, was £92,313.

As noted, a further £490,045 is due to be expended on the completion of our present projects, and the liquid position is such that these further expenditures can be readily financed.

INCREASED PROFITS

The consolidated profits for the year, before taxation, at £827,186 show an increase amounting to £181,542 over those of the previous year. On the face of it, this is a substantial increase, but it must be remembered that considerable capital sums have been expended in enlarging units and building new factories covering the whole range of your company's activities.

In reality, for example, concealed within this composite figure of profits is the fact that the sales prices of our important and grow-

ing production of gypsum plasters have not been increased since 1941 and now average only 23 per cent. above prewar. Similarly, the prices set for plaster board cannot be regarded as satisfactory, and the prices of both these commodities have been the subject of negotiations with the Government Department concerned for some time past.

DEPRECIATION ALLOWANCE

One of several important points of principle involved in these negotiations is the question of depreciation. The amount which has been allowed in the past has been the same as that allowed in arriving at the assessment for income tax—that is, a percentage of the reducing balance of the original cost of the asset.

Wherever this applies to assets purchased with pounds at prewar values, it means that the funds being accumulated for the replacement of those assets can only amount to less than half the sums required, because of the fall in the purchasing power of the pound.

INCIDENCE OF TAXATION

Since income tax, at current high rates, is also being levied after allowing only these inadequate sums for future replacement, there is severe limitation on the company's ability to make adequate provision for this purpose.

Even for those companies which are no longer price controlled, the incidence of heavy taxation, without due allowances for replacement, will inevitably drive industry as a whole into a most difficult position—increasingly so as time goes on—unless some concession can be made.

So far as concerns the negotiations between your company and the department on sales prices, there is some reason to believe that this principle will be recognised.

As you will have noted, income tax, together with the onerous profits tax, have absorbed the substantial and indeed disproportionate sum of £505,617, so that the net profit remaining available as the result of the year's trading at £321,569 is only some £20,644 above that of the previous year.

THE NEEDS OF INDUSTRY

So much good sense has already been conveyed to the public upon the urgent need to relieve industry of such heavy burdens of taxation, that I will not add further remarks at this juncture, except to make one point, which is, I believe, not generally appreciated.

The Government have assumed many charges upon the national purse previously borne (and, incidentally, at far less cost) by industry and others, and these now swell the total charged for income-tax. It is surely most inequitable that these charges in the form of income-tax should be levied as an appropriation of profits, instead of remaining, as heretofore, a part of the normal business costs which are deducted before profit assessable to tax is computed.

The proposal to pay the same rate of dividend as that which has been maintained for many years past leaves us in the position to recommend the transfer to general reserve of £50,000 in comparison with nothing in the previous year.

REDUCTION IN WORKING HOURS

During the year our workers have been granted a reduction in their basic working hours. Your management had not felt able to agree to such a proposal, in view of the vital need for all the production possible, and this question was, therefore, submitted by mutual agreement between the company and the unions concerned, to the National Arbitration Tribunal. The award supported the desire for a shorter working week, without loss of pay, but there was agreement that, in fact, the actual hours worked would not be reduced whilst maximum outputs are required thereby occasioning additional overtime payments.

I have already intimated that our productions throughout have been substantially increased to the national benefit. It is apparent that the national exchequer has received very substantial additional contributions from your group. In maintaining the dividend at the same rate and in view of the very substantially reduced purchasing power of the net dividends receivable, the stockholders continue to bear the main brunt of events.

FUTURE OF BUILDING INDUSTRY

The immediate future of the building industry continues to be obscure. Such indications as have been given by the Government, as a result of centralised planning, are difficult to accept as sufficiently factual, particularly in view of the constant changes in forward plans which have been announced over the last two or three years.

Your company is well equipped in personnel and machinery to face whatever demands may be made upon it and, for the time being, sales remain at a relatively high level.

THANKS TO PERSONNEL

On your behalf, I thank the whole of the personnel for their efforts over the past year and for their continued keenness in promoting the interests of the group. In this connection I would specially mention the joint managing directors, Mr W. S. Trimble and Mr R. S. Jukes, whose successful work during such a difficult first year of office has fully justified the confidence placed in them.

The report and accounts were adopted; a final dividend of 15 per cent., less tax, making 25 per cent., less tax, for the year was approved, and the meeting concluded with a vote of thanks to the chairman, directors and staff.

OHLSSON'S CAPE BREWERIES, LIMITED

DIVIDEND 22½ PER CENT.

The fifty-ninth ordinary general meeting of Ohlsson's Cape Breweries, Limited, was held, on the 28th ultimo, in London.

Mr Geoffrey Dent, the chairman, in the course of his speech, said: The profit on trading and rentals of this company and its subsidiaries amounted to £750,788, which compares with £805,371 for the preceding year. During the first nine months of the trading period ended March 31, 1948, our sales were well maintained; in fact, we experienced the same difficulty as in previous years of meeting fully the demand for our products, but from Christmas, 1947, onwards there has been some falling off in sales due to the reduced spending power of the public.

In consequence of this restriction of public spending our sales for January, February and March suffered an appreciable decline, and it is a matter for regret that this decline has continued up to the present time. Such temporary setbacks in trade are the natural corollary of present unsettled world conditions, and no country can remain wholly unaffected by them. I consider that, given stable conditions, the long-term prospects for expansion of trade in the Union are as good as those of any country in the world.

As a result of the drop in sales our profits naturally show some decrease, amounting to £54,583. Whilst costs of ingredients and containers have kept reasonably stable during the past year, wages and cost of living allowances have again increased. It is proposed to pay a final dividend of 17½ per cent. on the ordinary shares, less tax, making 22½ per cent. for the year.

The report was adopted and the proposed increase in the authorised capital to £1,300,000 was approved.

ASSOCIATED BRITISH PICTURE CORPORATION, LIMITED

FACTORS AFFECTING RECEIPTS

The twenty-first ordinary general meeting of the Associated British Picture Corporation, Limited, was held, on the 29th ultimo, in London, Sir Philip Warter, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to March 31, 1948.

The trading profits and sundry income of the group amount to £2,026,110, compared with £3,076,783 for the previous year. In my review last year I anticipated a downward tendency in theatre receipts. The fall in net takings—that is, after entertainment tax—as compared with the previous year was nearly £700,000, and this factor, coupled with the increase in expenses which I foreshadowed mainly accounts for the substantial drop in trading profits.

The high rate of entertainments tax is a serious adverse factor in present circumstances. The primary function of the corporation is to provide entertainment for the people by exhibition of films. The gross takings at the corporation's chain of theatres during the year under review amounted to £18,842,321. Of this no less than £6,986,907, equivalent to 37¼ per cent., represents entertainment duty. In these days of diminishing incomes and increased costs of living, it is obvious that entertainments tax on its present basis is a serious deterrent to the theatres' gross revenue and consequently to successful film production in this country, and if persisted in at its present scale will defeat its own object.

The benefit anticipated from the repeal of excess profits tax has to a certain extent been offset by the doubling of the rates of profits tax.

The corporation is continuing to give every assistance, financial and otherwise, to independent British producers in an endeavour to make available as many worthwhile British pictures as possible to meet the high quota percentages fixed by the Board of Trade.

DIVIDEND 22½ PER CENT.

The net profits of the group applicable to the corporation are approximately £442,000 lower at £513,901. The distribution on the ordinary stock is 22½ per cent. Reserves and undistributed profits of the corporation and its subsidiary companies are £683,812 higher at £4,480,915, which is more than double the amount of the issued ordinary stock.

The first British quota percentages fixed under the Cinematograph Films Act, 1948, are to be 45 per cent. for first feature films and 25 per cent. for supporting programmes and these quotas become operative on October 1, 1948. It is too early to say what effect these high percentages will have on the business of the group. Theatre profits for the first three months of the current year are slightly in excess of the corresponding period last year, but the feeling of uncertainty arising from the film quotas and other causes make it impossible to give a reliable forecast for the immediate future.

As I see it, there is a serious danger that, in an attempt to meet this new quota situation, British producers may be driven to sacrifice quality for quantity at a time when British pictures are earning themselves a deservedly high reputation with the public. Despite the practical difficulties the corporation will do everything in its power to conform to the provisions of the Act and to maintain its usual high standard of entertainment.

The report was adopted.

