mobility to which technical progress must give rise. Labour must not be wasted; labour must move, between jobs and between localities, from where its usefulness is less to where it is greater; "redeployment" must not be resisted but actively furthered, whether in order to take advantage of new equipment or to make the best of what equipment there is. True, the TUC carefully averts its eyes from the question of wage inducements, whether positive or negative; but one cannot expect everything to happen at once. The conversion of trade-union leadership to the gospel of high production is in itself as striking a change as the conversion of the Middle West to a qualified internationalism. But the trade-union mind is not a single entity. The mind of Mr Will Lawther or Mr Jack Tanner is not the mind of the irritated and apprehensive docker at Butler's Wharf; still less is it the mind of the Communist borer-from-within, with orders from the Cominform in his pocket and industrial collapse as his immediate objective.

A time-lag in enlightenment is always to be expected, but it is as dangerous to let it persist and widen as to ignore it. The verdict that what British productivity needs is more equipment may be, on the evidence, obvious; but it is not sufficient. It is little use devising or buying superior equipment if the products are strikes, ca'canny and mutual ill-will—even if superior equipment could be conjured out of thin air by merely wishing for it. The need for mechanisation reinforces, and does not override, the need for economic wisdom, whether embodied in policy or in the details of good management. It is essential that there should be no such blunders in rate-fixing as recently caused a strike at Austin Motors against a new machine to which, in principle, no one objected; that is primarily the responsibility of employers, and should not be too difficult. It is essential that relations of mutual confidence and responsibility should be cultivated between management and labour from the lowest levels upwards; that is a matter for both sides, and cannot, given a long history of mutual antagonism, be easy. It is essential that labour shall willingly adapt itself with all the smoothness and speed which is physically possible so as to make the best of whatever technical opportunities present themselves; that is predominantly a matter for the workers themselves, and probably, in view of their historical tradition, the hardest of all.

The mass of the trade union movement has a great deal not merely to learn but to unlearn. The major lesson, that real earnings depend on production, may, to an optimistic eye, appear to be sinking in; but the important corollary now stated in the TUC Report that production can only be increased at the cost of greater mobility between occupations is likely to take some swallowing. How easily it is swallowed will depend not only on the intelligence of those most immediately affected, but on the actions of their comrades in other unions. It is all very well to look at the Butler's Wharf dockers, fighting the introduction of a machine which can lighten their labour, raise their pay, and contribute to cheapening what they buy with it, and to condemn their selfish short-sightedness and economic mediaevalism. It is all very well to point out that the guaranteed week safeguards their immediate livelihood and that even for the ultimate "redundants" there are unemployment pay, an efficient labour exchange, and training facilities; that there is little comparison between the lot of the latter-day Luddite and that of the displaced handworkers whose fate has coloured for more than a century the workers' attitude to new machinery. The crux of the matter lies in the behaviour of other unions towards those displaced by this and other improvements in equipment; those from whose temporary loss, inconvenience and anxiety they benefit in lower prices and increased production. Will they in turn move over and make room, as the displaced workers move over and make room for the machine, and share the benefits brought by cheapened production? Or will they cling to the sacrosanct *status quo*, merely resolving that they, if and when their turn comes, will put up a stiffer fight against their mechanical allies? The General Council's report gives the lead—a genuine lead, a powerful and positive contribution to the cause of social democracy—indeed, of democracy *tout court*. But the General Council will have its work cut out to put across the lesson; a job all the harder in an economy where Luddism, the gospel of stagnation, has so firm a hold not only on the workers but on their employers, too.

Uno Discusses Greece

THE attempt of the Slav *bloc* to filibuster the Greek dispute out of the General Assembly's Political Committee has failed. A long resolution has been passed which virtually repeats the resolutions accepted a year ago. Greece's northern neighbours are blamed for assisting the Greek rebels and are called upon to work with Greece and with the United Nations Special Committee on the Balkans to secure a peaceful settlement. The Political Committee, at Australian instigation, has also invited the three neighbours—Bulgaria, Jugoslavia and Albania—and Greece together for secret talks in Paris. Since, however, there is obviously no readiness to reach agreement and no intention of bringing intervention to an end, the discussions at the General Assembly seem likely to leave the Greek question exactly where it was left last year—with the northern neighbours assisting the Markos regime and Greece bleeding to death from the open wound of civil war.

This situation is so obviously dangerous and unsatisfactory that the western Powers can hardly rest content with the verbal condemnation of the General Assembly. Another year of ruinous fighting, or disorganisation among the peasantry, of mass withdrawals of country folk to the cities—already over 500,000 have crowded into the towns—may cause, irrespective of outside assistance, the sort of economic and moral collapse which is occurring among the Nationalists in China. The western Powers, with America at their head, can neglect no means of ending the struggle. To play a holding game—just sustaining Greece above the abyss—is not enough. No people can endure indefinitely the strain of life on the edge of the gulf and unless new hope is offered, a majority may come to prefer peace on any terms—even the terms of a "people's democracy."

It is useless to suppose that the civil war can be stopped simply by internal reforms. The roots of misery in Greece—poor soil, agricultural over-population, absentee capital, a poor administrative machine—all existed before the war and have only been exacerbated by the last eight terrible years. No change of government, no reform of taxation or fiscal policy will reconcile the people by the offer of quick prosperity. This is not to say that radical reform is unnecessary. If the United States and the other western Powers involved make new efforts to put an end to the fighting, they can and should demand the *quid pro quo* of a better government, a refashioned civil service, an acceleration of the reforms in government finance already initiated—for instance the shift from indirect to direct taxation—and the adoption of modern programmes of capital development (particularly of hydro-electric schemes), public works and social services. But these are measures whose results will be felt in five or ten years' time at the earliest, and never so long as the meagre resources of the country are absorbed by a hundred thousand men under arms and hundreds of thousands more living as destitute unproductive refugees in the cities. The first step is to end the fighting.

The proposal of the Greek Government—to increase the number of men under arms and to provide more modern equipment—can hardly be rejected, particularly after the summer's fighting when the successful clearing of Mount Grammos was simply followed by the reappearance of the rebels in the Vitsi massif. The Greek Army is clearly not yet on a sufficient scale to deal with its tasks, and some expansion should be conceded.

At the same time, it is doubtful whether even an indefinite expansion could settle the struggle so long as the rebels can retreat across the northern frontier, reform and refit and return to another mountainous area at a new point on the front. This is the crux of the civil war. The Greek Army cannot both hold a 500-mile mountain frontier—which it cannot cross, while its adversaries are free to come and go—and also clear the rebel-infested districts in the centre of the country. The army's effort to clear Mount Grammos was followed by a great increase in rebel violence in the Peloponnese, simply because the Greek Government had concentrated its forces in the north and the Peloponnese had as a result to be left relatively undefended. The first aim, therefore, in Greece must be to seal off the northern frontier.

The first possibility is to increase and intensify the intervention of the United Nations. The United Nations Special Committee on the Balkans has done valuable work. But its observers can only watch and report the constant violations of Greece's frontier by the northern neighbours. The situation would be different if an international force were created to patrol the frontiers, thus liberating the Greek Army for the task of clearing up the rebels in the interior. It is doubtful whether the northern governments would go to the point of armed clashes with United Nations troops. United Nations commitments could also usefully extend to guarantees of fair treatment to ex-rebels returning to their villages. Teams of inspectors should be provided for this purpose. It is by no means a hopeless task. Even in the burning passions of the last two years, the small number of British police advisers have achieved a great deal towards the creation of a professional force. The help of experts from the United Nations countries could achieve much more. And an international guarantee of fair treatment would go far to reassure the waverers on the rebel side and to appease the country. The General Assembly's condemnation of Greece's neighbours should be followed at once by the proposal to back the work of the Special Committee with a strong defence force, before the Assembly scatters and its condemnation is buried under the United Nations' inevitable avalanches of paper. The formation of such a force would inevitably fall to the responsibility of the western governments and their unwillingness to act in the matter of a police force for Palestine does not encourage optimism on their readiness to second detachments of their armed forces to serve in Greece. On the other hand, the alternative—an endless continuation of the war—may prove even more costly in the long run.

But is a strengthening of the role to be played by the United Nations the only possible step? One striking change has after all taken place in the Balkans since the General Assembly finished its fruitless discussions of Greece in 1947. The change is the excommunication of Marshall Tito from the Cominform and the new isolation of Jugoslavia. Is there nothing in this situation that the western Powers can use to close the breach between Greece and its Jugoslav neighbour and thus to reduce the length of the mountain frontier that must be sealed off?

The matter is admittedly extremely delicate. It is true that Marshal Tito is receiving increasingly contumelious treatment at the hands of his brother Slavs. On the other hand, it may be that his long service within the Communist ranks has left him with a distaste of the west too ingrained to permit of any contact. But the Western Powers have this advantage—that they want very little from Jugoslavia. They have no imperialist sphere of influence in which they seek to incorporate the country. They want no internal social changes. They make no demands for military assistance. In trade matters, they seek much less from Jugoslavia than Jugoslavia seeks from them. All they ask in the first place is Jugoslav neutrality over Greece—in other words, a sealed frontier. The terms of a bargain being so modest—on either side—it is perhaps not beyond the wit of western diplomacy to devise a solution.

One thing, however, is certain—that the risk both of increasing United Nations intervention and of seeking some sort of understanding with the Tito regime is worth taking. The most risky of all situations is the present position in Greece in which neither the people nor their armies—nor indeed their foreign advisers—can really see any end to the hopeless and horrible drain of civil war. A nation's endurance cannot be tested beyond a certain point nor can the Greeks be asked indefinitely to do the lion's share of military action in a war which has a Mediterranean as well as a purely local significance. One way or another, the Greeks must be relieved of their burden or the day may come when they will prefer to lay it down.

NOTES OF THE WEEK

Western Defence and European Doubts

The timetable of western defence is beginning to take shape. In the next weeks the discussions which Lord Montgomery is conducting in France, western Germany and the Low Countries should have produced estimates of responsibilities, contributions and requirements sufficient to provide the United States and Canada with a programme upon which a concrete defence plan can be based. The Americans have already entered—as responsible military authorities in Bizonia—into Lord Montgomery's preliminary studies, and the visit which Mr Forrestal is paying to Paris and London will ensure that the information Washington and Ottawa require before entering into firm commitments will cross the Atlantic without delay. The results of Mr Truman's victory are probably more obvious in this field than in any other. The elections have been followed by an acceleration in military preparations, and it is possible to believe that an Atlantic Defence Pact will not be too long delayed in 1949. Yet the smooth flow of preparations on the surface of the proposed alliance does not altogether obscure some dangerous reefs of political misunderstanding. The question of including other European nations besides the five of the Western Union will probably not prove too difficult. The French, with a wary eye on the amount of armaments the Americans can in fact supply, are most anxious to keep down the number of allies for the time being. But the Italians are beginning to resent this exclusion and to ask whether the North Atlantic concept is not overshadowing the European—in which case, are they to be left on an undefended periphery? This difficulty, however, is not likely to become acute at this preliminary stage and Mediterranean strategy is far too vital for the Italian position to be permanently overlooked.

The most dangerous difficulty lies in a slight but unmistakable difference of emphasis between France, and to a lesser extent the Low Countries, on the one side and the United States and, more hesitantly, Britain, on the other. It is clear that the Americans regard Russia as the chief menace, and as far as American opinion is concerned an Atlantic Pact is necessary solely to prevent a further extension of Soviet imperialism. The European countries, however, have longer memories of the last two wars, and for them Germany is almost as much the potential aggressor. Western Union for them is a method of holding the Germans down quite as much as of holding the Russians back. Thus the strengthening of Germany which—economically at least—is a first point in the American conception of a strong western Europe is regarded with painful suspicion by the French, and now that German steel production has caught up and actually surpassed French production, their anxieties are concentrated on the future and the control of the Ruhr. If the Anglo-Saxon Powers desire the really firm adherence of Europe's "western fringe," they would

be advised to reconsider the French case for safeguards. The conference which opens in London this week on the control of the Ruhr offers them their opportunity. Unfortunately, the timing of the decision to transfer the German coal and steel concerns to purely German trusteeship was calculated to rouse France's apprehension and has already led to a vigorous official protest.

* * *

Steel and Coal to the Germans

The reason for French nervousness can be understood but in themselves, the new trusteeship regulations do not justify alarm. Phrases such as "the Ruhr is handed back to the Germans" are as exaggerated as the German politicians' description of the new International Authority as "annexation." The chief effect of the arrangement will be to introduce the same system of control in both the steel and coal industries. Hitherto, steel has been in the hands of a German trustee, under a purely British control; while the coal mines have been controlled by a joint Anglo-American body, with trusteeship vested solely in British Military Government. Now, the Americans will join the British in control of the steel industry, while Germans will become interim trustees for the mines. The important point is that control remains in both cases with the occupation powers. A further result of the new regulations will be to regroup the "decartelised" steel industry into units which will be efficient without—it is hoped— coagulating afresh into powerful trusts. Here, too, a moderate American view has prevailed over the zeal of the British "decartelisers."

It may be asked whether the French are nevertheless justified in fearing that the British and Americans have opened the door wide to ownership of the Ruhr by a central German Government. On the face of it, they have. The German Government—when it is at long last formed—is to decide whether the industries shall revert to private ownership or be nationalised. The American objections to socialism have given way to their equally sincere attachment to working democracy. Nevertheless, it would be wrong to assume that the Occupation Powers have finally thrown the reins to the Germans, or that they intend to do so. Even if the Left should prevail in the future German Government, and a socialisation measure be passed, the Occupation Statute which is now being hammered out between the Powers may well provide for a veto on any step which might hamper Germany's removal from the list of countries requiring dollar subsidies.

It is, moreover, apparent that the proposed International Authority for the Ruhr will in practice mean that control is in the hands of neither the Germans nor the French, but the British and Americans. The new body will, in fact, have very limited functions beyond passing on recommendations to the Military Governors. Only if their zone is merged with Bizonia will the French acquire an effective voice in decisions, as their Military Governor will then join General Clay and General Robertson in command of the Ruhr. For as long as they think fit, the Military Governors will exercise the votes accorded to the Germans. It will be for them to hold a nice balance between the claims of Germany and the fears of its neighbours. For this impossible task to be fulfilled, the hard road must be taken towards integration of western Europe's heavy industries at the cost of mutual concessions. Much stands in the way of this path—British unawareness of its necessity, French obstinacy, and the arrogant nationalism of the resurgent German industrialists. Hopes can only justifiably be placed on the Americans, with their great financial power and their simple conception of the redundancy of western European frontiers. At the Six-Power conference last spring, the United States delegation put forward a proposal that not only German territory, but the whole of the Ruhr-Lorraine-Luxembourg complex should be placed under international control and operated as an integral whole. This idea was rejected instantly by the French. Perhaps it will appear again.

* * *

Basis for Civil Defence

The Civil Defence Bill published earlier in the week will provide more solid ground for the discussion and planning of the protection of industry and the civil population from enemy attack. In the first place, it removes the uncertainties about who shall bear the cost, which so retarded effective preparation before the late war. If local authorities are required by Whitehall to undertake the building of shelters and defence works, they will be paid for by Exchequer grants. The same will apply to the more important items of equipment if they are not provided from a central pool. Other local expenditure on works or services will be met by an Exchequer grant of up to 75 per cent.

Secondly, it enables the Minister to demand that local fire and police authorities shall be trained in civil defence. The general public may voluntarily enrol into defensive organisations, and once in are bound by much the same obligations as Territorials, that is, they can be fined up to £5 for shirking their training duties and heavily penalised for not showing up in an emergency. There is, however, no immediate intention to start recruiting members of the public until an instructional cadre has been built up and former civil defence centres re-established. When the time comes to recruit from the public, the general eagerness to come realistically to grips with the frightening possibilities of atomic and bacteriological warfare, and latent nostalgia for the old excitement of warden posts and plotting rooms, suggests that there will be a ready response.

Thirdly, although the Bill does not seek powers to centralise the control of fire-fighting forces, it does contain provisions which would enable factory, mine and public utility staffs to be brought within and trained for a general civil defence scheme. It is within these fields—in the measures contemplated to keep the essential services and the essential part of the economy up to date in methods of protection from the effects of attack—that planning and training must be unremitting.

Finally, according to the Bill, it seems unlikely that there will be any change in the higher organisation. Although it refers to the possibility of allocating powers between different Ministers, the only responsible Minister nominated in the Bill is the Home Secretary. There has been a great deal of muddled thinking on this subject. The Home Secretary only became involved in civil defence before the war because he was responsible for the police and public order. Since then it has been rightly recognised that civil defence should not be under the Army, and it has therefore remained with the Home Secretary. But the place where civil defence should be planned and executed is the Ministry of Defence, for it is a fourth Service. The fact that it needs the co-operation of civil authorities is as poor an argument for leaving it with the Home Office as to say that the Inland Revenue or Customs and Excise should be responsible to the Home Secretary because their officers have powers of search or enforcement. Local authorities have to deal with many Ministries in Whitehall, and it would be greatly to their advantage to deal on questions of defence with a Ministry whose whole attention was devoted to its defensive and offensive aspects, instead of with one whose Minister is not even a member of the Cabinet Committee on the subject.

* * *

Dog Days in Paris

A feeling of more than ordinary aimlessness and frustration has hung over the last weeks' deliberations in the General Assembly. The acrimony has reached a new high record, the performance a new low. The whole affair is expected to wind up in four weeks' time, having dragged on since late September with practically speaking nothing to show for the labour. The two positive resolutions of the week have only served to underline the general lack of achievement, for what could be more tragi-comic than the unanimous adoption by the Assembly of a Mexican proposal that the Big Powers should co-operate for peace and conclude treaties with Germany and Japan? And what could better represent the sum of wasted hours than the Assembly's decision, the eastern *bloc* alone opposing, to reaffirm the Baruch Plan for atomic control, recall the Commission to its fruitless labours and thus restore the position to the *status quo* of last spring, when, in face of complete Soviet obstruction, the Commission decided its usefulness had come to an end?

The truth is that the life went out of the Assembly when the attempt at conciliation over Berlin broke down. Without a minimum desire on the part of the Great Powers to co-operate, the United Nations can be little more than a sounding-board for their differences and Berlin has proved in this session to be the touchstone of their intentions. Nothing Russia did gave any promise of a greater desire to reach a settlement, and the western Powers had apparently not quite decided whether they really wanted to reopen negotiations, and if so upon what terms. The resulting deadlock has now lasted over a fortnight, and meanwhile in Berlin the Russians are improving their advantage by imposing even tighter controls on the passage of food and materials into the western sectors.

This situation is so obviously unsatisfactory—both to the Powers in general who by their efforts at mediation and their resolutions on peacemaking have sought to underline their impatience at the quarrels of their great neighbours, and to the three western Great Powers who must bear the full brunt of a winter air lift—that the Secretary General and his executive office are performing a valuable service in making yet one more effort to restart negotiation. A draft currency proposal is being prepared in the Secretariat, and it will be submitted to the contending parties. It is difficult to hope that the Secretary General will succeed on a point which proved the major stumbling block before the breaking off of direct negotiations in August, but his attempt is clearly justified and deserves success.

* * *

Can Uno Survive Palestine?

Our times are no advertisement for collective security. The man of fixed purpose can, it seems, defy any council of nations. Is Mr Shertok, Israel's Foreign Minister, newly arrived in Paris, about to prove this once again? The United Nations Assembly is running perilously close to letting him do so.

On November 4th the Security Council had to come to a decision of importance. The data before it was that both antagonists in Palestine had broken its truce; that the Jews had done so with military success and the Arabs unsuccessfully, and that Israel's forces had as a result won all Galilee and the key parts of the northern Negeb. They had also entered Lebanon. The Council's dilemma was as follows: was it to throw in its hand and accept the result of this fighting conducted in defiance of its authority? Or was it to reassert that authority? By a majority of nine votes to one, with one abstention (Russia), it resolved upon the "urgent study" of sanctions if its request for withdrawal in the Negeb to the position prevailing before October 26th was further flouted. It spoke belatedly. The Egyptians, who are the Arab army concerned, are in any case in military retreat in the area prescribed. What if Israel refuses to withdraw?

The United Nations will then be obliged to choose between two distasteful courses. Either it must implement its resolution of November 4th and apply at minimum economic sanctions, with all the bitterness that they entail. Or else it must accept discomfiture at Israel's hands, and sign its own death warrant. For unless it now upholds its Council's word, who is going to respect that word in future?

Unfortunately for Uno's repute, there is a way of sliding between these stark alternatives. And that way is already being sought, although its very negativeness renders it as damaging to the organisation as is any other form of failure. During two secret meetings held on Tuesday and Wednesday of this week the mediator in Palestine, Dr Ralph Bunche, attracted many doubting Thomases and other waverers by dressing up an old proposal in new guise. He suggested getting agreement to call the truce an armistice, and to follow this up by withdrawal and ultimate reduction of forces on both sides. He himself admits that his plan can only work "provided instructions to withdraw are accepted by both sides." But to bank on this is to blink the facts. All that Dr Bunche has done is to rob the earlier resolution of much of its weight, and to pander to those who are content to see Uno peter out in a living death, mouthing resolutions that it has not the will to implement.

* * *

Sharing the Blame

For this situation more than one member must take blame. The Arabs must shoulder some of it. Even they on occasion voted for the postponements from which the Jews have derived such handsome dividends. But the main share of blame for Uno's discomfiture must fall upon the United States, for it was the incidence of the presidential election that caused the American delegation to postpone action until matters have reached a stage at which nothing short of using the enforcement chapter of the Charter can prevent Israel from dictating its terms to the rest of the world.

Even now, American intentions are not clear. They are governed by two conflicting statements: General Marshall's, in September, that the Bernadotte plan must be pursued, and President Truman's, during the election, that he stood by the UN Assembly's plan of November, 1947. Which applies? And is America firm in its intention to pursue the "study" of sanctions, for which it voted? Uncertainty on this score was enhanced by the arrival in Paris, fresh from the front, of General William Riley, the mediator's chief of staff, who, through friends in the secretariat, made widely public his personal view that the Jews have won the war and rendered the truce a dead letter. The general confusion of mind as to American intentions became worse confounded when he was quieted into the silence that befits an official in his position, and into saying that he would of course carry out any bidding of the Security Council if instructed to do so. All told, the common man may be forgiven if he collects the impression that America's hesitations are having the same result as Russia's intentions—to let things slide, and so to create, throughout the Middle East, as much bad blood against the west as possible.

* * *

The Arab Refugees

While the record of the Security Council and the Political Committee on the Palestine issue is one of confusion and inaction, the third and fifth committees of the Assembly—responsible respectively for humanitarian matters and for finance—have a slightly happier record. They have dealt solely with the question of the Arab refugees, and they have, in the last week, done so with a somewhat heightened sense of urgency. On the money side, they can record some good results. Of the $29,500,000 that is required for feeding and sheltering the refugees for nine months from December 1st, $6,000,000 has been voted by the International Children's Fund—enough to provide 250,000 children with 850 calories only per day. The fifth committee has voted an immediate $5,000,000 repayable from the Secretary General's working fund. A sub-committee of the third committee is ploughing its way through a draft resolution calling on state members for more voluntary contributions in money or kind. In advance of this appeal, the British Government has stated that its contribution to any such fund will be £1,000,000.

But complacency is still premature. The job ahead, if half a million Arab lives are to be saved, entails much more than the mere provision of funds. The main problem is the purchase of goods and their delivery to the spot. (4,000 tons of wheat bought this week in Syria by the International Children's Fund, and 180,000 blankets on their way by air as a gift from the Iraq Petroleum Company are at the moment more valuable than any money promises; but they are a mere drop in the bucket.) For the physical operation, a major feat of organisation will be required. Has the Secretary General the drive to nominate and secure the right man for the job? He does not seem to have given his confidence to Sir Raphael Cilento, who was Count Bernadotte's director of relief. Has he anyone else in view? The task calls

The Economist DIARY

The ideal present for the busy man

A memorandum book, an appointments register, and a complete reference book, combined in one volume. Published by Messrs. Charles Letts & Co. Ltd. Price 30/- plus postage and Purchase Tax.

Full details are given in the illustrated pamphlet available from:

The Economist Intelligence Unit,
22 Ryder Street, St. James's, London, S.W.1.

for a skilled administrator, for every ton of goods purchased and delivered must—until Israel develops the magnanimity that befits a victor—travel round by Beirut, Damascus and the back way to the Jordan. Has Mr Trygve Lie a Nansen up his sleeve? If so, he may yet save something of Uno's dwindling reputation.

* * *

Scrapping the Controls

The abolition of certain controls announced last week by the President of the Board of Trade and the Minister of Supply is discussed in detail on page 801. Most of the controls which have gone, or are to go, did not affect the consumer directly—exceptions are the derationing of boots and shoes and curtain material, and the end of the priority allocations of utility furniture. Their departure will be felt with most relief by the business man.

There are, however, three points of general interest arising from the decision. Why did it not take place at least a year ago? The last people to recognise that a control has become unnecessary are the controllers themselves. Mr Wilson's appointment of an examiner of controls last February was tantamount to a recognition on his part that many of them should go; it can, therefore, be taken for granted that they had already by then been superfluous for some time. It ought not to have needed an official examiner to find out that the permit scheme for the distribution of thermos flasks had become a complete farce. It is to be hoped that the examiner, now that he has cleared a way through the first mass of unwanted controls, will be on the alert to pounce on those whose uselessness is not so obvious.

A second point of general interest is that Mr Wilson intends to retain controls which ensure "a sufficient proportion of inexpensive goods of sound quality on the home market." The difficulty is that so long as controls remain it is impossible to determine the extent of the true demand. Everybody, given a ration or an allocation, tends to draw it to the full in case there is a subsequent reduction in the ration. Very often the demand, as for supplementary petrol, is overstated because it is known that the controllers will automatically grant 10 per cent less than the amount asked for. The control of allegedly scarce materials and goods often helps to maintain an artificial scarcity.

Thirdly, Mr Wilson and Mr Strauss both said that there would not be a large saving of staff in Government departments as a result of the "bonfire" of controls. One would have liked some explanation of this. Does it mean that the controllers are being transferred to other Government work, and that there is no limit to the absorptive capacity of the Government machine?

* * *

Airy Confusion

It is ironical that, just as a new system of air traffic control, developed with the experience gained in the Berlin air lift, has virtually eliminated delays in landing aircraft at Northolt, even in bad weather, the services of British European Airways should be halted by a strike of engineers. The engineers, who are not supported by their union, object to the introduction of an incentive bonus scheme which is part of the drive to increase efficiency and reduce costs on which the British Air Corporations have been engaged for more than a year. BEA has recently called in a firm of industrial consultants and is to have the advice of an expert on organisation from the Ministry of Civil Aviation. Its part-time directors have agreed to take only half their fees. Similarly BOAC is now putting into effect a reorganisation announced in July and reducing its staffs considerably. Surely there could have been a shorter period of suspense between the announcement and the decision to retain or dispense with the services of particular employees?

The recent intensification of measures for efficiency and economy is probably aimed at taking the substance out of the criticisms that will follow the publication of the Corporation's accounts for last year, which were expected to show a bigger deficit than the previous year's £10 million. It also undoubtedly represents a serious effort to remedy an unsatisfactory position. Mistakes have certainly been made, but the Corporation's fleets are no longer such a heterogeneous mixture of highly uneconomic aircraft nor, perhaps, are their staffs so swollen. But perhaps the root cause is a failure to consider all the implications of operating nationalised air lines on a commercial basis.

One of the strongest arguments for nationalising civil aviation was that only a nationalised industry could undertake to operate certain services which were essential in the national interest. With this background it is surely absurd to treat the nationalised Air Corporations as entirely commercial undertakings. This is quite a separate issue from that of administrative efficiency on which two of the Corporations, at any rate, are open to criticism. But how can a commercial firm be expected to operate economically if its operations are governed by political considerations? Over £1,000,000 was lost by BOAC in 1946-47 on maintaining a service to Australia and New Zealand. There is no doubt that service was necessary. But it was not a sound commercial proposition: and it should not be forgotten that in the early 1920's, when British air lines tried to operate on an entirely commercial basis, they were all grounded and had to be revived by a subsidy. The problem is likely to arise in a more acute form when the Brabazon trans-Atlantic air liner takes the air. The Government has insisted that it should be built. The operators, BOAC, are chary of flying it without a guarantee against loss or at least a clear statement in their accounts of the cost of such a political service as distinct from normal commercial operations. If the Brabazon is the success it is expected to be, the Government will have been justified. But why confuse the issue by trying to foist off as a commercial venture projects which were undertaken in the national interest?

* * *

The French Elections

The elections for the Council of the French Republic undoubtedly increase the political power of General de Gaulle, but the situation is much more complex than current talk of a "walk-over" and an "electoral landslide" suggests. In the first place, the majority of the electors were delegates from municipal councils or of councils of the departments. Thus their voting represented not necessarily the views of the French people today, but the views which moulded opinion when the last municipal and departmental elections were held. In a sense, therefore, General de Gaulle's advance is a reflection of his municipal victories in 1947, not necessarily of a phenomenal increase in popularity this year.

Another element of confusion lies in the fact that his actual numbers in the Council are difficult to determine. The government puts the figure at 104 out of a possible 269, the General's own headquarters at 125 and more. The confusion springs from the fact that many independents and some centre party men may in fact accept the General's leadership, and his exact strength is therefore impossible to estimate. For the same reason it is hard to say in advance whether he can so obstruct the work of the National Assembly that it will be compelled to seek the new elections for which the Gaullists clamour. In general, the Council has only advisory powers, but it can return proposed legislation to the Assembly—in which case an absolute Assembly majority is necessary for its passage, and an absolute majority is something upon which neither M. Queuille nor any other moderate Prime Minister can confidently count.

In all the uncertainty, it is this setback to moderation, to the centre parties, to the Third Force that is the really sure result of the General's victory. At a time when dissensions were splitting the Gaullist "Rally", and the Government had gained credit for its firm but patient handling of the coal strike, the elections have struck a shattering blow at the MRP and may tempt many Radicals to look to the General rather than continue their association with a weakened MRP and with Socialists whose desire to check inflation and control prices by state intervention they do not share. All in all, the only certain result of the French elections is another disastrous weakening of the Third Force.

Industrial Diseases

On the face of it, the report of the departmental committee on industrial diseases (Cmd. 7557) is a technical document dealing with a technical subject. The committee was appointed

> to review . . . the policy adopted in scheduling diseases as industrial diseases under the Workmen's Compensation Acts, and to advise as to the principles which should govern the selection of diseases for insurance under the National Insurance (Industrial Injuries) Act. . . .

Such terms of reference would seem to preclude any pronouncements of general interest.

Yet there is, or should be, general interest in the committee's report for the following reason. One of the main objects of the whole social security scheme was to co-ordinate the various schemes previously in force and to provide a minimum income, sufficient for subsistence, for a breadwinner and his family in the case of his sickness, unemployment, retirement or death. The one departure from this co-ordinated, all-embracing scheme was in respect of industrial injuries, for which the benefits, replacing the former system of workmen's compensation, are much higher than those payable under the general national insurance scheme. If these higher benefits had been restricted to industrial injuries, the anomalies thus created would not have been so obvious. It is in the prescription of certain diseases as industrial diseases that will give rise to more serious anomalies. Here, again, if the intention were to limit the prescription to well-defined occupational diseases, like the pneumoconiosis of miners, that were scheduled under the old system, the anomalies would be less pronounced. But the whole tenor of this committee's report, which, indeed, accords with the intention of the legislators, is to make it easier for diseases to be scheduled as industrial diseases than it was under workmen's compensation. Thus, although tuberculosis is a risk common to all persons, it would be possible, according to the committee's findings, for it to be scheduled as an occupational disease for hospital nurses, who, if they contract it, would accordingly receive much higher benefits than would the ordinary sufferer from the disease.

The effect of treating people with the same needs differently is constant pressure from the less favoured to qualify for the benefits given to the favoured—a process noticeable under workmen's compensation, but much more probable now that virtually everyone pays the same insurance contribution. This means constant pressure to have a disease scheduled as an occupational disease in an individual case or for certain classes of workers, which, when successful, creates a further class of privileged people who are treated, not according to their needs, but according to the work that they voluntarily undertake.

A Rasher of Bacon

For the second time within twelve months the British public is to suffer the indignity—not to mention the inconvenience—of a weekly ration of one ounce of bacon. Again the reason is a "shortfall in Canadian supplies." But almost a year ago when Britain was trying to cut down its Canadian dollar commitments, the Ministry of Food representatives pointed out to the Canadian Government that its output target for bacon was too optimistic, and any observer of Canadian agricultural production during the past six months realised that this "shortfall" would occur. But what steps has the Ministry taken to secure alternative supplies? Admittedly, a new agreement was signed with Denmark this summer, but the increased supplies will not be available for Britain until next year. It is reported, however, that bacon has been offered by Poland, Jugoslavia and Hungary. Yet from none of these countries has Britain bought any additional quantities.

The food negotiations with Poland have already dragged on for many weeks. It is understood that agreement on the food items was reached some while ago, but that the Treasury is now objecting to the terms of compensation for the nationalisation of Polish industry. Does this mean that the Treasury will permit foreign holders of securities in nationalised British industries to enter objections to the terms of compensation after they have been enacted? Meanwhile people in Britain must have only one ounce of bacon each week for the four weeks beginning November 21st. And according to Mr Strachey British supplies will in future be dependent on shipments from Canada. The Polish supplies alone could have made good this shortfall.

The West Midlands

The plan for the west Midlands, which has been prepared for the Ministry of Town and Country Planning by Sir Patrick Abercrombie and Mr Herbert Jackson, deals with three counties—Warwickshire, Worcestershire, and Staffordshire—whose population was steadily growing before the war. The plan assumes, realistically enough, that migration into the area, though at a lesser rate, is bound to continue up to at least 1961, even if the Government takes steps, as the planners assume to be desirable that it should, to divert the general flow of industry into other regions. The problem area, however, is not the west Midlands as a whole, but its central industrial core of Birmingham and the Black Country. The further growth of this conurbation, which

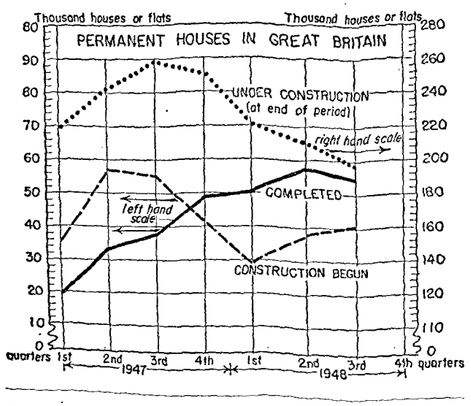
is inevitable unless firmly checked, would mean either that its housing densities would be further raised, and its standard of life thus lowered, or else that it would continue to engulf the surrounding countryside. Both these alternatives, or the mixture of them which would probably occur, are unacceptable to the framers of the plan. Their recommendation is that steps should be taken to relocate elsewhere in the west Midlands, 250,000 people who would otherwise in 1962 be living in Birmingham and the Black Country.



To do this, it is not necessary to formulate a large-scale scheme of dispersal or to build new towns in the way envisaged for Greater London. Nearly every other town in the west Midlands—including Coventry, Rugby, Stafford, Worcester, and Burton-on-Trent—is considered suitable for further expansion. What has to be done, therefore, is to make these places successful rivals to the main conurbation in attracting both industry and population. From the social viewpoint, at any rate, the objective is a good one. But it is, and can be, no more than a general aim; and town-planners should desist from the irritating habit of working out the target population of towns to the last digit. (These targets are given in *Records and Statistics*.)

One of the plan's most interesting features is the preferential treatment which it proposes for the Black Country. In order to redress the grave lack of amenities and the extreme shortage of service industries there, it is thought essential to encourage the middle-class to live inside the Black Country instead of migrating to its periphery. This would be done by according priority in building licences in this area, especially for better-class housing, and also by slowly regrouping development so far as possible into two broad residential areas and one broad industrial zone. It is also proposed that a joint local planning authority should be established for the Birmingham-Black Country area, which is tantamount to a further recognition of the inadequacy of the present local government units.

Housing—A Tale of Fluctuation

The latest housing returns* show with remarkable clarity the trend, as illustrated in the diagram below, of the housing programme over the last year. They also bring out the violent fluctuations to which the industry has been subjected first by over-expansion and subsequently by rapid deflation. Even before the official policy of cutting capital expenditure was started in 1947 the Ministry of Health had appreciated that the country's building resources were too widely deployed and had ordered a reduction in the rate of new construction. After the White Paper,

however, the restriction on the starting of new houses was so severe that the number begun each month fell low enough to cause acute concern lest the continuity between the various stages would break down. Housing authorities were therefore permitted to start building again, with the result that houses are now being begun at something approaching the same rate as before the capital cuts were inaugurated. Between July and September, 1947, 38,000 new houses were started in England and Wales; between January and March, 1948, this had dropped to 21,000; for July to September, 1948, the level rose to 32,000.

The rate at which houses are being completed has by contrast kept fairly level since last March at 18,000 or 19,000 houses a month, while the number under construction has fallen steadily during the whole year. How far the improved ratio between houses completed and houses under construction will be maintained must depend on how many new houses are started. But the prospects of a more regular progression are strengthened by the figures of the production of building materials and components. In the last quarter and in some cases over the last two quarters the output of such things as tiles, copper piping, guttering, sanitary fittings, cookers and washers has fallen—presumably in accordance with the new requirements of the programme. Although the history of the housing programme over the last three years has defied every effort of prognostication, there does now seem a better chance of stability.

Holding the Line in Italy

Signor Tremelloni, Minister in charge of ERP affairs for Italy, has just presented the first in a series of quarterly progress reports on Italian recovery. In reality the Minister had little progress to report. The most he could claim was that Italian industry had not fallen off the plateau maintained for the past year. Marshall Aid, he pointed out, had not yet brought any noticeable improvement to the Italian economy, and so far its role had been limited to the important but negative one of preventing conditions from growing worse.

According to the Minister, the general index of industrial production is still 20 per cent below the 1938 level. In the current year production is running slightly ahead of last year's average, although it has never regained the peak reached in September, 1947. When it is recalled that this marking time was accomplished only with repeated and potent injections of American dollars, it is obvious that Marshall Aid alone will not put Italy on its feet by 1952-53. A greater effort will be needed from the Italians themselves and from their western neighbours.

Some indications of the size of the effort required are given by preliminary reports from Paris of the Italian four-year programme. The Italian planners say that before the country can pay its own way, a number of conditions should be fulfilled. Production must rise 40 per cent above the 1938 figure. Exports, which last year were still 40 per cent below the prewar volume, must be restored to at least the 1938 level, with the emphasis on chemicals, food and mechanical equipment. The total investment required for modernising and expanding industry and for an enlarged public works programme is put at 2,273 billion lire of which roughly a quarter should be devoted to agriculture. Above all, Italy must find some permanent solution to the problem that overshadows all else in the economy. Unemployment today stands officially at 2 million. It is accompanied by underemployment, and this more than any other factor is responsible for inflated costs of production, and Italy's inability to sell at competitive prices on world markets.

However, even on the rosiest estimates of the numbers that can be absorbed through emigration, public works and the expansion of Italian industry, the planners confess that the country will still be left in four years' time with 1.2 million unemployed. Until a far more satisfactory method is devised for relieving the nation of this deadweight, it is difficult to see how by 1953 Italy can look forward either to economic or political stability.

* * *

New Phase in the Antarctic

In answer to a recent question in Parliament, Mr Bevin stated that the British Government was still in consultation with the Dominion Governments on the US proposals (not yet published in detail) for a condominium in the Antarctic; the Government, however, regarded them as a "useful contribution towards an eventual settlement of this difficult problem on an international basis." Meanwhile the Chilean Government, which has already announced its flat rejection of the proposals, is going ahead with plans to set up a new base in the disputed Falkland Islands Dependencies; the site, it is believed, will be at Marguerite Bay, where the British have been in residence for the last three years.

The Latin American states have been encouraged by the economic bargaining position they inherited from the war and by

* Cmd. 7552 and 7553.

the political influence their solid voting *bloc* has given them in the United Nations to allow emotional nationalism to stir them on the issue of European colonies in the western hemisphere. Hitherto, Britain's desire to allow so essentially silly a dog to sleep has played into their hands. If, however, the Chileans invade the Falkland Islands, the time for passivity is past.

In the first place, the British Government should make it quite clear that economic sanctions will follow attempts to take British territory. The increasing shortage of dollars is enhancing the value of sterling and the United Kingdom is not so lacking in weapons of reprisal as it was a year ago. In the second place, if "bases" are established, they must be quietly and efficiently removed.

It is not certain whether Argentina is involved in Chile's latest folly. It is certainly unlikely, since Argentina's claim to the Falkland Islands is its biggest bone of contention with Britain. There seems here to be a chance of dividing the Latin American republics and wooing Argentina to a more reasonable state of mind. During the recent visit of the Argentine Foreign Minister, Dr Bramuglia, to London, he and Mr Bevin are reported to have agreed to send no naval expeditions into Antarctica for the duration of the summer (which is just beginning) and the Argentine Government has only refused the American proposal of internationalisation on the grounds that all parties concerned must first be consulted. Here is an opening for firm and tactful Anglo-American pressure to take the hot air out of one of the silliest international disputes of this century.

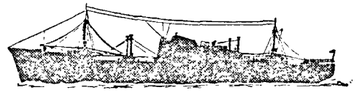
Shorter Notes

Four million pounds are to be distributed in prize money to the Navy and Royal Marines and £1,250,000 to the RAF. The money will come from the proceeds of prize captured in the war. Every officer and man in the Navy who had not less than 180 days sea service, as defined by the regulations, between September 3, 1939, and September 2, 1945, will be entitled to receive a sum based on his rank. Corresponding regulations for the Air Force will presumably be issued later. An Admiral of the Fleet will receive ten shares, an AB one share. Intermediate grades get appropriate shares between these extremes. With the total sum for division fixed at no more than £4,000,000, more wartime dreams will fade—and there will be fewer grand pianos to grace the parlours of fewer "Crown and Anchors" or "Admiral Benbows."

*

An interesting and somewhat unexpected judgment was given by the House of Lords on Tuesday to the effect that, by virtue of the Housing Act of 1936, local authority landlords are not bound by the Rent Restriction Acts. According to the judgment, from which Lord du Parcq dissented, a local authority may turn out one working-class tenant in favour of another as part of its functions of management, although a private landlord is debarred from doing so. The justification given by Lord Porter was that "local authorities might well be expected to exercise their powers with discretion." But there is no assurance that they will do so. Why should local authorities be privileged and private landlords penalised?

*

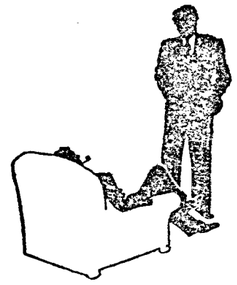


In an article in *The Economist* of October 23rd reference was made to the work done by Citizens' Advice Bureaux in London. It ought to have been made clear that the seventeen bureaux referred to are those maintained by the Family Welfare Association, in inner London, but that altogether in the whole of the London area there are 82 bureaux dealing with some 25,000 inquiries a month, the other 65 being assisted by the London Council of Social Service.

*

The Government's decision not to appoint a Select Committee to consider war pensions is unfortunate not only in itself but in the manner in which it was announced—to a private meeting of the Parliamentary Labour Party. The decision itself can be criticised. If hardship among the war disabled does not exist, it will be to the Government's advantage for a Select Committee to make it clear beyond doubt. If there is hardship, then a Select Committee is all the more necessary. But for the Government to treat it as a party matter is an equally grave mistake.

The South American Saint Line is an all British Company operating a fleet of fast modern general cargo liners loading at London, Cardiff, Hull, Antwerp and Hamburg. The fleet call, via Canary Islands, at the ports on the East Coast of South America from . . .



Pernambuco to Rio Grande and on to Montevideo, Buenos Aires and Rosario. With offices or agents in all the principal centres of the United Kingdom, Europe and South America the Company provide a thoroughly reliable and efficient service for the rapid shipment of cargo.

Letters to the Editor

Mr Truman's Triumph

SIR,—It is not often that *The Economist* lends itself to inconsistency, but anyone who read your article on "Mr Truman's Triumph" without reading "Victory of the Forgotten Man" in the American Survey, or vice versa, would obtain a totally contradictory view of the effect of the American elections.

Both as regards foreign and domestic policy, there were sharp differences between Republicans and Democrats, discernible to the naked eye even at this distance. These differences are very rightly emphasised by the American Survey article. To suppose, for instance, that the defeat of Senators Brooks, Robertson, Rizley, Ball and Revercomb does not affect American foreign policy one way or the other is somewhat startling. Not less so is the suggestion that Republicans and Democrats saw eye to eye on labour policy, price policy and trade policy. If in fact there was no real difference between Republicans and Democrats, one might wonder what the election was about, and why there is so much dismay in the Republican camp at the result. The answer is given by the second article, and no amount of analysis or explanation by the pollsters is likely to change its general judgment of the issues which determined it. Nor will it alter the fact that the result is very far from being a matter of indifference to Europeans.—Yours faithfully,

HAROLD BUTLER

Little Court, Sonning, Berkshire

[It would be silly to deny that there are great differences between individual Republicans and individual Democrats. What we said was that, in the recent election, "the candidates, and very largely their parties, stood together" on the major issues of interest to Europeans. It was the whole point of the article that, whatever the convergence of the parties in this election, there are likely to be big differences between the parties before long.—EDITOR.]

Mr Churchill on the Commonwealth

SIR,—Might I refer to one sentence in your criticism of Mr Churchill in your "Shorter Notes" of November 6th. You say "the tragedy is that he is building up a legacy of suspicion and dislike for the Conservative Party in India and Burma . . ."

To my mind, the real tragedy with regard to these two unhappy countries is that the British public know so little of what is going on there. And what they do hear is not the sufferings of the common people, but the "hand-outs" of the British Government and the high politicians in the countries concerned, all of which are very naturally at particular pains to make out that all has been done for the best. To call attention to the 400,000 people massacred in the Punjab last year, to the war in Kashmir, the rape of Hyderabad and the chaos in Burma, as Mr Churchill continually does, is regarded by the Socialist Government as mischievous diehardism. Yet the daily bulletins I get from Pakistan about the continued operations in Kashmir and the continuance of "arson, loot and rape" (I quote from the latest bulletin) in Hyderabad make very unpleasant reading. It is in the lack of information and publicity on all these things that we realise the shortage of newsprint to be so lamentable. The policy of sacrificing our friends and loyal supporters in Burma to achieve a quick and easy solution likely to cause the least obstruction to the progress of Socialism at home was never likely to bring anything else but misery and suffering to the bulk of the common people of Burma—which it has since done.

If, by showing up these matters and demanding some constructive action, the Conservative Party becomes unpopular with certain high politicians at home and abroad—then surely we should be proud of being unpopular in such a worthy cause. To many serious students of the East it seems possible that Mr. Churchill may prove to have been as right over India and Burma as he has been over so many other matters in the past. If Communism succeeds in engulfing China, only a strong and united Indian sub-continent will stay its further advance. India and Pakistan have coped manfully with the very difficult circumstances which inevitably followed on the overhasty and unplanned transfer of power, but the fact remains that conditions have been created which could facilitate the spread of Communism throughout the Far East.—Yours faithfully,

Dolphin Square, S.W.1 J. G. SMYTH, Brigadier

[The Conservative Party as represented by Mr Churchill has not demanded "constructive action." He has confined himself to lamenting the past. The object of our Shorter Note was to point out there is more constructive thinking in the Conservative Party on Commonwealth affairs than finds expression in Mr Churchill's speeches. Furthermore, one thing which would have made certain of a common cause between the Communists and the Indian Congress Party would have been a decision that Britain should indefinitely remain as the paramount power in India. While it is possible to criticise the timing of the British withdrawal from India, the decision to withdraw is one to which no one—not even Mr Churchill—has been able to offer a constructive alternative.—EDITOR.]

From *The Economist* of 1848

November 11th, 1848

Various reforms in the discipline and course of study at our universities have long been demanded and at length a beginning has been made. As an acknowledgment of fallibility it is of great importance, other improvements may follow. Now that the necessity of making some is admitted, there is no telling whither the admission will lead, and where it will stop. Being the admission of a principle, the five "graces" passed on Tuesday week at Cambridge are of considerable value; but the changes they really effect seem to us much too trifling to merit the approbation they have received from the liberal journals. . . .

The M.A.'s and LL.D.'s have slighted and neglected political economy, and it has become the pride of Britain, has helped to rescue her from the calamities that have fallen on other nations, and has gained for her honour abroad that has never been vouchsafed to anything especially taught at her Universities. Do the Germans and French borrow our classics and our mathematics? No. But they do borrow our political sciences, our free trade theories, and acknowledge that there is no other salvation for society, but in adopting and following the principles of that science which our learned Universities are now only beginning to appreciate. They despised it as long as they could, and now when it has become the master of the masters, when it has assumed its high place in the world of letters, they assume to ratify its worthiness by their signature.

Silent Discussion in the Coal World

SIR,—I agree with your remarks in the short Business Note in the October 30th issue to the extent that the aura of mysticism which surrounds the Coal Board's statement is, in my opinion, the sign of ineffective control.

This points to the need for decentralisation in an industry, where it has become essential for greater understanding from the executive and more practical use made of local knowledge.

With regard to the organisation underground I would point out that you may have given the impression to readers that the Deputy in the pit is responsible for safety alone. This is, of course, not the case. The Deputy is the NCO of the Mining Industry, and is very much a productive agent. In fact, from my own experiences and association with miners from many other pits, I would go so far as to say that if he could be trained and supervised with more careful attention from the management level, production of coal could be increased considerably. The Deputy is the fellow who leads a team of men at the coalface, and he directs their concerted effort, through the shift, by periodical visits and examinations.

The control of our mining deputies would bring better results at no extra cost, if more constantly exercised by the officers of existing managements.—Yours faithfully,

Rotherham Miners' Hostel, Rotherham D. A. HUGHES

[Hitherto the Deputy has been almost entirely confined to his statutory duties, i.e. safety. This is borne out by the paper delivered to the National Coal Board Summer School by Professor A. M. Bryan, HM Inspector of Mines.—EDITOR.]

Cards on the Table

SIR,—In your leading article in *The Economist* of October 16th, "Cards on the Table," you state: "Instead of refusing a reduction of one-third in armaments, the western Powers should have instantly proposed instead a reduction of three-quarters. . . ." Is not any common proportional reduction in armaments useless in so far as the balance of power is still maintained? If Russia has 200 divisions and the western Powers 50 a common reduction by three-quarters still leaves Russia with 50 divisions and the western Powers only 12! This is the cunning and subtlety of the Russian proposal for reduction by one-third which so many acclaim. Russia would still be the superior military power. The solution is insoluble except on a basis of trust and confidence between nations.—Yours faithfully, R. A. BAKER.

29, Stoneyfields Lane, Edgware, Middlesex.

Uses of Manpower

SIR,—It is doubtful if the observations put forward by your correspondent, Mr John Clews, will bring us any nearer to the solution of our manpower problem.

One need not be a disciple of Mr Lewis Ord to discover the disturbing drift from the occupations requiring mechanical skill towards the army of "Penpushers." To me—viewing this development from within industry—it seems that the problem is not so much whether a particular set of workers may or may not be suitable to shift to an entirely different type of operation within a short period of time, but rather whether something could be done to arrest the disturbing and often quite unnecessary drift towards those "indirect" functions which add so greatly to overhead costs and deprive industry of much needed productive manpower.

