The criterion is whether Britain is, or should be, involved in the particular Dominions affair to be discussed. The House of Commons can and does argue about what Britain should do in the event, say, of a conflict between two foreign countries. It should, therefore, also be allowed to discuss what Britain should do in the event of a clash between two Dominions. Obviously, no less tact is required in a discussion on the Dominions than in debate on foreign countries; but if Britain is concerned, then it would be wrong to ban discussion altogether.

The same criterion applies to the internal affairs of a Dominion. The Speaker did not prevent, for instance, the discussion of the Communist *coup* in Czechoslovakia; nor, then, should he prevent the discussion of a similar catastrophe in a Dominion. It will be difficult to lay down hard and fast rules, and it would probably be best if the Speaker were to judge each case on its own merits, but the general principle should be easily framed.

* * *

South Africa Settles Down

The fear of radical change in South Africa is melting away. The tenth Union Parliament was formally opened on August 6th by the Governor-General, Mr Van Zyl, and the speech from the Throne foreshadowed nothing drastic for the first short session, which is to be taken up almost entirely with the Budget (discussed on p. 278). The new government under Dr Malan and his electoral ally, Mr Havenga, are in fact settling down well to the business of administration and, for the moment at any rate, have put aside controversial measures.

This is a wise as well as a politically sound policy. Dr Malan's cabinet contains first-rate administrators who outshine all except the top two or three in General Smuts's United Party; provided their political partisanship can be kept in check they will render valuable service to South Africa as a whole and will enhance the prestige of the two Afrikaans parties which now constitute the government. Extreme measures, such as the restriction on native artisans and the release of Nazi saboteurs, which characterised their first fortnight in office, could do nothing but harm to their cause. It is gratifying to see such partisan fervour being replaced by steady attention to the details of government. Dr Malan and his colleagues have also shown themselves to be unexpectedly sensitive to public criticism both inside and outside South Africa. This fact alone has allayed most of the suspicions that they were intending harsh reforms against English-speaking South Africans and the Bantu. At a Nationalist Party rally early this week in Capetown, a plea for unity between all South Africans was strongly urged.

In Commonwealth affairs the new government has, if anything, acted more closely with Britain and the other Dominions than its predecessor. The Nationalist Party's newspaper, *Die Burger*, suggested sending aircraft to help in the Berlin air-lift even before Mr Bevin sounded out the rest of the Dominions at the end of June. This offer has lately been repeated by Dr Malan, and there is no doubt that his government are strong supporters of Britain in the present clash with Russia.

* * *

Biological Deviation

Nothing could be further removed from the principles of compromise which are guiding the Western statesmen in their search for a basis on which to resume talks with Moscow than the dictum laid down by a Soviet biologist, Yuri Zhdanov. In a confession of error made last week to Stalin as head of the Central Committee of the Bolshevik Party, Zhdanov confesses himself appalled at the way in which he lectured on different theories of contemporary Darwinism.

> I obviously underestimated my new position of worker in the apparatus of the Central Committee. I failed to realise that my speech would be appraised as the Central Committee's official point of view.

The mind boggles at the notion of Transport House issuing a party line on Darwin.

Zhdanov's cardinal sin was that his neglect of Marxist-Leninist theory "caused a desire to 'reconcile' the opposing parties, to erase differences, to lay emphasis on what unites and not on what divides the opponents." But, he declares,

> in science, *just as in politics, principles are not reconciled, they triumph.* The struggle proceeds, not by way of effacing, but of exposing, differences. The attempts to reconcile principles on a basis of pseudo-efficiency and narrow practicality, the underestimation of the theoretical aspect of the controversy, have led to an eclectic approach, which I do confess.

One may almost hear the applause from Yuri Zhdanov's namesake who has, through the Cominform, been laying down these same principles for the Communist Parties of the world. The Western mind must remain perpetually puzzled at the mentality of the Soviet leaders. No sooner has it been decided that the clue lies in the Oriental love of a bargain, or the Byzantine origins of Russia, than—as in the case of Yuri Zhdanov—the rigid dogmatism of Marxist theology emerges as the dominant factor in Bolshevik conduct.

* * *

No Change from Ulster

It was inevitable (writes a correspondent in Belfast) that sooner or later the new inter party Government in Eire, led by Mr Costello, should cast a fly into the stream of controversy which flows over Irish unity. The only rise that could have been expected was the reply by the Prime Minister, Sir Basil Brooke, reaffirming the absolute determination of Northern Ireland to adhere to the present constitutional position established by the Government of Ireland Act, 1920.

There can be no doubt about the solidity with which the great bulk of opinion in Ulster is behind the Northern Ireland Government in this matter. Twenty-seven years of separate government in Northern and Southern Ireland have done nothing to bring about any disposition towards unity, and there has been an increasingly close integration between Northern Ireland and Great Britain and an ever widening gap between the economic, social and cultural conditions in Northern Ireland and in Eire.

Ulster farmers through their union have for many years worked in the most direct co-operation with their fellows in England and Wales and Scotland, and Northern Ireland is covered by the same guaranteed prices and markets provided by the Agriculture Act of 1947 for the rest of the United Kingdom. Manufacturers and traders in Northern Ireland are allied with their opposite numbers across the Irish Channel through membership of the same trade associations, and it is as easy to open a branch or factory in Northern Ireland as in Scotland. Even in the case of labour, where contact with Dublin has probably persisted longest, the link with the trade union movement in Great Britain is becoming increasingly close. So far as the man in the street is concerned, his life is just as much a part of the British system—

with its advantages and disadvantages—as if he lived in London, Manchester or Glasgow.

If no other factors had been at work, the effect of the war alone would have been decisive. In Ulster eyes, Eire's policy of neutrality meant its virtual withdrawal from world affairs. Its isolation appeared in marked contrast to the position in Northern Ireland, where the war resulted in a great awakening of activity in agriculture, in industry and in contacts with the outside world—not only with Great Britain, but with other Allied countries also. Not only in economic activity, but in science and education Northern Ireland is far more concerned with the outside world than would have been believed possible ten years ago.

On the political side, the fact that the Ulster Government is Unionist and Conservative, whereas the Government at Westminster is Socialist, has doubtless created problems. At one stage there was evidence of a movement in favour of Dominion status in that it would safeguard Ulster against any action by Westminster to modify the Act of 1920, and that there would be less tendency for Ulster to be pushed along the road to Socialism by close integration with the British economy. The movement—if such it can be called—was short lived, since it soon became clear that opinion in Ulster was completely opposed to any break in the relationship that exists with the rest of the United Kingdom.

A New War Memorial?

Parliamentary question and answer two weeks ago, on the War Memorials Advisory Council's suggestion of a memorial in the areas of either St. Paul's or Westminster Abbey, displayed Mr. Herbert Morrison in a very odd light. No scheme, he said, had yet been put forward which would "make a wide popular appeal." Pressed for a criterion of "wide popular appeal," he told the House that a letter to *The Times* on the subject had elicited no supporting correspondence, and gave his opinion that "correspondence in *The Times* is a fair indication of the degree of public response." This is surprising. It is surprising that Mr Morrison, of all people, should choose the correspondence columns of the lofty browed and threepenny *Times* as the equivalent, in a matter of popular feeling, of a Gallup poll. Is this really where the leaders of the people's party look for the voice of the people? It must be very gratifying to *The Times*, whose Editor may now see himself, more incontestably than ever, in a position to influence Government policy not merely by his editorial pronouncements but by the discreet tightening or loosening of the tap which controls the access of letter-writers to his columns. In so far as these do constitute a recognised forum for expert opinion, there is good reason for the Government to pay attention to them; but the question of a War Memorial is not one of expertise, it is one of popular sentiment—and the spectacle of Mr Morrison hiding his momentary mental nakedness behind a column or so of *Times* newsprint is rather more comic than impressive.

* * *

Identity Cards to be Permanent?

Leaflets issued by the Ministry of Health, explaining how people can get dental treatment and sight-testing and glasses under the National Health Service state that people should take their identity cards with them. A person's identity number has to be inserted in the forms used—"for office reasons." If people using the dental and ophthalmic services have to be identified by number instead of by name, that can be accepted. But why cannot they be identified by their national insurance numbers or their husband's national insurance numbers if they are married women, or, for the small minority who are not insured, by an *ad hoc* number? Can it be that among this small minority there might be a few naughty people who would try to amass a hoard of spectacles or false teeth if they were not checked by their identity numbers?

If it is asked why there should be any objection to people being asked for their identity numbers, the answer is that national registration and identity cards were part of the emergency legislation of war. They have no place in peacetime England, and no Minister has ever given a satisfactory explanation why they are still necessary in the semi-peace of today. The theory that they are useful in finding deserters and other fugitives from the law has long been disproved. By bringing identity cards into use in the health service the Minister of Health is making the system of national registration permanent by administrative action. If the Government wants to make it permanent, and can justify its decision, let it do so by asking for fresh legislation.

Shorter Notes

When he visits London in a few weeks' time Señor Miranda, the Argentine President's economic lieutenant, may be more accommodating than usual. His country's trading position is much less favourable than the figures for the first quarter of this year show. The favourable balance this time last year was 222 million pesos; now it is 164 million pesos. There is generally much more resistance to Argentina's shockingly high prices; resistance which has the powerful backing of the American Economic Co-operation Administration operating for the ERP. Señor Miranda's department has tried to hit back by concluding trade treaties with East European countries, just to show that there may be markets other than those now shrinking or stiffening in Western Europe. The gesture is an ineffective one—like the renewed boasts of a vast increase in trade with Russia.

*

Just as, nearly two years ago, Mr Shinwell laughingly remarked that everyone except the Minister of Fuel knew that there was an impending fuel crisis, so for the last few weeks Mr Strachey has been apparently the only person unaware of an approaching cloudburst of plum jam. Growers might wait for help, manufacturers plead and housewives mutter, statistics might indicate unequivocally that the time for derationing had come; but the process of enlightenment could not be hurried. Like the end of bread rationing, the decontrol of jam had to wait upon the Ministerial prima donna's infallible sense of timing. It is not the less welcome—though its mechanics make it a dubious blessing to those who have hitherto concentrated their rationed purchases on marmalade, leaving teatime to look after itself, and now see their breakfast laid waste: and equally those who have counted on the sugar equivalent to make real jam instead of the stuff humorously described as "full fruit standard" and now face a similar reduction, only very partially compensated by the prospect of unlimited supplies of variously named pectin.

*

Uneasiness is being caused in the Netherlands by proposals that the deadlock over Berlin might be broken by the withdrawal of all occupation troops from Germany. The idea has been discussed in two such different quarters as Mr Walter Lippmann's column and the Soviet press. Our correspondent at The Hague points out that the Dutch see all too little of the military strength of the Brussels Powers, that three-quarters of their own regular forces are overseas, and that it would come as a great relief to see concrete—and photogenic—evidence that there are troops to train and aircraft to fly. The best available base for them is Germany.

*

The request by student nurses of six London hospitals for an increase in salary is chiefly interesting because one of the chief reasons for it is their liability to pay the new national insurance contributions. On the assumption that student nurses are still treated as nurses rather than as students, they probably have as good a case for a rise as any other body of workers. Examination fees, books and uniforms take a large toll from their monthly cheque. But to grant a rise to cover the new insurance contributions would create a dangerous precedent.

"*Knowledge is of two kinds. We know a subject ourselves, or we know where we can find information upon it.*" Not all Dr. Johnson's dicta are accepted to-day (e.g. is claret the liquor for boys, and must one drink brandy if one aspires to become a hero?) but few will quarrel with his views on knowledge. For example, business and other organisations requiring information outside their own subjects know that they can often find it at The Economist Intelligence Unit.

Letters to the Editor

Twilight Sleep

SIR,—As I read your article, I wondered whether you have considered the relation of efficiency of industry to almost any other activity in national life? Surely efficiency in industry is relatively about twice as high. It seems to me that there is no chance of obtaining higher productivity until the productivity of other phases of national life are increased. Otherwise, how could it be that so many people try to escape from industry? Goods cannot be produced under the conditions of slackness that one sees everywhere outside it.—Yours faithfully, HARRY WARD
Industrial Management Research Association,
Manfield House, Strand, London, W.C.2

SIR,—The leading article in *The Economist* of August 7th was needed to bring to Parliamentarians, industrialists and others a true appreciation of this country's industrial position. On one point only your article is not clear. What do you expect this coutry to gain from the American industrial advice?

American material aid has been magnificent and has won the gratitude of all. American industrial performance in their own country, as you say, sets standards which British industry would do well to copy. The performance of American owned and operated businesses in this country, on the other hand, has been generally at British and not at American levels of efficiency. They lead the best British firms narrowly, if at all. Why?

It is common knowledge that American industrial lead over this country is greatest in the mass production industries. In the same industries here, there are many American firms giving that example which is rightly preferred to precept. British firms in these particular industries believe that they are operating on the American pattern. Why is the British industrial lag greatest in those industries in which they have acted on American advice in the greatest degree? These questions can and need to be answered.—Yours faithfully, LEWIS C. ORD
23 Fitzjohns Avenue, London, N.W.3

[The important thing is that British industry, on both sides of the capital-labour fence, should be ready to accept advice, no matter whence it is proffered and should be eager to learn what can be learned from the experience of other nations, even if their methods cannot be imported bodily. What was so depressing about the discussion in the House of Commons was that it showed an almost total lack of this willingness.

We agree that there is no magic formula, known to American industry but unknown to British industry, which can simply be imported and applied here. But it would be silly to say that we have nothing to learn from America—the contrast is too great for any such conclusion to be tenable. The examples cited by Mr Ord suggest, as does other evidence, that the explanation lies not so much in the methods of direct production as in ancillary services (transport, handling of materials, organisation of flows, etc.) and in the general atmosphere of production, the former of which is hardly, and the latter not at all, within the control of the individual firm. But if so, as Mr Ward suggests, this opens up whole new fields of interest in American (and Swedish and Swiss) experience. Moreover, the conclusion that there is nothing to be learned from the Americans at the stage of direct production—at the lathe or on the assembly line—applies, if it applies at all, only in engineering, which is what is usually meant when "mass production" is mentioned.—EDITOR.]

From *The Economist* of 1848

August 12, 1848

WE noticed last week the two facts that the middle classes were now generally prosperous from the extension of enterprise and cheapness, and that they were devoted to our institutions. However much some amongst them may yet complain of the exclusive privileges yet possessed by the aristocracy, and whatever they may say against exorbitant taxation, and enormous pensions and salaries, they practically feel so secure and well off, particularly when they contrast their condition with that of the bulk of the labourers, that they are ready almost to a man to take up arms or a constable's staff in support of order. They enjoy the benefits of society, and they are ready to defend it. They hate even the threat of violence, and are roused at its aspect. Powerful as they are, they are perhaps unnecessarily alarmed at its slightest appearance, and apt then to be too much terrified. . .

Nearly all the political power is in their hands. They are the persons whose opinions the ministers consult, and whose interests they rarely or never thwart. The ten-pound franchise may be described as framed exclusively in the interest of the middle classes. All the modern political changes of importance took place at their instance, and were intended to serve them. All the changes made in modern times in our tariffs have been to their advantage. . . We everywhere see marks of their prosperity. All our towns have been rapidly enlarged and improved; the almost numberless elegant houses and suburban villas adapted for respectable families, that encircle the metropolis, the new streets filled with large shops, within it, are indications of the growth and prosperity of the middle classes.

Switching in Sterling Securities

SIR,—May I make some observations on the note in *The Economist* of July 24th. If the new regulations are studied in terms of British policy and self-interest, they are most difficult to understand. To divide British securities into thirteen groups and to forbid switching from one group to another, except into British Government securities, must inevitably mean that the largest offerings in New York will be of British Government stocks. Consequently, their price will always be at a discount compared with all other British investments. British Government stocks can be bought here at a "security sterling" rate of $1.75 to the £, while for shares in other groups the rate varies up to $2.05 to the £. This means that 4 per cent Funding Loan 1960-90 can be bought here at a flat yield of 8 per cent plus 100 per cent capital appreciation in probably twelve years. Such switching into Government stocks is also a disadvantage to the British foreign exchange position, since interest on Government securities is paid without reduction of British income tax.

Measures of this kind can only have the result that American investors get more and more afraid of their British investments and want to sell out at any price. After the war there was quite an interest here in British securities, and at the end of 1945 the effective rate for purchasing them was $3.90 to the £. Since February, 1946, the price of security sterling has dropped. Interest in British securities in New York is often referred to in London as "illegitimate dealings" or a kind of "black market." Such phrases are unjustified. American holders of British securities, some of which have been held here for a long time, acquired them legitimately and no blame attaches to any investor who wants to sell.

The British Government would like to minimise the change of ownership of British securities from soft currency countries to hard currency countries, and measures of this kind cannot be criticised. But it still should be possible to find ways of doing so which encourage American investments in Britain rather than discouraging them. Certainly they should be directed to making British Government investments the most attractive, and not the least attractive to the holder here.—Yours faithfully,
63 Wall Street, New York City D. BINGHAM

Frustrated Exports

SIR,—"The basic problem," says your note last week, "is to find a satisfactory definition of frustrated exports." May I offer the following:—

Frustrated exports are shortfalls in unrequited exports caused by unfair foreign application to British exports of the excellent principles governing British imports.—Yours faithfully,
1 Cornhill, E.C.3 H. W. AUBURN

Crown and Commonwealth

SIR,—The courage of Mr W. A. L. Coulborn in *The Economist* of July 24th must command the admiration due to one who endeavours to clarify the unclarifiable. The words "British" and "Irish" which he dubs adjectives have, long since, been used—quite erroneously—as nouns of multitude.

But in a hotel register the word to be entered is truly an adjective, qualifying the noun "nationality" at the head of the column. Why do the large majority of the population of the United Kingdom miss their opportunity of using the most glorious of all adjectives by casually entering "British" when they might proudly (and quite correctly) enter "English"?—Yours faithfully,
36 Hardinge Road, N.W.10 ALBERT BOLTON

Readers of the Economist . . .

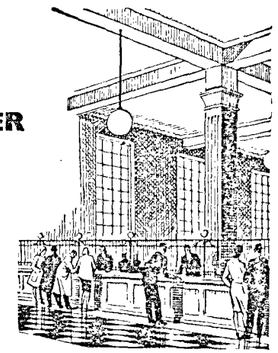
BALKAN SOBRANIE CIGARETTES & TOBACCOS

THIS ENGLAND . . . No. Seventeen

HOLIDAYS are a very English invention and Bank Holidays a proof that any excuse will do for neglecting our work. Only in recent years have we justified our laziness by reference to fatigue tests and lack of sunshine. The best reason for holidays is that we want them, and the best advertisement for our national common sense is that we take them . . And the wise holidaymaker makes sure of his *Balkan Sobranie* before he rings for the taxi; he looks forward to a long satisfying smoking and an aroma doubly sweet because for the nonce he is a free man enjoying his well earned leisure.

SOBRANIE LTD. LONDON. E.C.I.



STEAM TRAM "As early as 1873 the steam tram appeared — quite a logical development, of course, from the railway — and before long it had been brought by the North London Tramways to the area of Finsbury Park, Wood Green, Tottenham and Edmonton. Here is the fearsome contraption itself — the company must surely have had a lot of trouble in placating the owners of panic-stricken horses . . ."

The illustration and text are from *London on the Move*, a London Transport ready-to-read lantern lecture. Lecture notes and slides or film-strip are lent **free.** Other lantern lectures are: *The Story of the London Bus, The Story of the Underground, How London's Tube Railways are Built, A Night with London Transport, The Countryside of London, The Nature-Lover's London.* For details write to the Publicity Officer.

LONDON TRANSPORT, 55, BROADWAY, LONDON, S.W.1

BANKS OFFER

New Service

Your Bank is ready and willing to help you to invest your money in National Savings Certificates. All you have to do is to sign a Banker's Order form, either for a single block of National Savings Certificates, or for a steady month-by-month amount. Your Bank will do the rest without trouble to you, and without charging for their services.

Remember, that with Income Tax at 9/-, the new National Savings 10/- Certificates, when held for 10 years, are the equivalent of a taxable investment yielding £4 16s. 8d. per cent. If you are paying more than 9/- in the £ they are even more attractive. Savings Certificates are a profitable gilt-edged investment and you can now hold 1,000 units of the new issue in addition to permitted existing holdings of Certificates of earlier issues. See your Bank Manager about it today.

SAVE—*The Bank Way*

Issued by the National Savings Committee

AMERICAN SURVEY

Spies at Home and Abroad

(From Our US Editorial Staff)

THE Congressional attempt to divert the national attention from economics to spy thrillers is not without reasons, though too many of the reasons are frivolous. Spy hunts are as popular with all ages as economics are unpopular. Communists are safer game than rising prices. They make better headlines, demand less effort, stir a more primitive emotion, appeal to millions who are against Communism even more heartily than they are against sin. Three committees, two in the House and one in the Senate, are in hot pursuit of a number of politically profitable hares, who include former officials of a variety of Government departments and a former adviser to President Roosevelt. Such a chase, however unsupported by evidence that would convince a Court, delights the perennial Roosevelt-hater, embarrasses the Democratic Party, wounds Mr Henry Wallace. That it may also damage aspiring Republicans is a possibility which the gleeful questioners seem not to have contemplated until one of the accused revealed that he had the backing of Mr Dewey's foremost political adviser, Mr John Foster Dulles. As political ammunition, historical foot-notes which concern the living are not always safe.

It is too early to assess the effect of this summer circus on the voting public. The President condemns it, the serious press calls it irresponsible, disintegrating, even malign. But like so many unappetising spectacles in American politics, this has roots far below the surface. At the bottom there is an obscure sense of national danger, a bewilderment, a fear of the Russian unknown, a resentment at being forced to give up old isolationist habits and learn new international ways. America feels the need of a whipping-boy, and the Communists are first choice. With this subconscious unease goes a persistent belief that at some decisive moment before or during the war the Soviet Union did influence national policy, that it did use Russian spies or American Communists or both, that they have secured information (probably about the atom bomb) which is vital to the nation's safety, and that they are still active and dangerous, an uncaught menace in the event of another war. Thus far, little evidence has been uncovered which would support this belief, but the fear will not lie quiet. Its exploitable possibilities are known to Communists as well as to Congressmen.

Many people had hoped that the year-long labour of the New York Grand Jury, recently come to fruit in the indictment of twelve officers of the American Communist Party, would lead to trials in which rumour would be laid to rest, and the intentionally treasonable goats separated from the deluded sheep. The competition between House and Senate for the testimony of the Grand Jury witnesses, before the indictments have been heard, may end these hopes. It is worth noting, however, that the United States has not yet had its equivalent of the Canadian spy trials ; until some investigation as serious and as thorough takes place, there is little chance of curing what is coming to be a national neurosis. Afterward, it may be possible to pass an espionage Act which is competently drawn and to create an agency which can handle those suspected of subversive activity in a manner satisfactory both to Congress and the public.

In theory, the catching of spies at home might be supposed to be the job of the Federal Bureau of Investigation. In practice, this is a muddy pie in which many offices have a finger. Checks on the loyalty of government employees are made by the FBI and the Civil Service Commission. Checks on the loyalty of private citizens are, when occasion permits, attempted by the Un-American Activities Committee of the House of Representatives. Their sources of information vary but they have been known to refer protesters to lists of suspects compiled by the FBI. At the moment a sub-committee of the Labour and Education Committee of the House is looking into Communism among New York department store workers, though the ground for such enquiry is not clear.

★

That spy hunts at home should this summer coincide with a searching study of American facilities for spying abroad is not chance. The former make headlines, the latter proceeds with as much secrecy as can be managed. Yet despite this difference, and the semantic elegance of "intelligence service" as contrasted with "spy rings," it is obvious that for the American peace of mind Russian agents in the United States should be caught, and American agents in Russia should operate with skill and success. If the first is not at present being done satisfactorily, neither, say the experts, is the second.

Before the war, the Departments of State, War and Navy, all had their separate intelligence services. The first step towards co-operation was taken in July, 1941, and during the entire war there were continuous attempts to quiet competition and secure co-ordination in the triple process of obtaining, analysing and handing on information. At the end of the war such emergency organisations as the Office of Strategic Services and the Joint Intelligence Committee fell apart. A new series of efforts began which had as their goal the creation of a system which, in peace as well as in war, could supply the new needs of America's new international position. The Central Intelligence Agency, set up by the National Security Act in July, 1947, to operate within the new co-ordinated framework of the high command, is the latest result of these efforts. The CIA was expressly created for the purpose of "co-ordinating the intelligence activities of the several Government departments and agencies in the interest of national security." There are reasons to believe that it spent the first year amid more sparks of dissension than songs of harmony. The Secretary of National Defence has asked Mr Allen Dulles of war intelligence fame to conduct a survey of intelligence operations and to report next January. Certain changes in the CIA have already been made, and others are rumoured to be pending.

Mr Hanson Baldwin, of the *New York Times*, who is a member of another committee charged with examining the work of bodies set up under the National Security Act, believes that the existing intelligence structure is probably sound so far as organisation goes and "certainly it is better than any prior system." In action, however, he finds that it comes into conflict with the War Department, the FBI, the Atomic Energy Commission and the State Department. In general, it has trouble with the Washington ailment known as "empire-building," and with other woes arising when a new agency tries to teach its jealous grandmothers to suck eggs in chorus.

In a series of five articles, Mr Baldwin cites, as evidence of ineffectiveness, the failure of the intelligence services last spring to inform Mr Marshall that a Communist uprising was planned to take place in Bogotá while he was attending a conference there, the difference of opinion between departments as to Soviet intentions during February and March, intelligence fiascos in Finland and Hungary and the continuing lack of information on Russian strength in various fields. His recommendations for improvement include better personnel, recognition of intelligence work as a career for which training and advancement must be provided, and reorganisation of the CIA on a basis which is at once more efficient and more capable of imposing its plans on recalcitrant rivals in other departments.

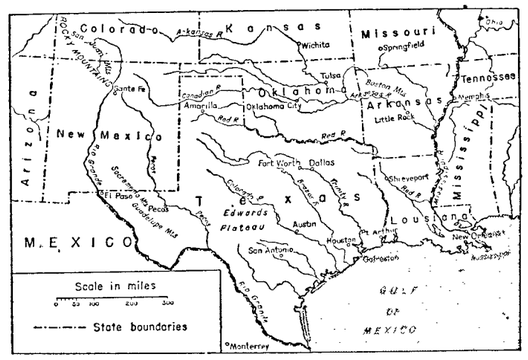
All this sounds elementary to nations better schooled in the techniques of distrust and defence (a study of British Intelligence is included in the report which preceded the setting up of the CIA). The United States comes late to the mechanisms of international responsibility as well as to its impact on national habits. The nation has, however, shown abilities both as a pupil and an innovator and under pressure sometimes performs miracles. The question is whether peace, however queasy, will provide sufficient pressure to make America turn in time from play with cloaks and daggers to a search for substitutes which, less romantic, may also be more effective.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

The Economy of the Southwest

[FROM A CORRESPONDENT IN TEXAS]

THE Southwest region of the United States is variously defined. A glance at the map tells why. But usually it is accepted as the area covered by Texas, Louisiana, Arkansas, Oklahoma and New Mexico. These states form an economic region primarily because they all produce prodigious quantities of raw materials, far more than their own residents can use. The surplus flows to the Gulf ports of Texas and Louisiana for export to foreign countries and coastwise shipment to the great industrial areas of the upper Atlantic seaboard of the United States. This common destination of its produce gives the Southwest its only unity. Apart from this, it is completely heterogeneous ; indeed, it has been called the "region of the meeting of regions."



Into this region from the east extends the southern pine belt to cover Louisiana, the eastern fourth of Texas and most of Arkansas. The great plains come down from the north covering most of Oklahoma and north, central and west central Texas. Through New Mexico and across trans-Pecos Texas run the eastern ranges of the Rocky Mountains, with characteristic plateaux and arid basins. The subtropical drylands of northern Mexico continue into south Texas. This diversity of physiographic and climatic conditions gives the Southwest its great diversity of agricultural production, which includes cotton, wheat, rice, market garden crops, forest products, beef, mutton, wool, and mohair. Its output of minerals is almost as varied ; a high proportion of its oil, natural gas and sulphur is consumed outside the region.

In recent years the most notable economic development has been the great changes in the agricultural industries. Not many years ago this area produced an average of ten million bales of cotton annually, of which about 90 per cent was exported. As the cotton region farthest from the domestic textile centres and nearest to the Gulf ports, it was the logical cotton-exporting area. Hence the restriction of cotton exports as the result of competition, of synthetic materials and of the wartime decline in foreign markets has reduced cotton cultivation by about 50 per cent.

The consequences have been far-reaching. Approximately fifteen million acres of cultivated land have been either diverted to other crops or put back into pastureland. This has resulted in the introduction of new crops and in the great expansion of former secondary crops—wheat, oats, grain sorghums, rice and a variety of fruit and vegetables. At the same time, there has been a precipitate fall in farm tenancy, since in this region tenancy exists primarily in the cotton-growing sections. The decline in the number of "share-croppers" has been particularly noticeable ; these are tenant farmers who pay their rent with a share of their output and whose standard of living is notoriously low.

Another result has been the rapid mechanisation of farms, since cotton is much less adaptable to mechanisation than the crops that have supplanted it. Even cotton has been mechanised considerably in its shift from the eastern wooded area, where small farms and tenancy prevailed, to the large-scale farming areas of the prairie plains in the central and western parts of Oklahoma and Texas. There has also been a simultaneous increase in livestock breeding, not only because land which used to be cultivated has now been diverted to livestock purposes, but also because concentrated stockfarming is replacing large-scale ranching operations to a substantial degree.

These economic movements have been accompanied by comparable movements of population. It is estimated that 800,000 people have shifted from rural work and homes to an urban environment. While the total population of the Southwest has grown at a normal rate in recent years, three-fourths of its counties have lost population and, as a result, there is a high concentration in the other one-fourth. This shift came with little economic strain, since even before the war it accompanied an increasing industrialisation of the Southwest, and it was speeded up by the growth of the great war industries. At present the employment situation remains good as the result of the rapid conversion of most of the war industries to peacetime production. The industrial activity of this region, as measured in real-income dollars or in the number of wage earners, is now about twice what it was immediately before World War II.

The movement of population has accentuated the housing problem of the Southwest. There is little shortage of housing in the areas that have lost population, but the situation is acute in the industrial areas. It has been relieved somewhat by a phenomenon hitherto little known in modern migration—the migration of houses themselves. This has been made possible by heavy motor transportation and improved highways, especially in the plains areas where there are few curves, undulations or bridges. In some instances houses of as many as eight or ten rooms have been moved distances of fifty or one hundred miles, either whole or after being bisected. There has been no census of house migration but, according to the figures of several contractors in the business, some tens of thousands of houses have been moved. There are boom oil towns which have been almost entirely dependent on such transportation.

Large-scale migration of the rural population to urban centres has frequently created serious social problems. Because of the lack of building materials and the high cost of construction, extensive suburbs of Dallas, Houston, San Antonio, Fort Worth, New Orleans, Little Rock, Oklahoma City, Tulsa and other cities have been built with flimsy residential structures, creating fire and health hazards. The provision of streets and other utilities for these areas has put a heavy burden upon city

inances, especially since their taxable value is below the average, because of their cheap construction. In several instances cities have refused to incorporate suburbs having as many as ten or twenty thousand people. While jobs are plentiful and wages high, people live in these sections with a minimum of discontent. But conditions could become bad if a period of economic recession should set in. On the other hand, much residential construction of modern, permanent quality is under way in these cities, promising considerable relief from the housing shortage if conditions remain favourable to building for a year or two. In each of the six or seven leading cities of this area, an average of about 2,000 modern houses has been continuously under construction (with a period of about three months for average completion) during the last year and a half.

Another encouraging factor in the current situation is that, while there is much talk of bad housing conditions created by migration to the cities, actually there has been improvement of the standard of living in most instances. Many of these new city dwellers are former sharecroppers. Conditions in their old rural slums were even worse than in their present urban ones, and there was less hope of improvement. In the cities it is difficult for the public to overlook bad conditions. Further, as a result of the migration, there has been a distinct improvement in the real-dollar income, not only of the former farm tenant who is now an industrial worker, but of the farmer himself who, with a larger acreage than formerly and with mechanised production, is in much better economic condition than when a portion of his farm was tenanted.

* * *

There is much controversy over the future of the oil and natural gas supply in this Southwest region, with possibly more optimism than pessimism because of continued discoveries of new oil and gas deposits. Nevertheless, withdrawals of both petroleum and natural gas are increasing at a very great rate. Long-distance high-pressure pipeline transportation of natural gas began only about two decades ago, and the depression and later the war caused almost complete cessation of pipeline building. But during and since the war a large number of these pipelines have been constructed, and natural gas from this region now goes to more than half of the forty-eight states, including the nation's principal industrial areas. There is also a large export of gas to Mexico to serve Monterrey and some other population centres.

The present great increase in export of natural gas from this area may have considerable consequences for the economic future of the region, according to some economic observers and writers. They point out that it has been to a great extent responsible, both as fuel and raw material, for the development of the huge chemical industries. More than $200 million has been invested in such plants in the last few years, and there is a large construction programme under way now. But industrial expansion might be seriously restricted if the supply of natural gas is depleted or even declines to the point where its price would be higher than that of other industrial fuels.

There is no reliable census of income for this Southwest region, but it is undoubtedly at an all-time high in real-income dollars. This is the consequence of the flush production and high price of oil, natural gas and other mineral products, and the high agricultural prices, particularly those of livestock. Since the region's income depends primarily upon its great outward shipment of surplus commodities to both domestic and foreign markets, its economic future will depend upon the ability of the national and international markets to absorb its products.

American Notes

Congress Compromises

President Truman's brave defiance of the Republicans has given him a victory on points, but it is a victory for the Democratic Party rather than for its Presidential candidate. The Democrats who are running for the Senate and the House will reap a harvest of votes from the unsatisfactory Republican repiy to the President's challenge, and it is only in these local contests that the Democrats have any real hopes of success. But, however much Mr Truman may try to make it seem otherwise, he is fighting not Congress but Governor Dewey, and in this battle it is he, not the Republican candidate, who must stand and be judged on his record. Mr Dewey has as yet given little indication of the strategy which he will follow when he opens his campaign in September.

If there was any doubt about the shrewdness of Mr Truman's decision to base his attack on Congress on its failure to control prices and remedy the housing shortage, it was dispelled when the Republicans showed that they did not dare to face the electors without doing something to repair both deficiencies. But politically the Congressional compromises are as feeble as Mr Truman maintains they are, and will detract little from the propaganda value of these two issues to the Democrats. A fierce attempt was made, by Republican as well as Democratic Senators (although not by Senator Taft), to secure passage of the full Taft-Ellender-Wagner Housing Bill, for which the President had asked and which the Senate had already approved. But the House—and the housing lobby—won and the provisions for direct Federal aid for public housing and slum clearance, which would have given help where it was most needed, were left out. The Act, as finally signed by the President, provides only for liberal credit and mortgage insurance for low-cost houses and flats and for the establishment of a Government agency to work for the standardisation of building codes.

* * *

Credit Controls

Congress has thus followed the bad example which it had accused the President of setting: the inflationary effects of its housing legislation will cancel out at least some of the deflationary effects of the credit controls which it also approved. This was the only part of the President's anti-inflation programme on which Congress was prepared to act, and in practice it was almost the only part on which action was likely to be effective. The power of the Federal Reserve Board to regulate consumer credit has been renewed: since it lapsed last October, the most liberal terms have been offered for instalment purchases and the volume of such purchases has greatly increased. It is expected that something resembling the wartime restrictions will now be reimposed.

This power has been given to the FRB until June, 1949, as has the power to increase the cash reserve requirements of its member banks by one and a half per cent for time deposits and by four per cent for demand deposits. The President had asked for increases of four and ten per cent, but Congress was not prepared to go so far. The House attempted to raise gold reserve requirements for the Reserve Banks, but this provision was dropped by the Senate after it had been denounced by government spokesmen. Congress could not, however, be induced to extend the cash reserve requirements to banks outside the Federal Reserve System, although Reserve officials insisted that failure to do this would penalise the banks within the System and would lessen the effectiveness of the legislation.

The voters have been warned that these credit controls are unlikely to bring prices down, and from their point of view Congress has certainly done little to weaken Mr Truman's case against it. But the President has gained a worthwhile addition to his powers to check inflation, powers which were already substantial and which he has been criticised for not using. His failure to use them has been explained by the disagreement on financial policy between the Treasury and the FRB. During the special session, however, there were indications that the Treasury was becoming more amenable, and it has this week raised the interest rate on short-term Government securities from 1⅛ to 1¼ per cent, an increase for which the FRB had been asking.

* * *

$65 Million for Peace

If the Eightieth Congress did little during the special session to gloss over the stains on its domestic record, it put a final polish on its already almost unblemished international performance. The only one of the President's eleven requests on which it was prepared to satisfy him completely was the loan of $65 million for the construction of the United Nations headquarters in New York. The loan is interest-free and is to be repaid in annual instalments, beginning in 1951. The House approved it by 264 votes to 97; the Senate had already passed the Bill before the adjournment, but at that time the Speaker of the House, Mr Martin, had successfully prevented the House from acting upon it, by refusing to allow the loan to be separated from the provisions for strengthening the United Nations and for giving diplomatic privileges to its staff, which the Foreign Affairs Committee had included in an omnibus Bill. Consideration of these provisions has now been left until the new Congress meets. Mr Martin's greater readiness to compromise may have been inspired by a belated realisation that isolationist tendencies are not at the moment an asset in the Republican Party.

The question of diplomatic privileges for members of the United Nations staff might have led to controversy, in view of the allegations of subversive activity which have recently been made against some of them. Indeed, in the debate on the loan itself, there was talk of "a sanctuary for Stalin's agents." To that the reply was made that, if the loan was defeated, the United Nations might move to Europe, where it would be even closer to the Communists. Such a move would certainly sap the already weakened faith of Americans in the United Nations. Failure to pass the loan would have had just as disastrous effects on the faith of the United Nations in the United States. If, as has repeatedly been declared, the United Nations is not only the world's best chance for peace, but the keystone of American foreign policy, the least the country can do is to give that keystone a concrete setting as a symbol of its permanency. In fact, of course, the readiness of the United States to pay its international way has already been amply demonstrated; participation in international organisations cost it nearly $1,10 million last year and it contributes almost 40 per cent of the total United Nations budget. The United States has requested that the method of assessing contributions to this budget should be reconsidered, but this is not because it objects to the amount of its own contribution, but because it fears that the present method may give major contributors undue influence.

* * *

Reconstruction Finance Corporation

The Reconstruction Finance Corporation has been authorised to advance $25 million to enable an immediate start to be made on the 39-story building for the Secretariat, which it is hoped to release from the "salt mines" at Lake Success by the summer of 1950. The site given by the Rockefeller family is already cleared and it is not inconceivable that next January the Governor of New York may stop on his way to Washington, to take office as President of the United States, in order to lay the foundation stone of the building that will provide tangible evidence of the bi-partisan foreign policy which he claims to have initiated and which he has certainly done much to maintain. The City of New York is to spend $20 million on improving the surroundings of the building, which will make it the capital of the world—provided that the United Nations does not break up before the building is completed, as some Congressmen fear it may. The City has good cause to be grateful to Governor Dewey for its newly exalted status and its citizens will be able to show their gratitude in November, a point which was probably in his mind when he gave his somewhat delayed support to the loan.

Mr Dewey's adviser, Mr John Foster Dulles, who is expected to be his Secretary of State, will once more be a member of the United States delegation to the United Nations Assembly in September. He was in Washington while the loan was being passed and it is believed that arrangements were made for his association with the State Department in the formation of foreign policy during the coming election campaign. Mr Dewey has evidently decided that this year, as in 1944, the national security makes it essential to keep the broad principles of that policy free from political controversy.

* * *

Meat on Velvet

In Beverly Hills, California, a butcher has evidently decided that meat has been in the luxury class long enough to qualify for permanency. He has spent £2,500 to make his shop window resemble an expensive jeweller's and he displays choice cuts on velvet pillows, hoping that the window shopper will be tempted to buy a Sunday joint of beef costing £4 or £5. Flamboyant Hollywood naturally goes to dramatic extremes, but carefully decorated meat now frequently appears in shop and restaurant windows.

Mr Hoover's campaign slogan of "a chicken in every pot" may have sounded fine in 1928, but today the demand for red meat (beef, lamb, veal, pork) has been encouraged by high wages and full employment to such an extent that it would need the promise of "a steak on every stove" to arouse the enthusiasm of the voter. Statistics indicate that families, who before the war could not afford meat, eat it now with regularity, but, conversely, a great number of those in the middle income brackets, who have taken meat for granted for two or three generations, eat beef and lamb only as a rare treat. Meat prices are on the average nearly three times as high as before the war. Rib roast fetches a retail price of 4 shillings a pound, lamb cutlets are 4s. 6d., bacon 3s. 6d., with cheaper cuts and offal also beyond the means of many. In restaurants fillet of beef costs anything up to 30s. the portion. Desperate housewives grumble in turn against their butchers, the Government, the farmers, and the hungry people of Europe (actually only ¼ of 1 per cent of domestic meat production was exported during the first half of this year). Even temporary boycotts, such as the one taking place at present, have accomplished only localised reductions in prices. There is just not enough meat to satisfy the demand.

The current shortage and high prices are the result of last year's poor corn crop; the cost of grain made it unprofitable to fatten hogs and cattle and many animals that should be coming to market were eaten last winter. Farmers reduced their livestock (the Department of Agriculture reports the fewest sheep in 24 years) so that grazing lands could be ploughed into profitable crops. Paradoxically, the prospect of more and cheaper feed this year will accentuate the meat shortage. Not only will the stock that might have been sold this autumn be held back for further fattening, but more animals will be kept for breeding. This will not increase meat supplies much before 1950 and lower prices are, therefore, unlikely next year if demand remains high.

A picturesque proposal has been made in the Far West where mustangs still graze freely on the high plateaux. Cattlemen have suggested that thousands of these wild horses should be slaughtered; this would produce cheap meat for export and leave more grass for cattle. Naturalists recall the disappearance of buffalo from the western prairies and oppose the plan, so perhaps the inventive housewife might get away with meat substitutes by appealing to the romanticism in her family with an occasional "save the mustang meal."

* * *

Alaskan Frontier

Long ago the late General William Mitchell insisted that "He who holds Alaska holds the world." The view that any future war may be won or lost on the short air-routes above the Arctic is strongly held by American military authorities. The reluctance of Denmark and Iceland to grant the permanent Arctic bases sought by the United States has served to concentrate attention on Alaska, which is not only a free field for experiment in sub-Arctic conditions, but America's own back door. Asiatic Russia is only 52 miles to the west, and Alaska, seeking from Washington the means of development, may well regard Stalin as Alaska's best friend.

If the backdoor is only lightly barred, it is largely because the scarcity and costliness of transport facilities impede both defence projects and the economic development which is equally necessary for security. Alaska is the prisoner of its own remoteness and size. Everything must be imported: food, building materials, workers, either by air, by the uncertain and costly sea route, or over the Alaskan Highway built during the war. Both the Administration in Washington and Governor Gruening of Alaska have insisted that statehood (Alaska has been a Territory for more than thirty-five years) is essential both for the purposes of defence and development. President Truman urged that Alaska, as a state, would be able to advance its own cause by sending representatives, rather than a voteless delegate, to Washington; it would be able to revise its antiquated tax system and to borrow money for its own improvements. But Congress failed to act on statehood either for Alaska or Hawaii. It did, however, approve a number of separate projects to explore Alaska's resources.

With only 94,000 inhabitants in an area one-fifth the size of the United States, Alaska is America's last great natural frontier. Enthusiastic colonists are not lacking, but Alaska is an even less rewarding field for individual pioneering than was the American West. The easy profits are already skimmed off by the absentee-owners of the salmon and gold industries. The veterans who streamed north as homesteaders after the war found jobs scarce, housing almost non-existent, and the cost of living prohibitive.

Under the $200 million appropriation approved by Congress, the Federal Government is to ease their way. The insistence of the Army that Alaska's chief defence needs are an improved railroad, a major oil pipeline, and the building of an internal road system, now almost completely lacking, led Congress to vote $50 million for these purposes. The rest of the money will be spent surveying sites for pulp and paper mills, hunting for scarce and strategic minerals and investigating the Point Barrow oil reserves, and surveying by air possible sites for homesteads. The hope is not only to lay the foundations for a broad five-year plan of economic development, financed by Congress, but to encourage private capital, hitherto alarmed by Alaska's high costs, to play its part on the frontier.

Something in the City

Talking about Ties

Whether choosing for town or casual wear—you will find a suitable and satisfying selection of ties at any of our City shops. They range from aristocrats in silk (some cut from the square), through every grade of foulard, rayon, wool and wool mixture. Styles, too, are unusually varied, and include self-colours, printed and woven designs in neat figures, and well-selected stripe patterns. No coupons are needed. Prices from 5/- to 25/-.

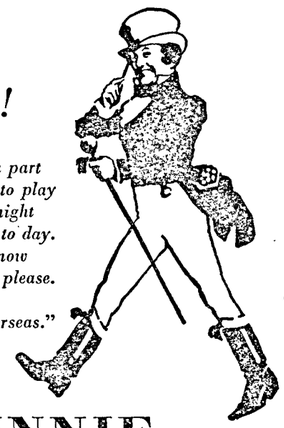
SALISBURY HOUSE, LONDON WALL, E.C.2

"I FEEL LIKE AN ANGEL, up here, winging on my way to be with you. . . ." It's the sense of riding on a big friendly cloud that makes her feel like that. Quietness, a tranquil atmosphere—she writes her letter easily, naturally, and in perfect comfort in the lounge cabin of the Short flying boat.

IN THE EVENING

After an excellent dinner, it is a pleasure to sit in the quiet, roomy cabins. The steward will bring the drinks—and through the wide window is a dreamlike view of the passing world below. And then, to bed in cloud-pillow comfort, to dream of breakfast in Augusta.

The romance of flying, to all parts of the world, is catered for in a big way by Shorts. Flying boats leave the U.K. regularly for India and China, South Africa, Australia, and New Zealand. Short flying boats operate also in South America and Scandinavia. Your travel agent has details.



It's fun to fly by flying boat!

THE WORLD OVERSEAS

In Rural Turkey

(By Our Special Correspondent)

FOR lack of good communications, the foreign traveller in Turkey is apt to fail to get into the countryside. He sees the cities. He meets the Turks who speak a foreign language, or have been abroad, or have got a degree. He rubs up against the uneducated either little or not at all. He therefore gives peasant life a miss.

He may see something of it in the fertile tobacco and currant-growing coastal area behind Smyrna, where intensive cultivation and horticulture produce green crops, and employ many hands. But inland, his view is apt to be limited to what can be seen out of trains and aeroplanes. His impressions of the Anatolian plateau, therefore, are chiefly two: firstly, how very much more this land could produce if better handled; secondly, where do all the people live who scratch its furrows?

Statistics provide a part answer to his question. (And, to the great convenience of the English-speaking reader, a useful variety of these has just been produced with a dispassionate and admirable commentary, by the former British Commercial Counsellor at Ankara. It is available from His Majesty's Stationery Office at 4s. 6d., and is value for money.) Of Turkey's population of nearly 19 millions, over three-quarters are villagers. In 1945, 81.8 per cent (counting both sexes) were engaged in agriculture and fisheries, as opposed to only 8.3 per cent in industry and 5 per cent in public administration. But the peasants' net productivity per male head was low. It was, shortly before the war, 109 international units per male earner per annum, as compared with 90 units in Egypt, 93 in Iraq, 475 in Great Britain and 661 in the United States. The cause of the low Turkish figure is not, as in Iraq or Egypt, climate or debilitating diseases. The Turkish peasant who survives his rigorous and insanitary infancy is tough and a worker. His handicaps are a lack of tools; a lack of communications and therefore of markets; and a lack of incentive to better himself owing to dissemination of his kind over tens of thousands of remote hamlets that have so far proved too small and inaccessible to modernise one by one.

Untouched by Social Changes

An agricultural population of about 15.5 millions is spread over 40,000 villages. An average village, therefore, numbers only 380. Nine thousand contain under 200 inhabitants. The social changes that have transformed Turkey's towns have left them untouched. They remain conservative, uninventive and unenterprising. Eating their produce as they do, those that lie on Anatolia's plateau produce six lamb cutlets and a partridge per head as a normal meal, having no means of sending half this amount abroad and buying an overcoat instead. Snowbound as they are for months at a time, they are far more often cold than hungry. But they are proof against crisis by comparison with the richer tobacco grower of the coast. Their tiny clusters of mud huts are the same colour as the dun landscape, and melt into it. A wide valley that at first glance looks uninhabited turns out to contain two or three. And, until lately, little has been done to disturb their complacent ignorance. All available state funds have been concentrated upon developing strategic or autarkic requirements in industry. By comparison with the advancement in the towns little has been done, therefore, for the countryman in the way of health and educational services and—all important in the coastal river gorges—of flood prevention. As a result, a new and conscientious young Minister of Public Works who last month visited the areas of Erzinçan that were devastated by February's floods, became the butt of endless reflections upon "our former negligence and incompetence."

It follows that a recent comment, made by an American visitor during a press interview, that "what an American can do, a Turk can do," at present applies only to individual Turkish scholars and technicians. It is and will be for many years to come untrue of the farmer. A generation or two must pass before every Turk can read what is on the bottle, and before he develops that instinct for handling machinery that seems to become second nature to the male sex in the second or third generation of industrial development.

But the change is on the way. There is no room, in an article on rural Turkey, to discuss how far it will be speeded up under the schemes for the development of communications, flood prevention and rural hygiene that form part of the present Government's ambitious fifteen-year programme. The success of this, and of the developments brought on by ERP grants and other moneys from abroad, depend to some extent upon the hazards of politics. But the traveller through the Turkish countryside can see for himself certain changes which are already taking place not only on paper but in practice.

Drive For More Teachers

One of these is a by-product of the mobilisation that is on every other count costing Turkey far too dear. It is the very considerable increase in literacy that has been brought about by teaching all recruits to read during their period of service. Of the age group under 25, 60 per cent in the towns and 40 per cent in the villages are now literate. The bulk of the illiterate are girls. In the years between 1937-38 and 1944-45, the number of schools all but doubled and the number of teachers rose from 21,500 to 34,800. But this second figure, covering as it does both town and country, at once shows that there is far from being a teacher for every village. Nearly 10,000 are still without schoolmasters.

The drive to supply this want is the most interesting of the social developments at present in progress. Its name, in Turkish, is the Village Institute system, which means the special method devised for training teachers who are ready to undertake the long and uphill plod in the backward and inaccessible hamlets already referred to. For experience has taught that few town-trained teachers want to go there. Once a taste for modernity has set in, the Turk has no use for village life. Missionary zeal is rare. Civil servant, doctor and schoolmaster alike regard Eastern Anatolia as banishment because, only too often, it turns out to be so. One of the weakest points in the organisation of Turkish Government service is that out of sight is out of mind, and the young man who has gone east sees himself passed over in favour of those who are in a position to dance attendance on Ministries.

In 1939, therefore, a system of training teachers in a village environment was begun. There are now 21 Village Institutes, each some 1,000 strong and each serving about 3 vilayets. Here promising local boys and—despite parental prejudice—also some girls are selected at about 12 years of age. The final selection is made by personal interview. Six years' instruction is then provided at state expense, divided as to 50 per cent for culture and the arts, 25 per cent for handcrafts and 25 per cent for agriculture. At the end of the period the pupil who passes out gets a village appointment—at about £T100 per annum, but with house, land and a horse supplied. A six-year course, the idea of which was evolved only in 1939, has, so far, passed out only two finished batches of students. At the present rate of progress every village in Turkey will have its qualified teacher by 1955.

The Institutes are self-contained, in that they do their own servicing from baking to building and plumbing, but are also taught to regard themselves as part, as it were, of a public schools system. At Hasanoglan—the Institute that serves the Ankara area—ground plans of the 20 counterparts hang in the corridor. "This one has the sea, but then we get skiing." Hasanoglan, with its colour-washed shacks and general air of vigour, is the very antithesis of the old-style village of its name on the slopes above. Below, girl students are playing women teachers at

volley-ball, each side vociferously cheered by male counterparts. Up the hill, the elderly woman driving her ass down the apology of a street snatches her head cloth into her mouth out of sheer habit, to conceal her face from strangers. She is a reminder that the student, once qualified, is going to a lonely job. Some marry at the Institute, and start work as a pair. It must be easier for two to set examples and to break hard ground.

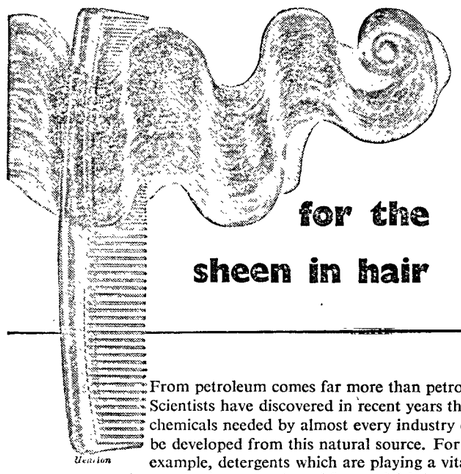
A visit to a Village Institute leaves some sharp impressions. One is of a fresh flowering of the pioneering spirit that was the hallmark of Kemal's zenith. Teachers and pupils alike create this atmosphere in their eagerness to show off what are, as yet, the meagre means at their disposal. The second impression is one of making the best of scanty equipment. "If only we had another machine. . . ." "There are a thousand of us but only 72 pairs of skis. . . ." Even the uniform, though warm, is drab. "But it would not do to be too smart where we are going. . . ." This, however, is no reason for equipping both sexes in porridge colour battle dress cut to fit giants whereas the average Anatolian peasant is stocky. Another impression is that more time given to agriculture, and in particular to teaching the many simple dodges that make for a better crop—such as how to double-trench, leaving top-soil topmost, and how to turn compost—would be a quicker route, than are the hours spent on foreign languages and the like, to converting Anatolia into the major food-producing area that it must become if Turkey is to prosper. The agricultural instruction, at least in this important inland area, does not, to a western eye, approach in quality anywhere near to the standard of the cultural syllabus. It is far below that given to corresponding pupils in Cyprus, whereas the instruction given in other crafts is more varied and better.

But the makings of a great change in rural Turkey are all there. A Village Institute is a show piece, and worthy of the pride taken in it, even by townsmen. Of course its very novelty is, by implication, an admission of a fact long concealed—that during the drive to modernise what had been Ottoman Turkey not everything could be done at once. Something had to slide, and that something was rural development and welfare. Parts of the Turkish provinces still welter in the Middle Ages. That they do so has lately been the subject of some candid but naïf articles in the Turkish newspaper *Cumhuriyet*. Its correspondent, who did a Cobbett's ride in Urfa, where Turkey's largest wheat silos have been installed, writes with astonishment of "mediæval conditions" and "no signs of modern legislation." Today his discoveries come as news to his readers. If Hasanoglan fulfils its promise, he should have a different tale to tell if he rides again in ten years' time. Meanwhile, however, the peasant sees no reason to change his ways and any revolution in Turkish agricultural production is bound to be slow.

Defence Policy of Pakistan

[FROM A SPECIAL CORRESPONDENT]

THE partition of India has left Pakistan occupying the unenviable post of Warden of the Marches, as important in its strategic position as it is vulnerable. Whether, with limited resources and a lengthy line of communications, Pakistan could fulfil its obligation of protecting the north-eastern Frontier is highly problematic; but fortunately the focus of the defence of the Indian subcontinent has swung back to its traditional orientation and the potential danger is from the north-west. It has been so since the dawn of history; what is new is that India is no longer concerned with the defence of the Frontier and is buttressed by another buffer state between itself and Russia. Pakistan has already risen to the occasion in what may be termed the local problem: the Frontier Tribes are no longer semi-outlaws perpetually harrying the border, but are yielding to the attraction of the new Muslim State and are quieter than they have been at any time during the last hundred years. But, in the present darkening international scene, it is worth while considering how Pakistan stands in the wider strategic sphere and what the broad outlines of its defence policy are likely to be.



At the outset, it may be said that the indications are that, so long as Pakistan remains a member of the British Commonwealth, it will fulfil its obligations as such. It would, no doubt, be entitled to follow the Irish precedent and adopt an attitude of strict neutrality in the event of war, but most observers are fairly sure that Pakistan will not be content to remain in the Commonwealth solely for what it can get out of it. It is more likely honourably to play whatever part is allotted to it on the side of the freedom-loving nations. Apart from the fact that this will be consistent with the general tone of Pakistan's foreign policy, the Dominion has a shrewd idea as to who are its real friends. Russia is certainly not one of them, and in the unhappy event of war breaking out between the USSR and the western Democracies, Pakistan will assuredly be found on the side of the latter. This is not to say that Pakistan will at once follow the lead of the United Kingdom and rush to arms. There is ample warrant for the view that in certain conditions "non-belligerency" may be more helpful to an ally than an immediate declaration of war, and the general feeling is that the Great Powers will find Pakistan more of an asset by keeping it neutral in the initial stages of a war than by placing themselves under the necessity of taking up responsibilities for defence which they could not fulfil. Such obligations could only be discharged if careful preparations had been made in advance, but nothing of the sort appears to have been done. Indeed, it is surprising that, as far as is known, the British Government has, as yet, made no *ad hoc* approach to the Pakistan Government in connection with their common defence problems; still less have any joint staff talks been initiated.

Favourable Strategic Position

Presumably the Imperial General Staff recognises the importance of the strategic and political position of this part of the Commonwealth. Apart from the broad fact that Pakistan is the largest, and perhaps now the most influential, Muslin State, Karachi provides an excellent harbour, commanding the approaches to the Persian Gulf with its vital oil installations; while the North-West Frontier Province and the West Punjab are situated only a few hundred miles from the highly industrialised areas of Russian Turkestan. Is the British Government taking Pakistan for granted, or does it consider the part it could play insufficiently important? The answer is beyond the competence of a layman, and quite possibly more is being done behind the scenes than is realised. War supplies are, of course, being drawn from the United Kingdom for the Pakistan armed forces; the position in this respect was not encouraging in the earlier part of the year, but the Defence Secretary's recent mission to London is said to have produced good results, and the flow of essential requirements is being speeded up.

Thanks to the formidable barriers provided by nature, the Pakistan Government is confident that a land invasion over the North-West Frontier is not a practical proposition and that Pakistan's small but efficient army would be capable of warding off any such danger. Parachutist attacks would, however, be a serious threat, and it is not likely that Pakistan would be able to spare any forces for other theatres of war. The Royal Pakistan Navy too, small as it is, would be adequate to keep the sea lanes open against any threat from a power which is not predominantly maritime and to guard the approaches to Karachi. The real danger lies in the air, and the crux of Pakistan's defence lies in the air arm. At partition, Pakistan received only two fighter squadrons and a few transport aircraft; if it became involved in war with Russia, it could be heavily blasted from the air either from Central Asia or from Persia (for it is assumed that the oilfields of the Gulf would be one of the enemy's first objectives, and Persia would be quickly overrun) without being able to put up much defence, unless heavily and promptly reinforced by the western democracies. Preparations for the organisation of adequate air defences must obviously take time and, unless they are put in hand well in advance, a fatal interval might elapse. As matters stand, an initial period of neutrality seems almost inevitable.

How, then, does India fit into this picture? The answer seems to be that India does not fit in at all. There is a strong probability that it will adhere to an attitude of strict neutrality. In any case, no attempt is being made to work out a co-ordinated defence policy between the two Dominions, and the possibility of such an attempt being made is remote. Apart from the fact that the two countries are even now engaged in something like an undeclared war in Kashmir, the memories of the ghastly events of last autumn are still vivid, and Pakistan could never contemplate the idea of Indian troops being moved across the West Punjab to help in the defence of the Frontier. Admittedly, regular meetings between the Defence Secretaries of the two Governments are being carried on, but their discussions are mainly confined to problems arising out of the division of ordnance stores and similar administrative matters. Ultimately, when relations between the two sides improve, the fact that they have much in common in their strategic problems may necessitate a closer approach. A common danger might also unite them, but for the present each must be expected to pursue its own separate policy.

for the sheen in hair

From petroleum comes far more than petrol. Scientists have discovered in recent years that chemicals needed by almost every industry can be developed from this natural source. For example, detergents which are playing a vital part in the processing of furs and fabrics and in the formulation of shampoos. These new detergents are only some of the products in which Shell—and Britain—will soon be leading the world.

British Rule in the Antarctic

[FROM A SPECIAL CORRESPONDENT]

THE comedy of diplomatic manners played out each winter against the frigidly improbable background of the Antarctic is attracting increasing attention. Many doubt whether Britain can afford a spectacle which, in itself so diverting, is clearly prodigal of prestige and presumably also of hard cash.

Although the Falkland Islands Dependencies Survey (FIDS) did not operate under that name until 1945, its work began in secret in 1943 under the title of Operation Tabarin for the purpose of maintaining British sovereignty in the face of Argentine and Chilean encroachments. The distinguishing mark of this work was that it was based on the then revolutionary policy of establishing a series of permanent bases in the Antarctic covering a large area. Meteorology, land survey and geological and biological research were all included in the scientific programme. Chile and Argentina both adopted a similar policy in 1946, and at the moment, in comparison with Britain's seven bases, the former are occupying one and the latter three (including the meteorological station on Laurie Island in the South Orkneys, the maintenance of which was handed over to them in 1904 by Dr Bruce, the Scottish explorer).

Economically, the value of the Falkland Islands Dependencies has been exaggerated. Their only proven worth lies in the vast quantity of raw protein in the Antarctic Ocean, which contains enormous shoals of tiny sea creatures, mostly about the size of shrimps, which form the diet of the whales. The exploitation of this, however, is not a short-term project, much further research being required. For immediate purposes Britain can only con-

centrate on the revival of shore stations to take advantage of the present market for whale oil (shore whaling is not restricted by international authority but only by the British administration) and on developing sealing in South Georgia and starting it in the South Orkneys.

It is hard to believe that so vast an area as the Antarctic does not contain great mineral resources, but none worthy of development have yet been discovered—rumours of uranium deposits may be taken with a large pinch of salt. The task of geological survey is prodigious and expensive. The thick ice-cap, the bad climatic conditions and the difficulties of communication would make only rich deposits of precious or semi-precious ore worth developing. In short, with so much of Britain's colonial territory undeveloped, the Antarctic does not offer an encouraging field for research.

Similarly the range of Britain's strategic interests has been overestimated. Meteorological and ionospheric work in the Antarctic is of importance as it gives Britain an opportunity of securing more accurate weather reports and of improving wireless communication. But the Dependencies do not offer good harbours for ships, and the passage round the Horn is controlled far more effectively from the Falklands or South America. Weather conditions make the establishment of air bases a doubtful project and Australia is not likely to find a fueling station there a practical possibility should the loss of the Middle East ever compel it to use the Cape route. Finally, there is no close analogy between the North and South polar regions; any potential enemies are in the North which does not suffer from such appalling climatic conditions as in the South. It is hard, therefore, to picture the isolated Antarctic as a strategic area in a foreseeable future war.

From 1943-46 the operations of the FIDS were financed by the Admiralty, and no separate accounts were kept for what was regarded as an item of war expenditure, but from April 1, 1946, financial responsibility was transferred to the Colonial Office. The large excess revenue amassed by the Dependencies during the last two years through the sale of their stamps—issued in 1946 and much in demand among philatelists—led to their making two contributions amounting to £99,000 towards the work of the organisation; consequently the FIDS cost the British taxpayer only about £21,000 in the two years for which it came under the Colonial Office vote. No further expenses will now fall on Britain, for, from April 1, 1948, the Governor of the Falkland Islands and their Dependencies under the Secretary of State for the Colonies has assumed control of scientific work and will finance it from a Research and Development Fund, now containing about £150,000, and from any excess revenue accruing to the Dependencies. In the interests of economy and of the whalers (who form the majority of the area's inhabitants and are the source of its wealth) the scientific programme will be one of immediate practical value—weather forecasts, tidal and ice observations, an annual seal census and hydrography. Elaborate surveys and geological work are unlikely to be pursued after 1949; research work financed from other sources will, however, be facilitated where necessary.

Taxes on Whaling Industry

This new move marks a return to the old system by which a programme of regular scientific research in the Dependencies was financed; for the FIDS is not the first British organisation to embark on such an enterprise. In 1923 a body known as the Discovery Committee was set up to organise hydrographic survey and marine biological research in the area with special reference to whales; it was then that the Research and Development Fund was set up. Totalling some £316,000 at the end of 1924, the fund contained the surplus assets accruing to the Dependencies from taxes on the whaling industry and was to be maintained by future surpluses and interest on investments.

Although the invention of the factory ship later led to large-scale abandonment of shore stations (which are alone subject to oil taxation) and of the institution of pelagic whaling, this was a time of great prosperity. Whaling taxes and licences and port dues brought in over £150,000 in 1923; but, though the gross figures rose to over £200,000 in 1926, from 1925 onwards generous tax refunds were made and the net income of the Dependencies from whaling were down to little over £80,000 in 1928. Expenditure by the Discovery Committee was at first very heavy, averaging £75,000 annually in the four years 1926-29, but for the following years up to 1939 the annual figure was about £58,000. The Fund reached the record figure of £477,302 at the end of 1928, from which it then declined, gradually at first, but far more rapidly in the latter thirties; for, while the Discovery Committee continued with their ambitious research work, the depression hit the whaling industry and the approximate whaling revenues of £77,000 in 1930 fell to £14,000 in 1932 and £9,000 in 1933; nor did they again rise above £16,000 until this last year, when the taxation rates were revised to accord with the present high market value of whale oil—£90 per ton. Taxation now is about 51s. per ton. The receipt in taxes on whale oil for this year is estimated at about £40,000, which is highly satisfactory in view of the fact that there are only three shore stations now operating—all in South Georgia.

Sovereignty or Trusteeship?

The British Government have verbally maintained its sovereignty in the Dependencies and put British prestige in the balance. Yet they have proved unwilling to defend that sovereignty as they would presumably in any other British territory. Surely it is time to end this contradictory policy? Either Britain must claim that its sovereignty is inviolable on the grounds that its Letters Patent for the area were never at the time disputed, remove the intruders and recover its prestige at least at the temporary cost of part of our meat ration. Or, confessing that its practical authority has only ranged over small areas and swallowing its pride, Britain must try to reach an agreement with the other claimants. This would allow each to keep those areas to which they have reasonable claim by virtue of occupation and administration (and Argentina's claim to Laurie Island is quite a strong one), while the rest of the area could be put under a form of joint trusteeship. Britain would thus keep the whaling and sealing centres, the sources of immediate wealth, and be able to ensure the development of these industries unharassed by violent nationalist restrictions. At the same time there is no reason why reduced sovereignty should hinder scientific work.

THE BUSINESS WORLD

Industrial Productivity

IT is easier to judge what is wrong with British industry than to measure what is wrong. For many years, it has been the recurrent theme of *The Economist* that industrial productivity in this country was too low, by comparison with productivity in the United States and also with what could be produced with the existing resources and skill of British industry if they were better applied. Such conclusions have usually been based on informed observation and judgment. If more facts about industrial productivity had been available, the Chancellor of the Exchequer's proposal for an Anglo-American Council to strengthen the technical knowledge of British industry would have evoked fewer protestations about the efficiency of British manufacturers and the unremitting efforts of British labour. Until full-scale censuses of industrial production are being taken each year, this statistical gap will remain. To fill it, the observer must content himself at present with impressions, evidence assembled in various working party reports relating to particular industries, some painstaking research into prewar productivity in Britain and America conducted by Dr Rostas, and a few—very speculative—estimates of what has been happening to productivity in this country since the war.

There is no need, on this occasion, to rehearse the evidence that British productivity is far from satisfactory which has been produced whenever a British industrial delegation has visited the United States. The Platt Report, the working parties, and Mr T. E. B. Young's recent account of American coal mining practice tell the all-too-familiar story that British industry is lagging behind. It is, however, as well to be certain what the argument is about. The study of productivity is concerned with the best use of real resources of labour, capital equipment and raw materials. It is concerned with technical efficiency, and not merely with low costs or competitive ability. The native potter may produce his crude wares at lower cost than the average worker in a modern pottery, but his productivity will be infinitely lower, and his lower cost only reflects a far lower standard of living than the industrial worker's. In modern industrial communities, of course, the two concepts of cost and productivity cannot be separated quite so obviously, but there are still good reasons for measuring relative industrial efficiency by the physical output per worker. There are, indeed, plenty of technical pitfalls in such calculations. A ton of cement may be very much the same wherever it is produced. But two yards of cotton cloth may be very different in quality and durability; and to compare the British and American motor industries without allowance for differences in size, quality and style of their respective products would obviously be wrong. Again, an industry in one country may have much more capital equipment per head than the same industry in another country—usually measured by differences in the horsepower of machinery installed per head of the labour forces in the two industries.

These initial difficulties are clearly set out in a privately circulated study of productivity in British and American manufacturing industry prepared by Dr Rostas two years ago for the National Institute of Economic and Social Research. The approach and methods used by Dr Rostas are described in this article, together with three tables setting out some of his main conclusions, with the permission of the Institute; the study itself is to be published in the Autumn under the title "Comparative Productivity in British and American Industry," as Occasional Paper No. XIII in the Institute's series by the Cambridge University Press. Dr Rostas relies largely on what he calls the "global method" for his comparisons; that is, he takes figures of production for comparable commodities (or groups of commodities) and of the total number of employees required to produce them, in both countries. This is not the only method; the "sample method" (employed in the Platt Report) attempts to show the differences in output per head of a small number of typical mills or factories, but since these factories have to be comparable in size, labour force, technical integration, and quality of plant, it is not an easy matter to get satisfactory samples in two countries. There are also difficulties in the global method because individual industries, as defined in the national censuses of production, turn out goods which are not identical in the different countries, either in type or quality. The difficulty is to get homogeneous definitions of an "industry" and a "product."

The first problem—to define an "industry"—raises questions such as the relative importance of main products and by-products. The motor industry produces cars and tractors; the radio industry produces wireless sets, and also radar and

other electronic equipment. Is textile finishing a separate industry, part of the cotton industry or part of the woollen industry? How is one to measure the relative efficiency of assembly industries, whose raw material is, to a large extent, already pre-fabricated? Secondly, if it is possible to compare those industries whose products are broadly homogeneous, some industries, like chemicals and jewellery, rule themselves out of any comparison. Industries producing the same end-product may differ in respect of technical integration—like the cotton industry in England (which is in separate sections) and that in the United States (which is not). Throughout the exercise, differences in quality, which may or may not be apparent to the consumer, dog the accuracy of international comparisons. All these difficulties are faithfully recorded and discussed in Dr Rostas's study. But he draws attention to one entirely different type of difficulty arising from "differentiation" of product—the difference, that is, between production which is largely standardised and that which is produced in greater variety. It is sometimes claimed that such differences account for the lower output per head of the British cotton industry compared with the American; but this, as Dr Rostas shows, is a problem, not of methods of comparison, but of the structure of the industry. It is one of the factors, like existing capital equipment and the skill and habits of workers, which play a part in determining productivity. It raises the question whether the advantages of variety are bought too dearly, compared with the much greater output of more standardised goods which could be produced (given the necessary changes in the industry) from the same amount of labour.

After this summary explanation of the methods and approach of Dr Rostas to the problem of productivity, it is time to review his conclusions. The first table gives the general results of a comparison of physical output per man and per manhour in the United Kingdom and the United States before the war. The comparison covers 32 manufacturing industries in both countries, accounting for about half of the value of net output in Britain and two-fifths of the value of net output in American manufacturing industry. Broadly speaking, consumption goods industries were better represented in the sample than capital goods industries.

The estimates suggest that in the prewar period between 1935 and 1939 average productivity in manufacturing industry was rather more than twice as high in the United States as in Britain. But this is not the whole story. An investigation into working hours in Britain in October, 1935, showed that they amounted to 47.2 hours in manufacturing industry, whereas the average hours worked in the United States were 36.6 in 1935, 38.6 hours in 1937 and 37.7 hours in 1939. Thus the British worker worked on the average 27 per cent more hours than the American worker; and hence the relative output per manhour in the United States was about 27 per cent higher compared with the United Kingdom. If allowance is made for the shorter working week in the United States, output per manhour was perhaps 2.8 times as high in the United States as in Britain.

These are average results. What is the showing of the main industrial groups and the main industries? The second table compares the productivity of main groups of industry in the two countries. Productivity is highest in those American industries producing packing materials and mass-produced durable consumption goods; the mixed group of seedcrushing, rayon, soap, matches and paper is close to the average; food is below the average; and steel, clothing, textiles and building materials are well below the average (though still appreciably higher than in Britain).

The third table gives comparisons for individual industries. It shows some truly astonishing results. How was it that the output of pig iron per worker was over 3½ times as high in the United States in 1937 as in Britain, or that output of tinCans

per manhour was over seven times as high? What explains the ability of the American radio industry to produce 3½ times the output per man in 1939 that was produced in Britain in 1935, and over four times as much per manhour? Nor are these differences the only significant lesson from the table; where figures for the United States alone are available for the period from 1935 to 1939, they show a consistent rise in output per man and also per manhour. Why are industries as diverse as steel, machinery, bricks, textiles, cars, electric lamps, breweries, margarine and matches so superior in terms of output per man in the United States compared with Britain? (The single exception is fish curing, which can hardly be taken as a measure of efficiency in the modern industrial state.)

There is, of course, no single explanation. The physical formation of coal deposits will explain some (though not all) of the difference between productivity in the American and British coal industries. British blast furnaces are less efficient, in terms of output per man, because they have to use lower quality iron ore, and therefore have to handle more ore and coke per unit of output. Markets differ in extent, and industries in their range of specialisation. At any point of time, output per man will also depend on the extent to which he is equipped with machinery; measured by horsepower, an American worker already had the advantage before the war of 1¾ times the capital equipment available for the British worker. It is no accident that output per man and installed equipment were both, broadly speaking, twice as high in the United States as in Britain. But these factors, important though they are, are not the only causes of differences in productivity; the willingness and ability of labour, the intense use of capital equipment by shift-working, systems of payment, and the layout of factories to enable workers to earn as much as possible—all these influences are also operative. It would be charitable to say that, in respect of any of them, the attitude of the average British manufacturer or the average British workman matches the attitude of their American counterparts.

★

On all these questions, however, much work remains to be done before scientific conclusions can be reached. It remains finally to make some speculative guesses about the course of of productivity in this country since before the war. The material does not exist for any accurate measurement, but some impression can be obtained from a comparison between the index of production compiled by the London and Cambridge Economic Service and the movement of employment for the larger industrial groups. Between 1935 and 1947, the index of total production rose by 9 per cent, while employment (at the end of June in each year) rose by 14.7 per cent. Comparison of the two changes suggests a fall in output per head amounting to nearly 5 per cent. The detailed figures for 10 industrial groups are given below:—

TABLE IV—ROUGH ESTIMATE OF CHANGE IN BRITISH OUTPUT PER MAN, 1935–47

	Production in 1947 comp. with 1935 (London & Cambridge Index)	Employment June 1947 comp. with June 1935	Approx. change in output per man

of which Coal	−14	+ 5·9	−18·6
Paper and printing	−18	−11·8	− 7·0
Total (incl. other trades)	+ 9	+14·7	− 4·8

(a) This increase masks a fall of 14 per cent in coal, a rise of over one-third in gas and a doubling of electricity output.

It must be emphasised again that these estimates are very rough and ready. The use of an index number of production over a period of 12 years, including six war years, is obviously far from ideal. But the conclusions suggested by the table are not repugnant to common-sense and ordinary observation. Productivity in coal and building is notoriously low. But it is disturbing to find that the industries which have expanded most rapidly (the metal using trades and chemicals, for example) have themselves suffered a fall in output per man. Moreover, the last column of the table makes no allowance for new capital equipment installed since 1935, and none for a reduction in the normal working week from 47/48 to 43/44 hours. With all necessary reservation about the method of calculation, these figures do indicate the need for major technical reforms in British industry, and a revolution of thought on the part of the British worker. British industry has much to learn from American industry, and even more to apply that it knows already. Will it do so in time?

The Coal Production Problem

OF the many economic plans for 1948 made by the Government, none is more basic than the commitment to produce this year 200 million tons of deep-mined coal and 11 million tons of open-cast coal. This target of 211 million long tons was announced by the British Government at the Paris Conference on European Reconstruction in July last year. It enters, therefore, not only into the industrial plans of this country but also into the industrial plans of Western Europe. Its attainment has been encouraged by giving the mining industry one of the first claims on manpower, lavish treatment in supplies of machinery and materials, and a greater latitude in expenditure on wages and welfare than any other industry has had in the same period. Such open-handedness cannot be extended to one industry without cost to others; its justification rests upon a sentence in the "Economic Survey": the coal target "must be regarded as an absolute minimum and every effort made to exceed it." This is no more than the plain truth: Britain's and Europe's need for coal production at least up to the target could hardly be more compelling.

The weekly statements of coal production issued by the Ministry of Fuel and Power provide a simple measure of the effort to reach the objective. Coal production is now in the annual holiday trough; production last week was 2,222,400 of deep-mined and 151,200 of open-cast. (The two together were 56,000 tons more than in the week ended August 9th last year.) The cumulative total output in the 31 weeks ended on August 7th was 115.14 million tons of deep-mined coal (57.6 per cent of the target for the full year) and 7.42 million tons of open-cast coal (67.5 per cent of the target for the full year)—the two together being 58.1 per cent of the full target. If there were no seasonal movement in coal production, output of the first 31 weeks of the year would need to be 59.6 per cent of the year's target. But there is an habitual tendency for coal production to rise above the average level in the eight weeks before Christmas; this happened last year, and unless miners' habits greatly change, it will happen again. Even so, the picture is not reassuring. In the first 31 weeks of 1947 109.07 million tons were produced in the mines and 5.65 mil-

lion tons at open-cast workings; the two together represented 58.4 per cent of the total quantity produced in 52 weeks in 1947. This examination shows that, if the level of output were to proceed for the rest of this year in the same manner as in 1947, total output of deep-mined coal would be about 196.5 million tons and of open-cast coal about 13.5 million tons. The two together would be about a million tons short of the target, and the total would be made up of more open-cast coal (in general, of inferior quality to deep-mined coal) than was intended. This result might be passable, by customary standards, if the coal target were a mere target; it is not good enough for an "absolute minimum," and it is not even certain that it will be achieved.

The production drive in the mines has achieved a certain quantitative success, but not of a final or decisive kind. Industry, in consequence, is freed from the immediate threat of coal shortage—though it cannot yet be certain that the freedom will endure. Exports, which play so important a part in the plans for European recovery and are essential to the maintenance of British influence in Europe, have been resumed—though not on the scale which is needed. These are entries on the credit side of the Coal Board's ledger, and it is open to doubt whether they could have been achieved without the nationalisation of the mines. It is in the cost and quality of coal that the postwar performance of the mining industry cries out for improvement. In the first quarter-year of the Coal Board's operations a ton of coal cost 37s. 11.4d. to produce; in the fifth quarter (the first three months of 1948) it cost 44s. 8.7d. Each of the intervening quarters showed an increase. Admittedly, the first quarter of this year was the first to show the full impact of the wage increases of last November; it is also true that (having increased the price of coal by 2s. 6d. a ton in January) the Coal Board began to show a profit. But there is no evident reason for supposing that the upward trend of costs has come to an end. The National Union of Mineworkers is preparing a claim for the restoration of sliding-scale payments based on the index of retail prices. It is early to say how this claim will be received, but claims from the mineworkers since the Board took over have not, on the whole, been met with any great show of resolution. In any case, this is not the only way in which the mineworkers' slice of the coal industry's budget may be expected to increase: there are other possibilities, of which the present negotiations on compensation for "redundancy" offer one example. With the cost of coal at 44s. 8.7d. a ton in the first quarter of this year, the Coal Board made a profit of 1s. 6.8d. a ton. After meeting interest charges and interim income to coalowners it showed an estimated surplus for the quarter of £501,000. There is clearly no margin to meet further increases in costs without raising prices yet again.

*

Merely to avoid fresh increases is, however, too modest an aim. The users of British coal at home and abroad are now getting not all the coal they could use, but enough coal (at least) to be able to turn their attention to the fact that it is too dear and not clean enough. To be in a position to make such complaints is, relatively speaking, a luxury. But the complaints are important, and it is on the cost and cleanness of coal that the Board must now begin to concentrate its attention. The Coal Board, in its recent report, admitted the deterioration in quality in recent years. This was partly due to long-term causes (it was, of course, perceptible before the industry was nationalised) but had lately been aggravated by the insistent demand for quantity. "While there has been a need to increase the quantity of coal mined at almost any cost, standards of quality have inevitably fallen." Thus, in addition to the acknowledged increases in the price of coal, there has been a concealed increase as well; for to the coal user a fall in quality is the same as an increase in price.

The nationalised coal industry has lived its life so far under insistent pressure, and has had little energy to spare from the quantitative needs of the moment. Its remedies have been of an expensive kind. The industry has (to take one of the remedies) contrived to expand its labour force, though more slowly than was planned. The important failure here is not in recruiting, but in making use of the new labour; the cost of the new labour (both in terms of the Board's wages bill and in terms of the loss to the labour force of other industries) is evident, but the gain to the coal industry so far is doubtful. More men need to be put to work at the coal face, and this is not apparently being done. The number of wage-earners on colliery books increased from 714,000 to 725,000 between November, 1947, and June, 1948. The number of workers at the coal face increased by only 2,000 (from 290,000 to 292,000) in the same period.

Indeed, the effectiveness of the drive to expand and revive the industry appears to decline as the drive approaches the coal face. Absenteeism is still much greater among face workers than among mineworkers as a whole. In June the average mineworker worked 4.91 shifts a week, the average face worker 4.63 shifts a week. The attempt to work mines on Saturday mornings since the five-day week was conceded has never given good results, and this has been partly because the surface and haulage workers came to work on Saturday mornings but the face workers stayed away; and such coal as was produced (it has lately been not much more than one-fifth of a normal day's production over the country as a whole) has been produced at quite inordinate cost.

COAL COSTS, PROCEEDS, PROFITS AND LOSSES

	1947				1948
	1st Qtr.	2nd Qtr.	3rd Qtr.	4th Qtr.	1st Qtr.
Output (mn. tons):—					
Commercially disposable	42·1	42·1	39·3	45·9	44·5
Saleable	46·2	45·9	42·8	49·9	48·6
Costs (per ton saleable):—	s. d.	s. d.	s. d.	s. d.	s. d.
Wages	24 9·8	25 3·9	27 8·8	28 8·2	29 4·8
Roof supports, stores, repairs	5 0·3	5 10·8	6 4·0	6 3·5	6 1·9
Coal and power	2 6·9	2 5·9	2 7·6	2 5·9	2 10·5
Other costs (incl. depreciation)	5 6·4	5 8·6	6 1·5	6 2·8	6 3·5
TOTAL COSTS	37 11·4	40 5·2	42 9·9	43 8·4	44 8·7

Profit (+) or Loss (—) (before charging interest)	+ 10·2	—1 7·5	—2 6·5	— 9·7	+1 6·8

The necessity now, therefore, is for the Coal Board to seek ways of producing the quantity of coal required without sacrificing (as it has so far been obliged to sacrifice) quality and price. It may have to be accepted that certain of the devices adopted to expand production, reasonable though they seem, do not yield a proportionate return. Ways might still, perhaps, be found of getting them to yield a proportionate return; but they would depend on getting a different spirit in the mines, and a different spirit cannot simply be created by administrative decision. Overtime would yield results if the daily task were increased; if it merely lengthens the day without lengthening the stint, it is better discarded. The expansion of the labour force would yield results if the working of the mines could be reorganised to take more workers at the face; but if labour practices are too rigid to permit this to be done, then the extra workers would be better employed elsewhere. The installation of new machines has given some results, but by no means on the scale that its advocates expected. For the future, the further mechanisation of the mines will need to be accompanied by the reorganisation of work, so that the labour saved can be productively employed: if this cannot be done, it may begin to be questioned whether better uses could not be found for the engineering effort which now goes to provide cutters and conveyors.

The mining industry is clearly entitled to its fair share of the country's economic advantages. It cannot, however, operate without regard to the economic climate in which the other industries of the country live. This fact may well find practical illustration when the Coal Board becomes more heavily engaged on its long-term development plans. For the cost of capital projects (as other industries are finding) is rising very rapidly; and one of the main causes is the higher cost of coal. Even a nationalised industry cannot plan its long-term development without regard to facts of this kind.

Perhaps only a vast programme of long-term development—the construction of new mines—can put the British mining industry on a level of efficiency approaching that of the mining industry of the United States, and high enough to meet the reasonable needs of British industry and the reasonable demands of the European purchaser of British coal. But this will take many years, and the need for more, cheaper and better coal cannot wait so long. In the meantime the main hope must be to raise efficiency by concentrating labour and resources at the better pits, and closing the costly and inefficient pits which are contributing more to the high price of coal than to the attainment of the target. It would mean hard feelings in the industry; this, no doubt, is why the Coal Board has so far approached the matter so delicately. A more radical concentration policy would have to be pushed through; it might mean a conflict of wills with some parts of the mineworkers' union, or even with Ministers. But the present expedients are bearing poor fruit, and sooner or later the Board will have to exert its collective will in the collective national interest.

Business Notes

Throgmorton Street Doldrums

August is never an active month on the Stock Exchange, but rarely have the markets found themselves so completely becalmed as they have been this week. The ebbing tide is causing prices to drift, though only very gently, to lower levels; there is an almost universal absence of interest, relieved occasionally by a little speculation in Kaffir shares (since disappointed by Mr Havenga's budget) and by the response of Australian bank shares to the rejection by the High Court of the Australian Government's plan of nationalisation. These occasional incidents apart, markets have never been more featureless in any holiday season.

But there is some evidence that investors are trying to pierce the dullness in the hope of discovering a line of policy. Sentiment is wavering a little owing to the prolonged and evidently difficult negotiations in Moscow. Wall Street, where shares look cheap compared with London, is again unsettled, and that fact has a sentimental, if not strictly logical, reaction in some investors' minds. There are still hopeful investors (many of them, one suspects, holding shares which they bought a good deal "higher up") who herald the fading-out of the policy of disinflation, and are optimistic about the return of open inflation. If that is the only bull point they can find, disappointment surely awaits them. For it is quite obvious that a thorough-going cost inflation (which the end of Sir Stafford's policy would certainly encourage) would have harmful effects upon industrial profits at this stage. And even those companies which managed to pass on the rise in costs to consumers would be faced with the problem of maintaining their real fixed capital and stocks at even higher prices than those which prevail today.

The paradox today—and it is time that the trade unions seized the point—is that industry cannot afford to depart from voluntary dividend limitation, unless it is prepared to face the risk of exhausting its capital and jeopardising its future earning power. The task of mere maintenance of capital—quite apart from extending it—is quite as much as most companies can now bear. As for new investment, the decision of Courtaulds not to proceed with an important project at Dundee (discussed on a later page) is an example of the limitations which high prices and taxation have imposed on new investment by even the most enterprising and liquid of companies. The steady drift in equities this week is therefore readily explained. Gilt-edged, on the other hand, are more vulnerable to the shift of sentiment about the Moscow talks. Politics apart, the scissors movement between the Funds and ordinary shares might in due course be expected to widen, rather than narrow—unless there is a complete breakdown in the Chancellor's policy. But although Sir Stafford has made concessions, he may be expected to fight for what is left of the main principle, so long as he is not overwhelmed by his own back-bench "supporters" and by those Ministers who speak for them in the Cabinet.

ECA Accounting Futilities

The tale of the ECA segregated sterling has been carried a stage further this week, but it cannot be said that its unfolding has done anything to dispel the misunderstandings which this curious device has caused. On the contrary, despite all the efforts to explain that the Treasury is merely indulging in a few purely book-keeping antics to meet the wishes of the Americans, the first appearance of the Treasury Special Account in the Bank return last week caused some revival of the fallacy that a fund is being created out of which a real, as distinct from a nominal, redemption of debt will be effected. At the week-end responsible quarters of the press were naively and too faithfully reporting the money market as speculating whether the accumulated ERP sterling would be used next week to redeem Treasury deposit receipts, when, after the recent gap, maturities again recur. It needs to be said once again, therefore, that any debt redemption (or minimisation of new borrowing) which occurs as a result of the Treasury's receipts from Marshall aid—or from any other portion of Britain's external deficit—occurs as and when the dollars are sold for sterling to British importers, or as and when bulk-purchased goods are sold by the trading departments to distributors. Redemptions of this character have been occurring for many months past—though in diminishing amounts as the total of the external deficit declines—and are best regarded as wholly independent of the mechanism of the Special Account.

The amount on that Account has shown no change during the past week because, contrary to expectations, the Americans have not yet responded to the official request for permission to "use" the fund for "redemption" of debt. The Bank return therefore showed the £33.4 million first credited to the account, and the corresponding borrowing from the Bank of England by which this nominal transfer was financed, as still outstanding. The Exchequer return, similarly, showed a £33.4 million increase in receipts from creation of "Other Debt—Internal," representing the special interest-free Treasury Notes by which the Treasury has temporarily borrowed from the Bank. When the Americans give the word, the ceremony of debt redemption will be duly performed: the fund—or, rather, 95 per cent of it, for 5 per cent will remain to finance America's ECA administrative expenses or stock-piling purchases—will be "employed" in correspondingly redeeming the nominal debt specially incurred for the purpose. At that stage, the Exchequer return will at last reveal that some ECA grants have been received: a new credit entry under that heading will appear under "Other Receipts" and "Other Debt—Internal," which this week has been increased, will be correspondingly reduced, and honour will be satisfied.

It remains to add that the confusion of the initial transactions has been made worse confounded by the necessity of carrying the first ERP dollar receipts (paid in reimbursement of earlier expenditure out of Britain's own stock of dollars) to a suspense account in the name of the Paymaster-General, pending agreement upon the mechanics of the Special Account. Since the funds in the Suspense Account did not exist in cash, but were nominally lent to the Treasury, the Paymaster could not make the eventual (nominal) transfer to the Bank of England until he had been put (nominally) in funds by the Treasury, which accordingly had (nominally) to redeem Ways and Means advances, financing itself for this nominal repayment by its nominal borrowings at the Bank against special Treasury Notes. This week's Exchequer return, therefore, reveals a redemption of departmental Ways and Means advances—another purely internal category of debt—corresponding to the increase in internal debt officially so described. These bewildering antics need to be described because of the widespread interest they have aroused. But the ordinary observer

—and even many supposed "experts" in the City—would be well advised not to waste any time in trying to understand them. They have no real significance whatsoever, and any argument to the contrary (there have been many such, and doubtless there will be many more) is presumptively false.

* * *

Rebuff for Mr Chifley

Mr Chifley's Government this week sustained its biggest rebuff when the Australian High Court handed down its delayed decision on the challenge to the Act to nationalise the Australian banks. The decision is a resounding victory for the banks and for the three states which joined with them in disputing the constitutionality of Mr Chifley's legislation. It had long been realised that the Government might lose its case, but not even the most optimistic of its opponents expected that the High Court verdict against it would be unanimous. Full details of the decision are not yet available in London, nor is it known on what precise legal and constitutional grounds it was based. But it appears that although there were two dissentients to the Court's ruling against the provisions of the Act governing the actual taking over of the businesses of the banks, there was a unanimous vote against the sections empowering the Government to displace the management of those banks. The Court has made an order restraining the Government from implementing the Act, but, because of the dissentient voting on certain sections, the operation of the Order has been postponed for fourteen days, during which either side is free to apply to the Court.

The decision has been warmly welcomed in banking circles, not only in London but in other Dominions. Most objective observers took the view that the powers conferred on the Commonwealth Government by the 1945 Act gave it as much scope to control the financial machine as even the most enthusiastic of Socialists could well desire. In view of the unanimity of the Court on the main question, most London bankers were of the opinion that the Government is unlikely to attempt to reverse the decision by appeal to the Privy Council. Such a move would, in any case, be very unpopular in Australia, which would dislike any such reminder of its former dependence upon the Mother Country. Hence an appeal would exacerbate the strong feelings which the nationalisation plan has aroused throughout the Dominion. Australian trade union circles, none the less, are reported to be urging the Government to fight the issue to the bitter end, and are blithely ignoring the recent lesson of the referendum on the question of Federal control of prices and rents.

Disinflation in South Africa?

Mr Havenga's first budget since the advent of the Malan regime in South Africa has set at rest the fears that the new Government's desire to court popularity might lead him to relax the sound financial principles for which he was reputed before the war. South Africa needs a disinflationary policy at least as urgently as Britain, and in its general structure this budget is plainly intended to exert a mildly restraining effect. Mr Havenga's tax remissions totalling £6,200,000 fell some £2,700,000 short of the realised surplus for the past financial year, while loan expenditure is cut from £90 million to £70 million. On the general aspects of South Africa's economic plight, Mr Havenga sounded a warning note, as it was undoubtedly his duty to do, but the tone of his speech was several degrees less austere than that of Dr de Kock at the recent meeting of the South African Reserve Bank (discussed in these columns a fortnight ago). Indeed, he actually affirmed that much of the public comment recently had been too gloomy—a remark which was conceivably pointed at Dr de Kock.

The Government, it is clear, is trying to avoid imposing any really drastic measures of retrenchment upon the economy unless and until they become demonstrably inevitable. It is easy to see how a Government which promised freedom from controls should find it difficult to restrain the excessive inflow of imports; but, political considerations notwithstanding, it might be wiser to reimpose import control forthwith. As it is, the Government is exhorting the business world to discipline itself, and in the meantime is evidently prepared to dip still more deeply into the accumulated gold and exchange reserves. The scope for further external disinvestment by this means will not, however, be large unless the Government is prepared to sponsor amending legislation to relieve the Reserve Bank from its obligation to maintain a gold cover of 30 per cent of its liabilities to the public. Since Britain's capacity for making unrequited exports is very limited, South Africa's still large holdings of sterling are no guarantee that the flow of imports can be maintained on a scale sufficient to sustain economic activity within the Dominion at its present level. Inevitably, as Mr Havenga recognised, the Union must buy largely from the United States. Such purchases naturally involve further drafts on the gold reserve. This, though less than one-third of the peak figure at which it stood two years ago, still exceeds £80 million, but the reserve ratio, at about 36 per cent, shows only a small margin above the present legal minimum. There was a hint in Mr Havenga's speech that this minimum may be reduced. "We shall not," he declared, "maintain reserves not required for financial stability merely to prevent the reserve ratio dropping from its previous exceptional height." Evidently the Government would prefer to take this step before withdrawing the present freedom for imports, but Mr Havenga said plainly that he can give no assurance that import restrictions would not have to be reimposed.

In the circumstances, it is hardly surprising that the Government recognises the importance of attracting, if it can, continued inflow of capital from abroad, and especially from Britain. It is therefore fully confident of the advantages of remaining within the sterling area.

* * *

Kaffir Bulls Disappointed

Something more than the relief afforded to the South African gold mining industry than Mr Havenga conceded on Monday will be required to revive interest in the Kaffir market. Hopes that the low-grade producers would be favoured, even at the expense of higher grade mines, were responsible for a burst of activity in the Kaffir market immediately prior to the Budget. But this minor stimulant to activity lacked an air of reality, and reaction came quickly, for the revised formula, as it turns out, slightly favours the high-grade producers.

Mr Havenga has, in fact, continued the process of scaling down taxation in the manner of his predecessor. Taxation concessions estimated at £900,000 a year have been granted to the industry. Mining taxation is still assessed by reference to the ratio of profits to recovery. For 1947-48 its incidence was governed by the equation $Y=63-\frac{325}{x}$ where Y equals the percentage of profit payable as tax and x the ratio of profit to recovery expressed as a percentage. The new equation is $Y=60-\frac{360}{x}$. By the new formula a mine which shows 50 per cent ratio of profit to recovery will now pay 52¾ per cent of its profit in taxation compared with 55½ per cent in the past year and 61½ per cent in 1946-47. At the other end of the scale the exemption limit is unchanged at 6 per cent ratio of profit to recovery; a mine with an 8 per cent ratio will be liable to pay 15 per cent, against 15¾ in 1947-48 and 17½ per cent in 1946-47. The merits of these changes have been widely assessed in relation to the possibility, which has been much canvassed, that some form of subsidy might be given to low-grade producers. The Nationalist Government has preferred to take the line of assisting mines of all grades rather than favouring lower grade mines at the expense of others. That the bias of the new taxation formula is on the side of the higher grade mines may be interpreted as an indication of the new Minister's policy. The new legislation to increase the rate of allowance for the amortisation of capital expenditure for tax purposes from 22½ per cent to 27½ per cent is also in line with this policy. Its importance for developing mines, now faced with heavy capital expenditure, needs no emphasis.

* * *

Wages and Restraint

Trade unions with wage claims pending have fastened upon the latest statistics of wages and prices to provide evidence in support of their case. The Ministry of Labour's retail price index in June was almost 10 per cent higher than in June, 1947, while wage rates increased during the year by only 6 per cent. The biggest single increase in prices occurred in food, which rose by 13 per cent during the year, though the increase of 5 per cent between May and June was mainly due to the new potato season. Increases were also recorded for clothing and fuel, but the price of household goods fell slightly between May and June, and rent and rates were actually lower than a year ago.

The unions, however, cannot complain that the wages "stop" has prevented them from increasing their money incomes. During June, more than half a million wage earners secured increases in weekly wage rates representing £129,000 a week, and the total increases in the weekly wages of 3,277,000 workers for the first six months of the year represented an addition of £962,000 a week to wages. The corresponding increase in the first six months of 1947, when nearly 1¼ million workers secured weekly

increases totalling £296,000, seems modest by comparison. The major part of this year's increase has occurred since the issue of the White Paper on Personal Incomes last February. From the beginning of March until the end of June, increases in weekly wages amounted to £737,000 a week, while the retail price index rose from 106 at the end of February to 109.7 in June. If the many wage claims now outstanding are conceded, increases in wage rates will certainly outstrip the rise in prices, much of which represents the open manifestation of hitherto concealed inflation.

The latest union to formulate its claim is the National Union of Railwaymen, which has this week decided to press for an increase of 12s. 6d. a week, representing "the balance" of the claim for £1 put forward last year, of which 7s. 6d. was admitted. Railway costs have been twice swollen this year by higher prices of coal; if the NUR claim is met, even in part, the deficit on the railways, which is already a certainty for 1948, will be seriously increased, and the inflationary cycle will presumably receive a further thrust from higher railway charges.

* * *

Courtaulds Goes Slow

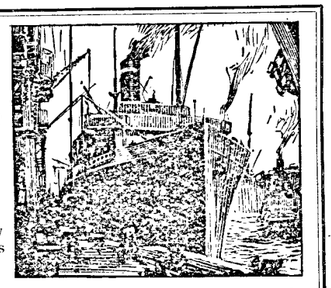
Few big industrial concerns have shown more enterprise than Courtaulds, Ltd., in embarking on new projects since the war; but the chairman's statement in June indicated that these plans were having to be cut down. One—the proposed acetate yarn factory at Sellafield, West Cumberland—was abandoned altogether, though an alternative plan was drawn up to expand the company's acetate yarn production at Coventry. Another—designed to produce film base at Norwich in co-operation with the Belgian Gevaert Company—was held up by the Government's decision not to grant building licences. The reasons were various, but the chairman's statement made it quite clear that, as a result of higher costs of new plant and factories, the company's large reserves could not be used for new development to the extent that had been hoped.

It became known this week that Courtaulds' project to build a plant at Easthaven, near Dundee, for the production of "Fibro" viscose rayon staple yarn had been shelved for the time being, and that the company had withdrawn its tentative offer to Dundee Corporation to bear the cost of improvements to the water supply system. This is no doubt disappointing for Dundee, since the scheme formed part of an industrial development plan. "Fibro" yarn was to have been supplied to the Dundee mills from Easthaven. It is also manufactured by Courtaulds at Greenfield (North Wales), and plans are in existence for a limited expansion of production there.

The company has not disclosed its reasons for the decision not to go ahead at Easthaven, but the decision can perhaps best be explained by a remark in the chairman's recent statement in the company's report: "It is, I believe, true to say that when the war came to an end we were all—and here I refer to Government as well as to industrialists—over-optimistic in regard to the speed at which recovery in this country would take place. However, it would appear that we have come down to earth." The chairman's statement had previously expressed concern at the rising cost of replacement of fixed assets, which would oblige the company to use for replacement funds which had been accumulated for development and expansion. The company had received £27,125,000 in 1941 for the forced sale of its interest in American Viscose Corporation, and the chairman commented that to restore the productive and earning capacity represented by that interest would today cost much more than twice that amount. Courtaulds have other new projects in hand—one of the most notable is the Pontypool factory of British Nylon Spinners, in which they hold a half-interest—which, as things are, will no doubt absorb much of the company's capital resources. Courtaulds' problem is symptomatic of the difficulty which confronts industry in general, and the enterprising industrialist in particular, in maintaining and extending its capital assets.

Working Party for Tobacco?

The cigarette shortage is again becoming acute, and the Tobacco Workers' Union is obviously getting worried. Reduced supplies of leaf tobacco have caused some tobacco makers to go on short time and some to curtail their staffs. Mr Percy Belcher, the secretary of the Union, has urged the President of the Board of Trade to appoint a working party to consider conditions in the industry. How a working party could help in present circumstances, it is difficult to imagine. Would it inquire into the actions of the Board of Trade in restricting withdrawals of leaf from bond, or examine the Chancellor's decision to reduce purchases of American tobacco in order to save dollars? The cigar-



FAMILY TRADITION

It is always pleasant to open an account for another member of a family whose name has been on our books for generations. It is still more pleasant to record that the number of such families is considerable. We like to think that this tendency to make 'banking with the Westminster' a family tradition is the outcome of the Bank's constant endeavour to make each customer, however small his account, feel that he is a welcome visitor . . . You can prove the extent of this welcome for yourself by a call at any branch of the Westminster Bank.

WESTMINSTER BANK LIMITED

3P 34

To promote Trade

The Bank of New South Wales offers these services:—

- Introductions to importers and exporters in AUSTRALIA and NEW ZEALAND.
- Credit information about residents of those countries, with whom you may wish to trade.
- Facilities for making payments to, or receiving payments from those countries.
- Arrangements for business visits to either or both countries.

FIRST AND LARGEST COMMERCIAL BANK IN THE SOUTH-WEST PACIFIC

GB4803F

ette shortage is a manifestation of the dollar shortage and no working party will relieve that.

More significant, perhaps, than this misunderstanding of the cause of the shortage, is the Union's insistence on the *status quo* in the industry. The essence of the import cuts and the export drive is to help Britain to balance its overseas trade accounts. To do so, there must be some curtailment of labour in certain industries and an expansion in others. How else are workers to be secured to man the industries *in an era of full* employment? Mr Belcher's union, however, takes the view that the size of the tobacco industry is unchangeable and that its labour force should be immune from contraction.

America is Britain's main supplier of tobacco. Larger quantities are being purchased from Empire countries, but a major expansion in production in those areas, commensurate with British imports of American leaf, would involve long-term schemes of *development and resettlement.* For the next five years, British manufacturers have agreed to buy a minimum of 46 million lb. annually from Rhodesia. This year, it is estimated that at least 56 million lb. will be available, but normal British consumption of all tobacco runs at 250 million lb. a year. Increased supplies could undoubtedly be obtained from Greece and Turkey against sterling, although the quantities involved would be too small to begin to make good the reduction in purchases from the United States. Up to June of this year, America supplied Britain with only 36 million lb. of tobacco out of total imports of 69 million lb. In the same six months of 1946, imports totalled 150 million lb. of which 129 million lb. came from the United States.

These import figures explain why, during the past year, most tobacco manufacturers have been drawing smaller quantities of *leaf from bond. From May, 1947, to April, 1948,* withdrawals for home consumption amounted to 208 million lb.; in the previous twelve months the total was 258 million lb. This reduction in consumption has been helped by successive increases in the tobacco duty and the policy of disinflation. From July 1st, however, the Board of Trade reduced maximum withdrawals from bond to 201 million lb. and from next month withdrawals will be cut to an annual rate of 193 million lb. Is the present shortage then due to increasing demand or to maldistribution of supplies caused by the holiday period and purchases by overseas visitors? Or are manufacturers unwilling to alter their blends for a short period because they are secure in the knowledge that American tobacco will be available to Britain under ECA? Whatever may be the cause of the present dearth in cigarettes, a working party would be the worst method of discovering it, or of finding a solution to the problem of getting enough tobacco without spending dollars.

ECA Loans at 2½ Per Cent?

The discussions in Washington between the British and US authorities on the terms on which ECA loans, as distinct from grants, will be made available, seem to be proceeding very satisfactorily. An unofficial report circulated last week suggested that the rate of interest on loans to Britain would be 2½ per cent, that the loans would carry a "waiver" clause analogous to that in the 1945 loan agreement and that the term would be "considerably longer" than the 10 years which has been fixed for the purpose of ECA loans to Iceland. This report is understood to have been premature and not necessarily accurate. The discussions are still proceeding and are unlikely to be concluded before the end of next week. Until all details are settled, there is naturally a possibility that the piecemeal agreements on particular points may be upset. It is believed, for example, that the precise provisions of the waiver clause and the actual term of the loans are still to be decided. If, however, agreement can be reached on these matters, it is likely that the rate of interest will be as forecast in last week's report.

It is difficult enough for Britain, in its present plight, to agree to shoulder any further burden for the service of overseas debt; yet, if hard currency imports are not to be cut to the point at which substantial unemployment might be caused in this country, some US aid transferred other than by way of grant would seem to be imperative. In the circumstances, a rate of interest only half per cent above that payable on the 1945 loan—when the economic risk on investment in Britain was certainly rated much lower by the Americans than it is likely to be now—must be regarded as very reasonable. It has been emphasised again that ECA loans will not in any case be negotiated unless the funds are required for specific capital projects in Britain. That does not mean, however, that the Government is contemplating outlays not already included in the investment programme set forth in last year's White Paper and in this year's Economic Survey. The purpose of this informal provision is simply to ensure that ECA loans, like ECA grants, shall be used only for essential purposes.

* * *

Overtime or Redeployment?

Overtime, as a means to expanded production in the cotton industry, could never be more than a stopgap effort to be maintained only until other methods could be brought into play. The effort has now almost died away. The spinners in the Bolton district, who have the best record for overtime work, have decided to return on August 30th to their normal working week of 45 hours. It is useless to blame the Bolton workers for this decision; they have maintained a considerable extra effort since last November, over a period in which little or no overtime has been worked in the other principal spinning districts. In practice this has usually meant starting work at 7 instead of 7.30. Many of the workers are married women with household responsibilities, and the extra half-hour has gradually become a real burden.

It would seem useless to persist with this method of getting extra production when the most willing group of the Lancashire workers has decided to abandon it. The only conclusion to be drawn is that the other (and in the long run more constructive) methods need to be pursued with more energy. The most promising of these methods is redeployment, and it may well have been in the minds of the Bolton spinners that the extra production which they were achieving by longer hours could have been attained (and, without difficulty, exceeded) by the reorganisation of methods of work within the mills. The Bolton district has the best overtime record in the spinning industry, and it has also made more progress in redeployment than any other. It was in this district that the Cotton Board conducted its experimental redeployment of the cardroom of the Musgrave Mill. At the end of the trial the operatives at the Musgrave Mill agreed to accept the new methods permanently; the owners (Fine Spinners and Doublers, Ltd.) have since applied the methods to their other mills, and have met with the same co-operative attitude.

The Cotton Board is beginning another experiment in redeployment, this time at the doubling mill of W. and R. K. Lee, Ltd., at Sowerby Bridge. The Shirley Institute is already engaged *on preliminary work at the mill,* and the industrial consultants will begin their work in the near future. Here also the employees are co-operating readily.

* * *

Large US Cotton Crop

The prospects of cheaper cotton were discussed in these columns on July 17th. This week an official estimate has put the American cotton crop at 15,169,000 bales compared with the *unofficial estimate then given of 14 million* bales. Last season's crop yielded 11,500,000 bales and the season before 8,500,000 bales. The carry-over stock on August 1st was under 3,000,000 bales; accordingly, available supplies of American-grown cotton for the coming season should amount to about 18 million bales. Consumption in the United States (which has recently been declining) has been estimated at 9,000,000 bales, but the needs of the rearmament programme and increased civilian demand due to higher wages *may well increase* this total to over 10,000,000 bales. Recovery in the European cotton textile industry has been encouraging, although in the past year purchases of raw cotton from the United States have been restricted by lack of dollars and by relatively high prices. Even including ECA purchases, cotton exports from America are estimated at not more than 2,500,000 bales, leaving an end-of-season stock next year of the order of 5,000,000-6,500,000 bales.

For the first time since the war, American farmers are likely to resort to Government loans. The loan rate is calculated on the basis of the cost of goods which farmers buy, and retail prices in the United States have been rising quite rapidly. The loan rate was recently fixed for the 1948 crop at 30.74 cents a lb. for middling 15/16 inch cotton. On Tuesday, the New York spot price stood at 32.20 cents and the New Orleans at 31.05 cents a lb. The price has not very far to drop until the loan price is reached. Cotton supplied to Western Europe under ECA will presumably be charged at the loan rate and supplies are not likely to be offered by farmers on the open market at any lower price. The only ultimate chance of much cheaper American cotton lies, therefore, in a general fall in American prices which would have the effect of reducing the loan rate for next season.

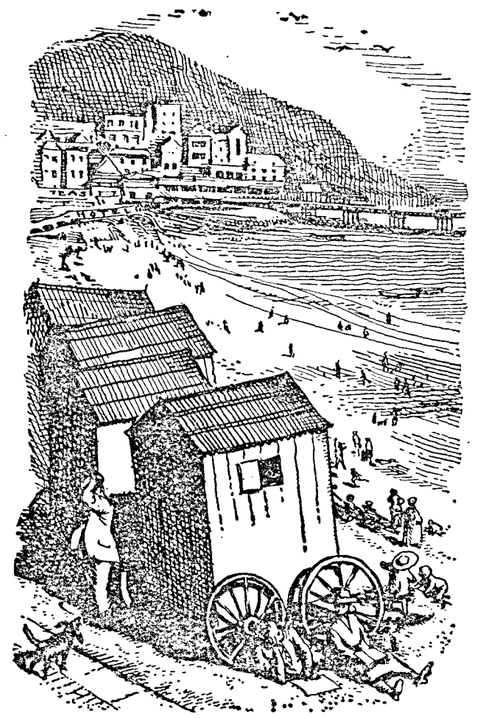
Barter with Italy

The text of the Anglo-Italian trade agreement signed a fortnight ago in Rome is not to be published, nor are any of its details. British traders must therefore be content with the very brief and uninformative communiqué issued last week by the Foreign Office. How merchants are to know that they may now import from Italy live lizards for experimental purposes in university laboratories is not disclosed. Presumably they must *read assiduously the various Government publications* with the hope of finding, some months hence, details of the new avenues of imports and exports opened up by the recent agreement. What conceivable reason is there for this reticence? In the past reasonably adequate information has always been forthcoming about trade negotiations. Is the Foreign Office now so preoccupied with secret diplomacy that trade agreements, which the Treasury has usually regarded as public property, come into the "top secret" class?

The broad outline of the agreement was given in a Note on page 239 last week and some further information has since leaked through the iron curtain of the Foreign Office. Negotiations centred almost entirely in essential exports. Britain is to send Italy textiles, machinery, chemicals and herrings. Australia is to sell wool, South Africa hides and wool, India cotton, jute, *oilseeds and hides, and Malaya rubber* and tin, subject to allocation by the Combined Tin Committee. Italy is also hoping to purchase wheat from Australia, if the International Emergency Food Council agrees. Rhodesian copper was also requested, but the entire output is already sold under contract.

In return, the United Kingdom is to take olive oil, fruit, vegetables, certain textiles, hemp, raw silk, caustic soda, soda ash and zinc concentrates. It is understood that there is also a list of minor items such as toys, broom handles—and live lizards. Italy has also agreed to export textiles, machinery, dyestuffs, sulphur, motorcars and other vehicles to countries within the sterling area.

These exchanges are not very impressive and are undoubtedly the result of hard bargaining on both sides. The purpose of Britain's bilateral trade agreements was avowedly to expand the volume of trade in both directions and in particular to permit greater scope for the export of non-essential goods. In this the Italian agreement is a conspicuous failure. Admittedly, it has obtained for Britain and the rest of the sterling area certain scarce raw materials, but they are being purchased in return for other raw materials which are equally scarce.



* * *

Flexibility in Cotton Exports

The open exports scheme for cotton piece goods has been made more open this week by one change in the existing regulations and less rigid by another. Hitherto, exports to hard currency areas have come under group "A," Commonwealth exports under group "B," and exports to other countries under group "C." In the revised scheme, areas "A" and "B" (that is, hard currency and Commonwealth markets) are combined in one group. With one exception, within this group no administrative distinction is made between the importance of the various countries. It is, however, emphasised that the necessity to earn dollars by cotton exports is in no way diminished by the modifications.

The one important qualification to this grouping affects Canada. During this, the third quarter of 1948, converters must reserve 25 million square yards of cotton piece goods for export to Canada. This reservation for Canada represents 10 per cent of all cotton export contracts, which are thus envisaged for the third quarter at approximately 250 million square yards. During the first two quarters of the year, export orders placed by converters were 246 million and 266 million respectively. The reservation of 10 per cent of export orders for Canada does not necessarily mean that each converter must send 10 per cent of all his exports to Canada; nor does the export scheme itself tie individual converters to meticulous percentage targets of present or prewar trade or individual export figures. The trade as a whole is expected to aim at the targets set. Yet somewhere someone must say "Converter X is not exporting enough to Canada," and it cannot be easy to decide when stronger pressure should be applied against individual converters who are not playing their *full part in the scheme.*

The second modification to the open exports scheme should make for greater continuity of production and relieve converters of some of their risks. Previously they have had to apply for permits for production of goods early in each quarter. In future, converters will be allowed to submit applications for permission to produce in the current period up to September 30th, the last day of the quarter. Thus converters will be able

August

August is the popular holiday month—it opens with Bank Holiday weekend, and a Bank Holiday means a holiday for all. Yet as we journey to escape the prosaic world of affairs the services which a great bank affords are ready to meet the leisure mood. Money can be made available wherever we may go; our instructions for regular payments can be met even in our absence, and it is reassuring to know that precious smaller possessions may be left with the bank for safe custody. Before going on holiday, it is wise to consider whether you are making the fullest use of all the services which this modern bank affords.

MIDLAND BANK LIMITED

to time their applications when they have a clear idea of overseas requirements; as a result orders should flow more evenly to the industry. The third quarter is now well advanced and the full consequence of the modified scheme will hardly be apparent by the end of September. But it in no way relieves the merchant converter of the responsibility to give hard currency markets first priority: the greater degree of flexibility, indeed, should make failure less excusable.

* * *

Good Hopes of the Steel Target

The average weekly production of steel ingots and castings by the British steel industry in July was 232,400 tons, representing an annual rate of 12,084,000 tons. This compares with an average weekly production of 294,700 tons (annual rate 15,323,000 tons) in the second quarter of 1948. Average weekly production of pig iron in July was 171,300 tons (annual rate 8,908,000 tons) compared with a weekly average of 182,000 tons in the second quarter.

These reductions in output are due to the effect of holidays; the figures are quite consistent with the "reasonable prospect" held out by the *Statistical Bulletin* for July of the British Iron and Steel Federation that the recently increased target of 14½ million tons of steel in 1948 can be not only reached but exceeded. The annual rate of production maintained during the first half of the year was 15,129,000 tons. The *Bulletin* estimates that this should be discounted by about 2 per cent to allow for the effect of holidays in the summer quarter; adjusted on this basis, steel production in the first six months of the year corresponds to an annual production of 14¾ million tons.

In spite of the continued rise in the level of steel production, the drain on stocks of pig iron and scrap, which had gone on almost continuously since 1946, was arrested in the second quarter of 1948. Stocks of pig iron rose by 15,800 tons in the second quarter, and stocks of scrap by 32,800 tons. The pig iron position may improve further during the summer holidays, since at holiday periods blast furnaces are more fully maintained in production than steelworks. "The possibility of some decline in home scrap supplies must not be ruled out," adds the *Bulletin*. "On the other hand, imports of scrap in the first part of the year fell substantially below the target rate, and there is a prospect that now the German currency reform has been introduced, considerably increased supplies from this source will arise during the second half of the year."

* * *

Canadian Eagle Issue Success

Applications for warrants to enable shareholders of Canadian Eagle Oil to subscribe for the new issue of 6,491,520 ordinary shares at 25s. a share are reported by the company to have amounted to some 96¾ per cent of the total rights. The final date for application for warrants was August 6th, and the last day of payment for the new shares is August 27th. This result bears all the promise of a resounding success for the new issue, although a certain number of warrant holders may not take up the new shares. Dealings in warrants have exceeded expectations in the market and prompted the suggestion before the announcement of the high percentage of applications that some of it might have been the result of short selling. French holders of the shares have been responsible for much of the selling since they are permitted to pay for new shares only to the extent of the sterling acquired from the sale of warrants. As August 27th approaches, a better idea may be obtained of the number of warrants which are not used, but the rise in their price early this week from 3s. 10½d. to 4s. 1½d., suggested a hardening of opinion on the success of the issue, though there was a reaction in later dealings. At this stage, underwriters to the issue still do not know the extent of the commitments, but if they have had any doubts during the past few weeks of international tension, they should now be reassured by the high degree of interest shown by shareholders.

There can be little doubt of the present strength of Canadian Eagle in a world short of oil. The recently published preliminary statement of results for 1947 revealed an increase in the combined profit of the company and its subsidiary, Eagle Oil and Shipping, from £1,760,917 to £2,481,305, and a rise in the dividend from 6d. to 10½d. per share. Since taxation at 9s. in the £ is deducted from only one-tenth of this payment, owing to the relief provided under Section 31 of the Finance Act, 1946, the gross dividend for 1947 is equivalent to 1s. 6.23d. per share. Calculated on the basis of the latest dividend, the old shares yield £4 2s. 8d. at the current price of 30s.3d. This might have seemed a modest return on an oil share measured by prewar standards, but earnings possibilities are high. So is the cost of new schemes of expansion. Both factors are likely to be more evident when the full accounts are published shortly.

* * *

Firmer Sugar Market

There has been a surprising change in the world sugar market. The price of Cuban sugar up to a month or so ago was rather under 4 cents a lb. (22s. 6d. a cwt.) f.o.b.; now it has risen to 4.20 cents a lb. (23s. 5d. a cwt.), and there is every likelihood that the rise may continue. The current sugar crop in Cuba totals almost 6 million tons. Of this total, local consumption will absorb 200,000 tons, the Commodity Credit Corporation has purchased 900,000 tons and the United States quota now totals 2½ million tons; thus there is a balance available for export of 2,400,000 tons. Sales to markets other than the United States are expected to amount to 1,650,000 tons, leaving a net surplus of 750,000 tons. As Messrs C. Czarnikow, Limited, point out in their recent review, such a surplus is not very large to cover further open market purchases, the possibility of American relief purchases and a satisfactory carry-over of stocks into next season.

This relative tightness in sugar supplies—and at the moment it is no more than that—has arisen from larger American purchases. The US Government recently decided to raise its buying quota by 180,000 tons to 6,400,000 tons, and under the American Sugar Act, Cuba will supply most of this additional quantity. Moreover, both Hawaiian production and domestic production of cane sugar in the United States will be below their allotted quotas, which again has given Cuba an additional market for over 125,000 tons. In all, therefore, American purchases of Cuban sugar have risen by nearly 290,000 tons, and the disposable surplus has been correspondingly reduced. There are also reports that Philippine sugar exports may fall below their quota and that Cuba will be asked to supply a further 45,000 tons to the United States, while rumours suggest that American relief purchases may amount to 350,000 tons, although not all of this quantity will have to be shipped during the current year.

Supply prospects for next year are uncertain. This year's European beet harvest is expected to be good, and import requirements are likely to be reduced. Another large area has been planted to sugar in Cuba, but it is, of course, too early to estimate its yield. Nevertheless, the high cost of Cuban labour (wage rates are now uniform throughout the season) has effectively restricted much of the field work. Hence, even if weather conditions prove to be very favourable, a crop equal to this year's may not be attained. And although Cuba is not the only important exporter of sugar, its crop has considerable influence on the world sugar market, since Cuban supplies account for over 60 per cent of world exports. A smaller Cuban crop may not mean a dramatic rise in world sugar prices, but it might well prevent the decline in prices which had been previously anticipated—particularly if American purchases should be maintained at the present high level.

Joseph Black published only three papers on chemical subjects in the course of over fifty years of scientific research, but his work is of such importance that he is regarded as one of the founders of modern chemistry. The most important of his papers, published in 1756 and entitled "Experiments upon Magnesia Alba, Quicklime and some other Alcaline Substances", deals with the chemical changes which occur when quicklime is added to the "mild alkalis" to render them caustic. He showed that when a solution of mild alkali is treated with quicklime, limestone and caustic alkali are produced. Black's explanation of this reaction is still accepted, and so well reasoned is his paper on the subject that it is regarded as one of the classics of chemical literature.

Born in 1728 in Bordeaux of Scottish parents temporarily resident in France, Joseph Black went to Glasgow University at the age of 18, becoming Professor of Anatomy and Chemistry in 1756, a post he retained for ten years until he took up an appointment at the University of Edinburgh. But it is for his work on the alkalis that this Scottish chemist is remembered. These chemicals which include such every day substances as washing soda and bicarbonate of soda, are as essential for industry as for the home. Their manufacture is one of the most important branches of the British chemical industry.

COMPLETE WORLD-WIDE BANKING SERVICE

With the immense strength of its combined resources and experience, the Three Banks Group is exceptionally well-equipped to fulfil the many varied functions of a modern Banking Service. Although the Group serves the interests of many large and important concerns, it is careful to preserve the personal touch that has been a tradition of each of its members during two centuries.

ROYAL BANK OF SCOTLAND

THE THREE BANKS

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

Fall in Bank Advances

The clearing banks' statement for July showed, rather unexpectedly, a sharp drop in the total of outstanding bank advances—the first decline in this item in any month for two years. The actual decline amounts to £13.7 million, most of which is attributable to a steep reduction in the advances of the National Provincial Bank, which for the second month in succession have dropped by £9,000,000. It is well known that the close connection of this bank with tobacco and film financing from time to time produces large changes which do not conform to the general experience; but it would be wrong to assume that the movement in the aggregate figure last month was wholly due to such special factors. Of the eleven clearing banks, only three showed further increases in their advances; and the largest was no more than £1,100,000. The contrast with the strong upward trend of earlier months is therefore quite striking. There is little doubt that this is the first pale reflection of the effects upon the banks of the changes which disinflationary influences are producing in industry. On the one hand, the decline in consumer demand for certain types of goods has made producers of certain non-essential goods anxious to rely even more heavily upon their bankers; on the other hand, this very relaxation of buying pressure at the margins of the economy is gradually opening out some of the bottlenecks which have forced producers of more essential goods to carry large stocks of half-finished articles and thus to lean heavily upon the banks. A further factor has been the influence of these tendencies upon bank policy. Formerly, the most important borrowers were those in the essential industries, but now the main pressure is shifting to industrial groups which, in present circumstances, are less credit-worthy. In consequence, the banks are certainly beginning to look much more discriminatingly at loan applications than they found it necessary to do a few months ago. It would be unwise, no doubt, to attempt to draw too definite a conclusion from the experience of a single month; it is noteworthy that there has been a decline in advances in the month of July in every year but one of the past decade. But there is little doubt that in recent weeks the banks have been glad to see existing advances reduced out of proceeds of new capital issues, and have grown more chary of sanctioning new ones.

Last month, in contrast with experience in June, the Chancellor's disinflationary financial policy was also reflected in the movement of bank deposits, but the total of net deposits dropped by only £5,500,000—actually by £9,000,000 less than the decline in the banks' advances and investment holdings. In other words, the Government has again been a net borrower from the banking system, but the disparity between these borrowings and its apparent needs (as disclosed by the Revenue Return) was rather less marked last month than in the month of June. In the period most nearly comparable to the three weeks covered by the latest clearing bank figures, the Exchequer return showed an overall deficit (including items both "above" and "below" the line) of £5,000,000.

Shorter Notes

The Indian Finance Minister introduced on Monday the Bill to nationalise the Reserve Bank of India. The decision to nationalise that bank, as well as the Imperial Bank of India, was announced last February. At many points the plan follows closely the model of the nationalisation of the Bank of England. There is no intention to nationalise the commercial banks.

*

An interim dividend of 2 per cent (50 cents per share) in respect of 1948 has been declared on Canadian Pacific $25 ordinary shares. The company states that during the first half of the current year railway earnings made no contribution to the dividend. The fall in net railway earnings is attributable to a continuing rise in costs. The rise in wages since March 1st—it amounts to $27 million in a full year—has completely absorbed the increased freight rates introduced on April 8th. The company has applied to the Board of Transport Commissioners for permission to increase charges further by 20 per cent, and pending final settlement, by 15 per cent. Last year's accounts showed net railway earnings at $22,892,189, while other income, chiefly from the company's smelting, hotel and shipping interests, amounted to $24,788,927.

*

The action brought recently by certain preference stockholders of Eastern Telegraph Company to restrain the company from paying £5,000,000 as a special tax free 100 per cent dividend has been discontinued. The dividend had been paid to Cable and Wireless (Holding) which owns 98 per cent of Eastern Telegraph's ordinary capital. The main point at issue had been whether Eastern Telegraph could make the tax free distribution to ordinary stockholders out of reserves, to the possible disadvantage of preference stockholders who rank in case of winding up equally with ordinary stockholders. Pending the outcome of the action, Cable and Wireless (Holding) had agreed to hold the £5,000,000 dividend in reserve; now that the case has been discontinued, the dividend received from Eastern Telegraph can be distributed at the discretion of the Holding Company.

*

The Foreign Relations Committee of the US Senate approved the International Wheat Agreement last week. But the chairman of the committee, Senator Vandenberg, in reporting to the Senate, stated that there were many reasons which made it unnecessary to consider its ratification at the special session. This step has effectively killed the agreement; if the Americans wish to proceed with the matter next year, a new agreement will have to be negotiated by the thirty-six signatory countries.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: British Glues and Chemicals; Murex; Reardon Smith Line; Guest, Keen and Nettlefolds; Richardsons Westgarth; Brewery Company Reports.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

THE

STANDARD LIFE

ASSURANCE COMPANY

For Mutual Assurance

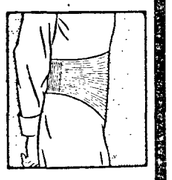
Established 1825 — *Assets exceed £54,000,000*

SPECIAL ATTENTION IS DRAWN TO THE FOLLOWING CONTRACTS:—

1. **BUSINESS MAN'S POLICY** Inexpensive Life Assurance with options to convert at a later date to an endowment assurance either with or without profits.

2. **FAMILY INCOME POLICY** The ideal contract for a young married man: maximum life cover at minimum cost.

3. **POLICIES FOR CHILDREN** (*a*) "Public Schools" Policy. Provision for education by means of premiums spread over the early years of a child's life.



(*b*) "Early Thrift" Policy. Should be effected as soon after birth as possible to provide a splendid life or endowment assurance policy when the child attains the age of 21.

(*c*) "Family Protection" Policy. A policy on the life of a parent incorporating valuable options on the life of his child at age 21. Income tax rebate is allowed on the premiums.

An enquiry will bring full particulars.

COMPANY MEETINGS

ARGENTINE ESTATES OF BOVRIL, LIMITED

LORD LUKE'S REVIEW

The fortieth annual general meeting of this company was held, on the 4th instant, in London.

In his address, Lord Luke, the chairman, said that the trading profit of £132,406 showed an increase of £117,359 compared with last year. Of that profit, taxation absorbed £72,000 and the net profit for the year was £43,533, against £2,521 in 1946.

The net preference dividend for the year to September 30, 1947, which had been paid on June 4, 1948, amounted to £16,500, and their directors recommended that a dividend of 4½ per cent. be paid on the preferred ordinary shares for the year to September 30, 1947, which would absorb £12,808. That left £75,957 to be carried forward and made the balance on profit and loss account approximately the same figure as it had been in 1945.

He had that day received the following cable from the Argentine:—"Cattle and camps are in very satisfactory condition and wintering well. Present prospects cereal crops on company's camps are good. Estimated profit on farming section about 50 per cent. of previous year, due to increased maintenance cost and decreased turnover on cattle account. Continually mounting social services, higher wages and short season are bound to affect factory figures very adversely. If present difficulties and restrictions causing inability to ship raw materials continue intensely difficult situation will arise."

Regarding the future, through no fault of theirs the prospects were decidedly uncertain. They could but look hopefully for some sign of encouragement and freedom for those industries which, like themselves, were endeavouring to maintain and increase the food supplies of the world.

THE GLOBE TELEGRAPH AND TRUST COMPANY, LIMITED

A SATISFACTORY RESULT

The seventy-fifth annual general meeting of The Globe Telegraph and Trust Company, Limited, was held on the 11th instant, in London.

Sir Edward Wilshaw, K.C.M.G., the chairman, in the course of his speech, said: The gross revenue has improved by £9,412. On the other hand, our expenses, due mainly to taxation, have increased by £15,086; £14,182 of this is due to the doubling of profits tax.—raised from 12½ per cent. to 25 per cent.—higher income tax on our increased revenue and an adjustment of a previous year's tax.

The balance is thus reduced by £5,674 to £191,329, which amount, when added to the balance brought forward from last year of £171,454, makes a total of £362,783. From this the dividends already paid and those now proposed will absorb £177,472, leaving £185,311 to be carried forward to next year, an increase of £13,857, which I think you will agree is not an unsatisfactory result in a difficult year.

Our Investments quoted on the London and other Stock Exchanges, which cost £3,817,765, had a market value at the date of the balance-sheet of no less than £7,794,227, in addition to which unquoted investments appear at £1,328,982. Taking these unquoted investments at cost, the total market value of both quoted and unquoted holdings at £9,207,473, shows an increase in appreciation of £202,083 over last year. This is mainly due to our investment in Cable and Wireless (Holding) Limited, which forms just over 41 per cent. of the book value of our portfolio. This originally cost us £2,124,486, and its market value on June 30th last was £6,064,705.

The report was adopted.

NOTICES

INCORPORATED ACCOUNTANTS

THE SOCIETY OF INCORPORATED ACCOUNTANTS AND AUDITORS EXAMINATIONS

The next Examinations will be held at London, Manchester, Leeds, Cardiff, Glasgow, Dublin and Belfast as follows:—
Final Examination: October 26, 27 and 28, 1948.

MATURE business man with many years' merchant experience at high level in various parts of the British Commonwealth would consider advisory or executive work near London.—Reply Box 801.

ANNUITIES

(Single lives; Last survivor; "Capital-protected"; "Capital-redemption"; Reversionary; Certain; Deferred, etc.)

Circumstances have made annuities an attractive proposition to an increasingly large number of people, particularly now that the capital invested in them can be safeguarded against loss due to premature death. Very considerable loss (up to £1,000 and over in individual cases) has been and is being sustained by the public due to their entrusting the purchase of their annuities to inexperienced and unrepresentative part-time agents. The undersigned has specialised for many years in every kind of annuity issued by the various Life Offices (for all of which he acts impartially and in the sole interests of his clients), and is therefore in a position to advise on those giving the highest NET yield with complete safety.

Descriptive brochure, without obligation, to bona-fide applicants, Box 712.—H. A. OUTHWAITE, Assurance Broker. 'Phone: WES. 3092. Interviews by appointment only.

ACCOUNTANT required by British Merchant Firm for senior position at Indian Branch. C.A. preferred, but all candidates with sound general experience of taxation and commercial and industrial accounts considered. Not over 35. Commencing remuneration £1,000 to £1,500 p.a. according to age and experience. Initial outfit allowance, free passages, local leave, pension scheme, provident fund and medical expenses. Initial agreement four years with six months home leave on full salary.—Apply to Box H.53, Foster, Turner and Everetts, Ltd., 11, Old Jewry, London, E.C.2.

THE Civil Service Commissioners invite applications for four pensionable posts of Research Officer (£900-£1,220), five of Assistant Research Officer (£650-£850) and three of Research Assistant (£330-£600) in the Board of Trade. Salaries rather lower for women and for posts outside London. For Research Officer candidates must be at least 28, for Assistant Research Officer 26-39, for Research Assistant 21-29. They must have a University degree in Economics, Statistics or a kindred subject with at least Second-Class Honours or equivalent. Candidates for the posts of Research Officer and Assistant Research officer must also have knowledge and research experience on distribution of population, trade and industry, communications and services, natural resources, etc. Full particulars and application forms from the Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 2267. Closing date September 16, 1948, for candidates in the United Kingdom and October 7, 1948, for candidates overseas.

(1947 Accounts)

UNIVERSITY OF ABERDEEN

RESEARCH FELLOWSHIPS IN ECONOMICS

Applications are invited for two Research Fellowships in the Economics Department, one of which will be in the History of Agriculture. The Fellowship will carry a stipend at the rate of £500 per annum, plus F.S.S.U. benefits. Applications to be lodged with the Secretary by August 31, 1948.—The University of Aberdeen. H. J. Butchart, Secretary.

AUCKLAND UNIVERSITY COLLEGE, AUCKLAND, NEW ZEALAND

Applications are invited for the following appointment: LECTURESHIP IN ECONOMICS. Salary £625 per annum (New Zealand currency). Allowance is made for travelling expenses.

Further particulars and information as to the method of application may be obtained from the Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1. The closing date for the receipt of applications is October 1, 1948.

THE WEST OF SCOTLAND AGRICULTURAL COLLEGE, GLASGOW; THE EDINBURGH AND EAST OF SCOTLAND COLLEGE OF AGRICULTURE, EDINBURGH; AND THE NORTH OF SCOTLAND COLLEGE OF AGRICULTURE, ABERDEEN

The Governors of the Colleges invite applications from graduates for three new posts of Agricultural Economist, one at each College, to develop farm management advisory work, with particular reference to work simplification and farm efficiency studies. The salary scale is £485-£25-£739 at Edinburgh and Glasgow and £470-£25-£710 at Aberdeen, plus consolidated addition of £90. Candidates should have some knowledge of farm management in its practical and economic aspects, and of investigational techniques used in farm management surveys. Persons appointed will be eligible for admission to the Federated Superannuation System for Universities. Further information regarding the conditions of appointment and the duties of the post and forms of application may be obtained from any of the undersigned, with whom applications and copies of testimonials should be lodged not later than September 30, 1948.

The Secretary, West of Scotland Agricultural College, 6, Blythswood Square, Glasgow, C.2.

The Secretary, Edinburgh and East of Scotland College of Agriculture, 13, George Square, Edinburgh, 8.

The Secretary, North of Scotland College of Agriculture, 41½, Union Street, Aberdeen.

PERSONNEL MANAGEMENT. Business executive with wide experience finance, commerce and industry and with profound belief importance personnel management, training and welfare, seeks appointment, offering scope and opportunities, with concern who have similar belief. High level contacts and references. Public school, University, good war record.—Box 798.

SALES STATISTICS.—East Herts manufacturer requires assistant in sales department with flair for handling facts and figures relative to sales, advertising, distribution stock control, etc. Perferably local resident. Not over 30. Keenness more important than experience.—Apply Box 799.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative post. under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees, payable by instalments, if desired.

Prospectus from Dept. P17, WOLSEY HALL, OXFORD

BANKING BUSINESS OF EVERY KIND TRANSACTED

A comprehensive service as Trustee and Executor is also undertaken by the Bank's Trustee Companies in HONGKONG LONDON SINGAPORE

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with limited liability.)—DIVIDEND NOTICE.—ORDINARY CAPITAL STOCK.—At a meeting of the Board of Directors held today, a dividend of two per cent (fifty cents per share) on the Ordinary Capital Stock in respect of the year 1948 was declared payable in Canadian funds on October 1, 1948, to shareholders on record at 3 p.m. on August 23, 1948. The Directors desire to point out that railway operations for the first half of the current year have contributed nothing to the payment of this interim dividend. Continuing increases in the cost of materials and supplies and heavy increases in wages (retroactive to March 1st), which alone will aggregate annually $27,200,000 or more than the net railway earnings for the previous year, have completely offset the increase in freight rates which became effective on April 8th. An application for a further increase in rates became imperative, and application has now been made to The Board of Transport Commissioners for a twenty per cent. increase including an interim increase of fifteen per cent, pending final disposition by the Board.—By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, August 9, 1948.

LONDON TRANSPORT EXECUTIVE

Applications are invited for a post as a Principal Executive Assistant for financial and accountancy work in connection with the establishment of an economic efficiency audit by financial and statistical methods. The duties of the post include the definition of measurements of *economic efficiency* in all branches—engineering, operating and administrative—of the Executive's work, the study of such measurements and their trend, and the investigation of particular aspects of costing data. A sound knowledge of accountancy and costing principles is essential and a professional qualification desirable. Applicants, who should combine the qualities of initiative and imagination with a practical outlook, must be able to write clear and concise reports and be experienced in the interpretation and presentation of financial and statistical data.

The salary for the post is in the range £1,100-£1,300, with prospects of further advancement, and the successful candidate will be required to pass a medical examination. After serving satisfactorily for a probationary period, membership of the Executive's contributory superannuation fund will be compulsory.

Canvassing, either directly or indirectly, will disqualify.

Applications, giving full particulars of education, business or other experience and professional qualifications, should be sent within 14 days of appearance of this advertisement to the Staff Officer (F/E.V.21), London Transport Executive, 55, Broadway, Westminster, S.W.1.

BIRMINGHAM CHAMBER OF COMMERCE (INC.)

Applications are invited for appointment as Secretary on retirement of present occupant of the office. Candidates, preferably between 35 and 45, must have had wide experience in secretarial and administrative work; a University Degree or some knowledge of legal work an advantage but not essential. Post, which also carries with it the secretarial responsibility for the Birmingham Section of the British Industries Fair, is a whole-time pensionable appointment. It offers considerable scope and a particularly interesting type of work to the selected candidate. Remuneration is commensurate with the high degree of responsibility involved and the prestige of the office.

Present occupant will remain in Office for a period of time to enable the selected candidate to take over *smoothly and efficiently.*

Applications, stating age and giving full particulars of qualifications and experience together with the names of three referees, and present remuneration, should be addressed to the President, Birmingham Chamber of Commerce, 95, New Street, Birmingham, 2, marked "Private and Confidential." They must be received NOT LATER THAN first post on October 1, 1948. Canvassing either directly or indirectly will disqualify.

GENERAL WORKS MANAGER.—A well-known confectionery manufacturing company invites applications for a post as Head of the Production Division. The position is at top executive level and involves the co-ordination and control of all production, chemical and process development activities, all of which are committed to a heavy expansion programme. *Essential requirements:* Honours degree (Engineering, Physics or Chemistry); not less than 10 years' experience in process type of industry, including three to five years at senior executive level; proven qualities of leadership and ability to direct operations of a team of high-grade executives; not over 48 years of age. The appointment will carry an initial salary of over £1,000 per annum, plus pension, life assurance and other benefits; prospects of executive directorship. Only candidates fulfilling all the above specifications can be considered.—Please apply in confidence, giving age and full particulars of education, career and salary level, to Box 800.

Troubled Truce

THE unofficial Israeli suggestion to the Security Council—that either a settlement should be reached with the Arabs within a specified time or the Jews should recover their freedom of action—brings into the open the decisive factor of the second truce in Palestine. It is that the Zionists are now on the offensive. Arab opinion, it is true, is divided on the issue of further fighting; those who have done least—the Iraqis and the Syrians—press most strongly for action. It is also true that popular opinion in the Arab countries and among the irregular forces in Palestine itself continues to be restive and ready for violence. But it seems clear that the more responsible Arab statesmen are no longer blind to the events of the last months. Threatened by powerful Jewish forces to whom arms and reinforcements are arriving steadily, overwhelmed by the ghastly disaster of their 300,000 destitute refugees, they realise that the tide of fortune inside Palestine is flowing strongly for Israel and that as a result the intervention of the United Nations, coupled with the maintenance of the truce, is now their chief hope of rescuing anything from the local situation which has turned so swiftly against them.

Zionist offensive strategy springs from the realisation on their side that renewed fighting might bring victory more complete than any yet conceived—outside the brains of the extremists. The successes of Zionist arms in clearing Haifa, Lydda, Ramleh and Nazareth, in overrunning most of western Galilee and in keeping open a corridor to Jerusalem (in which it appears new settlements are being hastily established) have convinced government and people alike that a new resort to arms would give Israel not simply the territories allotted to it by the United Nations Commission, but the whole of Palestine. Their recent policy reflects this new confidence that the best basis for the Zionist cause is now the right of conquest. The Prime Minister, Mr Ben Gurion, has announced that the provisional government no longer *regards the frontiers* suggested by the United Nations as final, and official claims have also been made to Jerusalem as a purely Jewish city. Yet, if the original basis of the proposed Jewish State—the United Nations proposal—is abandoned, there is only one other criterion to put in its place—the amount of territory that can be taken from the Arabs as a result of successful war.

Concrete actions speak as loudly as official claims, and in two vital fields—that of the Arab refugees and of Jewish immigration—Jewish policy confirms and underlines Mr Ben Gurion's statement, for it makes sense only if most, or indeed all, of Palestine is to be included in the Jewish State. The Arab refugees were systematically stripped of all their belongings before they were sent on their *trek* to the frontier. Household belongings, stores, clothing all had to be left behind—a factor which helps to account for the total destitution of the vast majority of the refugees. In some areas, once the villages and settlements had been cleared in this manner, Jewish settlers were brought in to take the place of the outgoing Arabs. Although the Israeli authorities have not publicly committed themselves to a refusal to allow the refugees to return to

their homes, they have shown extreme reserve in discussing the question of the conditions under which the Arabs would be allowed to re-enter the country.

At the same time, Jewish immigration is now being expanded to allow for the reception of 10,000 immigrants a month and it is hoped to bring in 200,000 DPs and 400,000 other Jews from Eastern Europe in the next five years. There is also talk of bringing in some 800,000 Jews who live in other Arab countries. Israel, in the form proposed by the United Nations, could not absorb so many in so short a time. Once again, the practical consequence of Jewish policy is to make control of most of Palestine a necessity.

The obstacle in the way of realising such a policy is the jurisdiction of the United Nations in the whole Palestine dispute and the mission to Palestine of the United Nations' Mediator, Count Bernadotte, and his group of observers. Through the United Nations, world opinion in general—and American opinion in particular—has given its support to the achievement of a peaceful settlement in Palestine. Moreover, the circumstances of the truce are such that the first of the two protagonists to revert to force, be he Jew or Arab, runs the risk of being named aggressor. This is the risk which restrains the Israeli Government today. Its belief that it has everything to gain by fighting is tempered by the fear that to break the truce would invite United Nations intervention—which would be to all intents and purposes American intervention—and undermine the Zionist cause in the country the Zionists must seek above all to propitiate, the United States. In their attempt to escape from this dilemma, the Jews have sought to pin the responsibility for breaches of the truce upon the Arabs. The blowing up of the pumping station at Latrun—allegedly by Arab irregulars—was used to launch an attack upon the uselessness of the Truce Commission, and every effort is being made to convince the world that the Arabs have started a major offensive in Jerusalem. But the evidence of the Mediator controverts these efforts. The United Nations observers are not prepared to commit themselves even upon Latrun and, in general, Count Bernadotte has made no secret of his view that in this second truce, the Zionists, not the Arabs, have shown the greater readiness to let off their guns.

Another line of Zionist tactics has been to invite the Arabs to direct negotiations—a suggestion which, to the chagrin of the Jews, Count Bernadotte passed on to the Arabs without comment. But the Arabs are by now too aware of their weakness to wish to abandon the protection of negotiation only within the jurisdiction of the United Nations. The Jews have therefore proposed the speeding up of a settlement under the ægis of the United Nations. The Security Council is being requested to set a time limit after which, if there is no agreement, both sides will be allowed to resort once more to force. There is reason to sympathise with the Jews in their desire for a speedy settlement, but it is surely clear that any attempt to secure a quick solution in Palestine at this stage can mean one thing only—the breakdown of negotiations and the reversion to violence. Approval of this procedure by the Security Council would simply mean that, after a certain point, the Zionists would be in a position to launch an offensive, but to do so this time without incurring world blame and risking the intervention of the United Nations.

*

The Security Council has, for the time being refused to consider any end of the truce except by its own decision. But many people, especially in America, might not be unduly distressed to see the efforts at conciliation collapse. So many kingdoms in history have been established by force of arms that the prospect of the Zionists carving out their state in the traditional way can be presented as a natural and indeed inevitable process. And since few peoples in the world have longed for a homeland as keenly as the Jews, there is rather more excuse in their case than in that of most other conquerors. But a moment's reflection must show that such an attitude is basically irresponsible. Quite apart from the justice of the matter—and justice is the first casualty in all wars of conquest—there are two reasons why it would be disastrous to permit the problem of Palestine to be settled by force. The first is the extent to which the successful functioning of the United Nations is now bound up with a peaceful solution in Palestine. The United Nations itself is at the moment no more than a piece of machinery which the powers can use or not at will. One development which is calculated with certainty to break it as an instrument for peace is a situation in which the powers, after taking it up and committing themselves to its use, simply allow it to slip from their hesitant hands.

The second reason is as grave. There can be no general peace in the Middle East if the Arab states are asked to reconcile themselves both to the loss of Palestine and to the principle that the Zionists can have what they can take by force. This is not a question only of Anglo-American rights and interests in Arab lands, important as oil concessions, transit and landing rights undoubtedly are. It is the wider question of the pacification of a whole area which lies on a dangerous frontier between competing spheres of interest of the great powers. Even if the Arabs could not destroy Israel by regular military operations, they and their guerrillas and irregulars could create a permanently explosive state of "no war—no peace" from which wider troubles might constantly spring up.

It is for this reason that the British Government has not ceased to urge that any lasting settlement must be based upon the consent of both sides, and in accepting the principle of mediation and peaceful settlement the powers are now committed through the United Nations to the same view. The fulfilment of this principle means that neither side can now hope to achieve its full ambitions. The Arabs must reconcile themselves to the existence in one form or another of a Jewish state—an outcome which their more responsible leaders probably realise already. The Zionists must moderate their territorial ambitions sufficiently to leave some sugar on the bitter pill the Arabs will have to swallow in accepting Jewish sovereignty. It may be that a lasting settlement can be built upon an "equality of discontent"; but there can be no hope of peace if either side forces the other to the total loss not only of its whole cause but of its prestige as well. This explains the much-maligned policy of the British Government in withholding recognition from the state of Israel. It is not because Britain rejects the solution of partition and Jewish sovereignty—on the contrary, it has been accepted as inevitable for a long time past—but because British policy, for all its hesitations and tergiversations has for many years held quite firmly—and, beyond question, rightly—to the conviction that only an agreed settlement has any chance of enduring.

Nor is it any more right today than it ever has been to abandon the quest for an agreed settlement simply because the two sides will not for the moment agree. Possibly the Arabs are by now sufficiently chastened to agree to a partition scheme. But even if they are not, it is the duty of the United Nations to set up a solution that both sides can be expected to agree to, however grudgingly, when they come to their senses and not to acquiesce in one that will never be accepted in any circumstances.

The overwhelming interest of the powers in securing a settlement that can be maintained peacefully cannot be doubted. It is equally obvious that their policy at present is leading them in exactly the opposite direction. Negotiated peace can only be secured, under present conditions, under the aegis of the United Nations and through the good offices of the Mediator. So little support, however, has he received from the powers directly concerned—the United States, France and Belgium who form the Truce Commission—that his own position is becoming seriously compromised. He has asked for more military observers. The response has been dilatory and inadequate. He has asked for a sufficient police force to enable him not only to maintain the truce but to reinforce his moral authority while he urges his unwilling protagonists along the slow and painful path of negotiation. To this plea the reply has been wholly negative. Under these conditions, Count Bernadotte cannot maintain much longer the position of authority which must be his if he is to achieve a settlement. Once the Israeli authorities become convinced that the powers' backing both for the truce and for the principle of mediation is so wavering that it can be flouted with impunity, they are likely to find the temptation to attempt a settlement by conquest overwhelming. Only the narrow thread of their continued acceptance of the Mediator's authority holds them back. If that thread snaps, Palestine will once again be plunged in war.

In the last analysis, only one power can stabilise this dangerous situation—the United States. Its desire not to be implicated directly, its desire to keep its own men from an area in which the forces of Irgun are operating, are perfectly understandable. But the risk seems small compared with the major danger of breaking the United Nations and allowing the conflagration in the Middle East to break out once again. Resolute and unequivocal American backing for the authority of the United Nations and for the Mediator's role and American readiness to provide the manpower necessary to hold the position in Palestine would stabilise a situation which is now showing all too many signs of drifting back to war. Other nations can contribute to a settlement. France and Belgium will undoubtedly follow an American lead. Britain will certainly not obstruct any solution reached by agreement and under international authority. But the United States alone has the power and the influence—above all with Zionism—to turn the scales in favour of peace.

Plan and Pseudo-Plan

THE spectacle of America, stronghold of free enterprise, urging upon the sixteen ERP nations the necessity of common planning, is paradoxical in more ways than one. It is not only that the advice comes from the last place whence, ideologically speaking, one would expect it; it is that the international aspects of planning have, ever since the beginning of the plan-or-no-plan debate, been regarded as offering the most difficult problems and, indeed, constituting the Achilles heel of the whole concept. The planning urged by Mr Hoffman, however, is more a co-ordination of policy and an estimate of its results than a "plan" in the sense in which Socialists understand the word; and indeed, the increasing extent to which planning—of some sort—is becoming a matter of international obligation makes it particularly important to decide just what are its intrinsic possibilities, difficulties and limitations.

Planning, as Socialist opinion understands it, certainly does not correspond to any one clearly definable, logically coherent principle or course of action. One may leave out of discussion that totalitarian Utopia, vaguely technocratic and wholly exempt from any inconvenient notions of pandering to the consumer, cherished by some of the dimmer spirits of the Left, and the still vaguer use of the word in incantations and perorations as an evocative symbol of everything that is non-capitalistic and virtuous. There remain two contrasting realities for which the word may stand when used by different people or by the same people in different circumstances. One of these is the ideal planned economy of the liberal socialists. This sets up as its aim, and claims to achieve through a scientific use of prices and market mechanisms, just that nice adjustment of resources to needs, that maximum exploitation of technical possibilities, which the competitive system ought to produce but does not. The other can best be described as pseudo-planning; it does indeed comprise an objective, or a more or less related series of "targets," but it makes only the most approximate guess at consumer needs, and works less through the price system (which its operators thoroughly distrust) than through piecemeal and spasmodic intervention by physical controls.

There has of course never been an ideal planned society or even a genuine attempt to achieve it. Russian experience has little relevance to a free society, and the dictatorially imposed schedules of a physical plan can only be accepted by such a society as a strictly temporary wartime measure, as intrinsically undesirable, even if as necessary, as blackouts or universal conscription. The same argument applies to such hangovers from wartime control as rationing. Rationing constitutes in itself a confession that the economic system is not producing things in the proportions in which consumers want them; it may be the best and indeed the only immediate way of dealing with the emergencies of war and postwar dislocation, or with an income structure grossly incompatible with current social ideals, but it is essentially a wasteful and clumsy makeshift. In a genuinely democratic planned economy its necessity would be regarded as a clear indication of failure—failure to use the price system either to elicit the right things or to distribute incomes in the right proportions. Deliberate reliance on rationing and on physical controls is, if complete, the mark of totalitarianism; if partial, the mark of the pseudo-plan. Britain, with its genius for muddling through (or at any rate for muddling), is just the country where pseudo-planning might be expected to yield the best results; but those results so far, apart from any judgment of their merits, throw no conclusive light on the theoretical possibility of successful democratic planning.

Quite an impressive case can be put for that theoretical possibility, as readers of the works of the "market socialists" are aware. Appositely enough, a new exposition of planning has lately arrived from America in the shape of a revised edition of Professor Carl Landauer's "Theory of National Economic Planning."* It repays study. Planning—such is its thesis—need not involve physical interference and control; it need not imply public ownership (except over that limited field of "natural monopolies" and communal services which would also need to be publicly controlled in the absence of a plan). It does require price-fixing, supplemented where necessary by taxes, subsidies and guarantees, but a flexible price-fixing such as should in theory result from the operation of the "perfect market." Imperfection in the market is, under private enterprise, ineradicable; actions are taken at best in the light of the present situation, not the situation as it will be when these same actions have borne fruit. Planning can change all that, on certain assumptions which Professor Landauer proceeds to elaborate. He assumes that the planners will not make the fatal mistake—the Russian mistake—of contenting themselves with a mere accumulation of material statistics of production, stocks, sales, manpower, capacity and so forth, but will also work out both supply and demand schedules, with due regard to interconnections, both technical and commercial, for every commodity and service within their purview, solving the myriads of simultaneous equations involved in order to discover the "true" market price of each. These prices they would then proclaim—and the whole equilibrating mechanism of the textbooks, powered by old reliable profit motive, would be able to pursue its beneficent work without further interference.

*Theory of National Economic Planning. By Carl Landauer. University of California Press. (London: Cambridge U.P.)

One would imagine that, having made this demonstration, Professor Landauer would regretfully consign liberal-socialist planning to Utopia. It may be intellectually satisfying to confute that school of thought which holds planning to be essentially irrational even as a paper theory. But the imagined spectacle of a planning board trying to work out, in constantly changing circumstances, what every family and every business man in the community will demand at every conceivable combination of prices for all conceivable commodities and with every conceivable technique, is enough to rouse the compassion of those fairy-tale tyrants who set their victims to sort out overnight a barnful of mixed seeds. Nor is the position really much improved if broad averages are struck for groups instead of individuals, and the less probable technical possibilities ruled out from the start. But Professor Landauer is undismayed. The market does just that, wastefully and clumsily, experimenting with men and goods instead of with figures in a column ; since the work must be done, why not let the planners do it, and do it properly ?

To argue thus is to overlook both that averaging of errors which is the salvation of the free market and the difference between the size of the problem confronting each individual business man and that confronting the planning board. (In the fairy tale, it is a hill-full of ants, or a flock of birds, which sort out the seeds and save the hero or heroine from the penalty of failure. There is a lesson in this.) It is also to overlook the contrast between the merchant shading his price as his business sense brings him a whiff of a buyers' market, and the ideal planning board deciding on a similar reduction after passing its ideally adequate data (collected on how many perfectly designed forms, handled by how many infallibly reliable clerks) through its ideally adequate calculating machines, is like that between the movement of a human player's eye across a tennis court and that of the Mount Wilson telescope across the heavens. The telescope is a more powerful and accurate instrument and backed by a better brain ; but the tennis player's eye is more sensitive and his reactions are quicker. When to these considerations one adds those which affect the actual, as against the ideal, planning procedure—the pitiful inadequacy of data, the inertia of officialdom, the power of the save-trouble motive—no sane mind can accept the fact of perfect planning. When one reflects, moreover, that one of the most important sets of market prices to be fixed is wages, then it becomes painfully obvious that comprehensive planning will never be able to do the market's job for it. In practice, the planning organisation will always be a more or less slapdash affair, making errors and correcting them by physical controls, clapping on more controls to make these effective and taking them off again when they prove unworkable or politically dangerous, judging the plan to fit its own incapacities, and approximating, according to the temper of planners and planned, either to the totalitarian or to the pseudo-planning pattern. And yet planning—of a sort—is essential. It is essential in the long run in order to remedy the recognised susceptibility of capitalism to boom and slump. It is equally essential in the short run, because adjustments which, under free enterprise, would have been made, have not in fact been made and cannot be made at one blow without catastrophe, any more than a traveller who has taken the wrong road over a mountain can safely rejoin the right one by jumping down a thousand-foot cliff face. The ivory-tower analysis of Professor Landauer casts little light on this interim planning for special ends—the only sort of planning, it is reasonable to suppose, that Mr Hoffman has in mind. More realistic, though less ambitious, is Professor J. E. Meade's latest contribution to the debate "Planning and the Price Mechanism."* He is as thoroughly alive as Professor Landauer to the irrational and undemocratic nature of physical controls ; but he has a much less starry-eyed view of the genus planner, and his objectives are limited accordingly. He has, after all, spent the last few years in Great Britain, not in California. Look after the total of national expenditure, the distribution of incomes and property, the possibility of monopoly, and—at all events for the time being—the flow of foreign trade, and the rest of the economy can look after itself ; such, in outline, is Mr Meade's prescription, and—still in outline—it is one with which few people outside the Society of Individualists are likely to quarrel.

Even this nucleus planning, as one may call it, presents difficulties enough. The control of total expenditure, where popular pressure insists simultaneously on enormous investment in the less productive forms of capital, on largely expanded communal services, on fully maintained private spending power and shorter hours, is a tough enough nut in itself—as Sir Stafford Cripps is finding and as any other Chancellor would find in his turn. The unravelling and control of monopolies calls not merely for enormous legal and administrative ingenuity but—since the really important thing is not monopoly *per se* but restrictive practices—a radical and prolonged process of popular re-education. And the control of foreign trade, in a world of wildly unstable prices, is itself a task to stagger anyone. (For just what world situation is Great Britain to plan its activities in 1952 ?) The minimum of planning, the control of the economic climate, is by any realistic standards the maximum too. One can have not only paper plans but paper planning-systems ; in the one as in the other

> We fortify in paper and in figures
> Using the names of men instead of men.
> Like one that draws the model of a house
> Beyond his power to build it.

Less elegantly than Shakespeare, one can only beseech the plan-minded not to insist on biting off more than they can chew.

The Rift in World Labour

IN October the World Federation of Trade Unions will be three years old, but whether it will survive to celebrate its fourth birthday is more problematical. It is true that the meetings of the Executive Committee in Rome last May gave some hope of its survival. By a series of uneasy compromises, by agreeing to differ on such controversial issues as the Marshall Plan, and by postponing decisions on others, the WFTU's life was saved. It was agreed to carry on, in an effort to recapture some of the lost unity of 1945 and to restore some of the dignity of which its recent dissensions have robbed it. But the international atmosphere since May has scarcely been propitious for carrying out the Rome proposals. The recent conference of western European and American labour leaders in London strengthened the non-Communist groups and established close relations with the ERP administration, even if it did not lead to the formation of a rival trade union international. When, five months after the Rome meeting, the Executive of the WFTU meets in Paris in September, it will either have again to gloss over differences, or face its problems squarely, risking the probability of a final breach.

The main reason for not lightly abandoning the WFTU is that it is a genuine international organisation, which if east and west ever resolved their political differences, might still do useful work. It is the first trade union organisation in which revolutionary and reformist movements have joined. With more than 70 million members, it is far more comprehensive than its predecessor, the International Federation of Trade Unions, which would have been quite inadequate to meet the needs of the postwar situation and which in 1943 had a membership of only 16 millions. Because of its rule—one country, one organisation—the IFTU excluded the American CIO, and it never dared to risk offending the American Federation of Labour by inviting its rival to join. British-led attempts to bring in the Russians were unsuccessful, even in the late 1930s when the "Red International" was no longer active and the Russians were pursuing a "Litvinov line." As recently as 1939, at the IFTU's Zurich congress, a proposal to invite the Russians was defeated.

*

Wartime developments precipitated the end of the IFTU. An Anglo-Soviet trade union committee was formed, and the CIO, with its mass membership in munitions plants, grew in influence. From 1943 discussions went on about the basis for the postwar international and eventually, in February 1945, the first world trade union conference was held in London, largely on British initiative. The only major organisation not represented, apart from the Germans, was the American Federation of Labour, which consistently rejected co-operation with the WFTU. The London declaration recognised

> the vital importance of uniting in one world federation the trade union bodies of freedom-loving nations, irrespective of race or creed, or of political, religious or philosophical distinctions.

These admirable sentiments provided the basis for the WFTU's constitution, which was endorsed with great enthusiasm in Paris in October 1945, when the Federation was officially born. It is worth recalling, however, that Lord Citrine warned this conference that the WFTU would only succeed if it concerned itself with trade union matters and kept out of politics, if it were financially and administratively sound, and if it made satisfactory arrangements for the inclusion of the International Trade Secretariats.

None of these three conditions has in fact been fulfilled. The political bias of the administration of the WFTU in Paris, under its secretary Louis Saillant (until recently also a secretary of the Confédération Générale du Travail) has been a constant source of irritation to the British and Americans, and has given the American Federation grounds for its incessant criticisms of Communist domination. Publications of the WFTU have contained vicious attacks on British and American policy and accused the western trade unions of carrying out the dictates of Wall Street. M. Saillant's refusal to place Marshall Aid on the executive's agenda last November precipitated a crisis and led the western trade unions to hold a separate conference to discuss labour participation in ERP. The WFTU'S excursion into Greece, the Middle East and other centres of delicate diplomatic negotiation has created considerable embarrassment.

The chief criticisms brought against the WFTU both by the British TUC and by the American CIO have, however, been on the grounds of the inefficiency and ineptitude of the administration. Mr Vincent Tewson, of the TUC, brought up in the efficient traditions of British union management, has complained bitterly about the World Federation's administrative incompetence. Mr James Carey of the CIO went so far as to declare at Rome that, unless M. Saillant were removed, his organisation would leave the WFTU—a threat from which he rather ingloriously retreated. This action did however result in a compromise arrangement, embodied in a seven-point declaration, whose main purpose was to limit the activities of M. Saillant, to increase the authority of his assistant secretaries (one of whom is Mr Walter Schevenels, former secretary of the IFTU and a strong anti-Communist) and to ensure consultation with the national centres on matters of major policy. It cannot be said that there have been any noticeable improvements in the efficiency of the WFTU or in the standard of its publications. A strongly worded telegram from M. Saillant to Signor Togliatti, after the attempt on the Italian Communist leader's life, has caused both British and Americans to wonder whether the Rome agreement had been forgotten ; it will be one of the bones of contention at the next executive meeting.

These administrative hurdles might be overcome without too much difficulty, but Lord Citrine's third condition—satisfactory arrangements with the International Trade Secretariats—is less likely to be fulfilled, for it now looks as if the protracted negotiations with these bodies will never be concluded. The Secretariats are the international organisations of specific groups of workers, such as miners, textile workers, metal workers and transport workers. They used to be loosely connected with the prewar IFTU and it was originally intended that they should become Trade Departments of the WFTU. Only the miners and printers have signified their readiness to enter the scheme. The majority have preferred to wait and see, while the powerful International Transport Workers' Federation has definitely refused, and its President at its conference last month at Oslo described the WFTU as "an unfortunate chapter in trade union history." The opposition of the Secretariats springs largely from fear of losing their individual autonomy—most of them are wealthy and influential—and from mistrust of the Communist elements. There have also been many technical and financial difficulties. The inclusion of these occupational groups as an integral part of its organisation would provide the WFTU with a solid and practical foundation, which it has hitherto lacked.

It may be that the force of these practical and political obstacles will lead to the disintegration of the WFTU. If this happens, no immediate alternative organisation seems likely to take its place. It is true that the American Federation of

Labour, which originally pressed for the revival of the IFTU, has been encouraging the western groups to form a new anti-Communist international. They wanted to see a body with a fully fledged international secretariat emerge from the recent London conference on the Marshall Plan, and this might well have been the end of the WFTU. These proposals, which were supported by delegates of the CIO and other American organisations, were not adopted, largely because the British and European groups were not ready to move so far. The British, whom the Americans criticised for a "lukewarm" attitude and for slow progress in making intra-European co-operation effective, insisted that international action must spring from effective national action, and that it was necessary first to ensure co-operation between the national trade union centres and their Governments. In the end, it was agreed that each national organisation should appoint a special ERP official, that M. Léon Jouhaux should act as liaison officer with the Paris ERP administration, which would recognise and consult with the unions' ERP advisory committee. It remains to be seen whether this arrangement will develop along the lines envisaged by the Americans or whether it will permanently be confined to ERP activities.

The American Federation of Labour in the meantime has been consolidating its position among the non-Communist groups. It recently set up an inter-American Federation of Labour to counter WFTU influence in the western hemisphere and it is believed to be contemplating similar plans for the Asiatic anti-Communist elements. The Federation is reported to have given substantial funds to the French anti-Communist Force Ouvrière and has recently provided advisers in Marseilles and Le Havre, where Communist influence is strong. No doubt the Italian minority movements will equally turn to it for support and advice. It has also encouraged its members to participate in the International Trade Secretariats, to oppose WFTU interests.

These developments have placed the British TUC in an awkward position. It conceived and nurtured the WFTU and has provided Lord Citrine and Mr Deakin as presidents. While there is considerable support for the WFTU in the British trade union movement, as resolutions for the forthcoming Margate conference show, the TUC has also been a prime mover in the ERP conference. European unions, like their political counterparts, have always tended to look to the British for a lead. Now there is a tendency for the Communist unions to look to Moscow, and the anti-Communists to Washington. Hitherto, the TUC has managed to keep a foot in both camps, but the role of peacemaker is a thankless one, and it may soon have to make up its mind to bring its feet together.

The conception of "workers of the world unite!" is very difficult to sustain. The idea that working people have common interests which transcend nationality and race flourished during the nineteenth century, when, except for fraternal gatherings, it was never really put to the test. The outbreak of war in 1914 dealt the first blow to it, and the divergence between revolutionary socialism, reformist socialism, and the American conception of organised labour in a capitalist state dealt it another. The harsh experience of the twentieth century has, in fact, been that national loyalty exerts a stronger pull than any other interest, and that, even where common interests exist between the members of a class in different countries, the division between democracy and totalitarianism creates a barrier which only the fanatical few are anxious to surmount.

Consequently, as the ideological conflict deepens between east and west, trade unions have come more and more to mirror the policies of their governments. The identifications between government and union in Russia and the Russian dominated countries is almost complete. The British unions are, with few reservations, committed to the foreign policy of their own Foreign Secretary. The two American federations, though they will reject any suggestion of governmental pressure, are in fact at one with the Administration on the Marshall Plan. Until there is some progress in the diplomatic and political spheres it is impossible to foresee anything but a precarious and unhappy future for the WFTU.

NOTES OF THE WEEK

Fruits of Moscow

The Moscow talks still hang in the balance and the last attempt to present minimum terms to Mr Stalin has not been made at the time of going to press. If they should prove acceptable and lead to a lifting of the blockade of Berlin, then it will be wise to restrain any tendency to claim a straight diplomatic victory for the West. After such hard bargaining it could be assumed that whatever the Russians had secured would be really valuable to them; and to that gain must be added their power to re-impose the blockade at any time and to nibble away by economic and administrative measures at the Western position in the city.

If Mr Stalin does not unbend, then the Western Powers will take a graver view of the consequences than will the Russians. The people of the Soviet Union appear to be unaware either that critical discussions are going on or that the Western Powers have organised a full-scale military operation in order to maintain the Western sectors of Berlin. They have been told that all the trouble arises from the introduction into Western Germany of a new currency against which the Russian authorities in Berlin felt obliged to defend the economy of the city and of their zone. If, therefore, the present talks fail the Russian people can be told that the Western envoys were unreasonable about highly technical currency matters. If they succeed the Russian people can be told that the Western envoys have sensibly given way and that the blockade is therefore no longer necessary.

In fact, it is worth emphasising that the whole Berlin question looks graver from the Western than it does from the Eastern side. It has taken three weeks of intense thought and careful manœuvring by the professional diplomatists of America, Britain and France to overcome the tactical difficulties created by months of prestige politics practised by the Berlin generals. Whatever the outcome of the conference, they should not again have imposed on them such a wide range of responsibilities, especially in economic matters.

* * *

Red Danube

"Law," says Mr Vishinsky, "is an instrument of politics, and the reverse theory is untrue." With this classic formulation the Soviet public prosecutor and draughtsman of the Stalin constitution rejected last Monday any idea of referring disputes about the use of the Danube to the International Court of Justice. Instead they will be dealt with by a tribunal of three, two nominated by the riparian states and one by the chairman of the new and solidly satellite Danubian Commission. It is now settled that the Western Powers have lost all status in Danubia; the new convention regulating control of the river reflects none of their rights or views. Time alone can show what rights Germany and Austria will be granted beyond the reaches within their territories.

The conference in Belgrade has been a damaging fiasco for British as well as American diplomacy. It will have raised the stock of the Russians among the neighbours of Tito at a difficult time. And it will have exposed the apparent inability of Western diplomatists—with their present instructions—to find any method of overcoming stubborn stone-walling tactics. Sir Charles Peake scored some sharp debating points but not enough to efface the memory of Mr Vishinsky's triumphant hectoring. One would like to know what Talleyrand would have done when confronted with a negotiator who says: "What is in the Soviet draft convention is acceptable. What is not in the Soviet draft convention is not acceptable."

Defence and Defiance

The question is being asked whether the lips of Mr Alexander, like those of Mr Baldwin, have been sealed. Certainly the Minister of Defence has done noticeably little either to warn the public of the dangers of the international situation or to arouse its interest in the implications of the Brussels Pact. Recruiting speeches have been left to Mr Shinwell, a task for which he shows little liking, and the explanation of British obligations and indebtedness to allies is nobody's business. It is really astonishing that the arrival of American bombers in East Anglia, greeted with relief across the Channel, brought forth barely a word of welcome or justification from a Cabinet Minister.

Ministers may readily be excused for avoiding talk of war. The men in charge of the Service Ministries are not of high calibre, and they are probably as much alarmed by the power as by the weaknesses of the forces they control. But they cannot be forgiven for failing to explain to the public two things: first, that defiant diplomacy without power is bluff; second, that the effort which Western Europe will make towards regional arrangements for its security depends on the lead given by Britain. About the progress made in London by the military committee of the Brussels Powers not a word has been published which would enable leaders of public opinion to present the country's obligations in a novel and interesting light. Recruiting, whether for the regular or for the territorial and auxiliary forces has no point, no appeal, so long as the danger it is intended to meet is not frankly and bravely explained. This task cannot be left to Lord Montgomery.

The Opposition too must take its share of the blame. Mr Churchill should have asked months ago in the Commons for information about the state of the nation's defences. His followers should have pressed the Government much harder for assurances about the state of civil defence, about the disbanding of special airborne and armoured formations, about the state of anti-aircraft and fighter resources and about arrangements for calling up reservists. Had such questions been pressed and reasonable assurances given, then British spokesmen—among them Mr Eden—would have been better entitled to speak brave and defiant words about Berlin. There is a general reluctance on both sides of the House to realise that policies which lead to situations just short of war need the support of forces which are just short of complete readiness. Ministers should spend part of their vacations reading the speeches they made on defence in 1937-38. They wear well.