Statistical Summary

GOVERNMENT RETURNS

For the week ended July 31, 1948, total ordinary revenue was £82,267,000, against ordinary expenditure of £55,765,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £3,603,493 the surplus accrued since April 1st is £219,018,488 against £262,224,175 for the corresponding period a year ago.

influence is by no means negligible, it is not strong. There are more than traces in Labour thinking of the love of controls for their own sake—but there is also an acute awareness that the way to win popularity with the electors is to relax a control. Much more powerful than these theoretical preconceptions are the conscious and unconscious vested interests that have grown up in nine years of control. Many of the controls are masterpieces of administrative ingenuity and it is difficult for their devisers to agree cheerfully to the scrapping of their handiwork. (One suspects that the continuance of the steel rationing scheme is mainly to be ascribed to this cause.) On the other side of the fence there are a number of industries, now frozen in a set pattern by controls that have grown familiar, where the participant firms would not really welcome a return to the rough and tumble of competitive freedom. However much they may yearn for liberty in the abstract, they have, in fact, come to love their chains. And most powerful of all, there is the agglutinative nature of all bureaucracies. The psychologists would explain it by the innate desire of all men to exercise power over other men, the cynic by the fear of destroying administrative jobs, the charitable by timid unwillingness to take the responsibility of launching from the orderly familiarity of control to the unknown hazards of a free market—whatever the explanation, there is no room for doubt about the extreme difficulty of persuading any administrative machine to abandon powers of control it has once assumed. Limpets are symbols of renunciation beside the bureaucrat on the defensive.

*

Behind all these influences retarding the liberation of the economy, there is another that carries great weight with the Socialists and is a by no means negligible force in far wider circles. This is the fear that the relaxing of controls will lead to "rationing by the purse." If the controlled allocation of any commodity is relaxed—certainly if it is relaxed before supplies are actually rotting for lack of takers—then, the argument goes, some people will get more than others. Some people, horror of horrors, may even get less than they are getting now, especially if the freeing of demand leads to any rise in prices. It is an appealing and insidious argument, and it needs tracing down to its psychological roots.

The fear of "rationing by the purse" has, of course, an entirely rational core. When supplies of necessaries are short, no one should suffer actual want merely because others have longer purses. In a besieged city, bread is distributed on a per head basis, not sold to the highest bidders. So far everyone would agree. But there really is no risk whatever of decontrol, even if it were accompanied by some rise in prices, being carried so far as to deprive anyone in this country of his fair share of the basic necessaries of life. To begin with, it is not the basic necessaries of life—certainly not the basic foodstuffs—that can be decontrolled. And secondly, even if there were some reversion to "rationing by the purse," the purses of the wage-earners of this country are longer today than they have ever been before. A pound of meat, a pound of butter, a pound of bread, costs the British wage-earner less, in terms of hours of work, than it costs almost any other wage-earner in the world—including those of most of the food producing countries.

The resistance to "rationing by the purse," in present circumstances, is not a humanitarian impulse. It is, in effect, an assertion of the doctrine that, even after a reasonable minimum standard of living is assured to all, no individual ought ever to enjoy more material welfare than another. It is the fear not that some will get too little, but that others will get too much, that lies behind the talk of "rationing by the purse." From the moral and philosophical point of view, this doctrine may have something to be said for it. But as a practical proposition for application in this country at this time, it has insuperable defects; we have already had too much of it. There is not another country in the world that has found it workable—Soviet Russia tried it, abandoned it, and now has more deliberate inequality of real incomes than most others. Moreover, the Labour Party, though their instincts incline them in the direction of compulsory egalitarianism, do not really believe in it themselves. They insist on the maintenance of traditional wage differentials. They attach large salaries to the posts they create—and surely not just as honorific badges of rank. And if they are asked in cold blood whether they are ready to create and permanently to maintain the enormous apparatus of administrative control that would be necessary if "rationing by the purse" were to be abolished, they know that the answer must be that they are not. The truth is that a certain inequality of material rewards is the mainspring of economic society, whether it is run on the principles of private enterprise or of state capitalism. The Socialists may not like it, but they cannot remove it until they have something to put in its place.

It is perfectly true that, in our present society, the possession of wealth is a most imperfect measure of individual deserts. Any attempt to correlate the distribution of income with the distribution of economic merit is vitiated by the institution of the inheritance of property. But to rush from this established fact to the opposite extreme of holding that money is no measure at all of right to consume is absurd. Imperfect though it may be, it is the only measure there is, and to reduce its effectiveness is to tamper with by far the most powerful motive force in the economy. To allow everything to be allocated at auction would, in a time of scarcity, lead to social evils which nobody—in this country, at least—would tolerate. But to allow nothing to be rationed by the purse would bring the economy to a standstill. And to move as far in that direction as Britain, under the pressures of wartime, was compelled to do, is to make the economy painfully sluggish.

In any case, these arguments of equity apply only as between individual citizens, and though there may be some more relaxations of controls over consumers' goods in the offing, the great majority of those that are now on the brink are controls over raw materials, which affect business firms rather than private individuals. Moral issues hardly apply here; and there can be no doubt that the apparatus of physical control is a most powerful brake on the economy. Where materials or production quotas are allocated, as many still are, on the basis of prewar experience, they are a direct incentive to slack complacency and an insurmountable barrier to initiative and enterprise. Where they are allocated by the grant of licences by a Government department, the system causes great administrative expense both to the Government and to industry and puts a premium on "contacts." What are the defects of "rationing by the purse" that make it worse than these systems of physical control? The main risk, of course, is that it would lead to sharp rises in prices. But to that there are several answers. The first is that nobody would suggest the removal of control in cases where the demand, at present prices, is still a long way ahead of supply—as in newsprint, for example. The second is that over a wide range of materials, a comparatively small rise in prices, or even no rise at all, would suffice to bring demand and supply together. And a third answer is that there is, in any case, a great deal of confusion in the public mind about the relationship between rising prices and inflation. The two things are by no means synonymous. A rise in some prices—most notably in the price of labour—is inflationary, since it increases incomes and therefore aggregate demand. A rise in other prices might serve to choke off demand and would thus be disinflationary.

"Rationing by the purse," in short, in the present conditions of this country, is a false bogy. It should not be allowed to obscure the basic fact that the time has come for taking risks in the liberation of the British economy. The risks will be small, and the rewards might be large.

The Uses of Uno

THE publication of the Secretary-General's latest Report on the work of the United Nations comes at the end of three years of troubled and frustrating existence. It is useless to pretend that the organisation is doing the work its sponsors mapped out for it. The Security Council is not a world cabinet; nor is the General Assembly a council in which the conflicting interests of the Powers, great and small, are peacefully merged. In fact, Uno is not assuming the functions of an embryo world government. The conditions for all these things are, as Mr Trygve Lie freely admits, simply non-existent. The division between East and West has grown steadily worse. Far from there being a peace treaty for Germany, the conflict over Berlin has carried the Great Powers to a new pitch of hostility. Far from there being a Far Eastern settlement, war continues in China and Indo-China, and there is a fierce undercurrent of violence in Burma, Malaya and Indonesia. As for the more distant prospect of peace, all expectations of disarmament have faded into an invisible distance. The Commission on Atomic Energy has decided to suspend its sessions in face of constant failure to agree with the Russians on any point. The hope of a United Nations is contradicted at every turn by the fact of a disunited world.

No one will deny the unfavourable background. But how many people will agree with the Secretary-General when he claims that the time has come to stop blaming the United Nations' inadequacies on the situation in the world at large, and that instead the United Nations must be upheld and applauded as the chief agency making for order and peace? In some quarters the only response can be a very feeble cheer. If the general public were asked to give a composite picture of their idea of the United Nations, they would describe a welter of reports and surveys, a mad round of conferences and commissions, the whole crowned by Mr Gromyko saying "No" in the Security Council. Nor is this general impression of frustration coupled with senseless activity confined to a not always well informed public opinion. Governments, too, have their reservations. Apart from anything else, they might well grudge the expense. The operations of the United Nations cost money in the currency which most nations can least afford—dollars. Only 20.5 per cent of the annual contribution may be paid in other currencies, and of this proportion, 12.5 per cent has to be found in another excessively scarce currency—Swiss francs.

Nor is it simply a question of direct contributions to the United Nations. The two chief centres of United Nations activity are New York and Geneva. It follows that there is a further constant drain of dollars and Swiss francs to maintain delegations and experts. The expenditure is increased by the almost incredible number of conferences which are, in fact, being held—over 2,000 meetings in New York in the last twelve months and nearly 2,000 at Geneva (the average daily hours of meetings at Headquarters during the year amounted to over two hours a day). And many conferences mean many documents—220 million impressions for internal use alone. Nor are endless conferences expensive only in dollars and paper. The seconding of trained administrators, the rounding up of experts, the provision of staff generally create a steady drain on the administrative resources even of the most advanced nations. For the less wealthy and educated, the problem is insoluble. And what, after all, the Government might ask, is there to show for all this work, worry and expenditure? Behind this milling mass of conference givers and takers, this mound of documentation, this tonnage of translation, is anything in fact happening? Has the Emperor really any clothes?