Among the many reasons which could be given for this unhappy development, not the least important is that work done on the floor of the factory is increasingly regarded as of a lower order of value than work done by the "penpusher." This would perhaps, have no economic significance were it not for the fact that it reinforces the drift towards the already greatly swelled ranks of the "indirects" and thus raises costs. No effort should be spared to make industry more "production-conscious" and less "administration-conscious." The Trade Unions would no doubt welcome this and they themselves might greatly add to its success by examining afresh the complicated methods of wage calculations which require additional clerical staff.—Your faithfully,

ANDREW TESSIER.

30 Netherhall Gardens, London, N.W.3

The Steel Bill

SIR,—I fail to understand the arguments produced in your leader on the Steel Bill about the desired future capacity of the steel industry. The home consumption of steel expanded at the rate of approximately 1¾ per cent per annum between the years 1913 and 1929, and at approximately 3¼ per cent per annum between 1929 and 1939. If we take a rate of expansion of 2½ per cent per annum as reasonable for years beyond 1939 it would make the desirable home consumption of steel about 13¾ million tons in 1952. The desired rate of exports in that year would seem to be about 5,000,000 tons (net), giving a desired output of a little under 19 million tons per annum.

Your objection to capacity estimates of this order of magnitude seems to be that they are intended only as "estimates of peak demand." But surely if we are planning for an era of full employment it is not wrong to base our estimates on the output figures of the best prewar years (both in 1929 and 1939 unemployment was over 10 per cent of insured workers compared with future hopes of 5 per cent or so). Furthermore, this estimate does not take into account a condition which you point out: that "the structure of the steel industry . . . was in the 1930's a tightly organised cartel." This implies a restriction of supply in those years, an implication which appears to be borne out by a comparison of steel prices in the late 1930's (which were 15-20 per cent higher than in the late 1920's) with general price indices of those years (which were, if anything, lower than a decade earlier).

I agree that a case for nationalisation cannot rest on this ground alone, but if the industry is unwilling to bear the risks of this expansion and the Government thinks such expansion desirable in the community's interest, then the community through their Government should see that this expansion takes place and should bear the full risks of such expansion. Whether it is necessary for the State to take over the whole industry to ensure this expansion depends on other issues which it is not my intention to discuss.—Yours faithfully, E. B. PALMER

22 The Gardens, Watford, Herts

Books and Publications

The Perfect Horatio

"The White House Papers of Harry L. Hopkins." By Robert E. Sherwood. Vol. 1. September 1939-January, 1942. Eyre and Spottiswoode. 491 pages. 25s. net.

IT is not easy to give an estimate of the interest and importance of this publication to any Englishman who has not read its 490 odd pages. If one can imagine Mr Brendan Bracken as a retired social worker as well as a wartime lodger in Number 10; if, furthermore, the author of *The Gathering Storm* had died in office before the end of hostilities and Mr Bracken had followed him within the year; and if, finally, the papers of the latter had been correlated and edited by a synthesis of Mr J. B. Priestley and Mr Noel Coward, who was *also* on the most intimate terms with both these eminent politicians—no, not even then should we have a British counterpart to the *White House Papers*. They are as unique as they are indispensable. Valuable as their documentary revelations are, it is conceivable that the information they give could with diligence be pieced together from other sources. What cannot, in the nature of things, be duplicated anywhere else is their depiction of the human relationships which made the New Deal and the Anglo-American war effort unlike anything else in history. Hopkins's position had no parallel; there was no other Horatio to his Prince of Denmark. And if the injunction

> Thou livest, report me and my cause aright
> To the unsatisfied

could not be executed in the first particular, Hopkins has left behind him in Mr Sherwood a literary executor who has fulfilled the rest with a fidelity and felicity of the highest order.

It is even arguable that we have gained by the two removes at which the Roosevelt-Hopkins story now reaches us. The total devotion which marked the Hopkins of the war years, while being the secret of his astonishing success as an executive assistant, is not necessarily an ideal equipment for a historian. Furthermore, he obviously lacked the literary skill for such a large-scale undertaking; except when fused by the heat of action or passion, Hopkins's own memoranda, as printed here, are ungainly and awkward. Lastly, he could hardly have given us, even if he had so intended, the astonishingly honest and revealing narrative of the New Deal Hopkins which Mr Sherwood inserts as the prologue to his own account.

The first volume divides naturally into three parts. The first adds little of substance (though much of colour and human interest) to the various narratives already published by other actors in the New Deal drama. There is some rebuttal of Mr Farley and some amplification of Miss Perkins, but nothing which will substantially change our views of this period—or, surprisingly enough, our dislike of the acidulous, none-too-scrupulous Harry Hopkins of the WPA. The second part (more properly deserving the description of "The Education of Harry Hopkins" than the first to which it is applied) is the story so rich in incident, drama and suspense (the almost unbearable suspense, as one reads it again, of the movement towards "all aid short of war") of the period from the fall of France to Pearl Harbour. This middle scene has Hopkins as a central character of truly heroic proportions whose efforts on behalf of Britain and the USSR are told here for the first time in detail, and gain enormously from being set against the frequent indecision and embarrassments of the President himself. Lastly, as a coda to the volume, comes the brisk narration of Pearl Harbour and the first reactions to total war. The curtain of this first volume falls, characteristically, with Hopkins back in hospital, recovering from the first of the great Roosevelt-Churchill war conferences, in December-January, 1941-2. One hopes impatiently that Mr Sherwood and his publishers will not keep us waiting a day longer than is necessary for the second act.

Ciano's Papers

"L'Europa verso la Catastrofe." Galeazzo Ciano. Mondadori, Milan. 722 pages. 1,100 lire.

WHEN Count Ciano's Diary was published it only showed half the story: it often excused omissions by reference to separate documents. Thus, when he visited Franco in Spain in July, 1939, his only remark was "I have set down my impressions of Spain in a notebook. The Duce is quite satisfied with the

"report"; and next month he skipped over the vital conversations with Hitler and Ribbentrop at Salzburg because "I have a transcript elsewhere, along with reports of all my conferences." Such references to a companion-volume of documents occur throughout the diary.

This companion volume is now published. It contains Ciano's papers between the Abyssinian War and the collapse of Fascism—transcripts of interviews with Chamberlain and Franco, Hitler and Ribbentrop and Balkan politicians, and reports from Italian ambassadors in foreign capitals. After the Diary and the Hitler-Mussolini letters it is the most illuminating document of its kind which has emerged from Italy.

After the evidence given at Nuremberg and the earlier publications, there is little left to reveal about Axis politics. The documents about Spain are interesting, and confirm the evidence of the Hitler-Mussolini letters and the Goebbels Diaries that Hitler and Mussolini banked heavily on Franco's entry into the war in the winter of 1940 and never forgave his defection. The interviews with Hitler show him as erroneous as ever in his generalisations: the war is won in 1940, the British Army and the American Navy are "dilettante organisations," and invaded England "will crumble at the first blow." Of crucial importance were the interviews at Salzburg, which Ciano remembered bitterly in his last hours. There we find both Hitler and Ribbentrop determined on war and "absolutely certain" that it will be localised and short. "Europe," said Ribbentrop, "will sit and watch the remorseless annihilation of Poland," and to Ciano's protests he retorted that his information, and above all his understanding of English psychology, convinced him that "any armed intervention by Britain is out of the question." Hitler supported him, only adding that a war with the west would nevertheless be necessary in the end, "if only to dispose of its pretence of moral superiority." Hitler's judgment of Europe was often confirmed by events: it was about the Anglo-Saxons that he made his wildest howlers; and the basis of them was his ineradicable inferiority-complex.

But if Axis politics have few secrets to reveal, Allied diplomacy can still be illuminated, and to English readers the most shocking document is Count Grandi's 30-page report on his three-hour interview with Mr Chamberlain and Mr Eden on February 12, 1938. No summary can do it justice. The meeting's only purpose was apparently to supply Chamberlain with ammunition against Eden. "I quickly took note of this," says Grandi, "and naturally enough sought to supply Chamberlain with all the ammunition which could serve such a purpose." "Chamberlain and Eden were not a Prime Minister and a Foreign Minister discussing a delicate international situation with a foreign ambassador, they were two enemies, face to face, two gamecocks in fighting posture." When all was over Grandi was satisfied. So was Chamberlain: he next sent a secret message to Grandi and congratulated him on the result. His message was that "he greeted me cordially, he appreciated my statements which would be very useful to him, and he was confident that from now on all would go well." Two days later Mr Eden and Lord Cranborne resigned, and the way was open for planned catastrophe.

The Economists' Bookshop

New West End Branch

●

The Economists' Bookshop Limited has now opened a West End branch at 30a, Bury Street, St. James's London, S.W.1 (in "The Economist" building). A selection from our stock is on view at Bury Street, where the hours of business are: Weekdays, 10 a.m. to 6 p.m.; Saturdays, 10 a.m. to 1 p.m.

* * *

The chief stock of books continues to be held at 11/12, Clement's Inn Passage, where the hours of business are: Weekdays, 9.30 a.m. to 6 p.m. (to 7.30 p.m. on Tuesdays and Thursdays during the University term); closed on Saturdays.

* * *

Telephone and postal enquiries should be addressed to:

11/12 Clement's Inn Passage, Aldwych, W.C.2

Telephone: CHAncery 7508

Subjective Anti-Semitism

"Portrait of the Anti-Semite." By Jean-Paul Sartre. Translated by Erik de Mauny. Secker and Warburg, and Lindsay Drummond. 128 pages. 7s. 6d.

THIS is a remarkable book. The tragedy of the Jews who are forever attempting to escape into anonymity; to merge themselves into the herd; to take on the protective colouring of their environment, but who are as often singled out and pilloried by the anti-semite's desire for a victim is movingly and brilliantly painted. M. Sartre describes with sympathy and understanding the effect of the anti-semite's ostracism upon the Jews which has built up their infinite patience, their foreboding of catastrophe and their anticipation of persecution. The picture of the anti-semite which fills the first half of the book, though as interesting is less convincing, except perhaps to another thorough-going existentialist.

The antipathy towards the Jews is, according to the author, entirely subjective—" . . . it is the anti-semite who makes the Jew," or " . . . the Jew is perfectly assimilable by modern nations, but defines himself as one whom the nations will not accept." While M. Sartre concedes that what weighed against the Jew in the first place was that he was the murderer of Christ, he dismisses this as an effective cause in modern life. To him anti-semitism has no roots in reason but is the offspring of fear and blind passion, the result of the desire of anti-semites to find a victim over whom they can feel superior. This passion of hatred is not provoked by anything: on the contrary it anticipates the facts which might give rise to it and interprets them arbitrarily in order to find them offensive. The anti-semite hates because he chooses to do so, not because there is cause. Indeed M. Sartre denies that the Jews have sufficient in common racially, physically, religiously or socially to account for their ostracism as a group.

Such an interpretation of anti-semitism may be satisfactory for fellow existentialists who believe that the individual is solely responsible for all his reactions and that the trends of history must be discounted in an analysis of this kind. But for those who are not impregnated with existentialism M. Sartre's explanation must leave a basic sense of dissatisfaction. The anti-semite may be personally responsible for flaming or suppressing his passion of hatred. But this explanation leaves unexplained the reason why the Jews are always selected as the victims. Why are not Indians, or red-haired people, or everyone over fifteen stone equally reviled? Yet in spite of this fundamental defect the book illuminates much that has been ignored by others.

Shorter Notices

"The Common Law of England." By a K.C. Published by Messrs Hollis and Carter. 36 pages. 2s. 6d.

THIS is a reprint of three broadcast talks on the Inns of Court and on the Substance and Practice of the Common Law. The theme of each is freedom and tradition, neither new, but in this volume distinguished by the sincerity of the pleader and the skill with which he pleads. What increases the charm of the published volume is the fact that the author includes as footnotes many of his references and his comments on them. These are delightful.

"The Motor Industry of Great Britain, 1948." Society of Motor Manufacturers and Traders Limited. 334 pages. 30s.

THIS latest edition of the statistical review of the motor industry contains complete figures for motor-car trade of this and other countries for 1947, and compares them with 1938 and 1946. A new feature is a series of maps showing population density per car and commercial vehicle throughout the world. A comprehensive table of the regulations relating to the construction and use of motor vehicles in all countries where they are permitted forms a useful part of the miscellaneous information. According to the preface an endeavour has been made to eliminate some material which is readily available in previous editions, and this has enabled the number of pages to be considerably reduced without seriously detracting from the value of the volume as a whole.

AMERICAN SURVEY

The Man and His Mandate

(From Our US Editorial Staff)

NOW that the tumult and the shouting have died, the would-be king-makers retired off-stage, and the political experts eaten the requisite amount of tough crow, it is possible to look behind the ballots at the winner and his mandate. Whatever else this election has accomplished, it has blown away the mists in which Mr Truman has walked since he took office in April, 1945, after Mr Roosevelt's sudden death. The bulky mantle of his predecessor still is clutched lovingly about his shoulders, but it no longer obscures his own outlines. From now on the man whom few took the pains to know is President in his own right, with a Congress of his own party. His achievements—and his mistakes—will be his own. The people, in whom, according to the Constitution, sovereignty resides, have told him so.

Mr Truman stands clear of almost all the usual commitments. He proved his ability to win with little help, against all predictions and despite organised opposition from both wings of his own party. He need placate neither the fellow travellers on his left nor the Southern cave-dwellers on his right. The road down which he campaigned to victory now emerges as the American middle way, and political observers must henceforth take it, and not some remembered past, as the norm from which divergences to left or right are measured.

In substance that road is the one marked out and paved by Franklin Roosevelt's New Deal. The constant refrain, spoken or implied, which runs through all those speeches that the sophisticates failed to read or were too bored to listen to is, "The Republicans will take the New Deal away from you if you don't watch out." The New Deal was not presented as a new way which had to be crammed down the voters' throats, but as the *status quo* to which they had become accustomed, the dearly bought and present heaven in which Mr Truman and his audiences believed, the pleasant state which gave them their present comfort, and which was threatened by "the Wall Street Republican way of life." To opponents who boasted that their candidate was an efficient administrator, he retorted, "efficiency isn't enough . . . Hitler was efficient . . . there must be life and hope in Government . . . democracy is a faith in human rights." Broader social security; full employment; co-operation between farmer, labour, industry; better education; better care for the old and poor; conservation of natural resources against the predatory designs of the interests; and in the international sphere, "peace, prosperity and progress for all nations and all people everywhere";—the programme is not socialist, but an expression of the American liberal tradition built up by Theodore Roosevelt (a Republican President), Woodrow Wilson, and Franklin D. Roosevelt.

Read in the light of his extraordinary victory Mr Truman's speeches constitute a model for those who want to know what kind of language reaches home to Americans. "How far," he asked in Lincoln's birthplace, "do you suppose the real estate lobby would get with Abraham Lincoln?" "Any plan," he told the workers at Akron, "which seeks to weaken one group in order to establish the superior power of another is not a democratic unity and threatens the basis on which our free institutions rest." The basic philosophy on which the New Deal rests is "service for the people—the greatest good for the greatest number."

If this Benthamite benevolence couched in Rooseveltian phrases be tub-thumping, it is the kind the people like. It exalts the Rights of Man as more precious than the rights of vested interests or the Communist Manifesto. Workers who are getting higher wages than ever before in their lives, as well as farmers who flew in their own planes to hear him rail against "gluttons of privilege" at a ploughing contest, agreed with that point of view.

The New Deal, then, is reaffirmed, sanctified and fortified. The verdict of the voters is that ground already won must be held against a repetition of attacks like those made by the Eightieth Congress and progress continued toward goals previously marked out. In domestic affairs most of those goals were defined by President Roosevelt in the years before the war. Internationally, they are those for which the war was fought, but events since Mr Roosevelt's death have given them a sharpness and definition which he did not live long enough to foresee

Of the fifteen or so major speeches which Mr Truman made between the middle of September and election day, two were devoted primarily to international affairs, a third to the Palestine question in particular, and two others to Communism abroad and at home. In addition, he touched on aspects of foreign policy again and again in his more general speeches, so that fully a third of his talking time must have been spent on matters of concern outside the borders of the United States.

★

This proportion is surprising only to those who still think of Mr Truman as a grass-roots candidate from the isolationist Middle West. If he has risen above his grass-roots, the Middle West has as clearly grown with him. Informed sources say that he is exceedingly proud of his foreign policy, and in comparison with that of any other President save Franklin Roosevelt it is in truth a thing to marvel at. To find his concern for it, and his repeated careful explanation of it, woven into campaign speeches along with domestic matters which form the more traditional warp and woof of American politics is to realise how far this country has come in a decade.

Search in his speeches for hints as to what he may do on specific points at issue, and the man's concern and his caution are both evident. He berates the Republicans for trying to capitalise on his private discussions with the Secretary of State, but he does not promise either to give that Secretary *carte blanche* in the future or to send another Mr Vinson if the stalemate with Russia is not broken by the men now on the job. "The heart and soul of the American foreign policy is peace," he said in Brooklyn on October 30th. "The President's responsibility goes far beyond the formalities of diplomacy. It extends to the ultimate realities—the final consequences of war and peace . . . He must leave no stone unturned in expressing their (the peoples') will for peace."

But at the same time the world situation is dangerous. The United Nations must be strengthened. "The very basis of our foreign policy is international co-operation," and we will not desert other nations with like objectives. "I do not believe that war is inevitable, and I shall make use of every honourable means of preventing it." What that means in practical terms is not defined.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

From his first enunciation of the Truman doctrine in the spring of 1947, through the difficult passage of the appropriations for the Marshall plan, the setting up of the Economic Co-operation Administration and its correlative organisms, to the last Palestinian wriggle, Mr Truman is proud of the record on foreign affairs achieved under his leadership and intends to carry it to further heights in the years ahead. This sense of continuity, permeating his whole campaign, gives the clearest clue to the future.

In a discussion of domestic controls he told an audience in St. Paul, "The only thing we can get automatically is boom or bust." Anticipating his probable measures to prevent "bust" the stock prices fell when his election was assured and commodity prices looked up. Financial writers eager to know the worst as soon as possible have filled the air with trial balloons. Business is pictured as expecting more "interesting events" than a maternity ward—a fourth round of wage rises in the spring, an attempt to raise the statutory minimum wage from 40 cents to 75 cents an hour, an excess profits tax, more anti-trust activity and a stronger anti-trust law. Meanwhile Mr Truman's running mate, Senator Barkley, is predicting that the Eighty-First Congress will give the President those selective price controls which the Republicans refused him, that they will extend the rent controls now due to expire on March 1st, repeal the Taft-Hartley labour law and amend the older Wagner act with the aid of those who believed in its fundamentals. He also mentioned a civil rights programme and the continuance of foreign aid.

A second "Truman honeymoon" is in full swing, with the man who, before November 2nd, could do nothing right now praised as having done everything right. How long this will last depends on what kind of a person this "new Truman" turns out to be. Did people misjudge him who for three years thought him a bungler, a weak executive, a nice little man whom everyone liked, but unequal to the Presidency? Now that he stands on his own feet, beholden to no one but himself and his predecessor, will he reveal qualities of mind and spirit previously unsuspected? Able now to offer a four-year invitation, will he put into his new Cabinet men of greater stature than most of the pre-election incumbents?

The process of myth-making which always surrounds a President has not been kind to Mr Truman. Material for a new and better legend lies at his hand. He has slain Goliath in a blue serge suit. Will he turn into King David, or remain that Jack who, having disposed of his giant, went contentedly back down the beanstalk and home to supper? On the answer depends much of the American temper for the next four years.

American Notes

After the Earthquake

The deflation of the public opinion polls is undoubtedly one of the results of the election that has given most pleasure. Had the returns borne out their predictions, not only would their pretensions have become insufferable, but voting in the United States might well have been on the way to becoming as vestigial a routine as the proceedings of the Electoral College. But if it is tempting to remark that if Mr Truman could win in a walk, he had no need to win in a Gallup, it would also be misleading.

Without taking the part of devil's advocate, it is only fair to point out that, although Mr Truman indeed has rolled up more votes than his three chief rivals combined, his lead over Governor Dewey, which stands at only 2,125,000, is the smallest since 1916, when President Wilson polled just over 9,000,000 votes to Hughes's 8,500,000. Republicans like Harding, Coolidge, and Hoover never had less than a lead of 6,000,000. The latest returns give Mr Truman 23,667,727 votes, with 304 electoral votes, Mr Dewey 21,542,581, with 189 electoral votes. When an important state like Ohio is carried for Mr Truman by a mere 18,000 (and, on the other hand, New York is lost by only 40,000) this election becomes, as Wellington said of Waterloo, "a d—d near thing." It constituted, in fact, the first searching test of the reliability of the opinion surveys; and the pollsters' only comfort is that the "wise money"—with a far longer record of infallibility—was just as wildly off the mark. Prophets, in any event, have no honour in their own country. The Missouri milling company which took its own poll by putting up feed in bags labelled "A Vote for the Republicans" and "A Vote for the Democrats" quietly abandoned the experiment in September when it showed an improbable and embarrassing bias toward Mr Truman.

It is, of course, possible to reckon that, had the Democrats been united, Mr Truman would have been the stronger by 47 electoral votes in New York, and 38 in the South. But it was hardly possible to do both. Without the civil right programme which alienated the South, the Democrats could not have won the Negro vote; and without Mr Wallace in the field, the campaign radicalism which paid such good dividends might never have been thought necessary. What does deserve a mention is the strategy which saw that a Democratic victory could be won in the apparently unpromising states of Ohio, Illinois and California, and concentrated upon them.

Fears that the smallness of the vote cast would throw a shadow upon the validity of the results have diminished as the total vote has crept up toward 47.5 million. But this figure is just half of the eligible voters, who now total 95 million; it represents the smallest proportion of those eligible to vote in a hundred years; and the total is just about what the vote was in 1944, when many soldiers and war workers were disfranchised. It is substantially less than the 49.5 million votes cast in 1940, although since that year the population has increased by 14 million. This problem of the sleeping votes must concern both major parties; as well as all believers in the Democratic process.

* * *

The Defeated

Governor Thurmond, the Southern "States Rights" candidate, won 1,005,945 votes in 14 States (including 111 in North Dakota), won the 38 electoral votes of Alabama, South Carolina, Louisiana, and Mississippi, and elected two Electoral College delegates in Tennessee. But one of these has already been persuaded to switch his electoral vote to Mr Truman, and there is some doubt whether the rest will go down with their ship, now that the hope of throwing the election into the House of Representatives has been frustrated. The rebels are now remembering, with some qualms, that each State which casts its electoral vote for the President receives a bonus of four votes at the Democratic Convention in 1952. To throw these away would further diminish that influence in the party's councils which the revolt was designed to increase.

It is worth recording that in not one Southern State did the existence of the Dixiecrats permit a Republican victory. Maryland went Republican, but not by grace of Governor Thurmond. This year saw no repetition of 1928, when the Republicans profited by Southern dislike of Al Smith to the extent of carrying six Southern States. On incomplete returns, the Republican vote in 13 Southern States was about 1.8 million, the Truman vote 2.9 million. In 1944 the Republicans received 1.9 million votes in the South. This year's similar total was won despite Mr Dewey's position on equal rights for the Negro, but even so it suggests no rapid dissolution of the traditional one-party rule.

*

The fact that Governor Thurmond polled only a quarter of Mr Truman's votes in the South is testimony to the pull of party loyalty there. Despite a total vote of only 1,116,379 Mr Wallace's influence was much more important.

The decision of the US Supreme Court not to interfere with the election law of Illinois kept Mr Wallace's name off the ballot in a State where Mr Truman's lead over Mr Dewey was a mere 50,000 votes and thus saved Illinois for the Democrats. In California a vote of 178,000 for Mr Wallace left Mr Truman with a lead of only 32,000 votes over Governor Dewey; in New York the vote of the American Labour Party for Mr Wallace saved Mr Dewey's skin in his own state. It is an amazing fact that if the ALP vote is left on one side on both occasions, Mr Truman did better against Governor Dewey in New York than Mr Roosevelt did in 1944. In the local contests, moreover, the bark of the ALP proved much worse than their bite. Mr Marcantonio survives as their sole representative in Congress, but the term of Mr Isacson, the first and only swallow of Mr Wallace's brief summer, is over. Mr Lee Pressman was defeated, and the June panic which led some Democrats to form local coalitions with the Republicans is now shown to have been groundless.

The Republican post-mortem is only beginning. Governor Dewey lays his defeat to over-confidence, which kept Republicans from the polls, but Mr Russell Davenport (a Willkie supporter) has put the issue bluntly as "the Republican party *versus* the American people. The people won." Certainly the *Chicago Tribune* lost. In Illinois not only its favourite Senator, Mr "Curly" Brooks, and its pocket governor, Mr Green, but six Republican members of the House of Representatives were retired. Coupled with the defeat of men like Senator Dworshak of Idaho (the last of the doubtful States to declare for a Democratic Senator) this should be a sufficient answer to those Republicans who are still inclined to criticise Mr Dewey for having been too liberal and too internationalist. The Republicans whose prestige survives the flood, and who will be instrumental in reforming it in accordance with the new realities, are men like Senators Vandenberg, Lodge, Tobey, and Morse, Baldwin and Aiken. Senator Taft, the leader of the Republicans' conservative wing, was not up for re-election this year, but his home State of Ohio was lost to the enemy.

* * *

The New Congress

Some observers are now saying that, far from local candidates riding into office on Mr Dewey's coat-tails, strong Democratic candidates in the state and Congressional races account for Mr Truman's victory. In the elections for state governor, the Democrats unseated eight Republicans, lost only one governorship (in Utah) and now hold 29 of the 48. It would be one more if Governor Hunt of Wyoming were not going to the Senate, to be succeeded by a Republican lieutenant-governor. In Ohio, it is quite true that while Mr Truman carried the State by only 18,451, Mr Lausche, the new Democratic Governor, polled 217,000 more votes than his opponent. In Illinois, where Mr Truman won by 50,000, Mr Douglas defeated Senator Brooks by 400,000. In Ohio over 300,000 voters who voted for the governorship could not bring themselves to vote either for Mr Truman or Mr Dewey and turned in blank Presidential ballots.

In the new Senate and House the Democrats will have a stronger hold than the Republicans had in 1946, and in the House, though not in the Senate, a larger majority than they possessed in the Democratic Seventy-Ninth Congress. The table shows the relative party strength:

	Republicans	Democrats	Other
The Senate:—			
Seventy-ninth	38	57	...
Eightieth	51	45	...
Eighty-first	42	54	...
The House:—			
Seventy-ninth	190	243	2
Eightieth	246	188	1
Eighty-first	171	263	1

But these party lines are often more honoured in the breach than the observance; despite the Democrats' Congressional majority in 1944, Mr Roosevelt was often frustrated on liberal measures by a coalition between the Republicans and the Southern Democrats, who are equally conservative on most issues and on the question of white supremacy much more obstinate.

* * *

State Issues

Freedom to drink in Kansas and to divorce in South Carolina were state issues settled at the election. Such contrasting proposals as the support for World Government and the liberalising of rules for osteopaths were among the couple of hundred issues which appeared on the ballots of 35 states. State procedures vary as to the way such questions can be presented to the people. It can be done by constitutional amendment, by taking a referendum or, in some States, the people have the right of "initiative" which allows them to put issues to the vote. To the outside observer, the most interesting results this year were related to prohibition, bonuses for veterans and issues involving organised labour.

The day when a legal intoxicating drink can be bought by the 2,000,000-odd residents of Kansas was brought considerably nearer. The voters repealed the amendment to the state constitution which has banned the sale and manufacture of liquor for nearly seventy years. The state, however, has a "bone dry" statute on its books which prohibits the transportation and possession of liquor, so before the unsuspecting traveller can obtain alcoholic refreshment, the second half of the battle must be won in the state legislature. This may not be done for some time as the "dry" rural districts are in control. The delay will give the bootleggers, who have profited so pleasantly from the Kansas law, time to move into Mississippi or Oklahoma, the two remaining "dry" states. Liquor was a minor issue in eight more states.

In two states labour won important victories but it suffered a setback in a third. In Massachusetts a referendum against the "closed shop" was defeated as well as two others advocating restrictions on labour unions. New Mexico voted for a "closed shop." But Arizona, which passed a law against the closed shop two years ago, failed to repeal it and tightened the existing laws governing labour.

Bonuses for veterans ranging in amounts from $250 to $650 appeared on the ballot of twelve states accompanied, in some cases, by requests for bond issues to finance them. Six states approved bonuses for veterans of World War II, four rejected bonus proposals entirely. North Dakota turned down a levy for veterans' rehabilitation and California, which had 15 other proposals on the ballot, rejected a plan to exempt veterans from certain taxes.

Many issues concerning roads, hospitals and schools appeared in one form or another. Two results involve matrimony. The electorate of Elkton, Maryland (the Gretna Green of the East) approved a referendum which outlaws loitering near public buildings. The local practice of urging couples to marry for the purpose of collecting a licence and ceremony fee should thus be eliminated. In South Carolina the voters chose to legalise divorce. This was the only state which had recognised no grounds for divorce. Colorado passed a law permitting pari-mutual betting on horse races and it is expected that dog racing will be introduced as a result. In Massachusetts a referendum which would have allowed doctors to give birth control advice was defeated. This issue has been brought repeatedly before the electorate of both Massachusetts and Connecticut, owing to their outdated laws relating to the subject, but the Catholic Church, which is powerful in both, has always succeeded in blocking medical progress in this field. In Connecticut a referendum was passed endorsing a strong United Nations and urging American initiative towards World Government. Altogether the minor issues of the 1948 election supplied more spice than the major issues.

* * *

Bargaining on Pensions

The scope of collective bargaining has been widened by two important decisions. The first is that unions are entitled to a voice in "merit increases" granted to individuals or groups; the second the ruling of a Chicago court, in a case brought by the Inland Steel Company, that management must discuss pension and retirement plans with the union it has recognised. In the same case, however, the court upheld the National Labour Board's view that to enjoy the protection of the law in bargaining on pension rights, the officers of the union concerned must sign anti-Communist affidavits. Both decisions are to be appealed to the Supreme Court, the first by the steel company, the second by the union. Though the law may be repealed before a judgment can be obtained.

The Inland Steel Company's view is that the right of a union to participate in drawing up pension plans will discourage employers from introducing or maintaining them. But union pressure is strongly in favour of increasing protection for labour's aged, and will be hard to resist. There are already over a million men of 65 or older employed; and Mr Murray, head of the Congress of Industrial Organisations, recently gave notice that pension and welfare benefits loom large in labour's plans for the future. Already at least 3,000,000 workers are covered by some type of private welfare or retirement scheme. Of these, 45 per cent enjoy health and welfare benefits, 44 per cent are covered by pensions as well, while 11 per cent have only retirement or pension coverage. These employer security schemes are concentrated in a few industries such as coal (where 450,000 workers are concerned), textiles (where 875,000 are protected) and transportation.

This strong demand for insurance from industry is the direct consequence of the failure of government social security benefits to keep pace with the cost of living, and of the fact that all workers are not covered. At the end of 1947 Federal retirement benefits averaged only $25 a month for a single person. Old-age assistance, granted by the States on the basis of need to those who do not qualify for Federal benefits, stood in June at $38 a month—substantially more than a worker received who had paid contributions into the national scheme. National health insurance is, of course, still only in the debating stage. In these circumstances, union attempts to secure adequate security for their members is not surprising. Not to be outdone the American Legion has passed a resolution demanding monthly pensions commencing at $60 for all veterans over 55. The promises of both the Republican and Democrats to increase Federal benefits are not likely to bring about sufficient increases to head off these demands. But the result, inevitably, is that the community will pay, in higher prices, for security which will be confined to workers in highly organised industries like coal and pressure groups like the veterans.

THE WORLD OVERSEAS

The Agrarian Crisis in Hungary

(By a Correspondent Recently in Hungary)

AN agrarian revolution was decreed in Hungary in the middle of March, 1945, a couple of months before the end of the war in Europe: the time has come for a first review of its consequences. It would have been necessary to review them in any case, and it may be partly by chance that the time of doing so has coincided with the stiffening of the Communist attitude as expressed by the Cominform in the summer of 1948.

The need for agrarian reform was notoriously more acute in Hungary than in the other countries of eastern Europe because the necessary legislation had in effect been shelved after the first World War. The crying problem of the country before 1945 was that of the landless labourers who, together with their families, comprised a third of the whole population in a country where the really big estate had survived and yet was very seldom well run. There was a strong case in the plains of Hungary for the big farming unit, but it was rare for the large-scale owners even to demonstrate enlightened self-interest. The reform of 1945 which the Russians pushed through with alacrity—sometimes, it is said, by suggesting that in the case of disputes or delay the available land could be offered to the neighbouring village—reduced the landless labourers and their families from 3,000,000 souls to 1,000,000 at the outside. Like nearly all reforms which war induces, this one, too, had to be carried out in unfavourable circumstances. Hungary had been literally ravaged by the war. It had been the scene of one of Hitler's "last stands" against the Russians; the battle ebbed and flowed, many villages changed hands several times; after the German occupation from the west, the country was swept by the Soviet armies from the east. Thus livestock was about halved; 39 per cent of Hungary's horses, 44 per cent of its cattle and 78 per cent of its pigs were eliminated, and the survivors tended to have accumulated in the west which was anyway the richer part of the country.

As the result of the agrarian reform it has been seen that some 2,000,000 souls (or about 640,000 families), many of them estate servants, ceased to belong to a landless agricultural "proletariat"; 50.7 per cent of Hungary's arable land was absorbed into farms of from 5 to 50 cadastral acres (this Hungarian unit measures 0.57 of a hectare or 1.37 English acres), while the number of dwarf holdings of less than 5 cadastral acres or yokes increased by over 200,000. Many of the new small farmers began with no kind of capital and at first the state could do next to nothing for them. Some of them were keen and made good and somehow arrived at the decisive purchase of a cow after a year or two. But some were foolhardy, and many felt lost. The weather was unpropitious, the difficulty culminating in the drought of 1947. It can have surprised no one that agricultural production fell between 1945 and 1947. This was accompanied by a good deal of surreptitious buying up of land by the richer peasants—the "larded" ones they are popularly called (the word kulak has only been introduced by the new official jargon). Some of the poorer peasants worked for them in addition to working their own plots; others gave up the struggle and went back to being landless labourers, often receiving nothing but a poor percentage of produce. The richer peasants did well out of the drought just as they had in the famine period in 1945; they still tend to be the only people who can afford to buy the expensive consumer goods in the shops.

The New Line

Now the leading economists of the new regime held all along that it was useless to chop the land up into smaller holdings, and that the only solution lay in industrialisation to absorb the surplus agrarian population into industrial employment. When they published their Three-Year plan in 1947, it was found to propose the investment of 2,000 million forints in agriculture which was thus to be restored only to its prewar level. It is further intended to reduce the production of wheat so that it shall no longer be grown for export, since Hungary cannot really compete on the world wheat market; instead, the Hungarian farmer is to specialise in sugar beet, fruit, vines and sunflower seeds, and in the south-east, in the valley of the Körös river, in rice. The richer peasants dislike these innovating ideas, and continue to concentrate on growing corn—wheat, maize and rye.

It is important to the regime and to the planners that the country should produce more efficiently, if less traditionally; for one thing, the increasing number of industrial workers must be fed. The Government cannot fairly be reproached with not doing its part. By now it has helped to bring the livestock level back to prewar, it has sent round reasonably competent technical advisers, it has started up a high number of tractor stations, especially in the poorer east, through a company founded for this purpose last June. The state also manages farms and forests of its own. It has also done a great deal to stimulate co-operative farming. MOSZK, the Hungarian National Co-operative Centre, has about 4,500 member societies, including 2,400 farmers' co-operatives: MOSZK also runs its own production (particularly of fat pigs), and has taken over a number of the small industrial enterprises which were formerly attached to many big estates.

Drive against the Rich Peasants

All this, however, is not enough in 1948; both economic and political considerations impel the Hungarian regime to go further and faster, and in both the economic and the political arenas the richer peasants are its antagonists. The conflict manifests itself in a number of ways. Since the summer the buying and selling of land have been more definitely blocked, and a register is being compiled of the post-reform state of affairs; a number of incompetent small farmers are losing what they were given in 1945. At the same time, the richer peasants are being taxed with increasing severity, largely in terms of produce which they have to deliver to the Government. But the most important drive since early this year has been towards the extension of MOSZK, which is to draw all farming into its control. So far the peasants have only gained certain advantages by joining the local co-operative, and they were free to remain outside it; indeed, it was astonishing on a recent journey to find how relatively little more the non-members paid for goods in the new village co-operative shops. Now this is to change. So early as last spring the change was defined by an important figure in the Hungarian revolution, Erdei, now the leader of the pro-Communist rump of the National Peasant Party. The co-operatives, he declared, were no longer there to protect small traders against capitalists (as they had before the revolution), but to develop national production by the creation of the framework of collective farming; within collective units, he added, the farms in Hungary would remain the private property of individual farmers. On July 2nd the Communist leader, Rákosi, followed this up with the statement that within a year or two it would not be possible to continue to raise the standard of living without changing the methods in use until now.

This seems to have given all the opponents of the regime their chance to play upon peasant prejudice, individualistic and conservative, whether the peasant is poor or rich, and a tremendous agitation is in process; in the most backward parts of the country the word "kolkhoze" seems to signify more or less the same as atomic bomb, at all events some kind of terrifying explosive. The Catholic Church was the biggest landowner in the country before the agrarian reform, which it has never ceased to condemn. Catholic priests, although some of the poorer ones were given small holdings as part of the reform, are active crusaders against the regime, and insist that nothing but imitation of Russia is intended. In the poor east, where there were less big estates and where Calvinism was strong and the peasants less servile, the clash between rich and poor peasants is perhaps most bitter; some of the staunchest Calvinists were well "larded" peasants; the official anti-kulak drive is making them suspicious and hostile for the first time since 1945. Traditional anti-Semitism is used to whip up feeling against a Government whose leading personalities are Jews.

It is too early to judge whether the planned industrialisation of Hungary which was inaugurated in August, 1947, will hamper agricultural production by drawing the ablest peasant youths into the factories away from the land. A tendency of the kind has operated through most of this century, and the present regime counteracts it to some extent by the encouragement of agricultural colleges and technical training. In the long run it is probably true that larger collective units are the only way to raise the general standard of living. Some of the prophets of agrarian reform, former leaders of the then revolutionary National Peasant Party, reply: "Yes, but our people would rather eat less and be their own masters. They do not wish to be estate servants working for the state instead of the Esterházys."

End of the Honeymoon in South Africa

[FROM OUR JOHANNESBURG CORRESPONDENT]

THE South African Government has issued import control regulations which it is hoped will reduce the total imports from non-sterling countries by a quarter. "Luxury" goods are prohibited from all countries except under permit; currencies costing gold are to be rationed. But the essential needs of agriculture, mining and secondary industries will be met by supplementary quotas.

The Minister of Finance, Mr N. C. Havenga, has embarked on this course with obvious reluctance. He had hoped that before now the import of consumer goods would have fallen as wartime arrears were overtaken, so that the Union would be able to cover its unfavourable balance with its current gold output plus the normal flow of foreign investment capital. But imports, as the Minister admitted, are still rising. It is moreover doubtful to what extent this rise is now due to consumer goods. A large percentage of imports seems to be accounted for by producer goods for secondary industries which expanded under the stimulus of the large net inflow of capital in 1947 and the first quarter of this year—although that stimulus has itself been removed.

If it is correct that a large proportion of the still rising imports is accounted for by the demands of industry rather than of commerce and the general body of consumers, Mr Havenga's task is made all the more difficult. In the Budget debate in August, he declared: "If we once start on import control, it will not be possible to limit it to what are usually called ordinary consumer goods and luxury goods." Analysing imports from the non-sterling area, he pointed out that, on the basis of the 1947 figures, textiles accounted for £28 million, motor vehicles and spares for £15 million, agricultural machinery for £4,000,000, other machinery for £20 million, petrol and oil for £5,000,000, paper and wood for £5,000,000, steel and iron for £9,000,000, and medical and chemical supplies for £4,000,000—a total of £90 million. He warned that import control applied to those items might cause "thousands of unemployed." What he is now seeking to do is to stop the drain on the gold reserve, estimated to be running at not less than £5,000,000 a month, by rationing non-sterling currencies while leaving imports of producer goods as far as possible unaffected. In 1947, the value of imports from the United States and Canada was £120 million, and from other non-sterling areas about £85 million. The estimated total of imports from the non-sterling area for this year is about £250 million. It is calculated that the new regulations will effect a cut of between £75 million and £100 million between now and next June (the quotas are retrospective to July 1, 1948). Obviously much depends on what proportion of current imports is accounted for by the "essential requirements" of industries, agriculture and mines.

The present position has come about after the cessation since May—the month in which the Nationalists came to power—of the extraordinary capital inflow from the sterling area. This began in 1946 and continued throughout 1947 and the first quarter of this year. The net capital inflow during this period has been estimated at £150 million, or two-fifths of the total foreign capital imported between 1870 and 1936. This enormous inflow permitted and encouraged a vast increase in imports, without any internal monetary decline. In 1946 the Union imported goods to a total value of £214.4 million, which was almost double the 1945 figure. In 1947 the total was £295 million. Of this 1947 total the United States accounted for £104 million and thus became the chief supplier of goods to South Africa, a position which Britain had held, with one break in 1941, since 1910. Nevertheless, British exports to the Union in 1947 also constituted a record, standing at £91.8 million.

This heavy external deficit on current account was not, however, accompanied by any decline in the volume of money in circulation. A contraction did occur in the early part of 1947; but the commercial banks' cash reserves rose to £175,277,000 in October, from £133,151,000 in January, while deposits rose to £329,800,000 and discounts and advances to £113,643,000—a record; the volume of money in circulation rose to £411,900,000. All this was made possible by the capital inflow from the sterling area. At the beginning of 1947 the Union's sterling holdings were £11,043,666. By the end of the year they stood at £53,068,070, and were to rise still higher, to £83 million in May this year. Though the gold reserve had fallen from £230,681,258 at the beginning of 1947 to £187,117,074 at the end of it (because of Lend-Lease repayment, contribution to the International Monetary Fund, and other causes), the end-of-the-year figure still represented a ratio of 73.5 per cent to liabilities: and though, in February, 1948, the £80 million gold loan was transferred to Britain, the decline in the Reserve Bank's gold and foreign exchange holdings was only £58.5 million at the end of March. Had it not been for the gold loan holdings would thus have increased by £21.5 million.

The picture today is very different. It now seems clear that the capital inflow, in excess of the country's capacity to absorb it, produced inflationary conditions which attracted labour and materials away from the mines, the Union's chief dollar earners, to secondary industry and commerce, the chief spenders of dollars. At the end of March, 1948, the gold reserve stood at £107,695,386; but by the end of August it was down to £75,700,000, and thereafter it continued to decline rapidly until it stood at £57,522,206 at the end of October. And with the cessation of the capital inflow after May, the sterling balances dropped from £83,000,000 to £50,801,543. The Union's deficit with the sterling area is estimated to be running at an annual rate of not less than £80 million.

The Nationalist Government's policy has been to delay import control as long as possible in the hope that the balance of payments would right itself as the demand for imported consumer goods was satisfied and the backlog of past orders placed in the dollar area was overtaken. Delaying action has taken the form of appeals for voluntary curtailment of imports, and reducing the statutory minimum of the reserve ratio from 30 to 25 per cent, to release more gold for sale in the dollar area. Repayment of the £80 million gold loan has been counted as part of the Union's sterling assets to demonstrate that the deficit with the sterling area presents no immediate problem. Meanwhile, the Minister of Finance has declared that import control is "only an emergency measure" and that it must be supplemented as soon as possible by "positive action"—increasing the gold output and increasing other exports, while economising on capital spending within the Union. But it will not be easy to apply these obvious remedies. Gold output is shrinking, and the new Free State mines are not yet in production. The new mines also require considerable capital. Mr Havenga has called for a greater volume of internal savings to take the place of the overseas capital which has now stopped coming, and Dr Donges, the Acting Minister of Economic Affairs, has calculated that with a national income of £750 million, a net amount of £120 million ought to be available for home investment. But this overlooks the inflation which defeats attempts to save—the cost of living is still rising.

Warnings Disregarded

Mr Havenga has been severely criticised for introducing a "favourable" Budget in August despite the warnings about the country's financial position delivered at the end of July by the Governor of the Reserve Bank, Dr de Kock. Another criticism is that the reintroduction of white bread will cost the country about £5,000,000 in wheat purchases from the dollar area. The gold output has dropped by 40,000 ounces a month compared with last year, and 10 mines which produce 14 per cent of the total output and employ 19 per cent of the total labour force are paying no dividends. It is argued by the Opposition that the Budget ought to have reflected the country's true financial position.

The Government's own finances present problems. In September, when the Government's 3¼ per cent loan matured, an attempt to convert it at 2⅞ per cent failed. The Minister has to find £15 million to pay out. It has also been calculated that Mr Havenga is not at present in a position to raise more than about half the £71.5 million which Parliament voted for expendi-

ture from loan account, and it is expected that State, provincial and municipal spending will have to be severely axed. Mr Hofmeyr remarked last month, "It all looked very nice on Budget day, but now the honeymoon is over."

FAO in Conference

[BY A CORRESPONDENT]

APART from the International Labour Organisation, which is an unaccountable survival from the peace-making of thirty years ago, the Food and Agriculture Organisation is the oldest Uno organisation now at work. It dates from the honeymoon period in East-West relations of 1943, when the thunder of the guns at Stalingrad was still reverberating around the world and the architects of the Grand Alliance were taking their first, sneaking look at the plans for the postwar world. The best that may be said of the FAO is that it still retains some of the spirit of the International New Deal which in 1943 everybody hoped would come out of the war. There is no doubt that if all the Uno organisations were arranged in order of progressiveness, the FAO would stand on the Left, with the International Bank unmistakably to the Right on one side and Unesco imperfectly seen in the mists of the far distant Left on the other.

The fourth FAO annual Conference which assembles in Washington on November 15th will meet under the leadership of a new chief, Mr Dodd, from the US Department of Agriculture. The first of its tasks is to allocate scarce supplies of certain cereals, fats and oils, fertilisers and feeding-stuffs by persuading, shaming and jollying producing and consuming countries into agreement. This is a wartime legacy, which will doubtless disappear with the shortages of these commodities. The second is the technical education of backward countries in the most efficient methods of producing and consuming food—an important and continuing job. It involves missions, conferences, visits by experts, training schemes and wide distribution of numerous technical publications. Since the technical advice comes from an impartial international source, the experts who give it are less likely to be suspected of serving any narrow national interest, while the roster of contributing countries is wide enough to ensure that the standard of expertise can be kept high. There have been missions to Greece and Poland which went into considerable detail with recommendations for improvements in farming and nutrition, and regional conferences have been held on technical problems such as the introduction of hybrid maize into Europe and the prevention of infestation of stored foods. Experts are continually being sent from the advanced agricultural countries of Europe and the Western Hemisphere to solve the agricultural problems of countries on the other side of the globe and a small return flow of students has started along the same routes.

In all of this strenuous and in the main useful activity, there is at times a certain danger for Uno as a whole. FAO has no funds of its own to distribute, its budget being limited to a bare $5,000,000 a year; and it cannot influence the International Bank or the International Monetary Fund directly. It has, however, succeeded in dropping some pretty broad, fraternal hints to the Bank, the most celebrated instance being when the FAO Mission to Greece recommended that the Greek Government should apply to the Bank for an "initial" loan of $100 million. Although this sally was ignored by the Bank, it may be surmised that the possibilities of using the technical Uno organisations to soften up the Bank and the Fund prior to a direct attack, were not lost on certain needy countries.

Part of the educational job of FAO is economic reporting. The reports to be discussed at the forthcoming Conference are on the whole optimistic, forecasting a world export surplus of grain this year of some 38 million tons, the largest since 1930. But the world will continue to rely overwhelmingly on the Western Hemisphere for its food imports and is not likely to get them any cheaper in the near future. World food production has been rising—but so has world population, some two hundred million new mouths having been added since 1938. Supplies available per head have therefore recovered less rapidly than total supplies. The relevant FAO index numbers for the principal regions of the world are:—

	Total Supplies Available (1934-8 = 100)		Supplies Per Head	
	1946/7	1947/8	1946/7	1947/8
Far East	92	95	84	87
Europe (ex. USSR) ...	77	75	73	81
United States and Canada	126	122	112	103
Latin America	119	127	96	101
Australia and New Zealand	108	110	94	95

The Swiss View on OEEC

[FROM A SPECIAL CORRESPONDENT IN SWITZERLAND]

SWITZERLAND'S attitude towards the European organisation set up to run the Marshall Plan seems to have given rise to some misunderstanding. That attitude may be defined as entirely co-operative in purpose, but as somewhat critically reserved and more effective than ostentatious in action.

At a meeting recently summoned in Berne to consider an inquiry received from Paris as to the future policies of the Swiss Government, one of the participants said in substance:

> Suppose that after a violent storm a fire had broken out in one of the villages in our Alps. The flames had ravaged and more or less burned out all the wooden *chalets*. One house alone, that of the village doctor, being built of stone, had been spared. What, under such circumstances, would and should be the attitude of its privileged occupant? He obviously could not be indifferent to the sufferings of his distressed neighbours. The less so as they were both his intimate friends for whom he had none but the kindliest fellow-feelings, and his suppliers and customers, whose welfare was a condition of his own material existence. To anybody who came upon the scene of desolation from without with offers of advice and assistance, he would not hesitate to pledge his full co-operation. But if it was suggested that, in order to show his sympathy and to assure a greater uniformity of architecture in the reconstruction of the village, he should adapt his own home to the style of that of the victims of the fire, he could hardly be expected to concur.

This Alpine parable was much appreciated by the other members of the commission in Berne as an expression of their unanimous views. The only criticism it elicited was to the effect that it did not quite faithfully illustrate the position of a liberal Switzerland in a ravaged and plan-ridden Europe. Might not the village physician be tempted to seek more congenial surroundings if his attitude were misunderstood and his counsels disregarded?

The Swiss Government had no hesitation in accepting the Franco-British invitation to join in a co-operative effort to promote the economic rehabilitation of Europe. In this they were fully supported by the Swiss parliament and the Swiss people, the only opposition being that of a negligible Communist minority. The Swiss acceptance was prompted by feelings both of international solidarity and of enlightened national self-interest.

Switzerland's Financial Strength

Switzerland neither needs nor seeks Marshall aid for itself. Although its balance of trade is exceptionally passive, and indeed in recent months has become somewhat alarmingly so, its balance of payments as yet shows no signs of disequilibrium. In fact, all foreign currencies, not excluding even the American dollar, are cheaper than the Swiss franc, at home and abroad. Furthermore, the country suffers from no unemployment. Its financial and monetary position has heretofore allowed it to purchase all the foodstuffs and raw materials it needs on the markets of the world. The products of its highly developed mechanical, chemical and dairy industries are eagerly sought for all over Europe. As for its textile and other industries, which supply what most hard-pressed states tend to brand today as non-essential goods, but without which civilisation would be a mere word, they are kept in full employment by an active policy of bilateral agreements, supplemented by freely, perhaps all too freely, granted financial credits.