* * *

Tobacco Cuts

Last Friday's announcement of a further cut in the supply of cigarettes and tobacco to retailers raised a cry of anguish from a British public which had spent most of its holidays queuing for supplies which had suddenly become scarce. In fact this cut may lower consumption to 195 million lb., the point at which it stood in 1938. The extent of this reduction can be seen by comparing it with the figure of 258 million lb. for 1946-47 which had, however, been reduced by savage taxation to the rate of 208 million for the year 1947-48.

This might be the genuine symbol of Nemesis, ramming home to the British public what it means to be a citizen of a country with an adverse trade balance and therefore unable to set its own pattern of living standards. To the worker sick of queuing for a twopenny cigarette of indifferent blend, it might be possible to demonstrate—as it is impossible with subsidised food—that living standards depend upon productivity. But in fact the operation of two factors will probably mask this grim truth. First, tobacco will inevitably bulk large in Marshall aid to Britain and ECA had already estimated the United Kingdom needs of American tobacco for this year at 205 million lb. of which Britain will probably take up the two-thirds covered by grants under ERP. Limited supplies of Greek, Turkish and Rhodesian tobacco are available, but although the American Government may have no immediate objection to their purchase, it is unlikely that the American growers would allow such a risky change in consumer habits to become permanent.

Secondly, cigarettes are not in the same category as other consumer goods. The process of reducing the consumption of nicotine is so painful to the hardened smoker that he or she will curtail many other pleasures (including saving) first. Although it is considered by sociologists to be more easily controllable than drinking or gambling, smoking has nevertheless acquired a steadily stronger grip in Britain. (Consumption in 1946 was almost double that of 1924.) Its volume is not related to the standard of living (the highest figure of domestic consumption ever reached has just been recorded in the United States) nor to the availability of other goods. Although the power to satisfy the urge depends upon the level of money wages, the urge itself is created by the many tangible and intangible factors which contribute to the strain of living. Many works managers will agree with Mr Belcher, secretary of the Tobacco Trades Association, that any saving of dollars on tobacco will be offset by a decline in the efficiency of the British worker who, quite wrongly, is convinced that regular smoking is essential to his well being. Whatever the result of better housing and amenities, and a return to more settled civil conditions, will have upon permanent smoking habits, there can be no doubt that the smoking urge is still near its peak, especially among male workers.

Faced with a possible drop in industrial morale and the certainty of political unpopularity, there is very little that the Government can do except to juggle with the distributive arrangements. The placing of cigarettes on the ration as an alternative to sweets might work, but there would inevitably be a big black market traffic. To tax tobacco even more highly would inevitably create a demand for bigger wages, since the workers regard them as a necessity of life. The Government's probable course will be to make some discreet arrangement whereby cigarettes find their way into the industrial areas and the canteens at the expense of other localities.

* * *

Cost of Living

In the latest Bulletin of the Oxford Institute of Statistics Mr Dudley Seers has further elaborated his cost of living estimates by a subdivision of the middle classes. The results, reproduced in the table below, are based on careful calculations, and would doubtless be borne out by that somewhat elusive body of people whose living conditions happen to conform to weighted mathematical averages. Yet, bearing in mind that individual circumstances vary widely, the trends shown in Mr Seers's calculations conform to experience. From 1938 to 1940, he estimates, the working and middle-class living cost rose about equally, from 1941 to 1943 the middle-class cost of living rose more rapidly and from 1944 to 1946 the two groups rose again at about the same pace. Since 1946 the calculations show a slight differential disadvantage against the working classes, which is indicated in the last column of the table.

COST OF LIVING OF DIFFERENT SOCIAL STRATA
(1938=100)

	(1) June, 1947	(2) May, 1948	Percentage Rise Since June, 1947
Working class	161—2	174	7·8
Lower middle class	166—7	179	7·3
Clerical employees	168	180	7·2
All salaried personnel	169—70	182	7·3
Upper middle class	185—6	198—9	7·0

The cost of living index of the working classes since 1938 has risen somewhat less than the consumer's price index, but whether this means in effect a rise in real wages depends upon the view taken of both size and quality of the national product today as compared with prewar. There is little doubt, however, that the incomes of the higher groups have fallen behind their respective cost of living indexes; no mathematics are needed to prove this. At best the national product has moderately increased in quantity, yet the larger share of the working classes in that product must come from somewhere and as it does not, at least all of it, come from more production or overseas borrowing, it must come from less consumption—for someone. "The general rule appears to be that the higher a social group was in 1938, *ceteris paribus*, the greater has been the increase in the prices of their customary purchases since 1938." It is rationing by the purse indeed when cost of living rises faster than incomes.

In the last year the middle classes have apparently not fallen behind in the race to retain their share of the national product. Indeed, the upper middle class—on Mr Steers's definition, all people whose incomes in 1938 exceeded £500 a year—have fared least badly in the past 12 months. Yet this has become an economy where cost, and thus standard, of living depend on good fortune as much as good management. The working man who since the war has a new home at £1 a week (and subsidised by £22 a year) and the salaried person who took a 14-year lease in 1938, are relatively comfortable; but for the postwar tenant at uncontrolled rents normal budgeting has been made impossible for years ahead. Too much individual hardship is hidden by averages to warrant sighs of relief at the statistical cost of living of any section of the community.

She Chose Freedom

In the Biblical narrative of the Fall an angel with a flaming sword was posted to keep people out of Paradise. Under the rule of the Marxist-Leninist state, on the other hand, the more important task of the flaming sword is to stop people escaping from Paradise. Extraordinary precautions are taken by the Soviet Union to prevent its citizens from fleeing from their happy land. As long as the iron cage does not extend beyond the frontiers of the Union, it is no matter for international law—even though cases such as that of the detention of the Russian wives of British subjects are a cause of international friction—but when the Soviet state pursues its wayward children outside its territorial boundaries, awkward incidents are liable to occur.

The latest case is the astonishing "rescue expedition" of officials of the Soviet Consulate in New York to bring into Soviet keeping the school teacher Mrs Kosenkina, who was living on a farm owned by a White Russian organisation outside New York—having been abducted thither according to the official Soviet version, but having taken refuge there according to her own account which she has now given to the New York police. Even if she had been abducted, there was no justification for the Soviet Consul's action; it would have been his duty in international law to request the American police to liberate her, not to organise a rescue party himself on the territory of a foreign state. But by jumping from the window of the Consulate, and afterwards refusing to allow Consulate officials to take her from an American hospital, she effectively refuted the Consul's contention that White Russians, and not his own staff, were the kidnappers.

Meanwhile the Soviet Government had raised the matter to a high diplomatic level by formally protesting to the State Department and demanding that Mrs Kosenkina and another Soviet citizen, Mr Samarin, who with his family had also "chosen freedom," be handed over forthwith to the Soviet authorities. As Mr Samarin had already placed himself under the protection of the Federal Bureau of Investigation, it was no longer sufficient to accuse the White Russian group of abduction, and American officialdom was directly charged with being in the plot to entrap Soviet citizens longing to return to their own country. This insolent bluster is unlikely to convince any honest American that Mrs Kosenkina jumped from the Consulate window because of her joy at being once again within the embrace of the Soviet state.

In any case, the American Government has refused the extradition of the fugitives, and the Swedish Government has now been encouraged by the example to warn the Soviet Embassy in Stockholm to desist from attempts to force the return of an Esthonian girl who wishes to remain in Sweden. It is, indeed, about time that the Russians, who lay such stress on their own sovereignty, were told clearly that they can claim no extra-territorial rights on foreign soil for the purpose of applying their discipline to their own nationals.

Too Many D-Marks?

The German people in the three Western Zones will have another billion D-marks placed at their disposal by the decision taken this week to release the remaining quota of 20 D-marks per head, which was promised in the currency reform law last July. Dr Erhard, head of the Economics Department at Frankfurt, opposed this step on the grounds that consumers had too much purchasing power already, while industry is acutely short of medium and long-term credits. The public was blamed by the German authorities for forcing up the now largely decontrolled prices by reckless buying and for encouraging the fresh hoarding which is taking place.

It is often overlooked in such arguments, however, that the former "legal" prices which have now risen were in any case fictitious, and that real prices have fallen by far more than the cut in currency would have justified by itself. Thus, the legal price of a pair of shoes was 18 Reichsmarks before July 20th, but at the rate of allocation and issue it would have taken eight years for each consumer to secure a pair. On the black market, shoes were to be had for 800 to 1,000 Reichsmarks. At the exchange rate of ten to one, this price should have sunk to 80 to 100 D-marks; but, in fact, shoes can now be bought on points in the shops for prices which are wavering between 30 to 40 D-marks.

Undoubtedly, there is a risk attached to the present decision. There may, indeed, still be too much purchasing power in the public's hands. The Anglo-American estimate of old money in circulation before the exchange proved to be only about half the actual figure; no less than 123 billion Reichsmarks were in circulation. This figure has been cut to 5.7 billion D-marks, in cash and bank accounts, a figure to which the extra billion will now be added. And the danger of another buying spree exists. The Germans have not yet realised how poor their country has become. The great need is for a return to reality in all aspects of life, and it is the basic virtue of the currency reform that it sharply forced the trend in that direction. For the British it is hard to estimate how far illusion had gone in Germany, where belief in a miracle weapon had been succeeded by faith in a whole range of other fictions, political and economic.

Though there is a risk in giving the public its 20 D-marks per head, it had nevertheless to be taken, even if it temporarily fosters the illusion that good times are coming. If the currency law had been altered, public confidence in the new marks would have been undermined. Rumours of fresh inflation are already being spread by speculators and Communists, including the report that the Western Powers will, after all, allow the Russians a share in control of the D-mark in order to remain in Berlin. That the Western Germans should be nervous on this score is a warning of the danger of any but the most limited concessions on currency matters in Moscow.

* * *

Christian Trade Unions in Italy

The expected split in the Italian Confederation of Labour (CGIL) is now virtually complete. The Christian Democrats had long presented the political twist given to CGIL policy by the Communist majority. The last straw was the general strike ordered by the Communists on July 15th, after the attempted assassination of Palmiro Togliatti, their leader. The next day the Christian Democrat trade union leaders sent a letter to the CGIL Secretariat declaring that, since the objectives of the strike were against the proper aims and tasks of trade unionism, they must denounce Article 9 of the CGIL Statute. Under that article all members agreed to abide by majority decisions of the Directorate. Furthermore, the Christian Democrat trade union leaders urged their workers to ignore the strike notice.

In reply, the Communists appealed for trade union loyalty. But the quarrel was taken up by the Christian Association of Italian Workers (ACLI) recently formed by the Christian Democrats to operate within the CGIL. This action was followed by the predominantly Communist executive committee of the CGIL expelling its Christian Democrat colleagues. The expelled leaders refused to leave their offices, and parleying went on for several days. But the die now seems cast, and news of "free trade unions" is coming from all over Italy including even Bologna, the Left-wing stronghold. It is expected that when the ACLI holds its first national congress early next month, it will set up a fully independent and rival trade union organisation like that of the *Force Ouvrière* in France.

Meanwhile, two particular aspects of the present confused situation are of interest. First, the Pope is reported to be preparing an encyclical on Christian Trade Unionism, to be issued probably just before the ACLI congress in September. This promises to be a momentous document, for which there has been no precedent since the encyclical *Quadragesimo Anno* issued in the early thirties. Secondly, the Christian Democrats, having successfully got the courts to block the CGIL's liquid assets, amounting to 200 million lire at the Banca dei Lavoro, pending a decision on legal entitlement, have now been allotted 23 million lire as their share. This event has convinced many doubting observers that united trade unionism in Italy really is finished.

Constitutional Progress in Rhodesia

Northern Rhodesia is the latest colony to have its constitution modified towards more responsible government, but the changes announced by the Colonial Office this week are less interesting than the events which led up to them. Constitutional advance in Northern Rhodesia is hampered by the two facts that it is a colony with a white settler community and that it is adjacent to self-governing Southern Rhodesia which discriminates against the African in its legislation and administration. There is always the fear that if more responsible government, in accordance with the Europeans' wishes, is given, it will pave the way for the infiltration of discriminatory practices from Southern Rhodesia and possibly for the amalgamation of the two territories.

It was against this background of suspicion that earlier this year the unofficial European members of Northern Rhodesia's

Legislative Council put forward proposals for constitutional reform. Not unnaturally they would have allowed Northern Rhodesia's Europeans a bigger say in its affairs by giving the Legislative Council control over the Executive Council in which three of the European elected members should sit. But they also proposed that the balance of power in the Legislative Council between Europeans and Africans should be preserved and that an African, chosen by Africans, should sit in the Executive Council as Minister for Native Affairs. Yet so great is the suspicion of European intentions that the very real advance proposed for the Africans was overlooked both by the Africans themselves and in this country, and the scheme was denounced lock, stock and barrel.

The Colonial Office's counter-proposals, which were agreed to by the European and African delegation sent to discuss the whole matter, are much more limited. The Executive Council will include three European unofficials from the elected members of the Legislative Council and one of the European unofficials nominated to represent African interests. Provision is also made for one or two of the unofficial members to have responsibility for groups of departments—the usual device in the colonies for helping the transition from an Executive Council to a full Cabinet system. When Africans are ready for it, they will be eligible for appointment to the Executive Council, but for the time being they must rest content with the direct representation in the Legislative Council which they will have for the first time this autumn. Yet the Africans apparently prefer these cautious proposals of the Colonial Office to the real advance which the unofficial proposals would have given them.

* * *

Federation or Amalgamation?

No official statement was issued at the end of the talks between the Secretary of State for the Colonies and the Northern Rhodesian delegation on the question of federation with Southern Rhodesia. But it is becoming such a prominent topic in both colonies that it can hardly fail to have been discussed. There is no doubt that many Europeans in the Rhodesias still desire amalgamation as wholeheartedly as they did in the 'thirties when the Bledisloe Commission pronounced against it for the time being. But there is also no doubt that the reason why the Commission pronounced against it is as strong now as it was then—the fear of Southern Rhodesia's native policy held by the Africans of the northern territory. On the other hand, federation would, it is claimed, give all the advantages of amalgamation—it would provide a larger and more convenient unit for the administration of such matters as civil aviation, transport, hydro-electric schemes and external relations—but without the great disadvantage of amalgamation, for it would reserve to the individual governments all aspects of native affairs. Amalgamation of Northern Rhodesia with Nyasaland would be the natural introduction to the federation of the three territories, and there are signs that the former opposition of the Nyasaland Africans to the proposal is breaking down.

Whatever their real feelings, an important section of Europeans in both Rhodesias appears to have decided to drop amalgamation in favour of federation as being the most practicable aim. In fact, the United Central Africa Association, an organisation in Southern Rhodesia, is anxious that Southern Rhodesians should not press for Dominion status because it would be impossible for the federation of a colony and a Dominion to be achieved, and at the moment it puts the practical advantages of federation above the problematical advantages—and undoubted costs—of Dominion status in isolation. The nucleus of federation of the three territories already exists in the Central African Council, and the Colonial Office may well think that this body, which is solely advisory, should be given a longer trial before anything more ambitious is attempted. In the meantime, the Africans of Northern Rhodesia and Nyasaland should be told exactly what federation implies and, more important, what it does not imply, and their opinion on it ascertained. It would be unfortunate if yet another scheme should founder on African distrust.

Insurrection in Burma

For months past a large area of central Burma has been outside the control of the Burmese Government and under the domination of Communist rebels led by a certain Than Tun. But it has only been during the last fortnight that revolt has assumed such proportions as to endanger the very existence of the Government—now a "caretaker" administration still headed by Thakin Nu, who succeeded to the leadership of the AFPFL (Anti-Fascist People's Freedom League) after the assassination of Aung San, and concluded the Independence Treaty with Britain. A section of AFPFL, the PVA (People's Volunteer Association), formerly Aung San's private army, broke away and seems to have formed a working alliance with the Communists; there have also been mutinies of units of the regular army and a spread of brigandage ensuing on the breakdown of the central power. Rebel forces have attempted to take Rangoon, but have been beaten off by troops still loyal to the Government, including garrisons urgently recalled from the Chinese frontier.

U Tin Tut, who has resigned as Foreign Minister, but continues to support the Government, is trying to raise an auxiliary military force, which in accordance with current Burmese custom will, doubtless, be in effect another private army. What is now happening in Burma appears to be a dissolution of the state in which central rule may virtually disappear for some time in a struggle of factions, with the border tribes perhaps asserting their independence. With reorganised military forces the present regime may ultimately succeed in restoring its authority, but in the meantime Burma, and foreign interests in Burma, cannot but sustain serious economic loss. If, on the other hand, Than Tun were to come to power in Rangoon, his programme commits him to cancellation of the treaty with Britain and to outright confiscation of British assets in Burma, which now form one of the most important sections of British capital holdings abroad.

The unrest in Burma is to some extent an inevitable result of inflated hopes of the results of independence among the masses of the people. Nationalist propaganda has long attributed all poverty and woe to colonial administration, and has painted a picture of a golden age to come with the passing of British rule; reality has fallen far short of expectation, and the Communists have been quick to suggest that, if the millenium has not yet arrived, it is because Ministers in Rangoon are still the slaves of imperialist monopoly capital. The peasants do not see why they should pay taxes or pay for tickets when they ride in trains, for they have been told that the country and its wealth now belong to them; if the officials want money, why don't they take it from the Burmah Oil Company, which has plenty? On such states of mind Communist agitation plays skilfully in accordance with text-book tactics to promote anarchy through which the Communists can come to power; it will be time enough afterwards to explain to the peasants that they will have to pay taxes after all. Meanwhile, the world is wondering what is going to happen to Burma's exports of rice, oil and teak.

* * *

ECA Delivers the Goods

The Economic Co-operation Act (ECA) has now been in operation for over four months, and some Europeans are beginning to ask what kind of goods they are getting under the recovery programme. The answer is given in a recent survey provided by the ECA authorities. It shows that, ever the four months ending August 7th, ECA had authorised the 17 Marshall nations to make purchases under the Act to a total of over $940 million. Practically all of this total was for food and raw materials. Authorisations for the purchase of capital equipment were negligible. The following table gives the authorisations by commodity group in detail:

Food and Agricultural Supplies	Value $ Million	Raw Materials	Value $ Million
Wheat and wheat flour	275	Petroleum products	108·5
Meats	48	Coal	66
Other food products	41	Non-ferrous metals and non-metallic minerals	60
Cheese and other dairy products	21	Cotton	55
Fertiliser, feeds and seeds	20	Lumber, etc.	30
Agricultural equipment	1·5	Inedible oils and fats	24
Total	406·5	Tobacco	22
Miscellaneous		Steel	20
Ocean and inland freight	97	Chemicals	13
Industrial equipment	21	Fibres and textiles other than cotton	4·5
Medicines	5		
Aircraft parts	3		
Miscellaneous	4·5		
Total	130·5	Total	403·0

The provenance of the goods offers interesting comparisons. Figures available at the beginning of August showed that 38 per cent of the purchase authorisations were issued for the buying of goods and services outside the United States. The largest contributors of these so-called "off-shore" supplies were Canada and the Persian Gulf areas. The main commodities they furnished were petroleum, wheat and wheat flour, and bacon. The par-

ticipating European countries themselves; apart from Belgium and Bizonia, have so far supplied little.

E.C.A. Authorisations, April-August, 1948

Total authorisations	100%	
Purchases in U.S.A.	62	
Off-shore purchases	38	
Canada		17
Persian Gulf area		4
Dutch W. Indies		2
Bizonia		2
Belgium		2
Scandinavia		1
S. and C. America		5
Rest of world		5

In the distribution of these supplies, by far the biggest share has gone to the United Kingdom, which has received 30 per cent of the total of $940 million. A further 25 per cent has gone to France, and Italy and Western Germany have each received about 12 per cent.

These figures and percentages raise the question how far the experience of the first four months may form the permanent pattern for the future recovery programme. If there is an improvement in world supplies of cereals and later of dairy produce, then the ERP countries can make greater savings in their use of dollars for imported food. A change, therefore, in the commodity composition of ERP imports is probable. Such a change, however, assumes that the Marshall countries will be able to use their saved dollars to buy capital equipment—deliveries of which play an insignificant role in the deliveries so far. The present signs are that they will not be able to buy all their requirements from the United States. The American steel industry is unwilling to finance large plant expansion merely to meet what it considers a temporary European demand.

So the prospect is that the ERP nations will have to turn to one another in order to obtain the industrial equipment needed for reconstruction and development. Such an increase in intra-European trade is, in fact, implicit in the whole design of ERP. If the programme is to fulfil the intentions of its American architects, the 17 nations should move toward a point where they are drawing off very little from the American economy—ERP food needs should be met primarily by Canadian and Latin American supplies and requirements of capital equipment should be met within Europe.

Satisfaction in Olympus

Despite the unfortunate symbolism of the fact that the torch blew out the minute it reached the white cliffs of Dover, Britain's turn as the host to the Olympic Games has been a much greater success than anyone had dared to hope. The arrangements for spectators and competitors were not luxurious, but they were adequate, and apparently better than many foreign visitors had been led to expect. There were occasional flashes of that unimaginativeness which British petty officialdom can display, as for instance the poverty of decoration and the three carriage Emmett train put on to return the entire audience from Henley to London. But every arrangement within the ambit of the Olympic organisations themselves was excellently contrived and great credit is due to Lords Portal and Burghley and their staffs, respectively the chairmen of the London Games and of the Organising Committee.

Apparently man (and woman) is destined to run faster and to jump higher as mankind knows less and less whither it is bound. The athletic prowess of the coloured runners was fully to be expected together with the general pre-eminence of the American and Scandinavian athletes. Apart from the boxing, which should be excluded from the Olympic Games until a better set of international rules can be produced, the various victories gave more pleasure to the victors than pain to the vanquished, and especially the performance of Mrs Blankers-Koen which made the Dutch happier than anything since the liberation.

One thing has become obvious. The success of an Olympiad depends on the quality of the crowd which watches it. The British are among the most expert of spectators, and the skill with which they summed up the finer points of the events was impressive. Their attendance outstripped official forecasts, although the British people have recently confided to Dr Gallup that their favourite sports are, in that order, soccer, cricket, tennis, racing, rugger and the dogs, only one of which was represented. That they were concerned more with the success of the Games than with the prowess of the British teams was evidenced by the wave of relief which swept the country when it was found unnecessary to disqualify the American relay team.

Nothing could have been in greater contrast to the Berlin Games.

Unfortunately, it is idle to pretend that such successful gatherings can do much to induce a better spirit of international amity. As a result of bitter experience the Western world has now learned that it is international politics that decide policy, and that the athletes who link arms in one year may be shouldering arms against each other in the next. It is certain that the echo of the crowd at Wembley will have been heard but dimly in the Kremlin, and perhaps the most significant test of the relative placings of Mr Marshall, Mr Molotov and Mr Bevin will be whether or not there will be an Olympic Games at Helsinki in 1952.

* * *

Mr Chifley Sets His Teeth

Mr Chifley is not, after all, accepting his defeat at the hands of the Australian High Court. The Federal Government has decided to appeal to the Privy Council against the invalidation of their Act to nationalise the Australian banks. The decision is surprising, for it is against the traditional policy of the Australian Labour party to take its problems outside Australia. Moreover, since the six judges of the High Court were unanimous in their findings against the crucial sections of the Act—those which gave the Commonwealth Bank power to take over the management of trading banks—it is unlikely that the constitutional law has been misinterpreted. And it is only on points of law that the Privy Council can base its decision on the validity or otherwise of the High Court's judgment.

Apart from appealing to the Privy Council, there were two courses open to Mr Chifley's Government. Either they could have accepted the High Court's judgment as final and abandoned their attempt to nationalise the private banks; or they could have framed alternative legislation, modifying the extreme measures in the Act. In the circumstances either one of these two courses would have seemed better than obstinately clinging to their original intentions. Political feeling in Australia has been exceptionally strong against the Banking Act, and Mr Chifley's determination to carry it through will not serve his party well at the general elections next year.

The question of whether or not the Australian banks can be nationalised has become the chief political issue in Australia. It has been lifted out of its immediate context and it is now a test case of how far the Federal Government can override the State governments without resorting to a referendum. In point of fact Mr Chifley's Government acquired the financial powers they needed by the Act of 1945, and, as far as the banks were concerned, the new Act of last year was an unnecessary attempt to make assurance doubly sure. Mr Chifley had little apparent reason for pursuing the question once the extent of public opposition had made itself felt. But the cat was let out of the bag by the Minister for Labour and National Service, Mr Holloway, who, commenting on the High Court's decision, said that it showed "how narrow and hidebound the Australian Constitution really is."

* * *

Meals for Children

Last week the Economic and Social Council agreed that the United Nations should sever its connection with the appeal for children which it originally sponsored and organised. If this decision is endorsed by the General Assembly, the responsibility for collecting non-governmental funds for the relief of children, principally in war-devastated countries, will revert to voluntary organisations.

What is important is that the United Nations International Children's Emergency Fund, which received a proportion of the proceeds of the Children's Appeal, should be given adequate funds to carry on and increase the vital work it is already doing. At the moment, with the resources at its disposal it is only able to meet a fraction of the demands made upon it. It plans to provide a meal amounting to about 400 calories for about 4,500,000 children and nursing mothers in twelve European countries and China. The meagreness of this meal, often the only hot meal the children receive, will be realised when it is compared with the 1,900 to 3,000 calories a day which is the dietary allowance for school-children recommended by the National Research Council of the United States. How inadequate is the number of such meals available is illustrated by the story of the Jugoslav schoolmaster with 200 children under his care, 160 of whom needed the 40 extra meals which was all UNICEF could allow him. He solved the problem by calling on the children themselves to name the forty most in need of the meal. The Fund is now extending its work to Germany, and to a number of countries in

the Far East. It is also planning, in co-operation with the Scandinavian Red Cross organisations, an anti-tuberculosis campaign involving 50 million European children.

To carry out its programme UNICEF is principally dependent on governmental contributions. Its provisional budget for 1949 has not been planned to allow any appreciable increase in the numbers receiving supplementary meals, but about $46 million has still to be found to implement even this moderate programme. It is surely time that the British Government was shamed into making a suitable contribution to the Fund, both by the generous response to the Lord Mayor's Appeal, which by the beginning of June was well over £500,000—and by the equally generous response of many other governments. At the end of June the Canadian Government had contributed over $5,000,000, and the Uruguayan $1,000,000, as compared with the $403,000 contributed by the British Government. There can be no pleading that we cannot spare the dollars—non-convertible sterling would do.

* * *

British Council, 1947-48

The British Council's report on its work for 1947-48 begins defensively—a bad tactical mistake by a body which has been exposed to so much ignorant criticism. Having been given quite a good testimonial last March by the Select Committee on Estimates it might have taken a rather tougher line. Funds for the year 1948-49 have been cut by ten per cent to £3,150,000 and the Council has withdrawn from Iceland, Switzerland, French North Africa and three smaller South American countries.

Those who attack the Council most noisily generally question not the quality of its work but the very need of its existence. This report describes valuable activities in the teaching of English, the circulation of books, the financing of chairs and lectureships which no other body could do, particularly under a government which is systematically draining dry the sources of patronage and private enterprise in the arts and sciences. Particularly valuable is the work done in receiving students and organising their studies and experiences in this country. If foreign students are to be encouraged to come—and there are good reasons why they should be—it cannot be seriously argued that they are best left to find their own way around the British educational and social system.

But if it is the Council's object to spread knowledge of the British way of life—there appears to be no statement of basic aims in this year's report—one must have doubts whether all its exports are the best procurable. A little more hard fact about British political and economic achievement could surely be provided without infringing the Council's rules against propaganda. And it is notable that the lecture lists include no references to British newspapers, whose standards and traditions are outstanding, both within and outside Europe. Against these omissions have to be balanced the European tour of the Sadler's Wells Ballet, much spreading of scientific information and the loan of some good pictures and rather pretentious music.

The Council seems to have made little progress with its main problem—to get for its staff the privileges as well as the disadvantages of civil service status. Personal quality is decisive in its work and the Council is not always represented abroad by men and women of the best type. Pay and conditions should be improved, even if it means further reduction in activities. For instance, headquarters staff remains at the figure of 1,271, of whom about a quarter are busy with finance, establishment matters and higher administration. The proportion seems excessive.

* * *

Lambeth Report

The report of the Lambeth Conference together with an encyclical letter has been made available with a speed which many secular bodies might do well to envy. If the rest of Christendom has been expecting some momentous decision to follow upon the deliberations of the 326 bishops of the Anglican communion it will have been disappointed. The Lambeth Conference is in no sense a legislative body, but only a gathering of Anglican bishops to evolve such common policies as can be reached by agreement. Consequently the bulk of the report is confined either to the generalities of established doctrine or to such domestic matters as the ordination of deaconesses in China.

The resolutions contain nevertheless certain definite points of interest. To avoid losing contact with the Eastern Orthodox churches one makes an implicit distinction between Communism as pursued by Christians and Marxian Communism, and in distinction to the Roman Catholic Church it refuses to make common cause with other bodies simply because they are anti-Communist.

It adopts, in so far as a seemingly uncompromising attitude on doctrine will permit, a policy of cautious cordiality towards other Protestant churches, including the recently unified Church of South India.

On the question of divorce the conference has set out the social aim of the Church with great cogency.

> If we could change public opinion and make society recognise that children have a claim to be brought up by both parents; that the most cruel act of parents is to break up the children's home; that to break up the home and destroy the happiness of children is the worst social crime—then a halt might be called to the ever-increasing stream of divorce which is in large measure due to the mean self-pity of parents who are determined to seek their own happiness even at the price of their children's distress.

In one important respect the conference has modified its recent practice and recommends that the distinction made by a civil court concerning the guilty and the innocent party should not be involved in the re-admission of divorced persons to the communion of the Church.

The report is not concerned with affairs of the Church of England except in so far as Lambeth and Canterbury are the hearthstones of the Anglican community throughout the world. But nevertheless there is a flavour of Barchester about the report which makes it hard to believe that the Church has learnt the most important lesson of its history—the danger to its own vitality of recruiting its priesthood from one social class. Despite many excellent individual efforts the Church of England and some of the Anglican churches overseas have yet to prove that they have again become movements with any strong influence upon the future of society.

Shorter Notes

The first general election to be held in Mauritius under the constitution granted last year took place last week. The Indians, who far outnumber the combined French, Coloured, British and Chinese population, won eleven of the nineteen elected seats in a Legislative Council. The remaining eight were won by one white and seven coloured candidates. The new constitution, however, also provides for twelve unofficial members in the Council who are directly nominated by the Governor. He will thus be able to secure that the minority communities are adequately represented.

*

Although Bizonia's exports last month reached the record figure of $55 million they are still well below the monthly rate needed to carry out German undertakings that $730 million worth of exports would be delivered during the first year of ERP. The progress is none the less striking and the value of exports for seven months of this year already exceeds the total for 1947.

*

A "Monthly Survey of Foreign Affairs" produced by the Conservative Parliamentary Secretariat has started well. Its first number, published this month, gives on four pages an interesting, balanced and fair account of Mr Bevin's Western Union policy, in which the only obviously critical passages are quite properly directed at the view favoured by Dr Dalton—that the Western nations can only co-operate on a Socialist basis.

INDEXES
to Volume CLIV of "The Economist"
and
to Volume III of "Records and Statistics"
(January to June, 1948)
These are now available at the following rates, post free:—
Index to "The Economist" ..... 2/6d.
Index to "Records and Statistics" 2/6d.
Both Indexes ..... 4/9d.
Please apply to
THE ECONOMIST, 22, Ryder Street, London, S.W.1,
specifying requirements clearly and marking envelope "Index"
In future, it is proposed to issue a monthly cumulative index to "Records and Statistics" and no further half-yearly indexes to this Supplement will be published. The monthly index will appear for the first time as part of the issue of September 4th.

Letters to the Editor

The World and the Dollar

SIR,—In *The Economist* of August 7th, Mr Hugh Townshend points out that, if, as you have said, the United States will always tend to sell more abroad than it buys abroad, then a fall in the dollar in terms of other currencies, enabling the American exporters to dispose of more goods in return for a given amount from the rest of the world, would suit both parties.

You say that he is right, "on the assumption that quantities are controlled." As quantities *are* controlled, and are likely to be so for an indefinite period, can I infer that *The Economist* is now a supporter of the up-valuing of the pound? Perhaps not, as the redress of the adverse terms of trade is only a part of the results to be anticipated.

There would be some loss of export trade, but only of the *least profitable* portion. And whereas the improvement in the terms of trade would be clear gain to the country, the diversion of productive resources from this margin of export trade to supplying our home needs directly might well be no loss at all.

You concede Mr Townshend's argument, however, only if "quantities are controlled." But even in your "relatively free market" the tendency of the United States to sell more than it buys obviously will not be such that *no* valuation of the dollar can ever be too high.

The power of a high valuation of the dollar to correct an adverse balance is *limited*, and, once the limit is reached, there is no advantage in raising it higher.

The high valuation works partly by deterring purchases of imports. When that effect comes up against a hard core of indispensable imports, reliance must be placed on the stimulation of exports. The widened gap between foreign prices and British wages enables the British exporters to extend their sales by price concessions. And it is these price concessions which diminish the proceeds in foreign exchange of a given quantity of exports, and cause the unfavourable terms of trade.

But that only lasts so long as the gap is not narrowed by a rise of wages. As soon as the external price level diverges at all far from the British wage level, the rise of wages is sure to occur. And the rise of wages marks both the extinction of the stimulus to exports and the irreversible progress of inflation.

As you recognised in your comment on Miss Curtis's letter in *The Economist* of July 17th, I have been urging an up-valuation of the pound not primarily to improve the terms of trade, but to stave off the contagion of inflation from the United States.—Yours faithfully,

R. G. HAWTREY

29 Argyll Road, W.8

[This is a large matter which cannot be adequately discussed in a footnote. Briefly, our view would be as follows. (a) In the *long* run it is overwhelmingly probable that the pound should be devalued relatively to the dollar—unless the American inflation goes much further, and the inevitable ensuing reaction much less far, than now seems likely. If Mr Hawtrey is arguing against this, we are sure he is wrong. But (b) the time for the devaluation of sterling has not yet come and will not come until the present world-wide inflation is ended. Nevertheless (c), we do not think, on a balance of considerations, that Mr Hawtrey is right to advocate an up-valuation. Is it only the "least profitable" exports that would be lost? And what does "least profitable" mean? Least profitable in sterling to the exporter or least profitable to the country in hard currencies? Surely if the sales of British goods would be affected by a rise in their price nowhere else, they would be in the United States? We share Mr Hawtrey's distrust of arguments that are based solely on the effect they would have on the terms of trade. This statistical device, useful to those who understand it, is now in danger of becoming a menace. After all, if the correction of the terms of trade, statistically defined, is what we are after, let us double the price of all British exports tomorrow. It is not only the relative prices that are of importance, but the volume of trade that can be done at those prices.—EDITOR]

Oder-Neisse Agitation

SIR,—In your last editorial note on the "Oder-Neisse Agitation," when dealing with the revisionist agitation among Germans in the Western zones for the return of former German territory east of the Oder-Neisse line, you express the view that the British and American Governments "should actively discourage such hopes and plans. They provide one of the few really cohesive factors in the East European bloc."

Here you strike the nail on the head, and it is highly desirable that public opinion should be aware of this danger of playing into the hands of Russia and the Communists. The present new Polish frontier along the Oder-Neisse rivers not only has the support of Russia and her puppet Communist regime in Warsaw but is also firmly and unanimously supported by all Poles, in Poland or abroad.

However anti-Russian and anti-Communist the average Pole is, however strongly his hopes are bound up with the West, he remains unyielding on this vital matter. Remembering that Poland was the first country to fight the German aggressor, suffered so much, and stood so unflinchingly by the Allies, he cannot comprehend how the Western Powers, who at Teheran and Yalta supported Russia's seizure of the Eastern half of Poland, now seem to be in favour of cutting away territory from Poland in the West. This appears particularly illogical because the Western Powers agreed at Potsdam to the transfer of the remaining German population and because this transfer is now complete.

It is important that the Western Powers should realise that any attempt to change this state of affairs, any shifting of the present Oder-Neisse frontier, would not only cause a repetition of the appalling sufferings of the Poles already once uprooted, but would be resolutely opposed by all Poles.

The best course for Britain and America is to recognise this provisional Polish Western frontier as final. This would strengthen the confidence of the Polish people in the Western Powers and would knock the bottom out of Communist propaganda presenting Russia as the only champion of Poland.—Yours faithfully,

Nothing to Live For?

SIR,—Your correspondent Mr Gerard Tallack ("Nothing to Live For?"—*The Economist* of July 31st) advocates a freer use of wine by the inhabitants of this country. May I support this plea with the following considerations?

(i) Beer as manufactured in this country consumes 700,000 tons of barley a year. At this rate the barley for which we went cap-in-hand to Moscow will not keep our beer factories open for more than eight months. Wine, if allowed to compete on an equitable basis with beer, would enable this country to effect a great economy in grain, and this would be of benefit to Europe as a whole.

(ii) In discussions on European co-operation the British Government has repeatedly refused to reduce its requisition for barley on the ground that beer is "indispensable to morale." Anyone who has ever tasted wine can only wonder what sort of morale beer is supposed to sustain. Surely the bitter feeling that is all too evident among our people today would be mollified, and the enjoyment of living increased, if for our prevailing national beverage we were to substitute the sweeter and more colourful potations of southern Europe.

(iii) Increased purchases of wine by this country (using foreign exchange economised on barley) would be good for the economy of viticultural countries.

A lowering of our tariff would thus do good to this country, to producing countries, and to Europe as a whole. I have yet to see any concrete proposal in connection with ECA that promises results more in keeping with the aims of the project.—Yours faithfully,

D. H. R. BARTON

From *The Economist* of 1848

August 19, 1848

By a parliamentary return which has this week been presented to the House of Commons, we have exhibited at one view a most interesting and instructive history of the results of that great experiment in the social and commercial economy of the country as contained in our postal regulations. The "*penny postage*" is marked as one of the great reforms of the age; not alone, or indeed mainly, because it cheapened the cost of sending a letter from the Scotch to the English metropolis from *thirteen-pence halfpenny* to *one penny*; nor because it enabled two individuals, the one living in Orkney, the other at Penzance, to communicate with each other at no greater cost than two others living in different parts of London; but because it did involve a great principle of increased facilities of communication, and, as such, was equally valuable in a social as in a commercial point of view . . . .

The success of the postal reform—in its way by far the boldest experiment of our time—is fortunately of that nature as to be capable of clear demonstration. A comparison of statistical facts is conclusive on the subject; and the social and commercial advantages which have been derived by the country can be easily understood to be in proportion to the arithmetical increase of communication. There is indeed much room for the most pleasing speculations as to the numerous and indirect consequences of facts brought to light by the array of figures before us, in their influence both upon the private happiness and public prosperity of the country . . . .

It is impossible that the most sanguine can have anticipated more remarkable results from this great experiment; and we do not wonder that other countries are thereby encouraged to follow our example. The United States Government has already presented to Congress a Bill for effecting quite as great a reduction in their present rates of postage as we did in 1839, considering the distances to which their regulations refer.

Rationing by Purse

SIR,—You write in *The Economist* of August 14th, p. 250, that "Any attempt to correlate the distribution of income with the distribution of economic merit is vitiated by the inheritance of property." But the possession of any ability is equally unpredictable for it is also inborn and according to your suggested *argument to reward its use would* also be vitiated by the *fact* that it was inherited. The fact is that property, like any other inherited asset can be developed, neglected or abused. Our need surely is *not* to deplore the inheritance of property as such, but to stimulate its wise use and penalise or prevent its abuse in anti-social ways.—Yours faithfully,

The Arab Legion

"The Story of the Arab Legion." By Brigadier John Bagot Glubb. Hodder & Stoughton. 368 pages. 25s.

NOTHING more annoys one of those modern Britons who have chosen a life-time of service with the Arabs than to be told that they are "second Lawrences." Lawrence was a neurotic with a genius for warfare, and a great writer. All the annoying literary tricks, poses, and mannerisms of the "Seven Pillars" only serve to bring out the greatness of the book. Similarly all the mystery-making and posing and self-mortification of Lawrence's military career in Arabia merely show up what a brilliant *tour de force* his achievement was. There have been since Lawrence, and are today, a few who have looked on themselves as following in his tradition. And they all are surrounded by a faintly second-rate aroma of make-believe. Strictly speaking, there is no Lawrence tradition, and his would-be imitators invariably go for the stylistic trappings. But it was in spite of, not because of, these that he was a unique individual.

Those Britons who do solid work among the Arabs today are of a different, genuinely traditional, and less challenging type. Lawrence's Arabic, there seems every reason to believe, was low-grade, fluent and serviceable, perhaps, but incorrect and unlearned. (From this alone one can measure how subjective some of the episodes and related conversations in the "Seven Pillars" must really have been). Lawrence's Arabic would not do for the modern desert Briton. Brigadier John Bagot Glubb—Glubb Pasha—who has just published the "Story of the Arab Legion," is a more thorough-going, seasoned Arabist. He is also a genuine empire-builder, simple, soldierly though without much regard for the regular Army and painstaking. The course of events which has pushed him into the world's headlines has made him the symbol and spokesman of a British policy which by the outside world is judged solely for its impact on Zionism. But it is much simpler than that. Glubb serves Britain by serving the Arabs. It is a thing such as many Britons are doing in many parts of the world, not seeking and rarely getting recognition. Glubb likes the Arabs, because liking people is in the long run the only way to get them to do what you want.

He and his colleagues had the job of pacifying and imposing orderly government on a wild nomad country, where tribal warfare and the hatred of all government had been for generations the only unchanging facts. They did so, using a technique which is the very opposite of that so far favoured by the United Nations. For laws which were not enforced and authority aloof and hated, Glubb substituted enforcement without much law and friendly personal relations. He lived among the Bedouin and recruited his police force from them one by one. This became the Arab Legion, a modern motorised force. The story of his achievement is well and simply told, with enthusiasm for his Arabs but without gush.

Just because the book is unpretentious and human, even boyish, unspoilt by official phrases, one may forgive it its episodic character. It is not a history, and even as a source-book for historians will be found imperfect though useful. Perhaps it is a foretaste of a longer book which Glubb will one day write. But the British may be grateful for it as it stands, if only in such flashes as the following:

> In England a boy so gentle as Nehhab would have been tormented and mocked. We seem at times to think too much of toughness, and to mistake loudness and bad manners for courage. Amongst the Bedouins, who lived in a world of violence, bloodshed and war, gentleness was not mistaken for cowardice.

Or again:

> In reality the Transjordan deserts had been won by love and not by force.

It is something to have been the agent of a power which in its better moments could compress its statecraft into such a phrase.

"Ordinary Girls"

"Rising Twenty." By Pearl Jephcott. Faber and Faber. 200 pages. 8s. 6d.

"RISING TWENTY" is in a sense a sequel to Miss Jephcott's previous study in adolescence, "Girls Growing Up," and deals with the immediately succeeding age-group, the 17-to-20s. It is a thoroughly human, often pathetic, wholly fascinating study of three groups of "ordinary girls" drawn from three contrasted working-class communities; of their work and leisure and their attitude towards these, their ambitions, interests, tastes and ethical standards. The composite picture which emerges is, from some points of view, one of depressing wastefulness; yet not wholly discouraging. Practically everything the girls learned at school, outside the imperfectly retained three Rs, had been discarded along with their school books; none of them took the slightest interest in public affairs; none—with the outstanding exception of a would-be novelist whose story about a "glamorous debutante," entitled "The Greater Love," is printed as an appendix—had a hobby of any description; hardly one felt any interest in her work, which considering the work which most of them were doing is hardly surprising. Two of the three groups of girls were, or had been, attached to local youth clubs; but the only use they made of these was to sit about listening to dance bands on a radiogram tuned up to roof-lifting pitch. By far the biggest interest in their lives was the cinema, visited, regardless of programme, three, four or five times a week; dance halls, skating rinks and pubs came a long way after as possible alternatives. The impression given is one of automatism both at work and at play, of stultification and commercialisation of the second-hand and the second-rate—a cheap-and-nasty content-porary counterpart of Aldous Huxley's horrible Brave New World.

But this is not the whole story. Underlying all the pseudo-Hollywood froth is an instinctive soundness and purpose, and all

the old kindly patterns of family life. These young things with their brassy perms are shown as dutiful daughters, loving sisters, loyal friends, and, in prospect, self-sacrificing and conscientious housewives. They may reject culture, but not mothercraft; they may shirk active collaboration in the youth club, but they do help their mothers with the housework and mind their married sisters' babies. Their idea of love is crooner-style romance, but their recorded comments on, and ambitions for, family life show both realism and responsibility. There, in the family, lies the true centre of gravity of their lives; a fact which must, as Miss Jephcott convincingly asserts, be the starting point of any effective Youth Service whether educational or social.

Local Government in Crisis

"The Development of Local Government." By William A. Robson. Allen and Unwin. 376 Pages. 18s.

THIS work was first published in 1931, but the author has brought his material up to date and has added a long prologue termed "Local Government in Crisis." The main part of the book has four divisions. The section on structure contains an excellent analysis of the way in which administrative and social needs have outgrown the existing units, and of how the present system makes inevitably for conflicts between urban and rural authorities, and between county boroughs and administrative counties in particular. The section on functions contains a strong plea for encouraging municipal enterprise in the arts, which has been swiftly met by a clause in the Local Government Bill introduced after this book had gone to print. Local authorities now have many of the powers both for controlling the citizens' environment and for promoting his cultural instincts which Professor Robson believes can overcome the present poverty of our provincial life.

He is wise enough to realise, however, that local councils are sometimes as much the destroyers as the defenders of æsthetic values, and this position, with all its dangers, must continue until either a greater number of educated persons become councillors or *vice versa*. The third and fourth sections deal with the local government service and the role of the district auditor. The latter is shown as an interesting example of the tightening hand of central control over the activities of the local authorities, which are cribbed and cabined in far too many directions for the right amount of initiative and variety to exist in English public life. Nevertheless, the author's revelation of the inadequate standards of service and recruitment shows how necessary it is, despite some important recent improvements, for the councils to put their own houses in order before seeking a wider discretionary authority.

The urgent need of the moment, however, according to the author's new prologue, is to overhaul local government structure so as to create larger and better-balanced major units. Professor Robson clearly believes the removal of hospitals, civic airfields, gas and electricity and perhaps road transport undertakings from the local government sphere to have been a grave mistake, which could have been and should still be avoided by structural reform. He castigates Mr Bevan for the evasiveness and duplicity of his attitude towards the problem. The reason for this attitude, no doubt, is that the subject is thorny and politically unrewarding. Unless, however, some Government in the near future has the courage to implement, or preferably to improve on, the Boundary Commission's recent report, local government will go into a decline which will seriously undermine the democratic foundations of society.

Shorter Notice

"A Short History of the British Police." By Charles Reith, Oxford University Press. 117 pages. 3s. 6d.

THIS is an admirable small book. It tells the story of the British Police from earliest times to the present day, but concentrates most on the turbulent years between 1829 and 1833 when the police as we now know them were first established. The account is lucidly and interestingly told, and the success of the police system is convincingly set against the politics and sordid social history of the times in which they started their existence. Most readers will wish, however, that even in so short a history a little more could have been said about the organisation of the police today, and that a chapter could have been devoted to a comparison of British methods with those overseas. As it stands, however, the book is very much worth while, and is an impressive justification of an unarmed force supported and helped by a friendly public.

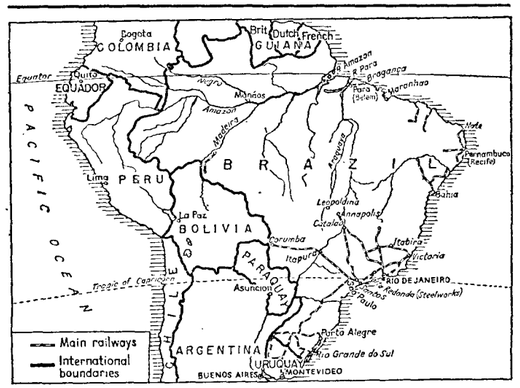
THE WORLD OVERSEAS

Brazil's Five Year Plan—I

(From Our Correspondent in Latin America)

"GOD is a Brazilian," says Brazil's best-known proverb. And in the average Brazilian's attitude to national problems there is the same tolerant, wryly humorous philosophy that marks his faith in Providence and his distrust of planning. Scepticism of this sort underlies much of the criticism directed at Brazil's Five Year Economic Plan, which now awaits attention by Congress. Yet it is perhaps a more careful attempt than any previously made to see some key problems steadily and to see them whole. Politically it is unique in that it has the support of a committee representing Brazil's two largest parties. This project, championed by President Dutra, is mainly an effort to fill out and co-ordinate existing programmes, and to sink party differences in their execution. It lays understandable emphasis on problems that, in a country so large and undeveloped as Brazil, any progressive Government would be bound to consider. It is likely to be passed by Congress with minor cuts in expenditure and is designed to come into force next January.

Health, food, transport and power, the initials supply the official title, are the *Salte* plan's priorities. President Dutra has spoken of the "valorisation" of labour as its eventual goal. Less comprehensive and not very kindly remembered plans used foreign loans to "valorise" coffee, that is, make it worth more; but it is a long step from the "valorisation" of coffee to the "valorisation" of labour—or, in plain English, higher living standards. Nearer and clearer targets are the replacement, by 1953, of two thirds of Brazil's wheat imports and half its petroleum imports by domestic production. Even the partial achievement of these two aims would do much to put Brazil on its feet by easing its shortage of foreign exchange. Together, wheat and petroleum account for a quarter of all Brazil's imports.



The four sections of the plan are considered in a lengthy official report recently published. Its sober examination of public health reveals how big is the task of raising living standards. This section of the report might equally apply to almost any Latin-American country except Argentina and Uruguay. It is an index to the productive efficiency and man-power shortages of the better part of a continent. In north-eastern Brazil, one reads, infantile mortality is thirteen times higher than in New Zealand, and in Brazil's chief cities the expectation of life of a man of 30 is six times less than in England. Some 8,000,000 Brazilians suffer from malaria, and another 8,000,000 from other pernicious diseases. Over 4,500,000 live in towns with no resident doctors, and in a country of 45 million people there are 547 certified midwives. "If God were not a Brazilian," comments the committee's report on these conditions, "we should have disappeared." Over the five years, from 1949 to 1953, the *Salte* plan provides for the expenditure of 2,620 million cruzeiros (about £35 million) on a public health drive.

Agriculture in general—chiefly the production and distribution of food which is the core of the health problem—fills the bulkiest of the report's four volumes, and is allotted 3,700 million cruzeiros (about £50 million). Most of what has been said about the possibility of Brazil becoming self-supporting in wheat is repeated here. The country imports (in grain and flour) over 90 per cent

of its requirements. That any wheat is grown at all, say the planners, is only "a miracle of tradition." Yet, they claim, Brazil has 150 million acres fit for growing wheat. They calculate that if only a fortieth part of this were sown, annual marketable production, now 120,000 tons, might reached a million tons by 1953, and this has become the *Salte* plan's wheat target. Land obviously exists in abundance, but unless a mechanical revolution takes place it is difficult to see how the target can be reached, for, as regards transport, tractors and silos, the planners are starting almost from scratch. Efforts to turn out tractors have made no headway in a country that still imports its hoes.

The plan provides for the purchase abroad of 5,000 of the 20,000 sets of farm machinery (each with its tractor) which are calculated to be the essential minimum; these are to be resold to farmers on easy terms. Tractor stations are to be set up, and a beginning has already been made with seed farms and agricultural colonies. For the rest, the programme leans heavily on private capital, which is to be encouraged to help in mechanisation and to participate with the Government in "mixed" companies to build the all-important storage space (for which a target of a million tons is set). Private capital is already in the field, in the shape of Mr Nelson Rockefeller's International Basic Economy Corporation, which has introduced hybrid maize and is building silos and bringing in land clearance machinery.

All this is a modest though direct approach to agricultural expansion. It may be doubted whether it heralds a mechanical revolution, for which domestic industry is not yet able to supply the tools. Most, if not all, of the raw materials of heavy industry are present, but the Volta Redonda steelworks—Latin America's

most ambitious experiment in heavy industry—exemplifies the difficulties of bringing them together and processing them economically. Since it was completed in 1946 (at a cost of $100 million, of which an American loan supplied $45 million) a more reliable index than most shows that the country's heavy industrial output has moved from the 1946 average of 100 to 119 for the first quarter of 1948. In spite of a heavy protective tariff, however, American competitors are reported to be underselling its products by as much as 30 per cent.

Volta Redonda is an outstanding example of the distance which separates industrial centres from their raw materials. Translating Brazilian distances into European equivalents, if Volta Redonda (lying between Rio and Sao Paulo) were located in Cologne, its ore would come from Copenhagen and the small proportion of domestic coal it uses from Marseilles. To reach the mills of Sao Paulo, Amazonian jute would have to be shipped over a distance as long as from the North Cape to Paris. Indeed, this might be a cheaper journey than it actually makes, for the *Salte* planners note that taxes and freight double its price by the time it reaches Santos, the Port of Sao Paulo. In this European comparison, Brazil's unexploited petroleum would lie in northern Finland, Manaus (the Amazonian capital) would be somewhere north of Iceland, and Rio Grande do Sul, the country's main larder, would be in Spain.

But no comparison can be made with European transport facilities. One can, of course, fly almost anywhere in Brazil by regular airlines. Without them, travel between one state and another would be unthinkable for most Brazilians. For industry, as for agriculture, roads and railways are patently essential. It is no coincidence that every section of the *Salte* plan touches on transport problems.

Not all the tasks examined in the transport section of the report are so difficult as that of linking Manaus by road with other state capitals. This the planners reject as impossible, because of "the insuperable barrier of the Amazon." But a fully paved road has yet to be built between Rio and Sao Paulo, in the most densely populated part of the country. Roads, airways and radio, says the report, will meet the needs of isolated communities which would formerly have been linked by rail. Yet the needs of rail transport, to which the *Salte* plan allots two-thirds of its transport estimates, totalling 10,130 million cruzeiros (£132 million), are none the less pressing. The central task is to link the northern, central and southern railway systems. This, the planners estimate, involves laying 2,000 miles of track. In addition 6,000 miles of the existing 22,000 route miles are to be overhauled.

(To be concluded)

New Zealand and World Affairs

[BY A NEW ZEALAND CORRESPONDENT]

NEW ZEALAND political leaders speak seldom on the grave international issues of the day, but there will be need for the Prime Minister, Mr Fraser, to speak soon—not so much to the general public as to his own Labour supporters in Parliament and to the union leaders—on a politically unpalatable subject. This is compulsory selective national service. Early in July, Mr Fraser said in Parliament that New Zealand must have national service "anyhow," but he declined pressing Opposition invitations to define "anyhow." Less than a fortnight later, however, the Minister of Defence, Mr Jones, revealed that the Government had in mind the military training of 8,000 youths of the 18-year old group for 14 weeks annually. And, personally, added Mr Jones—a genial man, not much given to risking a decline in his popularity—he favoured compulsion.

Reaction to this "feeler" has been slower to develop than might be imagined, but it is already clear that any talk of conscription will be bitterly attacked in industrial Labour organisations outside Parliament and by some of the Labour "diehards" within Parliament. Nevertheless, there is scarcely any doubt that in the end some form of compulsion will be adopted. Conscription is an issue which has never roused the same large-scale resentment in New Zealand as in Australia.

Between the wars New Zealand allowed compulsory military training to languish; now the Dominion is faced with its re-imposition—with some changes but at a much greater cost. Only those will be trained as soldiers who are certain to be wanted as soldiers in the event of another war, but even so one estimate gives the cost of training a man for 14 weeks as about £160, or a total of £1,280,000 for the 8,000 trainees, a formidable bill for a country like New Zealand. But the very size of the bill may have one good effect at least—awakening New Zealanders to the gravity of the new threat to world peace.

New Zealanders, speaking generally, are an insular people, mentally as well as geographically, and preoccupation with their own immediate problems (mainly relating to wages, the cost of living and safeguarding the five-day week) has made many of them heedless of the significance to their country of the grave situation in Europe. That is not to say that New Zealanders in the mass are unaware of world events, for the typical New Zealand daily newspaper gives a page devoted to what is known here as "cable news," with much background information as well on other pages from overseas correspondents. But a characteristic reaction is to shrug the shoulders with a muttered comment or two to the effect that "this is a bad business in Berlin" and, having skimmed the cable page headlines, to turn to the sporting pages. For Berlin is 12,000 miles away, and this is the height of the rugby football season in New Zealand, with competition just beginning to grow keen for places in the All Black team to tour South Africa next year.

Is the New Zealand public altogether to blame for its complacency? It gets little leadership or instruction from the Government on such a question, for instance, as Western Union. There was an approving but not very informative reference to the subject in the Governor-General's speech from the Throne at the opening of Parliament at the end of June.

It is expected that there will be a debate on foreign affairs before the Prime Minister leaves for London in October, but, although the New Zealand Parliament has advanced somewhat since the pioneering era of the "road and bridges" member, not very many members are well briefed on international subjects

and Mr Fraser is unlikely to be over-burdened with specific advice. Yet the fact that there are some members with an instructed appreciation of international affairs is due to a step taken in September last year—the setting up of a select committee of nine members (five Government, four Opposition) "to consider such matters relating to external and commonwealth affairs which may be referred to it by the House or the Government." This committee meets every Wednesday while the House is in session. Both the Prime Minister, Mr Fraser, and the Leader of the Opposition, Mr Holland, are members and usually attend. But, as the committee's proceedings are private, the public hears little about its work.

New Zealand's representatives overseas include High Commissioners in the United Kingdom, Australia, and Canada and Ministers in the United States and Soviet Russia. It so happened that the two Ministers—Sir Carl Berendsen from Washington and Mr C. W. Boswell from Moscow—were on leave in New Zealand at the same time earlier this year and both appeared before the External Affairs Committee. The Russian Minister to New Zealand returned to Russia last year, and a Charge d'Affaires has since then controlled the Russian legation in Wellington. This would give New Zealand a valid excuse for withdrawing Mr Boswell from Moscow without closing the legation, and while nothing has been said officially on the subject, there is a strong suggestion in quarters usually well-informed that Mr Boswell may be moved to a more congenial post—say, to Paris, to emphasise New Zealand's support of the Western Union principle.

Free Trade in Hongkong

[FROM OUR HONGKONG CORRESPONDENT]

THE contrast between the prosperity of this Colony and the deplorable state of China's economy has led to a series of attacks from Shanghai blaming China's plight on the administration here. A recent article in the American owned *China Economist* drew from the Hongkong authorities a spirited reply showing that nothing had been left undone here to implement the Sino-British Agreement in regard to smuggling. Hongkong has gone to considerable expense in expanding its preventive service by some 30 per cent and has permitted officials of the Chinese Maritime Customs to carry out searches within the waters of the Colony. One British shipping company maintains special guards in its ships to forestall any attempt to load or discharge unmanifested cargo. Apart from shipping, Chinese Customs Examination Officers check all railway freight leaving for China from the terminus at Kowloon and also operate at the air port. It is hardly fair, therefore, to accuse Hongkong of non-co-operation.

It is, of course, well known that a great proportion of the unrecorded imports into China are brought in by Chinese military and naval personnel who are a law unto themselves. Semi-official trading concerns are also responsible for the import and export of a considerable volume of merchandise which is exempt from Customs duties. More recently there have been attacks on isolated customs stations by armed bands; one such incident recently occurred which led to a customs station, a few miles from the British border, being burned down, the surviving officials having to flee for their lives by sea. Until this station is restored there is bound to be a flow of smuggled goods into the surrounding district and it is already reported that a Communist band in the neighbourhood is levying duties on all such goods.

It is perhaps of some significance that a non-British ocean going steamer of about 10,000 tons recently made the round trip to Macao, a Portuguese Colony with no facilities for any ships other than small coasters and river steamboats. Ostensibly the trip was experimental but it has since been learned that 860 tons of Wood Oil were loaded on the vessel from lighters. The Wood Oil was of Chinese origin and would have been loaded in Hongkong if the present Hongkong export regulations did not require a certificate from the Chinese Authorities that the relative exchange had been surrendered to them.

As Sir Stafford Cripps announced in the House of Commons, there has been a general tightening up of exchange control in Hongkong, and it is now becoming evident that the *entrepôt* trade of the Colony is going to suffer. This will mean a shrinkage in the volume of merchandise passing through the port to the detriment of commercial interests generally and with repercussions which may eventually affect the home export drive. Academically there may be good reasons for having a uniform procedure in the Sterling Area, but it may be that the price paid outweighs the advantages. There had undoubtedly been a certain amount of leakage, but in the course of the past year the authorities had already closed most of the leaks, and those still remaining could have been dealt with under the existing regulations. The forcible closure is bound to cause serious dislocation.

Policeman of the Sterling Area

It does not seem to be appreciated in England that Hongkong acts as a warehouse for other territories to a far greater extent than it does for China. In the early 'twenties as much as 70 per cent of Hongkong's entrepôt trade was with China, but since then the trade with the territories of South East Asia has developed enormously. By 1938 the trade with China had shrunk to 40 per cent, while today it is estimated at from 15 to 20 per cent. The Chinese are the traders, *par excellence*, of South-East Asian countries, and as they are mainly Cantonese they have close affiliations with Chinese business concerns in Hongkong. There is, in consequence, a considerable exchange of goods between Hongkong and such centres as Bangkok, Saigon, Singapore, Batavia, and more recently Manila. Much of the trade is on a barter basis involving mere book entries, but, of course, exchange transactions enter into the financing of the greater portion. What has happened hitherto is that Hongkong, in the words of one of our officials, "has played the part of the last policeman on the perimeter of the Sterling Area who has not only prevented commodities leaving the Sterling Area via Hongkong for dollar countries, but has also prevented them going to gold dollar areas via Hongkong after leaking from the Sterling Area into other Far Eastern countries." But no Chinese in Saigon is going to ship rubber to Hongkong for transshipment to the United States if he is only to get sterling from a French bank, as he will under the new regulations. He argues that his produce is worth considerably more than the equivalent of sterling at the official rate of $4.02. If he cannot get his usual profit he will ship on a through bill of lading and Hongkong will lose the profit it has formerly derived from the storage, handling charges, banking commission and insurance premium on such shipments. Furthermore, the Hongkong authorities have so far controlled goods passing through the Colony on through bills of lading, but under the new regulations it will be well-nigh impossible to apply such controls.

Onerous Terms for Merchants

The comparative freedom enjoyed by Hongkong traders has done much to encourage exports to hard currency areas in Europe. For instance, exports of Chinese produce to Belgium have realised francs, which in turn, have been used to finance the import of building material and piece goods. This trade will now be brought to an end, for, although the Hongkong importer can purchase United States dollars in the open market here to pay for his Belgian goods, he will be buying on the most onerous terms and will have no set off in the shape of cheap francs paid for by his exports.

There is no doubt that the fortified system of control will lead to the Chinese trader searching for new methods of circumvention. The Portuguese colony of Macao is obviously one alternative to Hongkong although it involves many inconveniences. But circumvention leads to many undesirable subterfuges and the Chinese trader would far sooner follow the procedure which during the past two years has worked well in practice. The European merchant will probably abide by the law, however irksome it may be, but he will still marvel at the obtuseness of the authorities at home. They, of course, make great play of unrequited exports, but they lose sight of the fact that the apparent loss between the official and the open market cross rates is compensated for by freights carried by British steamers, premiums paid to British insurance companies, profit on exchange accruing to British banks and the hundred and one charges which accumulate through goods being handled in a British Colony.

Before the war Hongkong was outside the sterling area. If this Colony exasperates the other members of that group there will probably be no great distress if it is once again placed beyond the pale. In any case it has been able to hold its own as a participant in the trade of Japan without the privilege of a sterling area country, and as it is almost entirely dependent upon its entrepôt trade it might be in its interests to secure freedom of action. The question which is being posed here is "Shall trade become the handmaiden of finance?" Most people would answer "No" and they would base their decision on the fact that for a century Hongkong has grown to its present position as an international mart by reason of its freedom of trade and absence of peacetime controls.

AMERICAN SURVEY

Remobilisation in Peace

(From Our US Editorial Staff)

THE moment at which a government begins to modify its structure and change the direction of its policy is seldom clear until that time is long gone by. A year has passed since the National Security Act was signed by Mr Truman, and the press still talks of it as the Bill that "unified" the Army and Navy. The fact that it was the National Security Council rather than a special session of the Cabinet to which General Clay reported in July aroused little discussion. Yet as the Act takes its slow way into operation it becomes increasingly clear that in the first place it did not unify the Services and was not meant to; that in the second place, what it did accomplish may mark a milestone as outstanding in America's development as, say, Washington's farewell address, which fed isolationist sentiment for a century and a half. The most important effect of the Act was to set up what amounts to a new Cabinet, prepared to devote its entire attention to the material needs and political implications at home and abroad of an armed foreign policy.

The operation of the new military estate thus set up within the body politic must be sketched in order to show its power. Its prime functions are two:—to take all necessary steps to defend the country, and to keep all other Government Departments informed of its fears, plans, needs and precautions. The capstone of the structure is the new National Security Council on which sit the President, the Secretaries of State, of Defence, of the Army, of the Navy, and of the Air Force, the chairman of the National Security Resources Board (whose job it is to gear the economy into war needs), and others chosen from a selected list by the President. The specified duties of this Council are to "assess and appraise the objectives, commitments and risks of the United States in relation to our actual and potential military power," and to consider appropriate policies. By making its first public appearance to hear General Clay's report on the objectives, commitments and risks of the policy he was carrying out in Germany, the Council underlined the new co-ordination between foreign and military policy which it was created to promote.

Thus the National Security Council is a policy board on the very highest level, in which the disputes between the State Department and the Army which have troubled Washington for at least three years can presumably be thrashed out. A set of eyes and ears for it abroad are provided by the Central Intelligence Agency, described in *The Economist*. The practical aspects of the Council's deliberations, in terms of guns needed to back up the risks accepted, are the business of the National Security Resources Board, which occupies the thorny seat of arbiter between civilian and military demands.

The members of this new Board for mobilising industry, in addition to the full-time Chairman, are the Secretaries of State, of the Treasury, of Defense, of the Interior, of Agriculture, of Commerce and of Labor, thus giving the rest of the regular Cabinet (with the exception of the Postmaster General and the Attorney General) their place in the defence structure at the economic level. Its start was slow. Its chairman was appointed in August, 1947, but the Board did not hold its first meeting until November, its organisation chart was not published until March, and its staff list is not yet complete. The caution with which it is feeling its way is, perhaps, an indication of the degree to which industry has, in the three years since VJ Day, resumed its individualistic and civilian ways. The Board's first recommendation concerned the stock-piling of natural rubber; almost immediately it began enlisting the co-operation of business men and industrialists in the formation of its programme. It has undertaken three studies so far—one on the capacity and requirements of electric power systems, one on the production of heavy power equipment, one on power problems as related to aluminium production.

Under the Act, military operations and their supply are in the hands of the new National Military Establishment. Headed by the Secretary of Defense, containing the three Armed Services each with its civilian Secretary, this includes the Joint Chiefs of Staff, a Munitions Board and a Research and Development Board. The latter, operating in a guarded preserve within the Pentagon, the National Defense Building, is the direct successor to the Office of Scientific Research and Development which played so important a part during the war.

As for the Munitions Board, it gets the Army, Navy and Air Force the supplies they need, but only after the NSRB has surveyed the nation's economy and set aside as untouchable that portion which must supply civilians if they are to live and work—for themselves or for the military. In theory, the NSRB carves up the economic pie between civilian and military, the Munitions Board divides the portion of the military between the three Services. The civilian has no such guardian.

★

How badly he may need one is indicated by the difference in approach of the NSRB and the Munitions Board. If the former seems to be starting far behind the goal line in its conversations with industrialists, the latter is already moving into procurement planning. It has inherited both the problems and the experience of the Army-Navy Munitions Board, which was dispersed after the war and reconstituted in 1946. At once it went to work to salvage certain war plants on the verge of being "cannibalised," and to enlist, for voluntary return on a "when needed" basis, others which had been sold to private industry. In March the Board announced that conversations were starting with industry on the ability of 11,000 plants to supply the possible needs of the Army, Navy and Air Force. On the first of June it issued a "Guide for Joint Industry-Military Procurement Planning" in which it undertook to advise industries how to prepare their plants for mobilisation if and when war should come. Meanwhile it has been moving more cautiously in its duties as co-ordinator of requirements and procurement for the three Services, whose differences are such a by-word that even pill bottles for the Army are said to be of a different size, shape and colour from those admitted into Navy medicine chests.

More than a year has passed since the National Security Act was signed. The new edifice is approaching peacetime completion, but it is still untried. How it would work if confronted with the sudden test of war no one knows, nor will guess. It was conceived in an attempt to forestall the waste and confusion which accompanied the improvisations of 1942, and planned against the background of that experience. The

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

operations of the British Committee of Imperial Defence were studied at the same time, and certain similarities are observable.

The powers and obligations of the new military estate go far. They are supposed to stop short of making America into an industrial Sparta by virtue of the fact that in the last analysis policy is under civilian control. Actually, the path between lounge suit and uniform has been proven too short and easy to be a trustworthy barrier. If, as West Point and Annapolis still argue, the Army and the Navy were during the war inflated by civilians to the detriment of the Services, it is also arguable that many of those same civilians were inflated by Army or Navy rank and prerogatives until they now carry several times their former sense of personal destiny. It is not without reason that the Act specifies that any Secretary of Defence shall have been out of the Armed Services for at least ten years, nor that the NSRB has moved from the Pentagon to the old State Department building near the White House.

The serious question which a few Americans are asking is what will be the effect of this co-ordinated military structure on the nation's political and economic future. Will it be beneficent or malign, the neat servant of a civilian foreign policy (no waste, no overlapping, no lost motion) or the creator of a military foreign policy to which civilian production and civilian life, not to mention the pursuit of happiness, are alike sacrificed? Will it prove so much more competent than the sprawling Government of which it forms a part that the new tail will wag the old dog? Or is this merely the forerunner and model for such reorganisation in other Government departments as the Hoover Commission is said to be preparing for the consideration of the new Republican Congress?

So far, the signs are contradictory. In the German theatre General Lucius Clay is both head of the Military Government and Commander-in-Chief of the European Command. The man who advises him on political matters, Mr Robert Murphy, acts in the name of the State Department. In June a civilian Under Secretary of the Army flew over to take a look at the Berlin air-lift. He happened to be still called General Draper, and to have been for years an officer on General Clay's staff. On the other hand there is the affair of the National Guard which the Armed Services wanted transferred from State to Federal control. In that dispute Mr Forrestal stood firm and the civilians won. The issue will not be resolved quickly, but the question mark remains. If, as experience seems to indicate, political and economic, as well as military, victories go to him who "gets there fustest with the mostest" pressures, it should be recognised that the pressures which the military can bring to bear under this new system are heavy.

American Notes

Locking the Barn Door

The pursuit of the red hare started at the special session shows no sign of flagging. The headlines this week on the international tug-of-war over the Samarins and Mrs Kosenkina, now under subpoena to appear before the Committee on Un-American Activities, have tended to obscure the categorical denials by Mr Alger Hiss, Mr Harry White (who died shortly after giving evidence) and Mr Lauchlin Currie of Miss Bentley's charges that they were part of an elaborate Russian spy-ring. Unlike earlier witnesses, who took refuge in the Fifth Amendment and refused to answer questions on the grounds that they might incriminate themselves, these well-known figures presented the Committee with the problem of determining the perjurer; and the Committee, baffled, has ordered a three-week recess. The hearings will be resumed, however, on September 7th, just as President Truman launches his campaign in Detroit.

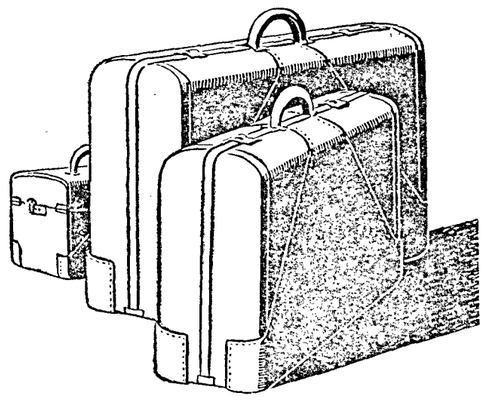
The chief weakness of the case being built up against the Administration is that the charges, even if fully substantiated, relate chiefly to the years before the war or during the war when Russia was an ally, and that, with one exception, they are laid against men who have long left the Government. It is the Roosevelt, rather than the Truman, Administration which is on trial for criminal negligence, though Senator Ferguson has declared that, despite Mr Truman's loyalty programme, suspicious characters are still retained in important posts, and other Congressmen have professed themselves dissatisfied with the small crop of dismissals and resignations reported by the Loyalty Review Board.

The report that for more than a year the Administration has been considering means of tightening the Espionage Act of 1917 suggests, nevertheless, that, despite his confident charges of "red herring," Mr Truman is alarmed both about the looseness of security provisions and the use the Republicans may make of the spy-scare in the coming campaign. Mr Brownell, the Republican campaign manager, believes that the American people are more intensely interested in the revelations of Communist infiltration than even in the high cost of living, and "shocked" by the refusal of the Administration to open confidential files to Congressional investigators.

Congress will not be easily persuaded into abandoning an issue which holds the promise of turning the tables on Mr Truman, particularly as the most recent Gallup poll shows that the Republicans are running neck and neck with the Democrats in the Congressional races. Governor Dewey, however, is under no such pressure; the polls show that after the conventions he was leading Mr Truman by 48 per cent to 37 per cent. Governor Warren insists that the chief issues are still high prices and "peace with honour." The Republican candidates may not be averse to having the case made overwhelming for a Republican house-cleaning in Washington. But Mr Dewey's earlier stand against outlawing the Communist party shows that he appreciates how dangerous it may be blindly to follow the Committee on Un-American Activities, particularly if, having once tasted blood, the Committee is tempted, as is now reported, to extend its hunt to the universities and the press.

* * *

The Budget and the Boom



The customary mid-summer revision of Budget estimates has brought another round in the perennial dispute between President and Congress on the accuracy of Treasury forecasts. For the year to June 30, 1949, the revenue estimate has been reduced from $44.5 billion to $40.7 billion, and the expenditure level raised from $39.7 billion to $42.2 billion, leaving a deficit of $1.5 billion to be met by a "paper surplus" of $3 billion arising from the decision by Congress to deduct ERP expenditures of that amount, and to make them nominally chargeable against the $8.4 billion surplus shown for 1947-48.

On the present level of employment and incomes there is justification for the complaint by the Congressional majority that Treasury estimates are too conservative. But Mr Truman, too, stands on solid ground in this respect. The tax reliefs voted this year will reduce revenues by about $5 billion—just at a time when fiscal policy might make an important contribution to stability. Of more immediate importance than the outlook over the whole of 1948-49 is the fact that, in the next six months, the Federal Government and State and local authorities will probably do no more than balance their accounts, on a strictly cash basis, whereas in the first half—or, more accurately, the first quarter—they were together taking as much as $7 billion from the stream of private incomes.

So far as controls against inflation are concerned, the special session of Congress made no major contribution to stability. Republican critics were sometimes loud in their assertion that the Government already possessed adequate powers with which to break the wage-price spiral. But they shied away from any precise steps which would mark their own determination to abandon the cheap money policy and they denied the Federal Reserve Board powers which would raise bank reserve requirements by $10 billion or more, and which could certainly work as a powerful deterrent to the expansion of bank credit.

Instead, they granted new reserve requirements totalling about $3.5 billion for member banks of the Reserve system only. This is a full addition to reserve requirements since the $700 million above the present legal requirements at which the member banks' reserves now stand is probably a working minimum. But its importance is minimised by constant additions to the gold inflow, and by the continuing cheap money policy which ensures that commercial banks may always replenish their reserves by sales of Treasury Bonds at "guaranteed" price levels.

The most that Mr Truman can be said to have gained from the special session is that Mr John Snyder, Secretary of the Treasury, has been persuaded to abandon an almost provocatively inflationary policy, and to harden the rate on short-term Government securities from 1⅛ to 1¼ per cent, with the rediscount rate up from 1½ to 1½ per cent. It may be worth while for Mr Truman to hold a special session in order to demonstrate to his Treasury advisers that other departments can sometimes offer better advice. But the delicate curbs on inflation so far announced will have no perceptible effect, unless the postwar boom is very near its end.

PROTECT YOUR FUNDS AGAINST LOSS OR THEFT

The fable of the sage and his critics

A certain Philosopher, who had fallen upon troublesome times, was taken to task by some of those around him. 'Most Ancient,' they said, 'your constitution is enfeebled. You have surely had your day. How much longer do you propose to live, O Obstinate?'

'Your grandfathers,' replied the Sage, 'often used to ask me the same thing. And in course of time I have no doubt I shall discuss the matter with your grandchildren.'

Things go hard for Britain now, as for many other countries. But Britain has a stubborn vitality, a quality as difficult to define as it is to destroy. If we are true to our character, we shall find that we are young enough and strong enough to outlast this emergency, and many another yet unknown. That is the belief behind all TI's plans for the future.

Food for tomorrow's hungrier millions

To avert mass starvation and world strife, more food must be produced. Man in his ignorance, however, has raped vast areas of the good earth. Soil erosion, like a cancerous growth, has doomed miles of the land to sterility.

While some men work desperately to renew the depleted land, millions more must husband its goodness where it still remains. The "Ferguson System" of *complete* farm mechanisation can make a major contribution to this world-wide effort.

It co-ordinates the action of "Ferguson" tractor-implement units. It gives more traction without the built-in weight that packs the soil. It gives finger-tip and automatic hydraulic depth control of implements carried by the tractor. Its versatility and manoeuverability enable the world's farmers to produce more food at less cost from every available acre.

* Every week, for Harry Ferguson Ltd., more than 1,000 "Ferguson" tractors are manufactured by The Standard Motor Co. Ltd., and more than 5,000 "Ferguson" implements by foremost British manufacturers.

Inserted in the public interest by Harry Ferguson Ltd., Coventry

B5

Oil and Water

Oil tanks in America are full and promise to remain so, whether they are in cars over the Labour Day holiday or in oil-heated homes during the coming winter. At last the petroleum situation is no longer critical, and this week's announcement of the voluntary scheme for the equitable distribution of oil in the event of shortages seems an anti-climax. It was prepared by the industry months ago, under the legislation passed by Congress last year, but has been held up by the Anti-Trust Division of the Department of Justice, traditionally suspicious where oil is concerned. Consumption of petroleum is still increasing, and the improved position is due to better transportation and to the efforts of producers and refiners, whose output is now regularly over 5½ million barrels a day, 10 per cent higher than a year ago. They are confident they can go on meeting the continued increase in demand which is expected, provided their calculations are not upset by any sudden expansion in military needs. But already the Berlin air-lift has required additional supplies of aviation spirit, and sooner or later it is believed that the Services will begin to build up reserves of oil.

This year, for the first time in twenty-five years, the United States will be a net importer of oil and next winter consumers in the Middle West will be using oil from the Middle East. Now that Mr Ickes is in retirement, not so much is heard of the approaching exhaustion of domestic reserves, but it remains true that the United States is becoming increasingly dependent on outside resources. The relationship between underwater oil and the national defence is not so direct as was imagined by the visitor to California who thought that the oil derricks in the sea off Long Beach were there for the convenience of the warships moored nearby at San Pedro, but nevertheless the chief hope of finding new reserves of oil lies in the ocean. Self-sufficiency for the United States would once more be in sight if the oilfields under the Gulf of Mexico are proved to be as rich as those on its shores. The modern "wildcatter" is to be found anywhere between ten and fifty miles out to sea, perched on a double-decker hurricane-proof raft, topped by drilling equipment.

The right of the United States to oil so far from its shores does not seem to have been disputed internationally, and within the United States no decision has yet been reached on the question of whether the oil inside the three-mile limit belongs to the Federal or State Governments. It led to a bitter struggle between the last Congress, inspired by the ideal of States' rights and urged on by the oil companies, and the President, safeguarding his constitutional responsibility for the defence of the United States. The battle was not over when Congress adjourned and it may well be renewed between the new Congress and the new President. Mr Dewey may find that one of the most embarrassing planks in the Republican platform is the pledge to give control of tide-lands oil to the States.

* * *

Behind the Gold Curtain

All is not well behind the great gold curtain of the Metropolitan Opera House in New York. The Opera Association, a non-profit-making organisation, has cancelled the 1948-49 season because the directors will not agree to the wage increases demanded by two (the musicians and the wardrobe attendants) of the twelve unions concerned with the production of grand opera. Last year the opera, in spite of filling most of its 3,400 seats at every performance, lost over £50,000 because of its enormous operating costs. The board feels that this deficit must not be perpetuated and that to raise the price of the tickets (stalls cost 38 shillings) as a means of breaking even would result in reduced attendance. In their announcement the directors express the hope that next year ways will be found to resume the art on a basis which is "economically possible."

Two strangely contrasting proposals have been made in an attempt to solve the problem. Mr Billy Rose, the well-known night club owner, has offered to guarantee the deficit provided he is allowed a free hand to do "a bit of streamlining" and Mr Lauritz Melchior, the famous tenor, has said that he would organise his own opera company. It is unlikely that either of these schemes will materialise, but it is hoped that further negotiations between the management and the unions may result in agreement or that, as in the past, a fairy godparent will be found who will provide the necessary funds for at least a curtailed season. However, it seems probable that a long term reorganisation is due and that new arrangements for financing and running the opera will have to be discovered which are compatible with modern labour conditions and sympathetic to the interest of the musical public.

The decision of the directors (if it stands) will shock and disappoint not only New Yorkers but also the large Saturday radio audience which for a number of years has heard a complete opera on winter afternoons. These broadcasts have done much to stimulate popular interest in music and, under the capable management of Mr Edward Johnson, the Metropolitan has lost some of its reputation for being chiefly a social function. However, the opening night continued to be the Ascot of New York society and the opera box was a stepping stone to position or notoriety for many an ambitious outsider.

The Metropolitan Opera has frequently been the guest of San Francisco, and the Pacific Coast today, in its own opinion at least, rivals the Atlantic as a centre of entertainment and culture. Large civic buildings provide space for audiences of sufficient size to make opera profitable and there is local enthusiasm to overcome the difficulties. Perhaps opera can still find a new frontier in the West.

* * *

Overflowing Breadbasket

Ideal growing weather this summer and relatively high prices at sowing time are now certain to have filled the American breadbasket to overflowing. The estimates of the Department of Agriculture for August 1st put the maize crop this year at 3·5 billion bushels (which is a record) and the wheat harvest, already half gathered in, at 1.3 billion bushels, only fractionally below last year's peak crop. Overall food production will be 6 per cent above all previous highs.

The emergency on the farm is one of storage; many farmers will not be able to qualify for government price support loans because they do not possess sufficient sealed bins and commercial warehouses are full. Consequently, wheat is already selling below the guaranteed price level, and being bought, to the indignation of many farmers, by the very government charged, under the farm parity programme, with keeping prices up. Under the Economic Co-operation Act, however, the Commodity Credit Corporation has no choice; it is obliged to buy for export at or below the market price. For bulk commodities this obligation is now to be assumed by foreign governments, a ruling which is seen as clearing the way for the return of the grain trade to private hands by October 1st.

It begins to appear that Congress twice missed the bus. By postponing downward readjustments in the price support programme until 1950, it may have saddled the government with expensive surpluses of grain and cotton to add to those of the incorrigible potato, which during the past five years have had to be bought and either destroyed or otherwise disposed of at the taxpayers' expense.

The International Wheat Agreement, which would have assured a five-year export market of 185 million bushels a year, was passed by the Foreign Relations Committee by 13 to 0 during the special session, but final decision by the full Senate was postponed until next year. Senator Vandenberg explained that this action would demonstrate approval in principle, but he argued that the withdrawal of five of the original signatories made it impossible, as well as unnecessary, to apply the agreement to this year's wheat crop, and that more time was needed to consider the new type of export subsidy, amounting to between $50 and $100 million, which would be involved if the United States were forced to make up the difference between export prices and a higher price guaranteed to the American farmer.

The disposition of prospective surpluses has set off a sharp debate. Dr Fitzgerald, the director of ECA's food division, has announced that the bumper harvest will make possible "appreciably larger" exports of wheat and coarse grains to ECA countries than last autumn's estimate of 350 million bushels of grain, including 300 million bushels of wheat. The Department of Agriculture has already raised possible export goals of wheat and flour to all countries from 375 to 450 million bushels, and an extra "emergency" allocation of wheat will be shipped next month to the occupied zones of Germany, Japan and Korea. Mr Sawyer, the Secretary of Commerce and a member of the President's Sub-committee on Food, has disputed the desirability of higher exports, in the interest of the housewife's budget (though government supports severely limit any fall in prices). Other critics have insisted that ECA would merely be bailing out the farmers and the Department of Agriculture, to the detriment of the recovery aspects of the Marshall Plan, now just getting under way. On this point, Dr Fitzgerald denied that any pressure would be put on the receiving countries to increase purchases of American foods, aside from the attractions of "bargain counter prices," made possible, in part, from the provision in the ECA Act that export of surpluses may be paid for half by the ECA, half from price support funds of the CCC.

THE BUSINESS WORLD

Sterling Releases

PARLIAMENT, just before the recess, reverberated with the echoes of well-worn platitudes, recriminations and justifications about unrequited exports, sterling releases, hard currency allocations and the familiar array of kindred subjects. This concluding phase of the debate on the adjournment shed little new light on this vexed but nebulous topic—necessarily nebulous, because from their very nature the operations involved defy absolute precision, but nevertheless unnecessarily clouded by avoidable reticence and obscurantism on the part of Government spokesmen.

The question at issue is whether the accumulated sterling balances held here on overseas account are being released too fast. The critics of the Government argue that nothing has been done to implement the undertaking shouldered by the British Government under the Anglo-American Financial agreement of 1945 to secure a writing down of these accumulated sterling balances. But these same critics are also the first to deny any intention of unilateral default. The Government's defence is that, since there can be no question of default, any arrangements reached with Britain's creditors must be the outcome of free negotiation and compromise; that none of the creditors has for a moment countenanced the possibility of voluntary cancellation (though Australia and New Zealand have made generous gifts) and that consequently the best the Government can do is, in the words of the Economic Secretary to the Treasury, "to make sensible, practical arrangements covering an interim period to enable trade and economic life to go on."

What is "sensible" and "practical" and what falls within Britain's capacity to repay are all concepts in the judgment of which no hard and fast criteria can be applied. They depend on the circumstances of each case. These differ enormously. There might have been a possibility immediately after the end of the war of making some overall settlement of these balances, drawing a line through each account, making all prior accumulations available only by *ad hoc* arrangements, and leaving later accumulations free. But the time has long passed—if it ever existed—when so simple and drastic a solution of the problem of the sterling balances was within the realm of practical politics. Now all that can be done is to make the best possible bargain with each creditor and to limit the arrangements to a comparatively short period, seeking to keep the total releases from these accumulated balances, and the corresponding unrequited exports, within what was described in the last "Economic Survey" as "an amount commensurate with the present resources of the United Kingdom."

No attempt has yet been made by a Government spokesman to define what this amount should be. It may be useful, therefore, to present in tabular form the available information about the releases which have been agreed with the more important of Britain's sterling creditors since the end of the war. In the accompanying table these releases are compared with the balances held by each creditor at the end of the war, thus providing a measure of the rate of release. To complete the picture, corresponding data are given of the hard currency allocations agreed with such of these countries as have had their access to the sterling area dollar pool limited in this manner.

In interpreting this information some reservations have to be made. The most important is that sterling released from accumulated balances or—to use the technical terms in which these operations are now couched—"transferred from No. 2 to No. 1 accounts," is not necessarily sterling spent and is not, therefore, tantamount to unrequited exports. It must further be realised that a substantial part of the releases was to provide the countries in question with working balances. The sums so transferred are not intended to be spent and have, in fact, not been encroached on to any appreciable extent. These working balances may be run down over certain periods of the year, but it is the intention that they shall be rebuilt from current receipts at other periods. To that extent, therefore, the "releases" agreed upon and included in the accompanying tabulation overstate the effective amounts made available for unrequited exports.

A true measure of the releases is the net movement in the total of the sterling balances concerned. On this, some information for the years 1946 and 1947 was contained in the "Economic Survey," and some of the figures given there were brought up to date for the period to April 1948 by Mr Jay, the Economic Secretary to the Treasury, in the debate on the adjournment. In 1946 the balances of sterling area countries fell by £36 million but this movement was accompanied by an increase of £76 million in the sterling balances held by countries outside the sterling area. In 1947 the sterling area's balances were run down by £165 million while those of non-sterling area countries rose again—this time by £23 million. Taking these two years, therefore, the sterling area's balances were reduced by £201 million while those of non-sterling countries rose by £99 million, so that there was a net fall of £102 million—or £105 million, according to later and presumably revised figures given in the House of Commons on July 30th. It was then stated by the Economic Secretary that, in the period from January 1946 to April 1948, the net draft on sterling balances, including countries both inside and outside the sterling area, worked out at only £83 million, so that there was actually an increase of £22 million in the total balances during the latest four months. Calculated as a percentage of total UK exports over the two and a third years in question,

(*a*) £4 million cannot be apportioned to any one year but may be drawn before Dec. 31, 1949. (*b*) Additional £1 million may be drawn if wheat prices rise. (*c*) Excluding unspecified sums for special purposes, e.g., purchases of wheat. (*d*) Some further amounts not specified. (*e*) In part available 1947 (*f*) Approximately £63 million carried forward to 1948. (*g*) In addition hard currencies earned made available against sterling. (*h*) Further releases made on application.

the £83 million is equivalent to between 2 and 3 per cent. Mr Jay appears to regard this figure with complete equanimity, implying that its size is an effective refutation of the charge that Britain has allowed unrequited exports to run at a rate more than that commensurate with its resources.

Net figures, however, should be treated with circumspection. They are influenced by recent accumulations of sterling on the part of certain European countries. These new accumulations of course represent freely available sterling which cannot, therefore, legitimately be offset against the release and running down of immobilised "old" balances held by other countries.

The running down of balances by sterling area countries, namely £201 million over the two years 1946/7, provides a truer measure of the extent to which Britain allowed wartime accumulations of sterling to be drawn upon by the countries concerned in order to pay for current imports from the sterling area and for allocation to them of hard currencies from the sterling area pool. There can be no denying that this drain, averaging over £100 million a year, was well in excess of the sums that were in contemplation when the problem of Britain's external liabilities was being discussed immediately after the end of the war.

It will be recalled that in the Anglo-American financial agreement of 1945 some indication of the extent of prospective releases was allowed to crystallise in the clause dealing with the waiver of interest payments on the $3,750 million US line of credit. It was specified that in calculating the balance of current payments of the United Kingdom for purposes of the waiver, releases from sterling balances accumulated by overseas countries before the effective date of that agreement would be allowed to rank as current transactions only up to an amount of £43¾ million. Any release beyond this figure was to be regarded as a capital transaction and would, therefore, be excluded from the calculations of the net income from invisible current operations for that year. This figure was not picked out of a hat. It must have represented a reasonable estimate by British and American experts of the scale on which the repayment of these accumulated balances, which then amounted to just over £3,000 million, could be attempted. In fact the releases to sterling area countries alone have been running at just about twice that level.

One further throwback to the Anglo-American financial agreement must be made in this context of released sterling balances. It is provided in that agreement that the waiver of interest on the US line of credit will not be requested by the United Kingdom unless the aggregate of any releases and payments on sterling balances is reduced proportionately. This intrusion of the Anglo-American financial agreement into the arrangements that may be made with sterling creditors of the United Kingdom will not, of course, take definite shape until the end of 1951, when the first instalment of principal and interest on the American line of credit becomes due. This, apart from any other considerations, sufficiently explains why the arrangements hitherto made between the British Government and its various sterling creditors have been restricted to comparatively short periods and do not look beyond the year 1951.

Fibres For Clothing

IN the past, the clothing ration has depended more on the output from Lancashire and Yorkshire than on the availability of textile fibres. But since the clothing subsidy was abolished at the beginning of the year, price considerations have tended more and more to determine the volume of consumer demand. Hence the cost of raw cotton and raw wool in the world markets is now of direct concern to both manufacturer and consumer alike. Conditions in the cotton and wool markets during and since the war have presented close parallels. In both fibres, trading during the war was virtually monopolised by Governments, and little or no private trade existed until 1946. Output of both was on the whole maintained until the last year of the war and then declined quite sharply. Consumption of both was restricted to cover only essential needs, so that large stocks accumulated. At the end of the 1944-45 season, for instance, world cotton stocks stood at 13,500 million lb. compared with 10,100 million lb. at the end of the 1939-40 season—over a year's supply at the prewar level of consumption. Stocks of wool suitable for apparel became even more cumbersome. In June, 1945, they were estimated at 2,750 million lb. (clean basis) compared with over 900 million lb. six years earlier; most of this huge stock was owned by the British and Dominion Governments and, it was thought, would take some 13 years to absorb alongside current clips. Despite these accumulated surpluses, both the cotton and the wool markets have been very firm since the end of hostilities, and prices have risen to extraordinary heights.

Rayon's experience has been very different. Being a man-made fibre, its production was regulated more or less closely to demand. No problem of stock disposal arose. World output dropped to its minimum in 1945 and since then has recovered sharply. Last year's production was 3 per cent above the prewar level. By contrast with prices of cotton and wool, those of rayon have therefore been fairly stable and relatively low. Rayon is undoubtedly a strong competitor of the other two apparel fibres, but its full competitive power has not yet been unleashed.

The apparent paradox that high prices have ruled for cotton and wool despite the large accumulated stocks, whereas relatively low prices have obtained for rayon although no such surpluses arose, is readily resolved upon analysis of the statistical position of these fibres. The data for such an analysis are presented in the accompanying tables. Table I compares estimated world production of cotton, wool, rayon yarn and staple fibre for the last two seasons, with a prewar average; for rayon a single prewar year (1938) has been taken. With wool it is possible to distinguish statistically between those types (generally the medium and finer qualities) used for apparel purposes and the coarser types used in the manufacture of carpets and other non-apparel goods. Such a distinction, which is in fact based on quality rather than on end-use, has been used in Table I, where the wool figures exclude estimates for carpet wool. No other allowance, however, has been made for industrial uses of the other fibres. Although it is highly probable that an increasing proportion of total output of the fibres concerned is used for industrial manufactures, they remain essentially apparel fibres.

It will be seen that in 1947-48 the combined output of these textile fibres was still fully 6 per cent below its prewar level, despite the fact that rayon output was over 30 per cent larger than in 1938 and continues to expand. Before the war, rayon yarn output accounted for 5½ per cent of the world total of these fibres; last season its proportion had increased to nearly 7¾ per cent. Staple fibre declined from 5 per cent to 4 per cent and cotton from 80 per cent to 79 per cent. The relative position of wool was virtually unchanged. Aggregate consumption of the four fibres since the war has been well above production, and the accumulated stocks of both cotton and wool have been considerably reduced. On August 1st, cotton stocks were estimated at 6,750 million lb., while wool stocks a month previously were believed to amount to only 1,800 million lb. Much of the remaining stock of both fibres consists of low grade material which has little or no ready demand. There is a serious dearth of high quality fibres. Nevertheless, there is at least a sign that output in 1948-49 may be more than adequate to meet consumption requirements.

Hitherto, cotton acreage in many countries has been restricted by the need to grow grain and pulse crops, but the favourable influence of high cotton prices, and the easing of the world food shortage, have led to a general expansion in the acreage sown to cotton. A bumper crop of some 7,500 million lb. is expected in the United States; an increase of 20 per cent over last season is reported from Mexico and one of at least 10 per cent from Brazil. The Egyptian Government has relaxed its restrictions on the cotton acreage and this season's crop is expected to be between 10 and 15 per cent heavier. Substantial increases in acreages under cotton are also reported from India and Pakistan. In all, the world cotton crop is likely to yield some 15,500 million lb.—at least 5 per cent above its prewar level. The current end of season stocks are, however,

low, so that no burdensome surplus is likely to arise, at least for the present.

The world wool clip is also expected to increase in 1948-49, but, at the estimated 1,625 million lb., it would still be 5 per cent below the 1934-38 average. Australian output is at last beginning to recover from the effects of the drought in 1944-45 and sheep population is again increasing. In New Zealand, production will show little change from last year, but a recovery is expected in South Africa where output has been declining since 1941. The American clip continues to diminish, although at a declining rate. Little change is expected in Argentina and Uruguay, but there may be a slight increase. Taking the clips as a whole, not only will the quantity of apparel wool be larger than in 1947-48, but there will probably be a higher proportion of merino—say, 45 per cent, compared with 43 per cent. Nevertheless, if demand is maintained, supplies of wool, particularly of the better merino types, will continue to be relatively scarce.

In rayon, the expansion of world production to record levels has occurred despite the fact that two of the largest prewar producers—Germany and Japan—are still producing only a fraction of their prewar output. Elsewhere, the expansion has been fairly general, and new producers are entering the field. The United States, whose output has developed very rapidly since 1938, continues to be the major producer and now accounts for almost half the total. Production of rayon yarn has recovered much more rapidly than that of staple fibre, which is more dependent on the rehabilitation of the German and Japanese plants. Nevertheless, by the end of 1948 world rayon capacity is expected to reach 3,300 million lb. annually; this figure includes the potentially large capacities in Germany and Japan, but the plants there are urgently in need of repairs.

Total rayon output during the current year cannot, therefore, approach capacity level. Moreover, rayon depends on cotton linters and woodpulp for its cellulose base. The supply of cotton linters has been restricted by the smaller cotton crops, and the general shortage of softwood throughout the world needs no emphasis. Other synthetic fibres are being developed which use various raw materials available in much freer supply. Although it is clearly impossible for supplies of rayon to expand so far as to displace cotton and wool—assuming consumers' tastes and manufacturing technique to be such as to make displacement otherwise feasible—rayon is evidently capable of expanding sufficiently to offer significant competition to the older fibres for marginal requirements. In Britain at

any rate, the existence of utility specifications in textiles tends to limit the amount of rayon which may be used with either cotton or wool, but under freer conditions the use of specific proportions of rayon in other textile yarns may prove attractive from the standpoint of both price and quality.

On the demand side, the limiting factor upon all these textile fibres is the mill capacity in the manufacturing countries. The postwar demand for clothing has largely centred in high quality goods, and this in turn has involved a concentration of demand upon Egyptian cotton and merino wool, both in relatively short supply. The cause of this insistence on quality is difficult to determine. To some extent it is a reaction from war conditions, when clothing supplies were scarce; but, as is well known, it has been accentuated by the rationing systems adopted by various countries and by the general inflationary pressure in the world. Re-stocking of pipelines is now virtually complete, so that a fairly definite, although perhaps transitional, pattern of the demand for apparel fibres is emerging. Table II shows estimated world consumption calculated on a similar basis to Table I. Total consumption of the four fibres is over 15 per cent beyond its prewar level, and again the most significant increase has been in rayon yarn, but part of that increase has undoubtedly been due to the rising industrial demand in the United States. Rayon yarn accounted for nearly 7 per cent of total consumption in 1947-48, compared with 6 per cent before the war, while the proportion for staple fibre dropped

from fully 5½ per cent to 3½ per cent. The proportion of wool consumption increased from under 10 per cent prewar to 10½ per cent last season, while cotton consumption rose from 78¼ per cent to nearly 79 per cent.

Consumption in certain countries shows some striking changes, as will be seen from Table III which compares 1947 with a prewar average. The outstanding feature is the remarkable increase in the consumption of apparel fibres in the United States. Cotton has expanded by over 60 per cent and wool by 55 per cent; rayon yarn has nearly trebled, and staple fibre almost quintupled. Of the countries listed in the table, only Germany and Japan have a total current consumption which is generally below prewar level. Britain's consumption of cotton is certainly below that level, but its consumption of wool is higher despite the smaller output of the wool textile industry. Before the war, large quantities of rags and shoddy were used instead of wool. In France, Belgium, Italy and India consumption of textile fibres is also generally higher than before the war.

An analysis by fibres shows that, except in Japan and Germany, the major increase in consumption in almost every country has occurred in rayon yarn and staple fibre. In India the consumption of rayon yarn has declined but that of staple fibre has increased; in Britain rayon yarn consumption has regained its prewar level, and the quantity of staple fibre used has increased fourfold. In Italy, however, rayon yarn consumption is larger than before the war and staple fibre consumption smaller. The inroads made by rayon yarn and staple fibre into the field of apparel fibres are clear—even though the figures quoted may to some extent exaggerate this trend, since part of the increased consumption of the rayon fibres may be for industrial purposes such as strong filament yarn for rubber tyres. Given the present discrepancy in textile fibre prices, rayon consumption could possibly have increased still further had a more rapid expansion in production been possible. Because of the shortage of textile workers, as in Britain, and the lack of modern equipment, as in Europe generally, total consumption of apparel fibres has a limit which cannot be readily raised. Moreover, a large proportion of the demand for textiles is traditionally related to certain fibres. Rayon frocks may compete with cotton frocks, but worsted suits as yet have no competitor. At present, therefore, competition from rayon tends to be restricted to marginal requirements for textiles, and in particular rayon is tending to be substituted for cotton rather than for wool. But before long rayon may be used to a greater extent both in wool and cotton mixtures and in place of them. Relatively to the other fibres, rayon was cheap even before the war, but the disparity has since been greatly widened. In July the price of filament yarn was only 50 per cent above its 1938 level and that of staple fibre 65 per cent higher. Egyptian cotton (Karnak), on the other hand, has increased by 500 per cent since 1938, and US cotton by nearly 300 per cent, whereas merino wool (64s) was over 300 per cent dearer and crossbred (56s) 157 per cent dearer. The chart on page 311 clearly shows the effect of an insistent demand for quality impinged on a short supply of Egyptian cotton and merino wool.

Given the prospect of an increased supply of cotton in 1948-49, it was natural to expect a fall in prices and a consequent stimulus to consumption. But the US Government has fixed its loan rate for the new crop at 92½ per cent of the parity price (calculated on the basis of the farmer's cost), or about 30.74 cents a lb.; for the 1949-50 crop, the rate is still as high as 90 per cent of parity. The current price is 32.13 cents a lb. The main hope of cheaper cotton—and perhaps of wool, too—must rest upon the possibility of some degree of disinflation in the United States. This would reduce the prices which farmers have to pay for those goods necessary for their livelihood and their production—that is, it would reduce the "parity price," and therefore the minimum price guaranteed by the US Government. It would also help to curtail the very large consumption of apparel fibres in America. For merino wool, the high prices depend rather upon the strong European demand than upon American influences. Yet raw wool is purchased largely for manufacture into exports which may well be affected by an industrial recession in America. And any reduction in the export demand would quickly be reflected in lower wool prices. For the time being the wool market may be indirectly supported by the maintenance of an artificially high American cotton price. One thing, however, is certain; dear cotton will only encourage still further substitution by rayon.

Business Notes

Disinflation and Manpower

A number of signs have suggested that the momentum of disinflationary influences, never very strong, has slackened a little in the past few weeks. Such symptoms as the abnormally heavy drafts upon accumulated savings during the height of the workers' holiday season, despite the depressing weather, and the response of clothing sales to the coupon concessions, may have only passing significance; but they do imply that this year's decline in spending is unlikely to be suddenly or sharply accelerated. At the same time, the tax reliefs, rising military expenditure and outlays in Germany, and the increased cost of subsidies, must all be tending to whittle down the projected budget surplus. But if the disinflationary policy has a blunter edge than it exhibited a few months ago, the complaints of those who feel its effects are certainly no less insistent, and the pressure for wage increases is spreading.

Evidently, despite the Chancellor's reaffirmations, firm adherence to the disinflationary policy in the face of growing resistance is by no means assured. Yet the need is at least as great as it was earlier in the year. The proof of this lies in the manpower figures, which month by month show depressingly slow progress towards the all-important recruitment targets of the key industries. The latest return, indeed, actually shows some retrogression; between May and June the manpower engaged on consumers' services, which over the year were expected to release 31,000 workers, rose by 9,000, and those in building and civil engineering, originally expected to release no fewer than 164,000, rose by a further 4,000 to a level 11,000 above the end-1947 level. At least the first of these setbacks partly reflects the seasonal influences upon the holiday and catering trades; yet in agriculture, which presumably was also facing seasonal demands, the expansion was only 1,000, making a net gain during the first six months of the year of 26,000—less than halfway to the target. Coal, too, gained only 1,000 in June, while the 2,000 improvement in textiles brought the year's recruitment to date to only one-fifth of the target.

* * *

Half-year's Recruitment Analysed

Evidently, a great deal of ground will have to be covered if the full targets for the vital industries—coal, agriculture, and textiles—are to be approached by the end of the year. The progress in the first six months is analysed in the accompanying table. It is interesting to note that the decline in the total working population has been less than forecast. Between January and June, the working population fell by only 144,000, compared with the Economic Survey's estimate of 213,000. From this table, it will be seen that, to reach the targets, coal needs another 25,000 men, agriculture another 29,000 and the textile trades, where the gap is most serious, a further 86,000.

Unless disinflationary pressures and specific controls can enforce contraction upon the three principal groups whose labour force is far above its projected level—building, clothing, and consumers' services—it is difficult to see where additional labour for the key industries can be found. The Economic Survey estimated that the total of unemployed would rise to 450,000 by the end of the year, but this does not now seem likely. Even on the revised basis of calculation which followed the introduction of the National Insurance Act on July 5th, there are still only 282,200 unemployed—or only 1½ per cent of the population, and nearly 4,000 less than in June. The extent to which the vital production can be achieved in Development Areas, where unemployment is relatively high, is limited. The importation of foreign workers is being speeded up; 9,000 were recruited in June, compared with 7,000 in May, but even so, there are practical limitations in the lack of housing in mining, textile and agricultural areas. Perhaps continued labour shortage will act as a spur to technical improvement and increases in productivity in the undermanned industries; but it would be idle to hope that gains from this source could suffice to avoid the need for sustained disinflationary pressure.

New Zealand at Parity with Sterling

Mr Walter Nash, the New Zealand Minister of Finance, announced at the close of his budget statement that the New Zealand Government had decided to raise the exchange value of the New Zealand pound to parity with sterling. The new rates became immediately effective, and as from last Thursday the New Zealand pound, which had been quoted at £NZ 124-125 to £100, was quoted £NZ 100-101. The move seems to have come as a complete surprise to the highest quarters in London, and does not appear to have been preceded by the process of consultation which normally accompanies such decisions within the Commonwealth family. Since New Zealand is not yet a member of the International Monetary Fund there was no need to consult that institution in Washington. The reasons for New Zealand's decision do not emerge clearly from the recent course of events in the Dominion. New Zealand's agricultural community has in past months pleaded vociferously for higher prices for its exports, virtually the whole of which go to the United Kingdom. They were given some satisfaction as a result of the recently re-negotiated food contracts between Britain and New Zealand which gave them increases of between 15 and 20 per cent in sterling prices on which those contracts are based. Now it would seem the whole of this increase and a little more is to be lost in terms of New Zealand pounds by the appreciation of the New Zealand currency. The decision becomes the more difficult to understand in view of next year's elections in the Dominion.

New Zealand's decision is all the more interesting in view of its inevitable impact on Australia. In the past, the two dominions have tended to move together, though not always simultaneously, in their exchange policy. Australia, as the bigger partner, has led the way. On this occasion Australia's freedom of action is circumscribed by its membership of the International Monetary Fund. It would be idle to pretend, however, that New Zealand's decision can leave Australia's exchange policy entirely unaffected.

For the time being the substantial appreciation in the New Zealand currency will have no effect on the prices of British imports from the Dominion, since the bulk of these is sold under long-term contract at prices fixed in sterling. The new currency move was justified by Mr Nash as an attempt to restore equilibrium between prices in New Zealand and elsewhere, particularly in the dollar area. It should have a most powerful effect in shifting the terms of trade, though the adjustments of the New Zealand economy to this sudden 25 per cent appreciation of its currency are likely to be more painful than the somewhat haphazard and incidental manner in which the move was announced would suggest.

* * *

Commodities and ECA

The implications of the stock-piling provisions of Article V of the ECA Bilateral Agreement are beginning to cause concern in the commodity markets. This and certain other articles of the Agreement were discussed in these columns on July 10th. They relate to Britain's undertaking to help the United States to purchase materials, originating in the United Kingdom and the colonies signatory to the Agreement, for stock-piling and other purposes. The issue now raised is the extent to which colonial production will be expanded—with or without the aid of American capital—to meet this relatively short-term increase in demand. Moreover, when these requirements have been fulfilled, how will the surplus output be marketed? On these points there is the usual official reticence. Even the commodities in which the United States is interested are at the moment conjectural. Those most likely to be concerned are rubber, tin, copper, zinc, lead and oil. For tin and natural rubber the United States is entirely dependent on imported supplies (demand for imported rubber is restricted by the American synthetic rubber production), while domestic production of copper, zinc and lead no longer covers domestic requirements. The Secretary of the Interior told Congress recently that American copper resources would be exhausted in 25 years, zinc in 24 years and lead in 15 years.

The scale of stockpiling purchases is naturally kept secret, but if the accumulated stocks are to be of any strategic importance, it must be large. With industrial demand for all these commodities well above prewar level and output only a little, if at all, above prewar, the strategic requirements can be met only by expanding production. Article V includes the phrase "after due regard for the reasonable requirements of the United Kingdom for domestic use and commercial export of such materials," which presumably implies that strategic purchases will not compete with normal commercial purchases. To what extent can the colonies expand their output of these commodities? An increase in rubber output requires, in the first instance, political stability in Malaya, and, in the second, replanting with high yielding stock. In neither case is American participation essential. Tin production can be expanded in either Malaya or Nigeria. Strategically, the United States preference is likely to be for Nigeria, which is also well situated for shipment to the Texas smelter. Current Nigerian output of tin concentrates is running at 9,200 tons a year; in 1943 it reached 12,666 tons. US tin consumption is over 60,000 tons a year, and over half this quantity is produced at home from imported ores coming almost entirely from Bolivia.

Colonial production of copper, zinc and lead is centred in Northern Rhodesia. Copper output in 1947 amounted to over 190,000 tons, compared with a peak of 250,000 tons in 1943. Yet American consumption is more than 1¼ million tons a year. Although the Rhodesian output is mainly blister copper, the United States has sufficient refinery capacity for converting it into electrolytic. Rhodesian zinc and lead production is on a much smaller scale. Output of zinc last year totalled 21,600 tons and of lead 15,600 tons, compared with an American consumption of 700,000 tons of zinc and 500,000 tons of lead. The probabilities are that America will be primarily interested in extensive development of Rhodesian copper, with a secondary interest in increased lead and zinc production.

An expansion in production of non-ferrous metals would undoubtedly be an important asset to the British dependencies concerned. But the crucial question is whether it will be an asset, reckoned in terms of dollars, to the sterling area. American capital participation naturally implies American participation in dividends. If the resultant output is sold to the United States so that the sterling area's net dollar earnings increase, all would be well. If, however, the increased output can be sold only to sterling or soft-currency countries, then Article V would have converted raw materials which had previously been purchasable for sterling into dollar goods.

* * *

ICI Prospectus

A month has passed since Imperial Chemical Industries first announced the terms of its offer of 10,093,023 new £1 ordinary shares, at 40s. 6d. a share, to ordinary shareholders registered on

July 20, 1948, in the proportion of one new share to five old ordinary shares held. On the eve of that announcement the price of the old shares had touched 44s. 3d. At that time it seemed that international tension might cause a further decline in ordinary share prices, which sufficiently explained the reason to fix the issue price well below the market level, even though the lowness of the price occasioned some surprise, since it had been confidently predicted in June that it would be nearer 45s. But in the past few weeks the decline in stock markets has given way to relative firmness, albeit in conditions of stagnation exceptional even for this time of the year. The price of the old ICI shares has been steady for some time at around 46s., although it weakened to 45s. 6d. on Wednesday, and fell to 44s. 3d., ex rights to the new shares, on Thursday. The issue of the prospectus this week has suggested that in offering the new shares at 5s. 6d. under the market price the company may have to pay dearly for its earlier pessimism; each 1s. on the price represents over £500,000 in premiums to the company. But the sacrifice is such as must be reckoned with in the present condition of markets, especially when the arrangements for the issue must inevitably be spread over several months. Indeed, much can happen in the remaining three and a half weeks to alter the present relationship of prices. But in view of its favourable terms—on the basis of the present 10 per cent dividend the new shares will yield £4 18s. 9d. per cent—and the present paucity of counter-attractions in new issues, the offer should be an assured success. The Bonus Issues Tax will, of course, take 10 per cent of the amount of premiums arising from the issue. Calculated on Thursday's opening bid price of 3s. 7½d. for the new shares, nil paid, plus one-quarter of the jobber's turn amounting to ¾d., the chargeable premiums will, on the Inland Revenue's formula, amount to £1,861,000, so that ICI must pay £186,100 to the Inland Revenue on account of the tax.

The prospectus reminds shareholders of the reasons for the issue—reasons previously explained by Lord McGowan, and, doubtless, now familiar to readers of *The Economist*. The group's programme of future capital expansion can no longer be financed from its own resources, although it has thus financed itself for the past twenty years. In 1947, the total draught on liquid resources for additional fixed and working capital was over £20 million. Capital expenditure for a further £52 million had been sanctioned by the end of last year, and other commitments, particularly the acquisition of further factories from the Government, are being negotiated. The development of petroleum chemicals figures prominently in the new schemes, as does the expansion of non-ferrous metal manufacturing plants in the Midlands and South Wales. Moreover, ICI will require up to £3 million sterling for its subscription to the new issues contemplated by its subsidiaries, Imperial Chemical Industries of Australia and New Zealand, British Nylon Spinners and British Titan Products.

The ICI offer will remain open until September 14th, when a first instalment of £1 per share is due, followed by a final payment of £1 0s. 6d. on or before October 28th. The prospectus states that preference and ordinary shareholders may apply for any balance of the new ordinary shares which remain after the rights of the ordinary stockholders have been satisfied. For this purpose, the special form B enclosed with the prospectus must be completed and forwarded to the company before September 14th, without any remittance. It is expected that certificates for new shares will be issued by the end of the year.

Anglo-American Differences on Steel Scrap

Anglo-American failure to agree on German steel scrap is not new; in the history of this subject, disagreement has been more common than harmony. The new development is that the necessity of allocating among the consumer countries the proposed German scrap exports for the first Marshall Plan year brought matters once more to a head in the third week in July; and, as the American Commander-in-Chief, General Clay, disclosed on Monday, the question has been referred to the two Governments for settlement. It is a matter of general concern to British industry. As the July *Bulletin* of the British Iron and Steel Federation showed, the British steelmakers have been counting on improved supplies of German scrap following currency reform in the three western zones. If these hopes are to be frustrated by the differences of the occupying powers, the difficulties of maintaining the present high rate of steel production will be made greater.

Exports of commercial scrap from Bizonia were fixed in April at 1,200,000 tons for the twelve months ending June 1949, and this estimate was among those placed before the OEEC at Paris. The British and Americans proceeded to negotiate between themselves the allocation of the first 600,000 tons: Britain, they decided, was to get 300,000 tons, the United States 200,000 tons, and the remaining Marshall Plan countries 100,000 tons between them. The British negotiators agreed to this, but with reluctance; they felt that the United States should take a good deal less. The original General Report of the OEEC had estimated in 1947 a European scrap deficit of 1,000,000 to 1,500,000 tons a year, and remarked: "Such a deficit can only be met, as it was before the war, from United States sources." But things were not going that way; since the General Report was written the American demand for European scrap had become keener, and the Foreign Office had begun to think that a regular system of allocation, involving full consultation with the other European countries concerned, would be better than bipartite negotiation.

The bipartite negotiators next proceeded to a general allocation for the whole year, and the compromise reached was that Britain should take 540,000 tons and the United States 440,000, the remaining 220,000 to be divided among the other participating countries. This was announced, in a press release from Frankfurt, as a settled thing; but the Foreign Office refused its approval. General Clay then placed an embargo (through the machinery of JEIA, on which the Americans have a majority voice) on all new contracts for the export of commercial scrap; while the negotiations continue, both occupying powers are necessarily limited to deliveries under existing contracts. But the British are also taking scrap from Germany as "war booty"; this does not enter into the commercial contracts.

* * *

Need for a Settlement

German commercial scrap has been a persistent disappointment to the British steel industry; in spite of the vast plans that were made, only 86,000 tons was in fact exported to Britain in the first six months of 1948. It was reasonable to suppose that the reform of the mark in June would overcome the reluctance of the German merchants to export scrap. This may still prove to be so, and it could hardly be more unfortunate or more ridiculous that exports should be held up at this moment by Anglo-American differences. Those differences are by no means confined to the division of the available exports. There is a long and absurd history of disagreement about prices. Last autumn American buyers were handsomely outbidding the British, and General Clay was angry with the British for not wanting to pay the world price. But the last British contract before the embargo (it may still not be carried out) was concluded at a price of £7 10s. a ton fob; this outbid the Americans, and was resented by them on that ground.

There is a further difference over British removals of booty scrap, which have greatly exceeded in quantity the commercial scrap exported. The Americans have defined booty scrap more strictly than the British, and their zone (by chance) contained much less than did the British zone. They announced recently their intention of not taking any more scrap as booty, and they would clearly like the British to do the same. This is something the British Government will have to consider. The war has been over for more than three years, and there must come a point at which removals of war booty—however defensible legalistically—will have to come to an end. If this happened the British would then be limited to what they could get through JEIA, and it is no doubt unfortunate that JEIA can be so readily used to impose exclusively American wishes on German foreign trade. But it may still have to be faced. The only hopeful way out of the present deadlock would seem to be to negotiate all these questions together and seek a coherent settlement. If this is attempted it will be best to settle a fourth question at the same time. The allocation of German scrap among the countries anxious to buy it clearly ought not to be handled as an exclusively Anglo-American affair at all; it is a common interest of the ERP countries. Once this point is established, it may become possible to draw American attention to the fact that American insistence on receiving steel scrap from Europe runs counter to the general purpose of ERP.

* * *

World Bank Operations

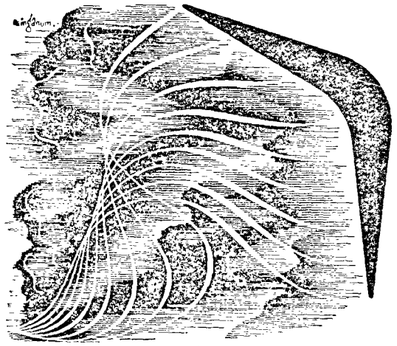
The International Bank for Reconstruction and Development has issued its financial statement for the year which ended June 30, 1948. During the period covered by the statement the Bank's loans increased from $250 million to $497 million. During the year the subscribed capital stock at the Bank increased by $261,500,000 to a total of $8,286 million. The total income of the Bank for this period amounted to $18,704,000 and the net income to $4,094,000. This is sufficient to eliminate the deficit of $1,064,000 brought forward from the previous financial year. The statement gives details of the various operations of the Bank during the financial year in question. Since the turn of the financial year, the Bank's most interesting operation has been the grant of a loan of $12 million to various Dutch shipping companies. This loan, which is guaranteed by the Netherlands Government, is intended to provide finance for the purchase of six American ships. This operation has taken an unusual form in that it involves the participation of American commercial banks. Ten of these institutions have subscribed for $8,100,000 of the 2½ per cent mortgage notes repayable over the next ten years, which is the form taken by this loan. The balance of the notes is being held by the International Bank.

* * *

Israel Pounds

The provisional Government of Israel have this week announced arrangements for setting up their own monetary system and foreign exchange administration. The Israel pound is to be the unit and will be divided into subsidiary coins expressed in mils. The notes, which are to be issued by a special issue department of the Anglo-Palestine Bank, will be in denominations of 500 mils, £1, £5, £10 and £50. The Israel pound will be equal to the pound sterling and changeable at par with it within the limits of foreign exchange restrictions. The profits of the issue department of the Anglo-Palestine Bank will go to the provisional government. The backing for the new notes will consist of (1) gold, (2) notes of the Palestine currency board which the public will be invited to hand in against the new Israel pound notes, (3) foreign exchange balances, mainly sterling and dollars, (4) Treasury bills and other short-term securities of the State of Israel, (5) re-discounted commercial bills. The amount held in gold, sterling notes and foreign exchange balances must be equivalent to at least half the note circulation.

In preparing these new currency arrangements, negotiations had to take place between the British and Israel authorities, and it is gratifying to be able to record, on the evidence of both sides, that these proceeded in a friendly and helpful atmosphere. Since last February Palestine has been outside the sterling area, although the Palestine Currency Board has continued to function. The operations of the Board will now be wound up, at least so far as the State of Israel is concerned, and new arrangements will have to be made for the provision of currency in Arab Palestine and Transjordan, which are also served by this currency board.



Israel will remain outside the sterling area and therefore the normal restrictions on movement of funds between Great Britain and Palestine will apply. The Government of Israel, however, wish it to be understood that the setting up of a separate monetary system "is not in any way directed against Great Britain or sterling but is a necessity to maintain monetary and economic order in the State of Israel." The Government of Israel have also expressed the hope of re-establishing normal financial arrangements with Britain immediately upon the re-establishment of political contacts. The re-establishment of these financial relations starts with the enormous impetus deriving from the fact that the bulk of the backing behind Israel's currency will be sterling—either sterling balances or notes of the Palestine Currency Board. This fact, plus the dominant part of Palestine trade that is transacted with other sterling countries, ensures that close relations will have to be maintained between sterling and the Israel currency.

The Royal Ordnance Factories

The report of the Select Committee on Estimates published on Wednesday underlines the urgent need for a reassessment of policy for the Royal Ordnance Factories. Under the policy laid down in the autumn of 1945, 23 of the 44 wartime ordnance factories were to be kept in operation under Ministry of Supply control; one has since been declared surplus, and another put on a care and maintenance basis, so the number is now 21. It was thought necessary to keep a nucleus of about 40,000 essential workers employed at these factories. The primary purpose was military. But ways had to be sought of keeping the factories and the 40,000 workers usefully occupied; it was this necessity that established the Ministry of Supply as a miscellaneous industrial producer in peace-time.

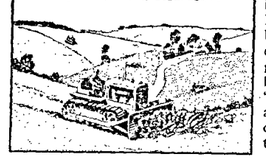
Two things have changed since the policy was laid down, and it is in the light of these changes that the administration of the factories needs to be reconsidered. The international situation

EXPORT BOOMERANG ?

Yes, exports destined for Australia and New Zealand can 'boomerang' if their price or quality is unsuited to the market. For although these Dominions are still eager for British goods and services, their buyers are becoming increasingly selective.
Exporters planning to sell to Australia and New Zealand are invited to consult the Overseas Department of The Bank of Australasia—where they will find up-to-date information from the Bank's branches 'down under' on local markets and conditions.

THE BANK OF AUSTRALASIA
(*Incorporated by Royal Charter* 1835)

HEAD OFFICE: 4 Threadneedle Street, London E.C.2. (Manager: G. C. Cowan)



RECLAIMING 30,000 ACRES

1. For 1,000 years the turf of the Sussex Downs lay undisturbed, except by grazing sheep. But war forced the authorities in 1942 to take great stretches for battle training.

2. For four years troops fired thousands of tons of ammunition into the slopes, and covered their surface with wire and concrete, trenches and gun-pits.

3. 'Caterpillar' Diesel Tractors are now speedily clearing the Downs of their dangerous litter, so that the urgent job of food production may begin again.

Before the Sussex Agricultural Committees could begin reclaiming the downland, miles of rough roads had to be cleared by 'Caterpillar' Bulldozers. Before ploughing could begin, innumerable shell and bomb craters had to be filled in, and undergrowth, wire, and defence works had to be uprooted. Once again, 'Caterpillar' equipment, provided and serviced by the Jack Olding organization, has saved precious time, manpower and money.

'CATERPILLAR' MOVES THE EARTH—
TO HELP REBUILD BRITAIN

Jack Olding WORLD'S BIGGEST 'CATERPILLAR' DISTRIBUTOR

has deteriorated; it is no longer possible to be complacent about the fact that—as the Select Committee reports—

> employment on the plant now manufacturing steel furniture does not correspond to munitions work and it would take some twelve months to remove the plant and re-instal the equipment for Service production.

And the economic position of the country has been revealed as so bad that the productive uses to which the factories are put, and the efficiency of their operation, need to be scrutinised far more carefully than they were scrutinised two or three years ago.

It has to be questioned now whether a factory (or part of a factory) which would take twelve months to get back to military production can justify on military grounds alone the cost of operating it and the labour and material which it uses. This particular factory, at the same time, is not making a good showing on civilian standards either:

> Large orders for office furniture have been placed by the Ministry of Works and are on a cost basis. The Ministry stated, however, that they can now buy from private manufacturers at a lower price than that charged by the Ordnance Factory.

To a certain extent the high costs of production are a book-keeping matter; production costs are burdened with 75 per cent of the overheads for a factory which is used productively to the extent of, perhaps, only 30 per cent. A part of this is properly a charge on the Defence Estimates. Unless the charging of overheads is put on a more realistic basis, and unless tests of cost and efficiency can be applied as they would be applied to a commercial undertaking, it is hardly possible to assess whether a factory is being employed usefully or wastefully. The Committee was clearly not satisfied that, if such tests were applied, the results would be reassuring. What is now needed is a military plan to ensure that factories supposedly maintained for war production in case of need are really available, and that in the meantime no ingenuity is spared to make efficient industrial use of them subject to that purpose. As things are, neither condition is being fulfilled.

Carriage of ECA Cargoes

American shipping policy has a habit of infiltrating into minor clauses of major agreements with foreign countries, and it hardly ever fails to lead to friction. The European Recovery Programme is no exception, and Colonel Arthur Syran, Director of Transportation for the Economic Co-operation Administration, may be expected to hear some criticisms in Paris of his plans for arranging shipments of ECA cargoes. There are two main conditions which have an unpleasant taste for the maritime nations of western Europe—the insistence that 50 per cent of all shipments shall be reserved to American ships, and the fixing of a preferential minimum freight rate for the cargoes reserved.

Clauses in trade agreements which retain 50 per cent of shipments for American ships are not new, but they are not always easy to enforce. A close watch can be kept on the chartering of ships for bulk cargoes such as coal, grain or oil, but miscellaneous liner parcels procured through ordinary commercial channels are not so easy to trace or control. Colonel Syran, however, has stated in New York that the principal function of his office is to "police" the "fifty-fifty" provisions. Whether those provisions are flag discrimination or not, shipowners in Europe take an even more serious view of the preferential rate scheme. The rates fixed by the War Shipping Administration are still used as a standard of comparison, although free freight rates have been well below this level for some time—recently as much as $4.50 below. American ships carrying ECA cargoes are to receive a minimum of $1 below WSA for coal and $1.50 for grain; no upper limit is fixed. For ships of other nationalities a maximum of $3 below WSA for coal and $3.50 for grain will be paid out of ECA funds; here no minimum rate has been announced. All this is obviously designed to protect American shipping from normal economic forces. American ships, with their high operating and manning costs, are uneconomical at rates which are still acceptable to their principal competitors. In recent months the freight market has been falling, and in the first six months of 1948 the number of Liberty ships laid up in the reserve fleet has risen from 800 to nearly 1,200, compared with 510 a year ago.

There can be no disguising the fact that American shipowners have been relying on ECA funds, directly or indirectly, to bolster their inevitably weakening position in the freight market. The fact remains that protected and subsidised American shipping in commercial competition has seriously hindered the European maritime nations from making the best of their dollar-earning shipping services. It is strange, in the circumstances, that the United States Government should now be engaged in proceeding against the U.S. Atlantic-Far East Liner Conference (consisting of six American and 19 other companies) on a charge of conspiring to monopolise that trade. "Such a denial of opportunity to independent shipping lines," the Attorney-General is reported to have said, "does violence to our American ideal of competitive enterprise."

* * *

£220 Million Settlement with India

Those who try to construe the mysteries of the Exchequer Return were confronted this week with a problem almost as intriguing as the unravelling of the book-keeping oddities of the ERP Special Account. The item "Other Debt—Internal," which is, incidentally, the heading under which the nominal borrowing for the purpose of providing the ERP segregated sterling is accounted, suddenly jumped by no less than £176.3 million. At the same time, Miscellaneous Receipts—the customary "above-line" item—rose by £45.8 million. These large transfers enabled the Treasury to show a big reduction in the floating debt, the amount of which declined on the week by £226 million, to £6,282 million. This batch of operations is quite unconnected with the ERP accounting, and though it is much larger than the ERP transactions have been to date, it has no more significance as an immediate factor in British domestic finance. Like the ERP operations, it represents merely book entries within the Government accounts.

The source of these movements is the recent agreements with India and Pakistan whereby Britain assumed liability for the pensions due to Indian civil servants and simultaneously determined the sum due by India to Britain for surplus war stores, after offsetting Britain's outstanding debt to India for war expenditure. Under the first of these arrangements, India was due to pay Britain just over £176 million, the estimated capitalisation of the cost of the pensions; under the second arrangement, the net sum due from India was some £45 million. These Indian debts were to be discharged by a corresponding cancellation of India's accumulated sterling balances. Had these balances been held in cash at London banks, the payment to the Treasury would naturally have enabled it to make a real repayment of floating debt held by the banking system. As it was, the money was already lent to the British Treasury in the form of "tap" Treasury bills. Hence the payment was made simply by surrender of these bills, producing a corresponding reduction in the floating debt, but not affecting either the debt held by the banking system or the credit structure.

Ordinary mortals might reasonably have expected that "money" thus secured might have been described as credits secured by way of cancellation of debt. In fact, as indicated above, the portion representing the pensions appeared in the Exchequer Return as "Money raised by creation of debt"—a new paradox which is explained by the fact that the "money" secured from redemption of the bills was employed to buy from the British Government an annuity calculated to produce the periodical sums required for the pensions. In fact, neither India nor Britain has paid or received any cash, but the nature of the British Government's liability has been shifted from "tap" bills to "other" debt—representing the annuity it has sold. This operation, following so soon after the first ERP accounting, surely drives home the need for a reform of the Exchequer Return so as to separate plainly all internal operations, which have no effect or no immediate effect upon the domestic credit situation, from those of real and immediate economic significance.

* * *

Indian Agreement Postscript

Meanwhile the Indian view of the financial agreement with Britain was given with significant frankness in the course of the debate which preceded approval of that agreement by the Indian Parliament. Sir Shanmukhan Chetty, then Indian Finance Minister, said that all fears of scaling down India's sterling debt could now be dismissed. He was asked in the course of the debate what would happen to the debt in the improbable event of a war between Britain and India. His reassurance to his questioner was to point to the value of British commercial interests in India which could, in case of need, be appropriated and set off against the sterling debt. The Finance Minister thought that the present value of these direct investments amounted to about £600 million, but he added that the compilation and valuation of these interests was now being undertaken by the Reserve Bank of India, which was expected to make its report on this by next March.

The Indian Finance Minister put up a strong defence of those parts of the agreement which covered the sale of military stores to India. He admitted that, without this settlement, India would

have been helpless at the time of the Kashmir crisis last autumn, since it was the stores obtained from Britain that enabled India to defend Kashmir against aggression. In an earlier part of the debate the Finance Minister confirmed the indications given when the agreement was announced in London that India had proved a very cautious and self-restrained user of the sterling balances released to it last year. He pointed out that, of the £83 million of balances released to India over the past twelve months, only £3 million had been utilised.

Manpower and Effort in Textiles

If Sir Stafford Cripps is the Cassandra of the Labour Government, it may not be unreasonable to regard his economic assistant, Mr Douglas Jay, as its Pangloss. Mr Jay's speech at Huddersfield on Monday contained warnings (it is true) of the need for still greater efforts, but its general tenor was remarkably optimistic. He claimed, for example, that as a result of better organisation of the labour force, national output is now 20 per cent above the 1946 level and 15 per cent higher than in 1939. It would be interesting to have comparable figures of output per head. The labour force in civilian employment, as Ministry of Labour statistics show, is now more than a million higher than in the summer of 1939. The increase in output, taking into consideration this expansion in manpower and the technological improvements of the intervening years, is welcome but not surprising—and not enough.

Mr Jay's remarks were primarily intended for wool textile operatives, and were part of the Government's latest production and recruitment campaign. The state of the industry is improving, but is still none too bright. Output of worsted yarn was running in June at 15.57 million pounds a month, compared with the target for the end of the year of 17 million; output of cloth was only 19.14 million square yards in May, compared with a target of 25 million. Exports of yarn averaged 1.5 million pounds in the first six months of the year, compared with the target of 2.6 million; cloth exports were 8.9 million square yards, against the target of 17 million.

The fulfilment of the targets depends largely on getting more manpower. The situation has been improving, but the labour force of 182,000 at the end of June was still 18,000 short of the 1948 target. The main recruitment drive is directed towards married women, through the provision of more nurseries and the extension of schemes for part-time employment. Further intake of both foreign and home labour is, however, limited by shortage of housing. The wool industry, it is officially recognised, has done less than cotton to encourage schemes for redeployment of labour. It is here, rather than in combing Yorkshire for fresh manpower, that the solution lies.

The cotton industry's labour force was 278,433 at the end of June (an increase of 12,175 in six months) against a target of 325,000. Both recruitment and output have been hampered by the Wakes Weeks holidays, and it is to be hoped that the autumn will bring improvement, for a 22 per cent increase in output is required to reach the 1948 target. It is encouraging to note a reduction in labour wastage since last year, which suggests that the great difficulty in any industry predominantly employing women—stability in the labour force—is to some extent being overcome.

* * *

Cheaper Cotton for Lancashire

The Raw Cotton Commission reduced its home issue prices of American type cottons for the third time within six weeks when it announced on Monday a reduction of 1¼d. a lb., making the new average price 21.50d. In all, American cottons are now 4d. a lb. cheaper than they were at the beginning of July. This downward trend reflects a corresponding movement in the New York market, but British prices now appear to be below the world level. There have also been various reductions in Egyptian cotton prices. Giza varieties are 5d. cheaper at 39.75d. a lb., and Karnak 3½d. cheaper at 53.75d. a lb. Other types of both Egyptian and Sudan growths have been correspondingly reduced. These prices follow similiar declines which have occurred in the Alexandrian market recently.

The Commission adopted in February the policy of keeping British prices in line with world replacement costs; it has since pursued the policy consistently and with reasonable success. The test was whether prices would follow the world trends downwards as quickly as they followed them upwards. Little criticism can as yet be levelled against the Commission on this account. Although the spinners are protected from these sudden changes by the cover scheme, the weavers and merchant converters have not yet evolved a similar scheme for themselves. But if the Commission pursues its present policy, both the New York and Alexandrian markets can be used as satisfactory guides to changes in British cotton prices. And if British prices continue to conform closely to world trends, Lancashire manufacturers will be at little disadvantage as against their foreign competitors. Indeed, the success of the Commission's buying operations may even give them a certain advantage—which they are now beginning to enjoy for certain varieties—by enabling them to buy cotton at prices below those in the world markets. According to the Cotton (Centralised Buying) Act, the Commission must balance its profits against losses over an unspecified period. But if prices are kept at replacement levels, Lancashire will quickly benefit from any profitable transaction. It must, however, be equally willing to pay higher prices when the Commission has not been so fortunate.

* * *

Coupons or Cash?

How far has the purse supplanted the coupon-book as the main instrument of consumer-rationing? Some answer might be expected from the retail trade figures for June which show the full effect of the coupon concessions announced at the end of May. Unfortunately for clarity of interpretation, the concessions were of two kinds. On the one hand the public received a bonus of twelve extra coupons to spend, before October. On the other some goods, notably stockings, required less coupons.

These concessions provided the expected stimulus. Sales of apparel, normally below average in June, rose to a level which was 8 per cent above their value in May and 37 per cent higher than in June, 1947. Coupons, therefore, still matter. But few people hastened to spend their bonus, for coupon takings were actually 6 per cent less than last year. The discriminatory nature of the buying suggests the uncomfortable middle position which much of retail trade has reached, not yet clear of the coupon economy, but with the sellers' market left well behind.

Women's wear benefited most from the concessions, and a rise in sales of stockings was a marked feature. Sales of men's wear rose by 4 per cent over the month, but footwear sales showed a fall from the high level of May. The increased sales of clothing were balanced by a fall in sales of food and perishables, leaving the total retail index unchanged, so that there was not, in fact, more spending. Sales of hardware, though rising by 5 per cent on May, were below the average of the last 12 months. Furniture sales rose by 3 per cent. Among the several regions, Central London showed consistently the least favourable results. Before the war quietness in this area was often a warning of restricted demand elsewhere.

PERCENTAGE CHANGE IN SALES COMPARED WITH A YEAR EARLIER: INDEPENDENT RETAILERS

Trade	June, 1948	Feb.-June, 1948
Drapers*	+ 28	+ 13
Men's wear shops	+ 29	+ 18
Boot and shoe retailers	+ 23	+ 24
Furniture dealers	+ 14	+ 17
Hardware, electrical and radio shops	− 8	+ 9
Booksellers, stationers and newsagents	*Nil*	+ 12
Jewellers, etc.	− 7	+ 9
Chemists	− 2	+ 5
Retailers of toys, sports and leather goods	− 4	+ 9
Motor and cycle dealers, garages, etc.	− 12	+ 2

* Includes women's clothing shops of all kinds

Among the independent dealers most of the trades unaffected by coupon concessions reported sales unchanged or lower than a year ago. The decline in consumer demand was more marked than in any of the 18 months during which these statistics have been collected. In the period February-June, 1948, most trades show increases compared with the corresponding period last year, but, on the assumption that prices have in each case risen by more than 10 per cent in the interval, any rise less than that figure represents a fall in real turnover. In the big stores, comparison with 1947 suggests that it is the vendors of musical goods, sports goods and cycles, hardware, radio and electrical goods, books and stationery who have been most exposed to the draught.

Readjustment in the Rubber Market

Towards the end of last week the rubber market underwent one of its frequent periods of readjustment. Prices had previously declined from the peak of 1s. 3⅛d. a lb. reached towards the end

of July, but the market had on the whole remained firm. Russia has of late been buying fairly large quantities, and when shipment from Malaya was held up through the lack of credit facilities, it was interpreted in some quarters as proof of the Soviet Union's inability to finance its recent rather heavy purchases. Stocks were accordingly liquidated, and the London spot price fell from 1s. 2¼d. to 1s. 1⅞d. a lb., but on Wednesday rallied to 1s. 1⅞d. Although the interruption of the loading of the Russian ships proved to be temporary, the price recession was protracted by the general belief that up-country stocks in Malaya had become unwieldy.

There should be no difficulty in financing Russian purchases. Although no details of the operation of the Anglo-Russian trade agreement have been published, Britain's balance is undoubtedly "in the red" at the moment. The main question is how long the Russian purchases will continue? Strategically, rubber is still an essential commodity, for all the technical development in synthetic rubbers, and it is reasonable to suppose that in present circumstances both the United States and Russia will wish to go on accumulating stocks. If normal industrial demand persists at its present high level, strategic purchases can only raise the price of natural rubber still further.

The Malayan disorders have not yet affected the supply of rubber. But events of the past week suggest that the unrest may be more deep-rooted than was at first suspected. If this is so, rubber production may well decline, although its effect on the market may not be felt for some time. A high price for natural rubber will not only help the producers and reinforce the central dollar pool, provided that American purchases are not thereby reduced; it will also stimulate the consumption of general purpose synthetic rubber. American synthetic consumption over the first half of 1948 has averaged 37,000 tons a month, which is considerably below the corresponding average of 52,000 tons last year. It is nevertheless higher than the minimum fixed by present American regulations governing the use of synthetic rubber in transportation articles. And any encroachment by synthetic rubber now may have long-term repercussions in the natural rubber market.

TUC and Productivity

Transport House is certainly not neglecting the production drive. There has been a spate of articles and announcements in recent weeks on the measures which TUC leaders have agreed to take in order to raise productivity. An article in the August issue of the TUC journal, *Labour*, observes that the main barriers to high productivity are suspicion and hostility surviving from the time when the workers were "slump-minded" and regarded such measures as scientific management, the Bedaux system, and time-and-motion studies as devices for keener exploitation by the employers.

While the TUC recognises these psychological barriers, it is critical of the unions for not going sufficiently far in following the General Council's lead. It asks: "Is there any indication that the unions affiliated to Congress are equally interested" in developments to raise productivity and improve efficiency? The Electrical Trades Union is commended for its decision to spend £12,000 a year on technical and economic courses for its officials and members, but there is no evidence of similar initiatives by other unions. The TUC reports a disappointing response to its suggestion that shop stewards should be trained for management in the Ministry of Labour's Training within Industry courses.

A new note was struck last week in its *Industrial News*, which warned the workers that the maintenance of full employment depended on their willingness to take work which might not be in the trade, or in the place, which they wanted. The need for greater mobility—both physical and occupational—of labour had been evident long enough, but the unions have hitherto resisted any breaking-down of the existing barriers. This lead from the TUC is therefore of special significance, and the Margate Congress, if it faces these issues squarely, should be a notable event.

Too often, in the past, difficult and controversial subjects have been evaded. The publication of a set of studies on British trade unionism by PEP, which deals largely with the theme of trade union responsibility in full employment, should help to clarify thinking. It suggests ways and means in which the existing gap between the trade union leadership and the worker at the bench can be bridged, and ways in which good advice from the top might come to be put into practice by the rank and file.

Five-Month TDRs

The resumption this week of maturities of Treasury deposit receipts, after the seasonal gap of several weeks, gave the authorities an opportunity to experiment further with their new system of issuing TDRs having different periods to run from the six months which was the standard maturity until recently. The new system, which embraces seven-month and five-month maturities, was first employed in the second half of June, when the longer-dated receipts were issued to ensure a flow of maturities next January, at which time the banks will be in the throes of the usual seasonal pressure caused by the peak period for transfers of tax money to the Exchequer. This week, five-month receipts were decided upon for precisely the same purpose, and the whole issue of £70 million was made in this form. The benefits of this arrangement of varying maturities will not, of course, become apparent until next year, but there is no doubt that the innovation is sensible. It should help perceptibly to reduce the disturbance caused in the money market at the foreseeable periods of pressure, and will eliminate in due course the inconvenient gaps in maturities such as occurred in the six-week period just ended. The only reason for regret is that the Treasury, when making one departure from the traditional plan, did not seize the opportunity to take another desirable step to prevent avoidable disturbance—by arranging the life of its floating debt in terms of weeks instead of calendar months, and thereby cutting out the large credit anomalies caused by the uneven lengths of months.

One other point about this week's TDR issue deserves to be noted. The issue exceeded the week's maturities by fully £10 million, so that the Treasury was a net borrower to that extent. This took some members of the money market by surprise, because of a mistaken belief that the credit in the ERP Special Account could, when the Americans gave the word, be used in effect to meet part of the Treasury's current demand for cash. The object lesson of this week's borrowing ought to prevent any recurrence of that particular fallacy. The reasons why it is a fallacy were fully set out in these columns last week.

Trade with Japan

Although the text of the Anglo-Japanese trade agreement has not yet been published in this country, certain details are trickling through from the Pacific. Japan will sell to the sterling area raw silk, cotton, rayon and wool textiles, industrial machinery, rolling stock, paperware and chemicals. In exchange, Japan will buy from the sterling area raw cotton, raw wool, raw jute, wool waste and rags, hides, skins, cereals, iron and other ores, gums, resins, crude rubber, salt, oilseeds and coconut oil. In fact, the sterling area is bartering raw materials against manufactures, and from a balance of payments standpoint this may appear to be unsound policy. But the raw materials in question are in relatively free supply, and, since Britain's productive capacity is limited, the purchase of lower quality manufactures to satisfy cheaper markets would enable British exporters to concentrate on the higher price markets. The raw materials will come largely from countries fairly near Japan, and Japanese manufactures will presumably be returned to these same areas. This means merely a resumption of the prewar trade pattern in the Far East.

The trade will be on a cash sterling basis; these monetary arrangements were discussed in a Note on July 31st. The total for the twelve months ending July, 1949, is expected to exceed £60 million; this would increase the trade between Japan and the sterling area to more than four times its present level. If Japan accumulates a surplus of sterling, it will be convertible into dollars at the discretion of SCAP. To prevent such a necessity, the trade position between the two countries will be kept under close review.

British Securities in Holland

Trading in Dutch certificates of British 4 per cent Funding Loan and 3½ per cent War Loan has recently been resumed on the Amsterdam Stock Exchange, without restoring prewar arbitrage facilities with London. Consequently these two securities are quoted in Holland at a discount of approximately 10 per cent, which arbitrage facilities would eliminate. A Dutchman wishing to dispose of his British holdings by sale in London may do so, but in return must accept blocked sterling; thus in effect the would-be seller is restricted to Dutch buyers and a new variety of security sterling is created at Fls. 9.70 to the £, compared with the official rate of Fls. 10.69.

Though more narrow, there is a market for Dutch securities in London. But the London discount on Dutch securities is much heavier than the Dutch discount in Holland on British securities. Netherlands Government 3-3½ per cent stock, 98 in Holland, can be bought for 62½ per cent in London. Here, too, no arbitrage facilities exist with Amsterdam. The heavier London discount indicates that free movement between the two capital markets would hardly suit this country at the moment; Dutchmen being evidently more willing to acquire Funding Loan than British investors are to buy Netherlands 3-3½ per cent. A Dutch proposal suggests as a way out of the present situation that Dutch owners of British securities wishing to sell their holdings in London, and British holders of Dutch securities desirous to sell in Holland, should be matched, each then to receive the full value in his own currency.

Proposals for Two Development Councils

The Board of Trade, faced with deadlock in its attempt to negotiate with the hosiery, pottery and footwear industries on the setting up of Development Councils, has turned its attention to two trades which present a more hopeful prospect from the Government point of view. Its proposals for Development Councils for furniture and jewellery were published on Thursday. The proposed council for furniture will have seven members "capable of representing" the employers in the industry, seven "capable of representing" the workers, and three independent members (one of whom will be chairman). It will be empowered to raise a levy on turnover not exceeding £25,000 a year to meet its expenses. The Board of Trade points out that no powers of compulsion will attach to the functions of the council; its aim will be "to assist and advise firms in the industry, and the success of its efforts will depend on their willing co-operation."

The Development Council for jewellery will have similar functions except that it will not be empowered to collect statistics—for which, as a smaller industry, it is apparently to rely on the Board of Trade. The council for jewellery is to have four employer members, four worker members and three independents, one of whom will be chairman. The trades concerned have been consulted in drawing up these proposals, and the employers' and workers' organisations in the furniture trade (at least) agreed in principle that a council should be established. But they still have until the end of September to submit their comments. This time the Board of Trade is reasonably confident about the agreement of the furniture industry. The response of the jewellers is still doubtful, as the various sections of the trade have not shown themselves to be entirely agreed among themselves. If all goes well, Mr Wilson will be able to place the orders for these trades before Parliament in the autumn. But if it does not, he may have to draw the conclusion that the opposition of industry to statutory bodies of this kind has become general.

Shorter Note

The latest increases in electricity charges, announced on Thursday by the British Electricity Authority, affects only a minority of electricity users: but the minority is geographically widely spread. In each of the fourteen areas of the country some users have been paying less than ¾d. a unit as their running charge. Their charge is now brought up to ¾d. a unit. Most of the users concerned are domestic users, since the increase does not apply to tariffs which include a coal-price adjustment clause—and such a clause is in most industrial tariffs. The increases are expected to bring in £2,000,000 in a full year. They are a further step in the process of standardising the electricity price structure; the majority of users will now be paying ¾d. a unit on two-part or similar tariffs. Those who are paying more than ¾d., however, get no relief. The Electricity Authority appears to be hopeful that (for the near future at least) further increases can be avoided.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Metal Industries; Wm. Cory; Seager Evans.

Statistical Summary

GOVERNMENT RETURNS

For the week ended August 14, 1948, total ordinary revenue was £96,892,000, against ordinary expenditure of £38,957,000 and issues to sinking funds £10,000. Thus, including sinking fund allocations of £4,333,000 the surplus accrued since April 1st is £301,797,948 against £270,846,533 for the corresponding period a year ago.

Unity in the West

ONCE again, "final talks" at the Kremlin have ended in the expectation of yet another bout of discussions, while in Berlin, Russian pressure on the Western sectors has been intensified by a series of kidnappings and border raids. There is no reason to suppose that the Russians, playing from what is tactically an immensely strong position, are particularly anxious to bring either the dragging talks in Moscow to an end or the deteriorating situation in Berlin to a head. But whether or not agreement is reached in the near future, the Berlin impasse has already had a dangerous and contorting effect upon Western diplomacy. It has centred its attention on a place and an issue which lie on the periphery of the Western World and has diverted the attention both of governments and peoples from what should be the real centre of interest, which is not Berlin but Brussels and Paris.

At no time during the last year has it been more urgent to press forward with the consolidation of Western Europe. If, under pressure of Russia and winter, the Allies have in the end to withdraw from Berlin, *their retreat will be saved from ignominy only if it can be interpreted as* a tactical straightening of the line and not the beginning of the end of all coherent resistance. If at the moment of withdrawal from Berlin, Western Europe were to be no more than a group of divided governments without common strategy or policy, the "retreat" would look like a retreat from all further opposition to Russia. The stigma of Munich would be removed only if a Western withdrawal were preceded by (or coincided with) the extension of the Western Union Defence Pact to the United States and the British Commonwealth, the reintroduction of lend-lease in armaments and the consolidation of the European base by further acts of political and economic union.

If, on the other hand, it is the Russians who finally abandon the contest in Berlin, a coincident strategic and political advance by the Western Powers in the shape of closer association would gain added significance since it would permit them to exploit to the full the diplomatic advantage which a raising of the blockade would confer on them.

There is a further reason why consolidation in the West is more urgent than ever before. Whatever the outcome of the Moscow talks, the Western Powers will shortly have a German state on their hands. It may for the time being include only two thirds of the German people, but it will nevertheless be a state not much smaller than the other major partners in Western Europe and its position will be strengthened by possession of the Ruhr. The French are already apprehensive at the likely impact of this new state upon the European community, and one of the arguments often advanced in favour of postponing the whole experiment of government in Frankfurt has been that it is unsafe to give Western Germany power and status until there is a stronger and more closely united European community in which it can be included and submerged. Today, the deadlock over Berlin—and its possibly unfavourable outcome—make the restoration of a more normal and hopeful political life in the Western zones a matter of the greatest urgency. But the only way in which the Germans' reasonable ambition can be satisfied and France's

equally legitimate fear exorcised is by pressing forward with the building up in Western Europe of a *bloc* of states, economically cohesive enough and politically strong enough to absorb Germany as one partner among many.

Undoubted progress has been made towards closer unity in the last nine months. At present it is being pursued officially by two different but overlapping groups of nations—by Britain, France and Benelux at Brussels with politics and strategy primarily in mind and by the Sixteen Nations at Paris in pursuit of economic aims. At the same time, outside the sphere of official policy, a movement in favour of general European unity has been gathering momentum. Its first important manifestation, the Hague Conference in the spring, was an unofficial gathering, but in the course of the summer both M. Schuman and M. Marie have pledged the French Government's support to the idea of summoning an Assembly for Europe. Nobody, however, appears to have thought out the relationship between the two official systems in Brussels and Paris and the possible harnessing to both of the growing popular enthusiasm for closer union. Britain, the largest partner at Brussels and Paris, is noticeably lukewarm to popular movements in favour of unity. The Brussels Pact Powers have not—in spite of pressure from the French—so far made themselves a spearhead for closer economic co-operation at Paris and indeed the presence there of nations such as Greece and Turkey, whose links with Western Europe would be better expressed by treaties and alliances than by efforts at closer union, must have an inhibiting effect. But in spite of this structural confusion, the Western Powers have in 1948 definitely advanced along the path.

But is the advance proving rapid enough to offset the gathering crisis over Berlin? It can quite properly be argued that any progress towards economic integration must necessarily be slow. There is a tendency, particularly in America, to look for more spectacular economic results from Paris than can be achieved in the short time during which the Sixteen have been working together. It is true that they have not contemplated structural changes, which might be drawn up more rapidly—at least on paper. Steps such as, for instance, the rationalisation of the European steel industry on a continental basis or the internationalisation of transport have not been discussed. But developments as sweeping as these are not strictly economic decisions at all. They are political decisions involving sacrifices of sovereignty and the OEEC has no authority to sponsor them. Economic integration can follow political—and strategic—unification. It is not a substitute for either.

Progress in the political and strategic fields should therefore go forward with all the greater energy and speed. In the first place, it is time that the peoples of the West received more specific information about the state of the Western Defence Pact. Conversations have been continuing ever since the signing of the pact in March, presumably with the aim of establishing a common General Staff, a proper division of function, the standardisation of equipment and the other pre-conditions of successful joint defence. The Americans have let it be known that they regard a serious effort of unification in Western Europe as an essential preliminary to their own full participation in the Pact and its transformation into an Atlantic alliance. But so far, all the outside world knows is that discussions are continuing. It may be that they are moving towards success and that the presence in Europe of senior American staff officers is a first step to American participation, but the Governments concerned must forgive public opinion for being sceptical. The only possible excuse for complete silence about progress in this field would be that there had been no progress. Half the value of the Defence Pact is that the Russians should realise that it is a serious effort and that the peoples of Western Europe should feel its reassuring effect. The total silence that has prevailed since March is calculated to make both friend and enemy conclude that, even in this vital sphere, a pooling of effort has proved impossible. This almost certainly false impression should be offset as soon as possible by a clear statement on the progress of the military talks.

A similar uncertainty hangs over the future of political co-operation. In this field, the signatories of the Brussels Pact are almost exactly where they were in March. Committees are discussing the fringe of national life—social security conventions, cultural co-operation—but there appears to be no machinery and little desire for the close regular political consultation which could draw together all the centrifugal activities of the Western Powers into a sustained and developing political strategy. The scene in Western Europe today is like that series of partial rehearsals of minor characters which often precedes the coming together of the principal actors in the full play. One can see that each discussion has some relation to the central drama, but until the chief actors begin their parts, the whole remains inconsequent and confused. A great many of the stage props have been assembled, but of the great play called Western Union there is still no sign.

*

The French have perhaps this central vacuum in mind in raising officially the proposal for a political assembly for Europe, drawn from the parliaments ready to participate—which means in practice the parliaments of Western Europe. This proposal seeks on the one hand to canalise the aspirations towards closer European unity made apparent by the Hague Conference. At the same time, it seeks to place the political keystone firmly in the European arch. M. Bidault gave notice of his Government's intention to take some such step at the last meeting of the signatories of the Brussels Pact. But at that time Mr Bevin and, after him, M. Spaak expressed the view that the matter should be left to the initiative of private societies. Now, however, M. Marie's government has raised the question of political unity in Western Europe with the specific proposal that the Governments should sponsor the convening of a European Assembly. The matter can no longer be referred to private societies. It lies squarely on Mr Bevin's desk.

It must be said at once that the French have raised this vital issue in a rather unwieldy and impracticable form. Among the various possible methods of expressing Western Europe's readiness to co-operate more closely, this is unfortunately one calculated to create a certain confusion and unlikely to achieve really concrete results. There are few bodies more impotent than official political assemblies who, nevertheless, have no powers and who represent intensely divergent opinions. (If delegations are to be chosen from parliaments on some proportional basis, they must include several Communist contingents.) One is forcibly reminded of that tragi-comic assembly whose centenary falls this year. The German constituent assembly which was convened in Frankfurt in 1848 bore altogether too close a resemblance to the Assembly proposed by the French. Then as now, a group of States had certain aspirations towards closer union. Then as now, the only solution which no one obstructed was a great assembly with political functions and no powers. Is it not all too likely that the outcome would be the same—the collapse of the Assembly under the weight of its own contradictions and ineffectiveness?

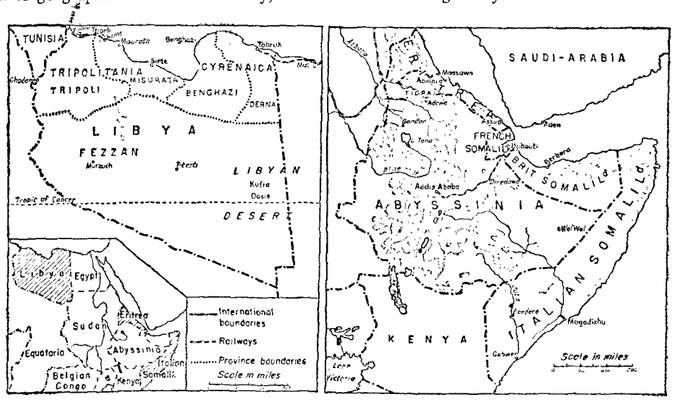
Yet Mr Bevin cannot reject the proposal out of hand, as he did at the former meeting of the Brussels signatories. The need for political consolidation in Western Europe is too great for the British Foreign Secretary to cast himself for a completely negative role. Already some blame attaches to Britain as a laggard in European affairs. Much of this blame is unfair, since it represents not so much Britain's own failures as the penalties attached to the position of leadership. All shortcomings from whatever source tend to get pinned upon the only Power influential enough to give impetus to the effort towards greater unity. It is also true, as Mr Attlee pointed out to Mr Churchill in the exchange of letters on the project of a European Assembly, that Britain must move in close step with the Dominions. But if in the sphere of close political and strategic co-operation—the sphere in which rapid and decisive results are much more easy to obtain than in the field of economics—the British response remains entirely negative, the criticisms of British policy will begin to carry more justification than they have hitherto.

Mr Bevin cannot, therefore, simply reject the French proposal. Yet it remains a faulty proposal. The only satisfactory way out of the dilemma is that Britain should formulate and propose a solution of its own designed to reinforce the political unity of Western Europe without putting chief reliance on the dubious and distracting method proposed by the French. A solution might be found in a proposal that the five Powers of the Brussels Pact should form a Prime Ministers' Conference which would meet at regular intervals, would be served by the secretariat which is beginning to grow up round the Pact and could, in appropriate fields, also use the machinery of co-operation set up under OEEC in Paris. Such a body would have authority and prestige. It would be compact enough to discuss the really vital issues and it would possess sufficient weight to carry its conclusions through the various parliaments. Only if a firm centre of political authority had been created would it be useful for some wider body, drawn from the Western parliaments, to meet annually rather in the manner of the General Assembly of the United Nations. Such an assembly would then have concrete issues to discuss and would be able to give the support of public opinion to the measures proposed by the Prime Ministers. Only in some such way could a large popular assembly be saved from futility.

There are undoubtedly other political expedients which might be explored. The chief point today, however, is to achieve the political and strategic consolidation of Western Europe with the least possible waste of time and effort. The Berlin crisis continues to weigh heavily on Western counsels. It is, in its turn, merely one symptom of the profound change in the European balance of power which has brought Russia to the Elbe. Old methods and traditional diplomacy are insufficient to meet this revolutionary change, but all the new efforts made so far remain tentative and confused. What is needed is a clear political lead. The French have thrust into Mr Bevin's hands the means of giving it.

Italy's Colonies

BEHIND locked doors in London the Foreign Ministers' deputies are "jointly" discussing—as instructed in the peace treaty with Italy—the "final disposal" of Italy's former colonies. Very sensibly, they have insisted upon discussion in private. For every conceivable solution is a bitter pill for someone. Even now, the wildest rumours are flying round Rome and Africa. Were these founded on fact, various excitable peoples would no doubt be plunging into premature demonstrations. But nothing final can be done by the present meeting; the deputies can merely hand their views upwards to their principals in the Council of Foreign Ministers. If these are not agreed by September 15, the whole question passes to the United Nations Assembly. Meantime, the territories tick over in a state of security, though not of prosperity, under an efficient but understaffed and unthanked British Military Administration.



Given the present state of Big Four relations, there is nothing startling in the discovery—to be made from the three reports of the Four Power Commission of Investigation now before the deputies—that the delegates are not agreed on what to do with the territories. The reports are full of square brackets enclosing dissident accounts of fact, as well as different interpretations of agreed facts. Comparison of one and another rendering at once reveals that, broadly speaking, the United States and Great Britain are at one in their estimations of the wishes of local inhabitants; that the Russians are everywhere anxious to read evidence in the light most favourable to Italy; and that the cardinal French concern is to keep the westward march of Arab independence at least one jump away from Tunisia. The reports also reveal, by implication, that at least four considerations are weighing in varying measure with the interested Powers. West European solidarity is one; all have an eye to the wooing of Italy. Strategy is another, particularly in Libya; no one wants to see a potential opponent add to its footholds on the Mediterranean shore. The wishes of the inhabitants are a third. Moral obligations are a fourth. Of these last there are two only: the famous British undertaking to the Senussi of Cyrenaica, originally voiced by Mr Eden in 1942, that they "will in no circumstances fall under Italian domination," and a less specific understanding that Ethiopia, having suffered so greatly at Italian hands, should get sympathetic treatment in the matter of compensation. Many rumours that the Emperor was given specific promise of territorial change have from time to time been started by his foreign sympathisers. They are all unfounded.

Of the three territories visited last winter by the Commission of Investigation, Somalia—the poorest—is not unnaturally the one over which it disagrees least. It ignored or buried the original British proposal for the lumping of all Somali lands into a single trusteeship. It considered ex-Italian Somaliland only. Its stay there was coloured by the riot in Mogadishu in

which the Somali Youth League, provoked to excess by local Italian hotheads, murdered many members of what was obviously its Italian black list. This affair seems profoundly to have impressed the inhabitants with the virtues of a quiet life. The words "peace and security" punctuated the evidence of witness after witness. The Commission found that a majority of the inhabitants want a trusteeship. It reports that the trustee preferred by most is Great Britain or the United States, but that many people expressed readiness to accept any reputable nominee of the Four Powers. It found no great objection to the Italians as trustees. (Indeed, many Somalis are ex-soldiers with claims to settle, and would welcome a chance to do so.) It found great antipathy to any suggestion of recognising Ethiopia's aspiration to run the territory. All told, there seems to be a chance that the local Italians, sobered by the evidence against them that emerged during the public inquiry into the riots, may before long find themselves turned into trustees.

If account is to be taken of the wishes of the inhabitants, Italy is less likely to get support for its claim to run Eritrea. Even the Russian investigator, consistently anxious though he was to show the Italians in a favourable light, could label as "pro-Italian" only 10.73 per cent of Eritrean witnesses. The main items of evidence about Eritrean wishes are that, in spite of the territory's lack of geographical or cultural unity, all its inhabitants are opposed to its division into two, and that a cleavage of views about its future coincides with the strongly-marked cultural, religious and linguistic line that marks off the highland triangle adjoining the Ethiopian border from the rest of the territory. This triangle is Christian by religion, speaks Tigrinya and is closely akin to the adjoining Tigrai province of Ethiopia. Its inhabitants wish for union with the Ethiopian empire. In Hamasien province, where the capital, Asmara, lies, 95 per cent of the witnesses heard were unionists. In the western provinces and on the coast round the port of Massawa, where the inhabitants are Moslem and speak either Tigre (which is not intelligible to Tigrinya-speakers) or Beja, a majority wishes for independence after a time of trusteeship. Here there is no definite preference for any one trustee; some favour four-power management, in ignorance of its disadvantages and difficulties. No one wants Ethiopia.

If, therefore, Ethiopia is to get the access to the sea that is its goal, the only port that no one will grudge to it is Assab, at the southern tip of the territory. This is poor by comparison with Massawa, and in a bad state of war damage. It is also, strangely, somewhat pro-Italian. This predilection of its very backward inhabitants no doubt helps to account for the investigators' curious remark—it qualifies all their statistics—that the bulk of the opinions uttered to them in Eritrea were "not mature or the result of independent thinking." They leave all the arbiters concerned in a fine quandary about what to decide. At least eighty per cent of the population want either an Italian trusteeship or an Ethiopian one, and both these cannot be satisfied, for neither wants the territory divided. If it remains undivided, a trusteeship is imperative. But who wants the incubus? There are only two candidates eager for the post—Italy, which is unwanted locally, and which in any case misused the territory for one of the flagrant aggressions that led to World War II; and Ethiopia, which could not do the job at the standard to which Eritreans have become accustomed, unless it were to receive foreign help. Since some part of local wishes has to go by the board, surely the best one to jettison is the desire for unity. For need this be the guiding principle in a territory the shape of which is, after all, but the accident of an annexation in the nineteenth century, and has neither racial nor economic foundation? The best way out of an awkward impasse would be a Solomon's judgment that awarded a trusteeship for the Christian Highlands and Assab to Ethiopia, and for the Moslem areas to Egypt or the Sudan.

Many Libyans, also, are against dissection of their territory on the ground that it would be better to become a big than a little Arab state. But their wishes are less likely to be humoured than are those of the Eritreans. For one thing, they are less unanimous. The Cyrenaicans want unity, but only on their own terms, which are that their leader, the Grand Senussi, should rule the whole. The Tripolitanians, who think the Cyrenaicans backward, do not want to see them predominant. The two provinces agree only in wanting independence and in not wanting Italy back. But the main factor militating against a united Libya is the divergence of the Great Powers' wishes. And these, at a point strategically so important, are likely to carry the day. For Libya holds a commanding position in the Eastern Mediterranean. Its ports, of which potentially the best is Tobruk, cannot compare in strategic value with Haifa, or with Egypt's splendid harbours, because they lack water, as well as easy access to fuel and a local labour supply. But Libya is well placed in relation to the Mediterranean narrows, and its airfields are the best available flying route from West to Middle East, offering better weather than their European counterparts for at least half the year. The British caretakers have unhesitatingly used the two northern provinces as a parking place for troops and stores evacuated from Palestine. The Americans, too, have equipped Mellaha airfield, in Tripolitania, as a major stopping place on their supply line to Greece and Turkey. Farther south the French, who conquered the Fezzan province with their army from Chad in 1942-3, have since been running it as their own. A combination of all these ownerships therefore points to a partition. France wants the Fezzan and no one else does. Great Britain is adamant about its promise to the Senussi. Only Russia wants unity, under Italian trusteeship. Three trusteeships are indicated. If France and Britain get the two first, are Tripolitanian wishes to be flouted in favour of placating Italy with the third, or would the United States insert its comfortable bulk into the picture?

When the final decision comes to be taken, some other foreign views must be weighed, in particular those of the remaining neighbours, which are Egypt and Ethiopia, and of the British Dominions. Ethiopia claims the whole of Eritrea and would like Somalia too. Egypt's view is that northern Eritrea is a "natural extension of the Eastern Sudan" and that Libya, if it is to be endowed with a trustee, should be given in tutelage to some member of the Arab League. Its sager thinkers would not object to a British trusteeship for Cyrenaica, for they would like to think, in the present unsettled state of the world, that British troops who are due to leave Egypt would not be too far away. South Africa advocates the establishment of an Italian trusteeship for Somalia and Eritrea, French trusteeship for the Fezzan and British trusteeship for Cyrenaica and Tripolitania. However, if Britain were not chosen as trustee, Italy would be South Africa's second choice. Australia's view is that Somalia must be a trusteeship; that if Eritrea is not divided "Ethiopia should clearly be considered as a possible trustee power"; and that if it is decided to divide Libya, the separate territories should also be under trust. Canada would support the appointment of Italy as trustee for Somalia and, in Eritrea, union of the Highlands with Ethiopia with, elsewhere, a trusteeship providing Ethiopia with free zones at Massawa and Assab. Britain would be its choice as trustee for Libya. New Zealand agrees with this last proviso. Only Russia—supported by the Poles, Czechs and Jugoslavs—favours throughout a restitution to Italy of control in Africa.

The most serious aspect of the intricate problem just ahead is the proviso that, if the Big Four do not agree, the matter shall go to the Assembly. For, except possibly over Somalia, Big Four agreement is out of the question because of Russian insensitiveness to African views. In Africa, more perhaps than in any other continent, a clear cut decision is imperative if common men are not to suffer. Yet experience over Palestine suggests that the Assembly is not good at giving firm or clear verdicts. It is plainly impossible to go back upon the Peace Treaty. An Assembly debate, whatever its repercussions upon unwitting Africans, seems inevitable. How can its hearers be made to weigh the situation upon its African merits?

The East African campaign is seven years old. It is five years since the last fighting in Libya. Even so, the nations that spent themselves at Keren and Alamein and Knightsbridge surely retain a right to speak first. The Assembly should listen to them carefully. They are in the main agreed that African interests must be the paramount factor in the settlement. But if this principle does not carry the day, they have another argument up their sleeve. Unsatisfactory though it may be to introduce into a United Nations debate an element of *tu quoque*, they are, if needs must, in a position to point out to the Russians that, if the West had no say upon the Danube, the Eastern Powers need not expect one in Africa.

The Railway King

A CENTURY ago the Railway King, George Hudson, was at the peak of his power and glory. Of the 5,000 odd miles of railway then existing in the United Kingdom, Hudson controlled 1,450. He was chairman of four companies, the Midland, the York and North Midland, the York, Newcastle and Berwick and the Eastern Counties Line. Hostile newspapers asked how he could properly attend to his Parliamentary duties while "superintending the practical working of half a dozen lines separated a hundred miles or more from each other." But as the files of *The Economist* for 1848 show, it was in this high summer of Hudson's pride that his kingdom began to crumble and his courtiers to desert him. He was unable to attend the funeral of his hero George Stephenson that August because he was defending himself at the half-yearly meeting of the Midland Railway. Railway stocks fell sharply throughout 1848. Revolution had swept Europe, and Britain suffered from dislocation of trade and general uncertainty. To avert disaster, Hudson exerted all the power of his personality, exploited the prestige of his immense earlier successes and engaged in astonishing virtuoso performances in company finance. But all occasions informed against him. His credit was gone. By a series of valiant rearguard actions, Hudson covered his retreat through 1849, and even made an heroic counter-offensive in 1850 when he opened the Sunderland docks, but not all his Yorkshire tenacity and shrewd wits could save him. He, the most resplendent of all Victorian tycoons, was finally ruined and driven into exile. Yet before he died, he was able to point to the prosperity of ventures which had involved him in disaster.

Ceremonies have recently taken place in honour of Hudson's friend, George Stephenson. It would be an act of elementary justice if our nationalised British Railways acknowledged Hudson, too, as a pioneer with a vision of uncommon penetration. In contrast to the get-rich-quick speculators of that age, Hudson comprehended the relationship of the railway system to the country as a whole, to its trade and industry, and to its future growth. What makes this crook of genius so interesting to us today are his ideas of grouping and unification of transport.