A little reflection will show that this type of criticism goes too far. Over a wide range of economic and social activities the United Nations has made solid progress. The work of the Economic and Social Council and its subordinate agencies is worth an article to itself. Here it is sufficient to refer to its essential task in collecting and publishing world statistics, the start it has made in bringing out valuable analytical studies of various aspects of world economy—the report on economic conditions in Europe published by its Economic Commission in Europe was a model of its kind—the practical activities both proposed and achieved in its regional economic commissions, the mass of unsensational but vital work taken over from the League of Nations in such fields as the control of drugs, the suppression of traffic in women and children, the safeguarding of standards of labour, and practical welfare work, such as the feeding of over four million children and the launching of a mass campaign against tuberculous infection in the young. However, neither peoples nor governments are thinking primarily of economic and social activities when they criticise the United Nations. The challenge must be taken up where it is offered—in the political field. Given the frustrations and vetoes and fruitless wrangling of the Security Council, does the United Nations justify its existence as a political instrument and, above all, as a force making for peace?

*

Since the danger of war is the nightmare hanging over the unhappy world, it is by its success or failure in preventing conflict that the usefulness of the United Nations must ultimately be judged. If it is one of the elements in the world lessening hostility and postponing irrevocable resorts to force, then its rising budget and the $34 million spent on it in 1948 must be counted cheap indeed. And on this a good case can be presented. The forces making for peace in the world are neither very numerous nor very obvious, but the United Nations is certainly at their head. It is the only place, as the Secretary-General fairly points out, where the Great Powers meet regularly and where, nominally, at least, they meet in pursuance of common aims. On occasions, this meeting can quite unexpectedly break the hardening pattern of East-West division, as for instance when the United States and the Soviet Union found themselves together against Britain and China on the issue of Palestine. This fact of continued contact is particularly important when one of the Powers lives so remote and withdrawn an existence as do the Russians.

Another vital function performed by the Security Council is to keep a spotlight turned upon the areas of the world in which serious trouble may arise. In the last three years, nearly all the potential causes of disturbance between governments have been brought up and thoroughly discussed in the complete publicity of the Security Council. In some cases, the effect has undoubtedly been to put an end to the trouble. It is doubtful whether Russia would have withdrawn from Azerbaijan in 1946 if the fact of its presence there had not been sent to the ends of the earth by the sounding board of the United Nations. Similarly, the presence of United Nations Commissions in Northern Greece and Southern Korea has helped to prevent a local conflict developing into a major struggle.

A minor consequence of this fierce light thrown upon disputes by the necessity of discussing them in public, before a critical audience of other Powers, has been at times to show even to the nations involved a different facet of their case, which, considered at home against a background of nationalist ferment,

had passed unnoticed. For instance, it is clear that the Egyptians, when they arraigned Britain before the Council for a breach of the peace in maintaining garrisons in Egypt, were caught unawares by the extent of the other Powers' interest in the Sudan's progress towards independence. Similarly, the government of India may have at first been outraged by the amount of consideration shown to Pakistan's defence in the debates on Kashmir; but it is certainly possible that the attitude of the Security Council may ultimately have a tempering effect on the more ardent spirits in Delhi.

The chief justification of the Security Council lies, however, in the fact that in the last year it has succeeded on three occasions in putting a stop to fighting which had already broken out. It is beginning to evolve techniques of mediation and conciliation which have at least a chance of bringing the three disputes to a peaceful conclusion. Admittedly they are not disputes involving the major Powers; but from the first it has been assumed that the Security Council would be unlikely to resolve such conflicts. But the cases of Indonesia, Kashmir and Palestine are, each in its way, sufficient to inflame a whole area and, if unchecked, to lead to more widespread hostilities. The mere fact of achieving a cease-fire has probably already saved the world in absolute terms more than the $30- odd millions it has spent on the United Nations.

*

The Secretary-General's Report gives a full summary of the discussion of each of these three disputes in the Security Council. It is clear that, on the whole, the voting—though divided—has not been irresponsible. Even where the Soviet delegates did not entirely approve of the steps proposed—as was certainly the case over Indonesia and Palestine—they were not prepared to block action approved by the majority. The veto was not used to prevent action in these cases. As a result, the Council was able to begin at least the outline of a process of conciliation which may prove an effective precedent for all disputes save those between the Great Powers themselves.

The first step is to use its moral pressure to secure a cease-fire. This step was exceptionally difficult in the case of Indonesia, and over six months elapsed before agreement became effective. The second step is the appointment of a Mediator (in the case of Palestine) or a Good Offices Commission (in the case of Indonesia and Kashmir) to represent the authority of the Security Council on the spot and to lay the foundations of a peaceful settlement. This phase of the negotiations has not yet been successfully completed in any of the three cases; but it is significant that a renewed resort to war in Palestine was checked a second time and, so far, no irrevocable return to violence has taken place. The Security Council may not have completed its task and perfected its technique, but it has prevented bloodshed and held uncontrollable hostilities in check.

One weakness in the Council's procedure which the events of the last year have thrown into relief is its complete dependence on moral authority alone to maintain a truce while negotiations are getting under way. If, in Indonesia, there had been an impartial international force to police the line between the Dutch and Indonesian troops, a settled truce might have been achieved in half the time. In Kashmir the arrangements for a withdrawal of troops and the holding of an impartial plebiscite would present a far less formidable problem if a force whose impartiality was completely accepted were in being to supervise the settlement. In Palestine, Count Bernadotte's ability to hold the situation has been jeopardised by the obvious unwillingness of the United States (with France and Belgium following its lead) to risk the despatch of American forces to keep order in Jerusalem and to underpin the truce.

It is, therefore, a natural consequence of this year's experience that the Secretary-General should ask in his Report for the aid of armed men. He proposes that the General Assembly should consider as a matter of urgency the establishment of a small international police force, to be used by him for defence work in connection with settlements such as those proposed in Kashmir, Indonesia and Palestine. Such a force could not, of course, be used offensively. It is no substitute for the armed forces proposed as the basis of a United Nations military force. But it could be a valuable reinforcement of the authority of the United Nations in its task as a conciliator and mediator in limited disputes.

The limited achievement of 1947-48 does no more than offer hope. Basically, the future of the United Nations remains as precarious as that of peace itself. The initiatives taken in Palestine, Indonesia and Kashmir have not yet been crowned with complete success. What success they have had has been achieved in spite of the divisions between the Great Powers whose co-operation was to have been the foundation of the Security Council's authority. The development of effective methods of mediation still hangs in the balance. Yet the mere existence of such a possibility justifies all the expense and energy which have gone into the running of the United Nations in the last three years. If its economic activities and its social effort are added, there can be no doubt that the organisation has every reason to demand the nations' continuing support.

The Schools Question in Europe

ALL over eastern Europe, there are signs that the battle between Communism and the only force still coherent enough to resist it—Catholicism—is about to enter a new phase of violence; and the centre of the controversy is inevitably the issue of the schools. The Communists feel they can crush Catholicism provided no new generation grows up imbued with a rival philosophy of life. The Catholics know that with the passing of the schools to the state, materialist and atheistic teaching will shape the children's minds. Both sides feel, even if they do not say it, that this is a battle for survival. The Communists, in complete control of the power of the state, have gained every round so far. Only in a few instances did outright suppression take place on the morrow of liberation—in Jugoslavia, Slovakia and the Russian zone of Germany. Here the state took over the schools and forbade private schools. Elsewhere, the attack developed more slowly and even followed a period of co-operation. In Bohemia and Moravia, in Rumania, in Hungary and in Poland, there was a time of truce. Today, however, Poland is the only country in eastern Europe where no attempt has been made to nationalise education. Nationalised schooling becomes law this year in Bohemia and Moravia and private schools may continue only with state permission. In Hungary the offer of a compromise, according to which the Government would continue for a time to finance the church schools (the great majority), was refused by Cardinal Mindeszinthy on the not unreasonable grounds that it was merely the first step in a campaign of suppression. The state has therefore taken over the schools. In Rumania, the denunciation of the old Concordat with the Vatican is leading to the suppression of Catholic schools. To round off the picture, a system of nationalised schools will be introduced shortly in Berlin. Thus, throughout the Soviet zone of influence, with the probably temporary exception of Poland, a new *Kulturkampf* is engaged in which the schools question is the chief symbol of a violent and unbridgeable clash of faith.

It is not, however, only in the east that the division appears. In recent months the problem of the Confessional (or Catholic) school has thrust itself to the centre of western politics. In France, for instance, the Schuman Government, before it fell on the issue of the military budget, threatened on more than one occasion to split open on the question of subsidies to religious schools. Belgium was without a Government for a fortnight in the early summer because the Socialists would not agree to increasing the scale of the Government subsidy to Catholic schools. The issue is dormant in this country, but it roused sharp controversy when the Education Act of 1944 was before Parliament. In the United States, the issue of religion in state schools has been before the Supreme Court. Clearly the division of opinion is sufficient to make the schools question a live political issue in the west, even though the violence of the eastern conflict is lacking. The fundamental difficulty is the different view taken of religious education. To the secularist—Socialist or Radical or Conservative—religious education is an extra. The state has the responsibility of providing a certain basic education. If parents wish for more—whether it be elocution or dancing classes or a special form of religious instruction—they must pay for it themselves. It is no part of the state's task to provide such extras free of charge. Some people, particularly among the Socialists, would go further and say that religious education is a dangerous luxury since the Catholic Church—witness the Franco regime—is the enemy of liberty and progress.