The whole economic machinery of Switzerland is kept in operation not by any hard and fast system of state-planned directives, but by the individual efforts of salesmen abroad and of entrepreneurs and workmen at home. How could it be otherwise in a small and densely populated country, deprived of almost all natural resources and consequently entirely dependent for its prosperity on foreign trade? In this respect the economic policy, but not the structure, of Switzerland much more closely resembles that of the other and incomparably greater creditor beyond the seas than it does that of its European neighbours.

Is it really surprising under such circumstances that Swiss opinion should be sceptical of the much-vaunted but strangely deceptive schemes of rigid national, and purely hypothetical ideas of international, planning to which some abroad would have Switzerland adhere? How can it, as a relatively prosperous creditor nation, be expected to abandon or to jeopardise the policies of free enterprise to which it, no less than the United States, attribute their material welfare? Is it not displaying its sense of European solidarity more effectively, even if less spectacularly, by offering to share the fruits of its productivity with its less fortunate neighbours than it would be by seeking to emulate their paralysing policies?

To conform might be to please. But to produce, by not conforming, is more usefully to serve.

THE BUSINESS WORLD

The Contest Over Steel

AT some stage in the controversy which is breaking out over the Iron and Steel Bill it will be necessary to leave aside for a moment the merits and demerits of what the Bill proposes to do, and consider how to avert the heavy contingent disadvantage that it carries with it. The Bill, whether it would be good or bad in a timeless existence, threatens for the next two or three years to exert strong disintegrating forces on the steel industry, considered as a working part of the national economy, itself. It is, indeed, because these two or three years will be of such decisive importance for the material economic recovery of Britain that the Bill, introduced at the present moment, is seen to wear its Socialist doctrine with an impish and irresponsible air. Whether the Bill passes or not, and whether or not it undergoes substantial change, it will be vital to avert as much of the contingent damage as possible. Since the Iron and Steel Federation has this week entered actively into the controversy over the Bill, the means of doing this will be better considered now than later.

Up to the present the Iron and Steel Federation has displayed outwardly an impressive and to many observers puzzling lack of agitation about its future. Clearly its reticence did not arise from lack of concern; of the industries touched by the hand of nationalisation, the iron and steel industry is perhaps the first to be found in the posture not of prayer or resignation but of confident self-defence. One of the steelmasters' assets is their confidence that they can manage their affairs well if things are left as they are; when they say that the public interest will be better served by leaving them alone than by imposing the Bill upon them, they evidently mean it, and this goes some way towards strengthening the fairly widespread suspicion that by chance they are right. But the Federation's policy so far has been to concentrate on its business: the production of steel, the planning of the industry's development programme, the handling of such special matters needing concerted action as ore and scrap supply, and the furnishing to the public of an excellent service of statistical information on which the industry's recent performance can be judged. About the Government's plans to take over the industry, and the questionable political manœuvres in which those plans have involved the Government, it has been reserved. There could probably have been no more effective public relations policy.

This relative silence has been broken this week in two ways. Sir Ellis Hunter (not as chairman of Dorman, Long and Company, but as president of the Federation) issued a statement on Wednesday setting out briefly the Federation's opposition to the Bill. He concerned himself less with the general economics of the proposed nationalisation than with the fact that it promises to destroy the Government's position of impartial public supervisor of the 2,000 or so firms which came within the sphere of action of the Iron and Steel Board, and bring it into direct competition with many of them over a wide field of mixed industrial activities:

> In future the Government would itself be an interested party controlling the price and volume of the raw material supplies of its competitors in the finishing branches. As owner of the 107 firms it would similarly become a competitor in many British industries beyond the bounds of iron and steel products.

The variety of these activities in which the Iron and Steel Corporation will be engaged, or from which it will require to disentangle itself, is shown more fully than has previously been done in a list issued by the Federation. To the celebrated example of umbrella frames it adds some that are more unexpected: hotels, insecticides, cookers, and tennis rackets among them. The conclusion drawn by Sir Ellis Hunter is that conflict will be created between the State and private enterprise over a wide field of industry "without the slightest indication being given of the terms on which public money and public powers will be used." In sum:

> The industry has always been prepared for further constructive development of public co-operation but the Government have abandoned their own experiment of control through the Iron and Steel Board, in favour of a policy grievously prejudicial not only to iron and steel output and development, but also to the industries which iron and steel serve.

These are not immoderate words. But they are merely the opening shot in a cannonade which promises to be long and to grow more bitter as it progresses; what is alarming about them is that the responsible industrial leaders from whom they come will have to work, throughout the entire controversy which is now opening, in the closest contact with the Government over vital matters of the day-to-day conduct of the steel production drive and the realisation of the steel development plan. The first sight of the danger in which this collaboration now stands came over the resignations from the Iron and Steel Board in September. This action of the members (other than the trade union members) of the Board has been described in a recent Labour party pamphlet as "petulant" and as proving that "the Tory way of controlling steel is unworkable." There is no reason to suppose that it was anything of the kind. The gibe, which itself promises ill for the way in which the argument over steel is to be conducted, ignores the fact that the difficulty which is being created is a real one, and will arise again and again over a period when cross-purposes in the working of the steel industry can least be afforded.

★

There are probably few instances of a matter of this size and importance being decided against so slender a background of impartially collected expert knowledge; the rule that survey should precede action has not been observed in more than the most perfunctory manner or to the satisfaction of any but the actively engaged protagonists. What is the existing organisation of the steel industry? To what extent does it leave room for the play of healthy competitive forces? To what extent is it a cover for monopolistic practices? In what ways is it, as it stands, responsive to the overriding necessities of the public interest? The Iron and Steel Federation has produced its own answers to these questions in an article, "Organisation in the Steel Industry," in the October number of its *Statistical Bulletin* which appeared this week. Since this article is intended as a considered statement of the steelmasters' own view of how their industry is organised, its main points deserve recapitulation.

To some extent the article is a theoretical statement: it assumes, as a beginning, that "detailed control from the centre cannot satisfactorily replace the discipline to which a particular firm is subject when it has to compete and survive on its own merits." It assumes, on the other hand, that untrammelled competition is out of the question, and to that extent

gives away in advance the pure individualist case against nationalisation:

> The capital investment in many industries is now so large, and the importance of overcoming extreme trade fluctuations is so great, that there is inevitably a direct public interest in industry which, in the conditions prevailing today, may not be fully safeguarded by private competition alone. Over a wide field of industry, therefore, a conscious expression of the public interest may well be required, as well as the discipline and stimulus of competitive enterprise. It is in this field of the practical working out of a relationship between the State and industry that the steel industry has much to contribute from its practical experience.

The argument which follows is clear and coherent, though there is no blinking the fact that it depends to some extent on unsupported assertion and is to some extent prejudiced by the highly abnormal set of conditions in which the present arrangements operate. The steel industry is competitive and free from monopoly practices, it is argued, because in each field of production a number of firms is engaged, and because the price of steel products is fixed not by the industry but by external factors. But what are the external factors? Substantially they amount to the Government's decision upon what the price of steel products ought to be. It is true that there is a clear incentive to efficiency in the prospect which the efficient firm enjoys of a bigger margin on the fixed price. But only the Government itself can support the assertion that the system of price-fixing shows no tenderness to the marginal producer; and the Government, being itself about to engage in monopolistic practices which promise to dwarf anything ever achieved by the steelmasters in the most restrictive moments of their past, can only be a suspect witness.

The *Bulletin* is, however, able to show that large variations exist in the margins earned by steelmaking firms, and shows, too, that room for initiative exists in the possibilities of expanding production in the present boom times. Some firms have increased their production by as much as 70 or 80 per cent since 1938, while some have achieved little or no increase; and on the whole the smaller firms have achieved larger proportionate increases than the bigger firms. Rigid technical factors determine, no doubt, much of this apparent success or failure; but the room for individual effort is no doubt there.

Having sought to establish that competitive conditions exist in the iron and steel industry, the article goes on to describe the machinery which exists for curbing and co-ordinating it: the common services which the Iron and Steel Federation provides and the supervision on behalf of the public which is provided, until the resignations of its members take effect at the end of this year, by the Iron and Steel Board.

It is not necessary to accept the whole of the Federation's case to recognise that the work done over the last few years represents, as the article claims, "a constructive development in industrial organisation," and that it has something to do with the industry's excellent production record in the postwar years. The point is underlined at the same time by the announcement that the annual rate of British production of steel ingots and castings in October, 15,455,000 tons, was the highest ever reached in the steel industry; and the comparison between the steel industry running well ahead of its target and the coal-mining industry lagging behind is not one that has been lost on the public.

There are at the same time questions which any critical reader of the Federation's case must ask himself before he gets near to accepting it. He is not likely to be satisfied that the industry's present organisation contains no element other than the two to which the Federation points, internal competition and external public control; the other element may not be playing any outstanding part at the moment, but then the conditions are at the moment strange. He is not likely to be satisfied that in the pure field of technical growth the search for efficiency plays the unhampered part that it should play. Neither of these doubts, however, is likely to decide him in favour of the Steel Bill, the only competitor to the steelmasters' thesis which for the moment has the field.

The immediate case against the Bill rests most strongly on two feelings which are widely to be found. The first is that the Bill is likely to perpetuate some of the main faults in the existing organisation. The second is that, whatever ultimate virtues the Bill might have, its immediate effects are bound to be mischievous. The second argument is strong, but because of its strength needs careful handling. It can best serve the steel firms if they and their representative organisation continue to display the patience and restraint and attention to their business that they have shown so far. The responsible leaders of the industry will go on trying, no doubt, to resist any pressure on them to turn their full attention from the running of the steel industry to the conduct of a fight. That there must be such pressure in the heat of a political contest of this sort is evident. If it is not resisted the industry, and the country's economy, will be damaged; the evil effects will outlive the controversy itself, and it will be the steel industry's case more than the Government's case that will suffer. The steel firms cannot in any case decide the outcome; all they can do is to create the conditions (or preserve them) in which their case has the best chance of being effectively heard. The first of these must be an industry which continues to be stable and energetic. By maintaining this condition the steel firms will be performing a public service which is needed whether the Bill passes into effect or not.

Bonfire of Controls?

IT was a happy thought of Mr Harold Wilson to stage his "bonfire of controls" on the eve of Guy Fawkes day. The Government has said repeatedly that it does not control for control's sake, that some relaxation or simplification of controls takes place "almost every day"; but a public which sees little sign of increasing freedom in its daily life is excusably prone to greet such protestations with a rude retort. It was good tactics, therefore, for Mr Wilson to dramatise what is being done, to show that enough tinder could be piled up to make a setpiece. True, the effigy was a mere skeleton, without substance for a roaring blaze; but there was quite enough for a brief flare. The public, dazzled only momentarily, is now wondering whether anything important has been burnt; and, if not, whether this scene promises a bigger and better spectacle eventually.

There is little doubt that the significance of this occasion lies rather in the second of these possibilities than in the first—but the chances of a good honest blaze by next Guy Fawkes day are not bright. Mr Wilson's statement explained that since February 1st he had authorised the relaxation of controls affecting more than 60 commodities for which the Board of Trade is responsible; but they are mostly minor commodities and minor relaxations. And he then said:

> Apart from those basic controls which are essential for our economic recovery for industrial efficiency or for full employment, it is our policy to maintain all those controls—and only those controls—which are essential to secure a proper distribution of materials which are still scarce. A wide range of materials still continues in short supply, and we shall consequently have to continue the measures by which they are allocated though we shall continue to introduce improvements and greater flexibility wherever possible.

Here is a considered statement of Government policy. It stands by the main structure of control, but reiterates the need for flexibility and the desirability of relaxation wherever possible. The reason given for the recent changes is to "assist our industrial efficiency and our power to export." Moreover, apart from what Mr Wilson calls the "basic" controls, the Government is definitely committed only to the allocation of scarce raw materials.

To understand the significance of the recent changes and the scope for further simplification within the range of direction which the Government still regards as necessary, it is desirable to glance first at the shape of the whole system. Broadly, there are three groups of controls. The first is exercised by statutory regulation of manufacture and supply of an article, by a licensing system related to the prewar pattern of industry. The principle of licensing was that unless a firm produced certain types of goods before the war, it could not be allowed to produce those types after the war. Such a control, no matter how justified it might have been during the war, is pernicious by its very rigidity. It prevents competition by preventing new entrants, and it tends to perpetuate the same old ideas and the same old designs. The second group of controls works through the allocation of scarce raw materials, and is quite distinct from the first. Hence a permission to manufacture carried with it no guarantee of a supply of raw materials, and the risk of duplication inherent in this arrangement gave obvious scope for simplification. The third group of controls embraces import and export licensing, and public purchase.

All these controls had their origin in the war, and although a good many modifications have been made in the past three years, there has been no major reorganisation of the control system. In war, the problem was one of conserving labour and materials and getting maximum output for the forces, consistent with a basic supply of essentials for the civil population. In peacetime the problem is still to maximise output, but to direct as large a part as possible to the diverse needs of export markets instead of to a single mass buyer, the Government; and to do this in such a way as to economise hard currency and scarce raw materials.

★

In both sets of circumstances, of course, supplies to the home market had to be drastically curtailed. The use of the wartime system of control without any major alteration to meet the changing circumstances inevitably involved some overlapping and the retention of some controls which had become redundant. Indeed, as the postwar economic situation deteriorated, controls were used as stop-gap devices to help dam the dollar drain. The whole system of statutory control of manufacture was in fact merely used as a secondary control on the use of raw materials; later, it was modified as an instrument for fostering the export drive.

In principle, any system of controls of this kind is a substitute for "automatic" control by the price mechanism. But in certain directions, as subsidies on various raw materials were abandoned and as the home issue prices of those goods centrally purchased were brought into line with world market prices, the automatic system of control began to do its work again, and the need for many of the physical controls tended to disappear. Price determined the allocation, and in some categories of clothing and footwear it determined the ration as well. In addition there has been a distinct improvement in Britain's economic position, especially in certain lines of production. In chemicals, home production has expanded sufficiently to meet both overseas and domestic demand, while the supply of certain less known raw materials has improved owing to a softening of certain currencies, thus providing further scope for relaxation of control.

RELAXATION OF BOARD OF TRADE CONTROLS
Since February 1, 1948

Abolition of Statutory Control of Manufacture, etc.	Allocation Abandoned and/or Private Purchase Restored	Relaxation of Export Licensing and Control of Distribution
Mechanical lighters	Acetone	Cotton piece-goods
Perambulators	Sunn hemp	Formvar
Certain plastic manufactures	Leather	Glue, gelatine, size
Rugs	Liquid rosin	Knitted goods
Toilet preparations	Pyrethrum	Lactic acid
Toys	Japanese silk	Linen
Artificial flowers	Constructional veneers	Potassium permanganate
Braces	Acetates	Rubber tyres
Curled hair	Amyl alcohol	Soda ash
Cutlery	Caustic potash	Plywood, boxwood and veneers
Embroidery on net	Cotton linters	Woollen piece-goods
Fertilisers	Cotton waste	Cork
Fountain pens	Derris	
Glassware	Drying oils	
Gramophone records	Sisal and manila hemp	
Hollow-ware	Manila copal	
Jewellery	Rayon yarn and staple	
Linoleum		
Miscellaneous household and fancy goods		
Miscellaneous textiles		
Sports gear		

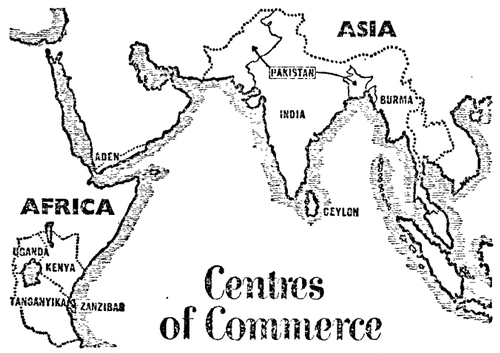
Note: The above list is not fully comprehensive but it includes most of the Board of Trade items concerned. It does not include those items covered by the revocation of the Wireless Receivers and Radiogramophones Order and the Machinery, Plant and Appliances Orders of the Ministry of Supply and referred to in the text.

Such was the background of the decision of the President of the Board of Trade last February to appoint an Examiner of Controls to advise him on the possibility of relaxation and, in particular, of cutting out duplication. The Examiner's terms of reference, however, did not include matters of policy, such as price control or de-rationing. The first group of controls to be examined was that involving the regulation of manufacture,

least necessary part of the whole system. In the main, it was reinforcing the raw material controls or export licensing. Moreover, the control of manufacture caused the greatest number of pinpricks to industrialists. It is clearly wrong in principle to attempt to keep an industrial structure rigid for any long period, while there is a possibility that the increased competition which relaxation would permit might stimulate industrial efficiency. The revocation of many of these statutory orders was not, however, well received by many trade associations. The fear of competition and the veneration of the *status quo* dies hard after a phase of spoonfeeding and sellers' markets. But it is now permissible to manufacture any of some 25 categories of articles, whether or not such a manufacture had been carried on before the war. These include wireless receivers, radiograms, numerous types of machinery coming under the Machinery, Plant and Appliances Order of the Ministry of Supply, and a number of miscellaneous consumer goods ranging from perambulators to mechanical lighters and toilet preparations. For many articles, the control of distribution has also been abolished. In the past, manufacturers even of new products or new types were permitted to sell only a small proportion of their output on the home market. But the risk involved in selling an entirely new product overseas was often too great, and the projects were generally abandoned. Now a larger proportion can come on to the home market, so long as the export target is reached by the industry as a whole. These relaxations, it is estimated, will save the Board of Trade from issuing some 200,000 licences a year. This is an impressive figure, but unfortunately it throws into relief the magnitude of the licensing which will still take place; for it is admitted that these relaxations are marginal.

In raw material allocation the relaxations have been limited to the relatively minor commodities. Acetone, sunn hemp, manila and sisal hemp, liquid rosin, Japanese silk, constructional veneers, cotton linters, oiticica oil and other little known commodities have reverted from public to private purchase. In each case, either the supply has improved so that the commodity can be readily purchased in the sterling area, or, where only dollar sources are available, control will be effected by allocation of foreign exchange. Although the main group of raw materials has not been affected, this policy of decontrol at least gives an opportunity to experiment with the less constrictive methods of control, by a general allocation scheme for foreign exchange. If the experiment is successful—if under these conditions private importation does not cause any serious drain on dollars—it may be all the easier to get the more important raw materials put on the same basis.

The relaxation of export licensing is in the main a corollary of the relaxation of the other controls. In many instances, the abolition of the statutory orders controlling the acquisition, manufacture, supply and distribution of goods automatically abolishes export licensing—that is, specific control of the proportion of output destined for export. Experience has proved that the achievement of export targets depends on the co-operation of industry rather than upon specific regulations. The Government has set the general target and the various industrial organisations have split it into individual targets for factories; and it is now generally recognised that those industrial organisations will do more to ensure that the target is met than any licensing system can do. When the sellers' market was ubiquitous overseas (and when, also, home demands were at their peak), the export licensing system undoubtedly helped to expand the volume of exports. But now, with the growth of buyers' resistance abroad, this system is proving to be too rigid. Exporters must be free to switch from market to market and from commodity to commodity as saturation of local markets becomes apparent. Without this flexibility, the potentialities of the export drive might be



COMPLETE WORLD-WIDE BANKING SERVICE

With the immense strength of its combined resources and experience, the Three Banks Group is exceptionally well-equipped to fulfil the many varied functions of a modern Banking Service. Although the Group serves the interests of many large and important concerns, it is careful to preserve the personal touch that has been a tradition of each of its members during two centuries.

severely limited. Moreover, in many categories the pressure of home demand is now less insistent, so that the danger of undue diversion to the home consumer is lessened.

The changing conditions in Britain and the world have permitted some measure of relaxation of controls—even within the rather austere limits still set by the overriding policy of the Government. With steel, timber, paper, building, textiles and fibres still firmly under control, it may seem that not much has yet been achieved. But the relaxations conceded this year are a beginning. They will help industry more than they will help the consumer. They will permit greater flexibility, will stimulate competition, and will remove many annoying restrictions which industry has long regarded as unnecessary. These relaxations will not, however, permit any perceptible reduction in staffs at the Board of Trade; this may or may not be a measure of their extensiveness. But they should reduce the clerical burden imposed on industry. These measures should perhaps be regarded as really no more than a streamlining—the abolition of redundancy or, in some cases, a simplification. They have not meant a complete reorganisation of the system of control. For that very reason, there must be great scope for further relaxation—in the Board of Trade, the Ministry of Supply and other departments—even without abandoning any of the basic objectives of policy. Mr Harold Wilson has already promised more easements; and he must be held to his promise. This good beginning must not be made an excuse for reduced vigilance in the search for new opportunities for economy and simplification.

Business Notes

Priority for Productivity

Sir Stafford Cripps, who had in recent weeks given no more than hints of any uneasiness about the trend of production, has now plainly conceded that the effort is slackening and can only be revived through higher production per head. He qualified his acceptance of the recommendations of the Anglo-American Council on Productivity (which are outlined below) by pointing out, legitimately, what is already being done to furnish the tools which industry needs and by reiterating that the need to export machinery and vehicles must continue to restrict the volume of re-equipment at home. But he accepted the Council's report in general readily enough, and his comments on the trend of production could hardly have underlined it more strongly:

> There is evidence for believing that after the remarkable industrial recovery achieved in this country in the first two years of peace there is an apparent flattening out of the curve of production, suggesting a slower rise in productivity per head of the population than we are entitled to expect with the growth of mechanisation.

There had been little change in the production index since the spurt of a year ago, and another such spurt was urgently needed now. But how was this to be done?

> Unless with our existing labour force we continue to increase output per head substantially we cannot expect to see a further improvement in the overall level of production, since there is very little fresh labour that can now be drawn in.

There is indeed no escape from the conclusion that only a major increase in productivity can save Britain from a further and probably severe constriction of its standard of living when the economy has again to support itself, as it will have to do, willy-nilly, when the ECA period ends. Henceforth, the drive for productivity must be foremost among Britain's economic objectives. Critical importance is attached, therefore, to any elements in this campaign which hold promise—notably to the efforts of the new Anglo-American Council on the one hand and of the trades unions on the other.

The results of the first series of meetings of the Anglo-American Council have been summed up this week in a number of incontestable general statements and (more important, no doubt) in the announcement that it has set up committees to pursue special lines of action and inquiry between now and its next full session, which will probably be in the United States in the spring. It had seemed that the council was suffering from an excessive tenderness towards British susceptibilities, but the statement issued last week suggests that it has laid its plans in a businesslike manner, and may yet produce results. One committee is to arrange visits from British factories to factories in the United States. This is only one part of a general recommendation that the best industrial practice should be more generally shared; another, and essential, part is that "knowledge of the best practice in the United Kingdom itself" should be made more generally available, and this is left to British industry to arrange.

Another committee will study the level of productive plant and power in British industry, and will inquire whether the level is relatively increasing or declining. As the report points out, the amount of energy available per employee is one of the main determinants of productivity, and this ratio in the United States is about twice that in Britain. A third committee will try to establish a basis of productivity measurement to permit comparisons of British and American experience and thus to settle at last the differences of opinion on the bare facts of the matter. Companies which operate comparable plants in both countries can obviously help to elucidate this, and their collaboration is to be sought. A fourth committee will report on the possibilities of specialised production of components, and a fifth will tackle what may yet prove to be the central task of getting economic problems, as they relate to productivity, more widely understood. This is a task with which the Government has been struggling for some time, and which (as the latest TUC report on productivity indicates) will have to engage the attention of the trade union movement as well. But there is still room for the Anglo-American council to act as a stimulant.

* * *

TUC's Output Drive

The general questions raised by the decision of the TUC to call a special conference of trade union executives to consider productivity are discussed in an earlier article. The TUC report, published this week, was prepared for the special conference, and will form the basis of the discussions on Thursday. The assumption from which it starts is therefore worth noting:

> For the purpose of this conference of executives the General Council feel assured that there is common agreement on the need for greater productivity. The purpose of this conference is to discuss *how* the level of productivity can be raised.

It will be concerned, adds the TUC report, not merely with the volume but also with the economy and efficiency of production; and with workers not merely in productive industry, but also in non-productive occupations, for in those too it is necessary in a period of full employment that "manpower should be organised efficiently and treated as the precious commodity which it is." The task which the TUC has set itself is therefore very wide, and one conference will clearly not dispose of it. The first stage of the task is publicity, and here the General Council of the TUC decided that general publicity would not do; the problems in each industry were too various, and it is to be supposed that the council had the inadequacy of recent Government publicity, of precisely this general kind, in its mind. It decided that separate consultation with each industry was unavoidable, and Thursday's conference is an attempt to prepare the ground for a series of conferences with the major negotiating groups in the trade union movement—the federations of trade unions—with whose member organisations the power of decision rests. If active policies are to result, they will have to be worked out in the separate conferences which are to follow. To criticise the report for its failure to lay down any new policy in detail is therefore hardly to the point. It does, however, tackle a number of the main questions in a preliminary way, and in doing so concedes some important points.

It recognises that there are over-manned industries which could lose labour to under-manned industries to the general benefit, and that the solution "may possibly mean the transfer of membership and the adoption of measures which may not be universally popular." It refers to the waste of manpower caused by the excessive turnover of labour—in many industries at the rate of 50 per cent a year—and urges on unions "the necessity for examining the conditions in which an excessive turnover of labour exists." Although the Restoration of Prewar Trade Practices Act has not yet been applied, it recognises that restrictive practices need careful examination both by unions and manage-

ments, and draws attention to the losses of production and employment which demarcation disputes still cause. It discusses the "training within industry" scheme, the part to be played by the shop stewards when the new productivity policy passes from the union leadership to the floor of the shop, and the qualifications of industrial consultants.

Most of the report is plain commonsense; the process of growing up has been carried a stage farther. But the conversion of Transport House was perhaps the easiest matter; in the conversion of the unions themselves, as the tepid reception given by the Margate Conference to the general council's proposals on production showed, there is still a stubborn body of tradition to be overcome.

* * *

Steel Companies' Compensation

The method of compensation prescribed in the Iron and Steel Bill has evoked emphatic protests from the City—and far beyond it. In *The Economist* last week it was emphasised that the basis of Stock Exchange values is indefensible in principle and grossly inequitable in practice. Now The Council of the Stock Exchange, following the precedent of its own action over the Transport Bill, has addressed what it terms "the strongest possible protest" to the Government, pointing out that "whilst the general arguments against the use of Stock Exchange prices as a basis for compensation remain undiminished in force, there is in addition a new and grave cause for objection" in the voluntary limitation of dividends. The Council urges once more that, failing agreement between the parties, independent arbitration is the only equitable way of determining compensation "in all cases of State acquisition of private property." The resulting "take over" prices of shares are demonstrably unjust, whether measured against the value of current and prospective earning power or against fair current values for fixed and floating assets. Full documentation for this view would require a statistical repast of indigestible proportions. In the accompanying tables a middle course is adopted. These indicate how "take over" prices estimated according to the provisions of the Bill compare with prices estimated by two alternative methods. Calculations are given for four of the leading companies—United Steel Companies, Dorman Long, Stewarts and Lloyds, and Lancashire Steel Corporation—which together produce nearly one-third of the steel output of the country.

ESTIMATES OF BALANCE SHEET BREAK-UP VALUES OF STEEL SHARES(*a*)

	The United Steel Companies June 30, 1948	Dorman Long Sept. 30, 1947	Stewarts & Lloyds Dec. 31, 1947	Lancashire Steel Corpn. Dec. 31, 1947
	£000's	£000's	£000's	£000's
Fixed assets, at cost, *less* written off	17,586	7,025	13,789	3,718
Assets vested in National Coal Board	3,840	(*a*)	1,056	...
Investments in associated companies (*a*)	5,693	395	5,732	1,012
Net liquid assets	3,728	9,885	10,167	4,407
Net total assets	30,847	17,305	30,744	9,137
Less prior charges at take-over prices	*24,252*	*6,595*	*10,988*	*2,390*
Net total assets for ordinary capital	24,252	10,575	19,756	6,747
Total compensation at estimated take-over prices (*f*)	15,450	7,165	25,200	6,059
Deficiency	− 8,802	− 3,410	+ 5,444	− 688
Estimated "take-over" prices per share (*b*)	30/4	54/9(*c*) 33/1(*d*)	57/4(*e*)	35/−
Balance sheet break-up values per share	47/8	53/−(*c*) 53/−(*d*)	44/11(*e*)	38/10

(*a*) Market values adopted for investments where obtainable. (*b*) Not separately distinguished. (*c*) £1 preferred ordinary. (*d*) £1 ordinary. (*e*) £1 deferred. (*f*) As provided for in the Iron and Steel Bill.

The estimates in the first table are based on the valuations of assets given in the latest consolidated balance sheets, except that, where market valuations are available for trade investments, these have been included in preference to book values. Total trade investments and capital loans of Stewarts and Lloyds have a balance sheet value of £1,292,849, whereas its holdings in Tube Investments alone have a market value of over £4,500,000. Similarly, the market value of quoted investments held by United Steel Companies is some £2,300,000 more than the book value. It will be noticed that, on this basis, the value of the £1 deferred ordinary shares of Stewarts and Lloyds works out at about 12s. 6d. less than the estimated take over price of 57s. 4d. But, as will be evident from a study of the table in the succeeding note, this arises from the heavily written down value of assets which in all cases is quite unrepresentative of replacement values at prices now ruling. It will also be noted that in all four cases goodwill has been entirely written off in group balance sheets, and that in general balance sheets provide no accurate indication of amounts ploughed back over the years. Neither Dorman Long nor Stewarts and Lloyds shows the amounts written off assets in its group balance sheet.

* * *

Valuation by "Intrinsic" Worth

A second method of valuation which attempts to value the companies on their "intrinsic" worth, or their value as going concerns, has been adopted in a circular prepared by a leading firm of brokers before the publication of the Iron and Steel Bill. The validity of calculations on this basis, of course, stands or falls by the value placed on producing capacity and the reasonableness of the assumptions implicit in this valuation about future demand and earning power. The firm in question estimates that the cost of erecting steel plant today is something over £30 a ton of annual output capacity, compared with from £10 to £13 a ton before the war. Taking this as a basic figure, but discounting it for age and condition of the plant, it then values the principal fixed assets of each of the four companies by reference solely to their output. For this purpose, the actual output has been adjusted upwards by about 10 per cent to allow for plant extensions already in hand and financed which have not yet contributed to output. It has also been found necessary to make an

ESTIMATES OF VALUE OF STEEL COMPANIES AS GOING CONCERNS

	The United Steel Companies	Dorman Long	Stewarts & Lloyds	Lancashire Steel Corpn.
Steel output (tons) (*a*)	2,000,000	1,300,000	1,200,000	600,000
Estimated present value of producing capacity (per ton)	£15	£15	£25	£15
	£000's	£000's	£000's	£000's
Total estimated value of producing capacity	30,000	19,500	30,000	9,000
Estimated coal compensation	2,500	3,250	2,500	1,050
Trade investments (market values where stated)	5,693	395	5,732	320
Net liquid assets	3,728	9,885	10,167	4,407
Estimated value of plant for processes subsequent to rolling of light sections	2,500	Nil	10,000	300
Goodwill valued at two years purchase of profits (*c*)	5,653	4,200	8,500	2,400
Estimated value as going concern	50,084	37,230	66,899	17,477
Less prior charges (at "take-over" prices where applicable) and minority interests	*6,595*	*6,730*	*10,988*	*2,390*
Estimated "actual" value of assets attributable to ordinary capital	43,489	30,500	55,911	15,087
Compensation for ordinary capital at "take-over" prices (*b*)	15,450	7,165	25,200	6,059
Deficiency	*28,039*	*23,335*	*30,711*	*9,028*
Indicated value per ordinary share on going concern basis	85/4(*d*)	152/9(*f*)	127/2(*g*)	87/3
Estimated "take-over" prices for ordinary shares (*b*)	30/4	54/9(*d*) 33/1(*e*)	57/4(*g*)	35/−

(*a*) Allowing for post war increase in capacity. (*b*) As provided for in the Iron and Steel Bill. (*c*) After depreciation but before taxation. (*d*) Preferred ordinary. (*e*) Ordinary. (*f*) Preferred and ordinary rank *pari passu*. (*g*) £1 deferred.

approximation for the amount of coal compensation receivable by the companies; book values of assets vested in the National Coal Board are not a reliable guide. The item for capital attributable to plant for processes subsequent to rolling of light sections must also be an estimate, and while it is possibly overstated in the case of Stewarts and Lloyds, the high cost of replacement must be duly taken into account. The Government's decision to keep in being the trade names and the organisations of the present companies in the industry is a measure of the importance to be attached to the value of goodwill, the scarcity value of assets and the "know-how" which goes with a business. It is certainly not over-rated at two years' purchase of profits.

The results obtained from these calculations are somewhat startling. Admittedly, this method invites a number of criticisms in principle; but if the basic assumptions are reasonable, the conclusions at least afford an indication of the wide range of valuation estimates which may reasonably be brought into the argument about the merits—or, rather, demerits—of the Stock Exchange valuation method.

Count Mahé de la Bourdonnais was born in France in 1699 and took his title from Mahé on the Malabar coast which he captured from the British in 1724. Successful though he was as a naval commander, de la Bourdonnais is chiefly remembered for his fine work in developing and improving Île de France—the name by which Mauritius was known in his day. During his term as Governor he founded the town of Port Louis and was instrumental in establishing the cultivation of sugar cane as the principal industry of the island. De la Bourdonnais died in 1753 and Mauritius was subsequently ceded to Britain in 1814. The cultivation of sugar remained the mainstay of the Island's economy and Mauritius is now among the greatest producers of sugar in the British Empire.

Full and up-to-date information from our branch at Port Louis, covering the sugar industry and other commercial activities in Mauritius, is readily obtainable on request.

D·C·O

deficit. A note in these columns a fortnight ago, commenting on the expedient of revising the Reserve Bank statutory gold cover, remarked that such shifts and devices would not serve for long to enable the Government to avoid the import cuts the need for which has been apparent for many months. Now the first cuts are already effective; some of them, indeed, are in effect operative from July 1st last. Imports of a lengthy list of mainly luxury items are wholly prohibited, regardless of the countries of origin, except under licence which will be granted only in "very exceptional circumstances." Imports of all other goods from non-sterling countries are to be sharply curtailed by a system of exchange rationing which, in the absence of specific permits for special treatment, will be at the rate of 50 per cent of the import level of the calendar year 1947. As the volume of hard currency imports has been rising, this choice of base period means that the new standard rate of importation will be less than half the current rate. In practice, however, the total enforced economy will be less severe than this, because the Government does not intend to place any "undue" restrictions upon exchange required by mining, agricultural and secondary industries. Though the choice of adjective may look rather ominous to the industries concerned, Mr Havenga's calculations of the rate of saving suggested that the present intention is not to make any cuts in these particular imports. About half the total imports, he estimated, consist of producers' goods; and he then went on to say that "if supplementary quotas are freely granted for all producers' goods," the total reduction in hard currency imports will be about 25 per cent.

From Britain's point of view, the prohibitions are less drastic than might have been expected. A good many minor items are affected, including certain domestic electrical appliances, cut glass, jewellery, matches, cigarettes, soap, biscuits, confectionery and processed foods—and many others of less significance for British export trade. But some of the key lines are outside the range of the ban. Motor-cars are prohibited only if they cost more than £500, radios if they cost more than £15; whisky is excluded from the prohibition of liquor imports. Outside the prohibited groups, the constriction of hard currency imports may actually divert some business to Britain—at least so long as South Africa's domestic purchasing power is maintained.

Here, however, comes the rub. It is questionable whether the cuts are sufficiently drastic from South Africa's point of view. And it is still more questionable whether a policy of cutting down non-essential imports can suffice by itself. It needs to go hand in hand with measures to relieve the excessive pressure upon South Africa's economy as a whole; and such measures, the need for which is further discussed on page 797, could scarcely leave the level of domestic investment untouched, however drastically they might strike at the consumer. Micawberism, it is clear, is still very much alive in the Union. Through the lips of Mr Havenga it still talks glibly of a dollar loan—despite the fruitlessness of the recent informal quest, and despite the admission that there is no intention to make "formal application" in the near future. Mr Havenga remarked that if the restrictions on non-dollar imports achieve a sufficient improvement in the reserve position, he "would seriously consider giving priority to the relaxation of restrictions in favour of those countries." Does he really expect the Americans to swallow so obvious a bait?

Government Loans for Film Production

Although the Bill to set up the Film Finance Corporation has still to be introduced in Parliament, the corporation is already at work in its preliminary form as the National Film Finance Company, and the chairman, Mr J. H. Lawrie, disclosed this week something of what it is doing. A good many requests for loans have already been turned down (precisely how many would be hard to say: Mr Lawrie observed that it was possible to turn down eight times the same proposal coming from eight different people) but two loans have been agreed. Both are to go to distributing companies, since this is the method laid down by the Board of Trade. It is a method which carries probably the smallest financial risk consistent with the purpose, but it is open to the criticisms that it will finance for the most part undertakings which ought in any case to be able to find money privately, and that it will not help the producer to escape from under the distributor's thumb. One of the loans, being under £20,000, underlines the fact that the Government finance will supplement, rather than replace, the customary bank advances. The other, to the British Lion Film Corporation, is for more than £1,000,000—it appears, considerably more; Mr Lawrie has not disclosed the exact sum. This is to be used by British Lion as additional working capital to finance "a programme of films to be produced by a variety of people who can in varying degrees be described as independent." Complete independence rarely exists in the film world, but the general prospect opened up by the British Lion loan is fairly clear; the activities of the group of producers more or less loosely associated with Sir Alexander Korda are to be expanded, and a nucleus will be maintained for large-scale British film production outside the Rank Organisation. Sir Alexander Korda has stated his intention to raise the production of this group to 18 films a year. Whether the funds which will now be available will permit anything so extensive will depend partly on the speed at which the money is turned over, and partly on the degree to which the box-office results shown make it easier or harder to raise money from commercial sources. Such incidents as the delay in sending "Bonnie Prince Charlie," which has gone back to the studio for re-editing, out into the world, show a praiseworthy desire for perfection, but they tie up money for inordinate periods and can only damp the hopes of expanded activity.

One of the main preoccupations of the Film Finance Company must presumably be to see that mistakes of this kind become rarer. Anyone financing film production undergoes some risk of being faced with an accomplished fact in which the production time and the budget have exceeded what seemed probable, and more money is needed before the first investment can be recovered. This will need keen examination of the budget for each film, and strict control of current expenditure on production. It will limit severely the number of budgeting errors which any one producer can afford to make in one lifetime. Mr Lawrie indicated that the decision to make or refuse a loan would be guided by the creditworthiness of the distributing firm concerned, the producer's personal record, the firmness of the project, the ability of its budget to withstand scrutiny, and the eventual home and foreign box-office prospect in relation to the outlay. He would not attempt to be an arbiter of taste. This is reasonable, but there are pitfalls in it. Occasions have been known when film producers have put taste second and still failed at the box-office; and commercial failures are less readily forgiven when no purpose but a commercial one is intended to be served.

* * *

Sterling Trade with Japan

The trade agreement between Japan and a number of countries in the Commonwealth which was announced this week provides for a more than three-fold increase in the trade between Japan and the sterling group. This group includes Australia, India, New Zealand, South Africa and the United Kingdom and its colonies except Hongkong. The agreement is for twelve months, and will operate retrospectively from July 1st last. It anticipates a two-way flow of trade totalling some £55 million and envisages approximate balance between commercial traffic in each direction. This is the first time that so large and representative a part of the sterling area has combined for the purpose of forming one of the two parties in trade arrangements of this kind. The agreement provides that all trade between the two parties shall be conducted on a sterling basis. The previous arrangements made last May also conceded the point that British trade with Japan should be conducted in sterling but excluded from this concession the most important item of all, namely, the trade in Japanese cotton goods. Dollar payments had to be made, for such goods, on the ground that the raw cotton from which the textiles were manufactured was in large part being supplied by the United States and financed by dollar loans.

The intention will be to prevent excessive accumulations of sterling on either side of the account. The balances will be struck every six months, and any sums in excess of balances required to meet short term commitments will be converted into dollars. The main goods to be exported by Japan under the arrangement are cotton textiles, which will account for a minimum of £16 million of Japan's estimated sales of £27½ million under the agreement. The rest will include exports of industrial machinery, raw silk, caustic soda and other chemicals, rayon and silk manufactures, paper and paper products and bunker coal. The reverse flow of goods from the sterling area will include a wide range of raw materials, including raw wool, iron ore, salt, raw cotton, cereals, rubber, tin, jute, manganese, etc. Shipping services will also account for an appreciable figure. The total of these exports is estimated at £23 million for the current twelve months. The balance of approximately £4,500,000 will be offset against debts already incurred by Japan for goods delivered prior to July 1st on open account under Governmental trading arrangements

On all counts, this should be regarded as a valuable and welcome agreement. If, as is reported, it has been received with "very mixed" feelings in British cotton circles, that is a sad commentary on the parochialism with which world events are now viewed from Lancashire and on the defensive timidity that besets an industry which once thrived on free trade and bestrode the markets of the world.

* * *

Export-Import Bank Report

Now that it has been designated as the chosen instrument through which ECA loans will be canalised to European countries, the Export-Import Bank at Washington is acquiring a stature which can hardly have been conceived by those who launched it in 1934 as a Governmental agency to help in the finance of US exports. With the termination of hostilities, the Bank began to depart from its strict sphere of activities by granting reconstruction loans to European countries, and in effect cushioning the impact on the European economy of the sudden suspension of lend-lease. In 1945 the Bank was given increased capital resources and made a permanent agency of the US Government. At present its lending authority amounts to $3,500 million, of which only $628 million remained uncommitted at the end of last June. During the twelve months which ended June 30, 1948, the "Exim" Bank authorised new credits totalling $465.7 million, and in addition allocated $171.6 million for specific projects under credits authorised in previous fiscal years. The operations of the Bank showed a marked diminution in the first half of this year, a movement due to the belief of the board of directors that, in view of the programme launched with the Economic Co-operation Act of 1948, credits to European countries participating in Marshall Aid should not be authorised save in exceptional circumstances. In this respect, therefore, the Exim Bank followed the general line of policy also adopted by the two Bretton Woods Institutions, and the common source of inspiration, namely, the National Advisory Council in Washington, stands revealed.

This line of policy is not crossed by the decision to make the Exim Bank the channel through which ECA loans are being granted. When acting in this capacity the Bank will be operating as an agent for the ECA. Though it will make and administer the credits, the terms will be specified by the Administrator in consultation with the National Advisory Council. The Bank will also be agent for the issue of guarantees extended to US firms making investments in the recipient countries under the relevant section of the Foreign Assistance Act of 1948. All operations of the Exim Bank under the Foreign Assistance Act of 1948 will be carried on the books independently of the normal banking operations. They will not, therefore, require an increase in the capitalisation of this institution, since the resources required for these operations will be provided out of the funds appropriated for the Economic Co-operation Administration by Congress.

* * *

Thomas Tilling Agreement

Proof that fair compensation terms can be reached by negotiation with the state authorities on the basis of assets values is afforded by the agreement which has now been completed between Thomas Tilling and the Transport Commission. Sir Frederick Heaton, the chairman of the company, has himself commended the settlement as "an equitable one." Nevertheless, some disappointment has been shown this week that the payment of the compensation sum will be made in Government stock and not in cash, as was generally expected. The payment of £24,800,000 to Thomas Tilling is to be in British Transport 3 per cent Guaranteed Stock, 1968-73 at 101 per cent. Interest at the rate of 3 per cent on the purchase price will be paid as from January 1, 1948, and the profits of the Thomas Tilling undertaking will accrue to the British Transport Commission from that date.

The company is to propose a capital distribution to shareholders at the rate of £5 of British Transport Stock for each £1 ordinary stock of Thomas Tilling held. This will leave it with £3,954,455 of the new stock for which suitable opportunities for conversion and investment will be sought. In addition, the company retains its holdings of 253,348 £1 ordinary shares in Cornhill Insurance, 225,000 £1 ordinary shares in Daimler Hire, smaller interests in other companies, £1,148,000 in liquid assets and certain freehold properties. Total income of the parent company from these assets in the last completed financial year amounted to £240,000 before taxation. No indication has been given of total group earnings from which to form an idea of the future value of the Thomas Tilling shares, which in active dealings this week have reacted 1s. 9d. to 119s. 3d.

"Glad you like this sherry —it's South African"

It's extremely good. I got some South African wine the other day . . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

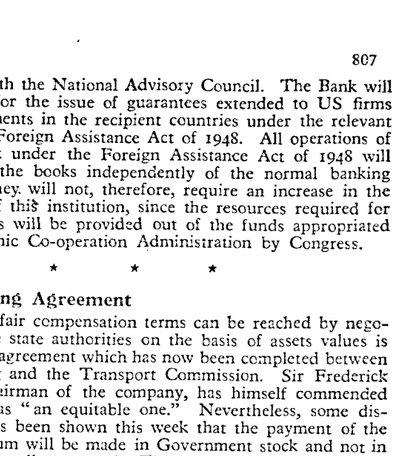
Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?



You certainly can, and very soon, too."

SOUTH AFRICAN WINE FARMERS ASSOCIATION (LONDON) LIMITED

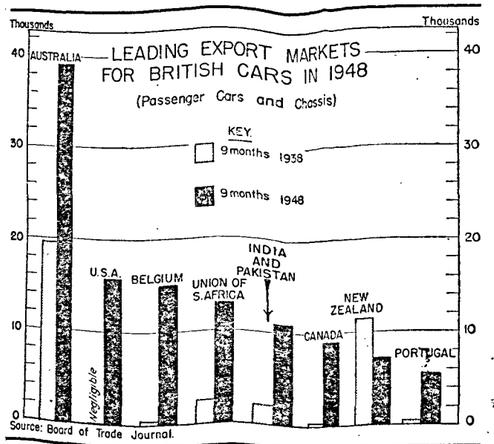
Valenta

the luxury cigar from Jamaica



Among men who appreciate the distinctive qualities of a fine cigar, Valenta is recognised as the foremost imported brand of today. Skilfully rolled, sumptuous in flavour and aroma, Valenta is a cigar to linger over with supreme enjoyment. Available from your usual cigar merchant in any of three favourite sizes, *all* in boxes of 25 and the handy 'Fives' pocket carton. To secure these luxury cigars, ask for your Valenta *by name.*

Guaranteed by the Government of Jamaica

The Motor Industry's Progress

With the success of the Motor Show and the exceptional interest shown in the new year's models by foreign as well as British buyers, the great opportunities within reach of the British motor industry can be taken for granted, and the striking progress made towards its immediate objectives can be conceded. The industry's task now is to sustain the impetus gained in production and keep the initiative won in foreign markets in the past year, while at the same time looking critically on its new models. Figures published in the *Statistical Review* for November of the Society of Motor Manufacturers and Traders illustrate one trend which was to be expected from the changes in motor-car taxation since the war: the proportion of cars with an engine capacity over 2,200 cc (roughly, 16 h.p.) rose from 5 per cent in the early summer to 10 per cent in August and September. This trend has still some way to go before a balance is reached corresponding to world demand. At the same time

the interest which the new models of the two surviving British-made 8 horse-power cars (Morris and Ford) aroused at the Motor Show suggests that the career of the very light car is by no means over.

Figures published in the *Board of Trade Journal* and expressed in the chart above give a picture of the relative success with which the industry has not only enlarged the volume of its exports but changed their distribution between different overseas markets. Total exports of cars and car chassis numbered 170,000 in the first nine months of 1948; this is 25,500 more than in the whole of 1947. In addition, 54,000 commercial vehicles and chassis were exported in the nine months; in building up this figure, agricultural tractors have played an increasing part.

* * *

The Trend of Earnings

The Ministry of Labour's half-yearly review of workers' earnings is always useful, but suffers from the unfortunate time-lag in the collection of information. The survey in the current *Ministry of Labour Gazette* relates to the position last April, so that it is still impossible to assess fully the effects of the Government's wage stabilisation policy announced in February. But it is fairly safe to assume that the steady upward trend revealed in the present survey has continued in more recent months.

The average earnings of the 6,000,000 workers covered in the survey (mainly in manufacturing industry) were 114s. in the last pay week of April, an increase of 114 per cent over October, 1938. In October, 1947, the average was 108s. 2d., which represented an increase of 103 per cent over the prewar figure. The average earnings of workers in industries excluded from the survey—agriculture, rail transport, mines, distribution, catering and entertainment—would probably not affect the national figure, for the high earnings in mines (165s. 2d.) and docks (155s. 5d.) would be balanced by the lower earnings of distributive and catering workers. The average earnings of mineworkers are 206 per cent higher than in April, 1938, and are well above the present general level.

The increase in earnings arises more from the extension of overtime and the operation of piecework systems than from increased wage rates. In fact, wage rates had increased by only 67-68 per cent compared with October, 1938. The reduction of working hours in many industries and the introduction of the 44-hour week have undoubtedly led to increased overtime throughout industry. The actual average of hours worked in April was 45.3, compared with 46.5 in October, 1938.

The survey reveals the disparity between men's and women's earnings and between earnings in various industries. The average for men was 134s., compared with 72s. 11d. for women, although the women's earnings had increased by 124 per cent over 1938, while the men's had gone up by only 94 per cent. The same relationship is shown between youths' and girls' earnings. The most highly paid sections are found, as might be expected, in the metal, engineering and shipbuilding groups, in iron and steel and in transport other than railways. Thus the average was 151s. 7d. in steel smelting and rolling, 138s. 3d. in motor manufacture, and 140s. 11d. in shipbuilding and repair. In the trades which employ mainly women and the traditional Trade Board occupations, the average ranges from 70s. to 90s. The textile group shows a bigger increase over 1938 than any other single industry covered by the survey (144 per cent), but its earnings are still relatively low in the scale. The average in cotton was 96s. 6d. (81s. 10d. for women), and in the woollen and worsted industry 94s. 3d., with only 72s. 1d. for women.

* * *

Faroes Leave Sterling

The Faroe Islands have left the sterling area. An announcement amending previous notices issued under the Defence Regulations states that as from November 10, 1948, these islands were placed outside the "scheduled territories." It follows that the Faroese kroner is now included in the list of specified currencies which must be offered for sale to the Bank of England. Henceforth, payments with the Faroe Islands will be made through the same machinery as that which applies to Danish accounts with which Faroese accounts will now be merged. Payments arrangements with Denmark are on a bilateral basis, but tempered with administrative transferability which has in the recent past been operated in a very liberal manner (though there is no automatic transferability of Danish sterling as was stated in *The Economist* last week). The Faroe Islands have always been somewhat exotic and transient members of the sterling area. Their admission dates back to the war years when the islands were occupied by British forces. This membership has become increasingly incompatible with the political and economic ties between the Islands and Denmark, itself a non-member of the area. The latest development is an adjustment to these political realities and has no greater economic significance than this.

* * *

Record Sugar Crop

If current prospects materialise, world sugar production in 1948-49 will reach the highest figure ever recorded, 30,200,000 tons, and it will be over a million tons above its 1937-38 level. Beet production in Europe has made a remarkable recovery compared with last year, but at 6,400,000 tons it will still be 800,000 tons below its prewar level. Nevertheless, practically all the countries of Western Europe, except Germany and Austria, have regained their prewar output, and some of them, including the United Kingdom, are well above it. World output of cane sugar is estimated at 19,800,000 tons, compared with 18,900,000 tons a year ago and 18,000,000 tons before the war. And this expansion has taken place despite a smaller crop in Cuba, whose production this season is expected to total only 5,400,000 tons, and owing to adverse weather conditions, even that may be an optimistic estimate.