It was Hudson's misfortune to be, like the Duke of Wellington, "much exposed to authors." Macaulay fancifully pictured him as a combination of Mammon and Belial. Through the smoke and fury of Carlyle's *Latter Day Pamphlets*, Hudson appears as a colossal idol, a Victorian Calf of Gold before which a money-mad generation abased itself. To the cooler judgment of Mr Gladstone, a judgment given after Hudson's fall, he was "no mere speculator, but a projector of great discernment, courage and rich enterprise . . . a very bold, and not at all an unwise projector." The rapid expansion of the Early Victorian lines had been stimulated by two speculative booms, the minor one of 1836 and the great Railway Mania of 1845-46. The railways, like Stephen Leacock's horseman, began galloping madly off in all directions. Little lines and big lines were projected—what did it matter where they ran, who wanted them, what purpose they served? Any kind of railway was a triumph for Progress, and Progress was the god of the age. Hudson wanted to secure a regulated development of traffic between the industrial North and Midlands and the rural South. He sought to impose order upon anarchy. He was, in modern language, a rationaliser. Naturally he was denounced as a monopolist. He was pictured as an octopus reaching out to grasp all lines and unite them in Hudsonia. It is worth recalling that Government ownership of the railways was a lively issue a century ago. Gladstone's Act of 1844 included a clause making any new line liable to state purchase or control after a period of 21 years, provided it had yielded a dividend of ten per cent for three successive years. The answers Hudson gave to the Select Committee of 1844 showed a remarkable understanding of the part the railways should be expected to play in the development of Britain, and the subsequent grouping of the lines has taken place very much as Hudson forecast. Like latter day capitalists, one suspects he would not have been averse from Government control if he could have been the chief amalgamator.

John Leech drew Hudson for *Punch* as a locomotive with a moon face and a spiky crown. He was, indeed, the Railway Age incarnate. He summed up in himself its vaulting ambitions, its tearing energy, its ruthless enterprise, its unquenchable optimism about the future. And, like all the great Victorians, whether politicians, poets or tycoons, Hudson believed in his Divine mission. He spoke of "the great moral effect of railways on the human race." That he could say this while he was cooking the accounts of his companies by no

means implies that he was a hypocrite. Hudson always believed that noble ends justified romantic book-keeping, and the company law was in a primitive state in his period.

Hudson's energy was fabulous. He sat for years as Conservative MP for Sunderland, and, incidentally, rewarded the loyalty of his constituents by building them fine docks—out of his railway stockholders' money. He developed the seaside town of Whitby, and, after his disgrace, Whitby never faltered in its fidelity to its benefactor. When he was an old, broken man fleeing from his creditors, Whitby would have made him its MP if the Liberals had not unsportingly incited the Sheriff's officer to pop him into York prison on a writ of attachment on the eve of the election. Uneducated, uncouth in manners, and with that explosive Yorkshire bluntness of speech which usually alarms the southron, Hudson came to be adulated by half Debrett. Rank and fashion swarmed at his grand mansion at Albert Gate, they laughed at his solecisms, they quizzed Mrs Hudson's gowns, they ate his magnificent dinners, and they reverently attended his lightest whisper on investments. After the Conservative Party was broken in two by Peel's conversion to Corn Law repeal, Lord George Bentinck, the leader of the Country party, invited Hudson to a seat beside him on the front bench. Disraeli and Hudson, the alien popinjay and the former Yorkshire linen-draper—what a striking combination to lead the forlorn hopes of the gentlemen of England.

Hudson is almost as significant a figure in the social history of Britain as in its industrial development. His triumphs in the forties represented the final capitulation of the aristocracy to big business. Frederick Williams, the Victorian railway historian, quotes the account of King Hudson's appearance at the reception given to the Royal Society in 1846 by the Marquis of Northampton at his house in Carlton Terrace. A wonderful pageant of the age was there presented.

> England's greatest painters, greatest authors, greatest sculptors, greatest inventors, greatest philanthropists, greatest statesmen, greatest physicians, greatest engineers, greatest captains jostled each other in the crowded rooms. Amid the constellation of celebrities, there were two men round whom the crowds circled, let them turn which way they would—bright particular stars each with revolving satellites, and both receiving the deference of the great and noble as their right. One was the late Prince Consort, the other was Geo. Hudson. They looked rival monarchs, each with his obsequious courtiers round him, and divided pretty equally the honours of the evening.

The supreme moment came when a buzz ran round the room—"His Royal Highness has asked to be introduced to Mr Hudson." Before such a dazzling conjunction, the illustrious assembly lowered their heads. Within the circle drawn by the gentlemen-in-waiting, the two Great Personages conversed. Then on a sudden, all that was eminent in the arts and sciences, in statecraft and in war, was astonished to hear a burst of laughter coming from the Prince Consort's lips. Albert the Good seldom laughed. And this was a hearty Teutonic roar. What could have amused him so? The Prince, insatiably curious about science and invention, had asked Hudson what he thought of atmospheric railways (the method of propelling trains by air pressure, which fascinated Brunel and other eminent engineers)—would they replace steam locomotion? Then came the answer which set the Prince in a roar—"It's all 'oombug, your Royal 'Ighness." (It was while visiting another Marquis, Westminster, that Mrs. Hudson, being shown a bust of Marcus Aurelius, enquired: "It ain't the present Markis, is it?")

One pictures Hudson at the end of his days, ruined, discredited, living on the kindness of friends, but still sanguine, still believing in his own vision of railway amalgamation, and, as Williams recounts, saying to a young visitor:

> Sydney Smith, sir, the Reverend Sydney Smith, the great wit, first called me the Railway King. And I remember very well that he made a very pretty speech about it, saying that while some monarchs had won their title to fame by bloodshed, and by the misery they inflicted on their fellow creatures, I had come to my throne by my own peaceful exertions, and by a course of probity and enterprise.

Probity is hardly the word we should use nowadays for the chairman who so sedulously paid dividends out of capital. But as for enterprise, he was the embodiment of it. For many years it has been the fashion to regard such characters as Hudson as pirates and freebooters, whose activities run counter to the social purposes of a civilised society. Nowadays we are beginning to perceive their virtues as well as their crimes. This bold "projector of rich enterprise" certainly advanced the interests of the community while pursuing his own, and in so doing fulfilled Adam Smith's classic conception of a great citizen.

NOTES OF THE WEEK

TUC Account Rendered

The General Council's report to the TUC, which will form the backbone of the forthcoming Margate conference, is mainly remarkable for its length and breadth. Whether it be in the sphere of economic, industrial or even international policy, the TUC has had a finger in every pie during the past year, acting either under the instructions of the 1947 Congress, or on its own initiative. The report tends, in consequence, to be a catalogue of committees and conferences—impressive as a testimonial to the activity of the TUC in national affairs, but not fertile in guidance about future policy.

Since the report is mainly historical, it does not touch the burning question of future policy on wages, prices and profits, and no further discussion can be expected until the Economic Committee has presented its supplementary report to Congress. But it is worth noting that Sir Stafford Cripps told a TUC deputation in April that he believed the level of subsidy of £400 million would be effective in keeping prices stable, in view of the fall in world prices which was expected to follow this year's harvests. He added that, if necessary, he would agree to a temporary increase in the rate. This is a matter which should have been discussed in Parliament and not with a private body.

The most important section of the report deals with the administration of nationalised industries, undoubtedly one of the most controversial topics that will be discussed at Margate. Resisting the possibly more attractive vistas of "workers' control" and "joint management," the TUC firmly adheres to its view, first outlined in 1944, that trade unionists should serve on public boards as individuals, and not as representatives of their union. As the report points out, the unions ought not to lose their independence of action by becoming identified with the machinery of nationalisation, and a trade unionist dually responsible to his union and to the public would be in a hopeless position. It is however surprising, in view of the outcry that greeted the expression of a similar opinion by Sir Stafford Cripps, to find the TUC admitting that a man who is well qualified as a trade union leader may not necessarily have the best qualifications for filling a big executive post in industry.

The General Council, however, is critical of certain aspects of nationalisation. It is concerned at the lack of consultation over certain appointments and at the situation of part-time trade union members, who tend to be treated rather as "labour advisers" than as responsible for policy decisions. The TUC's own remedy to the problem of workers' participation is increased training and education, and for gradual development of responsibilities, through such bodies as Development Councils at the top and joint production committees in the factory.

It is disappointing that so little attention is paid to reforms of the TUC's own machinery, which is still in need of modernisation and overhaul. Little has been done to follow up the promising lines of action envisaged in the 1944 report on the structure of the trade union movement. The whole question of union organisation, the position of the small union and the interests of sectional groups within the big unions, is of immediate moment. It came up sharply in the recent London dock strike and emerged again last week, when railway catering staffs complained that they were not adequately represented in the National Union of Railwaymen, which seemed (they said) to concern itself mainly with ticket collectors and porters. The General Council cannot for ever sit back and say that this is a matter where each union must work out its own salvation.

The Austin Strike

The strike at the Austin motor works in Birmingham fortunately came to an end after four days on Tuesday, and negotiations between the two sides have been opened. The effects of the dispute were more serious than just the loss of production, which has been estimated at about 1,500 vehicles, since it raises the wider issue of the manner and method of introducing technical improvements.

The men's case, set out in a statement by the shop stewards, was that the firm installed a six-spindle gear cutter, and set a piecework price based on a demonstrator's timing, which would have meant a reduction of from 25s. to 30s. a week in the earnings of some operators. This machine does the work of two or three semi-manual gear cutters and is capable of a maximum of 400 operations a day compared with the 160 of the old machine. The shop stewards' case that they were in favour of increased production through improved technique as long as it did not affect earnings appears to be supported by the fact that the new rate seems to have been fixed at an unduly low figure. It is clear, however, that the old fear of a "speed-up" throughout the works was behind their objections.

The men's complaint seems to have some justification, though in the absence of any statement from the company it is impossible accurately to judge the merits of the case. Where the shop stewards put themselves completely in the wrong was in calling out the entire factory over a dispute which immediately involved only two men, and in failing to invoke the regular negotiating machinery. The situation seems to have been exacerbated by the failure of the management to explain the situation to their workpeople with due care and forethought, and to have shown a failure in elementary works relations, which assumes its greatest importance in questions of rate fixing.

In and Around Berlin

It becomes increasingly clear that nothing can emerge from the Moscow conversations which will not prove in the long run a gain to the Russians. Whereas the Western envoys are concentrating on the task of making it possible for their garrisons and officials to stay in Berlin, the Russians are concentrating on the task of making their position there untenable. On one side it is the air lift that supplements the diplomatic effort; on the other side it is financial, administrative, and economic action—in fact cold war—directed at the Germans of the western sectors. What happens in Berlin itself is a surer guide to Russian intentions towards the West than any appearance that Mr Stalin is more genial and reasonable than Mr Molotov.

Another letter has been added to the writing on the wall by the Soviet authorities' decision to postpone for a year elections in their zone. At the elections two years ago the Socialist Unity Party (SED) won roughly 50 per cent of the votes. Then it was not clear to Germans as it is now that the Party represented exclusively the Russian and Communist interest. It had still to accept the Oder-Neisse frontier with Poland, the delay in the return of German prisoners of war, a detailed plan of economic exploitation through reparations, and the gradual elimination of all political opposition. If properly conducted elections had been held next week—as intended—the Socialist Unity Party might have seen its vote drop from 50 to 20 per cent. And one of the factors in this defeat would have been the loophole to the West which Berlin provides; British and American controlled newspapers would have commented on the elections, full information about the real sentiments of the Eastern zone would have reached other zones, and the SED would have risked a resounding blow to its prestige at a time when it is Communist policy to secure Berlin as the key-point in an area designed eventually to provide the nucleus of a united Germany.

The next year may mean the end of open opposition in the Eastern zone. Germans who wish to maintain political activity may be forced into the parties prepared for them—the National Democrats and the Farmers' Party. These will nominally maintain a separate existence from the SED while doing nothing to limit its supremacy. This political development should help to convince hesitant opinion that the reuniting of the Eastern zone with the Western zones in the immediate future is as impracticable in fact as it is undesirable from the Russian point of view. It would be better to stop talking about the unification of Germany.

* * *

No French Elections

The French Assembly has voted to postpone the autumn elections in the Departments, and this fact may make smoother the path of M. Marie's coalition. The Government is committed to sweeping action in the economic field to put a stop to the new round of inflation which, since the spring, has wiped out all the advantages of devaluation and now threatens to bring on a new wave of labour dispures. But the Socialist members of the Government team have been so perturbed at the effect a deflationary policy would have on their wavering working class supporters that they brought down the last coalition and might well have proved an utterly unstable element in the new. Now, however, electoral fever can abate a little, and M. Reynaud has taken the further precaution of postponing all action until after the adjournment of the Assembly in the first week of September.

Even so, it seems certain that M. Reynaud's fiscal and financial programme will prove a bitter pill for the Socialists to swallow. He has not announced it in detail and, in his broadcast appeals, he has mentioned little more than the necessity for France to work harder and produce and export more cheaply. But, without proof to the contrary, most men of the Left assume that the appeal presages longer hours and lower wages coupled with an attempt—by cutting state expenditure and "creating confidence"—to tempt the middle classes back to the way of thrift. At the same time, M. Reynaud's promise that farmers would receive higher prices has been interpreted as a threat to the price of bread and milk. The non-Communist unions have already given vent to their suspicions by breaking off negotiations on the stabilisation of wages on which they were engaged with the Government. The truce from elections is also felt by some to be likely to encourage the Communists in new efforts to foment strikes and unrest. With or without the Assembly, M. Reynaud seems to be heading for the usual trouble.

* * *

Land Under Cultivation

The Ministry of Agriculture's returns of acreage for England and Wales at June 4th show no startling advances towards the 1951-52 goal of a 20 per cent increase in production over last year's output. But at least they give evidence that the farmers are responding to the Government's appeal, and that a decided increase in acreage has occurred with 36,000 less workers than in 1947. This decline in the labour force is mainly attributable to the repatriation of prisoners of war, although 11,000 of them are still employed in agriculture.

The total area of arable and grass land (excluding rough grazings) is now 24,372,000 acres, an increase of 45,000 acres since last year and only 215,000 acres below the 1941 war-time peak. Permanent grass accounts for 10,265,000 acres, and of the arable land 3,456,000 acres are under temporary grass and over 75 per cent (10,651,000 acres) is tillage. Grain crops make up 64 per cent of the area of tillage, which shows an increase of 263,000 acres on last year's figure. Although all the grain crops have an increased acreage, wheat, at its new level of 2,188,000 acres, was 152,000 acres short of its official target. The increase in barley and wheat acreage will not be viewed without misgiving by some farming experts. The ominously-named disease of "take-all," which attacks these crops as a result of over-cropping, appears to be gaining ground, and a change in the cropping policy may be necessary to restrict the disease.

Both potatoes and sugar-beet exceeded the official targets, and with 1,116,000 acres of potatoes, as against 941,000 acres last year, there should be no fear of a return to rationing this winter. (Potatoes account for over 10 per cent of the tillage acreage.) Linseed, on the other hand, at 86,000 acres was well below the target of 155,000 acres. Despite the heavy subsidy, this is not a

popular crop with farmers, and considerable effort will be needed to reach the 1951-52 target of 400,000 acres.

Peas for stock-feeding increased by 22 per cent to 44,000 acres, but it is doubtful whether the crop will justify the acreage involved because of adverse weather. Beans, turnips and swedes, also for stock-feeding, decreased by 47,000 acres. The most striking decrease was, not unnaturally, in bare fallow, which, at 237,000 acres, was only 48 per cent of last year's acreage.

The true value of the general increase in acreage can only become apparent when the harvest has been completed. A detailed estimate of losses caused by bad weather is not possible at this stage, but present indications are that no disaster has occurred, except in the Borders. Yields should be reasonable despite the ravages of the weather, but the difficulty of harvesting laid crops will put a strain on the labour resources of the farmers.

At a time when every effort is needed to make full use of the land under cultivation, it is pertinent to ask whether enough is being done to employ crop by-products to the fullest advantage. Waste in this direction cannot be afforded just now.

The Dean is Aggrieved

In this country we are so accustomed to regard the Dean of Canterbury with the indulgent affection proper to an ecclesiastical oddity in a cathedral city that it is hard for us to appreciate that abroad he sometimes appears as an alarming, and even sinister, figure. When, not long ago, he innocently declared in the capital of Soviet Armenia that the Soviet Union ought to annex a few thousand square miles of Turkish territory, there was a flurry in Ankara, and Turkish officials solemnly argued that, as the Church of England was "by law established" and specially associated with the state, the Dean must be speaking as a mouthpiece of the British Government, which could only mean that perfidious Albion was preparing to "do a Yalta" on Turkey. Even in the United States misunderstandings are possible; few Americans realise that Anglicans are just common or garden Episcopalians, and the Dean of Canterbury is frequently confused with the Archbishop.

The Dean, however, is fond of travelling abroad, and he likes to receive a warm welcome wherever he goes. The American-Soviet Friendship Society had prepared for him an extensive speaking tour in the United States, to culminate in a grand demonstration in Madison Square Gardens, New York, so that he could add his eloquence and respectability to the Society's campaign of denunciation of American foreign policy. But he has been refused a visa to enter the United States, because the Society is listed as a subversive organisation. The Dean's feelings have been greatly hurt by this obstruction. "We always give Americans a cordial welcome to Canterbury Cathedral," he complained to reporters, "but the Dean of the Cathedral is not to be welcomed in the United States. On the other hand, Eastern Europe has opened its arms wide. I fly to-morrow to the Congress of Intellectuals in Defence of Peace at Wroclaw in Poland. . . . I hope to go [to America] when this has blown over and when Mr Wallace is President, as I think he is sure to be within three years."

As Mr Wallace, if not elected President this year, will not constitutionally have another chance until 1952, the Dean's dark saying about his being in the White House in three years may well alarm American russophobes; perhaps Canterbury has advance information of an intended *coup d'etat* in Washington? Meanwhile there is a danger that, despite his Christian charity, the Dean's hospitality to American visitors may lose something of its customary warmth. There appears, however, to be an easy way out of this unhappy situation. It is to form in Moscow an American-Soviet Friendship Society highly critical of the policies of Mr Stalin, and to persuade it to arrange a speaking tour in Russia for Dean Inge. If only Dr Hewlett Johnson would get a Soviet visa for the White Dean to cultivate friendship in the East, the authorities in Washington could hardly continue to bar the Red Dean from the shores of America.

* * *

The Select Committee at the House Party

After all the publicity that was given to the Civil Service Selection Board at the end of May, the report of the Select Committee on Estimates on its activities contains few surprises. In spite of some ill-informed attacks made on the Board during a debate in the House of Lords, the general conclusion on its work was then, and is now, that it is an experiment which is well worth trying, but that it is experimental and its results—the candidates thus selected—should be carefully followed up before it is decided to make it permanent. So far, the follow-up suggests that the Board's methods of selecting candidates are superior to the prewar method of examination and single interview; of the first 147 candidates selected 97 have been subsequently rated as outstanding or very good and only two as poor and not likely to rise above the rank of Principal, whereas over the last forty odd years as many as 13½ per cent of the candidates failed to rise above that rank. But, as the Select Committee points out, the Selection Board's first candidates came from an older, maturer and more experienced group than is normal.

Even if it is granted that the Board's work is valuable enough to justify its continuance, there is still the question of how it can operate economically. The total cost of maintaining it in the present year is estimated at £26,000, of which about £8,000 is for the domestic staff and upkeep of the Manor House, Stoke D'Abernon, where its tests are held. This £8,000 seems unnecessarily costly, and the Select Committee is right in recommending a less elaborate background. But it is more difficult to suggest means of keeping the Board fully occupied once the reconstruction competition ends and the number of candidates presenting themselves for testing falls. Candidates for the Foreign Service, all of whom will be required to take the tests, and the 25 per cent of the Home Civil Service candidates who will be required to, will provide the Board with work for only three or four months of the year. It will be hard to find good enough people to staff the Board on this basis, and if they are not good enough and its standard of accuracy consequently falls, it will not be worth its cost. The outcome of the discussions with the Federation of British Industries on the possibility of using the Board for testing candidates for industrial posts on an agency basis will be awaited with interest.

Troubles Around Tito

During the last two weeks there have been several signs of disaffection in Jugoslavia. The "Republican" (regional) governments of Montenegro and Bosnia have been reshuffled; the Jugoslav Ambassadors in Bucharest and Teheran have declared for the Cominform and resigned their posts, and the former Chief of General Staff, General Arso Jovanovic, has been shot while trying to cross illegally the Rumanian frontier.

Whether or not the curious movements in Belgrade of Vyshinsky and of Mrs Pauker (Rumania's Foreign Minister and delegate to the Danube Conference) were connected with Jovanovic's flight, there is little doubt that the subversive machinery of Cominform and MVD are working at full steam within Jugoslavia, but the results of their efforts are not yet clearly visible. Montenegro is a sparsely populated outlying province. It has, it is true, a sea coast and a common frontier with recalcitrant Albania. But its land and sea communications are so few and primitive as to deny it any real strategic significance. It is not, as it is sometimes depicted, the stronghold of the truest Communism. Montenegrins are, above all, unruly individualists: they are to Jugoslavia what the Scottish clans were to 18th century England. Montenegro has a long tradition of uncritical Russophile feeling. Before 1914 its national outlook was summed up in the notorious phrase, "We and the Russians are 150 millions" (Montenegro's share then being 200,000). It is this tradition which accounts for the loyalty of some Montenegrin Communists to the Cominform. But Communists are a minority in Montenegro, which is of little importance to the rest of Jugoslavia.

General Jovanovic was a tough, brave, ambitious and boorish Montenegrin, who distinguished himself during the war by insulting British liaison officers and prostrating himself before the great Russian ally. Relieved of his position as Chief of Staff at the end of 1945, he could add personal rancour to ideological indignation as motives for his alleged treason to Tito. But the Jugoslav Army of 1948 is not the same as the insurgent force of 1941-2. The younger generals and colonels are mostly Tito's devoted men. This is still more true of Rankovic's police force, which (like SS and MVD troops) is the favourite child of the leaders.

Nevertheless, Tito's position is increasingly difficult. Blood has flowed. The Soviet Government has its excuses for action if it wants them. "Restoration of order" and "liberation of a friendly people from tyranny" have been used before to justify invasion by Great Powers in the Danube Basin.

*

Tito is at present conducting political war on two fronts. On the one side are the Politbureau of the Soviet Union, the Cominform and the hard-steel Stalinists of all lands, including Jugoslavia. The latter, if joined by the careerists, so numerous in Jugoslavia's bureaucracy, can provide a considerable Fifth Column. And the careerists will join if they see Tito waver or if apparently overwhelming Soviet force is brought into play. On the other side are the discontented people of Jugoslavia, who do not want any Communism, orthodox or heretical. No one knows their exact numbers; but they include the Churches, the old-style Nationalists, the exploited professional class and millions of peasants; the villagers, even if the townsfolk think they are doing too well, and the Cominform says they are pampered, are themselves convinced that they have good reason to grumble.

If there should be a Russian invasion of Jugoslavia—and at the moment there is no evidence of such a possibility—the plains and cities would be occupied as in 1941, with or without serious resistance, and once more the people would fight in the hills. But the people would be fighting not for Tito, but for Jugoslavia (or perhaps for Serbia and for Croatia and for Slovenia), not for "heretical Communism" against "Stalinist Communism," but for political, social and national freedom.

Inquisition in Czech Industry

The course of nationalisation in Czechoslovakia's industries is evidently not running as smoothly as was expected. Until the *coup* of last February, the Communist leaders not only refused to allow the dismissal of incompetent Communist managers of nationalised enterprises, but actually reinstated several who had been dismissed without their approval; now they have at last realised that it is essential to appoint managers who know their job and not those whose only qualification is their political orthodoxy.

A report from our Prague correspondent gives several examples of the managerial purge now being carried out throughout Czechoslovakia. The head of the nationalised textile industry has been dismissed in favour of the manager of the Bata works at Zlin, who is also a Communist but has more industrial experience. The manager of a big nationalised linen factory in Moravia and the deputy manager of a nationalised wool factory in Slovakia have been dismissed, and the manager of an important lead ore mine and the deputy manager of the Stalin Works at Most have been allowed to resign. It also appears that there has been an almost clean sweep of the upper hierarchy of the nationalised chemical industry, although according to the statistics of the Two-Year Plan the industry is exactly fulfilling its targets.

The inquisition into Czech industry has not stopped short at the managers, and the efforts of the workers have received more blame than praise. It is true that Mr Zapotocky, the Prime Minister, recently spoke of the "miracles of production" being achieved by a "united working people." But he did not specify what the miracles were, and the output per head is, in fact, still 12 per cent below prewar. Moreover, the quality of what is produced often leaves much to be desired. *Rude Pravo*, the Communist daily, recently complained that the nationalised Tito works had sent 16,780 foundry products to the nationalised Praga factory during a specified period and that 10,347 had to be returned as useless. The URO, the Trade Union Council, has found it necessary to reintroduce a six-day working week, because of the disastrous effect on production of the five-day week, and Mr Zapotocky has complained in no uncertain terms of the amount of absenteeism.

The Czech worker is in fact becoming thoroughly disillusioned. His outlook on life has not changed in spite of the change-over from private to nationalised enterprise. He still judges the new system by the extent to which it secures to him his comforts, his leisure, and his freedom. But while he has lost his strike weapon and his power of collective bargaining, his new employers are rapidly becoming indistinguishable from the old. For the outlook of the workers has not. Their first care is no longer to champion the workers, but to get results. Mr Zapotocky has indicated that he no longer regards himself as head of the working class, but as leader of the whole nation. But when he tries to help the whole nation he must often offend the workers whose leader he used to be, and whose organised voices put him where he is. Conversely, when he remembers his position as head of the trade unions he must frequently offend the rest of the nation. The result is that the new regime is already very unpopular; but for all that its grip on the nation is complete.

London Airport

The report of the Select Committee on Estimates upon the progress of construction at London Airport illustrates how very difficult it is, having decided upon the necessity of reducing capital expenditure, to apply the cuts in detail. The aerodrome at Heathrow, originally acquired for, but never used as, an RAF base, has a development plan which was originally intended to be complete by 1953. The first stage was to finish the runways and temporary buildings, the second to develop maximum traffic on six runways, and the third was to divert the main London-Bath road to the north and to complete a nine-runway airport with permanent terminal buildings in the middle reached by a tunnel. At the moment the first stage is nearing completion and the second has begun. The successive contracts to complete the ground work to the end of the second stage were awarded to Messrs Wimpey because on examination it was found that they were the only firm with sufficient resources to complete the job, although they had not submitted the lowest tender.

The effect of the cuts in capital expenditure has been to reduce by about 25 per cent the amount being spent this year, and to reduce by anything up to one-half the amount being spent over the next four years on the development of hangars and buildings. It also postpones the time when the air corporation can establish their maintenance bases at Heathrow, which in the case of the British Overseas Airways Corporation would effect a saving of £900,000 annually, more than half of it in reduced engineering overheads. Finally, the contractors have been forced to reduce their labour force from 2,000 men to 500. The men, mostly Irish, are housed in a special camp and are quite unwilling to take other work, and if no construction jobs are forthcoming will depart to Ireland. Consequently the Select Committee recommend that the cuts in expenditure be revised to allow concentrated work on the second stage, including the necessary developments to permit the Corporation to establish their maintenance bases there.

Apart from such faraway projects as the Severn Bridge, every project involving capital expenditure can present a convincing case for not being pruned. In view of potential saving in the cost of operating the airlines (and not on the grounds of losing some Irish labourers who will always be attracted here if work exists for them) the development of London Airport probably has as good a case as any. But it would be quite wrong if the rule were to be relaxed in this instance and without reference to the overall demands for capital expenditure, simply because the scheme happens to have come within the purview, and to have

IT has been said that there are three kinds of intelligence:

INTELLIGENCE, HUMAN
INTELLIGENCE, ANIMAL
INTELLIGENCE, MILITARY

The Economist Intelligence Unit, however, is concerned with a fourth category: INTELLIGENCE, ECONOMIC. Our specialist staff of research workers and statisticians can provide information on industries, agriculture, commodities, banking, finance and commerce, at home and abroad. If you will send us details of your needs, we shall be glad to put our services at your disposal.

Dock Discipline

Mr Arthur Deakin was perhaps wise not to turn last week's dockers' delegate conference into a post-mortem on the London dock strike. It might, however, have been instructive if he had. There are several rumours in circulation about the nature of the backing that the strike leaders received—not all of it by any means from Communist sources—and it would be good for the political health of the community to know how much truth there is in some, or any, of them. In any future trouble in the docks, the Government and the union leaders will no doubt be on the look-out for outside influences, as well as the purely internal dissidents.

The conference concentrated on its immediate business to devise improvements in the dock disciplinary scheme, which had immediately caused the strike. The fact that few concrete amendments were put forward by branches suggests that dissatisfaction with the scheme was not so widespread as has commonly been supposed. The final proposals, which will be taken up with the Dock Labour Board, will not require any fresh legislation, nor do they involve any change in the arrangements for joint responsibility between management and the union for discipline. Their main purpose is to secure a more liberal interpretation of the existing clauses and more decentralisation in the administration. The men want the period for which a docker can be suspended from payment of the guaranteed wage limited to 14 days (the imposition of a penalty of 13 weeks' suspension had led to the strike) and they suggest that joint section committees, covering smaller areas, should be responsible for administering discipline.

Mr Deakin has been holding an inquest of his own into press criticisms that the Transport and General Workers' Union is too big and centralised. As leader of the world's largest labour union, he is naturally a believer in the doctrine that size means strength and argues, in his union's monthly Record, that a big union can cater more efficiently for its membership than a small one, because it is richer (the transport union has funds of over £5,000,000) and can draw on a wider field of administrative talent. Mr Deakin denies charges that his union includes too many different groups to represent the sectional interests adequately, and that the union officials are remote from the rank and file.

Mr Deakin is perfectly right in saying that the question of size is irrelevant, but his defence does not really explain away the hard fact that the London dock strike spread and continued against the authority of the union, and that it was Mr Attlee, the bourgeois politician, who succeeded in getting the men back to work, where he—the supposed champion of the men—had failed. The trouble was the men's misplaced sense of loyalty—they gave their allegiance to the strike committee rather than to the union leaders. However, this was not a prime cause, it was an effect of some deep failure in human relations, which will not be cured by Mr Deakin's airy pretence that nothing is wrong.

* * *

A Salve for Conscience

Some stir has been caused by an allegation appearing in the introduction to the 1948 edition of Crockford's Clerical Directory, to the effect that the atomic bomb was only used on Hiroshima and Nagasaki because of a Japanese threat to massacre all Allied prisoners of war held in Japan if a landing were attempted in any part of the Japanese home islands. The writer did not claim to know whether this story was true or not, but called on the authorities with official knowledge of the facts to disclose them, adding that "if it is true, we think that the tenderest conscience would be relieved permanently of all scruple and doubtfulness."

The American State Department has promptly denied the truth of this version and has repeated President Truman's declaration, that the atomic bomb was used simply in order to shorten the war. But the twinges of conscience are still widespread and it is not only among devout Christians that minds are seeking to be delivered from "scruple and doubtfulness" about the atomic bomb. Not least among the scientists themselves are there searchings of heart such as have never before existed about the uses to which the progress of scientific knowledge is put. The prospect of the ruin and devastation which would be caused by the use of atomic weapons in a future war is indeed the great fear overhanging this generation.

It must nevertheless be pointed out that as a weapon of mass destruction the atomic bomb differs in degree rather than in kind from other means of warfare which have ceased to evoke the same horror and indignation. About 100,000 persons are believed to have perished in the great American air attack on Tokyo on March 9, 1945, when 15 square miles of the city were destroyed with high explosive and fire bombs; the atomic bomb on Hiroshima merely killed a comparable number with one explosion. Yet the divine who seeks a salve for tender consciences about Hiroshima does not seem to think that the area bombing of cities with ordinary bombs requires equal justification. The fundamental division in principle is not between atomic and other bombs, but between the selective war against combatants and military objectives, approved by international law and usage in the eighteenth and nineteenth centuries, and the total war against populations practised by both sides from the air in the last war. *Unfortunately there does not seem to be any ground for hoping that, if there is another war between Great Powers, it will not be total.*

* * *

Arab Moves in Palestine

The reported union under a single command of the Iraqi and Transjordan forces in Palestine suggests yet another shift in the pattern of Arab politics. The difference between Iraq and Transjordan, which appeared in their voting on opposite sides in the Arab League on the truce resolution, was fundamentally that between a Government which had to consider a vocal and hostile public opinion and an absolute monarch who did not. The new development, if confirmed, would mean that the Iraqi Regent, Amir Abdulillah, had been able to assert himself at home and move closer to his Uncle Abdullah. The Arab Legion is known to be very short of ammunition. The Iraqis, who have done less fighting, may have more. However, ammunition is nowhere plentiful in the Arab world. The British have been keeping the truce, while it seems that the Soviet suppliers of Israel have not.

The Iraqi troops were assessed, before May 15th, as among the best the Arabs had, as good as the Arab Legion. During the fighting in Palestine, they did little to justify this opinion, but it does not appear that they were there in any force. The long haul over the desert highway from Baghdad has been a handicap. But Israeli reports this week of "large-scale war preparations" at Mafraq in Transjordan may, if they have any foundation at all, refer to some regrouping which has been going on. Probably there were a certain number of Iraqi troops already based on Transjordan before the second cease-fire came into force.

The merger of forces and any other dispositions which may have been taken are almost certainly defensive in their aim. The Arabs are in no condition to plan an offensive, and the defence of what they hold might well be more than they could manage, if hostilities were to reopen. On the other hand, a joint Transjordan-Iraqi force would be better able to keep an agreed truce than the two acting separately. And the association of the Iraqis with Transjordan would isolate Syria, the only Arab state which still seems to want to go on fighting. Egypt, as the third state with troops in Palestine, has another uncomfortably long line of communications. And the Sinai desert road, though tarred, is in nothing like such good condition as the Haifa-Baghdad highway. It may well be that the Egyptians will find it too expensive to hold on to Gaza and southern Palestine indefinitely, and will become more willing than they have so far been to allow King Abdullah a secondary and precarious outlet to the Mediterranean through the south.

MacArthur Quotes Roosevelt

One of the principal aims of the original American programme for democratising Japan was to build up a strong trade union movement. In recent months, however, the American authorities in Japan have been looking more and more askance at the actions of certain Japanese unions, particularly those which are under Communist influence—for the Japanese Communists, though they have achieved very little in parliamentary elections, have had considerable success in the field of trade union organisation for which they had plans ready before anyone else. On the economic side American policy has been to get a balanced budget and halt inflation as a prerequisite for industrial recovery; but this has meant a check on increases of salaries and wages of state employees, whose incomes have in any case been lagging far behind the continual rise in the cost of living.

Japanese private capitalism, on the other hand, has proved very adaptable to the new order of things; in order to avoid trouble many industrialists have not only granted substantial wage increases, but have maintained full-time union officials on their payrolls and provided them with office space and printing equipment. As a result, rates of pay and union privileges in private industry have risen well above those in state employment, and the highest rates have been those paid by the American Occupation authorities to their Japanese employees, which are charged to the Japanese budget under Occupation costs. All this has naturally caused much discontent among state employees, which was specially worked up with an anti-Government political emphasis by the Communist-influenced Railwaymen's and Communications Workers' Unions. Go-slow tactics on the railways—which are state-owned—seriously affected the movement of goods and began to impede industrial recovery.

Then on July 22nd came a bombshell from Supreme Allied Headquarters in the form of a letter from General MacArthur to the Japanese Prime Minister declaring that public servants had no right to strike or engage in "struggle tactics" intended to disrupt essential services. The Government treated this message as an order and issued a decree depriving all state and municipal employees of the right to strike. The sudden decision caused something of a crisis, though the effects were less disturbing than was at first expected; the threatened protest strike of the Communications Workers had to be called off owing to lack of support from local branches and the two Left-wing Socialists in the Cabinet—one of whom is Minister of Labour—went back on initial intentions to resign. But Mr James S. Killen, Vice-President of the Pulp and Paper Mill Workers' Union of the American Federation of Labour and head of the Labour Division of Allied Headquarters in Tokyo, resigned in protest at General MacArthur's "denial of the right of collective bargaining to legally constituted unions."

Against this reproach General MacArthur relies on a supramundane authority; he triumphantly quotes the late President Roosevelt as saying that a strike by government employees is "unthinkable and intolerable."

* * *

Korean "Independence"

The independence promised for Korea "in due course" by the Allies at the Cairo Conference has now been formally achieved. But the nation remains split in two by a frontier unknown to Korea's past history—the 38th parallel of latitude which was agreed on during the war as the boundary between American and Russian zones of postwar military occupation, and became the line of division between two opposed political systems. After prolonged negotiations had failed to obtain Russian consent to any political unification of Korea which would not have assured the national ascendency of the Communist-controlled *bloc* administering the Russian zone, the United States decided to hold elections for a constituent assembly in their zone and go ahead with preparations for an independent Korean state, treating North Korea as an area temporarily detached from it. The American military government has now been terminated and the Korean Republic proclaimed in Seoul with Dr Syngman Rhee, the former head of the Provisional Government set up in exile in 1919, as its first President. But though American control has formally come to an end, American troops are to remain to protect the new-born Republic against attack or infiltration from the rival Communist regime north of the demarcation line.

The situation is similar to what it would be in Germany if there were no sectors of occupation in Berlin, the difference being that the Russians would then hold the capital for their *protégés*, whereas in Korea it is the Americans who, by the zonal division of the country, have been in possession of the capital, Seoul. It is hard to overestimate the psychological importance of having the capital city when a country is divided between rival regimes, for the habitual identification of the capital with the source of state authority means that the appearance of secession and rupture of national unity is incurred by the side which has to set up its government in a provincial town. This is one reason why the Russians attach so much importance to gaining complete control of Berlin.

In Korea the advantage of holding the capital rests with Dr Rhee, and the majority of the Korean population—augmented by refugees from the north—lives in the territory controlled by his Government. But the intensive militarisation of North Korea, which was begun as soon as the Communist administration was set up there, has made the North stronger in arms, so that it would probably be victorious in a trial of strength if the American forces were to be withdrawn. There has been some talk of withdrawing them, whatever the consequences, and freeing America from any military commitment on the mainland of Asia; but it now appears that they are to remain, mounting guard on the frontier between two worlds at lat. 38 deg. N.

Shorter Notes

Marshal Tito's troubles have spread to Trieste. The Communist Party of the Free Territory has split into its Italian and Slav groups—the Italians, who form by far the larger faction, siding with the Cominform against Marshal Tito, and the Slavs, who, though small in number, hold the Party's funds and their modern printing press, adhering to their former leaders. Reports show that the clash between the two factions is much more bitter than the attacks on "western imperialism." The pro-Tito faction, for instance, has been able to prevent the Italian Communists from publishing their newspapers as all newsprint for the Communist press in Trieste comes from Jugoslavia. The odds are thus about even on which faction will win, but the clash should result on an easing of Communist pressure on the Anglo-American zone of the Free Territory. If, as has been hinted, the Italian faction joins up with their colleagues in Italy, the moment might also be opportune for bringing up once more the British, American and French request that Trieste should be returned to Italy.

The one man above all others who would welcome any end to the present interregnum is Major-General Airey, the Military Governor of the Anglo-American zone, who has just issued his third quarterly report on his "caretaker" administration. He stresses once again the impossibility of governing the area satisfactorily since long-term plans are forbidden as they might prejudge the wishes of the still undetermined future rulers of Trieste.

*

To the tune of Mr Pollitt's condemnation of the "colonial war" in Malaya, the 4th Hussars and the 2nd Guards Brigade are sailing for Singapore. They will bring the strength of British troops operating against the insurgents up to about a division and a half and they should make it possible for Mr Malcolm MacDonald to carry out his promise to sweep the Communist rebels out of Malaya before the end of the year. The decision to send first-line troops has come none too soon. The continued toll of murders and terrorist raids is weakening the confidence of planters and Malayans alike in the Government's power to protect them. More still might have been done to restore this waning confidence if the traditional leisurely progress by sea had been abandoned in favour of air transport.

*

American machine tool makers are worried over the lack of orders for their equipment coming through under the European Recovery Programme, and their disappointment has led them to conclude that the programme is becoming a "gigantic relief project." It is true, as noted in *The Economist* last week, that so far most of the purchases authorised by ECA have been for food and raw materials. However, the authorisations to date are only for US grants to the Marshall nations, not loans. A higher percentage of industrial equipment is likely to start appearing on European buying lists when the current negotiations for ERP loans are completed.

*

The European edition of the *New York Herald Tribune* fills an important need by its decision to devote one of its six pages every month to a survey of the progress of the European Recovery Programme. There is too little news in the daily press of the details of European production and the changing pattern of trade which is emerging. The first survey last Saturday revealed, for instance, that steel production in all the great steel-producing countries, except Germany, is well above the prewar average, that exports to Eastern Europe (except Russia) had dropped to 44 per cent of what they were in 1938, and that the petroleum needs of the ERP countries will in 1951 be more than twice the amount consumed in 1938. Such figures provide a useful guide of what is happening in Europe; they should also serve to drive home to the lay reader the importance of ERP.

*

In *The Economist* of August 14th it was noted, in discussing the report of the Select Committee on Estimates upon the petrol consumption of Government departments, that the National Debt Office had accounted for 7,600 gallons. In fairness to that body it should be pointed out that it controls the Trustee Savings Banks, which have some 900 offices in all, and that these excellent institutions, whose funds now total some £870 million as against £300 million in 1938, are operated on a petrol expenditure of about two-thirds of a gallon each per month.

Letters to the Editor

European Currencies and the Dollar

SIR,—May I suggest that we Europeans are busy buying a dollar deficit, at the cost of our foreign investments, of our gold, and finally at the cost of the American taxpayer.

With a free market for currencies, the European gap would of course result in the appreciation of the dollar, thus making American goods more expensive on our markets and discouraging their import; at the same time the exports of our goods to dollar markets would be more rewarding, hence encouraged. Our Exchange Controls have achieved precisely the reverse. These grant dollars to our importers at prices in European currency which are notably lower than the true market value of the dollar. Thus in effect they make dollar goods cheaper on our markets than they should be. There is but one name for this practice; we subsidise these imports.

On the other hand our Exchange Controls do not allow our exporters the true value of their exports. Our European exporters get less for their dollar sales than their true counterpart in European currency: thus we penalise our exporters. Applying proper incentives to imports and proper disincentives to exports we get a very logical result.

May I further suggest that we discriminate against the European producer? We are unwilling to grant him the benefit of world prices. Take Continental wheat: traditional protection held its price far above the transatlantic level; now price controls depress its price well beneath the transatlantic level. It is surely a disincentive to clap a ceiling on the prices of essential European products which are scarce. To round out the paradox, our American friends at the same time provide price support for American goods which are in surplus, such as potatoes.

While we agreed (in the lapsed Wheat Agreement) to guarantee prices for transatlantic wheat over a number of years, no such incentive has been offered in our zone where it might have restored North Africa to the role it played in Roman days.

Before we even dream of discrimination against the American producer—a most regrettable course—should we not redress our present discrimination against the European producer of essential goods. Whether it is coal or wheat, should we not cease to penalise exports to the dollar area and cease to subsidise imports from across the Ocean?—Yours faithfully,

BERTRAND DE JOUVENEL

6 Avenue du Général Detrie, Paris

From *The Economist* of 1848

August 26, 1848

IN another part of our journal we published two petitions against the Factory Act, growing out of the prosecution lately instituted against Messrs. Jones, Brothers and Co. The petitioners have much to complain of. The girls of losing good wages, the employers of the uncertainty of the law and of being unable to make the most profitable use of their capital. At present the evils may not be so much felt, though now there are a great number of hands out of employment in the manufacturing districts; but when Europe is restored to tranquility, when all the energies that are now directed to the pursuit of political chimeras on the continent, shall be concentrated on the production of wealth, when competition shall be more active and fierce than it has yet been known, it may become a very serious question, whether the fixed capital of this country vested on spinning mills shall produce its owners at the rate of 21 to 16 ounces of yarn per day . . . . The mill being stopped working for three and a half hours, there will be so much less of its produce to exchange for other things, and the girls dismissed from the factory, and losing amongst them £9 18s. 3d. will have so much less to lay out for food, groceries, books etc. Everyone of the trades which supply these articles—the baker, the butcher, the grocer, the sugar planter, the printer, the paper maker—will suffer, to some degree, by the arbitrary limitation placed on the powers of working of Messrs Jones' mill . . . We are as sensible as any of our contemporaries of the evils of excessive labour; but, after all, the factory workers are better off in this respect than most other labourers, and the remedy for excessive toil is something totally different from stopping the motion of those helps to human exertion, which, with a small quantity of labour, do very much increase production and wealth.

Leak in the Dollar Pool

SIR,—The Australian journalist who wrote the enclosed article, which I have clipped from the Singapore *Sunday Times*, has at last put into print a question which many thinking people must have been asking themselves for the last couple of years.

> To a transient from Australia, Malaya's whole gold-dollar position seems—despite Malaya's huge dollar earnings—crazy; to anybody from Britain it must seem more crazy. Australia is so schooled in the rules of the Empire Dollar Pool that, on the whole, she is spending dollars only on articles which either aid Australian development or help Australia to boost food production.
>
> Singapore at first glance—and at second and third glances—is stocked to the roof with gold dollar trinkets and non-essentials which must represent a big gushing leak in the Empire dollar pool. Zany American ties, oversize petrol-eating American cars, American cigarette lighters, fountain pens and shirts.
>
> And to a caller from Australia, well-schooled in the shabby details of English austerity, Singapore's colossal bill for alien firewater is eye-opening. One cannot help wondering whether the kroner that went to buy Danish beer might not have been better spent in such tricky times on Danish butter.

To say that Singapore is stuffed with non-essentials, luxuries and trinkets of hard dollar origin is scarcely to exaggerate the facts. To the few items enumerated anyone could add a list of any length after an hour or so of inspection.

It is probable that Singapore and Malaya are permitted to spend a certain proportion of their hard-dollar earnings upon themselves, yet with an administration under the control of the Colonial Office, and including a Controller of Foreign Exchange and a Controller of Imports and Exports, there is some reason for asking why the expenditure of that proportion is not restricted to essentials.—Yours faithfully,

H. M. SEVERN

Post Box 586, Singapore

Tobacco Shortage

SIR,—Why should we not ration tobacco? Why must we all—including even yourself—assume that the market for coupons which would inevitably develop must be "black"? Is not a black market an illegal market? Why should it be made illegal to sell one's tobacco coupons?

Why cannot the Government issue to every adult of 18 or over coupons entitling him or her to whatever very small amount of tobacco can be made available per head per week, stating clearly on the coupons that they are transferable, negotiable and generally at the absolute disposal of the recipient? With perhaps a footnote to the effect that you are advised to sell them for the highest offer you can get and invest the proceeds in National Savings. The Government would then be handing such tobacco as we can afford to buy to the public to distribute among themselves without any fuss or bother. Those who could not find a better market, but nevertheless wished to sell, could sell the coupons to tobacconists.

This would be rationing through the purse—but applied only to that quantity of this expensive commodity which we may want above our fair share. Everyone will be entitled to a basic ration at the normal price, together with as much more as they could persuade sweethearts and wives to let them have for love. For the rest they must pay—and their demand will govern what they pay.

It may be objected that this will come hard on the poor man who is nevertheless a tobacco addict. But is it reasonable that his troubles should guide our policies? Is it not right that he should be encouraged to take a pull on himself? Almost anyone *can* cut down smoking if he only makes up his mind that he will. Surely this scheme would assist that frame of mind?

Then there is the objection—I suspect the bureaucrat's objection—that all rationing would be brought into contempt if any coupons were freely bought and sold. I have no sympathy with this objection, and don't expect you to; but one might perhaps call it a distribution scheme and label the coupons tickets.

Finally, I am told that if the coupons are saleable, they will inevitably be forged. But clearly we can print coupons which—like pound notes—will be very difficult to forge. This will take months; but does anyone suppose that the tobacco shortage will not be with us for years? Can we not kick off with a spare

page in the food books, and by the time the forgers have got on to this, replace with something that will puzzle them? If the scheme is sound in principle, surely the mechanics are manageable.—Yours faithfully,

A SMOKER

Berlin Generals

SIR,—After reading your paragraph on p. 294 in the issue of August 21st:

> It has taken three weeks of intense thought and careful manœuvring by the professional diplomatists of America, Britain and France to overcome the tactical difficulties created by months of prestige politics practised by the Berlin generals.

May an Air Marshal (retired!) wield his pen in defence of the "Berlin Generals" who assuredly will not be in a position to address you themselves.

Your note paints to me the picture of the generals practising "prestige politics" on their own initiative and without being amenable to guidance from, still less control by, their Governments with the advice of their respective Foreign Departments. This may be the position (I have no other than public sources of information); and, if so, it may be a faulty arrangement to ask for diplomatic duties to be performed by or in the name of commanders trained for military service, though there are, I think, many precedents for such an arrangement.

But is it fair to imply, as to me your wording certainly does, that the generals are to blame for this arrangement? It must have been laid down for them by their Governments. Moreover, each successive move in this "practice of prestige politics" must have been well known to their Governments as, or most likely before, it occurred. These Governments have from the start been in a position to control or change the generals and to determine their "practice" as closely as desired by modern communications.

So that the Governments must bear the responsibility both for the arrangement itself and for its working. In these circumstances the inference of your paragraph seems to me most unfair to our appointed representatives placed in a position of tremendous complexity and responsibility. At such a time and place they need, above all, to feel that they have the confidence and backing of higher authority *and also* of their public opinion at home. This paragraph could only serve to dishearten them.—Yours faithfully,

RICHARD PECK

Grosvenor House, Park Lane, London, W. 1

[The note to which Air Marshal Peck refers was less unsympathetic in intention than he suggests and was intended to refer as much to Marshal Sokolovsky and General Clay as to General Robertson. It is the view of *The Economist* that the Western Governments have allowed their representatives in Berlin to move into tactical positions which offered overwhelming advantages to the Russians. In the course of the Berlin dispute things have been said and done which seemed to weaken rather than strengthen the Western position; for example the demand—never pressed home—that the Russians should leave the Rundfunkhaus, the decision to introduce Western marks into Berlin, and the statements by General Clay suggesting directly or indirectly that only armed attack could dislodge him and his colleagues from the city. Air Marshal Peck is right in pointing out that the responsibility for such happenings lies with the Governments; but there is evidence that the military governors have sometimes been obliged to commit themselves in advance of official instructions. The view of *The Economist* remains as expressed last week that "they should not again have imposed on them such a wide range of responsibilities, especially in economic matters."—EDITOR]

Nothing to Live For

SIR,—Your correspondent Mr D. H. R. Barton wonders what sort of morale beer is supposed to sustain.

If he will consult George Borrow he will find that the Romany Rye has made plain for all time the respective merits of beer and wine in his story of the pusillanimous publican on the verge of apostasy who, by giving up wine-bibbing and taking good ale instead becomes bluff, prosperous and a churchwarden!

If my stevedore customers ever seek to refresh their wearied bodies with "small ports" instead of lashings of beer, I will retire, shuddering, to a milk bar.—Yours faithfully,

"*The George*," *London, E.14.* WALTER SEELEY.

AMERICAN SURVEY

Mechanising the Grass Roots

(From Our US Editorial Staff)

NO one knows better than the storm-tossed British farmer the difference between crop estimates and harvest realities, but the official forecast of this year's maize and wheat crops in the United States makes it safe to assume that a better than average harvest will be gathered in. If the present promise of plenty is fulfilled, near-record supplies of wheat and record supplies of maize will be on hand this winter.

For wheat the yield in 1948 is estimated at 1,284 million bushels compared to the all-time record of 1,365 million in 1947 and an average yield during the ten-year period 1937-46 of 943 million bushels. For maize, the estimate of 3,506 million bushels is 8 per cent over the previous record, 25 per cent higher than the ten-year average, and 46 per cent above last year's poor crop of 2,401 million bushels. These forecasts probably represent a more fundamental attack on inflation than the credit controls contained in the Bill passed in the special session, to which the Republicans have just obtained Mr Truman's reluctant signature.

Wheat has now reached the state of commodities like potatoes and oranges, whose prices are maintained at government expense. On August 16th, the price of wheat at Kansas City and Minneapolis was $2.18 and $2.19 a bushel, which is just under the support price of $2.20 at Chicago. To the consumer, who is now spending 42 cents for food out of each dollar of his income, compared with 34 cents in normal times, these figures bring some hope. The promise of lower prices does not apply to beefsteak, the cost of which will remain high because heavy marketings, in response to soaring prices for meat, have reduced the herds and to increase them takes time. But there is a real hope for lower prices for poultry and pork, since the supplies can be built up more quickly. Milk, which now costs 20 cents a quart, may be cheaper, and the price of bread is expected to drop as much as a cent a loaf.

To the farmer, out harvesting while the statisticians process the harvest into neat columns of figures, it looks as though the moment were approaching when prices will stop running up hill and when, on their downward journey, they may collide with cost rigidities. But in 1948 the farmer can rely on two buffers. One is the government price support programmes, which will fend off any repetition of the farm disaster of 1920; the other is the reduction of costs through large-scale mechanisation.

On the western prairies, mechanisation has reached fabulous proportions since the end of the war. Trains of huge farm machines clank over endless stretches of wheat. The great plains are probably the most completely mechanised farming area in the world. No one cares, today, whether the farm hand can hitch that anachronism, the horse, or milk that little-known creature, the cow, but he must be a good mechanic. Winters are long, and farm mechanics, owners, and farm hands spend them figuring out how to make bigger machines do more work at a lower cost. Units of standard farm machinery are combined to create mechanical Gargantuas. High power is the chief need, and since 120-horsepower caterpillar tractors have become relatively plentiful, farm geniuses have been able to give their imaginations a loose rein.

For example, on an eastern Colorado farm, a specially built disk plough turns strips of earth 63 feet wide and can prepare 320 acres—half a square mile—in a farmer's working day. One special "rig" works for a few days a year in South Dakota drilling 42 rows of wheat in a strip 35 feet wide. It moves four miles an hour and thus plants more than 160 acres of wheat in less than a farmer's working day; and it is run by one man. This miracle worker is composed of one 120-horsepower tractor and one 35-foot wide Graham Hoeme plough.

This is the new plough now becoming widely popular in the West. It stirs the soil deeply with biting teeth of "chisels," but does not turn it over. Soil thus prepared, with a rough surface of clods, trash, and humus, absorbs all available moisture and resists erosion because there is so little dust for the wind to lift. Behind the first chisels come others set at 10-inch intervals, which furrow the soil, and behind them, hitched in tandem so as to cover a ribbon "only" 35 feet wide, come three smaller Graham Hoeme machines with grain boxes and press wheels added. The grain is dropped into furrows from these automatic hoppers and covered by the press wheels. Necessary repairs are made by a mobile machine kept at the fields' edges, a workshop mounted on a jeep chassis which can weld, drill, or shape parts within a few minutes.

The farmer who uses this equipment says its mechanical costs are only seven cents an acre. The purchase price, including the tractor, is about $13,000. The same man has another such assembled giant which can plant eight rows of maize at once. He says, in spite of the high purchase cost, these innovations never fail to save him the entire purchase price in the first year of their use. The expenditure of time per man to grow either a bushel of maize or wheat is far below the 12 minute American average.

*

Machinery like this requires elaborate machine shop equipment and farms which use it have machine shop inventories worth between $25,000 and $50,000. The reputation of these grass roots mechanics is such that farm machinery companies keep scouts travelling over the great plains watching for new ideas. The main business of the companies is to make standardised equipment to supply the needs of orthodox farmers having fields too small for these trains of machines, but from these agricultural mass production lines flows a steady stream of improvements in farm machinery design, such as, for instance, at least two leading brands of mechanical harvesters for sugar beets.

These large-scale farmers also follow all research in new and improved seeds, as their gains come from increased yields as well as from lowered costs. They are, of course, far ahead of their neighbours, but the consequences of their pioneering are widespread. They buy out adjacent farms and build bigger units. One 40,000 acre farm in the grain country was made up, a decade ago, of nine separate family farms. These inventive agricultural magnates live in the towns, send their mechanical miracle workers out to plant and harvest, and take long vacations. What they have done on the great plains can, of course, be copied only on similar open spaces such as the Ukraine and Argentina. In a period of declining wheat prices they can continue high production and stay in business without fearing bankruptcy. Even in the United States their example can only be followed on a limited scale, because of lack of capital and unsuitability of land.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Fight Against Discrimination

[FROM A SPECIAL CORRESPONDENT]

REPUBLICANS and Northern Democrats may vie with one another in Washington to get credit for civil rights legislation without actually passing it, but no such shadow boxing is possible in New York State. The laws enacted by many Northern States in the 1880s to assure Negroes equal access to hotels and restaurants had become dead letters by the early twentieth century. In their place New York State has passed a whole series of laws forbidding "discrimination because of race, creed or colour"—not only in such accommodation (1909), but in public employment (1918), employment by regulated monopolies (1933), in the civil service and public housing (1939), in trade union membership (1940), in munitions factories (1941), and finally in all private employment for profit where there are six or more employees (1945).

This last of the series adds "or national origin" to "race, creed or colour," extending explicitly to all those of foreign birth or ancestry the protection intended for Negroes, Jews, Roman Catholics, and the other "racial" and religious minorities in which America is so rich. It has served as a model for other States and is likely to continue to do so. New York and New Jersey have had three years' experience of anti-discrimination laws based on the same report of a New York commission, Massachusetts has had two, Connecticut one. The cities of Chicago, Milwaukee, Minneapolis, Cincinnati, and Philadelphia have adopted similar ordinances, and Bills based on the New York law are introduced regularly in more than a dozen Northern State legislatures, 16 of them in 1947.

The movement owes much to the unpleasant resemblance between Hitler's racial theories and those historically dominant in the more backward parts of the South, and spreading into Northern areas where migration has made Negroes a significant proportion of the population. The Detroit and Harlem riots of 1943 contributed to the feeling of urgency, as did shooting affrays between whites and Negroes in army camps, and the increasing militancy of a now-literate Negro population. Three million Negroes, out of a total Negro population of over 13 million, now live outside the South, enjoying full political equality and good Northern board schools.

Moreover, by persecuting European Jews, Hitler awakened American Jews to a new consciousness of their position as a minority, and drove their scholars and the leaders of their lay organisations into active championship of the rights of *all* minorities. There were local incidents to dramatise the issue in each of the four States that have adopted legislation: the Harlem riot in New York, Negro soldiers in Trenton, New Jersey, tearing up the cashier's booth in a cinema theatre when told "Balcony only for coloured"; the brutal beating of a beloved Negro preacher from Hartford, Conn., on a Southern railway carriage; gangs of adolescent Boston toughs invading Jewish neighbourhoods to ask small boys if they were Jews, beating them if they said yes.

So when the time came, the new laws were passed with support from both major political parties in all four States. In New York, Governor Dewey, though criticized for delaying the passage of the law for a year, has given its enforcement every support. These new State and city laws against racial and religious "discrimination" in employment differ markedly from the old civil rights laws of the 1880s, in that they are enforced by administrative process instead of by criminal law. Under the old laws, a Negro denied service in a restaurant may, if he is determined enough, get a prosecutor to act; he may even win his case and see a small fine assessed. But his chance of permanently changing the restaurant's practice is very slight.

To assure the much more important new civil right of equality of opportunity in employment, a gentler but more effective device is provided, the threat of publicity. The laws require the use of "conference, conciliation and persuasion" as the first step after investigating a complaint for "probable cause." So far, in not one of the four States has the next legal step been taken of calling a public administrative hearing of all sides of the case, before commissioners specialising in this law. After the hearing the commissioners may issue a "cease-and-desist order," but this has no force of law. If it is not obeyed, the State takes the case to a court of equity and prays for an injunction to enforce the law (not necessarily the order). Some months after successful conciliation, the administrators investigate again to see if the employer—or trade union, or employment agency—is keeping its word about obeying the law.

How effective are the laws proving to be? The bulk of the complaints, from 60 to 80 per cent, come from Negroes, the next largest number from Jews, the rest mostly from Italian-Americans and other recent immigrant stocks. The National Urban League, a Negro social service agency, recently conducted a survey, unpublished as yet, by asking its secretaries in 25 cities (mostly Northern) to enumerate the Negroes they could discover who were employed on January 1st in private enterprise for profit outside wholly coloured areas, and in more than menial jobs. Employment in public service and social welfare agencies was omitted because the Negro secured a foothold in them long before private enterprise let down its bars.

It was found that 7,734 Negroes were employed in the 25 cities as black-coated or professional workers, positions almost entirely out of the reach of Negroes a few years ago. New York, with 2,613 Negro technicians, clerks, and professional workers, and Chicago, with 2,524, led the rest by a wide margin. But in Chicago the figures are deceptive, for almost all the Negroes are employed by Chicago's big mail order houses and never meet the firm's customers.

If Chicago is included, four cities, New York, Boston, Newark, and Hartford, all in States with anti-discrimination laws, are seen to have provided just under half the total of coveted job opportunities. But if Chicago is omitted, the record of the cities in States with fair employment laws is outstanding. Of the 4,850 Negro black-coated workers in the 24 other cities, 77 per cent were found in New York, Hartford, Newark, and Boston.

It is also useful to compare the work of the new State agencies with the achievements of the Federal Fair Employment Practice Commission, which during the war tried to stamp out discrimination in employment by threats of cutting off workers and supplies from firms with war contracts. The FEPC settled an average of 1,000 cases a year for the whole of the United States, leaving 1,400 more unsettled. The four States with new civil rights laws can point to the fact that they are settling 1,200 cases a year on very little more money, combined, than the FEPC commanded.

Perhaps more important than the laws themselves are the public opinion which has called them forth, the public and private research and education that accompany them, and the new habits of working together, on the job and in public affairs, that the movement fosters.

American Notes

Campaign Plans

Mr Wallace, who, unlike Mr Truman and Governor Dewey, is free to devote all his time to campaigning, is already out beating the Jim Crow bushes. Governor Dewey's statement that he favours Italian trusteeship for the Italian colonies is a reminder that, with the election now only nine weeks away, the major campaigns are about to start in earnest. There are, of course, substantial Italian minorities in New York (which contains a third of the country's 1,600,000 Italian-born) in Pennsylvania, California, and Illinois, all key election States, and Mr Dewey is certainly no more immune to such considerations than Mr Truman showed himself over Palestine.

The chief conclusion, however, to be drawn from Mr Dewey's insistence that he has a "solemn obligation" to discuss foreign policy is that he is determined that, while underwriting the Administration's aims on European recovery and Russian relations, he shall not fight this campaign, like that of 1944, with one hand tied behind his back. A Republican campaign acquiescing in Democratic foreign policy and confined to domestic issues would ideally suit Mr Truman's book. A Gallup poll taken since the end of the special session shows that sentiment for restoring rationing and price control on food and clothing has grown from 39 per cent in April to 56 per cent and Mr Truman's appointment of Mr. Maurice Tobin to be Secretary of Labour brings an able and popular figure into the battle to win labour votes for the Democrats.

If Governor Dewey is content to hunt his political quarry outside the ECA and Russian reservations, emphasising in foreign policy only the relatively minor sins of vacillation and blundering, no such restraint is likely at the lower levels. Mr Halleck's broadside charging that the Administration's foreign policy, by inflating foreign aid and defence costs, has been the chief cause of high prices at home, is one pointer towards the trouble Mr Dewey, if he is elected, may have with his party's unrepentant Congressional leaders. In a speech a fortnight ago the Governor accepted the challenge, in a reference to Republicans who would like to restore the "dim, departed, almost forgotten, and surely never to be recovered past."

The story is that Mr Dewey's campaign will be whirlwind and his speeches largely impromptu. But Republican strategy conferences suggest it will be exhaustively planned in advance: no asset will go unexploited, no threat overlooked, no opportunity missed. Mr Warren, unlike many Vice-Presidential candidates, who are chiefly famous for their obscurity, will be given a prominent national role, with careful liaison arrangements to ensure that no contradictions mar the unity of the team. The big cities, which have been the Republican Achilles heel since Mr Roosevelt came to power, will receive special attention. Of particular interest is the admission that the Republicans take seriously the possibility (discussed in *The Economist* of July 17th) that, even if Mr Dewey wins, the Democrats may recapture the Senate. Every effort will therefore be made to bolster shaky Republican incumbents, to tip the balance in States where the Democrats are vulnerable, and to exploit Democratic divisions in the South.

* * *

Closed Shop and Hiring Hall

Just one year after the Taft-Hartley Labour Act came into force, the National Labour Relations Board announced what is regarded as its most significant decision under the provisions of the Act dealing with unfair labour practices. This decision is likely to bring before the Courts the controversial question of whether Congress was within its constitutional powers when it banned the closed shop or whether, as the trade unions allege, this ban was an unwarranted invasion of the principles of free collective bargaining. If the matter goes as far as the Supreme Court, as it is expected to do, the Act will probably have celebrated its second birthday before a final judgment is given.

The NLRB ruled that the hiring hall for seamen, as operated on the Great Lakes by the National Maritime Union of the Congress of Industrial Organisations, violated the closed shop provisions of the Act. Under the hiring hall system, employers are required to hire men supplied by the union: the NLRB objected not to this, but to the discrimination exercised by the union against non-members when supplying the shipping companies with personnel. This decision applies only to Great Lakes shipping, but similar decisions are anticipated in cases now pending in connection with shipping on the Atlantic and Gulf coasts. On the day the NLRB published its ruling, the NMU reached an agreement with shipping firms on these coasts, which retained the hiring hall until such time as a Court of "competent jurisdiction" should determine its legality. The NLRB has condemned such attempts to get around the ban on the closed shop and the union intends to appeal against the NLRB decision on the hiring hall. Labour could hardly have found more favourable ground on which to fight the closed shop issue, since there is general agreement that the hiring hall brought much-needed order to the chaotic abuses which had previously prevailed in the employment of seamen. The NLRB itself refused to comment on the contention that the peculiar characteristics of maritime employment require regulation of the supply of labour.

This case has obvious bearings on the typographers' disputes which have been going on in a number of cities during the past year. NLRB trial examiners have so far reported on about half of these cases, but the Board itself has not yet given any decision. The most important report was on the charges brought by the Newspaper Publishers' Association against the International Typographers' Union of the American Federation of Labour, in which the union was held to be attempting to maintain closed shop conditions.

A strike amongst dock workers on the Pacific coast is also threatening over hiring hall and wage questions, but the dispute with the longshoremen on the Atlantic coast is over changes in premium pay for night work. The difficulty arises out of a recent Supreme Court decision on the basis on which overtime pay for dock-workers is calculated, which involves a substantial addition to the rates at present prevailing. The strike has been postponed for eighty days by an injunction under the emergency provisions of the Taft-Hartley Act. The injunction against the strike of maritime workers expires on September 2nd but it seems probable that the other unions involved will follow the example of the National Maritime Union in reaching an agreement. The NMU has won wage increases of from $12.50 to $25 a month, similar to those given by other shipping companies to the AFL Seafarers Union while the negotiations were in progress.

* * *

Medicine for Shipping

These wage rises will mean a further increase in the excessively high costs which are the chief complaint of America's permanent invalid, the shipping industry, which is once again sinking back into its chronic depression. It has been apparent for some time that the war was only a temporary, even if a very successful, cure for the illness of this industry and its poor state of health is particularly trying when compared with the rapid recovery of its foreign rivals and the abounding energy of the rest of the American economy.

Obviously it is the duty of the family doctor, the United States Maritime Commission, to provide a tonic. He has been pressing his usual prescription—subsidies—for some time, but the patient complained that the remedy was not strong enough. The subsidies are intended to offset the difference between American and foreign shipbuilding and operating costs, and the USMC has been offering to pay about 30 per cent of the total cost of new passenger ships. Congress at its recent session failed to take a hand in the treatment, and the Secretary of Defense insists that a cure is urgent. Moreover, $84 million, nearly half of the USMC's available funds, will lapse if not pledged within the next five weeks. So the Commission has at last brought itself to agree with the shipping lines that its estimates of foreign shipbuilding costs have been too high and that a subsidy of 45 per cent is justified, although not one of 50 per cent as the companies were demanding. As a result, two passenger vessels, the first built in American yards since the war, are to be constructed for the use of American Export Lines in the Mediterranean; an operational subsidy, as well as the building subsidy, will be paid by the USMC, which will also bear the cost of special defence features in the ships, such as their speed of over 25 knots. Three passenger cargo ships for round the world service have been ordered for the American President Lines and bids have been asked for the largest and fastest passenger liner ever built in America, to be operated by the United States Lines in the North Atlantic.

The Department of Justice has also prescribed some medicine, but not only did it disregard the patient's aversion to free competition, but it offered its advice without being consulted and was implicitly critical of the family doctor. It is not surprising that this drastic purge is being indignantly rejected by the patient. The Department asserts that the Far East shipping conference, dominated by foreign lines since only six of its 25 members are American, is breaking the anti-trust laws by conspiring to monopolise the cargo trade of the Orient. It charges the conference with violating "the American ideal of competitive enterprise" by its system of exclusive patronage contracts, which are also used by many other shipping conferences to avoid rate wars. The Department holds that such contracts are contrary to the 1916 Act which exempted shipping conferences from the anti-trust laws. Under the Act the USMC has the duty of approving such agreements, and it is affronted at the suggestion that it has ever permitted foreign lines to set rates or to dominate American steamship companies. This difference of opinion between the two agencies is no new development, and the USMC probably shares the view of the shipping interests that the indictment menaces the stability of the whole shipping world.

* * *

Peacetime Conscription

Next Monday is R-day, and newly restored draft boards will start taking the names of the younger brothers and even the sons of the men they called up between 1940 and 1946. Under the Selective Service Act of 1948 all civilian males between 18 and 26 must now register for 21 months of military service. Although there are some eight and a-half million in this age group, the new draft law, which expires at the end of two years, provides so many exemptions that only a few of this number will actually put on uniform. It is estimated that there will be about 600,000 eligibles, of which the Army will need 250,000 in the first year. The Air Force and Navy are up to strength, so that, at least for the present, the draftees will not be inducted into either of these Services. After a certain amount of objection from the National Security Resources Board, which deplored the depletion in the ranks of skilled labour, it has been decided to call the eldest men first, though as most of them were in one or the other of the services during the war and are, therefore, exempt, it will be the younger men who will make up the majority of those selected. Politics probably have something to do with the fact that inductions are not expected to begin until after election day in November.

The time since the draft law was passed has not been wasted by those men becoming eligible for service. Some spring courtships have been hastened into summer weddings (married men have been deferred by an Executive Order); many thousands have volunteered for the Navy and Marine Corps, and the Army is also well satisfied with the way recruiting has flourished—in July enlistment figures were around 50,000. The law provides a popular training programme for boys of 18; with the consent of their families they are invited to enlist in any one of the Services for 12 instead of 21 months. Besides serving a shorter time than the older recruits, they are better able to wedge their military service in between school and college or to complete it before taking a job. Such large numbers have taken advantage of this opportunity that many a 17-year-old fears the 161,000 quota for this age bracket will be filled before he reaches his eighteenth birthday. Religious groups, on the other hand, have demonstrated their disapproval of conscription, and they have observed a Sunday for "mourning and repentance." Some Quaker groups favour "civil disobedience" and offer assistance to conscientious objectors.

Three years of demobilisation finds the Army short of the officers who will be needed to train the incoming draftees, and while some reserve officers have volunteered, it is feared that the ablest soldiers think that their war service sufficiently interrupted their civilian pursuits. The problem of doctors in the Service is even more acute than that of line officers, and, as almost none of the medical profession will be found among the recruits or the draftees, the Army will probably ask Congress for powers to draft doctors. If such an amendment is passed at the next session, the first to be called would be those who were given their medical education at Government expense during the war.

* * *

Singing in Minor Political Keys

Since the Civil War only three Presidential candidates, other than those nominated by one of the two major political parties, have managed to carry even a single state and thus collect any votes in the electoral college—James Weaver, the People's candidate in 1892, and two Progressives, Theodore Roosevelt in 1912 and Robert La Follette in 1924. Except in those three years the minor party vote has never been more than six per cent of the total vote cast and it has been declining fairly steadily. Yet there have usually been at least four minor parties running candidates for the Presidency, and this year it looks as if there may be nine of them singing for their suppers in the White House.

Mr Gerald K. Smith, who stood for the America First Party in 1944, has this year been nominated by the Christian Nationalist Crusade, an even more violently isolationist organisation, and the Texas Regulars and Independent Democrats of that year have been replaced by the "Dixiecrats," the rebel Southern Democrats whose candidates are Governors Thurmond and Wright. On the left wing of the Democratic Party there is, of course, Mr Henry Wallace, who is expected to attract the three or four million votes that traditionally go to a Progressive. The Communist Party at its recent convention put its official seal on the support which it has been giving to the Progressive Party and which the Progressive Party could well do without. The readiness of the Communists to work for a candidate who believes in "progressive capitalism" is understandable if it is remembered that in 1940, when they last ran a candidate for the Presidency, he polled only 46,000 votes; even at the height of the depression, in 1932, the party received only 103,000 votes.

In that year, Mr Norman Thomas, the hardy Socialist quadrennial, polled nearly 845,000 votes, a record for him. Mr Thomas reported on the three Philadelphia conventions for the *Denver Post* in order to raise money for his sixth campaign. He sees himself as the alternative to "a Communist peace, Truman's confusion and Republican conservatism." Many independent voters will sympathise with this view but few will express their sympathy in the polling booths; in 1944 the Socialist vote was only 79,000. Mr Thomas is not even the only Socialist competitor. The Socialist Labour Party has run a candidate fairly regularly for over fifty years, longer than the Socialist Party proper; its champion, Mr Edward Teichert, gained 45,000 votes in 1944. He is a follower of Karl Marx as interpreted by Daniel De Leon and stands for "an industrial republic of labour." The Socialist Workers' Party, supporting its own candidate for the Presidency for the first time this year, is apparently a Trotskyite party and intends to "mobilise the masses for a Workers' and Farmers' Government."

The Progressive convention gave the impression that Mr Wallace had collected all the "antis" and "one purpose" groups around him, but not only do the Socialist parties find their solitary point of agreement in their opposition to him, but the American Vegetarian Party is asserting its independence by putting up a candidate for the first time. It complains, however, that Mr Wallace has stolen some of its thunder. It is not so surprising that neither the Greenback Party nor the Prohibition Party have allowed themselves to be absorbed, since both first appeared on the ballot in 1876. The last Greenback candidacy was in 1884, but the Prohibitionists have been running candidates without a break. The Greenbacks take their name from the slang expression for paper currency and they propose to put "100 per cent greenback reserve behind all bank demand deposits to stop the boom-bust cycle." The Prohibition Party collected nearly as many votes as the Socialists in 1944 and this year it has the advantage of the only candidate who was born in a log cabin, a qualification for the Presidency that is becoming very difficult to acquire.

Shorter Notes

The Interstate Commerce Commission has confirmed as permanent charges the three temporary increases in railroad freight rates which have been granted since October, 1946. With adjustments recently announced, these amount to 22.6 per cent. Railway managements had asked for increases totalling 29.2 per cent, and they are expected to seek further relief this year, since costs are still rising and they are faced with new claims for higher wages which seem likely to be granted.

*

The sixty-sixth season of the Metropolitan Opera will take place after all. The 1948-49 season was cancelled recently because the management refused to meet union demands. After further negotiation, the employees have decided to sign contracts for another year on the same terms as before.

*

Next month "buying on tick" will become a little more difficult due to the anti-inflation Bill passed at the special session. Congress authorised the Federal Reserve Board to restore the wartime curbs on instalment buying; this will mean stricter terms for the consumer, who will be obliged to make larger initial deposits on purchases costing over $50 (one-third in the case of cars) and to finish payments in 15 or 18 months. But anything from a new roof to a diamond ring can still be bought on the instalment plan.

THE WORLD OVERSEAS

Canada's New Leader

(From Our Canadian Correspondent)

THE Rt. Hon. Louis St. Laurent, who will become Prime Minister of Canada when he takes the place of Mr Mackenzie King this autumn, was born 66 years ago. His father was French-Canadian, his mother Irish-Canadian, and he is, of course, Roman Catholic. Until eight years ago, he was a lawyer in Quebec City, a very able lawyer with a nationwide reputation. He could scarcely be called non-political, because in the Province of Quebec politics pervade everything, but at least he had not previously run for any political office.

In 1940, however, Mr Mackenzie King lost his Minister of Justice and right-hand man, Ernest Lapointe. Mr St. Laurent was brought in to the Cabinet to make good the loss. No doubt there were staunch party men who resented the intrusion of an outsider at that time, but this month, at the Liberal convention called to choose a new leader, Mr St. Laurent got 848 out of the 1,227 votes cast on the first ballot. It was an overwhelming victory for the newcomer.

Mr St. Laurent's political career has been marked by only one incident of outstanding importance. This was in the conscription crisis of 1944, when, after various expedients, Mr Mackenzie King finally decided that conscripted men would have to be sent overseas to reinforce the Canadian Army in Europe. Mr St. Laurent stood firm beside him, and many people said that, considering the unreasoning French-Canadian antagonism to any form of military conscription and, above all, to conscription for overseas service, this was political suicide. But in the general election that came a few months later Mr St. Laurent got the largest majority in the history of his constituency—larger than it had ever given to the great Lapointe.

In spite of this political triumph, Mr St. Laurent is not at his best on a political platform. Quiet, scholarly, even erudite, he is more at home at a meeting of the Bar Association or receiving an honorary degree at a University Convocation. He is most courteous, even courtly. He speaks elegant English—indeed, the linguists say that his pronunciation of English is more pure than his pronunciation of French, which, despite his Irish mother, is his native tongue. The House of Commons listens to him with attention and respect, for he can quickly grasp the essentials of a complicated situation and see the point of an involved argument.

Only once has he seemed to wander from the path of strict political honesty. As Minister of Justice, he was responsible for the secret Royal Commission which investigated the great Canadian spy ring in 1945-46. It happened that, at the end of 1945, he had to tell the House what Orders-in-Council were still outstanding under the War Measures Act, and, perhaps inevitably, he omitted to mention the Order under which the Commission was then secretly working. But it is a pity that, when he was later charged with misleading the House, he did not openly admit that he could not then have made any statement which might have led to a disclosure of the Commission and its work.

Strong Supporter of Western Union

When Mr Mackenzie King decided to divest himself of the responsibility for External Affairs, which had traditionally been the task of the Canadian Prime Minister, Mr St Laurent became the Secretary of State for that department. Since external affairs are largely non-partisan, the position has suited him well, and he has filled it with distinction both at home and abroad. In recent months he has taken a lead both in Ottawa and Washington, in sponsoring North American military guarantees for Western Union. Once again he is taking a line diametrically opposite to the tradition of his native province which has been strongly isolationist. But now that foreign entanglements can be interpreted as alliances against Godless communism there is less opposition than when they could be held up as British imperialism.

On purely domestic issues his views are not widely known. He seems to stand to the right of centre, both within the Liberal Party and also in the country at large where the party occupies a central position between the Socialists on the left and, on the right, various groups that can be broadly classified as Conservatives (the national Progressive-Conservative Party the *Union Nationale* in Quebec, and the Social Credit Party in Alberta). In one speech, given several months ago, he vigorously opposed any subsidies for housing from the federal government. On the other hand, he has supported the recommendations of the Rowell-Sirois Report (1940), which called for an extension of social services based on a redistribution of powers and revenues between the Dominion and the provinces; indeed, as the Commission's Counsel, he may well have had some influence on its conclusions. Moreover, the same Liberal convention which chose him as their leader endorsed proposals, put forward by the Government in 1945, that go even farther along the path of social security.

Liberal Opposition to Provincial Rights

This puts the Liberal Party and its new leader on the side of centralisation of powers and revenues, and against "provincial rights." Strangely enough, it was on exactly the opposite side of the same broad issue that the Liberal Party, led by Wilfrid Laurier, another French-Canadian, came into power in 1896. At that time it was the Conservatives who had been favouring political centralisation together with industrial protection and expansion. For most of the time since then the Liberals have been in power (except for two unsettled periods, 1911-1919 and 1930-35). They have usually stood, both under Laurier and his successor, Mr Mackenzie King, for decentralisation and for provincial rights. This Liberal era was marked by Privy Council decisions regarding the Canadian constitution that have made it a great deal less centralist than (according to most historians) the Fathers of Confederation intended it to be. Now, however, it is the Liberals who favour centralisation (although not with the same violence as the Socialists), while the Conservatives, seeking to stem the tide of social legislation and government regulation, are on the side of provincial rights.

The position of the Conservatives as the champions of provincial rights is being strengthened by developments in the Progressive-Conservative Party. Its leader, Mr John Bracken, has resigned, ostensibly because of ill-health and to admit a younger man. This is the work of an aggressive group, centred in Toronto, who want to get the national leadership for Mr George Drew, Premier of Ontario. Since they have got Mr Bracken out, they will probably get Mr Drew in. Mr Drew, of Ontario, and Mr Duplessis, who got back into power in Quebec in 1944, have together, and perhaps with some measure of collaboration, defeated the centralist overtures of Ottawa arising from the Rowell-Sirois Report. Within the past two months both of them have held provincial elections in which the issue of provincial rights bulked large. Mr Drew was returned with a big but diminished majority; Mr Duplessis with a big and substantially increased one. Interestingly enough, Mr St. Laurent took an active but apparently not very successful part in the Liberal Party's provincial campaign against Mr Duplessis.

People are beginning to speculate on what sort of government Mr Drew might form in Ottawa if he got the opportunity. He would have his own followers labelled Progressive-Conservative from the three Maritime Provinces, from British Columbia and from his home province of Ontario. He would also have some from Quebec, and others from the Duplessis camp labelled *Union Nationale*. On the Prairies, where the name of Drew epitomises the unwillingness of the richest province to "share the wealth," he would have no direct following but would get co-operation from the Social Credit party which has, this month, firmly re-established its hold on the provincial government against the opposition of Liberals and Socialists.

The question that the Liberals were asking at their convention earlier this month was: who can maintain the Liberal tradition of a truly national party, of Canadian unity, against the rise of socialism in various parts of the country and against the unholy alliance that Mr Bracken's successor might piece together? Looking to the next election, in 1950 at the latest, they were wondering how they could keep the held over Quebec which they had maintained since Laurier's success in 1896 and which Mr Duplessis is now challenging. To this problem Mr St. Laurent was the obvious answer. His overwhelming victory will give the party a sense of solidarity and purpose. (The contrast with the antics that accompanied the Republican and Democratic conventions in Philadelphia in July also gave all Canadians a sense of the dignity of Canadian politics.) But he is not the ideal party leader. His inexperience, his firmness which may turn out to be stubbornness, his lack of common touch, and his ignorance of the hurly-burly of ward politics, all count against him. And so, of course, does his age. This factor alone will prevent him being another Laurier or another Mackenzie King who respectively led the party from 1887 to 1919 and from 1919 to the present day. There are a number of exceptionally able Liberal ministers around the age of fifty who would, in the opinion of many Canadians, make better leaders in the long run. But for the moment, and for an election next year, Mr St. Laurent is almost ideal. And he may be counted upon to carry out the duties of Prime Minister with dignity and with honour.

Russian Tactics in Berlin

EVER since the battle over Berlin became fairly joined between East and West, the Russians have made every effort to persuade the 2,500,000 Germans in the western sectors that their salvation lay with Russia and not with the "rather windy air bridge" of the western Allies. After having succeeded, by their blockade of the three western sectors of the city, in depriving the inhabitants of all fresh meat, and practically all fresh fruit, vegetables and milk, in reducing the domestic consumption of electricity to four hours daily, and in forcing all tram and underground services to stop running at six in the evening, the Russians then sought by various offers of food and fuel to show that only they were willing to take practical steps to alleviate the distress of the Berliners. At the same time they have taken every opportunity to insinuate that the western Allies were trying to dismember Berlin just as they were trying to dismember the rest of Germany. While the Russians have tried to assume unilateral control of various aspects of the city's economy, such as currency and food distribution, in order to present the Germans with the *fait accompli* of sole Russian control, the Anglo-American countermeasures which have thus been provoked have lent colour to the charges of Anglo-American "separatist and divisionist measures."

The Soviet offer of July 20th to feed the whole of Berlin was called an "act of unexampled humanity and generosity" by the Soviet-controlled paper *Tägliche Rundschau*. It was made, with careful timing, the day after the western Allies announced that owing to the Russian blockade, the increases in the ration scales agreed to at the last meeting of the Kommandatura could not be introduced in the western sectors. The effect of this offer was somewhat marred by the fact that it happened to coincide with an acute temporary bread shortage in three districts of the Soviet sector, the inhabitants of which were forced to borrow from their friends in the western sectors. However, the Russian offer was made to sound sufficiently alluring. The rations provided would include new potatoes and fresh milk. Those registering at shops in the eastern sectors were offered an extra allowance of one pound of sugar, three pounds of potatoes, and one pound of flour, and the Germans to whom this offer was made were not then to know that it would later be withdrawn without any reasons given. On July 21st the Soviet-controlled German Economic Commission announced that it would consider means of improving communications between the western sectors and the Soviet sector in order to make it easier for people to fetch their food. Last week the Russians announced that every Berliner registering in the eastern sector would receive a hundredweight of coal and two extra pounds of flour, and that next month white rolls would be baked for all ration categories in the eastern sector. These successive bribes reflect the poorness of the response to the Russian offer. Only a bare one per cent of the inhabitants of the three western sectors had registered in the eastern sector by August 1st, which was originally supposed to be the last day for registrations.

The Russians have been quick to make use of the dislocation of trade and industry, and consequent unemployment, which is an inevitable result of their blockade of the city. At the beginning of this month 3,410 firms in the western sectors were forced to stop work because of lack of power, and 4,627 had applied to go on short time. Russian propaganda has been suggesting that all economic problems caused by the blockade could be solved if only the works councils and managements would co-operate with the Russian-controlled German Economic Commission, and several offers have been made by the Russians to supply Western firms with fuel, raw materials and trading facilities. On July 22nd the German Economic Commission issued orders to the city electricity undertakings to supply 10,000 kilowatt hours of current daily to the AEG turbine works in the British sector. Undeterred by the British refusal of this offer, on August 3rd the German Economic Commission offered to bring electric cables to those firms in the western sectors which were ready to work for the Soviet economy, as well as to provide them with raw materials. A few days earlier the formation had been announced of a "Trading Company of Greater Berlin," the object of which was said to be "to restore normal trade relations between Berlin and the Soviet zone and to put an end to the stoppage of work in the western sectors." Firms joining the company were offered a supply of raw materials and fuel and an assured market in the eastern zone. The day after the announcement was made the Soviet controlled press announced that fifty unnamed western firms had opened negotiations with the company.

The Russians have accompanied their claim that the Western Allies have forfeited all right to share in the administration of Berlin by increasingly aggressive moves designed to deprive the Allies of their share in the administration of the city and to supersede the democratically elected German *Magistrat* by the German Economic Commission. The economic dislocation caused by their determined efforts to secure unilateral control over Berlin's currency must have had an unfortunate effect upon their campaign to woo the Germans. They authorised the transference of 25 million marks to the *Magistrat* from its blocked accounts in the eastern sector probably because they realised that the *Magistrat's* unpaid German workers would have the perspicacity to place the blame for their lack of wages in the right quarter. But their offer to unblock part of the accounts of western private firms in the eastern sector was vitiated by the "clearly unacceptable conditions" by which it was accompanied.

The British refused to allow the Russians to disrupt the distribution of food in the city by trying to take over half the staff of the *Magistrat's* food department to run their own scheme for feeding the city. And the move of Herr Fullsack, the legal head of the food department, with about 500 of his staff, from the offices out of which the Russians had turned him to new quarters in the British sector was hailed by the Russian-controlled press as a carefully designed British attempt to split the central food office. The suspension on July 26th of Herr Markgraf, the head of the city police, on the grounds that he was fostering Communist influences in the police force, was also claimed by the Russians as evidence that the Western Allies were trying to split the city's administration, in this case by creating a separate police force of "fascist rowdies" under their own nominee Dr Stumm. However, 60 per cent of the police in the eastern sector were unimpressed by this interpretation of Allied actions, and joined Dr Stumm, even though it meant migrating, bag and baggage, with their families from their homes in the eastern sector.

Brazil's Five Year Plan—II

[FROM OUR CORRESPONDENT IN LATIN AMERICA]

IT is an open question whether the remarkable development of air transport has bypassed or merely postponed Brazil's "railway age." If the country's resources are ever to become the lifeblood of its gigantic frame, then its actual predicament seems to be that it has acquired veins before arteries. Yet aircraft themselves are helping to correct this novel development. Virtually the only links between some population clusters, they are carrying road-building materials into the hinterland for a "Transbrazilian Highway." When a Brazilian can take to the road as he now takes

to the air, the pattern of the country's economy will be very different, especially if his car is running on Brazilian petrol. But the *Salte* plan looks only five years ahead.

The power section of the plan lays down a programme to exploit Brazil's petroleum deposits, and to build 15 tankers and two refineries (for which France may supply the materials) capable of handling a domestic production equal to the country's present consumption of 50,000 barrels a day—all imported. Wells sunk in the State of Bahia are not being worked. Their potential output is estimated to be a mere 2,500 barrels a day, and this is the extent of Brazil's proved reserves. The amount of 1,150 million cruzeiros (£15 million) which the planners propose to spend on new drilling is three times more than the Government's total outlay since it first began to hunt for oil 28 years ago. It remains to be seen whether it will assure a domestic production of 50,000 barrels a day in four years' time, as the planners believe. They estimate that, by then, the country will need 80,000 barrels a day. The vexed question of the terms on which foreign oil interests might participate is left severely alone, but Brazil's oil prospects appear to depend on how this is settled more than on anything else.

Hydro-electric schemes (for which Brazil has ample water-power) and the development of a heavy electrical industry are also contemplated. Here, however, financing is left predominantly to the foreign interests such as the Canadian-owned Brazilian Traction, Light and Power Company, Ltd., and the American and Foreign Power Corporation. Between them, they are to supply 6,822 million cruzeiros (£91 million) of the 8,172 million cruzeiros to be spent. This does not include a loan of $90 million which the Brazilian Traction recently obtained from the World Bank with the Brazilian Government's guarantee, for an electricity supply scheme for Rio and Sao Paulo.

Such are the provisions of the *Salte* plan. Brazil has had plans without end, but the imagination is captured by the way the latest one marshals the development problems of the world's fourth largest country. What of its attempt to relate its task to budgetary possibilities? According to the planners, the Government's outlay would amount to no more than £48 million, or 3 per cent of the national income for 1947, which was 120,000 million cruzeiros. This computation, however, allows for recoveries from development loans that are part of the plan. Even so, the proposed expenditure of 8,200 million cruzeiros in foreign currencies would be a cheap price to pay if, as the planners hope, increased domestic wheat and petroleum output during the last two years of the plan were to save more than all its foreign spending. The following table shows what, in fact, the Government proposes to spend.

(in million cruzeiros)

	Ordinary Budget	Internal Loans	Total
Health	2,240	380	2,620
Food	...	3,700	3,700
Transport	6,060	4,070	10,130
Power	1,900	1,350	3,250
	10,200	9,500	19,700

In round figures, foreign capital is to supply (for electric power) £91 million of the £360 million for which the whole plan calls, and State and Municipal authorities a further £8,000,000, leaving £261 million (the 19,700 million cruzeiros shown above) to be found by the Federal Treasury over five years. Of this, £20 million are budget appropriations which would be made in any case for programmes absorbed by the plan, so that £241 million, or about £48 million a year, is the extra strain to be thrown on the country's budget. On the basis of the 1948 budget, this would increase annual expenditure by a quarter. The planners count on raising half of this increase by internal loans, and another sixth by a 40 per cent increase in Brazilian tariffs (agreed at the ITO Conference in Havana) which came into force this month. The loans are to come from exporters, who would subscribe 5 per cent of their sales over the five years to "*Salte* Plan Bonds"; from the Bank of Brazil, backed by its foreign holdings (mainly Brazil's blocked sterling); and from the "prudent" liquidation of coffee stocks held off the market in order to "valorise" Brazil's most important export crop.

Foreign Trade the Key

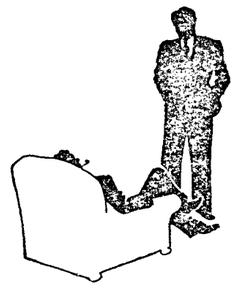
Much obviously depends on the course of Brazil's foreign trade, and both the planners and the political committee express understandable concern over its present trend. Foreign trade during the first four months of 1948 showed an import surplus of 1,612 million cruzeiros (against an export surplus of 30 million cruzeiros for the same period last year). Import licences have been introduced, but with the United States alone Brazil had run up an import surplus of $49 million from January to May. And there has recently been a steep decline in cotton exports and a drop in the all-important coffee shipments. These are unpromising signs. They hardly point, either to an effective "forced loan" from exporters or, if import restrictions are enforced, to more lucrative tariffs. Nor do they strengthen the economy of a country where inflationary prices seem to resist every control. Brazil's dollar import surplus is proving equally intractable.

But if foreign trade means much to the *Salte* plan, so does the attitude of Brazil's vested interests. Crop producers, whose wealth comes largely from exports and whose strongholds are Sao Paulo and the south, complain that higher tariffs mean not only still dearer living for Brazilians but dearer tools for farmers. Added to the forced loan on exports this, they argue, would discourage agricultural expansion. Sao Paulo manufacturers may take comfort from the tariff increase, but they also resent the drain of the loan on their exports. The consumer may well continue to be the guinea pig. But the real significance of these arguments, calculated as they are to defend the interests of the richest States, is that they point to the intrinsic problem of all planning on a national scale.

Importance of Sao Paulo

The problem can be simply stated. The Federal Treasury draws the bulk of its income from the few wealthy States. Sao Paulo is said to pay two-thirds of the nation's taxes, and has been described as "a locomotive pulling twenty empty wagons." But many of Brazil's richest natural resources lie in its poorest States, in Amazonia and the north-east, where conditions today prompt the visitor to echo the question of an early Portuguese statesman—"What is this wealth that makes such misery?" The national conscience is with the Federal Government, but the funds are in Sao Paulo. And, not unnaturally, the *Paulistas* put their own problems first.

Less developed States cannot finance their own development (more than 90 per cent of the revenue of Amazonia goes in salaries to state employees). In some cases they cannot pay their richer neighbours for the food they need so badly, cannot grow, and do not get. Until their wealth is commercialised they have nothing to offer the busy and self-centred south. Amazonian jute might well be Brazil's next great crop, in a country whose growth has been marked by cycles of "crop economies." It would be just as rash to deny the possibility as to bet on the certainty that plantation rubber, or cotton, or petroleum, or the nickel and coal deposits on the Tocantins, will one day reach Brazilian or world markets. Only eight tons of jute seed have been produced this year, as an experiment. But next year there is every prospect of 40 tons. Meanwhile, Sao Paulo relies on India. And the Amazon is worlds away.



Politically, the federal outlook is today perhaps more truly national—and more nationalistic—than ever. The trend began with President Vargas, and was strengthened by wartime development, which taught Brazilians much about the possibilities of their enormous country. But the economic balance of power is still held by Sao Paulo.

All these circumstances do something to explain why, one after another, schemes to "valorise" the Amazon and other parts of the country find a ready press but no solid backing in the country. The development of such resources has usually fallen almost exclusively to foreign capital. And future development seems likely to follow the same course.

The fact remains that behind the feverish cosmopolitanism of Rio, the industrial fervour of Sao Paulo (which has closer links with the outside world than with the Amazon) and the activities of many ports serving mere pockets in Brazil's 4,000 miles of coast, half a continent waits to be modernised. The statistics embedded in the sesquipedalian report on the *Salte* plan only state the task of opening up this other Brazil, by far the largest, and perhaps the least understood, of all South American countries. Under the hand of President Dutra, however, and in no small part because of the pressure of world shortages, the task has at least acquired a new look.

During the first half of his five-year term, the President has gone some way towards balancing the country's budget. Whether the extra funds for the plan will be forthcoming depends more on the immediate prospects of Brazil's foreign trade than on the planners. But funds are at best only half the battle. Only when the *Salte* plan is actually put in hand will it be seen whether its new look is merely a passing fashion or really a new deal for Brazil.

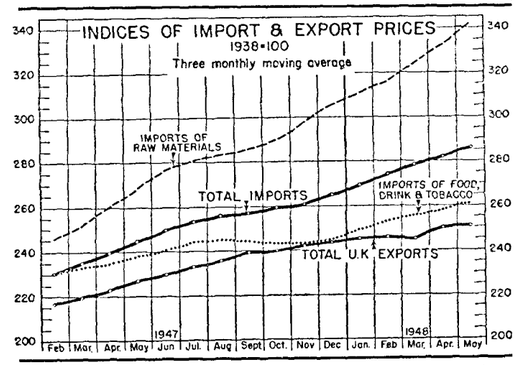
THE BUSINESS WORLD

The Direction of Britain's Trade

One of the most heartening signs recently has been the progress of the export drive. In the first half of this year the volume of British exports surpassed the (admittedly reduced) target fixed in the "Economic Survey." The extent of the impression which this bigger flow of British goods overseas has made upon the total external deficit has, however, been disappointing. As Sir Stafford Cripps pointed out recently, the visible deficit was running during the half year at an annual rate of £300 million—although the volume of exports was almost one-third larger than before the war and the volume of imports one-fifth smaller. The total external deficit, including invisibles, for the half year was equivalent to an annual rate of perhaps £400 million. Admittedly, this represents a marked improvement upon last year's deficit of £675 million (or, according to alternative official figures, £575 million). Even so, the final deficit for 1948 will certainly be far larger—perhaps by as much as £100 million—than the £250 million upon which the Chancellor's economic planning has been based. External disinvestment on this scale would have been intolerable without American aid and, even with that aid, may still be imposing an undue strain upon the gold and dollar reserves.

The general problem of Britain's balance of payments therefore remains, even though it is yielding to some extent to the efforts of recent months. What of the specific problem of the "hard currency" deficit which, until recently at least, was generally regarded as far transcending, in difficulty and importance, the general problem? Recently, it has been contended that the scheme now being matured for extending trade within Europe, by directly linking intra-European credits with Marshall aid, will lead European countries increasingly to turn their attention from the dollar problem as such towards the problem of achieving external equilibrium as a whole. Certainly, if means could be found to promote a multilateral flow of trade, and to restore convertibility to soft currencies, the distinction between "hard" and "soft" deficits would disappear; and it may be true that any progress towards multilateralism may make that distinction more and more blurred. In these early days of European co-operation, it is easy, perhaps, to take too pessimistic and cynical a view. But at least it should be said that there is little sign yet that the dollar problem as such is receding, and no assurance that it will not still be a source of anxiety when the Marshall period ends.



Without prejudice, therefore, to the possibilities which may open out when the OEEC outgrows its teething troubles, it is still important to watch with great care the progress of the efforts to reduce Britain's dollar gap, as distinct from its external deficit as a whole. In the short run, probably the only chance of further narrowing the gap lies in the expansion of British exports to the dollar area; but in the long run such efforts could be strongly supplemented by developing alternative sources of supply within the sterling area. Closer economic co-operation in Western Europe, if it includes some form of multilateral trading, will undoubtedly help, but the measure of relief it can afford is likely to be limited.

Britain's dependence on the Western Hemisphere for imports can be seen from Table I. In 1947, over 45 per cent of total imports came from this area, compared with under a third in 1938. Although no serious steps to rectify the dollar disequilibrium were taken until August, 1947, and although the measures then adopted were not particularly drastic, British imports from the Western Hemisphere declined significantly during the first half of 1948—though not to the extent that the full programme of cuts had led many people to expect. They amounted to £358 million, representing 34 per cent of the total imports, compared with £381 million, or 46 per cent, in the first six months of 1947. This decline has occurred mainly in goods imported direct from the United States. As the value of total imports has increased, there has necessarily been a larger proportional expansion in imports coming from other sources. Thus, between January and June, the sterling area (excluding South Africa) supplied nearly 35 per cent of Britain's total imports, compared with 30 per cent in the similar period of 1947. The proportion of supplies coming from European and other countries also increased significantly; as this trade is largely regulated by bilateral agreements, much of it is equivalent to transactions in sterling.

There has been in the aggregate a switch of imports from dollar to non-dollar sources. To what extent, however, has this been a genuine switch, in the sense of affecting comparable commodities? Imports of grain from the United States have been considerably reduced during the first half of 1948 compared with the corresponding period of 1947. Those from Argentina, however, expanded almost threefold, as can be seen from Table II. Larger quantities were also received from Australia. In total, grain imports from the Western Hemisphere have tended to increase. Supplies of meat from Argentina were 30 per cent smaller, but this reduction was partially offset by increased supplies from Canada and New Zealand, and on balance British meat imports declined by 8 per cent on the year. Imports of American cheese, dried eggs, and processed milk were drastically reduced during the first half of 1948. Although imports of these foodstuffs from the Southern Dominions have tended to increase, the effect of the reductions in dollar expenditure has been to reduce British total imports of these categories. This is equally true of imports of fresh fruit, other foods and tobacco. In general, then, the saving of dollars on food and tobacco—such as it is—has resulted in a net reduction of supplies reaching the United Kingdom. There has been an expansion in supplies from the sterling area, but this expansion has been insufficient to offset the decline in goods coming from the Western Hemisphere.

Raw material purchases have been little affected by the dollar cuts. The United States, Canada, and Argentina supplied £59 million worth between January and June, compared with £61 million a year ago. But total imports of raw materials increased from £245 million to £342 million; in other words, imports from dollar sources have been maintained while those from other areas have increased. For example, purchases of raw cotton from the United States have been reduced, or rather postponed, but bigger purchases have been made from sterling sources. On the other hand, imports of hides and skins from the Western Hemisphere have been considerably reduced without any corresponding increase in purchases from other areas. Imports of manufactures, on a value basis, have increased quite considerably during the year, both from the Western Hemisphere and from other sources.

On the import side, therefore, the authorities have had some success in their efforts to substitute sterling area and European sources of supply for dollar sources. The main cuts in dollar expenditure, however, have had to be borne in a reduction of supplies. The extent to which substitution might be possible within, say, the next five years, is necessarily limited. Large quantities of grain will still have to come from the Western Hemisphere—from Canada, the United States or Argentina. Similarly, Argentina will remain one of Britain's major sources of supply for meat. Britain may be able to do without American dried eggs and American cheese and luxury fruits and perhaps may even be able to reduce the quantity of Canadian cheese, eggs and bacon which it buys; but it will still have to import Cuban sugar, although perhaps not in the same large quantities as at present. So, too, with raw materials; the Western Hemisphere will continue to be an important source of Britain's supplies—Canada for non-ferrous metals, wood pulp and timber; United States for cotton, timber and metals, and Argentina for oilseeds, hides and skins.

This basic level of imports from the Western Hemisphere must in the last analysis be paid for by exports. Unless, therefore, genuine multilateral trading is restored on a scale far surpassing most present hopes, the payment can be made only by expanding the sale of British goods in dollar markets. And certainly that is true at present. The improvement in the re-direction of British exports, however, has not been so marked as that in imports. Although the value of exports to the Western Hemisphere amounted to £125 million in the first half of this year, compared with £92 million in the corresponding period of 1947, it represented under 16 per cent of the total—actually a slightly smaller proportion than in the similar period last year. The decline in the proportion occurred

mainly in the United States and Argentine markets; in other words, the expansion of exports to those markets has not kept step with the general expansion in the volume of British exports. The major expansion, of course, has taken place in exports to the sterling area; the proportion of total exports sent to South Africa has, however, declined.

In value, exports to the United States in the first half of 1948 showed hardly any increase over 1947, but those to Canada, Argentina and other Western Hemisphere countries were appreciably larger. The major increases in exports to the United States consisted of vehicles, which in value increased fourfold; of machinery, which were almost trebled; and of wool manufactures, which were more than doubled. There was also a large shipment to the United States of non-ferrous metals, which probably consisted of partly worked gold. In the vehicle group, the largest single item was the export of private motor cars amounting to almost £2,000,000; textile machinery was the main item in the machinery group. The increase in exports to Canada has been due to larger shipments of wool manufactures (chiefly tops), which have risen from £4,000,000 in the first six months of 1947 to £9,000,000 in the same period of 1948. Exports of vehicles to Canada have also increased appreciably, from over £1,000,000 to nearly £4,000,000. This was largely due to a large consignment of aircraft, but the number of private cars exported also increased. Exports of manufactured goods to Argentina expanded at a smaller rate than those to either Canada or the United States, the main increases being in machinery, electrical goods, chemicals and vehicles.

By improved design and sales promotion, British exports to the Western Hemisphere can undoubtedly be increased still further, but such an expansion is unlikely to reduce Britain's deficit with that area to less than £250 million a year—unless there is a pronounced change in the terms of trade, which this year have deteriorated still further; that is, import prices have risen much more sharply than export prices, as the accompanying chart shows. So long as ECA is available to meet this deficit, the present standard of living in Britain may be maintained—given the strict limitation of the scale of domestic capital outlays. But, at best, ECA will last only until 1952, and that leaves little time to develop alternative sources of supply.

Capital Formation in Industry

AT this season, with Parliament in recess and political activity cut down for the holidays, the Government planners are working on the programme of capital investment for next year; in the autumn it will be subjected to political scrutiny and revision, and in November or December can be expected to appear before Parliament as the White Paper on Capital Investment in 1949. When the first White Paper on Capital Investment was published last December, its principal novelty lay not in anything tangible in its detailed contents, but in the attempt to formulate a comprehensive investment programme at all.

Such an attempt was new, and the appearances were that the techniques both of drawing it up and of applying it were still embryonic. Its statistical basis did not appear to have got beyond the roundest of round figures. Its attempt, however necessary, to distinguish between net and gross investment would probably not survive detailed examination: by what method, and with what accuracy, was the running down of existing equipment assessed? The programme outlined in the White Paper did, however, give one distinct impression which the intervening months have done nothing to remove. It gave the appearance of treating industry—and especially privately-owned industry—as residuary legatee to an estate which the prior claims of housing, utilities, and Government undertakings would largely consume. Assuming the gross total of physical investment at home planned for 1948 by private and public bodies to have been £1,600 million, it proposed to reduce that total by £180 million over the year. The reduction was to take effect largely in the second half of the year, so that the gross annual rate of investment would have fallen as low as £1,320 million by next December.

Most of this reduction was to come out of private industrial investment—which included, for this purpose, plant, machinery and vehicles as well as building. The Government did not propose to re-introduce "licences to acquire" machinery, but proposed to rely on export quotas to reduce the actual amount of home investment, and on "the good sense of private industry" to reduce the amount of capital work started:

> With this object in view, the Government will discuss the matter with the appropriate industrial organisations, so as to attain the maximum possible postponement of all investment not making a significant contribution to the export drive or to the output of basic industries such as agriculture, coal and steel.

Industrial building was to be cut down, primarily in order to release more steel for the manufacture of engineering goods for export:

> To achieve the necessary diversion of resources, it would not be sufficient merely to restrict the number of new buildings started. It will also be necessary to postpone work on a good many factory building projects which have already been authorised but which have not yet been started or are in the early stages of construction.

Here the necessary physical controls were ready to hand, and a series of measures was enumerated on which Government action would be taken. Allocations of steel for building were to be reduced. For six months no new industrial buildings or extensions would be started, "other than a limited number of projects of exceptional importance by reason of their contribution to exports or import saving." (In fact, as the figures for the issue of licences for factory building show, this was maintained for five months, from November to April.) All factory building already in progress, but which had not yet reached the steel erection stage, would be reviewed "with the object of postponing at least half." And the general principle was laid down that "within the reduced volume of factory building, preferential treatment will continue to be accorded to the development areas."

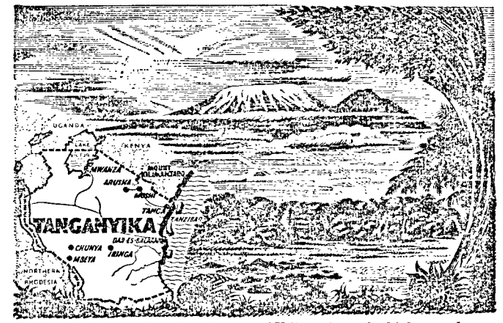
The second White Paper may attempt an assessment of the working of the policy laid down last December. This, if it is to essay completeness, must be an elaborate task; the forms which "investment" in the sense of the White Paper can take (ranging from a new motor-coach, an isolated machine, or a telephone switchboard to a complete oil refinery) are too various and some of the media of control too tentative and incomplete, for it to be otherwise. This article seeks merely to discuss some of the factors which have influenced industrial investment in the nine months since the programme for this year was laid down.

Government policy makes itself felt by various means—some direct, some circuitous. The bulk of new industrial building in the past three years has been financed not by new issues but from the existing resources of companies. But an industrial project, whether it requires an issue of new capital or not, cannot be realised nowadays without the approval of a Government department. Since the White Paper, "approval" has been hardly a strong enough term; many projects are viewed with benevolence, but only those which can secure active support have a good chance of going ahead. They must have building licences, access to steel and timber, and the assurance of working materials once they are in production. They must also have machines. Where control is not exercised by licensing, the Ministry may still wield a substantial authority simply through its power to divert machines or commodities to other destinations. If the Ministry of Supply causes machines to be exported (as, of necessity, it does) it follows that the home industrialist cannot buy them. If the roller-bearing manufacturers are occupied with huge contracts for the National Coal Board, so many fewer bearings will be available for other customers. Methods of pre-emption favour the official user as against the private user; methods of allocation favour the old customer as against the new entrant into the field. The new entrant cannot get far without positive official backing.

Equally, he cannot get far without finance. In view of the steady depletion of industry's wartime accumulations of liquid assets, a larger proportion of new capital outlays is likely to require finance through the new issue market than in the recent past. But, even though the ostensible method of vetting such outlays will be the mechanism of the Capital Issues Committee, the power of decision will still effectively reside in the controls (mainly physical) which are exercised by the departments. This now familiar arrangement has a simple effect: the Capital Issues Committee is rarely called upon to turn down any application, and it is doubtful whether the proportion of applications turned down this year, measured by cases or by the volume of capital involved, greatly exceeds 5 per cent. This is not to say that the Committee is ineffective: it is extremely effective. Most industrialists, and all issue houses, are perfectly aware that it is useless to go to the Committee with a scheme for which departmental approval has not first been obtained. If they should do so, they would merely have to wait while departmental reports were obtained. And the departmental reports concern themselves not merely with the merits of the scheme, but with the hopes of fitting into the department's investment budget the expenditure of physical resources which the scheme would involve. The departments mainly concerned with private industrial building are the Board of Trade, the Ministry of Supply, and the Ministry of Food; each has a maximum labour force assigned to it, and is enjoined not to support projects which together would employ more than the maximum. Each is also restricted as to the steel which it can cause to be put into new building. That these budgets may be exceeded does not imply disregard of the restrictions; it implies inability to control completely the speed at which new projects, once approved, make their call upon the constructional resources.

Substantially, then, the Capital Issues Committee does not itself restrict investment, but seeks to ensure that new issues are in line with the real investment possibilities as seen by the Government. An apparent exception is the project which involves foreign capital, or which may require large purchases of plant or patent rights from foreign sources, or which may enlarge a foreign-owned undertaking and thus create a future drain on sterling. On these the Treasury itself has the last word; the mere usefulness of the project, and even the readiness of a Ministry to divert the labour, the timber and the steel from other work, have to be set against the possible monetary burden involved, and have to weigh heavily in order to prevail.

Any new industrial project must therefore, to be translated into fact, enjoy the conjuncture of a set of favourable circumstances. It must conform with Government economic policy; merely not to conflict with Government policy is not enough—it must be met not with acquiescence, but with something approaching enthusiasm. It must also, still, have the support of industrialists prepared to undertake it and able to see it through. A good example is the new refinery programme of the Shell group. The White Paper on Capital Investment on



Under Charles II

The Great Fire of London, following on the Great Plague, changed the face of the capital. In recent years another Great Fire has changed the face of London once again. In both these catastrophes the watchword in Lombard Street was "business as usual."

Martins Bank, through the old private bank which operated at the sign of the Grasshopper, a business which was absorbed in 1918, has a link with the famous men of the reign of King Charles II, for the King himself, Prince Rupert, the Duke of Monmouth, the Prince of Orange, and Samuel Pepys, the famous diarist, all had accounts at the old bank.

The business of Martins Bank is now countrywide and branches number nearly 600, but the personal touch has not been lost and is still one of the outstanding features of the service provided for customers.

MARTINS BANK
LIMITED
LIVERPOOL, LONDON AND 600 BRANCHES.

It seems incredible that the existence of Kilimanjaro, the highest and most impressive mountain in the African continent, only became known to Europeans a hundred years ago. But such is the fact, for it was not until 1848 that a German missionary-explorer realised that the billowing white masses, thousands of feet in the air, which he saw from his camp in the plains, were not clouds as he had supposed but the snows which crown the mountain's peak throughout the year.

This seeming contradiction—a snow-capped mountain within a few degrees of the equator—has done much to bring prosperity to the local inhabitants. The melting snows of Kilimanjaro provide irrigation for the coffee plantations on the lower slopes and from these plantations the natives of the locality derive a great part of their livelihood. Full and up-to-date information from our branches in East Africa covering the coffee industry and other commercial activities of importance is readily obtainable on request.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)
HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3 D·C·O

the one hand, and the successive statements of the Shell chairman on the other, show how the Government and the commercial undertaking each arrived by independent routes at the conclusion that complete oil refineries would have to be built in this country. The coincidence is an indispensable one. To fulfil the further necessary condition of finding the capital is not the simple matter that it appeared two years, or even one year, ago. That it is not may be attributed to the fall in the value of money, which (as company boards have lately begun to perceive) has rendered inadequate reserves which used to be thought ample. Or it may be attributed to yet another Government control over industry—control by budgetary and fiscal policy. Chairmen of companies have given attention to both points in a number of recent annual meetings.

The chairman of Courtaulds observed in June that " this whole problem of plant replacement is perhaps the greatest problem facing industry today." He pointed out that the production and earning capacity of the company's former American subsidiary, the American Viscose Corporation, could not now be bought for twice the sum which the parent company received in compensation for its forced sale during the war. Courtaulds had reserves of £26,000,000 of which £24,000,000 represented capital and revenue profits accumulated in the main for the purpose of development and expansion of the business:

> We must regard a large part of this amount of £24,095,842 at the present time as likely to be required ultimately for additional costs of replacement of our fixed assets, and we might even find it necessary to add further substantial sums. While your directors are concerned that we should have to eat into these reserves to meet what, to my mind, should be regarded as current depreciation costs, the additional annual amounts involved are so large that there appears to be no reasonable alternative at present to taking this course.

He mentioned also that many of the projects which the company had been considering a year before had since had to be modified or postponed, and that the Government had drawn attention to the necessity of cutting down capital expenditure: the country (he observed) had come down nearer to earth.

*

Other heads of companies have been speaking with concern of the problem of preserving real capital value in inflationary times. The chairman of Patons and Baldwins pointed out that profits calculated on a basis which ignored the higher replacement value both of the stocks expended and of the fixed assets used were not really profits at all. The effect of taxing them as if they were, he clearly implied, was to drain off the sources from which capital for new development ought to come. Patons and Baldwins has undertaken large plans of expansion, and the chairman explained that its capital requirements to complete those plans had risen with the rise in costs of construction. In this case, short-term arrangements had been made to finance the more immediate of these commitments, the directors " considering it prudent to postpone the initiation of any permanent funding operations until more stable conditions prevail."

The problem of maintaining real capital in inflationary conditions, and its connection with the problem of capital formation, were discussed even more forthrightly at the Unilever meeting on Thursday, when Sir Geoffrey Heyworth illustrated them on a huge scale in Unilever values (but the elements are the same for many smaller concerns):

> The cost value of our fixed assets at the end of 1947 was £82,000,000, and depreciation is being charged in the normal way, which will lead to an accumulation in due course of this sum for replacements as and when they are required. To-day, however, we estimate that to replace our existing fixed assets would cost £148,000,000, so that at present price-levels our depreciation fund would be about £66,000,000 short of our requirements.
>
> Thus, if it relied on the normal depreciation provision, the company would eventually find itself with fewer machines, fewer employees, and a reduced scale of operations. It could avoid this only by the introduction of new capital. But this would not be an acceptable solution.
>
> The purpose of new capital is to provide facilities for making new products, to increase facilities for making the greater volume of existing products necessitated by extra demand and to purchase more expensive plant if it will do existing jobs more efficiently.
>
> The idea that the depletion of capital, due to inadequate depreciation allowances and under-valuation of materials, can be met from new capital is perhaps a natural confusion. One reason is that the replacement of a used-up appliance and the expansion of a company's capacity by substituting a different, better and more expensive appliance often occur simultaneously. There is confusion, too, because current profits are an important source of new capital—indeed, in the past, the most important source.

It remained true that savings used for one of these purposes could not also be used for another, and that if they continued to be depleted by being taxed as profits the share remaining for expansion of the business would be even smaller. Sir Geoffrey added that the same point could be stated in terms of the national economy:

> In England, as in most parts of the world, the available capital is inadequate to meet the many legitimate demands that are made upon it. It is essential to ensure that new capital is used for proper purposes and not applied to make good failures to maintain existing capital. Otherwise we shall find that our capital resources are being gradually dissipated in current expenditure.

The cases quoted here are in no way exceptional. Most of the major enterprises in most fields of British industry are conscious of ground lost during the war, or of new fields of activity which await the technical innovator, of expansion needing to be undertaken or re-equipment which would make possible the essential improvement of productivity. Many of them have embarked on plans from which they hope to see splendid results. The new oil refineries, the great undertaking of Imperial Chemicals at Wilton, the youthful petroleum chemicals industry, the innovations in plastics, nylon, and rayon, the new steelworks which are already beginning to give results—these are projects which have contrived to push their way past some of the obstacles of the economic crisis and the pitfalls of inflation. But they have still some distance to go—many of them a great distance—before they yield the full results which their authors expect from them. And the costs of construction and equipment rise while the planning and the building are in progress. In the immediate post-war scramble, one project after another was frustrated or delayed until it became clear that the economy as a whole was taking on more capital effort than the resources of manpower and material would permit. Some of the capital effort was diverted to consumer goods industries which, at the end of the war, were given a higher place in the scale of priorities than they could hope to have today. When the Government took action last autumn to bring capital enterprise into a more realistic relation to the possibilities of execution, it was taking a step in itself reasonable and necessary. Unfortunately the division of capital effort in the White Paper gave industry a smaller share of the resources available for new investment than industry could reasonably claim. The next investment White Paper may correct this error—and will, indeed, be judged largely by the extent to which it does so. But the further obstacles interposed by the fallen value of money have been present throughout the postwar period. They were concealed for a time, largely by the impossibility (for the other reasons outlined) of getting large undertakings carried through. In the past few weeks they have been more and more openly recognised ; it appears likely that, if the physical and administrative restrictions on investment could be relaxed, the difficulties of forming and preserving capital in present conditions would require, all the more urgently, to be solved.

Business Notes

Record Trade Figures

Exports from the United Kingdom during July reached the highest value ever recorded and the highest quantity since July, 1929. At £146 million, the value was £8,000,000 above the previous peak attained in July, 1920, and the margin would no doubt have been greater but for the London dock strike at the end of June. This " record," however, may easily be misunderstood. A seasonal peak tends to be reached in both exports and imports in July, both because it has the maximum number of Customs working days—27 instead of 26—and because of the tendency to clear documents to the Customs before the holidays. Yet the daily rate of exports last month was only very little above that for June ; indeed, the difference was almost entirely accounted for by the extra working days. Nevertheless, the general upward trend in exports was continued, though at a slower rate, as the accompanying table reveals. Recalculated on the basis of a standard month of 26 working days, the export figures show a very marked pattern. At the turn of each quarter the increase in exports is very small ; between the intervening months it is, however, large. Is this quarterly cycle due to the incidence of holidays and the methods of compiling the trade returns or is it merely a statistical freak ?

BRITISH EXPORTS

(Values Recalculated on Basis of Standard Month of 26 Working Days)

	£ Mn.		£ Mn.		£ Mn.
November ..	106½	February.	122½	May.....	135
December ..	114½	March ...	126	June	139½
January	115	April	126½	July.....	140

But it is not only the value of exports which has increased. The volume for July has been provisionally estimated at 49 per cent above the 1938 level—just short of the target rate projected for the year-end. In these volume figures, too, the rise since the beginning of the year has been continuous ; but, if past experience is any guide, this month's volume index is likely to show a decline.

By value, imports in July also attained a new high level, at £186 million. Much larger shipments of grain were received, mainly from Australia, and more meat and dairy produce from both Australia and New Zealand. Imports of raw materials, in particular raw cotton, were much smaller than in June, but arrivals of refined petroleum and jute manufactures showed an appreciable increase. Notwithstanding this heavy cost of imports, the adverse visible balance of trade was reduced to £33½ million, compared with £38 million in June ; in both cases import value includes insurance and freight.

The vital question is whether the export drive can maintain its current progress throughout the remainder of the year. Machinery and vehicles are still the main export groups. Machinery exports in July established new records for both quantity and value ; nevertheless, the main markets continue to be India and Pakistan, followed by South Africa. Exports in the vehicle group, taken as a whole, have not increased to the same extent as machinery, and the expansion last month was mainly due to larger shipments of main-line locomotives. But the export of private cars continued to expand, totalling 18,600 units, of which 3,715 went to the United States, 2,326 to Canada, and 1,820 to Belgium. It is encouraging to find these three " hard currency " countries as the three leading markets for British motor cars. And a further bright spot has been the increase in the exports of cotton manufactures, which in July were 29 per cent larger than in June ; their value at £13 million was the highest attained since 1929. Larger quantities were sent to the United States and Canada, but the main expansion was in sterling markets. Nevertheless, it will be no easy matter to maintain the current rate of total exports until December.

* * *

Steel Prices

Whenever steel prices rise, as they did last Monday, the whole economy feels an inflationary shudder. They form the backbone of the cost structure of every mechanised industry. But examination of the list of increases permitted by the Ministry of Supply reveals them as milder than they appear at first glance. The recent Coal Board shuffle of coal prices has meant on balance dearer coal for the blast furnaces, and has driven up the price of pig iron by 2s. 6d. or 3s. per ton. This is the latest of three increases. Basic pig iron cost £8 14s. 6d. in January and is now at £9 14s. A rise of 17s. on February 1st was the result of increased coal prices. The further increase of 8s. on June 21st followed the government's decision to change the subsidy on freight of imported ore. The steel industry, instead of being charged 150 per cent of the prewar freight, is now charged 200 per cent, while the actual freight is around 340 per cent. The additional 8s. for pig iron meant 5s. extra for billets. In conformity with the government's price stabilisation policy, the industry agreed to absorb all this extra cost itself and the price of finished products remained unchanged. Now the cost of billets has again gone up without an increase in price, and once more the industry has absorbed the difference. There must be a limit to this process whereby the government subsidises the steel industry and the steel industry subsidises its consumers. In one direction the end has already been reached. Increases in cost of heavy products formed direct from ingots, including heavy steel bars, sections and plates, colliery arches, pit props and rails, have been passed on to the consumer at 3s. 6d. a ton. Scaffold lashings will cost 3d. more a dozen. Main consumers of these heavy steel products are the National Coal Board, the railways, and the building and civil engineering trades. Possibly the Chancellor is less unwilling that prices should rise in these sectors than in the general run of industry. In the one case expansion is not regarded as being in the public interest ; in the other the inflationary impact can be softened by the policy of the nationalised boards.

Advantage has been taken at the same time to correct some anomalies between costs and prices. Prices and costs of silico-manganese products (especially used in the manufacture of springs) had got particularly out of line: increases range from 20s. a ton for billets to 27s. 6d. a ton for wire. Alloy steel billets are raised by 5s. a ton to parallel similar rises in the prices of other billets in June.

These changes have left finished steel prices still only 60 per cent higher than in 1938 while coal prices have risen 140 per cent in the same period. They also leave Britain still the world's cheapest producer next to Australia. The comparable American prices have recently risen and are generally higher than British or Belgian prices. Accurate figures are not yet available, but the gap between British and American prices—except for tin plate—is now considerable.

The Treasury announced on Saturday its sanction of the purchase of 100,000 tons of steel from Belgium and Luxemburg as part of the 500,000-ton import programme. More than half of the Belgian steel is expected to be in billets, sheet bars and wire rods Semis are more welcome imports than finished goods from the point of view both of the British steel industry and of the Treasury ; finished goods cost more in hard currency, and the cost of finishing is higher in Belgium.

* * *

Belgian Steel and European Payments

The deliveries of the Belgian steel are to take place over the next three months. In making the announcement the Treasury stated that the main purpose of the operation was " the easing of barriers to trade between the participating countries of the Organisation for European Economic Co-operation." This steel is additional to the amount being purchased under the current trade arrangements between Britain and these two countries—though not to the total imports planned for the United Kingdom this year. Since Belgium is still reputed to hold close to its £27 million ceiling of sterling, it is probable that this additional purchase of steel will cause Belgium's holding of sterling to rise above the ceiling and thus bring into play the convertibility clause. This steel may, in other words, have to be paid for in gold. This marks the operation as being in a special category ; the Treasury has announced that a continuation of purchases on a similar scale must depend upon the institution of a payments scheme between the participating countries which will facilitate trade exchanges and remove, or at least postpone, the convertibility threat which is inherent in the existing payments arrangements. The gesture, however, has not been a British one alone. Belgium is understood to have somewhat reduced its prices for this special deal and has also abandoned its customary technique of linking exports that are essential with exports of inessentials. The advantages of this purchase of 100,000 tons of steel will not be diluted by the compulsion to purchase, also, azaleas or hot-house grapes.

Anglo-American Film Relations

Mr Eric Johnston, president of the Motion Picture Association of America, is in England again at the beginning of a short European tour. He is to meet the President of the Board of Trade, who is on holiday, at Oxford this weekend. The meeting is to be informal with no agenda, and there is evident a strict—almost ostentatious—lack of intention to discuss the British 45 per cent film quota, which has supplanted the remittance of earnings as the principal matter of contention between London and the American film industry. In days of dollar shortage, the preservation of European markets for American films—and particularly their preservation in a remunerative state—requires activity on more than one front, and there are plenty of problems to occupy Mr Johnston without any frontal attack on the British quota. He will be visiting France, Germany and Czechoslovakia: in Western Germany, with the reformed currency and the approach of a federal government, the organisation of the market for films is clearly an urgent matter for Hollywood, and attempts to arrange for the remittance of film earnings may follow at only a short interval.

Mr Johnston held lengthy meetings during the week with the London representatives of the American film companies, to whom the quota has presented difficult problems of distribution policy and strong temptations to return to bellicose methods of trading. There have already been signs of a tendency for American renters to offer their first releases less to the big British circuits which are linked with the major British film producers, and more to smaller circuits which themselves resent the quota and are uneasy about their prospects of getting a good supply of films under it. There are suggestions, too, of a reversal of the American intention of three months ago to undertake film production in England on a substantial scale. As an answer to the higher quota, such a reversal is wildly illogical. It merely expresses the deterioration of feeling between the British and American film traders. The corollary (no less logical, since it cuts down the total of American film earnings remittable from Britain) is the collapse of the market for British films in the United States; for this the Sons of Liberty have been getting too much credit, and the American film trade too little.

It appears unlikely that Mr Johnston will waste further energy at the moment on a direct attack on the quota. But he may suggest ways in which its effects might be mitigated. Such suggestions would probably include the appointment of an American distributor member to the Films Council; the Americans have not concealed their resentment at the loss of the seat on the Council which they had come to regard as theirs by established custom. They might also suggest the abandonment of extravagant attempts to exceed the quota on big British circuits, and even the admission of American producers operating in England to the *British Film Producers'* Association. These are largely, though not entirely, matters which could best be settled by direct accommodation with the British film industry, and it may be relevant that Mr Johnston has seen British producers and exhibitors during the week. The American film industry has still one bargaining counter in its hand; it could offer a more helpful attitude towards the distribution of British films in the United States, and co-operation (instead of the present sharpening hostility) in the other markets of the world.

Unilever on Capital Maintenance

Sir Geoffrey Heyworth's exposition on the subject of replacement of capital, which formed the basis of his speech at the annual meeting of Lever Brothers and Unilever on Thursday, represents a challenge to both industry and Government. The dangers and fallacies involved in dressing capital up as income, which have often been the subject of discussion in *The Economist*, were most lucidly expounded and exposed, as is shown in a leading article on page 344 of this issue. Sir Geoffrey has not minced his words; they are tantamount to a condemnation not only of the present method of fixing depreciation allowances for the purpose of income tax but also of the whole Government attitude towards price control. Moreover, he makes it quite clear that, although it is not easy to define methods that will preserve true values of current assets in all circumstances, industry itself has not really got to grips with the problem of the replacement of fixed assets. His plea for a more enlightened approach to the problem is timely, and in the final analysis all sections of industry are concerned. He states that "The proper provisions to allow for replacements must be calculated. . . . Distributions of profit, however desirable, must not be made unless the maintenance of true capital is first assured. Selling prices must be so fixed as to bear relation to real cost." As he rightly points out, a partial alternative lies in a sufficient increase in efficiency, but efficiency itself depends on the use of new and better plant which in turn is dependent on adequate provisions being made to acquire it. The implications for taxation policy are not new, but they have been made a little clearer.

* * *

Holiday Dis-saving

The passing of the peak of the holiday season has been accompanied not only by the customary steep fall in the note circulation—its decline has been even steeper than it was twelve months ago—but by a welcome improvement in the trend of the "small" savings figures. The latest return, which relates to the week following the Bank-holiday week, actually showed a modest amount (£788,000) of "net" saving. Except for an insignificant sum in a single week in June, this is the first weekly credit since early May, and is the more striking in that the middle two weeks of August last year both showed small net debits. The improvement was mainly due to a decline in gross repayments, although encashments of Defence Bonds, despite the continuing stream of maturities (not included in the official figures) were still running above last year's level. In the four weeks to August 6th, in which net dis-saving, as officially computed, totalled no less than £15¾ million, encashments and withdrawals of past savings amounted to nearly £73 million, and for two weeks were running at roughly £19 million, the highest weekly figure since the eve of last Christmas. In the latest week, however, they dropped to £13.8 million, the lowest since the first week of this financial year. During the early part of the year, as the National Savings Committee pointed out recently, withdrawals were running noticeably below their 1947 level; in the twenty weeks to date, they have averaged virtually £1,000,000 per week less—a difference which may, perhaps, be associated with the more rapid redemptions of maturing Defence Bonds. During the four weeks strongly influenced by the holidays, however, the margin was sharply reduced. It will be particularly interesting, now that the holiday influence is waning, to see whether the former relationship to the 1947 trend will be restored, for the stream of Defence Bond maturities, which may be regarded as supplementing the repayments as officially defined, will shortly dry up.

In the financial year to date, "small" savers have imposed heavy demands upon the Exchequer. On the official figures, there has been a net dis-saving of £16.4 million, in contrast with net saving of £54½ million in the corresponding period of 1947-48. But this official figure measures only a fraction of the true net disbursements which the Exchequer has had to make to holders of savings securities and deposits. Including £44 million of bonds repaid at maturity and £9,500,000 of interest paid out on encashment of savings certificates, the total is almost £70 million.

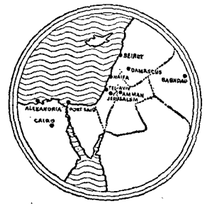
New Zealand's Exchange Policy

Second thoughts on the decision of New Zealand to bring its pound up to parity with sterling still leaves a good deal of uncertainty on the motives for this sudden move. Later information does not alter the first impression that this was an essentially unilateral act which had not been preceded by the usual consultation with Britain or with Australia, the countries most directly affected by the decision. A few individuals in Britain and Australia knew that the question of a revaluation of the New Zealand pound was under serious discussion; but they apparently knew no more than that.

The reasons for the decision appear to be the usual mixture of economic and political arguments. The Government faces elections next year and it would profit it nothing to woo the agricultural vote, which is lost anyhow. Politically, therefore, the exchange gesture is an appeal to the urban vote. As such, it is of considerable importance. Even the farmers will for a time be protected from the impact of revaluation. They have in hand the recent substantial increase in prices obtained in the renegotiation of the food contracts with Great Britain. In addition the New Zealand Dairy Commission has at its disposal the substantial buffer pool accumulated in recent years of agricultural prosperity and will be able to pay the farmers the guaranteed prices for some time to come. The farming community, moreover, is in a favourable position to withstand a slight breath of adversity. Seldom have agricultural mortgage loans been lower and never before have the liquid assets of the farming community been so large.



One important factor in the situation is that the revaluation of the New Zealand pound will produce an annual interest saving of £NZ800,000 on the overseas debt. This matter has already been raised in the New Zealand Parliament and has led to a demand that a new budget be introduced to take account of the fundamental change in the situation brought about in this and other ways by the exchange move.

* * *

Australia Drops Subsidies

The Australian authorities are adhering to their first and immediate reactions to the New Zealand move, namely to assert that it will have no effect on their own exchange policy. To allow the slightest hint of doubt or qualification to intrude in these assertions would inevitably ensure their defeat. As it is, Australia will encounter some difficulty in resisting the effects of the New Zealand move, which has created the belief that sooner or later Australia will have to follow suit. Already every trader who can so arrange his affairs as to be short of sterling and long of Australian pounds is endeavouring to be in that safe position. For the time being, however, the determination of the Australian authorities to hold the present rate of exchange cannot be in doubt and must be reinforced, if ever it had been in danger of wavering, by the angry protests that have come from Australian interests, industrial and agricultural, against the initiative just taken by the neighbouring Dominion.

An important development in Australia which is not without relevance in the exchange situation was this week's announcement by Mr Chiffley to the State Premiers that the Commonwealth Government could not continue subsidy payments on certain basic commodities. All Federal subsidies are being abolished except those on butter, tea and super-phosphates. The effect of this move, which follows inevitably the result of last May's referendum supporting the discontinuation of central control of prices, will be to raise the cost of living and, consequently, to increase by about 4s. 6d. per week the basic wage which is anchored to the cost of living index. This adjustment in Australian prices and costs must provide an additional argument for resisting the pull of New Zealand's exchange revaluation.

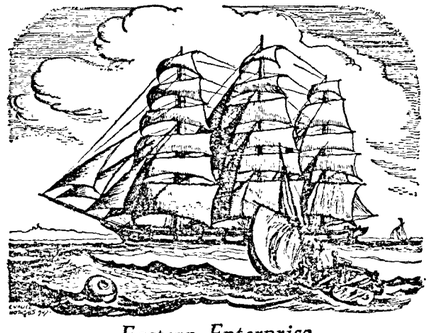
Do you trade with



AUSTRALIA

As a market for British manufactures and as a source of food and raw materials, Australia plays an important part in Britain's economy. Whether your interest is in imports or exports, the services of the Commonwealth Bank of Australia can be of considerable assistance. With over 400 Branches in the Commonwealth and New Guinea, and guaranteed by the Australian Government, the Bank can provide the British trader with up-to-date, authoritative information on every aspect of Australian commerce.

COMMONWEALTH BANK OF AUSTRALIA

London Branch: 8, Old Jewry, E.C.2 *Also at Australia House, Strand, W.C.2*

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

Italy and Sterling

The "free and easy" economy in which Italy is now evolving is having certain adverse effects on other countries, notably Britain. The multiple currency and exchange systems allied to Italian native wit and the ingenuity of the commercial fraternity are beginning to cause some interesting contradictions in the financial situation. The Italian authorities have recently been complaining to the British that they are still acquiring sterling, and that this is having a certain inflationary effect on their economy. At the same time, it has been evident that Italian traders and financial houses have been using every possible device to borrow sterling. The paradox is readily explained. A part of the sterling facilities in question has been used to finance deals in commodities involving arbitrage between the various layers maintained in the Italian exchange system. The British authorities have become painfully aware of this abuse of sterling credits, and recently instructed British banks to reduce to a minimum the availability of sterling for Italian banks. The inevitable howl of protest has gone up from Italy. It need not be taken too seriously. Facilities will be made available in London for all genuine commercial operations. For the others, the Italian interests concerned should shift their accounts elsewhere—somewhere, perhaps, where multiple currency practices are also the order of the day, and where little irregularities are better understood and more readily forgiven.

* * *

Commodity "Shunting"

Evidence is accumulating that the regime of differential rates of exchange, which has been spreading over Europe and Latin America despite all that the International Monetary Fund may say against it, is having increasingly distorting effects on international trade. The latest revelations on this subject come from Australia, where it was announced last week-end that a special Government investigator is to be sent to Europe this year to secure proof of the resale of Australian wool which has recently resulted in a loss of direct wool sales to the United States by Australia and thus has cost the Commonwealth valuable dollars. Four countries have been named by the Federal Government as indulging in such practices. They are France, Holland, Belgium and Italy. These countries have been informed that their purchases from Australia will in future be subjected to far closer scrutiny than in the past; so as to ensure that the amounts they purchase are sufficient for their domestic requirements only, and include no surplus which can be profitably "shunted" by re-exports to hard currency countries. The most important commodity involved is wool, but rabbit skins have apparently also entered into this type of transaction.

These Australian accusations have been answered by the French Foreign Office with denials that any such direct operations have taken place. These denials admitted that purchases of wool had been made in Australia by French buyers acting as representatives of American firms and that payment had been made in dollars.

There is a decidedly unconvincing air about this explanation. It would, indeed, be strange if American importers of wool were using the services of French firms purely in the capacity of brokers or agents. French official spokesmen must, in any case, be regarded as inadequately informed about operations which, in large part, must circumvent their own regulations. Their reassurances on this subject cannot, therefore, be conceded very great weight.

* * *

China Tries Again

China is making one more attempt to establish order amid the chaos which uncontrolled inflation has wrought. This time the Government is formally introducing a new currency unit as part of a programme of economic and fiscal reforms which would be really impressive were there any solid grounds for hoping they could and would be successfully carried through in the turbulent political and social conditions which are a primary source of China's present troubles. The extent to which the money economy has collapsed is well demonstrated by the terms of the currency exchange. The new unit, the so-called "gold" yuan, has conversion rates assigned to it in terms of gold and silver bullion, silver dollars and US dollars, the rate for the last being 4 yuan per $; and a one-yuan note will be given in exchange for 3,000,000 units of the existing currency, the Chinese National dollar. It has been officially stated that an issue of only 200 million yuan will suffice to convert the whole existing currency; but even that modest sum implies that the total circulation of the old currency is astronomical—amounting to CN$600 million millions (fourteen noughts in all). It is hard to credit even the physical possibility of withdrawing this whole mass of paper in the two months to November 20, which is the present intention.

It is scarcely less difficult to envisage the means by which the Government hopes to avoid currency excesses in the future, for note-printing has been its principal instrument of finance, given the void in the budget and the absence of any effective machinery for tax collection. The new programme takes due note of these not inconsiderable deficiencies, and proposes, among other things, an overhaul of the fiscal mechanism, tax "adjustments," an effort to end the losses of State enterprises, and cuts in the bureaucracy and functionaries. But, even supposing a sufficient respite from political turmoil to enable a determined Government to pursue these praiseworthy ends, it would surely be optimistic to expect enough progress to be made in time to stop the drain before the Government coffers are empty—though there are hopes that American aid will bring some grist to the mill. The objective now declared is not, in any case, a balancing of the budget; it is to reduce the deficit to one-third of expenditure. Other measures include cuts in imports, compulsion to surrender bullion and foreign exchange, prohibition of hoarding, registration of overseas assets, a freezing of prices and wages, and a discontinuance of all cost-of-living contract clauses.

The "gold" yuan is stated to have a "100 per cent reserve," but it appears that 60 per cent of the cover will be in negotiable securities and assets of Government enterprises; the remaining 40 per cent is to comprise gold, silver or foreign exchange. The hard cover available at present is stated to be equivalent to US$200 million—sufficient to back an issue of 2,000 million yuan, which is declared to be the maximum circulation. It is a pity to denigrate a plan which, ostensibly, is cast on such sound principles. But doubts about the determination and ability of the Government to carry it through in such difficult circumstances are hardly allayed by reports that the whole plan was drawn up, but shelved, two years ago, and has only been brought forth now because the sheer weight of the existing mass of paper has virtually destroyed the money economy and is paralysing business.

* * *

Richard Crittall Receivership

Since the passing of the interim dividend on the 5 per cent cumulative preference shares of Richard Crittall on June 12th this year, the board have had a stern tussle with the company's auditors to determine the treatment in the accounts of the item for development expenditure. The vital question whether the accounts would show a profit or a loss for the year ending December 31, 1947, apparently hinged on the outcome of this debate. Now the company states that a loss will be shown. Moreover, it is announced that the old board has resigned in favour of a new set of directors and that a receiver and manager has been appointed by the principal bankers to the group of companies.

This is a sorry series of admissions for the company to make less than eight months after a notable approach to the public for new finance—450,000 5 per cent cumulative £1 preference shares at par were successfully issued to the public in December last, through the Whitehead Industrial Trust. The heavy oversubscription to that issue was, of course, partly attributable to the undiscriminating attitude of stags in the particularly favourable market conditions at the time. But it was noticed then that some of the more discerning fought shy of the issue on the grounds that the balance sheet at December 31, 1946—reproduced in the prospectus and still the latest available—included amongst current assets an item of £99,746 for "expenditure in connection with development and expansion of export trade and newly-formed subsidiary and associated subsidiary and associated companies." However, neither the intangible character of this item nor the existence of a bank overdraft of £391,194 deterred investors from upholding the judgment of the stags. In the first few weeks of dealings the shares were a firm market at around 2s. premium. In the prospectus the directors estimated that net profits less profits tax would be not less than £100,000 for 1947 and £150,000 for 1948. Yet in the light of the controversy on the treatment of development expenditure—on which the auditors have apparently had their way—it seems that these estimates were based on the assumption that it would be permissible for the company to capitalise at least part of the development expenditure incurred during the period. The full accounts must be awaited before the amount of the loss for 1947, and the extent to which it has been due to the auditors' requirements of writing off development expenditure out of the year's profits, will be revealed.

Machine Tool Stocktaking

The exhibition of machine tools which opened at Olympia this week is the first of its kind in London for fourteen years. During these years the British machine tool industry has greatly extended the variety of its products, and notably its ability to provide high-speed machines for single processes. Recent developments to be seen at the exhibition include machines for a new gear grinding process and for centreless thread spinning.

The exhibition is the shop window of an industry which is exporting 60 per cent of its production. It affects the machine tool makers little, but the development of the British economy a great deal, whether their product is sold at home or abroad. In 1947 close on 40,000 metal-working machine tools valued at £26 million were made in this country. Production this year is running at an annual rate of £30 million (the figures exclude tools priced below £30). There has, in fact, been only a moderate increase in units completed compared with the immediate pre-war production. But the working capacity of the product has gone up with the increasing number of special-purpose tools made. There has been no fall in demand for machine tools since the war. Both the home and export markets have absorbed machine tools auctioned by the Ministry of Supply without difficulty; about one-tenth of exports has come from the auctions. Despite the auctions, orders in hand for new metal-working machines exceed 40,000 and represent 15 months' work, or more, for the industry as a whole. There are indications that this accumulation of orders is shrinking.

It is no doubt unavoidable that the machine tool industry, like other branches of industry, should be called upon to make export its primary concern, but the cost to the home economy has to be borne in mind. In so far as these exports keep home industry starved of the necessary tools for replacement, they mean that home industry has to live on its physical capital. It has been estimated that approximately 750,000 to 850,000 machine tools are in use in this country. Last year 31,138 units were delivered to the home market, all but 2,138 from home production; this provides for only an inadequate rate of replacement, rather less than 3 per cent.

It is difficult to be certain that the machine tool industry could in present conditions expand its output greatly. At one time the shortages of roller bearings and electrical motors were major obstacles. They appear to have been overcome, but delays through shortages of castings continue. The results of the partial census of production of the machine tool industry in 1946 suggest that productivity is too low. From 1937 to 1946 employment in the industry increased by half (from 28,000 workers to 42,000), yet in 1937 81,000 tons of machine tools were produced against 78,000 in 1946. The increasing complexity of machine tools can hardly account for the whole of this discrepancy. Symptomatic of the fall in productivity has been a sharp increase in non-productive workers employed.

* * *

Petrochemicals Finance

Proposals for the reorganisation of the capital structure of the Petrochemicals group have been announced in conjunction with the news that the group has formally applied to the Treasury for permission to raise an additional £2,500,000 capital. The group's desire to raise more capital, for the completion of the new works at Partington, near Manchester, for manufacturing chemicals from oil by the "Catarole" process, was made known some months ago. At present the capital of the group is mainly vested in Petrocarbon Ltd., whose principal operative role since the inception of the enterprise in 1945 has related to the provision of plant, technicians and research personnel. Now it is proposed that it should shed its major capital responsibilities. These would be assumed by Petrochemicals.

It is proposed, as a first step, that Petrochemicals should take over the entire preferred ordinary capital of Petrocarbon in exchange for 90,000 5 per cent £1 preference shares and 35,500 £1 ordinary shares in Petrochemicals, while 45 per cent of the ordinary shares of Petrocarbon would be exchanged for 75,000 £1 ordinary shares in Petrochemicals. A similar exchange would be effected in respect of the outstanding "A" and "B" notes of Petrocarbon. The £900,000 of 4 per cent "A" notes at present held by Finance Corporation of Industry would be exchanged for an equivalent nominal amount of 4 per cent secured loan stock of Petrochemicals. The £900,000 of 4 per cent "B" notes of Petrocarbon, which carry the right of conversion into ordinary shares in Petrochemicals, would also be converted at par.

It was indicated in *The Economist* on May 29th that the Finance Corporation for Industry would provide the major part of the new capital required by the group and the remainder would be subscribed privately. This arrangement has now been confirmed. The Finance Corporation for Industry would subscribe an additional £900,000 of loan capital and £548,998 ordinary capital. A further £1,050,000 capital would be furnished privately.

* * *

Canadian Eagle's Bumper Year

The release of the Canadian Eagle report and accounts for 1947 on the eve of the final day for applying for the new shares provided the perfect bait for any wavering warrant holders. The preliminary profits statement showing a rise in group net profit from £1,742,917 to £2,481,305 was satisfactory enough to give the right background for the new issue, but the revelation this week that group trading profit had increased from £2,506,998 to £4,453,488 went one better. With trading profits in such a buoyant state that a total sum of £1,750,000 can be placed to reserve for exploration and general purposes, it is evident that Canadian Eagle are looking internally as well as externally for the means to finance their schemes of expansion. As a result the price of the warrants on Wednesday, in the last day of dealings, shot up to a record level of 5s. 7½d. after their decline to 3s. 9d. last week. On the same day the old shares rose to 31s. 7½d. which is the highest price since the new issue was announced some weeks ago. With the success of the new issue thus underwritten by the group's own profit record, it is perhaps less necessary to dwell on the company's acute need of new capital as revealed in the balance sheet at December 31st last. In a group of this kind, with inter-locking interests with Royal Dutch-Shell and other international oil concerns, it is difficult to measure the correct significance of assets items which would otherwise be interpreted as intangibles. For instance, the total investment in exploration and oilfield expenditure of £9,325,936 includes not only the cost of shares in subsidiaries operating in Ecuador, Venezuela, Guatemala and elsewhere in the Caribbean area in conjunction with the Royal Dutch-Shell group, but represents an unstated amount of capitalised development expenditure. Yet the group's capital requirements are clearly illustrated by the excess of £1,607,933 of current liabilities over a total of nearly £6,000,000 current assets.

Moreover, the present note of expansion in the activities of the Canadian Eagle is audible even alongside the great development schemes now being undertaken by Royal Dutch-Shell and Anglo-Iranian Oil. The finance required will be considerably beyond the group's resources at December 31, 1947. It is expected that the increase in its crude oil supplies will be carried much further than the expansion from 6,505,774 barrels in 1946 to 7,674,938 barrels in 1947. The principal additions to output will be obtained from the Dificil and Casabe fields in Columbia and from new fields in Venezuela. Further extensions of the marketing operations of the group are contemplated. These are to be undertaken by Eagle Oil and Shipping, whose oil sales rose from 25.2 million barrels in 1946 to 26.5 million barrels in 1947. The ocean-going fleet of this company, which now consists of 21 tankers of 244,438 d.w. tons, is to receive additions of four new tankers, although only one of these is at present under construction.

* * *

Central Uruguay Compensation Revised

The new proposals to be submitted to stockholders by the Central Uruguay Railway of Monte Video for the payment of compensation were announced by the company at the end of last week. The revised scheme, which is tentative and must be embodied in legal form before being submitted to the vote of stockholders, is the result of discussions between the company and the dissentient second debenture stockholders. The second debenture holders had vetoed the original scheme on the grounds that their rights as holders of a prior charge had been unduly sacrificed to satisfy the nuisance value of the ordinary stockholders.

The main difference between the two schemes lies in the transfer from the ordinary shareholders to the second debenture holders of the right to any surplus remaining after stockholders have been paid the fixed rate of compensation under the scheme and after meeting all outstanding liabilities of the company. But although the capital repayment to be made on the second debenture has been increased only from 85 per cent to 86 per cent, one per cent on the second debenture stock is equivalent to some £37,400. The compensation of the ordinary stock is unchanged at 12½ per cent. To assist in making up the additional sum required for the second debenture, the amount of compensation

earmarked for the directors under the original scheme is to be reduced by 20 per cent.

As they stand at present, the new compensation terms do not specify clearly whether the transfer of the right to the "sweepings" also carries with it the obligation to bear any deficiency which might arise after the payment set out for the various stocks. It might be presumed that any such amount would be deducted from the payment of 12½ per cent due to the ordinary stock. It is considered unlikely, however, that such a contingency would arise. Although some second debenture holders will obviously cavil at the meagreness of the concessions obtained by their representatives, at least it appears that the principal objectors to the first proposals have now been appeased. With the object of ensuring that the scheme as a whole goes through—it would be foolish at this stage to tempt revocation by the Uruguayan authorities—it is believed that the various interested parties will accept the compromise represented by the new proposals. At any rate, the firmness of the Uruguayan Railway stocks this week indicates that the chances of confirmation of the general scheme are regarded as having improved.

Quotas for Sugar?

Sugar is the first of the food crops to be faced with a post-war surplus. The restricted demand, however, is due to monetary causes rather than to the saturation of the market. The chief exporters are Cuba, St. Domingo and other countries within the US dollar area, so that sugar purchases by European countries are conditioned by the availability of dollars. ECA will afford only a partial relief from this particular dollar stringency. Details of sugar allocations to Western Europe are not expected to be published until next month, but it is generally believed that the scale of imports will be no greater than last year. The International Sugar Council estimated at their recent meeting in London that in the season just ending supplies to the free market have totalled 4,835,000 tons, compared with estimated requirements of 4,675,000 tons. Forecasts for the coming season are necessarily tentative, as much will depend on the out-turn of the Cuban crop. If the Cuban crop yields over 5,400,000 tons (or nearly 600,000 tons less than this year's), then prospective supplies for the free market should total 4,715,000 tons—substantially more than the requirements of 4,135,000 tons.

In these circumstances, it was natural for the Cuban delegation to propose at the meeting a revision of the existing sugar agreement and reimposition of production quotas. Their case did not rest entirely on economic arguments; it was concerned rather with the social unrest which might be caused in Cuba by any sharp fall in the world sugar price. Britain, however, led the opposition, because of the need to develop sugar production within the sterling area. The British West Indies are no less dependent on sugar than Cuba, but since their entire output is purchased by Britain, the vagaries of the world sugar market have little political significance for them. Moreover, it would be difficult, if not impossible, to expand production in sterling countries—as alternative sources to Cuba and other dollar producers—if output were strictly regulated by quotas.

The general opinion of the Council was that a new Agreement would not be advisable at present, but it was decided to set up a Committee to study "the changing sugar situation as it relates to the need or desirability for negotiating a new agreement," and to report to the Council its findings and recommendations. Meanwhile, a further protocol was signed prolonging the existing agreement until August 31, 1949. By then, at least, the effect of ECA on the world sugar market will be known. Perhaps, too, the significance of the Havana charter to commodity agreements in general will then be more fully appreciated.

The Nationalised Industries

It is generally agreed that the time has come for the creators of nationalised boards to behold their work and see whether it is good. Mr Chester's survey of the statutory origin of each of these new leviathans* is only a beginning to the study which is needed on this subject, but it is a thorough beginning. He compares, point by point, the constitution, degree of decentralisation, financial organisation and Ministerial and advisory relationships imposed by statute on the eight corporations formed since 1945—BBC, Bank of England, Coal Board, Airways Corporations, Electricity Authority, Gas, Raw Cotton Commission and British Transport Commission. Then he has repeated the process for the three pre-1939 corporations, the Central Electricity Board (1926, now replaced), the LPTB (1936) and the Port of London Authority (1908). One interesting organisation, the North of Scotland Hydro-Electric Board, is omitted, and there is no reference to the oldest of all nationalised enterprises, the Post Office.

What emerges is the contrast between the statutory provisions before and after August, 1945. "There has been a considerable increase in the powers of the Minister to control and to interfere in the working of the corporations. There is, for example, no instance in the pre-1939 corporations of a Minister having the power to issue general directions." Since 1945, regulations normally permit the Minister to dismiss a member of a corporation if, in his opinion, he becomes "unfit to continue in office." Finally, the later corporations have less financial independence.

A study of this kind can only describe the mould in which each of these corporations was cast. In British experience, environment is as important as formal origin in influencing the character of organisations. A full comparative study of nationalised industries would include the development of their organisations both within and without the statutory framework. However, changes in the shape of the matrix since 1945 do give some indication of the trend of official thought—goaded by unofficial criticism—in the last three years. There is a perceptible tendency towards greater decentralisation. The latest nationalisation Act (the Gas Act), gives the area boards a considerable responsibility for policy, especially financial policy. In transport, by contrast, the revenue accounts not only of Area Boards but of executives were merged in the undertaking as a whole. The temptation to allow the economically efficient department to carry the rest is common to every financial unit, but the greater the financial unit, the more widespread its possible effects. A second development is the increased accountability of the Minister to Parliament, especially for the gas and electricity industries.

Hongkong Entrepot Trade

Trade returns from Hongkong support the necessity for the local import and exchange restrictions recently introduced. Hongkong as a major centre of exchange between east and west can perhaps do no more than reflect the economic relationship between the continents. Thus inevitably dollar imports have increased since the war. But since the colony is in the sterling area, any foreign exchange losses are made good from the central reserves. When a local trader buys from the United States against dollars but receives payment for his re-exports in a soft currency, the sterling area has, in effect, provided another country's dollar needs.

Such considerations, quite apart from a number of activities which by their nature defy statistical investigation, explain the need for imposing a measure of control. To some extent the colony's trade balance will inevitably be adverse, because the two million inhabitants have to live largely from imports. While considerable entrepot business is done in foodstuffs, food has to be retained for consumption, and raw materials are needed for the local manufacturing industries. The restrictions are therefore not so much intended to reduce the trade deficit as the dollar losses, which are largely invisible.

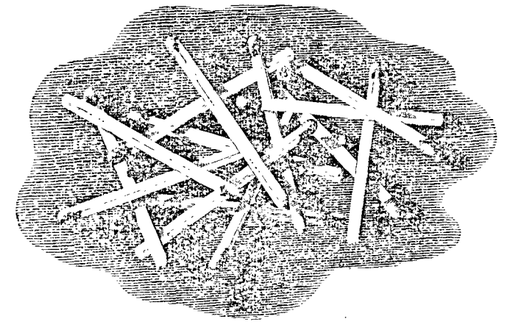
INDEXES
to Volume CLIV of "The Economist"
and
to Volume III of "Records and Statistics"
(January to June, 1948)

These are now available at the following rates, post free :—

Index to "The Economist" ..... 2/6d.
Index to "Records and Statistics" 2/6d.
Both Indexes ..... 4/9d.

Please apply to
THE ECONOMIST, 22, Ryder Street, London, S.W.1,
specifying requirements clearly and marking envelope "Index"

In future, it is proposed to issue a monthly cumulative index to "Records and Statistics" and no further half-yearly indexes to this Supplement will be published. The monthly index will appear for the first time as part of the issue of September 4th.



In a 'Recordon' equipped office, work goes smoothly and efficiently. Your letters are magnetically recorded on paper discs, passed to your secretary who transcribes without interruptions and distractions. Recorded discs can be folded and mailed—filed—played back at any time—or instantly erased for use again. 'Recordon' keeps correspondence up to date—solves the shortage of trained secretarial staff. At £45 it is within the reach of every business—large or small.

LIGHTING EVERY MATCH

A hundred years ago Arthur Albright's idea for making *Amorphous Phosphorus* on a commercial scale brought safety to workers in match factories, and gave the world its first safety match. Today Albright & Wilson's match phosphorus products light every match made in Britain and countless millions of others all over the world.

New facts about the under

35's

your most vital customers

The 1948 edition of the independent Hulton Survey has just been published. Based on this year's research, it shows that the Daily Mirror is read each day by 8,730,000 adults of whom 4,310,000 are aged under 35, and that it now has 1,130,000 more adult readers under 35 than any other daily paper. These under-35's, whose growth to maturity as consumers was hampered by war service and shortages, are now rapidly forming buying habits that will remain with them for life. They amount to over a third of our adult population and the most important potential market in the country. To safeguard your future prosperity sell now to the under-35's through the advertisement columns of the Daily Mirror

Daily Mirror

THE NATIONAL DAILY WITH THE SECOND LARGEST SALE

1,130,000 more adult readers under 35 than any other national daily paper (vide independent Hulton Survey)

Cost of advertisement space (per column inch per thousand readers) lower than any other national daily

The extent of local industrial activity should not be underestimated. Textile exports, for instance, during the first six months of this year were valued at 144 million Hongkong dollars and exceeded textile imports fivefold. The expansion in Hongkong's textile industry is due largely to the arrival from China of rich Chinese textile manufacturers, complete with machinery and labour.

HONGKONG FOREIGN TRADE

First Half of 1947 and 1948, in Million Hongkong Dollars

	Imports				Exports			
	1947		1948		1947		1948	
	$ Million	%	$ Million	%	$ Million	%	$ Million	%

U.S.A. deficit	...	...	...	...	− 76	...	−126	...
Total deficit	...	...	...	...	−100	...	−193	...

Trade with China still heads the list; the published figures are an understatement on account of the smuggling which continues despite increasing watchfulness. Furthermore, to escape the Hongkong restrictions on exports to China, goods destined for China are first sent to Macao and shipped on from there by devious routes; significantly, exports from the colony to Macao have trebled in one year.

★

The value of Hongkong's foreign trade has been over £100 million (£1=16 Hongkong dollars) in the first half of this year and, as has been stressed here before, the new foreign exchange and import controls must not be applied to do in the long run more damage than good. It is the less visible exchange losses from the Hongkong leak that call for action.

Three measures of control recently anounced were discussed in *The Economist* of July 24th. Hongkong merchants who had hitherto been allowed to retain three-quarters of their dollar earnings had, in future, to hand over all their dollar earnings. The import of goods from the sterling area (some of which have been re-exported to the United States and the dollar proceeds not surrendered) was tightened, and all monetary transfers from Britain involving more than £500, unless *bona fide* trade transactions, required the approval of the Hongkong authorities. This latest regulation was extended last week, when it was announced that as a further measure of stopping the Hongkong leak, monetary transfers from the whole sterling area and not only Britain in excess of £500 would require local approval.

Shorter Notes

Mr. C. E. Simkins, trading as C. E. Simpkins brokers, was declared a defaulter on the Stock Exchange on Wednesday afternoon. The member concerned was admitted to membership of the Stock Exchange in 1945 and is the first to be "hammered" since 1941.

★

Net profit of The International Nickel Company of Canada for the six months ended June 30, 1948 in terms of US dollars was $20,235,066 ($16,460,339 for the corresponding period of 1947). This is equivalent to $1.32 ($1.06) a share on the common stock. Net profit for the quarter ended June 30, 1948 was $9,819,301 equal to 64 cents a share compared with $10,415,705 or 68 cents a share for the first quarter of 1948.

★

The latest calculations made by the London and Cambridge Economic Service put the provisional production index for June for all industrial groups at 122, against 117, 123, 115, 122 and 115 for the months January to May, 1948. Metal production has risen from 111 in May to 118 in June, and the output of motor cycles and aircraft from 133 to 143. Further data having become available, the authors of the index have adjusted a number of earlier calculations, in particular the comparison of the base year 1946 with 1935. More improvements of this kind will be made as results of the 1946 partial census of production are published. A comparison of production and exports made in the *Bulletin* of the service shows a directly related expansion in both figures until the end of 1947. In 1948, however, exports have been taking an increasing share "of a production which is probably still rising slowly."

★

It is reported from Calcutta that local jute mills are to stop buying raw jute for the time being owing to excessively high prices. Current quotations stand at about Rs 210 a bale (equivalent to £15 15s. per bale) and the Calcutta mills do not want to pay more than Rs 200 a bale (£15). The American demand for jute manufactures has declined appreciably owing to the use of substitute materials which high jute prices have lately encouraged.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Canadian Eagle Oil; Tunnel Portland Cement; Vaux.

COMPANY MEETINGS

GERRARD INDUSTRIES, LIMITED

TENSIONAL STEEL STRAPPING
EXPORT SALES PROGRESS
MR KAY HARRISON'S REVIEW

The twenty-fourth annual general meeting of Gerrard Industries, Limited, was held, on the 18th instant, at Winchester House, Old Broad Street, London, E.C., Mr Kay Harrison, the chairman, presiding.

The following is the chairman's circulated statement:—

I present the following statement on the annual accounts of the company and on the consolidated annual accounts of the company and its subsidiary, Gerrard Safe Seal (Overseas), Limited, for the year ended March 31, 1948.

Dealing with the balance sheet and taking the liabilities side first, the issued share capital is unchanged at £73,350. General and dividend equalisation reserve at £37,000 compares with £35,000 and this increase is explained by the transfer by your directors to this reserve of £2,000 from the profit and loss appropriation account for the year now under review. Trade and sundry creditors, returnable deposits and accrued charges at £49,147 as against £57,835 show a reduction of £8,688 compared with the previous year.

Turning to the assets side of the balance sheet, freehold land and buildings after taking into account the additions and depreciation stand at £14,722 as against £12,040, which is an increase of £2,682. As you will observe there is, under the heading of additions, the sum of £3,240 and this relates to the cost of house property situated in close proximity to the company's premises in Brentford and acquired for occupation by a member of the executive staff to ensure improved supervision of the factory and offices.

Machinery, plant, motor vehicles, factory and office equipment and furniture stand at £15,443 as against £10,287. This is an increase of £5,156 and is mainly accounted for by the acquisition of new machinery and plant for enlargement of the scope of our manufacturing facilities.

The item of shareholding in subsidiary company at £28,000 is unchanged and refers to Gerrard Safe Seal (Overseas), Limited. In this respect I might mention that whereas in the previous year's accounts a consolidated balance sheet only was included the accounts now before you are in the form prescribed by the Companies Act, 1948, and thus also include a consolidated profit and loss account; I am reverting later to these consolidated statements.

TECHNICOLOR INVESTMENT

Investment in Technicolor Limited, at £29,087 is the same figure as in the previous year's accounts. The Technicolor company in respect of its last financial year paid a dividend of 7 per cent. the gross amount of which, namely £3,172, is included in the present accounts. This is the fourth successive annual dividend from this investment and I am happy to say that having regard to the sound financial position of the Technicolor company there is every reason to expect a continuation of dividends at a rate not less than is now reported.

Adverting now to the profit and loss account forming part of the directors' report you will note that the trading profit is £34,056 as against £28,960, showing an increase of £5,096. The turnover both in value and volume was substantially in excess of that of the previous year, but the cost of sales, particularly that of raw materials, was higher and this factor in view of our policy of stabilisation of prices resulted in a lower margin of profit. In the light of these circumstances you will, I feel sure, regard the trading results as satisfactory.

ALLOCATION OF PROFIT

The net profit for the year after provision for income tax is £12,933, compared with the previous year's figure of £14,903, and after including the balance of £7,778 brought forward and the reserve for taxation no longer required of £3,500 there is a total sum of £24,211 of which £10,086 has been distributed as interim dividends. Thus there is left for appropriation the sum of £14,125 of which £2,000 has been transferred to general and dividend equalisation reserve and £3,000 transferred to reserve for future taxation, and as your directors do not recommend the payment of a final distribution there is a balance of £9,125 to be carried forward to the current year as against £7,778 brought in.

As I have previously mentioned the present accounts include consolidated statements in the form of a combined balance sheet and profit and loss account of the company and its wholly owned subsidiary. This picture of the group shows that reserves and surplus stand at £72,170 (being the figure of £145,520 the total of capital, reserves and undistributed profits less £73,350 the amount of the issued capital) an increase of £15,881 over the previous year and that the combined trading profits for the year under review amounted to £48,571 which is an increase of £13,998 over that of the previous year. In this context I would like to point out that a substantial part of this increase in trading profit is attributable to the export trading results of the subsidiary company.

On the subject of the dividend policy of your Board which is and always has been a prudent one the larger earnings of the company would have permitted—and in fact it was your directors' intention to recommend—an increased distribution of not less than 15 per cent. for the year which would have made a total distribution of 40 per cent.: but in deference to the wishes of the Chancellor of the Exchequer for voluntary limitation of dividends and in conformity with the recommendation in that regard of the Federation of British Industries no final distribution is recommended seeing that the interim dividends for the year under review amount to 25 per cent. less income tax which was the total distribution for the previous year.

I would like to refer to the practice of some people who regard dividend distributions in terms of rate of dividend only without taking into consideration the actual capital employed. It is pertinent to point out that a total distribution of 25 per cent. gross on the issued stock is approximately 7 per cent. on the actual capital employed in the group. It is this latter percentage which denotes the true return to stockholders and it is, to put it mildly, not excessive; and this calculation takes no account of the relatively low values at which the majority of the assets appear in our books and at anything approaching present-day market values the percentage of dividend return would be still lower.

ANALYSIS OF EXPENDITURE

Before leaving the subject of accounts and having in mind the Government White Paper "Economic Survey for 1948" I am sure you will be interested in the following analysis of the company's expenditure in terms of percentages of its income for the year now under review:—

	Per cent.
Raw materials	56
Wages and salaries including staff bonus and staff pension and life assurance contributions	18
Operating expenses	12
Taxation	6
Dividends, net	4
Depreciation	2
Profits retained in business	2

I think these figures, broadly representative of industrial concerns in general, clearly show that investors have received, in comparison with other income recipients, a financial return on their stockholdings which does not adequately reflect their true economic value.

THE COMPANY'S PRODUCTS

The accounts having now been dealt with I wish to refer to our principal business of manufacturers and distributors of tensional steel strapping and ancillary equipment for use therewith. Our products are applied for the exterior closure and reinforcement of boxes, cases and like containers and all other types of packages and provide a highly efficient means of security and deterrent against pilferage: and the "Gerrard" service available to all customers includes a free supplementary advisory service for the solution by technical experts of any and all packing problems and we are entering into arrangements with other organisations abroad to supply an expert inspection of cargoes service.

The demands of users have continued unabated and under the existing limitations of supplies of raw materials our greatest difficulty has been to cater for all the demands made upon us, but I am glad to say that due, in part, to the sympathetic co-operation of suppliers and of the appropriate Government Department responsible for the steel allocation to meet the requirements of the tensional steel strapping industry—and which co-operation I gratefully acknowledge—our supply difficulties were somewhat less severe than in the previous year.

DIRECT EXPORTS

Regarding direct export business, which is exclusively handled by the subsidiary, Gerrard Safe Seal (Overseas), Limited, I am happy to be able to report that substantial sales progress was made in the year under review and in comparison with the previous year sales in value increased by 135 per cent. and in volume by 101 per cent. But this does not reflect our total contribution in the field of export business. It is calculated that of the parent company's sales of strapping more than 50 per cent. is employed by customers on containers shipped to overseas markets and thus represents indirect exports.

So you will see that we are very actively participating in the national export drive, and given an improvement in availability of raw materials we are confident of our ability to make in the immediate future still further substantial progress.

HEAVY TAXATION

Taxation claims at present, in my opinion, are unreasonably heavy, and I would particularly make reference to the profits tax levied on undistributed profits which I think is entirely unwarranted. This denudes a business of funds which are normally ploughed back and employed on capital account for replacements, re-equipment and new developments; and as the costs under these heads have greatly increased it is to be hoped that the Government will alleviate these burdens and thus enable a company to retain a larger proportion of its profits and so encourage business expansion and the attainment of the objectives of research, development work and plant modernisation unquestionably essential for increased production and lower costs.

Stockholders, I feel sure, will, especially in view of the results of the year, wish me to express their appreciation of the service rendered to the company by the managing director, Mr Stanley Parkes, and also their appreciation of the zeal and enthusiasm displayed by the officials and all employees of the company in all departments. We all realise that the satisfactory results which we have been able to show, despite the many and varied difficulties during the year's trading, are very largely due to the loyal support and devoted service they have given to your company.

The report and accounts were unanimously adopted; the other formal business was duly transacted, and the proceedings terminated with a cordial vote of thanks to the chairman, directors and staff.

LEVER BROTHERS & UNILEVER, LIMITED

NEED TO PRESERVE CAPITAL

SUPREME IMPORTANCE OF RESERVES

EFFECTS OF POSTWAR CHANGES IN VALUES

DEFECTS IN GOVERNMENT'S ATTITUDE

PRODUCTION, DEPRECIATION AND TAXATION

SIR GEOFFREY HEYWORTH'S SURVEY

The annual general meeting of the members of Lever Brothers and Unilever, Limited, was held, on the 26th instant, at the Hall of the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.2.

Sir Geoffrey Heyworth presided.

Addressing the meeting, he said:—My Lord, Ladies and Gentlemen, I propose to take this opportunity of discussing the purpose of the two large reserves which we have made before arriving at our 1947 results; one of about £3,600,000 for replacement of fixed assests; the other of about £4,200,000 in respect of stocks.

The reserve for replacement of fixed assets in effect represents the additional loss in value of our fixed assets during the year over and above the depreciation based on original cost values. This reserve is necessary to preserve intact at the end of the year the effective capital which we had at the beginning of the year; in other words, it relates to 1947 only and it does not cover real losses of capital suffered in earlier years.

The stock value reserve is a contribution towards the loss of real worth which we have suffered in respect of our current assets since the beginning of the war.

As we shall see in the subsequent discussion, both these reserves have a common origin—namely, the need to preserve capital intact — an elementary and universally accepted principle of economics. Beset as the world is at the present time by so many economic problems, there is a danger that this fundamental principle may be overlooked. In fact, it is more than ever necessary today that it should be in the forefront of our minds and be properly applied. Furthermore, under our democratic system it is vital indeed that this principle should be understood by all elements of the community.

FIXED ASSETS

First, let us examine the preservation of the capital invested in fixed assets. To produce output we require buildings and plant. As these fixed assets wear out in producing the goods we sell to the public, it follows that the selling price of the goods must contain an element equal to the wastage of these fixed assets, in other words a charge for depreciation. If depreciation is based on the original cost of the asset and price levels of plant and buildings remain unchanged, then the amount of reserve which we should accumulate during the life of the asset will be sufficient to buy a new fixed asset when the old one becomes worn out or obsolete. If, however, when replacement becomes necessary there has been a complete change of values—for instance the doubling of the original price level of plant and buildings, then it is clear that a company can purchase only half its replacement requirements of buildings and plant.