The Catholic view is precisely the contrary. Catholics argue that the parents have the absolute right to determine the kind of education their child is to receive. Since the state insists on compulsory education and Catholic parents pay their share of the rates, which provide it, they are entitled to receive in return subsidies from the state to run Catholic schools where the education of their choice can be given. And far from religious training being "a dangerous luxury," it is on the contrary a public service since it trains responsible, reliable and industrious citizens. These, then, are the opposite points of view. It is hard to think of a more divergent approach.

In practice, however, western countries have been able to work out a variety of compromises. In Britain, the state pays a part of the expense of Catholic schools, leaving a large sum to be found by the Catholic community. In the United States few obstacles are placed in the way of the Catholic community organising its own schools, but the state gives no financial assistance (although a recent judicial ruling allowed the State of New Jersey to provide its Catholic children with a school bus). On the Continent, various forms of state subsidy to religious education are the rule. The Belgian crisis occurred when an attempt was made to increase the existing figure. In France, the situation is more complex. Before the war, there were no subsidies. The Vichy regime introduced them and the Fourth Republic surreptitiously continued them. The Socialists, as the anti-clerical party *par excellence*, were restive and sought to have all subsidies removed. The issue was exacerbated this year by the question whether or not the state should take over a number of Catholic schools run for miners' children. Twice the schools question threatened a complete deadlock in the Cabinet, and although a face-saving formula was found—that needy Catholic parents should receive a grant to send their children to private Catholic schools—the fundamental issue remains bitter and unsettled.

*

This issue may seem of only limited political significance in face of the racking problems of war and peace which torment the western world. There is, however, a reason why the issue of the Catholic schools has immediate political significance. It is that this struggle may have a vital bearing on the continuance in western Europe of coalitions of the "Third Force." The core of democratic government on Europe's western fringe today is the continued co-operation of the Catholics and the Socialists. In Holland, in Belgium, in France, in Austria they are the key to the coalition. In Italy, the adhesion of the Saragat Socialists to the Christian Democrat Government increases its political range. In Germany, the future of constitutional government probably turns on the ability of the two sides to co-operate. But on the schools question, the possibility of compromise seems to be growing fainter. The Catholics feel less than ever able to waive their right to Catholic education for their children, now that in eastern Europe the full consequences of handing over education to an anti-Catholic state are becoming daily clearer. At the same time, the Socialists are committed by tradition and instinct to the lay school and, under constant pressure from the Communists, feel they cannot risk the charge of supporting "clerical fascism."

The Socialist unwillingness to compromise is increased throughout western Europe by the fact that, in the economic life of the country, the Socialist Party has been compelled to give ground. On the morrow of liberation, the idea of a coalition of "all progressive forces" to refashion the face of society, to introduce measures of nationalisation and planning, to conduct industry "in the interests of the working masses," was strong enough to give Socialists the feeling that part at least of their electoral programme could be realised in coalition with other groups. At this time, sections at least of the Catholic parties were markedly radical and in France and to a lesser extent in Italy and the Benelux countries willingly supported a number of left-wing reforms—for instance, the nationalisation of the Central Bank in Holland and France, the nationalisation of coal and public utilities in France and the beginning of a measure of land reform in Italy.

It costs less

to effect a With-Profit Endowment Assurance as you may now take advantage of the reduced rates of premium recently announced. The Society's With-Profit Policies provide OUTSTANDING VALUE IN LIFE ASSURANCE.

The hope that there was a semi-Socialist, middle-of-the-road economic policy upon which both Catholics and Socialists could agree has vanished in the last three years. Smoothly as in Belgium, or with turmoil and crisis as in France and Italy, the government has returned more or less to the doctrines of *laisser faire*. The political majorities may have been Catholic and Socialist, but in the event Socialist economic policy was too doctrinaire, while a coherent Catholic programme simply did not emerge. In principle, the two sides might have found common ground in such points as Catholic teaching on the social duties of property or Catholic support for the rights of trade unions. But in practice, neither Catholics nor Socialists were realist enough or clear-minded enough to apply their principles. They might command parliamentary backing, but economic policy has been the work of minority groups led by such "unreconstructed" Liberals as Signor Einaudi in Italy or M. René Mayer in France. The Socialists thus bear the daily burden of participating in governments whose economic policy appears to bear most hardly on the masses they are supposed to represent, while their rivals for working class support—the Communists—are everywhere able to reap the advantage of being in irresponsible opposition.

The difficulty of maintaining a Third Force coalition in the face of these economic facts amounts to this—that the western world has so far failed to work out the next phase in democratic economic policy. That a mere return to *laisser faire* will not survive the first business depression is clear enough. Indeed, the opposition of the Communist-led unions may be enough to give it a stillbirth in any case. Yet without labour's co-operation recovery will be hard to seek. On the other hand, the *dirigisme* supported by Socialists in western Europe in the last three years has satisfied nobody, the workers least of all. The result is confusion and dissatisfaction on both the Socialist and Catholic side and a steady draining away of mutual confidence.

To some extent, therefore, such political issues as the schools question—upon which various forms of compromise are possible and have indeed been reached—are subordinate to the underlying economic problems of restoring a stable and productive economy in which the co-operation of both management and labour can be secured. This is the basic instability of the Third Force—its lack of any agreed and coherent economic policy. If such a policy could be evolved, other problems, even the vexed schools problem, would probably fall into place. Without it, the likelihood that the coalitions of the Third Force will disintegrate, with disastrous consequences for western democracy, is a perpetual risk.

Sitting on the Fence

(By a Wavering Correspondent)

THE first moves in the election-campaigns are being made with the outbreak of polls and surveys which are apparently to be relied on to forecast the British election results as accurately as they have done in America. Straw votes, cross section surveys and all the rest of the card index-comptometer science are unanimous in showing one thing: a swing-over from Socialism to anti-Socialism. While old-fashioned publicists might suggest that it does not need an army of investigators to discover that there is a pendulum motion in the affairs and views of the electorate we may presume that these figures are studied at party headquarters with chagrin or glee as the case may be.

It might be unfashionable and unscientific, but I feel that a more useful purpose could be served by investigating the views of the electorate a little more fully than is possible with a questionnaire of the "Yes ; no ; don't know" variety. I myself have never found a representative of Drs Gallup and Durant on my doorstep ; but if I did I fear that I should prove an unreliable decimal point in their percentages. I could not answer in one word sentences—certainly not this far ahead of the election. For I simply don't know how I shall vote.

One factor which might make me a valuable pollster is that I would probably exemplify the swing from Socialism one month and the swing back the next. In this I believe I am the average man, though my reasons cannot be digested by an adding machine. Most people would agree that the poll for Labour candidates in 1945 reached the total it did largely because of the service vote. I had no vote, the cards were lost somewhere in France months before, and my vote for Socialism was therefore theoretical. By the time of the election I was back in England, and in that lazy pleasant period of service life around election day there was little to do but talk politics. To all intents and purposes every junior officer, every NCO, and every ranker was strongly pro-Socialist.

One must not underrate the serviceman's "bloody-mindedness," which was a big factor in this sudden interest in politics. A vote against the Tories was a vote against "them"—the people who sent silly orders from Whitehall, the brass hats, the die-hards with lots of "scrambled egg," the old order of 1914, 1938, and all that. It might seem ridiculous to suggest that grown men, members of a citizen army in which bank clerks, solicitors, labourers and boys were intermingled, could regard a vote for the Reds (as we invariably called them) as anything remotely like cocking a snook at Authority. But there it was. We did.

That, I believe, was the mainspring of the serviceman's interest in his vote. True, from that narrow interest many of us started to think for ourselves, and those of us who were already thinking had done so because of those yellow-covered books of Mr Gollancz, of which each copy was read by dozens (and overseas, by hundreds). Another remarkable and rarely mentioned influence on the serviceman's vote was the welfare and rehabilitation lectures which were both common and compulsory by 1945. Although the speakers were non-political, as was right, the fact remained that their expositions of the Beveridge Plan, the housing schemes, and the general outline of the plans for a well-paved Civvy Street, were strongly Socialist in character.

Another factor was the women's influence. Most servicemen's wives, a little embittered at living on the allowance, nurtured a natural instinct to champion the underdog. They told their husbands they were going to vote Left, and this swing-over came from women who had never troubled to work out these things for themselves in peace-time. Running the finances of the house, apart from food shopping, had been the husband's worry. The nation's economics affected the wife only if they affected her husband's job. But several years of fending for herself in these matters made her also think for herself. She thought—and subsequently voted—Left.