The most welcome feature for Britain has been the sharp expansion in output in Commonwealth countries. This totalled some 2,800,000 tons in 1937-38. All areas, with the exception of British Guiana and Fiji, have a larger output than before the war. Estimates of world production by major producers for the current season, compiled by Messrs. C. Czarnikow Ltd., are reproduced in this week's issue of the *Records and Statistics* Supplement.

The prospect of a large sugar crop has naturally tended to reduce the world price, and new crop shipments are being offered at around 22s. a cwt.; current shipments, however, are almost 2s. a cwt. dearer. Britain is reported to have bought the exportable surplus from San Domingo, and it will no doubt also buy a large consignment from Cuba. Under Marshall aid, Britain has been allocated $25 million for this purpose, but this sum would provide only 250,000 tons of sugar, and Britain will

THE

'BANK-INSURANCE' GROUP OF TRUSTS

British banks and insurance companies conform to the Three Golden Rules for investors: ONE — They provide essential services to trade and industry. TWO — They are managed with skill and prudence. THREE — They allocate a large part of profits to reserves.

A most convenient and economical method of obtaining a freely marketable investment in these high-grade equities is by a purchase of Units in the 'Bank-Insurance' Group of Trusts. Apply through any Stockbroker or Bank for leaflets, prices and dividend rates.

Bank-Units. *A spread over shares of 36 British, Dominion and Colonial banks and 9 discount companies.*
Offer price, 11 Nov. 22/4½. Yield £3.5.11%†*
Insurance-Units. *A spread over shares of 30 British Insurance companies.*
Offer price, 11 Nov. 22/10½. Yield £3.4.5%†
Bank-Insurance Units. *A spread over shares of 50 British, Dominion and Colonial banks and British insurance companies.*
Offer price, 11 Nov. 22/7½. Yield £3.4.2%†*
**Subject to reduced rate of tax, allowing for D.I.T. relief.*
† The yield is conservatively calculated on net cost which includes commission and 2% Government Stamp Duty.

(Incorporated in England under the Companies Acts, 1862 to 1900.)

MANUFACTURERS OF TRADE RECORD MARK TOOLS

CAPITAL

Authorised £100,000 in 400,000 Ordinary Shares of 5s. each . . Issued & fully paid £100,000

There are no Mortgages, Debentures or Loan Capital outstanding.

The List of Applications will open and close on Friday, 19th November, 1948

for an

OFFER FOR SALE

of

200,000 Ordinary Shares of 5s. each at 32s. 6d. per Share

The Offer for Sale shows (inter alia) that :—

1. The business of C. & J. Hampton was established in 1898 and the Company is today one of the largest manufacturers in the United Kingdom of hand tools which are marketed under the well-known "RECORD" trade mark. The Company's principal products are bench vices, pipe tools and bolt clippers for engineers, and metal planes, cramps and vices for woodworking craftsmen.
2. Throughout its existence the Company has made continuous progress and has never failed to make a profit in any year. The demand for "RECORD" tools far exceeds the present capacity of the works and orders on hand, which include a large percentage for export, are equivalent to approximately 18 months' output.
3. The Directors are confident that subject to unforeseen circumstances, the Company will be able to maintain at least the same rate of dividend as that paid for the year ended 30th June, 1948, viz., 45 per cent.
4. Profit for the year ended 30th June, 1948, amounted to £153,707 before taxation. Calculated on the most conservative basis the earnings yield at the offer price based on the profit for that year would have been £18 10s. 1d. per cent. The dividend of 45 per cent. required £45,000 to cover which there would have been available £131,586 after deduction of Profits Tax at the appropriate rates. At the offer price a dividend of 45 per cent. represents a yield of £6 18s. 5d. per cent.

Copies of the full Offer for Sale, on the terms of which alone applications will be considered, and Forms of Application will be obtainable after 12 noon on Monday, 15th November, from :—

BANKERS:

6, Old Jewry, London, E.C.2

probably need up to a million tons from Cuba. In general, purchases from dollar sources will tend to be limited, particularly as European production is again expanding. Yet, as producer stocks are believed to be low, the sugar market should be able to absorb the larger world output without any undue difficulty. This expansion in production, however, will undoubtedly raise again the question of a new sugar agreement at next year's meeting of the International Sugar Council.

* * *

Jute Allocations Cut

The scheme to reduce the consumption of jute which was introduced in Dundee at the beginning of November provided for an all-round reduction of between 25 to 30 per cent according to the types produced. This curtailment has been a serious blow for Dundee, for the jute industry was again beginning to get into its stride and even attracting new labour. But it was clear that shipments of raw jute from either Chittagong or Calcutta could not be relied upon to keep the industry going, while stocks in this country had fallen to about four months' supply. More recently, however, the Indian Government has lifted its ban on exports from Calcutta for November and December, but the United Kingdom will receive only 50,000 bales, compared with a normal weekly consumption of 11,500 bales. This quantity is therefore too small to cause the reduction in consumption to be rescinded.

The important question is how much jute the Indian Government will allocate to Britain during the second half of the season beginning in January. Last season Britain received 106,000 bales, against a consumption of nearly 300,000 bales for the six months. If the curtailment continues, consumption this season is likely to be 200,000 bales for the six months. The Pakistan Government has allocated to Britain 207,000 bales for shipment up to December, but the difficulties encountered at Chittagong have delayed most of these supplies. If Britain is given a similar quantity for the second half of the season, provided there is no hold-up in shipment, arrivals would be adequate to cover the normal level of consumption. In these circumstances, however, it would seem more prudent first to build up stocks in this country to a healthier level before expanding consumption again.

The Pakistan Government has recently decided to treat the United Kingdom as a hard currency country, so that larger shipments ought to be forthcoming. Indeed, they would be, were it physically possible to move the raw jute through Chittagong. These difficulties, however, are likely to endure unless the Indian Government allows the unrestricted shipment of Pakistan jute through Calcutta.

* * *

Dearer U.S. Lead and Zinc

American prices for both lead and zinc have again risen. Zinc is ½ cent dearer at 15½ cents a lb. (equivalent to £86 a ton), while the lead price has been raised by 2 cents to the record level of 21½ cents a lb.—equivalent to £119 10s. a ton—and is now only 2 cents a lb. cheaper than copper. The supply of lead—the scarcest of metals—has been even more restricted recently in the United States owing to strikes both there and in Mexico. Moreover, commercial consumption has been fully maintained, and is likely to be so long as industrial activity remains high. It was first thought that, owing to its scarcity, lead would not be included in the stockpiling programme. But now the US Government has intimated that purchases will have to be made during the coming year. And these can only be at the expense of commercial consumption. There is also an indication that the American copper price might rise to 25 cents a lb. or £139 a ton; the current British price is £140 a ton.

The British price of lead was raised at the beginning of October to £112 a ton and zinc to £92 a ton. The latter price is still above the American level so that no change need be expected here. But the lead price is now well below New York's quotation. Nevertheless, some 60 per cent of Britain's import requirements comes from Australia and Rhodesia and only 30 per cent from Canada and Mexico, with little or none from the United States. Deliveries in this country are based on a quarterly allocation scheme, so that any adjustment of the lead price is unlikely until the turn of the year. Even then it is not a certainty, unless contract prices to sterling area producers are also raised, or unless the Ministry of Supply decides to keep British prices in line with world replacement costs. One thing, however, is certain. Consumption is about 5 per cent above last year's level, and imports some 20 per cent below; stocks in Britain have accordingly declined quite sharply, and at the end of August amounted to only 26,000 tons against 40,000 tons at the beginning of the year.

The Savings Banks Bill

The second reading of the Savings Banks Bill, brief though it was, produced one or two points which deserve to be put on record. Mr Glenvil Hall confirmed the objectives of the Bill as those indicated in these columns last week, and gave details of the new financial arrangement between the National Debt Commissioners and the banks. It is commonly supposed that the rate of interest allowed by the Commissioners on the fund, now exceeding £600 million, which the banks invest with it bears some relationship to the rate the Commissioners themselves earn on their investments in Government stocks. This is not so. Under the Act of 1920, as Mr Hall explained, the Treasury fixes the rate, within the limits of £2 15s. and £2 17s. 6d. per cent; and, in fact, the rate paid throughout has been unchanged at the maximum of £2 17s. 6d. Compared with the appreciably higher yields which have at times been obtainable on Government securities, this may appear a modest payment; but as the banks have consistently paid ⅜ per cent less on their ordinary deposits (i.e., 2½ per cent), it has sufficed to enable some of them to earn substantial surpluses. Even after allowing for the smaller surpluses of others and the deficiencies of some, the movement as a whole has been able to show a comfortable margin beyond its management expenses.

The Treasury, evidently with an eye upon the diminishing margin earned by the National Debt Commissioners (a margin which would assuredly have turned from positive to negative if Dr Dalton's dreams had been fulfilled), therefore decided that the allowance to the banks should be reduced to £2 16s. per cent. This will cut the banks' gross margin over their allowance to depositors by one-fifth—a squeeze which can be exerted without either hindering the development programme of the banks or threatening a reduction in their deposit allowances only if the surpluses which will still accrue to the strong banks are made available to support their weaker brethren. Herein, as last week's note hinted, lies the real purpose of the Bill. It is a perfectly legitimate purpose, given the fact that the Consolidated Fund already guarantees both capital and interest due to depositors, and given, too, the Treasury's determination that the 2½ per cent allowance shall be maintained. "The present terms upon which any moneys are deposited and accepted," declared Mr Hall, "will continue, and there is no intention whatever of changing them."

Equally, there is no intention of opening the door to the large depositor. The clause which empowers the Treasury to limit deposits from any one individual in the special investment department is designed merely to remove doubt that powers in the ordinary department extend also to the special department. The present limit of £500 is under review, but there is no intention to withdraw the limit altogether. Incidentally, it deserves to be noted that, at least for the time being, the distinction between the two departments has lost most of its former significance. Deposits received in the ordinary branch are automatically invested with the Commissioners; the other deposits may, with the consent of the Commissioners, be invested directly by the banks in approved securities. Formerly, an important avenue for such direct investment was in loans to local authorities, enabling the banks at times to pay appreciably more than 2½ per cent on the deposits received "for special investment." This channel, however, was closed by the centralisation of local authority borrowing through the Exchequer, so that now there is hardly any practical difference between deposits in the two branches—except that those in the special department, though equally receiving only the basic 2½ per cent, are withdrawable only at notice.

Prospectus Profits Requirements

In their recently issued memorandum prepared in conjunction with the Institute of Chartered Accountants and the Society of Incorporated Accountants and Auditors, the Share and Loan Department of the Stock Exchange has moved one step forward from the Companies Act, 1947. Neither the Act nor Appendix 34 to the rules of the Stock Exchange gives precise guidance on the method of showing the ten-year profit record required in a prospectus. Appendix 34 to the rules makes it incumbent on either the auditor or accountant of a company to report on the profits or losses for each of the past ten years of its existence, but nothing has been laid down about the form of reporting. In future, a written statement will be required by the Share and Loan Department; its memorandum lays down both the form of this statement and the information to be inserted.

Section A of this pro forma statement must show all items which would be separately distinguished in the profit and loss account under the provisions of the Companies Act, 1948. It is clear from the wording of the memorandum that the Stock Exchange is particularly anxious to ensure information about directors' fees; non-cash benefits, however, need not be revealed. Distinctions must also be made between depreciation provided out of taxed profits and that for which taxation allowances have been granted. Interest on debentures must be separated from that payable on other fixed loans, while any material revenue items dealt with outside the profit and loss account must be shown. Section B provides an important additional safeguard; details of any adjustments made to a company's accounts which are shown in the report of the auditors or accountants must be submitted with the prospectus application. Another requirement ensures that in the case of a holding company not presenting consolidated accounts the information pertaining to separate companies in the group is presented in summary form. These are useful supplements to Appendix 34. They suggest that the Stock Exchange is maintaining its modern tradition of keeping ahead of the law in the matter of new issue requirements—despite the advance recently made by the law.

SECURITY PRICES AND YIELDS

A fuller list containing 371 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Thos. W. Ward, Standard Motor.

Ready to look and to buy— the under 35's

Today's generation of under 35's is unique. These young veterans of the war years are old in experience yet still immature as consumers. Now, as a buyer's market returns, they are finding their first opportunity to form selective buying habits. Their tastes are unformed—they want news of worth-while products. The preferences they form now may last for life—and they have the longest buying lives ahead. Are you telling this vital third of our adult population about your product? The Daily Mirror is read by a million more men and women aged under 35 than any other daily paper. Advertisement space in the Daily Mirror carries your sales story to the generation which is only now learning the art of buying.

1,130,000 more adult readers under 35 than any other national daily paper (vide independent Hulton Survey)

Cost of advertisement space (per column inch per thousand readers) lower than any other national daily

FINANCIAL NEWS LIMITED

SUCCESS OF PUBLICATIONS

MR. BRENDAN BRACKEN'S SPEECH

The fifty-first ordinary general meeting of The Financial News, Limited, was held, on the 9th instant, at Winchester House, Old Broad Street, London, E.C., The Rt. Hon. Brendan Bracken, M.P. (chairman of the company), presiding.

The secretary (Mr A. E. Knock) having read the notice convening the meeting and the report of the auditors,

The chairman said: Despite the increase in production costs during the past financial year we have earned satisfactory profits. You will observe that no less than 52 per cent. of our earnings go to the tax gatherer.

The Chancellor of the Exchequer is given to sermonising industry on the necessity for ploughing back profits. It is difficult to reconcile his gratuitous advice with the Government's action in taking away more than 50 per cent. of the profits of companies. They are told to plough back what remains of their profits after the Chancellor scatters the biggest part.

THE FINANCIAL TIMES

As this company is the principal proprietor of *The Financial Times* you may like a report on the progress of that newspaper. It is now reaping the reward of years of strenuous efforts to increase the services it offers to readers. Great are the benefits that came from those efforts. Today *The Financial Times* is much more than a financial newspaper. Industrialists and traders now regard it as an essential paper. And it is read by many who are more interested in public affairs than in the technicalities of finance or industry.

The editorial staff of *The Financial Times* deserve praise for this remarkable achievement. Their colleagues on the management side have been no less enterprising. They are providing good profits for shareholders.

OTHER NEWSPAPER INTERESTS

The other newspapers which this company owns are no less rewarding to shareholders.

The Investors' Chronicle: The Investors' Chronicle is a rare blend of wisdom and liveliness. Shareholders have good reason to be pleased by its earnings.

The Practitioner: Twenty years have gone round since we purchased this great medical newspaper. Monotonous but very pleasant is its record of increasing circulation and profits.

The Banker: This paper is a credit to financial journalism. Its influence extends far beyond its necessarily restricted readership. It continues to earn a good dividend on a modest capital.

The Economist: In 1928 we acquired half of the ordinary share capital of this famous paper. Though we have benefited by the growth of its circulation and revenues, we must also acknowledge a greater debt to *The Economist*. It has provided us with the present editor of *The Financial Times*, Mr Hargreaves Parkinson, and other journalists who have played a great part in our affairs.

Printing interests: We are busily developing our printing interests. The St. Clements Press retains its leadership among City printers. W. Speaight and Sons is making satisfactory progress although handicapped by delays in the delivery of new plant. That company has handled a large quantity of printing work for the George Newnes Group who are partners with us in this company.

THE BALANCE SHEET

There are no significant changes in the balance sheet of The Financial News Limited. You will notice that our various reserves, including profit and loss account, are three times as large as our ordinary capital. Our investments are conservatively valued. All stand in our books at far below their value. Were it not for the singularly foolish bonus tax, your directors would bring the issued capital more in line with true asset values.

General Dawnay: Though I was a staunch Parliamentary supporter of the most of what is called the "Cohen" Act, I objected strongly to the provision that discouraged men who passed their seventieth birthday from acting as directors of public companies. Age is not always a good test of wisdom, endurance and enterprise. Those qualities will never be lacking in General Dawnay. Many were the responsibilities thrust upon him during the war. One of the most arduous was the chairmanship of this company. From my experience as his predecessor and successor I can claim some right to speak of his masterly handling of our affairs in years abounding in problems. He was the delight and ever-present helper of our depleted wartime staff. To his guiding hand we mainly owe the successful amalgamation of *The Financial Times* and *The Financial News*. Long may he continue to serve on this board!

The report and accounts were unanimously adopted and a final dividend of 35 per cent., less income tax, making 60 per cent. for the year on the ordinary shares, was approved.

The retiring director, Major-General Guy P. Dawnay, C.B., C.M.G., D.S.O., M.V.O., was re-elected; and the remuneration of the auditors, Messrs Price, Waterhouse and Company, having been fixed, the proceedings terminated with a vote of thanks to the chairman and directors.

BRAZILIAN WARRANT COMPANY, LIMITED

A DIFFICULT YEAR

The annual general meeting of the Brazilian Warrant Company, Limited, was held in London on the 9th instant, Mr A. K. Graham, the chairman, presiding.

The following is an extract from his circulated statement for the year 1947:

The year under review has been a very difficult one largely owing to the problem of exchanges and the inevitable rules and regulations imposed by the various Governments to enable them to create buying power in those countries that have and can supply their particular requirements and as aids to the solution of trade balances which, insofar as they require unrequited exports, are by no means the least difficult of the problems that will have to be solved before a free exchange of commodities can be hoped for throughout the world.

Some contraction in business was compensated for by the dividends declared and remitted by the Brazilian subsidiaries up to the limit permissible under the Brazilian regulations but still leaving substantial balances in their accounts to go forward to the current year. Out of the net earnings of the group of £186,999 there has been paid away or reserved for taxation £134,379 or 79 per cent., leaving available for dividend and carry-forward £36,981 or 21 per cent.

In the United States of America, after a dull period while surplus stocks were being absorbed, the market improved and our sales for the year were up to average. The demand for coffee in Europe is as great as ever. Our Santos warehouse business showed considerable activity. Perhaps the most interesting feature of the year has been the volume of Brazil's import and export trade, which must constitute a record at 44 million contos or approximately £585,000,000.

The report was adopted.

DALGETY AND COMPANY

A PROSPEROUS YEAR

The sixty-fourth annual general meeting of Dalgety and Company, Limited, will be held in London on the 2nd proximo.

The following is an extract from the review of the chairman (Mr D. Abel Smith), circulated with the report and accounts:—

I am pleased to report that the operations of the company for the year ended June 30, 1948, have been satisfactory. In all the countries in which we are engaged the company has enjoyed a prosperous year, and present indications point to another good season, but it is at all times dangerous to attempt to forecast the future, and doubly so with world affairs in the condition in which they are today. In these circumstances, it is obviously a wise policy to take advantage of a good year to build up our financial resources, and the balance sheet which you have before you bears out this prudent course of action.

OUTSTANDING WOOL RESULTS

Dealing now with wool, your company's main business, the results have been outstanding and far exceeded those for the previous season, which were exceptional. Values rose to new high levels, and wool growers in both Australia and New Zealand have reason to congratulate themselves on a record season from a financial point of view. It is gratifying also to report that Australian production has shown further recovery, and while the New Zealand clip did not quite reach last season's figures, the decline was comparatively small.

The company's own sales of wool were well maintained and, in fact, showed a satisfactory increase, taking into account additional wools handled in London. It is hardly necessary to add that the excellent results of the past season are fully reflected in our wool earnings.

MARKET OUTLOOK

It would be manifestly unwise to express any very definite opinion on the future course of the market—so much depends on events in the political field. Given reasonably stable world conditions one would expect a continuance of the present good demand, especially of the finer merinos which are in relatively short supply, production of these having seriously declined during recent years. Sooner or later, however, the price factor must operate and, while there still appears to be a shortage of wool textiles, particularly on this side of the world, the sellers' market is disappearing and, in addition to import restrictions in some countries, a good deal of sales resistance is being experienced both in the home and export markets to the current level of values. So far there is no evidence of any marked decline, and the new season's sales opened in Australia with a strong tone and some increase in prices for the better merino wools. Values fell subsequently, but the demand continues good, and recent sales have again shown a rising tendency.

In the profit and loss account you will observe that the profits for the year, after deducting expenses and provision for bad and doubtful debts, have risen to £1,005,056 compared with £789,786 for the previous year. We are recommending the payment of a final dividend of 5 per cent. on the ordinary shares, which, with the interim dividend of 3½ per cent. paid in May, represents a total distribution for the year at the rate of 8½ per cent. per annum. We are also recommending the payment of a bonus of 1 per cent. on the ordinary shares—the dividend and bonus distribution being similar to that of last year.

S. SCHNEIDERS AND SON, LIMITED

STRONG FINANCIAL POSITION

The thirteenth annual general meeting of this company was held, on the 5th instant, at Grosvenor House, London, W. Sir Harold Moore (chairman) presided.

The following is an extract from his statement circulated with the report and accounts:

Our capital and reserves amount to a total of £547,008 and our fixed assets only to £334,110, so there is a sum of £212,898 available as working capital. This is fully invested in current assets, and you will see that not only is our holding of manufacturing stocks greatly increased but we have also taken a substantial stake in a business manufacturing one of the products essential to our own production.

The volume of our trade during the year has been well maintained, and we are actively developing our export business. To further this, some of your directors and staff have, during the year, made visits to overseas territories.

The branded lines which we manufacture continue to be well received, and although in these days it would be unwise to attempt to predict what the future has in store for us, I can at least say that, so far as we can see, the results for the year now current will be entirely satisfactory.

During the year we have paid the dividend on the preference capital, absorbing a net sum of £6,187, and have distributed an interim dividend of 7½ per cent. to the ordinary shareholders amounting to £8,250. We now recommend a final dividend of 7½ per cent., making 15 per cent. for the year, absorbing a further £8,250. This will leave a sum of £22,287 to be carried forward.

The report and accounts were adopted.

At a subsequent extraordinary general meeting new articles of association were adopted.

ALLIED INDUSTRIAL SERVICES, LIMITED

HIGHER OUTPUT

The fourteenth annual ordinary general meeting of Allied Industrial Services, Limited, was held on the 5th instant at Bradford, Mr W. H. Rhodes, C.B.E. (chairman and managing director) presiding.

The following is an extract from his circulated review:—

The trading results show that the net profits for the year are materially the same as for 1947, and although output has been appreciably higher than in any previous year, increasing costs of operation by way of materials and wages have offset any benefits which might otherwise have accrued.

During the year we have again been able to install a certain amount of new machinery, and you will see by the note on the balance-sheet that expenditure of approximately £75,000 has been arranged to replace and augment existing buildings and plant.

After making proper provision for taxation, depreciation of the company's properties, plant, etc., and directors' remuneration, the net profit for the year (including dividends and transfer fees, etc. received) amounts to £127,904, and after bringing in the balance from last year, and an adjustment in respect of prior years, £167,658 is available for allocation. The directors have recommended the payment of a similar ordinary dividend to that paid during the last two years.

I wish to make a few remarks concerning the prospects. Earlier in my review I stated that materials are increasing in cost; they are also inadequate in quantity, and thus whilst every effort is again being made to increase our turnover, it is difficult to visualise how financial results can be quite as satisfactory as during the preceding year.

The report was adopted.

CONSOLIDATED MAIN REEF MINES AND ESTATE, LIMITED

(Incorporated in the Union of South Africa)

SHORTAGES AFFECT RESULTS

IMPORTANCE OF RESERVES

Mr W. M. FRAMES ON THE POSITION

The annual general meeting of Consolidated Main Reef Mines and Estate, Limited, was held in Johannesburg on the 9th instant.

Mr W. Frames, chairman, presided, and in moving the adoption of the report and accounts said operations had continued to be restricted by shortages of labour and materials. There had been, however, some improvement in the work accomplished both in stoping and in development. Ore milled compared with the previous year had decreased by 81,000 tons to 2,229,000 tons, which was considerably below the capacity of the plant. Working costs had increased by 1s. 7d. per ton milled but as the yield was higher by 0.227 dwt., equivalent to 1s. 11d. per ton milled, working profit for the year had risen by £27,012 to £272,383

PROFIT FOR THE YEAR

The profit carried to the appropriation account, after adding the difference of £4,414 between sundry items in the income and the expenditure account, was £276,797. There had been a withdrawal of £11,900 from the shareholders' contingency reserve and a credit on capital account of £15,102 representing the proceeds of freehold sold, less expenditure on equipment. Provisions in respect of silicosis outstanding liabilities had totalled £22,997 and provision for taxation had amounted to £2,833. There had been a refund of forfeited dividends of £11,904 and dividends had absorbed £249,520.

He would draw the attention of shareholders to certain alterations which had been made in the method of presenting the annual accounts. Those accounts, formally grouped under the heading of "Trade creditors, accrued liabilities, contingency and renewals and replacements reserves," were shown separately as shareholders' contingency reserve, creditors and provisions and abnormal costs reserve. To facilitate reference, comparative figures for the previous year were shown in the margins of the accounts.

FOOTAGE DEVELOPED

Compared with the previous year, footage developed at 97,086 feet had shown an increase of 6,890 feet. Although footage sampled had been 7,195 feet greater, that classed as payable had increased by only 365 feet. Payable ore developed amounting to 663,400 tons of an average value of 3.7 dwt. per ton had been 437,600 tons less than in the previous year, value being 0.1 dwt. per ton lower.

A few payable blocks of Main Reef Leader in the north-east corner of the property and of the Main Reef west of Bantjes Dyke had been developed, but in the lower levels results had been disappointing. Values on South Reef had been satisfactory in the north-western area. Development on Bird Reef had again disclosed appreciable tonnages of low-grade ore, mainly in the No. 10 shaft area. Kimberley Reef values had been generally poor, but development had not yet reached the area towards the eastern boundary where payable values had been intercepted in boreholes drilled from the surface.

ORE RESERVE

Available ore reserve had been recalculated as at June 30th, 1948 to be 4,199,000 tons averaging 3.7 dwt. over a stoping width of 55.2 inches. Compared with the previous year, that represented a decrease of 775,000 tons, the width being lower by 0.6 inch, and the value unaltered. Ore developed in recent years had been insufficient to replace ore mined from the payable reserve. The position had been further aggravated by the exclusion of marginal blocks which had been rendered unpayable by the increase in working costs. Prospects of an early improvement in the ore reserve were not good. The only undeveloped area of appreciable magnitude was towards the southern boundary where exploratory drives and winzes had not yet disclosed any considerable area of payable ore.

It was important that the existing ore reserve should be conserved as much as possible and in order to achieve that it might become necessary to reduce the percentage of ore mined from the reserve with the resultant lowering of the grade of ore sent to the mill. Shareholders would realise that the future of the mine depended, to a large extent, on the results of exploratory operations now being carried out from the lower levels towards the southern boundary of the property.

PRICE OF GOLD

The price of gold had remained unchanged throughout the year at 172s. 6d. per ounce fine. Fresh legislation had been enacted during the last session of Parliament, whereby alterations had been introduced in gold-mining taxation providing for a reduction in the formula tax, which was based on the ratio of profit to recovery, and for an increase in the redemption allowance in respect of capital expenditure to 27½ per cent. of the unredeemed balance at the end of each year. As the company did not at present incur any tax liability in respect of its gold-mining profits the changes did not affect it.

The report of proceedings at the meeting would be published in the press and shareholders could obtain copies from the head office in Johannesburg or from the London office.

The report and the accounts were adopted.

MODDERFONTEIN EAST, LIMITED

(Incorporated in the Union of South Africa)

LABOUR AND MATERIAL SHORTAGES

STRONG ORE RESERVES

MR P. H. ANDERSON'S SPEECH

The annual general meeting of Modderfontein East, Limited, was held in Johannesburg on the 9th instant.

Mr P. H. Anderson, chairman, presided and, in moving the adoption of the report and accounts, said that due largely to continued shortages of labour and materials, the mill was now operating at only 86 per cent. of its rated capacity. The yield per ton milled had decreased further by 0.136 dwt. to 2.8 dwt., and consequently revenue per ton milled had been lower by 1s. 2d.

Working costs remained unchanged at 18s. 7d. per ton milled, but working profit had decreased by £76,918 to £412,058 due to a lower yield. Total profit was £418,154. Provisions made in respect of silicosis outstanding liabilities had totalled £20,173, provision for taxation had accounted for £123,642, provision for lease consideration had amounted to £42,151 and dividends had absorbed £232,701.

FORM OF ACCOUNTS

Shareholders would have noticed that some alterations had been made in the form in which annual accounts were presented. That had been done with the object of giving shareholders a more easily comprehensible picture of the company's financial position.

In order to facilitate comparison, figures relating to the previous year were shown in the left-hand margin of the accounts.

Development accomplished during the year had totalled 12,107 feet an increase of 642 feet compared with the previous year's figure. The greater proportion of that development had been concentrated in the south-eastern corner of the mine. By the end of the current financial year, that area should be almost fully developed. Thereafter, the only remaining area of any promise lay in the most northerly portion of the property and even there prospects of opening up any material quantities of additional ore were not particularly encouraging. A certain amount of development had been done in that area during the past year but no payable ore had been disclosed.

That had not been entirely unexpected, as the area was known to have a low percentage payability and, in any case, operations had been directed more towards improving the ventilation and opening up the area than to proving the extension of payable patches of ore already exposed.

AN INTERESTING BOREHOLE

Over a number of years, prospecting by means of surface boreholes had been carried out on the neighbouring Holfontein property and on a portion of Farm Klipfontein number eleven lying between Holfontein and Modder East, commonly known as the "Klipfontein corridor." The results of those boreholes had been almost consistently disappointing, but one borehole was of particular interest. The borehole had been drilled some 1,800 feet from the point where the company's No. 11 drive reached the northern boundary of Modder East. The core assayed 10.25 dwt. over 16 inches, equivalent to 164 inch-dwt.

As that encouraged the hope that there existed a patch of payable ore in that portion of the "corridor," application for a lease of undermining rights in extent of approximately 735 claims had been submitted to the Mining Leases Board. Should application be granted, it was the intention to drive out on the 11th level to explore the area. He would warn shareholders, however, not to be too optimistic regarding developments in that direction as experience both at Modder East and other mines lying on the sub-outcrop of that portion of the Far East Rand basin had not been encouraging.

In addition, it should be borne in mind that the distance from the nearest main shaft, No. 2, would be an important factor in determining costs and, therefore, pay limit. Although prospects of opening up any material quantities of payable ore in that portion of the "Klipfontein corridor" were highly speculative and although progress would be slow while the shortage of labour persisted, it was, he thought, essential that the area should at least be explored by underground development.

PAYABLE ORE DEVELOPED

Payable ore developed during the year had totalled 486,000 tons which represented an increase of 1,000 tons over that opened up during the previous year, the value being the same, namely, 3.2 dwt. per ton.

At June 30, 1948, the available ore reserve had been estimated to be 4,555,000 tons, averaging 3.3 dwt. over a width of 43 inches. Compared with the estimate made a year previously, available ore reserve had decreased by 661,000 tons, the average value and stoping width being lower by 0.1 dwt. and 0.2 inch respectively.

NATURE OF ORE BODY

The nature of the ore body at Modder East was such that it was the practice to include in ore reserves only that ore which lay immediately ahead of the stope faces and only the narrow strip along payable exposures in reef drives, raises and winzes. The ore in that portion of the Rand was of a comparatively low grade and values were not persistent. It was not uncommon, therefore, to find stope faces becoming unpayable after a relatively small advance from the payable raise or from what had been previously a payable stope face.

The converse was also true. A conservative policy in regard to the estimation of ore reserves was consequently essential and while a whole block of developed ore might ultimately prove payable, it was the practice to include only the fringe of such blocks and await results of stoping to prove continuity of value. Should stoping operations prove continuity of value in a reef, then a further strip of ore in advance of the stope face was included when the annual re-estimation of reserves was made. In that way, ore was said to be developed by stoping. Only about 13½ per cent. of additions to reserves during the period had been derived directly from development operations the balance of additions being proved by stoping.

Thus, although the mine had now reached the stage where development operations were unlikely to open up any considerable quantities of additional ore for reserves, the quantity of ore remaining to be developed or proved by stoping operations was likely to be material.

FACTORS AFFECTING FUTURE

The latter would, however, show downward trend each year as blocks of ore already established became mined out. As the rate of mining from reserves was in excess of the rate of replacement of ore by development and stoping operations, shareholders must expect an annual decline in the quantity of the ore reserve. Reserves were, however, in a strong position, as it was estimated that the total reserve, including pillars but without making any allowance for the opening-up of further ore, amounted to 4,875,000 tons averaging 3.4 dwt.

In considering the future of the mine, another important factor was its ability to maintain its present position as the mine with the lowest working cost on the Witwatersrand. During the first nine months of 1948, working costs per ton milled had averaged 18s. 5d., which was an achievement of great credit to all concerned.

CHARGES IN TAXATION

During the recent session of Parliament, certain changes had been made in gold mining taxation with effect from January 1, 1948. There had been a downward adjustment on the tax formula with the result that given the same ratio of profit to recovery, the 1948 rate of tax was equivalent to 95.24 per cent. of that calculated under the 1947 formula. In addition, redemption allowance in respect of capital expenditure had been increased from 22½ per cent. to 27½ per cent. of the unredeemed balance at the end of each year.

Those alterations had been effected after the close of the financial year and there was therefore a credit adjustment of £6,458 to be made in respect of the amount provided in the accounts to meet taxation for the half-year ended June 30, 1948. Tax concessions were relatively small but were, nevertheless, welcome as further steps in the right direction. He would emphasise that notwithstanding that belief, the company was liable for mining taxation at an inordinately high level. On the revised basis the rate of taxation for the half-year ended June 30, 1948, was equivalent to no less than 7s. 8d. in the £. In addition, the company had to pay lease consideration in terms of its lease agreement with the Government.

A report of the proceedings at the meeting would be published in the press and shareholders could obtain copies on application to the secretaries in Johannesburg or London

The report and accounts were adopted.

NOTICES

ASSISTANT REGISTRAR OF STATISTICS, SINGAPORE

A vacancy exists in Singapore for an Assistant Registrar of Statistics. Applicants should possess an Economics degree (including Mathematics or Statistics) or a Bachelor of Commerce degree. Preference will be given to candidates with experience in statistical work. The duties of the post are to assist in the collection, collation and publication of Statistics and also in the analysis of statistics of trade, production, industry, prices, etc. Salary: $400 x $30—$900 per month (about £560—£1,260 per annum), plus cost of living and expatriation allowances amounting to a minimum combined total of $240 a month (£336 per annum) for a single man, $290 per month (£406 per annum) for a married man.

Point of entry on this scale would be according to qualifications and experience. Age limit 35, unless special qualifications and experience can be offered by an older candidate, aged between 35 and 45.—Write for application form, quoting this advertisement, to Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1, within two weeks of the appearance of this advertisement.

STOCKBROKERS of Moderate importance, but possessed of ample means and intending to expand, invite correspondence from fellow-members with connection or other sound attribute. Only those will be interested who believe in a scientific approach to the problems of our profession and who find in present difficulties the urge to improve their standard of efficiency in the interest of the investment clientele.—Write, Box 814, Reynell's, 44, Chancery Lane, W.C.2.

ABLE YOUNG MAN, economics, industrial and public relations, current affairs, negotiation, exceptional executive qualifications, seeks contact suitable firm or organisation.—Box 879.

SALES MANAGER, able to formulate tailor-made policy and carry it out; fully up to date on advertising, sales promotion, marketing; first-class education, war record, references; seeks change at four-figure level.—Box 877.

STATEMENT

An unfortunate mistake in Professor Ian Bowen's Book BRITAIN'S INDUSTRIAL SURVIVAL indicated that the prices of the Cold Rolled Brass and Copper Association were raised by 1s. 4d per lb. in 1937, when, in fact, they were reduced by 3d. per lb and the context where this statement was printed constituted an adverse reflection on the policy of the Association.

Professor Bowen is anxious to correct this misstatement and to apologise to the Association for the imputation. The book has been withdrawn and will be issued again with this passage amended.

(signed) IAN BOWEN, 10.10.48.

Witness: M. B. LAMACRAFT, Solicitor.

LATE IMPERIAL SERVICE OFFICER with excellent record (39), Public School, at present holding responsible executive post in Government department, desires permanent position in London area carrying responsibility and affording opportunities for the exercise of energy, keenness and initiative; has had considerable experience of buying, large-scale administration, contact and liaison work and handling men, and has studied the supply and distribution sides of the food system.—Box 881.

SENIOR ECONOMIST, good school and university education, some business experience, journalistic experience or drafting ability. Market survey and allied work.—Write, stating salary required, to O. W. Roskill, Industrial Consultants, 14 Great College Street, London, S.W.1.

SINGLE, Urdu speaking, English ex-Public School/Indian Army Staff Officer (25), requires early employment India (Calcutta)/Burma. Box 886.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

Statistical Summary

GOVERNMENT RETURNS

For the week ended November 6, 1948, total ordinary revenue was £81,520,000, against ordinary expenditure of £50,353,000 and issues to sinking funds £1,070,000. Thus, including sinking fund allocations of £10,513,000, the surplus accrued since April 1st is £272,167,584 against £243,474,548 for the corresponding period a year ago.

UNIVERSITY OF CAMBRIDGE

The Faculty Board of Economics and Politics give notice that they intend to appoint a Faculty Assistant Lecturer in Statistics. The appointment will be for three years in the first instance, and will be subject to the Statutes and Ordinances of the University. Further particulars can be obtained from the Secretary to the Board, the Marshall Library, Downing Street, to whom applications should be sent so as to reach him not later than December 1, 1948. Four copies of the application should be sent, and should consist of a statement of the qualifications of the candidate for the appointment; testimonials should not be sent, but the names of not more than two persons to whom reference can be made may be given.

UNIVERSITY OF MELBOURNE

Applications are invited for the position of PROFESSOR OF POLITICAL SCIENCE. Salary £1,500 (Australian), plus £90 cost of living allowance per annum, subject to superannuation contributions.

Further particulars and information as to method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 32 Woburn Square, London, W.C.1. Closing date for the receipt of applications is January 1, 1949.

DEVELOPMENT DIRECTOR.—An important Company with rapidly expanding interests in fine chemical manufacture proposes to appoint a Director with full responsibility for chemical process development. Wide experience essential, together with proved capacity economically to develop pilot plant and full-scale production facilities from research laboratory results. Salary will be commensurate with the substantial responsibility involved and appropriate to the ability and experience required. Age preferably not exceeding 55. All applications will be treated as strictly confidential.—Box 874.

COMMERCIAL, industrial or legal-secretarial post sought by young lady, aged 28, just finished at University, B.Com. degree, 3 years' industrial experience, 5 years' medical administrative experience. Only responsible work considered. Knowledge of shorthand and typing, but prefers to restrict its use to essential minimum. Referees, personal, academic, and covering whole period of former employment, have undertaken to answer inquiries. Any part of country, or abroad considered. Salary £400-£500.—Reply, Box 869.

FOR SALE: ECONOMIST, January, 1917-July, 1948; ECONOMICA, Feb., 1945-May, 1948; Econ. Jour. June, 1915-March, 1948. Offers to Box 867.

UNIVERSITY OF LONDON

THE CREIGHTON LECTURE, entitled "The Cycle of War and Peace in Modern History," will be given by Dr. G. N. Clark (Provost of Oriel College, Oxford) at 5.30 p.m. on November 15th at University of London: Senate House (entrance from Russell Square or Malet Street, W.C.1). The Chair will be taken by the Vice-Chancellor of the University (Professor L. M. Penson).

ADMISSION FREE, WITHOUT TICKET.
JAMES HENDERSON, Academic Registrar.

UNIVERSITY OF THE WITWATERSRAND, JOHANNESBURG, SOUTH AFRICA

Applications are invited for a SENIOR LECTURER IN COMMERCE. A knowledge of accounting would be desirable and business or teaching experience would be a strong recommendation.

Salary Scale, £800 x £25—£1,000, plus temporary cost of living allowance, which at present is £75 per annum in the case of a married man and £16 16s. in the case of a single officer. A higher initial salary may be paid on the grounds of special qualifications and experience.

Further particulars and information as to method of application can be obtained from the Secretary, Association of Universities of the British Commonwealth, 32 Woburn Square, London, W.C.1. The closing date for receipt of applications is December 1, 1948.

EDUCATED WOMEN, under 25 years of age, are required for posts as investigators in the Market Research Department of a large Company. The minimum educational standard is Higher School Certificate and preference is given to University Graduates, especially in statistics, mathematics, economics, modern languages, and the social sciences. Good health and the ability to make contacts easily with all kinds of people, are essential. Ability to drive a car is an advantage. On appointment investigators undergo a training period of four to eight months at the Company's Head Office in the North of England, and are subsequently expected to reside in London, but to be prepared to travel extensively in Great Britain. Replies to this advertisement should give very full personal details and be addressed to Box 880.

A YOUNG EXECUTIVE, aged 31 and married, with a good legal qualification and managerial experience, is looking for a job with a firm of repute. He is willing to work (and work hard) either at home or abroad. He has a successful post-war record in commerce—principally in organisation, selling and publicity, and staff relations—is able to negotiate successfully and to think logically. He has read Economics to degree standard and has travelled extensively abroad. He is accustomed to earn £1,200 a year; would accept less to begin with; but aims to reach a higher figure in due course. Replies, which should be addressed to Box 875, will be treated in strictest confidence.

COMPANY director, age 35, fully experienced in sole management of small food manufacturing Company, desires change of occupation. Experienced at all stages of production, including office management and secretarial department. Residence abroad is no deterrent. Salary, £1,200 to commence.—Box 858.

Second Reading

THE task of the Government speakers in the second reading debate on the Iron and Steel Bill, which has occupied three days in the House of Commons this week, was to convince the country that the scheme to nationalise the steel industry is both necessary and urgent. There is a large body of opinion still honestly perplexed, conscious that the existing organisation of the steel industry is not perfect, doubtful of the remedy proposed, but willing to be convinced by the force of argument. The Minister of Supply accepted the task in his opening sentences

> We are confident that, whatever public opinion may be before this Bill was published, as over the coming months the debate inside and outside of the House proceeds, so the great majority of the people will share the Government's view that, if our country is to prosper and our people to live a higher and a better standard of life, this Bill is essential. We base this belief, not on dogma or abstract theories but on the known facts and the conclusions to which they inevitably lead.

It was a brave beginning. But unfortunately neither Mr Strauss himself nor any of his colleagues lived up to it. There were, indeed, plenty of arguments, but every one of them, on close examination, turns out to be based, not on "known facts" but on assertions and assumptions that only convinced Socialists would accept. It may be that there is a wholly realistic, wholly factual, wholly non-ideological case for the public ownership of the iron and steel industry. But if so, it evidently escapes Ministers fully as much as the general public. Even those who have been most reluctant to believe that Ministers of the Crown would so far forget their responsibility as to monkey with a major industry for reasons of mere internal party manoeuvrings are now compelled to agree with Mr Churchill when he calls the Bill "a feature in party tactics intended to keep the Socialist left wing as far as possible in order, and the Government as long as possible in office."

The central issue round which any realistic argument ought to revolve is a very simple one indeed. Will the proposals of the Bill make the steel industry a better industry than it would otherwise be? And the definition of a "better" steel industry, in its turn, is a simple matter. Now and for the next year or two, the best steel industry would be that which produces the greatest quantity of steel. In the longer run, the best steel industry would be that which produces steel of good quality at the lowest cost. In the short run, the test is quantity; in the long run, cost. Beside these simple tests, nothing else matters very much. Yet it is astonishing how very little of their speeches Ministers addressed to these central issues. On the question of timing, Mr Strauss limited himself to the single remarkable—and wholly unsubstantiated—assertion that "the transfer of ownership . . . will plainly be less disturbing if it takes place now, when trade is good, than in a period of trade depression." But when Sir Andrew Duncan, on the third day, asserted that the Bill would endanger the industry's development plan, nobody contradicted him—indeed, nobody is in a position to do so. As for the effect of the Bill on costs of production, though he recognised the importance of

cheapness, the Minister did not even attempt to prove that nationalised steel would be any cheaper than private enterprise steel. Indeed, one part of his argument made it apparent—though he did not appear to realise it himself—that the opposite would be true. This was when he was arguing that, in deciding how much capacity the industry must have, "we cannot, we dare not, be as conservative and cautious as the steel industry has been and is bound to be." It is not clear that this is in fact the case, since Sir Andrew Duncan was again unchallenged when he asserted that there is no difference of view between the industry and the Government on the capacity to be aimed at. But if it is true that a nationalised steel industry would have larger capacity, relatively to the average demand, than the private industry would provide, then it must follow that its costs would be higher, since additional capacity is not costless—certainly not if it is provided today. Nor did Mr Strauss realise what nonsense this promise of greater capacity made of his statement that the nationalised industry "will offer greater security to those who work in it." The larger the capacity relatively to average demand, the larger over the years will be the average unemployment. It is the inability, or unwillingness, of Socialist Ministers to grasp simple logical propositions like this that creates such profound distrust in their general claims to be able to manage industry better than the industrialists.

*

If, then, they virtually ignored the simple main issue that the Bill raises—on which the public, if it is wise, will base its judgment—what were the subsidiary arguments which, in Ministers' own minds, seemed to justify such a gigantic undertaking? There were, of course, a great many hard words about the organisation and policies of the industry in the decade before the war. Many of those criticisms are most fully justified. But why do Ministers assume—it was an assumption, there was no attempt to argue it—that the structure they propose would be better? Most of the prewar critics of the steel industry attacked it because there was too much central organisation, not too little; because there was too little competition, not too much. On the face of things, the Bill would seem to be accepting all the main defects of the prewar industry and making them worse. Why do not Ministers deal with a point like this? Is it because they do not really care whether their arguments make sense or not?

Apart from criticisms of the past—and apart also from such distinct matters as the terms of compensation, with which Sir John Anderson dealt most forcefully—the ideas in Ministers' speeches consisted of a number of variations on two main themes. The first can be called the power theme. The Bill, said Mr Strauss, "transfers to Parliament and the community that power to dominate the economic life of this country which now resides with the steelmasters in Steel House"; "we have to decide," echoed Sir Stafford Cripps, "whether such a large measure of industrial control by private interests is consistent with present day democratic government." It can be asserted—justly in the opinion of this journal—that "the steelmasters of Steel House" mismanaged their industry before the war. But the charge goes far beyond the confines of the steel industry; it is that they exerted a baleful influence on the economic life and political sovereignty of the whole British democracy. This is the sort of bogy that constantly recurs in Socialist speeches. But it is difficult to recall that a single piece of evidence has ever been offered to substantiate it. When did the "masters" of the steel or any other industry in this country step outside the boundaries of their own concerns and deliberately exercise an improper influence on public affairs? Trade unions do so regularly, and perhaps, if there is anything at all in the argument, they ought to be the first to be brought to heel. But if far-reaching statutes are to be based on the allegation that there is some danger to democratic sovereignty, surely one or two pieces of evidence should be produced. It is really remarkable to what extent the Socialists allow themselves to be carried away by this myth of their own invention. Listen, for example, to Sir Stafford Cripps:—

> Is there some peculiar right in the owner of this class of property to have his property preserved and with it the power of control over the industrial life of the whole country? I answer that question without any hesitation by saying that, this challenge having been put forward by private interests, it is essential that democracy should assert its rights, as otherwise it must acknowledge for all time that it cannot touch these citadels of power, and that it is not the electorate but the owners of industrial property who shall determine the economic policies of the country.

If one interrupts the flow of eloquence to inquire when the private steel industry has "challenged" "democracy," the only answer that emerges from Sir Stafford's rhetoric is that it has done so merely by existing. And if one ventures to protest that what is now at issue is not the right or the power of Parliament to do anything it wants to the steel industry—nobody has "challenged" that—but the wisdom of the particular measures now proposed, no answer at all emerges. Sir Stafford Cripps is a high-minded and clear-headed man, who in the past twelve months has deserved well of the nation. It is a pitiful sight to see him stooping to demagogy.

The second main theme is what may be called the planning theme. "In our view" said Mr Strauss "it would be madness for the Government . . . to perpetuate in this basic industry a system in which serious clashes on matters of major policy between private and public interests are bound sooner or later to arise." It will be noticed that Mr Strauss was careful not to say that any disagreements on policy had in fact arisen between the Government and the industry. Sir Andrew Duncan asserted, without correction, that they had not. But even if the likelihood of such clashes is accepted, does it necessarily follow that the state must always be right and the industry wrong? This is another assumption that Socialists always take for granted. Most conflicts on matters of economic policy are of one of two kinds. They may be disagreements over the distribution of wealth, as between consumers and producers, or between employers and workers. In these disputes, the common interest must indeed be paramount; but it is far from apparent that a government department is always the best judge of the public's interest. Wherever possible, the public should be allowed to state its own interest by exercising freedom of choice—which is an argument for less control and monopoly, not for more. The second type of disagreement arises out of different guesses about the future. Can it really be held that Ministers are better guessers than business men? They are, in most cases, personally less well qualified; they are far more subject to pressure from the fashion of the moment; and they have far less to lose by being wrong.

The state is poorly equipped to run detailed business affairs. There are, indeed, certain things it must do, since nobody else can. It must concern itself with the general economic climate of the country, whether it is inflationary or deflationary; it must wield the powerful economic weapon of taxation; it must supervise the balance of payments; it must aim at a balance between thrift and capital creation. These things it must do—or so the great majority of people in the twentieth century would hold—but it has not yet learned how to do them very well, and it would be well advised to hold itself as far apart as it can from detailed decisions in specific industries. When it comes to the question of running the steel industry, it is overwhelmingly probable that the state would not be an improvement on the private owners. The existing cartel is not a good way of running the industry, but the path of wisdom for the state is not to take it over and run it still worse, but rather to consider how the "steel masters," in running their own affairs, can be induced to do so in a way that also serves the public interest in cheap steel.

Back to the Ruhr

THE Six Power Conference which is meeting in London to shape the proposed international control board for the Ruhr has assembled under the shadow of intense French displeasure. When the Powers met in London last June to discuss the future of the Ruhr, the French were unwillingly persuaded to give up their old contention that both the ownership and the management of the Ruhr should be international. The question of ownership was shelved and the French negotiators abandoned their insistence upon internationalised management in return for Anglo-American readiness to set up a control board drawn from France, Benelux, Britain and the United States to allocate Ruhr coal and steel between the home market and the export trade. This decision, however, did not prove final. The French National Assembly thereafter instructed their Government to reopen the question of management in the Ruhr and France's desire to strengthen the controls on German industry has steadily increased as, in the course of the autumn, German steel production has overtaken French levels of output.

Opinion in France on the eve of the conference was in any case somewhat suspicious and hesitant. The mood was then confirmed by the announcement of the American and British Governments that they were handing over the trusteeship of the coal and steel industry to the Germans and would be ready to leave the question of ultimate ownership to the decision of some future German Government. To the French, this appeared to be an entirely unjustified attempt to prejudge the issue both of management and ownership on the eve of an important conference which, they felt, should be concerned with both issues and M. Schuman, the French Foreign Secretary, instantly issued an official protest, which was reaffirmed in a statement made by M. Hervé Alphand at the opening of the London talks.