To take a simple example—that of a road Transport Company. Imagine that it originally had fixed assets of four trucks and that these cost £500 each, and that at the end of 5 years these trucks were worn out, fully depreciated, and had to be replaced. If by that time new trucks of the same capacity cost £1,000 each, the money accumulated through the depreciation fund would buy only two trucks instead of the previous four and the operations of the company would be reduced to a half.

COST OF REPLACEMENTS

To turn to our own business, the cost value of our fixed assets at the end of 1947 was £82,000,000 and depreciation is being charged in the normal way, which will lead to the accumulation in due course of this sum for replacements as and when they are required. Today, however, we estimate that to replace our existing fixed assets would cost £148,000,000, so that at present price levels our depreciation fund would be about £66,000,000 short of our requirements. In other words, if we were to rely only on our normal depreciation provision we should fail, by this amount, to maintain the fixed assets necessary to continue our present scale of operations. We should have fewer machines and would have to throw people out of employment. We could avoid reducing the scale of our operations only by the introduction of new capital, but what follows will show that this is not an acceptable solution of the problem. If the price level of buildings and machinery rises further, the deficiency will be greater, and if the price level falls, it will be less. But in any event it is quite unlikely that prices will fall to such an extent that depreciation reserves on the basis of the original cost values will be adequate.

The only way, then, in which we can maintain that part of our capital which is invested in fixed assets is to recover in the price of our products an amount which truly represents the wastage in value of our fixed assets at present day prices. If we cannot do this, then we shall be fixing our selling prices on a basis below real cost, and if the business community as a whole does the same thing, then the country will be consuming a part of its capital instead of paying its way.

CURRENT ASSETS

Let us now consider the preservation of capital in current assets. Current assets consist in the main of stocks of raw materials, goods in process and finished goods. For a given flow of production there is a minimum level of stocks which must be maintained, otherwise interruptions occur and output falls. This minimum can only be properly expressed in physical units, i.e. tons of oils and fats, cases of finished products and so on—and not in money value which depends on the ruling price level.

It will be sufficient if we consider what happens when stocks of raw materials are consumed. The difference between the consumption of raw materials and the wastage of fixed assets is merely in the element of time. If industry wore out its plant several times a year in making its product, there would be no difference; but normally, industry consumes its fixed assets over many years whereas it consumes and replaces its raw materials several times in a single year. If, however, it is to retain its normal productive capacity, in charging its raw material it must apply the same principles which I have indicated should be applied to fixed assets; namely, it must recover in its selling prices the value of the materials it has consumed. This value must be the replacement cost, for if there were a continuous rise in the price level, a recovery of the original cost price would only permit replacement by ever-diminishing quantities. The flow of production would be progressively hampered until ultimately the business could no longer be carried on.

PROBLEM ACCENTUATED SINCE WAR

The problem has become accentuated since the recent war because today inflationary pressure is widespread. Since 1939 there has been a vast change in the value of money and a consequent permanent rise in the mean price level. As a result, there has been a severe depletion of real working capital. We can take it for granted that industry will, unless prevented by Government, fix its selling prices so as to recover the cost of replacing materials consumed; but this will not suffice because for taxation purposes profits have to be calculated on the basis of the original money cost of materials used. Thus, in a period of rising prices profits for taxation purposes are inflated by the lower cost at which materials were bought; these profits are taxed, and because of this taxation the business is left without the means to replace the materials used in the same volume.

Again to give an example: a manufacturer buys 100 tons of raw material for £1,000. This he converts into finished products. The market value of this raw material rises to £1,400. He then, using replacement as the appropriate basis, fixes the selling price for his finished goods so as to recover the £1,400 for the raw material element of his cost. He has thus made an apparent profit of £400 on the raw material element, in addition to any true profit he may have made on the manufacturing operation. This apparent profit will be taxed to a varying extent in different countries. In the United Kingdom the tax would be about £200, which would leave him with £1,200 to replenish his stock; he can buy only 85 tons with this £1,200, and thus his real capital has been depleted. In other words, under these principles of taxation, Governments are obtaining part of their revenue by consuming the capital of industry.

GOVERNMENT CONTROLS

It is necessary to mention here that in a number of cases where Government controls have been applied the losses have not been limited to the amount of tax collected on the apparent profit. What has happened in the seed-crushing, oil refining, hydrogenation and margarine industries in the United Kingdom will serve as an example. In these industries the Government at the beginning of the war took over at the then market prices the whole of the stocks so that there has been no opportunity to get back in higher prices even a part of the rise in price that will ultimately have to be paid for new stocks. When these industries are again freed they will probably be able to buy with the compensation received only a quarter or a third of the volume of the stocks taken over.

In our own business it is extremely difficult to calculate the real loss in capital invested in current assets which arises from the change in values between 1939 and today, for unlike the fixed assets which are still in existence and can be identified individually, these current assets have changed many times and today may not even be similar in description. Moreover, until free markets are restored it is not possible to establish the limits within which postwar raw material prices will fluctuate. It is certain, however, that the loss amounts to a formidable sum.

THE BOARD'S METHOD

How then have we dealt with it? It has been our practice to retain profits in the business in the main to provide for natural expansion without having recourse to new

capital. During the war years we increased the proportion of these retentions to meet in part these real losses in current assets. The amount of £4,200,000 put to stock reserve this year is another expression in a more precise form of the same practice. It may be that most people will regard this particular appropriation as something which is required in case there should be a fall in prices, i.e., to cushion the losses that would then occur. That is one way of looking at it. It will be clear, however, from what I have been saying that the reserve is required equally certainly if price levels remain high, i.e., to ensure that we have the amount of capital necessary to maintain intact the volume of our current assets.

The impairment of capital invested in current assets is an accomplished fact and there is little that we can do about it. It took place when our stocks were cleared out at low 1939 prices, and the profits arising from sales at higher prices were either retained by the Government or creamed off by Excess Profits Tax and Income Tax so that they are not available for re-stocking at higher current prices. We can only hope that the large amounts of profits put to reserve during the war period, and the specific allocations to stock reserve that we have made since, will prove adequate. If the price level continues to rise, we shall have to make further provisions.

FUNCTION OF NEW CAPITAL

Now let us consider briefly the function of new capital because it is important to distinguish between it and the maintenance of existing capital. The purpose of new capital is to provide facilities for making new products, to increase facilities for making the greater volume of existing products necessitated by extra demand and to purchase more expensive plant if it will do existing jobs more efficiently.

The idea that the depletion of capital, due to inadequate depreciation allowances and under-valuation of materials, can be met from new capital is perhaps a natural confusion. One reason is that the replacement of a used-up appliance and the expansion of a company's capacity by substituting a different, better and more expensive appliance often occur simultaneously. There is confusion, too, because current profits are an important source of new capital. Indeed in the past the most important source. But the fact that current profits serve as the source both of additions to real capital and of replacement of existing assets, does not alter the fact that the same savings cannot be used for both purposes. If we have to use savings to meet the need for reconstituting stocks and replacing fixed assets at a higher price level, they will not be available for expanding the physical volume of production and trade. And if these savings continue to be depleted by being taxed as if they were true profits, more still will have to be used for replacing materials at higher prices, leaving still less available (even if dividends are restricted) for expansion of the business. In such circumstances to resort to new capital issues would be to risk incurring additional capital liabilities without the assurance that the new money would provide any net increase of earnings.

THE NATIONAL ANGLE

Let us look at the problem from the national angle. In England as in most parts of the world the available capital is inadequate to meet the many legitimate demands that are made upon it. It is essential to ensure that new capital is used for proper purposes and not applied to make good failures to maintain existing capital. Otherwise we shall find that our capital resources are being gradually dissipated in current expenditure. This will mean that it will be impossible for us to improve our standard of living or indeed to keep it at its present level. From the national point of view, therefore, the importance of maintaining industry's capital intact cannot be over-emphasised.

What then must be done to maintain capital invested in industry? Our discussion has shown that, however desirable, it is not easy to define methods that will preserve true values of current assets in all circumstances. Action, however, is practicable in the case of fixed assets and for this reason I will now deal mainly with this aspect.

A PROBLEM FOR INDUSTRY

The maintenance intact of capital invested in fixed assets is in the first place a problem for industry itself. The main essential is that the problem should be fully understood by all concerned—shareholders, management and workers. The proper provisions to allow for replacements must be calculated. Distributions of profit, however desirable, must not be made unless the maintenance of true capital is first assured. Selling prices must be so fixed as to bear relation to real cost. It would be highly desirable if the maintenance of capital could be achieved without raising selling prices, i.e., by finding the means for the extra provisions from increased efficiency. But to a large extent, increased efficiency depends on the acquisition of new and better plant, so that the setting of a selling price that will allow a proper provision for it must have priority.

But it is equally important that the problem should be appreciated by Government. Unfortunately there are many signs that this is not the case. In industries which are still operating under Government controls, prices as a rule only allow a depreciation charge based upon prewar costs of plant and machinery. In Holland we have an example in point. Measured by traditional methods which are enforced upon us by Government price controls, we have made a profit there. This profit, however, is wholly fictitious. When we calculate our results in the right way, making provision for maintaining real value, practically the whole of the profit disappears.

GOVERNMENT'S FAILURE

Equally serious is Government's failure to recognise for tax purposes a proper basis for provision for depreciation. Briefly, the Government method is to treat as adequate and not liable to taxation depreciation of fixed assets only sufficient to replace their original money cost. They also allow expenditure on materials sufficient only to cover the cost of supplies taken from stock acquired when prices were lower. In both cases Government completely disregards the contemporary values (and therefore the cost of replacement) of the equipment and materials used. Such an attitude is logical only on the assumption, which common observation and everyday experience contradict, that values of fixed assets and materials never change between the time of purchase and the time when they have to be replaced. In both cases it is the value today that matters: the charges necessary to replace that value without reducing the quantity either of fixed assets or stocks of materials must be made against receipts before taxable profit is struck.

AN UNDESIRABLE POSITION

It follows that the Government's current tax revenues are made up in part of taxation of something that is not a profit at all but is capital, and it is using this capital for current expenditure. Such a position is undesirable at any time, but it is doubly so at a time when strenuous efforts are being made to curb inflation. Unless industries are able, out of their taxed profits, to augment their depreciation reserves, they will slowly but inevitably lose their power of production. So far as the United Kingdom is concerned it follows from what a Government spokesman recently said in the House of Commons, that current tax revenues include between 100 and 150 millions annually, due to depreciation allowances not being calculated on present-day values of fixed assets. The nation is using up capital to this extent each year for revenue purposes.

In some countries the problem has been recognised by Government and limited action has been taken to deal with it. In France, for instance, even before the recent devaluation of the franc, the authorities permitted a revaluation of fixed assets for the calculation of depreciation, and in Belgium, where the change in the value of the franc between 1939 and today is not very different from the change in value of the pound or guilder, similar provisions have been incorporated in the tax law. It is vitally necessary, in the interests of all classes of the community, that appropriate steps should be taken here. Administrative difficulties in the assessment of tax on a replacement basis are surmountable and it would enable industry in due course to maintain its existing capacity. If this reform is not made then the country will be slowly consuming its real capital, the result of which would be as disastrous as it would be for an individual.

POSITION SUMMARISED

To conclude—our discussion of the problem of maintenance of capital invested in fixed assets and current assets amounts to this:—

(i) Very real losses have already been sustained under both heads.

(ii) These losses have been incurred, because the Government, both in fixing prices and margins, as well as in its taxation policy, has ignored the change in value of money.

It is inevitable for a country to have to draw on its capital to wage a major war, but to continue to do so in peacetime is to invite disaster. In peace there must be a reversal of policy, for if the scale of production is to be maintained—let alone increased—it is essential to replace as quickly as possible capital which has been lost.

ESSENTIAL CONDITIONS

This can only be done if there is a realisation of the fact by all concerned. There must be:—

(i) A recognition of what true profits are.

(ii) An acceptance that the maintenance of a reasonable level of true profits is necessary to the life of the nation.

(iii) The corollary—that taxation methods must be revised so that true profits only are taxed.

The problem does not merely touch shareholders as a class, or even shareholders plus employees; it is national in its scope, for if the loss of capital in industry is allowed to continue, the productive capacity, and therefore the well-being of the country, will be gravely affected. Among the many difficulties of the moment, the importance of this problem is such as to call for urgent consideration by Government, industry and labour. (Applause.)

The Chairman concluded by moving the adoption of the report and accounts.

LORD LEVERHULME'S TRIBUTE

In seconding the resolution, The Viscount Leverhulme (Governor of the Company) said: My Lord, Ladies and Gentlemen,—Before formally seconding the resolution, I would like to take this opportunity of expressing the pleasure which we all felt—and I am sure it was shared by the stockholders—when H.M. The King recently conferred upon our chairman the honour of Knighthood. (Applause.)

It was a tribute to Geoffrey Heyworth's great services both to this world-wide business, of which he is chairman, and to the public and industrial life of the nation generally. He has always been ready to give freely of his talents and ripe experience wherever he felt he could help his country in a special problem at a difficult time. His member-hip of the Company Law Committee and his chairmanship of the committee which reported upon the gas industry

are only two of many examples which might be quoted. We congratulate him most warmly, and hope that he and Lady Heyworth may long be spared to enjoy this distinction. (Hear, hear.) And now I have pleasure in seconding the resolution which the Chairman has just moved.

The resolution was put to the meeting and carried unanimously.

The proposed dividends of 10 per cent. on the ordinary stock and 6 per cent. on the deferred stock payable on September 3, 1948, were approved, the retiring directors were re-appointed and the remuneration of the auditors, Messrs Cooper Brothers & Co., and Messrs Price, Waterhouse & Co., who had been re-appointed under the provisions of the Companies Act, 1948, was fixed.

LEVER BROTHERS & UNILEVER N.V.

The annual general meeting of the members of Lever Brothers & Unilever N.V. was held, on the 26th instant, at Museumpark, Rotterdam. Mr P. Rykens presided and made a speech in similar terms to that delivered by Sir Geoffrey Heyworth at the annual meeting of Lever Brothers & Unilever Limited, reported previously.

The report and accounts for the year 1947 were adopted. The proposed dividend of 8.9 per cent. (being the equivalent of the dividend for the same year to be paid by Lever Brothers & Unilever Ltd., to its ordinary stockholders calculated in accordance with the provisions of the equalisation agreement and converted at a rate of exchange of Fl. 10.691 to the £ Sterling) was approved, the retiring directors were re-appointed and the auditors, Messrs Cooper Brothers & Co., and Messrs Price, Waterhouse & Co., were reappointed.

NOTICES

GOVERNMENT OF SOUTHERN RHODESIA
FOUR AND A HALF PER CENT INSCRIBED STOCK 1953/68
CITY OF JOHANNESBURG
FIVE PER CENT INSCRIBED STOCK 1950/60

NOTICE is hereby given that in order to prepare the Warrants for Interest due October 1st next the BALANCES of the several Accounts in the above mentioned Stocks will be STRUCK on the night of September 1st and that on and after September 2nd the Stocks will be transferable ex dividend.

For Barclays Bank (Dominion, Colonial and Overseas),
(London Registrars of the above Stocks)
ROWLAND SMITH, Manager.

Circus Place, London Wall, E.C.2. 9th August 1948.

OXFORD UNIVERSITY INSTITUTE OF STATISTICS

Applications are invited for research posts at the above Institute. The basic salary will be not less than £350 per annum. Candidates are expected to have qualifications in Statistics and Economics. Application forms may be obtained from the Secretary, Institute of Statistics, 91, Banbury Road, Oxford.

UNIVERSITY COLLEGE OF SWANSEA

The Council of the College invites applications for the post of Lecturer in Social Science and Supervisor of Studies for the Diploma Course in Social Science. Starting salary, within the scale £500-£25-£750 per annum, will be determined by the experience and qualifications of the successful candidate. The appointment will date from January 1, 1949. Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, by whom applications must be received *on or before Saturday, September* 11, 1948.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE
(UNIVERSITY OF LONDON)

Applications are invited for the post of Assistant to the Secretary. Salary scale £500 per annum rising to £700 with superannuation benefits and family allowances. Starting salary according to qualifications. The Assistant will be responsible for the School's official publications. Preference will be given to graduates (between the ages of 25 and 35) with appropriate experience. Applications with the names of two referees to be forwarded not later than September 6th to the Secretary, London School of Economics, Houghton Street Aldwych, London, W.C.2, from whom further information may be obtained.

DERBY TECHNICAL COLLEGE

The Governors invite applications for the post of Senior Assistant in the Department of Commerce and Economics, to commence duties on January 1, 1949. Candidates should possess a Degree in Commerce or Economics, and preferably have had some teaching experience. Industrial or commercial experience will be an additional qualification.

Candidates should be prepared to teach Accountancy, Business Administration, or Economics to Final Degree standard.

Salary in accordance with the Burnham Technical Scale for Senior Assistants, £700-£800, with additions for graduate qualifications and training, if applicable.

Further particulars and forms of application, which should be returned not later than September 20, 1948, may be obtained from the undersigned.

W. ALFRED RICHARDSON, Principal.

URWICK, ORR & PARTNERS seek additional staff for the Control Division of their professional work as Consulting Specialists in Organisation and Management. Applicants must satisfy the following requirements:—

1. Professional qualifications in accountancy.

2. Some years in responsible appointments, with particular reference to costing. Older candidates should have had 5-6 years as Senior Executives.

3. Sound basic general education and wide interest in contemporary affairs.

Service in H.M. Forces will be taken into consideration. Applications should be addressed IN WRITING to the Company's offices at 7, Park Lane, London, W.1, quoting reference No. 1016.

AN Assistant Secretary to specialise on the Export Trade side of its work is required by The Association of British Chambers of Commerce, 14, Queen Anne's Gate, London, S.W.1. Essential qualifications include first-class secretarial ability, appropriate education and experience. Practical experience in overseas trade would be an advantage. Applicants should state salary required; remuneration will take experience into account. Applications, marked "Confidential," should reach the Secretary within two weeks of this announcement.

LABOUR PARTY RESEARCH DEPARTMENT. Applications invited for post Research Assistant, edit. *Labour Party Bulletin*; run information service. Knowledge economics, Labour Movement; writing ability essential. Salary £475 rising annual instalments £25 to £550. Closing date applications September 20th. Forms from Secretary, Labour Party, Transport House, Smith Square, S.W.1.

"COTTON INFORMATION," weekly trade service, and "Monthly Cotton Trade Review," published by Frederick W. Tattersall, Ltd., 17, St. Ann's Square, Manchester, 2. Specimen copies and subscription terms on application.

EAST SUFFOLK COUNTY COUNCIL
COUNTY PLANNING DEPARTMENT

Applications are invited for the appointment of a SURVEY OFFICER to take charge of the Survey & Research Section of the County Planning Department.

Applicants should have received a University training and preference will be given to those who have specialised in either geography, sociology, or economics.

The appointment will be on the Council's established staff A.P.T. Grade V. Salary £520-£570 per annum, in accordance with the National Scheme of Conditions of Service, and subject to the Local Government Superannuation Act, 1937.

The successful candidate will be expected to maintain a motor car for which an allowance will be paid according to the National Joint Council's scales.

Applications endorsed "Survey Officer," stating age, experience, qualifications, present and past appointments, and giving names and addresses of two persons to whom reference may be made, to be delivered to the undersigned not later than the first post Saturday morning, September 11, 1948. Canvassing is prohibited and will disqualify an applicant.

G. C. LIGHTFOOT, Clerk of the County Council.

County Hall, Ipswich.

HEMEL HEMPSTEAD DEVELOPMENT CORPORATION
ADMINISTRATIVE AND LEGAL DEPARTMENT

The Hemel Hempstead Development Corporation will shortly appoint a person to organise and maintain a centrally controlled section having responsibility for filing and indexing all current papers, and for arranging for the orderly preservation of documents relating to the growth of the New Town.

The work calls for a person, preferably with University training, with experience in registry or library work, and with ability to follow with interest all branches of the Corporation's work.

The salary will be on a scale £450/£25/£525, and the post will be superannuable.

Applications, stating age, qualifications and experience, and giving the names of three referees to whom reference may be made, should be addressed to the General Manager (R), Hemel Hempstead Development Corporation, Westbrook Hay, Hemel Hempstead, Herts., to reach him not later than September 13, 1948.

W. O. HART, General Manager.

August 20, 1948.

SUDAN GOVERNMENT

SUDAN RAILWAYS require an ACCOUNTANT for service in the Sudan.

Duties: Cost Accountancy.

Qualifications: Candidates should be conversant with modern costing methods and have had sound practical experience with reputable business firm. Knowledge of punched card accounting would be an advantage. Preference will be given to candidates holding recognised professional qualifications.

Age Limits: 25-35 years.

Terms of Service: Appointment on short-term contract for four years, subject to satisfactory completion of probationary period, at a starting salary between £E375-£E510 per annum, according to age, experience and qualifications. Bonus of one month's pay for each year's service payable, subject to a maximum of six months' pay.

Cost-of-living allowance from £E180 to £E399 per annum, according to number of dependants, is at present payable.

Outfit allowance of £E10 is payable when contract is signed.

There is at present no Income Tax in the Sudan. Free passage on appointment. Strict medical examination. (£E1=£1 0s. 6d.)

Papers containing fuller information for candidates are obtainable from the Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Accountant—Railways."

THE Civil Service Commissioners invite applications for the situation of PRINCIPAL (ADMINISTRATIVE CLASS) in the pensionable establishment of the Home Civil Service on the scale (in London) of £900 x 30—1080 x 35—1220 (men) and £900 x 30—1050 (women). Applicants must have been born after December 31, 1897, and before August 2, 1913. The duties of the Administrative Class are primarily to give advice on the formation of policy and the preparation of legislation and to organise and administer the work of Departments. The standard of the previous Open Competition for Principals was the possession of a degree with at least 2nd Class Honours, but candidates in this competition, though they must be persons of high intellectual quality, will not be required to hold a degree. The Commissioners hope to secure a field of candidates who possess high academic qualification or show evidence of exceptional ability and experience in responsible administrative or managerial work. They particularly wish to obtain older candidates of good quality. They will select a certain number of those candidates who appear to be most fitted for appointment and will summon them for preliminary interview in London; they will select from these a certain number for further interview by the Final Selection Board. The Commissioners' decision in all matters will be final. The number of vacancies to be filled will be about 50. Candidates should write for an application form and memorandum to the Secretary, 6, Burlington Gardens, London, W.1, marking the envelope "Pria 2275" in the top left-hand corner. The completed application form must reach the Commissioners before October 31, 1948.

Statistical Summary

GOVERNMENT RETURNS

For the week ended August 21, 1948, total ordinary revenue was £58,929,000, against ordinary expenditure of £100,141,000 and issues to sinking funds £30,000. Thus, including sinking fund allocations of £4,363,000 the surplus accrued since April 1st is £260,555,837, against £251,530,227 for the corresponding period a year ago.

HIS MAJESTY'S COLONIAL SERVICE

Applications are invited for the post of Economic Secretary which is being created by the Government of Nigeria. The holder of this post will be required to advise the Government on all economic questions, and will have some executive responsibility for the control of a group of Departments of the Government which are concerned with economic development, production, marketing etc. Candidates should have had wide administrative experience in dealing with such problems in responsible positions in Government or Commerce. 2. The appointment will be on agreement for two tours of 12 to 18 months in the first instance. The salary will be £3,000 a year. A deduction of £150 a year will be made for quarters. Leave and other conditions of service will be according to the regulations in force for the public services in Nigeria. Free passages will be provided for the officer and his wife on first appointment, on leave to the United Kingdom, and at the expiration of the agreement.

Applications which should take the form of brief particulars of age, education and experience, should be addressed to the Director of Recruitment, Colonial Office, London, S.W.1.

DECEMBER 1948 EXAMINATIONS

The next examinations of the Association of Certified and Corporate Accountants will be held on Tuesday, Wednesday and Thursday, December 7, 8 and 9, 1948, at the following centres: Aberdeen, Belfast, Birmingham, Bournemouth, Bristol, Cardiff, Cork, Dublin, Edinburgh, Glasgow, Hull, Leeds, Liverpool, London, Manchester, Newcastle, Nottingham, Plymouth and Sheffield.

The last date for entries is October 1, 1948, at the office of the Association, 22, Bedford Square, London, E.C.1. Candidates should give early notification of their intention to sit, and it should be noted that late applications cannot be entertained.

OTHER NOTICES APPEAR ON PAGE 358.

Breathing Space in Germany?

THE Four Power struggle for Germany has become—temporarily at least—less sharp. After weeks of negotiation in Moscow, agreement has been reached upon a possible procedure for ending the blockade of Berlin and agreed instructions have been sent to the four Commanders-in-Chief in Berlin, requiring them to work out a formula whereby, under Four Power control, the Soviet mark could become Berlin's currency. If agreement is reached, the blockade will presumably be raised and this in turn may pave the way for a new meeting of the Foreign Ministers to discuss the whole future of Germany.

The negotiations in Berlin will be involved and may not be conclusive. The Russians wish to raise the question not only of the issue of currency but of the control of credit and it will tax the Western Powers' ingenuity to the utmost to discover methods of making their control effective and of preventing discrimination against the Western Sectors of Berlin. The Russians are probably in no hurry to conclude an agreement since each day's delay brings them nearer to the completion of harvesting in the Eastern zone while to the Allies it only brings the threat of November weather to the airlift. Agreement may be reached in Berlin, but it may be followed by weeks of further negotiation in Moscow.

What then? Suppose that the blockade were lifted, would the underlying Four Power struggle be resolved? Are the Allies on the verge of a solid settlement or are they witnessing no more than a change of handhold as the Russian wrestlers prepare a new move? Berlin itself gives no answer to this question, since Berlin is only one element in the wider struggle for Germany and it must be confessed that if the Four Power dispute is examined in its wider context, the latest developments in Berlin look more like a change of manoeuvre than a change of heart.

The basic fact of the German situation is that the Powers are locked—inevitably—in a struggle to secure the allegiance of the German people. As this contest has developed, it has become increasingly clear that in Germany as a whole, the Western Allies hold all the cards. Quite apart from such issues as the Oder-Neisse frontier and the expulsion of the Germans from the Eastern lands, conditions in the Soviet zone have made nonsense of any Russian claim to be friend and liberator. Politically, the imposition of Communist rule has proved so unpopular that this year the Russians dare not risk elections, even faked elections. Economically, the systematic stripping of the Soviet zone has led to an acute food shortage and to a lack of consumer goods that no propaganda can cover. Even if the Western Allies had done nothing to improve conditions in their zones, they could hardly have failed to profit by the contrast with Soviet policy.

In fact, they are doing a certain amount to rebuild the West. The economic situation in Western Germany is precarious and unstable enough, but American credits are coming in; Germany's participation in the Marshall Plan has begun; above all, the currency reform has brought back elements of normality to lift the nightmare of German existence. Politically, there can now be no doubt that in spite of their hesitations, the Germans welcome the offer of self-government.

During their deliberations on the Allied proposals for a German government in the West which began at Coblenz in July and were carried on at a later conference at Chiemsee, they have continued to stress the provisional character of any statutes they may approve and to insist again and again that no final step can be taken except by a reunited Germany. But their first fear that they would lose popular support by appearing to "split the Reich" has been largely dispelled.

They have, it appears, been strongly influenced in their decision to accept responsibility by the intervention of the democratic leaders from Berlin. Dr Reuther, in particular, has impressed on them that Eastern Germany looks to them to establish a strong, democratic and self-governing community in the Western Zones as a rallying point for Eastern hopes. Western Germany can be the Piedmont of a united Germany provided that the Western Government speaks for Germany as a whole. It is in this spirit that the West German leaders have assembled at Bonn this week to accept—with their own emendations—the Allied proposals for self-government and to initiate the process which will lead first to the drafting of a constitutional document for Western Germany and then to the election of a government by popular vote.

This is the general picture—one of steady Allied advance and of steady Russian falling away. There is, however, one exception to it and that is Berlin. Weak in Germany as a whole, in Berlin the Russians remain overwhelmingly strong and the pattern of the struggle for Germany thus resembles a wrestling match in which one wrestler has almost got his opponent to the floor but is handicapped by the agonising grip the man has on his right elbow. Everything that has happened since the blockade was imposed has underlined the strength of Russia's local position. Outside the Western Sectors, Soviet and Communist control is being imposed. The police force has been taken over. Food distribution is in Communist hands and it is now no longer possible for the freely elected city government to meet in the Stadthaus since it suffers organised invasion by Communist crowds.

The German people have certainly shown opposition to the Russians. Sixty per cent of the police in the Soviet Sector moved into the Western Sectors and only a tiny proportion of families sought to re-register in the Soviet Sector to secure some of the extra food offered as a bribe. But the blockade limits the capacity of the Western Sectors to live as a self-contained unit. There is growing unemployment. The small ration depends upon an uninterrupted airlift. Public utilities only operate intermittently. So far, German morale has remained high, but it may be that in the long run the position will prove untenable.

The Russians have attempted to use their two instruments of pressure in Berlin—the blockade and Communist control—to prevent the organisation of Western Germany. Like Dr Reuther, they clearly regard a free Frankfurt as a possible magnet for the enslaved East. But in this they have failed. The meeting at Bonn this week is the West's answer to Russian tactics in Berlin. In the major struggle for Germany, Russia has lost the round. But it is also true that its grip on Berlin is as complete as ever. And in the circumstances, is it conceivable that the Russians should agree to any permanent relaxation? It is surely more likely that they will make the Allied position in Berlin more and more untenable with each advance in Western Germany towards political and economic stability. To abandon, in a losing game, one's only trump card would be the tactics of a fool, and as tacticians the Russians are not foolish, however unwise their grand strategy may be.

It is therefore possible that the shift of the discussions from Moscow to Berlin and from principle to technicalities may be no more than a new turn in Russia's game of delay—delay until Eastern barns are full and November weather brings fog to the Western airfields. Even if a currency agreement is reached and the blockade is lifted, the Soviet mark can be used as one more instrument in establishing *de facto* Communist control throughout the city and the Russians could then choose their own time and their own pretext for reimposing the blockade. If in return for the concession over currency, the Allies could secure a land corridor to their own sectors, then, indeed, a new situation would arise. Short of that, the Allies will remain as exposed as they are today to Russian ill-will.

An agreement on currency and a lifting of the blockade—however temporary—are, naturally, to be sought. They offer no permanent solution, but they can give the Allies the opportunity of thinking out their position in Berlin in conditions of relative calm and of taking action without seeming to act under immediate Russian pressure. Now as at any time since the blockade was imposed and Communist control began to spread through the city, there are really only four choices open to the Allies in Berlin. The first is to fight. The second is to maintain the Western sectors by means of the airlift. This is very costly and may prove impossible. It can certainly only be done at the cost to the Germans in Western Berlin of unemployment and minimum rations. The third course is to abandon control of the sectors but to maintain Allied garrisons by air. The fourth is to move out. There are no other possibilities; any other policies would depend on a Russian choice; and any time and any elbow room gained by agreement on the currency issue and by a lifting of the blockade should be used, not to sink back into a complacent belief that after all the Russians will play the game, but to take a firm decision on the Allies' future policy in Berlin and its relation to their policy for Germany and, indeed, for Western Europe as a whole.

Labour and the Nation—I

The Limitations of the TUC

ON Monday next the Trades Union Congress resumes for one week the powers which for the rest of the year it delegates to its General Council. Even if it were held in some sleepy inland town and not in the brisk air of Margate, it would be obvious from the agenda that the General Council and its officers face a week of turbulent debate and criticism. Nothing could better illustrate the separate pressures that are exerted upon the high command of the TUC, lodged within the heart of Westminster, and upon the leadership of the individual unions in all parts of the country, than the difference between the annual report and the agenda for the Conference. The report is concerned with the work of committees, co-operative bodies, and advisory councils—in short, the somewhat uninteresting record of a responsible public body. The items on the agenda, on the other hand, contain much radical fire, some of them the more fiery (such as the demand for the reversal of allied policy in Greece) because they are not likely to form the spearhead of trade union demands. But the crux of the business at Margate is to be found in ten resolutions dealing with wages, prices and profits, and nine with workers' control or participation in the control of industry. On these two subjects the main interest of the conference will assuredly be focused.

These are, of course, the traditional subjects of trade union pressure; their importance today lies in the extent to which the unions are prepared to move from a policy of single-minded self interest towards non-sectarian and positive endeavour. Shaken by the seriousness with which Sir Stafford Cripps has treated Britain's economic problem, the unions have at last

begun to feel the need to justify their pressure for higher wages. The response of the General Council to the Government's White Paper on Personal Incomes was, it is true, equivocal in the extreme; it left individual unions free to press outstanding wage claims and it defined, in its own terms, the conditions under which claims would be regarded as reasonable. But at least the TUC recognised a principle of responsibility to the nation in demanding higher wages, which shakily though it was upheld went very much further than some of the individual unions were and are prepared to go. The argument for slowing down wages increases was related by the Government to the stabilising of prices and the curbing of profits; in the hands of the unions it has been twisted to become conditional upon their reduction. Prices have risen, largely because imports have cost more since February—though Sir Stafford has been finding £70 million a year more for food subsidies than he expected four months ago. Distributed profits have not increased, save for a small percentage of firms most of which could justify them quite reasonably. Yet many unions which diffidently supported the TUC on its wages policy seem on the point of withdrawing their support. They had expected lower prices, and therefore increased real wages. They have found instead (unless their money wages have been raised since February, as some have) that their pay packet buys less. And the moral they draw is, not that there is less to buy, because Britain is poorer, but that a further rise in wages will enable them to maintain their standard of living.

★

Consequently the debate at Margate will generate a strong head of pressure for reversing the General Council's policy, weak and illogical though it was. One faction, encouraged by the success of the engineers' wage claims, will press strongly for the abrogation of any principle of slowing down wage demands: the other, more loyal to the General Council, will press for the fulfilment of the other half of the bargain—a drastic reduction of prices and profits.

This controversy will raise in its most acute form the issue whether the trade union movement can fairly claim to be a responsible element within the nation. In its own eyes, the TUC is not merely a vehicle for canalising the demands of its various unions. Its General Council has, or would like to think that it had, the dual responsibility of representing the interests of eight and a half million workers to the Government and the nation and also of representing the Government's viewpoint to the workers. It has a sense—by no means unfounded—of proprietorship over the Labour Government, and it is equally anxious to demonstrate to the world that the workers will follow its guidance. Next week's conference and the decisions that flow from it will show to what extent these pretensions are true, more particularly because the General Council has two further unpalatable recommendations to lay before the Congress. First, it proposes that trades unionists appointed to the boards of nationalised industries should function as individuals and not as delegates of their unions. It is obvious that a man bound by loyalty to two organisations would be reduced to a state of complete incapacity to play a useful part in the direction of a nationalised industry. But it is a blow aimed at the lingering attachment to syndicalism which persists in some unions and some parts of all unions. It means that the general staff of labour has rejected the tempting notion of taking a direct part in the government of the nationalised industries in favour of maintaining the independence of trade unionism.

The second message which the General Council will attempt to impress upon the delegates at Margate, is that higher productivity and full employment go hand in hand. It has at last realised that full employment does not depend upon the complexion of the Government in power; that a Tory government would honour its pledge to maintain it and that a Labour government, owing to the rising cost of raw materials and wages or to a failure to compete effectively in foreign markets, might itself be unable to maintain it. Full employment is in fact an aspiration, and it is perhaps the realisation of this that has goaded the TUC to take a stand on productivity, rather than gaze into the future to discern whether in the next round it is to be the doughty opponent of a Tory government or the trusted henchman of a Socialist regime. It now demands that its members should abandon their attitude of suspicion towards industrial efficiency, accept mobility as a condition of full employment, and justify the load of the new social services by higher output.

The effect which this change of heart will have upon the workman at his bench must be determined by the extent to which the TUC can move the minds of the working people of this country. A recent analysis by PEP* of the Trade Union movement suggests that the TUC cannot do very much in this direction. The study shows that there are three levels within the structure of the unions. At the top are to be found members of the national executives and the permanent officials, most of them middle-aged men who have risen by their intelligence and energy, who are in touch with the higher reaches of national and industrial policy making and who, once elected, are seldom turned out of office. Below them comes the active membership of the branches, including the modestly remunerated voluntary officials. Research has shown that the average percentage of union members voting at branches is between 15 and 25, and though pressure on the national executive comes from these branches, attendance at branch meetings is limited to the politically conscious and not always responsible minority. Finally there is the 80 per

cent who, lacking either the energy or the enduring interest in the affairs of trade unionism, will accept the advice of the minority in the branches on some issues but on others prefers to listen to shop stewards or even to unofficial leaders. The radical pressure is strongest at the lower level and becomes progressively diluted as it approaches Transport House. Thus, it is not surprising that the latter possesses no power to bind the unions or even frequently enough to sway their views. The Government likes to treat the TUC as if it were a sovereign, federal body. For its part, Transport House must often wish that it were, for in fact it wields only the lowest common denominator of sovereignty which the unions are grudgingly prepared to give it in the interests of solidarity.

The more closely the structure of the trade union movement is examined the more apparent it becomes that it is not, as some observers have supposed, a fourth estate of the realm, but is a pressure group, devoted to safeguarding and extending the political rights and economic privileges of the British worker. There is nothing shameful about a pressure group unless its aims or methods be shameful; the repeal of the corn laws, the abolition of slavery, and the enfranchisement of women were achieved by such groups and the social achievements of the trade unions have been very great. But the awkward question remains of how such an organisation can—as it were—reverse the pressure, presenting the demands of the community to the worker instead of (as in the past) presenting those of the worker to the community. Will the docker or the miner accept unpalatable truths or unwelcome decisions from an organisation which in his view exists simply to further his own interest and does that job none too well? Will the shop steward listen with any greater attentiveness to talk of productivity from Transport House than from his own production manager? Does not the tendency of a trade union official to adopt the tone of a mentor rather than the manners of a delegate stamp him in the eyes of the worker as untrustworthy?

The truth is that in the urgent task of changing the workman's attitude to technological progress and of evoking a spirit of industrial enthusiasm, the nation cannot rely upon Transport House to fight its battles for it. Even if it were absolutely certain that the TUC was committed without reserve to a crusade for higher productivity, it is doubtful how much it would achieve without radical reform of its whole organisation and powers. The admission of some breath of common sense in the councils of TUC is welcome to a public weary of the timid attitude of the past, but that does not alter the fact that the problem of raising productivity is fundamentally one of works relations through shop stewards or the machinery of joint consultation (a fact recognised by American management many years ago). It may be galling that while the unions, ably abetted by the prewar Labour party, helped to create the problem of low productivity, they cannot do more than help to solve it. But industry should examine its own deficiencies in industrial relations over many decades before deciding to put the responsibility solely upon the TUC.

Students of British trade unionism (including PEP) have emphasised that the attitude of the British worker depends upon his confidence in the future, in the recognition of his standing as an individual, in the improvement of his standard of living, and in his security of employment. But it is too often thought that lack of confidence is a disease peculiar to the working man. Confidence implies a mutual relationship, and the British worker cannot expect to acquire confidence if his qualities of perception and adaptability do not inspire it. But confidence is not something which can be advanced by fine words, for it involves two difficult and controversial questions—the wage structure of British industry and the real possibilities of joint consultation—which will be dealt with in later articles.

Efficiency in Uno

THE seventh session of the Economic and Social Council has come to an end at Geneva leaving behind a disagreeable impression of confusion and wasted effort. Everything seemed to conspire to lay bare the gap between the vital aims and purposes of the organisation and its actual achievement. There was something infinitely discouraging about the agenda of 50 items arranged without any sense of priority, the futile, day-long arguments on points of procedure and the comparatively inconclusive results. Some things, it is true, were achieved. The past work of the Economic Commission for Europe was approved and its future scope enlarged. A number of reports from the specialised agencies which are active in the economic and social field were received and approved. The Economic Commission for Asia and the Far East received its terms of reference. Minor points of jurisdiction were clarified. But the achievement was painfully small, measured against the expenditure of time and effort.

Such a situation is little short of tragic. The Economic and Social Council was intended to stimulate international action and co-operation in fields where human needs obviously transcend national boundaries, and offer a clear opportunity for genuine international effort. Starvation, disease, underdeveloped resources, over-population—these are fundamental factors of human misery in which no nation seeks to maintain a monopoly and which few governments can overcome single-handed. Economic and social reconstruction could also be the one achievement most likely to rally genuinely peaceful and creative enthusiasm behind the work of the United Nations. In Goethe's great allegory, Faust discovered the moment of time he longed to perpetuate only when, after experiencing every pleasure that love, power and philosophy could offer, he found a marsh that he could drain and land he could reclaim. Today, some of the greatest national symbols—the Dneipestroi Dam, the Tennessee Valley Authority—have the same quality, and nothing could so quickly rescue the United Nations from its arid paper-bound existence than the achievement, under its aegis, of visible economic and social results. But the record of the Economic and Social Council so far has been on the whole the contrary one of damping hopes and hastening cynical discouragement.

Some of the reasons for the Council's disappointing record are temporary and some, in the present state of the world, cannot be helped. Before useful action can be launched, a great deal of preliminary study and reporting must be done. Not all the vast documentation is redundant. Some of it is necessary factual preparation for international action; it is natural that preliminary studies should be more in evidence than completed plans in the first two years of an organisation with such wide scope as the Economic and Social Council. Moreover, the Council cannot avoid the reality of a divided world. The tasks of economic and social reconstruction ought to transcend national frontiers, but it is a harder job for any kind of action to cross the Iron Curtain. The endless debates at the Council Meeting in Geneva—with Russia, Poland and Jugoslavia in a perpetual minority—simply reflected the growing inability of East and West to agree about anything.

Yet the East-West split is not the whole explanation. In certain fields where a clear sphere of action exists or an obvious and important service is being performed, the polemics of Mr Aroutinian and his colleagues were not a serious obstacle to the Council's work. The Economic Commission for Europe has been able, against all expectations, to provide a link between the Marshall Plan and the "Molotov" Plan. Some bodies, such as the International Emergency Fund for Children, are able to operate freely, supported by both sides.

The fundamental difficulty is that the organisation of the economic and social activities of the United Nations is in such a state of chaos that it is extremely difficult for defined areas of action, unconfused purposes and clear authority to emerge. In the first place, the United Nations is confused and divided within itself. Whether by intent or inertia, the functions of the eight Assistant Secretaries-General have tended to develop towards eight separate jealously guarded departmental kingdoms with no authority below that of the Secretary-General to solve their jurisdictional conflicts—and the Secretary-General would be fantastically overworked even if he had nothing else to attend to. The consequences for the Economic and Social Council of this structure of entirely separate departments are particularly unfortunate since two departments—for Economic Affairs and for Social Affairs—are responsible for the organisation of the single Council.

*

The rivalry and potential overlapping within the United Nations itself is repeated in the relations between Uno and all the independent specialised agencies which are primarily concerned with economic and social policy. The Monetary Fund, the World Bank, the Food and Agriculture Authority, the World Health Organisation, the United Nations Educational, Scientific and Cultural Organisation—to name only five of the dozen agencies—are independent of the United Nations. They may limit themselves by sovereign agreement; or they can, in a great variety of ways, invade each other's fields, engage in overlapping activities and duplicate work at a time when the resources available internationally are so stretched that the utmost economy and concentration of effort are essential. A number of these agencies have signed conventions with each other, delimiting their spheres of responsibility, but much more co-ordination is needed, and confusion is increased because there exists under the direct responsibility of the United Nations another set of institutions—the various Commissions, on Employment, on Economic Development, on Population, on Transport—which introduce a further element of duplication. There is no escaping the conclusion that the confused agenda, the endless debates and the sterile conclusion of the Economic and Social Council's meeting in Geneva in large measure reflect this administrative confusion.

This weakness has, fortunately, become increasingly apparent in the last eighteen months and the British and American Governments have taken up with some vigour the question of what can be done to create a more efficient machine. The General Assembly in 1947 instructed the Secretary-General to act energetically in co-ordinating international activity and the progress he has achieved will be one of the most important matters on the agenda at the next meeting of the Assembly in Paris.

Some critics have felt that the responsibility for bringing into proper perspective international activities in the economic and social field should belong to individual governments and should not be laid on the Secretary-General. It is true that the governments are the final source of authority and in most cases they are also Uno's executive agents, since much of the work of Uno and of the specialised agencies lies in urging governments to take action rather than in taking action directly through their own officials. It is also true that governments themselves are in great part responsible for the present confusion. Not only did they originally establish the independence of the specialised agencies from Uno: they continue, conference by conference, to make new contributions to administrative chaos. One of the most disturbing features of any conference held either by Uno or by the specialised agencies is the string of resolutions for fresh activity with which the agency then becomes saddled. These resolutions themselves are not co-ordinated in any way; one put forward, say, by a country's Ministry of Agriculture may directly contradict another put forward by the Treasury of the same country. In the past year, governments on the Budgetary Advisory Committee have proposed cuts and economies while the same governments, represented by health officials or agricultural officials or transport officials at specialised conferences, have forced resolutions on the UN involving millions of dollars of fresh expenditure. There is thus some justification for the plea that governments, as the real centres of authority, as the habitual executives and also as one of the chief sources of trouble, should be given the task of pulling the economic and social activities of the United Nations and of the agencies into better shape.

Ideally, this might be the solution. In practice—as the recent proceedings of the Economic and Social Council have proved beyond doubt—governments are neither ready nor really able to carry out this task. They are much too divided between themselves to hammer out a comprehensive and detailed programme of co-ordination. They are insufficiently organised both internally—between government departments—and externally—between governments—to agree upon a list of priorities such as food production, land reclamation or migration which could be accepted as the main goals of effort throughout the international field and in relation to which each agency might be allotted its appropriate sphere of activity. For the same reason, the Economic and Social Council cannot become the co-ordinating centre. The Council is merely the governments meeting together once a year and it is no more capable than they of producing a genuine plan of co-ordination. If there is to be an end to the present frustration and chaos, it can come only from the United Nations and the specialised agencies themselves.

*

Happily, they recognise this situation. A co-ordinating committee of the United Nations and the specialised agencies under the Secretary-General has been set up; it has presented the Economic and Social Council with a first tentative survey of all international economic and social activities with the aim of eliminating duplication of effort and of establishing the five or six broad questions on which the whole international machine should concentrate as a matter of urgency. The establishment of this co-ordinating committee has been followed by another important step. In the early summer a new post was created within the Secretariat of the United Nations with the special responsibility of co-ordinating the internal departmental activity of the United Nations and the external activities of the different agencies. The appointment of this new Assistant Secretary-General to the Secretary-General's own executive office clearly strengthened the structure of Uno at its weakest point—its capacity to co-ordinate, supervise and direct its vast activities; it has begun, slowly perhaps, but with some degree of hope, the long task of bringing order out of chaos.

The Secretary-General has thus shown himself sensitive to what was becoming the gravest criticism that could be made of the present machinery of international co-operation—that, over and above all the frustrations and difficulties thrown up by the division of the world, the machine itself was appallingly incompetent. Now a new start has been made and new hopes have been aroused both within and without the United Nations. The General Assembly will have no more fruitful task in economic and social matters than to see that this initiative of co-ordination and constructive planning is developed to its fullest extent.

Industrious Designers

ALTHOUGH the practice of industrial design in this country is by no means as recent as many designers would have industrialists believe, it is still an inexact study, and industrial designers, with very few exceptions, are still largely inexpert practitioners. This is reflected in the persistently poor design, both functionally and aesthetically, of many British goods, especially among the factory-made products of the newer industries. It is commonly recognised that the situation can only be improved by training better designers and of extending the confidence of industry to them. Recent changes, therefore, in the methods of instruction at the Royal College of Art may, however, help to change this sorry situation during the next twenty years, and thus merit the attention of everyone concerned with the competition of British goods in overseas markets.

Changes have long been overdue at the Royal College of Art. Instruction, as in a majority of art schools in this country, has been anachronistic, unsuited to the conditions of employment and the industrial problems awaiting students. Too often the Royal College and the art schools have been seminaries in which teachers have taught students to be teachers, an inbred and unhealthy round. Art teachers were fearful of industry, which they did not know, and castigated businessmen they had not met. Artists who broke from this round and began to design successfully for industry soon forgot their art schools, and commercial salaries and fees were apt to make them scornful of the inadequate teaching fees offered by educational authorities, especially in the provinces. There were honourable exceptions to this lamentable story, but extremely few. The majority of art teachers probably saw themselves as potential Constables, subsisting during the harsher years of apprenticeship by teaching at two or three guineas a day. Then, with little or more usually no recognition of genius, cynicism set in, the existing system was blamed and part of that system was industry. The chances for any art in any industry were thus minimised and neglected. Industrialists were blamed, of course, and often rightly. For them, the commercial artist was too often a long-haired bohemian who knew nothing of industry's problems—somebody to bring in, via the publicity manager, when a design for a label or an advertisement in the trade press was required. Yet, often enough, artists have also been to blame. For a hundred years they have been too keen to take shelter in their own art-for-art's sake studios. When they were offered commissions for labels they accepted the commissions but thought that they could still design the labels without leaving their studios. For every William Morris there have been a hundred Tonks.

The rise of the advertising agencies changed this picture, but not impressively. The agent employed the artist, on behalf of the manufacturer, but at the same time kept the manufacturer and the artist more firmly apart than ever before—and the artist's work was still that of a decorator. Advertising agents dealt mainly with posters, press advertisements, booklets and so on. The artist was required to soften the stark injunctions of the salesman, in colour or black-and-white, and in two dimensions. All problems concerning the design of the product itself, or the machines that produced the product, were almost exclusively the concern of engineers, and engineers are more usually concerned with how or why things work than with how things look. An engineer's work on a knife-sharpener rarely includes suggestions concerning the colour of the enamelled finish, the design of the pack or the label; his work on an airplane rarely includes the selection of fabrics for seats, the design of luncheon baskets or of uniforms. For such jobs some kind of artist was again necessary, but he was still called in almost as a decorator or toucher-up. Yet if the engineer were more of an artist or the artist more of an engineer, many disadvantages of the existing procedure would disappear. Product, package, label, advertisement would have a desirable and marketable unity. The knife-sharpener or airplane might be a planned whole and not a series of parts.

So, at least it seemed to a few artists (or designers as they now termed themselves), and they began to try to train themselves for such tasks, but their training was self-imposed, their curricula too hazy and too easy. Engineers might have seemed the logical technicians to take on these tasks, but engineers are usually too busy engineering and their training does not include the study of aesthetics or the applied arts. Architects were more suitably trained than most other designers for such tasks, but were often weak on the fundamental facts of engineering. The brothers Adam in an earlier age, Voysey in a later age, pointed the way, but architects, with few exceptions, were slow to see it or thought the job beneath them.

Many efforts have been made to bring industry and art (or design as the more chilly protagonists of art in industry prefer) into a closer working partnership, but Wedgwoods are rare in industry, Frank Picks are equally rare in management, and designers who are both competent and persuasively articulate are perhaps even rarer.

The success of the first and most persistent of these efforts, the Design and Industries Association, an association of manufacturers, designers and well-meaning citizens, founded in 1915, has been pervasive rather than spectacular. It has been fonder of gentle precepts such as "fitness for purpose" rather than frontal attacks upon ill-designed objects. During recent years the Society of Industrial Artists has been formed, and has fought a good fight to establish itself, but it has far to go before it can exercise a power over industrial design comparable with that of the Royal Institute of British Architects, its obvious model, over architectural design. Other organisations representing artists and designers have made their modest contributions. The Royal Academy and the Royal Society of Arts (which was founded in part to encourage a closer union between art and industry) have been apathetic and over-genteel in their endeavours. Lectures, committees, and cosy gatherings of the converted are rarely effective substitutes for action, and meantime bad design flourishes more strongly than ever. There is also the Royal Fine Arts Commission; but, here again, the interest of the Commission in questions of industrial design is dim, although the subject is often linked with the Commission's tasks.

The most important attempt which has yet been made to bring some sense of order into these well-meant but too-divergent efforts was the formation of the Council of Industrial Design by the Coalition Government in 1944. This new body, under an able industrial designer, is making strenuous attempts to educate both manufacturer and consumer in the virtues of sound design. The problem is immense, for sound design, like good taste, is an intangible but recognisable quality, which cannot be demonstrated by statistics or diagrams. Manufacturers are thus apt to remain antipathetic towards something as nebulous as a quality; they desire convincing proof in the form of cost sheets and rising sales curves before they can be convinced that sound design pays dividends. The "Britain Can Make It" Exhibition in 1947 and the projected Festival of Britain in 1951 have awakened the interest of industrialists, but less in design than in the new markets which have grown up during the war. The industrialist is not yet certain that it is design which has brought in the crowds and not the novelty of a colourful exhibition.

In a planned economy, sound industrial design is often at a discount. The manufacturer who is dealing with the home market is under no imperative urge to make beyond his quotas, often in no hurry to make unwelcome changes and by no means anxious to open up his production methods to the inquisitive gaze of an industrial designer. In the export industries, however, British manufacturers are increasingly aware that sound design is important. This intangible quality may reduce costs and will probably sell more goods. British manufacturers, under continual prodding from Sir Stafford Cripps (who has no illusions concerning the design of much that Britain exports, and who was chiefly responsible for starting the Council of Industrial Design), are gradually learning that although a Rolls Royce aero engine can be sold overseas on its performance alone, other goods—automobiles, textiles, cutlery, pottery, glassware and most consumer products—are sold on their performance and appearance.

The new principal of the Royal College of Art has made a number of changes, salutary but not revolutionary, in the more traditional schools of painting, engraving, sculpture and architecture, but in the Design School his changes have been more emphatic and controversial. In place of one professor for the Design School, six professors have been appointed to direct six divisions of design—publicity; furniture and engineering; silversmithing, metal engraving and jewellery; fashion; pottery and glass; and textiles. These professors are to be encouraged to carry on with their own work as designers within the college, a characteristic of its instructional system which has not been widely practised of recent years.

Practising designers will find fault with these divisions. It is questionable whether it is desirable or practicable that designing in metals and precious stones should be carried out in South Kensington, so far from the indigenous homes of those crafts, but perhaps the college will establish a closer union with the industries and art schools of the industries than has existed until now. It is questionable whether any engineering worthy of the title can be satisfactorily carried out in South Kensington. And what manner of engineering in any case? Constructional, electrical, mechanical? And what is a Professor of Publicity? Surely this is a dubious title, more reminiscent of the bad old days of advertisement touts and shady postal university courses than of the Royal College of Art. "Professor of Graphic Design" would have been a better and more accurate title. And will the Professor of Publicity deal with photography, a weak division of graphic design in this country? (One of the two leading fashion magazines in this country finds it necessary to use a French photographer for its more important fashion commissions.) Should not the School of Architecture have been dropped, or handed over to the Architectural Association? The amount of architecture (or even architectural draughtsmanship) which can be taught in the time available to students at the college is not impressive. The most competent architectural draughtsmen are invariably architects. Certainly an appreciation of architecture is necessary for most students, but does this require a Professor?

These are minor criticisms. The main thing is that at long last a move seems to have been made in this country to train industrial designers along sound lines, and British industry should be watchful of the experiment if it intends to hold its own against the competition of American, Scandinavian and Swiss firms.

NOTES OF THE WEEK

Engineers' Wages

The findings of the Court of Inquiry on the engineers' wages claim will almost certainly open the floodgates to other claims. Although the Court found "special circumstances" unrelated to the White Paper on Personal Incomes, to justify its recommendation for a 5s. weekly increase, and although it specifically stressed that this must not be regarded as a precedent, its findings will undoubtedly have an inflationary effect. Some of the shop stewards are already up in arms against the "meagreness" of the amount, but there seems no reason to suppose that it will not be accepted by the unions when they meet next week. It is customary for the awards of Industrial Courts to be honoured by both sides, and the engineers would have nothing to gain by refusing this one, even though it is lower than the 13s. a week they claimed. But the increase is bound to have wide repercussions throughout industry and to influence the course of the debates on wages, prices and profits at next week's Trades Union Congress. For though the Court argued that the increase could not be justified within the strict terms of the White Paper, it was disposed in the circumstances of the claim, to admit it for consideration.

Even more encouragement will be given to the opponents of the White Paper by the Treasury's astonishing decision (which leaked out several days before the main award) to raise the wages of the engineers employed in Government establishments. These 70,000 engineers have in fact done better than the 1,600,000 who are likely to be covered by the decision of the Industrial Court. The Government engineers now have an unskilled minimum of £5 and a skilled minimum of £5 15s., compared with the unskilled minimum of £4 12s. and skilled minimum of £5 7s. for those in industry. It is being argued that there were "special circumstances" in this case—the Government engineers' claim was formulated before the White Paper was published and their earnings (as distinct from their basic wages) are below the level of those in private employment. Nevertheless the Treasury's decision has been widely interpreted as a direct violation of the Chancellor's policy.

The Court was in a dilemma. To have granted the whole increase would have been quite out of the question. To have upheld the employers' view and granted nothing would certainly have given rise to widespread industrial unrest, which might have resulted in a greater loss to the national economy than the cost of allowing an increase. Instead the Court decided on a traditional British compromise, and decided on 5s.—without giving any reason for its choice. It had generally been expected that the decision would favour the lower paid sections, and pass over the more highly paid men, to whom 5s. a week would make little difference. By awarding a flat rate of increase, the Court has dodged the crucial issue of incentives to higher output. Owing to the complex wage structure of the industry, it is impossible to estimate the final cost. It will probably be of the order of £30 million a year, when shipbuilders, women, apprentices and pieceworkers have their rates adjusted to the new scale.

The Court agrees with the unions that the whole structure of engineering wages urgently needs revision and simplification, and that, as a long term policy, consolidation of the national bonus with the basic rates is "highly desirable," though impracticable at this stage. It is very much to be hoped that the two sides of the industry will reach a satisfactory agreement on a revised wage structure, and bring to an end a long series of negotiations. The crucial test for both sides, however, will be whether they can carry out the final recommendation of the report—that an increase in output should follow the adoption of their findings. Unless this does become a reality, the cost to the nation will indeed be heavy.

* * *

Another French Crisis

The reason why French Cabinet succeeds French Cabinet after a series of identical upheavals is that each new governmental reshuffle is simply a reflection of an unchanged and continuing economic and social crisis. For the last nine months the condition of the organised workers has grown steadily less favourable. Wages have failed to keep pace with the constantly increasing cost of living and the pressure for higher wages—which would give one spin more to the inflationary spiral—has grown steadily more insistent.

This intensification of economic pressure has, inevitably, played into the hands of the Communists. Last November, general disgust at their political antics drove a mass of workers into the independent *Force Ouvrière*, which began to look to the Socialists for parliamentary support. Discontent also strengthened the position of the Catholic trade unions, who look to the MRP. But as the summer has advanced, this split has begun to be tided over by the growing sense of grievance and unity on the wage issue. Even in the Reynaud works, the starting-point of *Force Ouvrière*, the workers have made common cause with the Communists to press for increased pay.

The Socialists, and to a lesser extent the MRP, have thus been faced with the fact that if, in the process of balancing the French budget, the Government demands further sacrifices from the working-class, the Coalition parties may lose a mass of their working-class support to the vigorous and, on the wage issue, uncompromising Communist leadership. Yet the Radicals—the third pillar of the Coalition and the dominant force in economic policy—see no means of achieving stability save by freezing wages, encouraging the "confidence" of the middle-classes, slashing state expenditure and wooing the farmers. To the worker, these policies simply mean more for the rich and less for the poor.

The Socialists, therefore, would not go along with M. Reynaud, since he would increase wages only by 10 per cent. The Marie Government fell, and now M. Schuman has acquired once again the ungrateful task of governing France with a Cabinet at loggerheads on the basic issue of economic reconstruction. M. Schuman's first statement of policy to the Chamber differed little from that of M. Reynaud. One can only ask whether his chances of survival are as small.

* * *

OEEC Begins to Ration

The full Council of the OEEC which is meeting in Paris this week faces two crucial problems. Both are tests of the ability of the seventeen nations to develop their co-operation further and both have roused considerable misgivings. Details have not yet been made available of the plan to increase multilateral trading in Europe by making available credits to the debtor nations out of local currency funds set aside by the creditors as the equivalent of their dollar aid. Comment, therefore, must be postponed, but it is known that the creditor countries of Europe, with Belgium and Britain at their head, have serious reservations to make about the scheme in its present form.

The other problem—the allocation between the seventeen nations of the $4,875,000,000 available under the Marshall Plan until June 30, 1949—is not essentially so intractable. Two weeks ago, a special OEEC working party produced a draft allocation which was acceptable to all save three of the member Governments. One of these, the officials of Bizonia, are merely the Americans and the British wearing other hats, and it is reasonable to assume that ways and means can be found either of offsetting the scaling down of Bizonia's share by $100 million or of reconciling the Bizone authorities to the cut. But the other two—Greece and Turkey—are fully sovereign, independent nations, and their disagreement could be enough to destroy the whole proposed system of allocation, since, within OEEC, agreement must be unanimous.

The failure of Greece and Turkey, alone among the independent nations, to agree raises in an acute form a query that has been hanging over the European Recovery Plan since its beginning. It is quite clear that if the OEEC is to be, as the Americans demand and press, the kernel of greater economic integration in Western Europe, the presence of two Eastern and Mediterranean countries is even in theory a source of embarrassment. In practice, as is common knowledge, the perpetual carping of both nations at their "insufficient" allocations and their natural but stultifying obsession with tobacco have been among the heaviest of the many heavy crosses borne by the officials of OEEC. Would it not be both more reasonable and more practicable to give Greece and Turkey the special status of "strategic commitments"—which they are—to allot them aid directly as has been done in the past, possibly as part of the American military budget, and to give them observer and adviser status at Paris?

* * *

Zhdanov's Death

Few people in the West will regret Comrade Zhdanov—whose sudden death in Moscow was announced this week—but many will miss him. His rowdy attacks on the decadent imperialists, his heresy hunting among the literary men and historians of Russia, his excursions into the finesses of musical orthodoxy, above all, his glorious blunder over Tito, have provided the Western Powers for the last year with a continuous undercurrent of amused surprise in a world in which such opportunities for mild diversion are growing more and more rare.

Now the wry jester is dead. Such is the nature of the Soviet regime that the extinction there of any high official instantly suggests the possibility of "liquidation." Speculation will be rampant. Was he murdered as a scapegoat for the Tito fiasco, for which as a Secretary of the Central Committee of the Communist Party in Russia and as initiator and chief instigator of the Cominform he was apparently responsible? Or is his disappearance simply one move in the dark struggle for succession which must already encompass the throne of the ageing Stalin? However, the nature of the Soviet regime also makes it certain that speculation will remain speculation. Nothing is likely to be known about the succession to Stalin until someone has actually managed to succeed.

The facts are less tantalising. Zhdanov was the prototype of Soviet Russia's "new men." He fought through the Revolution and the Civil War as a junior and belonged to the generation who were ready to take power when Stalin had liquidated his own contemporaries. Zhdanov succeeded the murdered Kirov at Leningrad in 1934 and was distinguished—even during the brutal period of the Purges—for his brutality. But the force behind it enabled him to lead the people of Leningrad through the long German siege, and it has been said that his efforts there produced a physical exhaustion to which he has now succumbed. Since the war, he has been recognised as one of the three or four men on the inner ring of power in Moscow and one of the deeply disturbing features of his fanatical attacks upon the West in the last year is the likelihood that his picture of a war-hungry ring of capitalist states represents the deeply ignorant world view of the Soviet leaders. The very fact that he is so completely representative makes his disappearance a matter only of internal political significance. There are many men, of exactly the same type, to take his place.

* * *

Collecting Union Dues

The miners, it is now clear, are determined to set up what would virtually amount to a closed shop in the coal industry. Their decision to press the National Coal Board to apply in every Division the system which now operates in certain coalfields, under which union contributions are deducted by the colliery management from the miner's weekly pay packet, was originally forecast at the Union's conference. It has now been carried a step further by the setting up of a joint working party with the Board, to work out the lines of a national agreement. The Board is understood to be opposed to establishing a closed shop as such, but it is difficult to see what other consequences can emerge from such an agreement. It is true there would be a theoretical safeguard in that each prospective employee will be asked to sign his agreement to this procedure, but it is improbable—to say the least—that a man who refused to agree would be taken on, and membership of the union would thus in fact, if not in theory, become a condition of employment.

The issue, as far as the mines are concerned, is to some extent academic. The practice of deduction is already applied in South Wales, Yorkshire and parts of Northumberland, the proportion of miners outside the union is very small in any case, and foreign recruits are already obliged to give this undertaking. Difficulties, however, may arise in the case of men who wish to join another union, such as the Winding Enginemen's Union, where the majority are catered for in a special section of the NUM. If the Board and the union agree to an arrangement which they believe will lead to greater stability in the labour force and which is administratively the most convenient, that is largely their affair, although it is difficult to see that it is really in the interests of the union members to place themselves so unreservedly in the hands of their employer.

Nevertheless, once adopted, the principle of compulsory deduction of dues may have serious repercussions. The railway unions and other unions in nationalised industries may well press their national Boards to make similar arrangements and there is no reason why the demand should not spread to private industries, such as journalism. The TUC has always differentiated between the closed shop and 100 per cent trade unionism, and the former has never been a feature of British industrial life, as it has in America. It goes a long way to destroy the voluntary nature of trades unionism and is in fact a concealed demand that any dislike of paying union dues which may result from a discontent with inefficiency in the union shall be transferred to the employers.

Closed Shops

If there is one shopping advantage that the suburbs and the provinces have over the West End of London it is the ability to shop on Saturday afternoon. Now this is threatened. Later this month the Union of Shop, Distributive and Allied Workers is to launch a campaign for the closing of all food shops at midday on Saturday. If it is successful, legislation will be sought to make the dissident minority come into line.

This is a preposterous campaign which shows how badly the virus of shorter working hours has infected the national life. The union claims that "tests have proved [sic] that only 2 per cent of the week's food shopping is done on Saturday afternoon." The public is to be told: You have your Saturday afternoon free, why should not shop assistants have theirs? This, in fact, is the answer of the shop assistants' union to the Gowers Committee, which last year recommended a general closing hour of 7 p.m. with a weekly extension to 8 p.m. So far from serving the convenience of the consumer by agreeing to this recommendation, the union is now attempting to make shopping more difficult than ever, since it can be taken for granted that the campaign to close food shops would, if successful, sooner or later be extended to all shops.

It does not matter whether the amount of food bought on Saturday afternoon is 2 per cent of the weekly total or less than 1 per cent. But it does matter very much that this tiny minority of purchases, which may, however, represent a very large number of purchasers, should continue if those affected so desire. If there is a shopkeeper enterprising and energetic enough to stay open on Saturday afternoon to suit the convenience of some of his customers, why should he be compelled to close earlier? The answer is that otherwise he might steal customers from his less industrious competitors. Hard work, in fact, is synonymous with "cut-throat competition." By these arguments—a particularly glaring example of restrictionism—the union will hope to win the support of the shopkeepers for their campaign.

It must be strenuously resisted. Nowhere perhaps is the interest of the consumer so clearly apparent as in the retail trade. If ground is given here, there will be small hope of making a stand anywhere else.

* * *

Progress of the Health Service

It would be difficult for a foreigner, reading the press of this country, to decide whether the national health service was being a success or not, and it is not easy for a native to ascertain the facts. The Ministry of Health has contented itself with giving the number of general practitioners who have agreed to serve, and the number of people who have registered with them. Over 18,500 general practitioner principals in England and Wales out of a total of 21,500 principals and assistants and over 7,000 dentists out of a total of about 10,000 have joined the service, and over 39,000,000 people have placed themselves on doctors' lists. The number of cases in which people have had to be allocated to a doctor because they could not find one to accept them is very few.

What other items of news are available are used by Conservative and Labour propagandists to serve their own ends. There has evidently been an enormous demand for spectacles. This, say the Conservatives, shows how people will abuse the right to free treatment and appliances. On the contrary, say the Socialists, it shows how many people in the past were prevented by poverty from having the spectacles they undoubtedly needed. Both may be right, and it is too soon to say how far they are right.

It is the same with dispensing. The *Pharmaceutical Journal* reports a big increase in the amount of dispensing during the first month of the national health service, compared with the same period of 1947. For the Middlesex pharmaceutical committee alone it is estimated, on the figure for July—a summer month it should be noted—that the number of prescriptions dispensed annually will be over 6,700,000. Even if all the prescriptions dispensed carry the ordinary fee of 1s., the cost of this one item in the health service in only one local health authority will be high. And the same journal also reports a considerable amount of prescribing of the more expensive drugs and appliances.

Once the decision to have a free national health service was taken, it would be wrong to start any cheeseparing economies which would merely exasperate doctors and patients. It would introduce a utility medical service that would have an inferior status in the eyes of the general public who, judged by the statistics, are at present prepared to regard the service favourably. Nevertheless, its cost, both in money and manpower, should be carefully watched. If, as now seems likely, the estimates will be far exceeded, people should be warned what the consequences of abusing the service may be—that they may have to choose between better education for their children and better medical treatment for themselves.

* * *

British Justice on Trial

The Government's sudden decision to try the four German generals who have been held in captivity in this country for the past three years comes as a severe shock. All the relevant evidence of war crimes—the shooting of prisoners, the waging of aggressive war—in which the German General Staff was implicated was collected for the trials of Keitel and Jodl at Nuremberg in November, 1945. There is apparently no question of additional evidence implicating these four generals in particular, and, like the trial of Admiral Schniewind, Raeder's Chief of Staff, they will presumably be charged with carrying out orders which were contrary to the common precepts of humanity, and for which their superior officers have already been imprisoned or executed.

What is particularly odious about the decision to try these four men—Field-Marshals von Brauchitsch, von Rundstedt, von Manstein, and Colonel-General Strauss—is not so much the fact that they are to be tried at all—though that, too, is a debatable question—but that they should have been held in captivity for three years without trial and without even the promise of a trial. Does the Government think that its rights as a victor entitle it to flout what has been one of the most cherished principles of British justice? If these men were to be tried at all, if indeed there were ever any *prima facie* case against them, they should have been tried in 1945 with their superior officers. They were taken into custody at the same time; the documents which they signed were examined at the same time; the witnesses were available at the same time; the charges, too, must be the same. What possible reason can the Government have had for delaying their trial from November, 1945, until January, 1949?

The complete inability of any unbiased observer to produce a valid reason for the trial inevitably opens the door to every kind of unsavoury speculation. At a time when standards of international behaviour are touching new low levels the world over, it is all the more tragic that the British Government should have laid itself open to the charge of callousness.

* * *

The Facts of East-West Trade

The economic future of Western Europe depends in the long run upon two factors—its ability to export large quantities of manufactured goods, particularly the products of heavy industry, and its success in finding or stimulating supplies of food and raw materials in other than dollar areas. There is thus a *prima facie* case for examining with the greatest attention the possibilities of increasing trade between Eastern and Western Europe. For decades to come, Eastern Europe will need industrial imports to increase its own industrialisation and to modernise its agriculture. In return, surpluses of food, timber and minerals could, it is believed, be made available in increasing quantities for export. What, then, would be more natural than that Western Europe should use its industrial exports, first to stimulate and then to buy back the agricultural and mineral surpluses of Eastern Europe?

The Economic Commission for Europe has devoted its attention recently to this precise problem and a conference is to be called shortly to discuss both the interests involved and the existing opportunities for increased East-West trade. Some of the data upon which the Conference's deliberations will be based have been released to the press by the ECE, although any conclusions and proposals it may have seen fit to formulate will be reserved for private discussion at the conference. The Commission's report will be discussed in greater detail in an article in next week's issue of *The Economist*. Here it is sufficient to say that the ECE believes a substantial increase in trade could be secured, provided more Western industrial goods could be made available to the East.

This proposition, desirable in itself, must however be qualified by two questions, neither of which are within the competence of the ECE. Given the fact that the amount of industrial exports from Western Europe are at present limited, will the West gain the speediest return on its outlay if those industrial exports go not to Africa or the Southern Dominions or Argentina, but to the countries of Eastern Europe? The second query is political:

is it a wise policy to assist in the economic strengthening of the police state regimes in the Soviet sphere? It may be that in both cases the right answer is in fact to stimulate East-West trade, but a reply to both questions is needed before the undoubted possibilities of expansion are accepted and exploited.

* * *

Bread and Bahrein

In a parliamentary statement, the Persian government has again brought up the subject of Bahrein. Ever since 1820 they have been making periodical assertions of Persian sovereignty over this strategic island in the Persian Gulf. It was held by Persia intermittently during the seventeenth and eighteenth centuries, but since 1783 it has been occupied, independently of Persia, by Arabs from the Arabian mainland. Since 1816 it has been ruled by the Khalifa family of the Utubi tribe, and the Sheikh of Bahrein has been since 1820 in treaty relations first with the East India Company, then with the British Government. The effect of these treaties and other documents is to give Britain control of the Sheikh's foreign policy and the right to veto economic concessions to non-British interests, but to leave him otherwise autonomous. The oil concession, held since 1930 by an American company registered in Canada, could not be granted until the British Government had given its permission. It was the occasion of fresh protests from Persia to the British and US governments. In earlier protests they had referred to a British Note of April 29, 1859, in which Lord Clarendon was said to have recognised Persian sovereignty.

This is the background of the Persian government's new initiative, but Bahrein and its one million tons of oil a year are not at stake in this latest developments. It is the outcome of an interpellation last week by the leading pro-Soviet deputy in the Majlis, Abbas Eskandari, who made a speech lasting five hours and dealt at length with the other stock red herring of Persian politics, the Anglo-Iranian Oil Company's concession in Persia. In the Majlis the government is bound to reply to each interpellation and then to ask for a vote of confidence. Interpellations are thus used as a form of obstruction to wear down the government and were the means of overthrowing the last (Hakimi) government. The government of Abdulhussein Hajir got its vote of confidence by a handsome majority, but only after the Foreign Minister, Nuri Esfandiari, had stated that the government considered all pacts and understandings between two or more foreign Powers concerning Bahrein or its oil null and void.

*

One reason why the attack was launched at this moment was probably to counteract the goodwill created by the Shah's visit to England; the fact that the visit was non-political and on the personal invitation of King George was favourably noticed in the press. But issues more immediately important to the mass of Persians than Bahrein or Anglo-Persia relations were involved. A left-wing daily wrote on the Shah's journey: "His visit to Britain, where food is still rationed and where King and beggar enjoy equal justice, will show him the true meaning of democracy and freedom." And the Shah's own parting words were: "I particularly wish to draw the Deputies' attention to the need for legislation to establish a just relationship between employers and workers, and between landlords and peasants. I sincerely hope that such laws will be passed in the near future."

Instead, he has returned from his first journey abroad to find his government struggling with a bread crisis. (It was a bread crisis in Iraq which overthrew Saleh Jabr and the Portsmouth Treaty.) A Cabinet decree has given the Finance Minister wide powers to control the transport of wheat throughout the country. The landowners, amply represented in Majlis and government, have been reluctant to hand over their prescribed quantities of grain to the government. A letter to the Teheran press has thus summed up the central problem of all Middle Eastern countries:

> Two things make the bread situation a source of anxiety, the weakness of the Government in the provinces and the smuggling of wheat. The only way to dispel this anxiety is to use force in collecting grain without regard to the hue and cry which will be raised by the Deputies, who are either landowners themselves, or the patrons of landowners.

* * *

The Roving Forties

Full employment has done little to break down the prejudice against employing the over-forties. The impression is still current that any new employee, if middle-aged, is either infirm, insipid, or intractable, or that the problem of adapting his fellow-workers or his pension is insuperable. Ask any employer over forty if he himself suffers from any of these disabilities and he will be affronted: suggest he takes on a new member of his staff of equal age and ten to one he will raise every conceivable objection. Such at least has been the experience of the Ministry of Labour in their campaign to persuade business men to take on a proportion of the older age groups—men and women who are stable and experienced, but who fail to come within the absurdly low ages which are demanded in advertisements in the press—and demanded in conjunction with a quite impossible range of qualifications and experience.

In this matter the Civil Service is becoming enlightened, and it is now inviting applications for appointments for the administrative grade from men and women born between 1897 and 1915. The object of this new recruitment campaign is to even up the sides of the existing pyramid of promotion; at present there is an exceptionally large number of administrative staff approaching retiring age, and to replace these only by young recruits under 30 at the base of the pyramid would be to court discontent and unhappiness in ten to twenty years, when all these younger groups would be competing simultaneously for promotion.

Not only will this intake of older men and women adjust the present distortion of age groups, but it will also have the valuable effect of broadening the range of experience of the administrative grade itself, which tends to an inbreeding and exclusiveness inappropriate to its postwar functions. Industry and commerce would do well to take this example to heart. A population whose health and longevity are increasing while its supply of young workers falls must seriously consider the better use of those who are still in their prime, but no longer can be described as "young Achilles, on the threshold of youth, gloriously unprepared."

* * *

Not Enough Ballast

Giving evidence to the Select Committee on Estimates, Sir Thomas Lloyd, Permanent Under Secretary of the Colonial Office, said that to speed up the work of his department he would "rather have 30 typists than two or three more Assistant Secretaries." One of the greatest causes of delay in coming to a decision, he said, was the difficulty in getting anything typed. If another Government Department had to be consulted, it might take two or three weeks to get the letter copied.

This shortage of typists to underpin the administrative staff is not confined to the Colonial Office. There are at the moment about 500 vacancies for shorthand-typists in the Civil Service in London and 400 for typists alone. It is not confined to the Civil Service. Nor is it confined to this country, for a shortage is also reported from other capital cities. But here it is confined, at least so far as the Civil Service is concerned, to London; there is no shortage of typists in the provinces, and to relieve the pressure of work in London work is sent off to pools of typists either at a regional office of a Department or at the headquarters of a Department, like the Ministry of National Insurance, which is established out of London. The old lure of the big city, which drew so many young women from the provinces into London, is apparently not so strong as it was.

In pay and conditions of work, the Civil Service ranks as favourably as other big employers. A junior shorthand-typist of 15 years of age begins at £2 17s. a week and can reach a maximum of £5 16s. a week, plus 10s. a week proficiency allowance even if she is not singled out for promotion to the secretarial grade. What the Civil Service cannot offer, however, is a five-day week; and the difficulties, for a woman, of just living in this postwar world are so great that she will often prefer a worse-paid job, with no prospects but with Saturday mornings off, to a Civil Service "career."

The decline in the number of women of working age, the greater variety of jobs available for them, and the competing demands of other forms of public service, such as regional hospital boards, for those who do go in for shorthand and typing all point to increasing difficulties for the Civil Service in finding its shorthand-typists. But it is a sad thought that the Government of the country may break down because, in the words of the chairman of the Select Committee, it has "a lot of top hamper and not enough ballast." Mechanisation may be one answer. But dictaphones cost dollars, and, according to Sir Thomas Lloyd, make a person long-winded and therefore defeat their own ends. Probably the right answer is that Departments should be fewer and should do less work—or have less work thrust upon them.

Failure to Register

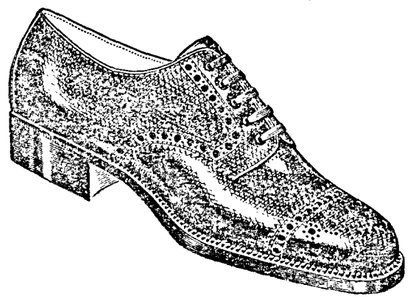
The Ministry of Labour, announcing the date of the next registration of young men for military service, says that at the last registration in June a considerable number failed to turn up on the appointed day. The Ministry of National Insurance announces that since the appointed day for the social security scheme, 367,799 self-employed and non-employed persons have applied for insurance cards, making a total of 1,167,410 in these two classes who have now complied with the regulations, but leaving over a million and a half still unrecorded.

There is not the slightest evidence that this failure to turn up on the appointed day is, in either case, a deliberate attempt to evade an obligation. The Ministry of Labour found that most of the missing eighteen-year-olds came to register in the following weeks, and that it was carelessness or ignorance that caused their failure to show up at the proper time. The space which the daily press can give to the announcement of the date of registration is very small, and there is no obvious reason why anyone should listen to the BBC announcements at the right time. There is less excuse for the national insurance failures, for there must be very few of the self-employed and non-employed who do not know of their obligation to stamp a card. In their case, it is probably apathy, an irrational but understandable wish to put off the evil day when another tax has to be paid, or often sheer laziness that is responsible for their failure to collect their cards.

But even if the most charitable interpretation is placed upon the action, or rather inaction, of both sets of people, their failure to do what is expected of them creates some difficulties for the administration. The machinery of conscription, with all its medical boards, conscientious objection tribunals and the like, is held up when an age group does not register on the right day and at the right time. The gigantic task of insuring virtually the whole adult population cannot be carried on smoothly if there are a million or more stragglers to be chased. The Government is often charged with inability to explain its policy to the people. The failure to register shows that it will have to pay more attention to the minutiæ of administration as well. But it may well be that a large number of stragglers will prove to be a danger signal that the country is being over-administered—it is also significant that people were much more dilatory this year than previously in collecting their new ration books. The Government cannot prosecute a million stragglers; if it cannot secure the co-operation of the people, its administration will break down.

* * *

The Queen of Holland



Today, Queen Wilhelmina ends her fifty years' reign on the Dutch throne. It has been a week of nostalgia and of rejoicing in Holland. Queen Wilhelmina was a great monarch who has guided her people safely through two of the biggest crises in modern history; there can be nothing but regret that she should now feel herself no longer able to carry out the onerous duties of a Prince. She is to be succeeded by her daughter who has established herself high in the affections of the Dutch, so that while the crowds in Amsterdam and at The Hague may lament the abdication of Queen Wilhelmina, they must at the same time rejoice in the accession of Queen Juliana.

Holland has now had 58 years of feminine rule—for the eight years before Queen Wilhelmina's accession it was governed by the Princess Regent—and it is likely to have many years more. Princess Juliana's children are all girls, and though she herself may regret the absence of a male heir, the Dutch people have come to prefer Queens rather than Kings. The monarchy in Holland is not so limited as in England; the Queen can and does satisfy herself that what her government is doing is both according to the will of the people and for the good of the country. She is therefore more than a figurehead and her responsibilities are correspondingly greater. A king with such powers conjures up an atmosphere of oppression; a queen conjures up an atmosphere of chivalry and becomes a rallying point for the people. For this reason the Dutch feel that the monarchy is best left in a woman's hands. Their predilection has been greatly strengthened by the immense skill with which Queen Wilhelmina has conducted the affairs of their country for half a century.

Queen Juliana comes to the throne at another crisis in Holland's history. Like Britain, Holland is having the utmost difficulty in establishing its balance of trade. It has suffered heavily both at the hands of Germany and, paradoxically, because Germany too was damaged, for a major part of its prewar trade was with

Germany, and the great port of Rotterdam is still not working to full capacity. Abroad, the prolonged unrest in Indonesia has cut Holland's overseas assets and brought the Dutch hard up against as difficult a political problem as any country has had to face. Queen Juliana will need all the skill and patience which she has inherited.

Tension in Finland

Communists are increasing their pressure on the new Finnish Cabinet. Their protestations could be dismissed as routine, if they did not in various ways receive support from their foreign friends. The Cominform journal, for instance, has denounced as reactionary a Government consisting, except for a non-party Foreign Minister, entirely of Social Democrats, and Russian diplomats in Helsinki are showing signs of disfavour with the Fagerholm regime.

The occasion for the present tension was the publication of the report of a committee of inquiry into the activities of the state police under the former Communist Minister of the Interior. The report justifies the grim jibes about the "Stapo"—the abbreviation of the Swedish name of this force—and the Gestapo. The force has been staffed since its reorganisation in 1945 almost entirely by men of the extreme left. Nearly half its members have criminal records, treason being a common offence. Over 85 per cent of the force are considered by the committee to be incompetent and unsuited for police duties.

To obtain a true picture of the state of public security in Finland, however, this legacy of a Communist Minister of the Interior must be set against the other two police forces which the country has—the municipal police and the mobile police. The municipal police, the ordinary policemen, number many thousand, are scattered about the country, hold anti-Communist opinions and take their orders from the local chief of police. The mobile police, of whom there are about 1,500, are an armed and uniformed flying-squad, most of whose members are based in Helsinki. The state police, who are controlled directly by the Minister of Interior, are a small secret force of about 400 plain-clothes political police. Attempts to increase their numbers and thus their influence have been persistently thwarted, and it is probable that the force will now be disbanded. Certainly it will be radically reorganised.

The revelation of the calibre of their nominees has infuriated the Communists. The very fact that the report has been published rubs in their continual failures, and the possibility of support from their powerful friends abroad cannot be ruled out. Finland is most vulnerable in its obligation to deliver heavy reparations to Russia. The Peace Treaty, too, gives Russia the right to interfere to change a "reactionary government." But the fact remains that to be successful, any pressure would have to be sustained and heavy. This is the essential weakness of the Russian position. The Finnish Communists alone are not strong enough to achieve their ends, whereas the provision of the requisite force by Russia would have to be so obvious that it would have undesirable repercussions in Sweden and the other Scandinavian countries. The Finnish Government knows this well. It knows also that, although it is a Social Democrat minority regime, it can count on the support of all non-Communist parties in the basic issue of Finnish politics—the struggle to retain freedom of action as Russia's neighbour.

Wooing the Chinese Peasant

While military news from China continues to be generally confused and to reveal no spectacular decisions, an important event has taken place on the political front with the establishment of the Sino-American Rural Reconstruction Commission. This body is to dispose of funds up to 10 per cent of the allocation made by the United States Congress in the China Aid Act of 1948, and will consist of two American and three Chinese members. It will operate in the parts of China under the control of the Nanking Government, and will undertake a co-ordinated programme of agricultural improvement, including "the multiplication and distribution of improved seeds, the control of rinderpest of cattle, the construction of irrigation and drainage facilities and the introduction of health and sanitation measures." Without directly intervening in questions of land tenure, the Commission is to advise on marketing, credit and rural education—topics which cannot fail to affect the social order in the countryside. The Americans are paying the piper, and their representatives on the Commission will be able to some extent to call the tune, provided they have full backing from Washington. There are strong indications that this will be given them.

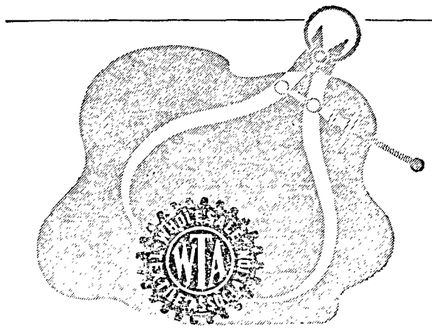
American official opinion has been greatly agitated by recent Communist successes in China, and has been largely converted to the view that the struggle in China cannot be decided by military means alone, but depends on economic factors—above all, on the relative attractions of the rival ideologies for the Chinese peasant. The new Rural Reconstruction Commission is primarily a device for counteracting the influence of Communism over the Chinese peasant, by bringing direct to his village, under American supervision, the equivalent of Marshall Aid. The directness of approach is essential to the scheme, for, given the political composition of the Kuomintang ruling group, no real benefits for the peasants were to be expected from mere American financing of Chinese Government projects.

The task of the American members of the Commission will be to see that the peasant gets what is intended for him instead of the gain going to landlords and officials. It will not be easy to ensure this, but in the long run the success of the programme offers the only alternative to the victory of Communism in a country of extreme agrarian poverty and discontent.

Shorter Notes

Last Saturday, anticipating the meeting this week of the United Nations committee on "non-self-governing" territories, the British Government categorically rejected the suggestions that Uno should control or supervise the British Empire. The Colonial Office memorandum, which sets out the British case, puts the position clearly. The Government stands by the Charter of the United Nations. The relevant sections of the Charter call only for information from members about their colonies and nowhere is there any claim for rights of supervision over them. The Colonial Office memorandum shows how Britain has complied with this demand for information as fully as possible, but, by long quotations from the proceedings of the General Assembly at Lake Success last year, it also shows the sort of trouble which the British delegation can expect in Paris this year. No one in Britain will question the Government's attitude, but it is far more important that the Government should make its case clear in the colonies rather than in Britain. It can rely on almost unanimous support at home; it should not be deceived into thinking that similar sentiments will be equally strong in Africa or the West Indies. It would also make the British case far stronger before the United Nations if it could be genuinely shown that the colonial subjects themselves prefer the single-headed, though occasionally obtuse, control of Britain to what would be a hydra-like and impotent control by 57 different and quarrelling nations.

*



The delegates assembled at Interlaken to carry forward plans for the federation of Europe will have been very heartened in their work by the emphatic support which Mr Marshall has given to the idea of closer union in Europe and to the summoning of a European Assembly. It has often been said that no nations have found unity save as a result of pressure from a stronger outside Power, but in the past that pressure has invariably been hostile. America's strong and friendly concern is a new factor in international relations and, provided it is steered clear of impractical projects, it can prove a constructive and creative force.

*

The reduction in the price of cigarettes, sold outside territorial waters upon the steamers belonging to British Railways, suggests that it may have suffered a twinge of conscience over the profiteering it has inherited from the railway companies. It buys the cigarettes in bulk for 24s. a thousand, which suggests a retail price of about 6d. for 20. After the 1947 Budget the existing price, 2s. 6d. for 20, was increased to 3s. 4d. This has now been reduced to 2s. 6d. again, or only five times their wholesale cost and two and a half times as much as that charged on other steamers. It is apparently considered immoral to permit cheap pleasures to the traveller even when the law does so.

*

Correction.—On page 324 of *The Economist* last week, there was a misprint in the article "Italy's Colonies." The article stated that "at least eighty per cent of the population (of Eritrea) want either an Italian trusteeship or an Ethiopian one." This should have read: ". . . the population want either an *international* trusteeship or an Ethiopian one."

The measure of Wholesale Service . . .

How wide is wholesale service? Let's reckon it up. Consider the many responsibilities the wholesaler shoulders in the textile trade and the nature of the duties he discharges. There's bulk buying that keeps the factories going. There's stocking, warehousing, displaying the product. There's efficient marketing by speedy, economic nation-wide distribution. In fact, a service of immeasurable value to every manufacturer and retailer in the country.

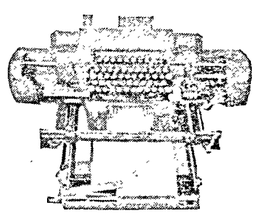
The Wholesale Textile Association, 75 Cannon Street, London, E.C.4



UNDERWOOD SUNDSTRAND

CLASS 'D' ACCOUNTING MACHINE

An all-purpose, fully automatic Accounting machine equipped with two cross-computing Registers, eight accumulating Registers, and Front-Feed Carriage. Maintains accounts in perpetual balance, and enables up-to-the-minute totals, sub-totals and balances to be obtained instantly without extra work. Ideal for Pay Roll, Stores Accounting, Costing, Analysis, Public Utility Billing, Municipal Accounting, etc.

Two machines that, between them, supply the answer to every problem connected with the writing and simultaneous computing of accounting records, giving greater speed, simplicity, and complete mechanical control over accuracy. Both machines have extreme flexibility of operation and quickly pay for themselves in improved efficiency and lower costs.

UNDERWOOD ELLIOTT FISHER

ALL ELECTRIC ACCOUNTING MACHINE

For all records that require typing, adding, subtracting, with simultaneous accumulation of individual column totals and simultaneous cross-computation of one or more balances. All electric operation. Standard typewriter keyboard. Exclusive Flat-Writing Surface gives unequalled speed in handling forms which may be of paper or card stock, in original only or with copies alike or different in shape and size.

Letters to the Editor

Distribution of Exports

SIR,—Your articles repeatedly emphasise the importance to our export trade of increasing our output per head. I have recently established figures for the proportionate costs attributable to different factors for a class of engineering product which South Africa imports from this country at the rate of about £100,000 a month.

Taking the cost to the ultimate user in South Africa as £100, the c.i.f. price is .61 per cent—the distribution costs, including profits, being no less than 39 per cent. In contrast, the direct labour cost is only 4.3 per cent, and the total factory cost only 40.5 per cent. If the efficiency of production were doubled, the direct labour cost could be assumed to fall to about 2 per cent, which would be less than half as important as reducing the costs of distribution in South Africa by one-eighth.

It is true that if productivity over all were to rise, the cost of material and bought out parts (which represents 24.5 per cent of the price to the South African user) would also fall; but in general I think these figures show that overhaul of the distribution system for UK exports is at least as important as any increase in productivity in this country.

As a matter of interest, I should say that freight and insurance account for 1.7 per cent and landing charges, plus customs, for 5.5 per cent.

It would be interesting if any other of your readers could supply similar figures for different classes of goods.—Yours faithfully,

BOSWORTH MONCK

26a Canonbury Square, London, N.1.

The Uses of Uno

SIR,—May I be permitted to say that I and many other of my countrymen do not at all agree with your statement in the above article that "The mere fact of achieving a cease-fire in the Netherlands East Indies has probably already saved the world in absolute terms more than the $30 million odd it has spent on the United Nations."

On the contrary, if the United Nations had not intervened in a purely internal affair of the Kingdom of the Netherlands—as they did not intervene in the internal affairs of the British in Malaya or of the French in Indo-China—and the Dutch police action of last year in Java had been completed, several million dollars' worth of raw materials and equipment would have been saved to the world, which were now destroyed by irresponsible people after the cease-fire, proclaimed by the United Nations.

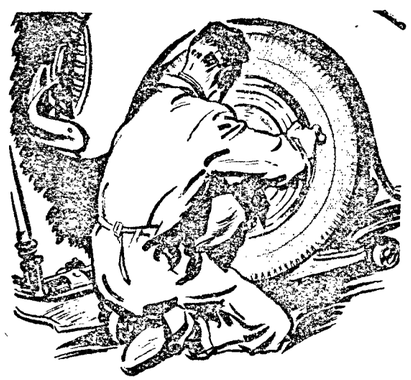
Oosterdninweg 248, Aerdenhout, Holland G. LULOF

Industrial Productivity

SIR,—The above article in *The Economist* of August 14th asks why it was that the output of tin cans per man hour in 1937 was seven times higher in the USA than in Great Britain.

The short answer to your question is that it was not. Dr Rostas, in comparing the British and American tin box industries, has compared industries producing substantially different articles and catering for very different markets.

The output of tin box industry in the USA consists very largely of standard "tin cans," i.e. mass-produced food cans. The technique for producing these cans was studied by British industrialists more than a decade ago. American high-speed machinery was installed in this country and American manufacturing techniques adopted. As a result, where identical articles are being produced in the two countries, the relative efficiencies are in every way comparable. In fact, the lower labour costs in this country tends to give to the British article a slight bias in its favour.

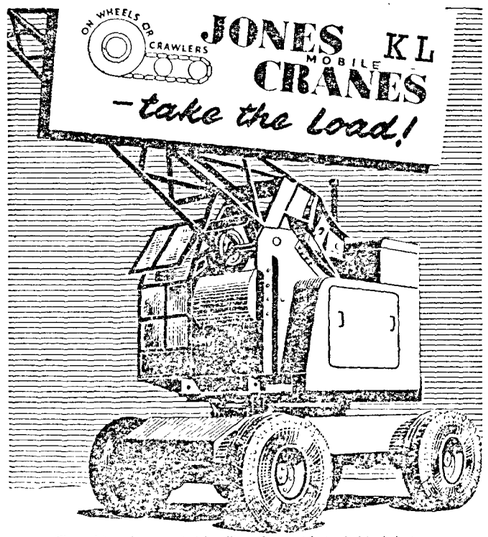


But the British tin box industry still devotes a great amount of its capacity to the production of highly decorated non-standard containers, to meet the varied demands of the British manufacturers. The production of such containers must necessarily show up adversely in terms of output per man hour. But so far as manufacturing techniques are concerned, comparisons still reflect in favour of the British article. In fact, British containers are selling today for their decorative value alone in many parts of the United States and Canada.

Dr Rostas's figures are therefore misleading. They are made particularly so by the necessity which compels him to compare figures from the 1935 British Census of Production with those derived from the 1939 American Census of Manufactures.

For it was during that period that Anglo-American co-operation in this industry reached its maturity. The success with which the results of this co-operation were applied for the improvement of British industrial efficiency is surely encouraging for similar endeavours in the future.—Yours faithfully,

JOHN RYAN,
The Metal Box Company, Ltd.



The Langham, Portland Place, London, W.1

Only half a motor tyre is pure rubber—the rest consists of chemicals, fibres and wire. Of the many different chemicals used in the rubber industry, among the most important is a group known as Accelerators, necessary for the correct vulcanisation of rubber articles. Monsanto are the largest manufacturers of rubber Accelerators in the world.

MONSANTO CHEMICALS

SERVING INDUSTRY . . . WHICH SERVES MANKIND

The quick and economical handling of materials is *vital* in industry—which is why so many bouquets are handed to 'JONES' MOBILE CRANES. They save lots of time, labour and money in lifting and carrying all sorts of goods; they are sturdy, speedy, simple and unbelievably cheap to operate; in fact they are the perfect answer to many of to-day's handling problems. Send for leaflet TE.464/127.

LETCHWORTH, HERTS

Makers of the World's best Mobile Cranes.

SIR,—Although most people are aware that mechanical handling equipment is a big factor in the cost and output of coal, perhaps few realise the increase in "productivity" that has been achieved in the handling of coal in power stations during the last thirty years. Due to mechanical equipment, productivity has been increased as much as 150 times, wage rates having been raised five times and the cost of labour per ton of coal reduced to one-thirtieth.

From an engineering angle, the problem of moving coal from A to B in the most economical way is not so vastly different, whether it be in a power station or in a mine. In the former case, the equipment is put to the best possible use, whereas in the mines it appears that this is by no means so, otherwise results might be considerably different.

In the case of our power stations, the number of electrical units generated has been increased by twenty times during the period in question, whereas the output of coal has decreased. Does this not have some bearing on the general question of resistance to labour-saving devices? Where increased output is absorbed and the labour is not displaced, machinery is welcomed. Contrariwise, where labour is displaced, machinery is resisted; which simply indicates that, until economic policy is geared to maintain full production, maximum productivity will never be achieved.—Yours faithfully,

ANTONY VICKERS

Worton Road, Isleworth, Middx.

Dilemma of the Atomists

SIR,—In your Editorial of July 24th you comment on the recent memorandum by the Atomic Scientists' Association and you disagree with our views on contacts between scientists in different countries.

You suggest that we may actually do harm by giving away more information than we receive. No doubt this would be true if those of us who know official secrets about atom bombs or other military matters were to talk freely. However, we are under an obligation to guard these secrets and, whether we like it or not, we are well accustomed to observe the rules in talking to those of our colleagues here, or in western Europe, or in America, to whom we have not been instructed to reveal our secrets. If scientists could not be trusted to draw the line between basic science, which is free, and military secrets, no secret Government project would be possible, since we live in democratic countries and, therefore, anything known to the general public will sooner or later be known abroad.

In this respect the distinction you draw between the academic freedom of the British or American scientist and the position of a "scientist in a totalitarian state" is not real; as regards these problems, both are servants of the state and for both it would be treason to divulge their knowledge.

But these official secrets are of small intrinsic interest, and most scientists would in any case much rather talk about the more fundamental and academic problems. It is in the nature of discussions on such topics that you cannot give information without gaining at the same time. Even if I talk to a colleague on a matter of which he has no knowledge whatever, the process of explaining my thoughts to him, and his questions, will help me in my own understanding of the problem, and for that reason, when military secrets are not involved, discussions are always of advantage to all sides. Since the end of the war we have had practically no opportunity of talking to our colleagues in Russia, but we have met scientists from Poland, Jugoslavia, Hungary and many other "eastern European" countries and we have certainly found such contacts stimulating and useful, as well as enjoyable. It is interesting to note that these people have seen or heard as little of the Russians as we have; for them, the "iron curtain" is the border of the USSR.—Yours faithfully,

R. E. PEIERLS,
President, Atomic Scientists' Association

The University, Birmingham, 15.

Books and Publications

Land of Milk and Honey

"The Americans." By Geoffrey Gorer. The Cresset Press. 211 pages. 10s. 6d.

"THE American conscience is predominantly feminine," says Mr Gorer, and pays a well-deserved tribute to the conscientious and energetic idealism of the portly clubwomen immortalised in the *New Yorker* and in the heart of many a visiting lecturer. In the family of the immigrant, authority rests with the mother, the home maker, and with the school mistress, the source of the knowledge that creates real Americans, not with the father, who is as aware as are his children that in a strange country he no longer knows best. The child who rejects the authority of his father becomes the man who is unwilling to accept the authority of his Government. The United States is ruled, not by Uncle Sam but by the Goddess of Liberty, according to Mr Gorer. His study of the habits and emotions of Americans is logical and gay, and only the occasional intrusion of such words as "ambivalence" remind the reader that this is the result of detailed psychological and anthropological research.

The thesis is not new but it is used to explain, not some but all, the problems of American behaviour that baffle foreigners—and many Americans too: the contempt for the professions of politician and soldier, the pathological hatred of Franklin Roosevelt, the force of anti-Semitism at home and Zionism abroad, the materialism and the generosity, the desire to be loved and the fear of being a sucker, the belief in equality and the importance of the social symbols of inequality. Everything fits into Mr Gorer's pattern, but occasionally a suspicion arises that the pattern is unnecessarily complicated. Perhaps American men do drink milk and call their girl friends "honey" because, as babies, they were brought up on strict schedules that kept them waiting for their feeds and rewarded them for good conduct with candy; but perhaps they find milk a cheap and strengthening beverage and their girl friend sweet in a non-gastronomic sense.

Americans may not be flattered by this frank discussion of their national character, but they will prefer it to the unintentional insults of those Europeans who explain their contradictions by their inexperience and immaturity and imply that, once the young nation grows up to be like Europe, all will be well. That, as Mr Gorer makes very clear, is the last thing either that Americans want or that is likely to happen, and Europe must realise that a new type of civilisation is being created in America. If other countries want to share the benefits of the American way of life they must at least try to understand it.

The Indian Inheritance

"A Survey of Indian History." By K. M. Panikkar. National Information and Publications. Bombay. Rs. 7/8.

"The British Achievement in India." By H. G. Rawlinson. William Hodge and Company. 248 pages. 15s.

SINCE August 15th of last year the age of British rule in India has become a part of the past history of India, a completed chapter of a story reaching back 5,000 years—to go no further into pre-history than the founding of the first brick-built towns in the Indus valley. In such a perspective it is interesting to compare two recently published books—one by an eminent Indian scholar and statesman who is now his country's Ambassador to China and the other by a former British member of the Indian Education Service and of the Indian and Historical Records Commission. Sardar Panikkar covers the whole of Indian history, including the British period, whereas Mr Rawlinson deals with the British period only, but the great theme of its relation to the new era of independence is common to both writers, and though they differ on many points, there is a quite remarkable measure of agreement in their estimates of the British achievement.

Mr Rawlinson's book is frankly an apologia; he is proud of our national record in India and seeks to defend it from the accusa-

tions which have been made against it by Indian nationalists. He claims that "England cannot be charged with depriving India of a nationhood which she never possessed or of a political freedom which she never enjoyed under her indigenous rulers." These things, he holds, India learnt from England. On the count of economic exploitation, he admits the injustice of early British policies towards Indian textile competition, but finds the causes of contemporary Indian poverty to lie, not in any British extraction of wealth from India, but in "the inherent social structure" of India, in population increase which keeps on running ahead of production, and in popular habits such as that of hoarding instead of investing money.

Mr Rawlinson's attitude to these phenomena seems, however, to be marked by a certain fatalism and helplessness which, as typical of the former British administrative outlook, are the features of the British Raj most condemned by leading Indians of the present generation who, like Dr Panikkar, are intensely concerned with economic and social problems. "From the point of actual administrative work," writes Dr Panikkar, "the British Government was one of the best in the world; but from the point of view of organisation for national welfare its work fell far short of what could have been legitimately expected." He finds a restriction of state activities to the "minimum essentials of government" and a lack of positive policy for increasing the wealth of the country or raising the standard of living. But he concedes that "the growth of popular political institutions, though tardy, may be credited to the British Government" and that "the most notable achievement of British rule was the unification of India." His most wholehearted praise, however, is reserved for the part played by British scholars in the reconstruction of Indian history and in the recovery for Indians of India's own cultural heritage. "When the viceroys and governors, whose statues adorn public places, are forgotten," he writes, "India will remember Fergusson and Havell, 'Hindu Stuart' and Marshall."

Third Force Economics

"Economic Security and Individual Freedom." By Albert Lauterbach. Cornell University Press. 166 Pages. $2.50.

MR LAUTERBACH is a liberal—it would be tactless, in view of his nationality, to call him a radical—with an attractively firm grasp on first principles, a laudable disinclination to mistake words for things, and an eclectic willingness to learn from any quarter which has valuable experience or information to offer. His book is a study, from the American standpoint, of the way in which society may hope to free itself from its two besetting fears of oppression and depression; it surveys the *laisser faire* solution with only a little less distaste than the totalitarian solution, and plumps for a liberalised planning—"purposeful action by a democratically organised society." Such planning should combine three principles: control of the development and fluctuations of economic life (by methods including "substantial changes in property relations"); the preservation of individual initiative in carrying out plans, with substantial use of money incentives; and international co-ordination of national controls as "an effective and indispensable step towards a gradual elimination of outmoded concepts of national sovereignty."

There is a great deal of good sense and sound logic in Mr Lauterbach's book. He has looked at American society with a realist's eye, and he has read widely of what has been done elsewhere. But it is painfully obvious that distance has lent enchantment to his view of liberal socialism. He sees it very much as Mr Herbert Morrison, say, would like it to be; flexible and realistic, harmonising private initiative and public spirit, respectful of the individual whether as worker or as consumer, impatient of vested interests of all kinds, and, almost by definition, firmly on top of those economic forces whose insusceptibility to control by the automatic devices of capitalism have so thoroughly discredited the latter in his eyes. He sees nothing of the stodgy rigidity of the mechanism of planning and control, of the withering or distortion of incentives, of the selfrighteous paternalism of bureaucracy, of its tenderness towards any and every vested interest that can express itself in the appropriate class-war terms. No doubt some of these traits are not inevitable attributes of planning—though Professor Hayek would of course maintain that they, and a large number of vastly more unpleasant characteristics, are inborn in any form of Socialism whatever; some of them, notably the stodginess, are probably peculiarly British, others are a hangover from wartime. On the other hand other countries in other circumstances might develop other unforeseen complications. (The riotous development of the American black market during the war, and the American susceptibility to the disease of graft, are pointers to the forms which they might take there.)

Mr Lauterbach really ought to come and spend a few months in Great Britain to get the full flavour of democratic planning at close quarters. He would probably be a sadder and a wiser man at the end of his stay; but so intelligent and sympathetic an observer would not only be able to turn his observations to good account for his next book, but to give some really valuable advice on what he saw.

From *The Economist* of 1848

September 2, 1848

THERE is always some one panacea popular at the moment, which is to cure all the evils of humanity, and convert earth into paradise. At one time it is co-operation, at another the charter, at another communism, and now it is emigration. Societies are formed to promote it, and gentlemen of birth and station travel about the country to enlighten the people on its advantages. Almost every journal has something to say in its favour, or some particular colony to recommend. All parties require a grand and comprehensive scheme, something that shall at once relieve society from pauperism, and remove from amongst us that excessive competition, which at once stimulates exertion and makes employment scarce. While journalists are writing about it, however, and societies seek to promote it, in fact to a very considerable extent it has been for some time going on greatly to the increase of population in some of our colonies. . . . In seven years . . . 854,000 persons have left the country, or nearly one-thirtieth of the whole number of the population, without lessening pauperism, or apparently making it more easy for those who remain to procure a comfortable subsistence. . . . . It is self-evident that, selecting as emigrants the young, the vigorous, the enterprising, and the skilful—and not removing a fair and equal specimen of the whole society—not taking away the aged and the imbecile, as well as the youthful and the strong, the bad as well as the good, the vicious with the virtuous, the criminal with the right minded, the idle and the industrious in equal proportions, but only the better parts, must increase the predominancy and influence of the classes left behind, and can only hasten the demoralisation and deterioration of the whole.

Shorter Notices

"Letters of an Economic Father." By W. S. Hill-Reid. Falcon Press. 140 pages. 8s. 6d.

THE idea of this book, designed for young people just reaching the age of economic responsibility, is excellent. It is a commonsense guide, in the form of letters to a boy in his last term at school, to the business side of ordinary life; bank accounts (with or without overdraft) and investments, income tax, life and other insurance, house purchase and rent, and wills. It provides a framework of legal knowledge, a bare minimum of economics in the narrower sense, and a maximum of useful practical information such as no textbook dreams of giving. Its message is lightly, chattily and often vividly imparted, with a seasoning of anecdotes faintly (but, alas, only faintly) reminiscent of that masterpiece, the "Letters of a Self-Made Merchant to His Son."

It is a pity that Mr Hill-Reid loves clichés so dearly, and surprising that his grammar should be so shaky; also nowadays an Economic Father really ought to tell his son something about his financial rights and obligations under the National Insurance Act.

"Kaffirs are Lively." By Oliver Walker. Gollancz. 248 pages. 7s. 6d.

MR WALKER was given a rare opportunity by the South African Government in 1944 to investigate the conditions of the natives throughout the length and breadth of the Union and its protectorates. That he now bites the hand that fed him was not perhaps entirely unexpected. Mr Walker is a South African journalist, and his swing from pro-White to pro-Black has been violent. The result is a highly emotional treatment of a subject which is emotional enough already. This is a pity, for it spoils what must otherwise have been an invaluable study. The extravagant presentation of facts leads the reader to doubt those facts rather than to accept them more readily. But underneath the mass of irresponsible nonsense which clutters up the book, there is much real information about how the Bantu live and work in modern South Africa.

"The South African Financial Year Book, 1947-48." R. Beerman, Publishers (Pty.) Ltd. Cape Town. 1128 pages. 45s.

THE first edition of this comprehensive annual review fills a gap in present information available on the growing field of investment in South Africa and Rhodesia. Apart from its fairly complete record and appreciation of companies it provides useful data on taxation and finance.

AMERICAN SURVEY

The Coming Campaign

(From Our US Editorial Staff)

IN the United States the period between the two public holidays, Independence Day on July 4th and Labour Day on the first Monday of September, is the official holiday period. During that time shops and offices are shut on Saturday mornings, only urgent work is done and, even in an election year, it is considered a waste of time to make political speeches to a people deep in the pursuit of pleasure. Polling day being the first Tuesday after the first Monday in November, this time-table mercifully leaves a bare two months for campaigning—not a long time for a candidate who wants to cover forty-eight States and, perhaps, a hundred cities.

Mr Dewey and Mr Warren, the Republican nominees, have had many meetings and laid their plans with great care. Governor Warren will start from San Francisco on September 15th for a ten-day trip ending in Detroit, with stops in Nevada, Utah, Colorado, New Mexico, Texas, Oklahoma, Missouri, Indiana, Kentucky, and Ohio. Governor Dewey will leave Albany for the West a few days later. The President will begin his campaign at the earliest possible moment. A joint rally to be held by the American Federation of Labour and the Congress of Industrial Organisations on Labour Day in Detroit gives him an excellent opportunity, which he is taking, for an important opening speech, and he will make four others in Michigan on the same day. He had intended to go south after that in an attempt to limit the effectiveness of the States Rights party. But the danger from that quarter is declining, so he will speak in Iowa on September 18th and then go on to California, where he will probably find himself face to face with Mr Dewey at the end of the month.

The two candidates, it appears, are in no hurry to get at each other's throats too soon. Mr Truman, as he made clear in his acceptance speech, will fight Congress; Congress will fight the Communists; the Communists, through their control of the Progressive Party, will fight the Dixiecrats (among whom they include, as Mr Henry Wallace explained in Louisville last week, Messrs Truman and Dewey as "sophisticated versions" of the States Rights candidate); and the Dixiecrats will fight the President. The circle is complete without Mr Dewey who can, and will no doubt be delighted to, sit in the middle picking off his warring opponents one by one. The ethics of party politics in the United States will, however, unfortunately for him, prevent him shooting at what may well prove in the end his most dangerous enemy—Congress. If there were some way in which he could ensure the defeat in November of a few party leaders and Committee Chairmen (Representatives Joseph Martin, Charles Halleck, Leo Allen, John Taber, Leslie Arends and Dewey Short, for example), the Republican majority would be little affected and he could look forward to the next four years with more certainty that the kind of legislation he has sponsored in New York will not be greeted as subversive and un-American.

The strategy of each—except the Dixiecrats—seems to be working well. The President's decision to call a Special Session of Congress has proved the successful political stroke which his enemies feared it would be. It was not successful enough to give him a chance of being elected, but it may well have saved a number of Congressional seats in industrial districts and it will have its effect on the vital battles for the Senate. The polls show, at the moment, that, although Mr Dewey is running comfortably ahead of the President, many of his supporters would prefer Democratic Congressmen. This fact, in a country which likes to vote for one party's candidates for all the offices at stake, is a sufficient indication of the low opinion generally held of the Eightieth Congress, an opinion brought even lower by the cynicism of the Special Session. The American people have long been resigned to seeing their representatives forget the programme on which they campaigned as soon as the elections are over. This is the first time they have seen it perfunctorily pushed aside before the campaign has even begun.

The Congressional idea of fighting Communism is also having some effect. When Mr Carroll Reece opened the Republican Convention by saying that there were only two forces in the world today—the Republican Party in the United States and the Communist Party—it was believed that he was dismissing the Democrats as a spent force and declaring that the election would be fought against Russia. It has since transpired that the Communist enemy he was preparing to disembowel was within the Democratic Party. Thanks to the Un-American Activities Committee, the people have been given the circuses of public hearings rather than the bread of public housing; the Committee allowed witnesses to spread accusations and suspicion with the same inconsequence with which the wind spreads thistledown. But it succeeded in diverting a great deal of public attention from the failure of Congress to legislate. The publicity given to its activities has certainly had, as intended, political value and for that reason there are some who think the President would have been better advised to let Congress stay at home. It is doubtful, however, whether he could have escaped their attack so easily. The words of a leading Republican suggests that he would not: "Truman has got only himself to blame for this. If he hadn't called the Special Session it wouldn't have happened until October."

*

Mr Wallace is now embarked on a grand tour of the South where he is behaving more as an agitator than a candidate. He arrived in Louisville, ostentatiously accompanied by a Negro, tried to register his companion at a hotel and, meeting the refusal which, unless he is a dunderhead, he must have expected, made the appropriate public scene and retired to the private house at which, it is to be presumed, he had always intended to stay. He repeated this device in North Carolina when he met a barrage of eggs and tomatoes as well and had to give up the attempt to speak in town after town. In his speech to a negro audience in Louisville, he referred mysteriously to "a number of lynchings" in New York State, incidents which have escaped the attention of the press, police and public of that state and then made an appeal to the 15,000,000 American Negroes to fight for their lives, an appeal which it is kinder to assume was not intended as an incitement to revolution. The tragedy of Mr Wallace's candidature is that it will leave behind greater mistrust and unrest among Southern Negroes and a fear among Southern Whites (which will lead to more repressive measures).

The Southern Whites themselves—the Dixiecrats or States Rights Party—are making little headway. Two Senators, Mr McKellar of Tennessee and Mr Robertson of Virginia, have

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

announced that they will not leave the Democratic fold for such doubtful adventures. The defection of Senator McKellar, at least, must have been a bitter and unexpected blow; that aged servant of the Crump machine has always been a solid supporter of Southern "ideals." But perhaps the staggering defeat of the machine, when Representative Estes Kefauver—one of the best of the young Southern liberals—won the Senatorial nomination against the frantic efforts of Boss Crump, made Mr McKellar cautious about cutting party ties.

But the real fight, when it begins, will be between Mr Truman and Mr Dewey and it will be concentrated in the ten states where the crucial Senate battles will be fought. Even in the face of a big majority for the Republican Presidential candidate, the Democrats have reasonable hopes of winning Oklahoma, Kentucky, West Virginia, Wyoming and Minnesota, victories in four out of five of which would give them control of the Senate, unless seats are lost in other States. There are equally five where this could happen—Montana, Colorado, New Mexico, Tennessee and Rhode Island—and the Republicans will make as great an effort to win them as to keep the other doubtful five. Confident of victory in the Presidential race, Governor Dewey will be able to allot much of his and Governor Warren's time to an intensive campaign in these States, four of which Governor Warren will visit. On his first trip Mr Truman will then be forced to do the same, because the Republicans can, thanks to Mr Wallace, set the pace. If there were no Progressive Party, their position would be by no means as happy. The latest polls do not show that Mr Dewey is overwhelmingly popular, even in his own State. In 1944 he got 47 per cent of New York's votes and in 1948 he seems likely to get the same percentage. But the opposition, which four years ago went to Mr Roosevelt in its entirety, is now split 37 per cent for Mr Truman and 16 per cent for Mr Wallace, who is expected to get one-third of his national vote in New York City alone.

The Democrats' position has been improving steadily since their Convention. They are no longer the depressed and disunited party which went to Philadelphia. Mr Truman's stubborn courage has had much to do with this change and his mood is beginning to infect local organisations throughout the country and may yet destroy the threat of the Dixiecrats. That Mr Dewey is aware of this and its potential danger—should the unpredictable Mr Wallace suddenly retire or die—was shown by his statement to an Italian-American group that he believed Italy should be given the trusteeship of her old colonies. Mr Truman reacted strongly to this breach of the bi-partisan front, and the press was obviously unhappy. Mr Walter Lippmann's view that Mr Dewey had a perfect right to disagree with the Administration, but that his views would have been better given to the American people rather than to a delegation of Americans of Italian descent, is probably representative of general opinion. A former missionary to Ethiopia wrote a bitter letter to the *New York Times* saying: "Instead of a platform of civil rights, are we now adopting a platform of giving men back into slavery?" All in all, Mr Dewey's sally out of the bi-partisan field was not successful enough to encourage many more. There is every reason to hope, in fact, that the battle, as far as it concerns the two principal candidates, will be fought on a higher level during the important part of the campaign.

American Notes

The Dilemma of the Red Herring

When and how did Mr Alger Hiss dispose of his Ford car? Was Mr Whittaker Chambers ever known as George Crosley? In the hearings before the Un-American Activities Committee on Mr Chambers' allegation that Mr Hiss was a Communist, the two men gave exactly contradictory replies to these two questions and the correct answers, if they can be proved, will probably decide whether it is Mr Hiss, late of the State Department and now of the Carnegie Endowment for International Peace, or Mr Chambers, late of the Communist underground and now of *Time* magazine, who has perjured himself. The Committee's present attempt to prove that there has been Communist infiltration into the Government depends on the reliability of Mr Chambers' evidence, and therefore the answers to these questions will also show whether the present investigations are only, as President Truman insists, a political red herring, or, for the first time in the Committee's history, a genuine service to democracy.

The Committee conducted the Hiss-Chambers hearings with a courtesy almost worthy of its new respectability, but it found it hard to maintain this unaccustomed moderation through six hours of careful testimony from the handsome Mr Hiss, who introduced a legal exactness into the far from judicial atmosphere of the Committee room. Mr Chambers, on the other hand, had no difficulty in telling the Committee exactly what it wanted to hear about events which took place twelve years ago. The hearings were a prosecution of Mr Hiss, rather than an investigation, and provided good examples of the procedure by which the Committee endangers the basic rights of American citizens—the sacrifice of the innocent on the altar of publicity—the readiness to believe anyone, except a reformed Communist, guilty until proved innocent, the disregard of established legal practices.

* * *

The same faults reappear in the interim report with which the Committee is defending itself and ensuring that it will not be forgotten before it resumes its hearings next week, when a new spy-scare, involving industrialists and the atom, is expected to bring it back into the headlines. The Committee, evidently having realised that its discoveries relate to the Roosevelt, rather than the Truman, Administration, makes its political capital out of the present Administration's lack of vigour and diligence in dealing with the "Communist conspiracy" and out of the President's refusal to give the Committee access to the employment records of the individuals concerned, a long-standing bone of contention. It claims that its responsibility to the American people forced it to act and that the remedy for the Communist espionage revealed by its investigations can be found almost entirely in the Anti-Communist Bill passed by the House last May. Since the Committee drafted this Bill, this attempt to show that Congress was more aware of the Communist menace than the President is not altogether surprising.

Even though the Administration is probably right when it says that the Committee's precipitancy had hampered its efforts to get to the root of the question, it looks as if Mr Truman might have been well-advised to adopt a more co-operative attitude towards the Committee's investigations, in the interests not only of his party's electoral chances but of the national welfare. It takes smoke to a make a herring red, and the Committee has shown that the rule that there is no smoke without fire still applies. There are few in Washington who commend the Committee's way of smoking the herring, but there are many who feel that the present system of investigation by the Federal Bureau of Investigation and a Federal Grand Jury produces almost as unsatisfactory a fish. A new way out of the dilemma is now being suggested, an independent commission, composed of men of the calibre of General Eisenhower and Mr Justice Roberts, to establish the facts and make the recommendations it considers necessary.

* * *

Farm Surpluses Again

Candidates in the election campaign may hear a new version of the old chicken-and-egg conundrum, one which is also concerned with the farm; their answer will depend on whether they are facing a rural or an urban audience. The question is whether the high cost of living, and therefore the high cost of production, in the cities results from the high levels at which farm prices are supported by the Government, or whether the high "parity" prices for farm products, which bear a fixed relationship to the cost of the things the farmer buys, result from the high cost of producing those things in the cities. The town dweller, who sees as yet little or no decline in his food bill, although his newspapers are full of reports of bumper crops and the danger of agricultural surpluses, naturally takes the former view. The farmer argues that the cost of the things he needs has been increasing steadily, and that the support price of 90 per cent of "parity," which he is guaranteed for his major crops, was fixed to ensure maximum output of farm products and has thus prevented a scarcity that would have driven food prices still higher. To the suggestion that he should make the first move to break the circle, the farmers, or rather their representatives, reply that a collapse in agricultural prices is the traditional forerunner of a depression and, in any case, why should they make the first sacrifice?

It had already been expected that the new Congress would reconsider the farm price legislation passed by its predecessor in June, which extends the present price supports until the end of 1949, after which a more flexible system is to take their place. This new system will probably mean a substantial reduction in support prices for many commodities, and it has been suggested that it may be brought in sooner, in order to relieve the Government of the heavy financial commitments which the present prices may involve during the current crop year. It is unlikely, however, that the farm bloc will permit Congress to break its promise to the farmers, however anxious the economy bloc may be to do so.

The price support programme is usually operated by means of loans through the Commodity Credit Corporation. The farmer is given a loan, equal to the support price of the commodity which he offers as collateral and if it is not repaid by a fixed date, usually the end of April, the CCC takes over the commodity. The farmer will obviously repay the loan if he can sell his crop at a price above the loan rate, but he must provide satisfactory storage during the interim period. It is shortage of storage space which explains why wheat has been selling below the support price and why maize for December delivery has been offered at $1.38, when the support price will probably be $1.45. But this is a purely temporary development, which does not mean that the price support system has broken down.

Nevertheless, the total outlay on loans this year may reach $2 billion. The CCC is not likely to have to take over anything like this value of commodities from the farmers, but the time is almost certainly approaching when it will once more have large stocks of wheat, maize and cotton on its hands. These surpluses will inevitably depress the markets, even though the CCC can only sell them for feed, for seed, for industrial purposes and for export. The temptation to force them on reluctant buyers overseas will be great and the farmers' organisations at home will do nothing to lessen it. Already grain export quotas for September have been stepped up in order to get rid of the temporary glut. Already oats, flaxseed and linseed oil and meal have been declared surplus, which means that Economic Co-operation Administration funds cannot be used to procure them outside the United States.

Freedom on the Air

Brooklyn boasts a professional "quiz queen," who has been in regular attendance at "audience participation" broadcasts for ten years; the first "get-rich-quick" radio programme, "Pot of Gold," was on the air in the late 1930s. To find the automobile, the permanent wave and the pile of other free gifts at the end of the rainbow, it may only be necessary to say, with the help of the question master, "George Washington" when asked who was the first President of the United States. These "give-away" programmes have recently increased greatly in popularity; there are now about forty of them on the schedules of the major networks and many others on those of individual stations. Prizes are being given at the rate of at least $150,000 a month; one listener won $20,000 worth of saleable merchandise, although the reward for identifying Mr Bernard Baruch's "phantom voice" was only $3,000. The final judge of an American radio programme is the advertiser who finances it, and to the ears of these sponsors "give-away" programmes became quite unbeatable when one of them, *Stop the Music*, stole his hitherto devoted audience from Mr Fred Allen, one of America's most popular radio comedians.

This was the result of a new development in the field of listener appeal, which explains why these programmes have suddenly risen to what may prove to be their zenith. Nowadays the listener does not usually have to make a fool of himself in the studio; he sits at home and waits for the telephone to ask him a question which, if he has been listening to the programme, he should be able to answer correctly. This formula guarantees a maximum audience and is obviously worth the cost of the refrigerators, the Shetland ponies, the honeymoon trips and the dollar bills which provide the financial incentive to listen, regardless of the merit of the programme.

Mr Fred Allen is, however, not the only member of the radio industry who feels that the long-term interests of broadcasting are endangered by this disregard for its original function of providing entertainment and instruction. The National Association of Broadcasters recently approved a new code for the guidance of the industry and it recommends, among many other things, the avoidance of programmes designed to buy an audience. But the main purpose of this code is to forestall government interference with programming and the NAB is therefore unlikely to welcome the Federal Communications Commission's proposed ban on "give-away" programmes.

Listeners will be more interested in this interference with radio's attempt to establish freedom from want than they were

in the recent controversy over freedom of speech on the air. Here, too, the industry's opposition to the FCC, it has been suggested, is inspired more by the desire to remove all control of programmes from the Commission than by devotion to liberty. The question arose in connection with the FCC's review hearings last spring on its so-called Mayflower decision of several years ago, when it ruled that a station licensee who broadcast "editorials," taking sides on political and other subjects, had not carried out his duty of presenting important public questions fairly and objectively. The industry insists that this amounts to the abrogation of the licensee's right of free speech, but the FCC contends that the decision safeguards the broader aspects of this right by ensuring that listeners hear all sides of any controversial question. However, now that it is becoming hard to find a community of any size that has not one or more radio stations, there is at least an argument for giving station owners the same freedom of expression that is allowed to newspaper proprietors.

* * *

Plight of the Airlines

Air-minded America has let its domestic airlines down. After a loss of $20 million in 1947, summer traffic this year, usually counted upon to build up fat to see the lines through the leaner winter months, has dipped again. Not only did the airlines, in the rosy days after the war, grievously overestimate the growth of air travel; they are, like the railroads, and even the city taxi-cabs, suffering from a new disposition to count the cost of transport in terms of long-distance bus fares or petrol for the family car.

The meeting with the 15 scheduled airlines called by the Civil Aeronautics Board last month prescribed for the airlines' ailing finances the 10 per cent fare increase already favoured by three of the big five lines. But there is no assurance, even at CAB, that this will turn the tide, and the smaller operators, though they probably will follow suit, are more than doubtful whether the increase may not further discourage air travel and increase the attractiveness of the cut-rate unscheduled "wild-cat" airlines which have already raided many profitable runs. Other schemes were discussed. The cherished free lunch in the air may vanish; it cost the airlines $11 million in 1947, over half their combined deficit. Promotion schemes, like mid-week cheap family rates, may also come. More brutal diagnosticians prophesy that the industry needs stronger medicine: the reduction of excessive competition through the withdrawal of some route authorisations, mergers, and bankruptcies, and vigorous cutting of costs on the model of Eastern Airlines, which alone has maintained its profits.

Congressional attention in the next session seems assured if only because the airlines, hounded by their deficits, keep pressing for higher airmail payments and thus forcing the Post Office to request larger appropriations from an economy-minded Congress. President Truman has also asked the Reconstruction Finance Corporation to study the type of financing required to meet the long-term, as well as the emergency, requirements of the lines. It is thought this may lead to Government purchase of the latest transports, which would be leased to the airlines. This plan conveys more than an echo of a Bill passed by the House during the Eightieth Congress, but blocked in the Senate, which would have used Air Force funds to develop new types of commercial transport planes on the ground that, in the hands of the airlines, they would constitute a national defence reserve. The aircraft manufacturers stoutly opposed such Government control, but the Bill is likely to be revived as part of the urgent review of national air policy.

* * *

Scramble for Steel

A battle royal over the disposal by the War Assets Administration of a lease to operate one of the world's largest blast furnaces and coke ovens underlines the continuing acute shortage of steel and iron. The Cleveland plant, built by the Republic Steel Corporation for the Government in 1943, has been operated by the company on a short-term lease. When negotiations over the terms of a long lease failed to produce agreement and Republic proposed to discontinue operations, WAA speedily—critics say clandestinely—found a new lessee in the Kaiser-Frazer Corporation.

The automobile industry's major worry is the steel shortage, and Mr Kaiser, whose latest coup did not make him any more popular with his fellow-industrialists, hoped, it is thought, to use the plant's pig iron production as a lever to extract more steel for his cars. Republic Steel, waking up to find the plant being snatched from under its very nose, found vocal and politically powerful allies in the Cleveland and New England foundries it had supplied in the past. The case was at once taken up by the friends of small business in Congress, and the WAA official, who at first callously declared that allocation of pig iron was no concern of his, has learned the wisdom of singing a different tune. Under the final agreement, Republic will operate the plant for Kaiser-Frazer until May 1st, retaining all its rights to bid for permanent possession.

Production of finished steel, at an expected 65 million tons in 1948, a peacetime record, still fails to match demand, though some companies are reported to be over-buying. The steel shortage is the villain in the oil industry, housing, farm machinery, and even, according to Governor Warren, responsible for depriving California of essential water supplies. Nevertheless, the National Security Resources Board, while ostentatiously hugging the power of mandatory allocations smuggled through at the end of the last session of Congress, finds the voluntary allocation schemes working satisfactorily at present.

These slow-starting steel allocations (authorised under an Act which, unless renewed, expires next February) will channel over 5,000,000 tons of finished steel a year into housing, defence contracting, freight cars, and the oil industry. With ECA exports, the amount of steel thus set aside becomes substantial, and *Iron Age*, the magazine of the steel industry, is resigned to a renewed assault upon the failure to expand capacity more rapidly. The industry not only suspects that present demand is abnormal, but points out that full use even of its present facilities is limited by shortage of supplies. But the Government and labour economists, who have long urged that the demand for steel has reached a permanently higher level, are now vigorously supported by industrial consumers like the automobile and washing machine industries. The continuous casting process for steel developed by the Republic Steel Corporation and the Babcock and Wilcox Tube Company will, its sponsors believe, cheapen, simplify, and increase steel production, but this revolutionary relief is still far in the future.

* * *

Printers Under Fire

The general council of the National Labour Relations Board moved last week to bring new pressure on the International Typographical Union, still obstinately sustaining its Chicago local in a nine-month old strike against five Chicago daily newspapers. In March an injunction was granted restraining the union from making demands in pursuit of the closed shop, banned by the Taft-Hartley Act, but of long standing in the printing trades. Mr Denham, the NLRB's counsel, is now bringing a civil contempt charge against the union, charging that the International's payment of strike benefits in Chicago violates the injunction by sustaining an illegal strike, and asking that the union's "competency hiring" clauses be condemned as discriminating against non-union printers. The hearing takes place on September 15th; although the Chicago printers hope to receive outside aid, the loss of $434,000 in monthly benefits would make it almost impossible for them to hold out. It is not known whether the contempt action, if it is upheld, would affect agreements already reached on "competency" clauses in New York and Philadelphia.

The ITU convention in Milwaukee, while expressing a defiant support of Mr Randolph, the union president, showed every awareness that when the Chicago printers walked out in November they unleashed a printing revolution whose effects will be much more lasting that any court action. The Chicago dailies, by using the Vari-typer, which produces an even right-hand margin, and photographing and engraving the result, disappointed the union's hope that resistance would be short and ineffectual. Instead, as the months have gone by, improvements have steadily made the process faster, and the printed result more conventional in appearance.

In Chicago the substitute has proved expensive, but this need not always be so. A Vari-typer costs $700; a new automatic composing machine $4,000 to $10,000, and the typist who operates a Vari-typer charges a third the wage of a linotype operator. And behind the Vari-typer stand even more breathtaking inventions which compose by photography, setting no type at all, and "print," not by pressure, but by utilising a stream of electrons to make the impression.

The resolutions passed by the ITU note that the menace of these substitute printing processes cannot be ignored or belittled, and urge that the union hasten to organise its new competitors. The convention also authorised the executive council to establish competing enterprises to bring pressure on firms where strikes exist or are threatened; and opened the way to extending a strike against one paper of a chain to the rest of the chain. Publishers of three Chicago dailies have newspaper interests in other cities.

THE WORLD OVERSEAS

Prospects of Japanese Recovery

THE fourth year of the Allied occupation of Japan opens this month with most of the basic problems which faced the Japanese economy at the end of the war still unsolved. The transition from defeat to recovery is even slower and more painful than in Japan's European counterpart, Western Germany.

Today, Japanese industrial production is less than 40 per cent of the 1930-34 level. Note circulation has increased fifteen-fold from 16 billion yen in 1946 to 240 billion at the present time. Foreign trade has reached less than 20 per cent of its pre-war volume, and the pattern of trade is even more lopsided than that of the other defeated nations. Last year, for instance, Japan took 90 per cent of its imports from the United States, but return exports were sufficient to cover a mere 4 per cent of these imports. In short, there is still an enormous gap between hard reality and the dream cherished in some US quarters that Japan can be turned into the "workshop of Asia."

This lack of progress is due to a combination of war, Allied policy and Japanese officialdom. War deprived Japan of its overseas empire in Manchuria, Korea and Formosa on which it relied heavily for food and raw materials paid for out of income from investments in these areas. By itself this loss of empire posed a critical problem for the inhabitants of a group of islands whose arable land is a bare 16 per cent of the whole and whose population is 78 million and growing at the rate of a million yearly.

In addition, the occupation authorities were confronted with large-scale physical damage and with the disruption of Japan's normal trade channels. A chaotic China has made a hopeless trading partner, South-East Asia has failed to produce its prewar food surplus for export, and the Indian sub-continent has contributed very reduced supplies of such vital raw materials as cotton. Japan has not been able to trade further afield because of its lack of shipping resources and because in some markets wartime memories are still potent. The upshot of this devastation and dislocation has been to throw Japan even more abjectly than Western Europe on the mercy of the United States for supplies of food, raw materials and capital equipment.

General MacArthur, therefore, as Supreme Commander of the Allied Powers, has had two long-term economic tasks before him: to see that domestic production increased and to ensure that Japan was eased back as fast as possible into its old trading relationships.

The Search for Stability

American-inspired efforts to increase production have taken several forms. The first was an attempt to put domestic finances in order by means of sound budgeting and strict controls over wages, prices and the allocation of scarce raw materials. Accordingly, regulations have poured from MacArthur's headquarters; but the Japanese officials, whose job it is to enforce them, have seldom done so. In part, this is due to high occupation costs—they absorb one-third of the national budget—and in part it is the result of Japanese flaccidity.

The heads of Ministries have fought each other for the purchase of materials in short supply, while the diversion of such materials from essential uses into the black market has gone virtually unchecked. Again, Japanese officials, like some of their counterparts in the West, hesitate to unleash the political storm which would follow rigid wage controls. This timidity explains why the Japanese Government was forced to carry on for three months last spring without a national budget. No budget could be drawn up until a wage-level was fixed for government workers, but these workers claimed that their wages should be raised to the level prevailing in private industry. Meanwhile, the Japanese trade unions were demanding higher wages in the private sector of industry. With no end to inflation in sight, the Japanese Government, and especially its Socialist members, refused to back a policy of wage freezing.

The second—and less unsuccessful—attempt to expand production took the form of a drive to pare down the level of reparations. In this policy the General had ample support from Washington which has become increasingly anxious to lighten for the American taxpayer the burden of subsidising Japan. On paper, reparations remain at the fairly punishing level recommended in 1946 by President Truman's adviser, Edwin Pauley. In practice, however, reparations are likely to amount to little more than primary war plants and the contents of Japanese arsenals. Mr Pauley was followed by the Strike Commission and then the Johnston Commission which successively slashed the estimates of what should be made available for reparations.

Coupled with the campaign to reduce reparations is the current slowing-down of MacArthur's original drive to break up the Zaibatsu, the old family monopolies in industry. It is now argued that the over-zealous application of this policy, as in Germany, is depriving Japanese industry of its best brains and technicians. The defenders of the Zaibatsu deplore in particular what they call the "atomisation" of Japanese industry.

The third assault on the problem of production sought to extract sufficient funds from Congress to cover not only relief but also to finance Japanese recovery. This met with only limited success. Together the US Export-Import Bank and various US commercial banks recently gave Japan a $60 million credit for the purchase of American raw cotton. In June, Congress set up an $150 million revolving credit fund to be used by all occupied areas for buying American agricultural commodities and raw materials. Congress, however, rejected the $150 million recovery programme for 1948-49 recommended last April by William Draper, Under-Secretary of the Army.

Need for Foreign Investment

Now it is apparently clear to General MacArthur's headquarters—though not to the Japanese themselves—that Japan must rely for industrial reconstruction almost entirely on private foreign investment. For their part, the Japanese are still dealing with the crisis by wishful thinking. In a dutiful attempt to attract foreign investors, they have recently produced a rash of stabilisation plans—6-point, 8-point, and 10-point. An alternative nomenclature popular with Japanese planners is in terms of two, three and five years. None of these plans is any more substantial than that recently announced by the President of Japan's Economic Stabilisation Board. This 10-point programme called, among other things, for the prompt collection of taxes, the cessation of currency speculation by civil servants, the stabilisation of wages "with flexibility" (or alternatively, the flexibility of wages with provision for freezing them).

In spite of all these measures, declarations and plans, industrial production has shown no real signs of recovery. Today it is little more than ten per cent above the level of January, 1947. Meanwhile, however, efforts to deal with the external trade problem are somewhat more promising.

When he first took over, General MacArthur showed himself little aware of the impracticability of the insistence from certain quarters in Washington that Japan should operate as part of the dollar area. US cotton growers were, of course, eager to sell their product to Japan, and US Government agencies such as the Commodity Credit Corporation were anxious to get a dollar return for their dollar loans. Hence the American occupation authorities were under constant pressure to see that Japanese exports, principally textiles, were sold only to those who could pay in dollars or currency convertible into dollars. But the piling up of unsold textiles in Japanese warehouses soon convinced MacArthur and his officials that this proposition was unworkable. As a result, there has been a gradual improvement in arrangements for trade between Japan and its traditional customers in the non-dollar area. Japanese textiles can now be sold for sterling or on the basis of 50 per cent dollars, 50 per cent barter. A new and improved payments agreement was signed in May with certain parts of the sterling area, and a large-scale conference has recently met in Tokyo to implement the agreement.

What is emerging is a series of bilateral trade pacts. While

these have little in common with the multilateral theories of the sponsors of ITO, yet they may help very materially in providing Japanese industry both with raw materials and with customers. In the process it is hoped that Japan may reduce its dependence on the American dollar and at the same time help to rehabilitate itself and the rest of Asia. Latest reports suggest that the current trade negotiations in Tokyo will result in a total trade of £67 million beween Japan and the sterling area, an increase over last year of some 400 per cent.

For the moment there is clearly much to be said in favour of these bilateral arrangements. As long-term instruments, however, they may, in the opinion of some American experts, prove dangerous. The bilateral pacts now work through a system of multiple exchange rates, and if these are retained too long, the Japanese economy may get clogged in a system of hidden subsidies and concealed taxes. Hence a great deal of discussion has recently centred on the fixing of a single exchange rate. The advocates of this move have a strong hankering for Adam Smith's "invisible economic hand," and are convinced that its operations through such agencies as the big private banks of the China coast and points further east would soon establish the true value of the yen. The opponents of a single exchange rate argue that, although it is desirable in the long run, such a move carried out now would introduce a fresh series of shocks into Japanese industry. It would be idle, they claim, to risk new disturbances merely for the sake of making obeisance to the doctrines of a *laisser-faire* economy.

The immediate economic prospect for Japan does not make a cheerful picture. Japanese political leaders will have to convince the population that for some time to come their standard of living is likely to be much lower than before the war. Indeed, if the Japanese themselves were to bear the full economic consequences of the war, there would be mass starvation in the cities. Something less than this austerity will be called for. But, even so, there can only be a real break in the present *impasse* when Japan produces a government prepared to face the facts—and the unpopularity.

South Africa Under the Nationalists

[BY OUR JOHANNESBURG CORRESPONDENT]

THOUGH South Africa's new Nationalist Government has been in office only three months, it has done enough to show that it means business. Its first act was to set free the wartime saboteurs and convicted traitors; its second to lift the ban on the semi-military Fascist organisation the *Ossewa Brandwag*, and on the Afrikaner secret society, the *Broederbond*. The army is being reorganised to give more scope to Afrikaans-speaking officers. General Poole, who was to have been the next Chief of the Military Staff, has been "given a bowler hat" and sent to Berlin. The chief of Military Intelligence was dismissed, and the new Minister of Defence, Mr Erasmus, authorised a lightning raid on MI headquarters and the seizure of files. The "rifle associations" which General Smuts disbanded during the war are being reconstituted as a "platteland army." Immigration from Britain has been curtailed, "to ensure the maintenance of the existing composition of the white population"; meanwhile the Germans whom the Smuts Government intended to deport are to stay in the country.

The trade unions are to be investigated for "Communist" influence, and the Government says it will not continue to "tolerate the Michael Scotts and the Basners who take South Africa's domestic affairs abroad and use them for propaganda." Churches which "undermine the policy of *apartheid*" will be "opposed." The English-speaking Press has been warned that it must be "more responsible." In the House of Assembly, the Government has already developed a habit of naming individuals against whom action is threatened; they include a Jewish trade union secretary.

The Asiatic Act is to be amended. Under this Act, passed by the Smuts Government, the Indians had their property rights further restricted, but were promised a limited franchise in return. The Nationalists intend to continue, and perhaps tighten, the restrictions, but to withdraw the franchise provisions. The present representation of Natives and Europeans in Parliament is to be entirely abolished; and the Cape Coloureds are to be taken off the common roll.

These measures and proposals are extremely drastic. Yet so far the Nationalists have managed to adhere to their election programme—for they said beforehand that they would do all these things—without rousing very much active opposition in the country. It is quite possible that if another election were held tomorrow, the Nationalists would increase their majority. There are several reasons for this.

Some of the most powerful trade unions welcome the curtailment of immigration. Townsmen welcome the *Louwcol* plan which has cut profit margins. Farmers are pleased with their higher prices. The middle class is pleased with the £6,000,000 tax relief granted in the Budget. Commerce and industry both welcome the assurance that import control will not be imposed, since both want imports costing dollars. The gold mines have been promised every consideration due to their central place in the national economy, and have got a first instalment of nearly a million pounds. The Budget had a reassuring air of returning to prewar solidity. Figures about the adverse balance of trade are very dull, and £6,000,000 tax relief is very concrete.

Support for *Apartheid*

The Nationalists have a solid backing for their non-European policy. The franchise provisions of the Asiatic Act were never carried out, and were opposed by the whole of white Natal, which is quite ready to endorse their withdrawal. *Apartheid* also has much support. The Nationalists do not really intend to send all their natives back to the Reserves; not a penny was provided in the Budget for the purpose. The towns will probably continue to have cheap native labour; but under *apartheid* the natives will have fewer rights than ever. Very little will be done to improve their miserable living conditions—Dr Jansen, the new Minister of Native Affairs, bitterly attacked the Smuts Government for having provided the natives in towns with "pensions, unemployment insurance and school feeding." *Apartheid* means more repression, that is all. That native unrest will grow seems self-evident. But a major upheaval is hardly a physical possibility: the Government has the guns. There will, of course, be outside criticism—hence the Nationalist intention to fight "propaganda abroad," if necessary by curtailing freedom of speech within the Union. Mr Te Water is to go overseas to tell the world how misinformed it is. But, if he fails, external criticism will simply be used to rally all patriotic South Africans in defence of their "way of life" against foreign slanders.

It is significant that the Smuts Opposition, which was defeated mainly on the native issue, does not now venture to attack the proposal to abolish native representation on the ground that it is manifestly unjust, but rather on the score that if the Nationalists do it by a simple majority, the way will be open to them to reduce English to a subsidiary language by the same means. The native vote, and equality between English and Afrikaans, are both supposed to be entrenched in the South Africa Act and alterable only by a two-thirds majority in both Houses of Parliament sitting together. The Nationalists do not say they will abolish the native vote by a simple majority; but they refuse to give any pledge that they will not. They may be counting on colour prejudice seeing them through; and they may be right. The door would then indeed be open for other fundamental changes.

Policy Step-by-Step

However, it would be equally mistaken to suppose that the Nationalists will let power go to their heads. They have struck swiftly where they felt they had to—Mr Eramus alleged that Military Intelligence was supplying confidential information to the General Secretary of the United Party, and that the army had become a postwar political weapon against the Nationalists—but otherwise they are unlikely to abandon the step-by-step policy. They do not propose to leave the Commonwealth at this stage, but merely to ensure that the Union Defence Force is an instrument at their disposal, not at Britain's (or General Smuts's). They do not intend to stop all immigration from Britain forthwith—merely to render it no assistance and to ensure that in any event it is not large enough to change the "existing composition" of the white population. The English language will continue to have full equality with Afrikaans; but, of course, if the Native vote can be abolished by a simple majority, without creating too great an outcry, that will be a useful precedent.

Those who cry that South Africa is in immediate danger of Fascism meet with considerable scepticism, and a good deal of that scepticism is justified. With the exception of colour policy—though that is an important exception—South Africa is a very tolerant country. The tempo of life has on the whole been leisurely, and political differences have seldom debarred personal

friendships. The two white sections, English and Afrikaner, have hitherto been too evenly balanced for one to dominate the other. But a review of the Nationalists' present programme and past performances suggests that a change may be in store. It is true that though the Nationalists won the election by a very few seats, the United Party of General Smuts actually polled more votes. But this may be overlooking an important factor. A large proportion of the younger generation of Afrikaners have been strongly indoctrinated with "purified" Nationalist teaching. The hallmark of this generation is intolerance and a leaning towards Fascism. The majority of Afrikaner university students are as attracted to Fascism (they still cheer Hitler) as British university students are, or used to be, attracted to Socialism. The *Ossewa Brandwag* mainly consists of young men. Meanwhile the English section feels there is much to be said for the Nationalists' colour policy, and so is confused and hesitant. Time may be on the Nationalists' side.

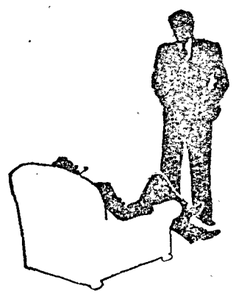
But how far the Nationalists can push their declared policy without finally rousing antagonism between English and Afrikaner remains in question. Their ultimate aim is undoubtedly a Republic, probably an Afrikaner one, and probably totalitarian. However skilfully they exploit colour prejudice, the chances are that sooner or later they will succeed in rekindling the old feud between English and Afrikaner, with much of the old bitterness that Smuts and Hertzog once hoped to end forever.

Oil, Agriculture and Industry in Venezuela

[BY A SPECIAL CORRESPONDENT]

IN spite of the oil boom, Venezuela remains essentially an agricultural country. The vast majority of its 4,000,000 people earn their living from the land, and in the long run, unless Venezuela can establish a productive and prosperous agriculture, it is doomed to disaster. The oil boom will not last forever.

Traditionally, Venezuelan agriculture has been dominated by large landowners These date back to the times of the Spanish conquest, when great plots of land were given out to Spaniards who happened to be in the good graces of the crown. In time, much of this land came into the hands of Venezuelan-born Spaniards. But during the rule of Juan Vicente Gomez, which lasted for most of the first four decades of this century, the tendency towards the centralisation of land went even further than before. Gomez treated all Venezuela as his private *hacienda* and gave lordly grants to his generals, his relatives and his favourites. As oil became important he carried out a policy which only now Venezuela is trying to counteract; he took out of production large areas of agricultural land and either turned them into grazing land or let the land lie fallow. Yet even the good results of this policy—the building up of at least some large herds of cattle were largely vitiated by the governments which succeeded Gomez, and which sold much of the cattle, including breeding stock, to the Columbians and other foreign purchasers.



One result of this policy of large landholdings was to drive the small peasant up the sides of the hills to farm. Driven out of his valley by the landlord, the little *campesino* tried to farm on the slope as nearly as possible in his accustomed way There was little or no use of terracing or other methods which might have preserved at least some of the fertility of these hillsides. The long rows of corn or yucca were planted up and down the hills. In two or three years the soil was washed away and it was necessary to move on to the next hill.

The extent of the concentration of land ownership can be seen from the fact that in 1941 there were 59,014 agricultural proprietors of which 4.4 per cent, or 2,568, had holdings of more than 160 hectares, with a total of 2,705,888 hectares or 78.7 per cent of all the arable land in these holdings. The other 56,446 proprietors, 95.6 per cent, had only 21.3 per cent of the land —731,795 hectares. Of the 3,437,683 hectares included in these holdings, only 708,773 hectares were actually cultivated. Many of those engaged in agriculture did not own the land they worked, but were squatters of one kind or another. The great majority, however, were farm labourers. Thus, there are some 420,000 agricultural families in the country, and only 59,014 are listed as proprietors.

The Venezuelan peasant has been greatly undernourished. The Ministry of Health has drawn up what it considers an

adequate diet for an adult male farm worker, but the average worker eats only about half the amount of meat called for, little or no milk, and practically no citrus fruits. In fact, the staple foods of the agricultural worker have been bread, yucca, beans, bananas, coffee, and some meat. The result has been an efficiency far below that needed to do the job. It has also meant that the agricultural worker has been more easily subject to disease.

Other factors have in the last few decades worked against Venezuelan agriculture. The most important of these was the petroleum industry. Under the regimes of Gomez and his immediate successors agriculture was more or less lost sight of in the giddy whirl of oil profits. While the nation's external debt was paid off with the oil proceeds, while millionaires were made in the Gomez and succeeding governments, it was hardly worth while to engage in agriculture. People streamed to the cities, and the urban land boom absorbed the energies and capital of many others who might otherwise have gone into or stayed in agriculture.

Move to the Towns

The very high wages paid in the oil fields in comparison with elsewhere led to a discontent with the wages and conditions in the countryside which probably resulted in less production. Until the present regime it could not result in positive action among the workers. Many agricultural workers went to the cities and the oil fields. But, as there are only about 40,000 workers employed by the oil companies, it is not literally true to say that the oil fields themselves drained off any really large part of agricultural labour. The discovery of petroleum, however, did result in a boom in the urban parts of the country which resulted in the more energetic and ambitious workers leaving to seek their fortunes in the cities and towns.

The result of this situation has been the decline of agriculture and the grazing industry. For instance, 32.6 per cent less maize was produced in 1947 than in 1936—and maize is the largest grain crop. The chief agricultural exports, coffee and cocoa, have been declining for several decades. The livestock industry has been on the down grade since the end of the last century, when a large proportion of the cattle of the country were killed off in the civil wars.

The government has tried to come to grips with the agricultural crisis since 1945. The general policy has been to take advantage of the petroleum boom while it lasts, to get as much out of it as possible and then to reinvest this capital in building up both agriculture and secondary industries. Farmers have been given credit, and "agricultural communities" have been established using modern machinery. Much of the work is still in the planning stage. But some results are already apparent.

The Venezuelan government is also carrying out a number of large irrigation projects. One of the most interesting of the plans for agricultural development is that which is being developed by the Venezuelan Basic Economy Corporation, of which Mr Nelson Rockefeller is the head. Mr Rockefeller was Co-ordinator of Inter-American affairs during the second world war, and his interest in Latin American affairs dates several years before that. This experiment attempts to combine real economic aid for the development of the economy of the country with the possibility of making a reasonable profit. The Corporation is interested in four projects. The agricultural development company is one. Others include a fisheries company, a wholesale business and a milk production corporation. The company is bringing in the latest machinery and hopes to use US or US trained technicians. Good houses for the workers will be built, schools, hospitals and other social services provided, and these establishments will be operated in every way as model farms—and, it is hoped, still make money.

Use of American Private Capital

All these Rockefeller projects are of particular interest as an experiment in the co-operation of Venezuelan and foreign capital. The Corporation has invested in the four projects mentioned on the basis of putting up half the capital for them, and having full common-share stock control for the first ten years. The *Corporacion de Fomento* has come in with the other half of the capital, and receives preferred stock with a guaranteed return. It is agreed that, as soon as the individual companies start making money, the Basic Economy Corporation will begin putting its stock on the market, and, at the same time, the government will turn in an equal amount of its preferred stock to be exchanged for common stock, which will also be offered on the market to Venezuelans. In any case, it is provided that within ten years the Basic Economy Corporation shall offer majority stock control to Venezuelan buyers. There is a distinct possibility that, in view of the high return from urban real estate and the comparatively low return expected from the Rockefeller enterprises, no market will be found for these shares. The government officials apparently believe that the *Corporacion de Fomento* will be free to buy up the majority control, while the Americans are not in favour of this. In any case the issue will not be alive for some years, but the project has the support of *Accion Democratica* and of the large majority of the trade unions.

The *Corporacion de Fomento*, which is interested in the Rockefeller enterprises, the agrarian experiments and other projects, has also done something in the way of direct investment in industry. It has put a good deal of money in an old textile mill in the city of Maracay and is making it into a first-rank plant. It has invested in a consortium to pasteurize milk and supply it to Caracas. It has invested in a food-oil plant, also in Maracay, and in a number of similar projects. This Corporation was one of the first projects of the revolutionary government. It was set up on the model of such enterprises as the Chilean Development Corporation. Its capital was completely subscribed by the government. Its function is to stimulate production, through loans, direct investments and any other way that seems feasible. It is becoming an increasingly important weapon in the struggle to diversify and industrialise Venezuela's economy.

But oil still remains the rock upon which the prosperity of the country is based. For instance, 95.15 per cent of all foreign exchange brought into the country in 1947 came from oil and 93.10 per cent in 1946. The petroleum companies estimate that in 1947 they provided about 63 per cent of the total revenue

taken in by the Venezuelan government, or about 814,500,000 bolivares. This money is collected in a variety of ways. The government takes 16⅔ per cent royalty to start with, then there is income tax, plus various import and export taxes. The government also makes a profit on its exchange operation with the companies: they must buy bolivares from the Banco Central de Venezuela, which sells at 3.09 per dollar, instead of 3.30 which is the current rate.

The oil companies employ between 40,000 and 45,000 workers, and pay the highest wages in the country. In housing, education, and other things they are a good deal ahead of the Venezuelan average. They are, of course, draining off the resources of the country, as the Venezuelans sometimes complain. And it is undoubtedly true that previous governments did not see to it that the companies do their fair share towards building a sound Venezuelan economy. The present government, however, takes 50 per cent of their profits. The companies have not raised any particular objection to this, since they realise Venezuela's situation, but it is likely that, if the Venezuelan government tries to take much more, they will object. As the oil companies point out, Venezuelan oil is in competition with that of the Middle East, which is produced a good deal more cheaply.

In any case, the oil boom is not likely to last forever. Known reserves will sustain present production for at least twenty years more. Of course, it is likely that there is a good deal more oil than is at present known. But it is possible that the demand for oil will not continue at its present level. With this in mind, the present Venezuelan regime is trying to establish a sound agriculture and what industry it can.

THE BUSINESS WORLD

Disinflation in Jeopardy

THE Government's policy of disinflation, which is surely the very heart of its attack upon the problem of Britain's rehabilitation, is in jeopardy. That would be true even if it were not apparent that the policy of the White Paper on personal incomes, the first and shakiest plank in the disinflationary programme, will have to carry the main burden of criticism when the TUC meets at Margate next week. The additional pressure will obviously increase the risk of collapse. But, even before the drift of trade union feeling became discernible, many people had reached the conclusion that Government-inspired disinflation ought to be written off as a lost cause. That was conceivably an over-hasty judgment; but the omens grow steadily less propitious. The latest and most ominous symptom is the prospect of a further round of successful wage demands. The court of inquiry has delivered its decision on the engineers' claim—a flat increase of 5s. instead of the 13s. which had been demanded. It is futile to argue that this claim was an exceptional case, outside the ambit of the White Paper. Every single claim has some exceptional quality about it and if pressure is strong enough, the retreat from principle to expediency is certain. The repercussions of this award—widely regarded as a key decision—coupled with the impetus that is likely to be imparted from Margate, plainly threaten to destroy most of the fruits of Sir Stafford Cripps's efforts to put British economic policy on a rational footing—unless the Chancellor's pleas, and the hard facts of Britain's needs, induce an unaccustomed level-headedness in trade union policy.

At this critical point, before the additional strains develop, the effects of the disinflationary policy to date and its present strength or weakness deserve to be soberly assessed. The Chancellor is reported to have put the facts of the British economic position dispassionately before the Council of the TUC. If the whole Congress could show an objectivity equal to his, the results might be salutary. For there is no doubt that the effects of disinflation so far have been limited and therefore disappointing; and the conclusion to be drawn is, not that the disinflationary prescription was wrong, but that it was diluted before its effects on the patient could be fairly judged and when there was even a presumption that the mixture might already be too weak.

In retrospect, it now seems evident that the symptoms of disinflation which aroused such noisy complaints from the few discomfited trades some months ago were due rather to natural causes than to direct consequences of the Chancellor's policy. But, whatever the true diagnosis, it was rash and foolish of the Government, as *The Economist* pointed out at the time, to rush so solicitously to the aid of the afflicted. The outcries of the vested trade interests concerned did Britain a double disservice. They gained their immediate point, by extracting various concessions on coupons and purchase tax and thus tending to keep resources employed on work which Britain cannot at present afford. Worse still, by creating in the minds of certain Ministers a disproportionate—and, indeed, irrational—fear of deflation, they must have played a large part in inducing the more damaging revisions of policy in much more important spheres, notably housing, building repairs and "frustrated" exports.

These and similar concessions, moreover, were granted at a time when the disinflationary programme was already being undermined from other directions. It has since been shown that the continuing rise in import prices and in other costs has lifted the bill for cost of living and agricultural subsidies far beyond what was contemplated in the budget. The cost of the Berlin air-lift and of other measures in Germany has plainly been heavy, and the Government has been facing and will face unexpected expenditure on military and other precautions. The running cost of the National Health Service, too, seems likely to be much beyond estimate.

Altogether, the statistical basis of the disinflationary programme—that is, the now familiar capital budget for the national economy as a whole—must have altered its shape quite drastically since the official estimates were framed early this year. The additional strains have not by any means been confined to the whittling down of the surplus on current account shown in the Government's prospectus. Even in some official circles the £1,800 million assumed for gross capital formation of all kinds in this calendar year was regarded, from the outset, as an under-estimate. Most unofficial estimators had put the likely total at nearer £2,000 million. The reasonableness of this guess may perhaps be a little more debatable now. The decision to halt the planned decline in the number of houses under construction may mean, but will not necessarily mean, that housing outlays (which play a very large part in total investment at present) will be appreciably larger in the second half of the year than was at first intended; and this is also likely to be true of other building work, such as repairs in general and rehabilitation of war-damaged offices and industrial properties. On the other hand, there have been the postponements of several notable new industrial projects recently discussed in these columns. These particular decisions have rightly attracted widespread attention; their immediate significance in the current balance sheet of disinflation may not, however, be large, because their potential demand for labour and other resources would not, in any case, have materialised rapidly. But such postponements may be symptomatic of shrinking confidence and increasing reluctance to embark upon major outlays in other industries whose investment demands cannot be accurately known. On balance it seems rather improbable that formation of fixed capital will this year surpass the official estimate so largely as was at first expected.

Gross capital investment, however, includes additions to stocks; and from the point of view of their immediate inflationary effect it is immaterial whether the additions comprise vitally needed supplies or unsaleable surpluses—both must be financed. Indeed, even business losses may be provided for on the "investment" side of the national balance sheet, because they absorb other people's savings just as surely as a net outlay on new plant would do. In measuring the demands for finance to carry the accumulation of stocks, therefore, it is necessary to balance the effects of disinflation in opening out bottlenecks, and in thereby releasing the abnormal accumulations of semi-finished goods, against its effects in piling up finished goods which nobody will buy.

Though its trend can only be a source of disquiet, there is one factor in the balance sheet of disinflation which is giving a greater relief from inflationary pressure than the official estimates assumed. This is the total deficit on the external balance of payments—the net inflow of goods and services.

from abroad. The official estimate of £250 million for the year will be largely exceeded, not specifically because of Marshall aid, but simply because the official estimate was never realistic. The actual figure is likely to surpass £350 million, and may be as much as £400 million. On the savings side of the balance sheet, it is surely unlikely that provisions for depreciation will fall far short of the £800 million which represented the upper limit of the official estimates; the figure for 1947 was £775 million. The current account surplus of public authorities, as already demonstrated, is likely to be a good deal less than the £400 million originally envisaged. The trend of spontaneous private saving is much more difficult to guess. The wide measure of observance of dividend limitation will obviously have tended to sustain corporate saving, but in some trades the pressure of costs and the partial brake upon price-increases have been exerting a squeeze upon profits. Personal saving is, of course, virtually immeasurable by the unofficial investigator. The so-called "small" savings have on balance imposed a very heavy net demand upon the Exchequer—probably a much bigger demand than was assumed last April. But these figures are no reliable guide to the trend of net personal saving as a whole. The original balance sheet, however, did not pre-suppose any large contribution from personal saving; the implied estimate for private saving, if depreciation provisions were taken at £800 million, was, on the official figures, no more than £350 million. Most of this could reasonably be expected to come from corporate saving, so that there seemed at first to be a fair latitude in the balance sheet as a whole.

The statistical basis of disinflation can now be briefly stated. Suppose private saving and depreciation provisions can still be depended upon to reach their combined target of £1,150 million. On that assumption, the question whether the basis of disinflation is more or less assured than it seemed last April depends upon whether the prospective "gain" of £100 to £150 million on the external deficit is likely to be less or greater than additional investment (beyond £1,800 million), plus the shortfall on the public authorities' surplus (below £400 million). It is hard to believe that the balance of this equation could fall on the right side; but it is perhaps improbable that the net addition to the inflationary forces, in this statistical sense, has been large.

In these matters, however, it is the margin that counts. No radio manufacturer has any doubt that a small measure of disinflation can have significant effects. So, too, with a small margin of inflation—though its "benefits" would not necessarily accrue to the industries, like the radio industry, that were hit by marginal disinflation (among other influences). Moreover, even if it were certain that the disinflationary account was in equilibrium, that would not suffice by itself to check all inflationary tendencies. A theoretical and statistical equilibrium on the nation's capital budget, desirable though it is, does not mean that supply and demand will be neatly balanced in every sector of the economy. Excesses of demand in one sector, as all recent experience goes to prove, can exist side by side with excesses of supply in others. Indeed, after any boom, inflationary and deflationary influences are bound to be present together until a decisive trend asserts itself. And when the source of the disinflation is a pressure deliberately imposed by the Government rather than the pressure of natural causes (such as the evidence that particular industries had expanded far beyond their sustainable market), it will always be particularly hard to estimate the effects, and even more the outcome, of the tussle between the opposing forces. That seems to be the situation today. The natural disinflationary influences, evidently important earlier in the year, seem largely to have exhausted their impetus, at least temporarily. It is noteworthy that there have been no fresh outcries from the trades which recently were so vocal; and the chorus has not been taken up by others. There are even signs that the radio industry is re-expanding.

In conditions such as these, when the disinflationary movement has lost its impetus and yet has not demonstrably gone into reverse, ostensibly small changes in policy, either by the Government or the trade unions, could easily upset the precarious balance of the equation and alter the direction of the whole economy. But though the policy is thus vulnerable, it has so far achieved very little. The clear proof of that conclusion lies in the manpower figures which, as was shown in these columns a fortnight ago, reveal only a very modest rate of recruitment to the all-important industries and an even more disquieting failure to draw labour away from the industries which were scheduled to release it—to the extent of more than 250,000 workers. The depressing conclusion to which one is forced is that a genuine disinflationary equilibrium, in the balance sheet sense described above, will never suffice to produce any large changes in the face of strong resistance, or at least will not do so rapidly. Perhaps the Government knew that when it budgeted for an increase in unemployment to 450,000 by the end of this year. But, if so, its budgeting was purely theoretical. Unemployment has steadily declined throughout the year. It now stands at 282,000. Dr Dalton, in the heyday of his financial inflation, did not reduce it much lower.

Rayon and the New Fibres

THE still unfinished search for a nomenclature for synthetic fibres is merely one of the signs which mark the rayon industry as a young and lively industry still in its growing years. The search is accompanied by controversies which expand in range with every important technical innovation; and nobody knows where it will end. It advanced a stage at the conference of the International Standards Organisation at Buxton in June, when the British Rayon Federation urged without success that "rayon" should be adopted as a standard term for all man-made fibres. It was finally agreed merely that there should be a generic name for all synthetic fibres. But the name is still to be found.

For the moment the language of synthetic fibres is undergoing a process not of unification but of fissure. In the United States it has reached the point at which cellulose acetate yarns and fibres have claimed a new generic name of their own, "estron." By a new series of definitions adopted by the American Society for Testing Materials in June, the term "rayon" is confined to fibres and filaments of regenerated cellulose. Fibres and filaments "composed of one or more esters of cellulose" cease to be rayon, and become "estron"; these are the acetate fibres, but there seems also to be some doubt whether the new synthetic fibre now in course of development, "Terylene," would by this definition be an "estron" fibre or not; for it begins the manufacturing process as an ester, but is afterwards polymerised. But "Terylene" is a British, not an American, innovation, and unless the term "estron" makes a quick recovery from its unpromising start the likelihood of its adoption for British fibres is dim. The principal British manufacturers of cellulose acetate materials, British Celanese, are disposed to be content with "rayon" and with their own trade mark. British shoppers have accepted "nylon" as a separate classification (in so far as they are able to buy nylon at all) but this does not mean that their receptivity

to new words is endless. For the purposes of this article the term "rayon" is used, with all proper diffidence, generically, and under cover of it the attempt is made to discuss not only the familiar cellulosic fibres but also the synthetic fibres with which the British public has still only a slight acquaintance—whether nylons, polyesters, or proteins. *The Economist*, at any rate, has no intention of intervening in this battle of technical terms.

Not only is rayon an expanding industry, it is also a changing one. A series of technical innovations which were bottled up by the war years has been brought near to fruition, and it is hardly possible that the technical pattern of the industry should for long remain static; processes, and the uses of the product, assume a different relative importance. These changes are occurring in a period of abnormal trading conditions, when demand has been high, when the slow post-war recovery of the German and Japanese industries has artificially limited supply, and when the natural fibres (cotton and wool) have reached extremely high prices. New enterprises, the exploration of new markets and new uses, and the planning of expansion all press for attention at a time when the demand for the existing standard products is abnormally hard to satisfy. The natural optimism of the rayon trade does not conceal the fact that the total problem they present—how to plan the trading and production policy of the future—is a difficult problem to solve. This was illustrated a few weeks ago when the decision of Courtaulds to postpone the plan for a viscose fibre factory at Dundee became known. That decision was presumably influenced by the high costs of construction. It was offset to some extent, no doubt, by measures to expand further the production of viscose staple at the company's factory in North Wales. But the company in explaining the decision, referred to "world conditions," and it is probably relevant that the American rayon industry has not lately shown an unlimited confidence in the prospects of expansion in the market for rayon staple.

The modest attitude at present of important sections of the American rayon industry towards the prospects of future expansion is worthy of study. American Viscose Corporation, the principal producers of rayon staple in the United States, recently shelved a scheme to build a new rayon staple plant at Radford, Virginia where land was bought two or three years ago. In this decision also the high cost of building and of machinery played a part. American Viscose prefer to expand production by improvements to existing plant, which have already achieved appreciable increases for a moderate outlay. Their attitude is the more interesting in that the present demand for rayon staple in the United States greatly exceeds supply; a grey market in the resale of yarn and staple is carried on at prices well above those charged by the producers, and users of staple have approached the United States Government to complain that the volume of production is too small. The producers take the view that the expansion plans already in hand may prove sufficient to meet the demand. The calculation is necessarily uncertain, because a part of the present demand is for rayon as a cheaper alternative to cotton. This is not accepted as a permanent trading factor by the established rayon yarn and staple producers, who discourage direct competition with cotton. But if the price of cotton falls, the total American demand for rayon will suffer, and foreign suppliers would be among the first to feel the reduction.

Considerations of this kind induce restraint, but they need not induce pessimism. In fact the British rayon industry has increased its production of rayon yarn (filament) steadily, and its production of rayon staple rapidly; and further increases are in prospect. Production of rayon yarn, which averaged 8,500,000 lb. a month in 1938, has been above 11,000,000 lb. in each month this year; in June it reached 12,600,000 lb.—the highest figure yet recorded, and 26 per cent higher than in June, 1947. Monthly production of rayon staple averaged only 2,800,000 lb. a month in 1938, but by 1946 the monthly average had risen to 5,900,000 lb. Last year it rose further to 7,000,000 lb. The next substantial increase is expected in December, when the expansion of capacity should begin to make itself felt. By the autumn of 1949, according to a trade estimate, monthly output of rayon staple may rise to more than 13,000,000 lb., and in 1950 it will be between five and six times the production of 1938. As prospects appear at the moment, the largest consumer of this output will be the Lancashire spinning and weaving industry, working for the most part on spinning and weaving machines originally designed for cotton. Production of rayon yarn (filament) will not expand at the same rate; the main increases now planned are unlikely to take effect before 1950.

The bulk of the increased production of staple fibre is likely to come from the Courtaulds plants at Greenfield, in North Wales, to which reference has already been made. In the production of acetate staple, however, British Celanese are also preparing to expand, and extensions to their works at Spondon are in progress. Acetate staple was relatively neglected during the war; the utility programme required acetate rayon in yarn. A certain amount of acetate staple was produced, but was used to the extent of 30 per cent in mixtures with viscose staple. The results of this largely accidental fact may now prove commercially interesting. The mixture was found to have qualities of its own; in particular, attractive dyeing qualities and good resistance to creasing. Promising experiments are now being made with 50 per cent mixtures on the same lines. The higher price of acetate staple (33d. a pound, as against 16.5d. for viscose staple) must limit for the present the scale on which sales of acetate staple can expand; but the prospects for acetate staple are not dull.

★

As production expands, attention can presumably be given to uses of rayon which have not yet been fully exploited. One probable field for expansion is the woollen and worsted industry, which already uses considerable quantities of cotton—cotton yarn for warps, and cotton linters for mixing in the yarn. The extent to which rayon can be substituted depends, in the short run, on the price of cotton. In addition, there are further possibilities for the substitution of rayon for a modest proportion of the wool used in the woollen and worsted industry; these may expand as techniques develop and the properties of the rayon fibres are improved.