Have I a tendency to over-emphasise the importance of the service vote in 1945 ? It did happen in the rural area of East Anglia where I was stationed at election time that the result was a close thing in favour of the Socialist candidate. A polling officer subsequently told me that the soldiers' votes totalled some fifty over the Socialist majority. He was certain that without those votes the Labour man would have lost.

We voted Socialist last time—several millions of us. We helped to swell the enormous vote of the "workers." The latter will presumably vote Left once more. But what of us—the political infants ?

If I can offer myself as typical, then I would say we don't know. We shall not know until the election draws nearer. I think we have serious doubts about it at the moment. We are not so anxious as we were to vote Socialist, though we are still less desirous of voting Tory. There is, indeed, a sign of that chronic sickness—the voter's apathy. We tend to solve our bewilderment by saying we are sick of politics. The Tories can thank their past record for this. The Socialists can blame some of their present leaders.

The Tories cannot win our favour by suggesting that the troubles are due to mis-government. We people who saw the mess of Europe and sometimes paused to wonder at the wealth of armaments which we were using day after day, year after year, feel that a pretty good job of work has been done, all things considered. The oldsters had told us of the "land fit for heroes" debacle of the 'twenties, and we expected it this time. It hasn't occurred. We just don't believe our freedom is in danger, though we thank God and Parliament for all the controls which no one grumbles about—on rents, on profits, on food. The Tories' Fleet Street friends who shriek against the iniquity of rationing, the terrors of pleasure travel restrictions, and the tragic situation of luxury hotels, do them no service.

I am afraid that the Tory party cannot rely so far on getting the majority of our votes. If it were a case of voting for Churchill then the situation would be very different. I met men who disliked Montgomery ; I knew plenty who failed to venerate Mountbatten. But I never heard of one who did not admire Churchill. Most of us, I believe, have a feeling of guilt for throwing him out at the end of the war. But we find little else in his party which would influence our vote—least of all in the peculiar mixture of "controlled private enterprise" which is occasionally dangled before us. If the Tory party wants to overhaul its machine it should first of all get busy on its local units. All of them are very busy, but they still seem to be centres of sterility. The kernel of officials are a little pathetic in their blustering complaints of what's going on, and confirming that nasty suspicion we got in 1938—that patriotism is a little too much for them. It must be their Britain—or Britain can go under. Now, I don't believe there is a Tory MP with this attitude (I would not say as much for his opponents), but it undoubtedly exists in the rank and file of garden-party organisers and whist-drive secretaries. The Tories must not get complacent about the rising membership. In 1945 we chaps in uniform crammed the local Conservative club. It had two excellent billiards tables.

I don't think I shall vote Tory—not unless there are more tinkers' cusses and verminous rantings. Why must we have this sort of exaggeration ? The only Tory MP I know told me that if only more Ministers would shout this sort of thing then his party would get in next time. I believe him.

Apart from this emotional reaction against voting Socialist what other objections have we now ? Until we are given very cogent reasons why ideology should not give way to practical requirements this will lose votes. So will the faint aroma of "jobs for the boys." We don't mind when Throgmorton Street wangles directorships for its pals in politics. That's the way of things in the jungle of private enterprise we have read about ; but it doesn't suit the venerable placidity of Westminster.

But more than anything else is the need for the party leaders to eradicate the guilt complex we feel just because we are not members of a trade union. The miners are gods ; the railwaymen angels ; and the dockers supermen deserving of every privilege. We realise that comparatively speaking this approaches the truth. But the fact that we don't get filthy during our day's work should not cause us to want to make excuses about it. Mr Morrison is wooing us well enough. But he is disciplining his friends too little. He must banish the suspicion that Transport House, not Westminster, is running the country.

Patriotism, which in my younger days was an emotion to stifle and apologise for, has, I think, become a strong factor in this country's life. The more the United States suggests that the sun is setting on the Empire, the more the Soviet Government rants about the reactionary British Isles, the more will there be a tendency to wave the Union Jack.

Every time a Socialist Minister talks about the new Empire I raise a glass to him and promise a vote. The new conception of the Commonwealth seems pretty good to us. It was not long ago that we had believed that we would all be pals in the fine new world of Uno. Now that we are not so convinced about it we pin our faith in the new Britain. The Socialists have done the spade work. We would like to let them get on with the building.

I was told by a Socialist MP: "Don't worry about the election. A few weeks before the day Morrison will cram the shops with every kind of goods you can want ; there'll be some bonuses on the ration. That will help the women's vote. As for you—you'll vote Left. Really, you know it's the only way. We'll get back." Not with that attitude they won't.

NOTES OF THE WEEK

Moscow and Berlin

By this Sunday the blockade of Berlin will have lasted 51 days and the Moscow negotiations 17 days. Insofar as the Western envoys are still in touch with Mr Molotov there seems ground for hope that they will approach some basis of agreement without sacrificing any vital interest in Germany. Mr Marshall says there is no intention to get "agreements for agreements' sake," and there is no sign so far that either Americans or British have put the brake on developments in western Germany—which is what the Soviet Government wants above all. In fact, representatives of the premiers of the eleven western *Länder* began discussing on Tuesday their work on a constitution for Frankfurt Germany. Their proposals will be submitted to a Constituent Assembly on September 1st, which will prepare the final draft of the constitution. On no account should the western envoys be allowed to concede to the Kremlin a postponement either of this meeting or of the Six-Power meeting which is to begin drafting a statute for the Ruhr.

Rather should they be told that the tactics of their governments in western Germany will be precisely those of the Russians in Berlin—to go on working to get what they want as if nothing was happening in Moscow. For in Berlin the fight for power goes on as bitterly and ingeniously as ever.

The economic prospects of the Germans in the western sectors are worse than correspondents in the city are allowed to say: the Russian attack on the city's police administration, on its finances, on the machinery of food distribution is pressed home daily. The predominantly Social-Democrat *Magistrat* may well see its powers in the Russian sector of the city lopped off—in which case little more would be needed to divide Berlin completely.

The danger that Mr Bevin has now to recognise is this: that even if the Moscow talks get the blockade of Berlin lifted, the power of the western governments and the Berlin authorities may have been so whittled down by the end of this year as to make the western position in the city untenable.

* * *

Daily Bread for Bizonia

An Allied spokesman announced in Frankfurt last week that the food situation in Bizonia was "extraordinarily favourable." His optimism is borne out by the figures. Ordinary consumers this July actually received 1,990 calories daily, whereas in July, 1947, the basic ration—subject to availability—was just over 1,500 calories daily, and in June, 1946, only 1,050 calories. The potato ration has been doubled since last July, and the fat ration more,

than trebled. There is every hope that, with the prospects of a good harvest and the continued flow of Marshall Aid dollars, it will be possible to maintain the rations at over 1,800 calories a day for the rest of the year. In short, the Allied spokesman felt confident enough to assure the Germans of Bizonia that the nightmare days of last winter were over, never to return; they could cease to worry about their daily bread.

The situation compares very favourably with that in the eastern zone. At a press conference on August 6th, the chairman of the Zonal Economic Commission could not announce definite increases in the food supply, but only a possible hope that, in view of this year's good harvest, it might be possible to increase rations by 150 to 200 calories a day. Even by 1950 the Russians and their German advisers do not aim at providing more than 2,000 calories a day, to be obtained solely from indigenous production.

Russian policy seems still to be based avowedly on the assumption that the eastern zone is there to be made the most of, and that requisitioning either for export or to feed the occupation troops need not be limited by either humanitarian or economic considerations. It is estimated that the Russians have been requisitioning well over half the high-quality food produced in their zone, whereas during the first ten days of July nearly 200,000 tons of food were imported into Bizonia from the United States alone. While in western Germany food is being pumped in, in eastern Germany it is still being pumped out.

* * *

M. Reynaud's Success

The question before the French now is quite simply this: whether M. Reynaud's plan for restoring the national economy can be carried out without a regime such as General de Gaulle would favour. Everything he proposes to do hits some interest at a vital point: reorganisation of the nationalised industries may upset the Socialists; reforms in taxation designed to turn the French taxpayer from a rebel into a loyal contributor will strike at a bad but cherished national habit; and retrenchment in the public services will cost many people their jobs.

The debates that took place before the Assembly gave M. Reynaud some of the powers he wanted and revealed many points of interest for the future. In spite of instructions from the General's *entourage* the Gaullists were divided on the Bill—a third of them abstained from voting. The Communists argued for Parliamentarism and constitutional propriety in the tones of Pym and Hampden. They got the Socialists to vote with them in favour of an amendment which obliges the Government to table its taxation reforms on December 10, instead of bringing them automatically into force on January 1, 1949.

M. Reynaud has shown great determination and skill in his handling of the debates, although his analysis of the French economic situation was really the old story rather better told. He has denied that he is either a planner or an anti-planner. And he has put well to the front of his programme his hopes of western co-operation and eventual union. But he remains at the mercy of the mass of Frenchmen. If they strike, if they relax their efforts, if they insist on wages resuming the chase of prices—then what M. Reynaud treats as a financial and administrative problem becomes a problem of morale. And everyone knows, with the present rightward swing in France, which personality believes himself to have the cure for bad morale.