It can be argued, in a strictly technical sense, that the French complaints and protests are not altogether relevant. The conference on the Ruhr is not concerned with problems of ownership at all. The work of the proposed board of control will not be prejudiced by the Anglo-American desire to allow the Germans in the long run to decide whether heavy industry in the Ruhr should be under public or private control. The regrouping of the decartelised steel combines in smaller units—a step which has accompanied the transfer of trusteeship to Germans—does not decide the final settlement with the shareholders or prejudice the rights of the very considerable body of foreign owners.

Nor are changes in control either so revolutionary or so binding as the French protests might suggest. In effect, the British and the Americans have simply given the management of the coal industry and of the steel industry the same pattern. The steel industry, which formerly had a German trustee acting under British control, will now acquire an Anglo-American control body. The mines, which had British trustees under Anglo-American control, will now receive German trustees instead. Effective power rests with the Anglo-American control—which the French could join were they to complete the fusion of their Zone with Bizonia—and it is clear that neither the Americans nor the British are ready to relinquish it for the time being. Thus the actual situation in the Ruhr is not yet drastically changed.

However, whether or not the French protests strictly apply to the present conference on the Ruhr, they cannot obviously be dismissed on a mere technicality. What has happened in the Ruhr is undoubtedly part of a general process of restoring power and responsibility to the Germans and of giving them incentives to work and expand production. It is the whole movement, and not this or that particular phase of it, that the French resent and wish to arrest. It does not much matter whether their protests are relevant to the talks in London this week. The real issue is whether France can stomach the whole trend of Anglo-American policy.

*

It has been argued again and again in these pages that on the general direction of policy, the British and the Americans are right and the French wrong. The essence of the argument is that there is in the long run no halfway house between complete and prolonged suppression on the one hand and, on the other, the granting to Germany of equality with its neighbours. Permanent suppression is beyond the desires and the capacities of the western Powers. It is, therefore, all the more important that the goal of building a responsible, equal, democratic Germany should be accepted and its attainment not impeded by attempts here and there to maintain galling and ultimately useless controls. Both in detail and in general, the French plan for an internationalised Ruhr would come within this definition. Detailed interference in German management by foreign technicians and managers would lead to strikes and boycotts by German management and labour and, in general, the imposition of a status on the Ruhr accepted by no other nation would make that status the object of angry German nationalism and revisionism. The only control that the western Powers can be relied on to maintain and which the Germans can hardly have the audacity to attack, is control on the production of actual weapons of war. In every other sphere, equality in status and

OUTSTANDING VALUE IN LIFE ASSURANCE

EQUITY & LAW

LIFE ASSURANCE SOCIETY

20, LINCOLN'S INN FIELDS, LONDON, W.C.2

opportunity must be the goal of the Allied Powers first for western Germany and ultimately for the whole country.

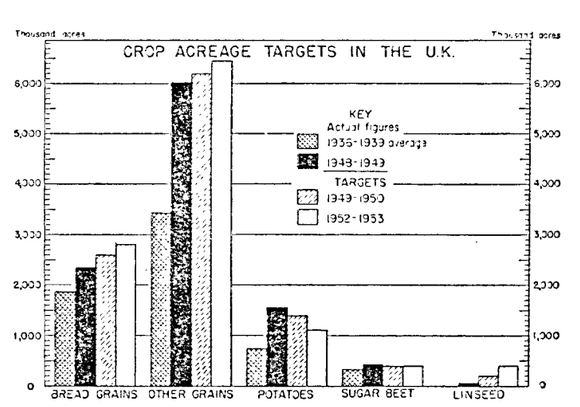
Yet having said so much, any student of the mood in Germany today and of the German record in the past cannot but be filled with uneasiness. However clear the general objective—the creation in the long run of a reasonably satisfied Germany—and whatever controls are established in the meantime, the ultimate transfer of the Ruhr to virtually unrestricted German authority raises a number of formidable difficulties. In the first place, the fear of German aggression felt in France and the Low Countries (and in even intenser form in eastern Europe) is a political factor at least as important as the discontent felt in Germany at the disadvantages inherent in losing wars. American officials, with their direct administrative and financial responsibility for a part of Germany, are particularly prone to appear more sensitive to German complaining than to European distrust. Already there is an arrogance in German reactions, particularly in the reactions of the business world, that creates small respect for Germany's sense of proportion and the gravest doubts for its future behaviour.

Nor are the problems raised by the re-establishment of single German control in the Ruhr simply political. At present the chief economic difficulty, both in the Ruhr and in western Europe generally, is likely to be the continuance of certain shortages. The earlier shortage of coal and coke has been to some extent overcome, but in part only, by pushing the difficulty back a stage and saving coke by increasing the amount of high-grade ore and scrap consumed. The more German steel-making capacity is brought back into operation, the more for the time being will be the pressure upon inadequate supplies of rich iron ore and scrap. But this situation is not likely to last. By the time sole German control has been re-established, the situation in the western European steel industry may be much closer to the conditions of over-production prevailing in the thirties. Moreover, since practically every one of the four year plans being prepared within the framework of the European Recovery Programme states each government's intention greatly to expand exports of heavy industrial products and at the same time to reduce imports, there is every chance that the western European industrial nations will find themselves involved in a violent competitive race to capture increasingly inadequate markets.

Such a development would almost certainly lead to a re-establishment of a European steel cartel of the most negative and restrictive kind. During and after the Great Depression, it was the Germans who took the lead in building up the old steel cartel which controlled in the greatest detail—through its various sales comptoirs—the export of every type of steel product, shared out markets and regulated prices. It need hardly be said that the return to such a system, once again very probably dominated by Germany as the largest producer, would be in every sense a retrograde step. To permit the "planning" of western European industry to take the most restrictive and unconstructive of all possible forms would be to defeat the whole purpose of the Recovery programme. Yet such a development seems inevitable if the result of Allied policy in the long run is to re-establish in the Ruhr the *status quo ante*; this, unfortunately, is the direction in which their policy is moving today.

There is, however, one obstacle to a complete return to the prewar situation, but this, far from easing the problem of the future status of the Ruhr, complicates it still further. It is now clear that the five nations of the Brussels Pact will have in the next decade to devote a proportion of their industrial resources to rearmament. It is equally clear that the one thing a German-controlled Ruhr could not be permitted to produce is weapons of war. The practical consequence of this ban would be that whereas Germany's competitors in their drive to secure industrial exports would be limited by the necessity of diverting some of their heavy industrial capacity to armament making, the Germans could devote all their production to serviceable and saleable products. The paradoxical position might then arise that Germany, by reason of the ban on German armaments, might find itself exceptionally favoured in the drive for exports which western Europe as a whole will have to carry on.

The political and economic arguments against the Allies' general policy in the Ruhr have thus more weight than British and American officials have seemed to allow in their discussions with the French. Yet the opposite difficulty remains that in the long run it will be dangerous and indeed impossible to impose upon Germany—save in the single instance of disarmament—a status different from and inferior to that enjoyed by its neighbours. An internationalised Ruhr as the solitary example of international control in an otherwise rigidly nationalist Europe would immediately become a powerful centre of discord and unrest. Is there then no way out of a deadlock in which an uncontrolled Ruhr is a menace and a controlled Ruhr an impossibility?



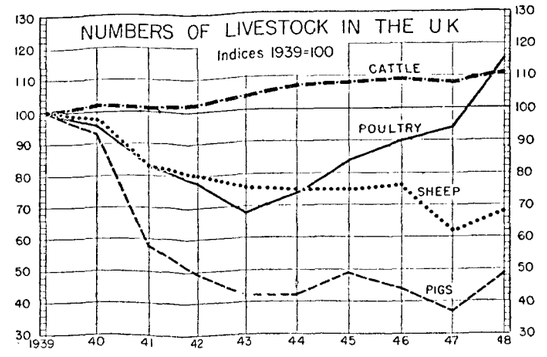
*

There is one solution which has already made a brief appearance at the conference table and which could now be very usefully revived. At an earlier discussion of the Ruhr, the Americans proposed that the project of international control should be extended from the Ruhr to cover the industrial areas of Lorraine, Luxembourg and Belgium. The scheme might, as a starting point, take the industries included in the old *Entente Internationale de l'Acier*, but the new international authority would not be a restrictive body designed to maintain prices by restricting production to a limited demand. Its functions would rather be to control and plan investment, to encourage expansion and to allot different types of production to different industrial centres within a unified western European steel industry. The most practicable form of control might well be that of a holding company, entrusted with ultimate financial decisions and responsible to Governments as well as to the industry. To this body, the British steel industry could either adhere completely or belong in a less formal fashion, as it did at the time when the *Entente de l'Acier* was widened by the inclusion of Britain to become the European Steel Cartel. British adherence in some form or another would, however, be essential, since the role of British industry in Western Union rearmament is clearly crucial. The protection offered by the Channel makes Britain the most suitable centre for an expansion of armament making, yet the island could hardly make the sacrifice involved to its export trade, unless it were in a position to share in the gains of western Europe's other steel producers.

A project for the international control for the Ruhr can thus be envisaged once western Germany is treated not as a single German problem but as part of the wider issue of strengthening and integrating western Europe as a whole. There will, of course, be no easy acceptance of the solution. The French have already rejected it once. The Germans are developing a mood of such arrogance that they, too, may denounce a solution which a year ago would have satisfied their most Utopian dreams. The Allies are, however, still in a position to override German opposition if they have the will. The real obstacle is the attitude of nations of the Western Union and of France in the first place. If, however, the alternative to international control for the nations of western Europe—a control which, in a restrictive anti-social sense, they have been prepared to stomach in the past—is the re-emergence of a strong, ruthless, exceptionally well-placed German competitor, there can surely be no doubt where the balance of advantage lies. For a few months more, the international solution can still be imposed on Germany. The French, and indeed the British, will have bitter cause for regret if, to protect their own unimpaired national sovereignty, they finally return Germany to the unencumbered enjoyment of its own.

How Much Food Can Britain Grow?

EVER since discussion started about British postwar policy, it has been an accepted axiom that this country can and should grow more food than it was producing in 1938. The scope for agricultural expansion, however, has been very variously estimated by different authorities, and by the same authority at different times. Until last year, the Government assumed that crop production should gradually be allowed to drop to a level much closer to its prewar than to its wartime volume, but that livestock production should be expanded as quickly as possible to an appreciably higher level than before the war. The general pattern of British agriculture would thus be the same as of old, but its total size would be somewhat larger. It was expected, for instance, in the White Paper on "The Post-war Contribution of British Agriculture to the Saving of Foreign Exchange" (Cmd. 7072, 1947), that the prewar net agricultural output might eventually be exceeded by something like a third. This was a reasonable goal, which was certainly within the industry's capacity, given sufficient feeding stuffs and labour. The emphasis on livestock production meant that its attainment need not be unduly costly or repugnant to the farmers' natural inclination and would be in line with factors of soil and climate.



The Government's policy was drastically changed as a result of the dollar crisis of fifteen months ago, which made it cast around for any and every means of saving hard currencies quickly. The four-year plan of agricultural expansion, which it then instituted, envisaged that crop production as a whole (though the ratio between the different crops would be different) should by 1951-52 be raised to around its wartime peak and presumably kept there indefinitely. This heavy emphasis was placed on crops, partly in order to save on imported feeding stuffs, partly because it was here that expansion could be quickest, and the immediate saving of exchange therefore greatest. Livestock expansion is necessarily much slower, although here again the plan provided for a specially rapid increase in the output of the two easiest dollar-savers, eggs and pig meat. This autumn, some changes in the original plan have been submitted to the Organisation for European Economic Co-operation. The plan's original targets, as a percentage of prewar production, were 123 for milk, 110 for beef and veal, 77 for mutton and lamb, 92 for pigmeat, and 152 for eggs. The Government has now postponed by a year the date for realising the beef, mutton, and pigmeat targets. It has reduced the egg targets—partly because of the cost of feedingstuffs, partly as a concession to Danish plans—although the actual prospects for many more eggs soon are bright. The general objections, however, remain unaltered.

If the Government's plan is realised, net agricultural output in a few years' time will be about 50 per cent higher than before the war. This, however, would not be the limit of its expansion, since livestock production—especially of mutton and lamb—would still be disproportionately low in relation to crop production. There would still be scope for a further increase in livestock production, which might eventually produce a total agricultural output greater by two-thirds or even more than before the war. Considered purely from a technical standpoint, there is nothing inherently impossible about such an achievement. The crucial questions are whether the agricultural industry, as at present organised, is either able or willing to produce an output of such a size and character, and whether it can do so without incurring steeply rising costs.

The Government's programme involves a return to a highly artificial pattern of production, which was only secured during wartime by dint of detailed compulsion as well as of patriotic exhortation. The revised targets for 1952-53 require farmers to put four million more acres under cereal production than before the war—an enormous increase which would match the achievement of the best wartime year. There is also a rather preposterous demand for 400,000 acres of linseed. The assumption is made that the improved wartime yields will be maintained. There is, however, some danger of yields falling off through exhaustion of the soil caused by overcropping. On the other hand, there is still considerable scope for raising yields by an improved application of fertiliser. Indeed, it is likely that more can be gained in the long run from raising yields still further than from finding new land to plough, which is much easier to do on paper than in practice. Even so, to expect farmers to grow—and to keep on growing—450,000 acres more wheat and 400,000 acres more other grains than they did this year is highly optimistic. The appeal to the farmers' patriotism is anyhow much fainter in peacetime. Moreover, it is one thing to appeal for a special effort and quite another to expect that effort to be maintained indefinitely. The idea of using compulsion on a wartime scale, and for an indefinite period, has been expressly, and no doubt rightly, rejected by the Government as completely inimical to the willing co-operation on which it counts. There remains the appeal to the farmers' pocket, but the marginal costs of stimulating much further crop production by this means are so high as to deter any but the most imprudent disburser of tax receipts.

Although it is necessarily a slow process, livestock production is making better progress than crop production. To a certain extent, the two types of production are competitive with each other as well as being complementary. The maintenance of a higher acreage under crops reduces the amount of permanent grass available for supporting stock. However, this difficulty was partly overcome in wartime by a greater intensity of stocking, which increased the stock-carrying capacity of an acre of grass by as much as a third. The scope for still further improvement in grassland management is generally agreed to be enormous. It may be roughly estimated that a ley has one and a half times the productivity of permanent grass, and that the feeding value of silage is one third greater than that of hay. A considerable expansion of ley rotations and of ensilage could therefore, in theory, enable the same numbers of livestock to be supported on a still smaller acreage and thus free more land for crop production. Moreover, grassland improvement ought

not to add to the average costs of production; it has been argued, for instance, that it costs less to get a unit of protein from silage than from hay. But in practice the more profitable and acceptable contribution of improved management of grassland would be to enable farmers to carry higher numbers of cattle and other stock. The obstacles in the way are partly the conservatism of many farmers, and partly the lack of labour and of new machinery, which they cannot always afford. If it could be made administratively practicable, a subsidy for the good management of temporary grassland would yield worthwhile results.

Another point is that agricultural expansion can be carried out far more economically and efficiently if the pace is not too rapid. Mechanisation is still proceeding fast, and the agricultural machinery industry is being expanded to deal with an anticipated high flow of orders. This process is sound enough in principle. To substitute machine labour for hand labour wherever possible not only economises manpower, but has obvious attractions to an industry where wage rates have increased much more steeply than prices. Unfortunately, the average British farm is much too small in size to use many types of machinery to the best advantage. The Government's demand for quick returns, backed by fairly generous price incentives, together with the cost and scarcity of labour, is encouraging some farms to become overcapitalised in machinery in relation to their size. There is no simple way—short of revolutionary and unpopular changes in land tenure—to overcome this difficulty of size. Something can be achieved from the development of contract services for machinery. The efforts of the County Agricultural Committees in this direction have been singularly unsuccessful and may soon be discontinued, and the future probably rests with private contractors and local co-operative machinery pools. Much could certainly be gained from a more scientific use of labour on the farm, although this is less an alternative course to creating larger units than another argument for doing so.

The new capital and new techniques that are needed can only come into play gradually. The danger with the Government's rush tactics is that they may start expansion off on the wrong foot—on an uneconomic and superficial basis. The best form of state aid to agriculture would be subsidies for the improvement of fixed capital, the renovation of farm buildings, and the improvement of grass management, awarded on as selective a basis as possible. The concentration of economic aid to the industry in the form of price incentives is more likely to retard than to accelerate the necessary economic changes. It gives considerable security to the indifferent farmer, with the result that the differences between good and poor farmers—despite the activities of County Committees—may be widening. It risks encouraging farming for quick returns instead of for durable results. It helps to inflate the capital values of many farms, a circumstance which may one day leave them overcapitalised yet short of the means for making necessary improvements. British agriculture is certainly capable of an appreciable and reasonably economical expansion — so long as it is gradual and balanced. Even for livestock the possibilities are not, of course, unlimited. There would come a point when, on the basis of present farm organisation, difficulties would multiply and costs rise steeply, but—except perhaps in the case of milk production—it is still a long way off. By contrast, the prospects for raising crop production much above its present level are uncertain and the costs of doing so can already be seen to be great. Any forecast of conditions in the outside world is hazardous, but it can at least be said that a policy of emphasis on livestock would not contradict the indications of future prospects. It will take longer to restore the world's production of animal products to normal than its production of crops and the increased demand is also likely to be more permanent. The danger is that the natural limitations and genuine opportunities—both alike—of British agriculture will be forgotten by Government blueprints which seek a quick solution for pressing problems of foreign exchange. The urgent need for saving dollars certainly requires some special and early contribution from British agriculture. But this contributon will be far more effective if it is spread over a long period and brought about in an efficient and economical manner than if it is hastily improvised on shaky and expensive foundations.

The Trials of Tito

SIX months have passed since the Cominform denounced Tito. Jugoslav policy remains linked to that of the Soviet Union and Mr Bebler's speeches before the United Nations are no less obstructive and insulting to the western Powers than those of Mr Vyshinsky. Yet Moscow continues to condemn the Jugoslav regime, and in his speech on November 7th Mr Molotov again denounced the "treachery" of the "nationalistic Tito clique."

Jugoslavia's "popular democratic" neighbours have not confined themselves to words. The Rumanian government seems to have been implicated in the attempted escape of General Jovanovic in the summer, and has exerted pressure on Jugoslav diplomats in Bucarest and on the Jugoslav minority in Rumania to disown Tito. Those who have refused have, according to Belgrade, suffered persecution. The Hungarian government is reacting in the same way to Jugoslav diplomats in Budapest, and a major of the Hungarian political police stated that Jugoslavs "possess no diplomatic rights." In Bulgaria, agitation against Tito's rule in Macedonia is growing, and is becoming steadily less distinguishable from the "Great Bulgarian" propaganda of the prewar regime. In Albania the Communist Party has been purged, and Koci Xoxe, the former Minister of Interior and police chief, has lost his job and been disgraced for pro-Tito deviationism. These are signs that the Moscow-dictated hostility of the neighbour satellites is a serious matter for Tito. Perhaps even more serious are the admitted difficulties in obtaining vital imports from the more distant and more industrialised satellites, Czechoslovakia and Poland. In a speech this week Tito complained that the eastern states were treating Jugoslavia's "people's democracy" worse than they have treated the capitalist states.

It may be taken as certain that the Cominform's agents are doing their best to subvert the Tito regime from within. As long as Tito maintains an iron dictatorship based on the Soviet form of Marxist ideology, their task will be facilitated. They can count on the sympathy of the small number of veteran

Jugoslav Marxists and of all unprincipled careerists who have joined the party for personal gain. The latter, who have always been numerous in all Balkan states under all regimes, will no doubt go over to the big red battalions as soon as it seems safe. Tito's friend, Rankovic, firmly controls the secret police, but it cannot be easy for him to decide whom he can trust. It is in fact only too likely that in Tito's own entourage there is treason: it would be surprising, in view of the past history of Communism in general and of Serbia in particular, if there were not.

Meanwhile, material conditions are bound to deteriorate. The Five-Year Plan was too ambitious even for the most favourable circumstances. The results of "linked prices," by which peasants were to be supplied with manufactured goods, have been disappointing. The boycott of the satellites is turning into a blockade, and yet the Jugoslav government still refuses the minimum concessions required for trade with the west. If present trends continue, there is real danger of internal disintegration, leading through mutiny and treachery to civil war and enabling the Soviets or the neighbour satellites to intervene "to restore order."

Tito is too sharp a politician not to see these dangers, and though he has shown no sign that he wishes to be reconciled with the western Powers, it is improbable that he has not given the matter some thought. What in fact are the practical possibilities of a *rapprochement*? One possibility must be at least discussed before making an assessment of Tito's chances. If Moscow expected war, it might make temporary concessions. Tito on his side might for a brief period co-operate with the west solely in order to raise his own price. When the time came, Moscow, needing him for war, would accept him as an ally, and he would for the second time betray the west. Co-operation leading to this result would be a bad bargain for the western Powers—and for Tito. It would be a bad bargain for Tito because, once Soviet troops had entered Jugoslavia in the course of military operations, a way would be found to "liquidate" the Marshal. If, however, Moscow has no thought or expectation of war, Tito has only one thing to hope for from the Kremlin—and that is the acceptance of his complete capitulation. The consequences of such action must obviously be known to him. He would disappear from the political scene, and perhaps from this world. The history of Communism shows that such capitulations are possible. If it is proved expedient that one man should perish for the good of the Party, the one man may willingly accept his sentence. But Tito does not seem quite the type of Party fanatic who has been capable of such self-abnegation in the past.

There thus seem to be two alternatives before the Marshal. The first has already been discussed. It is to cling on to the present position while economic unrest and Communist treachery gradually lead to the crumbling of the regime. The second is to seek some sort of *rapprochement* with the west.

There should be no mistake about the amount of crow Tito would have to swallow to achieve even a minimum understanding with the western Powers. It may not seem that their terms are heavy. Indeed, they are not. Nevertheless, they demand some striking departures from current Jugoslav practice. In the economic field the British must demand the payment of reasonable compensation to nationalised British interests in Jugoslavia. This may stick in the throats of demagogues who for years past have demanded the expropriation of the "foreign capitalist plunderers," but surely British firms may ask for terms as favourable as have already been granted to Swedes and Swiss? This economic precondition of better relations is, however, relatively unimportant compared with the demands which must be put forward in relation to Tito's foreign policy. Jugoslavia would surely be required to cease all aid to the Markos rebels; to stop military threats to the frontier of Trieste and subversive activity within the city itself; and to show neutrality in the event that the western Powers should be obliged to take any action against Albania. It would probably be unwise to press the point further and to demand a more general detachment from Soviet diplomacy. But, in the Balkans, the western conditions are limited and specific and therefore stand a better chance of being the basis of a bargain.

The most delicate point of all, however, is the question of political freedom for the friends of the west inside Jugoslavia. Tito is a convinced Marxist, and does not intend to abandon his aim of transforming Jugoslavia into a state of the Soviet type. The western Powers on their side are not dictating the social system of Jugoslavia; they wish neither to overthrow nor to bolster up the Tito regime as such. They do object, however, to the persecution of Jugoslav subjects who have shown themselves their friends, simply and solely because they are their friends. But Tito no doubt fears that if he releases those unjustly imprisoned and relaxes police pressure on western sympathisers he will soon find himself dependent on the support of non-Communists. Then the dictatorship of the Communist Party will have to be modified, non-Marxist democrats will recover influence, and the achievement of Communism in Jugoslavia will be indefinitely postponed. This is the real dilemma facing Tito—to modify his programme of total Communism or to risk the total disappearance of his regime, to choose between a partial loss of power or a complete loss of power and possibly of life as well.

Tito is not, however, alone in facing this unpalatable choice. He must consider the men around him. He, trained in the Comintern, might prefer everything to "capitulation to the west." But what of his colleagues? The top ranks of the Jugoslav armed forces and bureaucracy are filled with men who have not long been—and some who are still not—members of the Communist Party. They joined or supported the Party during the war, because it stood for resistance to the Axis and a social revolution which they hoped would sweep away the rot of past regimes. These men have always been passionate nationalists. For them, the victory of the Partisans was to mean the regeneration and territorial expansion of Jugoslavia, which was to become a powerful state, "almost a Great Power." They favoured Russia because they thought it the generous "big brother" of all Slavs, both a mighty military force and a land of liberty and justice. But events are showing them that the threat to Jugoslavia's independence, let alone its future greatness, comes not from the west but from Russia. It is the Soviet Union that is the "imperialist Power."

It is with these men that the western Powers should seek in the first place to establish contact. If a reorientation is to be brought about in Tito's policy, it is most likely to come as a result of their pressure and influence. The methods whereby such contacts can best be made cannot usefully be canvassed in public. But there is one means which cannot and must not be overlooked—radio propaganda, or to use the more exact language of four years ago, political warfare. From Britain at least the Jugoslavs must hear, in their own language, an explanation of the real dangers, the similarity of the present situation with that of February and March, 1941; the imperialist nature of the Soviet policy; the friendly feelings of the western nations towards Jugoslavia and their desire for peace in the Balkans; the common interest of Jugoslavia with Greece in resisting Bulgarian and Albanian irredentism and in keeping the Balkans free from servitude to any Great Power. These are slogans which will find an echo among most Jugoslavs, including highly placed supporters of Tito, and which have the important advantage of being based on the truth. At the very least, propaganda on these lines will increase confusion and suspicion in the Soviet camp. At the best, it may hasten a welcome evolution of Jugoslav policy and benefit the west's most hard-pressed ally, Greece.

NOTES OF THE WEEK

Heir Male

A royal birth is, to quote Walter Bagehot's description of a princely marriage, "the brilliant edition of a universal fact, and, as such, it rivets mankind." Birth, marriage, and death, these are the universal human experiences, and the King's subjects who today are rejoicing over the birth of a son to Princess Elizabeth are also rejoicing over their own natural happiness in the first-born as much as in the assurance of the royal succession. The strength of the monarchy, even the present-day constitutional monarchy, does not rest wholly upon a utilitarian concept, but upon deep-felt instincts of community which it has the power to elicit. The role of the Royal Family—a desperately exacting one—is to live on behalf of their people, as their people feel that life should be lived, with dignity and gracefulness, with solid virtue and domestic discipline, with restraint and with charm.

But it is a dedicated calling and his destiny will mark the life of the new Prince from the day of his birth. In the natural course of events, he will have reached manhood before he becomes heir apparent, and half a century may well pass before he ascends the throne. One need not fear with Bagehot that a prince who comes to the throne old or middle-aged comes to it "unfit for work," for he will "have spent the whole of his youth and the first part of manhood in idleness." A twentieth-century prince is more likely to work too hard than to be too idle, and the greatest assistance his subjects can give their future king is not to expect too large a measure of public life from him and to give the greatest possible respect to his private life.

* * *

Should the Powers Negotiate?

Everybody in the western World wants peace and wants it passionately. If the journey of Mr Truman to Moscow would ensure general pacification, the plucky little President would go there on foot and no one would blame him. If an immediate calling of the Foreign Ministers Council could carry with it a guarantee of a settlement, the western Powers would summon it tomorrow. If Dr Evatt and Mr Lie could produce peace out of a United Nations document, they would be encouraged to write not one but fifty-six letters tomorrow morning.

The difficulty is not the desire for peaceful negotiation. The difficulty is the utterly unpromising course that negotiations have taken so far. Dr Evatt and Mr Lie, undoubtedly with the best intentions, have jumped into the middle of the endless disagreement between east and west and have simply treated the past as though it did not exist. In a sense, they say to the Powers: "Let us all begin here. This is a new page." The trouble is that it is not. The page is very old, very dirty and by now it is hardly possible to write on it another word.

When the Russians by isolating their zone economically and steamrollering it into the Soviet political mould, had made Potsdam a dead letter, the western Powers at last—in November, 1947—gave up the fruitless job of waiting for agreement and determined, reluctantly, to follow Russia's "unilateral" example. The Russians did not then plead for new negotiations. On the contrary, it was not long before they smashed across all negotiations with the violent coup at Berlin. Even so, the western Powers were ready to continue to negotiate. They waited for months on Soviet pleasure to see if important concessions on the issue of currency would lead to an end of violence—i.e., of the blockade. But the Russians simply let the western Powers talk and continued to reinforce their blockade. It was at this point that the issue was referred to the Security Council.

Talks began again in Paris and the western Powers, always ready to negotiate, approved a proposal evolved by Dr Bramuglia, President of the Security Council, so reasonable and conciliatory that every nation save the Russians accepted it. By them, it was vetoed. Almost on the same day, a new twist was given to the screw in Berlin. Is it really surprising, therefore, that the western Powers now regard yet another bout of negotiation as a waste of time and even resent the suggestion, latent in the Evatt-Lie letter, that there is in some way an equality of blame attaching to all the Great Powers over the issue of Berlin?

This is not to say that the western Powers will not resume negotiations. They will do so instantly if any action on Russia's part suggests that negotiations could at last lead to results. And the required action is obvious. It is to lift the blockade.

Party Divisions and Western Union

Ever since the project of a United Europe caught within its sails the following wind of Mr Churchill's enthusiasm, there has been trouble over the issue between the Government and the Opposition. Mr Churchill has consistently attempted to make the issue of closer unity in Europe an all-party affair and his first clash with Mr Attlee occurred early this year when the Labour Party officially discouraged its members from attending The Hague Conference. Since that time, the integration of at least western Europe has ceased to be a matter for private people and unofficial movements only. The persistent efforts of the French have raised it to the governmental level and at the latest meeting of the five signatories of the Western Union pact, it was agreed that a committee should be set up, representing the five governments, to discuss two proposals for achieving closer unity—the French proposal for a European assembly and Mr Bevin's suggestion of a European Council responsible to governments.

The selection of a British delegation to attend this meeting—which opens in Paris on November 20th—has now led to another clash between Mr Churchill and Mr Attlee. The Prime Minister has decided to make the delegation strictly a governmental one and has refused Mr Churchill's request that members of the Opposition should be included. To this Mr Churchill has angrily opposed his thesis that the unity of Europe—one of the greatest issues of foreign policy—should be above party.

What can be said of this running fight between the two leaders of the House? On the immediate issue of the delegation to the forthcoming committee, Mr Attlee cannot really be blamed for underlining its governmental character. If the Committee is to be something more than one more revival meeting to boost the ideal of unity, it must have delegations capable of reaching decisions and of committing governments to a line of policy. But on almost every other issue, it is impossible to congratulate the Government on its record. Even if enthusiasts for Western Union have gone too far with their paper plans and projected constitutions, there can be no doubt that Great Britain needs the closest possible relations with its neighbours and should be the first to encourage the genuine sentiment for unity and to direct it into useful and practicable channels. Instead, the record is one of a steady pouring of cold water.

Each advance has appeared to be wrung from a reluctant Cabinet and even now, when Mr Bevin's excellent proposal for a European Council has given European—and British—opinion the idea that perhaps a less half-hearted policy is on the way, the hopes can hardly fail to be dashed by the choice of Dr Dalton to head the British delegation. The peoples of western Europe have not forgotten the discouragement of the whole idea of closer union expressed by the Doctor at the Socialist Conference in Paris this spring. Yet it is this known opponent of the ideal of union that is chosen to go to Paris. Mr Attlee has really only himself to blame if, after this, the suspicion of British lukewarmness hardens to conviction.

Steel Debate

A Parliamentary correspondent writes:

The Debate in the House of Commons on the Second Reading of the Steel Bill began very lamely, but as the leaders on both sides warmed to their subjects it developed into an impressive display of Parliamentary debating. On Monday, Mr Strauss, Minister of Supply, opened the debate by merely intoning a bulky written brief, a habit that is becoming only too frequent among Ministers. Ministers are advocates of the Bills they present, and not BBC announcers. It is not surprising that the Steel Bill took third place in Tuesday's news to the weight and progress of the new Prince and to the unfolding of the evidence before the Tribunal of Enquiry.

But on Tuesday and Wednesday Mr Churchill and Sir Andrew Duncan succeeded in raising the debate to the level on which it belongs—as one of the most important of the session. Sir Andrew Duncan proved that, though he speaks seldom in the House and cultivates the deceptive appearance of a rugged and unsophisticated businessman, he is, in fact, a debater of a high order. His speech was an example of the Parliamentary system at its best, the spectacle of a man arguing coolly, logically and without tension against a policy which, although it affects his special interest, can also be demonstrably proved to be wrong.

Since steel will be one of the issues of the next election, it was not surprising that Mr Churchill and Sir Stafford Cripps should conjure up some of the arguments they used in 1945. Mr Churchill smelt a plot—not a Gestapo plot this time—but a conspiracy by the Government to paper over the cracks within its own ranks. Sir Stafford, by implication, admitted a grain of truth in this charge. He departed from his usual technique of economic realism sufficiently far to advance the thesis that the alternative to the peaceful penetration of the citadel of capitalism would be their violent overthrow. In other words, that if the Labour Party cannot pursue a sufficiently radical policy to keep control of the workers, the Communists will take over their leadership. This, in effect, cuts at the root of the whole of the Government's—and in particular Mr Morrison's and Mr Strauss's—preliminary build-up for the nationalisation of iron and steel, since it is now admitted that this is not primarily a technical, but a political, measure.

Apart from a few verbal rows, the debate did not produce the bitter and violent controversy that had been expected. This was partly a reflection of the serious mood of the House, which felt instinctively that this was a graver and more fundamental issue than any which it had faced in this Parliament, and one in which political philosophies rather than administrative techniques were being discussed. Consequently, it reflected the soul-searching which has taken place in all three parties. Those Ministers who had opposed the Bill in draft listened with wry faces as the Opposition stated many of their own arguments in public. Among the Conservatives, the Industrial Chartists carefully let it be known that they were not prepared to die upon the barricades of Steel House, and that Sir Andrew Duncan had been elected as a Nationalist. But the Liberal Party suffered the most severe internal hæmorrhage, for it had not clarified its views on steel in advance of the publication of the Bill, and had to cram into a hectic fortnight the formulation of a policy, and only at the last moment were its four dissident members persuaded to follow their leader into the Opposition lobby.

* * *

Undermining the Chancellor

The Parliamentary Labour Party's appeal to the Chancellor to "increase the purchasing power" of lower incomes has more political weight behind it than may appear. Although Sir Stafford Cripps replied, as he was bound to do, that he could not *anticipate his Budget, notice has been served upon him of a* demand for some further cushion between the masses and harsh economic reality. It is becoming fairly obvious even to the most orthodox that nationalisation, whatever its doctrinal merits, butters no parsnips; and it is butter on the parsnips—as the big fall in Labour's majority at the Edmonton by-election shows—which at the moment arouses the electorate's interest. Many Labour MPs are prepared to search with Mr Maurice Webb for a means of "easing the cost of living for the lower income groups without damaging the Government's general economic policy." Presumably, this will result, as the winter wears on, in pressure not only for lower beer and tobacco taxes and the abolition of purchase tax on articles of mass consumption, but for higher food subsidies.

Sir Stafford Cripps's policy of economic realism has been severely bitten into already, and he can be counted on to put up a stiff resistance to any further attempts to nibble at it. He knows, if others do not, how impossible it is to run the present volume of social services and the present administrative machine on the proceeds of taxes from the well-to-do. The confiscation of that dwindling minority's entire income would, indeed, fail to provide enough. The main source of public income on the present scale can only be the public at large—its earnings, its beer, tobacco, entertainments and miscellaneous purchases. It is, of course, both perfectly arguable and often argued that public spending and the taxes which sustain it are intolerably high, and that the former should be drastically cut in order to reduce the latter. To that proposition, family budgets are more relevant than many Labour MPs would probably care to admit. It is easy to win votes by a programme of social services or capital development to be paid for by an unpopular minority; it would not be so easy to get support for the same programme presented as an expense to be met by its beneficiaries. There springs eternal in the voter's breast the hope of something for nothing, the hope that by conjuring with figures it will somehow be possible to produce the irreducible, indefeasible birthright of a quart of good living out of an optional pint of production. There are always a dozen would-be Daltons to play upon that hope for every Cripps with the courage to dash it.

The Parliamentary Labour Party are quite naturally reflecting the anxieties of their constituents, but Members of Parliament are more than delegates, they are the link between the nation's leaders and the nation itself. Even from the standpoint of pure politics, they should remember that political courage in a party makes a more abiding impression upon the electorate than any attempts to create temporary palliatives for unpleasant truths.

Privilege for the Co-ops

The Minister of Food's decision to grant a preferential allocation of imported rabbits and poultry and of the extra sugar distributed for the manufacture of cakes and biscuits to the co-operative societies has caused a storm of protest only partially allayed by his subsequent promise to consider the claims of other traders. It is almost universally agreed that to continue to allocate supplies, whether of food or other goods, on the basis of the trade done in a given prewar period, causes injustice both to traders and their customers. The co-operative societies, whose registrations for rationed foods have increased by up to 10 per cent since the beginning of the war, have a legitimate grievance—and, more important, so have their customers. But what is justice when done to all at the same time becomes injustice when done to a few, and the relaxing of the prewar datum rule specifically in favour of the co-operatives, which, it hardly needs saying, have strong political ties with the Labour Party, cannot be condemned too strongly.

Bombarded by questions in the House of Commons on Monday, Dr Summerskill, Parliamentary Secretary to the Ministry of Food, stated that Mr Strachey was prepared to consider similar claims for increased allocations "from any other well-defined group of traders." Whether this definition will enable justice to be done to every small independent trader whose trade has increased since the war remains to be seen. What can be said now is that this afterthought, resulting from the widely voiced protests, does not undo the original injustice. The right course would have been to work out an allocation scheme based on registrations, or, if this is not possible, to have considered claims from all groups of traders before granting an increase to any. The worst possible course is to have shown what will be widely regarded as political favouritism.

The Economist DIARY

The ideal present for the busy man

A memorandum book, an appointments register, and a complete reference book, combined in a diary for the desk. Published by Messrs. Charles Letts & Co. Ltd. Price: in the U.K. (including Purchase Tax) 36/8, or 37/6 post free; overseas 30/-, or 32/6 post free.

Full details are given in the illustrated pamphlet available from:

The Economist Intelligence Unit,
22 Ryder Street, St. James's, London, S.W.1.

Israel in the Ascendant

Thanks largely to its own efforts, but partly to those of its friends, Israel is in the ascendant in three places at once. The first is in the Security Council. Here, on Tuesday, a majority of eight votes to one adopted a Canadian resolution calling on both sides for an immediate armistice in Palestine. The few voters who attach importance to the Council's survival as an instrument of consequence were to be seen deluding themselves into thinking that this new vote did not prejudice their "sanctions" resolution of November 4th. In fact it cannot fail to do so. For the Israelis accept the one and reject the other, and since no one seems ready to force them to accept anything distasteful, there is nothing to prevent them from calling the tune. A similar scene of triumph is taking place in the Political Committee. This, though it contains a safe majority for the Bernadotte plan, is even more lacking than the Council in the physical means to put its wishes into effect. The third site is in Palestine itself, where fresh small segments are daily being chipped off the remaining Arab areas. From now onwards, therefore, all further votes and deliberations in Paris are no more than futile delays in the way of a final settlement which Israel is in a position to dictate.

This situation, though so triumphant, is not one hundred per cent satisfactory to the Israeli delegation in Paris. Its members are worried at the extent of their dependence on the Soviet Union, to which they have had to turn for promises to kill the sanctions resolution with a veto in the Council if the unpredictable Americans now decide not to accept a situation in Palestine brought about by force. The Israelis relished and extracted all possible advantage from the Great Power line-up which until lately prevailed—that in which the USA and the USSR were for wholly different reasons on the same side and against Britain in backing partition and ignoring Arab rights and wishes. Now the Americans have seen a red light. Is it wise to throw to the winds the basic principles upon which Uno was founded? Or to drive the Arab states into passionate opposition to the west? For the moment, therefore, American and British policy is closer than it has ever been, and the juggling that is necessary to keep the USA and the USSR on the same tack at the same time is proving too much even for that unquestionably talented Israeli delegate, Mr Aubrey Eban.

* * *

The Battle for Suchow

The civil war in China is now centred on the struggle for the approaches to the capital and particularly for the railway junction of Suchow. A thick curtain of censorship at the front has prevented reliable information about the fighting from reaching the outside world, but it appears that the Nanking forces on this front are in somewhat better shape than the army which was destroyed in Manchuria and it is claimed in Nanking that the Chinese Air Force has blunted the Communists' offensive across open country east of Suchow. If Suchow is taken, a Communist advance on Nanking and Shanghai will presumably follow, but even a Communist capture of these cities would not necessarily end the war, as it is likely that the south would continue to resist and that the Chinese Government, whether in its present form or with changed personnel, would move to Canton, thus restoring the situation which existed before 1927, when Canton was the centre of Kuomintang power.

China since the war has been in effect divided into three zones according to the duration and intensity of Japanese occupation; in Manchuria it was longest and most complete, in the north-eastern provinces of China Proper shorter and less thorough, while in the west and south the Japanese only gained local footholds or did not penetrate at all. Japanese conquest meant that the local Chinese officials, army commanders and bourgeois families either collaborated or fled; if they collaborated, they became discredited and, if they fled, they lost their local roots. Thus the established social and political order was largely broken down, and the Communists, who almost alone operated by guerilla tactics behind the Japanese lines, were able to organise the leaderless population in their own political interest. But more than half of China has not undergone this process and the Communists, if they reach Nanking, may find postwar China as hard to unify as Chiang Kai-shek has already found it.

* * *

French Extremism and the Ruhr

One of the most sinister episodes in the whole sordid chain of events which brought Hitler to power was the temporary alliance in 1932 between the extremists of Left and Right to destroy the disturbed and vulnerable government of the Centre.

Something of the same kind is developing in France today, where the Republican régime in general and M. Queuille's Cabinet in particular is under heavy fire from both flanks. These attacks from Left and Right are proving all the more bitter because in the last two months the Government has succeeded in displaying a marked combination of firmness and moderation in dealing with the French industrial crisis and has thus begun to show a more hopeful capacity of survival.

The Communists, who may have decided that it is better to rally an anti-militarist, anti-clerical front against a Gaullist government rather than to risk the present continuous weakening of their position, are to launch a maritime strike next week to offset the breakdown of the strike in the mines, where about 75 per cent of the men have returned to work. But the Communists do not confine themselves to the industrial field. They are now launching a new attack upon the Government's "capitulation" to the Anglo-Saxons in the matter of the Ruhr.

It is at this point that General de Gaulle and the Communists make common cause. A large part of General de Gaulle's first press conference since his electoral victories a fortnight ago was devoted to an attack upon Anglo-American policy for the Ruhr and on the French Cabinet's cowardly acceptance of it. "If this is the price of the Marshall Plan, let us have no Marshall Plan." It is true that the General fears a united Reich because it may ally itself with Russia, and the Communists profess to fear it because it may, on the contrary, attack Russia. But, as on so many occasions, difference of ultimate objectives is less important than a coincidence of immediate aims. And they, on Right and Left, are quite simply to destroy the chances of moderate government in France.

* * *

The Corfu Case

The case of the mining of two British destroyers in the Corfu Strait in October, 1946, which has been brought by Britain before the International Court of Justice at The Hague, has now reached a stage at which evidence on the facts is being presented and learned counsel are hard at it on both sides. That two years have elapsed since the explosions, which cost the lives of 44 British sailors off the coast of a country with which Britain was not at war, is no fault of the International Court or of its rules of procedure; the delay has been due first to the prior appeal to the Security Council, which was prevented by the Russian veto from reaching any decision adverse to Albania, and then, after the dispute had been referred to the International Court, to Albanian objections to the Court's jurisdiction which involved a lengthy legal battle before the case itself could be heard. That it is now being heard is a fact worthy of notice in a world which is not otherwise marked by unity in support of a reign of law.

The Corfu case is the most serious which has ever been brought before a world court; the issue is an alleged act of violence involving three nations and having political implications even more far reaching. Questions such as that of the Austro-German Customs Union, which came before The Hague Court in 1932, have had considerable diplomatic importance, but they have turned on the interpretation of treaties, not on the sifting of evidence about deaths at sea. Witnesses are to be heard, and the lawsuit has all the dramatic quality of a trial for murder—which is what it really is. Blood has been shed—but by whom? This is what the Court has to decide. It is a Court of sixteen judges, including one appointed by Albania under a clause in the Court's rules which grants the right to any litigant nation which has not already a judge on the bench. The Court gives its verdict by a majority; there can be dissenting opinions, but no veto. Before the sixteen the case for Albania is being pleaded by M. Pierre Cot; the British case is being conducted by a team of eminent legal brains consisting of the Attorney-General (when he is not concerning himself with the affairs of Mr Sidney Stanley), Sir Eric Beckett of the Foreign Office, Professor Waldock and Mr R. O. Wilberforce. Britain is not pulling any punches in this matter; the Government has given it the importance it deserves, and its case is a very strong one. But, whatever the result, it is a fact of vast significance that an ugly international incident is being dealt with, not by the unilateral acts of a sovereign state, but by "due process of law."

* * *

Larger Papers—Larger Sales?

The Government have permitted themselves to be outmanœuvred on the question of newsprint. Mr Wilson has

allowed the hope of larger newspapers which he held out last week to become emasculated by a concession on circulation. Thus papers will, from January, 1949, be only a very little larger in size because more copies will be sold. No one can say that the British public is starved of newspapers: 60 per cent more copies of the London dailies and 70 per cent more copies of the national Sunday papers are sold than before the war. The trouble is that there is so little in them that the public cannot possibly be well-informed.

Additional newsprint—which is now in sight—can be used either for more copies of papers of the present size or for more pages with the present circulations. Of the two, the second is obviously preferable—indeed, it is on the need for this that the case for more newsprint has always been based. The Government should have insisted that every additional ton of newsprint should go into more space; it is not beyond the wit of man to devise a method of permitting competition for circulation without an increase in the total amount of copies. The whole of the balance would then be used for news, and would have provided larger papers at once. As it is, all the penny paper readers will get is an extra page every other day, which is what they got during the first part of 1947 before dollars expenditure on newsprint from Canada was cut.

As it is, they have compromised with the desire of several proprietors for still larger circulations and the readers of the penny dailies are to have six pages on only three days a week, instead of on four or five, or eventually six days a week that would otherwise have been possible.

The reason for the proprietors' insistence on circulation is financial. With newsprint at £42 a ton (compared to £10 a ton in 1937) a 25 per cent increase in newsprint consumption per copy is a serious matter which cannot necessarily be recouped by advertisement revenue from the extra pages—and a 50 per cent increase would be worse. The effect of the new concession falls differently on different papers according to their circulation and advertisement rates, but at least one of the papers with the larger circulations will be faced with diminished profits. There is thus a direct incentive to increase revenue by increasing the circulation at the expense of extra pages. What is remarkable is that this Government—of all Governments—should have swallowed the argument.

* * *

The Burden of Hospital Treatment

The latest and last statistical summary of King Edward's Hospital Fund for London records the work done by 159 voluntary hospitals in 1947, and their revenue and expenditure. From it some idea can be formed of the mounting burden of hospital treatment. It is interesting to note, first, that compared with 1938 fewer beds were open (17,893 against 18,651) and consequently there were fewer new in-patients (287,746 against 307,292). Yet the number of nurses, including midwives, working in hospitals in Great Britain had increased during the same period from an estimate of 114,300 to some 130,000. Thus, in the London voluntary hospitals at least, the increase in the supply of nurses has gone to shortening nurses' working hours rather than to opening more beds.

This increase in the number of nurses, together with the increase in their salaries, has naturally led to a huge increase in the maintenance cost of a patient. The average weekly cost of an occupied bed in the hospitals covered by King Edward's Fund has gone up from £3 19s. 7d. to £11 4s. 0d., which is largely accounted for by the increase in the item salaries and wages. Part, however, of the increase in this item can be attributed to the greater number of paid specialists working in hospitals since the war. This will also partly explain the rise in the cost per attendance of out-patients from 2s. in 1938 to 5s. 3d. in 1947.

But the rise in the cost of hospital treatment, whether out-patient or in-patient, is not only due to the higher salaries paid to the workers in hospitals. It is also due to the increasing amount of work done for each patient—more pathological and X-ray examinations, more blood counts, more physiotherapy, more occupational therapy, and so on—which means that in addition to the ordinary medical and nursing staff, itself much expanded since the war, there are a whole host of auxiliaries and technicians. The burden that this increasing amount of work done for each patient places on the hospital service, and ultimately on the country as a whole, has been discussed in the medical press and was commented upon in *The Economist* of April 24, 1948 (page 666). Can the country afford to allow the cost of its hospital services to increase indefinitely? The answer is obviously that it cannot, but who will be brave enough to impose a check?

Communists on Local Government

It is rarely that sound sense emanates from the propaganda of the Communist Party. Its document on the future of local government, however, correctly diagnoses the administrative and financial weaknesses of the present authorities, and deplores their loss of functions and independence and the emergence of new regional bodies of a non-elective character. It seeks a remedy in the creation of newly elected regional authorities, whose size would vary locally but would lie somewhere between that of a county and of a Civil Defence region. It recognises that the need for such authorities is most urgent and unmistakable in the large industrial conurbations, now administered by a medley of antiquated local units and intruding Government agencies. The plan would also refurbish and reorganise the minor authorities, so that they could take part—either directly or by way of delegation—in the administration of health and education. Some transferred functions, such as hospitals, would be handed back to the regional councils. Both regional and local authorities would be directly elected.

All of this is sound sense (with the possible exception of a proposal for regional income tax) and sound democracy. Why, then, is it said? The Communist Party is in the happy position of having few local councillors or established local interests whose susceptibilities it must respect. It is therefore nicely placed to take up the cudgels for local democracy against the increasing encroachments of the central Government. Anyone who thinks that the Party would have any respect for local democracy, if by mischance it ever came to power, is extremely simple. The theme is just a useful stick which has come conveniently to hand through the dilatoriness and timidity of the other political parties. Still, sense is sense—whoever states it—and those who have a greater claim to speak for local democracy would do well to study the document.

Separate Opinions in Tokyo

The long-postponed verdict in the Tokyo War Crimes trial, the "Far Eastern Nuremberg," has entirely lacked the dignity and impressiveness of its European prototype. After the general principles of juridical responsibility for the preparation and waging of aggressive war had been established at Nuremberg, there was never any reasonable doubt that the Japanese leaders who had promoted the attacks on China, Britain and the United States would be liable to the same conviction from an international court as had fallen upon the principal Nazis, and the known record of Japanese atrocities against prisoners of war and civilians was such as inevitably to involve the highest military authorities in responsibility for crimes against the laws of war. As far as General Tojo and his accomplices are concerned, the law has taken its expected course. But it was not expected either that the Indian member of the Court would enter a dissenting judgment totally repudiating the majority verdict and exonerating all the

The Economists' Bookshop

New West End Branch

The Economists' Bookshop Limited has now opened a West End branch at 30a, Bury Street, St. James's, London, S.W.1 (in "The Economist" building). A selection from our stock is on view at Bury Street, where the hours of business are: Weekdays, 10 a.m. to 6 p.m.; Saturdays, 10 a.m. to 1 p.m.

The chief stock of books continues to be held at 11/12, Clement's Inn Passage, where the hours of business are: Weekdays, 9.30 a.m. to 6 p.m. (to 7.30 p.m. on Tuesdays and Thursdays during the University term); closed on Saturdays.