The industrial uses of rayon appear also not to have been fully explored. At present the main industrial consumption is of rayon of coarse denier for tyre cloths; and this can be expected to grow as the supply of the special yarns concerned is increased. Other uses, it is fair to assume, would have been exploited more thoroughly before now if the rayon producers had not been working in a general atmosphere of excessive demand and inadequate supply.

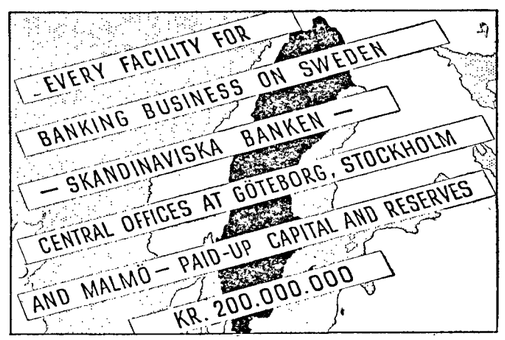
Both nylon yarn and nylon staple may have a large part to play in the development of industrial uses for synthetic fibres, and there is room for experiment in the mixture of nylon staple with other fibres. The immediate interest is, however, in the prospects of expanding the supply of nylon yarn. Production is now starting at the new factory of British Nylon Spinners at Pontypool. Since 1941 the company has been producing yarn at Coventry, and since 1942 at Stowmarket; the two together have lately been producing yarn at the rate of 1,000,000 lbs. a year. The company's total production should now begin to expand, and by the end of next year (when the Pontypool plant should be in full operation) it is expected to reach the rate of 10,000,000 lb. a year. Hosiery will continue, no doubt, to be the largest use for nylon, but other fabrics are in preparation. The development of lightweight worsted materials with a reinforcement of nylon is reaching an advanced

stage; the worsted yarn can be doubled with nylon filament, or it can be spun round a nylon core.

Imperial Chemical Industries are concerned in the development of two new fibres of particular interest. "Ardil," a protein fibre for which the warmth and resilience of wool is claimed, is being produced in small quantities at the ICI works at Ardeer, so that it is already known to the textile trade. It originated before the war in a programme of research undertaken to find new uses for the primary products of colonial countries; the starting material of "Ardil" is the protein in groundnuts, which is extracted after the expression of the groundnut oil and before the remaining carbohydrate is converted into cattle-feed. The first filaments were produced in 1938, but further plans were held up by the war. "Ardil" makes a soft yarn; mixed with a stronger and harder-wearing fibre, it should make fabrics with qualities which have not previously been produced in this country from synthetic materials. The company's production plans indicate confidence; it is intended to set up a plant at Dumfries to make 10,000 tons a year. The customary difficulties which surround new industrial construction operate in this case also, and it is not likely that production at Dumfries will start before 1950. Until then, only the "pilot" quantities produced at Ardeer will be available.

The newest textile fibre to have reached an advanced stage of development in this country, "Terylene," has been described as the first truly synthetic fibre—in the sense that the starting material is not merely adapted, as in the cellulosic fibres, but entirely reconstructed—to have been evolved in Britain. Its theoretical origin can be traced to the work of Dr. W. H. Carothers, the Du Pont chemist who evolved nylon. Carothers, after examining the polyamides and the polyesters, chose a polyamide as the starting material of nylon. Mr J. R. Whinfield, of the Calico Printers' Association, examined the polyesters further and found one (derived from the condensation of ethylene glycol with terephthalic acid) with suitable fibre-forming properties. The work on "Terylene" has since been taken over by ICI, and much work has by now been done in exploring the qualities of the fibre and in making industrially efficient the processes necessary to its production—and in particular, the intermediate chemical processes. Great versatility is claimed for "Terylene," with other valuable properties. Some years' work will be needed before it can be produced in commercial quantities.

As the exploration of synthetic textiles goes on, the industry expands its technical frontiers until the distinction between textiles and plastics becomes merely a convenience of phrasing. But as in other young and lively industries (and, indeed, a number of old industries too) the limiting factors lie not in what the chemist can do but in what is commercially feasible—in the detail of factory method, in the conditions of the world markets, and in the difficulties of capital investment. For a number of years to come the industry must base its livelihood on selling the well-known fibres which are already in production and on the markets. Its success in marketing will depend largely on the prices at which yarn and staple can be produced and sold, and on the relation between those prices and the prices of natural fibres. And the degree of success attained must influence the readiness with which capital can be found for plans to produce new materials. The new materials in turn will lead to further problems of capital investment; for the logical development from truly synthetic fibres is likely to be a new series of spinning, weaving, and finishing plants designed specifically to handle them. Indeed, the rayon producers, through the new British Rayon Research Association, are already planning the development of specialised rayon spinning and weaving machinery. Thus the rayon industry, which at present is turning its fibres into cloth mainly through the mills of the old textile industries, will tend to branch out into an industrial structure of its own. But this will require more capital investment, and yet more; and since rayon is not exempt from the difficulties of capital formation which are hampering industry at large, it cannot happen quickly.



Business Notes

Stirrings in the Markets

After the paucity of business and the depressive melancholia of most of August, the security market is now showing signs of quicker response to what it interprets as a lifting of political fears. The new Stock Exchange Account has opened well; public interest has shown a marked increase; the plus signs have re-appeared in the daily price lists; the bulls, if not exactly roaring, are again talking above a whisper. On Wednesday, this week, when the new account opened, markings reached nearly 6,700—a "big day" by present standards, except for Monday with its week-end accumulation of business. The *Financial Times* index of industrial ordinary shares had by Wednesday gained a point, at 116.3, compared with its level at the end of last week, and is fully seven points higher than the intermediate "low" of 109.2 recorded in the mid-July crisis over Berlin.

How far are these changes of direction dependable? If there were any guarantee of political improvement in Europe, they would obviously proceed much further. But few investors are prepared, at this stage, to underwrite that particular risk. Part of the improvement must be attributed to the ending of the holiday season, though it is worth remarking that the impact of the Berlin crisis produced a sharp reduction in business at least two weeks before the season really began. The bears have had their own way for several weeks, and their operations—as is invariably the case in the ever-thinning markets of recent times—have added their own technical force to the attenuated supplies of stock which

nowadays are available in the market. Some of the briskness of this week's recovery can be attributed to that single technical factor.

What happens now? To look beyond the present discomfiture of the bears reveals little sign of fundamental change which would justify a broad upward movement in ordinary shares. If there is agreement about Berlin—and it is still a very big "if"—more buyers will doubtless appear. But the factors in the domestic economic situation, which afford a more or less firm hold for investment calculations, are still unpropitious. A bout of further wage inflation is threatened, but that is quite unlikely to induce a further inflation of profits—indeed, the reverse is more probable at this stage. How long will "voluntary dividend limitation for a year" really last? If it were withdrawn overnight, how many companies, faced with the urgent and costly tasks of capital replacement, would take advantage of the fact and pay higher dividends? The portents clearly favour a policy of safety first.

The Fall in Rentes

The financial markets in France have drawn the only possible conclusions from the latest turn in the political situation. From what was vaguely known of M. Reynaud's programme—severe pruning of the civil service, and increased incentives to workers by reduced taxes and to all production by removing controls—there appeared to be some prospect, not very bright it must be admitted, that the present level of prices and exchange rates might be held. Now that the government of which M. Reynaud was a member has disappeared, and precisely because the Socialist Ministers could not accept the rigour of his financial proposals, the prospects of holding that line have vanished. Whatever M. Schuman may do, a further wave of wage increases is clearly on the way. French prices, which have already more than adjusted themselves to the last devaluation of the franc, are likely to rise to a still higher level and thus demand yet another downward adjustment in the exchange value of the currency.

The expectation of such a move has been reflected in this week's rise in the free market prices for gold and foreign bank notes. The gold sovereign has touched 6,125 francs which, on the basis of the official rate of exchange, would put the Paris price of gold at the equivalent of about £32 per ounce. Bank of England notes have risen to 1,050 francs to the pound, compared with the official rate of 876 francs. Another facet of the inflationary prospect is the fall in Rentes. Following the resignation of the Marie government, the 3 per cent perpetual stock slumped from 73 to 62. There has since been a recovery to 65, but the market in French government securities remains entirely artificial and devoid of any public support. It must be many months since any French investor has bought a long term security of his government. The government remains dependent on the banking system for financing its deficit. The inflationary impact of this deficit financing is, however, mitigated by the substantial deficit in the French balance of payments. This is now being filled mainly by Marshall grants and overdrafts from other European countries. Before long it will also be filled by the currencies of all other ERP countries with which France is running a deficit.

Inverted Goodwill in the Film Trade

Mr Eric Johnston, president of the Motion Picture Association of America, announced in London this week the first fruit of the long discussions which he held last week with the London representatives of the American film companies. There is a pleasant contrast between the decision and the charming expressions of goodwill which accompanied its announcement. From October 1st the American companies will not rent their first or second feature films to British exhibitors to be shown in the same programme with first or second British features. The intention, Mr. Johnston said, was simply to protect the revenues of American films—to ensure that an American first feature would not have to take second place to a minor British film so that the quota might be satisfied. This is a risk which might arise from the quota, but it could probably have been dealt with by less rigid commercial means. It is hard to avoid the conclusion that the American companies have decided to seek a stricter and more clear-cut competition with the British industry on its home ground—and that this is, in fact, a part of their answer to the 45 per cent quota. They can hardly gain any immediate revenue by refusing bookings; the implication is that they are hoping for a competitive advantage over a longer period, and that they feel reasonably sure of the inability of British film production to replace the films they withhold with more British films of equal commercial value. The other part of their answer to the quota is their withdrawal of support from the distribution of British films in the United States. To withdraw support is not, of course, to "boycott"; nothing so crude. It would be obviously impolitic for the American film industry, which has itself been exposed to boycotts of various kinds in different parts of the world, to admit the existence of such an evil thing. But Sir Alexander Korda, in a letter to the *Manchester Guardian* this week, explained clearly how American circuits have been refusing British bookings in the last few weeks.

The verbal niceties do not matter a great deal. The Americans have not concealed their feelings about the British quota, and it was not to be expected that they would resist the temptation to retaliate. But these moves and counter-moves have been disrupting the life of the film industry since last autumn; they can do nothing but harm.

Sir Stafford Goes West

The Chancellor of the Exchequer will be visiting North America during the second half of this month. His first objective is Canada, where many problems await him. The first is the availability of what remains of the Canadian line of credit to Britain. This has been completely frozen since the end of last March, when slightly less than $250 million of the credit was still unspent. Since that time imports from Canada have been paid for partly from Marshall aid dollars, partly from the growing British exports to Canada (£32 million in the first half of 1948 compared with £19 million in the corresponding period of 1947) and partly in gold. The Canadian reserve position has undergone a considerable improvement over the past few months and the stage should be set for unfreezing the balance of the credit.

Another matter which is likely to be on the Canadian agenda is the interest free loan of $700 million dating from 1942. Under the agreement which funded that loan all dollars accruing from the sale of Canadian securities by holders in the United Kingdom must be applied to its repayment. In 1946, however, the Canadian Government agreed that new direct investments in Canada by UK residents should be set off against the proceeds of sales of securities. These could thus be used to build up new live assets instead of paying off old debt. In addition, it was announced in the House of Commons towards the close of the last session that the dollars required for the purchase of Canadian aircraft might also be provided out of the sale of Canadian securities. These two important amendments of the earlier agreement may call for a reconsideration of the whole status of the interest free loan which is due to be repaid in five years' time.

Apart from these specifically Anglo-Canadian subjects, the Chancellor will have the whole problem of offshore Marshall dollar expenditure to discuss in Ottawa, where interest in the subject is understandably keener than in any other capital. From Ottawa, the Chancellor will travel south to Washington, where he will attend the annual meetings of Governors of the Bank and the Fund. Apart from the formalities of these gatherings, he will find more than enough to occupy his interest during the few days he will spend in the capital of the United States. His main difficulty will be to decide who, of the people he will talk to, will remain in Washington after the tornado of the November elections has struck and passed.

Hot Money to Australia

Although Mr Chifley has this week re-emphasised Australia's decision to maintain the present parity with sterling, money continues to flow to Australia in anticipation of a currency revaluation similar to that recently decided upon by New Zealand. Much of this movement can hardly be regarded as "hot money." Rather does it take the form of postponement of payments of debts from Australia and, conversely, anticipation of payments due to Australia. In addition, there has been some speculative movement of capital. This has not been seriously discouraged by the threat that there may be difficulties in getting this capital out of Australia when the overseas holders wish to withdraw it. In the prevailing circumstances that menace has lost all its power to frighten and deter.

A new and interesting note has crept into Australian reactions to New Zealand's move: it is a suggestion that the best of all possible worlds might be secured if only sterling were devalued by 20 per cent in terms of gold and dollars. In that event Australia, by adhering to its present gold parity, as notified to the International Monetary Fund, would automatically see the exchange with London and with New Zealand return to par. That

thought was clearly in the mind of Mr Chifley when he said this week that "while the pound sterling remained at its present value in relation to other currencies Australia would not alter its exchange rate." But it will need more than that argument to induce Britain to ask for the necessary exchange adjustment or for the International Monetary Fund to authorise it.

* * *

Australia's Gift

Meanwhile, Mr Chifley has also announced this week that the Australian Government would include in its forthcoming budget a proposal to give a further £A10 million (this is still worth £8,000,000 today) to Britain. This generous gift, which brings up to £A35 million or £28 million the voluntary transfers which Australia has made from its accumulated sterling balances to the British Government, has been accompanied by some intriguing interpretations from Australia. The first, which cannot be directly attributed to any official spokesman in Australia but which appears with significant regularity in the reports explaining the gift, is that "it is intended to help Britain to maintain purchases from the sterling area." No sense can be made of this argument unless it is suggested that Australia is unwilling to allow its sterling balances to rise beyond a given figure, that this gift will reduce those balances below that figure and that this will therefore be followed by British purchases in Australia which could not otherwise have taken place. This sequel of suppositions needs only to be mentioned to be ridiculed out of court.

The second explanation was given by Mr Chifley himself. He linked the gift to the negotiations which have been going on in Paris to facilitate trade between European countries, and added that Australia stood to benefit from any measure which assisted the external buying power of European countries because of the important markets Australia had there. If, by this remark, all that Mr Chifley meant to say was that Australia intended the gift as partial compensation for the credits which London has been making available to France and other European countries in order to allow those countries to import wool and other commodities from Australia, some link between the two operations could be established. It would, however, be quite otherwise if the suggestion were that this Australian gift will provide sterling which can be directly put at the disposal of European countries. The provision of the necessary sterling to finance unrequited exports to Europe will be decided upon irrespectively of Australia's generous and welcome gesture. Generous though it is, it affords no immediate relief whatever to Britain.

* * *

Banks and Disinflation

The clearing banks' return for August, though it shows much smaller movements than usual, suggests more definitely than any previous return that the conflicting influences of disinflation are exerting an effect upon the credit position. The July return, discussed in these columns on August 14th, attracted attention for the large decline it revealed in bank advances. But this movement, though sharply reversing the continuous trend of the previous two years, seemed inconclusive, because most of it was attributable to the figures of the National Provincial Bank, which are known to be spasmodically and largely influenced by tobacco financing. No such special factors seem to have affected the August return; yet this shows total advances virtually unchanged at £1,326 million, and six of the eleven banks report modest declines. The largest movement among those reporting increases is no more than £3,900,000. This experience, following a period in which total advances were rising at the rate of more than £20 million a month, seems clear evidence not only of some recession in industrial demands for accommodation, but also of a more selective attitude on the part of the banks towards would-be borrowers.

For two months, therefore, the needs of the private sector of the national economy have ceased to be a source of credit creation, for in this period the clearing banks have also slightly reduced their investment portfolios. Such demands for additional credit as have arisen have therefore come from the Treasury. Last month, however, the banks' total holdings of floating debt (including call money) declined slightly; a small increase in the Government's net borrowings on Treasury deposit receipts was offset by a decline in total money market assets. The total of net deposits, however, rose fractionally to £5,732 million, owing to a rather abnormal increase caused in the cash holding by heavy Government disbursements on make-up day. After allowing for this purely ephemeral influence, the movement of deposits is roughly in line with the Government's apparent need for finance during the period. In the four weeks to August 21st the Treasury showed an above-line surplus of nearly £70 million, but £46 million of this represented purely nominal receipts arising from the recent settlement with India. The true above-line surplus, therefore, barely covered the below-line deficit—before allowing, on the one hand, for the credit effects of the seasonal contraction in the note circulation and, on the other, for the Treasury's sterling receipts arising from Britain's overseas deficit.

* * *

Return to TDRs

The Treasury this week has resumed borrowings from the banking system against Treasury deposit receipts, with an issue of £150 million, easily the largest since early April. In July and early August there was the usual seasonal gap caused by the fact that, until recently, TDRs were invariably issued with a life of six months. Under this system, a succession of weeks devoid of maturities tended to recur six months after the phase of main revenue collections, in which no new TDRs were issued. The recent close season for TDRs may, however, prove to be the last, thanks to the Treasury's new arrangement of borrowing, at its own option, for periods ranging from five to seven months. The TDRs issued this week consisted entirely of the shortest of these maturities, which will thus occur during the main tax gathering season early next year.

This week, moreover, the banks entered a phase of quite abnormally heavy maturities. During the seven weeks to mid-October the nominal weekly amount falling due will never be less than £80 million, and the aggregate for these weeks will be no less than £920 million. The fact that the Treasury will need to make big issues of TDRs in this period does not, of course, mean that it will necessarily be a net borrower. This week, because of the heavy payments of Government interest which fell due on Wednesday, the issue did in fact exceed the corresponding maturities, but the excess was no more than £14 million. Whether the aggregate TDR issue continues to rise during the phase of heavy maturities will therefore depend mainly upon the Treasury's normal week-to-week cash needs. One special factor which is likely to produce an expansion during the autumn, however, is the pending disbursement of the £43 million or so which is due to the preference and ordinary stockholders of the Argentine rail stocks. Pending completion of the formalities, the companies are holding the funds on deposit account, and it is believed that their bankers are still holding the counterpart of some of the money in special issue bills. If this is so, the disbursements by the companies will no doubt be accompanied by a discharge or resale of such bills, whereupon the authorities are likely to finance themselves by issuing additional TDRs in the usual way.

The size of the outstanding TDR issue, it deserves to be noted, no longer seems to be influenced by any desire on the part of the authorities to maintain any particular relationship between it and the supply of tender Treasury bills. In the early postwar phase, in order to meet the needs of the banks for increasing liquidity as industrial borrowing increased and Governmental borrowing began to slacken, the Treasury made important changes in the structure of its floating debt, and switched largely from TDRs into bills. But the tender issue of bills has now been stabilised for many weeks at £2,210 million, or a little below the peak figure attained at the end of last year. It will be interesting to see, now that the new TDR arrangement gives the authorities a chance to match their TDR technique to the abnormalities of the main tax gathering season, whether they will this year feel it desirable to make the usual seasonal increase in the tender issue of bills. Apart from the possibility of a small fluctuation on this account in a few weeks time, the chances of a bigger supply of tender bills seem small. The banks, however, seem quite satisfied with the current level of their money market assets, the ratio of which to their deposits has for some time now been relatively steady at around 20 per cent.

Trade Discussions with Denmark

The Anglo-Danish trade talks opened in Copenhagen last Monday; as yet only preliminary discussions between the two delegations have taken place. The British team includes representatives of the Ministry of Food, the Board of Trade, the Treasury and the Bank of England, which is at least a measure of the scope of the discussions. The main bargaining will be on the exchange of coal and steel against butter and bacon, although Denmark will no doubt add meat to its list of goods offered, while Britain will press for a reduction in import restrictions on less

essential British goods. Superficially, negotiations need not be protracted; indeed, to judge from both the British and Danish press, there is general optimism about the outcome. But it would nevertheless be surprising if the protocol was signed without some hard bargaining on both sides.

The dairy cattle population in Denmark has been declining owing to the poor feed situation last summer. Pastures have been adequate this year and feed grains will be in fairly plentiful supply during the winter, but the output of butter is unlikely to show any marked expansion for some time. Pig numbers are still below last year's level, but there are definite signs that a recovery is taking place, and within the next year or so supplies of Danish bacon should increase appreciably. The annual quantities which it is believed Denmark will be willing to offer Britain are 77,000 tons of butter and 45,000-50,000 tons of bacon. In 1938 Britain imported 118,000 tons of Danish butter and 170,000 tons of Danish bacon.

In return the Danes will ask for between one and two million tons of coal and 100,000-200,000 tons of steel. Under last February's agreement, Britain agreed to send 870,000 tons of coal and 55,000 tons of steel. From Britain's standpoint the output of coal this year has been rather disappointing, and it is not certain that the target for the year will be met. Steel production, on the other hand, has been higher than was expected, but supplies are still short and it is doubtful whether Britain will be able to spare a further 45,000 tons for Denmark. At least there should be little squabbling about prices. In the past, the Danish case for high butter and bacon prices rested on the high costs of feeding-stuffs. But since prices of feed grains are falling quite rapidly, Britain will no doubt press for lower Danish prices despite the increases recently agreed with New Zealand. Denmark will, of course, point out that its other markets—Russia and Western Germany—both pay higher prices than Britain. The result is likely to be confirmation of present prices unless the cost of British coal and steel is raised still further.

These negotiations must be carried out in the spirit of European co-operation, and they may therefore have to be handled more delicately than in the past, and with less opportunity for driving hard bargains. If Britain cannot satisfy Denmark's requirements for coal and steel, one solution may be the offer of a long-term contract, particularly if the Danish market is opened to "less essential" British goods. The Ministry of Food is not very eager to sign a contract; such agreements have in the past been reserved for Dominions and Colonies. And last year, at any rate, the Danish farmers were not very enthusiastic about entering into one. But if European co-operation is to have any tangible meaning, the present discussions must not end in a fiasco like those a year ago.

* * *

The Coal Board Summer School

The National Coal Board is confident that its second summer school, held at Oxford last week, was a success. In the present stage of evolution of the industry the most useful success that can be expected from gatherings of this kind is that they will help to create, among all grades of men occupied in mining, a common interest in the problems of the industry to replace the sectional interests and the over-localised points of view which have so far held the field. In the summer school this can best be estimated by the receptivity which men of one mining occupation display towards what men of other mining occupations have to say; and from this point of view the signs at Oxford were reasonably good. The organisers observed a "disposition of men of all grades to listen to the evidence of experts"—and, as a counterpart, a general anxiety to listen to the point of view of the miner himself. Among the 450 mining officials and workers of all grades there were 20 miners; next year the number of miners is to be greatly increased, and this is all to the good. Eagerness to hear a lecture delivered by a Scottish miner, Mr. R. Farquhar, was so great that the lecture had to be transferred at the last moment to a larger hall.

A paper of particular interest was delivered by Professor A. M. Bryan, who as Chief Inspector of Mines is well qualified to discuss the recruitment, education and training of mining under-officials; for, as he observed, "health and safety are inseparably linked with education and training." Professor Bryan put forward some radical proposals for raising the qualifications and status of the mining under-official, and particularly of the "fireman, deputy, or examiner."

> The present farcical examination for the deputy's certificate must be replaced by one requiring a much higher standard of general and technical education, coupled with the successful completion of a directed course of practical training suited to the needs of the job.

So much for the examination. But Professor Bryan urged also that the "fireman, examiner, or deputy" should be elevated to

September

September is the month when schools reopen. Entering a new school, moving into a fresh form, embarking upon a different course of studies—these are important occasions in the lives of young people. For all parents and guardians, provision for the future is an ever present obligation, and it is good sense to ensure that plans for the coming generation will be faithfully observed. In particular you must be able to rely on the availability of your trustees just at the moment when your children have need of them. The Manager of any branch of the Midland Bank will readily explain the services of the Bank's Executor and Trustee Company, where friendly personal assistance, based on wide experience, is always at your disposal in matters concerned with wills, trusts (educational or other) and settlements.

MIDLAND BANK
EXECUTOR AND TRUSTEE COMPANY LIMITED

some such new status as "district-overman," he should not be expected to do hard manual labour, and he should also be responsible for production as well as for safety: "You cannot divorce safety and production." The present requirement that deputies should confine their attention to their so-called statutory duties had not, he said, worked well in practice. Having received his new status, the deputy should not be remunerated "at a rate less than that of the average workman under his charge." This seems evident, but it needed to be said.

A Development Plan for Coal

The paper delivered at the Summer School by Mr E. H. Browne, the mining engineer responsible for production and planning at the Coal Board, was of special importance because so little is known, and so much suspected, of the state of preparedness in which the Board is facing the question of the long-term development of the British coalfields. Mr Browne did not, after all, outline a plan; he confined himself to the first principles on which the plan is to be made. This is not surprising; it is, indeed, valuable and necessary, and to criticise Mr Browne for dealing with generalities instead of with concrete proposals is irrelevant. Of more interest is the specific train of thought in the paper. Mr Browne began with an assumption:

> One of the implications of nationalisation for the mining industry is that there should be a planned economy for the industry in place of the evolutionary development of the past.

Glimpses of the new world are always good to have, but Mr Browne proceeded to whittle down his first assumption until it almost disappeared:

> Throughout this paper I shall refer to the absence of prescience about the essential ingredients which must make up the plan.

Among the uncertainties to which he referred was uncertainty about the future trend of home demand, which would depend on the future of home industry in general and on the trend of investment policy. There was uncertainty about the future trend of foreign demand for British coal, which would be affected by the future of international currency relations, the rate of recovery of other European coal producers, and the level of production costs. Plans for new production in any coalfield would obviously have to take account of the varying level of costs at different levels of production. In any coalfield the production efficiency which was attainable would depend on the volume of production required. But the volume of production required would be influenced not only by the inscrutable course of demand, but also by such considerations as labour supply and by the limit (which, Mr Browne said, would be for the Government to set) to the "vast social upheavals" which could be undertaken in moving coal production to the places where material conditions were most favourable. It would be influenced by transport policy and by the extent to which capital might be spent on improving the railways. It would be influenced by the limits of capital investment for the mining industry and by the method which might be adopted of expressing capital expenditure in terms of cost per ton.

All this is practical good sense, and in saying it Mr Browne had much that was useful to say about the problems of cost, technique, quality, quantity and distribution which arise. But what is the conclusion? Substantially, it is this:

> There is no short cut. The Plan must be moulded and moulded again. . . . The preparation of a National Plan will be a perpetual task.

There is nothing alarming here. It merely boils down to the probability that the development of the mining industry will continue to be evolutionary.

Stock Exchange Agents

The Stock Exchange Council this week issued a notice that forms are now available for applicants for inclusion in the general register of agents, under the new agency regulations which come into force at the beginning of next year. At the end of this year, existing registrations on the general register will automatically lapse; intending applicants must lodge their forms by October 15th, and applications received after that date will not be considered until after the publication of the new register. The Council, having decided to go ahead with its policy regarding agency, and to set aside the objections of the petitioners who mustered strong support in the "House" for second thoughts on the question, have thus taken the first step to start the machinery for the elimination of solicitors, accountants, the Public Trustee and the trustee departments of the banks from the general register.

From next January, the number of agents on the general register will be radically reduced. There will be a register of banks, including members of the Bankers Clearing House, the British Bankers Association, and those banks whose names appear on a list to be kept in the Secretary's office—which henceforth will include firms or companies represented on the Accepting Houses Committee. Agents on the present register of banks who are not covered by these categories can apply for inclusion in the general register (their names, of course, will lapse from the register of banks) which will be eligible to banks, firms or persons who satisfy the Council "that they are habitually engaged in the creation and promotion of Stock Exchange business," are not members of a professional body in a position to charge for their services in connection with Stock Exchange business, and that they do not compete with the Stock Exchange by dealing for their own account.

Fluctuations in Rubber

The rubber market has not yet fully recovered from the sudden wave of selling experienced some three weeks ago. Since then the price has fluctuated rather indeterminately; a week ago the unofficial London spot price was 1s. 0⅞d. a lb., but by last Wednesday it had rallied to 1s. 1⅜d. A year ago rubber was only 9d. a lb., and then it was generally feared that the price would drop still further. There appears to be no completely satisfactory explanation of the present instability of the market. Political conditions in Malaya are undoubtedly responsible for the uneasy undertone, but price fluctuations are probably due more to technical factors such as the lack of comprehensive insurance cover, which tend to force merchants to realise their stocks rather than hold them.

During the first six months of 1948 world production of natural rubber totalled 727,500 tons and consumption 667,500 tons, leaving a net increase in stocks of only 60,000 tons. In the same period last year production amounted to 607,500 tons and consumption to 505,000 tons. Thus during the past twelve months consumption has expanded more rapidly than output. On the other hand, world consumption of synthetic rubber has fallen more rapidly than synthetic rubber production. Between January and June of this year, world synthetic rubber output totalled 271,400 tons, compared with world consumption of 245,000 tons; in the first half of 1947 production amounted to 332,600 tons and consumption to 352,500 tons.

These figures, at any rate, give little reason for doubting the fundamental firmness of the rubber market, although no commodity market faithfully follows statistical trends. There is, however, one fact which may prove to be portentous. In the second quarter of this year, consumption of natural rubber in the United States was smaller than in the first quarter, while for synthetic rubber the converse was true. It is clear that the recent high price of natural rubber had reduced its competitive advantage over synthetic. Under present American legislation, the US rubber manufacturing industry must consume a minimum of 200,000 tons of general purpose synthetic (GRS) a year. In the first six months of this year American consumption of GRS was 176,850 tons, so that there is scope for an appreciable expansion in the consumption of natural rubber in America. But the real strength of the rubber market at the moment lies in strategic purchases by the United States and the Soviet Union. If these should cease, the price of natural rubber may well fall to a lower but more realistic level.

Jute from Pakistan

Dundee's jute supplies are assured until the end of the year. The export quota of raw jute from Pakistan to the United Kingdom covering the first half of the season has been fixed at 37,000 tons, which, with 12,000 tons to be shipped from Calcutta during the fourth quarter of 1948, gives a total supply to Britain of nearly 50,000 tons. British consumption during the first half of this year has averaged a little over 2,000 tons a week, or an annual rate of nearly 106,000 tons. Stocks, which at the end of June amounted to 43,300 tons, are gradually recovering from the low level reached at the end of 1947, when they totalled 33,600 tons, and are now adequate to cover any gap in shipments which may occur.

Total export quotas allocated by Pakistan to soft currency countries up to December 31st amount to 86,000 tons. Britain will get 37,000 tons and France 20,000 tons; the remainder is shared by various European countries, the Soviet Union, Brazil and Australia. The Russian quota of 6,000 tons is the fourth largest, coming after Czechoslovakia with 8,000 tons. The Pakistan Government has further announced that no licence will be necessary for the export of raw jute to India, and that unlimited quantities may be sold to hard currency markets. In view of the bumper grain crops throughout the Northern Hemisphere the demand for jute sacks and other packing materials is likely to be keen. The high price of jute has tended to develop the use of substitutes, but so far no satisfactory alternative to jute has been discovered. Nevertheless, one result has been the fuller use of bulk handling of various commodities, including cocoa beans and sugar. Brazil started to grow jute in 1940, and although output has been increased to 10,000 tons a year, the experiment does not appear to have been very successful. At any rate, it has not enabled Argentina to dispense with Indian jute as was originally intended.

* * *

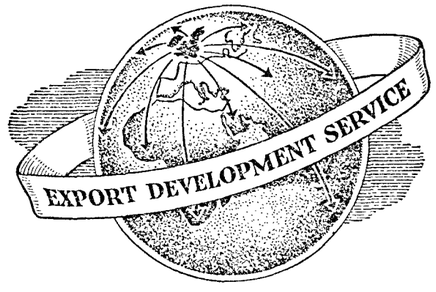
British Cars in the United States

There is a growing demand for British cars in the United States, despite the fact that their retail price is generally higher than the more popular American makes such as Ford, Chevrolet, and Plymouth. The small size of the British car is an obvious asset in a country where the shortage of parking space is becoming a serious problem, and an additional but less marked advantage is its low petrol consumption. It is, of course, impossible to determine the extent to which sales of British cars have been helped by the waiting list for American cars. Under more competitive conditions, price may be the telling factor, as it apparently is for commercial vehicles. The American motor car industry is, however, already producing two small cars—the Crosby and the Bantam. Both are cheaper than corresponding British cars but are less attractive and are not comparable in quality. The production of another small car—the Playboy—is being planned. At the moment British cars are earning valuable dollars. The Minister of Supply's announcement on Tuesday that no increase in the industry's steel allocation would be made can only mean that any further increase in car exports must be at the expense of the home market.

According to a press release issued by the Export Promotion Department of the Board of Trade, a report on the market for motor vehicles in the United States has been furnished by the Minister (Commercial) to the British Embassy in Washington. The facts earlier in this note are drawn from the press release. But surely it is surprising that the Department did not think it proper to publish the full report, which is of obvious interest to the motor-car industry and indeed to the public. Is not the purpose of the consular service, now at last greatly strengthened, to provide information for industry and not to render reports which are hidden in the recesses of departmental archives?

* * *

Richard Thomas "out of the Bank"



By selling the balance of its ordinary shareholding in Richard Thomas and Baldwins, the Bank of England last week disposed of its remaining interests in the group. In 1938 the Bank came to the assistance of Richard Thomas when the company was in need of finance to complete the new works at Ebbw Vale. The Bank invested £500,000 by the purchase of 1,500,000 Richard Thomas 6s. 8d. ordinary shares at par, and a banking consortium provided £5.5 million in the form of 4½ per cent prior lien debenture stock, which was redeemed some time ago. At the same time a committee of control was constituted under the chairmanship of Lord Norman, then Mr Montagu Norman, which was also joined by Mr E. H. Lever, who later became chairman of the group. The committee of control was disbanded in 1945, and in February this year the Bank began to sell its shareholding in Richard Thomas and Baldwins through the market. By June this holding had been reduced to 410,000 shares, and the remaining shares (approximately 310,000) were sold in one bargain last week at around 13s. 10½d. per share.

Inevitably such large disposals of one stock, even when extended over a period of time, have exerted some pressure on the price of the shares. Since last week, when the sales came to an end, however, Richard Thomas ordinary shares have recovered 1s. 1½d. to 15s. At this price the shares still yield £6 13s. per cent, which is rather above the yields obtainable on steel shares of similar calibre.

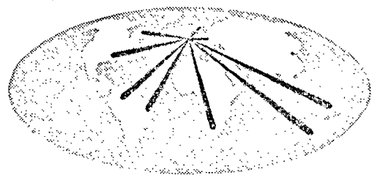
Fair Weather for Wool?



Twelve months ago a well-known economic forecaster in the United States prophesied that during the past season (1947-48)

The District Bank, in world-wide touch with every important centre where British goods are marketed, co-operates with exporters in securing suitable representation in overseas markets and in bringing export enquiries to their attention.

You are invited to discuss your problems with the local Manager.

DISTRICT BANK
LIMITED

Financing World Trade

More and more is international trade being financed through the London Bank Credit — a welcome step towards the restoration of London's pre-war eminence. Our long and extensive experience of such facilities, and our knowledge of current Foreign Exchange regulations, enable us to place a very complete service at the disposal of our customers. Merchants are invited to consult us at any time.

GLYN, MILLS & CO.

Associated Banks: Royal Bank of Scotland
Williams Deacon's Bank Limited

the Joint Organisation would buy-in some 2,000,000 bales of wool. The wool market was expected to collapse and prices to fall below the Joint Organisation's reserve schedule. This collapse, in the event, did not happen, and Empire wool stocks have declined during the past twelve months by 1,300,000 bales to 3,218,000 bales—making a total reduction of 7,200,000 bales in three seasons. Yet the disposal of these large wartime stocks has certainly not weakened the wool market. In the past season, the Joint Organisation had to buy-in only 30,888 bales of new clip wool; in 1946-47, its purchases were on the much larger scale of 193,876 bales. Even during the sharp break in prices last March, only

1,500 bales—and those of medium crossbred types—had to be bought-in before confidence was restored and prices again began to rise.

But the main problem now is to dispose of the remainder of the stocks, which consist largely of inferior wools. The accompanying table shows an analysis of the Organisation's stocks at the end of June classified by type, source and present location. (A similar table showing the stock held by the Joint Organisation on June 30, 1947, was published in *The Economist* of September 20, 1947.) Comparison of the two tables shows that stocks of greasy merino wool (60s and above) declined by over 600,000 bales during the season to 1,026,000 bales, whereas fine crossbreds (56s to 60s) declined from 636,000 bales to 442,000 bales, and medium and coarse crossbreds from 1,251,000 bales to 1,037,000 bales. Stocks of scoured wool fell from 607,000 bales to 483,000 bales and sliped and carbonised wool from 183,000 bales to 140,000 bales. One interesting feature has been the appreciable reduction in stocks of South African native wools. At the end of June only 90,000 bales of native and karakul wool were held by the Joint Organisation, or less than half the stock at the end of the previous season. The location of the stock has no immediate significance, as wool is shipped to the United Kingdom by JO as and when necessary to fit in with market requirements.

In the first half of the 1948-49 season—that is, up to December—the Joint Organisation will offer some 700,000 bales at the auctions. If the recent level of wool consumption is maintained, there should be little difficulty in disposing of this quantity. Consumption in Britain and Europe generally is not only higher than in 1947; it is also above its prewar level. At the moment only a few markets for wool textiles are showing signs of saturation. But once arrears of demand have been met, current production of wool textiles may well exceed demand at present high prices. In the United States, although the average weekly number of hours worked in the wool textile industry is above last year's level, the quantity of wool consumed has, nevertheless, declined, which suggests increasing resort to other fibres mixed with wool. At the moment other fibres are not so readily available in European countries; thus the chances favour the maintenance of wool consumption at least for the first half of this season.

Compensation for CEB 3½ per cent Stock

The first dispute affecting compensation terms for stockholders in the now nationalised electricity undertakings has arisen. It is concerned with Central Electricity Board 3½ per cent stock 1963-93 of which, on December 31, 1947, £7,722,350 was outstanding. Compensation payments for quoted electricity stocks were to be based on the mean of prices on six dates in November, 1946. On these six dates the stock in question had a mean price of £113, but was quoted ex dividend. Interest accrued at that date was approximately £1 10s. per cent and consequently, the stockholders argue, the market quotation on the crucial dates undervalued the stock by that amount.

The Electricity Act, 1947, provided for settlement of disagreements between Minister and stockholders on compensation terms by creating in subsection 6 of Section 20 of the Act the necessary arbitration machinery. But this arbitration tribunal as yet exists only on paper. The Bank of England has been instructed to pay on October 1st interim interest on the stock on the disputed compensation basis pending the final outcome of arbitration, which may take some time. So far compensation for electricity stockholders has proceeded smoothly (both for quoted and unquoted securities) and it is highly desirable that the now-needed tribunal should be set up and begin its work without delay.

Shorter Notes

Efforts on the part of the preference shareholders of Victoria Falls and Transvaal Power Company at the annual meeting on Tuesday to obtain something more than par value when the capital is repaid made little headway. The company's London office has received £14,500,000 in compensation for the company's electricity undertaking, taken over by the Electricity Supply Commission of South Africa on June 30th. The chairman considered it unlikely that ordinary stockholders would agree to grant an additional 2s. 6d. per £ to preference shareholders as compensation for their loss of income.

*

The issue to ordinary and preference shareholders of Canadian Eagle Oil Company of 6,491,520 ordinary shares has been an outstanding success, for 96¼ per cent of the shares offered have been taken up. The net amount raised by the issue is £7,887,112. In addition to this sum, Eagle Oil and Shipping, the British subsidiary of Canadian Eagle Oil, recently obtained £1,250,000 by the private placing at 99½ of 3½ per cent unsecured notes 1953-59.

*

Tanganyika Government 4½ per cent guaranteed stock 1948-68 is to be repaid at par on December 1, 1948. The issue was made at 96½ per cent in 1928, and the amount of stock outstanding is £2,070,000. No conversion offer will be made; the maturity is covered by the sinking fund and other cash available to the Government of Tanganyika.

This week's Security Prices and Yields will be found on page 398.

"Nowhere else in the world . . . . "

The RECORDS AND STATISTICS supplement to THE ECONOMIST is entirely devoted to the recording of factual information. Nowhere else in the world are so many facts put so promptly on record.

A cumulative index appears as part of the current issue of RECORDS AND STATISTICS; it covers material published from January to August, 1948. In future this cumulative index will be published in the first issue in each month.

RECORDS AND STATISTICS is available on postal subscription only. The subscription rates are £2 10s. a year for RECORDS AND STATISTICS alone or £5 together with THE ECONOMIST.

COMPANY MEETINGS

TUNNEL PORTLAND CEMENT COMPANY, LIMITED

INCREASE IN HOME CONSUMPTION

CALL FOR GREATER EXPORTS

TOWN AND COUNTRY PLANNING ACT

CONCERN CAUSED BY CERTAIN ASPECTS

MR N. M. JENSEN'S SURVEY

The thirty-seventh annual general meeting of the Tunnel Portland Cement Company, Limited, will be held on the 13th instant at 105, Piccadilly, London, W.

The following is the speech which the chairman, Mr N. M. Jensen, proposes to make on that occasion:—

Ladies and gentlemen,—In the accounts for the previous period we made certain changes in anticipation of the requirements of the new Companies Act. This Act is now in operation and, in order to comply with it, it has been necessary to make several further alterations in the form of the accounts. Unfortunately, this means that we cannot give comparative figures for last year without making numerous adjustments and we have therefore decided to leave them out on this occasion. In this connection it should also be remembered that the previous period was 15 months.

BALANCE SHEET

The issued capital and the capital reserve are unaltered. To the general reserve has been added the sum of £15,000 transferred from bad debts reserve. I am pleased to say that during recent years we have incurred hardly any bad debts. Previous provisions are therefore in excess of requirements and such excess has been transferred to reserve. During the previous accounting period—and again this year—we have disposed of certain investments at a substantial profit and we have created an investment reserve to which this has been transferred.

The special depreciation reserve has been increased by the sum of £90,000. This corresponds to the amount of the initial allowances on new capital expenditure which we can claim in our income tax computation. Trade accounts and accrued charges stand at £337,386. The figure shown under this heading in the last accounts was £430,605, but it included provisions of £63,000 for deferred repairs and £25,000 for contingencies in respect of estimated liabilities under trading agreements. These items are now shown separately and they have been increased to £80,000 and £50,000 respectively. The income tax liability to April 5, 1948, and profits tax amounted to £215,161, compared with a liability of £143,473 shown in the last accounts.

Property, plant and equipment have been increased by net additions amounting to £444,092, being mainly expenditure in connection with the new cement works which we are building in North Wales. The amount of depreciation written off to date is increased by £58,810, which is the charge in the profit and loss account. The capital of the subsidiary company working the limestone quarries which will provide raw materials for the new cement works has been increased from £20,000 to £70,000.

SUBSIDIARIES' PROFITS

All the company's subsidiaries have this year operated at a profit, but last year two of them made small losses and the amount of £2,864 is the balance of such losses which has not yet been recovered. A subsidiary company which is in course of liquidation is shown as a separate item. The payment so far received from the liquidator is in excess of the book value and the balance is therefore included in the amount transferred to investment reserve. I am pleased to say that further substantial payments are expected to result from the liquidation.

Other trade investments have increased by £129,918, but only £56,488 of this represents new investments less disposals, whereas the balance of £73,430 is included in the amount transferred to investment reserve, to which I have already referred. The reference to the book value on acquisition in 1938 relates to the 26 per cent. of the ordinary share capital your company owns in Alpha Cement, Ltd. This investment has never appeared in our accounts at its full value, but was included at the nominal value of the "B" ordinary shares issued in exchange.

STOCKS NORMAL

The amount of stocks of cement, sundry materials and stores is normal. Last year the stocks were unusually low. Advances to associated companies have increased by £120,000, being temporary loans made during the year. Sundry trade accounts, amounting to £477,909, show an increase on the corresponding figure for last year, which was only £197,115. The reason for this is that deliveries during the months of January to March, 1947, were severely curtailed owing to the fuel crisis, an experience which, fortunately, was not repeated this year.

We have disposed of about £642,000 of Government securities. The proceeds have been used in the main to pay for new property, plant and equipment, but we have also invested £91,000 in additional tax reserve certificates, and cash at bankers and in hand is up by about £40,000.

PROFIT AND LOSS ACCOUNT

The profit on trading cannot be directly compared with that shown in the last accounts. As already mentioned, these covered a period of 15 months, and the figure then shown was after deduction of various items which now have to be shown separately to comply with the new Companies Act. The profit on trading is, however, somewhat above that of the previous accounting period. I have already referred, when dealing with the balance sheet, to the provision for losses in subsidiary companies not required.

The investment income, although not as large as shown in the last accounting period, is quite satisfactory. It will be noted that trade investments show an average return of just over 6 per cent. Provisions for deferred repairs and contingencies, auditors' remuneration and directors' emoluments (apart from fees) have previously been deducted before arriving at the figure shown for profit on trading. The increase in the amount required for taxation is largely due to profits tax, and the fact that the rates payable were altered retrospectively to January 1, 1947, is responsible for the adjustment which we had to make for the previous period.

After transferring £90,000 to special depreciation reserve and providing for the dividends on the Preference shares and the interim dividend and the proposed final dividend on the "A" Ordinary shares and the "B" Ordinary stock, there remains a balance to be carried forward of £600,801, which is an increase of £132,624 on last year's balance. In recommending the dividend on the Ordinary capital we are complying with the undertaking given earlier in the year.

CONSOLIDATED ACCOUNTS

The consolidated balance sheet and profit and loss account combine assets and liabilities as well as the trading result of this company and all its subsidiaries, with the exception of the subsidiary company which is in course of liquidation. The only comment I need make refers to the new additions to property, plant and equipment for which the amount shown is much smaller than the corresponding figure in the company's own balance sheet. The reason is that Tunnel Asbestos Cement Company, Limited, has disposed of its mine in Cyprus to another company.

DEMAND FOR CEMENT

During the period under review there has been a considerable increase in the home consumption of cement which has necessitated the curtailment of exports. We have been urged, however, to increase exports again, partly in order to satisfy the needs of the colonies. This will mean a reduction in the amount of cement available in the home market, unless it is possible to import cement from other countries or the obstacles and difficulties in the way of building new works and extensions are removed. Costs have again increased, particularly of coal, paper sacks and transport. Some of these additional costs have been recovered by small increases in price and, fortunately, increased output has taken care of the remainder.

The cement industry has for many years had an almost steady growth in the demand for its products and in spite of the restrictions on building and the curtailment of expenditure on public works, etc., the demand today is practically at prewar level. Concrete is being used to an increasing extent as a substitute for other materials and, therefore, I think it is safe to assume that the moment the existing factors restricting building and civil engineering work cease to operate, we shall find the demand will be considerably in excess of production.

Export is still a sellers' market and a large share of our profits emanates from this. There are signs, however, that other exporting countries are beginning to find difficulties in disposing of their cement and we must, therefore, expect, sooner or later, a reduction in export prices, if not in volume. When this happens, your company's profits will be affected.

EXTENSION OF PRODUCTION CAPACITY

The erection of our new works at Padeswood, near Buckley (Flintshire), is progressing. We were hoping it would be possible to commence operations before the end of 1948, but unfortunately the necessary priorities have not been forthcoming and we were considerably hampered by the rearrangement of the steel allocation. I am pleased to say that much of the building work has now been done and the erection of some of the heavy machinery is well on the way. We have now received all the necessary steel allocations to enable us to complete the works, and I am hopeful that we shall commence production during the spring of 1949. The output of the new works will be in the region of 250,000 tons per annum and should not only overcome the shortage of cement supplies in North Wales, Lancashire and Cheshire, but also release a fairly large quantity of cement for other markets.

At West Thurrock we are at present replacing one of the older rotary kilns with a new and larger one. We are also about to install more grinding equipment. I am hopeful that the rotary kiln, which will have a capacity of 125,000 tons per annum, will be in operation by December next and the grinding plant a few months later.

Last year I mentioned that we were proceeding with the installation for oil-firing our rotary kilns at West Thurrock. We were urged to do this by several Government departments and also informed that the necessary oil would be made available. A few months ago, however, we received a short note from the Ministry of Fuel and Power stating that no fuel would now be available for us and, at the same time, intimating that we would have no claim on the Government for any expense incurred. Fortunately, we have been able to cancel contracts for the bulk of the plant and some of it can be used elsewhere. The price of oil has also increased so much in the meantime that it would have been uneconomical for us to use it.

The extension of the Ribblesdale Cement Company's works in Lancashire, in which we own a half interest, is also proceeding, but the extension of our Pitstone works is still held up by the authorities. It is difficult to understand the reason for this, considering that our Pitstone works is expressly laid out for duplication, and the capital cost of this increased productive capacity would therefore be far less than in most other places. This particular works also has a fine record in regard to cost of production which could be improved still further by increased output. It seems, however that the authorities are now beginning to realise that we are likely to be short of cement for some time to come, and I anticipate that we shall be given permission shortly to proceed with our plans for extending Pitstone's output.

ASSOCIATED COMPANIES

The Helwan Portland Cement Company in Egypt has again had a successful year. Notwithstanding the fact that the capacity of the works was recently increased, it has been possible to dispose of the full production. The Helwan Company is taking an active interest in the planning and building of a new works near Alexandria and it has also sponsored the building of a small works at Atbara, in the Sudan, which will shortly commence production.

Your company holds a substantial part of the capital of the National Portland Cement Company in the U.S.A. I am pleased to say that this company has had a fairly successful year during 1947.

TOWN AND COUNTRY PLANNING ACT

Certain aspects of the Town and Country Planning Act, 1947, are causing grave concern in the cement industry and other industries which win and work minerals to provide their raw materials. Under the new Act the ordinary day to day working of our quarries is a development for which we shall have to pay a development charge from July 1, 1951, onwards. In the past, wherever possible, we have followed the prudent practice of buying enough land near each of our works to provide ample reserves of raw materials. At both West Thurrock and at our new Flintshire works this has necessitated our paying prices very considerably in excess of the value of the land for its existing agricultural use. It follows that we shall have to pay development charges for the use of our own land which we have bought at full development prices.

It is true that under the act we shall be entitled to compensation out of a fund of £300 million for the loss of our development rights, but it is generally agreed that this fund will be inadequate to meet in full the claims that will be made. We have been promised that mineral workers in our position will be given some right to prior payment out of the fund of £300 million, but we have not been given any details of this concession which, I understand, will be contained in a scheme to be prepared by the Treasury in some years' time when the total claims against the fund of £300 million have been ascertained.

DEVELOPMENT CHARGE

We are equally in the dark as regards the amount of the development charge we shall have to pay. As the act stands, it seems as if this will be the full development value of our chalk, limestone and clay lands, even having regard to the increase in this value due to the proximity of our own cement works.

Apart from other demerits, the imposition of such charges would, of course, have the effect of increasing the cost of manufacture, and such increases would ultimately have to be borne by the consumers at home and they would make us less competitive in export markets. I sincerely hope the Government will realise the unwisdom of burdening in this manner industries manufacturing important commodities. The Lord Chancellor, I am pleased to say, recently stated in the House of Lords that he hoped and believed that that would not happen at all and that cement manufacturers would find that they will have to pay no more for raw materials than they have paid hitherto. An early decision by the Government would do much to relieve the anxiety of industrialists on the subject.

STAFF PENSION SCHEME

The pension scheme introduced in 1938 for the male staff has now been extended to include the female staff. The scheme now complies with the requirements of the Finance Acts so that employees' contributions are allowed as a charge for income-tax purposes. At the same time, certain alterations were made which have the effect of bringing the pensions more into line with the increased cost of living.

In conclusion, I would like to thank all our employees of the various companies in which we are interested for the loyal service they have rendered us during the past year.

THE PUNJAB NATIONAL BANK LIMITED

CHAIRMAN'S REVIEW OF A DIFFICULT YEAR'S TRADING

The One Hundred and First ordinary general meeting of this Bank was held on the 7th ultimo, in Delhi, Mr Yodhraj (chairman and general manager) presiding.

The chairman, in the course of his speech, said:—

As the biggest bank in North-West India, having as many as 32 per cent. of our offices in this area, we could not be expected to come out unscathed, through the dislocation consequent on partition. Like individuals, the joint stock companies owned by Hindus and Sikhs also became "refugees." The banks in particular were in special difficulty because while they made Herculean efforts to transfer their liabilities to the other Dominion in order to safeguard the interests of their depositors and at great expense to them, they could not and were not given facilities to have their assets transferred.

It was only when the back of the refugee problem was broken and inter-Dominion talks at Government level resumed that it became possible for us to organise a systematic salvage of our assets in West Punjab and removal of essential records from the mofussil branches which were no longer functioning to our main office in the West Punjab, 47, The Mall, Lahore. Under inter-Dominion agreement the Pakistan Government, I am glad to say, is giving all help to our men in this task.

PROFIT AND ALLOCATION

Our profit for the year ended December 31, 1947, including Rs. 1,04,111-13-3 brought forward from last year, after payment of bonus of Rs. 6,70,493-11-6, to the staff, is Rs. 64,31,892/8/11. This compares very favourably with our profits during the past three years

The board of directors, keeping in view the interests of the shareholders, have decided to utilise almost the entire profit towards the writing off of all the bad debts and other losses apprehended in West Pakistan.

It will be noticed that for the purposes of estimating the market value of our assets in West Pakistan we have taken a very low figure of 25 per cent. of the pre-partition value of immovable property mortgaged in the West Punjab and only 5 per cent. of the value of the immovable property of our debtors to whom loans were advanced on personal security.

STRONG LIQUID POSITION

Coming to the assets side you will find that the figures indicate a strong liquid position. The assets in cash, bank balances and investments amount in the aggregate to Rs. 39.56 crores equivalent to 66.4 per cent. of our total liabilities to the public by way of deposits. The market value of our investments is greater than the balance sheet figure by Rs. 53,48,906-8-8.

Considering the upheavals in the country it is surprising that we have been able to produce such a good balance sheet and I hope you will agree with me that the results of the last year are very satisfactory.

POSITION IN INDIA

India is like a huge slumbering giant that has lain in sleep of slavery and dependence for centuries. It has got the freedom now but it is yet to wake up to the full realization of what freedom means. The lesson that liberty does not mean licence and that it affords privileges as well as imposes obligations is yet to be assimilated. Above this crowd of people, towering like a giant, stands Nehru. What he sorely needs is a team of practical men experienced in business, tactful but firm and not lacking in adroitness in financial matters. He is fortunate in having one such deputy, Vallabhai Patel, whose astounding achievements in consolidating and unifying India are unparalleled in India's troubled history. Where the Moghuls and the British failed, Patel has succeeded. And once more we see the spectacle of a united India striding forth in world history as a nation whose people and princes are again indissolubly linked together in one common destiny.

INFLATION PROBLEM—PRODUCTION

The crux of India's inflation problem to which our leaders must turn their attention is the deterioration in production. India made a supreme effort during the war period to expand her production and though the pace of this production was much slower than the pace of currency inflation, a notable achievement, however, was the result. The advantage gained during the war has, however, been steadily lost in the postwar period. In 1946 industry lost more than 12 million man-days due to labour disputes and the figure rose to over 17 million in 1947—a rise of over 30 per cent. There is yet no end to the decline in production and the situation is deteriorating every day. In these circumstances to talk of India's glorious future or, what is more fashionable, to talk of India's rich economic potential and conjure up visions of a great Indian State looks rather ironical. What is required is patient

efforts in building up of capital largely at the expense of consumption, in providing incentive to private industry to make an all round effort and in Government giving help to private entrepreneurs.

CURRENCY

Production is only one side of the picture of inflation. The other side is that of currency. The first six months of the year 1948 have recorded an increase in total note issue of Rs 80 crores and an increase of Rs. 140 crores in notes in circulation since September, 1947. A part of the increase in total circulation may be due to the need for providing more currency under the policy of decontrol. Large increases of wages given to labour also require more currency. But the additions to currency have been made at a time when production has fallen by one third, foreign trade has shrunk to half its former quantum and a considerable part of the country has been surgically cut away from the main body.

NEED FOR SUBORDINATION OF PRIVATE TO NATIONAL INTERESTS

India is passing through difficult times. It may have to face many more difficult problems on the national as well as international front before it emerges victorious from the ordeal. But we should remember that during the last Great War, England had to go through an ordeal which was many times more terrible than the ordeal through which the Government of India is passing in these days of transition from an economically dependent to an independent status. But whereas England in her worst days of blitz never neglected her home front or "economics" for the sake of "politics," we on the other hand are engrossed more in politics than in economics. Parties and individuals are more bent upon securing for themselves a position of vantage in the new set up of things than in looking after the interests of the country as a whole. This danger must be avoided at all costs We must learn to subordinate individual or sectional interests to National interests.

BRITISH GLUES AND CHEMICALS LIMITED

MR ROGER DUNCALFE'S REVIEW

CAPITAL BUILD-UP ESSENTIAL TO INDUSTRY'S PROGRESS

The twenty-eighth annual general meeting of British Glues & Chemicals Limited was held in London on the 1st instant. The following are extracts from the circulated review by the chairman, Mr Roger Duncalfe:—

It is clear that increased efficiency of productive effort is essential if our nation is to resolve its present difficulties. This paramount need has inspired our effort to secure greater productive efficiency throughout our group, by increased mechanisation and improved processes.

Our postwar plan for increased glue production of improved quality has made good progress, and we anticipate that we shall complete it in the current year; we then expect to be in a position to meet all demands from our customers at home and overseas. The demand for our fats, fertilisers and cattle feeds has continued readily to absorb all we can offer. Chinaware manufacture has called for increased supplies of calcined bones produced at our mill in the Potteries.

SUBSIDIARIES

The proportionate contribution of our UK subsidiaries to our group profit has been greater than in the previous year. B. Young & Co., Ltd., producing photographic, pharmaceutical, edible and technical gelatines, increased its turnover, and made notable additions and improvements to plant and process. "Spa" brand low melting point gelatine is proving attractive to overseas buyers, and continues in heavy demand at home.

Calfos, Ltd., has experienced increased demand for its products for pharmaceutical use and for the manufacture of food preparations, and a useful export trade is being developed. Our soap companies have made progress; "Personality" Turtle Oil Soap continues high in public favour.

Croid, Ltd., has increased the range of "Croid" adhesives, of which it now produces over eighty different qualities for a wide variety of industrial uses. Annual sales of several million small units for domestic, school and office purposes give "Croid" an unrivalled position in the market.

Murray's, of Mark Lane, has continued to expand its varied interests, and its profits have achieved another record. During the year we acquired all the shares in the old-established business of Cockman Bros., Ltd., of Stratford, London.

In Toronto, our wholly owned subsidiary, Canadian Organic Developments, Ltd., holding important agencies in addition to those of our own group, is now well established. Its operations have been extended 2,000 miles further west by acquiring controlling interests in two businesses in Calgary. W. Harris & Company, Ltd., has successfully introduced some of our standard manufacturing techniques at its glue works in Toronto. We have strengthened our Canadian personnel by suitable appointments of trained staff sent out from England, and members of our board have made frequent visits.

THE ACCOUNTS

The consolidated profit and loss account shows a consolidated profit for the year amounting to £113,606 after the charges shown in the account and after providing for all taxation. With the carry forward from last year, reduced by retrospective profits tax, and with further amounts brought in, we have £211,249 available for appropriation. Appropriation includes: £21,500 to contingency reserve (now totalling £100,000), £15,000 to general reserve (now £150,000), and a newly-created replacement reserve amounting to £80,000. Dividends (10 per cent. preference and 25 per cent. ordinary) amount (net) to £52,937, leaving to be carried forward £41,812.

Out of every £1 we receive, 18s. 6½d. is asborbed by raw materials, expenses of production, wages and plant maintenance, leaving 1s. 5½d. for taxation, reserves and dividends. Of this amount 10½d. is absorbed by taxation, 3¾d. is retained in the business as additional capital, and only 3¼d. goes to the stockholders as dividend.

Fixed assets, after charging depreciation of £53,395, total £801,726, an increase over last year of £348,313; some of the increase is due to the inclusion for the first time of our Canadian interests, but to a greater extent to the considerable progress in our restoration and development programme. Orders placed on capital account at the end of the year and schemes passed on that date amount to a total of £230,000. This expenditure will substantially complete our present capital programme.

PERSONNEL AND PROFITS

It is a pleasure to record here that our group pension scheme was successfully launched on November 1, 1947, and received almost universal acceptance.

Whilst paying my tribute to all our employees, I must refer especially to the few uncommon men who inspire our forward march, men such as our managing director, Mr Harold J. Cotes, and our technical director, Mr I. H. Chaven. If our nation is to survive its present distresses, it will only be by recognising to the full the virtues of the man with the vision which creates, the man of ideas with the faith to develop them, and with the strength and purpose to convert them into action.

Yet industrial profit, which is normally the result of his ability, imaginative drive, industry and economy, and is a good thermometer to use in judging the success of his work, appears to be looked upon in some quarters as anti-social. I am convinced that the uncommon man will never survive in the strait-jacket of nationalisation, and without him our great schemes of social amelioration, in which I am so profound a believer, will die of starvation.

Let me make it abundantly clear that I agree limitation of dividends as a temporary measure at a time when the TUC has agreed not to press claims for wage advances —but profit is a different matter.

For industry's progress substantial profits ploughed back are essential to build up additional capital from within—capital needed to finance expanding trade at price levels much higher than prewar, and to maintain and improve buildings, plant and tools.

British industry became great by building up capital out of retained profit in days of low taxation, but in the present days, with income tax, profits tax and with wear and tear allowances inadequate to meet the cost of replacement, this build-up moves too slowly for that speedy resurgence of manufacturing industry which our economy so sorely needs. It is, in my view, essential that the 10 per cent. tax on retained profits should go and that a more liberal attitude should be adopted towards the wear and tear allowances permitted as a deduction before profits tax and income tax are calculated.

CONCLUSION

You will have gathered that we have faith in ourselves and in the future of our company; our heavy programme of capital expenditure rests on that foundation and on our determination to retain the lead we have established. Although there are clear indications that the sellers' market is passing and the buyers' market is at hand, our products are essential. It is clear, however, that we must pursue a conservative dividend policy for some time to come. I am sure that policy will redound to the strength and prosperity of our company.

The report was adopted.

THE VICTORIA FALLS AND TRANSVAAL POWER COMPANY, LIMITED

SALE OF THE UNDERTAKING

The annual general meeting of the above company was held at Winchester House, Old Broad Street, London, on the 31st ultimo, the chairman and managing director, Mr Arthur E. Hadley, C.B.E., presiding.

The chairman paid a sincere tribute to their colleague, Dr Bernard Price, O.B.E., who had passed away on July 9th, after having been associated with the company since 1908, serving as chief engineer, general manager in South Africa, and resident director and technical adviser in South Africa. Dr Price had taken the leading part in South Africa in the recent negotiations for the sale of the undertaking to the electricity supply commission of South Africa.

The accounts, which were the last the company would present, were drawn up in the form provided by the latest Companies' Act.

PROFIT AND DIVIDEND

The profit for the year 1947, after providing for taxation and transferring £1,000,000 to reserve for taxation and contingencies, came out at £644,225, an increase of £43,950 over the previous year. The sum of £150,000 was transferred to general reserve and the dividends paid for the year were 10 per cent. on the preference stock and 19½ per cent. on

the ordinary stock. The amount carried forward to the current year was £540,040.

At the annual general meeting in 1947 the chairman stated that the electricity supply commission would like to take over the undertaking at an early date instead of waiting until the end of 1950. Conversations had therefore started with the object of arriving at an arrangement fair to both sides.

On July 14th last the board issued to all stockholders a statement to the effect that a settlement had been reached and that the undertaking in the Union of South Africa (except cash and debtors) had been sold for £14½ million, which sum has been received. The commission have also offered employment to the whole of the company's staff and employees at their present remuneration, pension rights and all other benefits which they enjoyed in the company's service.

The chairman stated that in 1922 the Electricty Act was passed in the Union, under which the electricity supply commission was established, with power to expropriate the company at the end of 1950. The company had always worked in the most friendly manner with the commission

FRIENDLY NEGOTIATIONS

In 1947 the commission approached the company with a view to acquiring the undertaking by voluntary negotiation and without waiting until 1950. The board decided it was in the best interests of the company to enter into a friendly negotiation rather than to carry on in opposition to the commission and its principal consumers and to await notice under the Act, when the compensation to be paid to the company at the end of 1950 would doubtless be left for an arbitrator to decide.

The chairman pointed out that counsel's opinion had been taken with regard to the position of the preference stockholders, and he had ruled that they were entitled to the par value of their stock, together with any arrears of 6 per cent. per annum cumulative dividend up to the commencement of winding up.

The chairman thanked the staff and employees for their most satisfactory service during the year. He specially referred to Mr T. G. Otley, who had been general manager in South Africa since 1936, and who retired on June 30th last.

Mr Hadley said that this would be the last time after 41 years that he would meet stockholders at an annual general meeting, but he hoped to meet them again towards the end of the year to submit a proposal for the voluntary liquidation of the company.

The report and accounts were adopted, and the retiring directors, Sir Dougal O. Malcolm, K.C.M.G. and Mr J. B. Braithwaite, and the auditors, Messrs Cooper Brothers & Co., were re-elected.

MUREX, LIMITED

IMPROVED DEMAND

The twenty-ninth ordinary general meeting of Murex, Limited, was held on the 31st ultimo in London, Mr George P. Joseph (the chairman) presiding.

The following is an extract from his statement circulated with the report and accounts for the ten months ended April 30th, 1948:—

The trading profit is £526,190 for the period—an increase of £231,457 compared with the previous year. The consolidated trading profits of the parent company and its subsidiaries are £695,828—an increase of £264,595 compared with the previous year; the consolidated net profits represent 5 per cent. on the combined sales turnover.

The improved demand for the products of the parent company in the closing months of the last financial year was maintained throughout the period under review, and I am glad to say that the indications of a lessened demand at the date of the interim dividend announcement in February last were of a temporary nature. The period under review was a difficult one, but despite the acute shortages of vital materials which have existed on many occasions, we have been able to meet all demands for our metallurgical and chemical products.

We are continually adding to our range of pure metals, ferro alloys, special alloys, metal powders and fine chemicals to meet the expanding requirements of modern metallurgy. The sale of our secondary products, tungsten carbide (hard metal) tips for cutting and turning tools, tungsten and molybdenum rod and sheet and wear-resisting dies, which are distributed in the home market mainly by Protolite, Limited, have again shown a satisfactory increase. Owing to the continued shortage of steel supplies, Murex Welding Processes have been unable to meet the demand for welding electrodes which has continued at a high level.

EXPORT ORDERS

The marked improvement in the export orders for the products of the parent company during the latter part of the last financial year has been maintained; in consequence, the value of export sales for the period under review shows an increase of 100 per cent. on that of the previous year. The combined value of export sales of electrodes and welding plant by Murex Welding Processes for the ten months' period shows an increase on the previous year; that is again attributable to increased sales of welding plant. The demand for welding electrodes in both the home and export markets greatly exceeds available supplies.

The level of activity of the period under review has been maintained in the opening months of the new financial year; the parent company's products are, in the main, specialist raw materials, and there are no present indications of any sustained falling off in demand. The demand also for welding electrodes and plant shows no sign of recession; indeed, owing to shortage of steel supplies, there is an acute deficiency of electrodes manufactured in Great Britain, and as a consequence overseas customers are being diverted to the American market.

The immediate outlook for your company is satisfactory in so far as factors within its own control are concerned. It is the uncertainties in the national and international spheres that cause us anxiety; despite these uncertainties, however, your directors are confident that your company will continue to expand its interests and maintain its competitive position.

The report and accounts were adopted; the proposed final dividend of 2s. 1d. per £1 unit, making 3s. 4d. per £1 unit for the period, less tax, was approved.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Guest, Keen and Nettlefolds; Coast Lines; Distillers; Watney Combe Reid.

The Silly Session

ON Tuesday next, Parliament will assemble for a short special session. Its business will be concerned, not with the crisis of Europe, not with the urgent problems of relations with Russia, not with Britain's unsolved economic problems, not with defence, not with the gathering storm in Malaya. All these are questions of weight and emergency, but except for incidental mention, nothing will be heard of them while the Commons sits for its ten-day ritual. That solemn observance will be concerned simply and solely with the passage through the Commons, in the second of the three successive sessions stipulated in the Parliament Act of 1911, of the Government's new Parliament Bill, which was rejected by the House of Lords in June. There is no need to put any gloss on this devious process. Much as the Labour Party's intellectuals would like to fan into flames the old issue of "Peers versus the People," it remains so much incombustible dead wood. The point of the silly session is not to settle, once and for all, the part which a revised Second Chamber should be allowed to play in a modern democracy; it is a mere device for procuring against any threat of opposition the passage of the Steel Bill by the spring of 1950.

Thus the special session is the first active step in anticipation of the general election which must take place, at the latest, by that time. The Labour Party's election programme in 1945 included the nationalisation of the steel industry, and the more moderate members of the Government have been regretting its appearance ever since. It is true that the Prime Minister has since reiterated the Government's intention of taking the "relevant portions" of the industry into public ownership. But the omission of the Steel Bill from the legislative programme of the session which technically closes on Monday showed that two years later it still lacked the knowledge or the courage to do so. The draftsmen were then sent away to revise their palimpsests, but postponement could only be had at a price. That price, on the insistence of Mr Bevan and other keepers of the left-wing conscience, was a revision of the Parliament Act to reduce the Lords' powers of delay, and to ensure the passage, by early 1950, of the Government's Steel Bill—when they had decided what it ought to contain.

Historians in the future will point to the contrast between the Government's obstinate refusal to allow the Commons to be recalled during the period of mounting economic crisis during the summer recess last year, and its insistence this summer on recalling Parliament, not to conduct urgent business, but to secure the token nationalisation of the steel industry in eighteen months' time. The process could hardly be more wasteful or more undignified. For nothing that the Government does in the next fortnight, or indeed in the next year and a half, can disturb the simple truth that the next election, if it is held in 1950, will decide whether steel nationalisation is to be put into operation. If a Socialist Government is returned, it will presumably have an Act on the Statute Book which can be put immediately into effect; if it is defeated, the new Government will presumably repeal the Act.

Perhaps the party managers feel that, shrewdly handled, here is an issue,

capable of arousing the electorate. But it is hard to imagine it as a burning question, even when it is dressed up with all the rousing overtones of "steel barons" and "backwoods peers" conspiring together to defeat the popular will. Indeed, so far as the shifting vote is concerned, the reverse is more likely to be true. The next eighteen months are unlikely, on balance, to bring any material relief to Britain's economic situation—indeed, the receipt of the second instalment of Marshall Aid (which cannot be counted on as a certainty) is itself a precondition of economic stability next year. The year 1950 itself will be uncomfortably close to the approaching end of American assistance, and it will bring a fuller realisation than exists today of the hard responsibilities of economic independence, unaided by the United States. The period before the election ought to be spent in sober preparation for these responsibilities.

Instead, the Government is evidently determined to proceed with the nationalisation of an industry which, whatever its past and present shortcomings, is playing a vital role in Britain's economic recovery. To suppose that this can be accomplished without serious risk of affecting the output of steel and the smooth operation of the metal using trades—whose contribution to the export drive is vital—is self-deception. And the lamentable fact is that the more moderate elements in the Cabinet appear to share these fears. If they could be rid of their own creature, they would give deep sighs of relief. But it is now fastened upon them; the unbroken party front must, it seems, be preserved, even at the sacrifice of wiser counsels of policy. The calculations of the radical wing is presumably that a demonstration of extreme Socialism will win more votes than it will lose. But that is doubtful, as Mr Morrison almost certainly realises. The formal passage of the Steel Bill may well be paraded as a personal triumph by Mr Bevan; but that astute politician (competing with Mr Dalton for the leadership of the left wing of the party) has done all the damage that can be done to the Labour Party's appeal to the floating vote.

Perhaps these discussions of the legislative time-table are doubly theoretical, for while there is still a presumption that Parliament will run its full course, there is no guarantee that it will do so. On some calculations (they appear to have been in the minds of certain Ministers in their consultations with constituents during the recess) there might be a balance of advantage in holding the election next year, rather than in 1950. The second instalment of Marshall Aid will be secure, and the third only contingent. The prospects of success at the polls at the end of a full Parliamentary term might look less certain. Admittedly, there would then be further delay in the passage of the Parliament Bill and the Steel Bill. Whatever the Government's decision may be, one thing is already certain. For the next eighteen months, if Parliament runs to its full term, the shadow of the approaching election will be increasingly evident in every decision of policy that is taken. The right decisions on economic policy will be tempered by their supposed reactions on the electorate. The struggle for power between the two wings of the party will become more acute. The rigour of economic adversity will be softened, as far as possible, in the interest of vote-getting. Such a prospect, coupled with the superficiality of the special session, is not a very satisfactory portent of a healthy political life in Britain, confronted by critical issues at home and abroad. It will take all the honesty and realism of Ministers who are capable of wider views to insist on a policy to fit the times.

Labour and the Nation—II

The Reward of Work

POWER is pleasant in its exercise and irksome in its responsibilities. So at least it must have appeared this week to some of the delegates at the Trades Union Congress at Margate, for they have been confronted with rough and unpleasing truths. Whatever private and public reservations the General Council may have had, the ramrod personality of the Chancellor of the Exchequer left no room for doubt about the course of duty which lies before responsible trade unionists. In his speech on Tuesday he pointed out, with the clarity of a judge directing a criminal jury, the urgent need for higher productivity to restore Britain's economic independence and raise its standard of living. He killed (once and for all, if human words have any staying power) one of labour's most cherished dreams—that wage increases can be paid for, not through inflation but out of profits—by pointing out that if British corporation profits were slashed by a quarter, it would mean an average addition of only four pennies in the pound to wages and salaries. Anyone with a head for arithmetic could have arrived at that answer long ago; it is to be hoped that the union movement will accept from Sir Stafford Cripps what they have refused in the past to accept from the evidence.

The review of the economic situation issued by the General Council of the TUC (which was adopted on Thursday by a majority of 5 to 2) is a less courageous statement. Most of it is accurate and unexceptionable; yet it reveals one disagreeable aspect of union thinking—the willingness of the TUC to share in the glory of any governmental measure (such as social insurance or the repeal of the Trades Disputes Act), which is popular with organised labour, and its hesitation in endorsing any measure of a Socialist government which is likely to be unpopular with the workers. Thus the General Council takes great credit for its tremulous stand on wage increases after the White Paper of February; but criticises the Government like a schoolmistress for such mild disinflationary measures as the withdrawal of the clothing subsidies, and the increases of duty on drink and tobacco. A painful economic situation, it seems, should be allowed to inflict pain only on those who did not support labour. For labour, the claim is for the greatest possible increase in real wages.

Despite these limitations, however, this report is a sensible application to trade union problems of the Chancellor's policy. It points out that six months is too short a time in which to judge its effects and that official restrictions or voluntary limitation of prices have in fact been effective. But even so, the report does not conceal the fact that, while the TUC will support the Government in its attempt to attain economic stability and to increase productivity, trade unionists are still more determined upon a larger slice than on a larger cake. The speakers who followed Sir Stafford Cripps on Tuesday completely ignored his arguments which connected a higher standard of living with a higher volume of output. This unimaginative response to the Chancellor's speech shows how strongly established is the illusion that there is some alternative way of raising real wages than by extra output. Sir Stafford declared that he was in favour of using more brain, rather than more muscle, in increasing the volume of output—by improved methods, by better use of existing factories and machinery and, in the modern jargon, by "redeployment." Perhaps this underrates the increase in output which could be secured by greater and longer physical work, and overrates the potentialities of improved management. But only by one means or the other is real improvement possible.

The share of manual labour in the national income has

remained remarkably constant over the past three generations. Dr Kalecki has calculated that between 1880 and 1935 it varied only between 40.8 per cent and 43.7 per cent of the total, and later researches have shown that even during the exceptional circumstances of the second world war this ratio changed only in a minor degree. The high command of labour deduces from this fact that, in the past, any efforts of theirs to raise the level of money wages have resulted in a raising of profits, thus keeping the relation of wages to the national income almost constant. But if profits are kept under restraint, the economists of the TUC see a very good chance of increasing the real share of labour. It is partly this analysis—dubious though it is—rather than feeling of national urgency which has led them to urge a policy of wages stabilisation upon the unions. The TUC is not as ingenuous as it sometimes appears, and from the first it translated the terms of the White Paper into a policy for higher real wages and in this it had the full support of the Congress. That they are betraying the prospects of a higher standard of living for the working class, by quarrelling over the crumbs instead of baking a larger cake, does not seem to have occurred to them.

The delegates will disperse from Margate, primed with the importance of raising productivity—though so long as two million of the population are employed in central and local government, it will hardly be possible to admit the Chancellor's claim that there are no more resources of manpower to throw in to increase production. Yet this emphasis on productivity constitutes a great advance over the thinking of previous congresses. To translate this into effective action at the bench, however, is a profoundly difficult task, which must somehow overcome the pressure of union branches, and of the many millions of workers who, though they do not go to meetings or read union magazines, have a clear idea that the job of their representatives is to increase the size of their pay packet. To them, the TUC's new-found desire to demonstrate its responsibility by initiating research and education in the union movement, and to co-operate with the Government and management, may well seem a strange perversion of the simple-minded ends for which the unions were formed and for which the majority of members still support them.

It is paradoxical that the advocates of a planned economy should belong to the same political party as the exponents of freedom in an area where control is most vital to effective national planning. Without a wages policy (and a profits policy) the calculations of any Central Planning Board must be reduced to mere guesswork and earn for it the unkindly *sobriquet* of the Society of Hypothecaries. The present local anæsthetic that is being applied to wages and profits is no substitute for the operation which could re-fashion the structure of British industry, and redress the unbalance between the essential and the less essential trades. But before condemning this or any future government for not undertaking major surgery, it is as well to be clear about the difficulties which it presents.*

The greatest problem, inherent in the principle of collective bargaining, is the irrational structure of wages in different industries and in different trades within an industry. The chaos is due not to economic theory but to economic history—to degrees of skill, to the relative strength of union organisations, and to the ability of an industry according to whether it was sheltered or not to pay. The distribution of wages among different trades and industries bears little more than an accidental relation to their national importance. Moreover, differences in wage levels, once firmly established, tend to perpetuate themselves and acquire a permanent social significance. When this is combined with the remarkable immobility of the British worker (who has usually been prepared to stay at a low wage in a depressed industry rather than move to an expanding area somewhere else), it is not surprising that the classic theory of prosperous industry attracting the labour which obsolescent industry expels should never have been more than very approximately true in Britain.

The various theories aimed at correcting this are discussed in the third of the PEP studies.* It separates three strands of opinion about a wages policy. The first is the doctrinaire planning (on Russian lines) of a permanent correlation of wages with the economic plan; the second, the provision of a centrally co-ordinated system of incentives to attract labour where it is most needed; and the third is the short-term solution, at present under trial, of resisting unregulated increases in wages. All of these plans, or a synthesis of them, may break down for various reasons. First, above a reasonable level of subsistence, wages are not the only and perhaps not the most important factor in determining a workman's choice of job; questions of location, amenity and social *cachet* are often so important in the mind of the worker that wage differentials would have to be very great indeed to overcome them. Secondly, the application of any policy to replace the present makeshift one would imply the abandonment of collective bargaining and by threatening the dominance of the trade unions would arouse their undying opposition. Thirdly, the creation of a logical wages system, unless it were carried out in a period of severe slump, would involve raising wages in the undermanned industries and would increase the pressure for wage increases in other industries. That, indeed, has been happening ever since the war. Finally, who would have the necessary power, courage and support to implement a drastic wages policy? Only some resolute combination of employers, the unions and the Government could achieve it, and the chances of such a partnership can be dismissed at once.

Whatever the possibilities of education and research within the union movement, and the development of a sense of greater

responsibility among its leaders, trade unionism can only remain a voluntary movement if it continues to settle the reward of labour by the give and take of collective bargaining. This fact gives the question of productivity its contemporary significance. Only if increases in earnings can be associated with increases in production, can there be any hope of correlating effort and reward. But this in itself presumes a change of thinking within the unions. The effect of union pressure over the last decades has been to assess the workman less upon his individual merit and more as one of a mass. The gap between the skilled and unskilled worker has become steadily narrower because the pressure of big unions representing general labour has forced the lower level of wages upward, and the rewards of skill and effort have relatively diminished. Time rates and the guaranteed week are still as important as payment by results in many industries and the effect of unionism has often been to deaden any competitive spirit among the workmen.

This is the core of the problem. Behind all the exhortation and conferences, the joint boards and the committees, the only way to elicit a high rate of production, in industrial processes at least, is a system by which deft and energetic workers (or groups of workers) can earn more real wealth while the lazy and the incompetent earn less. In British firms where this principle has been maintained, the rate of production can compare with any in the world. The Victorian age had definable, if rigid, standards in work as in morality; until its clear distinction between good and bad reappears throughout British industry and is related to monetary reward, no propaganda and official encouragement will avail to increase productivity.

Rally in China

SINCE the military successes obtained by the Chinese Communist armies early this year, there has been a disposition in some quarters to write off the regime of President Chiang Kai-shek as a lost cause. The patient has appeared to be sinking rapidly and discussion has been directed rather to the character of his heir than to his own chances of recovery. During the last month or so, however, the American doctors by the bedside have been administering injections of such potency that the presumed corpse has been showing signs of renewed vitality; there have also been signs that the patient's own constitution is somewhat tougher than was generally supposed and will not easily give up the ghost. Kuomintang China is still a very sick man, but there are grounds for questioning the recent statement of an observer of Chinese affairs that "all realistic political speculation now begins with the assumption of a final Nationalist military defeat."

The currency reform which has been taken in hand is the first really serious attempt to tackle the riot of inflation made by the Chinese Government since the Chinese dollar began to get out of control under pressure of the Japanese invasion. Whereas China's last great monetary reform was planned with the advice of a British expert, Sir Frederick Leith-Ross, this one—as is natural in the changed circumstances of the time—is being carried out with American advice and financial backing. A Nanking decree of August 19th announced the establishment of a controlled gold standard "gold yuan" with 100 per cent reserve cover convertible, "under control," into foreign exchange. The new yuan is to be worth 25 cents in American currency and will be exchanged for 3 million *fapi* or Chinese dollars of the old inflated currency. The primary object of this reform is to stabilize China's finances, revive production and provide definite rates for foreign exchange. A secondary object is to render useless the large amounts of *fapi* held by the Communists (in addition to their own LA or Liberated Areas currency), which has hitherto been used by them for secret buying of commodities in Government-controlled areas or purchase of American dollars on the black market.

How far this currency reform proves effective will depend on the degree to which its various provisions are administratively enforced, and the story of economic controls in China has not been such as to give rise to an easy optimism on the subject. Yet there are signs of an altogether unwonted resolution in grasping the nettle. The Americans, with memories still fresh of the misuse of Unrra aid to China and of earlier American attempts at economic assistance, are concerning themselves with the details of the new financial measures in a manner which suggests that the grosser forms of corruption will no longer be overlooked; a Sino-American committee with three Chinese and two American members has been formed to administer the American funds which have been voted by Congress. Converging with this American pressure, the reformist group within the Kuomintang has been active in demanding a financial overhaul as an essential condition of the struggle against the Communists. General Li Tsung-jen, who was elected Vice-President by the National Assembly contrary to the wishes of Chiang Kai-shek, is reported to have refused to take up his office unless a successful start were made with currency reform. President Chiang has responded to this agitation by appointing his eldest son, General Chiang Ching-kuo to enforce the currency law in Shanghai, and the latter has hinted in a speech that measures will now have to be taken against persons hitherto immune from the application of economic controls. Some very privileged fish will no doubt still succeed in slipping through the net, but it seems possible that the meshes are this time going to be drawn closer than they have ever been before.

Closely linked with the new fight against monetary inflation is the scheme for applying part of the American assistance funds directly to rural rehabilitation under joint Sino-American supervision, which in this case also is to take the form of control by a commission with three Chinese and two American members. This move, as indicated in *The Economist* of September 4th, is the first real counter-attack on the Communist political offensive among the Chinese peasantry. The Communist exploitation of agrarian land-hunger has at least forced one thought into official minds in Nanking and Washington: that the Chinese peasant matters, that he is indeed the most important factor in the civil war. Unless and until the opponents of Communism in China can show the villager that they have the will and capacity to do something for him, and not merely talk about it, Communism will continue to extend its hold on the Chinese countryside. But, with the funds available and a definite policy for spending them, much can be done to provide attractions alternative to the Communist programme and the beginnings of a new deal for the peasant without the threat of the *kolkhoz* which lurks behind the shop window of Communist promises.

Certainly, if the Nanking leaders and their American advisers have any skill at all in co-ordinating propaganda with their administrative measures, recent events in Europe should have placed some strong cards in their hands. The agrarian policy now being promoted by the Cominform in Eastern Europe has already made nonsense of the assurances of yesterday that the aim of the Communist-directed land reforms was to give land to the peasants in private ownership and that collectivisation was not intended. There can be no doubt that the ability of Communists to exploit peasant land-hunger as a revolutionary force depends on the peasant's expectation of having land of

his own and on systematic concealment by Communists of their ulterior aims. But now that peasant ownership is being threatened in the "People's Democracies" of Europe even sooner after the redivision of the land than it was in Russia, the cat is fairly out of the bag and the Chinese peasant may well be capable of recognising the animal if he can get a good view of it. The Chinese Communists continue loudly to assert that they have no object but to endow peasant proprietors—in Manchuria their radio even boasts of creating large farms operated by "private capitalists" on 20-year leases—but it must become increasingly difficult for them to square their programme with the Cominform denunciations of Tito for allegedly pursuing similar agrarian policies. It is, of course, open to them to take Tito as their model, but how could they reconcile this with their proclaimed devotion to the Soviet Union and their present dependence on it for moral and material support?

Even without headaches over Tito, Chinese Communist agrarian policy seems to have run into heavy weather on the route southward. The Communists have apparently decided to suspend land reform in their areas of control in central China because this region "had not been sufficiently prepared for its enforcement" and to substitute a system of rent and interest reductions. It is complained that "the political consciousness of the farmers had not been sufficiently awakened, with the result that there was a lack of confidence in the success of the revolution." These difficulties suggest that the Communists find it harder going as they penetrate into what used to be "Free China" during the war than it has been in Manchuria and those parts of North China which were under effective Japanese occupation and where, as a result, the structure of Chinese society was disrupted and the officials and propertied classes either fled or went over to the Japanese. There is indeed no reason to expect that a decisive Communist victory in North China would be automatically followed by similar success in the South within a short period.

Nor have the Communists yet gained the upper hand in North China to an extent which enables them to emerge from guerrilla status and set up a geographically solid *de facto* state of their own. As long as they have not possession of Peiping, Tientsin, Taiyuan, Tsinan or Tsingtao, their control is still a patchwork affair. They have, however, now formed a North China People's Government to combine the local Communist administrations in the five provinces of Hopei, Chahar, Shansi, Shantung and Honan. An assembly of 528 delegates—Communists and fellow-travellers—is reported to have elected a council of 39 members, reserving 12 places for areas "to be liberated in the future." This regime is stated to be a forerunner of a People's Government for all China, but it is worthy of note that in spite of the fairly good communications which the North China Communists have with Manchuria, no attempt has been made to amalgamate the new North China regime with the Communist administration of Manchuria and thus to create a more imposing political unit. It is not at all unlikely that the Soviet Union has no wish for such a development, even for the advancement of Communism in China, and Soviet policy is only too well aware, in China as in Europe, of the potential divergence between Communist and purely Soviet interests. The Soviet position in Manchuria is one of effective domination; the country is almost encircled by Siberia, the Mongol People's Republic, the Soviet Zone of Korea and the Soviet gateway guard in Port Arthur and Dairen; the Russians also control the trunk railways. In North China the Soviet Union has no comparable means of pressure and dictation. Whatever Chinese Government might hold Manchuria would—thanks to the Yalta decree imposed on China in 1945—have to share power there with Russia; but, on the other hand, any Chinese Government of nationalist tendency, or sensitive to nationalist opinion in China as a whole, would inevitably try to enlarge its share at Russia's expense. It is therefore in Russia's interest to keep Manchuria as far as possible separate from any Chinese authority, even a Communist one, set up to the south of the Great Wall.

Meanwhile China misses a celebrated personality whose arrival via Siberia was expected with much excitement in Chinese political quarters. General Feng Yu-hsiang, the "Christian General"—who has been perhaps better described as an "Old Testament Christian"—denounced the Nanking Government from North America several months ago and there has been speculation on the possibility of his forming a coalition with the Communists and even eventually emerging as the leader of a "third force" in China. Perhaps his old influence in North China would have been a valuable asset for the Communists; perhaps he would have double-crossed them, as he double-crossed every faction with which he was allied in his political career. But now we shall never know, for he perished in a fire in a Russian ship that was taking him to Odessa. It is possible, though not probable, that his death was accidental.

A Western Statesman

SOME nations and some statesmen seem more fitted than others to fill a tragic role in history. There is tragedy and a sense of destiny even in the names of Poland or Spain, and the echo of disaster and lost causes clings to the titles of Habsburg or Romanov. But it was the wry fate of Czechoslovakia and of its second President, Dr Benes, to be cast, in the drama of Europe, for parts for which their talents did not fit them. During Czechoslovakia's brief life as an independent community, the Czechs showed nearly all the qualities necessary for success in an orderly, settled world. They were reasonable, industrious, intelligent, honest and reliable. And in none of the citizens were these qualities more marked than in the man who, after Thomas Masaryk, was the first citizen of the state. But the world offered them neither order nor settlement. The gulf into which they were flung, first in 1938 and then again ten years later, was no place for the practice of liberal virtue or of democratic leadership. On to this most undramatic of communities and this least sensational of leaders were thrust parts that might have been written for them by Euripides or Sophocles. To meet such a challenge with fitting words and deeds, Dr Benes would have had to be a genius or a poet or a saint. It only deepens his tragedy that he had to die in silence; whatever legend of Benes is created in the future, it will have to clothe itself in its own words. He leaves the liberal order that vanished with him without an epitaph.

Born in 1884, Dr Benes grew up as a child of that liberal world whose culmination was President Wilson's Fourteen Points. He believed with his generation that political democracy and the national self-determination of peoples were the twin pillars of progress and, as a student, he became Thomas Masaryk's disciple in attempting to realise both principles in the autocratic, multi-national empire of Franz Josef. The first World War gave both him and his master their opportunity. While Dr Masaryk campaigned on behalf of Czech self-determination in the United States, Dr Benes pursued the same end, first in Bohemia, then in Paris. Their joint efforts were successful. The Czechoslovak National Council was recognised in 1918 and Dr Benes himself played a leading part at Versailles. As a result, Czechoslovakia emerged as the most advanced and stable of the "Successor States."

From October, 1918, until 1935, Dr Benes was Foreign

Minister of Czechoslovakia without a break. In 1935, he was the obvious statesman to succeed Dr Masaryk when failing health led him to resign the Presidency. As President, he endured the bitter years leading to Munich and, after the disaster, retired from office and withdrew from Czechoslovakia. The outbreak of war a year later, however, made it possible for him to secure recognition for a Czech Government in exile—in 1940—and to achieve the full renunciation of the Munich Agreement by Great Britain two years later.

In 1943, Dr Benes journeyed to Moscow to secure a settlement with Russia. The negotiations appeared successful, but in 1945 the scope of Russia's intentions became clearer. In the first government after liberation, the Communists secured the key position of Minister of the Interior and their influence grew steadily, particularly after the elections of 1946, from which they emerged as the strongest party in Bohemia and Moravia. The President sought to maintain at all cost the democratic traditions of the prewar Republic, but in 1947 his health began to fail and this breakdown coincided with a sharp worsening of the relations between East and West. When Russian antagonism culminated in the *coup d'etat* of February, 1948, the President was a sick and bewildered man. He lingered in office, seeming to condone the Communists' *Gleichschaltung*, but sooner than accept the new constitution he resigned on May 4th. His public career was at an end and he survived it by only four months.

Such is the outline of a career which began with such unique achievement—the creation of a state—and ended tragically with the absorption of that state, first into the German and then into the Russian empire. In the case of both disastrous eclipses, the immediate political causes lay far beyond President Benes's control. Between 1919 and 1938, he regarded a resurgent Germany as the chief danger to Czech security and he sought to counter the menace by relying on the Versailles system, the League of Nations, the ideal of collective security and the underpinning of them all by Anglo-French military strength. In 1938, neither the French nor the British were prepared to fight and, sooner than expose the Czechs to the horrors the Poles almost ran to meet a year later, Dr Benes capitulated. After 1945, his calculations once again proved unfounded. He could hold the balance between Communist and non-Communist in Czechoslovakia only so long as relations between East and West did not deteriorate beyond a certain point. The break over the Marshall Plan sealed the fate of Czech democracy.

Yet is this account of Dr Benes's failure adequate? He was not simply a spectator of his country's downfall nor did he play a passive part in the twenty years during which the Czech Republic was built up and then destroyed again. By all odds, he was one of the outstanding statesmen of the Europe created by Versailles and he was one of the leaders in the attempt to rebuild Europe on the Wilsonian pillars of political democracy and national self-determination. If the order failed, he, too, was in some measure responsible and, since he was so typical a son of the West, his failures throw light on the weaknesses of the whole tradition.

In the first place, he shared his contemporaries' blindness to the fact that, in Europe after 1919, nationalism was ceasing to be enough. Politically it was bound to break down before the stark fact that in an atomised, unrelated Europe of nation states, Germany would inevitably emerge as the strongest. The enemy had either to be absorbed and reconciled in a wider community or to be held in check by it. Nowhere did reconciliation fail more strikingly than in Dr Benes's policy towards the Sudetens—or the Austrians. But, on the other hand, alliances between the victorious states and their determination to keep the Versailles settlement intact proved to be links too brittle and inorganic to hold German aggression for long at bay. In the end, the League of Nations amounted to no more than these alliances under a rather more respectable name. Thus the aggressors were able to destroy all solidarity before they even launched their main attack.

In the economic field, a similar atomisation of Europe was accepted in the name of national sovereignty and the Czechs took the lead in destroying the wider ties that had held the old Habsburg Empire together. In the event, no nations suffered more from the ravages of economic nationalism than did the Successor States. Dr Benes cannot certainly be blamed for being no wiser in all this than the statesmen of France and Britain. It was only his tragedy that he practised a faulty policy in a position which exposed him to all its risks.

Dr Benes shared the Western World's lack of insight into the link between economic insecurity and political and social unrest. In the inter-war years, the Czechoslovak Government achieved many things—sound administration, reasonable finances, an honest judiciary—but it succeeded no better than other Western Governments in drawing organised labour into the national community and Communism began to grow, particularly after the depression. Dr Benes showed little interest in these matters, even after unemployment and distress among the Sudeten Germans—whom the depression struck hardest—had helped to move the Sudetenland from the home departments to the table of the Foreign Minister. After the Second World War, the mood of the workers developed in a still more radical fashion. It was not only liberation by Russia that determined the 1946 elections. It was also the failure of the non-Communist parties to maintain their hold. Recent events in Finland have shown how difficult it is for Communists to stage a *coup d'etat* if mass support among the workers is lacking. In Czechoslovakia, a sufficiently large percentage of the working people—though short of a majority—had long before February, 1948, already deserted the principles for which their President stood.

But, above all, Dr Benes and his Government shared with the Western World a failure in imagination, in vision, in creative power. The President stood for much that is infinitely valuable in civil society—above all for the humanitarian tradition which sought to banish violence from politics. Yet he lacked, as did all the West, the power to charge these ideals with energy. In the 'twenties and 'thirties the "prophetic word" passed from democracy to the totalitarian faiths.

If the tragedy of Dr Benes is more than a personal tragedy, more even than the tragedy of a nation, and represents in fact a fatal weakening in that Western tradition of which he was so typical a representative, there should be more than sorrow at this passing. There should be doubt and questioning and disquiet. It is true that *force majeure* was used in the rape of Czechoslovakia, both in 1938 and in 1948, but the reasons why the use of outside force was possible are in part grounded in the weakening of Western influence and Western ideals. President Benes's failure may be dismissed as a failure in an outpost of democracy, in the furthest point at which Western society threw down genuine roots. But it is surely wiser to use it as a symbol and a warning, and to ask whether the rest of the Western community is not threatened by the weaknesses that brought Benes down. National sovereignties are as strong as ever; in spite of all talk of Western Union, is any wider political and economic solidarity genuinely growing up? In the social field, can those who look at France—or Italy—say that the support and loyalty of the mass of workers for the democratic state has really been achieved? And, in the whole wide sweep of Western society, from London to Sydney, from Frankfurt to San Francisco, is there not still a confusion of voices, an absence of unity, the presence of fear? These weaknesses defeated all that was wholesome and sturdy and decent in Dr Benes's career and in the Czech state he attempted to build. The same weaknesses unchecked could write the epitaph of Western society.

NOTES OF THE WEEK

Ungovernable France

It seems more and more likely that whatever government emerges from the present French crisis, it will have one task only—to prepare for fresh elections. Government in conjunction with the present Assembly is clearly impossible. Its dilemma—which is described in detail in an article on page 419 lies in the fact that it is divided almost equally between Communists, extreme right-wingers and a centre *bloc* of moderates. Any lack of unity among the moderates therefore instantly exposes the *bloc* to defeat at the hands of the extremists. But unity is precisely what moderate opinion lacks. It in its turn is divided between right and left, the right believing that a restoration of the French economy can be achieved only by favouring and encouraging the peasant and the businessman, the left arguing that only if organised labour is satisfied can stability be achieved.

This underlying pattern of discord explains the unsurmountable political crisis of the last seven weeks. The Socialists—left wing of moderate opinion—could not stomach the relatively conservative and orthodox economic measures proposed first by M. Réné Mayer in the Schuman Government and then by M. Paul Reynaud in the cabinet of M. Marie. Their opposition brought down both coalitions. M. Schuman then took up once again the ungrateful task of cabinet building a week ago and, faced with rising food prices and the threat of strikes, secured socialist support only by giving the key Ministry of Finance and Economic Affairs to a Socialist, M. Pineau. The first act of this new cabinet was to grant a bonus of 2,500 francs to all save state and agricultural workers. The apparent "move to the left" was, however, too much for the Conservatives. When M. Schuman appeared to obtain approval for his Cabinet, he was defeated by six votes and immediately resigned.

M. Vincent Auriol, the French President, has no power to dissolve the Assembly. The different coalitions have not fallen as the result of votes of no confidence. The conditions of dissolution—eighteen months of life for the Assembly and two votes of no confidence—have not been fulfilled. The President, after failing to enlist M. Herriot's services, has therefore asked M. Queuille, a Radical, to make an attempt. But it seems that, in one shape or another, elections may give the final answer. If M. Queuille tries to secure Gaullist support, he will be successful only if he accepts the condition that cantonal elections should be held in October, and these may well repeat the landslide that gave General de Gaulle a majority in the municipalities last year. Gaullist pressure on the Central Government might then prove irresistible. If, on the other hand, M. Queuille fails, the pressure for a direct dissolution—by vote of the Assembly—will grow even more emphatic. The Council of the Republic has already endorsed it, and there are reports of wavering among the Socialists and the MRP—the two groups which stand, as moderates, to lose most by an electoral contest. It is difficult to avoid the conclusion that the Assembly's days are numbered and that it will be the lot of new elections to determine whether France itself, as well as its present Assembly, is incapable of parliamentary rule.

* * *

No Change in Germany

The Russian aim in Germany has been—ever since November last—to find some way of bringing the Foreign Ministers back to the Conference table and thus of preventing the crystallisation of a separate Allied policy in Western Germany. The blockade was imposed in the hopes of securing renewed negotiations and a halt in the West, and, throughout the talks in Moscow, each turn of the screw in Berlin seems to have been designed to underline to the Allies the "hopelessness" of their position in Berlin and thus to bring them to terms. But the Russians have needed to play their game carefully. Too brusque a reaction in Moscow, too violent an attack in Berlin might have driven the Allies away altogether. The Russians have therefore haggled and haggled in Moscow, leaving the door open a chink for agreement. In Berlin, they have offered all provocation short of military action.

Today they have no reason to be dissatisfied with their tactical position. While the four Military Governors have reached a deadlock in their discussions on a single currency and the blockade the situation in Berlin grows steadily more desperate. The airlift feeds people, but it does little more. Meanwhile, the whole Russian sector has been taken over by the Communists, and when, under mob pressure, the lawfully elected municipal government moved to the protection of the British sector, its writ instantly ceased to run a yard into the Russian controlled sections of the City. The Western sectors are now islands virtually divorced not only from the surrounding German countryside but even from the rest of the city.

Yet, in spite of this local advantage, the Russians' major strategy has failed. The Allies are no more ready to discuss the future of Germany than they were on the day the blockade was imposed, and, at Bonn, talks on the new political regime for Western Germany are entering their second week. It may be this blank Allied refusal that has led the Russians suddenly to press for a meeting of the Foreign Ministers to discuss the future of the Italian colonies. The other Powers have agreed, in spite of the difficulty of assembling before September 15th. Will they find Russia determined to slip Germany on to the agenda?

* * *

America Overrides the OEEC

The two issues with which the Organisation for European Economic Co-operation has been continuously and often agonisingly concerned for many weeks past have now been brought to an agreed conclusion, but in neither case can the reception given to the agreements be anything but extremely reserved. The issue of the European payments scheme is discussed at length in an article on page 424, in which its very real economic disadvantages are analysed. The drawbacks attaching to the agreement on the allocation of Marshall Aid for the current year are mainly political. On two important points of principle, decisions have been taken and it is difficult to avoid the conclusion that both decisions are wrong.

In the first place, the allocation of aid between the European nations, which was, on the strongest American insistence, to have been a purely European responsibility, has been drastically modified by direct American intervention. The Committee of Five appointed by the OEEC drew up a list of allocations to which all the major Powers agreed. The chief dissentient was the German Bizone, in other words, the United States itself. The Bizone's officials refused either to allow its allocation to be cut from a demand of $450 million to $367 million, or to contribute some $90 million in credits to its neighbours. After a prolonged deadlock, Mr Harriman intervened on the side of American Military Government and, after a series of hasty conferences in the capitals of Western Union, compelled OEEC to raise the German figure by $145 million and to waive the demand for German credits. Thus the Europeans were deprived of their full responsibility and in the event a direct American *fiat* took the place of European agreement.

The second point of principle is even more unfortunate. Nothing will so discourage Europe, nothing will so quickly destroy confidence or play more effectively into the Communist hands than the belief that the United States intends to rebuild Western Germany at the expense, if necessary, of everybody else. Yet what other conclusion can be drawn from a decision which treats Bizonia as a most favoured child and releases the Germans from obligations of mutual help imposed on their neighbours. American intervention can thus only be characterised as politically very unwise and the contentions issue of Germany's "favoured position" may well check the best efforts at European co-operation for months to come.

* * *

Reparations and ERP

The decisions taken in the OEEC in favour of Germany make it all the more unfortunate that the Americans should have chosen this moment to raise the issue of German reparations. That they would raise it at some point was certain since such a move is implicit in the terms of the Economic Co-operation Act. There it is laid down that the Administrator shall

> request the Secretary of State to obtain the agreement of countries concerned that such capital equipment scheduled for removal as reparations from the three Western Zones of Germany be retained in Germany if such retention will most effectively serve the purposes of the European Recovery Programme.

Mr Hoffman has now asked Mr Marshall whether the question of reparations may not be reviewed in order to find out which plants scheduled for dismantlement would be better used in Germany. Mr Marshall, in his turn, has passed on the request to the British and French Governments.

It is not likely to receive a very favourable response. In the first place, there are technical difficulties. One virtue of the list of plants to be dismantled as reparations, published last October, was its claim to finality. Mr Marshall has at a stroke destroyed its character and now the Germans will seek to reopen every item. There are already threats of strikes on this issue and the German administration is threatening to move officially. Another drawback is the fact that some types of light equipment and machinery are genuinely lying idle in Germany and could be used in other countries which have indeed based some of their recovery plans on the expectation of receiving reparations. The re-opening of the question creates new uncertainty on every side.

The main difficulty, however, remains political. Germany remains Western Europe's sorest issue, and the American raising of the reparations issue on top of its insistence on the scale of aid to Germany must revive in every French—or indeed Western European mind—the query whether Germany's economic revival with American aid is not going to prove a grave political menace in the future. The failure of Britain, France and America to concert their policy on Germany has long been the weakest feature of Western diplomacy. Is it now to bedevil the European Recovery Programme as well?

* * *

Conflict at Margate

On Tuesday the Trades Union Congress turned with relief from the thorny subject of wages to debate the relation of the unions to the nationalised industries. It was obvious that the mild passages in the annual report of the General Council in which, adhering to a policy first outlined in 1944, it recommended that unionists should sit as individuals, and not as union delegates upon the boards of nationalised industries, would stir up a hornet's nest. Tuesday's debate underlined the difficulty which faces Transport House in acting as a responsible body and yet keeping in step with the less responsible views of its constituent unions. Mr Figgins, of the National Union of Railwaymen, rose in righteous wrath to move a resolution which had been slightly toned down after consultation with the National Union of Mineworkers. His original motion had flatly demanded that the Government should give greater participation to the workers, through their unions, in the control of state industry. As amended it became more a hope than a threat and merely demanded that those appointed to administer these industries should be men of proved ability and convinced of the success of nationalisation. The latter phrase is perhaps an attempt to salve the injury to the pride of the NUM inflicted by the strictures of Sir Charles Reid and of his resignation from the National Coal Board. As to proved ability it was as well that the topic was discussed in very general terms since some of the most lightweight recruits to the management of nationalised industries have been elderly trade unionists.

The railwaymen obviously felt themselves the more aggrieved since both the Transport Commission and the Railway Executive Committee each contain only one railway trade unionist. The miners have a better representation at the centre and nine trade union leaders on the Divisional boards. The Council accepted the resolution only as a general statement, without prejudice to rights of Ministers to use their judgment, but it is obvious that the railwaymen in particular feel themselves badly cheated by the course which the nationalised industries have taken. Apart from the National Union of Post Office Workers, which has avowedly syndicalist aims and means one day to run the GPO itself, it is obvious that the unions concerned with nationalised industries have not recovered from the shock of finding that nationalisation does not mean workers' ownership. They still do not know whether they want to run the industries with perhaps a little outside help or whether to remain as independent pressure groups representing the workers. Many of the less clear-sighted unionists obviously still believe that they can do both, but it is apparent that Transport House, looking ahead to a future which includes the possibility of less sympathetically inclined governments is determined to persuade the unions to remain as such and not to become integrated into the management of the industries.

Co-operative Breakthrough

In response to the Chancellor's appeal in February to reduce costs and prices the Co-operative Union persuaded its member societies to lower the retail price of a number of foodstuffs. This decision embroiled the co-operative movement with other retailers who feared undercutting (the unpardonable sin of retailing in Britain), but the policy was pursued and has now led to serious difficulties within the movement itself, owing to loss of some £8 millions of profits. Some societies have already broken away, and raised their prices again; others are straining at the leash. In order to hold the position the leaders of the Co-operative movement are seeking a meeting with the Government to discuss measures needed "to attain a stable national economy."

This announcement gives an ironic twist to the controversy on wages at the Trades Union Congress. The initiative of the co-operative movement in cutting prices is cited in the supplementary report of the Trades Union General Council as an example of the success of Government policy at the exact moment when the co-operatives are reversing their tactics and blaming the trade unions for the necessity of doing so. According to the statement by the co-operatives, the unions catering for the co-operative workers ignored both the Government's appeal for a freezing of wages and the attempt of the societies to reduce prices in their own shops. As a result co-operative workers are receiving higher wages, and the shops are getting lower profits. Evidently the co-operative leaders feel they cannot stop the rot without further Government support.

One interesting sidelight in this controversy is the reasons given by the Secretary of the Leeds Industrial Co-operative Society for its decision to restore the cuts in prices in advance of the approach being made by the leaders to the Government—namely, not only the recent wage-increases to co-operative employees but the increase in national health insurance contributions. These contributions have been cited by workers elsewhere as a ground for wage increases. This is the first time they have been cited by the employers as a ground for a price increase.

A reversal of policy on price-cutting in the co-operative shops would have important repercussions. Not only do they run the country's largest chain of retail establishments (with, in 1947, 9,805,292 members and a sales total of £434,215,000) but their competitors would certainly follow their example in marking up prices as quickly as they followed them down. If the Co-operatives cannot make ends meet why should others less favoured attempt to do so?

* * *

BBC Record

The BBC has just published its annual report [Cmd. 7506]. It is a disappointing document in so far as it maintains a heavy silence about all the questions of policy and controversy which are of interest to members of Parliament and the intelligent listener, and lists fully and aridly only the outstanding programmes and the main accounts for the year 1947-8. As a reminder of performances given it is useful; as an exposition of the working of the nation's sole broadcasting system it could hardly be less helpful.

Yet with a monopoly of what is probably the most powerful single influence on current thought, the BBC surely owes the public more information about the controversies which influence broadcasting policy. There are now over 11 million licence-holders, 400,000 more than the previous year. Could they not be told more about this large machine to which they contribute? What is now considered to be the place of the Third Programme in the main trilogy, now that it has been given a full trial? What was the public's reaction to the political broadcasts? What are the essential cleavages in the dispute with the Musicians' Union? How is the programme apportioned between the claims of those who turn on the tap of sound continuously or indiscriminately according to the state of the washing-up or their cigarette supply, and those who conscientiously mark their *Radio Times* and firmly quell their families at the appointed hours? What are the broadcasting problems to be faced in telling the people about the country's economic position?

This last is certainly the BBC's biggest political job, and one to which governors and directors have devoted much thought. There clearly are limits to the amount of exhortation the public will swallow, and it is possible that the experience of other broadcasting systems may have some lessons to offer on the difficult job of getting serious subjects into the listening ear. America, for example, makes much more of radio personalities than is made in this country. The talks by Mr Graham Hutton and the chairmanship of a long series of talks by Sir George Schuster were, for example, a great success; is continuity of this kind an advantage? The intelligent and well-informed listener is the lesser problem; he is usually already half converted. The real stumbling block is how to reach the individual factory worker or coal miner. How does the BBC hope to convert him to higher output?

India Cracks the Whip

It is now generally expected that India will launch a military invasion of Hyderabad in the near future. According to the Delhi correspondent of *The Times*, India as a whole welcomes the prospect and "is averse from awaiting the outcome of Hyderabad's appeal to the United Nations." It is, of course, an obvious procedure to destroy a state complaining to an international authority before its appeal can be heard and then argue that there is no longer any case to discuss. India further argues that Hyderabad cannot make an appeal to Uno because under the "Standstill Agreement," which was concluded for one year and expires in November, Hyderabad has agreed to be represented by India in its foreign relations. But Hyderabad claims that the Standstill Agreement has in any case been violated by India, as indeed it has, for one clause of the agreement provides for the reference to arbitration of any disputes arising out of it, but when Hyderabad requested arbitration, the Indian Government replied that "it is no doubt true that the Standstill Agreement provides for such reference," but that arbitration "could be regarded as a practical solution only if the Hyderabad Government were agreeable to taking certain steps immediately which could be regarded as a genuine token of that Government's desire to maintain cordial and friendly relations with the Government of India." By making fulfilment of the Agreement conditional on Hyderabad's acceptance of fresh demands India has shown a complete disregard of treaty obligations and its juridical case before a world tribunal would certainly be a weak one.

A strong case can be made for the view that full accession to the Dominion of India would be in the long run in the best interest of Hyderabad and its people. But the peremptory and menacing language used from the beginning by the Indian States Ministry and the ruthless blockade, which has been extended even to medical supplies, have merely confirmed the worst fears of the Hyderabad Moslems and prompted them—with the memory of the Punjab massacres less than a year old—to undertake a desperate resistance. As far as this country is concerned, Britain no longer has any specific responsibility in the matter apart from general obligations under the Uno Charter, and is naturally concerned to maintain the best possible relations with a co-member of the Commonwealth. But if the case comes before Uno, the British delegation will not be able, without incurring a charge of perfidy, to go back on the declaration made by the Secretary of State for India in Parliament on July 16, 1947, that after the lapse of paramountcy the Indian States "will be entirely free to choose whether to associate with one or other of the Dominion Governments or to stand alone."

* * *

Communist Purges

The Communist Parties of Czechoslovakia, Poland and Hungary have embarked on purges of their membership. The Rumanian Party may be expected to follow. "Nationalist, bourgeois and opportunist elements" are being eliminated, and no effort will be spared to give members a "firm grasp of Marxist-Leninist methodology" and to "raise the ideological level" of the parties.

These purges mark an important new phase in the development of East European Communist policy. Before 1939 the Communist Parties of Poland, Hungary and Rumania were tiny factions, while the Czech Party had few followers outside the working class. In the first two years after "liberation" recruits were welcomed. Quantity was preferred to quality, and ideological examinations were slight. The Communists were engaged in seizing power and needed numbers to overawe their rivals.

Communist recruits were of various types. Some were men of solid convictions, workers or intellectuals who stood for Socialist principles. Others were swept away by vague admiration of Soviet power. Then there was a large contingent of opportunists, who sought personal security and a career under the protection of the Party "to whom the future belonged." A fourth important group were the toughs, mostly recruited from Fascist organisations (Iron Guard, Arrow Cross, etc.), willing to serve impartially any organisation which would put out extremist slogans and allow them to exercise their strong arms.

Special inducements were also offered to men holding key posts in the administrative or industrial machinery, who were prepared to obey, and persuade their subordinates to obey, the Party's orders in a crisis. These men regarded such action as "personal reinsurance." In the short term it benefited both themselves and the Party, and no ideological questions were asked. The most striking example is the growth of the Czechoslovak Party in the weeks before and after the February "revolution."

But once the Communists had monopolised political power, a change was bound to come. In the present stage the supreme aim is the consolidation of the Soviet Empire's stranglehold in Eastern Europe. Key jobs must pass from the careerists to "steel-hard Bolsheviks," who truly "appreciate the part played by the Soviet Union in the world struggle against imperialism." Now those who thought themselves so clever are realising that their fate does not differ from that of the Hugenberg Nationalists who helped to put Hitler in power in 1933. But even the purest are subject to purge, as the case of Poland's Gomulka shows.

It is worth noting that the Jugoslav Communist Party never quite fitted the usual East European model. The Jugoslav Communists obtained their political monopoly during the course of the war itself. Most new recruits had at least proved their loyalty in the hard school of guerrilla warfare. After the war, expansion of membership was comparatively slow. Loyalty to Tito and his closest collaborators had the first priority. Today the best material for the Cominform, in its attempt to subvert the Jugoslav Party from within, are on the one hand a small number of pre-1941 ideological veterans, and on the other hand the opportunists who only joined because the party was on top, and may now calculate that the Soviet Politburo is stronger, and therefore better worth supporting, than their "people's leader." In other words, Moscow must enlist precisely the "bourgeois opportunists" in its fight against Tito.

* * *

Arsenal for the West

Mr Gladwyn Jebb's visit to Washington to discuss matters relating to Western Union was presumably exploratory and no formal communique has been issued. Yet the lack of inspired guidance suggests that there is little progress to report. At the present moment, any hint at all that the strength of the five Powers of the Brussels Pact is to be increased would be more than welcome to the harrassed negotiators in Moscow and Berlin. If, therefore, Mr Jebb had succeeded in persuading America to undertake commitments, his success would presumably have been shouted from the housetops. As it is, it seems unlikely that there can be any question of American military support for the Brussels Pact until January next year, when the presidential elections will be over and the Senate will next meet. Even then, Congress will probably insist that the five signatory Powers to the Brussels Pact should prove that they have done everything possible to build up their own defences before it commits America to any form of military guarantee. Mr Harriman's suggestion that Britain should turn itself into an arsenal for Western Union is perhaps a hint of the type of re-organisation likely to persuade Congress that the Western European Powers are willing to do more than watch the Superfortresses fly to and fro.

But the dilemma facing the Five Powers is that in their present economic predicament they cannot both expand their fighting forces and increase their trade and production. Men, dollars and raw materials are all scarce. Europe can make enough tanks or enough tractors; it cannot make enough of both. This is not simply a matter of arithmetic. As the experience of France in 1940 shows, the effectiveness of a country's war production depends directly upon the general resilience of its economic life. A dragging economy cannot switch to an effective war effort, but given a healthy economy, tanks, guns and aircraft can be produced when and as they are needed. To make a sick economy worse, as Mr Harriman's suggestion for Britain would do, though it might temporarily improve the military strength of the Brussels Pact, must in the long run weaken it. Since America genuinely desires a strong Western Europe, the only immediate solution is that the North American continent should for the time being act as the chief arsenal of Western Union and thus allow Western Europe to continue its struggle towards economic recovery, unhampered by too great a diversion of its resources to the needs of defence. The burden could then be more evenly distributed as Western shoulders became progressively more ready to take the strain.

The Need for Hospitals

There is a wealth of material in the survey* of hospital-treated sickness in Stirlingshire sponsored by the Nuffield Provincial Hospitals Trust. It analyses the case records of the county's hospitals over a year according to the patients' age, sex, disease, occupation, duration of treatment and result of treatment. It is difficult to make a selection from the abundance of statistics thus collected, but one fact will impress itself upon the layman's mind —one in seven of the county's population had hospital treatment, either as an in-patient or out-patient, during the year.

One in seven had hospital treatment. . . . But the survey shows the pattern of hospital-treated sickness as it was met by the available resources—it was not concerned with waiting lists. Consequently, the real demand for hospital services must be even greater than the proportion of one in seven suggests. In fact, as the survey itself points out, according to the official hospital surveys undertaken a few years ago, Stirlingshire has a deficiency of some hundreds of hospital beds. The hospitals place a heavy burden on the resources of the community, and the depressing conclusion to be drawn from this survey is that the burden seems to be increasing rather than decreasing. Thus it traces the growth of Falkirk Cottage Hospital, opened in 1889, into the Falkirk and District Royal Infirmary of today. During the hospital's lifetime there has been a tremendous advance in medical knowledge and in the treatment of disease. There has also been an advance in what may be called preventive medicine—the public health services, accident prevention, immunisation campaigns and so on. These advances in medicine are reflected in the changing pattern of the cases treated at the Falkirk Hospital; from being mainly concerned with the treatment of accidents, it gradually undertook a wide variety of medical and surgical cases. But they have not led to an absolute decline in the amount of hospital-treated illness. Reduce one disease to insignificance, or lessen its severity so that it need not be treated in hospital, and there is always another ready to take its place.

This is not the only side to the picture. Against it must be put the decline in the death-rate and the fact that far more hospital-treated patients than formerly are now made fit for work again. But one may well ask, reading this survey and recollecting that hospital treatment is now free for the whole population, whether there is any prospect of the burden being lightened.

* "Hospital and Community." Nuffield Provincial Hospitals Trust. 3s. 6d.

Price the Panacea?

Sir Hubert Henderson, in his address to the British Association, said some things which badly needed saying—and left unsaid some others which might have been even more valuable. Long endurance of the frustrations and absurdities of pseudo-planning, impatience with the self-righteous rhetoric by which it is too often justified, has stimulated a reaction in favour of free prices "marked," said Sir Hubert, "by the same defects . . . incoherence and wishful thinking." *Laisser faire, laisser passer*—the old slogan is not overtly revived, but its substance has an increasing and potentially dangerous attraction, and not only on the extreme Right. Sir Hubert's criticisms, however, were directed not upon this naïve set-the-people-free nostalgia, but upon the far more attractive "central prescription" of price-system ideology: that the state should exercise strong positive central powers to equate aggregate demand and aggregate supply, thus establishing "global equilibrium," and then allow prices to do the rest. He had no great difficulty in demonstrating that, when the economic system is really severely out of gear, freely moving prices are a quite inadequate means of getting it back again. They will establish a short-term, immediate balance, of a sort; but this will have very little relation to the long-term balance of resources and needs. In foreign trade they are almost certain to impose an intolerable strain or to bring about frenzied exchange fluctuations causing worse disequilibrium than ever. In the field of long-term capital investment they would require an enormously high rate of interest at the moment, and a very erratic one thereafter. They require to be supplemented, however distasteful this may be, by direct physical controls. Existing controls may be wrongly conceived and wrongly applied; but, by and large, our hardships are really necessary.

What Sir Hubert did not touch upon is the way in which these controls, and economic policy in general, should work towards an eventual equilibrium whose attainment would make it possible to reintroduce the price system without catastrophe. For there is a real distinction to be drawn between these controls which must in any conceivable circumstances remain in force and those whose necessity, however unanswerably established, derives from war, postwar disorganisation and the gross errors of earlier planning. To insist on this distinction, to demand that the onus of proving the continued necessity of any particular control shall always rest with those imposing it, and to look forward to the ultimate extinction of those not concerned with "global equilibrium," is a very different thing from ranging oneself within the ranks of what Sir Hubert calls "extravagant propagandists of go-easy illusions, pushing salesmen of enervating fools' paradises."

* * *

Dream of Plenty

One of the largest question marks, if not the largest of all, in the economic affairs both of Great Britain and of the world at large concerns the potential production of foodstuffs. There are no new prairie frontiers; are there, or are there not, technological frontiers whose forward advance will be as spectacular and as beneficent? Agricultural policy, migration policy, trade policy and perhaps in the long run the prospects of world peace, hang on the answer. Dr Scott Robertson, addressing the agricultural section of the British Association, was confidently positive. Quite apart from any discoveries as yet unmade or wholly unexploited, the mere raising of general standards to those of the best farming practice now current would, in his view, raise the productivity of British or American agriculture by 50 per cent—with correspondingly greater possibilities in backward countries where the margin to be made up is vastly larger. Great, though unspecified, gains may be expected from the better use of grass, whether dried or in silage. And a reduction of only 10 per cent in the cereal losses inflicted by pests between harvest and consumption would by itself go a long way towards closing the "cereal gap." The establishment of fertiliser industries in India and China would make it possible for those two problem countries to feed their own people properly. The twentieth century's advantage in scientific knowledge, in fact, more than outweighs its deficiencies in virgin lands.

All this is, of course, extremely encouraging—though scientific and technical potentialities must be exploited as vigorously as any pioneer ever exploited his prairie holding if they are to be productive. But some obstinate misgivings haunt the mind of the reader of Dr Scott Robertson's speech. One can hardly repose unqualified confidence in the judgment that "no material progress was possible" up to 150 years ago, and depicts all the preceding centuries of human history as consisting of unrelieved "want and famine." This is an over simplification of history, as Drummond's *The Englishman's Food* would show. Great advances in scientific farming and stockbreeding occurred well before the end of the eighteenth century. Confidence is further undermined by Dr Scott Robertson's belief that "the old conception of exchanging agricultural products for industrial products has almost passed" and his criticism of the British import of Polish pig-meat and eggs because Poland needs them more than Britain, for all the world as if Poland were being forced into this trade against her will. If the possible 50 per cent increase in British and American agricultural productivity bears the same relation to reality as his comments on the past and present, the outlook may not be so promising as Dr Scott Robertson would make it appear.

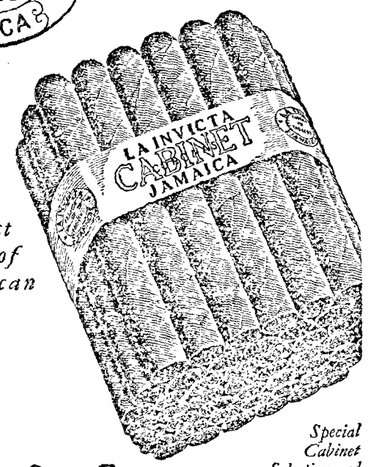
Burmese and Karens



The Communist revolt in Burma has had the natural result of loosening the bonds of union between the Burmese and the non-Burmese peoples who under a carefully drafted constitution have been joined with them in a federal state. The most numerous and important of these are the Karens, who live in the hilly country along the Salween in the south-east of Burma and have also settled among the Burmese in the plains of the Irrawaddy delta. There is an old antipathy between the Karens and the Burmese, who differ from each other in language, customs and temperament, and the divergence was accentuated during the war when the Karens resolutely resisted the Japanese while many of the Burmese were collaborating with them. The Karens have been generally dissatisfied with the place given them in the new Burma and some of them have even been talking of setting up a separate Karen state between Burma and Siam. Taking advantage of the civil war in Burma, the Karens last week occupied

the important port of Moulmein; their leaders denounced the Burmese Communists, but made it clear that their support of the Government would be conditional on the granting of their demands for local autonomy. Rangoon claims that a settlement with the Karens has now been reached, but its terms have not been disclosed.

The civil war has also affected the Shans of the interior whose territory marches with the Chinese province of Yunnan and who have many Chinese settled among them. Communists are reported to be active in this region and in view of the difficulty of closing the frontier to infiltration, it is possible that the Yunnan authorities may at any time begin to intervene on the Burmese side of the border. Chinese penetration into Burma might be initially helpful to the Government in Rangoon if it cleared Communists out of the border areas, but it might soon become very embarrassing, as China maintains extensive territorial claims on northern Burma, where a part of the frontier had never been finally demarcated down to the time of the British withdrawal.

Opposition in Israel

Long before the Zionists achieved a State, they had a Revisionist Party. With its militarist mystique and its adolescent power fixations, it exactly resembled the German free corps fighters and early Nazis, or any of the other groups of disorientated and thwarted petty bourgeois who have been one of the curses of Europe for a generation. In 1939 and 1940 an "activist" group split off from the Palestine Revisionists, taking with it the cream of the movement. It founded in Palestine the National Military Organisation—Irgun Zvai Leumi—and in America it built up various Hebrew leagues and liberation committees which succeeded in raising a great deal of money from gullible—and some less gullible—Americans.

The Irgun became a secret terrorist society, whose subsequent exploits are well known. Their mentality has been ruthlessly exposed by Arthur Koestler in his book *Thieves in the Night*, the "hero" of which abandoned life as a communal settler to be absorbed into the Irgun with its secret initiation ceremonies, its terrorism, murders and bank robberies. A further schism in the Irgun produced the Stern Gang, an even more secret and mystical assassination society, led by a mathematician who was later killed by the police.

Both these groups are now troubling Israel and the United Nations. After the proclamation of the state, they came out into the open. The Irgun lost credit by its early failures in the fighting for Jerusalem and also by the strong action taken against it by Hagana when it tried to run in an arms ship during the first truce. Since, however, it has been building up its strength again. It has now swallowed its parent, the Revisionist Party, and has formally proclaimed itself the spokesman of Israeli militarist expansion. The first objective is the incorporation of Jerusalem in Israel, and the United Nations will have to take note of the fact that the Irgun is ready to resist by force any attempt to internationalise the Holy City.

The Sternists, who since last year have made a nominal shift to the left and pretend to support Russia, have also, in a tragically naïve and childlike series of statements to the press, announced their intention of carrying on the war. They, however, propose to organise murder campaigns against leaders of the United Nations. These indiscretions have brought on their Tel Aviv headquarters an Israeli police raid, and a number of their leaders have been detained. The Israeli authorities, however, still have to behave respectfully and even tenderly towards all these dissidents, and the problem they present is by no means solved.

* * *

Stocktaking in a Development Area

The North-East Development Association states in a memorandum just issued* that the reduced capital investment programme last winter caused 50 industrial projects in Northumberland, Durham and the North Riding to be deferred and that these deferred projects represented an "employment potential" of 10,000 workers. Information on the vicissitudes of the capital programme is not plentiful, and the association asks reasonably enough for the publication of figures which would make it easier to compare the impact of the capital cuts on the north-east with that on other parts of the country. The north-east has not, the association admits, been worse treated than the other development areas. But there is a natural anxiety that "so far as is consistent with export demands, the cuts should fall much more sharply on the areas of low unemployment than on the development areas as a whole." It is on this point that the association, which speaks on questions of industrial expansion for the bulk of the local authorities in the area, would like more information. In July, 1947, before the White Paper on Capital Investment was issued, the proportion of insured workers in the building trades was 6 per cent below the national average; and unemployment in building trades in the area was 6.3 per cent last March. The association finds this disturbing; but it might be the result of other causes than too little factory building.

It should be added that "employment potential" is not so calculable a thing as development plans tend to assume; the memorandum makes this clear. Two years ago a similar memorandum stated that the region needed about 150,000 additional jobs in years of average trading conditions. New factories agreed upon by mid-1946 were expected to provide employment for about 70,000 persons; by last April the expectation had risen to 102,500, and actual employment in new factories had reached nearly 32,000. But during the period in which 32,000 new factory jobs were provided the actual volume of employment in the area rose by only 20,000. This suggests a strong drift of workers from the old to the new industries. At the same time the reliability of the estimates is doubtful, since "a number of factories have not achieved the target set for labour demand and see little likelihood of doing so." The tendency for expanding industries to draw more workers than they can maintain in employment is noticeable. Building and contracting, the light mechanical industries, and textiles and clothing have attracted insured workers more quickly than they have been able to employ them. This is one of the difficulties which accompany attempts to diversify and expand the regional economy. Another is the tendency for the employment of women to expand with the industrial changes, and for the employment of men relatively to contract: "Any further contraction of the basic industries will fall almost entirely upon male workers, and it is therefore imperative that the industrial development during the next few years should be concentrated upon providing more jobs for men."

* * *

Aerial Bludgeoning

The air exercises last weekend were unpleasant reminders of the war in more senses than one. Air Ministry communiqués have naturally been reticent, but it has nevertheless been possible to deduce the broad outlines of what the rival air forces attempted and what they achieved. The disturbing picture which emerges is that apart from the use of faster aircraft, little progress seems to have been made in either offensive or defensive tactics. The bombers still try to "obliterate" their targets; the fighters continue to be misled by "window" deceptions. The whole exercise had an air of small boys playing soldiers, and in spite of the sleep-preventing roar of aircraft over London in the early hours of the morning, it was not a particularly impressive display of the skill which saved Britain in 1940 and which sank the *Tirpitz* in 1944.

The Air Staff must learn that war is not a blunt instrument with which to destroy everything of the enemy within reach. Europe is paying in full now the price of the annihilation tactics of the Allies during the last three years of the Second World War. If the same tactics are used in a third war—and the reports of last week's air exercise show no change of heart on the part of the Air Ministry—the desolation in Europe will be complete. Victor and vanquished will alike be destroyed. If, instead, the air force were to concentrate on precision bombing, on destroying communications and on attacking only those targets which must be destroyed to facilitate the advance of troops on land or to secure the safety of ships at sea, then there might be some hope of having something left with which to rebuild after victory had been won.

Shorter Note

Comment on the report issued by the Economic Commission for Europe on trade between eastern and western Europe has had to be postponed for a week. The digest of the press release and the statistics included in it can be found in this week's issue of *Records and Statistics*.

Letters to the Editor

Defence and Defiance

SIR,—In *The Economist* of August 21st you say that Mr Churchill's followers "should have pressed the Government much harder for assurances about the state of civil defence, about the disbanding of special airborne and armoured formations, about the state of anti-aircraft and fighter resources and about arrangements for calling up reservists."

I feel it only fair to point out that these matters have been constantly raised by the Opposition, not only in the past but in the present Session. Regarding civil defence in particular, a Supply Day was obtained by the Opposition and the matter raised at considerable length in a debate on March 22, 1948. Owing to the utterly inadequate reply of Mr Younger, the matter was brought up once again by the Opposition in the House of Lords on June 23, 1948.

Questions and criticisms regarding the state of our anti-aircraft resources have been constant since 1945, and I personally have asked for information on this subject at least four times without eliciting a single answer.

May I say in conclusion that it is a source of disappointment to many of us who are interested in defence matters that your paper so rarely devotes major articles to this subject.—Yours faithfully,

ANTONY HEAD.

House of Commons

[We have omitted, for reasons of space, the ten references to Hansard included in Brigadier Head's letter. Certain Conservative MPs have worked hard in debate and in question time to secure information, but it can hardly be said that criticism of the Government's defence policy has played a major part in their party strategy. *The Economist* shares with MPs and the rest of the press the difficulty of getting from the appropriate ministries information adequate for constructive discussion of defence questions.—EDITOR]

Unity in the West

SIR,—Why have the signatories to the Brussels Pact not appointed a commission whose terms of reference are to subdivide the nations of Western Europe into political constituencies for the purpose of holding direct popular elections to a European Assembly with advisory powers?

This course would serve to:—

(1) Make the electorate "union" conscious.

(2) Drive the candidates to stand for European parties of the left or right *irrespective of their nationalities*.

(3) Encourage the members of the elected assembly to gain the confidence of the European peoples and thus their support for demanding that the existing National Governments should transfer executive power to the Assembly.—Yours faithfully,

GERVASE A. FRAIS

130 *Bickenhall Mansions, Baker Street, W.1*

Disinflation in Jeopardy

SIR,—The article on "Disinflation in Jeopardy" in *The Economist* of September 4th is not without relevance to the question of up-valuing the pound. Disinflation, you say, has been "diluted." "The continuing rise in import prices and in other costs has lifted the bill for cost of living and agricultural subsidies far beyond what was contemplated in the budget." You are referring here not to the rise in the cost of living (which has not been altogether avoided), but to the encroachment of increased subsidies, as well as of other items of increased expenditure, upon the budget surplus.

If the dollar-value of the pound were raised, the sterling prices of imports would be reduced in proportion, and the excess prices of the subsidised imports much more than in proportion.

You do not refer to export prices. In my letter in *The Economist* of August 21st I said: "As soon as the external price-level diverges at all far from the British wage-level, the rise of wages is sure to occur." The recent rise conceded in the engineering industry, which was the occasion of your article, is an apt example. So far as it goes, it "marks both the extinction of the stimulus to exports and the irreversible progress of inflation."

In your note on that letter you express the view that "in the *long* run it is overwhelmingly probable that the pound should be devalued relatively to the dollar—unless the American inflation goes much farther, and the inevitable ensuing reaction much less far, than now seems likely." I fear that is so; for it is "overwhelmingly probable" that the Government will continue, with the support both of *The Economist* and of the majority of economists, to keep the pound tied to the dollar, so that the British wage-level will rise nearly in proportion to the American, and when at last inflation in America gives place to deflation, Great Britain will be faced with the disastrous alternatives of depreciation of the pound, or deflation, with its accompaniments of depression and unemployment.

In my previous letter I said that up-valuing the pound would cause the loss "only of the least profitable portion" of the export trade, and you ask what "least profitable" means. The least profitable exports are those which use up the greatest amount of productive resources in proportion to their yield in foreign exchange. The cessation of these exports may in some instances result in the productive resources released being applied to some purpose for which they are less well adapted. But it is much more likely that they will have been diverted by the export drive from more suitable employment, and will be more fruitfully employed by reverting to it.—Yours faithfully,

29 *Argyll Road, London, W.8* R. G. HAWTREY

The Olympic Games

SIR,—Your Note of the Week for August 21st brought politics very much into the picture when discussing the one international organisation which nowadays strives to exclude the political element. It was not the fact that you implied that the Olympic flame went out on its arrival in England, but the fact that you have missed the general feeling of the common peoples of the nations which took part in the Games, and in particular in the Torch Relay.

The Olympic flame was accepted by all who saw it, or read about it, or were told about it, as a symbol of the brighter future for which all the peoples of the world are yearning. Just how it did this or exactly what it was symbolising was of no importance, the fact was that here was an aspect of international scene which surprised and delighted the ordinary man and woman in the street. Here was something which passed international frontiers without let or hindrance, which burnt steadily from its start in Olympia to its final glory at Wembley Stadium, as an expression of the fact that the international brotherhood of sport has, even in these depressing times, a real meaning to the sportsmen of the world.

The International Olympic Committee owes no political allegiance to anyone, for politics plays no part in its organisation and in its deliberations. Admittedly the politicians are the people who have the greatest say and make the greatest noise in the world today, but they are not necessarily gifted in interpreting to the world the desires of the people they represent.—Yours faithfully,

The Organising Committee for the XIV Olympiad

From *The Economist* of 1848

September 9, 1848

THE National Assembly at Paris is debating the new constitution. It has been framed by a committee, reported to the Assembly, and is now undergoing discussion by the whole body. Almost unanimously, too, it has been resolved that the Assembly shall not separate till the constitution be settled. For the twelfth or fifteenth time within the recollection of the yet existing generation, the wisest men of France . . . . are performing over again a work which all former experience since 1790 proves will not stand for one moment against the necessities, real or imagined, of circumstances, and of men in authority. They lay down rules to bind those they entrust with power, which nobody thinks of observing. Men in power are obliged, or fancy they are, from an instinct of self-preservation, to set those rules aside, and, under the first spur of necessity, they find in their swords or the circumstances of the times a rule of action at variance with the written constitution. From that moment the labour of the legislature is worthless. Some exceptional laws or other vitiate its principles; some individual or other sets them at defiance; and society is never governed by the written constitution so elaborately made It is interpreted by passion, it is set aside by interest, and the principles which dictate the exceptional laws supersede the constitution. That has been the course over and over again; and yet, with a silly and dogmatic attachment to a theory, shutting their eyes to facts and experience, the leading men of France are now pursuing the same vain and fruitless course.

Books and Publications

Economics With a Wet Towel

"Towards a Dynamic Economics." By R. F. Harrod. Macmillan. 159 pages. 7s. 6d.

THIS reprint of five lectures delivered at the University of London in the spring of 1947 arouses in the reader an incredulous compassion for Mr Harrod's original audience. A lecturer who drivels or perpetrates commonplaces can be easily dealt with ; one quietly leaves the lecture hall, or, if polite and conspicuously placed, merely registers a vow to return no more. One who is hard, just ordinarily hard, to follow can be listened to with as much concentration as possible and subsequently supplemented by reading and discussion. But a lecturer who, like Mr Harrod, compresses into (presumably) not more than ninety minutes or so a volume of theory unfamiliar, intrinsically very difficult indeed, and very incompletely translated, so to speak, from the mathematical, sets himself and his audience an impossible job.

In book form, *Towards a Dynamic Economics* emerges as a cruelly compressed, highly stimulating, beautifully articulated statement of the fundamental economics of growth ; of the necessary relations obtaining between the dynamic elements—population change, technological progress, and long-term saving—of an advancing society. In the realm of dynamics it is roughly analogous to Professor Cassel's *Fundamental Thoughts on Economics*—though one cannot imagine Professor Cassel soaring off, as does Mr Harrod in his final lecture, into a sociological discussion of the implications of his theory. (That final lecture, the only one of which the lay reader could be expected to make head or tail, deserves a wider audience than, in its present setting, it is likely to get.) Certain rates of growth, certain related rates of real capital accumulation, and certain rates of saving (defined as a fraction of income) are alone mutually compatible ; divergence of any of the factors in this fundamental equation sets up a centrifugal tendency, making the dynamic economy essentially unstable. This is the core of the argument, which one can only hope that Mr Harrod will one day restate at about five times the length, in the interests of intelligibility. The basic equation, progressively modified, serves as a sharp and elegant tool for disentangling the problems of fluctuation and depression, of foreign trade policy and of contracyclical measures. *Towards a Dynamic Economics* is packed as full of practical precepts as of fundamental theory. It has, in fact, all the hallmarks of an important and seminal work ; and it is a great pity that it should be, in its most essential parts, so very nearly totally unreadable.

Documentary History Continued

"Documents on British Foreign Policy, 1919-1939." Edited by E. L. Woodward and Rohan Butler. HMSO. First Series. Volume II. 971 pages. 32s. 6d.

THIS is the fourth volume to appear in the collection of Foreign Office documents which, though originally projected in two series, has now been divided into three, in order that the volumes for the few years immediately before the war may be published as soon as possible. The three volumes which have already appeared included one in the First Series, beginning in 1919, and the two in the Second Series, covering the years 1930 and 1934. No volume in the Third Series, which will presumably start in 1935 or 1936, has yet been published.

The publication of yet another volume for the year 1919, in advance of any of the volumes of the Third Series, which will deal with events more relevant to the outbreak of the war, will be resented in some quarters. It may, however, do something to correct the tendency of even reputable contemporary historians to run before they can walk, for in the search for the origins of the war it is only too easy to begin in the 1930s, to look no earlier than the rise of Hitler ; and it is fashionable—perhaps inevitable, also, if this first mistake is made—to diagnose Europe's trouble after 1933 as the bankruptcy of statesmanship. It is equally fashionable, among those who, avoiding this error, pursue their researches as far back as the Treaty of Versailles, to defend that Settlement and to describe any uncertainty on this score as "twaddle about Versailles." It is unsound and over-simplified to defend the authors of the Versailles Settlement while denouncing the policies of their successors. Some of the problems at the Peace Conference were not settled because they were not seen ; some, though realised, were misunderstood and therefore aggravated by the Treaty for Versailles ; many, if not all of them, were perhaps well-nigh insoluble. At all events, it will still be impossible, even when all the documents have been published for the period since 1930, to present a convincing analysis of the origins of the war without giving equal attention to the evidence on the Versailles Settlement itself and the succeeding years. The parallel publication of early and late volumes in this collection of documents will help historians to keep this truth in mind. They may be impatient that the entire collection is not published more quickly ; but they cannot fail to welcome the decision of the editors to continue the regular publication of the First Series as well as of later volumes.

When the documents of the first volume of Series I begin, the peace treaty had been settled in its main outlines and the principal topics had been decided. The Allied Supreme Council had taken the form of meetings between Heads of Delegations at which the leading statesmen were not present. Their minutes filled the first volume and are now completed in the first part of the present volume. The secret minutes of the more restricted conferences of Allied statesmen in London and Paris up to January, 1920, when the main session of the Peace Conference came to an end, form the second part of the present volume, which therefore concludes the publication of the more important of the records of the Peace Conference in its various forms.

A close study of these volumes, and especially of the records in the second half of the volume under review, which include material on Anglo-French policy towards Russia and on the difficulties created by the non-ratification of the Treaty of Versailles by the United States, is indispensable for any reliable history of the inter-war years. If they are ignored, our understanding of the problems inherent in the Versailles Settlement will remain incomplete ; our estimate, therefore, of the statesmanship of which that Settlement was the result will be unsound—and so, in consequence, will be any interpretation of the subsequent developments which led to the Second World War.

Jerusalem : During British Mandate

"Jerusalem: The City Plan." Preservation and Development during the British Mandate, 1918-1948. By Henry Kendall. London, HMSO, 1948. 21s.

The British provided Jerusalem with a plan, excellent of its kind. This book, with its abundant photographs, which anyone who has known Jerusalem will want to possess, is the story of the plan. It is seldom nowadays that so much can be had for a guinea—a handsome quarto volume, well printed, with maps and illustrations in colour. The latter, from watercolours by H. G. Gray, recall the Palestine press censor in a more human and more thankful guise. But inevitably a publication so beautifully got up, expressly intended as a challenge and a lead to Britain's successors, whoever they may be, raises questions which cannot be answered in this context alone. To the plan Jerusalem no doubt owes its freedom from some of the major vices of haphazard growth—though even here authority might have been more diligent in its support—but as operated it was essentially negative, a list of things that private enterprise might not do.

AMERICAN SURVEY

Zinoviev Writes Again

(From Our US Editorial Staff)

THE United States is bedevilled today by two complicated problems. One is the problem of Un-American Activities—polite synonym for treason—the other that of the Committee on Un-American Activities of the House of Representatives. There is little likelihood that either will be solved easily.

The patriotic fiction that no American—since Benedict Arnold—could be a traitor has been tenuously upheld through two world wars, thanks to the inadequacy of laws which made it impossible for the Department of Justice to obtain convictions. Over the last thirty years some very obvious German agents have been able to attribute their life and liberty to these laws. However, since Igor Gouzenko revealed in 1945 the existence of a Soviet espionage ring in Canada, with threads leading to the United States, the previous complacency over individual traitors and small treasonable groups has been disturbed. There is more fear today of the American Communist Party than there ever was of the German-American Bund, which made itself conspicuous and, therefore, ridiculous by wearing uniforms, holding rallies and giving the Hitler salute. The Bund was underrated ; but the Communist danger is being taken more seriously because it works underground and goes quietly about its job of persuading the innocent of the superiority of Soviet Democracy to the American Way of Life.

As long as the American people are not satisfied that real progress is being made in rooting out Russian agents, they will be inclined to accept, even though they do not approve, the privileged gossip column operated by the Un-American Activities Committee. When they try to get rid of it, they may find it is too late. This Committee was set up in 1938 as a Special (that is, temporary) "Committee to investigate Un-American Activities" under the chairmanship of Representative Martin Dies. As the Dies Committee it made itself notorious and when Mr Dies, whose own connections many people wanted to investigate, retired from Congress in 1944, there was an attempt to retire the Committee as well. The attempt failed and, during the last Congress, it was made a Standing (that is, permanent) Committee. When the Republicans gained control of Congress in 1946, Representative J. Parnell Thomas, the only survivor of the original membership, became chairman.

*

"The duties and functions of the Committee," says its latest report, "are somewhat unique among the Committees of Congress, which are principally concerned with matters of commerce, taxes, and the operation of the Federal Government ; but there is delegated to us the function of investigating subversive influences which seek to destroy the Government and institutions of the United States." Other Committees of Congress, in the past, although ostensibly legislative committees, have undertaken investigations and therefore, as Mr Walter Lippmann has said, became "in reality composites of detective agency, grand jury, prosecuting attorney, judge and public hangman." Bitter complaints about their activities have usually come from the executive side of the Government (Mr Andrew Mellon, while Secretary of the Treasury, wrote to President Coolidge that "government by investigation is not government"). But this Committee is justified in its claim to be unique in having no other function than investigation, though it has produced the Mundt-Nixon Bill as a by-product of its official task.

Such a Committee might have done valuable work had its membership been chosen from among the best in Congress. Unfortunately, beginning with its first chairman, most of its members have come from the bottom of the Congressional barrel. It may be too late to correct that situation now. Over the past ten years it has been realised that membership of the Committee is destructive of both character and reputation. The present chairman, son of a Catholic Democrat named Feeney, is chiefly remarkable for having abandoned his father's name, religion and party. Representative Karl Mundt, the vice-chairman, has been adequately described by *The New Yorker* as "the old elocution teacher from South Dakota who used to make isolationist speeches during the period of the Communist-Nazi Pact and has now fallen out with the people he once agreed with." The three other Republican members are all new to Congress this session. Mr McDowell, of Pennsylvania, is the most curious and has appointed himself guardian of the Committee's reputation. After staring vacantly into the distance through the testimony of a witness, he suddenly turns a toothy smile on him and asks obsequiously whether he thinks he has been treated with due consideration—somewhat in the manner of a head-waiter enquiring whether a customer has had a good dinner. Representative Nixon of California alone gives the impression of wanting to find out the truth even if the truth should upset the Committee's pre-conceived ideas.

All four Democrats are Southerners—probably no Northern Democrat would dare be associated with such activities—and hunt the New Deal witches on behalf of the Dixiecrat candidate for President as jubilantly as the Republicans hunt them in aid of Mr Dewey. Mr John Rankin, of Mississippi, and Mr Hébert, of New Orleans, are the most vocal. The Committee employs as Chief Investigator a certain Mr Robert Stripling, an old constituent of Representative Dies, who promoted him from running a lift in the Capitol to running a Committee.

*

This Committee has conducted two major investigations during the Eightieth Congress. The first was into Communist infiltration into the motion picture industry. During that enquiry a large number of people were charged with being Communists. Ten of them refused to deny the charge, and thereby allowed the country to assume their membership of the Communist Party. Others were not even given the chance of denial. No proof was ever given that any of these men had injected propaganda into their scripts and the public was left with the uneasy impression that they were being prosecuted for their beliefs. Mr Parnell Thomas promised a year ago to publish a list of motion pictures containing Communist propaganda, but he has never done so. The second investigation, not yet completed, has been into Communist espionage in the United States Government.

This enquiry has consisted of listening to the accusations of two ex-Communists, both filled with the self-righteousness of those who have been "saved." One, Miss Elizabeth Bentley, is a middle-aged woman of a type easily identified by any apprentice psychologist. The other, Mr Whittaker Chambers, by his own account is of the tragic company whose emotional instability drives them to try to solve the problems within themselves by rushing from one extreme to another—in his

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

case from Joseph Stalin to Mr Henry Luce. Supporting evidence was also given by Mr Louis Budenz, an old friend of the Committee, who left *The Daily Worker* for the Catholic Church in a blaze of publicity two or three years ago.

Among those accused by Miss Bentley of co-operating with one of the espionage groups was Mr Harry D. White, Assistant Secretary of the Treasury under Mr Morgenthau. Her charges were not new and had been considered by a Grand Jury in New York for fourteen months. When they were made public by the Committee Mr White, at his own request, appeared to deny them. Before taking the stand he handed the Chairman a note saying that he was recovering from a heart attack and asking for five or ten minutes rest after each hour. Mr Parnell Thomas went so far as to question the accuracy of this note—quite gratuitously, as the state of Mr White's health was public knowledge. Two days later, Mr White suffered another heart attack and died next day, his doctor saying that the strain of appearing before the Committee "could very definitely have contributed to his death." Four of the five leading East Coast papers—*The New York Times, Washington Post, Baltimore Sun* and *Christian Science Monitor*—called on the Committee to clear his name. (*The New York Times*, after admitting that the Committee could not be charged with responsibility for Mr White's illness, brought about, they said, by years of arduous government service, asserted that it could be charged with having denied him the due protection of the law, with having permitted witnesses to make unsubstantiated statements of which the accused learned only through public sources and with outraging the American sense of justice.) The Committee's only comment was in its report of August 29th, in which it referred to Harry Dexter White (deceased), stated that he had denied affiliation with the Communist Party and added that he had "admitted acquaintance with various members of the espionage group named by Elizabeth Bentley and Whittaker Chambers." The doctrine of "Guilt by Association" could hardly be stated more succinctly.

*

A great deal of time has been spent in trying to resolve the controversial problem of which of two witnesses—Mr Whittaker Chambers or Mr Alger Hiss—is lying. The day when they confronted each other publicly was worth more to this publicity-hunting Committee than a year's hard work. Before a battery of cameras, Mr Chambers bolstered his self-assertion by thrusting his head so high in the air that he stared at the room with his chin, while Mr Hiss, a stranger by background and training to the methods of this Committee, looked about him with bewilderment. Now President of the Carnegie Endowment for International Peace—on the recommendation of Mr John Foster Dulles—Mr Hiss was Mr Dean Acheson's principal assistant in the State Department during the war and was Secretary-General of the San Francisco Conference. He was charged by Mr Chambers with being a member of a Communist underground, but the altercation now revolves round his memory of the name under which Mr Chambers went in 1934 and of what he did with an old Ford car at the same period.

If it were the Committee's sincere desire to clear foreign agents out of the Federal Government, rather than to discredit Mr Roosevelt and the New Deal by finding that they were once there, it would not have wasted so much time on a witness, Mr Chambers, who left the Communist Party in 1937. (At that time the ideal of the Popular Front had attracted many liberals into innocent association with the Communists. The ferocity of the Committee, however, would make it dangerous for anyone now to admit such an association. Mr Chambers was in no position to report on which of his victims became disillusioned with his Communist friends after the signature of the Nazi-Soviet Pact, surely a vital point, even supposing his original accusations were true.) Nor would it confine its attention to men who left government employ more than two years ago. But if it is campaign material they want, the names of Mr Lauchlin Currie, Mr Harry White and Mr Alger Hiss can be used to discredit the New Deal, Bretton Woods and the United Nations.

A year ago when the Committee was investigating Hollywood it was possible to treat the proceedings as a slightly obscene joke. Its members might have been ignorant children playing with fire, but they were not actively interfering with the possibility of genuine efforts to tackle the Communist danger. Today things are different. All cameras corrupt; but television cameras, it seems, corrupt absolutely. The political children of twelve months ago have become juvenile delinquents. Their actions suggest that they, alone among the American people, think so little of the real problem that they can afford to use its shadow for electioneering purposes. They have scattered enough Zinoviev letters on the public to provide shelter for a dozen Gottwalds and Togliattis.

Television's Growing Pains

[FROM OUR US EDITORIAL STAFF]

THE struggle of peddlers for place to shout their wares over the waves that carry light and sound will enter a new phase when the Federal Communications Commission opens its September hearings on television's claim for more space on the wave band. The business of putting into mass production and consumption this mechanised combination of sight and sound, long awaited and even longer in kicking its way out of its swaddling clothes, has made enormous strides in the last six months. Those who work with it claim that television is now in full adolescence. It makes its present claims with the stridency proper to that age.

Specifically, it will ask for more room to flex its muscles, preen its pin feathers, sell its advertisers' goods. All electronic communication is, of course, held within the limit of a spectrum. In 1934 the Federal Communications Act placed control over *lines* on that spectrum in the hands of the FCC, which doled them out among the various claimants—commercial radio, marine radio, police radio, amateur short-wave radio, and so on. Television, then a mere infant, now wants more space, and is asking "blind" radio to move over. It tried to get more in 1947, but at that time its claims were weakened by a vital cleavage between two leading entrepreneurs, the National Broadcasting Corporation, which was asking for room for black and white television, and the Columbia Broadcasting System, which said it was ready to produce in colour. The FCC decided in favour of black and white, which took up less space on the wave band, and designated twenty-two channels (the 44-216 megacycle sector). The decision resolved major doubts, and the industry responded as to an elixir. By July, 1948, a former FCC Commissioner was telling his former colleagues that television needed twelve additional channels. It would like the 475-890 megacycle sector, which is almost exactly what was denied a year ago to those who sought it for television in colour.

So rapid is the present rate of growth that figures run the risk of becoming out of date between the pen and the printing press. At the end of the war there were 4,000 television sets in the United States. At the end of 1946 there were 10,000; at the end of 1947, 180,000; today there are 400,000. Sets are now rolling off the production line at the rate of fifty to sixty thousand a month, approximately as many new ones every four weeks as the total now operating in England.

In February of this year the Columbia Broadcasting System surveyed the industry and found 18 television stations in 11 American cities. It also found that 72 construction permits for new ones had been granted by the FCC, that 97 commercial applications were on file with the FCC, and some 40 stations in more than 20 cities were likely to be in operation by the end of 1948. By August the existing stations numbered 34, the construction permits granted were 89, the commercial applications on file 292, and guesses as to totals at the year's end had risen to perhaps 55.

Compared with radio, which counts its sets as nearly 70 million and its listeners by the hundred million, these television figures are small. It is the rate of growth which gives zest to the claims made by television's backers. In their more ebullient moments they prophesy that their infant prodigy will push "blind" radio out of business, supplant the newspapers if not

the books and magazines, empty the cinema houses, baseball parks, concert halls, even, perhaps, the school rooms. On the constructive side, they hope that it will restore the American family to the American home, keep the children around the fireside (provided that is where the video screen is set), put an end to night clubs, lower the divorce rate. As every house must have its television room it will, in the process, give a fillip to the building industry. Otherwise, domestic peace may be threatened when mother wants mending and lessons after supper, while father dims the lights to watch a prize fight. The industry is confident that progressive families will want more than one set. Already the cost is moving down. In 1947 the cheapest sets sold for about $300. Today one may be bought for $164. If they follow the pattern set by radio they must drop well below $50 before they can stir the mass market to buy the wares they advertise.

*

Its devotees insist, and with reason, that the time has gone when one could take television lightly. They are not so clear as to what will happen (apart from eye strain or stomach ulcers) if one takes it seriously. The turmoil extends not only throughout the radio industry and allied trades, but also stirs the entire entertainment business, the sporting world, the advertisers and advertised, and all who make their living by the printed word. Politicians are becoming aware of it; some of them appeared, unrehearsed, on television at the political conventions, and were told when they went home just what they had looked like. A few of them, who have found a favourable answer in their mirrors, may enlist the aid of television in their autumn campaigns, and rumour says that statesmen will be televised when the United Nations meet in Paris.

Within the radio industry, which has done most of the work and put up most of the money for the experimental years, the argument is joined between two groups—those who see looming here and now a parallel to what happened when sound invaded the province of the silent films, and those who claim that television has not yet solved enough of its problems to take over radio's work and radio's profits.

According to *Variety*, the magazine which is the guide and mentor of the entertainment world, the first group are a prey to "emotional hysteria . . . predicated on the fear that television will emerge full-blown overnight and that they'll be left out in the cold." The magazine points out that radio is now "headed for an alltime high in billings," and reproaches the industry for riding on its record and accepting such moronic evasions as programmes which attract their audience by offering prizes instead of new ideas.

If television's programmes could be sent out from the great web of transmitters which radio has built, all would be well, but the curvature of the earth forbids this. Sound bends, but light goes straight. Thus the country cannot be brought by television, as by radio, to laugh as one man. Programmes must be separately produced in each great centre, or passed from one to another by devices both costly and complex. Those most discussed at present are the coaxial cable now being laid from coast to coast for the transmission of telephone messages and able to be used by television, the micro-wave relay which is a system of "booster stations" every thirty or forty miles to pick up programmes and send them on, a "stratovision" system whereby "planes flying at about 30,000 feet will pick up television signals and spray them over an area having a 200-mile line-of-sight radius," a "celluloid network" whereby television programmes produced in one place are filmed and sent at once by plane to other places. The last proposal sounds a bit like sending a boy on a bicycle to deliver the shot heard 'round the world, but it is advocated by experts.

All this requires, of course, a vast amount of money. Television may have to duplicate the huge capital of the radio industry in order to get the sums needed to join sight to the sound which now pulses through 37 million American homes. The process could not be contemplated unless the potential profits were also tremendous. Television's backers assume that these costs will be met by the superior appeal of this combined medium to the advertisers who pay, in the United States, the costs of radio. It is already obvious that the advertiser will have to pay more in order to get more.

The fight between television and other forms of entertainment lies on a further horizon. Sample studies made in New York show that 51 per cent of those television owners who were interviewed had cut their cinema attendance in half after bringing the talking pictures within the walls of their homes. Of such figures are nightmares made for men who wonder who will sit in cinema seats when the present rate of television's growth has done its work for five more years.

Meanwhile a few voices rise to plead that something be done to keep television from being bound to advertising as is radio. Congress, says one lawyer, should "spell out before it is too late a comprehensive national policy for television" if it is to serve "not only as a source of casual entertainment but also as an instrument of public information and enlightenment."

American Notes

Campaign Kick-off

President Truman started the campaign rolling at Detroit on Labour Day with dire predictions and fair promises: predictions that a Republican victory would inaugurate a new "era of fear" for labour and a new boom and bust cycle—"boom for them, bust for you"—endangering living standards and democratic institutions; promises that under the Democrats the Taft-Hartley Act would be repealed, labour's gains during the last 16 years perpetuated, the minimum wage raised, and national health insurance adopted. (In fact, even were he re-elected, a revolution in Congress would be needed to enable Mr Truman to fulfil the first and last of these promises.)

The model evidently is Mr Roosevelt's Teamsters Union speech in the 1944 campaign. Its merciless jibes at the Republicans are widely believed to have turned the tide by arousing labour to fighting pitch on the one hand, and goading Mr Dewey into losing his temper on the other. But hardly had Mr Truman finished speaking than the very Teamsters who responded to Mr Roosevelt with cheers and a campaign contribution of $150,000, announced that they would not endorse the President, but would concentrate on the Congressional races. The loss of Mr Tobin, who led Mr Roosevelt's appeals to labour, is heavy; equally ominous is the suggestion that the Teamsters—the largest union in the country—were influenced by their West Coast members, who wish to be free to vote for Governor Warren on the Republican ticket.

It is true that the Americans for Democratic Action have "emphatically" endorsed Mr Truman after failing in their attempts to dislodge him. The executive council of the Congress of Industrial Organisations has voted by 32-12 to support the President; most of the union presidents of the American Federation of Labour—with the exception of Mr Tobin and Mr Hutcheson—are forming a committee to work for the Democratic ticket. But these federation decisions spring less from enthusiasm for the candidate than for the Democratic platform and distaste for the alternatives presented by Mr Wallace and Governor Dewey. It is also felt it would be difficult to work up interest in the local contests in which labour is supremely concerned, without taking a national stand. Such a restrained vote of confidence at the top levels does not relieve Mr Truman in any way of the need to dramatise his campaign so that the rank and file will ring doorbells, distribute literature and, most important of all, go to the polls as they did in 1944.

*

It is almost impossible for Governor Dewey to woo the labour vote with the brickbat of the Taft-Hartley Act in his bouquet. Instead, to reply to the President, he sent Mr Harold Stassen—no favourite with labour—to Detroit to defend the Act, to point out that it was passed by a majority of Democrats as well as Republicans, and that Mr Truman himself has invoked its provisions seven times to settle threatened strikes. The high cost of living, Mr Stassen insisted, was not a Republican responsibility, but largely a price America should be glad to pay for world reconstruction; but it had been exaggerated by Mr Truman's incompetent leadership both at home and in foreign policy. With his reputation as an advanced internationalist, Mr Stassen is a potent critic. The prominent role assigned him in the campaign reinforces the belief that Governor Dewey will emphasise the Republicans' new international note and dissociate himself as far as possible from the more conservative and isolationist wing of the party represented in Congress by Representatives Halleck, Taber, Martin and Allen.

Challenge to Taft-Hartley

While Mr Truman has been denouncing the Taft-Hartley Act, its emergency provisions have for the first time failed to avert a major strike. The agreements between the maritime unions and management on the Atlantic Coast have failed, this time, to survive transplanting to the more bitter industrial climate of California. There, the Congress of Industrial Organisations Longshoremen's Union, under the fiery left-wing leadership of Mr Harry Bridges, came out on strike as soon as the injunction expired which has imposed labour peace for the past 80 days. Mr Bridges threatens a four to six months' coastal blockade from Seattle to San Diego. Wage increases are at stake, but the main stumbling-block to agreement on both coasts was the ban of the Taft-Hartley Act on the closed shop, which the National Labour Relations Board has interpreted as applying, in one case, to the hiring hall operated under union control. On the East Coast the shipping companies agreed to continue the hiring hall as before, until a Supreme Court decision could be obtained. Mr Bridges, a root and branch enemy of the Taft-Hartley Act, has turned down a similar offer, on the grounds that he cannot accept a hiring hall "with strings attached"—and perhaps in the hope of securing a better settlement than the East Coast unions with whom he is at odds.

Four other seamen's unions, bound by a "one for all" pledge which forbids separate agreement, have joined the dockers. The employers, as ready for a fight to the finish as Mr Bridges, have announced that, tired of "Communist-inspired disturbances and chaos," they will sign no agreement with a union whose officers—like Mr Bridges—have not signed anti-Communist affidavits. As a result, Hawaii and Alaska are cut off, except by air, from American supplies, and aid cargoes to the Far East are suspended. In New York, meanwhile, Marshall shipments are held up, and the city's commercial life slowly strangled by a lorry drivers' strike for higher wages and welfare benefits similar to that two years ago.

The most interesting aspect of the dockers' strike is that it raises for the first time, on a large scale, the question of Federal policy toward a strike in an essential industry which the emergency provisions of the Taft-Hartley Act have failed to stop. With the withdrawal of the injunction, which is required by law after 80 days, the President's powers are exhausted; he can only lay the matter before Congress—which does not reconvene until January. A similar situation was reached in the atom plant strike at Oak Ridge, but in that case management met labour's claims without delay. Even so, the question of labour relations in the atom plants has led Mr Truman to appoint a special committee of inquiry. The watch-dog committee set up to make recommendations for changes in the Taft-Hartley Act is now faced, on the West Coast, with the fundamental question for which the Taft-Hartley Act failed to provide any solution.

* * *

Operation Squirrel

Beryl, bismuth and cadmium, columbite, kyanite and corundum, monazite and muscovite mica—these are some of the less well-known strategic materials which America's biggest squirrel, the National Munitions Board, proposes to collect at once for storage against the lean winter of a future war. In spite of their poetic names, they all have their military uses, just as do pepper and castor oil. Altogether there are 67 names on the Board's list of materials which are essential to the security of the United States and in which the country is relatively deficient. A five-year programme for building up stockpiles of these materials was begun in 1946 and is expected to cost at least $3 billion. Although the need for such a programme is generally accepted, in marked contrast to 1940, so far only about one-fifth of it has been completed, and it is said to be badly spread out of balance. However, the Board has now announced that it expects to spend or commit almost $500 million during the current fiscal year ending on June 30, 1949; actual expenditure will be about $213 million, more than twice that during the last twelve months.

This acceleration of the programme is explained by the unsettled international situation. The Board feels that it can no longer allow itself to be deterred by the fear of competing with industry for supplies and of driving up prices, and that the national economy has had sufficient time to recover from the war. The Board tempered its new aggressiveness with two changes in its methods, designed to minimise its psychological and practical effects on the inflationary situation. In the first place, it has published the quantities which it proposes to buy, during the current quarter, of the 28 materials on which it is concentrating at present; in the case of 18 of them it does not expect to make any further purchases during the fiscal year. But this does not apply to copper, lead, zinc and natural rubber, which are all in very short supply; during the July-September quarter the Board proposes to buy, from normal commercial markets, 30,000 short tons of copper, 16,000 short tons each of lead and zinc and 25,000 long tons of natural rubber. In spite of the Board's insistence that the quantities to be bought have been kept at low enough levels to have little effect on the price structure, industry fears that dislocation and rising prices will be inevitable if the Board continues to buy these commodities at the rate forecast for the current quarter. However, it is some comfort that the Board does not propose at present to stockpile iron ore or petroleum products—nor uranium, which presents difficult storage problems.

Businessmen have also welcomed the Board's second new move, which is to enlist the co-operation of producers and industrialists in making its purchases. Firms which normally buy large quantities of the needed commodities are to buy a little extra for Uncle Sam's stockpile, and it is hoped that, by using private channels in this way, the Board will be able to obtain what it needs without asking for compulsory powers. In order to reach its long-term goals, the Board proposes to include in the national stockpile reserves built up by industry for its own use and to take over all the output of any new sources of supply, which are developed as the result of stockpile contracts. Some at least of these new sources are presumably those which are to be opened up overseas under the Economic Co-operation Act. At present the United States is chiefly interested in acquiring chromite, antimony, manganese, lead, tin, copper, graphite and palm and coconut oil by this means, and they are expected to come mainly from French and British colonies. ECA officials insist that these requirements are to be met by increased production, that this is a long-term policy and that they do not want to disturb existing trade patterns.

* * *

The Right to Medical Care

The ten-year health plan for the nation submitted to the President by the Federal Security Administrator proposes to increase Federal expenditures on health from $743 million a year to $2.3 billion by 1960. Most of the goals are those advanced by the National Health Congress last year. The most urgent is to increase the supply of doctors and nurses by a Federal grant to enable training facilities to be doubled. It has long been recognised that American medical care, at its best a model to the whole world, is badly distributed throughout the country, with rural areas the most neglected. In 1940, for example, the number of persons per doctor in New York was 545; in Mississippi, which sadly accepts the label of 48th state, it was 1,758. The same disparity exists in hospital beds; and the report urges a doubling of Federal appropriations for hospital construction to $150 million, with the aim of adding 600,000 hospital beds to the present 900,000 by 1960. It also recommends increased Federal aid for mental health work, which has lagged far behind advances in knowledge, and for a number of other health services.

The proposal to establish a national health insurance scheme reopens an old controversy with Congress, however, at the very start of the election campaign. As long ago as 1932 the Committee on the Costs of Medical Care recognised the need of some form of prepayment scheme, financed by insurance contributions or taxes or both, to alleviate the crushing burden of the costs of illness and make better care more widely available. Since then there has been a great growth of voluntary insurance schemes, organised by hospitals, medical societies, co-operatives, labour unions, and industry, which now cover about a quarter of the nation. The Blue Cross plans, devised to meet hospital deficits as well as patients' needs, meet the costs of hospitalisation up to 21 or 30 days. The American Medical Association has approved prepayment schemes for medical and surgical care which cover over three million subscribers. New York City recently embarked on an ambitious experiment with tax-assisted voluntary health insurance for any resident earning less than $5,000 a year. But the present report insists that the voluntary system is too costly for more than half the American people.

The right to equal medical care was one point in President Roosevelt's "Economic Bill of Rights" and Mr Truman has been fighting for compulsory, comprehensive health insurance since 1945. Even the Democratic Congress in 1946 failed, however, to bring to a vote the Administration-sponsored Wagner-Murray-Dingell Bill for health insurance. The opposition of the medical profession to any element of compulsion or non-medical control is extreme; and most Republicans are wholeheartedly opposed to "socialised medicine" despite assurances that participation by doctors or hospitals would be entirely voluntary.

THE WORLD OVERSEAS

Sick Man of Europe?

(From Our Paris Correspondent)

THE combined talents of Edward Lear and Lewis Carroll would be needed to do justice to the monstrous and ever-growing incongruities of French politics under the Fourth Republic. Yet the comedy is being played in a tragic setting of social disintegration. The political spasms are symptoms of a serious disease—unless, as many people here believe, they are the death agonies of the regime itself.

The decline of the French currency, which is the root of the evil, is an old tale: since the first world war France has been living beyond its means and consuming capital with cumulative effect. The country has now reached bankruptcy, and at the same time it appears to be deprived of the energy and resilience necessary to recover solvency. Each class of the community—rural, industrial, professional or capitalist—clings to the illusion that it is the victim of the oppression or conspiracy of the others, and believes that there would be an easy way out of its misfortunes if only the others would pay the price.

Although the political leaders who pass the ball of authority between each other with the deftness of champion netball players are blamed for the instability and confusion, they are more fully aware than most of their compatriots of the need for drastic measures to halt the inflationary spiral. They are well placed to see the disastrous results of ever-increasing issues of notes and credit, to pay the bills for reconstruction, armaments, capital development, social security and all the burdens of a modern state deprived of modern revenues. They can watch at first-hand prices inexorably outstripping wages, causing havoc on the labour front and knocking French exports off the world market except during the fleeting moments of equilibrium which follow successive devaluations of the franc.

With varying success, French leaders have not ceased to strive to bolster revenues and contract expenditure. This year efforts in both directions have been intensified: the exceptional levy brought 92 milliard francs into the treasury; civil and military services are being cut; reconstruction and investment programmes curtailed and postponed. Nevertheless, when Monsieur Paul Reynaud became Finance Minister he found himself faced with a disastrous balance sheet, and the Finance Commission presented a report to the Assembly last month forecasting a deficit of 250 milliard francs for the present year and 500 milliard francs if the present rate of spending and receipts is maintained in 1949.

The Case Against Control

Plainly the country can only be extracted from this slough of financial despondency by sacrifice and effort. But it is a good deal less plain how that sacrifice is to be imposed and on which sectors of the community. The Socialists and Left-wing Catholics argue that the food prices have already offset the last wage increases, and that the workers therefore not only cannot contribute further sacrifice, but, on the contrary, must receive an additional portion of real revenue. In these circumstances inflation can only be warded off by redistributing the national income, increasing taxation, reducing profits, controlling prices and credit, and using authoritarian and coercive measures to compel the middle classes to disgorge stocks and pay taxes.