* * *

Government Departments Under Fire

Two reports published this week are the result of the ancient and salutary tradition whereby the House of Commons examines the affairs and expenditure of the Government with a cold and unfriendly eye. The sixth report of the Select Committee on Estimates deals with the use of petrol by Government departments and uncovers an interesting example of the official attitude towards privilege and to how until very recently the Ministry of Fuel and Power had made no effort to control the petrol consumption of Government departments. The various departments merely submitted their requirements and were issued with the coupons, about three-fifths of which were for bulk use in "G" coupons, and about two-fifths in "E" for use in private cars. The result has been that in 1947 Government departments managed to burn 38 million gallons or about 2½ per cent of the total consumption of the country (even the National Debt office managed to account for 7,600 gallons). The horrifying fact is that this consumption is only half of one per cent, or some 7,000,000 gallons, less than the total consumption of the armed services in this country, the Government-owned civil aircraft and the tractors of the County Agricultural committees. Perhaps most humiliating of all is the revelation that in August, 1947 (when cuts in the basic ration were proposed), the Ministry of Fuel and Power asked Government departments to economise petrol consumption by 10 per cent, but the only people to pay any attention were the Service departments, who cut down operational training in the Fleet and tank training in the Army, while bodies such as Naafi, with a tenuous governmental connection, received and consumed all the petrol they wanted. The Select Committee seem satisfied that the Ministry of Fuel and Power has now instituted an effective check on these extravagances, and confine themselves to recommending that Government departments should share in cuts or increases of petrol exactly like the rest of the community.

The Committee of Public Accounts has extended its examination of expenditure over a much wider range and finds a great deal to criticise. Since the Ministry of Information was dissolved it has apparently been impossible to do more than guess at the amount spent on Government information services although the Treasury hazard an estimate of £16,697,050—a not unreasonable sum if well spent, but a very high figure for the dissemination of the obvious which makes up the bulk of Government publicity. The Ministry of Health is scolded for not making use of requisitioned properties, while the Ministry of Food is criticised for being so gullible as to pay British firms the ruling world price for whale oil, and even the Navy's rum and baccy has been found to rest on a most insecure basis of statutory authority. But the biggest broadside is reserved for the Ministry of Labour, for failing to contract its training facilities as the need for them dwindled with full employment after the war, and for maintaining in April, 1948, six staff for every ten of the 4,300 remaining trainees.

It is to be regretted that no one suffers personally for such costly and foolish misconduct. Valuable though the select committees are, as providing the public with an informed criticism of governmental method, they have no weapon stronger than a pen. It is to be feared that their attacks and criticisms do little more than ruffle the vast complacency of officialdom.

* * *

Mr Mackenzie King Stands Down

Mr Mackenzie King, with the mastery of the diplomacy of politics which has characterised his whole career, is retiring step by step from the leadership of Canadian affairs. He has thereby escaped any possible retribution at the hands of time and avoided the fate which overtook Mr Churchill, Field-Marshal Smuts and Mr De Valera. In an atmosphere of great cordiality and respect he has laid down the leadership of the Liberal party which he has held for thirty years, and will shortly vacate the office of Prime Minister which he has occupied for a total of twenty-one years.

The election of Mr St. Laurent by the Liberal Convention to succeed him in the leadership of the party represents a mature and admirable decision to entrust their party to a man of character and intelligence rather than to a more routine politician. Mr St. Laurent is an able and upright French-Canadian lawyer who was "drafted" into politics only seven years ago. During that time—although he has occupied only politically unglamorous posts—Justice and External Affairs—his personal qualities have placed him head and shoulders above his colleagues as a leader, although his powers as an administrator have not been fully tested. He is not a young man, being sixty-six, but Canada, like most young countries, does not greatly care for young statesmen. His advantage to Canada is that he is the man most likely to succeed in continuing the Liberal tradition founded by Sir Wilfrid Laurier of extracting the maximum unity that is possible between French- and English-Canadians. His advantage to the Commonwealth and to the world is that he is a convinced internationalist and is prepared to commit Canada to such joint action with the rest of the democratic countries as a realistic assessment of her resources and limitations will permit.

Politically, his task is not easy. Canada is under two years away from a general election, and the Liberal party is in danger of finding itself sandwiched between a conservative and a socialist reaction. Even though Mr St. Laurent may lean slightly towards the right wing of his own party, traditional animosities would make any *rapprochement* with the Conservatives very difficult. The Liberal party must—as the convention appears to have realised—invigorate its policy if it is to maintain its position, and that is not easy for a party which has been in power for thirteen years.

* * *

Prison Life—From Two Aspects

The report of the Prison Commissioners for the year 1947 is the usual collection of facts and statistics concerning the prison population and those who look after them. It is pierced every now and then by a sentence or phrase that shows a spirit of humanity, but as befits an official record it is objective rather than subjective, factual rather than interpretative. This manner of presentation, however, does less than justice to the gallant attempts of the present Commissioners, an enlightened body, to introduce a more human and humane atmosphere, and the bare facts given in the report (Cmd. 7475) convey to the ordinary person, who has little interest in the subject and still less personal knowledge of it, a very poor impression of what prison life means to the prisoner. Yet public awareness of this is essential if any real progress is to be made with penal reform.

There was recently published, however, a little pamphlet* which gives an account of the prison system as it appears to the prisoners themselves. It is quite true that the evidence of prisoners, even if its honesty can be relied upon, is of necessity prejudiced, but this account, compiled from the evidence of Quaker prisoners sentenced for conscientious objection, has a ring of truth that will impress all but the most complacent. Read in conjunction with the official report it gives a detailed picture of life in an ordinary prison—and a horrifying picture it is. For instance, the commissioners state that the present overcrowding—prisoners are often packed three into a cell—has effects on hygiene which "must be disagreeable, but have not so far affected the general state of health." To realise just what this disagreeable hygiene amounts to, the reader should then turn to *Snail's Progress* and learn about the sanitary arrangements (or lack of them) in the average prison. Again, the commissioners, referring to the reinforcement of security measures, say that one result "was a further reduction of workshop hours to enable the staff to give time for searching." But a reduction of workshop hours means an addition to the already long hours of loneliness and boredom which, in Mr Carter's words, "sweep the mind bare, ready for the devils of sexual fantasy or morbid brooding to enter in."

Why, it may be asked, should one bother, at a time of shortages of manpower and buildings, about persons who, after all, are being punished for offences against society? The answer is, first, that a society which calls itself civilised is itself committing an offence in allowing the conditions described in Mr Carter's pamphlet. Secondly, a prison where such conditions are found achieves nothing. The petty discipline does not teach self-discipline. The deadly uniformity, the soul-destroying monotony effectively quell any response to what training and reformation may be attempted. A prisoner's grudge against society is fostered, and it must be an exception rather than the rule if he is not discharged from prison a worse man than he was on entering it.

* * *

Danube for the Danubians

The fortnight spent on the Danube Conference in Belgrade has been, from the British point of view, a fortnight wasted. Mr Vishinsky has enjoyed a busman's holiday, grilling his Western colleagues during working hours and boating on the disputed river in his time off. The *claque* of riparian states has given him well-drilled support in a clamorous retreat from international ideas about how this great European highway should be controlled. The outcome is now likely to be a new convention, based on the Russian draft, and containing such unimportant concessions to American, British and French views as can be extorted by hard bargaining.

Unfortunately the Western delegations have nothing to bargain with save the threat of walking out, a course of action recommended to them early in the conference by Mr Vishinsky. They started on the basis, untenable in the circumstances and in such a capital as Belgrade, that the 1921 convention could not be revised without the consent of all its signatories. Unfortunately they had not taken the precaution of insisting that all the signatories should be present at this conference. Then an attempt was made to get full representation for the Austrians, which enabled Mr Vishinsky to play the role of defender of east European sovereignty against Germans and Austrians generally. Then an American draft was submitted, rather late in the day, which proposed among other things that guarantees of free navigation should be clear and specific, that the new control body should have links with Uno and that Western representation should continue. That was, of course, rejected.

So far then Western diplomatic tactics seemed to show lack of forethought, co-ordination and resolution in preparing the case for a meeting in which Americans, French and British were bound to be steadily outvoted by seven to three. The assumption of Four Power agreement, on which the original proposal to hold this conference was based, broke down last year. If the world is to be divided into exclusive spheres of interest, then the Russians must expect no more consideration of their views on Italy's African colonies than they have given to Western views on the Danube.