Telephone and postal enquiries should be addressed to:

11/12 Clement's Inn Passage, Aldwych, W.C.2

Telephone: CHAncery 7508

accused, or that the President of the Court would make a personal attack on the Emperor, who had not been before the Court, and, by hardly veiled implication, on General MacArthur for not having permitted him to be brought to trial. It might have been thought that the Japanese were already sufficiently aware of the dissensions among the victors of 1945 without this painful exhibition of fundamental disagreements. The disunity would be less deplorable if it consisted merely of differences of opinion between individual judges, but it is sufficiently well known that they reflect differences of attitude in their respective countries, for the position which the Indian Congress Party took up in 1942 precludes the view of Japan's record which is normal in Britain or the United States, while the demand for the trial of the Japanese Emperor has been a political speciality of Australia. The dramatic advertising of differences of Allied policy cannot fail to deprive the judgment of the impressiveness which it might otherwise have had in the eyes of the Japanese people.

* * *

More American Help for Japan?

After a trip to the Far East last spring, the US Army Under Secretary, Mr William Draper, recommended that Japan be given assistance along the lines of the European Recovery Programme, although on a less ambitious scale. His proposal was blocked by the economy-bent 80th Congress; but with the prospect of a new and more benevolent Congress, General Draper has returned to the fray. In an interview last week he pointed to the spectacular effect on the Western German economy of US aid and argued by analogy that what American money has done to revive Germany could be repeated in Japan. Because of ECA help and increased production Germany would need less direct aid next year, he said, and suggested that the saving be applied to the task of reconstruction in Japan.

These arguments may carry more conviction in Washington than in Europe. The Continental as well as the Lancashire textile industry is already aroused over what it regards as the menace of Japanese competition, and a fresh reminder of this view has now come from Belgian textile manufacturers. They note that under the new trade agreement between Japan and the sterling area, over half of the Japanese exports will consist of cotton goods, and they see in this a further threat to their own textile industry, already suffering from high costs and lack of orders.

At this stage General Draper is probably only kite flying, since Congressional consideration is unlikely before January at the very earliest. However, in the long run it is probable that no barrage of protests from the European textile industry will deter the Americans from earnest attempts to make Japan "pay its own way."

* * *

Unesco's Third Conference

It would almost seem that the United Nations Educational, Social, and Cultural Organisation, which began its third annual conference in Beirut last Wednesday, has during its short existence gone out of its way to lay itself open to adverse criticism and unkind mockery. It is only too easy both to criticise and to mock. There is no reason to suppose that the financial scandal, over which the British authorities made a well-meaning but misguided attempt to draw a veil, was anything but a misfortune such as might afflict even the most promising international organisation. But it is, to put it mildly, highly regrettable that when nearly as much as one-third of Unesco's budget is spent on official salaries and administrative expenses, there should still be as much administrative incompetence and laxity as there undoubtedly is.

It is also only too easy to judge Unesco by the most ridiculous and far-fetched of its projects. It is true that the scheme to compile a world philosophy has been quietly dropped, but in the present state of the world the proposed compilation of a catalogue of world music does not seem a matter of burning urgency. And last July it was reported that the group of social scientists (including a Brazilian sociologist, a Hungarian marxist, and a Norwegian philosopher) who were engaged on a study of "the causes of tensions which make for war" were about to issue an agreed statement which would define "a minimum area of working agreement between opposing ideologies." What practical use is this to anyone? Its futility is emphasised by the further statement that each of the scientists engaged on the "tension project" is also producing a separate statement on his own views which in each case is over four times as long as the agreed statement. If the organisation is determined to go on making itself ridiculous by attempting to run before it can walk, there may be something to be said for holding the present conference in the comparative obscurity of the Lebanon; in the long run, however, it can surely ill afford to lose the publicity and well-informed criticism which a meeting in Paris or London would bring it.

But it would perhaps be more constructive to judge Unesco by its better efforts, especially as there are indications that the organisation is now making a real effort to pull itself together. It should not be forgotten that it is responsible for the distribution of 500,000 books to libraries in countries devastated by the war, and that it has recently financed twenty-seven scholarships in the United Kingdom to provide training facilities for educationists dealing with problems of educational reconstruction in war-devastated countries. These are only two examples of the kind of practical, useful work, well within the scope of Unesco, which will do far more to realise its ideal of constructing the defences of peace in the minds of men, than any of its more grandiose projects. Unesco cannot survive unless it realises its own limitation. It cannot comprise within itself the chain of common educational, social, and cultural activities which, it is hoped, will gradually bind mankind together. It can only be a link in that chain, but it could be a strong and reliable one.

Moves in East-West Trade

After many months of negotiation and hopeful publicity, the project for a World Bank loan which would help to finance increased timber exports from eastern Europe in exchange for machinery from western Europe has moved a step nearer realisation. It is reported from Geneva that the World Bank has agreed in principle to such a loan as part of its general encouragement of multilateral trade. The scheme has been sponsored by the Economic Commission for Europe, which has long attempted to stimulate east-west trade in the interests of both parties.

The loan is for $8,000,000, and will be divided among the eastern timber-producing countries. The credits will enable these countries to start buying machinery for the timber industry, and their orders will be placed in those western European markets most anxious to increase their timber imports—Great Britain, France, Belgium, Denmark, the Netherlands and Italy. Once this equipment has been installed, the recipient countries hope by 1956 to raise their normal timber exports by $120 million. Out of this $120 million the eastern countries will repay their World Bank loan. The western importing countries will be expected to underwrite the Bank loan and to extend further credits in their own currencies to the eastern buyers of machinery.

During 1947 the western countries concerned obtained little more than half their prewar timber imports. If the new scheme is successful, then by 1950 imports from eastern Europe will have increased to a point where the western group is obtaining approximately their prewar imports. (It is assumed that there will be no fluctuation in timber supplies from other sources.)

On the face of it, and given the urgent need for timber in western Europe, it is certainly to be hoped that the proposed trade materialises, even if the returns on the original investment are slow. Before too much is made of the proposal, however, it should be remembered that this is a plan which can be carried out and a pattern which can be expanded only if the west is ready to provide credits for eastern reconstruction and to accept eastern assurances that the repayment goods will ultimately be forthcoming.

Simultaneously news has come from Warsaw of another agreement to expand east-west trade. Belgium and Poland have signed a trade agreement involving Polish exports of approximately £6,750,000. In return for Belgian chemicals, dyestuffs and machine tools, Poland is to supply coal, timber and foodstuffs. It is not yet known whether the foodstuffs category will include any grain. Since the end of the war Poland, in fact, has had a grain deficit which was made good by the Soviet Union and south-eastern Europe, but it hopes to have a small surplus for export in 1948-49. The trade each way is equal to about 6 per cent of Poland's annual exports and 1.5 per cent of Belgian exports. But until more information is available about the contents and quantities involved, it is impossible to assess the value to the two participants of the new agreement.

Two Colonial Development Areas

British Guiana has an area of 83,000 square miles, and British Honduras one of 8,900 square miles. Between them the two colonies have a population of less than 500,000. It is, therefore, not surprising that to the planners it seemed attractive to investi-

The fable of the well-dressed man

A Visitor from another land once exclaimed in admiration at the spartan way of life he found in a certain isle. 'Ah!' he cried, 'I fear you must despise the superior elegance of my attire!' His hosts discreetly forbore to point out that his suit had come from their own best tailors, his sword from their own armourers, his hat and boots from their native hatters and cordwainers. They wisely preferred things that way round.

Britain's best merchandise is the quality of her manufacture, which is still the envy of other nations. TI is busily selling British skill in the form of wrought light-alloys, precision steel tubes, bicycles, ski-sticks, electrical equipment and automobile parts. Every dollar which can be made that way is needed, and every softer coin.

UNDERWOOD SUNDSTRAND

CLASS 'D' ACCOUNTING MACHINE

An all-purpose, fully automatic Accounting machine equipped with two cross-computing Registers, eight accumulating Registers, and Front-Feed Carriage. Maintains accounts in perpetual balance, and enables up-to-the-minute totals, sub-totals and balances to be obtained instantly without extra work. Ideal for Pay Roll, Stores Accounting, Costing, Analysis, Public Utility Billing, Municipal Accounting, etc.

Two machines that, between them, supply the answer to every problem connected with the writing and simultaneous computing of accounting records, giving greater speed, simplicity, and complete mechanical control over accuracy. Both machines have extreme flexibility of operation and quickly pay for themselves in improved efficiency and lower costs.

UNDERWOOD ELLIOTT FISHER

ALL ELECTRIC ACCOUNTING MACHINE

For all records that require typing, adding, subtracting, with simultaneous accumulation of individual column totals and simultaneous cross-computation of one or more balances. All electric operation. Standard typewriter keyboard. Exclusive Flat-Writing Surface gives unequalled speed in handling forms which may be of paper or card stock, in original only or with copies alike or different in shape and size.

gate whether the two colonies could be populated from the neighbouring British West Indian islands, which have a total area less than that of British Honduras alone but a total population of more than 2,250,000. And what more natural than to tack on to this the possibility of finding a home for displaced persons from Europe?

The results of the investigation have now been given in the report of the British Guiana and British Honduras Settlement Commission (Cmd. 7533), and they are not encouraging. There is hardly any scope for European settlement, which would have to be confined to skilled workers who would help in the development schemes proposed for the colonies. But the commission is also very cautious about the prospects of these schemes either for the successful development of British Guiana and British Honduras or for the transfer of the surplus population of the West Indian islands.

> It is unfortunately a fact that all of these schemes [for agricultural enterprises] . . . will to an unusual extent have to carry the capital and recurring cost of housing, sanitation and social services. . . . They will be launched at a time when the cost of capital equipment is at a peak, but their products when they mature may encounter falling prices. Finally, there is no escape from the difficulty . . . that settlers must be offered reasonably high material standards in their new surroundings, if any but the social dregs are to be persuaded to move. . . .

And on top of all this heavy initial expenditure is the burden of the very low productivity of West Indian labour.

The upshot of the commission's very justifiably cautious approach is a ten-year plan for the development of both colonies, costing at least £14 million and possibly £22 million, which would absorb 100,000 men, women and children from the islands. This plan could hardly fail to benefit the two colonies—their economies are so stagnant now that the influx of even a little capital should have some effect. It is much more doubtful whether Great Britain in the foreseeable future could carry out this new overseas investment. It is certain that the proposal to transfer 100,000 people from the West Indian islands, which represents the natural increase of only two years, would have no effect on their gross over-population. In short, one feels that the commission has made the very best of a very poor assignment.

Down with Homework

Delightful as it is to see preserves unrationed and the sugar ration increased by two ounces, these concessions do not compensate housewives who like to make their jam at home. Before August 15th they were able to draw a pound of sugar a head every month instead of the jam ration and thereby feed their households on real jam instead of the sweetish pink pulp which is all the manufacturers seem able to produce under the price ceiling. Their style has, of course, been considerably cramped since the days when, as the preserving season approached, grocers displayed sugar in fifty-pound bags, and Seville oranges stacked the fruiterers' shops. But this is the final blow; another creative skill has been sacrificed to maximum production for the undiscriminating.

This is a process by no means confined to jam. The home handyman who is hampered by lack of wood. The home dressmaker finds that the materials particularly suited to her needs have all been sent to the manufacturers. Schools, young people's clubs, and technical training centres are starved of materials; and it is almost an established rule (as anyone going round the Christmas shopping counters will speedily find) that of two toys or games that which presents a finished article, needing only to be used or admired, will be relatively plentiful, while that calling for constructive ability and the use of tools will be practically unobtainable. The small craftsman is hardly better placed than the school or home; and surviving workers in the crafts, driven out not by the competition of the machine-made article, but by the impossibility of obtaining materials, find no successors.

The utility schemes have brought great gains, improving both mass standards and mass design. Clothes and furniture have benefited. But along with much shoddy and pretentious merchandise there has vanished not merely the article *de grand luxe*, but the honest small-scale product, quantitatively unimportant no doubt, but constituting an invaluable leaven, a link with past traditions of craftsmanship, an inspiration for the development of secondary skills to mitigate the one-sidedness of a mechanised and specialised life. The controls of the planned economy are mopping up whatever pockets of individual artistry in work the Industrial Revolution left undisturbed; and that grand old Socialist William Morris must be revolving rapidly in his grave.

Shorter Notes

On page 786 of *The Economist* last week reference was made to part-time directors of British European Airways. There are no such persons in the Corporation. The reference should have been to British Overseas Airways.

*

In a leading article "The Enemy Within," which appeared in our issue of October 23rd, we said, "In building, the President of the union is a Communist." In the issue of November 6th we said that the union referred to in that article was the Amalgamated Union of Building Trade Operatives. We wish to make it clear that we were not referring to the Amalgamated Union of Building Trade Workers, of which Mr Harry Adams is President. We accept Mr Adams' assurance that he is not a Communist, and apologise to him for any inconvenience or distress which has been caused to him by our inaccurate statement.

*

British Jewry has some great gestures to its credit. Worthy to rank among them is its present appeal for £10,000 to pay for the despatch of a team of British Jewish workers, "together, if possible, with an Arab doctor resident here who desires to associate himself with us in our work" in order to work indiscriminately among Jews and Arabs. Their role will not be easy in a country as anti-British as Israel is at present. But they deserve great credit for setting the Israelis an example not only of tolerance but of maturity of mind. Their chairman is Professor Norman Bentwich and their president Rabbi Dr Leo Baeck.

*

The agreement between the British and American Governments on visas, which has been hailed as a triumph of enlightened co-operation, is, in fact, nothing of the sort. The British Government has agreed to regard the possession of a valid American passport as sufficient qualification to enter Britain. The American Government, on the other hand, using as an excuse the necessity of visas for the operation of its complicated immigration laws, has agreed to abolish only the fees hitherto charged for them. Therefore British visitors to the United States must still continue to be treated like potential anarchists, submitted to the indignity of messy fingerprints, and asked impertinent questions about their movements and their political beliefs. It is apparent that the privileged British diplomats who negotiated this one-sided bargain have never had to waste hours queueing in Grosvenor Street.

From *The Economist* of 1848

November 18, 1848

The peculiar circumstances which led to the extensive speculation in railways during the last four years are well worthy of being referred to, as having a most important bearing upon the future prospects of this species of property. Prior to the commencement of the recent railway mania in 1844 this species of property had acquired a reputation for security and profit greater than any other similar speculations which had preceded them: while nearly every other class of joint stock speculations, from 1824 downward, in which the accumulating capital of the country had been invested, had ended in ruin to the parties engaged, railways, as they then existed, appeared to promise a permanent security for very large dividends. Capitalists began to distinguish and recognise in railway investments a species of security which other undertakings do not offer. They saw that in the case of joint stock banks, which had been the favourite objects of investment in 1835 and 1836, and in all other similar undertakings in which the whole subscribed capital is dealt with by directors in a floating state, which involves extensive credits left to the entire discretion of directors, that not only is the whole paid-up capital always exposed to be lost, but that liabilities to an indefinite amount may be, and in many cases have been, entailed upon the companies, which ended in the entire ruin of whole classes of shareholders. In the case of railways they saw that the subscribed capital was actually invested in a *bona fide* property, which, be it a little more or a little less profitable at any particular time or under any particular management, still represented the subscribed capital entire, and that they could never be exposed to any liability beyond the actual amount of their shares. A consideration of these facts was mainly instrumental in giving so decided a bias in favour of railway undertakings in 1844, in preference to any other speculations, and the same must ever continue to form a marked distinction in their favour as safe permanent investments.

Letters to the Editor

Can Uno Survive Palestine?

SIR,—In your issue of November 13th, you call attention to the grave duty which now rests upon the United Nations to enforce its decisions concerning Palestine at the peril of committing suicide if it fails to do so. The responsibility and duty in this crucial test case are further accentuated by certain facts which do not seem to be recognised in England.

The general impression in the public mind is that the Arabs have lost the war in Palestine as a result of their incompetence and disunity. This attitude completely ignores the fundamental fact (attested by well-informed British observers of high authority) that the Arabs had fought well and successfully until the imposition of the first truce and that the military situation was developing in their favour when that truce was enforced. The situation was only reversed after the truce, and in large measure as a result of the truce, which the Arabs had been prevailed upon to accept under extreme moral pressure coupled with the threat of sanctions. Indeed in the case of the British Government certain sanctions were actually applied (namely the stoppage of arms supplies to the Arab States and the postponement of the payment of the instalment of Britain's subsidy to Transjordan which was then due).

Apart from coming at a moment when things were going reasonably well for the Arabs, the truce in its operation all along has played entirely into the hands of the Zionists, who with their powerful international ramifications are able to circumvent it and to go on importing large quantities of arms, ammunition and aircraft from many countries, notably from Czechoslovakia. These are no mere allegations, but facts, which have been boasted of by the Zionists themselves, which have been reported by the UN truce observers, and which have become the subject of official diplomatic protests by the United States Government to the Czechoslovak authorities. The Arabs on the other hand have been effectively hamstrung by the truce. Thus the United Nations have largely contributed to put the Arabs at a disadvantage, and if now Uno fails to enforce its decisions against Jewish aggression and defiance, it will have not only betrayed its own principles, but have committed a shocking injustice against the Arabs.—Yours faithfully,

EDWARD ATIYAH,
Secretary

The Arab Office,
92 Eaton Place, London, S.W.1

Rough Justice in Germany

SIR,—Though in substantial agreement with your correspondent's review of denazification (in *The Economist* of October 23rd), I am not satisfied that the concluding paragraph, in assuming National Socialism to be only an expression of political nationalism, is an adequate appreciation of the situation today.

The Nazi manifestation of nationalism will probably not recur as a dangerous force, if only because the social determinants, such as the Jewish influence, have largely disappeared. However, the legend that Nazis at least tried to defend western civilisation bolsters that supra-nationalism which equates one world with the final triumph of the west and sees in Britain the inevitable rival for American support. Anglo-American differences over dismantling policy and the "trade unionist" outlook of our own representatives foster this danger.

The widespread belief that the Nazis brought social unity through controlling organised capital—and organised labour—is a reminder that National Socialism was not only an exaggeration of nationalism but a perversion of socialism, born out of the insecurity of the German lower-middle class. Ironically, the international crisis has delayed the popular organisation of political authority while the economic crisis has been leading to the reconcentration of real wealth in the same hands. (Continued Military Government supervision of government in itself promotes the influence and prestige of outside "interests".) This time the middle class has not been ruined by inflation, but the circumstances of millions of refugees from the east have only been aggravated by the revival of prosperity since currency reform. There is, as yet, no mass unemployment, but thousands of young men from the middle class—ex-officers, former Nazis, graduates of the overcrowded universities—are professionally frustrated and socially insecure. They may not believe in Hitler, but they do see too many "Hitler-rejects" now in authority.

The gains of the Liberals from the CDU and SPD—parties which have become identified respectively with the industrialists and the unions, the sudden success of the youthful National Democratic Party at Wiesbaden, the recent "German Union" movement for an undoctrinaire political elite, should raise doubts whether the legal conception of rough justice was enough. Denazification was perhaps not in itself a mistake; the failure lies in taking it as an effective substitute for the creation of a new German society in the National Socialist aftermath.—Yours faithfully,

A. LIDDELL HART

Office of the Political Adviser,
HQ, CCG (BE), Berlin, BAOR 2

Hungary and Czechoslovakia

SIR,—I do not expect you to approve of everything done by the Hungarian or the Czechoslovak Government, but I am sorry that their brave and intelligent decision to eliminate the differences between their countries should be dismissed by you, in your issue of October 30th, as "a remarkable piece of demagogic dishonesty." This decision uproots Hungarian revisionism which has rightly been denounced by our neighbours as a threat to peace. It brings to an end the persecution of the Hungarian minority in Slovakia which has rightly been denounced by my countrymen as an infringement of human rights. In the meantime, it creates a basis for close economic co-operation between the two countries, a step constantly urged by Czechoslovaks like the late Thomas Masaryk, Hungarians like Michael Károlyi and some of the best British statesmen and scholars who have dealt with East-European affairs. It has, I think, also been urged in your columns until now. It was considered a noble aim yesterday. Should it be considered a crime today merely because the present governments are bringing it about?—Yours faithfully,

PAUL IGNOTUS,
Press Attaché

Hungarian Legation, S.W.1

THE WORKING PARTY REPORTS.

— Some Accounting and Economic Aspects —

Issued by the Association of Certified and Corporate Accountants

"I have the impression that shareholders would have been spared some of their recent shocks had all directors up-to-the-minute knowledge of the trading results of their Companies. For that reason I recommend a careful study of the pamphlet 'Working Party Reports—Some Accounting and Economic Aspects.'"
—*Financial Times.*

"The booklet emphasises the need for accurate and extensive cost accounting in all manufacturing units to make industry more competitive."—*Yorkshire Post.*

"The booklet comes at an opportune moment, for it contains an alphabetically arranged summary of the accountancy aspects of the seventeen reports which have so far been published."—*The Accountant.*

22, BEDFORD SQUARE, LONDON, W.C.1.

Dear Sir,

Take every day the leading newspapers from all over the world. Extract systematically their reports on all the important events in Economics, Politics, Social Questions. Condense these to their salient points, stripped of journalistic trimmings, stating sources in every case. Add a liberal sprinkling of statistics, charts, diagrams, tables. Quote verbatim essential speeches, communiques, agreements, etc. Check and counter-check each item against the others, verifying every point with the aid of governmental press releases and official documents. Translate the non-English data into English. Index and cross-index all entries alphabetically in scholarly manner. Print the whole material every week in clear-cut columns on durable paper in loose-leaf issues for filing in a special binding case. Base all this, if you can, on 17 years' specialised experience in "scientific chronicling" and you have—

Yours factually,
KEESING'S

P.S. *In case you can't, just fill in the coupon.*

Distribution of Building Resources

SIR,—A note in your issue of November 6 purported "to make a rough estimate of the (building) resources devoted to new houses during 1947." The statistics, most of which have always been published in the Digest, as presented in the table support the arguments consistently put forward in *The Economist*, but unfortunately they are misleading. A comprehensive estimate is included in the table for expenditure on new housing, but the total of £554.6 million is not by any means the total value of building work, but only as correctly described at the head of the table, the value of work licensed or approved.

You should have been aware from the *Economic Survey for 1948* that the total expenditure on building in 1947 was estimated at £850 million. The discrepancy between this estimate and the total of £554.6 million arises from two causes: the value of unlicensed work under the old £10 ceiling and work "authorised" by Government Departments other than the Ministry of Works on public utility undertakings, transport undertakings, schools, other local authority premises and so on. The proportion of building resources devoted to new housing is not, therefore, the 36.8 per cent shown in the table but 25 per cent. This ratio is equally apparent from the building labour statistics. According to the latest issue of the Digest, of the total 1,024,000 operatives employed, some 229,000 were employed on the construction of new houses including site preparation, or 22 per cent. On similar definitions it has been estimated I think that in 1938 about 300,000 were so employed out of a total of some 950,000, or 32 per cent. Thus the total labour force at present employed on new housing is not only substantially less than before the war, but also forms a much smaller proportion of the total. Before, therefore, challenging the size of the housing programme and arguing that more resources should be devoted to industrial building, you should make clear that despite the acute housing shortage and the need to augment industrial mobility, many fewer building workers are employed on housing and many more on industrial building than in the years before the war.

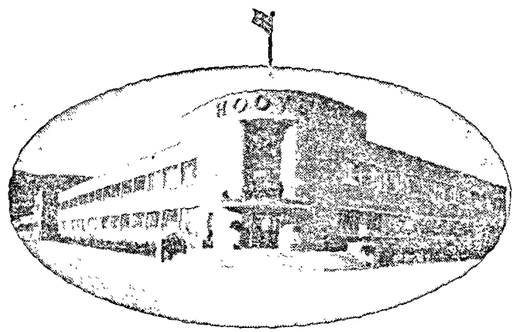
To secure more industrial building and a smaller total building labour force, for which your note also pleads, implies either that new housing should be reduced not by a few thousand, but practically to zero, or that repair and maintenance work on housing should be drastically restricted. New factories or mines without adjacent houses for workers are useless. The building licence regulations attempt to curtail repair work on houses, but notoriously cannot properly be enforced. In view of the lack of maintenance over a period of at least six years, the wisdom of strict enforcement is indeed questionable.—Yours faithfully,

ARTIFEX.

[No figures have been published for the "discrepancies" the writer quotes. Nor can they be dug out of the Ministry of Works. Little confidence can be placed in Government estimates of this kind given in the *Economic Survey* when Sir Stafford Cripps in the figures he gave last week showed that the estimates for capital investment had not been fulfilled and that non-industrial constructional work had risen sharply.—EDITOR.]

Workers' Control

SIR,—I was considerably surprised to learn from *The Economist* of November 6, 1948, that the London Committee for Workers' Control has a minimum programme "aiming in the first instance at establishing the rule that workers should elect the controlling boards."



In point of fact, no hard and fast policy decisions of this kind have been taken by my committee, whose activity, for the time being at least, is limited to the calling of an exploratory conference for November 14th. The committee has been fortunate in securing for this conference the support of a wide range of opinion, varying from those who would indeed consider the election of boards by the workers of all grades as a minimum aim to those who consider that an extension of the present consultative methods would constitute a sufficient advance.

The only statement of aims which has been issued on behalf of the committee is that contained in its letter of invitation to the conference referred to above, which reads: ". . . aiming at the extension of the participation of the workers of all grades in the control of industry."—Yours faithfully,

W. J. TAYLOR

London Committee for Workers' Control,
12, High Street, London, N.W. 3

Hoover Limited open a new factory at Merthyr Tydfil

On October 12th the new Hoover factory at Merthyr Tydfil was officially opened. This is the third new Hoover factory to be opened since the end of the War — the others being at Cambuslang, Scotland, and at High Wycombe.

The Merthyr Tydfil factory has been built for the manufacture of electric washing machines and is the largest factory in the country to be devoted exclusively to this purpose.

At the Company's principal factory at Perivale the entire production facilities are required to meet the huge demand for the world-famous Hoover Cleaners. The factory at Cambuslang, Scotland, is manufacturing Hoover Fractional Horse Power Motors in ever-increasing quantities, while the High Wycombe factory is working at full capacity producing Hoover Shaded Pole Motors, Commutators and Switches, all of which are used extensively by the Electrical Trades. Both for home and overseas markets Hoover production is constantly expanding, thus playing an ever-increasing part in the effort to raise the nation's standard of living.

HOOVER LIMITED

Head Office and Principal Factory: PERIVALE, GREENFORD, MIDDLESEX
Fractional Horse Power Motors: CAMBUSLANG, SCOTLAND
Electric Washing Machines: MERTHYR TYDFIL, SOUTH WALES
Shaded Pole Motors, Commutators & Switches: HIGH WYCOMBE, BUCKS

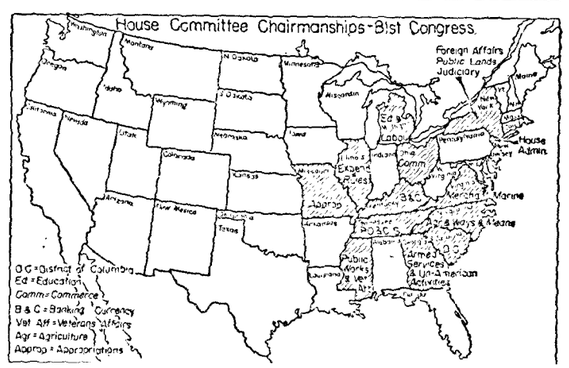
AMERICAN SURVEY

Democratic Control of Congress

(From Our US Editorial Staff)

THE capture of both houses of Congress by the Democrats was almost as unexpected and dramatic as Mr Truman's victory over Mr Dewey. The present Senate contains 51 Republicans and 45 Democrats. After January 3rd, the division will be 54 Democrats and 42 Republicans. In the House, there will be an even wider swing. The Eightieth Congress started with 246 Republicans, 187 Democrats, and two members of the American Labour Party. The Eighty-first Congress will start with 263 Democrats, 171 Republicans, and one representative of the ALP.

Because of the election to fill a seat vacated by death in Louisiana, there were 33, rather than the conventional 32, Senate contests this year. All but one of the newcomers have had political experience. Two of them have served in the Senate before: Mr Neely of West Virginia and Mr Gillette of Iowa, who in 1938 defied Mr Roosevelt's attempt to purge him as a conservative. Six more come to the Senate with experience of the House; five have been Governors; all the others have held local office, with the exception of Mr J. Allen Frear Jr, an unexpected winner in Delaware, who is a business man. Some of these gentlemen may have to rebut charges of having spent too much money on their campaigns, or of other irregularities, before they can take their seats.



Much has been written about the effect of this new blood upon the temper of the Senate, and of the comparable effect of the new members in the House. It is at any rate safe to say that the relatively large number of new faces makes for flexibility; fewer Congressmen will be faced with the problem of reconciling their records with the country's new mood. It is also probable that there has been a shift in a liberal direction, though it is hazardous to generalise in view of the tendency of American elections to be decided by considerations that have little relation to clear-cut issues. Thus, of the 20 Senators who voted against the Marshall plan, 14 were not running this time, five were defeated, and one was re-elected. In the House, of the 79 who opposed the European recovery plan, eight did not seek re-election, 48 were returned, and 23 were defeated. Forty-nine Senators opposed Mr Barkley's amendment which would have extended the Reciprocal Trade Agreements Act for three years. Of these, 36 were not running, eight were defeated, and five were re-elected. Of the 227 members of the House who opposed the companion Doughton amendment, 16 did not offer themselves again, 148 were re-elected and 63 were defeated. But it would be risky to take these last figures as evidence of anything more than the Democrats' capacity to win in given districts.

Actually, the thesis for which the organisation of the new Congress will probably provide the most evidence is that American political parties are better organised to win elections than to govern once they have won. From the party divisions, it might appear that Mr Truman will have no trouble in securing Congressional assent for his programme. Certainly there will be a change from the strained relations which have existed since 1946 between the White House and the legislature. But these had touched an all-time low; in his more pugnacious moments, Mr Truman called the Eightieth Congress the worst in history; and in his more tolerant moods, the second worst. Party majorities make a great difference in the treatment of legislation which gets to the floor, and here Mr Truman is unquestionably on fairly firm ground. But the Committee structure through which Congress does its business determines to a very great extent which proposals reach the floor, how the final Bill is drafted, and under what sort of rule it shall be discussed. An analysis of the incoming Democratic chairmen tempers the view that a revised New Deal is going to have things pretty much its own way.

★

At the time when the Congressional Reorganisation Act was in the making, there was much discussion of the custom of automatically allotting committee chairmanships according to length of service (the seniority rule) and many students of good government strongly urged its abolition. In the beginning, the Senate and House rules provided that each committee should elect its chairman. But it soon became customary for the party leadership to take the initiative in making appointments and in the Senate length of service hardened early into a major criterion. In the House, however, the hard and fast application of the seniority rule dates only from the revolt against Mr Cannon, the Speaker, staged in 1910 by a group of insurgent Republicans under Mr (later Senator) Norris with Democratic support. Before this Mr Cannon had served as chairman of the all-powerful Rules Committee, had enjoyed certain powers to recognise speakers on the floor, and had named all the committee chairmen. If his dictatorship was the frying pan, the fire of appointment by seniority may now prove equally intolerable.

The main issue at the Democratic convention this summer was the influence of the South on the party. At the election the Southern States' Rights ticket carried four of the traditionally Democratic states, with 38 electoral votes. The majority of Southern Democrats thus displayed a reluctant loyalty to Mr Truman, but many of them are as unenthusiastic about the campaign commitments that made his victory possible as they are about the President himself. Yet these are the very men who, thanks to the one-party system of the South, have been able to establish the longest records of service in Congress. If the seniority rule is rigidly observed, the bulk of the chairmanships in both the Senate and the House will go to the South. The opportunities this situation affords for the Republicans were hinted at by Senator Flanders of Vermont, a Republican, in a speech a few days after the election. He urged, as both desirable and practical, a working relationship with some of the "solid Democrats"; he may reasonably be interpretated as having meant solid (*i.e.*, anti-Truman) Southerners. Nearly a hundred Democrats in the new House of Representatives are Southerners, but only about a dozen of them have consistently liberal voting records.

The concentration of committee chairmanships in the South and East which will follow if seniority has its way is indicated by the maps. In neither house would there be any representatives, among the chairmen, of either New England or the West Coast. In the Senate the upper Mississippi valley and the whole Ohio basin is a blank expanse, and in the House there is but one chairmanship indicated for all the states west of the Mississippi. By way of contrast, eight of the fifteen Senate chairmanships and ten of the nineteen House chairmanships go to states in the South, five of them to South Carolina and Mississippi, the states which produced and supported the Dixiecrat candidates. How is this going to suit the Democrats in the states where the spectacular victories were won, either in the national or local contests, such as Ohio, Michigan, Indiana, Illinois, Minnesota and Iowa, or the Californians who took the Republican vice-presidential nominee's own state away from him?

*

The situation on the House Rules Committee illustrates the power of the Southern conservatives. The party division on this committee will be eight Democrats to four Republicans. On the opposition side the outstanding legacies from the Eightieth Congress are Mr Allen of Illinois and Mr Brown of Ohio. Mr Halleck of Indiana and Mr Michener of Michigan, if he does not remain with the Judiciary Committee, are likely to take the other two Republican places. All are active conservatives. The Democratic chairman, according to seniority, would be the aged Mr Sabath of Illinois, a New Dealer at heart. But flanking him and working against him at every opportunity, though they belong to his own party, are Mr Cox of Georgia and Mr Howard Smith of Virginia. Even if the remaining places were filled by ardent supporters of the Administration, the voting records of these two would appear to insure a six-to-six tie on all liberal measures, enough to prevent a Bill reaching the floor.

The decision on whether to maintain the seniority rule intact, or to take into account certain other considerations (already used in connection with the appointment of all members except the chairmen)—such as regional origin, personal qualifications, personal preferences and party regularity—will be made in the Committee on Committees. The fact that Mr Doughton of North Carolina will become Chairman of the House Ways and Means Committee is particularly relevant, because the Democratic members of that committee serve as the Committee on Committees.

Whatever decision is taken, the probability of change during the life of the Eighty-first Congress is suggested by the ages of its committee chairmen and the certainty that they will be worked hard. Mr Sabath is 82, Mr Doughton is 85, Mr Bloom, the future chairman of the House Foreign Affairs Committee, is 78, 14 of the 19 House chairmen are over 60. In the Senate, Mr McKellar, of the Appropriations Committee, is 79, Mr Connally, Senator Vandenberg's successor, and Mr Hayden, of the Rules Committee, are 71. Ten of the 15 chairmen are over 60. One recalls the changes that occurred in another old Congress, that elected in 1931.

To suggestions of reprisals against the Dixiecrats, Mr Truman has repeatedly stated that he is not vindictive. But it could surely be regarded as effective leadership, rather than vindictiveness, if Mr Truman used his influence, and his freedom from political debts, to combat three dangers which threaten his legislative programme. One is the use of the filibuster in the Senate, the second the blockade in the House Rules Committee, the third a coalition on the floor between conservative Southerners and the Republicans. One approach to the problem would be to take full advantage of the Party Policy Committee instituted under the Reorganisation Act and used only desultorily by Mr Barkley in the past. And if the steering committees seriously worked out time-tables for the reporting out of Bills, the last-minute jams that occur every year could be mitigated and a more comprehensive approach achieved to the multitude of Bills faced by each session. An effort could also be made to revive the party caucus, or party meeting, and make its decisions binding on members.

Much will depend on the handling of the civil rights programme, to which both parties are committed. More than any other single issue, this will determine the relation of the ex-Dixiecrats and reluctant Southern Democrats to the party as a whole. Mr Truman's victory raises a fundamental question. In the past the Democratic Party has been held together only by the emergence of a dominant personality. Can the issues which divide it into factions today be solved, rather than sublimated? The Democrats are in control of the Presidency and both Houses of Congress. Can they also control their own members?

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

A Free and Responsible Press

[FROM OUR US EDITORIAL STAFF]

"DEWEY and Warren won a sweeping victory in the Presidential election yesterday," began the main story in an early edition of the *Chicago Tribune* of Wednesday, November 3rd, under the headline "Dewey Defeats Truman." The Republican ticket, the story went on, was leading Truman and Barkley "pretty consistently in northern and western States." This last statement was printed upside down, a hint, perhaps, from Colonel McCormick as to the real truth, but too subtle for the average reader to understand. In another column it was stated that "G. O. P. retention of control of the Senate seemed assured." (The G. O. P., or Grand Old Party, is an American synonym for the Republicans.)

In the next edition the headline had become "G. O. P. Wins White House!", Dewey and Warren had now "swept the country," "the Republican ticket had won by an overwhelming majority of electoral votes," President Truman "had gone down to defeat with few States outside the South"; in the House the Republicans were "promised a measure of control even greater than that they enjoyed in the Eightieth Congress," and Senator Brooks and Governor Green "were indicated winners" in Illinois. At that time, according to the latest figures (which were printed in an adjoining column for those who preferred fact to fancy), with barely one-fifth of the Chicago votes counted, the Democratic candidates for Governor and Senator were already leading, Mr Stevenson by 150,000 and Mr Douglas by 130,000. The only returns on the races for the House of Representatives showed (as was admitted on an inside page) that three Republican members were threatened in Chicago; a little thought might have suggested that what was happening in one city could also be happening in others. With less than one-third of the Presidential votes in Chicago reported, Mr Truman was 120,000 ahead. A simple calculation, on the basis of the last two elections, would have told anybody that such a lead at that stage meant a close race for the Presidency, with the odds slightly on Mr Truman, and that Senator Brooks and Governor Green were already not even "indicated," but almost certain, losers.

This was only the most flagrant example of what might be politely called the excessive optimism of the Republican press. Though few announced flatly, as did the *Chicago Tribune*, that Mr Dewey had won, "an overwhelming majority" maintained right up till the last moment that he was winning. No great harm, perhaps, was done by such representation after the polls had closed, but the persistence with which one and all blindly followed their own propaganda long after the figures had proved them wrong is a symptom of a disease which has been eating the moral fibre of the American press for some time.

*

No newspaper need be ashamed of having made, as nearly everyone (including *The Economist*) did, an honest mistake and of having taken Mr Dewey's election for granted. Mr James Reston, who travelled all over the country for the *New York Times*, afterwards wrote that each reporter, including himself, "was carried away by facts he did not verify, by theories he did not fully examine, and by assumptions he did not or could not check." Just as Mr Dewey was wrong, he went on, because he was too isolated with other politicians, "so were we too isolated with other reporters, and we, too, were far too impressed by the tidy statistics of the polls."

It is not only on candidate's trains and during campaigns that reporters are too isolated with each other. The syndicated columnists, the coast-to-coast radio commentators, and the Washington correspondents of the leading newspapers all over the country lunch and dine with each other incessantly and produce much of their news by inbreeding. Although the majority are Democratic in their political sympathies, in their attempt at objectivity they remember that Washington, which is full of government employees, is not representative of the country and that they themselves are not representative of their own income group. When they go round the country they visit the influential men in each community and come away confirmed in their belief that the rest of the country is as stupid as they had always thought. They have no time, when trying to cover the whole of this continent, to find out what the people are thinking who have no influence, only votes. Even if they had, it would be courageous, if not presumptuous, to trust their own limited observation against that of the local experts. The parallel with 1945 in Britain is too obvious to be comfortable for the press of either country. Mr Reston recognises this when he says that "we were wrong, not only on the election, but what's worse, on the whole political direction of our time."

Granted the truth of this last remark, and its truth is undeniable, it is doubtful whether any amount of checking, examination and verification would have persuaded even the most diligent reporter that Iowa, Ohio and Wisconsin, which voted for Mr Dewey in 1944, were going to vote for Mr Truman in 1948, or that California, in the face of the Warren myth, would go Democratic again. And any reporter who had sensed the political direction of our time and foreseen a Democratic victory might well have lost his job before November 2nd arrived to vindicate him.

It is there that the real danger to the objectivity of the American press and radio lies. There are not many newspapers or networks whose proprietor consciously influences the news—though there are some, prominent among them being the *Chicago Tribune*—but there are any number whose staff, aware of the proprietor's political views, try to please by playing up whatever story will soothe him and hiding away in the back pages information which would upset his liver. As 65 per cent of the daily press, with 78 per cent of the circulation, was pro-Dewey, there was little that was favourable to Mr Truman on the front pages.

The wish, in this campaign, became father to the news; predictions were multiplied by propaganda to produce tainted news which, in turn, was used as the basis for further predictions. In the end the predictions became accepted as the fact and, on election day, were printed and sold as fact. It is a disaster which has been waiting for the American press for some time. The pressure of trying to get the news on the streets first has made them, in recent years, more and more organs of prophecy, until they are hardly newspapers at all. Only on the sports pages do they any longer wait for events to happen before reporting them.

Last among the causes of this year's blunder is one which, it is to be hoped, will not recur. For it the Republican candidate and his team of Svengalis must take the blame. It was well known that newspapers in New York State had been, since Mr Dewey became Governor, under continuous pressure to make their reporters at Albany toe the line and that some had even been removed at his "request." During the campaign the area of this pressure was widened and unsympathetic reporting by radio commentators and correspondents of national newspapers brought instant complaints to their employers. There was every reason to believe that, once in office, the new President would have been unforgiving and ruthless in his treatment of publishers who had failed to take the hint and rid themselves of such impediments to national unity. Not many would have given away to such blackmail, but it would hardly have been human for them not to hope, or even suggest, that their reporter's criticism might be toned down a little in future. There are, after all, many plums that can be fed to a good boy by the Administration in power.

Perhaps it is as well that the temptation has been so miraculously removed. With all its paper, the American daily press is still the best in the world. The danger that "responsible" may come to be defined as "amenable to pressure from the right quarter" and "free" as "taking out on the weak the irritation which it is impolitic to display against the strong" may be averted under a President who has learned, from long experience, to accept not only honest criticism but also insults and lies as part of the burden of office, and to remain unaffected by any of them.

American Notes

Maritime Blockade

Longshoremen along the east coast have now sealed up ports from Hampton Roads to Portland as effectively as Mr Bridges and his allies have blockaded the west coast since September 2nd. Only the Gulf ports maintain any sea contacts with the outside world. This is no concerted movement, but the result of two shipping strikes which, happening to coincide, have virtually paralysed shipping to and from the United States. All they have in common is that in both cases all the delaying devices of the Taft-Hartley Act have been exhausted, and the effect is to disrupt the flow of supplies on which the rest of the world is dependent.

Unlike the west coast maritime unions, the International Longshoremen's Union (American Federation of Labour) has an excellent record; this is the first coast-long strike it has ever called. The causes of such a drastic step are still obscure. As a Federal 80-day injunction came to an end last week, the union leaders approved a contract embodying many concessions by the employers, including a guarantee of four hours' pay for every work call. The wild-cat strike which followed eventually swept the leaders along, and Mr Ryan, the union president, under pressure, it is suspected, from a more radical rival for union favour, proclaimed the strike official. The union leaders who had approved the pay increase of 10 cents an hour granted in the contract are now demanding the 50 cents. rise originally requested.

In the west, the prospect is brighter; there are hopes that the strike may be settled by November 25th—appropriately Thanksgiving Day. The employers who loudly proclaimed they would negotiate with no union whose officers had not signed anti-Communist affidavits have hastily forgotten their fleeting resemblance to Generals Clay and Robertson. They have empowered to negotiate with Mr Bridges, the fellow-traveller *par*

excellence, the president of the Hawaiian Employers' Council, who has been successful in the past in concluding pineapple and sugar contracts with the Bridges' union. By far the most significant development has been the working out and signing of a formula for union and employer responsibility in labour relations. The national Congress of Industrial Organisations and the Employers Council of San Francisco are to underwrite any contract as a guarantee against local recklessness or bad faith. In future disputes it will be necessary, before the strike stage is reached, for the local union to consult the CIO and the employer to consult the Council.

The Taft-Hartley Act failed to prevent either of these crippling strikes; on the west coast, indeed, its ban on the union hiring-hall, and the anti-Communist affidavits it requires, were among the excuses for the stoppage. But it did postpone them. When Congress debates a substitute for the Taft-Hartley Act the effect of shipping strikes upon foreign policy will strengthen the hand of those who believe in the retention of devices to curb and delay strikes in essential industries.

House-cleaning by the Rival Firm

Mr Truman, recovering in Florida from his triumph, is presumably making up his mind which of the resignations, which the members of his government will automatically tender to him by January 20th, will be accepted. The amount of help, both financial and otherwise, which he received from leading Democrats during the election campaign varied considerably, but only a very few of them gave him as much support as he had a right to expect. Mr Truman will therefore begin his new term remarkably free of commitments and also, for the first time, free of any legacy from his predecessor. His choice of Cabinet officers and advisers may provide the first indications of how he intends to use the new authority and prestige with which he returns to Washington.

If, however, Mr Truman were to embark upon any large-scale reorganisation of the government at the lower levels, he would need a ruthlessness which can hardly be expected of him, since it would involve the sacrifice of agencies which the Democrats themselves created and of individuals with whom they have worked for many years. Even Mr Dewey would have had difficulty with vested interests of this type if he had been given the chance to undertake the "house-cleaning" which he foretold when he came to Washington, and, although Mr Truman is probably as well aware of the need as was his rival, for him the task would be Herculean.

This is the main reason why Washington today discounts the possibility of any far-reaching action being taken on the report of the Commission on the Organisation of the Executive Branch of the Government (discussed in *The Economist* of October 16th), which is to be presented to Congress in January. In addition, notwithstanding its bipartisan membership, its meticulous avoidance of political influences and the support which Mr Truman has given to its work, the Commission has an unavoidably Republican flavour, since Mr Hoover is its chairman, since it was first proposed by the Republicans and since its inevitable criticism of many government practices must be unfavourable to the party which has been in power for so long.

But the report may at least give useful guidance to those government departments which are already preparing their own house-cleaning schemes to forestall the arrival of a strange charwoman. The Commission, in its first public statement, issued last week, tried to appeal to as many as possible of those who will be affected by its later suggestions, which will almost certainly be less palatable. The proposals which have so far been tentatively approved recommend higher Federal salaries, especially for officials earning over $5,000 a year, who were left out of the increases voted by the last Congress (an omission which a Senate Committee is already preparing to remedy), the decentralisation of Federal hiring, the abolition of Senate confirmation of postmasters—which allowed the Republican Senate to refuse to confirm over 700 appointees this year, so that they could be replaced after the Republican victory—and, finally, relief for the President from his burden of detailed work by the consolidation of budget, personnel, procurement and other agencies.

The Chinese Dilemma

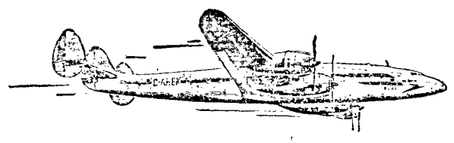
Washington, so long the proponent of the "open door" in China, is now desperately searching for some means to lock the Chinese door against the Communists. The defeated Republicans at least have the bleak satisfaction that the Administration can no longer ignore the impending Chinese catastrophe. It was the Sinophiles among the Republicans who insisted that, while American policy was barring and bolting the European entrance, it had left the backdoor in Asia wide open; it was a Republican Congress which, against Administration wishes, included in the Foreign Assistance Act $400 million for China, of which $125 million might be spent on the purchase of arms. It was Senator Bridges who sent Mr Bullitt—a Democrat who moved into the Dewey camp just before the election—to prepare the way for the aid a Republican Congress was pledged to grant.

The crisis in China is no longer under-estimated. Aid from funds of the Economic Co-operation Administration is continuing—on an "hour-to-hour basis," but discussions already are proceeding on ECA policy in the event that all of China may fall into Communist hands, that there may be a coalition government, or that China survive half Communist, half Nationalist. The National Security Council, on which the Services are all represented, has met to formulate recommendations on China. Shipments of arms bought out of China's ECA funds have been hastened, though without any certainty as to what forces will exist to use them. Most of these arms are still in the pipeline.

The situation is regarded as so desperate that many of those who in the past have strongly urged aid to China now feel that attempts to retrieve it would merely waste energy and resources. Senator Styles Bridges' demand for a special session of Congress to authorise more aid to China is not taken seriously. President Truman has made it clear he will not recall the old "do-nothing" Eightieth Congress for one last appearance before the Democrats take over in January; the Republican leaders who also have the right to reassemble Congress seem no more enthusiastic.

*

Mr Marshall's hostility toward a positive policy in China can now be seen to have been shortsighted. But the Republicans have helped to make a bipartisan approach impossible by using China as a stick to beat the Administration and arousing the suspicion that they were less interested in China itself than in a means of setting up a rival to the Marshall plan for Europe. This suspicion persists. But the Republican *Herald-Tribune*, after listing the serious consequences of a Communist China, does not hesitate to declare that the loss of China would not compare in significance with the loss of the industrial and potential military resources of Europe, and to point out that if Europe is to have first call on American aid, no vast increase in aid for China is possible. Actual participation in the Chinese conflict is unthinkable.



One expedient being discussed is that of by-passing Chiang Kai-shek—whose reputation has suffered a sad falling-off—and diverting military aid to those local commanders likely to make the best use of it. This would not make any more machine-guns available, nor would it eliminate the risk—felt to be very great—that in the end it would be the Communists who would profit; the Nationalists have been negligent about letting the Communists capture American arms. But in addition, the by-passing of Chiang Kai-shek would ensure the collapse of the central government; it would make it easier for the Communists to pick off their opponents one by one; and, a technical point, under the Foreign Assistance Act, aid may be sent only to qualified governments, not to individuals. The Chinese dilemma appears as a choice, not between two, but three or more evils.

What Happened to California?

One of the myths on which the Republicans built their edifice of over-confidence was that, with Mr Warren as vice-presidential candidate, California was safely on their side. It was less mythical than most of their theories, since they only lost the State by about 30,000 votes and, if Mr Wallace's performance had been less disappointing, he might easily have been as helpful to them in California as he was in New York. The Republicans had some justification (in so far as any public opinion poll can now provide justification) for assuming that Mr Warren would bring into the national campaign the bipartisan support which had given him the Governorship in 1946. A west coast newspaper, which questioned voters on their vice-presidential choice alone, found that a big majority in both parties preferred Mr Warren to Mr Barkley.

But in the polling booth the candidates for the Presidency still completely overshadow their running mates; that was perhaps why the Republican belief that Mr Warren's reputation for progressiveness and humanity would make up for Mr Dewey's deficiencies proved false. Then, too, progressive Californians had

"It's easier to do business with a man than an address!"

Sydney last month, Johannesburg last week . . . New York next week! As my firm's export manager, I find it pays to do business with a man and not just an address. Correspondence is cut to the bone, misunderstandings are prevented, problems are discussed and solved right on the spot. That's where Speedbird service and B.O.A.C.'s more than 72,000 miles of world-wide air routes come in. B.O.A.C. usually flies where I want to go, and Speedbird service gets me or my freight there in a hurry and right on schedule. Arranging my trips is easy. The local B.O.A.C. Appointed Agent fixes everything. No crowds or confusion, and no red tape. Everything goes like clock-work, but with this important difference: there's the *personal* touch!
About the actual flight . . . It's good, *really* good — from beginning to end. If you're hungry, you can eat wonderful food — "on the house" too. If you're tired, the comfortable seats practically lull you to sleep. Everything — and I mean *everything* — reflects B.O.A.C.'s 29-year-old tradition of Speedbird service and Speedbird experience.