Ethically, this case is hard to refute, but its practical inconveniences have proved almost insurmountable. The whole structure of the French economy, with its excessive number of independent producers and distributors and its reliance on food deliveries from small farms instead of from concentrated and easily controllable imports, makes control far harder to exercise than in Britain. The system of state direction, far from being associated with Socialism and progress, reminds the French of the black obscurantism of Vichy and German rule. The long standing embarrassments of the French Treasury and consequent under-payment of civil servants makes the administrative machine outstandingly incompetent and corrupt. Recent economy drives have completely dislocated the instruments of economic control which would now be excessively hard to restore. The French judicial system makes it virtually impossible to impose harsh and prompt penalties on speculators and social parasites. The taxes imposed gradually over a long period are many of them so complicated as to be ungatherable, yet fiscal reform or ruthlessness to superfluous traders and middlemen are electoral liabilities of the first order. The vote in the Assembly which brought to an end the short-lived Schuman experiment was not directed against M. Schuman himself, who had a majority at his investiture one week ago, but against Socialist direction of finance and economy.

These factors are held by Conservatives, and notably by the most able of Conservative financiers, M. Paul Reynaud, to show that the remedy lies not in compulsion, but in persuasion, less in forcing the capitalist to disgorge his capital than in convincing him that he has something to gain by investing it. Side by side with the reduction of state expenditure and the improvement of fiscal methods, M. Reynaud proposed to restore the confidence of the business world so that the vast reserves of wealth in private hands, now frozen in the form of hidden gold, stocks of commodities or accumulation of foreign currencies, could be brought back into circulation. Incontestably this would raise the nation's productive level and would later permit the standard of living of all classes, including wage-earners, to improve. M. Reynaud counted on precipitating this revival of capitalist confidence by a far-reaching monetary reform: he proposed to institute a new symbolic currency—a *monnaie de compte*—which would not enter into circulation at all, but would be used simply for loans and investments, would have a constant value in terms of gold and the dollar, and would be used as a species of yardstick for the economy as a whole, unaffected by fluctuations in the value of the franc. Had M. Reynaud remained in office, he would have made a pilgrimage to Washington this month to obtain the International Monetary Fund's blessings for this curious experiment.

Deadlock Between Left and Right

It was almost an accident that M. Reynaud's programme ended almost before it began. The decisive factor was the sudden advance of food prices at a moment when seasonal glut on the market normally reduces them. Meat prices were particularly affected, as extra rain induced farmers to keep their beasts fattening on the fields instead of sending them to market, and this was the final factor bringing the exasperated *cartel de la baisse* of non-Communist unions to stake new wage claims. The act brought them closely into line with the policy consistently pursued by the Communist-dominated CGT.

It can be reasonably argued that either the Socialist or the Conservative remedies for inflation, if pressed to logical conclusions, might ultimately succeed. But the brisk switch from one to the other, or, still worse, an unhappy compromise between the two, ensures the country the worst of both worlds. As it is, the capitalist and business world has less confidence than ever, while the wage-earners are likely to discover that the extra notes they may receive, not representing any equivalent sacrifice from the other classes, will merely speed on inflation and be quickly absorbed in a new rise in prices. Unfortunately, the political balance in the country and the Chamber is so precarious that only a coalition of Left- and Right-wing Parliamentarians can suffice to save the regime itself from its antagonists on the extreme Left and Right. Thus the switch from one policy to the other or the compromise between the two is inherent in the politics of the "Third Force."

Meanwhile, the country is kept going by American munificence, to which has recently been added extra assistance under the European Recovery Programme from France's ERP partners. When the intra-European currency pool was planned a few weeks ago to assist debtor countries, it was discovered that France would absorb almost half of the total at the disposal of the 19 member nations. Its helpless dependence is generally agreed to be the heaviest cross the Organisation for European Economic Co-operation (OEEC) has to bear today.

Nevertheless, it is hard to resist an underlying conviction that the French situation—to borrow an Austrian paradox—is "desperate but not grave." Desperate, because the end to the inflation is still out of sight, but not grave, because France remains potentially Western Europe's greatest asset—its people among the most talented and lively in the world, the land larger than the United Kingdom, Ireland and Italy put together and potentially far more fertile, its industry, if re-equipped and brought up to date, potentially immensely productive. Given the psychological conditions and the necessary financial technique, the possibilities are dazzling, and there are many who are beginning to wonder whether the political and economic union of Western Europe might not provide the necessary breach with the too recent past—its defeats, disillusion, paralysis and despair.

Crisis in Poland

[BY OUR WARSAW CORRESPONDENT]

Now that its Secretary-General, Wladyslaw Gomulka, has been demoted, the Polish Communist Party will be able to carry out its merger with the Socialists. The date of the fusion will be the end of October or the beginning of November, and it has already been settled that President Bierut will be president of the new party with Cyrankiewicz as the probable Secretary.

Although Gomulka has been left with the Government posts of Vice Premier and Minister of the Recovered Territories, he is not expected to have any position of importance in either the new party or the cabinet after the merger. He gave the Polish Communists a severe shaking, and while it may be true, as he said, that the party emerged strengthened, the Communists will not soon forget the Gomulka crisis. Now that all is settled, it seemed impossible that he could have avoided his downfall. It is certain at least that he could never have "pulled a Tito," taking the whole party with him, but there were moments when the Communist Party seemed to be on the point of splitting.

Gomulka's sins sounded remarkably like Tito's—"nationalism," the "will to personal power," and a refusal to submit to Soviet leadership and party power. On the agricultural question, Gomulka was also charged with favouring "rural capitalists" by refusing to sanction an immediate socialisation drive. But, unlike Tito, he did not suddenly change to complete collectivisation. However, it is clear that Gomulka defended Tito and only agreed to recant last weekend after an earlier refusal. It is also clear that he was not alone in his stand.

Gomulka's Bid For Power

The most ticklish question is exactly what stand he took. On the question of personal power, it is said that whether or not he admired Tito and wished to defend him against the Cominform's denunciation, Gomulka certainly did wish to emulate the Jugoslav leader to the extent of gaining single-handed control over the Party and the state. As Secretary-General, a strong man, and the only available and suitable "front man," he was in a fairly good position to try. It certainly cannot be said that Gomulka is popular with a majority of Poles—no Communist has achieved that felicity—but he was popular with the Party rank and file, and generally recognised as a Pole who spent most of the war in his country, and is not therefore referred to by the people as a "Russian." The fact that the Party had no ready replacement for him is considered to be an important reason why he was not demoted earlier.

Nevertheless, the Polish Communist Party has been an oligarchy since the days of the war, and there was strong opposition both in Poland and, presumably, in the Kremlin against allowing the rise and domination of a single prince. It has never since the war been possible to say that one man ruled Poland. Gomulka, as Party boss and front man, was more or less equal in influence to Jacob Berman, as arbiter on foreign affairs, the press and ideology, and to Hilary Minc, as chief of all economics. In addition, important individual powers are held by President Boleslaw Bierut, especially on matters of administration, and the police and army chiefs.

The problem of nationalism is much more complicated. To be a Polish Communist means of necessity to have two loyalties. More often than not, they are seen as complementary and there is no problem. But when the two conflict, practically everyone is torn. It would not be right to say that Gomulka is Pole first, then Communist, while others reverse the order. Rather, it is a question of delicate balance which cannot always be maintained.

One of the most important issues within the Polish Communist party on this subject is that of Germany. It is understood that Gomulka believed a divided Germany to be in the national interests of Poland, at least until reconstruction here is much more advanced. However, when Soviet policy made a strong point of a united Germany, the question arose of issuing a supporting declaration. Gomulka opposed, Foreign Minister Zygmunt Modzelewski (another man of importance in the party) went ahead. After much argument, the Polish delegation succeeded in getting a guarantee of the Oder-Neisse border inserted in the eight power statement issued at Warsaw. According to one source, it was the only change achieved in the draft Molotov brought with him. This problem of German policy cannot yet really be considered solved, but it is presumably in abeyance for the moment until the results of the current east-west negotiations have been translated into Eastern policy.

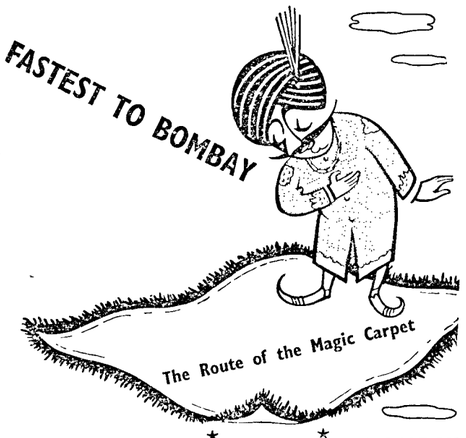
More Trade with the East

Another example of the type of argument involved by Gomulka's nationalism (which he, at least, would never imagine as anti-Soviet) was the decision on investments. Gomulka wanted the limited funds available to be put into artificial fertiliser plants. Poland always had to import a large quantity of fertilisers from Germany, and since most of its own small capacity went to the Soviet Union because the plants were near Lwow, it was left entirely dependent on Russia and Germany for this prime agricultural requirement. It was Gomulka's idea that Poland should become more independent, especially of Germany. But the economic chieftain, Hilary Minc, favoured the development instead of the textile mills of Lodz, which meant the expansion of textile exports to Russia, cotton imports from Russia, and therefore less Polish autarky but more Polish trade with the East.

But such points were simply detailed instances of a state of mind unacceptable in Moscow—the state of a mind still able to survey situations and make judgments independently, a mind still a little unamenable to the strict Party line. It was evidence of this attitude that cost Gomulka his pre-eminence. By the time of the Polish Communist Party's Central Committee meeting, called to uphold the excommunication of Tito and reshape the party's programme on the basis of the Cominform statement, the split had gone too far for Gomulka to attend. It is also true that he was ill, but his body was not ailing alone. He not only refused to accept the party's decisions (this is true in spite of a published telegram sent before the meeting that he approved of everything done) but also he would not confess the error of his own ways. The meeting was a stormy one, and it has now been ascertained that even at the end it was not unanimous. Of the 33 Central Committee members officially mentioned as present, one voted against the final resolution, several abstained.

Dependence on Russia

It would be unwise to attempt to prophesy the consequence of Gomulka's final submission, but it seems unlikely that it will have any fundamental effect either on Poland's internal composition or on foreign relations. To an observer here there appears no possibility that this country, next door to the Soviet Union, dependent upon it for assistance absolutely necessary for the fulfilment of its economic plans (which, unlike the Jugoslav plans, are progressing well) could hold out as the Jugoslavs have done. Furthermore, Gomulka had no such position domestically as that enjoyed by Tito, and the Polish Communist Party, as well as the Socialist Party with which it is to amalgamate, includes a number of ambitious opportunists besides the orthodox Marxists who would not hesitate to topple party leadership and obtain power in the way the Cominform proposed should be done in Jugoslavia.



Trade with the west, or even the possibility of western aid, could not be an alternative to remaining sufficiently in harmony with the Soviet Union not to incur its wrath. There has never been any indication that Russia objects to Poland's sustained efforts to increase trade with Marshall Plan countries—on the contrary, they seem to have been approved. Nor, so far, would it be correct to consider Gomulka or his sympathisers any less ardent Communists or any less pro-Soviet than they were before—or, for that matter, any less anti-western "Imperialist."

Something in the City

Double Breasted Comfort

Anybody who contemplates buying a new overcoat for the coming winter would be well advised to come, study and try on one of our double-breasted navy blue Chesterfields. They are unusually good. The excellence of the material, and the superb tailoring that has been put into them, make the price of £19.0.6 a modest one. *At Fenchurch Street only.*

Rhodesians Go Unwillingly to the Polls

[BY A SPECIAL CORRESPONDENT]

POLITICS in Southern Rhodesia, where a General Election will take place on September 15th, is very largely a game of Happy Families. Although four parties will put up 76 candidates for 30 seats in the Colony's tiny Parliament—which architecturally resembles a small provincial art gallery—the press has appealed in vain for the emergence of "clear-cut party differences." The Government of Sir Godfrey Huggins, Prime Minister for 15 years, was defeated on a proposal to give the Currency Board power to own property and dig vaults. Labour voted against the Government and tipped the balance; but it is alleged that a Labour MP was instructed to be absent from the House so that the Government would scrape through. He forgot, and the Government fell, no man willing it.

Rhodesia has only 100,000 whites and 1,700,000 blacks. The majority of the whites lives in the two towns of Salisbury and Bulawayo; spacious, well-built towns abounding in statues of Rhodes. Tobacco is booming, there is no unemployment, and taxation is only £10 a year for a married man with two children earning £1,000. Everyone is happy and no one really wants an election, not even the politicians. Sir Godfrey Huggins's chief opponent is Mr J. H. Smit, the leader of the Liberals. Sir Godfrey was a famous surgeon before he took to politics; he still occasionally operates as a favour to friends. Mr Smit is a Salisbury grocer and former mayor: a large, genial, cigar-smoking man, he arrived in Rhodesia 45 years ago, from Holland. He was Finance Minister during the war, but strenuously objected to higher taxation. The Liberal Party is described by Huggins's United Party as "old-fashioned Victorian Tories": but its real belief is in undiluted *laisser faire*. For this reason, the surviving Labour Party inclines to the side of Sir Godfrey Huggins, since it believes in Socialism (for Europeans only). There were formerly two Labour parties, but the leader of the other one, Mr D. Macintyre, recently joined the United Party, declaring that "though the United Party has become somewhat careworn, a blood transfusion such as this should have the desired effect." This earned him the title of the Bulawayo blood donor.

No Real Party Differences

Rhodesia got "responsible government" in 1923, after rejecting union with South Africa in a close referendum. Today it is a constitutional anomaly, a self-governing Colony. There would be clear-cut party differences with a vengeance if anyone proposed union with South Africa now; but the Liberals, who were suspected of wanting it (they number many Afrikaners imported from South Africa among their supporters) have lately specifically renounced it. The other issue might be amalgamation with Northern Rhodesia, but nobody seems to want this either. The Liberals say they want Dominion status, and "our own native policy, not Whitehall's." The United Party, the Labour Party, and the new Dominion Party all agree. At the same time all talk favourably of some sort of federation with the north—joint customs and defence, but separate native policies.

In the last two years the Colony has absorbed 30,000 British immigrants. This means that in that time the white population has increased by a third. Housing headaches, though not unemployment, have resulted. Most of the newcomers have swelled the urban white population. But the reserves cannot hold all the natives, and they are also flocking into the two towns, where an expanding industry provides jobs for them as well. The Liberals are afraid of the natives doing skilled or even semi-skilled jobs. They would like to keep the towns as "the white man's kraal." So would Labour, which represents only the white workers, not the black ones. White trade unionism has produced odd results. Gangs of native convicts are employed to build *pise de terre* houses in a hurry for Europeans; this is "unskilled" work, and the unions do not object. But the unions insist on only Europeans building "skilled work" houses for natives in the urban locations.

Native Labour Troubles

The Huggins Government created a Native Labour Board for compulsory arbitration in industrial disputes involving natives. This was in lieu of recognised native trade unionism. The Secretary of Native Affairs had reported serious unrest among

natives because of bad working conditions, and the Board awarded higher wages to native railway workers. Other natives staged a general strike following a report that private employers had agreed on a basic rate of pay of 30s. a month. Private employers blamed the Government and the Board, but the Government retorted that the private employers should have "seen the writing on the wall," and offered better terms.

Growing industrialisation needs more native labour, not less. The Miles Thomas Report urged that natives should be encouraged to do semi-skilled and even skilled work. The Liberals dislike this—so does the Labour Party. Both want development to take place more slowly—including immigration. But while Labour wants more nationalisation, the Liberals think the Huggins regime nationalised too much. They think that "private capitalists," not the state, should take the risks—and presumably also the profits. On the other hand, the Miles Thomas Report praised the Cold Storage Commission as "one of the most efficient undertakings in the Colony today—a virile example of a well-run state enterprise." The Commission has turned what used to be an annual deficiency of £60,000 into an annual bonus payment to cattle raisers of over £100,000. And other developments recommended by Sir Miles Thomas will obviously require state participation—hydro-electric schemes, transport ("the metronome" of the Colony's future progress), the need to raise 900,000 extra head of cattle in five years if the Colony is not to face hunger, irrigation of 500,000 acres in the Sabi Valley, quadrupling of the capacity of the Que Que steel plant, and increasing the capacity of the state-operated yard-spinning mills at Gatooma to 100,000 spindles.

Strict Control of Trade

The Government also had to intervene to correct Rhodesia's trade balance. From 1940 to 1945 the Colony had a favourable balance on current account of over £26,000,000. In 1947 the unfavourable balance was £14,000,000. Stringent import control has cut the dollar deficit from ten million to two million dollars and is expected to balance dollar spending against earnings by next March. One result is that only British goods are on sale in the shops, in vivid contrast to the Union of South Africa. Rhodesia also devised a gold subsidy to encourage greater gold production with which to obtain more dollars.

The Colony is suffering from numerous shortages which are really "opportunity bottlenecks." Money is plentiful, and so are jobs: many of the recent immigrants who came out to jobs have already started up their own businesses. But all are hampered by the lack of transport. Rhodesia is landlocked and its chief port is Portuguese Beira. To seek another outlet at Walvis Bay would involve negotiations with South Africa. An alternative plan is to construct a much more costly railway linking the two Rhodesias with Nyasaland and Tanganyika, with an outlet on the Indian Ocean, possibly at "Port Peanut." Sir Godfrey Huggins's United Party wants all those developments to take place as speedily as possible, with the state actively participating, and with fuller use of native labour in industries. The Liberals and the Labour Party are deeply divided on nationalisation issues, but are in substantial agreement about the undesirability of bringing more natives into the "white man's kraals," seeing in this a threat to the skilled white workers at present tightly organised in strong colour-bar unions, and also, ultimately, to the Colony's tiny white minority as a whole.

In the all-important matter of transport the Rhodesians have of course no quarrel with the Portuguese. But they feel that Beira is already proving too small and congested, and they would like the use of a port over which they had more direct control. Rhodesians are air-minded; the blue sky above both Salisbury and Bulawayo buzzes with planes, and from Salisbury to Johannesburg is only 3½ hours by air. But the railway journey, mostly through deserts, takes two days and three nights. Rhodesians may be pardoned for feeling a touch of claustrophobia.

Preference for United Party

Present indications are that either the United Party will be returned again at the election, or else the result will be a virtual stalemate between the United Party and the Liberals, possibly leading to fusion. Earlier the Liberals were running strongly, but opinion has since swung more to Sir Godfrey Huggins's side. He declared that the election had been forced on the country "over a frivolity," at a time when there might be a war with Russia in a month. This, combined with popular aversion to holding an election at all, seems to have had its intended effect.

If there were fusion, it might only be achieved at the price of dropping both pilots—Sir Godfrey Huggins and Mr Smit. Both have been appealed to to join forces; both have refused on what seem to be mainly personal grounds. Politics in Southern Rhodesia, with its tiny white population, are largely personal; politicians change camps with great facility. Whatever the outcome of the election, it is unlikely to alter the general picture of a Colony bursting at the seams with prosperity, and with ambitious plans for further development.

Carefree Trieste

[FROM OUR SPECIAL CORRESPONDENT]

TRIESTE is like a fair maid, who, after being wooed by many suitors with rich gifts, expects the same standard of living to prevail on marriage, and is unwilling to get down to the washing-up. The city is likely to remain an expensive toy, inspiring in its possessor a dog-in-the-manger attitude of "I don't want it particularly myself, but I'm hanged if anyone else is going to have it." Woman-like, Trieste has so far succeeded in getting the best of both worlds: it is under the protection of the West and in a special position to receive Marshall Aid, while the treasury which pays its living expenses cannot yet call the tune.

In the British and United States Zone there is a pleasant atmosphere of controlled prosperity, orderliness and industry. The streets are tidy and clean; there are new blocks of family flats, new schools, hospitals, roads, bridges; the shops bulge with a variety of goods; and the cost of living is, generally speaking, lower than in Italy. The occupation troops like the place. Their presence, and their control over the local police force, secure for the Triestini a solid protection against disturbances.

The Allied Military Government are prepared to stay indefinitely in Trieste and to bend to their requirements the difficult political and economic structure temporarily established by the Treaty of Peace with Italy. In Major-General T. S. Airey they have a wise administrator. His position is unique. He is responsible to the United Nations Organisation for the government of his territory. He depends for funds on the Italian Government, who are not yet members of that Organisation. Militarily, he is reponsible to the Combined Chiefs of Staff in Washington, of whom it is said that the only item on their agenda is "Trieste." At the same time he can appeal direct to the British Cabinet and the British Chiefs of Staff.

Easier Task for Government

The task of government has been eased by the Tito-Cominform split. The local Communist Party is divided against itself, and has only succeeded in producing a comic opera confusion of purpose and a stream of announcement and denouncement against anybody and everybody. The arrest of sixteen trades union leaders in July which before would have led to strikes and demonstrations raised only a murmur in its ranks.

Frontier incidents tend to be exaggerated, and those of the Free Territory are no exception. More often than not they are purposely provoked by individual Italians or Slavs who feel secure under the protection of their respective occupiers. But it is remarkable how few incidents there are when it is realised that in June alone there were 175,810 recorded border crossings to and from Italy, 11,097 to and from Yugoslavia, 224,536 to and from the Yugoslav Zone—and that this was an average month.

Whether or not the Russians succeed in deposing, exposing or liquidating Tito, whether or not a Trieste settlement emerges from the Moscow talks, whether or not the Yugoslav Zone returns to Italy, it is important that Western Powers stay in Trieste for as long as there is danger. The feeling that they will has removed some of the fears of investing domestic and foreign capital in Trieste. An Austro-Triestini Shipping Company and an Austro-Triestini Chamber of Commerce have recently been formed, and should be allowed to mature.

The shipbuilding programme cannot get into full swing until January, 1949, but work has begun on a new industrial free port at Zaule, and there is still sufficient work on hand to keep the ship repair yards fairly busy. The ground at Zaule is being drained, and roads and rail tracks are being built. Such increased industrial activity is very necessary to offset the rise of prices, which automatically follow rises in Italy, but efforts are being made to see that these higher prices are borne by industrial firms and by special bonuses and not by the employees.

The future of Trieste is still in doubt. The offer last spring by Britain, America and France to hand it back to Italy is still being blocked by Russia. But from the point of view of its inhabitants, there is little question that the interregnum has brought blessings which they will be loth to forgo.

THE BUSINESS WORLD

OEEC Faces the Test

MR HARRIMAN'S flying visits to Brussels and London this week appear partially to have resolved the immediate crisis which confronted the Organisation for European Economic Co-operation a week ago. The nineteen recipients of Marshall Aid (the sixteen original signatories of the Paris reports plus Bizonia, the French zone of Germany and Trieste) have become tangled up about two main issues. The first, in point of timing and importance, is the extent to which the nineteen will help one another by making genuine "unrequited" exports among themselves; the second is how far the "unrequited imports" represented by the $4,850 million of Marshall aid for the twelve months to June 30 next are to be distributed among the nineteen. Although Mr Harriman's statement referred only to the division of aid for the current year, on which agreed recommendations are being issued, the link between the two is self-evident. The ultimate dependency of each ERP country on assistance from the United States must be influenced by the extent to which it can satisfy its essential requirements within Europe.

One of the basic principles of the European Recovery Programme—and one which the United States never tires of impressing on the recipients—is that Europe's own resources must be used to the utmost in order to reduce to a minimum the total dependence of the nineteen countries on the United States. Europe's estimates of needs from the United States have been inflated by the growing paralysis of European trade—itself produced in part by the difficulty of making payments between countries in varying states of economic unbalance. The Americans have constantly urged that mere difficulties about payments should not be allowed to freeze the flow of trade which otherwise could take place between European countries. It is, of course, one thing to accept this as a commonsense principle: it is quite another to apply it in the hope that it will, of itself, solve Europe's economic difficulties. Its application, however, had to be attempted in framing the extent of American aid and in deciding upon its allocation among the various recipients. In each case the calculation had to be preceded by some estimate of the trade between each pair of ERP countries, for only after those calculations had shown the extent to which Europe's needs could be satisfied out of Europe's resources could any reasonable estimate be made of the gap that would remain to be filled by the United States.

To give the maximum incentive to European countries to help one another and to produce as much as possible for export to one another, two solutions suggested themselves. The first would have been the allocation of dollars to a European Clearing Scheme. This would have ensured that any European country which acquired other European currencies as a result of its export surplus to the rest of Western Europe would be able to convert part at least of this surplus into dollars. The second would have been to earmark a substantial part of Marshall dollars for the finance of "off-shore purchases" in Europe itself. Both of these courses would have created the incentive to export because each would have given the exporting country a chance of earning additional dollars. But both avenues have been firmly closed. The United States has from the first set its face against providing any free dollars to finance a European Clearing Scheme because there would be no means of "following through" the expenditure of such dollars and of convincing Congress that they had in fact been used in accordance with the terms of the Economic Co-operation Act. Some authorisations have been given for off-shore purchases in Europe, but these have been on a very modest and diminishing scale. In any case the allocation of resources for the European Recovery Programme has been cut so fine in relation to Europe's immediate and essential needs from the Western Hemisphere that it has left no room for any elasticity of manœuvre to make supplementary allocations of this kind.

Instead of pursuing such solutions for the problem of easing European trade and maximising the use of European resources, a scheme has been devised to finance deficits arising between European countries by using the deposits of local currencies which have to be kept by each country against the grants it will receive from ECA. Under this scheme every ERP country which has a surplus in its payments with any other ERP country will be called upon to make over that surplus as a free grant, by putting its own currency at the disposal of the deficit country. In most cases, though certainly not in all, the creditor countries will find it most convenient to use for this purpose the local currency deposits which they themselves have had to maintain as a counterpart of Marshall Aid grants. The European creditor countries, whilst then giving grants to their debtor colleagues, will have the assurance that they will receive "conditional grants" from ECA equal to their net grants to other ERP countries. Conditional grants, however, do not mean additional grants. These conditional grants will neither increase the total amount of Marshall Aid beyond the figure authorised by Congress nor can they substantially affect the provisional allocations which have been based on the estimates already sent in by the participating countries and which, until the breakdown occurred last weekend, were being refined and amended in Paris.

The choice of this particular system for financing surpluses and deficits within the group of ERP countries has serious implications. Instead of maximising the incentive to export to European countries, as would have happened if dollars had been forthcoming to match the credits arising from trade within Europe, it does the reverse; it maximises the tendency to import from other European countries because deficits will now be covered by gifts from the creditor countries. Only a few months ago, certain countries in the ERP group, hoping to be designated as markets from which off-shore purchases against dollars might be made, were loudly advertising the unsaleable surpluses they held—tobacco in Turkey, dried fruit in Greece, steel and grapes in Belgium, fruit in Italy. There were surpluses under which the economy of these countries was apparently groaning and which could readily be put at the disposal of the rest of Europe if dollars were paid for them. But today these apparent surpluses have disappeared as if by magic. Under the new scheme, if these surpluses entered into European circulation they would have to be given away. Consequently they no longer appear on the list of what is available.

The gap between what the countries want to export under this new payments scheme and what they would like to import was

ludicrously revealed when the first estimates of intra-European balances of payments for the coming year were tabled in Paris. Enormous divergences appeared between the two sides of the export and import accounts. Every country naturally tried to keep its exports to other European countries to a *minimum* and to inflate its imports from European countries as far as decency would allow—and sometimes beyond. This gap has had to be bridged by a reconciliation of each balance of payments between the 80 odd pairings of European countries in bilateral trade. This attempt at reconciliation by the committee of five has caused most of the difficulties and differences in Paris.

The calculations revealed three outstanding creditors in this intra-European group. The most important is the sterling area, from which the rest of Europe, according to first estimates, expected unrequited imports equivalent to about $600 million but which was prepared, according to its first estimates, to make unrequited exports to the rest of Europe of only about $225 million. It should be emphasised that these estimates concern not the United Kingdom singly but the whole sterling area; the system of multilateral payments within the sterling area and the structure of Britain's trade and payments agreements with other European countries would make it impossible to isolate the direct trade of the United Kingdom with Europe from that of the rest of the sterling area with European countries. The next important creditor, and perhaps the most vocal, is Belgium, from whom the equivalent of some $400 million was expected but which was apparently unwilling to go beyond the figure of $200 million. Bizonia is third on the list of potential creditors, and the cudgels have been wielded on its behalf by the US military authorities. At the other end of the scale stands France—a prospective debtor towards every other European country—which thus would siphon additional Marshall Aid from the rest of Europe to the extent of $350 million and perhaps more.

The fact that the whole sterling area appears as one of the units in this calculation of intra-European balances of payments means that Britain will, in fact, bear the burden of unrequited exports from the whole of that area to Europe. The larger part of the prospective surplus of the sterling area with Marshall Europe is probably accounted for by Europe's needs for commodities such as wool, rubber, jute and cocoa, and not for produce of UK manufacture. These exports, made to Europe as grants from Britain, will in fact be paid for by Britain, and the payment will be reflected in an increase in the sterling balances of the exporting countries. The recognition of this fact and the desire to bear part of the consequential burden were evident in the recent decision by Australia to cancel £8,000,000 of its sterling balance as a gift to Britain.

A contrasting situation will arise where ERP countries which are shown to incur a deficit with the sterling area in the coming year happen to hold sterling balances. In that case, should the deficits be made over by way of grants from Britain, or should they be debited to the sterling accounts of the deficit countries? Logic and equity suggest the latter. Grants should begin to apply only when other means of effecting payments have been exhausted. It would be the height of absurdity for Britain to make a gift of unrequited exports to a country such as Italy or Norway (in making which Britain might incur debt to other parts of the sterling area) when those countries have ample sterling resources at their disposal. But the difficulty then arises that the Economic Co-operation Agreement governing the grant of Marshall aid specifically lays it down that the proceeds of Marshall aid shall not be used to repay external debts of the recipients. That clause was introduced to prevent a repetition of the repayment of sterling balances out of the proceeds of the American loan to Britain—an alleged procedure which many Americans are firmly convinced bore a considerable responsibility for the rapid exhaustion of the loan. Since "conditional dollar grants" will be given to the countries which run surpluses with other European countries, the debiting of sterling accounts for such transactions would, in effect, involve a repayment of external debt out of the proceeds of Marshall aid.

Other difficulties of reconciling reason with the letter of the ECA agreements will, no doubt, be encountered in operating the scheme. There is some consolation and reassurance to be derived from the fact that the clearing scheme will be operated by the Bank for International Settlements. This, at least, ensures technical competence and efficiency; but it will not improve the character of a basically defective scheme.

Among these basic defects must be included the fact that the new system of European payments will be linked to Marshall aid grants. The new facilities may tend to give permanence to an artificial distribution of trade but only on the basis of the decidedly impermanent prop of ERP dollars. As Marshall aid falls off, or is cut off, the whole edifice of the system of European payments will be left suspended in mid-air.

In trying to decide this issue, the OEEC in Paris has inevitably been drawn into complex economic and political questions. On the economic front, the prospective creditors have used powerful arguments to stress the effect which the new, wholly unrequited exports to Europe would have on their own economies. Belgium has been able to show that it is already being dragged much too fast along the road to inflation by the credit it has made available to other European countries. Britain has pleaded its commitments elsewhere. To export more agricultural machinery by way of grants to France, for example, may mean that fewer of these machines are available for export to Argentina, where they must be sent to pay for imports of meat. The creditors, moreover, have been unable to suppress the doubt that some of the difficulties of the debtors are due to mismanagement rather than to misfortune and that this accounts in particular for France's voracious capacity to incur deficits with all its European neighbours.

From this type of argument it is but a short step into the political arena. The political aspects of the Paris disputes assume their most virulent form in the differences on the problem of Western Germany. The prospective balance of trade between Western Germany and the rest of Europe symbolises all political issues that revolve around the future of the Ruhr. Calculations on this question are bound to crystallise all the differences about the future location of industry in Western Europe, the priority to be given to the industrial reconstruction of the Ruhr, the future movements of coal, coke and iron ore to and from that district. They have, therefore, raised the issues which lie far outside the immediate province of OEEC and on which it can give no judgment.

Most of the trouble which has arisen in Paris must, however, be attributed to the means chosen to finance intra-European surpluses and deficits. The solution which is being attempted could not be better calculated to frustrate the basic objective of the European Recovery Programme. It has removed every incentive for European countries to work and produce in order to satisfy the essential needs of their neighbours. Conversely, it must give the maximum encouragement to each to suck what it can from the rest of the European community because what it will thus obtain, will be free of charge. Finally, it leaves to the creditors from whom grants are expected no other choice than to make them—or lose a corresponding part of the ECA dollar aid upon which they had counted. In an ideal world the nations of Europe would work unreservedly for the European community and there would be need for neither incentive nor sanction to ensure correct behaviour. But this is not an ideal world. Europe today still needs the carrot of incentive to lead it in the right direction, especially as the stick which the United States can wield, namely the suspension of Marshall aid, must fall indiscriminately on deserving and undeserving alike.

A Railway Slump?

THE latest statistical bulletin of the British Transport Commission contains the first official intimation that all is not well with the volume of railway traffic. Forecasts of traffic made a year ago are not being realised; gross receipts for the first half of the year are higher, but the additional revenue of £65 million in 1948 which was expected from the increased scale of charges introduced eleven months ago is not materialising. Costs have increased beyond the level which was foreseen when the estimates were made a year ago, and such economies as have been secured can go only a little way towards meeting increases elsewhere. It is not a cheerful summary of the operations of the Commission in its first half-year. The Commission naturally makes no attempt to predict the final result for the year; that depends on prices and costs, the trend of passenger traffic, coal output, the level of industrial activity and the movement of the harvest.

Here indeed is a situation which ought to inspire life and meaning into the cliché that "the Commission are keeping the position under constant review." There are two problems: first, to know what is happening; and secondly, to know what to do about it. By how much has the real volume of passenger and goods traffic fallen in recent months? And why has it fallen? The Commission's statement, though it is couched in sedate terms, suggests much of the mystification which railway officials have felt for two or three months about the fall in railway traffic. The mystery remains: why are railway traffics falling—and falling seriously—at a time when economic activity generally is still running at a high level? To measure the fall in the volume of traffic, it is necessary to discount the receipts this year by the increase in charges which took effect last October, and then to compare the resulting net figures with the corresponding receipts in 1947. The increases then made were of 16¼ per cent on ordinary passenger fares and merchandise by passenger train, and of 24 per cent for other rail charges including season and workmen's tickets, and all freight train traffic. For the first three months of the year, the comparison of railway receipts was so distorted by the fuel crisis of 1947 that it is better ignored. What has happened since then is suggested in the accompanying table, which shows the percentage movement in the estimated volume of traffic in the five 4-weekly periods to August 8th. These estimates are not precise—they are slightly affected by the different dates for the Easter and Whitsun holidays in the two years. The passenger figures understate the extent of the fall, since the discount in calculating them has been taken at 16¼ per cent without allowance for the higher rate of increase in season and workmen's fares.

ESTIMATED VOLUME OF TRAFFIC
(1948 Compared with 1947)

	Percentage Change in Four-weekly Periods to				
	April 18	May 16	June 13	July 11	Aug. 8
British Railways:—					
Passengers	− 4	+ 2	−15	−10	− 7
Parcels, etc., by passenger trains	− 4	− 2	− 1	− 3	...
Merchandise and livestock	− 8	−16	−14	−13	−17
Minerals and merchandise (Classes 1–6)	+19	+ 3	+ 1	+ 5	+ 1
Coal and coke	− 3	−10	− 5	+ 1	− 1

The most serious falls in traffic, measured in this way, are in passengers (understated as already explained) and in general merchandise. In passengers, the fall appears to have been quite sudden—from the middle of May onwards when there was evidence elsewhere that there was "less money about." But in merchandise (excluding the heavy classes and coal) the fall has now lasted for four months, and is ominously approaching 20 per cent. Classes 1 to 6 alone show "pluses" throughout the period, presumably reflecting a high level of activity in the steel industry; but even coal is now showing a slight fall (disregarding the May and June figures, which are largely accidents of comparison with the abnormal movements during the same period in 1947).

Obviously, there is no single explanation of these disturbing losses of traffic. In part, they reflect a sharp public reaction to higher fares, a reaction which has become more marked since the Chancellor's policy of disinflation was introduced. In April and May, the number of originating passenger journeys at ordinary or monthly fares fell by more than 10 per cent compared with the corresponding months of 1947. There are clear signs, too, of a fall in season ticket journeys, only partly compensated by workmen's tickets. Admittedly, excursion and week-end facilities have been better supported than last year; that is because there are more of them, and also because the public has used them, when it could, in preference to costlier facilities. In any event, the extra revenue to be gained from these cheaper travel facilities cannot make more than a small contribution to the railways' finances.

One of the biggest factors in the fall of passenger receipts is the severe competition from road coach services. It is often supposed that this competition is merely a matter of price, and indeed the differences in cost, already marked during the summer, will become startling enough when further reductions are made shortly on certain routes. Broadly speaking, the coaches have been operating at prewar fares, whereas railway fares are now 55 per cent above the prewar level. This summer, a passenger could travel to Torquay by coach for 38s. 6d. return, compared with a third-class return fare of 53s. 9d. on the railway, or to Folkestone for 14s. 6d., compared with 19s. 11d. These two coach fares are now to be cut to 32s. and 11s. 9d. respectively—both under 60 per cent of the corresponding railway fare. That differential in favour of the coach is already an important consideration for the passenger to whom speed is not a vital matter. But the increasing goodwill of the coach services is not founded solely on cheapness. The coaches often offer more convenient and more reliable direct services on cross country routes. The automatic booking of seats on long-distance and intermediate routes is evidently popular. For these advantages, coach travellers are often prepared to queue many hours in order to book their journeys months in advance.

To suppose that the railways could reply effectively to this competition is fanciful. The operating conditions of the two forms of transport are utterly different; with present full loads, the operating economies of the road vehicle are at present being maximised, whereas on the railways loads are falling and costs are still rising. The fact that the railways can never match in cost and (for many passengers) convenience the services provided by the coach services may be a portent of what is in store under "coordination" of transport.

But what is the explanation of the fall in merchandise traffic, and particularly of the fall in the most remunerative forms of merchandise traffic? There must be some connection between this fall and the rise in the number of goods vehicles operated under "C" licence by traders for the transport of their own goods. At the end of 1938, the number of such vehicles was 365,025; at the end of 1946, the figure was 383,738; but by the end of last year it had jumped to 487,151. For some time past, the growth in the number of "C" licensed vehicles has been causing official concern; some months ago, the Minister of Transport issued a veiled warning that such an expansion could not be contemplated indefinitely; and although the one radical improvement made in the Transport Bill during its passage through Parliament was to grant the "C" licence absolution from control, traders are now beginning to wonder how long this freedom will last. The fate of the "C" licence raises the most fundamental issues about the transport user's freedom of choice and the spur of competition to be applied to the gigantic road and rail transport system which will eventually be operated by the British Transport Commission.

Another factor in the fall of merchandise traffic may be suggested. It is more recondite and not easy to measure, but it may, nevertheless, be significant. Compared with a year ago, there is a better distribution of stocks of raw materials and components among industrial firms. This increase in stocks has plainly been at the root of much of the improvement in industrial output during the past twelve months, but it may have had a peculiar effect on transport. Last year, a manufacturer who urgently needed materials or components often had to scour the country to find them, and there must have been much extra transport of materials from points of local surplus to points of local deficiency. To this extent, part of last summer's volume of traffic may be reckoned abnormal, while the volume of traffic this year—again to that extent—should be more normal. To assess the weight of this factor is not a simple matter; but it would be surprising if the settling down of British industry to more "normal" conditions (in this sense at least) would not have reduced in some measure the exceptional demand on transport which always arises from dislocation of supplies.

These explanations of the fall in passenger and goods traffic may not be the whole story. But so far as they go, they offer little encouragement to the railway authorities, faced as they are with a continued rise in costs. For the thirty-two weeks to August 8th, railway receipts were up by just over £30 million. There is thus no likelihood that the extra £65 million which was thought to be required thirteen months ago to enable the railway system to earn the £38.6 million formerly payable under the rental agreement, can possibly be achieved. But in the meantime, costs have risen further. A year ago, the average increase in total costs compared with 1939 was already 100 per cent, including the effect of last year's wages award. It can hardly be less than 110 per cent to-day, and the further demand is being voiced for the "balance" of the wages increase sought last year—that is, the ungranted 12s. 6d. of the original £1. The cost of meeting such a claim would hardly be less than £20 million in a full year. Meanwhile, the recent adjustment of coal prices, according to quality, has increased the railways' coal bill by something of the order of £1½ million. No economies could possibly be secured to match further increases in costs on this scale. Indeed, the scope for economies so far revealed in the operations of the Railway Executive is limited to the unification of the requirements of the different regions for locomotives and wagons, which will yield a useful though not very spectacular economy in capital charges in future years.

The Commission and the Executive are in a painful dilemma. To seek an increase in charges would merely heighten the loss of traffic which is already serious and threatening. A financial crisis of the first order thus confronts them before they have had any opportunity to explore the true meaning of co-ordination, or to work out a system of charges for rail and road transport which would encourage the best use of existing facilities, making them equal and self-supporting partners without at the same time mulcting the transport user by the exercise of monopoly power. On the present trend of the figures, it is quite improbable that the Railway Executive can earn very much, if anything, this year to meet the £28 million or so of interest on the portion of Transport Stock issued to pay for its assets. The figures are an urgent warning of the need for seeking economies of unification by the more efficient management of the railway system and also for solving the questions of co-ordination and long-range transport policy which are peculiarly the responsibility of the Transport Commission. There is little evidence that any effective steps are being taken in these directions, and little public discussion of their profound importance on the future of the British economy. It is intended to discuss these issues in a series of articles in *The Economist* in the fairly near future. Meanwhile, it must be hoped that those responsible for transport policy are giving their consideration the most urgent priority.

Business Notes

ECA Dollar Reimbursements

It may be surmised from the level of the new Treasury Special Account that the Treasury's total receipts of dollars under ECA, by way of reimbursement of its own dollar outgoings in anticipation of such aid, now substantially exceed the £22 million which, as the Chancellor revealed, was received at the end of June. Details of the subsequent receipts have not yet been officially disclosed, but the total must have reached at least £33 million by early August, for that was the amount of the initial transfer then made to the Special Account. A further transfer, of just over £15 million, was indicated by the Bank return dated September 1st and by the Exchequer return issued this week—the latter, as expected, showed a corresponding increase in receipts from "Other Debt—Internal," that is, in the special interest-free Treasury Notes taken up by the Bank of England. And this week's Bank return revealed a further small transfer, of £1.1 million. The Special Account therefore now stands at £49.7 million, but, even so, apparently does not represent the full sterling counterpart of the dollars that have been received, the difference being presumably held on the Suspense Account with the Paymaster-General, in accordance with the procedure described by the Chancellor some weeks ago.

One reason for the disparity between actual dollar receipts and the disclosed sterling credits is, as previously explained in these columns, that the credits are not directly linked either with the dollar reimbursements or with the Treasury's cash receipts from the actual sale of dollars on bulk-purchased dollar goods. Following the provisions of the ECA agreement, the amounts of the credits and the timing of the transfers to the Special Account depend simply upon the periodic notifications from the US authorities of the dollar cost to them of the revelant ECA grants.

* * *

Special Account Accumulations

Actually, though for a different reason, the disparity between the level of the Special Account and the dollar reimbursements is smaller than it had been expected to be. The amount of the Special Account will fall when the US Treasury either authorises the British Treasury to employ the funds in debt redemption (or for any other agreed purposes within the scope of the master-agreement) or requires finance, up to the prescribed limit of 5 per cent of the total, for its own ECA expenditure in Britain or for stock-piling purchases. The recent rubber deal between the two Governments, which is discussed in a separate Note this week, falls into this category and will be thus financed. It has not, however, yet figured in the accounts; the assumption made in some circles that this week's small repayment of "Other Debt—Internal" is linked with the rubber deal is not correct. Apart, however, from the 5 per cent of the funds which is in effect reserved for America's own expenditures, it had been originally intended that the balance of the account should be extinguished as quickly as possible by its application to one or other of the purposes contemplated in the agreement—of which, of course, debt redemption was expected to be the main, and perhaps the only, method of release. The funds cannot, however, be employed for this or any other purpose until the US authorities give due permission; and it may be presumed from the high level of the account that they have not yet responded to the formal British requests that the money now be employed in redeeming the Treasury's debt to the Bank of England on interest-free Notes.

The reason for this delay has not, of course, been revealed; but it has been surmised elsewhere—and the supposition is not unreasonable on the face of it—that the hesitation in Washington may be due to the unfortunate uncertainties about the new European payments project, with its provision that approved inter-European credits may, in certain circumstances, be debited against the Special Accounts. In view of that possibility, it is worth reiterating that this complicated mechanism of the Special Account will cease to have merely nominal and formal significance as soon as, and to the extent that, it is used for any other purpose than debt redemption. If any portion of the funds has to be employed to finance tangible operations, whether capital projects or unrequited exports, which would not otherwise have been undertaken, the expenditure will have a real and inflationary effect upon Britain's economy—or at least, as an article on page 424 shows, will increase Britain's obligations to the overseas sterling area. So long, therefore, as the credits to the Special Account continue to pile up, so long will there be a possibility that they will eventually exert these effects. If and when they are "used" to redeem debt, the effects will be confined to the purely internal book-entries described on several occasions in these columns. But it rests with the Americans alone to give this discharge, and so to remove the uncertainty.

* * *

The Cost of Coal

The cost of coal, as the statistical statement of the National Coal Board for the second quarter of 1948 shows, continues to climb. But the increase of 7.6d. a ton shown in the latest statement is less than the previous quarter's increase, which was 1s. 0.3d. The elements which make up the rise in costs are stated, though not in detail, by the Board. The average cost of a ton of coal was 45s. 4.3d.; of this 29s. 8.4d. was made up of wages, including holiday pay and allowances in kind. This is an increase of 3.6d. over the previous quarter. "Roof supports, general stores, and repairs" accounted for 3.7d. a ton more than in the previous quarter; this was caused partly by the higher cost of materials, but partly also by the entry into force of the Coal Mines (Support of Roof and Sides) Regulation. "Other costs" accounted for an increase of 1.8d.; this reflects higher training expenses, an increased provision for depreciation, and the full implementation of the agreement on clerical salaries. The total was modified by a reduction of 1.5d. a ton in "coal and power consumed," attributed by the Board to improvements in the generation and use of power.

COAL COSTS, PROCEEDS, PROFITS AND LOSSES

	1947				1948			
	2nd Qtr.		3rd Qtr.		4th Qtr.		1st Qtr.	2nd Qtr.
Output (mn. tons):—								
Commercially disposable	42·1		39·3		45·9		44·5	45·5
Saleable	45·9		42·8		49·9		48·6	49·3
Costs (per ton saleable):—	s.	d.	s.	d.	s.	d.	s. d.	s. d.
Wages	26	3·9	27	8·8	28	8·2	29 4·8	29 8·4
Roof supports, stores, repairs	5	10·8	6	4·0	6	3·5	6 1·9	6 5·6
Coal and power	2	5·9	2	7·6	2	5·9	2 10·5	2 9·0
Other costs (incl. depreciation)	5	8·6	6	1·5	6	2·8	6 3·5	6 5·3
TOTAL COSTS	40	5·2	42	9·9	43	8·4	44 8·7	45 4·3
Proceeds	38	9·7	40	3·4	42	10·7	46 3·5	47 1·9
Profit (+) or Loss (−) (before charging interest)	−1	7·5	−2	6·5	−0	9·7	+1 6·8	+1 9·6

While the Board's costs rose, the proceeds from the sale of coal rose still further, and its revenue account shows an estimated surplus for the quarter (after charging estimated interest and interim income) of £1,002,828. The increase in proceeds is not analysed in detail, but the Board explains that it resulted (presumably, only in part) from the higher tonnage exported. Exports and bunkers (excluding supplies to fishing vessels and to Eire) rose from 1,873,392 tons in the first quarter to 3,925,525 tons in the second. To make ends meet by charging more to the export market than to the home market is likely to be a short-lived expedient.

Productivity in the Steel Industry

The productivity record of the British steel industry over the last decade is defended in an article in the August *Statistical Bulletin* of the Iron and Steel Federation, which demonstrates that steel, in contrast to British industry generally, can show substantial improvements in output per man since 1938. Both the labour force employed on steel production and the volume of ingots and castings turned out have increased substantially during that period. But there has also been a further change—"a noticeable swing towards the more highly finished products which involve the application of a greater amount of skilled work." Thus (to take two extreme examples) the output of cold rolled strip is now about 3½ times as high as in 1938, and the output of bright steel bars almost three times as high; these are products valued at between £30 and £40 a ton, while the output of rails (£17 a ton) is a little below its prewar level.

If the simple tonnage of ingots and castings is taken as the yardstick, then the index of steel production was 120 in 1947, 144 in the first quarter of 1948, and 147 in the second quarter of 1948 (with 1938 as 100). But the *Bulletin* makes another computation to allow for changes in quality: it measures the products of the steel industry by value, weighting the values to give constant

relative prices, and deducting the cost of materials used to get the net value of the work done. This gives a more favourable index: 138 in 1947, 157 in the first quarter of 1948, and 161 in the second quarter of 1948. The average numbers employed in steel melting and rolling have risen from 147,200 in 1938 to 184,500 in the second quarter of this year. From the numbers employed and the assessment of output on the basis described an index is reached to show the improvement in output per man-year.

OUTPUT* PER MAN-YEAR IN STEEL MELTING AND ROLLING
(1938=100)

	Operatives	All Workers
1938	100	100
1945	110	106
1946	118	114
1947	119	114
1948, 1st quarter	131	126
1948, 2nd "	134	128

* Net value of output at constant prices.

"Operatives" in this table exclude administrative, clerical, or technical grades; if these are included the resultant figure (the second column) shows a slower rate of improvement. It is worth noting that in the steel industry, as in so many others, the expansion of the labour force in recent years has brought a less than proportionate increase in the numbers employed directly on the productive processes. The tendency is shown in a further table:

FUNCTIONAL DISTRIBUTION OF WORKERS IN THE IRON AND STEEL INDUSTRY*
(Percentage of Total)

	Process Workers	General and Maintenance Workers	Clerical Workers
1940	67·9	25·9	6·2
1941	67·1	26·4	6·5
1942	66·6	27·2	6·2
1943	65·8	28·2	6·0
1944	64·8	27·8	7·4
1945	63·7	28·6	7·7
1946	62·5	29·5	8·0
1947	61·9	29·8	8·3
1948, 1st quarter	61·8	30·1	8·1
1948, 2nd "	61·7	30·1	8·2

* All sections except iron castings and bolts and nuts.

One reason for the higher proportion of general and maintenance workers (the *Bulletin* suggests) is the need to overtake arrears of repair and maintenance work accumulated during the war. Improvement in plant operation saves process workers but does not save maintenance workers; indeed, more complex and more mechanised plant may call for increased numbers of maintenance men. The biggest increase in numbers of clerical workers happened between 1943 and 1944, and seems to have been made necessary by the introduction of PAYE.

Dr Rostas, in his article in the *Economic Journal* in April, 1943, estimated that America's productivity in steel melting and rolling in 1937 was 68 per cent higher than Britain's. The *Bulletin* suggests that this should have been 31 per cent, and that Dr Rostas appears to have taken ingot production as his basis, making no allowance for the considerable amount of labour employed by the British steel industry in working up imported ingots and semi-finished steel. It concludes that the level of British productivity should improve further as the present development plan takes effect.

America Buys Rubber

At the end of last week the Board of Trade announced that it had sold a part of its stock of natural rubber to the United States. No information has been disclosed of the quantity involved or the agreed price. The total stock of rubber held by the British Government amounted to 88,362 tons at the end of June, and according to the US Munitions Board the target for American rubber purchases for the three months from July 1st last is 25,000 tons. But whether the latest purchase covers this target amount or was somewhat less has little significance for the rubber market, because the American authorities have agreed to regard the transfer as a special inter-Governmental transaction; it will not, therefore, reduce their buying programme from current production for stockpiling purposes. Moreover, the remainder of the stock held by the Board of Trade, with the exception of a small quantity of low quality rubber, has been withdrawn from the market and will be maintained as a British strategic reserve.

Since the official announcement of the sale, the price of rubber has weakened to 1s. 1¼d. a lb. The British Government's rubber stocks were only a potential threat to the market, as the official selling price, 1s. 3⅜d. a lb., was always above the market quotation. The chief result, therefore, is to remove the ceiling to the market. Moreover, the American buying programme remains intact; presumably that means that the US authorities will still purchase 25,000 tons of natural rubber for stockpiling in the current quarter.

This sale constitutes the first transfer of strategic materials to the United States under the terms of the Economic Co-operation Agreement. Payment will be met by a transfer from the Treasury Special Account into which the British Government pays the sterling counterpart of ECA grants, as notified by the US authorities. Article IV of the Agreement stipulates that up to 5 per cent of this fund may be used by the US Government to meet its local administrative expenses and to purchase strategic raw materials for stockpiling. The balance in the Special Account on Wednesday stood at £49.7 million. If the whole of the permitted 5 per cent of the existing balance were used to pay for the rubber, the quantity sold would be limited to a maximum of 21,000 tons—but conceivably the Agreement might cover a larger quantity in anticipation of the growth of the Special Account as further Marshall grants are received. In any case, part of the 5 per cent of the sterling balance will be used to meet American administrative expenses in this country. At least it is clear that Britain will not get any dollars from this sale, and that payment will be made on delivery which will be spread over the period ending next June.

* * *

Light on Savings Habits

In the past one of the weakest links in the chain of national income estimation and in the new technique of capital budgeting for the national economy as a whole has been the lack of reliable direct data about savings, and particularly about the distribution of savings and the motives which lead the public to save. The National Savings Committee, it might have been thought, would have bestirred itself long ago in an effort to fill part of this vital gap in economic knowledge. Its first attempt is no less welcome for being so tardy. During last March and April it arranged some 2,000 personal interviews with a random selection of people of different ages and occupations in 67 localities in England and Wales. If this sample can be taken as representative, it indicates that 86 per cent of the adult population held savings of one kind or another—59 per cent holding National Savings (i.e., Savings Certificates, Defence Bonds, or Savings Deposits) and 53 per cent having interests in life assurance. Other significant forms of savings were through the co-operative societies (15 per cent), building societies (12 per cent) and pension funds, etc. (11 per cent). These percentages, of course, relate to the number of persons involved and not to the actual amount of their savings, upon which no information was apparently furnished to the inquirers. Among the specific forms of National Savings, by far the most popular was the Savings Deposit account; 40 per cent of National "savers" had Post Office accounts and 8 per cent had Trustee Bank accounts. Rather less than one-third held Savings Certificates or Defence Bonds. Less than three-fifths of these National "savers," and only about one-third of the total population, could, however, be regarded as active savers even when activity is judged by so loose a test as whether they have made any deposit or bought a Certificate within the preceding twelve months. Of the National savers, a little under 30 per cent achieved a net increase in their holdings during the year, but just over 30 per cent decreased them.

The survey shows very plainly how enthusiasm for the savings movement has diminished since the war. Savings groups now include about 13 per cent of the population, but their membership is only one-third of what it formerly was. Similarly, two-thirds of the present holders of National Savings Certificates made their first purchases during the war, and most of them did so for patriotic motives. But this motive was not mentioned at all in answer to the inquiries about the reasons for new savings at the present time. Fifty-nine per cent of the total sample said that they were now unable to save, and nearly all these people said that the reason was that they "could not afford it." Similarly, 47 per cent of those questioned attributed the decline in National Savings to "the cost of living" and 14 per cent to "inadequate income"; only 4 per cent thought "anti-Governmental sentiment" was an

important factor, though many people referred to "apathy." Of the 41 per cent who claimed to be still able to save, through one channel or another, one-third said that they did so for reasons of security, one-third with some material objective in view (e.g., holidays, homes, etc.) and one-third did so as a matter of habit. The dis-saving, so far as it has taken place through net withdrawals from the Post Office Savings Banks, seems to have been largely due to specific expenditure on holidays, homes, clothes, etc.—40 per cent of those who have been thus dis-saving explained their action on such grounds as these. Only 14 per cent said that the money was needed for "living expenses."

* * *

Cotton by Sample

The Raw Cotton Commission is apparently sparing no effort to improve its service to the Lancashire spinners. One of the main criticisms levelled in its first few months was the lack of sampling facilities for buyers. Soon all types of cotton except sea-island will be purchasable under one of three contracts. First spinners may continue to buy cotton on description, as they have done since the beginning of wartime control, at a 5 points discount on the list price. Under this contract, however, spinners have no option to reject deliveries if they differ from the description. In fairness to the Commission, it has often come to terms with spinners when differences of quality have been proved, but it is under no obligation to do so.

If the spinner buys at the list price, under the second form of contract, he may have a visual sample of the description, and within certain limits he can reject deliveries which do not agree with the sample. This is now the standard contract. Thirdly, a spinner can, at an extra charge of 10 points on the list price, see samples of all bales of cotton before taking delivery. This service is given to the spinners on a cost basis, so that the premium may be increased or reduced according to the Commission's experience of costs. This last type of contract is not available for Sudan cotton, as its regularity in grading makes individual sampling unnecessary. It will be interesting to see to what extent spinners avail themselves of these different contracts. Although a similar choice has existed for Egyptian cotton for many months now, most of the purchases continue to be made on description—that is the first type of contract. But whether the other two forms of contract are used or not, spinners are at last being offered a service equivalent to prewar, and in some respects perhaps even better. And if the scheme works according to plan, spinners should be able to get the type of cotton to meet their individual requirements, particularly as they have over 3,000 types from which to choose.

It is, of course, too early to judge the operations of the Commission, but both in price policy and in sampling it is making an effort to restore to the Lancashire spinner all the advantages he had under private trading. Home prices were again reduced last Monday—the fifth change in nine weeks—with substantial cuts for certain Egyptian types. British prices are being kept very closely in line with world replacement costs even on a falling market, and if the Commission can maintain this policy without losing more on the downswing than it gains on the upswing, it will indeed be an achievement.

* * *

Rehabilitation in Tin

The rehabilitation of the Malayan tin industry has been progressing satisfactorily. Output for the first six months of the year reached 20,688 tons, compared with a total of 27,026 tons for the whole of 1947. In 1940 output in Malaya totalled 83,000 tons, which was admittedly a good year. Various forecasts have been made for 1948, and at the last meeting of the Tin Study Group, Malayan production up to June was estimated at 21,000 tons and at 25,000 tons for the second half of 1948. The first target has more or less been achieved and there is reasonable likelihood—political disturbances apart—that the second will also be attained.

The progress made between January and June of this year can be traced in the following table, which shows the total number of European and Chinese mines operating during each of the six months. There has been a steady increase in the number of gravel pump mines operating since the beginning of the year—from 339 to 393, nearly all of them Chinese owned—and the number of underground mines has also expanded almost continuously. The rehabilitation of dredges, however, has been much slower; 57 were operating in January; the total increased to 63 in May, but then fell to 61 in June. Shortage of steel and electrical equipment is still retarding both repairs to old dredges and delivery of new ones, while certain sites have been exhausted, necessitating the removal of dredges to new workable areas. Yet the increased activity in tin dredging can perhaps be gauged by the sharp increase in dividend receipts of London Tin Corporation, which owns considerable dredging interests in Malaya. But the recent political disturbances are affecting tin as well as rubber production. Although there has been no noticeable decline in output yet, unless reasonable security can be restored soon the rehabilitation of the industry may be seriously interrupted.

The next meeting of the Tin Study Group is to take place in the middle of October and most of the discussion is expected to centre in the proposed five-year plan for the tin industry. In Washington, last April, a subcommittee was appointed to review the possibility of a commodity scheme for tin, because, according

MALAYAN TIN MINES IN OPERATION, 1948
European and Chinese—number

	Jan.	Feb.	Mar.	April	May	June

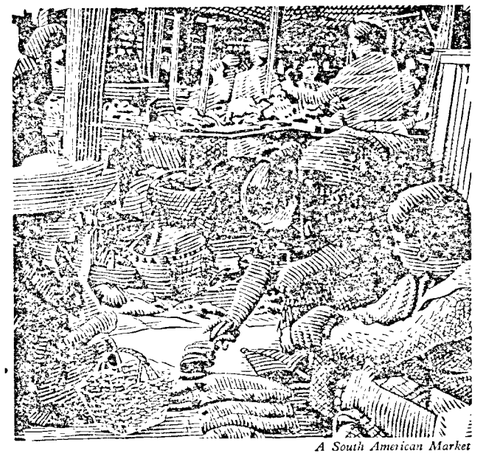
Hydraulicing	23	23	22	23	22	21
Open-cast	10	9	9	10	10	10
Underground mines	22	23	25	23	25	29
Small workings without machinery	43	46	45	47	47	46
TOTAL	494	504	518	527	539	560

Source: "Tin."

to the statistical forecast, world production would outstrip consumption by 1950. But the new agreement will have to conform both to the principles of the International Trade Charter, and also to the Economic Co-operation Agreement between Britain and the United States. It is difficult to conceive how a restriction scheme can be introduced when Britain has agreed to expand production of strategic materials to meet American requirements. Equally important is the question of price, for costs of production for tin differ widely among the various producers. Will the Study Group, which avowedly represents both producers and consumers, guard the consumers' interest in this matter?



* * *

Britain's Trade with Russia

Preliminary discussions on the future development of Anglo-Russian trade are continuing between Mr Bottomley, the Secretary for Overseas Trade, and the Soviet Ambassador, but though they have already lasted many weeks no agenda has yet been agreed. The prospect of successful trade talks will undoubtedly be conditioned by the broader aspects of the Berlin negotiations and within the context of ECA. The British approach towards Russian trade is sufficiently akin to the American to circumvent any possible objections under the Foreign Assistance Act, even though no formal list has been agreed between the two countries of commodities regarded as of strategic importance and not, therefore, available for export to Russia. The balance of trade between Russia and Britain during the first half of 1948 has been markedly in Russia's "favour"—at least in the old usage of the term. Britain has imported nearly £11½ million of Russian goods consisting almost entirely of grain, and exported £2,180,000 of British goods, half of which was machinery, and £1,145,000 of re-exports, mainly wool.

Under the trade agreement of last December Britain was to receive 450,000 metric tons of barley, 200,000 metric tons of maize and 100,000 metric tons of oats, making a total of 750,000 tons of grain. There was, however, a waiver clause to the effect that the last 200,000 tons would be withheld if the total value of Soviet orders placed by May 31st did not reach half the total value of the equipment required. Tenders had been submitted to the Russian trade authorities, but delays occurred through the tenders being referred back to Moscow. Although orders had not been placed up to required limit by the end of May, there has been no official intimation that Russia intends to withhold the final 200,000 tons of grain. Up to the end of July Britain had in fact received over 400,000 tons of grain. If imports during August and September continue to average 80,000 tons a month, total receipts by September 30th will be about 550,000 tons—equal to the original 750,000 tons less the 200,000 tons subject to the waiver clause.

Britain's adverse trade balance with Russia has, of course, been offset by Russian purchases within the sterling area. Large quantities of rubber have been bought in Malaya; during the first eight months of this year Malayan exports of rubber to Russia amounted to 56,143 tons. Although part of this quantity no doubt represents purchases made before the agreement was signed, Russia's sterling resources are assuredly much smaller than the trend of the British trade figures might alone imply.

A South American Market

There is colour and atmosphere in plenty in the country markets of South America, which, together with the great cities, form so vital a part of the export markets that Britain must maintain and expand.
Barclays Bank have their own Representative's Office in Buenos Aires and thus are well placed to assist those interested in trade with South America. Business men seeking to enter this market for the first time are particularly invited to discuss their problems with the Manager of their local branch or write direct to the address given below:

Chief Foreign Branch, 168, *Fenchurch Street, London, E.C.3*

Abridged Particulars

HACKBRIDGE CABLE HOLDINGS LIMITED

(Incorporated in England under the Companies Act, 1948.)

Authorised:		*Issued and Fully Paid Up.*
£450,000	in 450,000 5% Cumulative Preference Shares of £1 each	£450,000
£450,000	in 1,800,000 Ordinary Shares of 5s. each	£450,000
£900,000		£900,000

There are no Debentures, Mortgages or Loan Capital outstanding. There is, however, a mortgage granted by the Company's subsidiary, The Hackbridge Cable Company Limited upon which £38,000 is outstanding.

The List of Applications will open at 10 a.m. on Wednesday, 15th September, 1948, and will close the same day for an OFFER FOR SALE by

PHILIP HILL & PARTNERS LIMITED
of
882,000 ORDINARY SHARES OF 5s. EACH AT 15s. 6d. PER SHARE.

The Offer for Sale shows (inter alia) that:

1. The Company (incorporated on 3rd September, 1948, as a Private Company and converted into a Public Company on 8th September, 1948) was formed to acquire the whole issued share capital of The Hackbridge Cable Company Limited (the "Cable Company") which in turn owns the whole issued share capital of Bryce Electric Construction Company Limited and Mitcham Motor Company Limited.
2. The Cable Company (incorporated in 1917) carries on the well-known business of manufacturers and suppliers of "Hackbridge" electric cable to Public Utility and Commercial undertakings throughout the country and abroad, including the General Post Office and British Electricity Authority. Bryce Electric Construction Company Limited manufactures and distributes transformers, capacitors and electric meters and the Mitcham Motor Company Limited carries on the business of haulage contractors.
3. At present, about 25 per cent. of the Cable Company's total production is being exported, most of the balance being of highest priority for the home market. About 40 per cent. of the total production of Bryce Electric Construction Company Limited is for export.
4. The Accountants' Report shows combined net assets (excluding goodwill) of the Cable Company and its two Subsidiaries, amounting to £955,547, more than twice the nominal Preference Share Capital of Hackbridge Cable Holdings Limited.
5. In the opinion of the Directors, in the absence of any unforeseen circumstances, the profits of these companies for the current year, after charging all expenses including Directors' remuneration and depreciation, but before providing for taxation, will not be less than those for the year ended 31st March, 1948, which amounted to **£253,433.**
6. In this event, the Directors intend to recommend payment of a dividend on the Ordinary Shares for the period of approximately six and a half months from the date of this Offer to 31st March, 1949, at the rate of not less than 20 per cent. per annum, **equivalent to a yield of approximately £6 9s. 0d. per cent. per annum on the Offer price.**

Full Offers for Sale, on the terms of which alone applications will be considered, and application forms, are obtainable from:

BANKERS:
LLOYDS BANK LIMITED, Issue Department, 72, Lombard Street, London, E.C.3. and Branches.
BROKERS:
JOSEPH SEBAG & CO., 22, Old Broad Street, London, E.C.2, and The Stock Exchange, London.
REGISTERED OFFICE OF THE COMPANY, Kelvin Works, Hackbridge, Surrey.

or from the Vendors of the shares

PHILIP HILL & PARTNERS LIMITED
KINGSBURY HOUSE, KING STREET, ST. JAMES'S, LONDON, S.W.1.

If this is so, Russia may be willing to export larger quantities of grain to Britain, notwithstanding the distant delivery dates of British goods, especially as the harvest throughout eastern Europe has been good. In the trading sphere, at all events, Britain's bargaining position appears to be appreciably stronger now than it was twelve months ago.

Electricity Restrictions

Winter restrictions on the use of electric power are left for the Regional Boards for Industry to determine—appropriately, since the plan which will be most effective varies with the economic complexion of the region. The feature of the London and south-eastern region is the heavy commercial and domestic load and the relatively light industrial load. It is therefore unreasonable to expect industry to carry the entire burden of abstinence, and the arrangements for the coming winter which Sir Frederick Leggett announced during the week recognise this fact. Compulsory restrictions are to be extended from industry to commerce, and industrial establishments gain some relief, being required to cut their power consumption by one-fifth in the coldest months instead of by one-third.

Reasonable though this is, it is evident that the perfect method of enforcing the economies has yet to be found. Industry is to be restricted to a 90 per cent power load between 4 and 6 p.m. in October; 90 per cent between 8 a.m. and noon and between 4 and 6 p.m. in November; and 80 per cent between 7 a.m. and 7 p.m. from December to February. But 80 per cent of what? In each case the industrialist is restricted to a percentage of his peak load in the winter of 1946-1947. Thus the bad old principle of penalising past economy is retained. But there is a further point: how is the peak load to be ascertained, either for the winter of 1946-1947 or for the coming winter? The larger factories have, as a rule, maximum demand meters. In that case, ascertainment is simple. For those which have not, no more than a loose estimate based on the appliances installed and the habits of the factory is possible. It is hard to see how these factories can either be given a rigid maximum, or pinned down as to what they actually consume at peak times. And it is (as has so often been stressed) consumption at peak times that matters.

The remaining disputable point is whether the restrictions announced will serve their purpose of making load-shedding unnecessary. A spokesman of the British Electricity Authority explained that they would prove adequate if the winter were mild, but inadequate if it were really cold. New plant in service at the British generating stations would provide between 400,000 and 500,000 kilowatts more than last winter, he explained; but the increased load would be about the same, so there would be no easing of the supply problem. It is in some ways unfortunate that the whole problem continues to be treated as an emergency of an exceptional kind. The treatment is based, presumably, on the BEA estimate that there will be a net increase in generating capacity of 6,800,000 kilowatts by 1952, and that capacity will then just balance the load. It would help in dealing with the peak-load problem if the uncertainties of this proposition could be recognised.

Colliery Compensation Delays

In just over three months, on December 31st, colliery companies will cease to receive the interim income which they have been paid since the vesting date on January 1, 1947. Yet little apparent progress has been made with the apportionment of the total compensation sum of £164.6 million between the 21 districts; and that must be decided before the share of the eventual beneficiaries in the separate districts can be determined. Thus colliery companies remain quite uncertain of the date when they will finally receive compensation. They will be entitled to interest on their compensation claims as from the beginning of next year, but until these claims have been determined, the amount of interest will remain a matter of estimate.

Mr M. K. Burrows, chairman of Manchester Collieries, whose vested assets exceed £5,000,000, complains of the slow progress made by the Central Valuation Board, which is at present engaged in apportioning the total compensation sum as between the 21 districts. This work, in his opinion, cannot be completed before the end of this year at the earliest. It is, however, the next stage of the task—the examination of the claims of each individual colliery company by the eight District Valuation Boards—which will prove really extended. No one familiar with the coalmining industry will expect a speedy settlement of claims. Mr Burrows suggests that a payment on account could be made in anticipation of the final settlement. But the colliery undertakings should not overlook the part they themselves can play in expediting the proceedings. Thus the chairman of Staveley Coal and Iron has informed shareholders that the North Derbyshire collieries are "considering proposals aiming at the shortening of 'Stage 3 Proceedings'," that is, the apportionment of district sums to the companies.

Meanwhile, colliery undertakings pure and simple will be most affected by the intervening shortfall of revenue. Some companies, such as Staveley Coal and Iron, have demonstrated their independence of colliery profits—Staveley's trading profit for the latest year has risen by £169,868 to £790,756. Other companies are engaged in repaying part of their outstanding capital. Where repayment of preference capital only is contemplated, as in the case of Chatterley-Whitfield Collieries, it has led to litigation, which has still to be resolved. In other cases, such as Doncaster Amalgamated, the recent proposal to repay one-third of the preference and ordinary capital outstanding (£1,811,014 and £5,179,313 respectively) has been approved.

The requirement that the "statements of interest" submitted by each colliery must be verified by the Ministry of Fuel and Power before the district boards can start their work calls, in Mr Burrows' view, "for speeding up while retaining the necessary safeguards that public money is not improperly applied," if necessary by a revision of the regulations." But the first, and immediate, step should concern itself with the District Valuation Boards, which as yet consist only of eight chairmen.

Tilling Compensation Agreed

Negotiations between the Transport Commission and the Thomas Tilling group during the past eight months have ended in a satisfactory agreement for the purchase of the group's road transport undertakings affected by the Transport Act for a total price of £24.8 million. The Commission, of course, was already equally interested (through the shareholdings which it acquired from the railways) with the Tilling group in the operating companies, and purchase by voluntary agreement was naturally convenient to both sides in the negotiation. The Commission will retain the benefit of profits from December 31, 1947, and payment of the purchase price (which is subject to any detailed adjustments) may either be made in Transport Stock or cash, or partly in each.

Thomas Tilling retains important interests outside the passenger and haulage holdings which are to be transferred, and there is no intention of liquidating the company. But the directors' future plans have yet to be disclosed. What remains in the business is substantial by ordinary standards—the interests in Cornhill Insurance, Daimler Hire and others, and a holding of £811,406 of Transport Stock received in exchange for London Transport "C" stock. The break-up value of the £4,200,000 of Tilling ordinary stock works out at little below £6 per £1 of stock compared with a price of £5 1s. when the market closed on Wednesday. The news naturally caused great activity in Tilling and other road transport issues on Thursday, the former rising to £5 17s. The market is presuming that a substantial repayment of capital may be made, but this has been neither confirmed nor denied.

£2,000,000 for Agricultural Finance

A notable trustee issue this week will be the offering of £2,000,000 3 per cent debenture stock of the Agricultural Mortgage Corporation. This issue, which was underwritten in the City last Wednesday, is the first debenture issue to be made by the Corporation since 1932, although its share capital, which is wholly owned by the Bank of England and the clearing banks, was increased from £650,000 to £750,000 in 1944. There can be little doubt that the Corporation, sometimes known as the "Farmers' Bank," will have an important part to play in the big programme for expanding British agriculture; and the need for additional finance was apparent from its last balance-sheet. This showed that outstanding loans, made against first mortgages on agricultural properties, stood at £9,570,000 at March 31st last; they had increased during the year by fully £1,300,000, or by only a little less than the total of liquid resources which remained at the balance sheet date. Yet at the meeting a few months ago the chairman reported steadily rising demands for loans, for which the current charge to agriculturalists is 3½ per cent. The distinctive feature of this issue, therefore, from the Corporation's point of view, is that it offers a prospect of a small profit margin; the existing debenture stocks, totalling £8,500,000, were raised when capital market conditions were much less propitious—they carry rates of 5 and 4½ per cent.

Though a full trustee security, the stock is not directly guaranteed by the Government; it has, however, not only the high status which comes from the banking proprietary of the Corporation, but is, in effect, buttressed by the advances made to the Corporation by the Ministry of Agriculture. Partly because of its unique status, and partly because the stock, when fully paid (on January 11th), ceases to be free of stamp, it is not easy to make close comparisons with existing gilt-edged securities. But, on the basis of current prices for the securities most closely comparable—the 3 per cent Transport Stock, 1967/72 (also subject to stamp duty) and the 3 per cent New Zealand Stock, 1966/68 (which is stamp free)—the issue looks attractive, and will certainly be a welcome addition to the supply of high grade securities.

Nationalising India's Reserve Bank

The bill to nationalise the Reserve Bank of India, which is intended to take effect on January 1st next, passed its first reading in the Indian Parliament at the end of last week. The scheme does not raise any issues more contentious than those associated with the nationalisation of the Bank of England. Indeed, the Indian proposals follow very closely those adopted in Britain three years ago. The Reserve Bank of India, though created by the Indian Parliament in 1934, was a shareholders' bank. But the association between the Government and the bank, and the extent to which the policies of both were harmonised, was as close as if the bank had been a fully-owned state institution. Hence the Indian nationalisation scheme, like the British, has mainly moral significance, and will not have any discernible impact upon India's economy or banking structure. The existing share capital of the bank, totalling Rs. 5 crores and mainly held in India, is to be exchanged into 3 per cent long-dated Government Stock, and in future the board will be wholly appointed by the Government. Like the Bank of England Act, the bill empowers the Government to give directions to the central bank on matters of policy, while apparently safeguarding it from unreasonable interference in day-to-day routine. The Government has stated definitely that there is no intention to nationalise the commercial banks.

Gold Losses to Switzerland

A report issued this week by the Swiss Federal Council gives the interesting information that during the first two years of the working of the Anglo-Swiss payments agreement of March, 1946, the United Kingdom had to transfer to Switzerland 440 million Swiss francs in gold, of which 305 million francs were paid during the second year, that is, in the twelve months to the end of February, 1948. These gold remittances came to an end as a result of the supplementary agreement signed last January. By this both parties undertook to maintain payments between Switzerland and the sterling area in approximate balance, leaving Switzerland's holdings in sterling at the agreed ceiling of £15 million.

It is probable that the supplementary agreement, with its basic objective of preventing Swiss accumulations of sterling beyond this gold point, provides an explanation of the new arrangements for crediting interest on Swiss Nominee Assets referred to in *The Economist* of July 24th last. The new arrangements, under which the interest on such assets is paid to the credit of a sterling account appropriate to the residence of the beneficial owner and not of the nominee, means that an accumulation of sterling on Swiss account is prevented. Whether or not this suits Swiss interests, it certainly accords with the British Government's expressed desire "to bring payments between Switzerland and the sterling area into balance and so avoid further losses of gold."

* * *

Terms of Trade Still Deteriorating

The terms of trade are still moving against Britain, although the rate of deterioration slowed down in July. Import prices showed a relatively slight increase of 2 points, yet the cumulative rise since last December amounts to 11 per cent. The cost of raw materials showed the biggest increase in July; it rose by just over 1 per cent, while the increase for food, drink and tobacco was just under 1 per cent. Prices of manufactured goods actually fell, but the fall was only one point. The index of export prices, however, has remained around 251 for the past four months and has risen only by 3 per cent since the turn of the year. The export price of metal goods, indeed, has declined by one point for the second successive month; textile prices also fell in July. The value of other manufactures increased slightly, but was still below the level reached last April.

BRITISH IMPORT AND EXPORT PRICES

	1947 Dec.	1948 Jan.	Feb.	Mar.	April	May	June	July
Imports								
Food, drink and tobacco	243	249	254	255	259	260	263	265
Raw materials	304	313	317	319	336	342	348	353
Manufactures	258	263	269	274	275	278	279	278
TOTAL	263	269	275	277	283	286	290	292
Exports								
Food, drink and tobacco	224	223	230	221	223	224	224	226
Raw materials	277	283	293	304	306	305	305	305
Manufactures	245	244	247	248	251	251	252	251
Metal goods	222	221	223	225	226	227	226	225
Textiles	324	326	326	329	333	335	342	340
Others	236	235	240	240	246	244	243	245
TOTAL	244	244	247	248	251	251	252	251

It is a welcome sign that both import and export prices are tending to become more stable. But it is certain that the cost of food imports and certain raw materials will increase during the next six months—among them Canadian wheat, New Zealand and Australian meat and dairy produce and certain of the non-ferrous metals. Whether the cost of total imports will rise must depend on the extent to which other import prices may fall. American grain prices are not only much lower than a month or so ago owing to the excellent American harvest, but some are even below the minimum price guaranteed by the US Government Yet unless Britain is going to buy American instead of Canadian and Australian grain, it will benefit little from these lower prices. Even cheaper American cotton will have a proportionately smaller effect in lowering Britain's import costs, because purchases of American cotton are being kept to a minimum. But although import prices under the long-term contracts will rise, once the new season's supplies are received, total import prices should thereafter tend to fall somewhat. The main point, however, is whether export prices can safely be raised to match the higher cost of imports. There are indications at least that they cannot be adjusted; if so, the terms of trade must move still further against Britain.

* * *

New Capital without Tears

The scheme to infuse new capital into Aurochs Investment Company is in the highest degree ingenious. In June this year the Whitehead Industrial Trust acquired control of Aurochs Investment—an undertaking which has had a chequered career since the early 'twenties, and whose share capital of £2,100,000 was largely represented by a valueless charter party entered in the books at £2,000,000. Most issuing houses have the support of an associated investment company, but under present conditions it is impossible to establish a new investment company owing to the prohibition which is enforced by the Capital Issues Committee of all capital issues for merely financing purposes. The scheme for Aurochs Investment Company seeks to sidestep this prohibition—and apparently it succeeds. The whole of its share capital is to be preserved, but it will be converted into £140,000 in 4s. ordinary shares (this is the counterpart of the existing assets of the company which have largely been furnished by the Whitehead Industrial Trust) and £1,960,000 of convertible 4s. deferred shares.

Under a trust deed between Whitehead Industrial Trust and Aurochs Investment, the whole of the convertible deferred capital of the latter company will be put in the name of Whitehead Industrial Trust as trustees. As and when further capital is required for any work which Whitehead Industrial Trust may designate to Aurochs Investment, these deferred shares will be sold by the trustees at par. The trustees will then hand the proceeds to Aurochs Investment Company, and the deferred shares thus sold will be reconverted into ordinary shares ranking equally with the existing ordinary shares in issue. Ordinary shareholders of Aurochs are for the time being given preferential rights in purchasing such deferred shares as are offered by the trustees.

Technically this appears to be an extremely neat solution of a difficult legal dilemma. It is, of course, a quite exceptional case, and the likelihood of imitation is probably small. Certainly, any general tendency to use ingenious devices of this sort to circumvent the broad intentions of the Capital Issues control would

hardly commend itself to the authorities, and might provoke a strengthening of the regulations so as to put such schemes out of court.

* * *

Australian Estates Offer

The latest report of Australian Estates notifies ordinary stockholders that a substantial amount of preference stock and a smaller amount of ordinary stock have been acquired this year by interests registered in the names of various nominee companies. The late chairman of the company was informed by Mr Denys Lowson (who has been active for many years in unit trust business and was concerned with the Texas Land operation a few years ago) that these interests which were established in Scotland had obtained effective voting control of Australian Estates and wished to nominate representatives to the board. Three gentlemen have been notified as candidates for election at the company's annual general meeting which is to be held on September 29th.

Accompanying the report is a letter from Aberdeen Assets which informs the ordinary stockholders of Australian Estates that its friends and associates hold approximately 50 per cent of the issued preference and ordinary stock of Australian Estates (both classes have the same voting rights) and offering to purchase ordinary stock from existing holders at £140 for every £100 of stock free of expenses. This offer is open only until September 24th, five days before the shareholders of Australian Estates can have any opportunity of learning from their acting-chairman any further information about the new controlling interests. By reference to market prices the offer of Aberdeen Assets seems reasonable, for the ordinary stock has ranged during this year between 112 and 149. But the directors point out that the net asset value of the ordinary stock is substantially in excess of £200 per £100 nominal.

There is a suggestion in the timing of this offer that the purchasers are in a hurry to obtain the ordinary stock at their own price before stockholders can have the opportunity of hearing the views of their acting-chairman at first hand. In these circumstances the best advice that can be given them is to wait—either in the expectation that the time limit of the offer will itself be extended or for the possibility that they will have a later opportunity of realising their holdings closer to their intrinsic value than the price which the new interests are at present prepared to give.

* * *

UDT's Industrial Financing

Another aspect of the vexed question of capital formation in industry, which has been so widely debated recently by leading industrialists, was discussed last week at the meeting of the United Dominion Trust. Mr Gibson Jarvie naturally dealt with the problem from the point of view of the UDT, which is finding the provision of finance for industry's requirements for fixed capital an increasingly dominant part of its activities. His analysis of the whole problem, however, closely parallelled that recently made by Sir Geoffrey Heyworth and other industrial experts. He pointed out that while the burden of taxation on company profits since 1939 has made it virtually impossible for industry to accumulate new reserves for replenishment and modernisation of its equipment, the steep rise in replacement costs has eaten into the real value of the reserves accumulated before the war. More and more companies, therefore, are finding it impossible to bring their equipment up to date without raising fresh capital. But as Mr Jarvie pointed out, it may be unwise to raise permanent capital at a time of inflated prices. Many companies, therefore, are preferring to seek semi-permanent capital on fixed interest terms which is repayable over a period of years.

The United Dominions Trust, while deploring the political and fiscal tendencies which are thus impeding industry's capital formation, seems in fact to have derived—for the short run at least—a large benefit from them. Thanks to demands for loan capital of this kind, the Trust since the war has enjoyed a large expansion of business. Its profits last year increased by 57 per cent and the total of its loans, advances and bills, etc., rose from £5,514,000 to £8,263,000. It has financed the erection or adaptation of factories and the installation of new plant and machinery in "practically every industry." Mr Jarvie claimed that in present conditions loan finance is not open to the objection which might be raised against the creation of additional equity capital—on the ground that the industrial operations which the Trust is financing are "almost entirely self-liquidating" because the improvements will earn their own keep. Presumably this means that the net return from the additional output or from cost reductions thereby achieved should suffice to cover not only the interest but also the amortization on the loans. Mr Jarvie did not say, however, what level of prices is assumed for the purpose of such calculations. In some trades, if the equilibrium point were to be attainable only on the basis of the current price level, the transactions might eventually prove to be anything but "self-liquidating."

Shorter Notes

The Bank of England has now found it possible to print £5 notes, including the metallic thread, on thinner paper—"more in keeping with tradition"—than was needed when the metallic thread was first introduced, for security reasons, during the war. A new issue of thinner notes is accordingly now being made, of design virtually the same as that of the existing "thick" notes. These are not being called in and will, of course, remain legal tender.

*

The Stock Exchange Council announced on Monday the expulsion from the Stock Exchange of Mr Dermot Charles Piper. Mr Piper became a member in 1942.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Whitworth and Mitchell; Staveley Coal and Iron; Charrington, Gardner, Locket; London Tin; United Dairies

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked '*e*'), and those paying 3 per cent or less will be repaid at the latest date (marked '*l*'). (*m*) Net yields are calculated after allowing for tax at 5s. in the £. (*f*) Flat yield. * Assumed average life 15 years 6 months.

(*a*) Interim. (*b*) Final. (*c*) Whole year. (*d*) Int. paid half-yearly. (*e*) To earliest redemption date. (*g*) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (*l*) To latest redemption date. (*m*) 15 months. Yield Basis 25%. † Free of tax.

COMPANY MEETINGS

GEORGE NEWNES LIMITED

GRATIFYING FIGURES

SIR FRANK NEWNES' REVIEW

The fifty-first annual general meeting was held on September 9 at the company's head office. The following is an extract from the statement by the chairman circulated with the accounts.

The company is again able to present a balance sheet and profit and loss account of a gratifying character.

The combined profits of the organisation, comprising eleven publishing companies, amount to £712,052. After deducting taxation of £315,988, the total net profits for the year amount to £396,064 as against £279,618 for the previous year, or an increase of £116,446. The year's figures have benefited by an exceptional item of £53,767 representing mainly the surplus realised from sale of certain capital assets, so that the increase in trading profits is approximately £62,000.

The net profits of George Newnes Limited—the parent company—amount to £199,831 as against £191,604 last year. With the amount of £62,254 brought forward from the previous year, and after deducting dividends on the preference shares and the interim dividend of 5 per cent. on the ordinary shares, there is an available balance of £195,812. The directors propose that a final dividend of 10 per cent. be paid on the ordinary shares together with a bonus of 5 per cent., making with the interim dividend a total of 20 per cent., as for last year. This will absorb £75,000, and after transferring £6,500 to employees' sick and pension fund, £23,416 to supplementary pension account, and £25,000 to general reserve, there remains a balance of £65,896 to be carried forward to next year's accounts.

BALANCE SHEET ITEMS

There are few items in the balance sheet upon which I need comment, most of the changes being due to normal business fluctuations. General investments at £16,411 show a reduction of approximately £74,500. Certain investments have been realised to help provide the necessary cash requirements for purchasing an interest in another publishing business, the completion of which came in the current financial year. I will refer to this again later. With the same end in view cash at bank, £506,617, has risen by over £200,000. Stocks at £226,329 are higher by approximately £55,000, mainly attributable to work in progress in the preparation of important new projects for launching in the next few years.

An examination of the consolidated balance sheet and profit and loss account, setting out the position of the organisation as a whole, gives the simplest picture of our financial strength and resources. The total issued capital of the subsidiary companies held by outside interests is represented by £379,424 in preference shares and a small amount in ordinary shares in which Newnes have a majority holding. With the latter exceptions Newnes own the whole of the ordinary shares in their subsidiaries. The Newnes capital is £732,472 in preference shares and £500,000 in ordinary shares, so that the total issued capital of the organisation is £1,111,896 in preference shares and a little over £500,000 in ordinary shares. There are no debentures, bank loans or other prior charges in the balance sheets of any of the companies. The capital reserves stand at £235,977 and other reserves at £716,272. Development reserves, set aside over past years for launching new enterprises when the appropriate time arrives, are approximately £435,000. Undistributed profits in the various companies amount to £220,523, and the total cash resources are no less than £1,228,937.

Since the end of the financial year a substantial interest has been acquired in Temple Press Limited, proprietors of a group of technical and specialised journals holding an eminent position in their respective fields. The acquisition conforms to the company's policy of spreading its publishing interests as widely as possible, and we believe that this investment, wholly financed out of the resources of the group, will prove in every way satisfactory.

PAPER SUPPLIES

During the year under review the paper position suffered a further setback, supplies for periodicals being reduced from 35 per cent. to 31½ per cent. of prewar quantities. Serious questions were presented by this unexpected retrogression in the situation, but we were able to meet them by resuscitating some of the difficult and painful expedients we were bound to adopt in wartime, and which we thought we had been able to discard for good. Recently the paper quota has been restored to 35 per cent., thus providing a welcome relief, but even so the situation is that many of the publications are still unable to meet the full public demand for them.

As an indication of the immense hold the periodicals have upon the public in this country, shareholders will be interested to know that the aggregate circulations of the publications owned and published by our group alone amount to 6,500,000. Of this figure 1,250,000 are monthly magazines. Our largest circulation is *Woman's Own*, a colour-gravure weekly with a circulation of over 800,000 copies per week. We have good reason to think that the figure would readily pass the million mark if the necessary paper were forthcoming.

There are powerful claims for additional paper for periodicals. There is not only an unsatisfied public demand for many of them, but they are also deprived through lack of pages from rendering the full service they are so well fitted to perform to the community—the general public, the woman in the home, in trade and industry, in technical and specialised fields and other important directions—all of which have their appropriate journals. There is, as well, a considerable distribution of British periodicals in various countries overseas, where under present conditions they have to compete with the better values of other countries more favourably placed. Clearly these markets are of first importance to this country, not simply because of the currency value of the exports, but because the British periodicals constitute themselves as missionaries of the British way of life. So far with our own publications we have been able to hold our own in these markets, but we shall be all the happier when we are able to compete on more equal terms.

PENSION FUNDS

In view of the far-reaching economic changes of recent years the directors have been giving careful thought to the question of employees' pensions upon retirement. As shareholders are already aware, pension funds of a non-contributory character have been instituted in the various companies over the past 29 years, and altogether a total sum of £358,707 has been paid into these funds by annual allocations. This year the allocations amount to £20,000. Most of the funds are now reaching the stage of being self-supporting, but the directors and trustees feel that the pension benefit ought now to be increased to meet the changed economic conditions of today. Accordingly they are proposing to raise the benefit by one-third, the effect of which must be, of course, that substantial annual allocations will be required over a longer period before the funds reach self-sufficiency. Welcome though this step will be both to the beneficiaries and the company, the directors are of opinion that a supplementary plan is required to meet future needs, particularly in connection with the higher grades of wage and salary personnel. Various schemes have been studied but the very large initial appropriation required to found a suitable plan makes such a course impracticable at this stage. It is proposed, therefore, as an alternative and as a first step that allocations be made to form supplementary pension accounts in the various companies. The combined allocations proposed for this year amount to £200,000. Of this sum the parent company, Newnes, proposes to set aside £90,000 in its accounts, made up by £66,584 from reserves and £23,416 allocated from this year's profits. Pearson's will commence with £50,000, being £19,860 from reserves and £30,140 from current profits. Country Life, National Trade Press and W. H. and L. Collingridge will each allocate £20,000. The directors hope that the future prosperity of the organisation will be such that it will be possible to allocate further substantial sums each year so that within a reasonable period a sufficient total amount will have accumulated to permit them to review the whole position anew and to decide upon the best course to follow in the light of the resources then available. The directors feel sure that the shareholders will share their views in this matter and be fully in accord with what is proposed.

In February last we suffered a deep sorrow in losing our old and greatly esteemed colleague, W. T. Wallace. His health had been failing for some little time before his death, but notwithstanding his infirmities he maintained his business interest and enthusiasm to the end. He was one of the founders of the National Trade Press formed in 1918, and had since then acted as managing director of that company with great distinction and success. We acquired the control of National Trade Press in 1936, and shortly afterwards Mr Wallace joined our board. In that capacity he rendered valuable services to the organisation in many directions. His death removes a figure we shall always remember with deep affection and respect, shared by a wide circle who knew him and who worked with him.

TRIBUTE TO STAFF

As is customary the final paragraph, last though by no means least, is devoted again to thanking the staffs of all our companies for a continuance of their most excellent services during the year. This I do most sincerely on behalf of the company, and I am sure of the shareholders too. I have so often testified to the loyalty and able work of the personnel that its repetition may appear merely conventional. This is not the case, however. The board are deeply mindful of the loyalty and family spirit ruling throughout the organisation, and appreciate what that means in efficiency and smooth working. What I have already said about our hopes and plans on the question of pensions reflects the earnest wish of the board to do all that is possible in the years ahead to reward good and faithful service.

The report and accounts were adopted.

LEWIS BERGER AND SONS, LIMITED

RECORD PROFITS

The sixty-ninth annual general meeting of Lewis Berger and Sons, Limited, was held, on the 6th ultimo, in London.

Mr Thomas Litley, vice-chairman, who presided in the absence through indisposition of the chairman, Lord Greenwood, read the latter's speech, in the course of which he said:

The accounts cover approximately 20 months. They include, for the first time, group consolidated figures. Once again your chairman is able to report record profits.

DEVELOPMENT OF SUBSIDIARIES

The continuing and growing success of the company even during periods of restriction and control is supplemented by the active development of the earning power of subsidiary companies overseas; construction of new factories and improved production equipment; scientific research into alternative raw materials and the formulation of specialised surface coatings; sales policy which both supports and uses the practical services rendered by a highly organised distributive trade and enthusiasm of the company's staff, noticeable both in executive and factory operative.

The group consolidated profit and loss account shows a trading profit of over £2,000,000 for the period and a profit before taxation amounting to £1,868,000. The taxation charge of £950,000 is more than one-half of the profit earned even though it is reduced by amounts previously provided which are no longer required. The resulting net profit, for the period of approximately 20 months, is £918,000.

Each main production unit of the group has contributed record profit earnings to this account. In the world of today it is satisfactory that so large a proportion of the company's trading profit is earned from factories so widely dispersed overseas.

SUCCESS OF BOARD'S POLICY

The foundation of the company's trade has been the marketing of paint products for decorative and industrial purposes under brand names which have become known for the outstanding results which can be achieved by the user. During periods of raw material difficulty the group has avoided the temptation to debase the products sold in order to increase the quantity available for sale.

I believe this policy is now beginning to show results by reducing the effects on the company's trade of what is popularly supposed to be a current change from a sellers' to a buyers' market.

The popularity of "Pompeian" Enamel Paints, of "Matroil" Oilbound Distempers, and of "Lifeguard" Paint products for the amateur decorator is still the valuable security for profits which Berger factories give to stockholders.

The position disclosed by the accounts would seem to allow the directors to declare an interim dividend later in the year of 8 per cent. Thus distributions to ordinary stockholders during the calendar year 1948, subsequent to the FBI recommendations, would total the same rate of 33 per cent.

The group consolidated balance sheet shows that the stockholders' capital of £927,000 is now represented by net assets which total nearly £4,000,000.

Current assets exceed current liabilities by nearly £2,000,000. Liquid cash assets are maintained as adequate for immediate requirements of the company's business. It is doubtful whether continuance of the Board's policy of retaining profits for use in the business will be sufficient to provide for the planned increase in capital assets.

The report was adopted.

JAMES HOWDEN AND COMPANY, LIMITED

EXPANDING DEMAND

MR C. W. HUME'S REVIEW

The forty-second annual general meeting of James Howden and Company, Limited, was held, on the 8th instant, at 195, Scotland Street, Glasgow, Mr Crawford W. Hume, M.I.N.A., the chairman, presiding.

The secretary, Mr James S. Niven, read the notice convening the meeting and the report of the auditors.

The following is the Chairman's statement circulated with the report and accounts for the year to April 30, 1948:—

The accounts this year show very little material difference in form as compared with previous years, although now in the form required by the Companies Act, 1948.

In the appropriations made by the directors, you will notice that the sum transferred to the general reserve is double that of the previous year, and amounts to £60,000, increasing this reserve to £245,000.

TAXATION AND RESERVES

As will be seen in the consolidated balance sheet, the amounts reserved for taxation have been subdivided. The amounts due for all taxation up to April 5, 1948, including profits tax on the accounts to April 30, 1948, are shown under current liabilities, while the income tax for 1948-49 and that for 1949-50, not due till January 1, 1949 and 1950, respectively, have been included in the reserves.

The capital reserves are shown under subheadings. The excess profits tax postwar refund (shown on the assets side of the balance sheet as recoverable) has been added to the amount as credit last year. A further provision has been made for deferred repairs to cover the increased costs necessary to carry these out since the original estimates were made.

During the year the company purchased the goodwill and patent rights of a business allied to its own, the proprietor of which was a good friend with whom the company had worked for many years in close association on technical matters. This transaction is shown under the heading of goodwill and the book value of which was increased during the year by the purchase price and has now been reduced by a corresponding appropriation from the profits for the year.

INCREASING PRODUCTION

The company's order book, which, as you already know, reflects the demand for equipment, for power stations and ships, continues to mount and the company's capacity to meet this increasing load is being correspondingly increased.

The increased production per man-hour which is necessary to maintain our standard of living is mainly dependent on increased mechanisation of industry with consequent increased power consumption. The company is fortunate that its products are mainly used in the generation of power, and the high rate of expansion of the power supply industry, which is bound to continue for many years, offers a steady home market for our products. The company therefore continues to operate under the highest priorities for most of its products for the home market, and at the same time has a large export business amounting to nearly one-third of its total sales.

PURCHASE TAX

The output of our MacLellan Street factory was seriously retarded during several months

of the year by restrictions on the supply of material, and also near the end of the year under review by the imposition of 66⅔ per cent purchase tax on certain products of that factory. An appeal to the government to reconsider the tax was successful to the extent of having this reduced from 66⅔ per cent. to 33⅓ per cent. During the two months of negotiation, however, part of the business of this department was brought to a standstill and the company was involved in some loss of profit. It is regrettable that after previously giving official encouragement to undertake this new class of work, the government should suddenly change its policy. Such arbitrary and rapid changes are not conducive to the efficient management of business nor to the peace of mind of those employed in it.

Given freedom from such interference and assurance of supplies of essential materials, and provided the industrial activity of the country continues, the company should be fully employed for a long time.

The company has continued to enjoy the loyal support of the administrative and executive staff and the workpeople, and I am happy on your behalf to thank all the employees of the company for their faithful service.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, Mr Crawford W. Hume, M.I.N.A., and Mr Archibald Macfarlane, M.I.N.A., were re-elected and the auditors, Messrs. Wm. Hart, Jr. and Wilson, were reappointed.

SENA SUGAR ESTATES, LIMITED

DEMAND EXCEEDS SUPPLY

The twenty-eighth annual general meeting of Sena Sugar Estates, Limited, was held, on the 7th instant, in London, the Rt. Hon. Sir Francis O. Lindley, G.C.M.G., C.B., C.B.E (the chairman), presiding.

The following is an extract from his circulated statement:—

The crop turned out better than in the previous year and amounted to 56,537 tons of sugar compared to 46,529 tons. This increase was due to a variety of causes, the principal ones being a better climatic season and a larger acreage of land ploughed. Prices obtained for our sugar sales were much the same as in the previous year, and I regret to say that no increase in price in Portugal has yet been authorised. The increased revenue obtained from the bigger sugar crop was to a large extent offset by an increase in cost of production due to the high prices now being paid for replacements, bags and chemicals and an increase in native wages.

The demand for sugar for native consumption, both in the local market and neighbouring territories, continues to expand and, in spite of our increased crop, we were unable to meet it. This year's crop is turning out satisfactorily in spite of a dry season and the factories started crushing early in May.

The Lisbon refinery operated intermittently during the year as the raw sugar allotted to us is insufficient to meet the capacity of the plant, and the price obtainable does not encourage us to exceed our quota.

The profit on trading for the year amounts to £265,445, compared to £238,027 in the previous year. The net profit, after providing for depreciation, comes out at £102,397. Your board recommend the payment of a dividend of 12 per cent. on the ordinary stock.

The report was adopted.

ANGLO-PORTUGUESE TELEPHONE

RECONSTRUCTION AND REHABILITATION OF SYSTEMS

SIR ALEXANDER ROGER'S REVIEW

The sixty-first annual general meeting of The Anglo-Portuguese Telephone Company Limited, was held, on the 9th instant, at Derwent House, 2, Arundel Street, London, W.C.

Mr A. N. Rye, M.I.E.E. (one of the joint managing directors) presided in the absence of the chairman of the company, Sir Alexander Roger, K.C.I.E., and read his speech which was as follows:—

During 1947 the stability of the sterling-escudo exchange was maintained and the currency accounts have accordingly been converted at the rate of Escs.100 to the £, which has been the case since 1940.

Expenses, including interest on loans, interest on the 5 per cent. and 5½ per cent. debenture stocks, and the sinking fund instalments on these two stocks amount to £700,863 compared with £627,998. Revenue amounted to £758,675, as against £687,519.

In conformity with the consulting engineers' recommendation the amount for depreciation, which is included in expenses, again provides a contribution towards the exceptional wear and tear on the plant during the war years

PROFIT AND DIVIDENDS

Net profit at £57,812 compares with £59,521 and after providing for the usual dividends of 8 per cent. less tax, on the ordinary stock, and "A" ordinary shares, amounting to £57,172, the carry-forward is £42,732, against £42,092 brought in

Fixed assets now total £3,431,714. The provision for renewals stands at £1,031,165, which is equivalent to over 31 per cent. of the plant value.

The provision for renewals and the small reserves which the company has been able to build up in the past years are all invested in the business which undoubtedly assists the economical operating and financing of the service to the advantage of the Portuguese telephone community.

Your company and the Portuguese public continue to obtain considerable benefit from the connection with the Telephone and General Trust. Although your company has ceased to be a legal subsidiary of the trust, the close and helpful relationship between the two remains undisturbed and indeed it has been strengthened. Your company, with the trust, is associated with a group of companies which has a long and world-wide experience of the financial, technical, engineering and administrative requirements of the telecommunications business, and is able to draw to the utmost on these and to profit from the research activities of the group.

At December 31st last your company was in debt to the trust to the extent of £405,646 and at September 1, 1948, it amounted to £581,000.

EXPANSION AND DEVELOPMENT

With the limited amount of material which has been available to telephone undertakings in all parts of the world during the war years it was not possible to avoid overloading the plant in the endeavour to fulfil the demands of the service. For the purposes of correcting this and expanding and improving the service generally our gross expenditure on capital account alone during the two years 1946 and 1947 was over £900,000. Thanks to the co-operation and assistance of our manufacturing associates which we much appreciate, we have shipped from Great Britain during this period material to the value of £584,000. In addition we have expended in Portugal on purchases of locally manufactured material 18,500 contos (£185,000).

We do not limit our requirements for material to Great Britain. We extend our inquiries to all countries which manufacture telephone material whenever we think there are possibilities of supply. So far, however, our experience has been that with a few minor exceptions Britain is still in advance of the others when price, delivery and specifications are all taken into account.

STATION GROWTH

A further 8,361 stations were added in 1947, making a total at December 31st last of 80,546. This is equivalent to a growth of 11.5 per cent. For the two years 1946 and 1947 the number of stations has been increased by 15,341.

Station growth does not alone describe the heavy work performed by the company in Lisbon and Oporto in the reconstruction and rehabilitation of the systems generally. Considerable expansions and extensions of exchange equipment and cable plant were also undertaken which added materially to the work involved.

We have now 147 exchanges of various capacities throughout the company's concessionary areas in Lisbon and Oporto, but in spite of this great expansion the waiting list today is about 21,500, which is the highest it has yet reached.

Notwithstanding the vast quantities of telephone material which since the war years have been manufactured for civilian use the demand for telephones in every country continues to be in excess of the ability of the world's factories to supply, and is likely to be so until the shortages of the war years are overtaken. Certainly in the case of Britain it is intensified by the necessity for exporting the greater part of the telephone plant manufactured here, and Portugal is very high in the list of those countries which benefit as a result of this.

HIS EXCELLENCY DOCTOR OLIVEIRA SALAZAR'S TWENTIETH ANNIVERSARY

Since the last general meeting I have been to Portugal on three occasions, in October, 1947, and in April and July, 1948. My April, 1948, visit coincided with the celebrations then proceeding in commemoration of His Excellency Dr Oliveira Salazar's twentieth anniversary of his accession to office.

Expressions of goodwill and congratulations reached His Excellency from all over Portugal, Metropolitan and Colonial, and from many countries abroad.

I ventured to send to the Portuguese newspapers a public tribute to His Excellency on behalf of your company, the Lisbon Tramway Company and other interests with which I am connected in Portugal, and I was gratified to find that it was widely given front page publicity. It was pleasant to be able to say that we shared in the confidence which the people of Portugal have for their great Prime Minister, who had steered his country through all the perils and difficulties of the past years with such consummate skill, wisdom and integrity, and who had earned the respect and regard of Britain and many other countries.

During that visit I had the honour of being received by His Excellency and was able to give personal expression to the good wishes and congratulations which had been conveyed to him. I also had the honour of being received by His Excellency during my July, 1948, visit.

NECESSITY FOR TARIFF ADJUSTMENT

The purposes of my two visits to Portugal in 1948 were principally to explain to the Portuguese authorities that the necessity for an adjustment of telephone rates, owing to our great expansion programme and the continued rising costs of labour, materials, and all expenses, had become increasingly urgent since the company had first broached the subject to the Government in 1945.

I have found a ready understanding of the company's difficulties and the nature of our problems.

Our case is now being examined in detail by the Government representatives in co-operation with the representative of your company and we are hopeful of a satisfactory outcome at an early date.

It will be appreciated that until this matter is settled our plans for future financing must necessarily remain in abeyance.

EXCHANGE OF VISITS

Mr Hollyer accompanied me to Portugal during my visits. In the early part of the year, Wing-Commander Hulbert was able to see our properties in Lisbon and Oporto and meet our personnel there.

Mr A. F. Roger, who knows Portugal well through his other business interests there, has paid a further visit since his appointment. Senior officials from Portugal were in England at various times during 1947 for consultation and exchange of views, particularly on engineering technique. Clearer understanding and co-operation and avoidance of delay results from these personal contacts.

CONDITIONS IN PORTUGAL

Conditions generally in Portugal improved during the year. A determined and successful effort was made by the Government to check the serious postwar inflationary tendencies caused by a scarcity of consumer and other goods which was seriously affecting the living standard of most classes. Luxury imports were reduced to a minimum and imported food stuffs increased from various countries.

The Government continued to press on with their plans for further industrialising and modernising the country.

From my personal knowledge of Portugal which has been acquired over a number of years, I am able to pay a sincere and appreciative tribute to the progress made.

All the large schemes, such as those for supplying hydro-electrification plant for supplying current to the country, the electrification of the railways, and the expansion of the mercantile fleet are steadily going forward. The harbour works, docks, Custom houses and storage buildings, in Lisbon and Oporto, have improved and expanded, greatly aiding the loading and unloading of cargo and assisting passengers services.

New business and residential premises are constantly increasing in all the big towns and the roads, both highways and byeways have much improved.

For the twentieth year in succession Portugal has had a balanced budget, and its financial resources and reserves create confidence that the industrial and agricultural development of the country will proceed satisfactorily.

It is essential that the telecommunications services of the country should be maintained at the highest level of efficiency so that they can assist the national economy by facilitating the commercial, social and cultural life of the community in harmony with the Government plans. Your company continues to do its utmost to help the Government in every possible way.

DIRECTORATE AND STAFF

Mr A. F. Roger was appointed to the London Board in April last. He has been connected with the telephone business and has been a director of other telephone companies for a number of years, and his knowledge and experience is greatly welcomed.

We also welcome to the directorate Doctor Augusto de Castro, who was appointed to the local Board in July of this year, and is a valuable addition to its strength.

The company is truly fortunate in its direc-

torate in Portugal. The chairman, Senhor Branco Cabral, who is ably supported by his colleagues, has a wide and successful experience of public utility administration and is indefatigable in his work for the company. Our legal adviser, Dr. Bustorff Silva, is also a tower of strength and gives us unstintingly of his time.

Snr. Antonio Calem, who so admirably represents the directorate in Oporto, was appointed a Commander of the Order of the British Empire last September, and we take this public opportunity of congratulating him.

Mr Thorp has been with the company for 23 years, the last two years and more as general manager. The directors in London and Portugal have complete confidence in his ability and qualities.

All the personnel and staff met the demands of the year with great willingness and in the earnest desire to give satisfaction to the company and to the public we serve. On your behalf I thank them all for their work.

Our employees number over 3,000, of whom 99 per cent. are Portuguese, and we continue to do all we can to further their interests and welfare within the capacity of our resources.

The report and accounts were unanimously adopted.

WM. CORY AND SON, LIMITED

INCREASED PROFIT

The Rt. Hon. Lord Leathers, P.C., C.H., Chairman of the Company, presided, on the 9th instant, at the fifty-second annual general meeting of Wm. Cory and Son, Limited, held in the Council Chamber of the Chamber of Shipping of the United Kingdom, E.C.3.

The following is an extract from his statement, circulated with the report and accounts:—

The net profit for the year is £679,207, against a corresponding figure for last year of £440,669.

In conjunction with Powell Duffryn, Limited, we have acquired the share capital of John Kelly, Limited, Belfast, and a number of other companies under the control of the Kelly family.

The distribution of coal in this country has been more than maintained in the year under review, and our river properties, including our large fleets of tugs and lighters, were employed to the maximum. Our fleet of coal-carrying steamers has continued to run at full strength.

The export of coal from the United Kingdom has moved forward during the year, and while still relatively insignificant, should steadily increase.

The company's oil trade has reached a new high level in spite of the serious shortage of all oil products which developed in the course of the year.

The coal trade in South Africa has continued to suffer from a short supply of railway wagons, in consequence of which the output of our Natal Collieries shows a marked reduction. This wagon shortage has become more pronounced in the last few months, affecting more especially deliveries of coal for export, and causing great delay to the vessels loading coal cargoes at Durban and Lourenco Marques.

Decisions will shortly be taken to increase the output of our Natal Collieries to meet an expanding demand in the Union for coking coal. The sinking of a new pit and the erection of the ancillary machinery will take several years, and by that time it is expected that our output will no longer be restricted by shortage of wagons.

For the current financial year there is a noticeable falling off in the demand for coal for certain industries, only part of which is seasonal, and the stocks of these consumers as well as some of the public utilities are larger than for some time past.

Negotiations have opened between the National Coal Board and the Distributors and Exporters to fix the terms and conditions of sale and the remuneration to attach to the distribution of coal in this country and for export.

The report was adopted.

SILENTBLOC, LIMITED

CONTINUED PROGRESS

The thirteenth annual general meeting of Silentbloc, Limited, was held, on the 9th instant, in London, Mr Harold Vezey Strong (chairman) presiding.

The following is an extract from the chairman's speech:—

The trading profit for the year ended May 31, 1948 by comparison with the previous year, has increased by £26,601, or 29 per cent., and, for your information, combined sales have increased by 25 per cent., depreciation has risen by 119 per cent. due mainly to heavy purchases of plant and machinery, including that bought from the Ministry of Supply, but taxation on the actual year's profits has risen from £38,108 to £52,318, an advance of no less than 37 per cent., leaving a net profit increase for the year of £4,162 or 12 per cent.

After making all the provisions we deem necessary, providing also for a final dividend of 4d. per share, less tax, and bringing in the balance from the previous year of £18,017, there remains a balance on profit and loss account of £22,314 which we propose to carry forward into the current year.

In the last prewar year our customers numbered 739, today they number 1,728, which indicates the widening spread of our products over the field of general engineering. Moreover, we are exporting to eighteen countries at the present time—not in large quantities but in a nice steadily expanding way. In the field of rail traction and of rubber suspension our engineers are closely co-operating with electric and diesel locomotive builders in evolving designs—incorporating our products—to introduce resilience where desirable into bogies and traction wheels, and also for the suspension of coaches by entirely new methods.

We have acquired new rights, we have entered into reciprocal agreements between us and our American friends with the inventor of the original silentbloc—Leon Thiry—as the connecting link, and we have formed our own companies in Canada and Australia to produce and market components both of British and American design, according to the respective needs of the British and American firms now established or to be established in these two Dominions. These steps forge sound new links in a chain which we believe will in due course be further strengthened and extended.

THE ANDRE RUBBER COMPANY

To date—and remember it is still very early days—the company has received orders for its "rubbers" from 127 British mills; deliveries have been made to 68 of these mills and repeat orders are being received. The largest woollen mill in the country, which has co-operated with your subsidiary for over two years, has placed orders for the re-equipment of the whole of its condensers with "Andre rubbers" in place of leather, which fact after many months testing we feel we may regard as an outward and visible sign of the superiority of the Andre product. This order alone is of sufficient magnitude to indicate the potentialities ahead. Satisfactory first orders have also been received from Sweden, Holland, Belgium and South Africa, and just recently two Swiss mills have placed initial orders for testing purposes.

In addition the company has produced the "Andre Synthetic Condenser Tapes" which are already in use in a number of important woollen mills, while rubber "pickers" for the Northrop type of loom have also been successfully developed. Increasing business is now being obtained for both these new products.

The report and accounts were unanimously adopted and the dividend as recommended of 4d. per share (making 7d. per share for the year) was approved.

NOTICES

UNIVERSITY COLLEGE, SOUTHAMPTON

Applications are invited for the post of Lecturer in Economics and Statistics. The commencing salary will be at the rate of £650 per annum. Further particulars may be obtained from the Registrar, to whom applications should be sent as soon as possible.

BIRMINGHAM CHAMBER OF COMMERCE (INC.)

Applications are invited for appointment as Secretary on retirement of present occupant of the office. Candidates, preferably between 35 and 45, must have had wide experience in secretarial and administrative work; a University Degree or some knowledge of legal work an advantage but not essential. Post, which also carries with it the secretarial responsibility for the Birmingham Section of the British Industries Fair, is a whole-time pensionable appointment. It offers considerable scope and a particularly interesting type of work to the selected candidate. Remuneration is commensurate with the high degree of responsibility involved and the prestige of the office.

Present occupant will remain in Office for a period of time to enable the selected candidate to take over smoothly and efficiently.

Applications, stating age and giving full particulars of qualifications and experience together with the names of three referees, and present remuneration, should be addressed to the President, Birmingham Chamber of Commerce, 95, New Street, Birmingham, 2, marked "Private and Confidential." They must be received NOT LATER THAN first post on October 1, 1948. Canvassing either directly or indirectly will disqualify.

B.A. (Com.) girl, 21, wants post in London. Willing to be trained for Market Research, Sales Intelligence, business or administration. Intelligent and hard working.—Box 811.

THE EASTERN BANK LIMITED

The Transfer Books will be CLOSED from September 17 to October 2, 1948, both days inclusive. By Order of the Board,

C. L. MANNING, Secretary.

2 & 3, Crosby Square, London, E.C.3. September 8, 1948.

U.K.-DOMINION Wool Disposals Ltd. (The Joint Organisation) requires a qualified Economist/Statistician to take charge of its Statistical Department. Preferably applicants should have some administrative experience and be capable of interpreting international commercial statistics. The Joint Organisation is responsible for the orderly disposal of the stock of Dominions' wool accumulated during the war and at the same time operates a system of reserve prices for Dominions' wool coming on to the market in Australia, New Zealand, South Africa and the U.K. Applications giving particulars of qualifications, experience and salary required should be made to the Secretary, U.K.-Dominion Wool Disposals Ltd., 8, Moorgate, London, E.C.2.

FIRST-CLASS Book Salesmen required by important London Publishers. Experience of selling to the Book Trade essential. Advantage to have knowledge of Export work. Men selected will be trained in London with a view to sending overseas later if opportunity arises. Not over 35. Applicants should apply in writing giving particulars of experience, qualifications, age and salary required, to Box No. E197, c/o Streets, 110, Old Broad Street, E.C.2.

A COMPREHENSIVE service for industrialists: The Advertiser specialises in the planning and conduct of political, social and economic surveys, public relations and public affairs, personnel relations: he has wide experience at home and abroad, and is accustomed to operate at high levels and on a big scale; preliminary consultation need incur no liability; highest possible references, of course.—Box 809.

STUDENT urgently requires sound copy Arnold Plant's "Some Modern Business Problems."—Box 818.

Statistical Summary

GOVERNMENT RETURNS

For the week ended September 4, 1948, total ordinary revenue was £50,339,000, against ordinary expenditure of £82,634,000 and issues to sinking funds £2,945,000. Thus, including sinking fund allocations of £7,509,000 the surplus accrued since April 1st is £250,384,078 against £212,741,229 for the corresponding period a year ago.

UNIVERSITY OF EDINBURGH

Applications are invited for the appointment of a Research Lecturer in the Department of Political Economy. Salary £675 rising by £25 annually to £800. A scheme of family allowance is in operation.

Further particulars can be obtained from the Secretary to the University to whom applications, accompanied by the names of three referees, should be addressed not later than September 30, 1948.

THE UNIVERSITY OF ADELAIDE

CHAIR OF HISTORY AND POLITICAL SCIENCE

Owing to the impending retirement of Professor G. V. Portus, the CHAIR OF HISTORY AND POLITICAL SCIENCE will be vacant at the end of 1948 and applications for the post are invited.

Weight will be given to the particular interests of the successful applicant, but it is hoped that he will give courses on the evolution of civilisation with some emphasis on the development of the Asiatic world.

Salary £1,400 Australian a year with F.S.S.U. superannuation benefits.

Further particulars and information as to the method of application may be obtained from the Secretary, Universities Bureau of the British Empire, 32, Woburn Square, London, W.C.1. The closing date for the receipt of applications is September 30, 1948.

NATAL UNIVERSITY COLLEGE

(SHORTLY TO BECOME UNIVERSITY OF NATAL)

Applications are invited for the post of LECTURER IN COMMERCE in Durban.

Applicants should have a degree in Commerce or Economics and should state in their applications any special qualifications to lecture on marketing, international trade, business finance, industrial organisation and management or practical banking.

The salary will be on the scale:

Men: £550 x 25—£725
Women: £425 x 25—£600

A cost of living allowance, at present amounting to £154 per annum for a married person and £44 for a single person, is paid in addition. The initial salary will be determined in accordance with the qualifications and experience of the successful applicant.

Membership of the University Teachers' Provident Fund is compulsory.

Further particulars and information as to the method of application can be obtained from the Secretary, Universities Bureau of the British Empire, 32, Woburn Square, London, W.C.1. The closing date for the receipt of applications is September 30, 1948.

ADMINISTRATION.—Scotsman (40), available now. Chartered Accountant and Cost Accountant. Twenty-five years' experience professional, commercial and trade association secretarial work, including six years secretary/manager wartime pool company, turnover £250,000 p.a. Accounting, investigations and reports, statistics, industrial organisation, price maintenance agreements, negotiations Government departments and trade unions.—Wm. Eadie, 49 London Road, Reading, Berks.

YOUNG man experienced company secretarial work passed C.I.S. Finals seeks position with good prospects in commercial firm, would consider position provinces or abroad. Box 802.

HONOURS Graduate coaches personally (North London) or by correspondence. Economics, Mathematics, Statistics, History, etc. Box 823.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees payable by instalments, if desired.

Prospectus from Dept. P17, WOLSEY HALL, OXFORD

AVELING BARFORD LIMITED

At a Meeting of the Board of Directors held on Wednesday, September 1st, the following Resolution was passed:—

"It was resolved that an Interim Dividend be paid on October 15, 1948, on the £375,000 Ordinary Stock at the rate of 5 per cent (actual) less tax, and that the Ordinary Stock transfer books of the company be closed from September 15, 1948, to September 23, 1948, both dates inclusive."

By Order of the Board,
H. C. RYAN, Secretary.

Grantham, September 1, 1948.

A GOVERNMENT DEPARTMENT (London) invites applications from men and women for unestablished posts as (1) Assistant in Press Office, and (2) Research Writer. Candidates must be journalists with experience and interest in economic and financial affairs, and a knowledge of scientific and technological subjects would be an advantage. Salary range: £600-£800 per anum (inclusive).

Written applications, giving date of birth, full details of qualifications and experience, including Gates, should be addressed to London Appointments Officer, 1-6, Tavistock Square, London, W.C.1, quoting reference K.X.512/513. Original references must not be forwarded. Only candidates selected for interview will be advised.

ASSISTANT ACCOUNTANT, first-class man required for West African Gold Mine. Must be qualified, about 35 years of age and practical costing experience with mining concern or modern engineering firm would be an advantage. Salary £70-£75 per month, according to experience. Overseas tours 15 months, followed by three months' leave on full pay. Bungalow accommodation with simple furniture provided, also travelling expenses and first-class passages. Free medical attention.—Write, giving details of experience, to Box 3692, c/o Whites, Ltd., 72-78, Fleet Street, London, E.C.4.

TEXTILE Marketing Manager required by manufacturers of glass yarns. The post is an important one, concerned with the expansion of applications and sales of glass yarns. Applicants should be between 30 and 40 and have a wide experience in textile sales and manufacture. A University or other qualification in textile subjects is desirable. Apply by letter, giving short details of training and experience, to M.D., Fibreglass Limited, St. Helens, Lancs.

LONDON Book Publishers require first-class man to handle Sales Promotion work. Must be experienced in the preparation and supplying of appropriate selling material to both home and overseas markets. Not over 25. Applicant with B.Com. or B.Sc. Econ. Degree, or equivalent educational standard preferred. Interesting and progressive opening for the right man. Write, giving particulars of experience, qualifications, age and salary required, to Box No. E196, c/o Streets, 110, Old Broad Street, E.C.2.

A LONDON firm of Industrial and Business Consultants requires several first-class men of highest integrity, one for Senior position. Recognised degree in Engineering, and apprenticeship. About ten years' varied experience Works Management. Previous experience Management Consultancy for Senior Post. Age 30-40. Remuneration will correspond to requirements and individual. Our Staff have been informed. Full particulars in strict confidence to Box 815.

BUSINESS MAN (Wykehamist), of proved ability and adaptability, with fine record in peace (sales and advertising administration) and war (lieut.-colonel, staff), seeks scope for creative thinking, initiative and modern methods of marketing and sales promotion.—Box 820.

TECHNICAL ASSISTANT, production engineer, 25, Grad. I.P.E., seeks position. Experienced process research, abstracting. Original work layout costing. Tech. German, French. Typing, some shorthand. Free mid-September.—Box 814

EXPERT Shorthand, Typewriting, Duplicating, and/or Book-keeping offered by highly qualified secretary. Services available hourly or otherwise by arrangement.—Box 810.

PRIVATE SECRETARY required for Managing Director of international Company. London (Mayfair) office. Languages an advantage but not essential. Good salary and working conditions. Please apply in handwriting to Box 807.

YOUNG man (25), good administrative and accounting experience, Inter.B.Com., preparing for Final, sound working knowledge of French, seeks appointment in France or French North Africa.—Box 805.

INVESTMENT.—The Entire Share Capital of company owning proprietaries in a United Kingdom city yielding a gross rental of approximately £25,000 is offered for sale.—Box No. 500, Dorland, 18-20, Regent Street, London, S.W.1.

State and Public

THE Trades Union Congress at Margate may have demonstrated the solidity of the British Labour movement. But it also demonstrated the hollowness of Socialist doctrine. Socialism—in Britain at least—long since ceased to be a device for equalising wealth by confiscating property. Sir Stafford Cripps told the trade unionists that they could no longer hope to equalise wealth by raising wages at the expense of profits. And the Congress itself voted against the principle of workers' control of industry. If a Socialist is not a man who believes in confiscating wealth, who does not believe that the national income can be substantially re-distributed in favour of wages, who does not believe in workers' control of industry, what then is he? Perhaps the most accurate answer, so far at least as this country is concerned, is to say that a Socialist is a man who believes in the nationalisation of industry—or at least of some industries—but who has abandoned all the original reasons for that doctrine and is therefore dependent on a number of *ex post facta* rationalisations for what has long ago become an irrational instinct.

The latest example of this is to be found in the article that Mr Herbert Morrison has contributed to the new Labour Encyclopaedia. Mr Morrison says that there are two *prima facie* "qualifications" for socialisation that an industry can possess. The first is that it provides a common service for industry generally or is basic in character. The second is that it is a monopoly, or that owing to its nature or to the muddle into which private ownership has brought it the public interest can best be served by its becoming a monopoly. To put the same idea more briefly, the candidates for socialisation are those industries that are basic, that are monopolies or that are in a mess.

There is nothing very novel about this doctrine. It has long been a commonplace of the moderate, or pragmatic, school of Socialists. Indeed, something very much like it would probably be found acceptable by a wide range of people who would hesitate to confess themselves Socialists of any kind. But that does not make it true. In fact, as soon as the Morrison doctrine is closely examined it can be shown to be entirely dependent on a number of assumptions, each one of which is decidedly shaky.

For example, the doctrine that an industry or service which "provides a common service for industry generally or is basic in character" should be socialised clearly rests on the assumption that the state can far better protect the public interest in such a basic industry than anyone else. Indeed, in most Socialist thinking and writing the state is simply equated with the public interest. There are of course cases in which the state is the only effective protector and organiser of the public interest. In wartime, for example, and, to a large extent, in a postwar siege economy the state alone has the reach and the power to ensure the public interest. But as a general proposition for permanent and universal application, it certainly cannot be accepted that the state always acts in the public interest. It is far nearer the truth to say that "the state" merely consists of a number of government departments, each of which

tends to put its own interests above those of the public. No one would dream of asserting that the state's interest and the public interest are identical where the civil and political rights of the individual citizen are concerned. Indeed, the history of freedom is one long list of devices—from trial by jury and *habeas corpus* to the judges' rules of evidence—based on the assumption that the state can *not* be trusted to serve the public interest. No one would advocate dismantling these defences of justice simply because the executive organs of government are nowadays responsible to a democratically elected parliament. Yet in economic matters the doctrine appears to be accepted that whatever a Minister of the Crown may take it into his head to do is *ipso facto* in the public interest.

*

There really is no evidence for any such naïvely trusting view. Indeed, evidence is beginning to accumulate for the directly contrary view. For what is the overwhelming public interest in an industry, the more overwhelming the more basic the industry? Clearly that it should be conducted with the maximum economic efficiency. What does the public require of transport, or of electricity, or of steel? That they should render their services, or produce their materials, as cheaply as is possible without exploiting their labour or under-maintaining their capital. There is no other public interest that comes within a hundred miles of this in importance. Now what reason is there for believing that the public ownership of these industries and services will lead to their rendering their services or producing their materials more cheaply? In specific cases there may be good reason for so believing. But if what is sought is not specific judgments on the merits of particular industries but a sweeping generalisation of universal application, then it can only be said that nationalisation will generally lower the economic efficiency of an industry. There are three reasons for saying this. The first is that a nationalised industry, being a political structure, will almost certainly be cumbrous and slow-moving; of that there is already evidence. The second is that a nationalised industry will almost certainly be far too weak in its relations with the unions; it will tend to grant too much pay for too little work and recoup itself by putting up its charges (that is, at the expense of the public interest). Of this, too, there is also now plenty of evidence. And thirdly, a nationalised industry is inevitably more of a monopoly, and much more protected in its exercise of monopoly powers, than what it replaces. Protected monopolies are notoriously inefficient and there is no reason to suppose that they will be less so if they are publicly owned.

These are the debit entries that must be entered immediately on an industry's account when it is nationalised—they are being exemplified by the first-year deficits that one nationalised industry after another is showing. There are no correspondingly automatic credit entries. But if every nationalisation account, starts, other things being equal, with a deficit, then it would seem logical to conclude that the more basic an industry is the less, not the more, it should be considered a candidate for nationalisation. By the same reasoning, if an industry is economically inefficient under private ownership, it is, as a general rule, likely to get into a still worse mess when brought into public ownership.

There is a similar lack of logic about the argument—so specious at first sight—that if an industry already is, or should be, a monopoly, it should be made a public monopoly. Once again, the assumption is that a state-owned monopoly will *ipso facto* serve the public interest better than a privately-owned monopoly. But there is really no reason to suppose that this is so. It is true that a state-owned industry is subject to control by Ministers, who are answerable to Parliament. But no privately-owned monopoly would dare to be as obstinately deaf to public complaint as a Government department. Let anyone who doubts this compare how he is treated by his bank and his post-office, his electricity company and his telephone exchange. The way to treat monopolies is to avoid them if possible, to break them up where they are unnecessary, and where they cannot be avoided, to give them some direct incentive to efficiency, such as a sliding scale relating profits, and possibly wages too, to the charges they make to the public. This is far more likely to be effective than a simple belief, contrary to all the evidence, that monopolists, if only they are appointed by Ministers, can be trusted to know the public's interest better than the public itself.

The truth is that there are no general principles for socialisation—though there may be some against it. The only practical basis on which a policy of nationalisation can be logically built is a strictly opportunist one. Nationalisation is worth while where it can be shown that some basic change of policy is needed in an industry which the state both can and will bring about and nobody else can. Nationalisation will pay where it can be shown that there is some *strategic* gain to be secured through public ownership large enough to outweigh the inevitable *tactical* losses of a cumbrous and vulnerable form of industrial organisation. In the case of coal, most people were finally convinced by the Reid Report that there was such a strategic gain to be had through a thorough concentration of the industry, which its private owners could not and would not undertake. In electricity there are technical reasons for expecting real economies from a concentration of ownership. In transport, a theoretical case can be made on paper, though neither the Minister nor the Transport Commission have given any public sign of understanding what it is. There may be other industries—including some that have never appeared on the Labour Party's lists—where similar real economies would result from public ownership and would offset the wastes of bureaucratic, politically-minded organisation. But the essential point is that the case must be proved, industry by industry, with the onus of proof on the nationalisers, before it will be accepted by the public at large.

*

Within a few weeks the debate will open on the Steel Bill. It will be for the Government to prove their case. It will not be an acceptable argument to say that the steel industry is basic, or important. If that were all, it had better be preserved from the grip of the octopus. Still less will it carry conviction to say that, in its present organisation, the steel industry represents a "dangerous concentration" of "irresponsible power." The public should ask "power to do what?" and "what reason is there to believe that the Minister of Supply will exercise it any better?" It will be of no use to argue that the private steel industry is, or has been, imperfect in its organisation and policies; the question is whether the state would do any better. It will not carry very much conviction to say that the steel industry is a monopoly; the proper answer is to ask whether and how it can be made less of a monopoly, and what measures—the relaxation of protection against imports or other devices—can help to secure that it does not abuse its monopoly. None of these things would be a whit less necessary if the industry were publicly owned; Mr George Strauss cannot hold a candle to the power of competition as a guardian of the public interest. The ultimate test is very simple—if the steel industry were nationalised, would it produce better steel more cheaply?

On these issues the central body of opinion still has an open mind. Most people are waiting to see what sort of case the Government will make. But if the attempt to nationalise steel is not to torpedo the Labour Government, the case made for it will have to stick close to ascertainable facts and strict logic and eschew mere doctrine, even of the moderate Morrisonian variety, like the plague.

Mr Bevin's Two Minds

AFTER weeks of debate, often stormy debate, the Organisation for European Economic Co-operation has reached at least a provisional solution of the two main issues which have eluded agreement for so long. Marshall aid for the current year has been divided and into the division has been woven a plan for stimulating Western European trade by the provision of generous inter-European credits. The details of this settlement are given in an article on page 466. They demonstrate the wide scope of the agreement, and in particular they underline the sacrifices that Great Britain and Belgium are prepared to undertake. Belgium, Europe's principal creditor, will receive $250 million and make $207½ million available in francs. Britain, in return for an allocation of $1,263 million, is to provide sterling credits to the extent of $282 million. This readiness to provide unrequited exports at a time of great stringency at home—in Britain a stringency bred of absolute shortage, in Belgium of threatened inflation—seems clear proof of the earnestness with which both nations, and their partners in varying degrees, are accepting the obligations of mutual help.

There can be nothing but satisfaction at the immediate political implications of the agreement. The danger of deadlock has been averted and nothing could have so blighted the prospects of the Recovery Programme as a failure to agree on the distribution of American aid. But of the more lasting political consequences, it is less easy to be satisfied. The agreement has been reached against a background of very great American activity and pressure and the impression has been created that without the strongest possible action by Mr Hoffman and Mr Harriman, agreement might not have been reached at all. It would be unwise to overlook the amount of impatient criticism that has found its way into the American press in the last weeks or to ignore the fact that Britain, as the natural leader of Western Europe, has received the lion's share of disapproval on the grounds of its alleged "hesitancy" and "half-heartedness." These criticisms are unfair. Indeed, the generosity of the British credit policy ought to silence attack. But what is politically important is not the fairness or unfairness of the attacks but their existence, not that they are right or wrong, but that they happen at all.

Lack of confidence between the United States and Western Europe—and what after all is the perpetual undercurrent of criticism but a lack of confidence?—is obviously dangerous. The two segments of the free world belong together today with that fatality of destiny which the risk of destruction creates. If American aid ceases next year, who knows what political catastrophes may follow Western Europe's resulting distress? If the United States fails to back to the full the efforts of Western Europe to organise its own survival, the political balance of power can almost of its own weight bring Russia to the Atlantic. These are the stakes in Europe today and the nations of Western Europe must play with them constantly before their eyes.

They must also recognise that the United States, their most powerful partner, has strong views on how the game shall be played. The Governments of Western Europe may inwardly regret that America is not as willing to succour a queue of separate sovereign states as it is to support a unified and increasingly integrated European team. But they cannot change the decided cast of American policy. Nor can they change the visions and generosities of the American heart. Public opinion in the United States can be won for a great new venture which seems to confirm all over again the wisdom of the Founding Fathers. A Western Europe moving towards a federal experiment might conceivably find its Marshall aid doubled. A Western Europe falling apart in national rivalries may find America withdrawing first from aid, then from Germany and finally from any participation whatsoever in the European scene. These are not vague generalities. They are the immediate risks of American policy, whatever party is in power.

It is these major political issues—the overwhelming necessity of ensuring America's sustained co-operation and the certainty that closer union in the West is the best way of doing so—that make the policy of the British Government so bewildering. In one sense Britain is committed to closer Western association. Mr Bevin may not sound as enthusiastic about it as he did in January but once again in the House of Commons this week he has stated that a wide Western Union is his aim. Moreover, the payments agreement reached at Paris is some proof that the Government is ready, when pressed, to make a considerable economic sacrifice to bolster European solidarity. But it is also clear that nothing like the maximum political advantage has been gained from the sacrifice since public opinion in America, in Continental Europe and in Britain alike remains honestly confused on the question whether the British Government is really in earnest. To the straight question: does Mr Bevin or does he not accept Western association not merely as a desirable but as an imperative aim of British policy, the answer must still be: we do not know.

One can only speculate on the reasons for this hesitancy. It surely does not lie in fear of public opinion. The nation as a whole seems more united on the question of Western Union than is usual on any issue of foreign policy. All public opinion polls show a majority in favour of association, even those conducted

by newspapers notoriously hostile to "continental entanglements." It cannot be fear of hostile reactions in Parliament. Almost the only widely supported non-party motion put down in the Commons this year was one calling for sweeping measures of integration in Western Europe and it is clear that real enthusiasm for a wide project of Western Union would quickly spring up on both sides of the House.

If public antipathy is ruled out as an explanation, must one fall back on the possibility that the Government in fact think Western Union a bad idea? It may be after all that they are not convinced of the need of firing America's imagination and of thus ensuring its continued support. They may have genuinely weighed the risks of closer association with Europe against the risks of American withdrawal and have decided that closer links with Europe represent the greater evil. They may be reinforced in this judgment by an underlying belief that the Americans are not after all serious—or that they cannot be relied upon to continue being serious—in their demands for European Union, that fear of Russia will in any case keep them in Europe and that meanwhile a number of gestures—albeit expensive gestures such as the new credits scheme—will be sufficient to ensure continuing American support.

*

This explanation can almost certainly be ruled out. In the first place, it assumes that the British Government is pursuing a dishonest policy. To believe that Western Union is in reality undesirable but to make gestures in favour of it so that Marshall aid may continue would be, after all, to base a major issue of policy upon a lie. In the second place, such a policy would be a stupid policy. So wide a gap between gesture and actual performance could hardly pass unnoticed for more than a year at the longest, and the difficult appropriations of aid to secure from Congress will come up not in 1948 but in 1949 and 1950. These are also years in which complete American solidarity with Europe will be politically and strategically essential. If British policy were based on pretence, it would be precisely in these years that the pretence would be wearing transparently thin.

If honesty and duplicity are dismissed—as clearly they must be—one is left with the uneasy feeling that the reason for British fumbling is that although the Government sincerely believes itself to be pressing forward in the direction of Western Union, it has neither the clarity of mind nor the strength of leadership to turn that aspiration into policy. A sustained effort to secure an integrated Western Europe requires in the first place ability in the Cabinet to make firm decisions on general policy. It then requires the capacity within Whitehall to gather together the different threads of Britain's strategic, economic and commercial policies in support of the general line. Last of all, it demands vigorous political imagination to project that line both to public opinion at home and to Britain's partners in Europe. Unhappily the British Government today is hardly competent to achieve any of these three conditions. In the Cabinet, in spite of the existence of an inner Cabinet group, Ministers still tend to conduct their independent departmental policies and nowhere is the "separateness" of foreign policy more vigorously asserted. At the next level, policy is made by permanent officials whose function is very properly not to propose great lines of change but to straighten out technical difficulties. One consequence of this is the extent to which economic technicalities have taken the place of the wider political perspectives in all recent discussion of European co-operation. Last of all, there is no member of the Government who can speak for Britain and Europe, as Mr. Churchill once spoke for resistance and victory. Great ventures cannot be launched in little words and under the babble of voices speaking of multilateral compensation and off-shore purchases and unrequited exports there is a great silence in which the ordinary man's reserves of daring, imagination and hope are in danger of draining away. This vacuum cannot be filled with exhortations to caution or excellent reasons for inability to act. Nor can the British Government evade a position of responsibility which, alone among the nations of Western Europe, it is fitted to fill. Mr Bevin has in the past shown some sense of the wider perspective, of the historic moment. This instinct was never more needed nor have the risks of faltering ever been as great.

Labour and the Nation—III

Joint Consultation

IN the first of these articles it was pointed out that, admirable as is the new attitude of organised labour towards increased productivity, the directives of the TUC are no substitute for the growth of a spirit of confidence between the individual employer and his workmen. One important factor in the creation of confidence is a more exact relation of wages to output, which will permit the employer to reward the quick more generously than the dead and enable economies in production to have their effect upon production costs, undistorted by trade union pressure for general wage increases, which take no account of merit. The other factor of equal importance is the development of a spirit of responsibility among workpeople for the economic process in which they are involved. This has a dual importance: on the one hand it creates in the workmen a feeling of individual worth and importance which is essential to the survival of Britain, not only as an industrial society but as a society of any kind. On the other it enables the employer to develop technical improvements without the suspicion and resistance of the workers which has generally accompanied such efforts in the past.

It is the latter aspect, the result of the urgent necessity to increase productivity per man hour, which has forced the Government, the Federation of British Industries and the Trades Union Congress to place special emphasis upon joint consultation in industry. But among the unions and workers themselves, it is naturally the former motive—the desire to be treated as the equal rather than the servant of management—which is uppermost. It is the natural result of increased power, higher educational standards and a dawning belief in the connection between industrial policy and full employment.

It is becoming apparent that out of the confusion of thought which has habitually surrounded the topics of profit-sharing, workers' control and industrial co-partnership some kind of order is beginning to emerge. Profit-sharing, for all its attractions as a principle, is difficult to apply in practice, and can, it is obvious, only be developed gradually, until the workers are mentally prepared and economically able to bear the risks and losses as well to enjoy the fruits of enterprise. It is successful already in certain small firms where by reason of a good tradition an almost family relationship exists between the employer and his workpeople or where other specially favourable economic and social circumstances permit. But it would be hopelessly optimistic to pretend that any principles have been discovered which would be valid for the whole of industry. The pressure for workers' control or ownership persists mostly in the industries which are or may be nationalised, and is a relic

of the syndicalist teaching of early socialism. It has been tacitly abandoned by the leaders of the Labour Party and the TUC, and has been openly recanted by such keepers of the party conscience as Professor G. D. H. Cole. As a result, attention has become increasingly centred upon the device of "joint consultation" as the best means of achieving industrial democracy both in the free and in the nationalised industries.

*

Joint consultation has had a chequered history. It received its initial impetus from the report of the Whitley Committee of 1917 which recommended a system of works committees, but by the early 1920's the support from these and for the joint industrial councils had disappeared, owing partly to the indifference of the employers and partly to the suspicion of the Trade Unions who feared both a loss of independence and the rise of a competing loyalty to unionism. It was not until 1940 that joint consultation re-emerged in the somewhat altered form of Joint Production Councils, concerned not so much with settling matters of policy and environment, as with finding better ways of giving Mr Churchill the tools with which to finish the job. After the war, however, although both the unions and the employers showed a distinct tendency to allow the machinery to rust, maintenance of full employment and the gravity of Britain's economic position have effected a revival of interest which may establish joint consultation as a permanent feature of British industry.

An immense vagueness surrounds the whole idea of joint consultation. A mention of it, buttered with such words as "industrial goodwill" and "co-operation" is good for a paragraph in any Cabinet Minister's week-end speech, concealing the fact that the phrase can cover anything from a canteen committee to a fully fledged industrial parliament. The government is determined to force the pace at which some kind of consultation is established in all firms and industries without inquiring too deeply into real and apparent success. In this, although it hopes for great things, it can not in fact do more than create a climate of opinion whereby the company or plant which makes no attempt at joint consultation will feel itself compelled to explain why. To the real problems which such consultation presents the work of the National Joint Advisory Council (the astral level where the TUC and the Employers Confederation meet), of the Regional Boards for industry or of the Development Councils can make only a slight contribution. This is a problem which can only be settled within the fifty-one thousand establishments which make up the British industrial economy.

It is difficult to generalise and impossible to dogmatise about the form that joint consultation should take, for to be successful it is essentially a product of local and spontaneous action. In its lowest form it is merely an aspect of works publicity; some constituent committee of the workers exists to which management can explain the company's policy, announce impending changes in organisation and keep the workpeople in touch with developments. While this does avoid some of the major causes of frustration, it provides nothing much more than an animated bulletin board. A more evolved technique calls for a joint body upon which representatives of the various departments or trades meet on equal basis with the management to discuss questions relating to management, although wages are normally excluded as being covered by the union machinery, and welfare as being the affair of a separate department. In its highest form a joint production or consultation organisation discusses not only questions of organisation but also of policy, and represents not only management and the workers, but the board of directors and—a frequently forgotten group—the technicians, junior management officials and foremen.

Joint consulation is no substitute for efficient management nor for the firmness and justice which is the outward sign of good leadership. But it is an undoubted fact that the greater the confidence which management can bring itself to repose in its workpeople, the greater will normally be the response in zeal, in adaptability, and in increased production. Equally, while the burthen of making it a success rests as much on labour as on management, the responsibility for initiating joint consultation must come from management, for it is the keeper of the mysteries of finance and policy. Only to the extent to which it is prepared to trust its workpeople with some of these secrets will joint consultation be effective. It may be as some have maintained, that its value is mainly psychological and that the sense of responsibility and loyalty which it develops is of greater value than any actual practical result that emerges. Whether that be true or not, the fact remains that joint consultation is an attempt to break down the barrier between management and labour, which is erected with particular ease in Britain where the social structure conduces naturally towards stratification and not towards equality. It is a deliberate attempt, requiring both patience and skilled diplomacy. The pitfalls are legion, and only those who are prepared for them can hope to make joint consultation a permanent feature of British industrial life. But the rewards of success are very great for any procedure which can break down this barrier must in the end teach management and labour that they are involved in a common conspiracy to wring the greatest possible creation of wealth out of the economic process in which they participate.

*

Since joint consultation depends for its success upon the efforts of the individual workshop or factory, it follows that it does require some modification of the existing structure of the trade's union. If the emphasis is on direct negotiation within the firm, the shop steward or the workers' representatives on the works committee gain in power and importance at the expense of the local branches upon which the union hierarchy (except in certain trades such as printing) was built up. The growth of the shop steward's prestige is a natural result of the extension of joint consultation since, once management is prepared to discuss with the workers policy and issues broader than mere welfare, a workers' representative on the job gathers greater support than a union lodge or branch situated outside the place of work, which only some twenty per cent. of the workers will take the trouble to attend. The old defence rôle of trades unionism required massed battalions: its newer and more constructive rôle requires specialization in the affairs of particular industries and firms, and if it is to maintain this attitude it will involve painful readjustments in the Transport and General Workers' and other omnibus unions. But if the union movement is wise it will insist upon the need for such adjustments, since organization through the place of work rather than by trades or by geography, represents in the long run their best chance of keeping the loyalty of the working class and of harnessing it to higher output and a higher standard of living.

It is impossible to gauge the extent to which effective joint consultation is being developed within British industry. The inquiries of the Ministry of Labour show only those industries which have completed national agreements to institute it and cannot evaluate the firms where it is a mere formal show and those in which it is really effective. One hindrance to its growth is a transient working population, and it is fair to say that as the pattern of British industry becomes more settled and employees remain longer with the same firm, the opportunity for successful joint consultation becomes greater. But beyond giving publicity to the instances in which it has been successful, and of teaching by example, any attempt to force the pace by statutory obligation, such as has been adopted in France, would be the surest way to damp the voluntary enthusiasm which is essential to its success.

The day of the simple paternal relations between employer

and employed has long since disappeared. Only twenty per cent of the workers are now in firms of less than a hundred employees and while the number of small firms is declining the percentage of those employed in the very large firms of more than a thousand employees has increased from twenty-two to thirty in the past twelve years. The putative satisfaction of a craftsman in his craft is disappearing before continuously simplified productive techniques involving not skill but routine. Only a deliberate effort on the part of employers, and an equally deliberate response from the employed, can overcome the frustration, the indifference and the dead-levelling of character which is the characteristic disease of industrial societies.

Trade Between East and West

ON September 27th, the *ad hoc* Committee on Industrial Development and Trade set up by the Economic Commission for Europe will meet to consider a report prepared for it by the Commission. The full report has not been released and the Committee's discussions will be private, but some of the data upon which the Commission's recommendations are based have been published and seek to prove that whatever the political obstacles in the way of developing a greater volume of trade between Eastern and Western Europe, the economic advantages which both sides might gain are considerable. In general, Eastern Europe throughout the Report excludes Russia and Western Europe includes Great Britain.

In Eastern Europe it is the whole rate of development that is at stake. In all the states of Eastern Europe, industrialisation is the first aim of each national programme of reconstruction. But the ambitious plans for developing manufactures, drawing the surplus population off the land and mechanising agriculture, all demand an investment in capital equipment which heavy industry in Eastern Europe cannot begin to meet. The Soviet Union has not proved a more promising source of supply. Western Europe and North America are for the time being the only trading partners likely to provide the kind of equipment Eastern Europe is most anxious to buy.

The Western interest in increased trade is, perhaps, not quite so obvious since other sources of supply for the foodstuffs and raw materials which are Western Europe's lasting need do, in fact, exist. The difficulty lies in paying for them. The Report of the Economic Commission for Europe points out that if Eastern Europe were still supplying the exports sent to the West in 1938—valued at $2,100 million at 1947 prices—the sum would be equivalent to one-quarter of Western Europe's imports from the New World. The shrinkage in Eastern European exports by some $1,400 million in 1947, as compared with 1938, equals more than one-fifth of Western Europe's uncovered trade deficit with the Western Hemisphere. Nor is the importance of East-West trade simply a question of what might have happened in 1947. There are three reasons for stressing its importance in the future. The first is the likelihood that Western Europe will not be able to buy all that it needs from the New World owing to continued difficulties in finding the necessary currency. As an earlier Report of the Economic Commission for Europe has pointed out, in the 1950s Western Europe's most likely bulk export will be heavy machinery and this is of all exports the most difficult to place in the United States. It is, therefore, practically certain that increasing access must be secured to non-American sources of supply.

This necessity supplies the second reason for Eastern Europe's significance as a trading partner. When the nations of Western Europe make a systematic estimate of the non-dollar areas that are open to them, they will discover that one of the most profitable of such areas in the prewar world—South East Asia—is not likely to return to its old patterns of trade. The Far East may conceivably become within the next five years a stable area producing large surpluses of food and raw materials for Western consumption, but it would clearly require very great optimism to make such a prospect the sure foundation of Western trading policy. It seems more probable that the degree of political and economic disintegration in the Far East will reduce very sharply the scale of surpluses for export and that the flow of rice and oil and sugar and tin may be both smaller and more erratic than in the twenties and thirties. If this should be the case, the importance of Eastern Europe as a non-dollar source of supply is much enhanced.

The possibility that the world's areas of supply for foodstuffs and raw materials may be severely reduced reinforces the third reason for considering the importance of Eastern European resources. The extent to which Western Europe's present difficulties are due to unfavourable terms of trade—in other words to the high cost of all primary products—is generally admitted. But if the present shortages are to continue, the unfavourable shift in the terms of trade may be more than a passing consequence of post-war dislocation, and the urgency of expanding production of food and raw materials in order to bring down the price of primary products becomes a first priority for Western Europe. In such a situation, Western Europe should neglect no possibility of increasing supplies of primary products, and Eastern Europe is almost certainly a potential field of expansion.

These various reasons certainly add up to a case for considering carefully the development of trade with Eastern Europe. It is a non-dollar area of supply. Its chief need—capital equipment—is the type of manufacture of which Western Europe can best produce an export surplus. An increase of supplies in Eastern Europe could offset to some extent the possible decline in trade with non-dollar areas such as the Far East and, in so doing, could help to reduce the present pressure of unfavourable terms of trade. Theoretically, the case for increasing exchanges between Eastern and Western Europe is thus clear. But when the Committee meets in Geneva next week, it will have to study a formidable list of difficulties.

Some go back to first principles. How, critics may ask, can the intensive industrial development of Eastern Europe and the relative neglect of agriculture reflected in all Eastern European national plans lead to an expansion of agricultural surpluses for export? Are not the nations of Western Europe being asked to assist in the creation of competitive industrial economies in Eastern Europe and thus to ensure an even more unfavourable development in the terms of trade? The replies given to such objections by the Report must be read in the light of the fact that the Commission, poised as it is between East and West, has a strong institutional interest in proving the importance of trade between them. Nevertheless, the arguments the Report brings forward merit careful consideration. In the past, industrialisation and mechanisation have tended to increase not lessen the yield of agriculture. In an interesting comparative table, the Report shows that output in agriculture is in inverse ratio to the amount of manpower engaged in agriculture: the countries of Eastern Europe, where between 60 to 80 per cent of the population work on the farms, produce far less per head of the total population than countries such as Australia, New Zealand or Denmark, where only between 20 and 35 per cent are directly engaged in agriculture. Again, the Report remarks on the fact that highly industrialised communities such as Sweden, Britain and even the United States have not ceased to be bulk exporters of primary products such as iron ore, timber, coal and grain. It cannot be said, therefore, that increased industrialisation in the East will *a priori* lead to a reduction in primary production.

Critics have also raised the point that Eastern Europe's lands are, in any case, not particularly well endowed and have asked whether it is wise to situate a "development area" in a place from which, in a world of free movement, people would naturally emigrate. This argument can, however, be pressed much too far, since parts of Eastern Europe are exceptionally fertile. The Report goes further and gives general data on the value of Eastern Europe as a source of supply. The figures are somewhat misleading, since the percentages exclude Western Europe's very large trade with its colonial dependencies. But they are worth quoting to confound those who believe no good can come from beyond the Iron Curtain. Even with the backward methods of production prevalent before the war, Eastern Europe was responsible—to give only a few figures—for 23 per cent of Western Europe's non-colonial imports of bread grains, 55 per cent of its potatoes, 28 per cent of its butter, 85 per cent of its eggs, 100 per cent of its flax, 77 per cent of its logs and sawn wood, 92 per cent of its wood pulp, 100 per cent of its bauxite and 100 per cent of its coal and coke. Yet between 1934 and 1938, Eastern Europe was in a depressed condition. Even without improvement in technique, the output of the twenties could be reached again. With improvements to bring agricultural production say, to the level achieved in East Prussia, Pomerania and Silesia—an area of comparable soil and resources—the Report estimates that output in wheat and barley could be increased by over 60 per cent, oats by 46 per cent, potatoes by over 30 per cent.

*

Possibilities of expansion thus exist and their development could stimulate East-West trading on a healthy basis of mutual self-interest, Western Europe assisting Eastern Europe to higher technical levels in both industry and agriculture, Eastern Europe in return supplying primary products in place of dollar supplies to mitigate the present incidence of the terms of trade. So much is clear—and encouraging. The difficulties and obstacles will begin when the Committee attacks the practical problem of how this expansion in trade is to be carried out. At present, trade between Eastern and Western Europe is suffering from difficulties identical with those which hamper trade *within* Western Europe. Only gold and the dollar are universally acceptable currency and, after a revival of multilateral trade during 1946 on the basis of reserves of hard currency and the extension of credit, 1947 saw a contraction similar to the contraction in Western Europe. Today, such revival of trade as is taking place is more and more based on bilateral trade treaties which inevitably restrict trade to the amount each pair of countries can balance between them. The details of the pattern of East-West trading prepared by the Commission are incomplete since, among other lacunae, Russia would not disclose its trade with Germany; but, allowing for these gaps, the Report estimates that in 1947, 74 per cent of the trade between East and West was on a strictly bilateral basis. Yet on such a basis, the kind of expansion envisaged in Eastern Europe is in the short run unthinkable. On the contrary, the growing rigidity of trade is likely to throw the Eastern European nations back on their own resources—and those of Russia—and to lead to a steady contraction of East-West exchanges.

The Report's recommendations for the ending of this present trend are not published, but it is clear from the published figures that the Commission believes some advantage could be gained by attempting to work out a wider system of multilateral compensation. It is self-evident that the larger the number of countries included in a compensation plan, the greater the chances that some general balance will emerge and that countries will show a smaller tendency to fall into permanent positions of debt—or credit. The Report estimates that if, in 1947, compensation agreements had covered both Eastern and Western Europe the amount of trade thus conducted on multilateral lines would have increased from 10 to 18 per cent for Eastern Europe and from 11 to 18 per cent for Western Europe. It should thus be worth the Committee's while when it meets next week to examine whether an effort to negotiate a more general compensation agreement—possibly in an international conference such as assembled to draft tariff reductions in Geneva last year—might not have some effect in increasing and improving the flow of East-West trade.

*

Such an effort would, however, touch only the fringe of the problem. Clearly the disequilibrium in European trade is at present too deep for purely financial mechanisms to set it right. If present trends continue unchecked, Eastern and Western Europe will pull apart, the West in dependence upon the New World, the East in a hampering autarky. If the large, sustained and expanding exchange of Eastern primary products against Western manufactures—for which theoretically there is so strong a case—is to be brought about, it can be done only by systematic agreement, by long-term contracts which specify in broad outline the kind of industrial deliveries the West will be prepared to make in return for guaranteed exports of food and minerals and timber. It has been suggested in *The Economist* that the machinery for such a trading plan now exists—in the organisation for European Economic Co-operation (OEEC) in Paris, in the planning Ministries of Eastern Europe and in the Economic Commission for Europe. Next week's meeting of the Committee on Trade and Development might be a first step to bring this machinery into action and to prepare for a general conference between Eastern and Western planners on the long-term problems of East-West trade.

Yet it is useless to conceal the fact that the first difficulty which such a conference would meet would be the difficulty that has all but halted the development of commercial cooperation inside Western Europe—the lack of credits. Any long-term plans for the development of Eastern European surpluses must demand in the first years unrequited exports from Western Europe in the shape of machinery and seed and fertiliser. But how are these unrequited exports to be financed? The capacities of Britain, Belgium and Western Germany are for the moment fully extended in making credits available to their Western partners. A little Marshall aid may reach Eastern Europe via offshore purchases. The World Bank may finance one or two concrete projects such as the plan to increase the output of East European timber by the export of Western lumbering equipment. But of credits for a massive "Five-Year European Trade and Development Plan" there is today no sign at all. It is certainly a great gap in the West's economic strategy that no attempt has been made to determine where capital investment will give the highest and quickest return in terms of production and whether, on such an estimate, machinery despatched to Poland might not give a speedier result than the same machinery invested in Tanganyika—or France. But for the time being, terse primary decisions have been made and the West's spare capital is already fully allocated.

One reason for this is, naturally, political. Behind all questions of economic policy lurks the doubt whether the West can afford to build up the economies of States which make so little secret of their hostility. To answer to this question—which lies beyond the competence of next week's conference—is in the end the determining factor. The Committee meets under the shadow of Berlin, and however devoted its labours and clear and cogent its results, the final issue of East-West trade are being decided elsewhere.

NOTES OF THE WEEK

The Order of Release

Tuesday's debate upon the Address was a vernal rather than autumnal mixture of light and shade. It began with Mr Leslie's sunny account of conditions in Sedgefield, moved through Mr Symonds' scholarly account of the representation of Cambridge to Mr Oliver Stanley's urbane witticisms and broke into an abrupt and chilling shower with Mr Morrison's statement on defence. In a speech that was regretful almost to the point of apology, he expressed the Government's conviction that the international situation no longer justified them in continuing with the demobilisation plan and that those not already passing into the demobilising machinery would be retained for a further three months. As a result of this closing of the exit valve the size of the Armed Forces would be greater by 80,000 at the end of the year than if the demobilisation machinery had been in normal operation. He continued by making an appeal to men of standing to use their influence to speed up a return to the Territorials and the Auxiliary Naval and Air Forces. He promised a quickening in the supply of equipment and in particular of fighters, and in the pace of Civil Defence reorganisation.

The slowing down of demobilisation arises not from an immediate necessity to increase the size of the mobile reserve but from the need to increase the percentage of trained men, who could provide the instructional cadres were a sudden further expansion necessary. Presumably this will be followed by some permanent system of slowing down demobilisation for if it applies only for the time being the extra 80,000 would be dissipated by a return to the previous demobilisation rate. The retention of extra men in the forces could be a pure farce if they were employed as batmen and squadron clerks. The only justification of such a deprivation to the industrial manpower of Great Britain is either that they should be serving—or releasing others to serve—in the danger spots or else employed within an intensive training programme.

Mr Morrison, walking an already narrow tightrope, made no announcement regarding the raising of the term of national service. If the international situation is very serious in January, 1949, when a decision must be made, the Government will be assured of full national support; meanwhile, they prefer to avoid a party quarrel. As it was, it was only the shadow of an impending election which made the Parliamentary Labour Party swallow the deferment of demobilisation with no more than a wry grimace. Undoubtedly Mr Morrison was right in placing great emphasis upon a return of the millions of trained ex-servicemen to some kind of volunteer reserve. But are the Government prepared to create the conditions upon which men will willingly return to spare-time service, the chief of which is a highly organised training programme and a sufficiency of modern equipment? No one will give up hard won leisure to listen to lectures on mess etiquette or train with papier mache armoured cars and wooden dial sights.

By those few reluctant sentences Mr Morrison has altered the whole balance of the special session. The chimera of "Peers versus the People" looks very wan beside the possibility of an embattled nation. It could be given life if the members of the Upper House were known to be the hirelings of a foreign power, instead of, for all their political failings, a body of men conspicuous for their patriotism and individual military courage. This is the time to distinguish between the real and the imaginary enemy.

* * *

Second Front in the Cold War

Mr Bevin must really take more trouble with his speeches, or make trouble for those who draft them. He has had leadership in western Europe thrust upon him, and in that distinguished role he cannot afford to give his views to the world in a bloodless, matter-of-fact style which seems to reflect nothing but the monotony and pallor of the British diet. Before the House on Wednesday he very properly defended what Britain has done to promote co-operation and self-sacrifice in the West; it is in many respects an admirable record, but the form in which he presented it offered little to warm or brighten the despatches of European correspondents in London who have to fight for space in their newspapers. The argument that the pace of Western co-operation must be restrained until the Dominion Prime Ministers have met is wearing thin; there is no published evidence at all that his Commonwealth colleagues distrust or resent his Western Union policy.

What surprised the House and flustered Mr Dalton in his reply to the debate was the attention given to Malaya and a hint dropped about possible troubles in Africa. Yet Mr Bevin was quite right to include the situation in south-east Asia in his review, since the late Mr Zhdanov made no bones about pointing to that region as "the rear of the capitalist camp." One would like to think that Mr Bevin will consult with his Dutch and French colleagues about the Communist strategy in this area of common interests. The Brussels Pact provides for such action.

As for Africa, Mr Bevin or Mr Creech Jones should sometime develop the hint given on Wednesday. Among the signs that the African colonies are due for Communist attention are the size and activity of the Soviet Embassy in Addis Ababa; the interest of the Communist Party of India in the 170,000 Indians of British East Africa; attacks by Mr Tsarapkin in the Trusteeship Council, and the form taken by native trade union movements in the North Rhodesian copper belt, in the Belgian Congo and in East Africa. Russian propaganda has given wide publicity to a resolution of the British Communist Party condemning "the drive of East African white settlers against the African people," and there is plenty of other evidence of Communist interest in any signs of African resistance to the white races. It will be a tragedy if the cold war is extended to the African territories of the Western Powers, and it is a possibility that they should combine to avert.

* * *

Exhausted Patience, 1948

Just ten years have passed since Hitler was about to invade Czechoslovakia on the pretext of restoring law and order there. Indian troops have now marched into Hyderabad with the same proclaimed purpose, and oratory has been coming from the mouths of Indian politicians curiously reminiscent of the Fuehrer's exhausted patience. The Indian Minister of Works, Mr Gadgil, declared that it was time to complete the victory of Khadia won by the Marathas over Hyderabad in 1795; then the Deputy Prime Minister, Mr Patel, announced that "if Hyderabad did not behave properly, it would go the way of Junagadh"; and then Mr Nehru felt impelled to rattle the sabre at a press conference on June 17th, when he said that India had delivered its final terms "and the Nizam can sign on the dotted line as and when he likes. . . . Hyderabad, situated as it is, cannot conceivably be independent and India can never agree to it, whatever happens and whatever may be the consequences."

After all that has been said, there is nothing surprising in India's action. Official India had made up its mind quite deliberately to conquer Hyderabad by force if the Nizam would not submit to its demands. Whatever may be thought of the merits of the controversy over Hyderabad's accession, the fact remains that India has used force against an independent state in circumstances which exclude the justification of self-defence. It is true that India has described the invasion as a police action and claimed that Hyderabad is "part of India," so that it is all an internal affair. But legally there is no doubt that Hyderabad is an independent state, even though it has not received diplomatic recognition from other nations; for the Independence Act, whereby sovereignty was transferred from Britain to India, excluded the Indian States except in so far as they voluntarily acceded. Hyderabad has appealed to the Security Council—a move which must have been foreseen in Delhi—and the Council, which refused to recognise the fighting in Java as an internal affair of the Netherlands in spite of its unabrogated legal sovereignty in Indonesia, cannot logically accept such a plea with regard to a territory over which India has no legal right whatever.

It is difficult to see how Uno can come out of this affair without discredit. If the Security Council orders Indian troops out of Hyderabad, India will presumably refuse to comply; if the Council tries to make a "settlement," with Indian troops in occupation of most of Hyderabad, it will merely show its incapacity to prevent successful military aggression—as the League of Nations did in the Manchurian and Abyssinian crises. Whatever India may gain from a conquest of Hyderabad, it can only be at the expense of the international organisation for peace of which India is a member. Even more serious is likely to be the exacerbation of conflict with Pakistan which must result from India's action and the possible renewal of large-scale communal rioting and massacres which may ensue in India itself.

* * *

The Passing of Mr Jinnah

Of the three principal figures of the Indian scene a year ago—Mr Gandhi, Mr Jinnah and Mr Nehru—the first two are now dead. Gandhi, to whom all Indian nationalists pay at least lip-service as a saint and as the father of national independence, perished by the bullet of an assassin spiritually armed by the Hindu chauvinism which has come more and more into the ascendant in Indian politics since the Mahatma's death. Mr Jinnah has died from natural causes, but there can be little doubt that his death was hastened by the news of the impending Indian invasion of Hyderabad and the intense nervous strain of deciding Pakistan's policy in the crisis.

Mr. Jinnah was no pacifist and he was politically the antagonist of Gandhi, who aimed at a united India including both the Hindu and Moslem communities. Yet Gandhi opposed the use of force to bring Moslems into a united India, and he urged toleration and fair treatment for the Moslem minority in India as the means by which the Pakistan Moslems could be shown that they had nothing to fear from Hindu Raj and ultimately induced to come in of their own free will. Between Gandhi's India and Jinnah's Pakistan reconciliation was indeed possible. But the trend in India has been lately towards a more and more aggressive and uncompromising mood which has darkly overshadowed the prospect of future relations between the two Dominions.

The Pakistan national movement was far more dependent than was Congress nationalism on the leadership of one man, and the passing of Mr Jinnah has brought a great danger of confusion, faction and hasty decisions in a new nation swayed by strong emotions but lacking experience and tradition of framing policy. A good start has been made, however, with the appointment of the Prime Minister of East Bengal as Governor-General, an arrangement which links East Pakistan more closely to Karachi while at the same time allowing Liaqat Ali Khan to continue as Pakistan's Prime Minister. The fact that Liaqat Ali Khan did not claim the office of Governor-General for himself indicates that he wishes it to be in future more constitutional and less a position of executive power than it could be when Mr Jinnah held it.

Pakistan has officially avoided any commitment to aid Hyderabad, but popular feeling is naturally inflamed and will make it harder for the Government to yield in any way over Kashmir. The Kashmir question remains the greatest single issue confronting Pakistan. If India were to use the prestige acquired by military success in Hyderabad to cover a settlement favourable to Pakistan in Kashmir, the way would be open, in spite of all that has happened, to a fresh understanding between Karachi and Delhi. But there is a danger that success in Hyderabad might make India more, and not less, intransigent over Kashmir. If that turns out to be so, full-scale war between India and Pakistan will become again an imminent possibility.

Snail's Pace in Moscow

There seems to be no reason why the negotiations with the Soviet Government about Berlin should end for some time. While Marshal Sokolovsky uses boorish hustling tactics in Berlin, Mr Molotov uses polite delaying tactics in Moscow. This diplomatic method has a long history running back to Napoleon and Frederick the Great via Hitler; but none of those great rascals ever held such an ideal position for two-handed work as Mr Stalin holds in Berlin. It is not at all surprising that he has gone off on holiday and that Mr Molotov should show himself unable to answer quickly the questions put to him by the Western envoys early this week. He will find it still more difficult when the General Assembly of Uno starts meeting next week, and it would seem to him only common sense to suggest that the Council of Foreign Ministers should talk about Berlin and Germany generally in the limelight of Paris.

The Western envoys are gradually slipping into the position of negotiating "under duress"—the very thing they said they would not do when they went to Moscow nearly two months ago. The duress is being aggravated in Berlin, where the economic and administrative position of British, Americans, and French is being nibbled away. Things have now reached the stage where General Kotikov refers to himself as "military commander of the city of Berlin" and where Soviet officers publicly incite German crowds to violence against the Western authorities. As the position of the Western Powers in the city weakens, their prestige with the Germans rises, a development which only narrows the possibilities of a future settlement.

An air lift sufficient to deliver 4,500 tons of supplies daily throughout the winter has now been promised by the Americans. The stage is set for a winter siege during which prolonged bad weather might freeze Berliners out of their work places and supply aircraft out of the skies. From the Soviet point of view such a dramatic trial of nerves is worth waiting for; and there seems to be no reason why Mr Stalin should deny himself this experience—especially when he hears General Clay saying that he sees no war "just round the corner."

* * *

Italy's Colonies

As the result of a tiresome spectacle staged this week by Mr Vishinsky, the case of the Italian colonies is to go to the United Nations Assembly. This is the unsatisfactory end to an unprofitable two years of wrangling. For the Assembly, owing to its addiction to voting for reasons that have nothing to do with the rights and wrongs of the case in hand, is the wrong body for dealing with backward peoples. Yet no other end to the wrangle was in sight. The Big Four were in disagreement about every issue except the future of Somalia (which all were ready to assign to Italian trusteeship). But Russia refused to subscribe to any solution that did not form part of a complete whole. Few people, therefore, hoped for an eleventh-hour settlement even when the Kremlin, promising fresh proposals, called a meeting just before the appointed zero hour, which was September 15th.

This meeting, to which the other three travelled sceptically, took place in Paris from Monday till Wednesday last. The "new" Russian proposal was a reversion to the American proposal of 1946 for a UN trusteeship everywhere. But those were the days when words like Potsdam and Yalta still stirred a warm feeling in American breasts. In 1946, it was the practical Russians who were against mixed management. "If a baby has seven nurses," then said Mr Molotov, "you cannot expect it to grow up." In 1948, Trieste and Berlin have taught the Americans this home truth (the British and French, with their greater experience of mandates and condominiums, have always believed it). So that, this time, the proposal met a Western stone wall. At a guess the Russian purpose was to reduce the likelihood of awards of trusteeships by the Assembly to any single Great Power. The gambit may turn out to have been a mistake. The Assembly, cumbered as it will be with revelations of its incapacity in Palestine, is not likely to vote for more multilateral commitments. The Russians might have gained more by consistency.

The snag to an Assembly decision is, as has already been mentioned, the proneness of voters to think primarily of some domestic political consideration, and only secondarily of the intrinsic merits of the case and of the Africans whom their vote affects. Many tend to forget that Libyans, Eritreans and Somalis are men with legitimate hopes and fears, likes and dislikes, and all the rest of the human make-up. Thus, while the State Department takes a sober view of African welfare, Mr Dewey's first thought is, he has shown, the Italian vote in the states. The same thought weighs upon Brazil. Some of its neighbours also like pleasing Italy in the belief that to do so is to please the Pope. Many Asiatics want to make a gesture to Ethiopia.

*

Who is to choose amongst this gaggle of contestants? What they need is a clear lead from somewhere. There is one group well entitled to give such a lead—the countries which fought in the areas in dispute. Why cannot they strike a new note by presenting themselves as a composite candidate for the three trusteeships? They are a relatively harmonious group. Even if they add Egypt, as an interested neighbour, to their number, agreement is not beyond their grasp. They could promise the Assembly to work out as between themselves who should administer this area and who that, where they shall work jointly and where delegate power to one administrator. Their candidature would win many supporters who, at present, do not know for whom to vote. To the Russian critics of such a scheme the cogent answer would be that, as on the Danube, so in Africa, those who have not fought are not heard.

The TUC Goes Right

Any lingering fears that Communism was gaining ground within the trade union movement have been dispelled by last week's conference at Margate. The Communist candidates for the General Council were defeated, including Mr Arthur Horner,

the miners' leader, who is respected for everything except his political views. His defeat was not unexpected, but the size of the hostile vote came as a surprise. Throughout the conference hostile references to Communist tactics were sufficient to ensure the rejection of a resolution. Thus in a rather pointless debate on steel nationalisation, a motion, which was alleged to be purely Communist-inspired, calling for immediate emergency measures to take over the industry, was rejected in favour of the steel-workers' own amendment, leaving the method and timing to the Government.