If the riparian states get their way—and Russia is one of them thanks to the return of Bessarabia by the Rumanians in 1940—then the lower Danube will be under Russian inspired control from Linz to the Black Sea. Whatever general guarantees may be given about free navigation, the fact will remain that German and other west European trade by this route to eastern Europe will pass only by permission of the Cominform governments. In other words, for any future political or commercial dealings with a central or a west German government the eastern *bloc* will hold a card of great strength. It remains to be seen whether the riparian states can carry out the extensive works needed on the river without the assistance of machinery and materials from the West.

* "Snail's Progress." By Charles F. Carter. The Penal Reform Committee of the Society of Friends, Euston Road, N.W.1.

Oder-Neisse Agitation

Anglo-Polish relations may be slightly improved by setting up the mixed Commission which the Polish Government has proposed to settle a number of outstanding points of difference between the two governments. The first agenda, however, will probably be confined to minor questions left over from the days of the London Polish Government.

The major issue between Warsaw and London is one scarcely mentioned in the British press—the revisionist activities among the millions of Germans who have been expelled, or fled, from the territory east of the Oder and Neisse rivers, which has been under Polish rule since the Potsdam conference in 1945. The Poles—and not the Poles alone—have reason to be anxious about this activity, which is the subject of frequent Notes of protest to the British and American authorities in Germany. Although political activity is theoretically forbidden, it is in progress all the time, both openly and under the cloak of welfare organisations.

One of the propaganda sheets of refugee organisations in the American zone, which in this case appears to masquerade as a textile trade journal, recently quoted an interview given to the *Hannoversche Presse* by Pastor Albertz, who was recently made Refugee Minister in the Lower Saxony State Government. This appointment is the first of its kind, but has been defended by British Military Government against a protest from the Poles. The interviewer said:

> We have been hearing a lot recently about plans for forming an Eastern German Government-in-exile, and demands for representation of the East German territories in the future German National Assembly. What do you think about these plans?

The Minister thought shadow governments were no use, but supported the demand that the Assembly at Frankfurt should represent the refugees which, he said, numbered 37 per cent of the total population in the West. "For me, as for any decent German," he declared, "the Oder-Neisse Line is no object of discussion; that is to say, it represents not only Germany's death-line, but Europe's, and is a constant menace to world peace." In fairness, it must be recorded that the Minister added that immediate attention should be devoted to welfare matters.

In typically hectoring tone, the "textile journal" retorts to the latest Polish protest:

> What do the Poles think? As long as there is no peace treaty, Poland is solely a trustee administrator of the German Eastern territories. Every man can defend himself who discovers that a trustee is trying to enrich himself out of the property entrusted to him. Every expelled German has the right to raise his voice in warning when it is seen how a new threat to peace is created in the heart of Europe. That has nothing to do with "revisionism." It is the good right of the people to whom the country belongs to look after their property and demand it back from the "trustee" who is playing the lord and master.

Many Germans still find it obvious that everyone must see how right their unjustly treated country will be in starting another war forced upon it by an envious world. Indefensible though the Oder-Neisse frontier is, the British and American Governments, whose main objective should be to turn German minds to a Western future, should actively discourage such hopes and plans. They provide one of the few really cohesive factors in the East European *bloc*.

* * *

The Dutch Spectator

The British public is often astonishingly unaware of reactions of opinion abroad to acts of British national policy. At present

it seems to be quite ignorant of the strength of anti-British feeling in Holland, especially since the announcements of measures undertaken to suppress the revolt in Malaya. The Communists and extreme Left naturally disapprove of these measures from sympathy with the rebels; but among Dutchmen of conservative views, who might be expected to be pleased at the British display of strength, there is widespread bitterness and acid comment on what is regarded as dishonesty in the British attitude towards the Dutch in Indonesia.

As long as the current of British policy was definitely and obviously set towards renunciation of imperial authority, as in India and Burma, Britain had a fairly strong moral position in its persistent opposition to Dutch attempts to resume control by force in Java and Sumatra. Even now, there is from a British point of view a case for denying the analogy between the problems of Malaya and Indonesia, inasmuch as the rising in Malaya is not a national movement of the Malays, but is confined to the Chinese and is definitely of Communist inspiration. It can also be claimed that our basic policy has not changed and remains as liberal and renunciatory as ever. Nevertheless, the crisis in Malaya has made a difference; when the point is reached at which force has to be used on a large scale as the only alternative to immediate surrender, the emphasis of policy cannot be the same, and statements have been publicly made on the British side which seem to the Dutch utterly inconsistent with the sermons preached to them from London during the last three years.

The Dutch find it hard to understand why an Indonesian Republic, headed by a man who was a puppet of the Japanese, should be considered as inherently so much more respectable an institution than a Malayan anti-Japanese People's Army which the British once liberally provided with arms. If it is a question of murders, the Dutch suffered many more in the early days after Japan's surrender than the British have yet suffered in Malaya. But the Dutch now see Britain apparently resolved to stay in Malaya as the sovereign authority and to protect British material interests without interference from Uno; while in Indonesia, not only has the Security Council stopped Dutch military operations, but the Uno "good offices committee" has been acting more as a arbiter than as a mediator in its task of bringing about a settlement. The Uno intervention may be an excellent thing, but it should be clearly recognised in this country how painful is the contrast for the Dutch between their ticket-of-leave situation in Indonesia and the unfettered discretion which Britain enjoys in Malaya, though the juridical rights of the two nations over their respective territories are in no way different.

* * *

Old People at Work

It is unfortunate that the statistics of old people at work, given in the July issue of the *Ministry of Labour Gazette*, should perforce be so scanty. The only comparisons made are between the middle of 1947, 1945 and 1939. Thus the effect on the employment of old people of the raising of the old age pension to 26s. a week in October, 1946, cannot be distinguished from the effect of the end of the war. The comparisons are as follows:—

	Men, Aged 65 and Over	Women, Aged 60 and Over
Mid-1939	320,000	63,000
„ 1945	600,000	118,000
„ 1947	456,000	104,000

It was only to be expected that there should have been a decline in the number of old people at work since the end of the war. But what is wanted urgently is statistical information on whether this inevitable decline has been intensified by the higher pensions. From October, 1946, these pensions have only been given on retirement, and to satisfy the retirement conditions a pensioner must prove that he works "only occasionally" or "in circumstances not inconsistent with retirement." If a person earns more than £1 a week from such occasional employment, the excess is deducted from his pension. On the other hand, the fact that he is earning less than £1 a week does not prove that he has retired, for the umpire has ruled that the amount of remuneration is wholly irrelevant in determining retirement or not. The Liberal Party's committee, which examined the whole question in some detail, came to the conclusion that the retirement condition might have to be modified. It also reported a widespread view that it was causing elderly people to retire earlier than they otherwise would.

Since the full national insurance scheme came into force in July, people who work beyond the pensionable age will have an addition to their pensions of 1s. a week for every six months of work beyond that age. Both the Nuffield Foundation's survey committee and the Liberal Party's committee concluded that this incentive for old people to continue at work would prove inadequate, and they suggested additional incentives. But before any decision can be come to on their proposals it is necessary to know the facts. It is to be hoped that the Ministries concerned are doing all they can to collect them.

* * *

Who Should Plan?

The Committee on the Qualifications of Planners, under the chairmanship of Sir George Schuster, is embarking on its task of considering what qualifications are necessary for those engaged in town and country planning. It will have its work cut out. In no field, outside perhaps that of money and credit, is the case for collective modification of the results brought about by free enterprise stronger than in this. In no field, with the same reservation, is it more necessary that control should be intelligent, well informed, long sighted and, above all, inspired by common sense. And since town and country planning affects ordinary people more intimately, and more permanently, than does the more general control of the economic climate, it is particularly important that it should be carried out in the light of a sympathetic and imaginative understanding of the whole complex of human needs.

The ideal town planner, considered as an individual, would need to be a superman. He should be a good economist—for only a profound and practical knowledge can serve as a basis for estimating loss and gain in the siting of industry and agriculture. He should know a great deal about geology and the limits which it imposes on engineering; about water supplies and subsidence, soils and gradients. He should have an artist's eye for landscape and layout and an architect's sense of the possible. He should have a profound sense of history, combining respect for the past with an abiding recollection that the greatest numbers are still unborn. And, above all, he must be capable, through experience and imagination, of putting himself in the shoes of those who are to live and work in the community for whose physical framework he may be responsible. Considered as an individual, in fact, he is impossible to find ready made and very nearly impossible to produce by training. But it should not be quite impossible to constitute planning committees which between them comprise most of the necessary ingredients. The danger is that the expert qualifications, as they are both the most easily definable and the most immediately necessary, will be sought for with an eagerness which will obscure the equally fundamental necessity for qualities of human sympathy, imagination and common sense.