Food for tomorrow's hungrier millions

To avert mass starvation and world strife, more food must be produced. Man in his ignorance, however, has raped vast areas of the good earth. Soil erosion, like a cancerous growth, has doomed miles of the land to sterility.

While some men work desperately to renew the depleted land, millions more must husband its goodness where it still remains. The "Ferguson System" of *complete* farm mechanisation can make a major contribution to this world-wide effort.

It co-ordinates the action of "Ferguson" tractor-implement units. It gives more traction without the built-in weight that packs the soil. It gives finger-tip and automatic hydraulic depth control of implements carried by the tractor. Its versatility and manoeuverability enable the world's farmers to produce more food at less cost from every available acre.

* Every week, for Harry Ferguson Ltd., more than 1,000 "Ferguson" tractors are manufactured by The Standard Motor Co. Ltd., and more than 5,000 "Ferguson" implements by foremost British manufacturers.

85

good reason to feel that birds in the Democratic hand were worth more than those in the Republican bush. Republicans in the State Legislature have shown how easy it is to make difficulties for a liberal Governor and some at least of the Republicans in the Californian delegation at Washington (notably Representative Gearhart, who has now lost his seat) could have been counted on to follow this local example if Mr Dewey had been elected. Finally this year, unlike 1946 when Mr Warren's name appeared on both party tickets, Democrats would have had to desert their party in order to vote for him; the Republican statisticians, who were counting on the affection of the many newcomers to the State for the only Governor of California they had ever known, may have forgotten that a high proportion of them came from southern States where it is heresy to vote Republican—and from classes where it is rapidly becoming equally heretical.

Mr Warren's progressiveness was to some extent a liability to him in his own State, since many wealthy businessmen distrusted him so much that they sent their campaign contributions direct to Mr Dewey at national headquarters. As a result of this, and probably also of the Republican certainty of victory, money was short in California; Dewey buttons were almost unobtainable (and it was not because the demand had been so great) and the scarcity of party posters on the hoardings in Los Angeles and San Francisco was very noticeable in comparison with, say, Chicago. In part this was due to the fact that no Senatorial seat was at stake and that there was no Congressional fight in many districts; under the Californian system of cross-filing in primary elections (in which the parties choose their candidates), the same man can offer himself, and is often chosen, as the candidate for both parties in the primary, and the battle is over long before election day. But the lack of party posters was made up for by the number of billboards which argued for and against the numerous referenda which were also on the ballot. Many of these dealt with questions of close concern to the liquor, real estate and other business interests and absorbed not only the money but also the time of those who might otherwise have devoted more attention to the Republican cause.

The Call of the South

With the end of the sellers' market in textiles the call of the South is once more being heard in New England. On the same day in September that the Textron Corporation announced its intention of shutting down two mills in Nashua, New Hampshire, it rubbed salt in the wound by revealing expansion plans, to cost $11 million, in Georgia, South Carolina and Puerto Rico. The decision was challenged by the textile workers' union, and invited investigation by a subcommittee of the Senate Commerce Committee under Senator Tobey (of New Hampshire). This case of industrial migration is hardly typical, for the Textron Corporation only acquired the Nashua mills in 1946 and apparently more for the contribution they could make to the financial structure of the parent company than with any permanent intention of turning out blankets at a profit. The corporation, as well as the union, has been dilatory and half-hearted about applying its "New Nashua Plan" for increasing production, cutting costs, and putting New England back on the textile map.

The Nashua mills employ 3,500 work-people, and the pressure of publicity has persuaded the company to make a new effort to keep certain operations going, as long as they are profitable, which will save 1,200 of these jobs. Other industries are also to be brought in. But to keep the Nashua mills fully employed in the face of weakening prices would, according to Mr Little, the president of Textron, have meant a loss in 1949 of from $1,000,000 to $3,000,000. Textile mills during the summer have been curtailing operations to keep pace with demand and avoid over-production.

In these circumstances the lower production costs of the south are again becoming as attractive as they were from 1914 to 1940, when the south's share of the national production of cotton cloth rose from 14 to 75 per cent. Wage differentials have narrowed; textile wages are only from 3 to 10 cents lower in the south then they are in New England. But the productivity of southern workers is higher; the unions are still much weaker, so that welfare and holiday costs are lower, and the south has a surplus of labour, which makes it possible to run three shifts a day instead of the single shift for which it is possible to find workers in New England. Relative power rates and transport costs are also important; in the south a textile mill may be situated in a cotton field and on top of a coal mine. Local taxes are very much smaller.

In addition, the industry-hungry cities of the south often offer sites and even plants free or at low rentals to migrating firms. They will, in some cases, even build a mill to the employer's specification and, if he buys it, offer ten years' tax exemption. But any new exodus can be only in the nature of a postscript; most of New England's textile industry has already moved. Of 18.3 million spindles in New England in 1925, less than 5,000,000 remained in 1945.

THE WORLD OVERSEAS

The End of "External Association"

(From Our Dublin Correspondent)

THE repeal of the External Relations Act, which is now certain to take place, represents a natural constitutional development. It should not surprise anyone who is conversant with modern Irish history. The Irish claim for national independence is based on the fact that Ireland is one of the oldest European nations, with clearly defined frontiers and a well marked and distinctive cultural heritage. The Home Rule Party was willing to accept a reasonably limited measure of autonomy, but ever since the rising of 1916 the full claim for an independent republic has never been abated. Dominion status was the formula used in the Treaty of 1921 to define Eire's position. Even those Irish statesmen who accepted the Treaty regarded Dominion status as a transitional phase—as "freedom to achieve freedom." A powerful minority, however, which became a majority in 1932, always agitated in favour of a departure from the far-sighted gradualism of the supporters of the Treaty in favour of the immediate loosening of the Commonwealth tie through an expedient described as "external association." This was obtained in 1936 by the External Relations Act which enables the head of the British Commonwealth for the time being to accredit diplomats on behalf of Eire. Internally Eire is a republic with a President. When the External Relations Act is repealed the King will disappear from the Irish Constitution, even as a symbol of Commonwealth association. Except for the solution of the Partition problem, the programme of Irish nationalism will be completely fulfilled.

The repeal of the Act will, however, sever the intimate relationships existing between Eire and the Commonwealth countries only in the unlikely event of any of those countries deciding on such a severance. It was understood by most of those who voted at the general election for the parties forming the present Government that it would foster good relations with Great Britain and it has in fact done so. The Trade Agreement concluded in June has greatly strengthened the economic connections between Great Britain and Ireland. Personal relations between Irish Ministers and the Ministers of the Commonwealth countries have been excellent. Constant meetings have taken place during the summer at which the utmost cordiality has prevailed. Several Irish Ministers have stated that the repeal of the Act is designed, not to weaken, but to strengthen the ties that bind Eire to Commonwealth countries, with which it shares so many common interests and ideals—"a common pattern of life." The link between the Commonwealth countries has not been weakened by the passage of the Statute of Westminster and, they argue, there is no reason why it should be weakened by this further step. The Crown is no longer the appropriate symbol of Irish association with these countries. It is distasteful to many Irish people with long historical memories. In future, co-operation must rest, not on formulas, but on the fact of mutual recognition of common interests.

The Status of Foreign Country

When the Act is repealed, Eire may be deemed to have left the Commonwealth and to have assumed, from the British standpoint, the status of a foreign country. Attempts have been made on

political platforms and in the British press to make the flesh of Irishmen creep with the thought of the unpleasant consequences that such a development would entail. It has been suggested that Irish labourers and professional men would no longer be able to seek employment in Commonwealth countries as freely as they can do so at present, and that the exclusion of Irish doctors from the Commonwealth Medical Registers would inflict a severe blow on the Irish Universities. These dangers are undoubtedly exaggerated. The position of Irish doctors and dentists is protected by statutes. In so far as any practical inconveniences may arise, there is no reason why they should not be resolved by mutual agreements based on the good will that certainly exists in Ireland and, it must be hoped, in the other countries concerned.

The suggestion has been made that Eire would no longer enjoy the benefits of imperial preference. Mr Costello emphasised at a recent press conference in Dublin that most of the existing mutual rights and preferences enjoyed throughout the Commonwealth arise from specific agreements and not from Eire's Commonwealth status, and that their abolition would prove injurious to Great Britain and other Commonwealth countries, as well as to Eire. The adverse balance of trade between Eire and the Sterling Area indicates the value to many Commonwealth countries of preferences in the Irish market. In trade relations material self-interest might take the place of political sympathy in enabling mutually satisfactory arrangements to be achieved.

From the standpoint of internal politics, the Government's decision to repeal the Act has strengthened its position in the country, which is more politically tranquil than it has been at any time since the Treaty. No symbol or formula is worth the price of internal dissension. Since the Treaty, Eire has incurred the evil of civil disturbance and strife for the purpose of preserving a symbol which has proved to be a stumbling block in the internal politics and has achieved nothing of value in its external relations. There is no foundation for the statement that the repeal is the price paid by Mr Costello for the support of Mr MacBride and his party. That allegation has been categorically denied both by Mr Costello and Mr MacBride. The members of all sections of the Government have always disliked the External Relations Act, and have regarded it as an ignoble compromise which condemns Eire to a constitutional status defying definition—a republic at home and a monarchy abroad. By deciding to repeal the Act, Mr Costello has taken the wind out of the sails of the opposition, who can hardly oppose the last step towards the establishment of the republic which has always been so dear to their hearts. Mr de Valera has been outwitted and outflanked.

The objection has been raised that the repeal of the Act will render the other great problem of Irish politics, partition, less easy of solution. The realistic answer to this suggestion is that partition is, for the present at least, insoluble on the basis of voluntary action on the part of Northern Ireland. The "die-hards" in the North will regard the new Eire after the repeal with no greater loathing and aversion than they regard it today with its "external association." Mr Costello put this point well at a recent public meeting in Dublin when he referred to the fruitless sacrifices of some, and the scorn and ridicule cast on many, "whose efforts were directed towards maintaining, in one form or another, the Commonwealth relation in the hope, now proved to be without foundation, that thereby the unity of our country might be achieved." If partition is ever solved it will be as the result of external pressure which will pay scant regard to the constitutional niceties involved in the operation.

[*The above article, like all contributions from our Correspondents in overseas countries, should not be taken as necessarily representing the views of* The Economist.]

After the Swedish Elections

[FROM OUR SWEDISH CORRESPONDENT]

AFTER a turbulent election campaign, which stimulated party politics and paralysed national policy, there are now some signs of a political relaxation in Sweden. The voices of gods and giants have sunk to a more usual and pleasant level. The Socialist Government has yawed to starboard a little, but whether enough to solve its economic problem is open to doubt. For the recently published five-year plan admits that the balancing of the country's trade and payments will be a difficult task for years to come.

In spite of the great gains of the liberal *Folkparti*, the Social Democrats kept their position remarkably well in the elections on September 19th, and Mr Erlander retained his office with a palm branch in his hand. After stressing this victory of defence and dropping the Minister of Trade, Mr Gjöres, who had maintained a good reputation in trade and industry, but was nevertheless unwilling to continue with a thankless job, the Prime Minister immediately approached the *Bondeförbund*, the Farmers' Party and one of the three Opposition groups to the right of the Social Democrats, and asked them to join the Government. The Farmers replied, very diplomatically, that they were in favour of a National Government, composed of all democratic parties, and, secondly, that they were ready to go on negotiating with Mr Erlander. When the Social Democrats declined the first alternative, they did, of course, accept the second. The ensuing discussions between the two parties, which lasted until the opening of the *Riksdag's* autumn session on October 18th, failed to convince the Farmers of their duty to help Mr Erlander. With a more cautious approach the Prime Minister might have avoided this new addition to his list of shipwrecks; he has not been lucky in his efforts to gain the other parties' support for the Government's anti-inflation policy. He had, however, something in his hands when he returned from the Farmers, although not the bird itself. The two parties had agreed not only to differ but also to agree on some questions which are as yet unknown but which should duly appear on the agenda of the *Riksdag*.

Cabinet Changes

Mr Erlander then reconstructed his Cabinet. Mr Sven Andersson, principal Secretary of the Socialist Party, and Mr Sköld, Minister of Agriculture, were made Ministers without portfolio. It is well known that the latter will act as an equivalent to Cripps-before-Dalton-resigned—as a Minister of Co-ordination in the economic field, but with the famous veteran, Mr Wigforss, still going strong as Minister for Finance. Mr Sköld is commonly looked upon as an obstinate and somewhat rude person. This is not expected to be too big a handicap for his new post provided he does not get wrong ideas in his head. As Mr Wigforss, who is quite as doctrinaire as Mr Dalton, has openly admitted that, for reasons of age, he belongs to those members of the Government who intend to resign at a suitable moment, Mr Sköld is very likely to be his successor.

The Prime Minister also launched an eight-point programme to promote disinflation and the export drive. In the *Riksdag* debate on November 3rd both the *Höger* (Conservatives) and the liberal People's Party (*Folkparti*) accused the Government of having stolen their clothes while they were bathing. This programme thus seems to be acceptable to the Opposition, including the industrialists. Mr Erlander's New Deal aims at creating conditions favourable to exporters. Home consumption has to be cut down in order to release goods for foreign markets. Credit will be restricted without, however, any increase of the interest rate. Wages and prices will be stabilised at their present level, The budget surplus should be kept at least as great as this year (540 million kronor), investments controls are to be continued and directed in favour of the more productive enterprises. Export firms will have priority when applying for building permits as well as for import licences, rationed materials and credits. Although this programme is not at all sensational in itself, it indicates that the Government has taken the export drive to heart.

The election, but still more the prospects and necessities of the five-year plan, have produced this changed attitude. The plan, which was handed over to the OEEC on October 21st, has been carefully prepared by a committee under Professor Svennilsson.

According to the plan, which is officially called "the long-term programme," this country will be able to pay its way in 1952-53, with a level of ordinary imports equivalent to that of 1947. This will require an increase in exports by 25 per cent of the 1947 volume. The present crisis of payments, with a total deficit last year equal to $400 million, depends not only on the well-known international difficulties and the occasional lack of balance in Sweden's own economy. As the report points out, the whole problem is aggravated by structural changes in industry. The native forests of Sweden have been overworked during the big expansion of the past, and the production of wood and wood manufactures, which used to dominate the export side of the country's trade, must not exceed the annual re-growth. Other export branches, therefore, will have to cover a proportionately larger part of the export drive.

Swedish industry increased its production by more than 50 per cent in the 30's and immediately after the war started a very ambitious investment programme. The five-year plan mainly

consists of a collection of these enterprises already begun. An increase of 10 per cent from 1947 to 1952-53 is expected from higher productivity.

The total harvest is also expected to rise by 8.5 per cent by 1952-53 without any enlargement of the cultivated area. Sweden will then be self-supporting in bread grain. The amount of electric power will be more than doubled during the period 1947-53. The iron and steel industry is already working on a great expansion scheme. Steel production will be 50 per cent larger in 1952-53; this means that 500,000 tons of steel will then be available for the needs of other countries. The engineering industry, finally, is faced with an important and difficult task. At present it does not export more than 20 per cent of its total production, compared with 37 per cent before the war. As manufactured goods must play an essential part in the export drive, the figures must be raised at least to the prewar level.

It is in the field of manufactured goods that the difficulties and uncertainties of the export programme can be clearly seen. Widely varied exports require a much more effective and widespread selling organisation than staple commodities. They are also particularly impeded by trade restrictions and do not easily find new markets. This is a considerable disadvantage in these times of bilateral trade when the direction of goods is decided on other grounds than those of ordinary business interest. It is also to be feared that Swedish exports will now meet less favourable conditions on several foreign markets than immediately after the war, and the question of prices is stressed by some critics. In this connection they believe that the five-year plan is too optimistic in forecasting an increase of income from shipping and shipbuilding by 30 million dollars at the end of the period. Another well-known obstacle is inflation and the demands of home consumption on goods which ought to be exported. Here the Government's remedies are not thought to be effective enough.

In these circumstances, therefore, the Conservatives renewed in the *Riksdag* debate their objections to the present policy of a fixed interest rate; and Professor Ohlin, the leader of the liberal People's Party, put forward a request for a depreciation of the krona to the same level as before the appreciation in 1946. The Prime Minister, however, immediately declined to change the Government's policy, arguing that higher interest and higher import prices would threaten the stability of costs and wages.

In this case it can hardly be doubted that the bulk of the controls and restrictions will still be needed in order to stop surplus purchasing power from doing evil things on the market, and the Opposition will probably try to keep their freedom of action and criticism as long as Mr Erlander's list of points seems in need of yet further additions.

Policing Singapore

[FROM A SPECIAL CORRESPONDENT]

SINGAPORE has hitherto been kept insulated with surprising skill from the Communist insurrection which has gripped the Peninsula. Life in Singapore is just as peaceful as it was before the trouble started. There are two main reasons for this, at first sight, puzzling phenomenon. First, although there are some wild and desolate parts on the island, especially in the west, there is not the same jungle that on the mainland permits the Communists to carry on their guerilla warfare. Second, the police have had good information, have acted with resolution, and have had the full backing of all the other authorities concerned.

In his recent budget speech to the legislative council the Governor, Sir Franklin Gimson, outlined some of the measures taken by the Government. The chain of events really started in January of this year when the Harbour Board took the bold decision to abolish the old system of contract labour and to substitute direct employment, a change which has since greatly increased output and reduced costs. The Singapore Federation of Trades Unions, the instrument which the Communists had created in order to gain control of the colony's labour, agreed to the change and, in return for some minor concessions, promised two months' industrial peace. They kept their promise, but used the time to prepare a large-scale strike which would bring the whole trade of Singapore to a standstill. On April 12th seditious leaflets and posters inciting the workers to violent action appeared in the Harbour Board area. Banishment warrants were promptly issued against the leaders of the Chinese section of the Communist-controlled Singapore Harbour Labour Union. Arrests were made and the Union's premises were raided. Here were found complete lists of the active members of the Singapore Workers' Protection Corps, which was really the strong-arm branch of the Singapore Communists. Since it had not been registered under the Societies' Ordinance, and was therefore an illegal organisation, the police had powers to arrest all active members without warrant. A number of arrests were made and the men convicted and sentenced. In spite of these arrests the SFTU continued its attempts, by violence and intimidation, to prevent the Harbour Board labourers from working. On April 26th and 27th hand grenades were thrown in the dock area. The police arrested more members of the Protection Corps, and the full list of members was produced in court. This finally caused the Corps to disintegrate, and those members still at large went underground or escaped.

Significant Communist Reverses

The SFTU had meanwhile asked the Government for permission to hold an assembly and procession on May Day. The Government gave permission for the assembly, but, in view of the hostile anti-Government character of last year's May Day celebrations, banned the procession. The SFTU replied saying that they proposed to hold the procession anyway. The Government promptly banned the assembly as well. On May Day itself all precautions were taken and the day passed off quietly. It was another significant reverse for the Communists.

Shortly afterwards there were some disturbances at local Chinese rubber factories such as preceded the outbreak up-country. One was burned down and a large sit-down strike was organised at another. Again the police acted firmly, turned up in great strength, arrested 140 men for criminal trespass, and sentenced 35 of the leaders to three months' imprisonment. Describing these various occurrences, the Governor said in his speech, "the government took the initiative at the psychological moment and maintained it." As soon as the emergency started up-country the police increased their road-blocks and intensified their searches. The Special Emergency Regulations came into force on June 24th. These gave the police power to arrest a man on suspicion and to detain him for 14 days. Within 14 days evidence has to be placed before the Colonial Secretary as to why he should be detained. If the Colonial Secretary thinks fit, he can be detained up to two years. Although there is no trial, he can "object" to his detention before a judge of the High Court. More than 1,000 men have been arrested under the emergency regulations, but most are released after screening; about 300 are now held. The day before the regulations came into force many of the Communist and labour leaders fled up-country or went underground. When the police raided the offices of the SFTU, the Malayan Communist Party and the New Democratic Youth League they found the premises deserted. Nevertheless, many important leaders have been picked up and arrests continue all the time. It is never difficult to obtain information about the doings of Chinese providing there is sufficient money with which to purchase it. Since the emergency began the officer strength of the police has been increased by 25 (only four from Palestine), the Special Branch by 50 more detectives, and the Special Constabulary has been raised from 444 to 644. The Government is hoping to be able to recruit Gurkhas for this special reserve force.

The effect of the emergency regulations in the sphere of ordinary crime has been to reduce it to a lower point than at any time since the war. Ordinary crime figures are almost back to prewar standards. There were only five armed robberies in September as against 52 for September, 1947. Equivalent figures for house-breakings were 72 and 126.

Similarly in the labour field there has been less industrial trouble since the emergency regulations than at any time since the end of the war, partly because many of the leaders have either been arrested or disappeared, partly because the rank and file have been nervous and somewhat frightened. Out of the 167 registered trade unions, 24 folded up in June owing to the disappearance of the leaders. No alternative or more moderate leadership took over these unions, which remained completely inoperative. But recently some officials have returned and letters addressed to the unions' offices are being answered, suggesting that the Communists have begun a re-infiltration into Singapore.

The ordinary resident of Singapore, European and Asiatic, after a brief period of anxiety in June, quickly regained his wonted calm. The top officials hope for the best but take a much more cautious and serious view of the situation. The Communists are tenacious, clever, ruthless, and will stage a comeback at the earliest opportunity. All south-east Asia is in a very disturbed condition at the present time. Only by unceasing vigilance and by using the same sort of prompt and determined tactics which they themselves would use can the enemies of the Government be kept in check, and order and prosperity maintained.

THE BUSINESS WORLD

Public or Private Purchase?

THE recent relaxations of controls, discussed in these columns last week, involved only an insignificant contraction in the range of direct Government trading. This absence of any important change raises again the whole question of the scope and purpose of the system of bulk purchase. In the past, the Government's case for the continuance of state trading in food and raw materials has rested on the argument that in a period of world shortage centralised buying is the only method of ensuring a continuous supply. On a number of occasions both the Minister of Food and the Minister of Supply have defended their policies on these grounds. More recently, however, the Chancellor of the Exchequer and the President of the Board of Trade, while still couching their arguments in terms of world shortages, have revealed a change of front. Sir Stafford Cripps referred to ten-year contracts with colonial areas; Mr Harold Wilson spoke of "basic" controls to ensure "economic recovery, industrial efficiency or full employment." Neither statement gave any specific definition of policy in relation to state trading, but both left the same impression—that, despite the improvement in world supplies of certain foodstuffs and raw materials, Britain is apparently no nearer the resumption of private trading than it was in the middle of the war. Indeed, in many respects it is further away. New long-term contracts for seven years have been signed with Australia and New Zealand for dairy produce and meat; another contract is expected to be negotiated with Canada shortly, while the whole concept of the four-year plan for western Europe suggests that some measure of state control is expected to be maintained over trading in the future. Moreover, as new sources of supply are developed within the sterling area to replace those of the western hemisphere, the scope for governmental trading may tend to expand.

It is true that, since the end of the war, as noted last week, certain commodities have reverted from public to private purchase. Except for wool, manila and sisal, the list of relaxations mainly comprises relatively minor commodities; it includes cork, bristles, lemons, acetone, liquid rosin, oiticica oil, pyrethrum, japanese silk, sunn hemp, manila copal, cotton linters. Despite these releases, the Government still remains the sole importer of some thirty-six groups of foodstuffs and about the same number of raw materials. These together represented 57 per cent of Britain's total imports by value in 1947—a surprisingly large proportion, which gives a clear indication of the scope of governmental commodity trading. The scope of detailed control is, of course, much wider still, for most of those commodities which may now be privately purchased are still subject to import licensing. Admittedly, in many instances the Board of Trade issues "open general" licences, avoiding the need for separate licences for each particular importation; but for a very large number of goods individual applications for permission to import are still necessary. This system is maintained mainly, but not entirely, as a means of controlling the expenditure of scarce foreign exchange by discriminating between one source of supply and another.

The extent of the Government's present trading operations can be seen from the accompanying tables. Table I defines the whole range of goods of which the Government is the sole importer, while Table II shows the scope of purchases by the system of long-term contracts. Such contracts have been concluded with some twenty-six different countries, most of which are within the Commonwealth—and practically all the commodities are basic foods. The contracts are for a varying number of years, but most of the more recent agreements, it seems, guarantee the purchase of the export surplus for at least seven years. Indeed, the Chancellor of the Exchequer has expressed his willingness to conclude contracts for as long as ten years. Most of the contracts are for the entire exportable surplus or a large proportion of it; in only a few instances have fixed annual quantities been agreed to.

The method of the long-term contract, as distinct from mere centralisation of purchases, is undoubtedly an important instrument in policies of colonial development. It might be the only method available to encourage production in areas which are technically unsuitable for expansion, but which nevertheless appear to the Government as desirable sources from a currency standpoint; in such cases, the risk involved is likely to be too great to attract private enterprise. Even such contracts as these, however, could be operated in conjunction with private trading, subject to a government undertaking to purchase, at a predetermined basic price, such supplies as might fail to find a market. Such an arrangement would at least have the advantage of giving some measure of the cost of the subvention required in the interests—real or imaginary—of exchange economy. If, however, a government department is made solely responsible for such contracts, it will inevitably tend to control all purchases of like commodities. Moreover, even when used in such special cases, the long-term contract is still subject to the fundamental weakness that, while it gives some price stability to both producer and consumer, it is unable to guarantee a minimum quantity of output. By assuring producers of their markets for the next few years, the purchasing authority hopes to encourage an expansion in output; but it cannot do more than that.

The arguments for (and, for that matter, those against) the system of long-term contracts are not, in any case, necessarily relevant to the general question of centralised buying as such. Such contracts are a specific form of centralised purchase; and in fact by far the larger quantity of goods purchased centrally by the Government is acquired under short-term contracts (up to twelve months' duration) or by spot purchases in large or small amounts. The list of the commodities thus purchased (see Table I) is impressive, even when those commodities which are also bought under long-term contracts are excluded; as a comparison of the tables reveals, supplies of goods provided by such contracts are generally supplemented by spot purchases. Goods acquired only by the method of short-term contracts or spot purchase—that is, those covered by Table I which are not also listed in Table II—include the essential raw materials, such as cotton, non-ferrous metals and timber, and the less essential foodstuffs, such as canned fish, canned fruit and citrus fruit. These purchases follow no general pattern; they are made as and when opportunities arise. In certain instances they are made by private traders acting as agents for the government department; in others the department does its own buying; and sometimes both methods operate side by side. Obviously, centralised buying conducted by such spasmodic and variable

methods cannot be justified by the arguments advanced in support of the placing of long term contracts.

During the war, centralisation—even without the support of long-term agreements—was dictated by many converging factors. It helped to ensure smooth operation of the rationing and allocation systems, which often required not only a central supply policy but also control of the channels of distribution—and the case for each of these was reinforced by the policy of stabilising prices by means of subsidies. Moreover, in some commodities, the mechanics of Lend-Lease and Mutual Aid and, eventually, the machinery of the Combined Boards, left the Government no choice in the matter. In other instances, the dominant or decisive influences were the need to economise shipping space and sometimes to achieve this by extremely detailed systems of allocation; the recurrent losses of supplies through enemy action, necessitating sudden changes of policy; and the exigencies of economic warfare and pre-emption. In the aggregate, such considerations gave the Government an overwhelming case for centralisation in all or most of the commodities it eventually embraced.

There is no such indisputable general case now, however reasonable the case may be in certain instances. Necessarily, some of the wartime arguments still apply, though usually with greatly diminished force. There is still a shortage of shipping space. There is still world shortage of most industrial raw materials and foods—though this season the supply of grains, cotton and certain other agricultural products is expected to surpass the prewar level. There is still need to ensure smooth rationing, still a control of many channels of distribution, still a system of price-subsidisation, though its range is reduced. Instead of Lend-Lease and Mutual Aid, there are ECA and the associated central planning through the OEEC. There is a paramount need to ensure economy of dollars and other hard currencies, out of which have arisen the policies of switching purchases to soft currency areas and of bilateral trade agreements. There are, in short, many excuses for centralised buying, but only rarely do they add up to a case which is demonstrably sound; for many of these desiderata, considered separately, could be satisfied in other ways. Where formerly bulk purchase was inevitable, now its merits are a matter for argument and nice judgment. It is perhaps for that reason that a further argument is now much emphasised by the advocates of the system. They contend that it makes for cheapness of supply. By analogy with the economies secured by large-scale buying in private trade, it is argued that the Government, being potentially the biggest buyer of all, can reap an even richer harvest.

This contention merits more detailed and objective scrutiny than it has yet received—or, indeed, than is possible for the outside investigator to attempt, given the paucity of data released about the Government's buying technique. But empirical reasoning leaves the case at best not proven, with a strong presumption that it is untenable. Admittedly, it is arguable that in certain phases of the business cycle the organisation of Britain's import trade before the war did not always assure the smoothest possible flow of cheap supplies. Britain was then the dumping ground for food and, to a less extent, for some raw materials. In many commodities, the bulk of the supply reached Britain, not through the initiative of the British merchant in seeking overseas sources, but rather through the action of the overseas producers or shippers, who customarily shipped to this country and maintained their own selling agents here. When market conditions were easy, this virtually automatic practice of shipping surpluses to Britain probably gave British consumers a price advantage over overseas consumers. But the opposite condition tended to arise in times of stringency, because the initiative in diverting supplies away from the British market rested solely with the overseas shippers. The best chance of justifying the claim that centralised purchase provides cheaper supplies than private trade therefore arises during the sellers' market. So far, indeed, no attempt has been made to justify the system under any other conditions. But this is the very condition in which it is bound to be at a disadvantage—except, of course, where long term contracts happen to be negotiated just before an unexpectedly steep rise in prices. In the long run, there is certainly no reason to suppose that the foresight of the central buyer is likely to be greater than that of the seller or sellers, so that even this advantage is likely to be illusory.

But these possibilities of chance gains do not arise at all when the buying is by the predominant method of short-term contract or spot purchase. In times of shortage, a Governmental buyer always tends to be more or less at the mercy of the seller.

TABLE I

COMMODITIES FOR WHICH THE GOVERNMENT IS SOLE IMPORTER

Foodstuffs	Raw Materials
Cereals and flour	Raw cotton
Pulses	Cotton waste
Sugar	Flax
Oils and fats (excluding salad oils)	Raw jute and jute goods
Bacon and hams	True hemp
Carcase meat	Timber (excluding certain types)
Poultry	Kraft liner boards
Rabbits	Building boards
Canned corned meat	Pulpwood
Hen and Duck eggs	Woodpulp for papermaking
Dried egg	Esparto grass
Butter	Raw hides and calf skins
Cheese	Raw goatskins
Processed milk	East Indian tanned kips
Starch	Tanning materials (minor exceptions)
Tea	Sulphur
Coffee	Pyrites
Raw cocoa	Phosphate rock, etc.
Dried fruit (excluding African dates)	Molasses
Fruit pulp	Ethyl alcohol
Edible nut kernels	Acetic acid
Peels in brine	Acetic anhydride
Animal feeding stuffs	Butyl alcohol
Frozen white fish	Rosin
Canned fruit (excluding apples)	Turpentine
Oranges and grapefruit	Pine oil
Eating apples	Tung oil
Bananas	Caustic potash solid
Rice	Casein
Canned salmon, pilchards, sardines, crayfish, brisling, sild and crabs	Chrome ore
Ware potatoes	Lead
	Zinc
	Copper
	Virgin aluminium
	Pig iron
	Steel

TABLE II

BRITISH LONG-TERM COMMODITY CONTRACTS

Commodity	Country	Date of Expiry	Quantity
Wheat	Canada	July, 1950	Fixed annual quantities.
Copra and Coconut Oil	Ceylon	Dec., 1950	Fixed min. quantities.
	Zanzibar	Dec., 1950	Export surplus.
Palm Oil	Malaya	Dec., 1950	Export surplus.
Sugar	Australia, S. Africa, B.W.I., B. Guiana, Fiji, Brit. E. Africa, Mauritius	Dec., 1952	Export surplus.
Starch	Holland	Aug., 1949	Fixed annual quantities.
Meat	New Zealand	Sept., 1955	Export surplus*.
	Australia	Sept., 1950	Export surplus.
	Guatemala	July, 1950	Total output of undertakings concerned.
	Paraguay	Sept., 1950	Export surplus.
Bacon	Canada	Dec., 1948	Fixed annual quantities.
	Denmark	Sept., 1952	90% export surplus.
Butter	New Zealand	July, 1955	Export surplus†.
	Australia	June, 1955	Export surplus†.
Cheese	New Zealand	July, 1955	Export surplus†.
	Australia	June, 1955	Export surplus†.
	Canada	Mar., 1949	Fixed annual quantities.
Processed Milk	New Zealand	July, 1950	Fixed min. quantities.
Eggs	Australia	June, 1953	Export surplus.
	Canada	Jan., 1949	Fixed annual quantities.
	Eire	Jan., 1951	Export surplus.
	Denmark	Sept., 1950	Per cent of export surplus.
Dried Fruit	Australia	Dec., 1948	Maximum available.
Coffee	Kenya	June, 1952	Fixed annual quantities.
	Tanganyika	June, 1952	Total crop some varieties, fixed quantities of others.
	Uganda	June, 1952	
	Belgian Congo	June, 1952	Fixed max. quantities.
	Jamaica	Dec., 1952	Total crop.
	Gold Coast	Dec., 1952	Export surplus.
	Sierra Leone	Dec., 1952	Export surplus.
Bananas	Jamaica	Dec., 1948	Export surplus.
	Cameroons	Dec., 1948	Export surplus.

N.B.—In addition annual contracts for the current year exist with Poland, Holland and Hungary for bacon; South Africa, Holland and Poland for eggs.

* Except for pigmeat after September, 1952.

† Less agreed reservations for other destinations.

Although secrecy about the Government operations is undesirable in principle, administrative expediency and commercial tactics may make it appear necessary. But it is rarely sustainable in practice. Potential suppliers will always be able to discover the extent of Britain's total annual requirements for a given bulk-purchased commodity; and they will easily learn, too, when the Government is actually in the market. Only its initial purchases, if even these, will usually be made without forcing the market against it. And the hardening of the market against impending Government buying tends to be disproportionate, certainly more marked than it would be against a large private buyer whose operations can always be more effectively cloaked. The validity of this argument, and the extent of the risk which the Government runs, may perhaps be gauged by the dogged refusal of the Ministry of Food, despite repeated pressure in Parliament, to disclose the prices paid under particular contracts.

In principle—and ignoring the special consequences of the structure of Britain's prewar trade—it is arguable that in a buyers' market a Government organisation could wield much more power than a host of private traders could do. But it is inevitably fettered by political considerations. If the supplying country was a "friendly neighbour," it would have to be treated leniently. And if no such considerations were urged, the driving of what, in private commerce, would merely be a good bargain justified by the conditions of the moment, would quickly be denounced as harsh and unconscionable. Trade in such conditions becomes a political act.

What real economies can the system of bulk purchase yield? In principle, it may make possible certain administrative and marketing economies, though usually at the cost of a restriction of consumer choice. But the scope even for these economies would be greatest in a buyers' market, when the same political constraints would operate. In a sellers' market, even private concerns operating centralised buying systems have found that few economies can be achieved without assuming some form of control over the producers.

The experience of centralised buying to date has not, in any case, been very happy. Just over a year ago the Ministry of Food purchased large quantities of sugar from Cuba at what proved to be a peak price. The purchases of linseed and maize from Argentina and coarse grains from Russia have also been made at very high prices. Among other unfavourable examples are those of rubber and non-ferrous metals. On the other hand, there have been instances of favourable buying: dairy produce and meat from Australia and New Zealand, particularly during the war and, recently, wheat from Canada at the old contract price. But taking all in all, bulk purchase seems to have secured either an inadequate quantity of goods at reasonable prices or an adequate quantity at dear prices. It has apparently been the Government's policy to purchase food only at reasonable prices but to buy raw materials almost irrespective of cost, in order to ensure adequate supplies for industry.

The main argument in favour of state trading at the present time apparently rests on the shortage of foreign exchange. Even so, the advantages seem to be mainly ones of administrative convenience, considerations which arise also where the domestic prices are controlled or subsidised. It is contended, too, that central purchase is necessary to ensure a sufficient flow of raw materials to industry, because the alternative of import licensing, while effective as a means of restriction, does not guarantee the necessary imports. Here, perhaps, are more persuasive arguments than most of the others that have been urged. There is little doubt that the Government regards them as justifying maintenance of most of the present structure of centralised purchase—quite apart from the long-range buying which will presumably continue at least for the life of the contracts. But the case is still not proven, either in general or in particular. A policy of marginal relaxations, which is all that seems in prospect, ought not to be accepted as relieving the Government from the duty of demonstrating, by detailed and separate explanation in each major case, the justification for retaining the main structure.

Business Notes

Boomlet in Gilt-Edged

The boomlet in gilt edged goes merrily on, but remains as inexplicable as ever. It has this week carried 2½ per cent Consols to 80, the highest price since the early part of this year, and no less than 5½ points above the year's lowest. The advance has been spread throughout the gilt-edged list, but while the movement in Consols has attracted most attention, the gains have in fact been more marked in the medium and long dated securities than in the irredeemables As the accompanying table shows, since the morrow of the Budget, the redemption yield on 3 per cent Savings Bonds 1955-65 has been forced down from just over 3 per cent to a little under 2¾ per cent and that on the 1965-75 issue has fallen from £3 3s. 9d. to £2 18s. 2d. Over the same period, the flat yield on 2½ per cent Consols has dropped by a little over ¼ per cent to roughly 3⅛ per cent. Most of this striking recovery from the year's low points, of course, occurred during the summer, so that the recent gains have been relatively moderate; during the past fortnight, they have been of the order of a full point.

The striking feature of recent experience, however, is not the extent of the advance, but that it continues—and continues, moreover, despite the flow of new issues. A further trustee issue, £5,000,000 of Southern Rhodesia 3 per cent stock, 1971-73, to be offered at par, was announced just as *The Economist* went to press. The strength of the gilt-edged market began to attract attention precisely at the moment when the impairment of the disinflationary policy first became really apparent; and since then, despite the Chancellor's rather carefully phrased reassurances, the conviction has grown that the impairment may be greater than was at first supposed. It is hard to see, moreover, by what means the damage can be made good—unless, of course, the Government is prepared for reduction in expenditure on a scale which might threaten the bases of its policy and especially the maintenance of the structure of controls and rationing. It is difficult, in short, to explain the behaviour of gilt-edged on any grounds more rational than the market's empirical judgment that it reflects the weight of money—a phrase which conceals more than it reveals. Undoubtedly, there now seems a pressure to employ funds which were allowed to accumulate in idleness during the summer, but the very fact that these investable surpluses exist is presumptive evidence that

Chancellor on Steel Compensation

It was inevitable, no doubt, that the Chancellor of the Exchequer should take a large share of the unenviable responsibility for defending the steel compensation terms in this week's Debate. But to the many who have come to respect his qualities of objective reasoning and readiness to face all the facts, it seemed an unhappy role. True, the case was mustered with all his forensic skill, and was developed—as an apparently bewildered Mr Churchill put it—into a "very terse and clear-cut argument." But this display, impressively embellished with a new but unpublished share price index compiled by the Ministry of Supply ("far more accurate than that of the actuaries") still evaded the critical issues while appearing to tackle them.

The first question is whether a valuation by reference to Stock Exchange prices is fair in principle. The Government contends that it is, because these are the result of dealings in a free market between willing buyers and willing sellers. The flaw in this argument is that the commodity which can be bought in that market is not the commodity the Government wants to buy; it is only a tiny fraction of it. The price at any moment is determined merely by the marginal demand and the marginal supply at that moment. Buyers "for control" habitually negotiate outside the Stock Exchange; and, when the initiative comes from them, almost invariably have to pay substantially more than the market price. At that price an overwhelming proportion of holders are neither willing nor reluctant sellers; they are not sellers at all. And to deem them to be willing sellers at the price acceptable to the few who do sell at a particular moment is bound to be unfair. Sir Stafford was not so foolish as to ignore this critical point altogether. But he only purported to answer it—by making the fantastic assumption that all the holders were simultaneously anxious to sell, in which case, he said, they would get "an extremely bad deal."

Unless this question of principle can be satisfactorily answered, most of the other questions do not arise at all. But if it be assumed that a Stock Exchange basis is reasonable in principle, the question then is whether it is reasonable in these conditions and in this case. Here, too, the arguments to the contrary evoked no convincing answer. To show that equities have risen, or that steel equities have risen more than other equities, does nothing to rebut the contention that dividend limitation has affected their market value adversely or that steel shares have suffered additionally from the threat of nationalisation. Nor can the charge that dividend limitation has inequitable effects in this context be answered by the reminder that it is applicable generally. That does not alter the fact that the Government, having appealed for dividend restriction in the interests of disinflation, now seeks to reap an advantage as a buyer who can compel the sale. The case might be different if dividend limitation were a permanent and settled policy, firmly incorporated in effective legislation after democratic debate. But that, happily, is not the case; and Mr Strauss's example of the effects of the Rent Restriction Acts is irrelevant.

Europe's Long-Term Plans

The Organisation for European Economic Co-operation is considerably behind schedule in its presentation of the co-ordinated four-year plan for Marshall Europe which will show to the United States how the participating countries intend to secure their dollar self-sufficiency by 1952-53. The separate plans were due to be presented by October 1st, and integrated by November 15th. Only two, the British and Iceland documents, succeeded in making the first deadline. The final date for integrating these plans was then advanced to December 1st and even this has had to be abandoned. The latest information is that one important participant has still failed to put in its estimates. The plans that have arrived are an extraordinarily varied collection of documents, which it will be most difficult to combine into a single unified plan. The British plan, which will not be published until it has been presented with the others to ECA, is an extraordinarily painstaking and detailed document which has already spread some consternation both in American and European quarters which have had the privilege of studying it. The Americans have expressed their surprise at the severity of the proposed cuts in imports from dollar sources, and Europeans have exclaimed that the plan proves beyond all shadow of doubt that Britain has no intention of entering an integrated European economy and is putting all its money on the development of the sterling Commonwealth. No comment on these reactions can be made until the estimates are produced towards the end of the year; but the reactions are significant.

There has been far less diffidence about publishing the French plan, of which obviously authentic summaries have appeared in the press. The plan emerges from the same commission as drew up the earlier Monnet Plan, but differs substantially from that document. The emphasis of French economic development has now shifted from industrial to agricultural activity, and it is in the latter that France is apparently endeavouring to seek the solution of its balance of payments problem. Even so, the objectives of industrial development remain ambitious. Steel production is still put at 12,500,000 tons for the year 1952-53. This is substantially less than the figure in the Monnet Plan, but since it compares with an output of 6,500,000 tons in 1938 and a programme of 7,200,000 tons for 1948, even the reduced estimate may be regarded with some justifiable scepticism.

A number of the plans refuse to be drawn into detailed estimates. This is particularly true of the Swiss document, which refused to indulge in any estimates at all, and it is nearly true of the combined Belgian, Netherlands and Luxemburg plan which stresses that, in the free economy towards which these three countries are moving and in the setting of multilateral trade for which they hope, it is an unprofitable and indeed dangerous exercise to put down detailed estimates of what their external trade will be four years hence. The task of welding these various documents, realistic and unrealistic, detailed and highly generalised into one cohesive whole will present the OEEC experts with as tough a task as they have yet had to tackle.

Banks' Retort to the Stock Exchange

Some astonishment was caused among the members of the Stock Exchange on Thursday at the news of an exchange of letters on the commission-sharing question between the chairman of the Committee of the London Clearing Bankers and the Council

CANADA

This Bank's services are at the disposal of British business men for the development of two-way trade between Great Britain and Canada.

Enquiries welcomed by:

BANK OF MONTREAL

47 Threadneedle Street, London, E.C.2

Head Office: MONTREAL

Over 500 Branches throughout Canada.

Assets Exceed $1,800,000,000

Incorporated in Canada in 1817 with Limited Liability

NO dance bands—but real comfort, excellent cooking, and old-fashioned *courtesy* at the

KNOWLE HOTEL SIDMOUTH (Devon)

One of the loveliest hotels in Devon, situated in 15 acres of beautiful gardens overlooking the sea. Fully licensed. Write Manager for brochure.

(Tel: Sidmouth 955)

of the Stock Exchange. In effect, the banks have stated—and quite bluntly—that if the new Agency rules come into force on January 1, 1949, the banks intend on that day to revise their charges for banking services to members in order to recoup the loss of rebate on commissions for stock exchange business introduced by the banks. The Stock Exchange responded to this unexpected move by inquiring whether the contemplated revision of charges would apply to the general public as well as to its own members, and by requesting a definition of the extent and nature of the proposed charges. A further letter from the banks has not provided these details, but states that they regard their charges to the Stock Exchange as of a special and particular nature, different from those to the general public.

In view of the meeting of stock exchange members to be held on November 25th to consider a resolution to defer the coming into force of the new agency rules, this action from the banks has introduced an unexpected element for the consideration of members. If nothing else, the move by the banks should ensure a heavy vote next Thursday. In the opinion of many members the proposed revision of bank charges has not come as a surprise. Even so, it may sway a number of waverers to vote for the resolution, which in any case is considered to have a good chance of adoption. If it is, then it is likely that a poll in which voting may be by proxy, with one vote for each member, will take place between eleven thirty and three thirty the following day.

The Fund and Devaluation

M. Camille Gutt, the Managing Director of the International Monetary Fund, who has been visiting Europe lately, has given some interviews in which he has commented on and given details of recent operations of the Fund. For the most part his remarks paraphrased the report of the executive directors presented to the meeting of Governors last September, but in his references to the European currency situation and to the problem of the dollar gap M. Gutt had some interesting points to make. He argued that a simultaneous and widespread devaluation of European currencies would not solve Europe's present dollar problem. That problem, he said, was the reflection of an abnormal need for real resources. Where the primary difficulty lay in the present limited export capacity of many European countries a devaluation of their currencies would not increase their foreign exchange receipts; it would merely strengthen the inflationary forces in those countries. M. Gutt said that it was not the present but the future balance of payments of Europe that might be brought into equilibrium through an adjustment of parities. He added that the Fund was willing to act promptly whenever a change in parities became necessary and as soon as an apparent over-valuation of a currency threatened the export trade of a country. He expected a position of this kind to emerge when export capacities of countries in Europe had increased and the present conditions of a sellers' market had turned into a buyers' market. But he stressed that if devaluation were to be really effective, it must be accompanied by appropriate anti-inflationary measures in the countries concerned; otherwise they would merely face the necessity of devaluing a second time.

Those Manpower Targets

The Ministry of Labour's latest manpower returns give an indication of the results attained in one year's operation of the Control of Engagement Order. Since the Order was made in October last year some 4,500,000 vacancies have been filled by Employment Exchanges; over 500,000 of these were in the "first preference" undermanned industries. The September figure of 53,000 placings in those industries represents 15.6 per cent of the total adult placings, and is the highest proportion yet achieved. The working population continues to rise—the rise in September is largely the result of the ending of the school year—and at the end of September more people were at work in civil employment than ever before. The number of women at work is greater than at any time since the end of the war.

But in spite of these improvements, there is no possibility that the year-end manpower targets will be reached in the three main undermanned industries of agriculture, textiles and coal mining. Agriculture, which recruited 4,000 workers during September, is nearest the mark. The textile industries, which also gained 4,000 recruits, need another 77,000 workers to reach their target. The number of men in the mines actually dropped; the specific manpower problem in coal is dealt with in another note. There was a seasonal fall in hotels, catering, entertainment and sport during September, but the numbers engaged in distribution continue to increase, while the building and civil engineering labour force is now considerably above its prewar size.

One allied problem to which both the TUC and the Ministry of Labour are beginning to turn their attention is that of labour wastage. The General Council has urged its affiliated unions to examine how this can be reduced, and the Ministry of Labour *Gazette* has started to publish regular statistics of the turnover of labour. The powers of the Ministry under the Control of Engagement Order are limited to "steering" workers into industries; its powers of direction have been sparingly used—in fact, only 29 workers have been directed under the Order. But except in mining and agriculture, it has no power to bind a worker to a particular job. The result is that, though the employment exchanges are placing an increasing number of workers, they have no authority to prevent them changing their jobs whenever they wish.

In the firms covered by the Ministry's survey, 2 per cent of the men and 3.5 per cent of the women left their jobs in the four weeks ended July 24th. The firms concerned recruited as many men as they lost, but the recruitment of women was not sufficient to cover the loss of 3.5 per cent. The problem is particularly serious among women in engineering and the radio and electrical industries. Some wastage is obviously inevitable through death, retirement, marriage and other natural causes. But the present rate seems unduly high. Should not the next step be to analyse its causes and devise measures to increase labour stability? This is a problem which Mr Isaacs's National Joint Advisory Council might well tackle.

September Retail Trade

The autumn shopping season did not open well in September for the retail trade. Sales recovered from the seasonal low level in August but, as the calculations below indicate, the percentage rise this year was smaller than in September, 1947. A comparison of clothing sales in the two years has to take into account two non-seasonal factors. September, 1947, was the last month of the clothing ration year; sales in September this year might have been expected to reflect the general easing of the clothes ration as well as the issue of new coupons in the summer. Yet sales of footwear, which are freed from all coupon restraints, have risen least of all kinds of clothing. Sales of women's wear were up by 27 per cent and of men's and boys' wear by 25 per cent on August. Experience in the different parts of the country varied widely. The London areas had the largest increases compared with August, ranging from 31 per cent to 40 per cent in clothing sales, while elsewhere the expansion varied between 10 per cent and (in Scotland) 31 per cent. General clothing stocks have risen moderately, but stocks of footwear fell by nearly 20 per cent from the exceptionally high level of recent months.

Nor can the retail trade derive great encouragement from the recovery in sales of household goods. The sales indices are up on August, but by a smaller percentage than the increase between August and September a year ago. In the first eight months of this year furniture sales have increased only 13 per cent over the equivalent period of 1947—an increase which is largely accounted for by the intervening rise in prices. Hardware sales have risen in the same period by merely 3 per cent. Stocks of furniture are 7 per cent higher and stocks of hardware 9 per cent higher than in September, 1947. This is a modest expansion and hardly bears out the prevalent impression that in the last twelve months shops and warehouses have become overloaded with goods of this type.

BOARD OF TRADE INDEX NUMBERS OF VALUES OF SALES PER WEEK
(Average of 1942=100)

	August		September		Percent. Increase Sept. over Aug.

ICFC "Achieves Viability"

In his statement for the third annual meeting of the Industrial and Commercial Finance Corporation, Lord Piercy claims that "this new financial instrument" has accomplished its first stage —"the achievement of viability." Here is a case, perhaps, in which that now over-worked term is really apposite. The "small" finance corporation established at the close of the war has learnt to stand on its own feet—in the sense that it has not only earned a moderate profit but, if tax recoveries reach expectations, will shortly wipe out the accumulated debit on profit and loss account. The operating profit for the twelve months to end September was £219,834, which after crediting income received in respect of the previous year and tax definitely recoverable, just sufficed to provide a further £135,000 against bad debts and investments and to extinguish the debit brought in from 1946-47. Current taxation requires £114,000, but it is expected that this will be recoverable in whole or in part. The volume of new business, as was to be expected, was less than in the previous year, with applications running at about half the 1946-47 rate; but the expansion of total finance actually extended was a good deal more marked. Confirmed advances and investments rose from £10,501,000 to £13,648,000, compared with only £4,048,000 two years ago; and, despite £650,000 of repayments, the net advances and investments actually taken up rose from £5,716,000 to £10,771,000, in contrast with only £1,239,000 at the end of the first year. To meet these rising demands, further capital has been called up from the proprietary banks, the total amount paid being doubled at £6,000,000; the loan capital has also been increased.