Communism's biggest defeat came on international affairs, when, by an overwhelming majority, a seemingly innocuous resolution calling on the TUC to reaffirm its support for the World Federation of Trade Unions was rejected. Mr Arthur Deakin, smarting no doubt under the Communist pinpricks during the London dock strike, as well as the attacks upon himself in the Soviet press, abandoned all restraint, and in a speech of towering rage demanded a free hand in determining future relationships with the Soviet-dominated WFTU. The British TUC has always been the most internationally-minded of labour movements and fathered the present World Federation. The fact that it now seems quite happy to abandon its misbegotten offspring is a measure of the revulsion of feeling which Prague and Berlin have contrived to bring about.

The only near-success scored by the Left came on the Civil Service purge. Here the purge itself was not in question, but the right of an accused civil servant to be represented by a union official before the Advisory Committee. The block vote had to be swung over to the General Council, in order to save it and the Government from embarrassment. On the wages issue also the usual Communist-controlled vote of around a million was swollen by over another million votes. But this was partly due to the intentional confusion with which the subject was presented, since many unions with wage claims pending supported the official policy.

As a result of Margate, the TUC has rallied itself in support of gradualism and democratic socialism, the only major European labour movement which has not been split by the Communist issue. It was good that the issue was squarely faced, but whether mere anti-Communism will serve to maintain its unity is more doubtful. Had Congress shown as much enthusiasm in the debate on production the Communists would have suffered a more lasting rebuff.

Experiment at Health Centres

The British Medical Association have published a valuable report on the planning of health centres based on an investigation into existing private practice among doctors. Health centres were one of the features of the new health service which attracted the greatest public interest and consequently occasioned the keenest disappointment when their erection had to be delayed. Moreover, the report follows the dispute between the Minister of Health and the Birmingham City Council about the admission of paying patients to the single experimental centre which the council are erecting.

The report examines the existing family doctor system and the various forms of partnership practice which already exist, and stresses the irrational and inefficient division of functions between the family doctor and the various medical and preventive services provided by child welfare clinics, ante-natal clinics, health visitors, the school medical service and so on. The case for unifying these services in a single centre is overwhelming. The case for relieving the doctor (and his wife) of the demands of a 24-hour service, and providing him with better equipment than he could individually afford and with adequate secretarial and ancillary services is also very strong. But there are practical disadvantages for the patient, some of which are dealt with in the report, and still great dangers of extravagance, ignored in the report, which must be carefully weighed against the advantages. For example the individual patient will normally have to travel much farther to a centre than he now does to his doctor's consulting room ; when he gets there it will be much more difficult to create the same sense of privacy and friendliness as is achieved in a doctor's own house. Nevertheless these disadvantages are outweighed by the benefits, provided that the centres are skilfully and economically administered. The lay staff of hospitals has been growing recently, and since the start of the national health service has grown even more. There is a real danger that the economies of joint organisation in the health centres will be absorbed by an excess of clerks, receptionists and filing cabinets, or the duplication of services more proper to the hospitals.

These reservations do not make a case against the setting-up of health centres, but they do argue in favour of a careful watch on costs and the maximum of experiment in different types and sizes of centre, and in different part of the country, before further centres are built in any large numbers.

The Recruitment of Nurses

The belated Minority Report of the Working Party on the Training and Recruitment of Nurses, over the solitary signature of Dr J. Cohen, differs from the Majority Report over a limited but highly significant part of the Working Party's terms of reference. The majority, according to Dr Cohen, made the common mistake of considering the problem of the community's nursing needs in a vacuum, without relating it either to the other calls upon womanpower or to any objective criterion of nursing "productivity." They also took, in his view, an unwarrantably pessimistic view of the speed at which reform could be accomplished.

The problem of assessing, in any scientific and objective way, the need for nurses as compared with the need for teachers, industrial workers, typists and so forth, remains unsolved and probably unsolvable in any but the roughest and readiest way. Dimly one discerns behind Dr Cohen's generalities a yearning for the planned society of docile automata moving from job to job at the orders of an all-wise scientific hierarchy—of course, with every possible adjunct of vocational test and training. But short of this planners' Utopia there can hardly be more than a consensus of opinion (a notion Dr Cohen abhors) as to the proportion of the nation's human resources which should ideally be devoted to nursing. More positively useful is his suggested test of nursing efficacy. How long does it take, at various ratios of hospital beds to nurses, to cure and discharge the average patient ? Making allowances for the various types of hospital, Dr Cohen examines the data and concludes that if all hospitals had a nurse-to-bed ratio as high as the best, the average patient's stay would be shortened by one day—a saving of some 1½ million "patient days" at the cost of the employment of 5,600 extra nurses. (These figures refer to the year 1938.) Rough calculations lead him to conclude that this expansion would nearly pay for itself in production gained. Dr Cohen would be the first to agree that much more research is needed to establish a reliable accountant's background to the problem of the optimum nursing force ; but he has at least provided a test of "productivity" in a field where it is generally considered not to be measurable at all.

Refinements can wait. No contempt for mere unscientific "opinion" can alter the fact that, whatever the ideal, there simply are not enough nurses now. Dr Cohen agrees with his ex-colleagues in blaming "wastage" during the training period ; a wastage partly due to inadequate vocational guidance, but mostly unmistakably to be ascribed to the banes of the student nurse's life—near-prison discipline and near-workhouse food, the reign of the Old Battleaxe in the ward, the common-room and the hostel, and of Bumble in the kitchen.

* * *

Towards a Scandinavian Alliance ?

It is unlikely that the recommendation of the Foreign Ministers of Denmark, Norway and Sweden last week that their Governments should set up a committee to study military collaboration marks any real progress towards an effective Scandinavian alliance. The phrase is indeed a contradiction in terms. Co-operation on local security work there may be ; but an effective partnership for war is impossible not least because the partners have different views on the likelihood of their being involved in war. There are no signs that Sweden will abandon its belief in both the desirability and the possibility of continued neutrality. Equally Norway and Denmark, however much they may wish to keep out of a war, show no inclination to revise their opinion that they will be unable to do so. Between states whose policies are so fundamentally opposed there can be no genuine collaboration.

The result is that Norway and Denmark prefer not to prejudice their chances of eventual support from the West by subscribing to the Swedish doctrine of "alliance-free neutrality." For it is only on the assumption of powerful outside help—which means help from the West—that such an alliance makes sense. If Norway and Denmark are attacked and Sweden remains neutral, the alliance is no good to the former states. If all are forced to fight, they have no chance of successful resistance unless outside help is forthcoming.

An influential minority in Sweden has for some time advocated

that policy should be based on these assumptions and not on that of continued neutrality. But their electoral influence is slight and, although next Sunday's elections to the Lower House of the *Riksdag* are likely to bring about a change of Cabinet, they are unlikely to change policies either at home or abroad. Their chief importance is that they will probably register a drop in the Social Democratic representation. The Social Democrats now have 115 or exactly half the seats in the *Riksdag*. Any decrease in this number would mean that they no longer have the right to form a government by themselves. A coalition is therefore likely. Many combinations are conceivable, but none would radically alter present policies. Any hopes that Sweden's persistence in a policy of neutrality will be modified after the elections will be disappointed.

International and British Coal Planning

At the meeting of the Economic Commission for Europe last week the Polish delegate, faced with the prospect of coal export surpluses from his country, moved a resolution advocating what would in effect be a European plan for coal output, exports and imports. That Poland should take the initiative is very natural, for it will be the first country to run against the problem of coal export surpluses. But before very long the same problem might face Great Britain.

Shortage of coal has played such a dominant part in the last few years in the economic anxieties of Great Britain and Europe that few people have yet turned the mental somersault needed to face the prospect of over-production in a few years' time. Still fewer have been prepared to face the necessity of working out a plan for Europe as a whole which would ensure the production of coal from the most efficient fields. The fact that over-production, unemployment and dumping of coal caused serious international difficulties before 1939 appears to be forgotten, and the British Government, which has nationalised the coal industry precisely with the object of planning it, seems frightened about taking the lead in European coal plans.

The Coal Board, as Mr Browne's recent speech at the Coal Board Summer School showed, is busy wrestling with the problems of reorganisation in this country. Though the subject of foreign competition is often mentioned, neither his speech nor anything said by Ministers elsewhere indicated that there is any likelihood of international planning.

There are two aspects of international coal planning : one concerns the bargain or agreement made on the political plane ; the other, which properly should precede it, depends on long-term technical planning. Without international agreements about the levels of output and exports, production plans in this country make nonsense. For example, the futures of South Wales and of Northumberland and Durham are closely bound up with the coal export trade. In three or four years' time the coal production plans of European countries will be maturing, and the output of coal is likely to be in excess of demand unless national plans are suitably modified now. It is only by international agreement, based on consultation now between the technical experts of the various national coal industries, that there can be any prospect of stable production and employment. So far there is no sign that the Coal Board has been asked to contribute anything to this problem.

Bitterness in Newfoundland

The British Government's decision to accept the referendum on Newfoundland's future as final has been hotly challenged by the minority. A referendum on June 3rd showed 22,000 votes for the retention of commission government, 63,000 for confederation with Canada and 69,000 for a return to responsible government. Eliminating the first alternative a referendum on July 22nd produced 77,000 votes for Canadian confederation and 71,000 for responsible government, and on this basis the Commonwealth Relations Office decided, in consultation with the Canadian Government, to start negotiations for the entry of Newfoundland into the Dominion of Canada as a tenth province. With so small a majority and with so little public discussion of the terms on which Newfoundland was to enter Canada it was inevitable that there would be bitter feeling in Newfoundland.

This has now crystallised into a memorandum submitted by the Responsible Government League of Newfoundland and backed in the British press by such *amateurs* of the oldest colony as Sir Alan Herbert. This is a curious mixture of sense and nonsense. It castigates the Commonwealth Relations Office for

★ FOR AIR-MINDED CHAIRMEN AND DIRECTORS

Ten minutes in South America is worth a month of correspondence

Your men can be there over the week-end . . .

IN THESE DAYS when South American markets have to be not only captured, but also *held*, it is more than ever necessary for your salesmen and service engineers to make personal contact with your South American customers. British South American Airways enable them to do this with the least possible expenditure of time, as this table shows :

From London to	Flights per week	Time	Fares Single	Fares Return
Rio de Janeiro	4	33 hrs.	£171	£307
Buenos Aires	3	58½ hrs.	£192	£345
Santiago	2	81 hrs.	£208	£374

Subject to alteration

Fast and frequent services also to Recife, São Paulo, Montevideo, Lima, Barranquilla and the West Indies.

EXPORT BY AIR, too, and ensure that your goods arrive factory-fresh in the hard currency markets of Latin America.

• • •

One ton each—by air!

Many business men still instinctively regard air cargo services as being suitable only for light packages. B.S.A.A. recently carried to South America a consignment of four turbine parts weighing a ton each.

Business by Air by—

BRITISH SOUTH AMERICAN AIRWAYS

Reservations and Information, at no extra charge, from travel or freight agents, or from British South American Airways Corporation, 12, Grafton Street, London, W.1 (Regent 4141) for passengers, or 9, Albemarle Street, London, W.1 (Regent 7232) for freight.

The fable of the star-scraper

A certain Simpleton once climbed a high tree after gold, but just as he was reaching out to scrape a star his foot slipped, and he fell. 'Alas!' cried he, 'Now my life must pay for my folly!' With that he came to rest face downward in a midden. 'The gods are with me after all,' said the Star-scraper, as he clambered up an even taller tree.

Those who gamble on a succession of miracles stand to lose more than their dignity. Sound commerce for this country is the sale of its skill — skilled service or skilled merchandise. That is what TI sends abroad in the form of bicycles, pressure vessels, precision tubes, wrought light-alloys, traffic signs, electrical equipment and a thousand and one other products.

TUBE INVESTMENTS LTD • THE ADELPHI • LONDON WC2

placing Canadian confederation on the referendum when it had been rejected in the constituent convention by a majority of 29-16, without reflecting that this vote was a third of the total and had been supported by the direct votes of a quarter of the electorate. It maintains that any majority vote of less than two-thirds is inadequate for constitutional change, and quotes the American constitution in support, without reflecting that what applies to representative legislatures is not necessarily applicable to plebiscites, which, however undesirable they may be as a permanent feature of government, are the purest way of ascertaining opinion. The League has taken the advice of an eminent firm of Canadian chartered accountants on the issue of confederation without reflecting on the absurdity of asking accountants to pronounce on matters of state.

But on one point the League is on strong ground. Both legally and morally Newfoundland, as a country possessing Dominion status—even though that status is temporarily abrogated—has a right to elect a legislative body of some kind to negotiate the terms upon which she enters the Dominion of Canada. If the question of confederation be considered as settled, Newfoundland would as a Canadian province have a unicameral legislature. There seems to be no insuperable reason why the British and Canadian Governments should not re-constitute it (in accordance with the Canadian pattern) so that it could negotiate the details of Newfoundland's relations with the Canadian Federal Government. Desirable as it is that Newfoundland should unite with Canada, the British Government would be doing a disservice to Canada by permitting even a minority in Newfoundland to believe that they had been a pawn in a real estate deal.

* * *

Franco Casts About

The meeting last month between General Franco and Don Juan, the Pretender to the Spanish throne, on the General's yacht in the middle of the Bay of Biscay, inevitably gave rise to much speculation which the official communiqué issued afterwards did little to satisfy. It merely stated that "greetings and impressions concerning problems of general interest were exchanged," and that the principal object of the talks was to arrange for the education of Don Juan's son, the Prince of the Asturias, who will begin his studies in Madrid next term. But speculation points to at least one possibility—that Franco offered to recognise Don Juan's son as heir to the throne provided that Don Juan himself renounced his own claim. Such an arrangement would result in twenty years of undisputed rule for Franco—until the Prince of the Asturias reached the age of thirty, when he would be entitled to ascend the throne—while irrevocably depriving Don Juan himself of any chance of becoming king.

If such an offer, which blatantly puts all the trump cards into the General's hands, was in fact made, it simply reflected the undoubted strength of Franco's political position at home. Inside Spain the monarchy commands only passive support, and the Republican Government in exile hardly any at all. The opposition parties inside the country, driven underground, are ineffective and only too prone to squabble amongst themselves. Above all, Spaniards of all classes and all parties are afraid of the prospect of another civil war.

But Franco must be beginning to realise that there are grave disadvantages in political rule, however undisputed and undivided, over a country whose economy is rapidly going downhill. The denial of Marshall Aid was a bitter blow for which the Franco-Perón Protocol of mutual economic assistance was a poor recompense. Argentina may be able to provide Spain with food, but it cannot provide the agricultural machinery by which Spain can improve its own food production, nor the rolling stock and railway equipment with which to repair and modernise Spain's transport system, which daily becomes more of a menace to those who are forced to use it, nor the equipment to modernise Spain's factories, mines and power-stations. The present state of the iron ore mines is only one illustration of the present parlous condition of Spanish industry. The rich surface deposits in northern Spain are nearing depletion, and their further exploitation requires much new machinery. On the other hand, the deposits in the south are still easily workable, but cannot be exploited for the export trade because the port facilities available are hopelessly inadequate, and there is no equipment with which to modernise them.

In fact, it is estimated that at least $500 million worth of materials and equipment must be pumped into the Spanish economy in order to bring it back into working order. Private loans can only touch the fringe of what is needed, and Franco must realise that only the United States Government is really in a position to give him what he wants. He is therefore anxious to make any gestures which will help to reverse the verdict which has put him outside the community of Western European nations, and which will smooth the way for his admittance to the United Nations—possibly at the forthcoming meeting of the General Assembly—and then to a share of Marshall Aid. But his empty gesture to Don Juan will deceive nobody, and the recent announcement that municipal elections will be held throughout Spain next November will remain an equally empty gesture so long as the Falangists remain the only legal party and all others are either driven underground or into prison. Nor are the obstacles to aid only political. While nothing is done to halt the mounting costs of production which makes most of Spain's exports so expensive that nobody wants to buy them; while nearly half the national budget continues to be spent on the armed services and the police; and while all economic effort continues to be stifled and stultified by a monstrous bureaucratic growth, the Americans may well feel that their money can be more usefully loaned elsewhere.

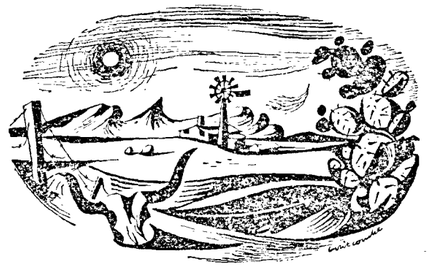
* * *

The Airlines Meet at Brussels

The international air transport business is on the road to bankruptcy. This is shown by the description of its cost and revenue trends which Sir William Hildred, Director-General of the International Air Transport Association, an organisation representing no fewer than 66 airlines, gave in his annual report in Brussels on Tuesday. There is plenty of time to turn off the road. But the trouble is that the vehicle has dual control. Governments, which are swayed by considerations of policy and national prestige, have a pilot's seat as well as the airlines which heed commercial factors. And the routes which the airlines fly and the way in which they fly them are becoming increasingly a matter of official regulation.

The growing cost of airports and navigational facilities is charged more and more to the airlines. Yet the airlines are under pressure—or orders—to act so that costs rise and incomes fall. The Governments in conference shorten the flying time of aircrews and impose stricter standards of airworthiness at the expense of payload. Individually they cut mail subsidies and reject increases in fares. The airlines cannot meet greater costs from smaller revenues and still stay in business. No wonder that Sir William put in a plea for more realism and more co-operation in these matters as a step towards lower costs.

In more detail the report gives interesting information on a variety of subjects. The Association is contemplating the early introduction of a second-class service, largely to compete with the increasing and successful activities of non-scheduled operators. At the beginning of October a Universal Air Travel Plan whereby the holders of Air Travel Credit cards can fly on credit over the lines of the companies subscribing to the plan will come into effect. It is expected to increase business by making it easier to fly.



The size of the international air transport system may be judged from the fact that at the end of 1947 there were about 500,000 route miles and nearly 2,000 aircraft in operation. The annual earnings of the industry totalled £250,000. About 1,000 airfields are in regular use now, representing an investment of over £825 million and an annual cost of about £60 million. The figures, which are rough but reliable estimates for the whole world outside Russia, show how small a business air transport really is—a fact which its political importance conceals. The struggle between political and commercial considerations, which has been frequently brought home to the taxpayer, is now going in favour of politics. It is not for nothing that a section of the report on the work of the Financial Committee of IATA which deals with the specialised air agency of Uno—the International Civil Aviation Organisation—is headed "Keeping ICAO's demands to a reasonable minimum."

* * *

Recalcitrant Engineers

The Amalgamated Engineering Union is in an awkward dilemma. Its delegates to the TUC conference opposed the Government's policy of wage stabilisation. This was only a fortnight after an industrial court had awarded the engineering workers a rise of five shillings out of the thirteen shillings which they claimed. The national executive of the union, which was bound by tradition to accept the ruling of the court, is now finding difficulty in exercising any control over its constituent parts. In London the Shop Stewards National Council of Engineering Trades issued what was tantamount to a threat of direct action to gain the full thirteen shillings, and in Glasgow they have

20,000,000
more mouths to feed
each year

While man multiplies his race by 20,000,000 people a year, the world rumbles on to disaster. Mass starvation and world strife are constant threats unless enough food is produced to feed today's and tomorrow's hungry millions.

Until man can repair the damage of soil erosion, and the antiquated production methods of the majority of the world's farmers are modernised, every acre of still arable land must be made to yield up more food than ever before. The "Ferguson System" of *complete* farm mechanisation can play a constructive part in this world-wide objective.

The "Ferguson System" co-ordinates the action of "Ferguson" tractor-implement units. It gives more traction without built-in weight that packs the soil. It gives finger-tip and automatic hydraulic depth control of implements carried by tractor. Its versatility and manœuvrability enable farmers to produce more food at less cost from every available acre.

* Every week, for Harry Ferguson Ltd., more than 1,000 "Ferguson" tractors are manufactured by The Standard Motor Co. Ltd., and more than 5,000 "Ferguson" implements by foremost British manufacturers.

Inserted in the public interest by Harry Ferguson Ltd., Coventry

COURTAULDS
IN THE UNITED KINGDOM
No 7 ROCHDALE

BEFORE 1914 Courtaulds began to study the possibility of creating a new material from which textiles might be woven and knitted. They had already made a great success of continuous filament viscose rayon (then called "artificial silk"), and the use by some firms of waste from this product indicated the need for a properly produced rayon staple, made by cutting continuous filaments into regular lengths in standard deniers.

In time, research established the techniques whereby this viscose staple could be manufactured in bulk and spun into yarn on all types of existing textile machinery (cotton, silk, flax, wool, jute, *et cetera*) and then woven or knitted into a limitless variety of cloths each with its own distinctive qualities.

So to widen the use of the new product, which they called "Fibro", Courtaulds in 1934 acquired Arrow Mill, Rochdale, a typical 27-year-old cotton mill; it had been idle for four years. Here, with an open door, they demonstrated how easily "Fibro" could be spun on cotton machinery; and before long the cotton industry was using it in large quantities not as a substitute for other fibres but on its own hard-earned merits.

Thus Rochdale has played a leading part in introducing this entirely new, home-produced raw material to Britain's textile industries. Since Arrow Mill started to encourage other spinners to use the new product, the British output of rayon staple has increased more than thirty-fold to 84 million pounds a year, a major contribution to the national economy.

Of over 24,000 people directly employed by Courtaulds in the United Kingdom, over 400 work at Arrow Mill, Rochdale, not merely producing spun rayon yarns but also assisting others to do the job as well and exploring even newer fields of research and development.

This is one of a series of statements to inform the public of some part of the contribution made by Courtaulds' industrial enterprise to economic well-being in various districts of the United Kingdom.

Issued by Courtaulds Ltd., 16 St. Martins-le-Grand, London, E.C.1

decided on a token stoppage on Monday as a protest against the court's award.

This is very distressing to the national executive of the AEU, which has sent a stiff note to its branches, pointing out that all the recent stoppages have occurred without the sanction of the executive, and in some cases without the approval of the district committee. They strongly condemn any unofficial strike, but it is very doubtful what the executive council can do about it. This illustrates very clearly the twin weaknesses of the union movement as at present organised. In the first place, the national executive can only represent and cannot control its members and branches. It is the head of the hammer and not the guiding hand determining where the blows shall fall or whether they shall be withheld. Secondly, this lack of national control is intensified in industries such as engineering where the shop steward, the representative at the place of work, has displaced the union branch as the centre of local loyalty and support. Consequently the national executive of the AEU is aware that it must both respond to the pressure of its membership and seek to outbid the shop steward movement in pressure for higher wages or else face the break up of the union. It is an awkward position for the men at the top, who face either the possibility of a debacle which will ruin their lives' works and lose them their jobs or else the certainty of permanent unpopularity in Whitehall, Smith Square and Tothill Street.

* * *

The Ghosts' Charter

The hankerings of the National Union of Journalists for a closed shop are unmistakably exemplified in its directions to its members, endorsed at last week's annual conference, that sports reporting shall henceforward be handled only by regular journalists, any stories by sportsmen themselves would be acceptable only if submitted by a union member whose remuneration for the story in question must be at least equal to that of the athlete concerned. There is, perhaps, something to be said for a Ghosts' Charter. The gifted reporter or feature writer who seeks out the latest horizontal heavyweight, extracts from him a dozen monosyllables on Why I Lost, and works them up, over the appropriate signature, into a narrative masterpiece compact of thrills, humour and human interest, is surely worthy of his hire. But the honest hardworking spectre and the mere Petrillo-style stand-in are not the same thing. Mr Harold Abraham and Mr Noel Baker are quite capable of writing, unassisted, better articles on the Olympic Games than any Fleet Street professional; the merits of a Cardus or a Newman are not dependent on union status. As lately as last year the secretary of the NUJ, giving evidence before the Royal Commission on the Press, explained that while the regular editorial staff on any paper ought, in the NUJ view, to be union members, this did not mean that outsiders should be prevented from contributing on special subjects; and while he and other NUJ witnesses supported the idea of a Press Council, with power to register and to "disbar" staff journalists, no attempt to eliminate the freelance was apparently considered. Those nasty suspicious minds, however, who saw in this proposal the first step to a closed shop, now find themselves justified. Why, after all, stop at sports writers? The amateur is just as dangerous and deplorable a blackleg when he writes on art, science, fashion, household hints, religion or politics. If he happens to be better informed, more intelligent, and more skilled in the use of words than the general run of professional journalists, and thus all the more worth printing and reading, his competition becomes all the more undesirable. From the union point of view, the only satisfactory outside contributor is indeed the inarticulate celebrity, whose name can remuneratively cloak a ghost in good standing at his local chapel. Accepted without protest, the NUJ direction points the way to a *Gleichschaltung* of journalism as potent and as pernicious as that of any totalitarian state.

Letters to the Editor

Industrial Productivity

SIR,—May I correct the impression that is likely to be made by the British Iron and Steel Federation's comment on Dr L. Rostas's figures for the comparative productivity of the UK and US steel industries? The Federation's *Bulletin*, quoted in your Note last week, refers to the well-known figures published in the *Economic Journal* in 1943. The National Institute will shortly be publishing Dr Rostas's full-length inquiry into comparative industrial productivity, and in this the figures for the steel industry do not differ substantially from the 1943 ones. I would like to stress that neither in his earlier paper nor in this later work does Dr Rostas take ingot production as his basis, as the Steel *Bulletin* suggests. The following passage from the forthcoming book makes this clear.

> The steel industries of two countries will probably have a different product structure in the sense that the proportions of light and heavy steel products having different labour contents, as well as the number of finishing processes applied to particular products, will differ. For example, in the one industry, re-rolling may have been carried one or two steps further than in the other. There will also be quality differences, even though the product may have the same name in the trade.
>
> For these reasons a comparison of the weight of output produced or the weight of steel ingot "treated" will not give a satisfactory basis for comparison of output, and it is necessary to allow for differences in the balance of production as well as for the different types of finished products.

With regard to Mr Ryan's points in his letter in *The Economist* of September 4th, I think he will find that for tin containers the physical comparison of output per head is based on 1937 in both countries, not on 1935 and 1939 as is suggested. Also the physical comparison is supplemented by a comparison of the net value of output per head in the tin container industry. This makes certain allowances for the quality factor. On the important point of "quality" *versus* "quantity" Mr Ryan will find that consideration is given to it throughout the book.—Yours faithfully,

F. S. STONE, Secretary,
The National Institute of Economic and Social Research

Industrious Designers

SIR,—I was much interested to read the article on Industrial Design which appeared in *The Economist* of September 4th; and I should like, if I may, to answer some of the "minor criticisms" of the present reorganisation of the Royal College of Art, put forward in the last paragraphs.

To provide the specialised and concentrated training demanded by modern industrial conditions, it was, I think, essential to subdivide the very comprehensive Design School which existed previously. But any divisions must to some extent be arbitrary in so far as all branches of design overlap one another, and it would be surprising indeed if all practising designers with their varying talents and experiences were to agree with those which were made. Whatever these divisions, it is necessarily of the first importance to ensure flexibility in the courses provided and to see that they are so planned as to bring out the individual student's aptitudes.

The expediency of teaching in South Kensington such subjects as Jewellery and Engineering (product) design raised by your correspondent—and he might well have added Textiles, Pottery and Glass—raises many large issues and indeed the whole *raison d'etre* of the College itself. One of its functions is undoubtedly to enable the talented student who has received a full technical training in the Provinces, whether in Art, Architectural or Technical Schools or in industry, to broaden his outlook and sharpen his creative faculties in a livelier and more competitive atmosphere, and this alone justifies continuing and developing courses in the subjects mentioned. Apart from that, however, London in its own right is one of the largest centres of the Jewellery and Silversmithing industries, as it is also of Furniture and of Light Engineering; and South Kensington with its Museums both of Science and Art, and with its other facilities, is surely the ideal place in which to train potential designers for them. On the other hand, as your correspondent suggests, it is most desirable and it is the intention of the College to establish the closest union with other centres of industry and with the educational and research establishments therein.

The title of "Publicity Design" is admittedly most unsatisfactory and is provisional. On the one hand, it was chosen to avoid that of "Commercial Art," so often criticised for its unpleasant ring, and on the other to include such subjects as Display, Photography, etc., which it is hoped to include as soon as accommodation permits and which your suggestion of "Graphic Design" is not sufficiently comprehensive to cover. Additional suggestions would, however, be most welcome.

Finally, the School of Architecture has never, I think, existed to train Architects and Architectural draughtsmen, but has provided a general educational background and an ancillary technical training to that given in other departments. Both functions are important and are capable of considerable development, and both demand direction by someone of high calibre. I think all who have had close connection with the College would agree that to have got rid of a Chair of long traditions which has had many distinguished occupants would have been as regrettable as it would have proved unwise.—Yours faithfully,

ROBIN DARWIN, Principal

Royal College of Art, South Kensington, London, S.W.7

SIR,—The author of "Industrious Designers," in your issue of September 4th, has issued a challenge which should not be allowed to pass unnoticed. It is easy to reduce the tempo of praise until it becomes condemnation, and no attempt has been made in the article to face squarely the inherent difficulties of the problem of industrial design. It is impossible, in the compass of a letter, to detail the difficulties. Let me quote one—the growth of specialisation. This affects not only the manufacturer himself, in mechanical and engineering complexities, but also the other experts of industry, packer, salesman, advertiser, transporter, and so on. Manufacturer and designer can and should have much in common, but the need for specialisation confuses issues which, a century and more ago, were comparatively simple.

The efforts of the Royal Society of Arts, a pioneer in industrial design, of the Design and Industries Association, the Society of Industrial Artists, the Faculty of Royal Designers for Industry, the Council of Industrial Design, and other collaborating bodies, represent attacks from various angles on the core of the problem; and the co-operation of the Royal College of Art in training the designer by new methods is welcomed. None of these efforts merits the labels "apathetic" or "over-genteel." They represent expert attempts to meet an extremely complex problem to which there is no single or simple solution. Certainly the author of the article does not attempt to propound one.

The Royal Society of Arts was responsible for the exhibition "British Art in Industry" held at Burlington House in 1935 and for organising the Faculty of Royal Designers for Industry in 1936; it encourages students of industrial design by means of scholarships; it shares with the Council of Industrial Design and with the Faculty of RDIs the responsibility for organising a new exhibition, "Design at Work," to be held at Burlington House this autumn—an exhibition which will illustrate the chief problems of industrial design and the methods by which manufacturer and designer can and do solve them in close co-operation. The efforts are being made all right and progress is being achieved.—Yours faithfully,

H. A. LINDSAY

Royal Society of Arts John Adam Street, Adelphi, London, W.C.2

The Dutch Spectator

SIR,—The Dutch spectator, whose views on the Malayan situation filled half a column in *The Economist* of August 14th, certainly exists. At the recent elections, he and his fellow-critics of the Right failed to reach 20 per cent of the vote. The Communists and extreme Left, dismissed with nearly two lines, got about as much. The remaining two-thirds are perhaps less interesting from a journalistic point of view, because they show neither much sympathy with Communist rebels, nor with diehard colonials. It would have been only fair, however, to grant them five or six lines in order to explain their point of view. They still remember the BBC news in Dutch, the voice of their Queen speaking from her British exile, the British paratroopers at Arnhem and British soldiers liberating the South of their country. Also they are reasonable enough to understand British troubles around VJ-day. This majority of the Dutch people fully back their Government in its policy towards a peaceful co-operation with the Indonesian nations.—Yours faithfully,

J. SANDEE

Pansierstraat 44 Scheveningen, Holland

Student Nurses' Pay

SIR,—The last of your "Shorter Notes" in your issue dated August 14, 1948, states that "to grant a rise to cover the new insurance contributions would create a dangerous precedent."

With this statement I would not quarrel except that it occurs in connection with a claim by student nurses.

Surely one reason which could have been advanced to account for the notoriously poor pay of the nursing profession as a whole is that sickness costs them nothing. Under the new act they must now pay for "free" treatment (admittedly there are other benefits, most of which are of exceedingly doubtful value to a student nurse). The proper procedure surely is not to grant them more pay but to exempt them and others in the similar professions from all or part of the contributions under the new Act. This would or should have the effect of leaving the student nurses in the same financial position as they now are, a not unreasonable situation. Student nurses, not one assumes being economic experts nor perhaps concerned with creating dangerous precedents but mainly with learning their jobs and trying to support life at the same time, not unnaturally have taken a short cut and asked for more money.

I should add that I have nothing to do with the medical or nursing profession.—Yours faithfully,

I. A. ESTRIDGE

47 *Lichfield Court, Richmond, Surrey*

[Mr Estridge has apparently fallen into the popular error, which the Ministry of Health is continually trying to correct, of thinking that the health service is paid for from the national insurance contribution. Actually only a very small proportion of the cost of the health service comes from the national insurance fund, the great bulk of it being met by taxes. To exempt student nurses from that part of the national insurance contribution which goes towards the health service, if it were practicable, would only save them 6½d. a week from the 3s. 10d. they are required to pay.—EDITOR.]

Tobacco Shortage

SIR,—Why do we not adopt the Dutch system of a combined sweet and tobacco ration, so that those who want more tobacco do without sweets, and those willing to forgo tobacco can have more sweets? It works well in Holland; why not here?—Yours faithfully,

STANLEY UNWIN

40 *Museum Street, London, W.C.1*

From *The Economist* of 1848

September 16, 1848

ABUNDANCE of raw material, improved skill, and cheaper methods of production, the consequence of competition—have combined to make manufactured goods cheaper now than at any former period of our history; and this is the sole cause why we have not suffered from the disturbed state of Europe so much as we were entitled to apprehend. To those changes in our laws which have removed all impediments to the supply of raw materials, which cheapened them as much as possible by the repeal of all import duties—to that increased skill which competition has promoted—and to the large accumulated capital of the country which gives to its possession no income unless profitably occupied—the working classes of this country are indebted for the striking improvement in their condition, at a moment when neighbouring countries are distracted by revolutions and internal convulsions, so injurious to our general trade. No one who recollects the serious losses, difficulties, and sufferings of 1842, can see the comparatively prosperous state of the country at this time under circumstances, in whatever light we view them, of an infinitely aggravated character, without recognising in the legislative changes which have taken place since then, causes of a great mitigation in the suffering to which this country would otherwise have been exposed during the two last years. What should we have done in 1847 and 1848 with the sliding scale of corn laws—with live animals absolutely, and provisions practically prohibited—with considerable duties upon all the raw materials of our manufacturers, and the duties upon the chief articles of colonial produce double the present rate? We all know the evils we have suffered. None can tell those we have escaped.

Books and Publications

Churchill Gives Judgment

"The Gathering Storm." By Winston S. Churchill. Houghton Mifflin Company, New York. 784 pages. $6.00. To be published by Cassells, London on October 4th. 25s.

MR CHURCHILL is a disciple of Gibbon. The urbanity, the irony, the very scale of his work refer him back to a serener age; above all, his olympianism lifts him above the modern world in which he seems a sole but confident survivor from the settled past. And this sense of continuity, being dynastic and not personal, reaches back far beyond his own time. The course of affairs after the first World War was familiar to him from the start. He had experienced it all before, personally during that war, mentally in his historical studies. Therefore he understood it and felt equal to handling it, while other politicians to whom such a world was new and strange naturally foundered. Now that history has vindicated him, Mr Churchill feels alone entitled to judge it.

Such is the spirit that informs Mr Churchill's new work It is a spirit that might easily slide into complacency, but never does. Serene, confident, exact, he passes through the twenty years from war to war, judging tolerantly but firmly and finally, the "decent easy men" and the earnest muddled men who excluded him from power. Why was he so excluded? we naturally ask; and to this mystery his narrative suggests one insufficient but human answer. While a private member of Parliament he yet never ceased to be an elder statesman: insistent, omniscient, and above all right, we find him advising ministers, foreign ambassadors, foreign governments on the correct policy to adopt, the proper weapons to employ. "Is it from you that I am to learn the state of the French artillery?" the French Premier once asked him. To M. Blum he was not a competitor —to Baldwin and Chamberlain he was.

But allowing that they had the wish, how had they the power to exclude him? A politician who frightens the reigning leaders requires public support. This Mr Churchill lacked. At one time he maintains that he was mustering it, but that his defence of Edward VIII was fatal to him: "All the forces I had gathered together on 'Arms and the Covenant' . . . were estranged or dissolved, and I was myself so smitten in public opinion that it was the almost universal view that my political life was at last ended." Whether such a consequence flowed exclusively from such a source may be doubted. Another question raised but not solved by this history concerns Mr. Churchill's entourage. He shows that "in my long series of campaigns for British re-armament I was by no means ill-informed." But by whom? A few names are mentioned, but casually and not enough. Was it his friends who estranged him from his potential colleagues?

The second part of the book deals with the "Twilight War." Mr Churchill was then First Lord of the Admiralty, and we are reminded that the sea and sea-warfare are yet another of the elements in which he is at home. "It was a strange experience, like suddenly resuming a previous incarnation"; and yet in this again his experience was unique: "No one had ever been over the same terrible course twice with such an interval between." The sea enriches his vocabulary and vivifies departmental minutes with sudden metaphors. "It would be very good," he writes to the First Sea Lord after the defeat of the *Graf Spee*, "if all the returning forces could scrub and search the South Atlantic on their way home for the *Altmark*"; and when the *Altmark* was traced to the Norwegian fiords he writes again, "Surely another cruiser or two should be sent to rummage the Skagerrak tonight." The book ends with the Norwegian campaign and the fall of Chamberlain's Government; here alone a scene vivid in Hansard is calmed by Mr Churchill's discretion—for he was both loyal to the falling Government and its obvious heir. Stubborn to the last, Chamberlain would have preferred Lord Halifax. There is a quiet but dramatic account of the cautious interview between the three in which the problem of the succession was resolved. "At last I had the authority to give directions over the whole scene. I felt as if I were walking with Destiny, and that all my past life had been but a preparation for this hour and for this trial."

Reading this book one can see that like Gibbon Mr Churchill is a happy man. That is one thing which makes the book so good. Even his misfortunes now seem fortunately designed, his years in the wilderness a liberation from party antagonism. This is the happiness of understanding. One thing only he cannot understand, and mentions prospectively with ironical perplexity: his ultimate fall. At the beginning of the book, referring to Clemenceau, he quotes Plutarch's words, "ingratitude to their great men is the mark of strong peoples"; and at the end he reverts to the same thought: "Thus . . . I acquired the chief power in the state, which henceforth I wielded in ever-growing measure for five years and three months of world war; at the end of which time, all our enemies having surrendered unconditionally or being about to do so, I was immediately dismissed by the British electorate from all further conduct of their affairs." This, for him, is the insoluble enigma.

America in the Mediterranean

"The Mediterranean: Its Role in America's Foreign Policy." By William Reitzel. Harcourt Brace, New York. 185 pages. $2.75.

THIS book is, naturally enough, primarily for American readers. It publishes as news many thoughts that have long been second nature to Britons. The man who needs to drink it in is the one who is ready to applaud slogans such as "We need mid-Eastern oil" or "We must spread democracy and check Communism" without thought of what these ends entail in the shape of American commitments overseas. It makes plain the hard fact that they cannot be pursued simply by paying third parties such as Greece, Turkey or even Great Britain to do the bluffing and, if need be, the dying. If America is to pursue them efficiently, it must make, in the Mediterranean, the choice between underwriting the British position, and with it British policy; or else developing an equivalent American system of bases, checks and balances; or else "relieving the British in agreed sectors." Mr Reitzel plumps for this last—for what he christens a "Siamese twin policy." It is the best and cheapest way, he thinks, to avoid the creation of a vacuum resulting from the diminution of British power, and the consequent inflow of some less desirable influence.

He writes tersely and well. He has personal experience of Italy, Greece and French North Africa. He is weaker on the Middle East. Though he has grasped its main attributes, he is hazy about detail. And—here is the biggest defect of his book—he virtually omits the problem of Palestine, which should be a key point in his theme, since it is the one place in the Mediterranean where his Siamese twin policy has not worked, and threatens not to work—for reasons that have often been set out in *The Economist*.

He divides his book into three parts, which are of unequal merit. The first is an admirable survey of American policy from the moment of the North African landing until President Truman sprang his doctrine of aid to Greece and Turkey in March, 1947. Remembered events are neatly slipped into their right perspective. Part Two analyses foreign interests, international tensions and local problems. Here the Palestine gap is serious. Part Three searches for an American policy that will "stabilise the Mediterranean" on a regional basis. But is this possible? At one point Mr Reitzel admits that it is not—that any string pulled there rings a bell at Abadan, or Mombasa, or Vladivostok. But despite this correct admission, he goes on to argue that a regional policy for the Mediterranean can and ought to be planned of a piece.

But despite some defects, the book is important. No other covers the same ground. It is full of a sense of the American responsibilities that devolve from American power, and of the dangers of letting home pressures sway foreign policy.

Russia and Its Neighbours

"Russian Economic Policy in Eastern Europe." By T. E. M. McKitterick. Fabian Publications, Ltd. 40 pages. 2s.

THE worst that can be said of this ambitious and interesting pamphlet is that the author is not quite fair to American policy as expressed in the Marshall Plan, and too ready to accept east

European statistics at their face value. The best that can be said of it is that it is clear, well argued and so far unique.

Mr McKitterick is trying to establish by deduction what should be—but which cannot be—established by direct inquiry: that Russian policy in eastern Europe has beneficent and fairly unselfish aims. He draws a very effective contrast between the present policy of the Soviet Union towards its western neighbours and that of the Germans towards the same countries between 1933 and 1940. His general conclusion is that Russian policy has three objects: to help in carrying out long-term industrialisation plans which are to raise productivity and standards of living; to organise a division of labour within the East European area which will stabilise markets and eliminate competition; and to encourage trade with the rest of the world in order to secure the capital equipment necessary for industrialisation—with the proviso that eastern Europe must not become dependent on the west.

Mr McKitterick can see no master plan dictated from Moscow and argues convincingly against the view that eastern Europe is destined to become an autarky. He states that trade with the west "would be accepted by the east European countries as a long-term feature of their economic life." It is a pity that this pamphlet gives so little space to study of the agricultural policy of the area, and its author may yet regret his insistence that bilateral trading will continue because of Russian distrust of multilateral trade and its implications. He admits in the introduction that his conclusions are "largely tentative"; he should have added that the difficulty of getting accurate information makes them even more so.

Europe on the Move

"Europe on the Move. War and Population Changes. 1917-47." By Eugene M. Kulischer. Columbia University Press. (London, Geoffrey Cumberlege.) 377 pages. 27s. 6d.

THE greatest change in the map of Europe produced by the Second World War was the re-establishment of the line from Denmark to the Adriatic as the western limit of the Slav world. As Eugene Kulischer points out, this is in effect a reversion to the situation which existed eleven centuries ago. The eastward conquests of Charlemagne in the eighth and ninth centuries were not undone till Hitler "destroyed the dam which had barred the human ocean of Eurasia from the rest of Europe."

Although Mr Kulischer sees all humanity at all times as a restless sea swept by waves of migration, he emphasises the fact that "all the so-called great migrations of past epochs are trifling in comparison with what happened in the nineteenth and twentieth centuries." And up to 1914 there were two great outlets for Europe's mounting population: North America and Siberia. The watershed dividing these two human streams ran through Lithuania, Byelorussia and the Ukraine, provinces from which emigrants flowed both east and west. This steady outpouring helped to keep the peace of Europe; the only sufferers were the indigenous peoples of America and Russian Asia.

Nearly a million Europeans went overseas every year before 1914; by 1924 this flow had fallen to one-tenth. In this simple fact Mr Kulischer sees the source of the Second World War. His account of the population movements between the two wars and up to 1947 is both detailed and clear. He re-states many points which need re-stating, and brings out others which have received little attention. Among the latter is the interesting fact that in 1937-38, in spite of the Nazis's efforts to strengthen their "ethnic wall" in the East, there was a record migration of Germans from East Prussia and Silesia to more western parts of the Reich.

There is no disputing Mr Kulischer's conclusion that there can be no peace unless outlets are found for migratory pressures, and that the success or failure of the United Nations' International Refugee Organisation is the test case. But he is over-simplifying when he defines war as "a violent movement of masses of people which stems from differential population pressures." The counter of heads must never forget the clash of ideologies which goes on inside them.

Colonial Populations

"A Demographic Survey of the British Colonial Empire. Vol. I. West Africa." By R. R. Kuczynski. Oxford University Press. 821 pages. 75s.

THE lack of reliable data on colonial vital statistics has been particularly disadvantageous since the colonial development and welfare policy was begun, for how—to take an obvious example—can educational and medical services be planned in the absence of knowledge about infant mortality, the rate of increase of the population, and so on? Before he was appointed demographic adviser to the Colonial Office, the late Dr R. R. Kuczynski had almost completed his survey of the whole colonial empire, of which this volume, issued under the auspices of the Royal Institute of International Affairs, is the first.

To call it comprehensive is to be guilty of understatement. It is so comprehensive as to be overflowing with facts, figures and quotations which find their way into lengthy footnotes that often take up more space than the actual text. It takes twenty-three pages to enumerate the sources quoted throughout the book. Dr Kuczynski does not merely give and discuss the results of censuses and other surveys directly bearing on the vital statistics, but also gives a great deal of the history of the colonies and social and medical information as well. The result is a volume which few people will be inclined to read right through, but which many people will dip into and find an abundance of interesting items, such as the history of the early colonisation of Sierra Leone. Still more, moreover, will need it as a reference book, and those directly concerned in colonial administration will find in it a badly wanted corrective for many of the easy assumptions about colonial mortality and fertility rates.

Shorter Notice

"The World of Learning." 2nd Edition. Europa Publications Limited. 824 pages. 60s.

THIS new edition, nearly twice as large as its predecessor, contains information on universities, learned societies and other cultural agencies in more than seventy countries. New sections have been added to give information about Unesco and international societies and about the colonies of the major colonial Powers. Within this volume there is to be found much information that can otherwise only be assembled by laborious research.

THE WORLD OVERSEAS

How the Commonwealth Consults

IT is a common fallacy in Britain and abroad that if, say, Mr Attlee wants to confer with his fellow Prime Minister in Canada, he simply picks up the telephone and speaks to him direct. This cherished illusion of Commonwealth intimacy fades at once when it is realised that both Mr Attlee and Mr Mackenzie King are each responsible to their respective Cabinets; what they say to each other must be discussed with, and made known to, their fellow Cabinet Ministers. In practice, therefore, consultations between the Prime Ministers of the Dominions take place by cable. The transatlantic telephone is seldom used, and, except on purely personal matters, communications between the Prime Ministers have the formal air of messages between independent sovereign governments.

The moral to be drawn is not that the bonds of the Commonwealth are weakened by the lack of intimacy, but that the insistence in each Dominion, including Britain, on joint Cabinet responsibility means that consultation between members of the Commonwealth is not a simple matter. Major policy decisions must be ratified by the parliaments concerned, and no Prime Minister of any Dominion is free to commit his country to a policy or a line of action without the consent of its people. For this reason the meeting of the Prime Ministers of the Dominions or their representatives in London next month will not be able to produce concrete results immediately and on the spot. The meeting is merely one of the many different forms of consultative machinery which has been evolved in the Commonwealth and which has been shaped by the British conception of parliamentary government.

There are seven different methods by which one Dominion government can consult with another. They range from the cables sent from Prime Minister to Prime Minister to meetings between officials in the various Dominion capitals. They have on the one hand all the formality of exchanges between foreign countries, and yet, on the other, all the intimacy of old friends discussing common topics over the coffee cups.

When Official Meets Official

The methods of consultation fall naturally into two parts: those between officials, and those between politicians. Under the former heading comes first the appointment of High Commissioners from each Dominion to each of the other Dominions. The High Commissioners are, in effect, ambassadors, and they fulfil much the same functions. The South African High Commissioner in Canberra, for example, watches over South African interests in Australia, consults with and is consulted by members of the Australian Government, and serves as a sounding board for South Africa's probable reactions to suggestions which are not ripe enough for more formal conferences. In all the Dominions the offices of the High Commissioners are, in fact, the principal channels through which the Dominions deal with each other.

Next, under the heading of officials, come the meetings between civil servants of the governments. Each High Commissioner has on his staff a number of officials covering the various aspects of government business—economics, foreign affairs, defence, immigration and so on. These officials meet their fellow officials in the various government departments several times a week in order to discuss the day-to-day details of administration. Officials of the External Affairs Department in Canada House in London, for instance, are frequent visitors to the Foreign Office and discuss with the "man on the desk" the particular problems of foreign relations in which they are interested. Finally, there are the visits of senior Civil Servants from one Dominion to another. They are usually connected with specialist or technical matters which can only be cleared up by direct consultation.

Generally speaking, it is when officials deal with officials that liaison between the Dominions is closest. But officials are not responsible for policy, and, because of the constitutional limitations already described, somewhat different and more formal methods of consultation have been evolved for the policy-makers —that is, for the politicians.

There are a number of different ways in which the politicians can discuss matters with each other. First, there are the telegraphic exchanges between Prime Minister and Prime Minister. Then there are the visits of Cabinet Ministers from one Dominion to another, the formal exchanges between Dominion Governments —something like the exchanges of Notes between foreign countries—and, at periodic intervals, the meetings of all the Prime Ministers in one or other of the Dominion capitals.

The choice of method of consultation is in no way fixed, nor is there any obligation on any of the Dominion Governments to discuss policy before it is framed. The New Zealand Government recently increased the value of the New Zealand pound without reference to London and with only a personal message to Mr Chifley. Mr Bevin frequently makes statements on foreign policy with often not more than 24 hours' warning to the rest of the Commonwealth.

This freedom of the Dominion Governments to do as they please is an essential feature of Commonwealth relations. It has obvious drawbacks and sometimes causes embarrassment, but without an unwelcome tightening of the ties between the Dominions it can hardly be avoided. The drawbacks are being gradually overcome, however, by the development of the Commonwealth committee system.

There are now roughly twenty different Commonwealth committees in more or less permanent session. They are composed sometimes of officials and sometimes of politicians, depending on the nature of what they are discussing. They cover a wide range of topics from the special economic committee on ERP to the Imperial War Graves Commission. Their work is a mixture of fact-finding and of advising the Commonwealth governments on policy. And it is in these committees that the main opportunity exists for evolving a joint Commonwealth policy and for ensuring that the Dominions speak with one voice when the need arises.

The two most important committees are the special economic committee and the committee for co-ordinating scientific research on defence. The economic committee is concerned with the problems arising out of ERP, with the sterling area financial arrangements, and with bilateral trade agreements. It cannot, of course, bind the Dominion Governments to its decisions, but the standing of the officials on it is sufficiently high to ensure that their advice will not be neglected. Other committees deal with such subjects as agriculture, communications, civil aviation and trade. Some are purely regional such as the South Pacific Commission—which also includes American and French representatives—and are limited to the Dominions directly concerned.

Foreign Affairs and Defence

The obvious gap in the system is the lack of committees for foreign affairs and for defence. The nearest approach to a foreign affairs committee is the meeting in Downing Street of the High Commissioners every fortnight when members of the Foreign Office are available for consultation. This is not an entirely satisfactory arrangement. It exists more to keep the Dominions informed than to frame foreign policy. Moreover, because of Britain's greater resources and larger diplomatic organisation, the Foreign Office in London inevitably overshadows the smaller and much younger External Affairs departments of the Dominion Governments. There is, too, the hard fact that in world politics the overseas Dominions rank at best as middle Powers. They do not yet equal Britain in military or economic strength, and as a result, much as the overseas Dominions might resent it, Britain must and does take the lead in foreign affairs. Nevertheless, the Dominions are becoming more and more able to take their share in world politics—particularly in their different corners of the globe—and there is as strong a case for joint Commonwealth action in the foreign as in the economic field. As the Dominions are sovereign states, there can, of course, be no question of forming a common diplomatic service, but there is very little reason why there should not be close co-operation at the fountain head of foreign policy-making.

On defence matters co-operation is in the hands of liaison officers of the equivalent rank of brigadier, and again it is technical and informative rather than consultative. The Imperial Defence Committee was disbanded at the end of the war, and nothing has yet been involved to take its place. The Chief of the Imperial General Staff may himself co-ordinate Commonwealth defence by personal visits to the Dominions, but that is not an adequate substitute for a defence committee in permanent session. On the other hand, much has been done with joint training schemes. Officers from the Dominions attend staff courses at the various staff colleges in Britain, and there is a continual flow of technical information between the Dominions. Indeed, on the technical side of defence, co-operation is almost as good as it can be. But, as in foreign affairs, since the overseas Dominions are so much weaker than Britain, the main burden of planning defensive strategy rests on the United Kingdom defence committee in London.

The Dominions have gone a long way towards perfecting the machinery for working together. They are more closely knit than any other group of foreign countries. But they are not, and probably never can be, a homogeneous unit. It may be that out of the system of Commonwealth committees and as a result of more frequent meetings between the Dominion Prime Ministers, the Commonwealth will become more single-minded than it is. It is allergic to external planning, and complex as the present methods of consultation and co-operation are, nothing less empirical and more orderly seems likely to fit the heterogeneous collection of peoples involved. There are now three British Empires—the old Dominions, the Asiatic Dominions and the colonies—and no simple plan for co-ordinating their activities will quite suit them all.

Recovery in Austria

[FROM OUR SPECIAL CORRESPONDENT]

IN Austria the Four-Power machine runs smoothly. French, Russian, American and British flags fly over the Control Commission building in Vienna. Though there is some hard hitting, Allied meetings take place regularly in a friendly atmosphere and much constructive work is done. But the Commission can no longer be called a "control" commission. Its functions are now more those of an "advisory" commission working beside the Austrian Government, and in spite of the ten-year gap which has resulted in a noticeable lack of men of experience, the Austrians have acquired a national identity, a sense of responsibility, and a wish for independence.

Austria suffers from a world-wide disease—inadequate production—caused by war damage, occupation, the need to reconvert factories to peacetime manufacture, exhaustion of the soil, reduced productivity of labour and shortages of road materials, food and fuel. The effects show themselves most clearly in the foreign trade balances. Exports are still only about half of what they were in 1937 and do not cover more than half of total imports. In 1946, however, exports were only one-fifth of total imports, so there has been a noticeable improvement since then. In 1946 the monthly average of exports amounted to 18 million schillings; in 1947 they amounted to 70 million schillings; and in May and June this year, they reached 163 million schillings and 161 million schillings respectively.

The Austrians have a long way to go before they can pay their way, and they have no hope of beginning to do so until they have changed the composition of their imports. Prewar imports of food and livestock made up 27 per cent of their imports, whereas today they amount to 39 per cent. Domestic deliveries of foodstuffs have been extremely low. It is, therefore, one of the country's principal economic tasks not only to restore its agricultural production but to ensure that the maximum amount consistent with the producers' legitimate needs is delivered through official channels for the use of the rationed population.

Hopes of a Good Harvest

During 1947 the Government introduced a number of measures intended to encourage farmers to part with their produce at better prices and to have confidence in their currency. There should be a very good harvest this year, and there is hope that the farmers will be induced to deliver far more food officially, thus reducing import needs and providing foodstuffs with which to purchase sorely-needed raw materials. Prices have been raised by 60 per cent, and the subsidies needed to bring about a fairly modest improvement in deliveries are going to cost something like 500 million schillings (or about 11 per cent of the national budget). The Government hope to get permission to use the schilling proceeds of sales in Austria of American relief supplies, but, as they are also hoping to use this money for reconstruction purposes, there is a danger that they may spend more than they get.

The coal picture is brighter. Total imports, which are financed largely from foreign assistance (the British taxpayer paid for Austria's coal right up to the end of last September), are at the high level of 400,000 tons of hard coal equivalent a month. As a result heavy industries have gone ahead, and production is about 20 per cent above what it was in 1937. Light industries and consumer goods are still hopelessly behind—only half of the 1937 output—but the availability of coal should lead to a sharp recovery here, too. Before the war, two-thirds of Austria's imported coal came from Silesia and one-third from the Ruhr. During the war, beginning with the huge Hermann Goering works at Linz, and subsequently—induced by Russian occupation—a gradual but definite move of Austrian industry to the West has taken place. The shortest haul is now from Germany and the smallest quantity of coal comes from Poland.

Oil is a closed topic, tied up with the Treaty, but it is sufficient to say that all Austria's production and refining is in the hands of the Russians. The United States are bringing in a certain amount of petrol and lubricants under interim aid. Transport is handicapped by the shortage of locomotives, wagons, new vehicles and replacements, but the use of diesel engined road transport is increasing, and is out of all proportion to what it was before the war.

Taken all in all, one can point a cautious finger of congratulation and encouragement at one corner of Europe.

Can Cyprus Think Straight?

THE Left wing in Cyprus, having failed to secure for the island a constitution that would suit it while discomfiting the Right, has adjusted its sails and set off on a fresh tack. Till a month ago its cry was for complete self-government. The strikers whom it prompted to demonstrate politically in August were all for this. Now its spokesmen, who are the five Communist, or *Communisant*, mayors of the chief towns, plus the leaders of two Greek trade union groups, have altered their slogan. They have this week presented the Governor with a memorandum condemning his present "autocratic regime which is not to the credit of His Majesty's Government," and extolling *enosis*, or union with Greece. They cannot possibly desire union with the present Greek Government. They are therefore poaching to the extent of appropriating a rallying cry that has for some time been the preserve of the Right. They have no doubt done so with a view to catching some *enosist* votes at the municipal elections, which are due next year. They feel that it is time to begin thinking about these, for the Right has clearly gained ground of late, thanks to better organisation in Church political circles as well as to a general fall in Russian stock since the Czech coup and the Tito incident. Unless the Left stirs its stumps it cannot hope to repeat its success at the last municipal elections, which were in 1946. Adoption of the catchy *enosis* slogan is the start of its election campaign.

The extremes of Cypriot politics, therefore, appear to be in harmony over their opposition to British rule and British autocracy, whereas in fact they are at loggerheads on every other count. Could British policy have avoided throwing them together? The circumstances in which the British Government

Overseas Information

To enable *The Economist's* specialists to comment on events abroad a regular flow of information from our overseas correspondents and contacts is required. This information, and the judgments that are based on it, can be applied to commercial problems. Through The Economist Intelligence Unit regular reports, each designed to meet the requirements of a business or other organisation, can be commissioned.

The Economist Intelligence Unit

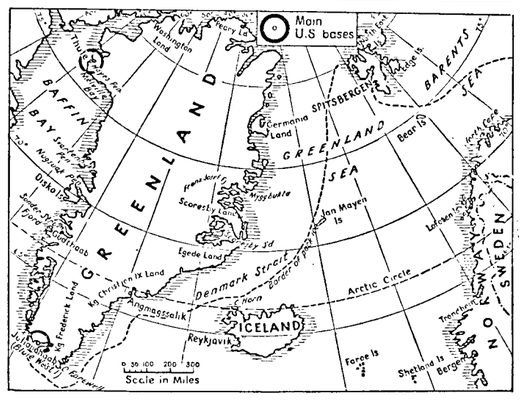
lately offered Cyprus a constitution were described in *The Economist* of May 29th. After laborious explanations that an island which has not governed itself for many centuries had best not try to run before it can walk, it offered a larger measure of representative government than many Cypriots expected (and than some of them want if any party opposed to their own is ever to hold power). This constitution was accepted by the Consultative Assembly that had been called to frame it, but only by a remnant of that body—a rump so small as to be quite unrepresentative. What was the Governor, Lord Winster, to do? Was he to say the vote was unrepresentative and to ignore it, or was he to take a plunge, put matters to a wider test, and hold a general election for the intended Legislative Assembly with a view to giving moderate opinion a chance to show itself? Admittedly, the second course involved risks. These would have been easier to take if the international situation were not so precarious, if there were not so much Russian money available for bribing ignorant voters, if there were a British governor more capable of capturing the island's imagination by dint of a bigger personality or better publicity, and if the moderate Cypriots were not so loth to do the tub-thumping which, in the island, passes for politics.

But none of these hypotheses existed. Sad to say, therefore, Lord Winster and Whitehall between them chose the cautious line. On August 12th they announced that the Consultative Assembly had become a dead letter, and was dissolved, that London, having given "ample proof of its sincere desire to give Cyprus a constitution," must perforce govern as before, and that the offer of a constitution remained open to any "responsible and fully representative political leaders" who cared to take advantage of it. They added that no change in the island's status was contemplated, meaning that there was no foundation for talk about union with Greece.

As was only to be expected, demonstrations followed and were well reported. A point that is less publicised is that Mr Creech Jones and Lord Winster, in choosing the course they did, have deprived the moderates, who are a shy lot, of all chance of showing their numbers and expressing their view. When the record of the present plodding governorship comes to be written its errors will be seen to be those of omission, not commission.

But Lord Winster is not the only person responsible for the current flare-up of anti-British opinion. King Paul of the Hellenes must take a share of the blame. In the last days of July, for some reason, he told Mr Cyrus Sulzberger of the *New York Times* that the gift of Cyprus might be a suitable exchange for Anglo-American bases in Crete. Why did he say so? No Greek royal purpose is served by stirring up Cypriot emotions just now. Sensible Greeks know it. Mr Sophoulis, who is one of them, at once cleared the air with a pronouncement which, while remaining respectful, pointed out that claims to Cyprus, made in the present state of European affairs, "can only harm Greece's international position." There are plenty of Philhellenes in Great Britain. Many of them are in a position to put the facts across to friends and relations in Athens. King Paul can with good reason be told, either via Whitehall or from Balmoral, that to accept British help with one hand while disposing of a British colony with the other is not the way to keep a throne. For Greeks without thrones to lose, and particularly for Cypriot Greeks, the facts are that tranquillity in Cyprus is in the interest of all those who want no change in political holds on the eastern Mediterranean—that is, of everyone except the Russians and their camp followers. Despite the superficial unity of Cypriot Left and Cypriot Right against Great Britain, their fundamental aims are as different as are those of Markos and King Paul or, indeed, of any other left and right in Europe. Therefore to offer an unpractised island anything more than the considerable first step in representative government that was offered by the British in May is, at a blow, to jeopardise Mediterranean security and to expose an inexperienced people to all the ills that Greece and Trieste and other disputed areas are enduring already.

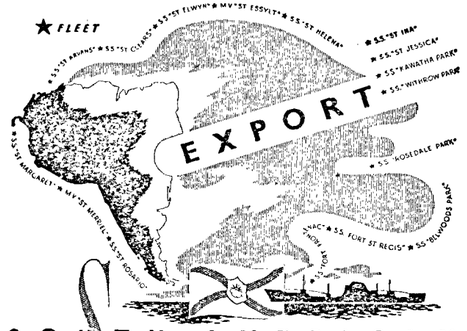
New Vistas in Greenland



[FROM OUR COPENHAGEN CORRESPONDENT]

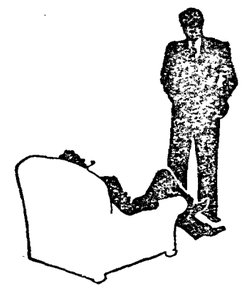
GREENLAND, the biggest island in the world, has for centuries been governed through a state monopoly. No one—except for a few explorers—was permitted to enter the country without being a functionary of the state. All trade went in Danish ships via the Danish monopoly in Copenhagen, the Board of Greenland (*Grönlands Styrelse*). All food had to be bought through the monopoly. Probably no other part of the world has for so long a time been under so strict a rule as Greenland. This policy was introduced centuries ago to protect the few thousand Eskimos (now numbering 18,100 against 400 Danes) from annihilation, and it is without doubt due to this policy that the Eskimos in Greenland are not demoralised and are, in fact, a very vigorous and healthy race. From a moral point of view the monopoly's authoritarian rule has been well founded. But for decades the monopoly with its complete isolation of the country has been strongly criticised. Greenland is a rich country. The critics warned that this wealthy area could not in the long run be kept as a closed land, especially when modern means of communication made access more easy.

The war gave great weight to this argument. When Denmark was invaded by the Germans in April, 1940, every link was immediately cut between the motherland and the colony. The Danish Ambassador in Washington, Mr Henrik Kaufmann, signed an agreement with the American Secretary of State, Mr Cordell Hull, according to which the United States took Greenland under its protection in return for the right to establish bases there as long as "the present danger" existed. The war then meant two things for Greenland: thousands of American soldiers came to the country—and it was proved that such an influx of foreigners could take place without harm to the native population. Secondly the Greenlanders realised that it was not at all necessary to ask Copenhagen for permission each time they wanted to enlarge a harbour or build a new house.



When the war was over there were two important questions for the Greenlanders to settle. One was to get rid of the Americans—and that was of equal importance to the Government in Copenhagen—the other was to get a new status for Greenland inside the Danish state.

It has from time to time been reported—and Greenland is not a country from which news comes every day—that there existed



a "to America" movement. There have also been reports of Nazi and Communist movements amongst the natives. These movements have all proved to be very short-lived, headed by young Hotspurs without any backing from the population, which, it now clearly appears, does not want any break with Denmark. But the natives wanted emancipation and a centralised administration with more responsibility for Greenland itself. A few months after the war the Council of Native Eskimos (*Landraadet*) met in their biggest settlement, Godthaab, and passed a number of resolutions, demanding amongst other things this centralisation. A delegation went to Copenhagen, but clever politicians and the Board of Greenland managed to get a compromise accepted by the delegation—a compromise disappointing both to the Eskimos and to those Danes who had been working in Greenland during the war.

A five years' plan, however, was laid down for speeding up reconstruction in Greenland, for building schools, hospitals and cultural institutions, and for carrying out research into new ways of utilising the richness of Greenland. Three months ago the first report about the achievements of this five years' plan was published. It shows that the progress of the reform has been much quicker than anticipated. Denmark has spent money lavishly. In the last year before the war only £40,000 were spent on construction work. This year the budget shows that £450,000 will be used, and the yearly volume of consumers' goods sent from Denmark has doubled since 1939.

Of prime importance is the change of mind that has taken place in Danish political circles and amongst the civil servants governing Greenland. Whether it is the astonishing prospects which the five years' plan has opened up, or the fact that Greenland has suddenly moved from the arctic background to the front of the world stage, that has produced the change is uncertain. But the fact is that the Government—with the full backing of all political parties—has set its hand to nothing less than a revolution in the relations between Denmark and the only Danish colony.

At the end of July the Prime Minister together with the chairman of the Parliamentary Greenland Committee and an audacious female member of this Committee made the long journey to Greenland to start negotiations with the Council of Native Eskimos. Before leaving Denmark the Prime Minister told the public that he would discuss with the Greenlanders the opening of the country to private initiative and also offer them two seats in Parliament. In Godthaab, on August 4th, the Prime Minister met the Council and the result of the negotiations was so promising that a spokesman of the Council declared that August 4, 1948, would live forever in Greenland's history as the "day of liberation." Mr Hedtoft had in mind when he left to suggest that there should be created either a purely Greenlandic co-operative society or a state-controlled Danish-Greenlandic Company in which the state owned 50 per cent and private Danish capital 50 per cent. Nobody wanted to lift state control so suddenly, least of all the Greenlanders. They know themselves that they are still not ready for that. For the same reason they also thankfully refused the offer of having two men elected for Parliament. They prefer to be represented by the Parliamentary Greenland Committee.

As a result of the Prime Minister's visit to Greenland—where he has everywhere been received as a "liberator"—a working party will now be set up so that Parliament will be able in the coming session to pass the bills which are going to change Greenland from being a sanctuary or "kindergarden," as the Greenlanders themselves called it, to a modern community.

There still remains the question of the Americans in Greenland. As early as 1946, when the United States had not yet given any signs of its intention to leave Greenland, the Danish Government asked in Washington that negotiations be opened concerning the annulment of the agreement. These negotiations have gone on ever since but without results; and even this summer Congress passed appropriations for enlarging the bases, of which America has six on the west coast with a total garrison of somewhere between 1,700 and 2,200 troops. It is also reported that the Americans intend to send troops to the east coast, near Angmagssalik. It is true that Denmark at the end of the war was not able to take over the meteorological stations which have proved so vital for the Atlantic shipping and the air traffic. But 23 stations which were established by the Americans are now fully taken over by Danish crews who have been trained by the Americans and are now operating under their supervision.

This meteorological service will place a heavy financial burden on Denmark's shoulders. Yet there is little inclination to heed the voices which suggest that Denmark should sell Greenland to the United States. If the costs are too heavy, Denmark would prefer Uno to share the burden. It is after all a service performed for the benefit of all the nations of the world.

AMERICAN SURVEY

National Health Programmes

(From Our US Editorial Staff)

"THE question of how a social idea, such as a national health plan, may work when transformed into a social institution can never be settled by conflicting theoretical charts. Such charts have certain of the touches and devices used by the ancient cartographers. There are areas of unknowns; by some they may be drawn in dark and forbidding colours, inhabited by monsters; by others they would be pictured in attractive pastel shades." This comment by Dr Nathan Sinai, in the introduction to his analysis of the Emergency Maternity and Infant Care programme carried on during the war, might have gone further. In the current conflict of views on how better health and more widely diffused medical facilities may best be obtained by the people of the United States, there is evidence that the cartographers of one view have on occasion sketched in monsters over the pastels of the cartographers of other views, with the surreptitious malice of the people who add moustaches to the figures in advertisements on the Underground.

But at the moment a number of map makers are including actual exploration in their activities. There is no doubt that a national health programme is slowly accumulating, with the massive, glacier-like motion by which all major pieces of legislation take form. Mr Truman, in his attack on the Eightieth Congress, will doubtless continue to refer to such a measure as part of the unfinished business which the Republican majority has allowed to be deferred. The variance in view between the two parties was given precision in the two Bills introduced in the 1945-1946 session. The Wagner-Murray-Dingell Bill, sponsored by the Administration, called for coverage of all employed or self-employed persons, and their dependants, by a system of compulsory insurance whose benefits would include doctors' care, hospitilization up to 60 days, some dentistry and home nursing. The US Surgeon-General would administer the plan under the Federal Security Administrator. The Bill would allow doctors to take part or not, as they saw fit, and to be paid in a variety of ways, by salary, fee, or on a *per capita* basis. Patients could choose among participating doctors.

The Republican alternative, introduced by Senators Taft, Smith and Ball, would extend services, not by compulsory insurance, but by increased federal aid to the states, so that they could provide medical care for those unable to pay, or able to pay only in part. The states could also make payments to physicians to induce them to take up practice in low-income areas. The programme would be handled by an independent National Health Agency, whose head would be a doctor of medicine.

Supporters of these different measures are more or less in accord about the deficiencies they are designed to meet. American health has made enormous gains since the turn of the century, in public sanitation, in reduction of communicable diseases, in decline in maternal and infant mortality, in increase in public practice of preventive medicine, with the result that life expectancy in the United States is now about 65 years. But the extent of medical service, and the incidence of disease and death, vary widely from area to area—from remote farm or forest county to densely populated city, from income group to income group within the various areas, from race to race. Moreover, while progress in reducing the incidence of certain diseases has been great, other disorders have been on the increase, and still others have not been declining to the extent that would be possible if available knowledge were more widely distributed and used. In an ageing population, chronic diseases are bound to be more numerous: 28 per cent of Americans are now over 45 as against 18 per cent in 1906. Of the 1,402,000 deaths occurring in 1945, 1,014,000 were from chronic disease —424,000 of these from heart disease. Statistics like these stimulate the relatively new science of gerontology. Figures on mental health give as much cause for thought: over half the patients in hospitals on a given day—some 600,000—are mental patients. The number of physically or mentally unfit in the country can be estimated from the rejection of some 5,000,000 men examined under Selective Service during the war. The yearly loss of work-time because of bad health, with its contingent losses in income and production, is estimated at 4,300,000 man-years.

Three main areas of action seem to be indicated, in all of which there are proposals for legislation to provide government funds and some measure of government administrative responsibility. The need for fundamental research to push forward the frontiers of science was stressed in the report of a Presidential Committee at the end of the war, and medical research is included in the pending Bills for a National Science Foundation as well as the Bills concerned primarily with health. The need for medical manpower and facilities was recognised in respect of hospitals in the Hospital Survey and Construction Act of 1946, which provides aid to states for new construction on the basis of $1 for every $2 found by the states. The present bottleneck in the production of medical manpower, with each of the country's bulging medical schools turning away hundreds of applicants while the demand for doctors is acute, cannot be broken overnight. The Association of American Medical Colleges and the Council on Medical Education and Hospitals of the American Medical Association are making surveys to determine how the quantity of such education can be expanded without deterioration of quality. Stress is also being laid on the integration of facilities so that a chain of relationships from rural clinics to community and district hospitals to medical centres may permit the widest use of existing apparatus and specialized skills.

The third need is for adequate individual purchasing power for medical service. At the high income levels of the postwar period, the percentage of families in various income brackets was as follows in 1946:

Gross Cash Income	Percentage of Families
$1,000 or less	12·8
$1,000 to $2,000	15·4
$2,000 to $3,000	19·5
$3,000 to $5,000	31·4
Over $5,000	20·9

Probably about 70 million people—half of the US population —belonged to families whose income was under $3,000. The difficulty—the impossibility in many cases—of meeting the cost of medical care at this income level has led to a number of private co-operative efforts to meet expenses, as well as to proposals for government aid.

On July 1, 1947, 20 per cent of the US population was enrolled in Blue Cross Hospitalization plans, which provide service benefits for limited periods in semi-private accommodation in their 3,800 member hospitals. Hospitalization insurance has spread very rapidly in recent years; so have co-operative plans for more general medical care undertaken by labour, farm and industrial groups. Mr John L. Lewis's health and welfare fund for the miners has attained rather more than its share of publicity; many other trade unions have long provided medical services for their members, and many industries have regarded group health insurance as a sound investment from a business standpoint. During the war when collective bargaining was largely confined to "fringe" issues, joint contributory plans were particularly frequent as an item of agenda. All three major farm organizations have active programmes in effect among their members.

Coverage on a community rather than on an occupational basis has in the last years been increasingly offered through county medical societies. The American Medical Association's attitude toward compulsory insurance under state auspices has been markedly similar to that of its British counterpart forty years ago. But the extent to which the medical cartographers are beginning to supplement their theory with actual exploration of the area of health insurance is shown by the AMA's publication, on August 20th, of a "Report on the Study of Consumer-Managed Prepayment Health Plans." It contains summaries of 69 plans, from all parts of the country and types of area, analyzed in great detail. Preceding this analysis is a series of suggested preliminary standards for consumer-managed voluntary prepayment medical care plans, offered by the AMA's Council on Medical Service.

The plans thus summarized are private plans. Almost simultaneously a government insurance proposal was released, a report to the President by Mr Oscar R. Ewing, Federal Security Administrator, on "The Nation's Health." This ten-year programme is prepared in the ostentatiously written-down style which government administrators fondly imagine will be persuasive to a wide audience, with frequent use of the word "We" meaning the public—*l'état, c'est nous*. (This is an election year, and Mr Ewing is an ardent Democrat.) Nevertheless, it contains very considerable substantiation of the needs noted above, and a series of recommendations for meeting them, including a plan for compulsory insurance. In this plan, some of the same moderation is noticeable as in the AMA report. A "tooling-up" period of three years is advised before insurance should be put into effect, and there is realistic recognition that new medical facilities can be offered only as the present supply is expanded and located in the places where it is needed.

The third recent publication on the subject, and one which takes an enhanced interest from the fact that its chief author is Governor Warren's adviser on health matters, is "EMIC — a Study of Administrative Experience," published by the Bureau of Public Health Economics of the University of Michigan and written by Dr Nathan Sinai and Dr Otis Anderson. EMIC —emergency maternal and infant care—was a war programme that at its peak delivered one out of every seven babies born in the United States. The attitude toward public medical care for service men has always been a thing apart: the medical care offered by the Veterans Administration has been accepted by the country and the medical profession with little or no theoretical sorrow. The VA runs 126 hospitals and 71 regional offices, 12 infirmaries and domiciliary institutions; in 1947 it spent $393,036,497, for 533,000 admissions to hospitals and 5,260,000 out-patients' medical and dental treatments; 65 per cent of the men were hospitalized for ailments unconnected with their military service. EMIC was half-way between a service and a civilian operation; it was run by the Children's Bureau through the Public Health Services of the states. Dr Sinai has used its experience most ably as a laboratory for the administrative problems of a public health programme of larger scope: problems of payment, quality, service, means tests, administrative controls.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

American Notes

The Unsolid South

Mr Elmo Roper, the most reliable of the "pollsters," has decided that the outcome of the Presidential election is so obvious that there is no longer any interest in reporting on the campaign. Paradoxically, in the South, where this is customarily true, the campaign this year is exceptionally exciting. The traditional certainty has vanished with the traditional solidity; there are three Presidential contestants for the Democratic vote and, in consequence, the Republicans have high hopes of winning in some of the Southern States for the first time in twenty years. In 1928 they owed their success to Southern revulsion against the Catholicism of the Democratic candidate, Mr Al Smith. This year any success they may have will similarly be due to the insistence of the official Democratic candidate that civil rights for negroes must be enforced by federal authority, an equally heretical belief in the South. But Mr Dewey is as unorthodox in this matter as is Mr Truman, and not many Southerners will be sufficiently blinded by their indignation to vote Republican. However, in some states such as Kentucky, West Virginia and Oklahoma, which are border states both geographically and politically, there may be enough Democrats who are either blind or unwilling to go to the polls, to ensure a Republican victory in the Congressional elections and therefore a Republican majority in the Senate.

In the true South, Democrats will be able to express their sense of outrage by voting for the Dixiecrats—the undignified but adhesive name given to the rebellious States Rights' Democrats by a reporter searching for a word to fit a headline. It looks as if Governor Thurmond, the Dixiecrat candidate, will be on the ballot in all of the five Southern States which the Republicans carried in 1928—Virginia, Tennessee, North Carolina, Florida and Texas—and all of which the Republicans can carry again if the Democratic vote is equally divided between Mr Truman and Mr Thurmond. In Virginia, North Carolina and Kentucky, the Dixiecrats have already succeeded in getting the names of Presidential electors pledged to Mr Thurmond on to the voting paper alongside those pledged to Mr Truman. In Texas, which, with its 23 votes in the electoral college, is the most important and the most independent of the Southern States, the official Democratic electors may be pledged to the Dixiecrats, who will otherwise try to put their own list on the ballot. In Florida half, in Tennessee one quarter, and in Alabama, Mississippi, South Carolina and Louisiana all, the Democratic electors are committed to Mr Thurmond. In Georgia the electors are unpledged and the State's Democratic leaders, although favourably inclined to the Dixiecrats, will probably not commit themselves until there is no danger of choosing wrongly.

All this adds up to 45 of the 266 votes in the electoral college which are needed for victory, with the Dixiecrats at least on the ballot in at least four more States. Mr Truman obviously cannot afford to let this threat go unchallenged. The Democratic National Committee is expected to take court action in an attempt to get his name on to the ballot in those States where Mr Thurmond has been chosen as the official Democratic candidate, so that the people of those States shall not be deprived of their chance of voting for Mr Truman. The Committee also is trying to frighten the Dixiecrats into instructing their pledged electors to vote for Mr Truman after all, by stigmatising them as "bolters," a stigma which in the South is almost irrevocable, and by promising official party status to any organisation supporting Mr Truman that is set up in the States where the Dixiecrats have captured the official State Committees. It does not look as if the Dixiecrats will be able to achieve their aim of having the best of both worlds, of defeating Mr Truman without losing their standing in the Democratic party.

* * *

Civil Rights Come Home to Roost

In view of the increased attention which the Democrats are giving to the Dixiecrat threat, it seems permissible to doubt whether Mr Truman has in fact cancelled his tour of the South because it is unnecessary, as is officially stated. It may be that he feels it would be unnecessarily hazardous, since he could not hope to escape direct tests on civil rights, which he could not pass to the satisfaction of both Northern and Southern Democrats. Mr Wallace will be on the ballot in some (it is not yet known how many) Southern States, but it was to win votes in the North that he dramatised the question of racial segregation when he opened his campaign in the South, where he can hardly have expected that campaign to gain him much support. Northern interference is always resented in the South, and the heckler, who cried "I don't want to go to no school at all," represented the attitude of many of those Southerners whom Mr Wallace is so anxious to rescue from their present ignorance and poverty. Even Southern negroes do not want to estrange themselves permanently from the Democratic party by supporting him; the more far-sighted of them must realise that their hope for the future lies not in Mr Wallace, but in the possibility that the Dixiecrat revolt, if it survives the present election, may lead at last to a genuine two-party system in the South, by giving independence to the liberal Democrats who have already done much to improve the position of the negro.

These liberals have recently shown their strength by the blow they have dealt to the Crump machine in Tennessee, but the Democratic primary election in Georgia has dealt them an even more severe blow. This election has justified the fear that Mr Truman's civil rights programme and Mr Wallace's championship of the negro would do more harm than good, and has given a new seriousness to the Southern revolt. As he left the South, Mr Wallace jovially promised that all the eggs thrown at him would be paid back with interest by his special breed of prolific hens. But far more sinister chickens, also bred by him, were already coming home to roost in Georgia, wearing the robes of the Ku Klux Klan and bringing fiery crosses to the hillsides and coffins to the doorsteps of negro voters.

Georgia is one of the Southern States where the poll tax has been abolished and negro voters are registered there in unprecedented numbers. But the State's progress towards liberalism has been arrested by the choice of the reactionary Mr Herman Talmadge as Democratic, and therefore as successful, candidate for the Governorship. If Mr Talmadge follows the precedent set by his notorious father, and by himself when he attempted to seize the Governorship by force two years ago, the set-back to liberalism in Georgia will last far longer than the two-year term of the present election. The most unusual feature of this election was that Mr Talmadge won by a clear popular majority; Georgia votes on a county unit system, which, besides being easily and habitually corrupt, favours rural districts at the expense of urban ones and enables candidates to be chosen on a minority vote. Mr Talmadge fought on the straight issue of white supremacy and evidently won the support of townspeople as well as of the backwoodsmen who had always followed his father. His successful appeal was to the fears of those poor whites, whom Mr Wallace wants to educate and enrich, but who are far more concerned with maintaining the racial superiority which gives them their only advantage over the negroes who surround them.

* * *

Bank Reserves and Business

The Federal Reserve Board last week resumed its efforts to provide curbs against credit expansion, within the limits permitted by the unwillingness to allow long-term 2½ per cent issues of the Government to fall below par. Under the authority given by Congress in the special session, reserve requirements for member banks in the Reserve system have been raised both for time and demand deposits on a scale which is estimated to immobilise almost $2 billion of bank cash in reserve balances. On September 1st, these banks held reserves of more than $900 million in excess of their legal requirements, and the sale of no more than $1 billion or so of government bonds can thus restore their earlier capacity to make new loans or advances.

Clearly, this move by the Reserve Board is no more than a temporary check. None the less, it came as a surprise to many banking houses, since it followed quickly on the adjustment of the short-term rate from 1⅛ to 1¼ per cent, and announcement of the new curbs for instalment credit which come into force next week. With government advisers now taking a more cautious line on price prospects (Dr Nourse, chairman of the Council of Economic Advisers, said recently that the present "creeping advances" were "mildly reassuring"), no fresh curb on credit had been looked for before next month at the earliest.

On the surface, at least, inflationary forces do seem to be losing some of their earlier force. Falling farm prices have now brought the Bureau of Labour index of wholesale commodity prices (1926 = 100) down by almost 2 points from the 1948 peak to 167.4; the sensitive Moody index of daily commodity prices has now sagged for some weeks and is midway between the high and low points of 1948 at about 420 (1931 = 100), while the Dow Jones futures index is thirty points below the 1948 peak at 140, and near the low point for the year.

There are, in fact, many indicators to suggest that the most feverish phase of the postwar boom is over. The fall in farm and food prices follows not from any collapse in speculative excesses, but from a fundamental correction in the supply deficiencies which have plagued the United States—and the world at large—for the past three years. In the long run, though not for some time, that influence could far outweigh other components in the consumers' price index, and thus deflate the power of organised labour to enforce yet another general round of wage advances.

The Truman Administration, however, which raised such a clamour for anti-inflationary controls at the special session, can hardly afford to be caught napping—as it was in May, when, at the insistence of the Treasury, the money market was given the green light precisely at a time when inflationary forces were once again dominant following the commodity weakness in February and March. Even this modest measure of control, coupled with seasonal tax collections, can exert a mild pressure for some weeks ahead. And with bank loans still rising, and many business equipment programmes still incomplete, it would be foolish to neglect any action which may serve as a stabilising influence while the postwar boom is working towards an inevitable correction.

* * *

Wanted: A Policy for Surpluses

This year's cotton crop, now estimated at 15.2 million bales, presents the Administration with a difficult decision. The aim of agricultural policy in the thirties was to raise farm prices by cutting down production; that was the time when every third row of cotton was ploughed under and there took place the famous massacre of baby pigs. In this year of meat shortage the baby

pigs are more precious than jewels; they represent the earliest hope of lower meat prices. But the cotton crop, the largest since 1937, promises, in the face of declining domestic demand and dollar poverty abroad, a carry-over of 6,000,000 bales, twice that of last year, some 4,000,000 of which are likely to go under government loan.

Crop restrictions were lifted in 1943 and 1944 when it became clear that American and world demand could absorb everything the farmer could produce. Has the time now come, in cotton, at least, for a return to restriction? The Agricultural Adjustment Act prescribes a farmers' referendum on acreage limitations and marketing quotas when supply exceeds "normal demand" by 7 per cent. The Department of Agriculture, now making its estimates, must decide by November 15th whether this surplus exists in cotton. The growers themselves are strongly opposed to any revival of restrictions and are said to be capable of rallying the one-third vote needed to defeat the proposal. It is small wonder. Under the new law passed in June, next year is the last of support prices at 90 per cent of parity for a commodity so manifestly superabundant as cotton. The cotton farmers naturally wish to make the best of the last of the fat years by increasing, rather than reducing, their sowings. Even acreage restrictions, without compulsory marketing quotas, are likely to be ineffective; concentration on better land and more scientific farming, aided by good weather, have raised yields from 185 bales per acre in 1935 to an estimated 313 this year.

In their platform the Democrats promised other New Deal remedies for dealing with farm surpluses: adequate financing for the school-lunch programme and their use in improving low-income diets through the food-stamp plan. But at today's high prices for farm products, both prevention and cure of surpluses will be much more expensive than they were in the thirties.

The relation of farm prices to the cost of living is certain to be a central issue in the campaign; but it is confused by the natural desire of both parties to woo both farmer and housewife. Thus though Mr Stassen made a manful endeavour to shift the responsibility for high prices from Congress to the Administration, he did not dare to attack the farm price support programme. And the Administration, which a month ago was attacking Congress for postponing downward revision of price support levels, now professes to detect a "sinister plot" to destroy farm supports and has rushed to their defence. Governor Dewey has yet to enter the arena, but he is believed to favour early readjustments which would be reflected in lower living costs. Any sign of a return to an artificial "economy of scarcity" at this time on the part of the Administration would no doubt be used to bolster up the Republican case that the Democrats are deliberately engineering high prices.

* * *

Unions on the Party Line

While the Committee on Un-American Activities pursues its inquiry into atom-bomb spies, and the ten indicted Communist leaders tour the United States to raise money for their defence, a sub-committee of the Labour Committee of the House of Representatives has turned the red spotlight on Communists in trade unions. It summoned for questioning Mr Fitzgerald, president of the United Electrical Workers, the largest of the unions reported to be Communist-dominated; and Mr James Carey, recently deposed Right-wing president of the UEW, national treasurer of the Congress of Industrial Organisations, and leader of the anti-Communist fight in the World Federation of Trade Unions. Mr Fitzgerald was, not unexpectedly, blandly and comprehensively ignorant of Communist tendencies in his union, but Mr Carey, though he appeared under protest, gave his investigators more than they asked by testifying, not only that the Electrical Workers acted as a Communist front on many issues, but that some managements actually dismissed anti-Communist workers in an attempt to appease the union leadership.

The limelight was more welcome to the sub-committee than to Mr Carey; for his testimony brought him a vote of censure from the union's convention, and his effort to persuade the convention to follow the national executive of the CIO in endorsing Mr Truman was overwhelmingly defeated. It is nowhere contended, however, that the union's membership, as distinct from its leadership, is Communist. Although most of the union's officers are working for the election of Mr Wallace, the convention refrained from officially endorsing his candidacy, frankly recognising that it would split the membership. The Transport Workers Union, where a fierce struggle for control is going on between Left and Right, has also repudiated Mr Truman but failed to endorse Mr Wallace. This means that Mr Wallace will have the official support of none of the large CIO or American Federation of Labour unions, though a number of smaller Left-wing CIO internationals support him.

The House Labour Committee comes late to the scene of Labour's own efforts to clean house. With every encouragement from the national organisation, a vigorous purge has been going on, with notable success in the Automobile Workers and the National Maritime Union. In this battle, even union critics of the Taft-Hartley Act admit that its requirement of anti-Communist affidavits has been useful. Unions whose officers are afraid, for reasons of perjury, to take the oath, may not take part in elections held by the National Labour Relations Board; they have lost valuable contracts to rival unions; and have not been able to put the grievances of their members before the Board. The result has been substantial secession from unions still on the party line to those like the Automobile Workers, who have shaken themselves free of it.

* * *

Defence Responsibilities

The Secretary of Defense, Mr Forrestal, has once again disentangled the lines of responsibility for the three Armed Services. They were supposed to have been straightened out last March at his Key West conference with the Joint Chiefs of Staff, but the different interpretations put upon the decisions then reached made it clear that, whatever was accomplished in theory, in practice the confusion was soon as bad as ever. This time Mr Forrestal has warned top-ranking officers of all three Services that the decisions must be "followed through with the aggressive intent to build, and not to mar, mutual confidence." Regular conferences, and co-operation on such matters as research, procurement and intelligence, are said to be lessening the bad feeling among the Service commanders and perhaps this improvement may in time sweeten the rivalries at lower levels.

The controversy centres on the strategic application of air power, discussed by General Spaatz in his first (and last, since he has retired) annual report on the Air Force as a separate Service. The Navy has been challenging the right of the Air Force to deliver the knock-out blows—the atom bombs—on the enemy's vital centres. The challenge became armour-plated when Congress approved Naval plans for a 65,000-ton aircraft carrier, designed for strategic bombing and regarded by the other Services as a white elephant. The official solution, reached at the recent conference at Newport, is to give the Air Force undivided authority in this "great new area" of warfare, while the Navy has undisputed power over anti-submarine defences. However, each is required to mobilise for its primary mission the maximum resources available from the other Services: the Navy can borrow Air Force planes to track down submarines and the Air Force can apparently launch its strategic bombing attacks from the Navy's aircraft carriers.

*

Apart from its white elephant, the Navy has in fact been concentrating on its allotted task, spurred on by the Secretary of the Navy's statement that there is a nation (presumed to be Russia) which has to his certain knowledge more than 250 submarines. The Navy has put one of its only two active battle ships into reserve, in order to have enough men to recommission an aircraft carrier and eight more destroyers for use against submarines. The emphasis in its current construction programme is on aircraft carriers, submarine chasers and submarines. The Navy and the Air Force between them have announced orders for 3,366 planes, costing $2 billion. The orders are being spread by means of subcontracts among a substantial number of firms in order to give them experience. The National Security Resources Board is also planning to show key industries what will be expected of them in the event of war. It is going to send "ghost orders," to be carried out on paper only, to manufacturers of machine tools and other vital equipment, in order to find out where difficulties are likely to develop.

Armament orders, according to some reports, have not so far been as large as was expected when the rearmament programme was introduced last spring. But they are to show a steady increase from now on. New Service orders to a value of $6 billion are to be placed during the current fiscal year, a rise of 250 per cent over last year. So far they have not caused any serious difficulty in the supply of materials and parts, and it is not expected that compulsory powers will be needed. The voluntary plan for the allocation of steel products to manufacturers holding defence contracts has at last been approved and provides for 1,230,000 tons of steel to be divided among such manufacturers during the year, whether or not they already have adequate amounts of steel on hand.

THE BUSINESS WORLD

European Payments Scheme

THE immense task of allocating direct Marshall Aid from the United States and mutual aid between the ERP countries was completed by the Council of the Organisation for European Economic Co-operation at its meeting in Paris last Saturday. Even then, after the long bargaining that had been proceeding in committees, approval was not unanimous, for Greece and Turkey both had reservations to make about their shares. The picture presented by the agreed allocations of direct and indirect aid, can best be shown, as in the following table, by combining the two and indicating what each recipient will have after his receipts of direct aid have been increased or diminished by intra-European mutual aid.

DIRECT AID AND EUROPEAN CONTRIBUTIONS
(In Million Dollars)

	Direct Dollar Aid	Intra-European Contributions(−) or Receipts(+)	Net Aid
United Kingdom	1,263	−282	931
France	989	+323·3	1,312·3
Italy	601	− 20·3	580·7
Netherlands	496	+ 71·7	567·7
Bizone	414	− 10·2	403·8
Belgium-Luxemburg	250	−207·5	42·5
Austria	217	+ 63·5	280·5
Greece	146	+ 66·8	212·8
Denmark	110	+ 6·8	116·8
French Zone	100	+ 0·8	100·8
Norway	84	+ 31·8	115·8
Eire	79	...	79
Turkey	50	− 19·7	30·3
Sweden	47	− 25	22
Trieste	18	...	18
Iceland	11	...	11
TOTAL	4,875	...	4,875

Note.—Contributions and receipts shown in column 2 are dollar equivalents of local currency surpluses and deficits.

To complete the picture, it should be added that Britain's net contribution of $282 million to other European countries will be supplemented to the extent of a further $218 million by unrequited exports to European countries to be financed by allowing those countries to draw on their sterling balances. It follows therefore, that according to present calculations, Britain—with the assistance, of course, of the sterling area—will be making unrequited exports to Europe equivalent to about $500 million in the twelve months to June 30th next and will thus be passing on to Europe nearly 40 per cent of its direct aid from the United States.

The means chosen to link direct Marshall Aid with the intra-European mutual aid scheme were described in last week's issue of *The Economist*; the details which have since emerged do not affect the basic criticism to which the payments scheme was there subjected. It should, however, be pointed out that the conditional dollar grants that will be made to countries which are net contributors in the intra-European payments scheme, will not apply to unrequited exports which are financed by drawing upon existing currency balances. In this way the legal risk of an infringement of the Economic Co-operation Agreements which would have occurred if a direct link could have been established between the grant of Marshall Aid and the repayment of external debt of a recipient country, has been carefully avoided.

The figures given in the table above speak for themselves. They show the real order of precedence among the recipients of aid and they indicate, more clearly than any dialectics could achieve, which countries of Europe are pulling their weight and making the fullest contributions to the cause of European co-operation and recovery.

Last Saturday's meeting of the Council of OEEC left two points on the agenda unsettled. The first was the mechanism of the intra-European payments scheme, by which the contributions of the creditor countries and the drawing rights of the debtors are to be operated. The second concerned the principles of commercial policy which should be applied by the participating countries while the payments scheme is functioning.

The more important of these two items is the payments mechanism and on this some basic differences of opinion still persist. The main issue is whether the contributions and drawing rights agreed last Saturday—which are based on calculations of no less than 110 prospective bilateral balances of payment—are to be exercised in a purely bilateral sense, or are to be "multilateralised." To illustrate the point, the question is whether, say, France's agreed drawing rights of £50 million on the United Kingdom must be used solely to meet its deficit in the sterling area or whether they can be used to pay a third country which is prepared to accept sterling in return for its exports to France.

The British negotiators have throughout insisted on strict bilateralism in the use of these drawing rights. Certain other European nations, with encouragement from the United States, have argued in favour of the elasticity, convenience, and efficiency of multilateralism. This second school of thought reasons as follows. Contributions and drawing rights are based on estimates which, with the best will in the world, can be regarded only as intelligent guesses. It is almost certain that the course of intra-European trade in the current year will not result in surpluses and deficits corresponding to the agreed contributions and drawing rights. It follows therefore that in many cases trade between the Sixteen will have to be forcibly contracted within the strait jacket of the agreed figures. In consequence, if the agreed contributions and drawing rights can be used only in a strictly bilateral manner, part of them will be left unutilised. To the extent that contributions may be unutilised, the conditional Marshall Aid grants, based on these contributions, will be cut down and Europe will thus be depriving itself of part of Marshall Aid, which even at the present figure of $4,875 million will be inadequate to cover its urgent needs. Therefore—so runs this argument—the real interests of Europe will be served by introducing the principle of transferability to the European payments scheme—in other words, by allowing drawing rights which cannot be exercised in the particular country for which they were intended, to be transferred elsewhere.

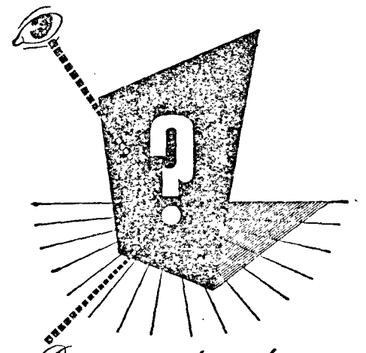
To all this highly plausible reasoning, the British representatives have put up adamant resistance. They still view the scene of international exchanges in terms of the convertibility crisis of 1947—and who shall blame them for that? The illustration already given provides a clear clue to the British attitude on this subject. If France should in fact be at liberty to transfer her sterling drawing rights to Belgium, the result would be to increase Belgium's holdings of sterling beyond the limit which that country has agreed to hold, and Belgium could be depended upon to take the surplus in gold. Britain is now working its international exchange arrangements (outside the transferable account system) on a bilateral pattern, tempered with "administrative transferability"—which broadly interpreted means that Britain will allow sterling to be transferred from one non-sterling to another non-sterling country only if it suits the circumstances of the moment and will ensure that no gold is lost as a result. In the British view, therefore, the contributions and drawing rights under the European payments scheme should fit into this bilateral pattern of payments. Transferability may be authorised where it does not endanger the "gold points" in Britain's payments arrangements with individual countries. It should be stressed in this context that all discussion on this new European payments scheme has proceeded on the express assumption that the new arrangements will not be allowed to supersede existing payments agreements between European countries.

Britain has signified its agreement to the mutual aid figures subject to a satisfactory payments scheme being evolved. If, therefore, the existing cleavage of views on the transferability of drawing rights is allowed to drift to a complete deadlock, and if the only retreat from this were to be a concession to the point of view of the multilateral school, the figures of British contributions to the various recipients in Europe would have to be reconsidered, and undoubtedly pruned to a point at which the menace of gold convertibility would lose any real force. This fact, allied to the magnitude and fairly wide dispersion of British contributions to other ERP countries, has brought a number of interested supporters for the British view. The opposition to that view is, as might be expected, led by Belgium, though, as might also be expected, the main philosophic inspiration behind the multilateral school of thought comes from Washington.

On the assumption that the scheme of European payments is evolved on terms which prove satisfactory to Britain and which therefore will allow the proposed figures of British contributions to stand, a new and quite weighty factor will have been introduced into the balance of payments position. There is a tendency in official quarters to regard with equanimity the prospective $500 million (or £125 million) of total assistance to Europe from the sterling area as a whole, to treat it as if it involves no threat to Britain's ability to maintain exports to hard currency areas, and as if Britain itself will not ultimately have to seek a reckoning with the sterling area. This complacency denotes either that the figure of the promised commitments to Europe is not taken very seriously (a supposition which can surely be dismissed) or that an extremely hopeful view is taken of the course of production and British exports in the months ahead. The achievements to date in the expansion of industrial production and exports, and particularly the developments of the last few months, do not justify unquestioning confidence in this optimism.

On the basis of the balance of payments forecast for the first half of 1948 in the "Economic Survey," the running down of sterling balances and other capital transactions reflecting unrequited exports should be running at an annual rate of about £170 million. It would be surprising if a figure as large as that indicated by the prospective unrequited exports to Europe had entered into these earlier calculations, even after making allowance for the fact that the prospective unrequited exports of £125 million to Europe for the twelve months will in part represent exports from the rest of the sterling area.

The two main impressions which, therefore, emerge from the British mutual aid contributions are, firstly, their magnitude and the substantial aid they represent to the European Recovery Programme, and, secondly, the effort of production and export which they will demand from Britain and the rest of the sterling area if their promise is to be fulfilled.



BUSINESS AND PLEASURE

Every now and then one of our customers will tell us that he regards a visit to the Bank as one of the more pleasant experiences of daily life. We appreciate the compliment. It has always been our concern to create at the Westminster Bank an atmosphere of friendly consideration, in which every customer may be able to feel that his affairs are as important to the Bank as they are to himself . . . If you would like to know more about the service of the Westminster, the Manager of any branch will be glad to assist you.

WESTMINSTER BANK LIMITED

Do you trade with

AUSTRALIA

As a market for British manufactures and as a source of food and raw materials, Australia plays an important part in Britain's economy. Whether your interest is in imports or exports, the services of the Commonwealth Bank of Australia can be of considerable assistance. With over 400 Branches in the Commonwealth and New Guinea, and guaranteed by the Australian Government, the Bank can provide the British trader with up-to-date, authoritative information on every aspect of Australian commerce.

COMMONWEALTH BANK OF AUSTRALIA

London Branch: 8, Old Jewry, E.C.2 *Also at Australia House, Strand, W.C.2*

Business Notes

Rearmament and Markets

It takes, apparently, even more than the serious announcement of rearmament by Mr Morrison to move security prices today. On Wednesday, there was the inevitable response in aircraft shares—they had been creeping up quietly during the slack holiday period—but public interest was evidently small. Yields of 6½ per cent on Bristol, 5½ per cent on De Havilland, and a little under 7 per cent for Hawker Siddeley leave perhaps a little to "go for", on the assumption of a large measure of rearmament for the air forces. But the buying which has so far occurred has been based on the expectation of sufficient Government orders to maintain the industry's business, rather than upon a tremendous expansion of plant and turnover. If control of contract prices were not enough, limitation of dividends would certainly rule out any expectation of increased returns on aircraft shares.

Perhaps the most curious feature of the first day of the new account was the confidence in the Funds. There were no inhibitions about buying the "undated" 2½ per cent stocks, despite the deterioration in international politics, and no attempt to discriminate between fixed interest and equity stocks. In this, the market evidently showed practical wisdom, for, with only a handful of exceptions, all securities today are either fixed interest or limited dividend issues. To argue about the damage caused by inflation to the one and the alleged benefit to the other is merely to shut one's eyes to the plain fact that, in the context of active rearmament, the demand for control of profits and dividends will become even more insistent. There is, indeed, no effective choice which investors can exert between the two classes, and Wednesday's dealings appeared to suggest that investors realised that fact.

This firmness does not reflect confidence so much as the pressure of uninvested funds. That is marked, too, in the gratifying response to new issues. The Imperial Chemical Industries issue has resulted in a "heavy oversubscription"; final figures for the response to the issue (of slightly more than 10 million shares at 40s. 6d.) are awaited, but it is clear that the terms attracted a satisfactory demand for excess shares, in addition to the exercise of rights. This week, too, the Agricultural Mortgage Corporation's debenture issue and the offer of Hackbridge Cable Holdings ordinary shares have been conspicuously successful. No doubt these successes can be interpreted, to some extent, as the counterpart of the payments for South American utilities, which amount in fact or in near prospect to perhaps £150 million or more. But they are significant of the investor's growing wish to get invested.

To complete the appearance of cheerfulness, there have been active dealings in bus shares—though not at the highest prices in the middle of the week, when speculative interest seemed to boil over—and in mining issues. Here the feature has been a positive outburst by New Pioneer, a share introduced to the London market only a few months ago, which in five days has jumped by 15s. to 48s. 9d. on the result of a borehole which the mining experts regard as being a promising portent for the future of the Far Western Rand. The promise may be there, but it must take a long time to translate into performance.

* * *

Disinflation Now?

To attempt, at this early stage, to measure the effect of rearmament on the British economy is a task full of hazards. To what extent is industry to be put on a near-war footing? Will the programme, at this stage, extend very far beyond the aircraft industry? How much slack can be taken up in the Ordnance and Ministry of Supply factories? What is the size of the extra demand for manpower for armament work? Where will it be found—at the expense of production for the home market, or for exports, or for existing Government work? What are the likely reactions of the new programme on the general pattern of Government finance?

A recital of questions such as these at least illustrates the scope of the problem. It is true, as the Chancellor of the Exchequer claimed last week, that the nation's manpower is being used to the limit, the extra labour required for re-armament can come only from existing uses, or be met by an increase in productivity —for which, indeed, there is plenty of room. No estimates of manpower engaged on work for the Supply Departments have been published since March, 1947. At that date, the total number of employees of insurable age was 6,650,000; of these 429,000 were estimated to be engaged on work for the Supply Departments, 4,777,000 on orders for the home market, and 1,440,000 on export orders. (These estimates, of course, are subject to a fairly marked degree of error since they are based on voluntary returns from industry which has obvious difficulty in allocating particular workmen to particular orders.) In June this year total employees were 6,921,000, of which 4,938,000 were engaged on work for Supply Departments and home orders (the total not being sub-divided) and 1,983,000 on export orders. Thus the increase in numbers employed between March, 1947, and June, 1948, was 271,000; defence and home orders absorbed (jointly) 268,000 fewer, and export business 543,000 more. Without question, the numbers employed on home orders alone must have expanded during the period, so that the fall in work on defence orders can be put at 300,000 at the very least. On these calculations (and given all the defects from which the figures suffer) it may well be that employment on work for the Supply Departments is little more than 100,000. An expansion of 50 per cent in the total would be small in terms of absolute size, but that alone would be equivalent to an extra labour cost on the Budget of perhaps £25 million in the full year, and conceivably double that sum when the cost of materials is added in. And this crude estimate includes nothing for the additional cost of the forces themselves.

A transfer of labour, even on this scale, will obviously mean a serious burden to add to the pressure for exports to the hard currency areas and from unrequited exports to the European deficit countries under the new payments scheme. It opens up possibilities of further control of labour, particularly for home industries. It also prompts the question whether the Government will be prepared to relinquish any part of its own demands for labour, now used for civil and Civil Service purposes. For it is crystal clear that Britain cannot add to its present commitments a rearmament programme of even moderate size without risking economic apoplexy. That conclusion is fortified by a simple consideration of what an additional £50 million of expenditure in the Government sector would mean to the Chancellor's financial policy of disinflation. That policy, already weakened by concessions of various sorts, has been whittled down to the point where gross investment may well exceed gross savings—in other words, to the point of further, if modest, inflationary pressure. What shall be sacrificed to make room for defence? Are industrial capital projects to suffer a further lamentable postponement? Will the Government have the courage to go more slowly on housing and social services? Will it seek the easy—and dangerous—way out by drawing further on the dollar and gold reserves? Has it any room left for further taxation and cuts in consumption? The Chancellor will be hard put to it to find a satisfactory solution to these questions.

* * *

Financing the OEEC Grants

One of the subsidiary aspects of the European payments scheme (the main features of which are discussed in an article on page 466) which remain to be settled, is the method by which the European creditor countries will finance the grants they are to make in local currency to the debtor countries. Until the formal procedure has been defined and the whole plan approved by the ECA, it will be impossible to know the precise repercussions which the grants will have upon the domestic credit structures. Naturally, the effects will not be uniform in all countries concerned, but it is already possible to indicate in principle how they will be exerted on the banking system in Britain. Two cases must be distinguished. The dead-weight burden of the grants (or, for that matter, of the releases from European sterling balances) upon the economy will not be felt until the money is spent on goods or services which are taken out in the form of unrequited exports. Britain will bear only part of that dead-weight burden; to the extent that the money granted by Britain (or released from balances) is spent on unrequited exports from elsewhere in the sterling area, the immediate burden will be borne there. In the first case, the financing of the grant will involve a corresponding increase in the British Government's active borrowings through the money market and banking system, and is likely to be accompanied by a parallel expansion of deposits at the commercial banks. In the second case, any such repercussions upon the commercial banks are improbable, except momentarily.

This is only another way of saying that the grants (and releases) will cause an increase in domestic inflationary pressure only to the extent that Britain furnishes the goods—and does so without being obliged to curtail either the volume of exports (other than grant-financed exports) or the programme of capital formation. When funds are put at the disposal (e.g.) of the French Government the money will presumably be re-lent to the British Treasury until required; but as soon as it is paid to the British exporters to France it will increase the level of active bank deposits in Britain—unless the Government is simultaneously taking separate steps to neutralise the pressure by curtailing its own (or industry's) domestic outlays. If, however, the funds are paid to (e.g.) exporters in the British Dominions they will quickly reach the central monetary authorities of those countries and go to swell their accumulated sterling balances. As these are not customarily held in cash at the commercial banks but are lent to the British Treasury by purchases of tap or tender Treasury bills (or, in some cases, against Treasury deposit receipts), this portion of the financing will involve neither an increase in borrowings from the commercial banks nor an increase in active bank deposits.

Despite the official hopes, it is likely in both cases that the grants will involve some loss of dollar earning power, either because the unrequited exports comprise goods which would otherwise be sold for dollars, directly or indirectly, or because they have some dollar "content." To this extent the immediate burden of additional inflationary pressure will be less than the amount of the exports. But as soon as measures are taken to make good this new inroad into the central reserves, the full burden would at once be felt—and most of it would probably fall upon Britain, whatever the source of the original unrequited exports.

* * *

Recourse to Special Account?

These fundamental effects, it seems, must arise whatever the precise mechanics of the financing. The visible effects, notably those shown in the Exchequer return and the Bank return, will of course depend on the particular method adopted. One possibility which has been discussed but has not yet been decided is that the creditor countries might be permitted to finance the OEEC grants by release of funds from the Special Accounts which hold the segregated local currency counterpart of ECA dollar grants. In Britain, if the ECA authorities gave permission for the use of the reserved sterling for this purpose, such an arrangement would present no complications—nor would it alter the basic effects, outlined above, on the commercial banking system. In this matter, however, as in form of the ERP bilateral agreements, the ECA authorities will doubtless wish to maintain as great a degree of uniformity as is practicable in the arrangements with the European countries concerned. And British experience is no guide to what would be practicable or expedient elsewhere.

In Britain, thanks to Sir Stafford Cripps's prudent budgeting, with its prospect of a large and genuine surplus on current account, the broad objectives which the Americans had in mind when insisting upon the device of the Special Account were already assured—so far as anything can be assured in the present conditions of international tension and rising military outlays—without any specific safeguards required by ECA. Here, therefore, as *The Economist* has repeatedly pointed out, the mechanism of the Special Account—to the extent to which the Americans authorise its use for debt redemption—serves simply the purpose of duly recognising, in formal fashion, that the underlying disinflationary obligations upon Britain have been faithfully fulfilled. In some other countries, however, where these objectives are far from being assured, and where the legal and political limits upon Government borrowing through the domestic banking system are being closely approached, the Special Account mechanism is far from being the merely formal device which it looks in London; it may be, on the contrary, a powerful brake upon unsound Governmental finance. Evidently, the relationship of the Special Accounts to the system of OEEC grants is likely to be decided rather by reference to the complicated cases than to the simple case which Britain presents.

If, notwithstanding these difficulties, the use of the Special Account sterling were to be permitted for the financing of the OEEC grants, the effect would be to enable the British Government to make them without any increase in its total borrowings. The funds on the account would to that extent be used, not for the purpose of redeeming the special interest-free Treasury Notes which are the technical counterpart of the funds held at the Bank of England, but in payments to British or sterling area exporters, as explained above. In principle, since the payments would be made by drafts on the central bank, the immediate effect would be to increase the commercial banks' cash by the full amount of the resultant expansion in their deposits. Hence neutralisation devices would have to be at once employed by the Bank of England, following its ordinary day-to-day technique, to prevent a glut of credit in the money market; and the net effect would be seen in a transfer of Government securities to the money market and the banking system. On the other hand, if recourse to the Special Account is not permitted for this purpose, the effect on the commercial banking system will be just the same, but the additional securities it takes up will represent, not releases from the Bank of England's portfolio, but direct additions to the global total of outstanding Government debt. In that event, the national debt would be restored to its original level only as and when the ECA duly authorised the application of the Special Account monies for the purpose. It may be noted, too, that if the Americans were to insist upon their application for active purposes, such as additional capital projects, the effect would be not only to prevent the retirement of debt but to generate yet another source of inflationary pressure.

* * *

The Task in Coal

Holiday interruptions are now largely over, and the mining industry has 16 weeks in which to hit the 1948 target—200 million tons of deep-mined coal and 11 million tons of opencast. Can it be done? Not, it would seem, unless there is a substantial increase in deep-mined coal during the rest of the year. Output for the 36 weeks to date totals 133.8 million tons; for the remainder of the year, output will have to run at an average rate of 4,140,000 tons a week if 200 million tons are to be secured. Last week's output was 3,815,000 tons, and only 43,800 tons were lost through holidays, disputes and breakdowns. The fact is that the industry, with 9,100 more workers on the books, and 3,500 more workers at the coal face, compared with a year ago, is still showing an unduly high rate of voluntary absenteeism, particularly among face workers For the week to August 28th, the figure was 8.42 per cent, and for the following week 8.06 per cent, compared with 6.73 per cent for the week ended September 6, 1947. This deterioration in attendance has more than cancelled out the improvement in output per manshift.

Opencast production to date amounts to 8,512,00 tons, leaving the average weekly output required to obtain the target output at about 156,000 tons. Given reasonable weather, this should be achieved fairly easily, for output in recent weeks has been well over 200,000 tons a week. But a success in opencast budgeting will not compensate for a failure in deep-mined, simply because the former is low quality coal, unsuitable for export or for high-grade industrial purposes. Meanwhile, the export figures themselves do not afford any case for undue satisfaction. The original programme was to supply 16½ million tons, of which 7,000,000 tons were for bunkers, 6,900,000 tons were earmarked for ERP countries in Europe (in this connection the resumption of exports to France, held up for nearly a year owing to currency difficulties, is an event much to be welcomed) and the rest was bound to find no lack of markets if it was of the right quality.

In view of the trend of output, Mr Gaitskell's hint about exporting coal from stocks is timely, and infinitely more reasonable than some earlier comments which suggested that the domestic consumer should be the last to suffer if output fell short of total needs. The Minister of Fuel and Power observed this week that "we entered 1947 with unusually high stocks"—a point made in *The Economist* at the time when it urged the resumption of exports and the reduction of stocks to a more seemly figure. He suggested that there would be no serious risk in letting stocks fall over the year by 2,000,000 tons. The stock figures certainly support this conclusion: distributed stocks are now 15.1 million tons, compared with 13.3 million tons a year ago; and every branch of industry has higher, and apparently adequate, stocks. Mr Gaitskell observed that Britain was now exporting coal at the rate of 20 million tons a year—the actual figures for the first 35 weeks this year are just over 10 million tons, equivalent to slightly under 15 million tons per annum. He hoped "eventually" to get back to 40 million tons—in which hope he will be joined by the country and by Europe. But to obtain the extra 20 million tons will call for a revolution of thought and practice in the industry.

* * *

Agreement in Copenhagen

Trade negotiations with Denmark were concluded in Copenhagen this week. This year, unlike last, there was no hitch, because Britain was able to offer larger supplies of coal and steel.

During the next twelve months, Britain will receive 60 per cent of Denmark's exportable surplus of butter, which will mean an import of between 65,000 and 70,000 tons. This is nearly double the 40,000 tons scheduled for this year under the agreement reached last February but the price has remained unaltered at 321s. 6d. a cwt. Exports of Danish bacon to this country will also be considerably increased. For the next four years Britain will get 90 per cent of Denmark's export surplus; in the first year this should mean some 50,000 tons. Again the price is the same as that agreed upon last February—225s. a cwt. But these quantities are still well below Britain's prewar level of imports from Denmark, when it took 118,000 tons of Danish butter and 170,000 tons of Danish bacon each year.

The increase in supplies—welcome as it is—will, however, hardly be sufficient to raise the domestic ration. The weekly consumption of butter on a 3 ounce ration averages under 5,000 tons while the present bacon ration means a weekly distribution of 4,100 tons. But the agreement should mean that the present ration levels for bacon and butter are assured as a minimum for 1949. Improved supplies of feeding stuffs in the world generally will undoubtedly assist the expansion of Danish livestock, but this must inevitably take time. Bacon production may not regain its prewar level until after 1950 and butter production is likely to take still longer to recover.

The success of these negotiations has been due to Britain's offer of coal. Denmark is to receive during the next year 1,600,000 tons of coal and 500,000 tons of coke, compared with 870,000 tons of solid fuel in 1948. Moreover the quantity of steel has been raised from 50,000 tons to 65,000 tons, and Denmark is also to get £5,000,000 worth of petroleum products. The Danish import programme of British manufactured goods will be expanded to £45 million (fob) a year against this year's estimated total of £28 million, but the details have not yet been worked out. The agreement, however, represents a real attempt to break down the inherently restrictive nature of bilateralism, and in this it promises to be successful.

* * *

National Savings—Gross and Net

Some detailed statistics of National Savings issued last week for the first twenty-two weeks of the financial year give a much clearer picture of the underlying trends than can be seen from the customary weekly figures. The object of the National Savings Committee in making this more comprehensive interim survey of the year's progress is to draw attention to the extent of new saving which has been taking place despite the depressing performance of the net figures computed after deduction of repayments and withdrawals. In measuring the part which National Savings play in the balance sheet of disinflation it is, of course, only the net figure which is significant; and it is for that reason that it generally receives most attention in week-to-week comment. But the effect of this spotlighting of the net dis-saving, especially noticeable in recent weeks, has been, as Lord Mackintosh said last week, to spread something akin to alarm and despondency among the workers and organisers in the movement. It deserves to be emphasised, therefore, that although in the twenty-two weeks "net" saving was a minus quantity—amounting, on the official basis of computation, to £17 million—new gross saving was proceeding throughout the period at an average of some £15 million a week. The gross total for the period was £330 million, compared with £421 million in the corresponding period of 1947—when, however, the receipts were swollen by the effects of the raising of the limits upon individual holdings.

The second object of the survey was to put the problem of withdrawals and encashments into perspective. Although encashments have been heavy during the holiday season, their total for the financial year to date is actually rather less than the corresponding figure for 1947—the totals are £347 million and £364 million respectively. A comparison over a rather longer period shows similar results; encashments and withdrawals in the calendar year to date have totalled £526 million, compared with £543 million. To some extent, this reduction in repayments must be due to the increasing volume of Defence Bonds which have fallen due and been repaid at maturity. These redemptions, which are not included in the official figures of "repayments," have totalled nearly £80 million in the current calendar year, compared with £56½ million in the first thirty-five weeks of 1947. Altogether, therefore, the cash demands of small savers have this year been larger, but not markedly so, than in 1947.

From the point of view of sustaining the morale of its workers, the National Savings Committee is undoubtedly right in drawing attention to these facts. The volume of dis-saving, it also points out, ought properly to be related to the total volume of accumulated savings, now standing at over £6,000 million, rather more than four times the prewar level. Thus the rate of dis-savings in the past twelve months, expressed as a percentage of the accumulated capital, has been no more than 15.1 per cent—a somewhat smaller percentage than that for the year to March, 1947, and an appreciably smaller one than for 1937-38, when the figure was 19.0 per cent. In 1920, it is interesting to note, it reached 29.3 per cent. It is evident, therefore, that the extent of net dis-saving is not attributable to any unreasonable or unexpected volume of withdrawals. Yet, in relation to the scale of the nation's capital balance sheet, the repayments are absorbing very large sums, equivalent to an annual rate of some £820 million. They would wreck any hopes of successful disinflationary budgeting if they were not being mainly offset by new gross savings. Obviously, it is to be hoped that the net balance of the week-to-week figures will soon be restored to a steadily increasing positive quantity—for the new burdens which Britain is assuming for national defence and European Recovery are adding greatly to the inflationary pressures, making saving now at least as important as it was during the war. But, even if the trend of savings is no better than it has been in the past few months, the workers in the National Savings Movement will still be entitled to feel they are doing a worthwhile job.

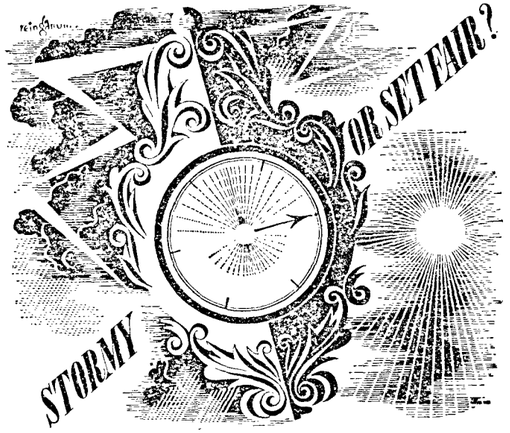
Development Councils Again

It was symptomatic of the wide interest among Government back-benchers in the establishment of development councils that this should be the first subject to be raised on the adjournment on the first day of the new session. The debate opened with special reference to the establishment of a development council in the pottery industry, accompanied by the familiar arguments of overriding social interest, the pooling of industrial experience between efficient and less efficient concerns, and the rich contribution to be expected from the workers' side on problems confronting the industry. There is no doubt that the patience of some Labour members is wearing thin as a result of the protracted negotiations on the setting up of development councils. Equally, there is more than a suspicion that some back-benchers claim—just as some employers fear—that the Industrial Organisation and Development Act is capable of being used as a kind of backdoor to nationalisation.

Mr Wilson, the President of the Board of Trade, was evidently anxious to rebut these claims and fears in his reply. Many of the doubts about development councils imposed by order under the Act stem from their statutory nature; there are many employers' bodies who would be quite content with a non-statutory advisory council. And sometimes they have carried the unions with them—as they did for a time in pottery and in the boot and shoe industry. In pottery, at any rate, the two sides have now swung apart—the employers adamant against a development council, set up under the Act, and the union equally insistent upon one. In other industries, too, there are sharp divisions—as in hosiery, wool, clothing and cutlery. In furniture, a development council may be functioning by the end of the year, if present discussions go favourably; talks are proceeding in china clay and jute, and there is a technical hitch in jewellery.



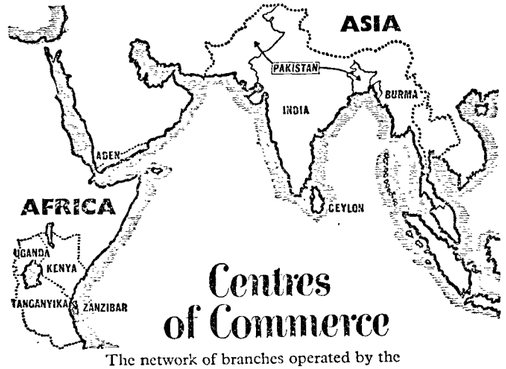
"We cannot," declared Mr Wilson, "delay some settlement of this problem for very much longer." The President of the Board of Trade has power under the Act to set up a development council by order, provided that he is satisfied that its establishment is desired by a substantial number of persons engaged in the industry. But wisely enough, he is still attempting to get agreement and to assuage such fears as "half-way house nationalisa-

Fact-finding

In the RECORDS AND STATISTICS supplement to THE ECONOMIST more facts are put promptly on record than anywhere else in the world. By means of the cumulative monthly index, published in the first issue in each month, any fact that has been recorded in the current year's issues can be quickly located.

RECORDS AND STATISTICS is available on postal subscription only. The subscription rates are £2 10s. a year for RECORDS AND STATISTICS alone or £5 together with THE ECONOMIST.

The Economist, 22 Ryder Street, London, S.W.1.



THE CONDITIONS which interest the modern exporter are those prevailing in his market, the 'commercial weather' in which he must trade. British products will always sell in Australia and New Zealand provided they are adapted in both quality and price to the Dominion markets. The Overseas Department of The Bank of Australasia can put at the disposal of the British exporter accurate up-to-date information from the Bank's Branches 'down under' giving him a picture of prevailing conditions upon which he can base his export programme.

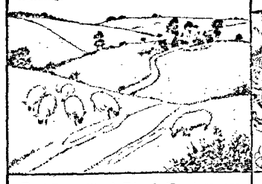
The Three Banks



The Royal Bank of Scotland, Glyn, Mills & Co., and Williams Deacon's Bank Limited, constitute a banking group whose resources rank them sixth among the banks of Great Britain. Their resources are large enough to meet the requirements of any customer. These three banks, each with a famous banking tradition, each still retaining its individuality, can give to every customer the advantages of their pooled facilities and diverse financial experience.

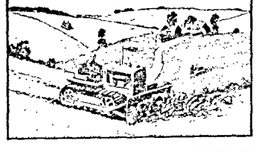
THE THREE BANKS

RECLAIMING 30,000 ACRES



1. For 1,000 years the turf of the Sussex Downs lay undisturbed, except by grazing sheep. But war forced the authorities in 1942 to take great stretches for battle training.

2. For four years troops fired thousands of tons of ammunition into the slopes, and covered their surface with wire and concrete, trenches and gun-pits.

3. 'Caterpillar' Diesel Tractors are now speedily clearing the Downs of their dangerous litter, so that the urgent job of food production may begin again.

Before the Sussex Agricultural Committees could begin reclaiming the downland, miles of rough roads had to be cleared by 'Caterpillar' Bulldozers. Before ploughing could begin, innumerable shell and bomb craters had to be filled in, and undergrowth, wire, and defence works had to be uprooted. Once again, 'Caterpillar' equipment, provided and serviced by the Jack Olding organization, has saved precious time, manpower and money.

tion," the supersession of trade associations and Government intervention under cover of a development council. It may be true that development councils can do little harm; but the doubts in some employers' minds are evidently concerned with the question whether they can do much good.

* * *

Bank Court and the TUC

Amid the stream of discussion on the major subjects of controversy at Margate last week, one incident has attracted less attention than it deserves. The National Union of Bank Employees moved that the Court of Directors of the Bank of England should include a representative nominated by that Union. The resolution was defeated, though by a relatively narrow majority of just over one million. The significance of the incident, however, lies not in the result of the voting but in the fact that Sir George Chester, when opposing the resolution on behalf of the Council, disclosed that the Chancellor of the Exchequer had given an informal assurance that the Council of the TUC would be notified or consulted when there was a vacancy on the Court of the Bank, and the Council would take into account the views of the Bank Employees' Union.

This, on the face of it, is a rather remarkable assurance. Since the nationalisation of the Bank of England, members of the Bank Court are appointed by the Crown. Naturally, the Government when tendering advice on the matter is not obliged to follow the wishes of the TUC whatever assurances may be given about "consulting" with it. Nor, for that matter, does it follow that the TUC Council would necessarily endorse the views of the National Union of Bank Employees. But, if the Chancellor's assurance was intended to have any real meaning, it raises an important question of principle. In seeking to draw a parallel between the banking industry and the nationalised industries—the Boards of which do include former trade union officials—the NUBE is implying that technical expertise in banking is the proper and necessary qualification for membership of the Bank Court. Opinions will differ about the extent of purely banking knowledge which is necessary —and also, incidentally, upon the fitness of the NUBE to pronounce upon it, for expertise in day-to-day banking technique is a very different thing from wisdom in central banking, even in its technical aspects. But it is certainly a little paradoxical that this particular argument should be urged from circles of the Left now that the Bank of England has been nationalised. In the bad old days when the privately-owned Bank of England was attacked by Labour for its wicked machinations, the cry always was that it was dominated by a Court comprising mainly banking and financial interests—though not, admittedly, representatives of the big joint stock banks.

It is not on these grounds alone that the principle implied in the Chancellor's assurance is bad. Though the Bank of England is nationalised, the commercial banking system is not; and even if it were, the Bank of England's relationship to it would not be comparable to that which subsists between a nationalisation Board and the industry which it controls. The Bank of England, even before its nationalisation, had become, and still is, in effect part of the central administration of Government. In the execution of Government policy the Bank may, indeed, exercise control over the banking system as a whole, but it does so in its capacity of central bank and not because it is part of the banking "industry" The interests of the banks and bank employees deserve no greater weight in the determination of central banking policy than the interests of any other section of the British public, and the interests of the whole are not to be secured by sectional representation. That principle was indeed strongly reaffirmed by Dr Dalton at the time of the passing of the Bank of England Act when he said that members of the Bank Court, if chosen from particular sections of the community, would not act in the capacity of representatives of that section. Perhaps Sir Stafford Cripps's assurance last week was intended to be merely a diplomatic way of rebutting an embarrassing proposal which he knew ought not to be taken seriously.

* * *

Cement and Dollars

On the face of it, the Ministry of Works' decision to allow the import of German cement and cement clinker is startling. In the next three months some 100,000 tons are to be shipped from North German ports and Rotterdam to Scotland. The Ministry explains that these shipments will permit "the increased supplies of cement which have been programmed recently for Scotland to be maintained without detriment to other recipients of British cement, notably in the Colonies and Dominions." The nature of this "programming" deserves fuller scrutiny. No extraordinary increase in Scottish demand has occurred recently, although Scottish cement consumption, especially for hydro-electric development, is higher than it was before the war. There were temporary shortages in April, but these were remedied later when transport difficulties were overcome. Are the "wash outs" on the North-East coast route now causing difficulty?

This is not the first occasion on which topsy-turvy conditions in foreign exchange have led to abnormal trade. For instance, some months ago Dutch rayon was imported in order to enable British rayon exports to earn hard currency. But in this case the flow of currency is reversed, as in the first purchase of grey cotton cloth from Japan for dollars. Bizonia, too, will presumably get the equivalent of dollars in order that Britain may earn sterling from the colonies.

The clue to the transaction appears to be that without British supplies, the colonies would be forced to import from Belgium, the only other source of supply. The implication, evidently, is that the Treasury regards the Belgian franc as being a shade harder, if anything, than payments to Bizonia. But why is the British industry unable to meet home and export demands fully? The demand for cement extends to nearly every country and sellers still rule supreme. British cement is a profitable and competitive export and its quality has earned it a high reputation. The answer seems to be twofold. First, cement is subject to export restrictions in the interest of the home building programme. These restrictions are lifted every autumn, and reimposed when the building season begins in the spring. Secondly, the industry has found it difficult to expand. The chairman of Tunnel Portland Cement complained this week that two new works had been held up by the authorities. Associated Portland Cement have had three extensions and two new works delayed for eighteen months. One of the new Tunnel works should be in operation in the spring of 1949 instead of this year as was hoped, while the first of the new Associated plants will not be ready before 1950. Over and above the abnormal demand occasioned by capital expansion abroad, there is a general trend towards greater use of cement in substitution for timber and steel.

* * *

Rhodesia and Copper Supplies

The Rhokana copper mine and mill had to close down completely last week for five days and the smelter operated only one reverberatory furnace. Production at Nchanga also had to be curtailed and the electrolytic refinery was working at only 25 per cent of capacity. The cause was a recurrence of the shortage of coal due to the lack of rolling stock on the Rhodesian Railways system. Last year's interruptions to Rhodesian copper production were sufficiently serious for the Government to give priority for delivery of locomotives and trucks to the Rhodesian railways. Much of this equipment has arrived in Africa, but not all of it is yet in use. Transport is, however, expected to improve considerably during the coming months.

An improvement will be welcome in view of the importance of Rhodesian copper output to Britain and the United States. Up to July the output of copper in Rhodesia had shown a satisfactory expansion; according to the British Bureau of Non-ferrous Metal Statistics, production reached 19,900 tons in that month, making an average for the first seven months of the year of 18,150 tons a month compared with the average of 16,200 tons a month for 1947. Smelter production has expanded on a similar scale, but the output of refined copper from primary refiners, after reaching a peak of 6,151 tons in March, fell to 5,026 tons in June and in July dropped to as low as 3,356 tons. Even so, the average up to July of 4,900 tons a month was still above last year's level of 4,600 tons.

Consumption of virgin copper in the United Kingdom has been on a smaller scale during the past two months owing to the summer holidays. But the general level has so far been some

Next week's issue of the *Records & Statistics* Supplement will include the Annual Survey of British insurance, covering recent trends in life assurance, marine business, and the investment problems of insurance offices.

Joseph Priestley *Yorkshireman, Doctor of Divinity, theologian and pamphleteer, owes his fame to chemical discoveries made in his leisure hours as a relaxation from writing sermons and political broadsheets. His first success as a practical chemist was the accidental discovery of soda water. While living next door to a brewery in Leeds, curiosity led him to investigate the process of brewing. In doing so, he found that carbon dioxide gas, which is produced during the brewing of malt beverages, could be dissolved in ordinary water to make "aerated water". The success of this experiment set him on his chemical career and he acquired a renown which matched his considerable reputation as a theologian.*

His appointment as librarian to Lord Shelburne at Bowood in 1773 gave him ample time and opportunity to develop his scientific hobbies and his most important work was done during the following eight years. In this period he discovered, prepared and studied a vast number of gases — all of them highly important — including oxygen, ammonia, nitrous oxide (the "laughing gas" of the dentist's surgery), hydrogen sulphide, hydrogen chloride and sulphur dioxide. Priestley's inventive genius was of a type that is typically British. As a practical experimenter he has had few, if any, equals, and the gases he discovered have proved of immense scientific and commercial importance. He died in 1804 in Pennsylvania, U.S.A.

ICI

"Glad you like this sherry —it's South African

It's extremely good. I got some South African wine the other day . . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

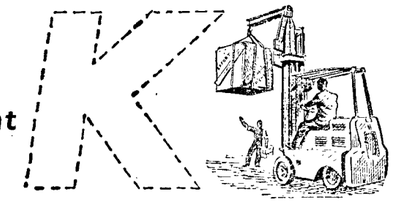
So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.



So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too."

SOUTH AFRICAN WINE FARMERS ASSOCIATION
(LONDON) LIMITED

4 per cent above last year's average of 29,200 tons, and the consumption of secondary copper has also increased. Imports of unwrought copper into Britain were very heavy in July, and at the end of that month total copper stocks in the country amounted to almost 100,000 tons—the highest figure since the beginning of the year; of this quantity 77,000 tons consisted of Government stocks. Britain, however, is still dependent on dollar sources for its supplies of electrolytic copper, which comprise 56 per cent of its copper imports, and the shipments from Canada and Chile, for this year at any rate, are being paid for by ECA dollars. The immediate problem in Rhodesia is clearly to ensure a steady flow of coal to the mines and smelters. But the longer-range problem for the sterling area is to expand its output of electrolytic copper so that imports from dollar countries can be reduced as far as possible.

* * *

Gold Coast Cocoa Production

The price for West African cocoa was increased last Wednesday from 50s. to 65s. per load of 60 lb. at the buying stations. But the higher price, welcome as it may be to the cocoa-growers, will do little to help solve the problem facing the Gold Coast cocoa industry. That problem is one of disease—"swollen shoot"—spread by mealy bugs from tree to tree. As these bugs can be carried considerable distances by wind, the infection is able to spread in all directions and at an increasing rate. Before the war it was estimated that one million cocoa trees a year were killed by the disease. Between 1939 and 1945 the rate of killing increased to five million a year, and by the end of 1947 the disease was spreading at the rate of 15 million trees a year. It has been recently estimated that some 46 million trees are infected which will die by the end of 1949. Before the war the total stock of cocoa trees was thought to be under 400 million; no accurate census has ever been made. This present high rate of killing thus means the virtual extinction of the Gold Coast cocoa industry within twenty years unless remedial action is taken.

The accompanying chart (reproduced from the recent statistical and economic review of the United Africa Company) portrays the striking relationship between the number of trees affected and the

Source: U.A.C. Ltd. Statistical and Economic Review No. 2.

reduction in tonnage of cocoa marketed. The Gold Coast supplies some 40 per cent of the world's output of cocoa, but its production has been declining at a very marked rate since the beginning of the war—notwithstanding the recent sharp rise in prices paid to farmers. If anything, the graph suggests a direct correlation between the prices paid and the incidence of the disease. This is understandable, as the only method yet known to science of combating the disease is cutting out the infected stock and replanting. As newly planted cocoa trees take five years to bear fruit, higher prices paid to farmers for cocoa beans are clearly a disincentive for cutting out, unless Government compensation is increased commensurately.

But the threat to the cocoa industry has wide economic and social implications. Cocoa is the most important cash crop in the Gold Coast, and its exports account for nearly half of the total value of exports from the colony. Moreover, it is a significant dollar-earner, as some 40 per cent of the cocoa shipped from the Gold Coast goes to the United States. When the problem of "swollen shoot" in the Gold Coast was debated in the House of Lords last Wednesday, Lord Listowel, replying for the Government, said that a new inquiry into the advisability of cutting out infected stock was expected to be made next year by a group of independent scientists of international reputation. In this way it was thought possible to convince the native farmers that only by such drastic action can the disease be eradicated. The results of the cutting-out campaign to date have not been very encouraging.

Harvest Hopes Materialise

Despite the bad summer in Britain the estimated yields of grain crops this year are well above the 1947 figures and even higher than the ten year averages. According to the Ministry of Agriculture the wheat harvest will yield 79 million bushels compared with 62 million bushels last year. Wheat has withstood the stormy weather better than the other grain crops, but there has nevertheless been a very considerable loss due to shedding and sprouting. The barley crop is expected to yield 84 million bushels compared with 76 million in 1947, while the oats harvest is forecast at 190 million bushels against 176 million bushels last year, notwithstanding the great difficulty which has been experienced in cutting. The total of these three crops is thus expected to amount to 353 million bushels compared with 238 million bushels before the war.

In the United States the harvest yields are proving to be even higher than the first official estimates. The wheat crop is now put at 1,285 million bushels compared with 1,365 million bushels last year, while the maize crop estimate has been increased by a further 22 million bushels to 3,529 million bushels. This figure exceeds the 1947 crop by more than 1,000 million bushels and is an all-time record. The United States Department of Agriculture has stated that American farmers this year will produce the biggest volume of food in the history of the continent. Exports of wheat from the United States during the current season are expected to total 450 million bushels, although the United States Secretary of Commerce has already asked that wheat exports should be limited to 400 million bushels. During the 1947-48 season American shipments of wheat and flour reached the record level of 476 million bushels. The US Bureau of Agricultural Economics has, however, pointed out that an export of 450 million bushels would still leave a carry-over next July of 275 million bushels, which will be the largest stock of wheat the United States has held since the war. A large export of maize is also expected this season and should total at least 200 million bushels.

Europe's import requirements in 1948-49 will in any case be reduced owing to the good domestic harvests. According to the estimates made at the Marshall Plan Conference in Paris last year, imports of bread grains during the current season were put at 750 million bushels and of coarse grains at 400 million bushels. If the American exports of wheat reaches 450 million bushels, Western Europe requirements can be easily covered, as Canada is expected to have an export surplus of 220 million bushels. There should also be little difficulty in meeting Western Europe's demand for feed grains without having to buy large quantities from Argentina. The world supply of grain appears to be so plentiful that the Argentine Republic will certainly have to modify its export prices if it is not to be left with large unsold stocks of both wheat and maize.

Dollar Stocks and Estate Duty

The official view of the Estate Duty Office on the valuation of dollar stocks for Estate Duty has been made known this week. In their opinion the values returned for United States dollar securities "should reflect the premium which was obtainable at the date of valuation on quotations in the United States." In American dollar securities, of course, the development of a London market with switching facilities has resulted in a fairly uniform rate of premium applicable to all stocks. This premium is now recorded in the Stock Exchange Official List—this week it has been 29 per cent—and it will have to be added to the sterling equivalent of the New York price (converted at the official rate) in order to compute the valuation of the stock for Estate Duty purposes.

In the case of Canadian securities, the problem is somewhat different. There are no opportunities for switching, owing to the ban, and premiums therefore tend to show a wide variation recently, from 5 per cent to 35 per cent. The Estate Duty Office has therefore laid down the principle that "Canadian dollar securi-

For the man of to-day

Sell now to the under

and gain customers for life

The under-35's have grown up against a background of war service and of shortages; their growth to maturity as consumers, therefore, has been severely retarded. Now they are forming buying habits which, if you persuade them in time, may give them a lifelong preference for your goods. From this vast potential market (over a third of our adult population is under 35) the Daily Mirror, with a net sale of over 3,700,000 daily, draws well over a million more readers than any other daily paper. Lay the foundations of your future prosperity by selling now to the under-35's. Talk to them through the advertisement columns of the Daily Mirror

Daily Mirror
THE NATIONAL DAILY
WITH THE SECOND LARGEST SALE

Cost of advertisement space (per column inch per thousand readers) lower than any other national daily

ties should be valued on the basis of the Canadian price, converted at the current official rate of exchange, or of the price obtainable in London, whichever is the higher."

The letter of the Estate Duty Office to the Stock Exchange, which sets out these official views, declares that they are based on the well-established principle that for estate duty purposes an asset should be valued on the assumption of a sale in such a manner as to realise the best possible price. Under the rules, it will follow that an American security will be valued *cum* premium, even though it may not enjoy a market in London, whereas Canadian securities will be valued at parity, unless there is a higher price currently obtainable in London.

Colliery Compensation Delays

A Note under this heading in *The Economist* of September 11th, referring to the statement of Mr M. K. Burrows to the shareholders of the Manchester Collieries, declared that Mr Burrows had complained of the slow progress made by the Central Valuation Board which is at present engaged in apportioning the total compensation sum as between the 21 districts. The emphasis of Mr Burrows's criticism was actually directed to the slowness of the preparatory steps towards the work of the District Valuation Boards. The following extract from Mr. Burrows's statement should make the point quite clear:

> The proceedings before the Central Valuation Board started in May last but with all the speed that is consistent with a fair hearing for all parties, the announcement of the apportionment of the Global Sum to the twenty-one districts cannot be expected before the end of this year. It is becoming apparent that the most serious, and in my view, the least excusable delay is in preparing the way for work of District Valuation Boards. The appointment of the members, other than the Chairmen, of the District Valuation Boards has not yet been made or at least has not yet been announced and therefore no steps leading to the valuation of collieries and particularly of the ancillaries can be taken.

Middle East Oil Enterprises

Among recent signs of the still growing interest taken by American companies in the oil-bearing areas of the Middle East, the Kuwait concession negotiated by American Independent Oil Company is perhaps the most notable. The company was formed last year with an authorised capital of $100 million by eleven independent producers in the United States, including Phillips Petroleum Company and Sunray Oil Corporation; Mr Ralph K. Davies, who was formerly Deputy Petroleum Administrator for War and vice-president of the Standard Oil Company of California, was appointed president. The parent group consisted of companies which had in the past produced, as well as marketed, their oil in the United States, and their interest in the Middle East was taken to mean that they were anxious to secure additional sources of supply for the American market. Presumably they do not intend to undertake refining in the Middle East.

Negotiations between the Sheik of Kuwait and various oil companies had been proceeding for some time for the right of exploitation of the Sheik's half-interest in the Kuwait-Saudi Arabian neutral zone. This area of about 2,000 square miles lies on the Persian Gulf immediately south of Kuwait, and was reputed to be the richest oil-bearing region still unallocated. Mr Davies has announced that his company has secured the concession. He has evidently succeeded in outbidding the major oil companies, and the reported terms, indeed, are handsome for the Sheik. They are said to include a bonus of $7,000,000, an annual rental of $600,000 until production starts, and royalties of about 33 cents a barrel. As Mr Davies has stated, this is the first time independent producers have entered Middle East oil production on such a large scale. The Saudi Arabian half-interest in the neutral zone has been secured by the Arabian American Oil Company, and negotiations are reported to be proceeding between the two American companies for co-operative exploration and exploitation of the area. Estimates of Saudi Arabian oil reserves have risen lately following the completion of a big well by the Arabian American Company at Ain Dar, 25 miles west of the Abquaiq wells.

Between the neutral zone and Bahrein there are important off-shore fields still to be exploited, and the Superior Oil Company of California has been negotiating with King Ibn Saud for these submerged areas; a British company, Central Mining and Investment Corporation, has been reported to be co-operating with the Superior Oil Company on this project.

Another area in which oil exploitation has lately been active is the Sinai peninsula. Production at the Sudr oilfield is expanding, and is likely soon to reach 10,000 barrels a day. South of Sudr a well is about to come into operation in the new oilfield (as yet small) at Asl. The Sudr and Asl fields are operated jointly by Anglo-Egyptian Oilfields (a company of the Royal Dutch Shell group) and Socony Vacuum Oil Incorporated.

Shorter Note

In connection with the implementation of the financial scheme of Petrochemicals, Ltd., outlined in *The Economist* on August 8, the "B" noteholders at an extraordinary meeting this week agreed to the conversion of the £900,000 4 per cent. "B" notes of Petrocarbon, Ltd., into ordinary shares of a similar amount in Petrochemicals, Ltd. At another meeting shareholders confirmed the appointment of General Sir W. G. Lindsell, hitherto a director of the company, as chairman of Petrochemicals, Ltd.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (a) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) To latest redemption date. (m) 15 months. Yield Basis 25%. † Free of tax.

COMPANY MEETINGS

INTERNATIONAL TEA COMPANY'S STORES, LIMITED

RECORD FIGURES

The annual general meeting of the International Tea Company's Stores, Limited, will be held in London on the 5th proximo.

The following is an extract from the annual review by the chairman, Mr Guy Collier, circulated to shareholders.

The company's trading year (53 weeks) to May 1, 1948, has produced further record figures in its long and successful history. I feel I should give you some idea as to the special features which have enabled your company to produce these results. Fundamentally, our business is dependent upon turnover. Let there be no misunderstanding on this point. Without continual effort on the part of the board and our buying and selling departments, this record profit could not have been made. In order to safeguard and expand turnover the questions of registrations and stocks of points goods to attract both registered and non-registered customers must receive our constant attention.

Our registrations show a great increase, and our stocks of points goods are maintained at the highest possible level and quality, bearing in mind the limitation of supplies. Only by day-to-day attention to these very important functions of management can good results be achieved. At the same time, it is essential to have the right type of staff throughout our business if we are to give the service to which our customers are entitled. Our margins of profit, nearly all controlled, are meagre, our expenses are considerably higher than last year, but I say again, turnover, registrations and service are the foundation on which these results have been achieved and upon which our business is maintained.

UPWARD TREND IN PRICES

Another point I must stress is the upward trend in prices of many commodities in the period under review. The resultant inflation of stock values is a question continually and prominently in our minds. There may well come a time when a downward trend in prices will set in, and for that reason we have considered it prudent to set aside the sum of £100,000 as a reserve to meet possible future depreciation in stock values.

The general economic conditions, the scaling down of imports from hard currency countries, the fact that large sections of the world are still either non-producing or are erecting price structures against this country, render it imperative for us to consider our position as distributors of essential foodstuffs from every angle. At times there is an apparent easing of our difficulties, not infrequently followed by some new regulation which takes us back to where we were, or places us in a position even inferior to that which prevailed one or even two years ago. These difficulties which are felt not only at head office, but which reflect through the staff at the branches, and eventually result in dissatisfaction on the part of some customers who cannot obtain their needs, have led us to offer incentives by way of competitions, on what might be described as the "friendly rivalry" basis, to our various selling outlets. The trading profit I am sure you will feel is satisfactory.

Our factories at Southall and Belmal Green and all our subsidiaries have contributed greatly to our success. We, in common with all companies, have been requested by the Treasury and the Federation of British Industries to refrain from increasing the rate per cent. of distribution by way of dividend. As one of the leading houses in our trade we must observe that request, although we could on this occasion have increased the dividend had we been entirely free to act.

TATA IRON AND STEEL COMPANY, LIMITED

MR J. R. D. TATA'S SPEECH

The annual general meeting of the shareholders of this Company was held on the 24th ultimo at Bombay.

Sir Ardeshir Dalal presided owing to the indisposition of the chairman (Mr J. R. D. TATA) and read the chairman's speech, which surveyed the economic and political difficulties which India had encountered during her first year of independence, and stressed the urgent need for steps to restore confidence and revive production.

The steel company's own production had declined from 753,000 tons to 664,000 tons, and production of most other industrial goods had also declined. On the other hand, both prices and the volume of money in circulation had risen to record heights.

NEED FOR INCREASED PRODUCTION

To check inflation, the first necessary step was to increase production. Nevertheless, attempts by the Government of India to reduce the number of man-days lost through industrial disputes had not been successful. On the Government of India's handling of this most vital problem would depend the prosperity of the country for many years.

The wage structure of the Steel Company's works at Jamshedpur had been further revised at a cost of Rs. 104 lakhs in the first year, rising to Rs. 162 lakhs annually. In spite of this, and in spite of the increases in dearness allowances and food rebates, production had not increased.

Transport shortages had also affected production, and, while the coal supply position had improved, shortages of certain essential raw materials continued.

The following figures were given as an indication of steeply rising costs, costs for the year 1939-40 being taken as 100:—

Wages	297
Coal	265
Iron ore	172
Total cost	257

As against that, the selling price index was 180. This represented a smaller increase than in any other country, except possibly Australia. This and other facts in relation to costs and prices were being brought to the notice of the Tariff Board.

The cost of maintaining the town of Jamshedpur has risen from Rs. 1.41 lakhs in 1939-40 to Rs. 40 lakhs in 1947-48, and for next year it was estimated to be Rs. 41.46 lakhs. The Government of India had accepted the principle (but had so far not implemented this) that part of the burden should be borne by them.

NEW PLANT

The company had an agreement of over 10 years' standing with Messrs Stewarts and Lloyds for the manufacture of tubes in India. Under this agreement the company was to instal a skelp mill (estimated to cost Rs. 165 lakhs) and was to share the cost of a tube mill (which would probably cost Rs. 125 lakhs) with Messrs Stewarts and Lloyds in the proportion of 60:40. The company had also under consideration the manufacture of alloy, tool and special steels.

The Government of India had decided to build one or two steel works, presumably in pursuance of its policy that all new developments in the steel industry would be undertaken by the State. More steel certainly required to be produced in the country, but it was unfortunate that this complicated and difficult industry should have been chosen by the Government for its venture on nationalisation. The Government had consulted the industry, and the steel company had submitted a scheme based on joint State and private enterprise, which the Government, however, had rejected. The company had started raising coal from its West Bokaro Colliery, and expected to increase raisings to 10,000 tons per month from October, 1948.

ASSOCIATED WEAVERS, LIMITED

INCREASED PROFITS

The twelfth annual general meeting of Associated Weavers, Limited, was held on the 15th instant in London.

The following is an extract from the statement of the chairman, Sir Frank H. Newnes, Bt., circulated with the report and accounts:—

Your directors are again pleased to place before you accounts showing a successful year's trading and increased profits of our group of companies which, for the period ending March 20, 1948, are £145,481 (51 weeks) after profits tax, against £108,163 (52 weeks), after profits tax and excess profits tax, in the previous year. We propose to declare a final dividend of 45 per cent. which, with an interim dividend of 20 per cent. already declared, will make 65 per cent. for the year, which is the same as last year.

YEAR OF EXTREME ACTIVITY

In the year under review the company has been extremely active in new developments necessitating large capital outlay in our carpet and moquette mill in Bradford, our spinning mill at Morley and our new Armoride mill at Earby, and the directors have under consideration the provision of further capital so as to maintain unimpaired the strength of the group's liquid position.

Our moquettes factory shows a 60 per cent. increase in production over last year, and our carpet factory 80 per cent. The demand nevertheless continues unabated and the present year to date shows a further substantial increase in production and turnover. We have brought out new designs which have been well received. The Board of Trade now gives us freedom of design, a relaxation of control we have long awaited and which is very welcome

We have given special attention to exports, I am glad to say most successfully. We again exhibited at the B.I.F. in London and we also showed at the Toronto Fair, where we obtained large dollar orders and were the only British carpet and moquette manufacturers there.

During the war we acquired on favourable terms a mill at Morley, near Bradford, and used it for storage and other purposes. We think it important, with our large and growing requirements, that we should be able to do some of our own spinning and so we have a spinning plant in this mill where moquette yarns best suited to our requirements are being spun.

The erection of the large new plant and equipment at Earby for Armoride, Limited, and its plastic and leathercloth production has proceeded rapidly and we shall soon have the most up-to-date plant of its kind in this country.

The size of our plant, with all the latest improvements in manufacture, will considerably reduce our working costs to enable us to compete successfully both in the home and export markets. The competition in the leathercloth market is perhaps keener than in that of other of our products, but we have every confidence that with our able management and up-to-date methods we shall be able to meet all competitors.

PERMISSION RECEIVED

In moving the adoption of the directors' report and the statement of accounts, Sir Frank Newnes said:—

Since my speech was issued to the shareholders, the Investment Registry and the Ocean Trust have arranged to place an issue of £300,000 four and a quarter per cent. notes, the permission of the Capital Issues Committee having been received for this issue, which has been placed largely with financial institutions. This additional finance is required to provide for new plant and machinery, and as further working capital to finance the company's increasing production.

The report was adopted.

DAWNAYS, LIMITED

YEAR OF PROGRESS

MR H. THORNE'S REVIEW

The thirteenth annual general meeting of Dawnays, Limited was held, on the 10th instant, at the Dorchester Hotel, London, W. Mr. Harry Thorne (chairman of the company) presided.

In moving the adoption of the report and accounts the Chairman said:

Again it is my pleasure to present to you a report and the accounts of the company which I am happy to state reveal the further progress which has been made during the current year. I say progress advisedly as my attention has been drawn to a reference in the Press which quite wrongly attempts to make the result look otherwise, no doubt some of you have seen or are aware of the report to which I refer and I, therefore, propose to direct your attention to the true position as shown by the figures set out in the profit and loss account which is before you.

INCREASE IN GROSS TRADING PROFIT

The gross trading profit for the year 1947-48 is £157,291, plus investment interest of £1,593, making a total of £158,884, which constitutes a profit record for the company and shows an increase of £32,583 over last year's gross trading profit.

OVER £7,000,000 OF CONTRACTS

During and following the war years we carried out contracts to the value of approximately £7,000,000, a large proportion of which contained costing clauses which were very onerous and it became necessary that we should make provision for possible repayments after costing; this we did to the extent of approximately 3 per cent. on these particular contracts.

Finalisation of these contracts being practically completed we find that £63,043 so provided has not been required and, therefore, that sum (less £34,268 which is placed to contingencies reserve) is brought in to the year's profit and loss account.

INCOME TAX PROVISION

The income-tax payable on the amount brought in amounts to £25,500 and tax on our present year's profits £51,500, making up the sum of £77,000, which you will find on the debit side of the profit and loss account.

NET SURPLUS

As mentioned above, our trading profit for 1947-48 is £158,884, against which we have charges for depreciation, audit fees, directors' remuneration and taxation of £107,496, leaving a net profit for the year's working of £51,388, out of which the dividend of 22½ per cent. is met leaving a surplus of £19,967, equivalent to a further 14 per cent. on the dividend.

The comparable net profit figure last year was £43,068. Balance of provisions brought in after deducting tax applicable brings the net profit available to £54,663, the figure shown in the directors' report.

I trust that this rather lengthy explanation of the figures, which I felt was necessary to set aside any wrong impression that might have been formed by those who read the report to which I previously referred, has removed any doubt in the mind of any shareholder that our profits were insufficient to meet our dividend.

I repeat that it has been a year of progress and my one regret is that we are not able, this year, owing to dividend limitations, to recommend an increase in the final dividend.

LIMITATION OF DIVIDENDS

In this connection I feel strongly that any attempt to limit or freeze dividends must necessarily check progress in industry and is contrary to what, in the long run, is good for the country. Unquestionably, as in the past, our whole future depends on a full and generous flow of private enterprise unhampered by restrictions, and the Government should do everything to create conditions which would stimulate rather than stultify this movement.

INCREASED TURNOVER

The improved result of the year's trading is mainly brought about by a satisfactory increase in turnover, the percentage return on sales being only very slightly up on last year.

The directors are pleased to inform you that the works at Hull, to which I referred in my speech last year, will be in production at the end of this month, the buildings, sidings and plant being practically complete. The capital commitment mentioned in the balance sheet of £53,000 is chiefly in respect of these works, and I have no doubt at all that when the works is in full production, as it will be shortly, it will prove a very sound investment.

ORDER BOOK

We have an exceedingly full order book of high priority and export work, and I am confident, in the absence of any national calamity, that I shall have the pleasure to report further progress at our next annual general meeting.

Our two subsidiary companies acquired during the year are also expected to produce good revenue. The Steel Concrete Company, Limited, of Southern Rhodesia, is already making satisfactory profits in a field where the opportunities are great. The machine-tool making company of Henry Pels and Company, Limited, which became almost dormant during the war, is quickly rehabilitating itself and, following the production of complete working drawings, very shortly now a good range of the world-famous Pels machine-tools will be available to meet the large demand, of which we have received ample evidence during the last few months.

A successful business such as yours could not continue to expand as it is doing without executives, staff and craftsmen of the highest order. We are fortunate in possessing such employees, and once more it is my great pleasure to publicly acknowledge the loyalty and quality of the service which we have received from them during the year.

FREER MARKET FOR COMPANY'S SHARES

In an effort to make a freer market in the company's shares a resolution will later be proposed for the £1 shares to be split into four units of 5s. each. I am advised this proposal has met with general approval on the Stock Exchange and I feel sure will prove of benefit to the shareholders.

The report and accounts were unanimously adopted and the resolution proposing that the £1 shares be split into four units of 5s. each was approved.

WILLIAM HANCOCK AND COMPANY, LIMITED

TAXATION AFFECTS BEER CONSUMPTION

The sixty-first annual general meeting of William Hancock and Company, Limited, was held, on the 16th instant, at Cardiff, Col. J. G. Gaskell, T.D., D.L., the chairman, presiding.

The following is an extract from his circulated statement:—

It is proposed to pay a final dividend on the ordinary stock at the same rate as last year, that is to say, maintain the dividend for the year at 16 per cent. During the year in question the output of the company's breweries has been restricted to 85 per cent. of the output for the year ended March 31, 1946, but in January, 1948, the output was further restricted to 82 per cent. of the output for the year 1946.

As a result of application to the Ministry of Food, an extra allocation was allowed in May of this year to firms operating in industrial areas, so we are now restored to the position at which we started. Even so, it is inadequate for our requirements.

The cost of beer and cigarettes has now reached a totally unreasonable figure, and a reduction in trade, therefore, can be expected, but, in view of the popularity of our own beers, I do not think we shall feel the effects for the time being, and I am hopeful that we shall still be able to maintain our output.

We have been developing that side of our business which is concerned with residential hotels which show satisfactory results, and in our catering business, too, the results have been most satisfactory, in fact, the best we have ever achieved, and is a branch of our business where there is great scope for advancement.

There are tremendous developments in connection with the steel trade taking place in Aberavon, a town where, fortunately, we have a representative number of licensed houses. There are similar developments at Llanelly, although not on quite such a large scale, where we are well represented. But it is to coal that we must look for the future; coal and everything that goes with it, such as shipment of coal and the manufacturing of steel and so forth. Also, there are new factories completed, some occupied and some not, but the amount of labour employed in these new industries bears no relation to the employment in the coal trade. When producers of coal realise their tremendous responsibility then we shall have little fear of the future.

The report was adopted.

NOTICES

THE IMPORTANCE OF TRAVEL AS A FACTOR IN INTERNATIONAL TRADE

Lecture by Sir Frederick W. Ogilvie, LL.D., Principal of Jesus College, Oxford, Author of "The Tourist Movement," at the Royal Empire Society, Northumberland Avenue, London, W.C.2, on Thursday, September 23, 1948, at 4 p.m.

Admission tickets obtainable free of charge from The Secretary, The Travel Association, 64/65, St. James's Street, London, S.W.1.

THE TRADES UNION CONGRESS invites applications for the position of Assistant in its Research and Economic Department. Knowledge of economics and related subjects essential. Further particulars of the appointment may be obtained before September 25, 1948, from Vincent Tewson, C.B.E., M.C., Trades Union Congress, Transport House, Smith Square, London, S.W.1.

GENTLEMAN, public school, single, requires situation with progressive Company, Kenya or West Indies. Excellent trade connections B.W.I. Advertiser now in W. African import export trade. Highest references.—Box 822.

EX-SERVICEMAN, 24, single, B.Sc. (Econ.), widely travelled seeks interesting administrative post with prospects.—Box 824.

COMPANY Group Headquarters, 14 miles west of London require business Statistician. Write full details, salary, etc.—Box 789.

YOUNG man, 21, B.Com., good education, bilingual English-French, no previous experience, seeks commercial position with training and good prospects.—Box 826.

APPOINTMENTS—Home and Overseas—Over two hundred are advertised in the current issue of "The Municipal Journal and Local Government Administration." Est. 1891. Price 1s., weekly or 1s. 2d. post free. Published by "The Municipal Journal," Ltd., 3-4, Clement's Inn, London, W.C.2.

Statistical Summary

GOVERNMENT RETURNS

For the week ended September 11, 1948, total ordinary revenue was £37,690,000, against ordinary expenditure of £35,375,000 and issues to sinking funds £560,000. Thus, including sinking fund allocations of £8,069,000 the surplus accrued since April 1st is £252,139,215 against £211,126,218 for the corresponding period a year ago.

NATIONAL COAL BOARD

Applications are invited from young ECONOMISTS for a post in the ECONOMIC SECTION of the Board's Headquarters staff in London. The successful applicant will be expected to undertake economic investigations and will be given considerable scope for initiative. Candidates should be economic specialists with a good honours degree; research experience will be an asset. Applications giving age, particulars of education, degree(s) taken (stating special subjects in examinations, dates and class of honours) experience and names of two economists as referees should be made as soon as possible to National Coal Board, Establishments (General) Branch, Hobart House, Grosvenor Place, London, S.W.1., marking envelope TT/88. Original testimonials should NOT be forwarded.

EMPLOYERS' ASSOCIATION: APPOINTMENT OF DIRECTOR

An important textile industrial organisation with headquarters in Manchester requires a Director of wide administrative and industrial experience. Candidates should be capable of expressing with clarity, firmness and moderation the views of the industry in its negotiations with the Government, Government Departments and Statutory Authorities on the one hand and Labour and Industrial Organisations on the other hand. No difficulty need be anticipated in arranging remuneration appropriate to the qualifications and standing of the applicant. Applications including full details of experience and career should be sent to Employment Manager, The Federation of British Industries, 21, Tothill Street, London, S.W.1.

CHARTERED Accountants, 30-35 years of age, wishing to widen their experience are invited to submit application for an appointment with a well known industrial organisation. Candidates who have served in the Forces and hold a University Degree would be given preference. The post requires good personality and administrative ability. Commencing salary up to £1,500 per annum with excellent prospects of advancement. Full details of qualifications and experience to—Box 823.

BUSINESS executive of outstanding ability with intimate knowledge of all Continental countries, South America and India, speaking five languages fluently, able to assume entire responsibility for Home and Export sales, seeks post where his unique organising abilities would be of service.—Reply to, Brownlie, Watson & Beckett, Solicitors, 241, St. Vincent Street, Glasgow, C.2.

THE BOND STREET STAMP AUCTIONS

The H. R. Harmer Saleroom is the Mecca of all serious Philatelists. The auctioneers of the "Hind" and "Roosevelt" Collections invite you to contact them if you have fine stamps or Collections for disposal. If you wish to buy, write for Catalogue subscription blank. Airmail editions of Catalogues are available six to seven weeks in advance of Sales. To all serious Philatelists, the H. R. Harmer Service is indispensable.

H. R. HARMER, LTD., 39/42, New Bond Street, London, W.1. Tel.: No. MAY 0218. Cables: "Philatamuel London."

54, 55 & 56, Threadneedle Street, London, E.C.2

GENERAL WORKS MANAGER: A well known confectionery manufacturing Company invites applications for a post as Head of the Production Division. The position is at top executive level and involves the co-ordination and control of all production, chemical and process development activities all of which are committed to a heavy expansion programme. Essential requirements: Honours degree (Engineering, Physics or Chemistry), not less than 10 years' experience in process type of industry, including three to five years at Senior Executive level; proven qualities of leadership and ability to direct operations of a team of high executives; not over 48 years of age. The appointment will carry an initial salary of over £4,000 per annum, plus pension, life assurance and other benefits; prospects of executive directorship. Only candidates fulfilling all the above specification can be considered. Please apply in confidence giving age and full particulars of education, career and salary level to Box 828.

MARKETING, Sales Promotion, and Advertising enthusiast. Manager for front rank manufacturers, also advertising agency experience. Public school man (Winchester) and lately Lt. Col. (Staff). Eats work, welcomes responsibility, uses brains. Seeks new executive post.—Box 821.

CAMBRIDGE GRADUATE, First-Class Honours. Age 26. Four years R.N.V.R. One-year Post-Graduate, Yale University, seeks post, preferably in industry.—Box 819.

BUSINESS EXECUTIVE and Engineer (44), recently returned U.K. Wide experience modern marketing, sales development and general business management in India and South Africa, seeks suitable appointment London area. Alternatively active directorship in promising undertaking capable of expansion, not necessarily engineering. Moderate capital available.—Write, Box 817.

GRADUATE (*Econ. Statistics*), 26, with experience in Banking; economic, social and market research; administration and management audit, desires to change present post for one offering greater responsibility and scope for advancement.—Box 813.

YOUNG woman Economist, Hons. London, at present employed in Planning Dept. of large engineering concern, seeks post with larger scope. Possibly assistant to commercial or industrial executive, research, literary, etc.—Box 812.

MECH. ENGINEER (28), G.I. Mech.E., Int. B.Com.(Lond.), six years' Industrial experience; specialising in production and administration; preparing externally for B.Com. in 1950, seeks industrial position.—Box 808.

TRADE ASSOCIATIONS.—Scotsman (40), available now. Chartered Accountant and Cost Accountant. Twenty-five years' experience professional, commercial, and Trade Association secretarial work, including six years' secretary-manager war-time Pool Company. Turnover £250,000 p.a. Accounting, investigations and reports, statistics, industrial organisation, price maintenance agreements, negotiations, Government Departments and Trade Unions.—Wm. Eadie, 1, London Terrace, Glasgow, W.2.

MANAGING DIRECTOR (45) seeks executive appointment, home or overseas. Wide experience commerce and industry; sound knowledge of finance. Good war record (Colonel). Many important personal contacts (banking and business) at highest levels. Excellent reference. Can introduce new capital.—Box 793.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

No Peace—No War

IT is clear that after two months of negotiations on the issue of Berlin, the Western Powers and Russia have hardly departed from their respective starting points. The Russians have no intention of raising the blockade. The Western allies believe that the airlift will enable them to stay in the beleaguered city. Indeed, Mr Bevin told the House of Commons on Wednesday that expert opinion now believes it possible to carry on the airlift through the worst of winters—although at the cost of "some discomfort for the people of Berlin." In other words, the crisis in Berlin has reached a settled deadlock, and no further despatch of Notes to Moscow and not even the reference of the matter to the United Nations is likely to resolve it.

One fact has, however, been made clear by the negotiations. They dispel any last lingering illusion about the possibility of talking the Russians into a peaceful settlement. They will talk, they will go through the motions of negotiation, but they make no concessions themselves and each concession made to them is simply the prelude to a further demand. Mr Bevin was insistent on this point.

> We are dealing with a people from whom you cannot buy peace. It reminds me of 1940, after Dunkirk, when Mr Churchill was discussing the position we were in and said "Whatever you do and wherever you go to meet the demands of the Nazis, you can't settle."

In these circumstances, Mr Bevin argued, there is no point in making further concessions. There is, in fact, no point in negotiating at all.

The implications of this position were clearly uppermost in members' minds when the House of Commons went on to discuss Mr Bevin's statement. If, in the face of implacable enmity, the limits of negotiation have been reached, what is the next step? If the Foreign Secretary has gone so far as to compare his adversaries with the Nazis and to speak of avoiding "another Munich," must the people of this country seriously consider the risk of war? Clearly, if Russian policy were exactly moulded on the Nazis', war would be inevitable. But there are differences between the Brown and the Red—not, indeed, in scruple or morality, or even perhaps in ultimate ambition, but in recklessness of method. Hitler was in a hurry and wanted war for its own sake; the Soviets have shown that they will avoid it if they can and wait upon events, which they believe to be moving inexorably in their favour. And, in spite of the hysterical attacks upon "American fascist imperialism" and the blind belief in Communism's world mission, the diet of words fed to the Russians is still very different from the glorification of militarism and war which was stuffed into the ears of the German people. These are differences which must be carefully considered before Mr Bevin's analogy is accepted as precisely exact. The Russians are not taught to seek war as such, and in the past their leaders have known when to stop. In this lies a reasonable basis for a continuing belief in peace.

The Western Powers must, however, realise that without considerable prompting on their part, the Russian leaders may not know where to stop in the future. Hitler might or might not have been able to halt the wild career of German aggression, but after the collapse of his Western

adversaries at Munich, he had little inducement to do so. The way seemed open and on he went. Similarly, today, if the Soviet leaders believed that no Western opposition would be encountered, whatever they did, they too might succumb to the temptation to expand. Dictatorship is most prone to adventurous action and least hampered by ordinary men's shrinking from violence. In these conditions, it is clear that the Western Powers' best hope of peace lies in making it perfectly clear at what point Russian action might precipitate a war.

Such a policy—one might call it a policy of armed vigilance—is nothing new in diplomatic history. In the past, Great Britain has based a large part of its dealings with Russia on precisely such an approach. The Eastern Question which was a permanent feature of nineteenth-century diplomacy was simply based on Russia's desire to expand to Constantinople checked by its knowledge that such an advance would lead to war with Britain. In seventy years, this tension did not lead to war. On the other hand, it very rarely slackened. The two nations simply lived with it—as one might with a tiresome relative.

If this analogy is exact, it is possible that the Western Powers are facing not so much a repetition of Hitler as the recrudescence of the Eastern Question on a much larger and more troublesome scale. To counter it they need to leave Russia in no doubt that further expansion means war but that, short of war, some sort of living together is possible and even desirable. To accept such a diplomacy means the abandonment of dreams of complete, untroubled peace. Vigilance, resolution and armed preparedness are the price the West must pay. But equally it does not entail the certainty of war. It is true that so long as the boundary between the two worlds runs across the living heart of Germany, no balance can be anything but unstable—the whole German people will have an imperative interest in upsetting it. It is also true that the state of "no peace—no war" is particularly trying to the temper of democratic states where people's longing for peace makes them impatient with half-peace and unwilling to accept its burdens. But in a world where total peace is unattainable and total war is its alternative, the Western Powers should be ready and even grateful to settle for perpetual vigilance and an "Eastern Question."

The practical application of this policy to Europe is, in the main, straightforward. It involves a formal warning to Russia that any further advance will lead to war. It involves the conclusion of a Western Defence Pact to include the United States and the Commonwealth and the acceptance of an agreed and pooled policy of partial rearmament and of general military preparedness. It also demands the political and economic consolidation of Western Europe. On the other hand, it should be accompanied by a general willingness to work with Russia, inside and outside the United Nations, on all issues which further the world's economic and political stability.

None of this is new. But it is now clearly urgent to pursue the policy with a new vigour, speed and enthusiasm. The line must be clearly drawn and the world—including the Russians themselves—must be given the conviction that any infringement of it will be resisted to the utmost. Only when that confident conviction has been created, will it be safe to enquire whether there is a balance of advantage or of disadvantage in permanently maintaining Berlin as an outlying garrison of the Western world.