* * *

Divided Arabs and Cocky Jews

The second Palestine cease-fire has seen a revival of what may be called the opposition within the Arab League. On the one side are the absolute monarchs, representing conservatism, acceptance of Western aid, and realism about Palestine, backed by the only organised armed forces available to the Arabs. On the other is an opposition representing a theoretical parliamentary progressiveness, xenophobia, and all-or-nothing in Palestine, with unceasing irregular warfare. This is not the only possible alignment of Arab politics, fluid as they are, though it replaces for the moment the simple dynastic grouping of the Hashimites against the rest. It seems to have come about during the recent upheaval in the Yemen, where the Arab "progressives" mostly gave their sympathy, if not their active support, to the revolutionary Imam, Abdullah al-Wazir; while the ultimate triumph of legitimacy and primogeniture in the person of Imam Admad seemed to the Kings an affirmation of divine right.

The Kings are the two Beduin rulers, Abdullah and Ibn Saud—now dramatically reconciled—and, so long as a Palace government is in power in Egypt, King Farouk. The Opposition is the Syrian Republic, Iraq—where the Hashimite ruler has had to bow to his opposition—and the Mufti of Jerusalem with the Palestine Arab Higher Committee. Their strength lies above all in the fact that no Arab leader has yet dared tell the Arabs that they have been defeated in Palestine. So it is only too easy to persuade them that they have been cheated of a certain victory over the Zionists only by the selfishness of their rulers and their complaisance to foreign interests. There is not yet an open breach, but the Iraqis and Syrians have publicly claimed credit for voting against the cease-fire, and are manœuvring to instal the Mufti in Palestine instead of the relatively efficient administrative arrangements made by Abdullah. The latter, congratulating his

Arab Legion last week on its part in the fighting, said "We and the others went into this fight jointly. Here we are. Where are the others?"

*

Among the Zionists, the policy of enlarging their aims with each tactical success has so far had spectacular results. They have shown that they did not underestimate their hold on the American administration or their military superiority in Palestine. They are now flouting world opinion in their attitude to the Arab refugees and their high-handed dealings in Jerusalem, which they evidently hope to incorporate, partly or wholly, in their state. Friends of Zionism would feel easier in mind if the tone of Tel Aviv were more sober.

Meanwhile, their economic difficulties are piling up. Price inflation in the Zionist areas of Palestine is formidable. These are being kept going by American dollars, but even dollars may not be inexhaustible. They plan to bring in 600,000 Jewish immigrants from Europe—the 200,000 DPs, plus twice their number from obliging Poles, Czechs, Rumanians, and Bulgars—in five years or less. They even want to take 800,000 Jews from Arab countries as well. A settlement scheme of these dimensions will demand capital investment on a gigantic scale, and it is difficult to see how it can be easily or quickly made to pay its way.

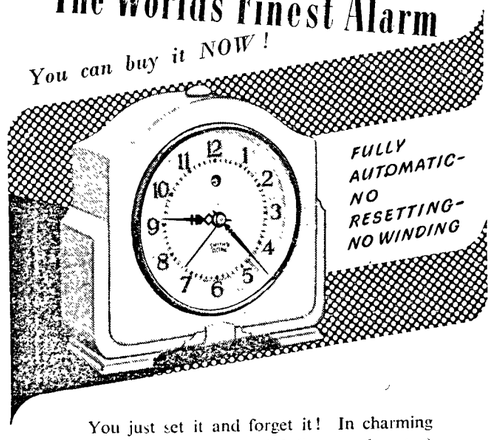
* * *

Oil Companies' Dilemma

Of the oil concerns affected by confusion and uncertainty in Palestine, by far the biggest sufferers are the Iraq Petroleum Company, because Haifa is—or was—its biggest export outlet, and Consolidated Refineries, Limited, owners of the big refining plant there. The companies that work the fields in the Persian Gulf area have outlets to the Indian Ocean, and have merely had to abandon, for the moment, their plans for pipes to the Mediterranean.

Nevertheless, owners of all nationalities are affected, for the IPC is an international concern owned in equal shares by British, American, French and Anglo-Dutch principals. CRL is British, being run jointly by Shell and Anglo-Iranian. While the present atmosphere in Palestine lasts, it is obviously difficult to pump oil from an Arab source in Iraq to a terminal in a Jewish-held town. None has been pumped since May. The company would like to resume pumping, and, without using the refinery, to ship crude oil westwards for refining in more peaceable conditions. But any prospect of doing this disappeared from the moment, at the end of July, when the Israeli government authorised 400 Jews to take over the refining plant, on the ground that all is fair in war and that local oil needs were paramount. These proceeded to refine some 40,000 tons of crude oil which were lying in store at the IPC's pipe line terminal. Israel is now hoping to buy further crude oil from abroad and to refine it in the same way. CRL officials who have paid a flying visit from Cyprus report that their plant is being well and carefully used by its impounders.

But what is the IPC to do about export from Iraq? Its only outlet is its pipe line to the Mediterranean. One fork of this does not enter Palestine—it goes through Syria, to Tripoli in the Lebanon—but that fork is the smaller of the two. The branch to Haifa had been doubled and would, if usable, now be carrying a flow at the rate of 4,000,000 tons a year. Only 2,000,000 tons a year can be pumped to Tripoli, and the refinery there, though its output will be doubled by next spring, will not even then handle one-tenth of Haifa's 4,000,000 ton annual capacity.



It is plain that if Haifa is used and benefits the Jews, there is a danger that Arabs in the other states will tamper with the pipe or pumping stations, including those feeding Tripoli. Here is a conundrum for the company. The problem for the Iraqi government is also difficult, for no export means no royalties, and a serious deficit in the national budget.

*

A layman who wants to review the whole oil position, including that of the companies on the Gulf, will find an excellent survey in the London *Petroleum Times*'s "Review of Middle Eastern Oil," published this summer. He will find there full details about the look and the layout of the different enterprises, their potentialities and their record of output. It is a pity that so good a publication should be marred by an article on local politics that is often wrong and conveys no idea of a major problem now facing the companies—how best to handle the Arab social and political chaos that is already beginning to result from Arab defeat. ★ FOR AIR-MINDED CHAIRMEN AND DIRECTORS

Ten minutes in South America is worth a month of correspondence

Your men can be there over the week-end . . .

IN THESE DAYS when South American markets have to be not only captured, but also *held*, it is more than ever necessary for your salesmen and service engineers to make personal contact with your South American customers. British South American Airways enable them to do this with the least possible expenditure of time, as this table shows:

From London to	Flights per week	Time	Fares Single	Fares Return
Rio de Janeiro	4	33 hrs.	£171	£307
Buenos Aires	3	58½ hrs.	£192	£345
Santiago	2	81 hrs.	£208	£374

Subject to alteration

Fast and frequent services also to Recife, São Paulo, Montevideo, Lima, Baranquilla and the West Indies.

EXPORT BY AIR, too, and ensure that your goods arrive factory-fresh in the hard currency markets of Latin America.

• • •

One ton each—by air!

Many business men still instinctively regard air cargo services as being suitable only for light packages. B.S.A.A. recently carried to South America a consignment of four turbine parts weighing a ton each.

Business by Air by—

BRITISH SOUTH AMERICAN AIRWAYS

Reservations and Information, at no extra charge, from travel or freight agents, or from British South American Airways Corporation, 19, Grafton Street, London, W.1 (Regent 4141) for passengers, or 9, Albemarle Street, London, W.1 (Regent 7222) for freight.

author of the article, Mr Max Thornberg, rightly warns readers against "over-simplification," and "failure to distinguish between the various groups comprising the Arab world." He then proceeds most flagrantly to default himself. "On the political side," he writes, "the Arab people have breathed life into the Arab League and made in effect an Arab state to match the United Nations creation of a Jewish state in Palestine." This assertion is false. It is worse than false, for it is bound to lull into unjustified complacency all those—they are chiefly Americans—who feel that, having helped Jewish refugees, they have earned a halo and need feel no responsibility for correspondingly displaced Arab refugees because these last "have plenty of places to go."

Dominion Affairs in the Commons

The rights and wrongs of discussing Dominion affairs in the House of Commons provide some nice points for the Speaker to settle during the summer recess. Clearly, the adjournment debate on Hyderabad and Kashmir at the end of the last session was in order, for Britain's policy was directly involved. Pledges had been given by the British Government with regard to the Indian states, and the British representative on the Security Council had to be told what to say when the question of Kashmir was brought up. On both points the House was entitled to know what was being done in its name.

But Mr Churchill brought up a further point. He asked:

> If, for instance, grave catastrophes arise there or in any other Dominion, or a clash occurs between two Dominions, is the House of Commons to be the only place in the whole world where this matter may not be discussed?

The rule on questions has already been settled: questions may not be put down referring to internal affairs of the Dominions. What needs to be settled now is the rule for debates. The two things are very different. No Minister of the British Government can be expected to answer questions about what is happening inside a Dominion, but there is a case for extending the scope of debates to include discussion on Dominion affairs, if only to provoke Government action when such action is needed. The Canadian Speaker, for example, thought it permissible to allow a heated debate on Britain in the Canadian House of Commons when a wheat agreement was being discussed.