Progress Report

SIR STAFFORD CRIPPS enjoyed a triumph in the House of Commons on Thursday of last week. His supporters have been heartened more than by anything else that has happened since the fuel crisis, and even the ranks of Tuscany could scarce forbear to cheer. Partly this was the welcome that any report of even moderate cheer can expect after a long siege of gloom. But in the main it was a deserved tribute to the masterly exposition of a very considerable achievement. Twelve months ago the last reserves of Britain's solvency seemed to be running out with alarming speed. Sir Stafford Cripps, coming to the Treasury in November, has been chiefly responsible for the measures that have stayed the flux and restored the position—not, indeed, to where it ought to be, but to where it was before. He has had good luck as well as bad; but his merits are the greater because he has had more of the bad than of the good.

The salient figures in the White Paper can be easily summarised. In 1947, Britain's payments to other countries for goods imported and services received were no less than £630 million in excess of receipts. This gigantic deficit has been reduced in the first six months of 1948 to £140 million—that is, at the rate of £280 million a year, which compares with £370 million two years ago. Moreover, within this general improvement, there has been a particular improvement in British trade with the Western Hemisphere (which is not quite the same thing as the dollar area). The deficit in this trade in the first half of the present year, when corrected to an annual basis, is less than half the deficit of 1947 and only a little larger than that of 1946. Furthermore, as a third improvement, the outflow of reserves to pay for capital transactions (as distinct from the current trade of which the previous figures consist) has also been arrested. In 1947 the loss of gold and dollar reserves was over £30 million a month greater than the deficit on current account; the corresponding figure for the first half of this year is little more than half as much. This final figure of the net change in gold and dollar reserves is, of course, the all-important one. In 1940 the country was losing gold and dollars at the rate of £19 million a month. In 1947 the rate of loss rose to £85 million a month. And in the first half of 1948 it was down again to £42 million a month.

One more statistical comparison may be of general interest. The deficit on visible trade—that is, in goods—is now almost exactly what it was in 1938. But the surplus on invisible account—that is, the net export of services—is now barely one-eighth of what it was ten years ago. The detailed figures are as follows:—

	1938	1948 (Annual Rate)
	(£ Million)	
Visible trade	−302	−312
Shipping	+ 20	+ 66
Interest, profits and dividends	+175	+ 36
Films	− 7	− 14
Travel	− 12	− 20
Government overseas expenditure	− 16	−114
Other invisibles	+ 72	+ 78
Invisible trade	+232	+ 32
Total Deficit on Current Account	− 70	−280

Nearly the whole story is in these figures. The deficit in visible trade has been brought back to the prewar figure—but only with heroic efforts, since the shift in prices has been such as to require an increase of 30 per cent in exports, and a decrease of 19 per cent in imports, both by volume, to achieve the same money balance. But the invisible account, instead of almost covering the visible deficit (1938 was not one of the best prewar years) now covers only one-tenth of it. For this the great increase in the overseas expenditures of the Government and the even greater fall in investment income are to blame.

These figures are subjected to detailed examination in an article on page 504, and there is no gainsaying the fact that the process modifies some of the satisfaction that is natural at first sight of the improvement that has occurred since last year. But Sir Stafford Cripps was right, in the whole community's interest as well as his party's, in thinking that this was not the time to dwell on what is still unsatisfactory but rather to engender some pride in what has been done. British self-confidence is not very high at present and it deserves a boost. The fact is that great efforts have been made and that they have produced results.

It is not often realised, either in this country or, particularly, in the United States, how well the British record in the last three years shows up in comparison with that of other countries that found themselves in a roughly similar predicament. The reading of almost any comparative document, such as the "Survey of the Economic Situations and Prospects of Europe" published some months ago by the Economic Commission for Europe of the United Nations, or the Annual Reports of the Bank for International Settlements, brings this out very clearly. There is a chart in the former document showing, for each of the European countries, how the volume of exports has moved since 1938 in relation to the volume of imports—as fair a test as any of a country's willingness to stint itself and make efforts to pay its way. In that diagram, the United Kingdom is in a class by itself. Is there another country in the world that has been willing to impose such crushing taxes on itself for the sake of financial rectitude, or that has been willing to carry on its own reserves the burden of other countries' trade deficits? It is the knowledge of these things, incidentally, which creates resentment in London when accusations are heard from America that Britain is "dragging its feet" in European recovery. Judged by any absolute tests of what is necessary or desirable, there are many defects in British economic policy, which have not been passed over wholly in silence in these columns. By the relative test of what others have done, the record is magnificent.

*

It is, however, unfortunately a cold, hard and unjust world. In the long run, the test of British economic policy will not be whether it has involved effort and abstinence in meritorious degree, or whether it has been as good as others; the test will be whether it has matched the need, whether it has succeeded in restoring independence and self-respect to the British economy. The figures that Sir Stafford Cripps gave to the House of Commons last week are proof that there is no longer any need for panic. Enough time has been won for sober policies. But they also need examination for the light they shed on the future prospect.

How is the battle for independence going? It is certainly going better than it was last year, when it was being lost hand over fist. But beyond that there is equally certainly no cause for rejoicing, and still less for throwing caps in the air. For one thing, all that has been achieved has been to get back to the position of 1946. Gold and dollar reserves are still being used up at the rate of £42 million a month, and though the flow of Marshall dollars—as long as they last—will reduce these drafts, the figure still stands as a measure of the deficit that we should have to meet if we stood alone. And the total reserve of gold and dollars stood on June 30th at only £473 million. To spend at a rate that would bankrupt us in twelve months is an improvement on last year's rate of loss, which would exhaust the present reserves in less than six months. But it is hardly a sufficient ground for complete confidence in the future.

Secondly, the improved results of the present year, such as they are, have been achieved only by such a severe restriction of imports as would be quite intolerable as a basis for permanent policy. A future prospect which holds out no hope of relief from food rationing, from the newsprint shortage, from petrol rationing, from the restrictions on foreign travel and from all the rest of the paraphernalia of austerity is not one on which permanent prosperity can be built. The wonder is that it has been endured so long.

The third reason for insisting that the battle is not yet over is that the whole matter completely depends on the maintenance of the present very high level of exports. Miracles have been performed in the export drive, and are still being done every day. But the world is still living under the sign of the sellers' market. With one or two exceptions, it is still true that if goods can be produced, they can be sold. These conditions will not last for ever. Some day—and perhaps some day soon—supply will catch up with demand. It takes a high degree of hardihood in optimism to believe that, when that day comes, British exports will stay up at the level of 130 per cent of 1938, or the even higher figures that are posed as targets. If they do not, there is no telling what may happen to the British economy. But they will stay at these levels in a buyers' market only if British goods make a sufficient appeal to the buyer. They must not be content simply to hold their place in competition, for their place—the place they occupied when last there was a buyers' market—is only 100 per cent of 1938. They must undercut the world.

It is difficult to reach any conclusion about whether British exports are, at present, competitive— that is, about whether they would be competitive if there were any competition. The evidence is conflicting. But there is no evidence at all that they are undercutting the market. Moreover, when the buyers' market comes, there are many other countries that will prove much nimbler at reducing their prices than Britain. There are a number of countries where it is not considered heresy to reduce wages, or where the search for economies in production is far keener than it is here, or where internal competition

OUTSTANDING VALUE IN LIFE ASSURANCE

ESTABLISHED 1844

EQUITY & LAW

LIFE ASSURANCE SOCIETY

20, LINCOLN'S INN FIELDS, LONDON, W.C.2

still puts a sharp edge on ingenuity. In addition, most other countries, if they are put to it, can reduce their selling prices by devaluing their currencies; the pound sterling, if it were devalued, would be followed down by most of the other currencies of the world. Indeed, the last time that device was tried, the pound was out-devalued by the dollar itself within eighteen months.

From now on, the factor that governs Britain's ability to survive is costs of production. Hitherto the need has been for increase of production, cost what it might. The achievement has been great, but it has also been costly. Not much more can be done—or at least done quickly—in pushing up the physical volume of production, the official campaign of exhortation to the contrary notwithstanding. What can and must be done is, while maintaining the volume of output, to effect a real reduction in the costs at which it is produced. Sir Stafford Cripps knows this. It would be encouraging to detect a sign that anybody else in the Labour movement knows it too.

Testament of Bernadotte

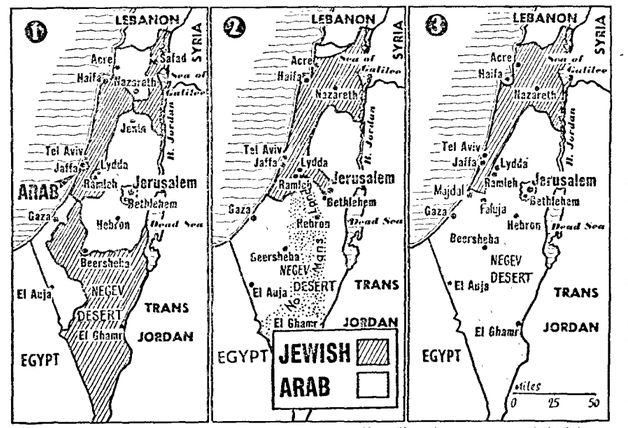
POLITICAL assassination is always a horrible thing. But last week's deed in Jerusalem is horrible even to this brutalised generation. The thought of who it was that was killed, of what his purposes were, of what he symbolised and of how much harm his death will do, most of all to his killers, inspires only exclamations of incredulity that men can be so wicked and of pity that they can be so foolish. Yet how many delegates to the Security Council and Assembly, as they have stood to honour the memory of Count Bernadotte, have asked themselves the immediate and vital question which will write his epitaph: Is the man with the tommy-gun to dictate to the United Nations what is to happen in Palestine? For Count Bernadotte left not only a memory but also a testament, which now lies before the delegates to the United Nations and was signed just before his death in their service. His report makes the two essential points with great clarity. The first is that it now rests with the United Nations whether a solution can be reached without further bloodshed. "The conclusion is inescapable," he wrote, "that at some juncture vital decisions will have to be taken by the General Assembly." His second point is that the juncture has now arrived. "Not even increased numbers of observers could for long maintain the truce in the city of Jerusalem if it should appear likely that a settlement would be indefinitely deferred." His murder merely serves to underline the need for decision and despatch. The issue which it sets before all delegates and their governments is whether or not to use force to back their will. Nothing else will be respected in the pass to which Palestine has come.

The fact is unpleasant, but not new. The murder of Count Bernadotte and Colonel Serot is but the sequel to those of Lord Moyne and the British sergeants Paice and Martin. Unwillingness to apply a solution unachievable by consent was the cause, after twenty years of effort in other directions, of Britain's abandonment of the problem. Now the United Nations must face the same issue or else surrender to the Stern gang. For, as matters stand, the Zionists are the only people possessing both the will and the tools to enforce an end in the affair. The Arabs lack the latter, the United Nations lack both. Unless, in Paris, they hasten to repair this omission, they have no option but to surrender to the tommy-gun.

Count Bernadotte's posthumous service to the United Nations is not merely that his death brings out, in relief so clear that none can ignore it, the supreme importance of the moral issue of exerting authority. He has also told the United Nations what to enforce. His report contains a proposed solution for the problem of Palestine that is both precise and practical. His scheme takes into account existing conditions on the spot, such as Israel's successful expansion in northern Palestine, and the myth still current in the Arab states (owing to their Governments' lack of the courage of honesty) that the truces baulked the Arab armies of victory. The report shows plainly that the most that the Arabs could hope for from a fight to the finish would be a stalemate, which, since it would imply the existence of a Jewish state, would be a Jewish triumph. The matters of fact that it establishes beyond dispute are first, that the zigzag partition line prescribed by the 1947 Assembly is a dead letter, along with the plan for economic union that was its corollary; and secondly, that the Jewish state is, within a circle of gunfire, a "living, solidly entrenched and vigorous reality." In short, there must be partition, with a fully sovereign Jewish state.

So much the fighting has made finally clear. But does it follow that the line of partition must follow the line of truce? The first truce, from June 11th to July 9th, froze a position in which the Arab armies dominated large parts of the territory labelled Arab by the 1947 Assembly. But in the ten days after they decided to resume fighting, they lost all western Galilee and a considerable Arab area in the central coastal plain. Count Bernadotte did not ignore the lessons of this trial by arms. But he was unwilling to concede that military conquest is a complete title. If future harmony in the Middle East is to receive any consideration, the boundaries cannot be frozen quite as they stand. The report makes out the case in equity for handing back some areas that were one hundred per cent Arab until armed Jews ousted their inhabitants two months ago. It therefore proposes the redrawing of the map to form two states (each containing one free port) and one international city. The proposals—sketched on the opposite page—prescribe that the Jews shall retain their gains in Western Galilee but shall renounce, in the south, larger but less fruitful districts formerly assigned to them in the Negev. The report proposes that they shall withdraw from the Arab cities of the plain, Ramleh and Lydda, and that Haifa sea and airport (in Jewish territory) as well as Lydda airport (in Arab territory) shall be free ports. It seeks to remove Jerusalem from the dispute by making it an international city.

A glance at the maps is enough to show that the Bernadotte proposals are an improvement on the Assembly scheme in practicability and on the adventitious truce line in justice. But as experience has proved time and again, and as Count Bernadotte was plainly aware, a new map is not a solution. The Palestine problem is not an exercise in history, or geography, or economics, or even in abstract equity, but in politics. A solution that will work has an insuperable advantage over all others; and one that will not work is useless, be it never so perfect on paper. For any plan to work, two conditions are necessary. The first is that it should be by its nature such that the Arabs and the Jews, though they will not voluntarily accept it now (the time has long since passed when it was possible to think of a solution that would be immediately acceptable to both sides), can reasonably be expected to accommodate themselves to over a period of time. This test the Bernadotte plan passes fairly well. A great majority of the Jews would have thought themselves lucky if they had been offered as much at any time before military success turned their heads. And those Arabs who have digested the lessons of the past five months may now count themselves lucky to have so much left.



The second condition that any plan must fulfil before it has a chance of working is that some outside power should have sufficient confidence in it to enforce it while one side is swallowing its pride and the other is moderating its ambitions—that is, until it becomes freely accepted. The "outside power" used to be Britain alone, and now that it bears the name of the United Nations nothing can be done without the agreement of the British and American Governments. The great advantage that the Bernadotte plan has over all previous proposals is that it has been accepted both in Washington and in London.

This fact at once creates a new hope. But it is not by itself enough. For great though the moral effect of agreement between America and Britain, endorsed by the United Nations, would be, the problem of Palestine is far beyond the stage at which it can be solved by moral means alone. Physical force will be needed. Even if both Jews and Arabs can be persuaded, cajoled or compelled to put their names to it, Count Bernadotte's report points out the necessity for the enforcement by the United Nations of a wide separation of the troops of both sides through the formation and policing of demilitarised zones.

Moreover, there is very little real reason to expect acceptance of the Bernadotte proposals—that is an acceptance sincere enough to stand up against the temptation that would be provided by the absence of enforcement. Those who, running in blinkers, still hope for a different way out, place hopes in the headline news of Israeli hunts for assassins. They see a chance of the triumph of lawfulness over terrorism in Irgun's agreement to disband. Undoubtedly, there are, inside Israel, many men and women who would like this to happen—who fled, when they fled Hitler's Europe, the ascendancy of the very doctrines for which the Stern gang stands. But to assume that their wishes will be fulfilled is wishful thinking. The professed objective of the Stern gang is a Jewish Jerusalem, and though many Jews may privately accept that this is unattainable, none can fail to sympathise with it or dare abandon it in public. Moreover, fugitives from justice can always find shelter amongst a population accustomed, by the habit of centuries, to help co-Jews to evade pursuit. Retreat underground is easy in a country teeming with newcomers and well provided with shelterers. Above all, the Stern gang is not composed of brawns without brain; it can be skilfully stirred up or soft-pedalled by men who are fired with a sense of mission and with memories of "martyrs" in their cause; their oaths to preserve Jerusalem from any but Jewish hands need to be taken seriously. Their threats endanger not only foreigners but also Israelis who have any truck with compromise. The Arab refugees created by the fighting are also, paradoxical as it may sound, an obstacle to Israel's moderation. Count Bernadotte's report makes it clear that a restitution not only of status but also of property to these 360,000 hapless people must be an integral part of a peaceful settlement. Nothing else would be just; but it would also be difficult and costly for Israel.

Count Bernadotte's testament provides a better hope than ever before of a solution to the thorny and exasperating problem of Palestine. But it also leaves no doubt at all in the mind of anyone who reads it that the hope will not be realised unless the United Nations is at last willing to grasp the nettle of enforcement. The force may not, in the event, have to be used. But the inescapable implication of all Count Bernadotte's findings is that only a seriously meant, and seriously taken, threat of irresistible force, and nothing short of it, can bring the parties to consider a negotiated settlement.

But if the nations now assembled in Paris are to quicken into action, they need a lead from some quarter. The application of force needs to be disinterested and accepted as such; it could not come from Britain. It also needs to come from someone in a position to implement a share of the responsibilities entailed. It must come from a power able to use political and, if necessary, physical force. Why should a small power—bereaved Sweden, for instance, or Belgium—fill a role that great powers are shirking? Russia, which hopes for the total ascendancy of a Communist Israel, does not want to fill it. The only possible candidate for saving the United Nations from surrender to violence is the United States. The role is, for the American Government, unenviable. It might entail the pitting of armed American umpires against Israeli soldiers — a thought almost unthinkable when a presidential election is less than two months away. Yet to shirk the initiative is to fall victim to the voice that seduced weak men to Munich and Vichy and that has heralded every disaster of our times.

1. UN proposal—November, 1947
2. Approximate position during second truce July-September, 1948
3. Count Bernadotte's proposal—September, 1948

Last week's murder has produced, in America as elsewhere, a revulsion of sentiment against the state of Israel which, if it was not consciously condoning terrorism, was all too ready to receive its loot. What the world must hope for is that this reaction in American public opinion will go far enough to permit Mr Truman and Mr Marshall, with Mr Dewey and Mr Dulles, not merely platonically to accept the Bernadotte plan but to put all the influence and strength of the United States behind it. If so, then those who mourn Count Bernadotte will be able to give themselves the only consolation that can bring any comfort, the knowledge that he did not die in vain.

The War of Europe's Ear

WHEN the thirty-three nations concerned with the distribution of long and medium radio wavelengths in Europe and the Mediterranean gathered in Copenhagen in June, the chances of securing an agreed plan seemed small. Although the disposable waveband—that is to say, the sum of available wavelengths—had been made rather larger at an earlier conference in Atlantic City, there were still not sufficient wavelengths to meet the nations' demands. Nor was there any agreed yardstick or formula upon which to base the new allocation; the existing basis—an agreement reached in Lucerne in 1933, but since modified by the disorganisation of war—was an uncertain starting point, for it did not include the Soviet Union.

It was generally expected that this need to find room for Russian wavelengths, and to do so on an agreed basis, would very probably break up the conference. In 1946, when the nations had assembled in Brussels to include Russia in radio's international body, the *Union Internationale de Radio*, the Russians insisted that the Baltic Republics, Karelia and Moldavia should have equal voting rights. At this the British and six other delegations walked out, and the Russians set up a new unrepresentative *Organisation Internationale de Radio*. At another preliminary conference in Brussels, the Russians staked out a claim for an unduly high number of wavelengths and demanded that they should all be exclusive (a number of European wavelengths can, technically, be shared, two nations taking one end each; thus a number of Britain's medium waves are used on the other side of Europe by stations in Rumania or Jugoslavia). The outlook for the conference was not improved—from the British standpoint—by the tendency of France in these early discussions to support Russia's claims, possibly in the hope of gaining similar backing for its own comparatively large demands.

Levant States	...	13	...	1

The first weeks at Copenhagen confirmed the pessimists' worst fears. The assembly divided itself instantly into a closely knit, uniformly voting Eastern *bloc* opposed by a much looser but recognisable Western *bloc*. The usual Russian conference techniques came into play, and for week after week delegates sat for hours listening to ferocious objections on procedural points, violent attacks upon the (unrepresented) Spaniards and repeated attempts to secure representation and full rights for the Baltic Republics and for Karelia and Moldavia. After a month there was not even an agenda; late and early, the Soviet delegation, working with a tirelessness and a precision that aroused a sort of distasteful admiration in the Westerners, shepherded the obedient satellites, outsat everyone in committee and stonewalled on every issue.

Just as the Western delegates were beginning to wonder whether they might not just as well pack their bags, the Russians apparently decided that the endurance test had lasted long enough. In the numerous working parties that spawned off from the general conference to consider technical issues, a hint here and a hint there suggested that they might after all be anxious to secure an agreed plan. Under cover of the war of words still raging on the surface, the process of concrete bargaining began. In the course of it the Russians made genuine concessions. For instance, they abandoned one or two wavelengths and dropped their demand that their wavelengths should be exclusive. A small group of experts worked on the allocation chart, and at the beginning of September a plan was completed which, with certain reservations, satisfied all save seven countries—Austria, Egypt, Iceland, Luxemburg, Sweden, Syria and Turkey—each of whom had a special grievance. This plan will come into force in March, 1950.

Agreement was possible because the chief powers—Britain, France and Russia—had an ultimate common interest in orderly broadcasting, and because each could prevent the others from using disorder to its own advantage. It would have been useless, in the long run, for any power to grab a wavelength not allotted to it, since the other powers could nullify the gain by jamming its broadcasts. Thus the incentives and the deterrents were equally balanced. East could only spite West by action which would lead to West spiting East. The idea of British broadcasts to Europe was no doubt as unwelcome to the Russians at the beginning of the Copenhagen Conference as at the end, but they could have prevented it only at the risk of Britain interfering with all Russian broadcasts to Europe; and if one fact emerged more clearly than any other, it was that the Russians set a very high price indeed upon their channels of foreign propaganda and wish above all to keep their unimpeded access to Europe's ear. When the new plan goes into effect, the Russians will dispose of exclusive long waves, exclusive and shared medium waves. If the allocations to the satellite states are added, the channels used by the Eastern *bloc* will amount to exclusive long waves, exclusive and shared medium waves.

The French delegation showed a tendency throughout the Conference to attempt to act as a "bridge" between East and West. This technique was not unsuccessful, and France emerged from the conference with one exclusive long wave, 5 exclusive and 13 shared medium waves, a total slightly above that of Britain, whose broadcasting services are much more highly developed. Nevertheless, the British delegation, whose rocklike patience was the chief reason why the conference did not break up after the first weeks of procedural battle, secured what they set out to secure—sufficient wavelengths to cover the BBC's present services.

With one exclusive long wave, two exclusive and eleven shared medium waves at its disposal, the BBC need make little change in its present schedules. This fact is in itself a victory, since British services today are being carried on by means of wavelengths one or two of which were "borrowed" during the war, and which might therefore have been lost in any agreed postwar plan. The home services will undergo small changes—for instance, a number of them will drop to lower wavelengths, but their reception should be unimpaired. The only exception is that one of the wavelengths at present used by the Third Programme—203 metres—has had to be given up and a wavelength below the 200 mark—195 metres—accepted in its place. This wavelength is unfortunately just outside the range of many existing wireless sets, though it will be quite easy to extend the range of new sets to cover it.

Over one point only did the British delegation feel compelled to enter a reservation. The wavelengths allotted for broadcasting in Germany are very unsatisfactory. Most European nations followed the Russian lead in declaring that the Germans had forfeited the right to good wavelengths, and there was support for the Russians' entirely inadequate proposal that each Zone should have one medium wavelength only. The British were uneasy at this development. They had in mind the strength and number of long waves available in the East for direct broadcasting into Germany and felt that the Russian plan would leave the Western Powers with no comparable advantage. They were able to get the number of medium waves per Zone increased to two but the coverage is still inadequate and the field appears to remain wide open to Eastern broadcasts on strong wavelengths. The British Government has made an official reservation on this point and attempts may be made to modify the position before 1950, when the plan is to come into effect.

The agreement reached in Copenhagen undoubtedly goes a long way towards avoiding chaos in the air. As a proof of the possibility of agreement, it is to be welcomed. As a technical plan, it is satisfactory. There are, however, two reasons why its results may not prove as promising as they seem today. The first reason is the lack of any international organisation to oversee the working of the plan, to keep nations on their wavelengths and generally to enforce its provisions. The old *Union Internationale de Radio* is anathema to Russia. The new *Organisation Internationale de Radio* set up under Russian aegis has not secured Western adherence since it still includes the Baltic and other republics. Yet the Copenhagen agreement refers constantly to the rights and responsibilities of the "expert international organisation." It does not yet exist.

The second reason is that one large field of broadcasting—shortwave broadcasting—has still to be agreed. A conference will meet this autumn to consider the allocation of short wavelengths and the Russians will undoubtedly seek to absorb most short wavelengths into purely internal broadcasting. Such a step would prevent nations from using short wavelengths to broadcast to other countries and would thus virtually stop British broadcasting to Eastern Europe. Medium waves from this island reach only to the fringes of Hungary; all broadcasting beyond that must rely on short wavelengths. Short wavelengths are in fact the only answer the Western Powers have to the concentration of medium and long waves under Russian control. The Copenhagen Agreement is thus only a phase in the battle for the ear of Europe. The decisive struggle lies ahead.

NOTES OF THE WEEK

The Parliament Bill

After a week of useful debate provided by the Address, the House of Commons turned on Monday and Tuesday to the real business of the short session—the passage of the Parliament Bill, 1947, through its second session. Because there was almost nothing new to say, Monday's six-hour debate upon the second reading was one of the poorest since the beginning of this Parliament, and because there was no possibility of compromise or alteration in the Bill, the speeches were of the *tu quoque* type, but without the gaiety which a university union can generally instil into this kind of argument. Mr. Morrison, drawing strength from the unanimity of the Labour Party on this issue, was concerned not so much to argue the merits of the Bill as to disprove the charge that it is aimed at forcing the passage of the Iron and Steel Bill. Not content with the most earnest of denials, he went so far as to say that even if Lord Salisbury and Mr Churchill gave a signed undertaking that the Lords would not reject the Steel Bill, the Government would still proceed with the Parliament Bill.

It would take more than affirmation to make Mr Morrison's denials convincing. If the Government is interested solely in the curtailment of the power of the House of Lords, the Parliament Bill could have been introduced earlier and passed into law without the necessity of a special session. If it is so anxiously concerned with the proper expression of the people's will, why has it not shown itself more interested in reforming the composition of the Upper House? If the special measures taken to ensure the passage of the Parliament Bill are not designed to protect the nationalisation of iron and steel, what are the unpopular measures which the Government proposes to introduce in the 1948-9 session? Mr Morrison may be a skilful Parliamentarian, but he should realise that to say that black is white upon the floor of the House advances him little if circumstantial evidence and common knowledge show that black is black

If the Government's motive is suspect and the affirmation of its leaders mere bombast, the Conservative argument is little stronger. To insist that it is impossible to discuss the powers of the Lords without reference to its composition, can equally be inverted to show that it is impossible to consider reforming the Lords and yet ignore the question of their powers. If reform of composition was their most earnest desire, they gave up a priceless strategic position—indeed, the only strong one which they have occupied since 1945—by permitting the all-party talks of last spring to break down. The great test of the continuing sincerity of the Conservative desire will come when they are next in office.

The Work of the House

However imperturbable Mr Morrison may appear on the floor of the House, he has apparently found it necessary to defend not only the Government's Parliamentary policy, but the House of Commons as an institution. In a speech delivered last Saturday to the Southern Regional Council of the Labour Party (who probably expected quite a different kind of oration), he explained the functionings of the House of Commons with the double object of showing that the pressure of modern conditions had not reduced the adaptability and efficiency of Parliament as a legislative body, and to refute the picture of an Opposition bound and gagged by the Government's control of business. Out of 171 sitting days in the last session, legislation occupied 83½ days and the Budget and Finance Bill another 21 days, while 55 days (including presumably Supply days and debates on the Adjournment) could fairly be described as deliberately afforded to the Opposition and to private members to discharge their critical functions.

On the time allowed for debate it is true that the Opposition has no ground for complaint. It would be true to say that much of the time at their disposal has not been very well used, were it not for the fact that when a Government has a very large majority there is little that an Opposition can do except expostulate—although the members for Orpington and Torquay have lowered the level even of expostulation. But Mr Morrison evaded the real issue; it is not that the Government has appropriated too much time to legislation, but that it has forced too much into the time available, overtaxing the powers not only of Members of Parliament, but of the Ministries and the Parliamentary draughtsmen. The work of standing committees is no substitute for proper governmental presentation of Bills, as the Transport Bill and the Town and Country Planning Bill showed. Nor does the Government seem to show any concern to better the procedure by which Parliament scrutinises delegated legislation.

If Mr Morrison is anxious to preserve the best traditions of Parliament, the same cannot be said of some of his senior colleagues. Last week both Sir Stafford Cripps and Mr Bevin, charged with the introduction of important debates, read prepared speeches and left the Chamber shortly after their delivery. If a Minister has a pronouncement of policy to make which cannot wait for the reassembly of Parliament or on which no debate is possible, Limehouse or Birmingham are as suitable as Westminster, but if it is intended for the attention of Parliament, Members have the right to expect something better than a press handout and to demand a personal explanation and clarification (by a Minister and not by a junior) of the points involved,

Civil Defence

It would be unfair to blame Mr Morrison for all the implications that were drawn last week from his statement about civil defence. What he told the House of Commons was that "considerable progress" had been made with plans for assisting the population, for the reorganisation of civil defence services and for the preparation of legislation. From the adjective "considerable" some lobby correspondents seem to have been encouraged to leap to the conclusion that equipment, training, evacuation and shelter schemes were all under active consideration. There is unfortunately no reason to believe that they are.

A Ministry of Health up to its ears in the organisation of the new health services cannot hear the Home Office's plea for some thought about evacuation. A Ministry of Supply with its eyes fixed on export targets can easily overlook the existence of instructions which until lately encouraged factory managements to demolish the shelters of the last war. A Treasury as hard-pressed as the British may well be reluctant to face the fact that a supplementary estimate will be needed for civil defence—present funds are insufficient even for the slender training resources now available—and that no meeting has yet taken place with the local authorities to decide how expenditure is to be divided between them and Whitehall. How important this omission is may be judged from the fact that before the war it held up Home Office attempts to start ARP for nearly fifteen months. And there remains the obstinate refusal to allow the Home Secretary to sit regularly on the defence committee of the Cabinet and stake his claim to attention.

This is all quite understandable as well as regrettable. Some of the failure arises out of the immense difficulty of developing simultaneously long-term and short-term defence policies. But if there is to be civil defence, with all that means in new burdens for the able-bodied citizen, then Ministers should take the matter far more seriously. Among other things they should inquire what has been achieved by General Irwin's inter-departmental working parties, and whether training of civil defence cadres can in fact be begun within a reasonable time.

The bright spot in the picture is the progress being made by the army; from private to general, training is being given in the new task of co-operating with the civil population. And when the Territorial Army begins to receive the influx of trained reservists, there will be a good nucleus of trained men to rely on. None the less, there is a grave risk that their civilian colleagues will find themselves without vehicles, premises, training facilities or local organisation. There will be an opportunity to raise these questions with Mr Chuter Ede when the Bill giving him new powers is presented next month.

* * *

M. Queuille's Balancing Act

M. Queuille's Government hangs by the usual thread of the "vigilant" Socialists' wavering and unhappy support. The organised working class is not pacified by the Premier's plan to save the franc—threatened by a budgetary deficit of 114 billion francs—and all unions, Communist and non-Communist, threaten a token strike against the measures which increase taxation by 80 billion francs and cut Government expenditure by 20 billion before any attempt is made to increase wages. The Socialists are shaken by the massive hostility of the workers, and now that the Assembly, reversing a previous vote, has fixed county council elections for October, they fear that the unpopularity of M. Queuille's financial remedies will be reflected in the ballot and that the Socialists' following will be once again reduced. In these conditions their continuance in the Queuille cabinet can probably only be bought by a really important concession to the workers on the wage issue.

Only one event—a tragic one—has played into the hands of moderate government since M. Queuille became Prime Minister. At the weekend, Communist interruptions to a Gaullist rally in Grenoble led to a violent armed counter-attack, in the course of which two people lost their lives. The Government reacted strongly against what they called the General's "private motorised police" and demanded its dissolution. This reminder of the increasingly violent character of extremist politics in France sobered the Assembly and was sufficient to pursuade more than one doubtful deputy that a Third Force government, however vacillating, may be preferable to the strong arm of Right or Left.

Western Europe's Harvest

Latest reports indicate that the early hopes of good harvests in Western Europe this year will be fulfilled, in some cases even surpassed. The picture is very much brighter than last year when the European harvest was consistently bad, and the French, to take only one example, were striking for more bread and were being forced to eat unpalatable maize loaves.

This year bread grain production in Western Europe is estimated to be about 37 per cent above last year and about 88 per cent of the average annual prewar yield. The wheat harvest in the United Kingdom is expected to produce 79 million bushels compared with 62 million last year. In France the total yield of bread grains is still 15 per cent below prewar, but 7,000,000 tons of wheat are expected compared with 3,266,000 tons last year. In Italy also, the total bread-grain production is still 15 to 20 per cent below prewar, but over 6,000,000 tons of wheat are expected compared with 4,674,000 tons last year. The latest reports from Bizonia indicate that almost all the bread grain crops show substantial increases over last year.

The political implications of Europe's bountiful harvest are as important as they are obvious. Hunger is among the most potent allies of Communist propaganda among urban workers, who are easily encouraged to blame their governments alone for their empty larders and to ignore such vital factors as storms and droughts, the world dollar shortage, and even the selfishness of farmers who hoard their produce in the hope of higher prices. M. Queuille's Government would have an even smaller chance of survival than at present if France were faced with another harvest like last year's.

Moreover, last year an already parlous condition was rendered even worse by the acute dollar shortage of many Western European countries, which made it difficult for them to stock their granaries from overseas. This year an improved outlook is made even more cheerful by the Marshall dollars which are available to buy supplementary supplies from the western hemisphere's export surplus. Western Europe's good harvest should in fact much improve the Marshall Plan's chances of success. On the one hand improved rations will help European workers to make that effort of self-help upon which Americans rightly place such stress. On the other, the good domestic harvests should make it possible to spend less of the Marshall dollars on wheat—by the end of August over $305 million had been spent on wheat and wheat flour—and more on such things as raw materials and machinery which are of more permanent value in the reconstruction of Europe.

* * *

India's Five-Day War

Militarily, the defeat of Hyderabad was a foregone conclusion; the only question was whether Uno would try to restrain India from its use of force, and this Uno did not do. The Security Council having decided on September 13th to admit Hyderabad's appeal to its agenda, but having adjourned for four days without calling on India to stop the invasion, the Nizam capitulated on the following day.

From a British point of view there is a clear distinction between the result of the Hyderabad conflict and the method by which it has been brought about. Certainly no British interest, political, economic or strategic, would have been served by the continued independence of Hyderabad as a state occupying an area in the middle of the territory of India and dominated by a minority group unfriendly to the Indian Government. On the contrary, British interests require the existence of a strong, stable and geographically solid India, and the documents which have been published by the Hyderabad Government itself show that Lord Mountbatten in his personal capacity strongly advised the Nizam to agree to accession. There is little doubt that the substance of accession could soon have been obtained if the Indian Government had chosen to treat the terms offered by the Nizam as a basis for negotiation instead of resorting to threats and finally to force. What has been condemned, and rightly so, by British public opinion has been the procedure of coercion applied to a state which, by the terms of the India Independence Act, was unquestionably left independent.

The strong criticism of India which has been voiced in this country, and which has apparently been much resented in India, has not been due either to any injury to British national interests or to any anti-Indian feeling, but to British concern at the damage done by such a military invasion to Uno and the principle of peaceful settlement in international disputes. The war may have been brief and localised; it may have removed a tiresome problem from Indian politics; yet every successful use of force against an independent state is an encouragement to men of violence in a

world which desperately needs the consolidation of the will to peace. Aggressiveness is catching; so is the habit of calling it police action. There is no question of any tutorial or supervisory attitude towards India; the press of this country would have commented similarly on any nation which had taken similar action. Nor should Indians suppose that membership of the Commonwealth requires that members turn a blind eye to each other's misdeeds; the function of the Commonwealth should be to provide its members with special means of peaceful settlement of disputes, not to cover up their acts of violence. It would indeed be a compensating sequel to the Hyderabad episode if the forthcoming Commonwealth Conference were to devise machinery of arbitration to which in future such cases could be referred.

* * *

Planning Act in Difficulties

It has at last been officially admitted that the system of land transactions authorised by the Town and Country Planning Act is not working properly. It is necessary for the Act's success that land should be bought and sold in the open market at its "existing use" value, since when development takes place a charge is payable to the Central Land Board which is intended to scoop off all of the consequent increase in the value of the land. The strict theory of the Act is that no profit should normally be made out of land development by private individuals, who are being compensated once and for all for the loss of existing development values out of the £300 million fund. If owners and developers refuse to co-operate in securing the Act's intentions, one of two things may happen—either desirable development may be held up through lack of sufficient profit incentive, or else the burden may be passed on to the consumer in the form of a higher purchase price or rental for new buildings.

The present grave shortage of accommodation makes the latter alternative only too feasible. This no doubt is the main reason why land is still frequently changing hands at well above its "existing use" value. In many cases, the purchaser is paying the equivalent of the full pre-Act price for the land together with the vendor's claim on the £300 million. Since this claim will not be realisable for some time (and is uncertain in amount), the immediate cost of such land when development takes place and the Board exacts its development charge will be a great deal higher than previously. The dangers of such a situation are obvious.

The Central Land Board has now reluctantly asked the Minister's approval for the exercise of its own powers of land purchase in cases where sales are taking place at prices considerably above "existing use" values. Mr Silkin has given wholehearted approval. The Board is anxious not to use compulsion or to take action on a large scale. Some time ago, Mr Bevan urged local authorities on no account to pay more than "existing use" value for land which they acquired. But if these measures do not have the necessary psychological effect on the market, what then? Compulsory action on a large scale would be contrary to the Act's basic intentions; but it is also becoming clear that its theoretical assumptions are no match for the niceties of the land market.

* * *

Real Wages

Hansard reports Mr Douglas Jay, Economic Secretary to the Treasury, as having said *in the House of Commons on September* 16th: "*The Economist* told us the other day that the British wage-earner by one hour's work was earning more food than any other wage-earner in the world." This is a misquotation of what was written in *The Economist* so serious that it contrives to convey exactly the opposite intention. What we wrote on August 14th was that "a pound of meat, a pound of butter, a pound of bread, costs the British wage-earner less, in terms of hours of work, than it costs almost any other wage-earner in the world—including those of most of the food-producing countries." This occurred in the course of an argument in favour of "rationing by the purse," and the reference was, of course, to the economic absurdity of the food subsidy policy. The moral was the lowness of British prices, not the highness of British output. The British wage-earner does not earn more food in an hour's work than other countries' wage-earners. For the fact that he gets it so cheaply, relatively to his own efforts, he should thank the United States, Canadian and British taxpayers.

The following figures are an interesting commentary on this issue. They show the number of minutes of work required, at representative standard rates of wages for adult males, to purchase various articles in three countries. The columns for the USSR and the United States appeared in the *New York Times* in December, 1947; that for Great Britain was added by the American magazine *Time* in February, 1948:

	USSR	USA	UK
	No. of Minutes Required		
1 lb. wheat bread	70	7½	5
1 lb. veal	315	34½	37½
1 lb. butter	642	48½	30
1 pint draught mild beer	171	6½	22½
Cotton dress	1,911	142	450
Man's woollen suit	34,815	1,684	2,700

The sharp increases in food prices in the United States in the last six months will have altered the comparison, so far as it relates to food, still further in favour of the British worker. A comparison of the food figures with those for clothing shows how strongly the British worker is being induced to shift his consumption towards food—which is a curious thing to do when there is a world-wide shortage of food.

Communist Manifesto 1948

Last Sunday the executive committee of the British Communist party issued a statement condemning the wage freeze, purchase tax, rearmament, the Malayan campaign and the Marshall plan. The party has apparently come to the conclusion that, great as may have been its defeat at the Trades Union Congress, *advantage can yet be reaped by a concerted attack upon* the positive actions of the Labour Government which are likely to be unpopular with the workers. It thus sees a chance of enhancing its own prestige and of retrieving its reputation with the Cominform for a not very successful year of unrest and agitation. The Communist Party's plan for this year was, first, quietly to withdraw their support for increased production, and later to concentrate on large scale stoppages of work in key industries, especially in shipping and engineering. As it turned out, their programme has not been a spectacular success: the aggregate of working days lost through industrial disputes in the first seven months of 1948 is higher than for the comparable period of 1947 by about 8 per cent; but this is largely accounted for by an increase from 28,000 to 496,000 in the iron and metal trades, and both transport and many of the export industries show a considerable decline. The London dock strike was a worthy achievement but hardly such as to satisfy the Cominform without further success, and thus the Cripps-TUC policy on wages comes as manna from hell.

Frustrated in its attempts to increase its representation in the official hierarchy of British labour, and by the noticeable resistance to Communist activities at the lower level of union activity (although it has lately had some success on the trade councils), the party has obviously decided on more direct methods of agitation. Mr Harry Pollitt writing for the Cominform newspaper in Bucharest on September 1st put it in a nutshell:—

> In leaflets and pamphlets, through its press organs, by the organisation of local petitions of housewives protesting against the cost of living, and for wage advances to meet the constant rise in the cost of living, the Communist Party stands out as the real defender of the interests of the working people.
>
> These campaigns now begin to meet with an increasing response as the immediate reaction of the engineering workers to their being refused a wage advance so clearly proves.

The new line of action is to concentrate the attack upon taxation and upon profits, and to cheer on any union which is pressing for higher wages, while preying upon the very real popular fear of war. But it appears that the party line is not quite straightened out as yet. At a meeting of the London Communist party on September 12th, Mr Pollitt, after offering to apologise if anyone mistakenly thought that increased production was still on the programme, said that it and class co-operation might have been desirable had they been on the verge of a revolutionary situation "but had nothing in common with the present objective situation" and that "no Communist party in the world needed to win allies more than our own." If the Communist party is out to confound the Labour Government, where does it expect to find allies—from the Trotskyists perhaps?

The Kettle Boils Over in Java

After the weary months of uneasy truce, abortive negotiations and Uno "good offices" which have elapsed since the Security Council checked the last Dutch "police action" in Java,

a fresh crisis has now arisen with the seizure of power by Communists in part of the territory held by the Indonesian Republic. From the beginning the Communists had been active as a section of the Indonesian nationalist movement, but they had made no open attempt to seize power for themselves; indeed, they seem to have tried to remain as inconspicuous as possible, while building up, and gaining control of, various mass organisations of peasants, labourers and youth.

Recently, however, two important Communists, Moeso and Soeripno, arrived from Russia, apparently with fresh instructions. For Moeso on the one hand conducted negotiations for the formation of a *bloc* with other parties and groups of the Left against the Hatta Government, and on the other sharpened the Communist line to one of uncompromising extremism. In highly inflammatory speeches in the early days of September he called for an immediate division of all land among the peasants, for a ruthless struggle against the Dutch—he said that the Communists recognised neither the Linggadjati nor the Renville Agreements concluded by the Republic—and for the alignment of Indonesia with the Soviet Union in the event of the latter being at war with the United States. These speeches were followed by armed revolt; the Communists have captured the town of Madiun with the aid of some regular troops who joined them and irregulars of the Pesindo, the Communist-controlled youth movement. The Hatta Government responded with police action against the Communist *bloc* in places which remained under its control, and the Republican Parliament vested President Soekarno with emergency powers for suppression of the revolt.

The splitting of the Indonesian nationalist movement follows the Communist revolts in Burma and Malaya and coincides in time with the assassination of U Tin Tut, the most able of Thakin Nu's colleagues in the Burmese Government and a man whose friendship with Britain was, unfortunately for him, beyond doubt. In each of the countries where the Communists have resorted to armed revolt, their greatest anxiety has been to prevent any compromise or reconciliation between the more moderate nationalists and the British or Dutch. In Burma, where Britain has conceded full independence, the anti-British campaign has been switched to the economic field, with propaganda to the masses that all will be well for them if only all foreign capitalists are expropriated. In Indonesia, the demand for political independence can still be exploited by the Communists. Hatta has declared that he wants no Dutch aid in dealing with the revolt; if he can crush it, the way should be open to an early settlement with Batavia; but if he fails, direct hostilities between the Communists and the Dutch will certainly follow.

Socialists Hold Fast in Sweden

The Social Democrats in Sweden have received a vote of confidence from the people. This is the unexpected result of the general election held last Sunday. The recent steady swing to the Right has been halted. It is significant that this should have happened at a time when the country's serious difficulties, so easily attributable to the party that has been paramount for over a decade, laid the Government open to valid criticism. Compared with the steadiness of the Social Democrat vote—it has increased from 1,415,000 in 1944 to 1,750,000, winning 112 in place of 115 seats in the Lower House—the remarkable gain of the Liberal People's Party (*Volkpartiet*), who polled 850,000 votes compared with 390,000 in 1944 and secured 57 seats as against 26, is of secondary importance.

The Liberal success was achieved almost entirely at the expense of the other parties of the Right, which lost heavily. The Conservatives now have only 22 seats compared with 39 and the Agrarians 30 instead of 35. They may derive some consolation from the decrease in Communist representation from 15 to 9. But in other respects the prospect for them is unexpectedly bleak—and the fact that there was a record poll of some 80 per cent of the electorate rules out any attempt to blame absentee voters.

There is now little doubt that the Social Democrats will retain sole power. Other parties' confident hopes of taking a share in office have faded. The Premier, Mr Erlander, has already said he will accept the renewal of his mandate provided by the elections. There is, therefore, scant likelihood of any changes in Social Democrat policy except towards measures which hard facts or political tactics impose.

The powerful Liberal Opposition, under the brilliant but equivocal leadership of the economist Professor Ohlin, will have plenty of opportunity and ammunition for preliminary sharpshooting as the Government goes ahead with unpleasant measures to meet a serious economic situation; but the lack of an absolute majority will prove a more serious difficulty to the Socialists than the attacks of the Opposition. In home affairs they can rely on the Agrarians or, according to circumstances, on the Communists, to support their measures. In foreign affairs all non-Communist parties will collaborate. In controversial measures events had already to a large extent imposed on the Social Democrats the caution which is needed to secure allies from Right or Left. The elections, although important for the future of the various parties, have changed little.

Defence in the Dominions

The lead given by Britain in overhauling and strengthening its defences is being followed in Canada and Australia. On Sunday Mr Brooke Claxton, the Canadian Minister of Defence, opened a new recruiting campaign, saying that Canada's defence forces were now seven times larger than before the war (although this represents an increase in the army only from 2,800 to 18,000 men) and that they will be built up further to meet the immediate needs of defence. In Canberra the Australian Defence Council has been meeting this week to discuss possible changes in its £250 million defence plans. The withdrawal of Australian troops from Japan has been proposed, and a sub-committee of the Federal Cabinet has been set up to review civil defence measures.

These are welcome signs of the willingness of the Dominions to take a greater share in the defence of the Commonwealth. Both Canada and Australia occupy strategic positions in the world and their ability to defend themselves will relieve Britain of a burden it can no longer bear. Nor are the Dominions moved only by self-interest. The acting Prime Minister of Canada, Mr St Laurent, speaking in the same recruiting campaign as Mr Brooke Claxton, said that the need for military forces was "to defend our country and to take our place in any arrangements for collective security we may assume."

Welcome as are these signs of increasing responsibility of the Dominions for their own defence and the development of regional defence pacts, there is still a lack of central direction of Commonwealth defence as a whole. The abolition of the Imperial Defence Committee at the end of the war has left a gap which needs to be filled. Although the training of staff officers and the development of technical equipment is co-ordinated, the higher direction of defence strategy is still left to the individual Dominion governments. The notable exception is the co-ordination of Canadian defence policy with that of the United States.

Court Martial Reform

In the Commons on Tuesday, Mr Shinwell announced certain reforms in the organisation of the Judge-Advocate-General's Department affecting both the Army and the Air Force. In form, the apparent scope of the reforms is small. In future, the Judge-Advocate-General will be answerable to the Lord Chancellor and not to the Secretaries for War and for Air. Instead, the Service Departments will set up their own internal organisations to provide advice before prosecution and to deal with the actual prosecutions at the court-martial trial itself. The Judge-Advocate-General's Department will be concerned only with the court itself, and the subsequent review of the proceedings. None the less, these changes are of considerable importance.

A Service trial by court martial resembles most closely the proceedings in a magistrate's court. The prosecuting and defending officers are serving officers probably without legal training. The court itself is also made up of serving officers, who may have a good deal of experience of Service life and procedure but who, again, are probably without formal legal training. The Judge-Advocate-General's Department has, hitherto, played a double role. It has had the duty of advising the prosecution on the preparation and conduct of the case, and also of advising the court itself on any legal points that arise during the trial, as, for example, the admissibility of evidence. It is possible for an individual successfully to divide his mind between these two functions, but if he fails to do so, injustice may easily arise. If a similar procedure existed in civil courts, it would be as though the police superintendent supervising the prosecution in the court had also the duty of acting as magistrates' clerk in advising the bench on any points of law.

The War Office has taken its time in effecting this reform. It was first proposed by a Committee in 1938, and re-affirmed by another in June, 1947. It comes into effect on October 1, 1948.

The Noxious Weed

The subject as well as the substance of tobacco is so inflammatory that it is of value to have a factual survey* of the smoking habits of this country as a check to unsubstantiated assertions about, for example, the greed of women smokers, or the deprivations due to taxation to the working man. The survey is based on 12,600 inquiries collected as an offshoot of the Hulton Readership Survey for 1948. It reveals two particularly interesting aspects of the demand for cigarettes and pipe tobacco, which should be valuable in any controversy about tobacco rationing or tobacco duty. The first shows the comparatively small demands for tobacco made by women. Although 39 per cent of all women over 16 smoke (as compared to 81 per cent of men), they consume only 17 per cent of all tobacco supplies. Even excluding the large proportion of women who do not smoke at all, the average male cigarette smoker consumes 14¾ cigarettes a day and the average woman smoker six cigarettes. Henceforth no man should be able to get away with the theory that his female clerical staff or his wife's friends get an unfair share of tobacco supplies. Any joint rationing scheme for sweets-or-tobacco would have to take account of this very large disparity in demand.

PERCENTAGES OF CIGARETTE SMOKERS IN EACH CLASS AND AGE-GROUP

Age Group	Well-to-do & Middle*		Lower-Middle*		Working*	
	Men	Women	Men	Women	Men	Women
16–24	64	37	60	44	71	47
25–34	61	50	67	52	75	52
35–44	70	52	71	47	77	40
45–64	69	42	69	38	72	31
65 and over	46	22	45	18	43	16

* Based on a combination of social and economic criteria.

Even more surprising is the uniformity in smoking habits between the various income groups as shown in the table. The inquiry was conducted during the first three months of 1948, and does not therefore reflect the most recent tax increases. Nevertheless, the level of taxation at that time was considered to be crippling and to be having a serious effect on working-class morale. In the absence of earlier research, it is not possible to say how individual smoking habits have altered since, say, 1946 or 1947. All that one can conclude from a single survey is the extraordinary tenaciousness of the smoking habit. If in spite of present levels of taxation men earning under £400 a year can still smoke in larger numbers than the higher or middle income groups, the habit is clearly very strong. Even when the figures are broken up, as they are in the survey, to reveal the amount smoked per head between different income groups, the conclusions are almost the same. It is enough to make King James the First turn in his grave.

Caution in School Planning

The controversy about comprehensive and multilateral schools has recently come into the limelight as the result of the proposals by Middlesex County Council to proceed with a small number of these schools in existing buildings within the county. With a government which is launching into so many social experiments in health and education it is important that they should refrain from imposing standard patterns of development without first testing them out on a small scale. A "caveat" was made about a similar need for caution in a Note on Health Centres last week. It is therefore satisfactory to observe the very sensible attitude of the Ministry of Education towards the development of the equally novel experiment of comprehensive schools.

There is as yet no given body of evidence in this country for or against large schools, which combine under one administration and in one place the functions at present carried out separately in modern technical and grammar schools. There are, indeed, strong social and some educational arguments in favour of the comprehensive schools; but there are also great dangers. The Ministry has therefore adopted the attitude that existing schools can be grouped and used for this purpose provided that there is local backing for each scheme. Against one of Middlesex's proposals, at Ashford, there was the strongest opposition: it was claimed that the only grammar school for the area would thereby lose its quality, character and identity, and a protest meeting was held at which the case for and against was made. Those against the proposal easily won the day, and as a result Ashford Grammar School is reprieved. Middlesex has now been given authority to proceed with three of its six schemes, none of them including an existing grammar school in its embraces.

To the paper planners this will be a disappointment. Nevertheless at a time when it is pre-eminently important to preserve the quality of education, the Ministry's policy seems both sensible and democratic. Parents and local teachers may not be all-seeing, but their opinions ought to carry weight against the more theoretical policies beloved by county authorities.

Mercury and the Ministry

An impulse to cheer Mercury Aircraft, Ltd., as a David standing up to the departmental Goliath is natural but misplaced. Economically and strategically the arguments are strong for treating scheduled overseas flying services as a unit and for preventing charter companies from chiselling at their market with what in fact, if not nominally, is a scheduled service of their own. Moreover, international agreements to which Britain is party impose on the scheduled services conditions from which the independents are exempt. America itself is far stricter with interlopers than is socialist Britain. In principle, therefore, Mercury Aircraft ought to be rapped on the knuckles, and the loopholes through which they have ingeniously slipped their pseudo-charter service to South Africa ought to be blocked.

The Ministry's methods, however, have been both highly undignified and somewhat sinister. First there was a ban on the picking up of South Africa-bound passengers. Mercury Aircraft flew them to Paris free. The Ministry forbade the supply of petrol to the offending aircraft. They then fuelled abroad for the double trip. The Ministry, thinking fast, drafted an amendment to its order specifying that no commercial aircraft registered outside the United Kingdom should load or unload inside the United Kingdom, except in accordance with agreements existing between the United Kingdom and the state of registration, unless by special permission and under specified conditions; and empowered aerodrome control officers to impound any plane suspected of being likely to infringe it. That should have settled Mercury Aircraft's hash. But no; Mercury Aircraft will fly their passengers in British-registered planes to Paris, keeping their long-distance aircraft safely out of the Ministry's jurisdiction; and there, after some sharp exchanges in Parliament, the matter rests.

This piecemeal legislation *ad hominem* really is unworthy of the British Government. The legislative power of the Crown—at least not since the clumsy and vindictive practice of Acts of Attainder become obsolete—is not an instrument to be used in conducting a vendetta with a private interest. If the Ministry cannot draft a watertight regulation, or reach such agreement with France as would prevent Mercury Aircraft from cocking these snooks from Paris, they would do better to let the matter rest until they can do the job properly. The present procedure recalls the trial scene in "Alice in Wonderland." "All people more than a mile high to leave the Court," was the King's Rule 42. Alice's retort that "that's not a regular rule; you invented it just now," had, it will be remembered, a powerful effect in Wonderland. It would count for little in Britain today, where the law seems strangely equated with the interest of the Government department concerned.

* * *

Shanghai's Shadow of Fear

Reports from Shanghai show that the city has been shaken to its foundations by the economic campaign launched by General Chiang Ching-Kuo, the Russian-trained son of the Generalissimo. It is being pursued according to the rules of Communist technique, and, although attempts to stamp out black market activities may be justifiable, legitimate trade may suffer great harm.

A speech made by the General to the youth movement has caused consternation because its terms were calculated to arouse the passions of the mob, and it showed no intention to seek the co-operation of those with a stake in local commerce and industry. For some time past business men have been harried by visits from the Woosung Garrison Police; now they have to suffer from General Chiang's officials, whose methods are a good deal more drastic. Arrests are made on evidence supplied by paid informers, and owing to widespread fear throughout the business community, trade is paralysed.

One of those at present detained is the owner of several cotton mills who recently attracted attention by transferring some of his machinery to newly erected establishments in Hongkong. This particular person has been accused by General Chiang of making his millions out of the blood and sweat of the workers, and he is

threatened with the confiscation of his factories. Although a number of Shanghai capitalists have managed to join their families in Hongkong, the exodus has now been stopped, as it is impossible to obtain an exit permit without submitting to close interrogation into all recent financial transactions. Lesser lights, such as dealers in commodities, are also being closely watched, and those with goods which have been in storage for over three months are labelled hoarders and their stocks confiscated. How far General Chiang will be able to proceed without colliding with some of the higher officials is a matter for speculation, but it is notorious that most of those in his father's inner circle have been among the biggest operators in Shanghai's financial market. One can hardly visualise them disclosing their holdings of foreign currency as required by the new currency regulations.

* * *

Hongkong and Japanese Revival

The excitement of China's traders over last month's currency reform has obscured the undercurrent of fear of the renaissance of Japan's export trade. Shanghai mill owners and merchants have been genuinely nervous of the effect of competition from Japanese textiles, and in Malaya there was a move to organise an anti-Japanese boycott when the terms of the agreement between the American headquarters in SCAP and the sterling area were published three months ago. In Hongkong a section of industrialists expressed alarm and appealed to the Government to ban the importation of Japanese textiles, but the agitation has long since subsided. There has been a steady influx of woollen and rayon piece goods throughout the year, and neither dealers nor customers regard these goods as tainted. Apart from serge, most of the Japanese woollens have been disappointing, the quality being inferior and the designs those of prewar days. The consequence is that prices have dropped, and it is not expected that there will be much demand until qualities and designs are improved.

Our Hongkong correspondent reports that there is no perceptible resentment there at the revival of Japanese industry. From the way in which the trade between Hongkong and Japan has developed during the past two years, it seems to be recognised by the Chinese community that the sins of the Japanese war party need not be visited on the country's civil population. The colony has close ties with Japan through branches of some of its leading mercantile concerns, both foreign and Chinese; and most of the Chinese business community participating in Japanese trade are quite familiar with the policy of SCAP and the efforts being made to set Japanese industry on its feet.

Shorter Notes

Delegates of Marshall Plan countries and Molotov Plan countries agreed about some important economic proposals during a three day meeting in Geneva last week. In the first meeting of the committee on agriculture of the Uno Economic Commission for Europe they went beyond the obvious problem of production to that of improving co-operation and the exchange of information. They recorded how some European countries have progressed so far in the rehabilitation of their fields and livestock that they can now look ahead to future needs. To do this they need to know more about stable and long-term markets for their produce. It was also agreed to ask countries to draw up lists of agricultural equipment which they require and for which they might pay with farm products over short periods. The dovetailing of any such barter schemes—involving East European governments—with the arrangements to be made between the Marshall countries will need closer co-operation with OEEC in Paris than there has been hitherto.

*

If voting of chairmen and vice-chairmen for committees of the Uno General Assembly must be rigged, then more trouble should be taken to produce a reasonable result. What is gained by refusing the Russian bloc a single chairmanship—as happened this week—is not clear, and the hurried conspiracy to get Poland the last of the seven vice-chairmanships made matters worse rather than better. The election of Mr Evatt as President of the Assembly crowns some very energetic and conspicuous activity by the Australian Minister for External Affairs.

*

On two occasions in the last few days Sir Frank Whittle has reminded expert audiences that jet-propelled air liners will not be feasible until there is a radical improvement in air traffic control. They cannot be "stacked" safely, if conditions demand that they stay in the circuit above the airfield at low level. Nor does their fuel consumption at present allow the regulation safety margin. The flight to Paris this week of the prototype Vickers Viscount, the first air liner fitted with propeller-turbines, is therefore of particular interest. Until traffic control does improve, this compromise type must be relied on to reap the benefits of jet-propulsion for civilian traffic.

*

The habit of accurate and independent newspaper editing is one of the best things left behind in India by the British. Its survival and growth should be assisted by the inclusion—announced this week—of Indian representatives among the trustees and directors of Reuter's, where the newly formed Press Trust of India now joins the Australians and New Zealanders. All internal news from the new Dominion will now be collected and distributed by Indian journalists working for the Trust. The whole story of Commonwealth co-operation in the supply and transmission of news is a creditable one which should receive the attention of the Brussels Pact Powers when they are planning "cultural measures" for Western Union.

*

The general election in Southern Rhodesia, held, not because of popular demand, but as the result of an almost accidental defeat of the Government, has been a triumph for Sir Godfrey Huggins and the United Party. After fourteen years in office he has increased the strength of his party from fourteen to twenty-four members out of a house of thirty; has halved the strength of the Liberal Party, and driven its genial leader, Mr Smit, out of politics. The United Party's success was largely the result of the support of British immigrants who constitute about one-third of the white population, and who recognised, in the policy of mild governmental direction of industry and assistance to development, one with which they were more familiar than the extreme *laisser-faire* attitude of the Liberals. The United Party's return means that there will be some measure of co-operation with the other Central African territories and that the demands for unilateral action, complete dominion status, and a more repressive native policy will not prevail.

*

General Smuts has this week challenged the new restrictions on immigration into South Africa on the grounds that they will slow down the development of the country. Without adequate statistics it is impossible to say whether General Smuts's charge is justified, but it is true that the rate at which South Africa can absorb immigrants should be governed by the limited facilities for employment and that that rate has probably been exceeded during the past two years. The Nationalist Government may therefore have a sound economic case for restricting immigrants to skilled workers only. The evident reason for the restrictions, however, is not economic but political. The Nationalist Government have made no effort to conceal their desire to keep South Africa not so much for Europeans only as for Afrikaners only—whatever the effect on the economic and cultural future of the country.

*

The absence of Mr Chifley and Dr Malan from the meeting of Commonwealth Prime Ministers in London next month robs the occasion of some of its importance. Dr Malan's representative, Mr Eric Louw, will only attend when he can get away from the General Assembly in Paris, and Mr Evatt, who was to have represented Australia, may be unable to leave the chair in Paris. Mr Mackenzie King will be making his last bow as Canada's leader, while the Prime Ministers of Pakistan, Ceylon and India will be making their first appearance. Southern Rhodesia will be represented, but Mr Costello of Eire will not be there, nor has he been invited. The meeting will not therefore present a solid Commonwealth front as had originally been hoped. The gaps are not serious, but it is a pity that, at a moment when international relations are in the balance, the Commonwealth will not be able to show the outward signs of its inward grace. This is particularly unfortunate, since it is not hard for outsiders to notice that all is not well within the Commonwealth. There are quarrels between India and South Africa; there are doubts about Britain's colonial policy; and the relationship of the Commonwealth to ERP and Western Union has still to be straightened out. It is true that the London conference is not empowered to take decisions, but it will be a great pity if the outlines of a political strategy do not emerge.

AMERICAN SURVEY

Support for Farm Prices

(From Our US Editorial Staff)

NO political press agent would feel equipped for a campaign until his store of pictorial releases included a number of shots of "Candidate with Prize Calf," "Candidate with Prize Ear of Corn," and so on. In American folklore the rural life is fondly held to be the purest form of the American way. It is therefore not strange that Mr Truman should have wanted to see the ploughing match at Dexter, Iowa, or that Mr Dewey's first stop on his transcontinental trip should have been at Des Moines. Moreover, as things now stand, each candidate would like not only to present prizes to agricultural winners but to be himself presented with prizes for agricultural prosperity, while awarding responsibility for high food prices to his opponent.

The big wheat harvest is in; the still bigger maize crop is reaching harvest stage. The price of wheat has dropped from its postwar peak of $3.13 a bushel to around $2.12; the bushel of maize that sold to livestock feeders in the heart of the corn belt at $2.30 to $2.35 in June has a December delivery price of about $1.40. Farmers are beginning to wonder if, after one more ride on the livestock merry-go-round, the party will not be over. At the same time, city dwellers, reading of the record supplies of feed and unaware, as one farmer acidly put it, that you can't feed the cattle you have on a crop report and that you can't grow cattle over night, are loud in their complaint that food prices are still exorbitant. The charge is growing that the Government's agricultural price support policy is responsible for keeping them up. The July index of the Bureau of Labour Statistics showed food prices at 216.8 of their prewar level and red meats at 263; since the index for all items was 173.7, the concentration of public interest on the meat counter is understandable.

The agricultural price support policy goes back to the early days of the New Deal, and indeed even further, but its present form dates from the Agricultural Adjustment Act of 1938. This Act provided that the Commodity Credit Corporation might make loans to farmers on "basic" crops—cotton, wheat, maize, tobacco, rice and peanuts—at from 52 to 75 per cent of "parity." Parity prices are those which give the farmer the same return, in the form of the goods he buys, for the crops he sells as the average he would have received during a base period, usually 1909-14. Crops on which CCC loans are given may either be stored by the farmer until a rise in the market price makes it worth his while to sell and repay the loan, or they may be turned over to the CCC after a few months as repayment for the loan. The general effect is thus to prevent prices from falling below the loan rate.

This legislation, originally designed to ensure an adequate income for the farmer in times of agricultural depression, was used during the war by the Administration to encourage greater production for export and by Congress to ensure that consumer price controls did not demand any sacrifice from the farmer. Early in 1941 the loan rate on the six basic crops was increased to 85 per cent of parity, and in July of that year the Steagall Amendment directed the Secretary of Agriculture to support, at not less than 85 per cent of parity, the price of any commodity of which he formally requested increased production. In October, 1942, the Stabilisation Act raised the support level to 90 per cent of parity on all commodities, with cotton temporarily at 95 and permanently at 92½ per cent. By 1944 support at 90 per cent had become mandatory for the six basic and for 14 Steagall commodities: hogs, eggs, chickens, turkeys, milk and butterfat, dry peas, dry beans, soyabeans, flaxseed, peanuts for oil, American Egyptian cotton, potatoes and sweet potatoes. Under separate legislation support for wool was also required from 1947; about 140 other commodities, including fruits, vegetables, sugar beet, and naval stores, were eligible for price support although it was not mandatory.

This system of guarantees was unquestionably one of the major factors inducing the record expansion of output which has brought American farm production to a 1948 yield approximately a third greater than before the war. Yet, even with an increase of this magnitude, supply has been far enough short of demand for inflationary pressures to be felt, and there is solid ground under the feet of those who stress the point that, without the inducements offered by this legislation, inflationary pressures would have been much greater.

*

The wartime price support legislation was scheduled to last for the duration plus two years, during which readjustment to peacetime requirements was to have taken place. The fact that the authority for support prices at 90 per cent of parity was due to expire at the end of 1948 gave urgency to the consideration of farm legislation at the recent Congressional session. The Agricultural Act of 1948, in the course of its passage through Congress, illustrated with exceptional clarity the political theory that the Senate, with overlapping terms and longer tenure, gives due consideration to the long-range considerations of the country, while the House, entirely renewable every two years, reflects the immediate wants of the people. The Hope Bill, passed by the House, represented the desire of tens of thousands of farmer constituents to continue to enjoy current benefits and to leave unchanged their patterns of production. The Senate's Aiken Bill gave expression to the foresight of farm leaders—including all the major farm organisations—and legislators mindful of the history of the past. The compromise reached in committee was an Act which provides new basic legislation to take effect in 1950, but continues wartime price supports for another year.

From 1950 on, in determining the parity price of a given commodity, use will be made of a ten-year moving average as well as the old 1909-14 base period. This method of calculation gives considerably lower parity prices for most commodities than does the old method. On June 15, 1948, the parity price of wheat, calculated by the new formula, was 82 per cent of that calculated by the present one; cotton was 87 per cent, maize 88 per cent. The Act tempers the transition from old to new by providing for a maximum decrease of 5 per cent a year until the transitional price reaches the price as calculated by the new formula.

At the same time the Act makes possible lower levels of price support. Beginning with the 1950 crops, the loan rate will vary from 60 to 90 per cent of the new parity, depending on the relationship between existing supplies of the commodity and market requirements. Nor will this support be offered for unlimited supplies. Marketing quotas and acreage allotments were authorised under the 1938 Act, but the only controls of this kind now in use are the marketing quotas established for tobacco farmers. After 1950, the Secretary of Agriculture is authorised to require compliance with acreage allotments, production goals and marketing practices as a condition for price support. If marketing quotas are voted down by farmers, the loan rate falls to 50 per cent of parity.

If the new legislation had been in effect now, the 1949 picture would have been materially different. But these arrangements

are not due to come in for another year and a quarter and by then Congress may well have changed its mind. Meanwhile, prices on a large number of commodities have dropped to the present loan rate, making government loans a major factor in the determination of prices. There has been talk of bringing in the new price supports before 1950, but by the time the new Congress meets, 1949 wheat crops will be in the ground, and any change in price support provisions would mean broken promises.

Surpluses began to appear in a few commodities in 1946 and, by its price supporting activities during the fiscal year 1948, the CCC lost more than $24 million on eggs, $47 million on potatoes, $15 million on prunes and raisins, nearly $12 million on domestic sugar beets and $19½ million on wool. The city-dweller, reading his evening newspaper in the crowded home-bound tram, is sympathetic to criticism of subsidies paid by the taxpayer while potatoes rot in the fields. Now wheat, oats, barley, grain sorghums and peanuts are all selling at below the support price. With an estimated cotton crop of 15.2 million bales, over and above an existing stock of 3 million bales, December futures for cotton are at support levels. But price supports may not cost the taxpayer quite so much as he expects. The cost of the things the farmer buys, from which the parity price is calculated, is expected to drop before long; for instance, the farmer buys feed and feed prices are falling.

The real test will come when the maize crop begins to move. A farmer has three choices. He can sell for cash to the grain trade. He can put his maize into the loan programme—if he can get storage that meets CCC requirements. But his existing corn bins are unlikely to be large enough for his bumper crop and the cost of new storage of a type acceptable to the CCC will run to about 20 cents a bushel. It is lack of storage that explains why farm products are selling below support prices. The CCC used to provide storage but this new charter forbids it to expand its storage space, a provision which has led to the charge that dealers in grain were helpful in writing the measure. Thirdly, the farmer can put his grain into flimsy temporary storage—this year's crop is exceptionally dry—and buy cattle for fattening. He will have to compete with the stockyards for these animals and the initial price will be high. But so, in all likelihood, will be the price he will get for the finished animal.

During these next weeks—these next very political weeks—the Government too will be making some delicate choices. If beet pulp, oats, grain sorghums are counted as well as wheat and maize, the country has perhaps a billion bushels of extra livestock feed because of the fine harvest. There are two chief uses to which this can be put, both politically as well as economically tempting.

Americans want more meat. Supplies available today will give them each about 63 lb of beef and 67 lb of pork in 1948 compared with an average annual consumption before the war of 55 and 56 lb respectively. But the fact that current prices at the counter are about twice what support prices would be if a Government loan programme were in effect shows the financial lengths to which consumers will go to get meat at their present levels of income, however much they may grumble and accuse the Government of holding up prices. The new feed supply can be turned fairly rapidly into more hogs and more milk-producing heifers and, with a longer time lag, into more steers.

Americans also want peace. The political and economic advantages of more foodstuffs in Western Europe, to make existing livestock more productive, to mitigate the battle between the peasant and the grain collecter, to bring nearer the day of whiter bread and higher rations, are plain. The farmer sees these advantages nearly as clearly as does the Department of Agriculture, faced with the prospect of once more having substantial stocks of surplus agricultural products on its hands before long. Thus the problem of farm prices is likely to play as important a part in post-election plans as it does in pre-election promises.

The Midwest and Europe

[FROM A BRITISH VISITOR TO MINNESOTA]

No one, least of all a visitor, should attempt to generalise over an area of the size of the American Midwest (however it may be geographically defined). But those who have been occupied with the study of the public mind of this section over a period of years and who have contributed to moulding it, to no little extent, believe that there has been a great and measurable change—away from isolationism, towards a readier acceptance of the idea that even here, in the midst of nature's plenty, there is no genuine independence of the outside world. Certainly in the editorial columns of the local press (though not in some of the national columnists they reprint) and in such comparatively small but active groups as the local branches of the Foreign Policy Association, one can get adequate discussion of world affairs—even if there are serious gaps in the supply of accurate information.

But against the hard thinking of small groups, and the generosity of the much larger ones who are readily moved when the problem involved has a humanitarian aspect, there is much to be set upon the other side. At the great state universities of this region—monuments to the Midwest's genuine if sometimes misplaced enthusiasm for a democratic educational system—there is not much sign either among faculty or students that the problems of Europe come very close. Experienced teachers deny that the coming of the veterans has increased the political awareness of the student body; rather, as in Britain, the effect has been the reverse.

Much more important is the fact that the political struggle, which is approaching the peak of the election campaigns, is a political struggle essentially waged on internal issues. And there is little doubt that a great deal of what is thought and said about foreign countries is a reflection of hopes and fears about internal developments. What people out here want to know is not whether the British balance of payments problem is being well handled, nor what are the obstacles to Western Union, but whether British socialism is "working." For an answer either way can be used as ammunition for and against the New Deal. And the New Deal, after all, is what the election is about, in so far as an issue can be detected in the welter of personal and party trivialities. It is true that this concentration on internal questions has been made possible by the general and praiseworthy agreement between President Truman and Mr Marshall and their presumed successors on keeping the issue of foreign policy out of the campaign struggle. But this corresponds pretty well to the popular feeling on the subject, even though, by way of the "spy" revelations, the foreign policy issue (which is simplified far too much into the "Russian issue") is injected into party politics, as it were by the back door.

*

There is some difference when one comes to the Third Party. Except in Illinois the Wallace movement is nowhere in the Midwest credited with anything like its reputed strength in New York and California. But in a state like Minnesota, with a strong third-party progressive tradition, the Wallace movement has its following, and even a measure of strength among some fairly well defined groups like the miners of the Iron Range, with their predominently Slav and Finnish background and a long history of political revolt. For the Communist core which is the only thing that gives the movement its cohesiveness and its strength, there is, of course, no quesion but that foreign policy is the issue. The American voter is being told he is voting for or against war with Russia. Fidelity to the Soviet view of world issues is the touchstone. But when one gets outside the Communist core to the muddle-headed fringe, particularly strong amongst college intellectuals, one finds substantially the same thing. When pressed for the real difference between their own policies and those of the more liberal wing of the Democratic Party they are prone to reply "foreign policy." And this in turn comes down to opposition to the Marshall Plan as an "extension of the Truman doctrine."

Yet this apparent exception is largely illusory. For the appeal of the Wallace movement, outside Communist and fellow-traveller groups, is not really an appeal based on foreign policy, unless aversion to war and military preparation is a foreign policy by itself. This aversion is, of course, a particularly powerful factor among younger voters (not to mention those too young to vote). For here in the midwest traditional isolationism has always had a strong pacifist tinge. But for the most part the call of the Progressive Party is a straightforward appeal to all who are discontented with their lot, to the personally maladjusted and frustrated and to the minority groups. Indeed, the fact that the intervention of the Progressive Party is likely to, and is indeed primarily intended to, bring about the defeat of genuine liberals in favour of Republicans who may have either isolationist or imperialist leanings or both (like Senator Ball of Minnesota) makes it clear that direct and immediate influence on foreign policy is not what the party is after.

In the case of the two main parties the domination of internal issues is complete; nor is it always clear how questions of foreign policy are going to influence such matters as price inflation, which is, at this moment, the dominant topic of discussion in the midwest. In spite of the prosperity which high prices and a firm demand have brought to both the agricultural community and its ancillary interests, and to the iron mines, it is probable that most people are going to vote as consumers rather than as producers. That is to say, more people are likely to feel that relief to Europe is a thing to be watched because it may raise prices still further here, than are likely to reflect that the United States is creating for itself new markets abroad. The whole idea, of which Communist propaganda has made so much, that the Marshall Plan is simply a method of cushioning the American economy undertaken deliberately out of narrow economic self-interest is far removed from the terms in which these problems are discussed on the spot.

*

It is not the Machiavellianism but the naiveté which persists in such discussions which is depressing. The Russians and their friends certainly give credit to Americans for being much more subtle and scheming than they really are, just as the Americans see a Talleyrand in every rubber-stamp diplomat in the Kremlin's service. What is meant by naiveté is the continued unwillingness to admit that all actions have consequences other than those directly intended. It is still possible for Americans to believe that economic aid can be given to countries without any political responsibilities being undertaken; that even Greece may suddenly find itself possessed of a working democracy; that military commitments can be assumed without consequences in the political and social field. They still tend to regard the problem of relations with the Soviet Union as one capable of being solved by the application of the correct formula, and to talk of "firmness" as opposed to "weakness" without asking "firmness for what?" In spite of the enormous extension of political responsibilities which the United States has undertaken, and in spite of the quite obvious growth in international awareness, there is a lurking desire to escape from the consequences of greatness, a human desire to live and let live which has its appealing as well as its tragic side.

This naiveté is reflected in the intense scepticism and mistrust of expert opinion—American and foreign—a scepticism which is combined with a great measure of credulity if the right note is struck by some acute propagandist.

Easterners, far more than European visitors, are prone to sneer at the midwestern outlook, and with little reason considering their own failure to use their much superior sources of information. What the European senses is rather the extreme difficulty which people have in this section, in trying to understand the material and hence the psychological condition of war-torn Europe. Still less can midwesterners appreciate the powerful influence in a country like France of the fact of having once been occupied, and of having undergone the humiliation of a collaborationist government. The issues of politics rapidly become issues of morals, and a black-and-white etching of the scene is preferred to any use of neutral tints.

It is difficult to be certain whether the general disappearance of the once strongly anti-British trend (the *Chicago Tribune* is not as typical as is sometimes assumed) compensates for an over-simplified view of the world in terms of Soviet influence and resistance to it. But there are good reasons, in the eyes of people well qualified to judge, for thinking that the process of bringing the midwest, intellectually as well as materially, into the full stream of world affairs is proceeding at a fairly rapid pace. How rapid that pace will continue to be in the future will obviously depend in part upon external events, but in part also on the extent to which the midwest feels itself to have a genuine share in the making of the country's foreign policy, how soon it can overcome its instinctive mistrust of Washington and of the east. The forming and upholding of a long-term foreign policy upon which the rest of the free world can rely will largely depend upon the extent to which the country can avoid the strains which threaten its own internal unity and proceed towards an even closer national integration.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

American Notes

Bipartisan Campaign?

The campaign trains of all the principal contenders are now puffing and hooting their way across the continent in solemn observance of a ritual which Mr Elmo Roper heretically declares cannot change the already sealed inevitability of a Republican victory. Indeed, the use of privileged communications granted to Mr Dulles in Paris to keep in touch with Mr Dewey is almost an official admission of the way the tide is flowing. Mr Truman's course was set long ago. In a gruelling speech-making marathon which, if his throat holds out, may well set a Presidential record, he is warning the farmers, as he warned labour, that under a Republican Administration, Wall Street's "gluttons of privilege" would scuttle the social gains of the past 16 years and starve the reclamation and public power projects which are the hope of the west. But in the brilliant light of farm prosperity, these spectres of the desperate 'thirties are hard to materialise convincingly.

The real surprise has been the detached, almost Olympian, note struck by both Governor Dewey and Governor Warren on opening their campaigns. Senator Vandenberg not long ago reaffirmed the indissoluble unity of America on foreign affairs; the Republican team is now trying on a measure of bipartisanship at home. The admission that both major parties have served America, that neither has a monopoly on progress, and that present problems, at home and abroad, are not wholly due to Administration sins, is a far cry from the Republican slogan of earlier campaigns: "Ten days (or nine or eight) to save the American Way of Life"—and are a shock to the rock-ribbed core of the party. For Governor Warren this broad-mindedness is both natural and prudent; a former candidate for Governor on both parties' tickets in California, he hopes to bring the Republicans a rich harvest of Democratic and independent votes this time.

On the part of Governor Dewey, it is a measure of many things: of a supreme confidence; of a desire to broaden the base of the party by binding to it the independent vote Mr Truman has lost; and of his determination to give no hostages to the Republican past, thus retaining a free hand to deal with problems which he realises no longer admit of purely partisan solutions. The bland assumption that progressive Republicans will take up where progressive Democrats leave off swallows the New Deal at one gulp. If the effect is to make Mr Truman sound a little shrill, a spokesman for special interests rather than the national unity, a nervous challenger rather than serene champion, that too is part of the design.

With his commanding lead, Governor Dewey probably can afford a "high level" approach. But it may seem an expensive luxury to Republican candidates in nip-and-tuck state races, and a form of treachery to the Republican majority in the Eightieth Congress, as well as frustration to the faithful after 16 years of waiting. There will be heavy pressure on the national candidates to come down from Olympus as the campaign grows warmer.

"Save Our Senate"

"S.O.S." is a strange device to find on the banner of a Presidential aspirant who is certain of success before he even starts to climb, but the geographical distribution of the 33 Senate seats that are being contested this year, combined with the fact that the Republican majority in the Senate is only six votes, make it conceivable that Mr Dewey may make electoral history by losing control of the Senate in the year he is elected to the Presidency. Of the 33 seats involved in this year's election, 15 are now held by Democrats and 18 by Republicans. Some of these are fairly secure—for example, 11 of the Democrats' 15 are in the South, which is still considered solid for Congressional purposes, however much the Dixiecrats may affect the Presidential contest. The Republicans are also fairly sure of 12. This leaves 10 doubtful seats—Kentucky, Oklahoma, West Virginia, Wyoming, Minnesota and Illinois now held by Republicans; and Rhode Island, Colorado, New Mexico and Montana now held by Democrats—and if the Democrats can win eight of the ten, they will have a majority in the Senate This explains why the Republicans are concentrating both time and money on the "Save Our Senate" campaign.

Public opinion polls have shown an independent spirit amongst the voters this year, which may lead to an unusual number of "split" votes, in which the elector does not pick candidates from the same party for all the offices on which he is voting. The other side of Mr Dewey's banner bears the maxim "Vote 'er straight in '48"—"'er" being the Republican ticket. It is, of course, most improbable that the threat to the Senate will materialise if there is the expected Republican landslide, and the emphasis which is being put on it is largely explained by the desire to give the Republican workers the feeling that their efforts are really needed.

If his Senate majority were not in question, Mr Dewey would probably not regret the defeat of the particular Republican Senators whose seats are in doubt. All of them, except Senator Cooper of Kentucky, belong to the "old guard" of the party, which is certain to insert a very substantial number of thorns into Mr Dewey's bed of roses. He is stressing the peril in which they stand in order that they may appreciate what he has done for them when they are drawn to victory by the magnetism of his coat-tails. Senators who dare not let go of those coat-tails will at least have only one hand free to prick him in the back.

*

The danger to those Republican candidates who do not swim with this year's liberal tide is most clearly shown in Minnesota and Illinois, where outstanding left-wing Democrats, well liked locally, are fighting Republicans of the most conservative type. Senator Ball, of Minnesota, did come out for Roosevelt in 1944, but that only alienated the official Republican machine, and his reactionary course since then has done nothing to keep the support of the progressive Republicans to whom he owed his original election. Mr Humphrey, the young and energetic mayor of Minneapolis and the champion of civil rights in the Democratic party, has a good chance of defeating him. If Senator Ball does win, he may owe his victory to Mr Wallace's Progressives. Senator "Curly" Brooks, of Illinois, will not have much help from that quarter, since the names of the national candidates of the Progressive Party are not to appear on the ballot in that State, although "write in" votes will be possible. The Democratic candidate, Mr Paul Douglas, may be able to demonstrate to Mr Brooks that the support of the *Chicago Tribune*, practically his only political asset, has at last become a liability.

In Wyoming and Oklahoma, the Democratic challenger is in each case the Governor of the State and both have great reputations as vote-getters. In Oklahoma Mr Rizley, who has replaced the incumbent Senator Moore as Republican candidate, may lose the seat. But Senator Robertson in Wyoming may survive. In West Virginia there is nothing much to choose between the two candidates, Senator Revercomb and Mr Neely, as regards popular appeal, or rather disappeal, but Mr Revercomb, by refusing to change the discriminatory clauses in the Displaced Persons Bill for which he was responsible, went out of his way to affront Mr Dewey, and has thus forfeited not only Mr Dewey's assistance but that of the Jews and Catholics, who are making every effort to elect his Democratic opponent. Senator John Cooper, of Kentucky, gained a sensational victory when he first won his seat in that traditionally Democratic State, but this year the Vice-Presidential candidacy of Senator Barkley, also of Kentucky, will give the Democrats the assistance of local patriotism.

The Democrats' hopes of controlling the Senate do not depend simply on winning some of these Republican seats; unless they can win them all, they cannot afford to lose any of their own four doubtful seats. But their chances of holding these seats are not particularly bright. Neither the 80-year-old Senator Green of Rhode Island nor Senator Johnson of Colorado are inspiring candidates, in spite of their long tenure of office, and both are states which are likely to desert the Democrats in the event of a Republican landslide. In Montana Senator Murray has an excellent New Deal record and strong labour support, but he nearly lost in 1942. In New Mexico General Pat Hurley is once more fighting in the Republican interest the battle he almost won in 1946, but he is by no means certain of defeating Mr Clinton Anderson, who resigned as Secretary of Agriculture in order to replace Senator Hatch as Democratic candidate.

Spies and Science

The cartoon showing a member of the Thomas Committee pounding the table and demanding "how did atomic energy information ever leak out to the damn scientists in the first place?" must have been received with sombre relish by the members of the American Association for the Advancement of Science gathered in Washington to celebrate its centenary. For it was an apt illustration of the dismal disparity they chiefly celebrated between man's ability to control and know his environment and his inability to control his political self and put that knowledge to its best use.

The feud between the Thomas Committee and the scientists started with the case of Dr Condon, head of the National Bureau of Standards. It is still unsettled, with Mr Thomas insisting that access to executive files would corroborate the committee's charge that Dr Condon was linked to a war-time espionage ring. The committee has drawn a tantalizing veil of secrecy over its present investigation, but it promises a "shocking chapter in atom-bomb espionage" when open hearings are resumed. Its announced aim is to trace back to its origins in the United States the sample of uranium 235 which Dr Nunn transferred to the Russians and hence to rebut the charge that all its highly publicized investigations have failed to prove that there were leakages of vital information.

This offensive against the patriotic integrity of government scientists has already provoked a counter-offensive. Mr Lilienthal, head of the Atomic Energy Commission, insists that the atomic programme is in a "dangerous situation" because of the unwillingness of scientists to undergo the political risks to their reputation that are involved in the Committee's zeal to make its charges public before they are proven; and eight prominent scientists, while admitting the need for security safeguards, have appealed to Mr Truman and Mr Dewey to check the Committee in a course which may deprive the government of its ablest scientists and thus do incalculable damage to the national security.

Scientists are, of course, only a special case of all government employees; but the loss of one leading physicist outweighs that of thousands of clerks and typists. And the expansion of the role of government in financing scientific research has now brought it to a point where it is greater than that of private industry. In 1947 it was estimated the government was spending $625 million a year on research through 60 different agencies in addition to the atomic energy programme, and employing directly 30,000 scientists as well as farming out many projects to industry and the universities. The report of the President's Scientific Research Board recommended that overall expenditures should be raised from just over a billion dollars a year to twice that amount, with the government supplying half.

* * *

The Pattern of Saving

How impossible it is to save, even out of high 1948 incomes, is a complaint common to bank presidents and taxi-drivers; the 10 per cent increase in withdrawals from mutual savings banks in the first six months of 1948, as compared with last year, is evidence that the most liquid form of personal saving is feeling the pinch of the high cost of living. But in part the wide sense of guilt and frustration is the result of a return to the prewar saving pattern. At 6.5 per cent of disposable income in June this year, the proportion of income saved was still slightly above the 5 per cent saved just before the war, though far below the giddy levels of 20 per cent and higher reached from 1942 to 1944. Then, of course, patriotic motives were aided, on the one hand, by rising incomes and on the other by a lack of goods on which to spend them.

The Council of Economic Advisers point out, however, that the over-all figures of net saving conceal the extent to which families in the low-income levels are forced to draw on their savings to meet the high cost of living. The most elaborate study of changes in savings habits is that published in the *Federal Reserve Bulletin* for August, 1948. Using a different definition of savings from that of the Department of Commerce, this study estimates that during 1947 31 million "spending units"—families or groups who pool their incomes and expenditure—saved $25 billion. At the same time, another 13.4 million spending units drew on their savings or went into debt to the extent of $11 billion. This is the greatest amount of "dissaving" since the war; and compared with 1946 these "dissavers" came increasingly from income levels above $3,000 a year. But the prewar pattern has also returned in the distribution of net savings according to income. The wealthiest fifth contributed 93 per cent of net savings in 1947, compared with 64 per cent in 1945 and 88 per cent in 1941. The poorest fifth was "dissaving" or going into debt even more rapidly than in 1941.

The fact that 28 per cent of the spending units were falling back upon their savings or incurring debt has been interpreted as the retreat of the consumer before rapacious living costs. The study is insistent, however, that those who spent their savings or went into debt were not financially at their wits' end; they at least had savings or credit to draw upon. Nearly three-fifths of those who "dissaved" did so to buy automobiles, radios, furniture or appliances. About a third of all consumer units went into debt in 1941, another year of high production of durable goods. It is the four million units who were "zero savers" in 1947 who cause the experts the most anxiety; they could neither save nor go into debt because they lacked both credit and a margin of income over essential spending. They had no choice but to balance their budgets.

In 1941 the boom was financed by hire-purchase. Although twice as many consumers drew on their credit in 1947 as in 1946, instalment buying was not the primary factor. Liquid assets in the hands of consumers at the end of 1947 were nearly three times what they were in 1941 in dollar terms; 30 million families still had some savings, and buying plans for 1948 were still ambitious, exceeding probable production for such goods as automobiles and houses.

Shorter Notes

Correction.—As will probably have been realised, in the last sentence of the second paragraph in last week's American Note, on "A Policy for Surpluses" (p. 464), the figures for cotton acreage yields referred to pounds, not bales.

*

One summer spy scare at least has proved to be a false alarm. In July three minor State Department officials testified before a Senate sub-committee that "hundreds" of foreign agents were using their membership in the United Nations Secretariat as a blind while they pursued subversive activities. The Secretary of State denied the charges, and a committee of three private citizens was appointed to investigate. Their report, which has recently been published, confirms Mr Marshall's denial, and repeats that there were no grounds for the accusations. The committee severely criticised the departmental administration which had made it possible for irresponsible subordinates to make public statements detrimental to United States foreign policy. The Senate committee which had permitted unsubstantiated evidence to be exaggerated in the press was also rebuked in the report. The State Department is taking disciplinary action against the officials concerned.

*

Over 330,000 employees of the General Motors Corporation have had their pay increased by 3 cents an hour—at least for 90 days—in accordance with the contract signed last May with the United Automobile Workers' Union. This is the first wage rise under the company's new "wage parity" formula which provides for wage adjustments every three months to meet the upward trend of living costs. The amount of wage changes is determined by the Bureau of Labor Statistics cost of living index. There is no limit to future wage increases if consumer prices continue to rise, but the average hourly wage of $1.64 could be cut by only 8 cents. This present increase will mean a rise of $21 million in the company's annual payroll.

The battle for exports *can be won*

AND THE U. S. MARKET CAN BE CULTIVATED

The recent study by TIME Incorporated on *The Market for United Kingdom Consumer Goods in the United States* will help British manufacturers plan their operations in the American market with greater confidence, and with a more specific idea of the methods to be used in achieving their full U. S. Sales potential.

THE WORLD OVERSEAS

Perón's Policy in Danger

RELATIONS between the United States and Argentina have again taken a turn for the worse after a brief two-year interval of surface cordiality. President Perón and his colleagues have suddenly become afraid that Washington is using the Marshall Plan to check various forms of Argentine profiteering in world markets. This is not what they expected. They had looked forward instead to a flow of dollars acquired through "offshore" purchases for the Marshall countries. Their reaction to the US failure to provide these dollars was recently summed up by the Argentine Foreign Minister, Señor Bramuglia, who is reported to have said, in anger more than in sorrow: "I have been duped."

More lies behind this sense of outrage than the frustration of legitimate expectations. Today the Argentine economy is threatened by an acute shortage of dollars. Argentine gold reserves, which stood at 1,700 million pesos at the beginning of 1947, had dwindled by August of this year to 600 million, and still outstanding against this residue were some $250 million (equivalent to 1,200 million pesos) due to American banks and exporters. This loss of gold is mainly the result of large-scale imports from the United States, a policy undoubtedly encouraged by the prospect of Marshall dollars. For the first three months of this year the Argentine deficit with the United States reached a record height of 640 million pesos, as compared with 240 million over the same period last year. The bulk of the increased imports took the form of machinery and raw materials which are urgently needed by the ambitious Five-Year Plan.

Demand for Lower Prices

Internally, too, the Argentine Government faces trouble. There has been a 25 per cent increase in retail prices over the past twelve months, and although wages are well in pursuit they still limp behind prices. By the end of August the note circulation had reached 6,200 million pesos, an increase in one year of 20 per cent. But instead of taking vigorous counter-measures, the Government has continued its post-war policy of extravagance. The estimated national budget for 1948 is twice the size of last year's budget, with the lion's share going to the Army and the Five-Year Plan. There has been some attempt to substitute bilateral trade agreements for the large, prestige-building loans which the Government handed out on all sides immediately after the war. But even here the Perón administration has been unable to resist extending an additional credit of 500 million pesos to Spain, from whom it can expect little in the way of essential imports.

It was clearly the hope of Argentine officials that easy dollars through the Marshall Plan would make it unnecessary to pull in their horns. So far, however, ERP purchases from Argentina have amounted to only $356,000 worth of supplies for Bizonia. Before they agree to increase purchases, American officials appear to be suggesting that Argentina meet four conditions. First, Argentine export prices should come down to world levels. Second, Argentina should pay in full for what it has already purchased in the United States. Third, conditions for foreign investment in Argentina should be liberalised, and bound up with this question is a fourth point which concerns IAPI, the trading monopoly of the Argentine Government. The Americans on principle are opposed to state trading monopolies, and in addition they argue that the operations of IAPI have often been responsible for the artificially high Argentine prices.

Results of State Trading

American disapproval has found a response from certain sections of the Argentine public, who have not benefited from IAPI's transactions and who have long suspected that not all the profits were being used to public advantage. This combination has goaded Perón into presenting the first balance sheet since the organisation was set up in May, 1946. The document is not as informative as it might be. It shows that the trading corporation has received considerable loans from government banks and that its outstanding debt now totals more than three billion pesos. At the same time the balance sheet claims that the corporation has made a profit of two billion pesos in the past twelve months. On the assets side there is a substantial item of 1½ billion pesos in the form of government securities.

These figures suggest that IAPI is more than a mere trading company and has in fact become part of the government's financial machine. Those who know the details of Argentina's precarious finances agree that IAPI cannot be dismantled at this stage. Foreign financial experts in Buenos Aires point out that, because of its enormous debt to the banks, its dismantling would merely reveal what they describe as "the bankruptcy of the Central Bank."

There are thus no signs that Perón will abandon IAPI. Indeed, he has seized on this aspect of American criticism as a convenient tool with which to revive the anti-Yankee campaign against "dollar imperialism." But throughout his invective runs a new thread of apology. He recently explained to an assembly of Argentine bricklayers that only through subsidies from IAPI had it been possible to keep down the price to the consumer of bread, sugar and oil.

Meat as the Last Card

This has not been the only admission of weakness. At the end of June, in order to attract some of the despised US dollars, the peso was devalued from 4 to the dollar to 4.85—an overnight rise of 20 per cent. in the value of the dollar. Since then there have been further discouragements. In mid-August Belgium announced the withdrawal of further credit facilities to Argentine importers and thus warned the world's exporters that Argentine exchange difficulties were not confined to dollars. Another blow was the fact that wheat crop reports from the rest of the world have been excellent. It looks as if the seller's market has subsided, at least for the present, and if that is so, the large stocks of wheat being carried by Argentina are a dwindling asset. Much the same is true of Argentine maize and linseed oil.

The weakness of Argentina's current position may induce the government to reach a settlement with the United States. This should not be difficult, since Washington no longer aims at the overthrow of Perón and is concerned primarily to increase world supplies of foodstuffs at reasonable prices. However, if the Argentine Government is unwilling to meet the United States half way, then it must now concentrate on extracting as much as possible from Western Europe for its remaining trump—meat. Even if the Argentine negotiators cannot obtain dollars for meat—a forlorn hope—they will certainly aim to get the maximum amount of scarce capital equipment from European industry. Approaches are already being made to Belgium, but clearly Argentina's real salvation depends on what Señor Miranda is able to extract from Britain when the two parties come to discuss Britain's meat supplies for 1949.

Pakistan Without Jinnah

[FROM OUR KARACHI CORRESPONDENT]

WITHIN a little more than a year after obtaining independence and, in the case of Pakistan, separate nationhood, both Dominions have lost the main architects of those achievements. Yet their respective bereavements are very different in character. Mahatma Gandhi embodied the moral force and inspiration of India, but there was a substantial body of opinion which regarded him as having outlived his usefulness as a practical statesman. Qaid-i-Azam Jinnah was above all a practical leader, and his loss is not merely a psychological shock but will be deeply felt in the inner councils of Pakistan.

From the highest to the lowest there is a feeling here of bewilderment and grief. It is not that Mr. Jinnah was popular in the ordinary sense of the word. Popularity was never a thing he sought and, indeed, there was nothing of the demagogue about him; his personal qualities were such as to arouse admiration rather than affection. Aloof, unbending, westernised in habit and outlook, the secret of his immense prestige in the country he created and in the Muslim world in general lay partly in his complete integrity and partly in the solid fact that he had always "delivered the goods." His unparalleled achievement of attain-

Felt is surprising!

Bury Felt, the fabric that takes any shape, plays a thousand parts in our key industries, including the major export industries. Felt washers, gaskets, strips and carriers; felt for packing, polishing and for anti-vibration; all classes of felt cut and fabricated to customers' specifications. Bury Felt can be as hard as nails or as soft as silk, for, besides felts for every heavy industrial purpose, there are fascinating felts for the lighter side of life, notably 'Carmilla' Carpeting and 'Felbury' Fabrics for colourful home furnishings.

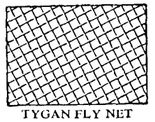
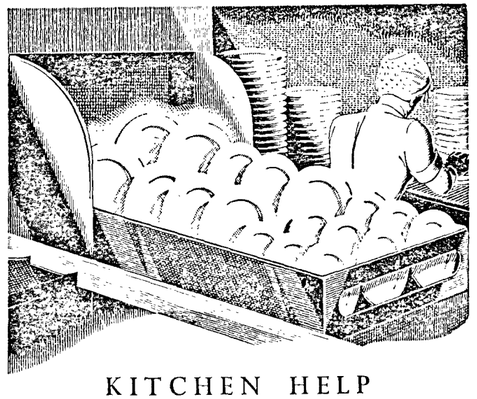
Fothergill & Harvey introduce



Tygan

A NEW WOVEN FABRIC



TOUGH · WASHABLE · WEATHERPROOF · ROTPROOF
MOTHPROOF · FAST TO LIGHT

Tygan, a new synthetic fabric woven from Bexan, is introduced by Fothergill & Harvey Ltd., the old established Lancashire textile manufacturers, in association with B.X. Plastics Ltd., who have devoted years of intensive research to the development of synthetic yarns. Tygan, which is immensely tough, has excellent wearing qualities. It has a negligible water absorption, is equally strong wet or dry, and can easily be cleaned by sponging. Tygan resists corrosion (even sea water) and in general possesses outstanding weathering properties. It is also exceptionally resistant to acids, alkalis, alcohol and many other organic solvents.

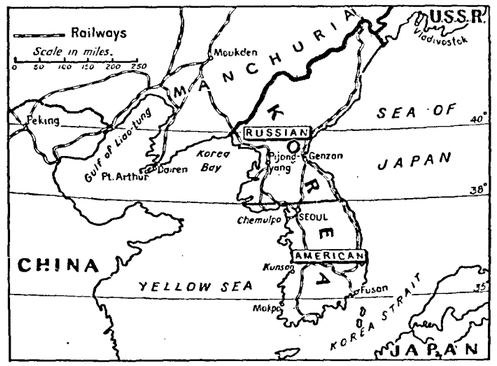
ing realisation of the Pakistan ideal only seven years after the Muslim League adopted the partition of India as its official programme naturally gained him a unique measure of respect among the Muslims of the sub-continent. The people of Pakistan had unbounded faith in his ability to see them through their difficulties; although in the last few months of his life he took little active part in the administration, there was always in the popular mind a comforting feeling that behind the Central and Provincial Cabinets there was an ultimate authority—not in this case a power behind the throne, but a throne behind the power, and one whose judgment would be final and whose order no one would dispute.

The feeling of security thus engendered was particularly valuable in the sphere of internal affairs; if there was friction between the Centre and the Provinces, if disruptive tendencies appeared to be gaining ground, the Qaid-i-Azam had only to say the word and opposition would melt away. He was the immovable rock amid the shifting sands of politics.

A Match for the Hindus

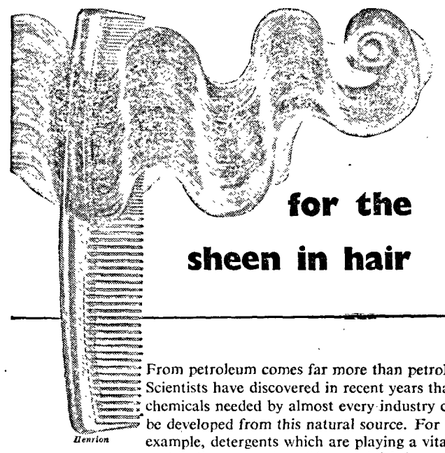
The simile is apt in another way. For years Mr Jinnah had in a sense played that very role, and he has perhaps provided one of the most outstanding examples in history of the success of a steadfast refusal to compromise. It was this policy, or perhaps it should rather be called this attitude of mind, which brought independent nationhood to 70 million people without recourse to arms. It is safe to say that had there been no Jinnah there would have been no Pakistan, and India would even now have been undivided, for no other man would have held out so unshakably for Pakistan or nothing. In 1946 even Mr Jinnah himself accepted the Cabinet Mission's plan, and it was only when Congress leaders made unguarded speeches which appeared to show that their acceptance was neither whole-hearted nor unqualified that he withdrew. It was never any use trying to throw dust in his eyes. Logical clear-sightedness was another outstanding facet of his character, and the Muslim community, traditionally conscious that the Hindus had the advantage over them in intellectual capacity, had the reassuring feeling that in him they had a leader who would never be "outsmarted" by the most subtle Hindu politician.



What then will be the effect of his death on the future of Pakistan? His loss will be felt most keenly in the sphere of internal politics. Pakistan has been as severely tested in this as in the foreign field. The menace of separatist tendencies in the outlying areas of the North-West Frontier Province and Eastern Bengal proved to be unexpectedly strong, while "provincialism" in the West Punjab and Sind no less endangered the foundations of the new State. Mr Jinnah dealt vigorously with these threats in the remarkable burst of energy which characterised his activities last spring. Airborne tours of East Bengal and the North-West Frontier, during which his tirelessness astonished all, were great personal successes and did much to consolidate his position, and consequently the position of the Centre. They were followed by the dismissal of the Premier of Sind (a combined blow against the two evils of provincialism and corruption in public life) and a series of ordinances issued by the Governor-General, arrogating for the Centre some of the powers of the Provincial Governments. There has been a growing feeling that provincial autonomy is an obsolete conception so far as Western Pakistan is concerned, and that in the interest of solidarity, economy and efficiency the administration should be centralised; equally there has been a feeling that only Mr Jinnah himself would be able to carry through this drastic reform in the teeth of provincial jealousies and vested interests. The future line of development is now uncertain. No drastic policy changes are expected, and, thanks to the work of internal consolidation put in during the last few months, there is no danger of any sort of *coup d'état*; but a gradual deterioration in the internal situation is not beyond the bounds of possibility.

No Change in Foreign Policy

In the foreign sphere, the most important factor in the situation is that Mr Jinnah was known to be favourably inclined towards the British connection. Though none cared openly to criticise his policy, there was a by no means negligible Anglophobe school of thought which privately dubbed him pro-British. This characteristic is shared by his successor, Khwaja Nazimuddin, but the latter, though in many respects an admirable choice for the post, will have neither the power nor the influence of his predecessor. No sudden reorientations are to be expected; on the whole, indeed, it is unlikely that Pakistan's foreign policy, which has always been guided by practical and realistic considerations, will change at all. Hopes have been expressed in some quarters that relations between India and Pakistan will now improve. It is difficult to see how this can be so. Had both Dominions not been so deeply committed over the Kashmir dispute, there would have been a chance that India would find the present opportunity a fit one for adopting a more conciliatory attitude in the hope of winning Pakistan's friendship, but the rift appears to be now too wide. There is not the slightest possibility that the two Dominions will re-unite.

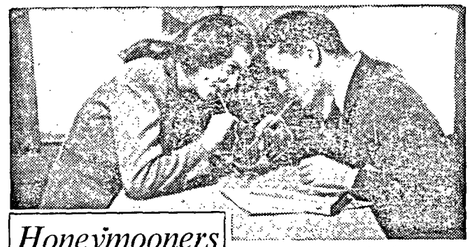


Two Camps in Korea

WHEN in a small country there are two governments, each claiming to be the sole legitimate government of the whole country, there are only three possible ways of deciding between them, short of their own voluntary agreement to merge. The first is to submit to the verdict of the people through free democratic elections; the second is to refer the dispute to an outside authority whose ruling both claimants undertake to accept; and the third is to fight it out by force of arms. In Korea unfortunately there seems little prospect of either of the first two solutions, because the essential fact of the situation is that the Soviet-sponsored North Korean regime repudiates either a verdict by free elections or a decision by the only international authority appropriate for the purpose. Free elections under Uno supervision have already been held in South Korea and have produced the Government which the North rejects; the elections held in the North have been of the familiar "new democracy" type, no political activity being allowed outside a unanimous Communist-controlled bloc, and the Uno Commission was refused entry to the zone or permission to supervise elections there. The Communists, of course, say that the boot is on the other foot, that it is the elections in the South that were rigged; and it is true that police measures were taken against Communist elements which were continually inciting to violence and trying

to prevent elections being held at all. It may also be conceded that in a country with no previous experience of parliamentary democracy and a population still largely illiterate, political choice is in any case likely to be unduly influenced by the party or parties already in power or favoured by the existing authority. When all allowances have been made, however, the fact remains that the attitude of the Russians and their Communist *protégés* towards the principle of Uno supervision of elections has precluded any possibility of an agreed procedure for ascertaining the likes and dislikes of the Korean people. The same attitude also rules out acceptance of a decision by Uno itself, for Russia has declined to recognise any action of the "Little Assembly," and Mr Vishinsky has just been doing his utmost to prevent the Korean question being even put on the agenda of the Assembly itself. Uno can pass a resolution, but it will make no difference in Korea north of the 38th parallel of latitude.

Must the issue then be decided by civil war? What is preventing civil war at the moment is the presence of the American and Russian troops. Any crossing of the demarcation line by substantial Korean forces from one side or the other would bring the American or Russian troops into action in defence of their zone; and the other Power would have either to permit the humiliating defeat of its own *protégés* or else use its own forces and thus bring on a major war. But now Russia has announced



for the sheen in hair

From petroleum comes far more than petrol. Scientists have discovered in recent years that chemicals needed by almost every industry can be developed from this natural source. For example, detergents which are playing a vital part in the processing of furs and fabrics and in the formulation of shampoos. These new detergents are only some of the products in which Shell—and Britain—will soon be leading the world.

162862

withdrawal of its own troops from Korea by the end of the year and has challenged America to do the same. By this manœuvre Russia certainly stands to gain a moral advantage; for it can be claimed that, if America keeps troops in Korea after that date, it is not only a violation of the agreement to withdraw occupation after Korean independence has been established, but an admission that the South Korean Government lacks the support of its own people and cannot survive without the support of a foreign army.

The reality behind the formal contention, however, is that from the very beginning of their occupation in Korea the Russians have exerted themselves to the utmost to build up a powerful Communist-officered Korean army. They already had cadres from the Korean community in the Soviet Union, whose men of military age served in the Red Army and had been suitably indoctrinated for military leadership in the Soviet interest in Korea. There were also Koreans of Manchuria who had taken part in anti-Japanese guerrilla resistance, with secret support from Siberia, during the period of the Japanese occupation. With these elements and with local Communist stalwarts the Russians set about organising, equipping and training a Korean army. Detachments of it have fought with the Chinese Communists against Chinese Government forces in Manchuria, thus gaining valuable military experience as well as giving aid to the Communist cause. In spite of the iron curtain enveloping North Korea, American military experts believe that a really formidable army has been created and that it would today be far stronger than any force which the South Korean Government could oppose to it.

When the Americans went to South Korea, they were quite unsuspecting and unaware of Russian intentions, and they had themselves no plan for militarising the Korean nation. They looked on the Koreans as a rather pathetic, downtrodden people who had been liberated from Japanese rule and they relied on the agreement which had made for a Four-Power Trusteeship to prepare the Koreans politically and economically for full self-government. They did not contest the right of the Koreans ultimately to have a national army of their own, but they did not regard it as urgent or as having any priority in a country which had been economically dislocated by the collapse of Japan (even without the economic effects of the demarcation line) and had suffered a 30 per cent decline of agricultural production due to the shortage of fertilisers. Nor was Washington inclined to form a Korean army before there was any properly constituted Korean Government to take charge of it, and in the American view there could not be such a Government until elections had been held or at least there had been American-Russian agreement on a provisional administration for the whole country. But month after month passed, and in the South there was neither Government nor army, while in the North the People's Committees ran everything under Russian supervision and the Communists' army was built up daily. At last the Americans began to get wise to the trick that was being played on them and to realise that the negotiations never would result in any agreement unless it was for Communist control of Korea, which had been the Russian objective from the beginning. So this year zonal elections have been held, a Government formed and Korea recognised by America as an independent state, with the sequel that the formation of an army in South Korea has been taken in hand three years after it was started in the North. But the North has a long lead, and unless Washington decides to abandon Korea altogether, some American troops must be kept there (by the invitation of the South Korean Government) until the Seoul regime is reckoned strong enough to look after itself. Even then, what outcome can there be of American withdrawal except that the two armies will fly at each other's throats as soon as all foreign troops are out of Korea? It is indeed a fantastic situation, perhaps the most fantastic of all the postwar monstrosities, for Korea, after all, was not an enemy country, but was supposed to receive from the Great Powers of the West under a benevolent tutelage the gift of freedom.

Letters to the Editor

Industrial Productivity

SIR,—I think that Mrs Stone's reply to my letter on the above subject is more distressing than the unreality of the original comparison for it misses completely the points at issue. It may be true that Dr Rostas has tried to provide a common base-year for comparing British and American industry, by a theoretical projection from the last available census figures. But the census figures themselves are some years apart, and as stated in my letter, bracket a period which saw in the tinbox trade very significant changes in the relative productivity of the industries of the two countries.

Whatever the statistical niceties, the conclusions drawn from them remain palpably false. The constituents of the two industries do not differ, as Mrs Stone suggests, in quality only (for which some allowance has been made) but in kind. The range of articles manufactured is different and to that extent non-comparable.

The moral of the Rostas figures is presumably that the industrial leaders concerned should consult their American counterparts, to remove what are apparently major anomalies in the relative productive efficiencies. The object of my letter was to point out that this had, in fact, been done many years ago, and that comparative statistics which have been available since that time demonstrate conclusively that, when like is compared with like, the anomalies prove to be non-existent. If Dr Rostas would like to obtain such a comparison he can come and see for himself here and I have no doubt that I could arrange similar facilities in the United States.—Yours faithfully,

JOHN RYAN, Vice-Chairman,
The Metal Box Co., Ltd.

The Langham, Portland Place, W.1

[We suggest that the argument should be suspended until Dr Rostas's full figures are published.—EDITOR.]

Opposition in Israel

SIR,—Your note, "Opposition in Israel," in *The Economist* of September 11th contains certain inaccuracies. Koestler's "Thieves in the Night" was not written in the spirit of exposing the Jewish Resistance movement. It is a study of the integration of the various elements of Jewry of Palestine around the idea of winning Palestine by force against unjustified Arab resistance and the mandatory's policy. Far from exposing the Jewish resistance movement, Mr Koestler views it with sympathy and understanding. British officialdom, and certain fractions of Jewry unable to keep pace with the realistic demands emanating from the situation in Palestine are brought to censure. I can well understand that bringing to light the spirit pervading the whole movement may "expose" it in London, but in Tel-Aviv Mr Koestler's book was taken as a vindication of its aims, and even methods.

The Stern Group had both independent beginnings and career from Irgun Zvei Leumi. It had existed for some time when Irgun came to life as a separate organisation. It is, of course, still difficult to trace the exact story of events; it is certain, however, that Irgun as a separate organisation appears as late as the early months of 1943. At that time a group of revisionists, deportees to Russia, including Menachem Beigin, obtained control of the hitherto insignificant underground forces, and of the political bureau of the party, and eventually engineered a split, which made Irgun completely independent.

To what extent this split was real it is difficult to say. It is quite possible that it was a purely tactical move to exonerate the official organisation from the doings of the underground. Radicals on both wings in Palestine, Irgun, Stern, and the leftist group headed by Moshe Kleinbaum-Sneh understand politics and policies in the purely Machiavellian sense.—Yours faithfully,

KAZIMIERZ GRZYBOWSKI

The Reward of Work

SIR,—In the course of your interesting analysis of contemporary conditions under the above heading, there is a statement in the article of September 11th which calls for comment. Sir Stafford is wise enough *not* to "under-rate the increase in output which could be secured by greater and longer physical work," and he certainly does not "over-rate the potentialities of improved management."

While admitting that there undoubtedly is today a certain slack in the duration and tempo of work, experience over many years has shown that, so far as sustained effort is concerned (and the short spurt has little relevance to Britain's needs today), there is a definite ceiling to the length of the working week, and that diminishing returns set in fairly rapidly thereafter. The ceiling is probably on the under side of 47-48 hours if the tempo of work is high. The tempo of work, however, is mainly a psychological factor, a reflection of morale: this has been proved by many studies. In turn, the level of morale is a direct product of the competence or deficiency of management. This is one important direction in which the potentialities of increased productivity through improved management cannot possibly be over-rated.

Equally, in the field of methods there is considerable scope. The archives of a professional consulting firm are full of examples of over-staffing, ineffective use of manpower, loss of production time due to a bad layout and flow of work, unplanned maintenance of machines, and so on. These are all factors peculiarly within the domain of management. So again there would seem to be ample scope for potential improvements in productivity due to better management and relatively little danger of over-rating the size of its contribution.—Yours faithfully,

7 Park Lane, London, W.1 E. F. G. BRECH

[We seem to be all on the same side. The ceiling of efficient working hours is generally agreed to be around 47-48 per week (in so far as a single figure can be quoted for all industry), but Mr Brech cannot contend that most workers exceed that figure. While we agree that management has a great deal to learn about its own efficiency, the finest management can only make the best possible use of the man hours available to it, and there must come a time when—economies having been made in every direction—increases in production can be achieved only by an increase in man hours.—EDITOR.]

Price Reductions

SIR,—A South Wales miner with whom I was discussing the reduction in prices made by the Co-operative Societies last February commented that, as far as he was concerned, the reduction had an effect the reverse of that intended since it had always been his practice to retain his dividends as savings and these dividends were now likely to be considerably reduced. The amounts saved as a result of the lower prices were spent on non-essentials.

If this is a general practice it would seem that the Co-operative Union's action might have had an inflationary rather than a disinflationary effect.—Yours faithfully,

MALCOLM H. MCDOUGALL

1 Napoleon Road, Twickenham, Middlesex

Railway Slump

SIR,—In relation to the article on "A Railway Slump" in your issue of September 11th you may care to be reminded (particularly as you contemplate reverting to this topic) that it is decidedly misleading to conduct any comparison of present with "prewar" fares on the basis that "railway fares are now (only) 55 per cent above the prewar level." This is true only if one defines "pre-war rates" as those in force immediately prior to the outbreak of war and ignores the fact that there had already been an increase of 5 per cent a few weeks earlier—i.e. on June 11, 1939.

I think you may agree that the average member of the public does not ordinarily construe the term "prewar" so strictly in any general comparison of present conditions with those obtaining before the war; the latter is more usually construed as those applying over some reasonable period.

The fact is that present rates are 63 per cent above the level in June, 1939, a fact that was confirmed to me by the Southern Railway on November 20, 1947. I submit that in the generally accepted sense this represents the more accurate description of the increase over "prewar" rates.

You may, moreover, be interested to observe that in respect of the so-called "cheap fares" the general rate of increase is even substantially greater. A concrete example is a Sunday trip to Gloucester (advertised on page 2 of the *Evening Standard* of September 15th) the present rate of 15s. compares with 6s. 6d. operating for several years before the war, when I was making the journey fairly frequently. Similarly I think enquiry would confirm that many "cheap day" return fares in the London suburban area (certainly that part served by the Southern Region) are up by 100 per cent or so.—Yours faithfully,

C. J. R. WHETMATH

55 The Grove, Twickenham, Middlesex

From *The Economist* of 1848

September 23, 1848

How to prevent revolutions is a new and important problem for statesmen to study. The Austrian, French, and Prussian method of keeping the people under severe control and in pupilage, which has hitherto been admired and followed, has obviously failed. It may do for a short season, but in the long run it is destructive. The best remedy probably is the abatement of that vanity which induces estimable men to deem lightly of society, and very highly of their own abilities to regulate it. Such a cure will be slow, but we are afraid it will be the only sure one. The benevolent intention of all political reformers and of all the administrators of government, now and to be, cannot be doubted; they have no other interest than that of securing their own fame and peace by making the people happy, but the wisest among them are lamentably ignorant of the means. We learn every session of Parliament that single laws, the most carefully drawn and considered, relating to some minute part of society, such as the regulation of the factories, do not answer the intended purpose, and affect many interests which the legislator never intended to touch; and we conclude, therefore, that the attempt to make a constitution at once regulating every part of society, is a wild impracticability. The best interests of mankind accordingly now require us to discountenance and discourage equally constitution-mongers and legislative meddlers . . . . . Governments desirous of preserving their authority, and insuring the peace and welfare of the people committed to their charge, with all the mercantile and industrial classes . . . whose dearest interests are so deeply injured by political change . . . . must now become the advocates of *laisser faire*, and seek security and safety by frowning down the vanity and interdicting the meddling of revolutionary heroes.

THE BUSINESS WORLD

Britain's Balance of Payments

WHEN set against the frightening background of 1947, the latest estimates of Britain's balance of payments—given in Cmd. 7520—portray a striking transformation. In the first half of this year Britain's total deficit on overseas payments on current account was running at an estimated annual rate of £280 million—well under half the catastrophic rate of 1947 (now revised from £675 million to £630 million) and little more than three-quarters of that for 1946. Whatever reservations need to be made about the basis of these estimates and the sources which have contributed to so dramatic a change, there can be no gainsaying that the rake's headlong progress has been checked. The new austerity imposed upon Britain last autumn has had some salutary effects in greatly reducing (though by no means stopping) the dissipation of vital reserves. The Government, flushed with relief and satisfaction at this achievement, may perhaps be forgiven for not recalling that any smaller success would have been calamitous. Some may feel, indeed, that any dispassionate analysis of the sources of this change must be an ungracious, kill-joy exercise. But it would be no service to Britain, and none even to its present Government, to neglect the task.

The truth is that the brightness of the bold strokes on the canvas becomes not a little dimmed when the necessary detail is filled in. The total deficit of £140 million for the half-year is only £4,000,000 greater than the £136 million estimated in this year's "Economic Survey"—a small difference which has been widely acclaimed as evidence both of the accuracy of the Government's forecasting and of the successful progress of its master-plan for Britain's rehabilitation. Those who argue thus have not read Sir Stafford Cripps's exposition, given in Parliament last week, with the attention it deserved. He showed, even if he did not emphasise, that the visible deficit—the portion of the whole account which most clearly reflects the course of the rehabilitation plans—was much larger than had been expected. The error, by comparison with the "Economic Survey" estimates was, indeed, nearly 80 per cent, for the actual deficit for the half-year was £156 million, whereas the estimate was £87 million. This large divergence from the programme seems to have been almost wholly due to the continued rise in import prices. The cost of imports, at £887 million, was £95 million more than had been expected but their volume as a percentage of 1938 volume, at 78 per cent, was only 2 per cent more than the "Economic Survey" postulated. Of this unforeseen burden of £95 million, exports and re-exports carried £26 million; they exceeded estimate by that amount, and this excess was by no means wholly due to the rise in export prices—estimated at 3 per cent, in contrast with 10 per cent in import prices. The achievement of exports is, indeed, very heartening. As Table I shows, they earned £731 million in the half-year, compared with £1,102 million earned in the whole of 1947.

These figures are certainly a tribute to the progress of the export drive. But it needs to be emphasised that if there had been no other sources of unexpected improvement the total deficit for the half-year would have been running at an annual rate of about £400 million—despite the cuts in imports and in industry's capital outlays and despite the new austerity. In other words, the virtual achievement of the target for the half-year's total deficit has been wholly due to the unexpectedly large net receipts from invisible transactions. It is important to recognise both that this improvement was partly adventitious and that it was not directly related to the Government's policy and planning. Otherwise people may jump to the dangerous conclusion that the major changes which were planned in the structure of Britain's economy—changes which have scarcely begun to take effect as yet—are after all unnecessary.

The invisible account as a whole showed a net credit of £16 million instead of an expected net debit of £49 million—an unexpected gain of no less than £65 million. To this gain, Government transactions contributed £13 million; that is to say, the net total of Government expenditure overseas, at £57 million, fell short of the estimate by this amount. It would, however, have exceeded estimate by £16 million had there not been a more than compensating error in the estimates of certain non-recurring credits: disposal of wartime surpluses and inter-governmental settlements of indebtedness arising from the war provided £29 million more than had been expected and financed scarcely less than half the net total of the Government's overseas expenditure on all other accounts, which amounted to £113 million in the half-year, or at the rate of £226 million per annum. This last figure compares with £328 million for the whole of 1947, so that the reduction has been less steep than is commonly supposed.

Up to this point, therefore, the current account, strictly so defined, shows only deterioration by comparison with the estimates—at the annual rate of £170 million, if the non-recurring Government credits are excluded. The really heartening achievement, which has saved the situation and brought the total deficit down to within striking distance of the estimates, has occurred in the traditional items of Britain's invisible income. The cost to Britain of invisible imports—shipping, out-payments of interest and dividends, films (net), tourism (£15 million) and business travel abroad (£9,000,000)—was, indeed, £34 million more than had been estimated, at £174 million, equivalent to an annual rate only slightly less than in 1947. But invisible receipts expanded very sharply, and surpassed the estimate by £86 million. Their total for the half-year was equivalent to an annual rate of £494 million, nearly £120 million more than in 1947 and actually £90 million above the figure for 1938, despite the estimated fall of £50 million in the yield from overseas investments. To keep these heartening gross figures in perspective it needs to be remembered, however, that invisible imports—excluding Government expenditure at a net annual rate of £104 million—were costing £191 million a year more than in 1938. Hence the net yield of commercial and private invisibles was fully £100 million less than in 1938, despite the big expansion of net shipping income in consequence of the rise in freight rates. This income was at an annual rate of £66 million in the first half of this year, in contrast with only £20 million in 1938.

The other big contributors to non-Governmental gross invisible income were the miscellaneous items, including inward travel now shown separately for the first time. These items produced a credit of £22 million in 1947 (instead of the debit of £20 million shown in the initial estimates for that year), but were expected to involve a net expenditure of £11 million in the first half of this year. Actually, they provided a net income of £53 million, and thereby surpassed the forecast by a sum equivalent to an annual rate of no less than £128 million. Part of this big expansion is, however, certainly non-recurring: for example, the residual item includes a notional credit of

£8,000,000 representing the counterpart of goods imported (and included in imports in the visible account) from overseas stocks accumulated and paid for during the war. Inward travel yielded £14 million in the first half of the year (compared with £19 million in the whole of 1947 and £28 million in 1938), and it is expected to be even larger in the current half-year, which includes a larger part of the tourist season and has also benefited from the Olympic games. There is still a net deficit on travel of £10 million in the half-year, but it is much less than in 1947 when, it is now estimated, outward travel cost the extravagant sum of £73 million and even the net figure exceeded £50 million; in 1938 it was £12 million. For the rest, there has apparently been an unexpectedly big increase in income from financial and commercial services and from the overseas activities of the oil industry, though no indication is given of the amount of these receipts.

So much for the current account of Britain's balance of payments as a whole. More reassuring, in some respects are the changes which have taken place in the distribution of payments between the main geographical areas. Despite the rise in dollar prices (which caused imports from the Western Hemisphere to exceed estimate by £27 million for the half-year), the net deficit with the Western Hemisphere—which is not to be identified with the dollar area—was reduced to £195 million, or only £12 million more than the figure forecast in the "Economic Survey." Its annual rate, though still at the alarming level of £390 million is £280 million less than in 1947, a year of disastrous strain upon the reserves. A large part of this improvement was due to the steep fall in the invisible deficit; this totalled £118 million in 1947 but was reduced to only £18 million in the first half of this year, thanks to the cessation of direct expenditure in the Western Hemisphere for account of Germany and thanks, also, to improved net receipts from shipping and oil.

Of particular significance, in view of Britain's large obligations under the new European payments plan, are the radical changes which have occurred in Britain's trade relationships with the OEEC countries. In 1947 Britain had a visible surplus of £34 million, but a final deficit of £30 million, with these countries. In the first half of 1948 the visible surplus had risen to an annual rate of £58 million and the invisible deficit of £64 million had been converted into an invisible surplus at the rate of £22 million, making a final surplus at the rate of £80 million. This large total of British aid for Marshall Europe suggests that the immediate burden of unrequited exports to Europe which Britain is assuming under the new plan will actually be less than the burden which has been carried in the first half of this year; for the Chancellor said in Parliament last week that at least two-thirds of the $500 million of British aid will be furnished by exports from the sterling area.

One other facet of Britain's external accounts is of particular importance—the capital account, shown in the second table. This shows large and contrasting movements. In the first half of this year, Britain has again been attracting capital from the non-sterling world, but this inflow has been financed on balance by a more than corresponding repayment of accumulated sterling balances; these dropped by £142 million (partly in consequence of Argentina's drawings for the purchase of the railways). The total balances of the sterling area countries, on the other hand, rose by no less than £116 million (in contrast with a drop of £147 million in 1947) partly because of their voluntary curtailment of drawings on the central dollar pool. In addition, Britain increased its capital assets in the sterling area by no less than £145 million—a huge rate of outflow of funds which was strongly influenced by the movement of "hot money" to South Africa. This particular movement, however, has now been reversed; and the Chancellor explained that the net outflow of capital in the second quarter of the year was much smaller than in the first. It is certainly to be hoped that this declining trend will continue, for Britain can ill afford to export capital on this scale, especially as much of the outflow is not to be regarded as the genuine accumulation of overseas assets which the accounting might suggest. This item of £145 million is, indeed, a mere residual, and includes such items as the capital taken abroad—estimated at "several tens of millions"—by emigrants.

Bretton Woods Twins

THE world's finance ministers and governors of central banks, with their retinues of experts, are gathering in Washington for the meetings of governors of the International Monetary Fund and the International Bank for Reconstruction and Development, which are due to open next Monday. These Bretton Woods twins have had 2½ years in which to thrive and show their mettle since their baptismal feast—the inaugural meeting of governors at Savannah in March, 1946. To assess their performance, it is well to recall this earlier gathering, at which the fundamental issues that were to determine the character of the two institutions, were decided. The most important of these issues concerned the basic character of the Bank and Fund: whether they were to be political or technical institutions; whether they were to provide a meeting place for bankers or for representatives of governments; whether each was to be managed by an international staff owing allegiance to an international institution alone, or by a large concourse of executive directors and their alternates sitting in permanent session and owing allegiance primarily to the governments which appointed or elected them. This last choice involved two issues: first, the siting of the Bank and Fund, whether they were to be in the political or financial capital of the United States (the fact that they should be in the United States at all had been decided earlier, at Bretton Woods itself); the second concerned the powers and incidentally the salaries to be given to the executive directors and their alternates.

The first British Governor, Lord Keynes, felt deeply on these issues and with all the concern of a man who could rightly claim the major share in the paternity of the twins. It is instructive to recall the speech he made at the inaugural session of the Savannah meeting. In this he invoked all the qualities that the good fairies should be bringing to the two infants, at this, their christening; but he added that if by ill chance some bad fairy had not been invited (like Carabosse at the baptism of the Sleeping Princess) it would lay a curse on the twins: "You two brats shall grow up politicians; your every thought and act shall have an *arrière pensée;* everything you determine shall not be for its own sake or on its own merits but because of something else." And Lord Keynes added that if this were to happen "the best that could befall would be for these children to fall into an eternal slumber, never to waken or be heard of again in the courts and markets of mankind."

This danger of the intrusion of politics must be more particularly present with the Fund whose concern is primarily with monetary policy, a jealously guarded preserve of national sovereignty. Looking back at the history of the Fund over the past year it cannot be said that it has altogether escaped the curse of Carabosse. The siting of the Fund in Washington has inevitably tended to make that institution an organ of the US Government and its American executive director an agent of the National Advisory Council, the financial committee of the US Government. While that political influence has been used discreetly and on the whole wisely and constructively, it cannot be denied that the mere intrusion of political influence has caused some resentment and suspicion among non-American members of the Fund and has lost for that institution some of the complete and unquestioned confidence with which it should be held by all member countries. One illustration of political inspiration will suffice—the decision to debar all member countries which are recipients of Marshall Aid, from purchasing American dollars from the Fund. The decision may have had considerable logic behind it; but the manner in which it was made and the obvious American prompting that lay behind it, gave it the appearance of a *diktat* which cut right across the concept of automatic access of members to the facilities provided by this institution, subject to the rules agreed at Bretton Woods.

Since it began operations in March, 1947, the Fund has done valiant work within the limit of its resources in filling the world's dollar needs. Its cumulative operations to date show sales of exchange amounting to $633 million, of which all but $16 million represented sale of US dollars. The scale of these operations has been steadily diminishing, partly because of the barring of ERP countries and partly because some members, including Britain, virtually exhausted their 12-month quota of permissible operations well before the 12 months were over. Since the beginning of the current fiscal year on May 1, 1948, and up to the end of July, the Fund had only sold exchange for $27,528,000 and the month of July itself provided one single operation, the sale of 100 million Belgian francs to Norway.

Looking back over the past year's activities of the Fund, no criticisms or second thoughts suggest themselves regarding the original decision to accept the parities notified by members before the Fund started to operate. However artificial these parities may have been, there was neither the statistical material to calculate true parities, nor the uniformity of economic development throughout the world to ensure that these parities, once calculated, would have remained valid for more than a very short period. The Fund has, in fact, made a good case for accepting the original parities while keeping a particularly open mind in its judgment on requests for changes of parities. The Fund's record is much more vulnerable on the issue of multiple currency practices with differential rates of exchange. One real fight appears to have been fought on that issue, that from which France emerged defiant and victorious. This appears to have broken whatever will the Fund ever possessed to resist infringements of its basic rule, that members should not indulge in multiple currency practices. After recognising experiments made in this direction by Greece and Italy, the Fund has been scattering dispensations from this rule among its South American members. The effect has been to penalise the disciplined and the well-behaved. Multiple currency practices not only call into question the official parities recognised by the Fund; they are also leading to an increasing distortion of the channels of world trade, a distortion which mainly harms the countries which continue to shun these practices.

Neither has the Fund emerged wholly victorious from its battle against differential gold prices. The more brazen proposals submitted by certain members to subsidise their domestic gold production by paying higher domestic currency prices than those corresponding to the official parities, have been suppressed. The grossest and most glaring abuses of international traffic in gold at differential prices have also been stopped; but in fact gold continues to find its way to the free markets of the Middle and Far East in sufficient quantity to make it quite apparent that the edict of the Fund against dealings at unofficial prices is being ignored by some of its members. In the fight against open and hidden transgressions of its rules, the Fund has undoubtedly lost face during the past year.

As for the International Bank, the past year has seen a gradual reduction in the tempo of its activities. The first hopes that it might play some part in the European Recovery Programme have been disappointed; it stands outside the main channel through which American capital is now flowing to other countries. It is perhaps inevitable that the Bank should have to take a back seat in international investment, since the international demand for new capital is almost exclusively for dollars and the Bank's dollar resources are severely limited. It collected about $750 million in dollar subscriptions from the United States and other member countries. In addition it mobilised another $250 million by last year's issue of bonds in the American capital market. It has to date made loans of slightly over $500 million. Since its dollar resources cannot be allowed to run down completely, the remaining scope for dollar loans is modest and will so remain unless Wall Street can be induced to absorb another issue of the Bank's bonds. There is very little prospect of this at the moment. The Bank has undertaken one or two minor non-dollar operations, such as providing a few Belgian francs for Luxemburg and Swiss francs for the Netherlands, but these are abnormal transactions and given the comparatively expensive terms on which they were made are unlikely to provide precedents. For the time being the role of the Bank appears to be to offer modest prospects of dollar loans for Latin-American countries, thus helping to console these for the major direction of US external assistance towards ERP.

While the operations of both Bank and Fund have been slowing down, the same cannot be claimed for the scale on which these two institutions live and provide livings. For the fiscal year to June 30, 1948, the Bank had an administrative budget of over $4,000,000—an outrageously high figure in relation to the actual business done. When the accounts of the Fund for the past year are published this sum will probably be shown to have been exceeded by that institution. The worst fears of those who looked askance at the grandiose scale on which these two institutions were launched are now being realised. The staffs of each appear to be out of keeping with the volume of business which is being transacted. The Boards of Executive Directors with their fourteen full-time directors and fourteen alternates, all of them drawing large tax-free salaries, with quite inadequate work to occupy more than a small fraction of their time, must tend to become lush and convenient pastures where governments put out to grass tired or deserving pensioners. There are honourable exceptions to this tendency, and some member countries have seen fit to keep their representation and the expenses they incur down to the minimum. Apart from the boards, the staffs of these two institutions are becoming unduly inflated. The Fund is reputed to have over 200 employees in its Research Department doing little more than is accomplished by a mere handful of people at the Bank of International Settlements at Basle. The Bank and Fund share a building, but nothing else. They have no common services. On the contrary, they tend to bid against one another for talent. As a result considerable duplication of effort is taking place within the four walls of the same building. What is worse, this inflated scale of administrative expenditure aggravates the dominant problem which these two institutions were formed to cure: the world's shortage of dollars. Their income is provided largely by the poor and the needy. It is they who have to take the Bank's loans and use the facilities of the Fund. Under the Keynes scheme, the excessive creditor would have been paying heavy interest on its large *bancor* balances and would thus have made his contribution to the running expenses of the Clearing Union. But no part of this idea survives and it is the deficit countries which provide the bulk of the income of both institutions. Their outlay, on the contrary, is almost wholly in the form of US dollars, since they are situated in Washington and pay their salaries in dollars. There is therefore a very strong case to be made for a drastic curtailment in the budgets of these two international institutions. By such action they might even provide a salutory example to the even more white elephantine services and off-shoots of the United Nations whose mounting expenditure and increasing administrative inefficiency urgently need reform. Slimmed and stripped of their superfluous fat, the two Bretton Woods institutions would be in better shape to tackle the work for which they were intended and to fulfil the valuable functions that still lie before them.

Business Notes

The Chancellor in Ottawa

The week which Sir Stafford Cripps and his experts have spent in Ottawa appears to have been largely devoted to expounding to the Canadian Government the facts of the British economic position and the short and longer term objectives of British economic policy. More specific issues will no doubt have been introduced, including the freeing of the unspent $240 million balance of the Canadian loan, the status of the interest free loan, the expenditure of off-shore dollars in Canada and the future of the bulk purchase food contracts.

The dominant issue, however, has far outranged these specific problems. It has encompassed nothing less than the future trading policy of Great Britain, the ultimate objectives regarding the convertibility of sterling and the dependence which Canada can therefore place on the sterling countries as a long-term market for its produce and as an assured and sound leg of the tripod on which the Dominion's commercial and financial equilibrium has rested in the past. Canada has watched with suspicion and apprehension the pursuit of the bilateral balancing of trade in British commercial and payments agreements negotiated during the past year. For the time being, the impact of this bilateralism and of non-convertibility has been effectively softened by the freedom with which authorisations have been granted by the Economic Co-operation Administration for British off-shore purchases in Canada. That, however, is not a permanent factor in the economic relations between Britain and Canada; and Canadian Ministers and their experts have shown the greatest and most natural interest in finding out the prevailing British views on what will happen to sterling when Marshall Aid comes to an end. Sir Stafford Cripps appears to have satisfied their curiosity. He has expounded the British plans, so far as they can at present be formulated, for the post-Marshall period from 1952 and what he has told the Canadians is reported to have given them some measure of assurance. Since the Canadian reserve position has undergone an appreciable improvement over the past few months, it is at least possible to hope that agreement may soon be reached on the gradual unfreezing of the balance of the Canadian loan to Britain.

* * *

Resilience in Gilt-Edged

The readiness of the Funds to respond to any symptom of improvement in the international situation could not have been better illustrated than on Wednesday. It was enough, given the pressure of accumulated funds awaiting investment, for the mere hint of a further approach in Moscow to produce a sharp improvement in gilt-edged before Mr Bevin spoke. But the remarkable feature, this week as last, has been the support for the "undated" stocks, like Old Consols and "Daltons." These two issues showed rises of ⅜ and ¼ respectively; Old Consols closed on Wednesday at 78 ex interest, to yield £3 4s. per cent, while 2½ per cent Treasury Stock was a quarter of a point lower, to yield £3 4s. 3d. per cent.

No doubt, the "undated" issues have been left somewhat behind in the long and steady improvement among the dated issues. The latter indeed showed that they were still capable of further slight improvement, giving the lingering hope of a reasonable settlement with the Russians. But for the most part, investment buying has been concentrated, when conditions were thought to be favourable, on the irredeemable stocks. It would not be right to exaggerate the movement, however, for earlier dealings this week showed that a few small sales were capable of causing fractional losses throughout the gilt-edged list. In a market short of the undated issues, however, moderate support is capable of producing a more than proportionate movement in prices.

Meanwhile, politics alone condition the market's behaviour. Neither in gilt-edged nor in equities have investors begun, as yet, to make any serious calculations about the potential effects of rearmament on the British economy as a whole or on the particular industries which may be affected for better and for worse. There

has, of course, been some measure of support for aircraft shares—Rolls Royce, in particular, were prominent and have advanced from 89s. 6d. before Mr Morrison's announcement of the new aircraft programme to 97s. 6d. Speculative buying of road transport and coke oven company shares has also continued on the prospect of acquisition and favourable compensation. But equities as a whole have done no more than maintain their ground. Perhaps the revival of new issue business is playing some part in this steadiness. Whatever the answer may be, the subscription for rights and excess shares of more than twice the money sought for the Imperial Chemical Industries issue is indicative of the volume of funds which awaits investment on favourable terms.

* * *

Australia Invites Success

The expected Commonwealth issue announced this week takes the form of £15,000,000 3 per cent stock 1965-67 at par. Together with cash payments from London funds amounting to £6,252,995, the new issue is designed to redeem £16,082,849 Commonwealth 3¾ per cent registered stock 1946-49 now outstanding, for which notice of redemption on January 1, 1949, has been given and £5,170,146 of Victoria 3 per cent 1929-49 stock due for final redemption on the same date. Cash subscription lists for the new loan (which is, of course, a trustee stock), will open and close on Tuesday next and conversion lists will be closed when the stock has been fully subscribed but not later than October 7th. As in the case of the two previous Commonwealth conversions carried out earlier this year the issue will be underwritten in the market, at ¾ per cent plus an overriding commission of ¼ per cent.

With its short bracketed redemption dates, the new stock follows closely the pattern of its two predecessors and will commend itself particularly to institutional investors on that account. It also reflects the improvement in the credit rating of the Commonwealth during the past three months. The British stock with the nearest life to the new loan is 2½ per cent Savings Bonds 1964-67, which on Tuesday offered a yield of £2 15s. 8d. per cent gross to the latest redemption date compared with £2 17s. 7d. per cent gross on the eve of the Commonwealth issue in May. On the same day, Commonwealth 3 per cent stock 1964-66 which was issued at par in May was standing at 1⅛ per cent premium, so it would seem that the Australian authorities have left themselves a little in hand in the terms for the new issue. Their caution indeed may seem a little excessive, given the fact that the gilt-edged market is so steady, despite all the obscurities of the international situation. Such prudence, however, might easily prove justified under present conditions, whereas in May the Australian authorities were prepared and, as it proved, able, to squeeze the best terms out of the market. Like the directors of Imperial Chemical Industries, who have scored an important success with their ordinary share issue, Australia has preferred to take the line of safety. This impression of caution is borne out by the movement of prices on Wednesday morning when the price of the 1964-66 stock declined ⅜ per cent. If no unexpected disturbance occurs in the market, there is every reason to anticipate that the issue will be a resounding success.

After the present issue and the recent gift of £A10 million to the British Government, Australia's London funds will still exceed £180 million. Further refinancing operations are to be expected. Two 4 per cent state issues 1942-62 totalling over £15 million await conversion and could have been included in the current operation if the required six months' notice of redemption had been given. There is also £6,000,000 of Victoria 3½ per cent 1929-49 stock which is finally redeemable on October 1, 1949, while some £37 million of mixed 3 and 3½ per cent State and Commonwealth loans will become eligible for redemption at three months notice on December 15th next year.

* * *

ECA Loans

Although broad agreement was reached in Washington some weeks ago on the terms on which ECA loans would be made to Britain, the drafting of the specific agreement has taken longer than was expected and has given rise to the usual difficulties which are encountered when lawyers, and especially the legal experts in the American administration, take up their task. The main point of difficulty appears to be the waiver clause which is to be incorporated in all the ECA loan agreements. In the early stages of the negotiations the United States representatives had suggested that if the waiver clause was invoked by the debtor on the ground that exchange difficulties made transfer impossible, interest and capital repayments on the loans should nevertheless be met in local currencies and added to the fund of local currencies set aside by the recipient countries against their ECA grants.

That proposal failed to find favour on this side. The agreement in principle which was subsequently reached in Washington was left particularly loose and amounted merely to an undertaking to enter into discussions about future payments of interest and capital on these loans if the borrowing country found itself in difficulties—in the specific case of Great Britain, if the waiver on the 1945 loan was being invoked. The time taken to translate this general agreement into legal terms appears, however, to have given the opportunity for differences of more fundamental character to emerge. The suggestion appears to have been made from the American side that, if the waiver clause is invoked, ECA shall have the right to take payment of interest and capital in kind, and particularly by additional stock piling of strategic materials. This proposal should prove particularly popular to Congress, but is causing quite natural consternation among the potential borrowers, because they could only invoke the waiver at the expense of cutting down their normal dollar earnings and so making their balance of payments difficulties even worse. This is one of the loose ends in the ECA loan agreement which may be expected to receive the attention of the Chancellor of the Exchequer and his Treasury experts when they visit Washington next week for the meetings of the International Bank and the International Monetary Fund.

* * *

Contributions to Europe

More detailed information about the British contributions to the European Recovery Programme was given by Mr Douglas Jay, Economic Secretary to the Treasury, in the House of Commons on Tuesday. Mr Jay confirmed that for the year ending June 30th next Britain had agreed to make available about £120 million in sterling to the other participating countries. Of this, £70 million would be provided by way of outright contributions and over £50 million by unrequited exports financed out of accumulated sterling balances of the participating countries. These last facilities would be given as follows: £17 million to Sweden, £14 million to the Netherlands, £11 million to Italy, £5,000,000 to Turkey and £5,000,000 to Greece.

Of the £120 million surplus with other European countries, only about £30 million will represent the United Kingdom trading surplus. The rest, and much larger share, will represent the surplus of other sterling area countries with the participating countries. Mr Jay could not estimate how much of this sum the sterling area countries would in turn spend in the United Kingdom, but no doubt *pour encourager les autres* he reminded the House that Australia had made a generous contribution by remitting £8,000,000 of the debt represented by Australian sterling balances. Mr Jay also stressed that the obligations undertaken to Europe would not be allowed to diminish Britain's capacity to export to hard currency countries. On this point, British productivity and export capacity will have the last say.

* * *

Contracts with the Colonies

In their trading strategy the Government are evidently placing increased reliance upon longterm contracts for the purchase of colonial products. A written reply by the Chancellor of the Exchequer has now set out at length the principles which, in the Government's view, should underlie such contracts. It is a statement couched in general terms and not lacking in conditional clauses. Each commodity and each contract will require "individual treatment." Contracts should "as far as possible" be freely negotiated between the producers and the purchasing department; the producers may join together in statutory marketing organisations or they may be represented in negotiations by Colonial Governments and the Colonial Office. On the British side, the Government will be ready to enter into long-term contracts "for many colonial products," for periods varying "according to the circumstances of the individual cases," but extending "where appropriate" up to ten years. There is a special need for guarantees in the case of tree crops, which take many years to come into bearing; this problem is recognised in the suggestion that the extension of contracts in such cases should be considered some years before they come to an end. The justification for this course—and it is hard to rebut—is that "a contract for more than ten years will probably never be practicable (and, indeed, contracts for this length of time present many difficulties)."

Clearly, the two basic considerations in any long-term contract are quantities and prices. On these matters the principles laid down are either self-evident or compact of reservations. Colonial producers will be given "as precise estimates as possible of the future requirements of the United Kingdom for home consumption and for export in manufactured form." But "it will not generally be possible" for Britain to take colonial production in excess of these requirements—which invites the further question: What happens if the estimates turn out to be wrong? Both sides will have in mind the nursing or development of other markets, in which balance of payments will be the controlling factor. All these various conditions, and the "probability of changes in market conditions during the currency of the contract," may make it desirable to fix minimum and maximum quantities.

In the matter of prices, the principles are even more tentative. To fix a price over a period of years, under present disturbed conditions, would be unwise. Where actual prices are to be written into contracts, it is not to be expected that they will match the inflated prices for marginal supplies which are obtainable under present conditions of scarcity on the open market. Producers are warned to have due regard to the security afforded by long-term contracts. Even so, it may be desirable not to fix an actual price, but to agree on a formula by which the price can be varied from time to time, according to market conditions or the terms of other contracts for similar products.

This guarded statement hardly takes matters much further. It suggests so many qualifications (necessary qualifications, be it added) that the determination of each contract is likely to be a matter of *ad hoc* bargaining rather than longterm planning. And on two matters of major importance the statement is silent. The first is the adequacy of guarantees by producing countries that they will provide increased supplies, which themselves must be subject to the risks of deficient or bumper harvests; the second is the provision of capital for the longterm expansion of colonial produce, which surely called for some reference to the principles on which the Colonial Development Corporation is proceeding in its work. That these questions are of more than formal importance is evident from the prolonged—and still uncompleted—negotiations on a rather different plane about the development of Queensland as a future source of meat supplies.

Anglo-Jugoslav Trade Agreement?

There is a strong possibility that trade talks which have been in progress, sporadically, for over two years between the British and Jugoslav Governments may shortly be brought to a successful conclusion and a trade agreement signed between the two countries. The main obstacle has been the amount of compensation that Jugoslavia was ready to pay for British property taken over under the nationalisation law in December, 1946. Unfortunately Mr Bevin, in his after-election glow, threw away Britain's best bargaining weapon by returning unconditionally to Marshal Tito's government between £2,000,000 and £3,000,000 of Jugoslav gold which had been held by the Bank of England.

The American Government were not so forthcoming—with the result that they recently succeeded in negotiating compensation of $17 million for holdings of American companies and individuals which were estimated at only 5.2 per cent of the total foreign capital invested in Jugoslavia. (The Swedes whose holdings represent less than 2 per cent received 30 million kronen, or approximately £2,500,000.) But Jugoslavia offered British investors only £2,000,000 for their much bigger holdings (representing 18.5 per cent of the total foreign investments), compared with estimated values of £12½ million. The highest offer made publicly by the Jugoslav Government has been £3,000,000.

It is now possible that, as a result of the Tito-Cominform dispute, the Jugoslav Government may raise their offer to £5,000,000 or £6,000,000. Marshal Tito desperately needs capital equipment to carry out his five-year plan. Large quantities of machinery promised by Russia for delivery in 1949 will not now arrive. There is a possibility, too, that industrial equipment from Czechoslovakia and Hungary will no longer be supplied to Jugoslavia. Consequently Tito will have to look elsewhere—to the United States or the United Kingdom.

The Jugoslav Government have been anxious to obtain a British loan as part of the trade agreement, but this the British Government were not prepared to grant without various political conditions which the Jugoslavs would in no circumstances accept. Apart from this question, however, the British authorities are no doubt anxious to conclude the talks, which have established a record for length of duration. Extra supplies of Jugoslav timber to save dollars, and feeding stuffs to assist the expansion of livestock herds in this country would certainly be welcome.

A Georgian Crisis

In the unsettled period of the Seventeen Forties, James Martin showed his faith in Britain's future by acquiring the freehold not only of the premises bearing the sign of the Grasshopper in Lombard Street, hitherto rented since Tudor times, but also of the adjoining property of The Three Crossed Daggers. This was in 1741, when the Young Pretender's invasion was so soon to follow. The old private bank was absorbed in 1918 by the Bank of Liverpool, whose title was changed to Martins Bank Ltd. ten years later.

MARTINS BANK

LIVERPOOL LONDON AND 600 BRANCHES

An old Indian word meaning, 'the land of waters' is the origin of the name Guiana—an apt description enough of a country which is intersected by numerous rivers. The most spectacular feature of the inland waterways of British Guiana is undoubtedly the Kaieteur Falls on the river Potaro, where the river plunges headlong into a fertile valley down a sheer vertical drop of 740 feet. In the industrial sphere the interior of British Guiana can show little to match such natural marvels, for it has yet to see the day when the rivers are harnessed for power and its resources of minerals and timber are exploited to the full. In contrast the coastal areas have long been intensively cultivated and the crops they produce—which include the famous Demerara sugar—make an important contribution to the prosperity of the Colony.

Full and up-to-date information from our branches in British Guiana on industrial developments and the state of local markets is readily obtainable on request.

Argentina's Hard Currency Problem

Argentina's hopes of "off-shore" purchases by the United States under the European Recovery Programme to make good its dollar shortage have been belied. The measure of its dollar stringency may be gauged from the shipments of gold to the United States in the last month or two. The good wheat harvest in North America makes "off-shore" wheat purchases from Argentina unnecessary; the most it can expect is an occasional purchase of raw materials to provide a modicum of dollars. It is doubtful whether Argentina can hope to be relieved of much of its maize against dollars, but purchases of oilcakes, linseed and linseed oil, hides and casein, particularly on account of France, may be possible. But these will not satisfy Argentina's hopes of solving its dollar problem by "off-shore" purchases under ERP.

Indeed, the republic's endeavours to acquire dollars or do without them by purchases elsewhere, have given it the appearance of a harassed debtor. The root of its troubles is to be found in the excess of imports under the five-year plan which was started on the crest of the wheat boom in 1947. When it became apparent that it could no longer continue its heavy imports of machinery from the United States for want of dollars, Argentina turned to Belgium. Trade between the two countries has been on a strictly bilateral basis and the balance of payments was substantially favourable to Argentina before it began to purchase Belgian machinery. The balance then turned very rapidly in favour of Belgium, with the result that Belgium was constrained, last month, to suspend the opening of further documentary credits to finance exports to Argentina.

Nor are Argentina's difficulties with Switzerland more encouraging. Here, too, the balance of payments between the two countries had been favourable to Argentina, and it attempted to use the resultant Swiss balances of about 100 million Swiss francs to purchase "finance dollars" in the Swiss foreign exchange market. These efforts, it would seem, fell outside the scope, as the Swiss authorities understood it, of the Swiss-Argentinian trade agreement and were strongly opposed by them. The situation hardly improved when Argentina seemed to be forcing the pace by cutting off food exports which Switzerland needed, and counted on. These various difficulties have now been largely resolved, in particular as Argentina is at the moment remitting dividends and interest abroad more regularly—a matter of some importance to Swiss holders of public utility interests in Argentina.

The rate at which dividends are being remitted has been raised from 16.20 pesos to the pound to 19.34 pesos—which is tantamount to a 20 per cent tax. Argentine foreign trade relations are based on a complex system of multiple currency rates, the gradual weakening of which reflects current difficulties. Export rates now vary from 13.53 to 20.15 pesos to the pound, the latter being a special rate for exports of manufactures. Import rates range from 15.04 pesos for essential requirements to the auction rate of 19.89 for non-essential goods. These devices illustrate a fundamental disequilibrium in the Argentinian economy, and one which will not be corrected by multiple currency practices.

Micawber Goes to Cape Town

Rather unexpectedly, it appears that the main parliamentary battle between the Opposition, led by General Smuts, and the new Nationalist Government in South Africa is being fought on economic and financial issues. These plainly call for a firm hand, for the Union is obviously living far beyond its means and no longer finds an eager and adequate body of investors standing by overseas to finance it. Mr Havenga's retort to Mr Hofmeyr's attack in this week's budget debate clearly showed, however, that the new Government is in no mood to take firm measures. Its policy is evidently to delay the necessary retrenchment until every possible alternative has been explored. What is needed is a dose of disinflation of the kind that Sir Stafford Cripps hoped to administer in Britain. Failing that, South Africa is almost bound to do what Britain, with greater justification, did before—seek specific loans abroad. In default of these, the excessive outlays must involve a steady drain upon reserves of gold and foreign exchange until retrenchment becomes inescapable.

That is undoubtedly what Mr Hofmeyr meant when he said that the Union was "heading for trouble"; though he was less than fair in implying that the difficult economic situation which confronts Dr Malan's Government was of its own making. Fundamentally, the position is not more unsound now than it has been for the past two years; but the unsoundness has been brought sharply to light by the hard practical fact that the inflow of "hot money," by which the disequilibrium

was formerly being financed, was stopped—and even reversed—by the political fears aroused by Dr Malan's victory On a longer view, therefore, the stoppage of this inflow, embarrassing though it is for the moment, deserves to be welcomed, as a factor tending to enforce policies of restraint. Mr Havenga, however, is evidently prepared to borrow elsewhere if he can, and meanwhile to go on dipping into reserves, before countenancing such policies. This wait-and-see attitude is proving very costly; Mr Hofmeyr, apparently quoting the estimates given recently by Dr de Kock (and discussed in these columns on July 31), declared that the Union's external deficit outside the sterling area is now running at £5,000,000 a month beyond the amount of gold production.

No doubt it is good and sound business for South Africa—even in these days of world shortage of capital—to borrow abroad for the opening up of the new goldfields; but if the Union needs capital for this purpose and cannot find it sufficiently from spontaneous investment by individuals in Britain, it can hardly expect American agencies to look sympathetically at the projects when they see that much of any capital inflow would be dissipated in quite other directions, including imports of non-essential consumption goods. Moreover, Americans may recall that, during the war, their Government rightly gave only a low priority rating to resources for gold development—a consideration which, in these days of international tension, is by no means irrelevant to the Union's present problem. Dr Malan and his colleagues, instead of waiting too long for something to turn up, as they seem likely to do, should recall the other prescription for which Mr Micawber was famous—in the days before the "new" economics.

* * *

Holidays and Exports

It was expected that the August trade figures would not maintain the high levels reached in July, if only because of the shorter working month. Exports were £17 million smaller at £135 million while imports at £174 million were the lowest since February. More significant, the visible trade gap for the month comparing exports and re-exports f.o.b. with imports c.i.f. increased to £39 million against £34 million in July. On the basis of a standard month of 26 working days, exports in August fell by only 3 per cent compared with July and were at a level a little above that for May; August had only 25 working days.

BRITISH EXPORTS—VALUE
(Standard Month of 26 Working Days)

	£ mn.		£ mn.		£ mn.
Dec.....	114½	March	126	June	139½
Jan.....	115	April	126½	July.....	140
Feb.....	122½	May.....	135	August ..	135½

The volume of exports in August has been provisionally estimated at 133 per cent of the 1938 level. This compares with the mid-year target of 140 per cent and the actual rates of 149 per cent for July and 138 per cent for June. Exports of raw materials fell sharply by £1,900,000 to £5,400,000—mainly owing to smaller shipments of coal. All the items of the manufactured group declined except vehicles but the exports in this class were inflated by an unusually large increase in the value of ships and boats sold overseas which varies widely from month to month. A more heartening feature was the quite modest decline, despite holidays, in exports of cotton and wool manufactures. Machinery exports, however, fell rather sharply, by £4,000,000 to £20 million, and were smaller in value than those of the vehicle group.

Imports of food in August were reduced by more than £4,000,000 to £76 million; supplies of wheat and dairy produce were appreciably smaller than in July although tea imports were much heavier. Imports of raw materials, however, increased by £3,000,000 to £58 million; this increase was mainly due to larger arrivals of raw cotton, wool and oilseeds. These fluctuations in supplies of foodstuffs and raw materials are largely seasonal and should not be read, in themselves, as indicating any trend towards a reduction in food imports in favour of raw materials.

More Dividends Passed

Light engineering companies continue to provide the main exception to the list of generally satisfactory dividend announcements from public companies, though they may well foreshadow a more general fall in the profits of industrial concerns during coming months. This week Sydney S. Bird and Eustace Watkins, two more companies in this category, have decided not to pay interim dividends. Both companies have suffered a similar reversal in trading conditions. The experience of Sydney S. Bird,

which manufactures electrical components mainly for the radio industry, conforms to the pattern set by other companies in the industry such as A. C. Cossor. This latter company itself is deferring consideration of the payment of the dividend on its 500,000 6 per cent £1 preference shares until accounts are made up for the year ending March 31, 1949. The decision is hardly a surprise, for although the preference dividend was paid for 1947-48, the accounts for that year actually showed a net loss of some £91,463. With the partial relaxation of the purchase tax on radio equipment and the spur given to the production of television sets by the Government's decision to keep to the present system of television for "a number of years," a more hopeful future is being predicted for the radio industry than seemed possible before the Government's policy of disinflation began to wane. Moreover, rearmament on any appreciable scale would imply a useful expansion of the company's radar business. Even so, the company's financial problems will not easily be solved.

Eustace Watkins has a mixture of interests which makes any estimate of future prospects rather difficult. Its adverse results may have some connection with the distribution of Wolseley cars, for which the company holds the sole London agency. There is, however, no mistaking the industrial identity of Bylock Electric despite the variety of its products. In the past few days this company has announced the unsatisfactory news to shareholders that no dividend is to be paid on the 1s. ordinary shares for 1947-48, whereas 360 per cent was paid in the previous year. In June, 1947, 200,000 1s. ordinary shares of the company were offered for sale by Whitehead Industrial Trust at 30s. per share; this week the price has fallen to 4s. 6d.—6s. 9d. The range of Bylock Electric products covers vacuum cleaners, refrigerators, electrical accessories, and floor polishers. It is understood that the concentration of production on new lines of floor polishers, portable sprays and hand drying apparatus has entailed a disruption of production during the first part of this year. Yet even these new products hardly come within the category of indispensable goods, and shareholders may ask whether they would be any more successful in countering sales resistance if purchasing power were to fall further. That is one of the factors to which the company attributes the sharp fall in sales of its former products in the six months to July 31st this year.

* * *

Film Finance

The "shadow" board of directors of the new Film Finance Company (who are acting as an organising committee until the company is formed shortly) have now been appointed. The chairman and managing director is Mr J. H. Laurie, who recently left the Industrial and Commercial Finance Corporation to undertake this new task; Mr Nicholas Davenport, who apart from experience in film finance and stockbroking, is a member of the National Investment Council; Mr. S. J. Pears, a chartered accountant; Mr C. H. Scott, a solicitor; and Mr R. J. Stopford, formerly Financial Counsellor in Washington.

The functions of the new company were described in *The Economist* of July 31st. Meanwhile, it has become apparent that a large prospective source of employment for the company's resources may be the British Lion Film Corporation. This company, a leading distributing organisation, is shortly to seek borrowing powers up to £2,000,000. A circular to shareholders, which reveals that the company has been in discussion with Government departments, anticipates a considerable increase in business when independent film producers take advantage of the new financial facilities which are being provided by the Government. The British Lion company therefore plans to raise "long-term loan capital" by borrowing on security from the Film Finance Company. Does "long-term capital," in this context, affect the original intention of the Government that the provision of public money to finance film production should cease after five years?

* * *

Indian Merchant Shipping Plans

Two smart white-painted liners, newcomers to the Port of London, last week aroused much interest, not only in the Royal Albert Dock, but also in the shipping purlieus of Liverpol and Leadenhall Street. These were the passenger and cargo liners *Jalazad* and *Jaljawahar*, forerunners of a fleet of similar ships which will run a regular service between British ports and India under the Indian flag. Manned entirely by Indians, apart from a British master and a few white officers, these ships carry 7,500 tons of cargo and provide excellent accommodation for 56 first-class and 44 "economic" class passengers. They are operated

by the Scindia Steam Navigation Company, which for nearly thirty years has been seeking a growing share of the Indian trades and has in the past complained bitterly of what was described as British "dominance" in those trades. Meanwhile, another Indian company, the India Steamship Company, has also inaugurated a regular cargo liner service between India and UK-Continental ports, and a few weeks ago the first cargo of jute from an Indian ship was discharged at Dundee. Both these companies have been admitted to the respective British liner conferences, so that the dangers of a "rate war" have been averted.

The entry of two Indian companies into the trade is indicative of the new conditions in the Indian Ocean. In the first flush of newly-won independence, the Indian Government is naturally conscious of its reliance on sea transport and it was quick to endorse the recommendations of a shipping policy sub-committee which advocated the rapid expansion of a wholly Indian mercantile marine. The plan is, to say the least, ambitious: its object is to secure for Indian ships the whole of the coastal trade, three-quarters of the trade with adjacent countries, half of the trade with more distant countries and "one-third of the trade formerly carried in German and Japanese ships"—ignoring the fact that trade disappeared with the ships. To achieve these ambitions, it is proposed to build or purchase ships totalling some 2,000,000 tons gross. Many American war-surplus vessels have already been acquired, and new ships are under construction or on order from British shipyards. In addition, the Scindia company has built a shipyard at Vizagapatam which has already launched its first ocean-going ship, though at rather startling cost. Even so, it is extremely unlikely that the fleet can be built up to the intended size within five years—if only because the Indians have not yet sufficient experience or trained personnel to man and operate such a large fleet in international trade.

These difficulties can, of course, be overcome in time, but meanwhile the Indians must and do rely on British assistance and co-operation. British technicians are assisting in the Vizagapatam shipyard; Indians are training in this country in the handling of marine engines; and the British shipping companies have shown their willingness to co-operate by the admission of Indian lines to the conferences on a normal competitive basis. But British shipowners will not accept (as they were asked to do by an Indian delegation last year) the principle which appears to underlie Indian shipping policy—namely, the apportionment of the carrying trades into strictly defined shares between flags. They cannot, in any event, be expected to look with equanimity on the extent of Government participation which is planned for Indian shipping, for three shipping corporations are to be set up with state control of 51 per cent of the capital and a majority on the board. Least of all could they concur in a policy which, pursued by every maritime nation to its illogical conclusion, would penalise efficiency and reduce shipping business to an economic mockery, to the detriment of importers and exporters.

Mexican Eagle Payment

Surprisingly little interest has been aroused in the City by the announcement this week that the Mexican Eagle Oil Company had duly received the first instalment of $8,689,258 in United States currency under the terms of the agreement of August, 1947. The price of the ordinary shares and of the 8 per cent

specifying requirements clearly and marking envelope "Index"

A monthly cumulative index to "Records and Statistics" has now been started; it appeared for the first time as part of the issue of September 4th. No further half-yearly indexes to the Supplement will therefore be published. Subscribers who have already paid in advance will have the amount credited to their Records & Statistics Subscription unless instructions to the contrary are received.

preference stock of the company rose by only a few pence on Monday, and both have been inactive and practically unchanged this week around the common level of 14s. 6d. In fact the price of the ordinary shares is as low as it was a year ago before the unexpected news of agreement was made known. Thus all the old fire seems to have been quenched in this once volatile counter. Speculation about the eventual value of the compensation per share fails to evoke enthusiasm among investment statisticians, and the market itself has taken the receipt of at least the first of the promised fifteen annual instalments to be paid in New York for granted. These instalments represent annuities to cover the compensation payment of $81¼ million plus interest at 3 per cent for the period from March 18, 1938, when the company's properties in Mexico were expropriated to September 18, 1948, together with interest on the outstanding balances during the period of repayment.

The payment by Mexico is a milestone which perhaps would never have been reached but for the energetic pressure by the United States to secure its own share of compensation for expropriated oil properties in Mexico. But although it has been arrived at successfully the question of the payment of future instalments is still necessarily regarded as a matter of conjecture. If, on economic considerations alone, the capacity of Mexico to meet its overseas commitments has been open to serious doubt in the past, it might appear odd that this could still be so, given the present demand and prospects for oil. Yet in recent weeks it has been thought in some quarters that the obligation to meet the payment to Mexican Eagle in United States dollars, the hardest of hard currencies, might prove difficult enough to prompt the Mexican Government to invite the company to resume the marketing of oil from its old properties. Obviously no stockholder could afford to be unduly confident that fifteen annual instalments will be forthcoming without some reconsideration of the alternatives. Yet in meeting the first instalment this week, the Mexican Government have strengthened their hand even if, one day, they are minded to seek new negotiations.

* * *

Ultramar Capital Requirements

The disappointing output from the Mercedes and Palacio fields of SA Petrolera Las Mercedes in the first two months of production have led to a further fall this week in the ordinary shares of Ultramar, which holds a half interest in the fields through its wholly owned subsidiary Caracas Petroleum SA. A circular issued by Ultramar at the end of last week announced that total production to date has amounted to some 1,150,000 barrels. Production has been raised from 8,314 barrels a day in the first week of July to a peak of 11,257 barrels a day in the week ending September 4th, while the average per producing well has risen from 131 barrels to 143 barrels a day. These figures are well below the estimate, on which the drilling programme was based, of 25,000 barrels a day for initial production; moreover, the output envisaged even when further wells are brought into production on the two fields is still only 15,000 barrels a day. The company has cautiously avoided giving an estimate of production from the further fields, including Guavinita, which lies to the west of the Mercedes field, since there is no assurance that the unexpected technical difficulties which have been encountered might not be repeated there.

As a result of the shortfall of revenue due to the failure of production to reach the original estimates, the Venezuelan company, SA Petrolera Las Mercedes, has had to look for further finance to the Texas Company, which holds the joint interest with Ultramar. Current requirements have been provided by the Texas Company on a temporary basis by advance payments for oil, but obviously the new situation requires the provision of additional permanent capital. The total required to meet the balance of capital commitments and development expenditure to June 30, 1949, is estimated at approximately $3,500,000, and Ultramar has indicated that it has proposals under consideration for the provision of its share. Up to the present, the Finance Corporation for Industry has advanced £1,750,000 to Ultramar on loan at 3½ per cent, repayable on March 31, 1952, and in addition there is £3,500,000 of 3½ per cent unsecured loan stock 1949-57 in issue This is a formidable weight of prior charges ranking before the ordinary capital, of which £1,749,929 in 10s. stock units has been issued. There has been a steady decline in the price of the ordinary stock units from over 85s. in June this year, when the first indications appeared that production might fall below the original estimates, to around 60s. a week ago. Fears that further loan capital will have to be raised and that the dividend stage has been postponed for a lengthy period have further depressed the shares to 52.6d. this week.

Bank Advances and Disinflation

The recent check to the strong expansion which has occurred in bank advances in the past two years has been generally attributed to the effects of disinflationary influences which, by causing embarrassment to certain luxury and semi-luxury trades, have led the banks to tighten their conditions for new loans. A further probable influence, which is really the obverse of the first, arises from the effects of an easing of inflationary pressure in opening up some of the bottlenecks which have been causing an accumulation of semi-finished goods. It is hard to find, however, any specific confirmation of the workings of these conflicting influences in the latest quarterly analysis of the distribution of bank advances in Britain between different categories of borrowers. In the three months to August last, total advances rose by only £29.8 million, an increase which contrasts with one of £44 million in the previous quarter, £80 million in the corresponding quarter last year, and £257 million in the twelve months ended last May. Nine of the twenty-five categories of borrowers showed declines during the quarter, but the largest fall—that of £21 million in the food, drink and tobacco group—appears to have been partly seasonal and partly due to special factors. It tends to confirm the assumption that the actual fall in total advances by the clearing banks in July (the classified figures, it should be noted, cover all banks in Britain but exclude loans made outside Britain) was mainly due to the vagaries of tobacco financing.

Special influences probably also explain the other large fall, that of £6,300,000 in loans to Churches, Charities and Hospitals, a movement which must reflect the recent repayment, under the National Health Scheme, of the private indebtedness of the voluntary hospitals. The other declines are all relatively small; but a significant movement, in view of the complaints about accumulating stocks of clothing, radio and electrical apparatus and other non-essential consumer goods, is the fall of £1,000,000 in the retail trade group, for this had been expanding rapidly and in the similar period of 1947 rose by £10 million. For the first time, its share in total advances has declined, but, at 10.2 per cent, is still much larger than in early 1946, when the first postwar classified figures were compiled. The two building groups have also contracted, whereas they were expanding in the comparable period last year; but this change is no necessary reflection of the trend of private building activity, because the classification relates merely to the business of the borrower and not to the purpose for which finance is needed. As for public building activity, it may be significant that loans to local authorities, which declined earlier in the year, have risen by £7,300,000.

The biggest increase during the quarter occurred in agriculture, which rose by £12.6 million, seemingly a more than seasonal expansion which raises the group's share in total advances to 9 per cent, compared with 8.2 per cent twelve months ago. After the pause in the three months to May last, the expansion of engineering advances has been resumed, with an increase of £11½ million, carrying the proportion to 8.5 per cent compared with 6.7 per cent fifteen months ago. The non-ferrous metals group, small in total, shows a large relative rise, from under £2,900,000 to £3,900,000. Cotton has risen from £7,500,000 to £9,500,000 and there have been small increases in wool and other textiles. The utilities group (which excludes transport) again made big demands, rising by £6,800,000 to £33.3 million—almost three times the total for August last year. Entertainment showed a smaller seasonal rise than in 1947.

* * *

Nourse—City Deep Merger

The proposed merger between Nourse Mines and City Deep, two of the oldest producers on the Rand belonging to the Rand Mines group, of which details have now been announced, has been motivated both by technical and financial considerations. It follows the amalgamation of Springs and West Springs arranged last June. Nourse Mines has suffered to such an extent from impediments of age, the rise in working costs and shortages of labour and material that its working profit per ton of ore milled has fallen from 8s. 5d. in 1941 to 1s. 4d. in 1947-48. At best its working life could be reckoned at nine years, and not a very profitable span at that, in the absence of a rise in the price of gold. A compelling technical consideration in the move is that the bulk of the ore reserves and the only undeveloped portion of the Nourse Mines property have become technically very difficult of access and lie adjacent to Number 5 shaft of City Deep.