A high proportion of the finance is still going to businesses of substantial size. Fully four-fifths of the transactions, by value, were for amounts of £50,000 or more; by number, the proportion was 44 per cent. Transactions between £5,000 and £10,000 accounted for 11½ per cent of the cases but only 1½ per cent of the money—which perhaps explains Lord Piercy's remark that "when opportunity offers, our facilities will be brought to the notice of small and medium sized manufacturers. . . ." Evidently, current conditions are not regarded as propitious for such a deliberate policy. Conditions during the past year are described as "uneasy," and one in every six of the corporation's customers experienced "setbacks or difficulties," giving the technical liaison staff "plenty to do." In the circumstances, the company has followed a selective policy and has evidently not hesitated to use orthodox aids to selectivity. As Lord Piercy discreetly puts it, "our rates for new business rose somewhat."

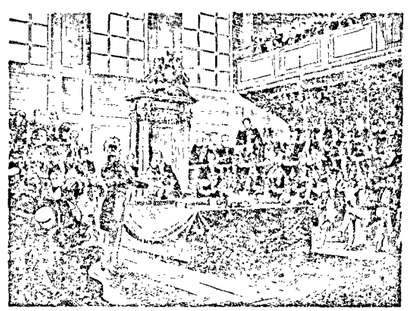
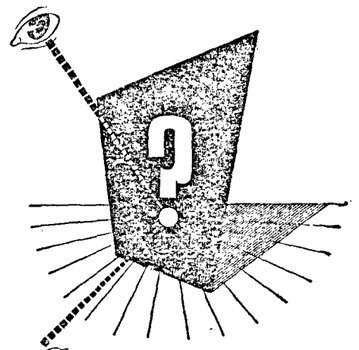
Film Production and Redundancy

If there is really, as the President of the Board of Trade claimed in the Commons debate on film production and costs last week, a carefully conceived plan for the British film industry, the industry must be strangely unresponsive. The return of production activity published by *Kinematograph Weekly* showed this week that 15 first features were in production in the British studios; a year ago, when the trade unions were calling the Government's attention to the inactive state of the industry, there were 20. The Warner Brothers studios at Teddington were added last week to the list of studios closed; this involved the dismissal of a staff of 120. A spokesman of the Motion Picture Association of America, defending the American companies against the implication that they are aggravating the slump, has explained that the Teddington studios, which were rebuilt and re-equipped after



Note:

A year's subscription to The Economist would make an excellent Christmas or New Year gift: the cost, including surface mail postage to any part of the world, is £3.



The Economist, 22 Ryder St., London, S.W.1

In 1831 The increasing wealth and trade of Liverpool created the necessity for greater banking facilities, and the Bank of Liverpool—Martins Bank, as it is known to-day—was founded in that year. The times were momentous; the Napoleonic wars were left well behind, we were on the threshold of those railway and great mechanical advances which were to lead in the proud progress of the Nineteenth Century, and in the House of Commons Sir Robert Peel was adding lustre to his name.

Over the course of the next fifty years the deposits of the new bank rose to £4,000,000, and to £110,000,000 within its centenary. The figure to-day is in the neighbourhood of £260,000,000, and branches number nearly six hundred.

MARTINS BANK

LIVERPOOL, LONDON AND 600 BRANCHES

Do you trade with

AUSTRALIA

As a market for British manufactures and as a source of food and raw materials, Australia plays an important part in Britain's economy. Whether your interest is in imports or exports, the services of the Commonwealth Bank of Australia can be of considerable assistance. With over 400 Branches in the Commonwealth and New Guinea, and guaranteed by the Australian Government, the Bank can provide the British trader with up-to-date, authoritative information on every aspect of Australian commerce.

COMMONWEALTH BANK OF AUSTRALIA

London Branch: 8, Old Jewry, E.C.2 *Also at Australia House, Strand, W.C.2*

their destruction during the war, had been kept open for many months in the hope that independent British producers would rent studio space; but that only two clients had been obtained, and the owners decided against bearing the further cost of keeping the studios open. The productive activities of Warner Brothers themselves in Britain are carried on at Elstree in partnership with Associated British Pictures. British feature studios not in use now amount to 13, with 26 sound stages and a floor area of 130,000 square feet.

This has aggravated the concern of the film trade unions over the growing unemployment among their members, and the prospects of an agreed policy on redundancy grow more remote. The dispute which arose at the Rank studios at Denham over the dismissal of 92 employees whom the company regarded as redundant has only temporarily been settled. The company has withdrawn 33 of the notices and has suspended four others; it is not willing to withdraw the remaining 55. The existence of restrictive trade union practices in the film studios, their tendency to keep in employment men who might rationally be thought redundant, and the effect of this situation in inflating film costs are fairly common knowledge. But the trade unions do not feel that they can afford to take an entirely enlightened attitude. The Association of Cine Technicians stated last week that it would refuse to recognise any more dismissals on grounds of redundancy without prior consultation through the trade union machinery. It explained:

> Redundancy in film production is not an isolated issue in itself but part of the wider problem of whether we should have an expanding British film production industry.

The question is expected to be discussed at the meeting of the National Film Production Council over which the President of the Board of Trade will preside on November 29th. The Council, which includes representatives of trade unions as well as the producers, has not met for some months. When it was appointed in the spring the intention was that it was to review production costs; redundancy is, therefore, a question that it can hardly evade. Before it meets, the membership of the Board of Trade committee on film distribution and exhibition is expected to be announced. Mr Wilson said in last week's debate that this committee would include the question of high studio rentals in its studios as part of the general economics of the film industry. The spheres of interest of these and other bodies which have been set up from time to time in the film industry tend to become more rather than less blurred; the carefully conceived plan of which Mr Wilson spoke is not yet evident.

* * *

The Mineworkers' Refusal

Mr Gaitskell, the Coal Board and the miners' executive have all suffered a definite rebuff in the refusal of the majority of the districts to accept the Joint Output Committee's plan for fining absentees. The proposal to set up joint attendance committees at every colliery, with power to fine persistent offenders, was a central feature (indeed, perhaps the only new one) of the Committee's plan for improving output. The only districts which have positively accepted the scheme are Northumberland, the East Midlands and North Wales. Durham and South Wales have yet to reply, but will probably cancel each other out; it now seems clear that the majority of the miners will have nothing to do with this particular scheme.

The most important reason is their reluctance to saddle their own officials with responsibility for disciplinary measures which are regarded as the function of management. It is an intelligible feeling; so is the fear, which has probably had some influence with the officials, of becoming unpopular with the men who elect them. There is also the rooted dislike among the miners of any kind of uniformity and the suspicion that this plan has been imposed on them from above. Finally, in the districts where Communist influence is strong, these natural objections have been exacerbated by political feeling to some extent, no doubt, artificially stirred up.

Faced with a situation which is clearly beyond its control, the Executive of the National Union of Mineworkers has decided to invite every district to submit alternative proposals for dealing with absenteeism. These will then be considered by the union and the Coal Board.

The miners' rejection of this particular disciplinary proposal does not mean that they have rejected the committee's entire report. Even those districts which are most strongly opposed to the plan have accepted many of its other proposals such as those dealing with upgrading, employment of EVWs and improved Saturday attendance. Some areas point out that they are already applying effective measures to deal with absenteeism and prefer to see recalcitrant miners demoted or discharged, rather than fined.

So long as the objective of the original scheme—the reduction in the rate of absenteeism—is realised, it does not really matter what method is adopted. But, although there has been a slight improvement in the last few weeks, the absenteeism rate is still nearly 2 per cent higher than it was a year ago, and twice as high as before the war. Too much time has already been lost, and it is essential that effective measures should be devised before the new year, when the post-holiday slump in production sets in.

* * *

Arabian Oil Finance

The announcement that Standard Oil Company (New Jersey) is to acquire a 30 per cent stock interest in Arabian-American Oil Company is a natural consequence of the settlement out of court of the legal actions between shareholders of the Iraq Petroleum Company. Standard (New Jersey) had already guaranteed bank borrowings by Arabian-American to the extent of $76 million. This loan is now converted into a participation, a logical operation which had been postponed until the continued validity of the 1928 "Red Line" agreement was decided. That agreement contained a restriction on separate activities within the "red line" area (which included Saudi Arabia and indeed most of the former Ottoman Empire) by companies participating in the Iraq Petroleum Company. The American participants, claiming that it no longer applied, desired release from the restriction in order that the extensive American development of Arabian oil might proceed unhampered. They obtained its removal in the recent settlement. Arabian-American Oil Company stock has previously been held on equal terms by the Standard of California and Texas companies; they are now joined by Standard (New Jersey). It is to be supposed that Socony Vacuum, which is also a guarantor of the Arabian-American company's finance, will similarly become a stockholder now that the "red line" issue is settled.

* * *

Australian Bank Case Appeal

The critical legal struggle between the Commonwealth Government on the one hand and the Australian banks and three states on the other, on the issue of bank nationalisation, reached a further stage last week. The Judicial Committee of the Privy Council, after four days' hearing, granted the Federal Government's petitions for special leave to appeal from the order of the Australian High Court restraining the Commonwealth Government from implementing the nationalisation Act. The order for the injunction was based, *inter alia*, on the High Court's declaration that Section 46 of the Act, which provides for the prohibition of private banks from carrying on banking business, was invalid under the terms of the Federal Constitution. It was on this particular point that the Federal Government's petitions were founded, and leave to appeal appears to be restricted accordingly. The hearing of the appeal will begin on March 14th.

The issue has assumed crucial importance for the Commonwealth Government, not only because of the intrinsic significance of the vexed question of bank nationalisation and the political consequences of its rejection, but also because of the risk that the latest interpretation of the Constitution might become a basis for challenge to the validity of social and economic legislation far beyond the sphere of banking. A decision by the Privy Council favourable to the Government's contention would, presumably, finally dispose of these risks, but would not of itself end the battle on the banking issue, because a new Bill would still be necessary to provide for other points in the High Court judgment. It has been reported from Canberra that, if the appeal fails, the Government will, even so, frame a new Bill in the hope of salvaging "what was left of the Nationalisation Act by the High Court's judgment."

China's Latest Devaluation

It has not taken long to reveal how sham was the glitter of the gold yuan. Little more than two months after it was introduced in China, the yuan was devalued last week to one-fifth of its previous value. The new official rate of exchange thus changed from 4 gold yuan to one US dollar to 20 gold yuan. The proclamation which announced this move also heralded the immediate free circulation of silver in China, though it maintained the ban on the circulation of foreign currencies and gold.

William Nicholson *turned to scientific research after a commercial career with the East India Company, and made the historic discovery that water could be decomposed by passing an electric current through it. This is an example of electrolysis which is the foundation of many important industrial and scientific operations. Working in company with another English chemist, Carlisle, in 1800, Nicholson constructed an electric battery (known at that time as a "Voltaic Pile"), from thirty-six half-crowns and a number of zinc discs and pieces of pasteboard. Though the current produced by this crude apparatus was so minute that only a few thimblefuls of gas were collected over a period of thirteen hours, Nicholson showed not only that water could be electrolysed, but that the two gases of which it is composed appear at different places, the oxygen being evolved where the electric current enters the water and hydrogen where it leaves.*

Nicholson, who was born in London in 1753, made many other scientific discoveries between his return from India in 1786 and his death in 1815. He invented a hydrometer, took out patents for textile printing machinery, planned and carried out a scheme for the water supply to Portsmouth. He was a scientific writer of great contemporary eminence and founded, and until his death edited, the "Journal of Natural Philosophy". But the electrolysis of water, a fundamental discovery of very great importance, remains this Englishman's real contribution to the world's total of scientific knowledge.

Consent of His Majesty's Treasury has been obtained to this issue in compliance with the Order made under Section 1 of the Borrowing (Control and Guarantees) Act, 1946.

The List of Applications will be opened on Tuesday, the 23rd November, 1948, and closed on the same day.

GOVERNMENT OF SOUTHERN RHODESIA

3 PER CENT. STOCK, 1971-1973.

Interest will be payable half-yearly on the 1st March and the 1st September.
A first payment at the rate of 7s. 6d. per £100 Stock will be made on the 1st March, 1949.

ISSUE OF £5,000,000 STOCK

Under the General Loans Act (Chapter 123), the General Loans Amendment Act, 1939, and the Loan Appropriation Act, 1948, of Southern Rhodesia.

PRICE OF ISSUE £100 PER CENT.

PAYABLE AS FOLLOWS:

On Application	£10 per cent.
On Friday, the 3rd December, 1948	£40 "
On Monday, the 28th February, 1949	£50 "
	£100 per cent.

The Government of Southern Rhodesia have observed the conditions prescribed under the Colonial Stock Act, 1900, as notified in the London Gazette of the 14th December, 1900, and the Stock is, therefore, an investment authorised under the Trustee Act, 1925, and the Trusts (Scotland) Act, 1921.

THE GOVERNOR AND COMPANY OF THE BANK OF ENGLAND are authorised to receive applications for the above issue of Stock.

The Stock is charged upon and payable out of the general revenues and assets of the Colony, and the Stock and the interest thereon in the ownership of persons or corporations neither ordinarily resident nor domiciled in the Colony will be exempted from liability for all taxation present and future payable or chargeable under any Law of the Colony.

The Revenues of the Colony of Southern Rhodesia alone are liable in respect of the Stock and the interest thereon, and the Consolidated Fund of the United Kingdom and the Commissioners of His Majesty's Treasury are not directly or indirectly liable or responsible for the payment of the Stock or of the interest thereon, or for any matter relating thereto.

Information regarding the public debt and assets of the Colony and the main development projects to which the proceeds of the issue will be applied is given in the appended Statement by the High Commissioner for Southern Rhodesia.

The Stock, if not previously redeemed, is to be repaid at par at the Bank of England on the 1st March, 1973, but the Government of the Colony reserve to themselves the right to redeem the Stock, in whole or in part, by drawings or otherwise, at par at the Bank of England on, or on any date after, the 1st March, 1971, on three months' previous notice being given by public advertisement, in which case the Stock to be redeemed will cease to bear interest on the date so fixed for redemption.

The General Loans Act (Chapter 123) and the General Loans Amendment Act, 1939, of Southern Rhodesia provide for the establishment, within two years from the issue of the Stock, of a special Sinking Fund for the redemption of the Stock by annual payments out of the Consolidated Revenue Fund equal to 1 per cent. of the nominal amount of the Stock originally issued together with a sum equal to the interest on any of the Stock redeemed or cancelled.

The Stock will be transferable by deed, in multiples of one penny, free of charge and stamp duty.

The Bank of England have been appointed Registrar of the Stock.

Interest will be payable half-yearly on the 1st March and the 1st September; the first payment, at the rate of 7*s.* 6*d.* per £100 Stock, will be made on the 1st March, 1949. The interest due on the 1st March, 1949, will be paid (less Income Tax) by coupon if the relative Scrip Certificate to Bearer has not been registered on or before the 1st February, 1949; in all other cases Interest Warrants will be transmitted by post and Income Tax will be deducted from payments of more than £5 per annum.

Applications, which must be accompanied by a deposit of £10 per cent., will be received at the Bank of England, Loans Office, London, E.C.2. In the case of partial allotment, the balance of the amount paid as deposit will be applied towards payment of the first instalment; should there be a surplus after making that payment, such surplus will be refunded by cheque.

Default in the payment of any instalment by its due date will render the deposit and any instalment previously paid liable to forfeiture and the allotment to cancellation. Instalments may be paid in full at any time after allotment but no discount will be allowed on such payments.

Applications must be for £100 Stock or a multiple thereof; no allotment will be made for a less amount than £100 Stock.

Scrip Certificates to Bearer, in denominations of £100, £500, £1,000 and £5,000, with coupons attached for the interest due on the 1st March, 1949, will be issued in exchange for Allotment Letters. Scrip Certificates must be surrendered for registration at the time when the final instalment is paid; in the case of registrations effected on or before the 1st February, 1949, the coupon for the interest due on the 1st March, 1949, must also be surrendered.

A commission of 5*s.* per £100 Stock will be paid to Bankers or Stockbrokers on allotments made in respect of applications bearing their stamp.

Prospectuses and Application Forms may be obtained at the Bank of England, Loans Office, London, E.C.2, or at any of the Branches of the Bank of England; at the Offices of the High Commissioner for Southern Rhodesia, 429, Strand, London, W.C.2; at the Standard Bank of South Africa Limited, 10, Clements Lane, London, E.C.4; from Messrs. Mullens & Co., 13, George Street, London, E.C.4; or at any Stock Exchange in the United Kingdom.

Copies of the authorising Acts may be inspected at the Bank of England, Loans Office, during business hours until the 4th December, 1948.

BANK OF ENGLAND,
LONDON, E.C.2.
18th November, 1948.

STATEMENT.

On the 31st March, 1948, the Public Debt of the Colony was £62,237,000, representing external debt of £42,267,000 and internal debt of £19,970,000, which includes Tax Reserve Certificates for £525,000, the proceeds of which will be used to liquidate the holders' Income Tax liabilities in due course. The total net expenditure from loan funds up to the 31st March, 1948, was approximately £66,000,000. The difference of £1,000,000 between this sum and the Public Debt is made up of £3,000,000 transferred to the credit of loan account from Revenue and £1,000,000 representing borrowings redeemed through sinking funds. In addition a sum of approximately £1,900,000 is held in sinking funds. During the current financial year (which commenced on the 1st April, 1948) £9,946,970 has been appropriated for loan expenditure and it is intended to appropriate a further £2,300,000 for additional loan expenditure during the same period.

£30,000,000 of the total expenditure of £66,000,000 was spent on the acquisition of and provision of additional capital for the Rhodesia Railways Limited, the Railways being responsible for interest and redemption in respect of this amount, and £12,000,000 on loans to Statutory Boards and Commissions which are also responsible for the interest and in some cases the redemption of the capital sum. Of the balance of £24,000,000 it may be said that £15,000,000 is fully represented by assets in the form of buildings, crown lands, roads, afforestation, water and soil conservation works, etc., and the purchase of the mineral rights of the Colony. The remaining £9,000,000 is accounted for by advances to government stores, trading and imprest accounts, loans to ex-Servicemen, loans to local authorities for housing and other schemes, and expenditure on agricultural, mining and miscellaneous development schemes.

The present loan supplemented by internal borrowing in Southern Rhodesia, is required to defray expenditure on development projects approved by Parliament, of which the following are the chief:—

Amount.	*Detail.*
£5,755,000	Further advances to Statutory Boards and Commissions. Of this sum £2,000,000 is required for advances to the National Building and Housing Board which was established to overcome the acute housing shortage throughout the Colony. This sum will enable the Board to build over 1,500 *pisé-de-terre* houses in addition to its other activities. £820,000 will be advanced to the Land and Agricultural Bank for loans to farmers and to assist in the acquisition of residential properties at reasonable rates of interest. £325,000 will be issued to the Rhodesia Iron and Steel Commission for the extension of the Que Que Steel Works and £520,000 to the Cotton Research and Industry Board for expansion of its spinning mills at Gatooma and to finance the purchase of seed cotton and cotton lint for spinning. £1,500,000 (to be appropriated by supplementary estimates) will be issued to the Electricity Supply Commission towards the present development plan which includes construction of a 40,000 kilowatt station at Umniati and the interconnection of the various power stations throughout the Colony. The balance of £590,000 is made up of advances to the Industrial Development Commission, the Cold Storage Commission, the Sugar Industry Board, and other Statutory Bodies for development and expansion purposes. All the above advances are interest bearing and therefore the burden of the interest charge on this portion of the loan will not fall upon the taxpayer.
£1,204,000	*Required for communications.* This sum includes £1,126,000 for expenditure on the road programmes for 1948-9, comprising over 300 miles of roads of various standards, including access roads to the Sabi Valley phosphate deposits, seven bridges, and £500,000 for road making plant and equipment. £77,000 is required for airport installations.
£1,170,000	Required for irrigation, water and soil conservation projects, etc., including £125,000 for the new Hunyani Poort Dam, the total cost of which, estimated at £1,000,000, will be divided between the Government and the Salisbury City Council, and a further £731,000 for earth moving equipment, boring machines, etc.
£240,000	Required for the newly established Central Mechanical Equipment Department for the purchase of motor vehicles.
£756,000	Required for telecommunications to extend the existing Government services by the purchase of telegraph, telephone and radio equipment.
£378,000	Required for the acquisition of land for Government purposes and for agricultural settlement.
£505,000	Loans to ex-Servicemen for mining and land settlement schemes.
£797,000	Will be spent on buildings and equipment mainly for health and educational purposes.
£500,000	Loans to local authorities for housing. These loans are also interest bearing.

Revenue from taxation and other sources during the year ending 31st March, 1949, is estimated at £13,900,000 and expenditure from revenue funds at £11,420,000. The accumulated surplus on revenue account at 31st March, 1948, was £1,691,000 of which it is intended to transfer £1,000,000 to loan account, leaving £691,000 to be applied to expenditure during the current year, so that at 31st March, 1949, there should still be a balance of accumulated surplus of revenue of approximately £171,000.

The cost of servicing the public debt, excluding that portion (£30,000,000) for which the Rhodesia Railways are responsible, is estimated for the year 1948-9 at £1,423,000 of which £1,127,000 represents interest, £291,000 sinking fund contributions and £5,000 miscellaneous charges. Interest payable to the Treasury during the year is estimated at £443,000.

18th November, 1948

It should be added that no sign of the new silver currency has yet appeared, and none is likely to make its way into general circulation while the present political and military chaos prevails in China. With the devaluation of the yuan, price controls in Shanghai and other centres were removed, and prices of commodities, and foodstuffs in particular, quickly bounded away from the controlled levels at which they had been precariously held. In Shanghai the rise in prices was soon followed by an inordinate scarcity of currency, since the normal mechanism for supplying additional currency has ceased to operate. As a result, astonishingly high interest rates came to be paid in the Shanghai money market, a figure equivalent to 500 per cent per annum being quoted last week for day-to-day money. Only scattered remnants remain of last August's programme of monetary reconstruction in China, and even these are now being swept away by the tide of military disasters and political uncertainty. Once again, therefore, the Chinese currency board is being swept clean for yet another reconstruction.

United Steel Companies and Nationalisation

Details of capital expenditure incurred by United Steel Companies over the past three years, outlined in the address of Sir Walter Benton Jones at the annual meeting of the company this week, should help to dispel any illusions that the steel industry under private enterprise has not responded to its heavy obligations in the task of reconstruction. The amount spent by the group on improvements and extensions has been at the rate of £3 million a year while, if investments and acquisition of properties are included, total capital expenditure during the past three years has amounted to £10,709,000. Only £1,869,000 of this amount has been financed by new money, since £3,615,000 of the new preference capital raised in the period was used for the redemption of prior charges. A further £1,380,000 has accrued from compensation for vested coal and railway assets. The remainder, no less than £7,460,000, or an amount equivalent nearly to half the issued share capital, has been found from the internal resources of the group.

Sir Walter's address has an Olympian ring about it, so numerous are the records which the modernisation and extensions to the various plants have enabled the group to achieve in the past year. Sir Walter declared that nationalisation would result in higher costs "which could only be met by higher prices for users or higher taxation for the community at large." He also had something to say on the silent encroachment of nationalisation in the coke-oven industry. If the Steel Bill goes through, only 10 per cent of coal carbonisation will be left to private enterprise. Already the state has taken over 50 per cent of this field by the nationalisation of the gas industry and a further 20 per cent by way of coal nationalisation. The steel industry accounts for another 20 per cent. By this means the state will have gained virtual control of the production of the many valuable products of coal carbonisation such as coke, coal gas, fertilisers, benzole, tar and other chemical products.

* * *

Towards the Export Targets

The export drive has gathered its momentum again after the interruption of the summer holidays; the provisional figure for the value of exports in October was announced last week as £140 million. This shows an increase of £9,000,000 on September, but it is still nearly £6,000,000 below the peak attained in July. October had one less working day, so that its daily rate was, in fact, equal to that of July. But the volume last month is thought to be only slightly more than 140 per cent of the 1938 level. This is an improvement on the September figure of 132 per cent and the August figure of 133 per cent, but it is still somewhat below the July figure of 149 per cent.

The changes in export prices play an important part in the achievement of the end-of-year targets, which were fixed last April on the assumption that export prices would rise by 5 per cent during 1948. This increase was applied generally to all categories, though it was realised at the time that prices would not move uniformly. The Board of Trade has recently calculated the changes in export prices for the different groups from the movements of the appropriate index numbers of average values of exports, and from these it is possible to make a more precise evaluation of the progress made towards the individual export targets.

For some groups the export price has not risen as much as 5 per cent—in certain instances it has even fallen—while for others the increase has been much greater. The following table shows the main items in each of these two categories. The individual deviations from the standard of 5 per cent have obviously affected the different industries' export progress. Where the export price has fallen during the year, the industry's performance looks poor in relation to its target, although it may be exporting the volume planned. And the reverse is true for those groups whose export prices have risen appreciably more than 5 per cent.

Main groups where export price has fallen since beginning of year	Per cent change	Main groups where export price has increased by over 10 per cent since beginning of year	Per cent change
Cutlery, implements, etc.	— 2	Coal	+37
Silk & rayon goods ...	— 4	Iron and steel	+11
Miscellaneous textile manufactures	— 4	Machinery	+11
Leather goods	— 3	Cotton goods	+14
Rubber manufactures ..	— 5	Oils, fats and resins	+17
		Paper & manufactures ..	+11

The progress made by the different industrial groups can be seen from the table following. Coal is already above its end-of-year target on a value basis, but its export price has risen by 37 per cent. Machinery exports are running close to their target and they have been helped by an 11 per cent increase in export values. Vehicle exports, however, are above their target rate although their average export price has not increased by as much as 10 per cent. Exports of iron and steel are also well above target but this is not so much due to the increase in price as to the fact that their export target did not allow for shipments agreed to under bilateral treaties. Cotton goods have shown great improvement during the third quarter of the year, but they, too, have been helped by higher prices. Exports of wool goods, on the other hand, although increasing, have still a long way to go to reach their objective by the end of the year. Cutlery exports would in all probability have reached their export target by now, had not their average price declined. But in silk and rayon goods,

This Form may be used.

The List of Applications will be opened on Tuesday, the 23rd November, 1948, and closed on the same day.

FORM OF APPLICATION

GOVERNMENT OF SOUTHERN RHODESIA

3 per Cent. STOCK, 1971-1973.

ISSUE OF £5,000,000 AT £100 PER CENT.

TO THE GOVERNOR AND COMPANY OF THE BANK OF ENGLAND, E.C.2.

I/We request you to allot to me/us in accordance with the terms of the Prospectus dated 18th November, 1948, £.....

say,.....pounds of the above-named Stock, and I/we hereby engage to pay the Instalments as they shall become due on any allotment that may be made in respect of this application, as provided by the said Prospectus.

The sum of £....., being the amount of the required deposit (namely, £10 for every £100 of Stock applied for), is enclosed.

* I/We declare that the applicant(s) is/are not resident outside the Scheduled Territories† and that the security is not being acquired by me/us as the nominee(s)§ of any person(s) resident outside those Territories.

Signature .....

Name in full.....
(BLOCK LETTERS) (State Title, if any, or whether Mr., Mrs. or Miss.)

Address .....

.....

Date....., 1948.

* If this declaration cannot be made it should be deleted and a Form D (obtainable from a Banker or Stockbroker) completed as to Declaration 2A and the Certificate appended thereto should accompany this application.

† The Scheduled Territories. The British Empire (except Canada and Newfoundland), British Mandated Territories, British Protectorates and Protected States, Burma, Iraq and Iceland.

§ The definition of "nominee" is given in the Bank of England's Notice E.C. (Securities) 1.

Applications must be for £100 or for multiples of £100, and should be forwarded to the Loans Office, Bank of England, London, E.C.2.
Cheques should be made payable to "Bearer" and crossed thus :—

Bank of England,
a/c Southern Rhodesia Loan.

miscellaneous textiles, leather goods and rubber goods, the fall in price has only accentuated the gap between performance and

target. Yet it would be wrong to judge an industry by its export achievement unless all the different targets were devised in the same manner. This, of course, was not done, and some were clearly more difficult to fulfil than others.

* * *

New Issues Activity

The recent issue of £100,000 3 per cent British Electricity Authority stock has narrowed the gap between the cumulative total of capital issues in 1948 and the corresponding figure for last year. Total new issues, excluding conversions, have increased from £223,886,858 on October 23, 1948, to £343,118,233 this week; the increase between corresponding dates last year was from £440,370,564 to £455,714,824. In 1947 the remaining six weeks of the year produced an additional £70,901,923 of new borrowings. These were widely dispersed over the industrial field, but included the issue of nearly £29 million for Shell Transport and Trading. In that period the industrial share market provided a favourable background to new issue activity on account of switching from railway stocks into industrial shares before the vesting date of the railways.

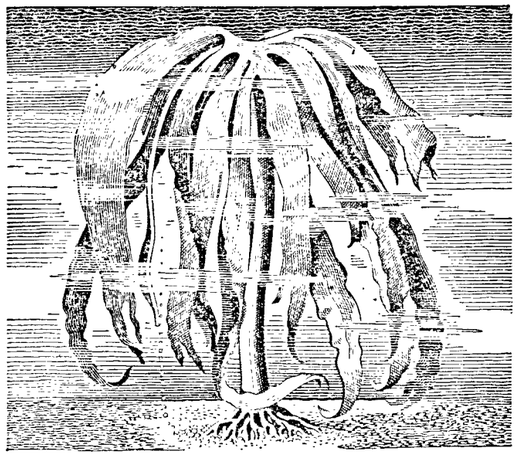
While the number of Government and industrial applicants for new issues is at present undoubtedly large, the call of £40 million on the BEA loan due on January 3rd makes it doubtful whether the coming weeks will see an unusual rush of new issues before Christmas. It must be conceded, however, that the heavy institutional stagging of the 3 per cent Trinidad loan last week points perhaps the other way, and this evidence of the volume of money awaiting suitable investment opportunities is supported by the new high level of deposits shown in the latest clearing bank returns. In any case, the market has enough to occupy its attention at the moment with applications from a catholic selection of interests. On Thursday underwriting was proceeding in the City for a new £5,000,000 loan of the Government of Southern Rhodesia. Lists also opened and closed this week for two important industrial debentures, the £1,000,000 English Sewing Cotton 3½ per cent first mortgage debenture, 1969-74, issued at 101 per cent, and the same amount of British Aluminium 3 per cent mortgage debenture stock at 95 per cent.

The reasons given for the English Sewing Cotton issue follow the now familiar pattern of industrial financial requirements—the shortage of working capital to finance stocks and debtors, the repayment of temporary bank advances, the expansion of production facilities and the maintenance of machinery and equipment. British Aluminium requires new money to supplement existing resources to finance its £2,315,000 development project at Falkirk, and a debenture issue seems well justified. This is more open to doubt in the case of the English Sewing Cotton issue, and ordinary shareholders may have a grievance at the prospect of a further prior charge. Among other new issues which are expected, Hector Whaling is applying for permission to make a public issue of £1,000,000 preferred ordinary shares, the proceeds to be largely used for the construction of two tankers. Austin Motor has also announced the first step to be taken in issuing some 2,500,000 5s. unissued shares.

Manpower Needs of the Mines

The mining manpower target of 750,000, originally set in the Economic Survey for 1948, has now been dropped as unrealistic by mutual consent. Even the National Union of Mineworkers (the vice-president of which, Mr James Bowman, had been specifically charged with responsibility for recruitment) agrees that this target is now academic, though it feels that there has been confusion and delay on the part of the Government in making its intentions clear and that the problems of accommodation and training have not been tackled energetically enough.

The report of the Coal Board and the NUM's joint output committee, now published in full, stresses that the main need is for a rapid increase in the proportion of face-workers in the industry. It estimates that the total manpower will be 727,000 by the end of this year, rising to 736,000 by the end of 1949. The programme for 1949 is an increase of more than 13,000 face-workers to bring the total number to 310,000. This means that the rate of increase will have to be more than doubled next year, compared with the 21 months since vesting day, an objective which can be reached only if there is a rapid development in face-room and if both sides accept an agreed procedure for upgrading. At the same time the report urges that training facilities should be speeded up and calls on all miners' lodges to accept the employment of EVWs.



Figures just published in the Ministry of Fuel's statistical review for 1946 and 1947 underline the gravity of the manpower problem. The average age of the men in the industry was 39 at the end of 1947, compared with 36 in 1937, and the recruitment of young men has been less than it was before the war. The total number of men under 20 in the industry in 1947 was 56,600 out of a total labour force of 711,400—compared with 109,900, out of a total manpower of 781,700, in 1938. There are still 20,000 men in the age group 65 and over, and this includes some who are in their seventies and even their eighties. Clearly an efficient mining industry will require not only a sufficiently large labour force but also a balanced one, with the right age composition, and the right proportion of faceworkers to total manpower.

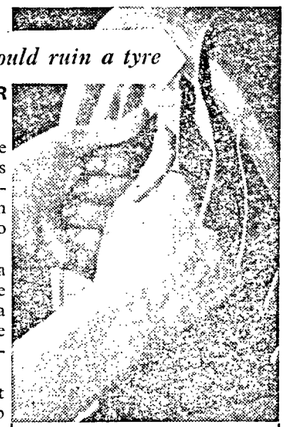
Trends in Life Assurance

It was hardly to be expected that all life offices would find it as easy in 1948 as in the previous two years to acquire new business in the ordinary life branch. Yet a number of important life offices are able to forecast confidently—with only six weeks left before the financial year of most insurance companies closes—that in their experience new business written in 1948 will be higher than in the previous year. This favourable experience is, however, by no means uniformly shared. Fairly generally, life offices are finding that the normal seasonal pattern has been exaggerated in the current year. The year opened very favourably in most instances, with new business running at a higher rate than in 1947. But by May and June, when sales resistance was increasing in other spheres also—in many consumers' goods and in national savings—the seasonal drop in new life business tended to be far more than seasonal. After, by postwar standards, unusually little activity during the summer months, in the past few weeks life offices have found demand recovering more sharply than usual. It must be borne in mind, though, that this recent experience has not been uniform; some offices expect their 1948 figures of new business to be a little below the record levels of 1947, despite the flying start made in the early months of the year. As a portent for 1949, it is hopeful that a number of offices have completed more new business in September and October, 1948, than in the same two months of last year. These tendencies are of some immediate national importance. Unless the poor performance of national savings is being balanced by a bigger flow through other channels of saving, the volume of personal saving upon which the Chancellor can count in the reckoning which he must soon make, may be so meagre as to have material effect upon the coming Budget.

Yet all offices, irrespective of their anticipated final results, are now finding life assurance harder to sell. The demand for annuities has fallen off generally, as was to be expected in a year when capital gains have been rare. Few premium rates have changed this year after the widespread adjustments made two years ago. Yields obtainable on new investments have become a little more satisfactory, and life offices are continuing to benefit from improved mortality. When turnover slows down, it may be found that the expense loading in premiums may need to be raised. An increase has been avoided so far, because in most insurance departments a rather smaller staff is handling a greatly increased volume of business.

LAMINARIA



Laminaria cloustoni is a seaweed found on the Scottish coasts. From it are produced Alginates used to form gels and viscous solutions of value in many industrial processes, pharmaceuticals and foodstuffs.

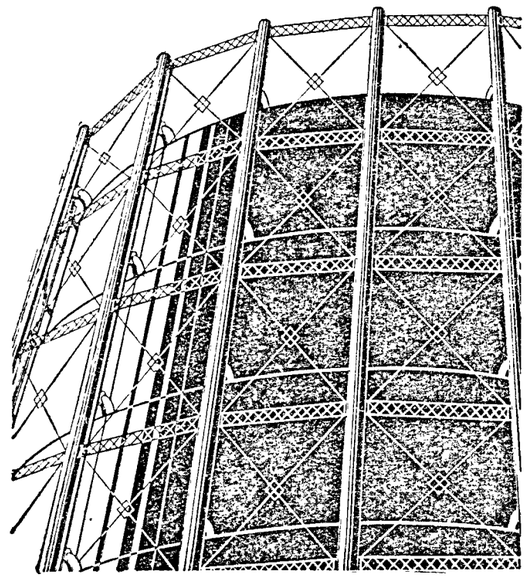
INCENTIVE MEANS BETTER TYRES

A wrinkle like this could ruin a tyre

BUT A KEEN WORKER WON'T ALLOW IT

QUALITY lies in the balance at each of the numerous hand processes in tyre building. Above all it depends on how keen the workers are to do a first class job.



Henley's have started a sound commonsense scheme to make good workers extra keen. Under a co-operative award system as work improves pay rises.

Now output, pay and most important, quality, are all up higher than ever before.

Extra incentive means finer workmanship. Finer workmanship makes Henley Tyres better than the good tyres they have always been.

WRINKLES: A wrinkle overlooked in any one of the fabric layers of a tyre means a poor finished article. Only when attention wanders can wrinkles creep in. Workers who are on top of the job never permit them. One reason why keenness is everything.

GAS

In scores of ways, from kitchens to steelworks, gas is the servant of man and his industries. Millions of tons of coal are carbonised for gas production. With sixty-seven years' experience of scientific carbonisation, Simon-Carves coke ovens, gas producers, by-product plants and gasworks equipment render distinguished service to efficient gas production at home and abroad. Simon-Carves gasworks coke oven plants are at present in hand in Britain, Denmark, Finland and Switzerland to carbonise nearly 2,000 tons of coal a day.

Cotton Supply and Demand

The prospects of a sharp increase in the world production of raw cotton are being fulfilled. The latest estimates put the world crop at 29½ million bales which is nearly 4½ million bales larger than last season. But in spite of the heavier production, total available supplies are less than 2 per cent above last season's level. The US Department of Agriculture has estimated that world cotton stocks declined by 3,600,000 bales to 13.7 million bales at the commencement of the new season (August 1st), which means a total supply of 43.2 million bales or only 800,000 bales heavier than a year ago. The two most important factors on the supply side are the large American crop of 15,026,000 bales or over 3,000,000 bales more than last season, and the increased output in Egypt estimated at 1,600,000 bales against 1,320,000 bales a year ago. These have already induced lower prices both in New York and in Alexandria but there is as yet no sign of a "break" on the market.

Mill consumption in some of the chief cotton consuming countries is still below its prewar level. Consumption in the US during 1948-49 is expected to be smaller than last season when it totalled 9,300,000 bales but it will still be more than before the war. In Europe generally, consumption appears to have stabilised itself at up to 85 per cent of its prewar level although activity in Belgium and the Netherlands is reported at about prewar rate. Latterly, however, there has been some curtailment of activity in Belgium, Italy and France. In the United Kingdom the general trend in consumption is still upward. While it is possible that total world consumption may equal or even be a little higher than last season's figure of 28.6 million bales, it is generally expected to be less than current production. This season, therefore, should see a net addition to world cotton stocks for the first time since the end of the war.

The US market will be of particular interest during the coming months because of the relatively limited export opportunities and the more or less stable domestic consumption. The dollar shortage will continue to restrict foreign demand for US cotton, although for western Europe ECA funds will be available. Yet it is precisely in these countries that there is little scope for any large-scale expansion in cotton consumption owing to the lack of modern textile machinery, the shortage of labour and the competition of synthetic fibres. ECA shipments are expected to total 2,500,000 bales and this will be the mainstay of America's cotton export. There are, of course, other export programmes; the 60 million dollar credit from the Import-Export Bank to Japan and the special 150 million dollar credit made by the US Government to revive the textile industries of occupied areas—but not all of this latter sum will be available to purchase cotton. There is also the Cotton Sales for the Export Programme which will in effect grant an export subsidy of 10 cents per bale and which is applicable to cotton purchased with foreign aid funds. But despite these artificial aids to the market, with the loan rate of ⅞ inch middling cotton fixed at 30.74 cents a lb. for the current season, the US Government is likely to become heavily involved in cotton. The US Secretary of Agriculture has not, however, proclaimed cotton to be in "surplus supply" so that marketing quotas will not apply for 1949-50.

Shorter Notes

Peruvian Corporation First Mortgage debenture holders are asked for consent to prolong the existing moratorium by a further year from January 1, 1949, with powers for the debenture holders' committee to extend the moratorium for additional periods from the end of 1949 but not beyond December 31, 1953. After the scheme had been prepared, but shortly before the particulars were circulated to debenture holders, Peruvian Corporation was informed that the Peruvian Government is claiming £255,000 taxation on interest paid by the Corporation in the past ten years. Peruvian Corporation is preparing to contest the claim on the strength of the Corporation's special taxation privileges in Peru. This latest occurrence provides renewed proof of the difficult circumstances under which the Corporation is operating the railways of Peru, the main source of its revenue.

★

It was agreed in Washington to continue the international allocation of grains, rice, nitrogenous fertilisers and fats and oils through the coming winter. America, Canada and Australia considered it unnecessary to maintain controls on cereals in view of the greatly improved supply position, but the majority of member nations wished to retain them for the immediate future. Grain supplies will be plentiful, and the oils and fats situation is expected to be easier, but both rice and nitrogenous fertilisers will continue to be in short supply.

★

The reductions in the prices of fuel oils announced this week by Shell-Mex and B.P., Limited, are the first price changes to the consumer since the Government fixed prices of petroleum products were replaced by maximum prices at the beginning of this month. Fuel oil was reduced from 10d. to 9¾d a gallon, and heavy fuel oil from 9¾d. to 9½d. a gallon. These are the first reductions below the permitted maximum prices.

SECURITY PRICES AND YIELDS

A fuller list containing 371 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Austin Motor; Wall Paper Manufacturers; Birmingham Small Arms; United British Steamship.

*Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'c'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (a) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 15 years 6 months.*

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) To latest redemption date. (m) 15 months. Yield basis 25%. † Free of tax.

COMPANY MEETINGS

THE UNITED STEEL COMPANIES, LIMITED

RECORD PRODUCTION FIGURES

NATIONALISATION MEANS HIGHER PRICES

THREAT TO FREEDOM AND ENTERPRISE

COMPENSATION ARBITRARY AND UNFAIR

SIR WALTER BENTON JONES ON THE POSITION

The annual general meeting of The United Steel Companies, Limited, was held, on the 17th instant, at the London Office of the Company, 8, Grosvenor Gardens, London, S.W., Sir Walter Benton Jones, Bt., Chairman and Joint Managing Director, presiding.

The secretary (Mr Ronald Peddie, C.A.) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement which had been circulated to the stockholders:

In these times of vast experiment at home, and great uncertainty and danger in world affairs, there is little general information which the chairman of an undertaking can give to his fellow-proprietors that is not already widely known. I propose, therefore, to confine my address to the affairs of our own company, and I have divided it into five parts, viz.: Nationalisation, Production, Progress in Development, Employees and Accounts.

NATIONALISATION

All those who like us have invested part of their savings in what is popularly called the steel industry, and all those for whom it is a means of livelihood, are greatly concerned about the outcome of the political controversy over the proposal to nationalise it.

An outstanding feature about this controversy is that those who own the industry, those who manage it and those who work for it, alike without distraction, have pursued a straight and even course in operation, administration and development, doing their best in a national emergency to give their country maximum production and to close up the hiatus in improvement and expansion caused by the stringency of war and its aftermath. For this we claim no peculiar credit. For us the industry is not only our means of livelihood, it is our own special walk in life, we are proud of it and if left alone we shall not let it down.

THOUSANDS AFFECTED

Those who urge the nationalisation of this industry appear to imagine it as a single thing. In reality nothing could be more false. The steel industry, so-called, comprises a very large number of industrial and commercial undertakings making thousands of things for thousands of purposes at home and abroad. The nationalisation of the steel industry, so-called, means expropriation of the property of thousands of persons and disturbance in the lives of thousands of operators. The object is obscure. The motive is compliance with theories propounded by a German school of theorists more than a century ago. The economic effect, it can be safely predicted, would be to raise costs which could only be met by higher prices for the users, or higher taxation for the community at large.

I could comment on the arguments used so widely by the advocates of nationalisation in this controversy; I could also recall the complete co-operation between successive governments and the industry which has persisted since the introduction of import duties in 1932, and I could ask what greater good could nationalisation bring to the community.

THE REAL ISSUE

But the nationalisation of our industry does not stand by itself, it is not really a single issue. The real issue is whether the industries of Great Britain are to be nationalised one after another, beginning with the iron and steel industry and finishing nobody knows where. In other words, whether Great Britain is to be cast into the mould of a state in which freedom will be chained and reward for enterprise and endeavour will disappear, or whether Great Britain is to remain the home of freedom in industry for individual initiative and enterprise. Let us hope when next the electors cast their votes they will see clearly to which of these alternatives their choice will lead.

PRODUCTION

Our production of steel ingots in the twelve months ended June 30, 1948, was 1,896,229 tons. This was 11 per cent. higher than in the previous year and was an all-time record. The steel production of the United Kingdom in the same twelve months was the highest ever recorded, viz.: 14,307,500 tons, compared with the highest prewar production for twelve months viz.: 12,984,000 tons in the calendar year 1937. The contribution made to this record by our company was equivalent to 13¼ per cent.

Our greater production has been facilitated by additional and improved plant installed in recent years. It has been especially facilitated by the operation of our steel melting furnaces continuously, instead of stopping and allowing them to cool at each week-end. This continuous working has been adopted throughout the country by agreement between employers and employees.

AIM TO BREAK RECORDS

There were record productions of plates and sections at Appleby-Frodingham, of billets at Steel, Peech and Tozer, of railway and engineering material at Steel, Peech and Tozer and at Workington. There were also record productions in many of the finishing processes at each of the works. The aim of all our operators has been to break records and they are proud of their achievements.

There is no reason why these rates of production should not continue, and even increase, provided adequate supplies of suitable coking coal and scrap are available.

I shall ask you later if you will pass a resolution expressing our appreciation and thanks to the operators, a word which I use to mean all those who serve the company at all levels.

PROGRESS AND DEVELOPMENT

I had intended to confine this part of my address to an account of expenditure on developments in the current year, but in view of the introduction of the Iron and Steel Bill I have extended it so as to give you a general description of the company's properties.

It may help you to form an appreciation of the company's assets if I give some information about the amount spent on them in the last three years.

The amount spent on improvements and extensions, including the establishment and equipment of the Distington Engineering Company, has been £9,011,000. The amount spent on investments and acquisitions of properties, including iron ore, has been £1,698,000, making a total of £10,709,000.

New capital issued in the same period, which was all in preference stock, produced £5,484,000, against which has to be set the redemption of debentures and the repayment of notes which together absorbed £3,615,000, leaving £1,869,000 of new money.

Compensation received up to date on assets which have passed to the nationalised railways and coal mines, amounts to £1,380,000. The new money and compensation, therefore, provided £3,249,000 towards the £10,709,000 spent. The balance of £7,460,000 has come out of the reserves and provisions made and approved by the stockholders. It is perhaps interesting to note that this is equivalent to nearly half the amount of our issued ordinary and preference stock.

APPLEBY-FRODINGHAM STEEL COMPANY

The Appleby-Frodingham Branch of the company is the largest iron and steel works in the country and is highly integrated. It is based exclusively on home ore which comes from adjacent quarries at Frodingham and quarries in south Lincolnshire and Northamptonshire, all of which are owned and worked by the company. The works comprise coke ovens and by-products plants; the most complete ore preparation plant in the country, which is about to be extended still farther; blast furnaces, including two very large modern units which came into operation in 1939; two large melting shops, one of which replaced the old shop at Frodingham and came into commission at the end of 1947, and is the last word in modern melting shop design; a plate mill; a heavy section mill, which is in course of complete replacement on the existing site, and lighter mills.

At the Appleby blast furnaces we have found after lengthy research and experiment that if the ore we use is treated and prepared in special plants before loading into the blast furnaces the productive capacity of the blast furnaces is increased by not less than 20 per cent. We are, therefore, giving first priority to this part of our blast furnace programme.

A large engineering workshop has recently been put into commission in order to concentrate maintenance in a central department and to cope with the increasing volume of this kind of work which a modern steel works demands.

There is a large constructional department in which plates and sections are assembled for structural purposes. Important by-products in addition to the customary recovery of sulphate of ammonia, benzol and tar, are tarred slag for road making, foamed slag for light weight concrete and basic slag fertiliser.

STEEL, PEECH AND TOZER

Steel, Peech & Tozer is another very large steel works in which ingots are produced from cold pig iron and scrap, and rolled into billets, bars and strip. The melting shops have been adapted for liquid firing since the war, and out of a total of twenty-one open-hearth furnaces eight are now being fired with oil and two with base tar. The production of ingots is only a little less than at Appleby-Frodingham. The cogging mill is believed to have the highest capacity in the

country and was installed in 1944. The finishing mills are all of the continuous type and are constantly being brought up-to-date.

There is also a heavy forge, a railway tyre mill, a new railway wheel mill, a new cold rolled strip department, and a modern plant for making laminated railway springs.

As part of the drive for fuel economy, waste-heat boilers have been installed in connection with open-hearth furnaces both at this branch and elsewhere within the company.

Both Steel, Peech & Tozer and Samuel Fox & Company draw gas from the company's coke ovens at Orgreave. The gas is carried to Stocksbridge through 14 miles of pipe line.

Except in the case of the wheel, cold rolling and spring departments, new construction at Steel, Peech & Tozer has not been of the same magnitude as at Appleby-Frodingham. Heavy and continuous expenditure has, however, been incurred in modernising existing departments and overtaking arrears of large scale maintenance left by the war.

SAMUEL FOX AND COMPANY, LIMITED

It is difficult to give a concise description of this plant because it covers so many products. Steel is made here in open-hearth, high frequency and arc electric furnaces and a high proportion of the output is of alloy and stainless steel. It is, in fact, the largest producer of alloy steel in the country.

The works are equipped with billet, bar and rod mills for the hot rolling of steel, and the numerous finishing departments include large sections producing special qualities of cold rolled strip and wire.

Production of stainless steel sheets began shortly before the war, and since demand already exceeds the capacity of the original plant we are co-operating with Messrs Firth-Vickers Stainless Steels, Limited, in establishing a new works in Sheffield, in which each company will produce stainless sheets from its own steel by the most modern continuous methods.

In addition to those already enumerated, Samuel Fox & Company produce a wide range of products ranging from forging ingots to the finest wire. We have developed the production of hardened and tempered strip, both for sale and for internal use in the manufacture of clock springs to serve the new low-priced clock industry in this country and avoid the necessity of imports. A large proportion of the cold rolled strip for razor blades made in this country is produced at these works, together with such diverse products as resistance wire for electrical apparatus, springs for heavy road vehicles, light coil springs, umbrella frames, and tennis racquets.

WORKINGTON IRON AND STEEL COMPANY

Our properties at Workington consist of hematite ore mines, limestone quarries, and at the iron and steel works, coke ovens with by-products plant, blast furnaces, acid bessemer converters and electric furnace plant, together with mills for rolling heavy and light railway rails and fish-plates, and presses for making railway sleepers. The works have private access to the Workington Dock in which imported ore is discharged and in which exports are loaded. We now own all the capital stock of the Workington Harbour and Dock Board. Through the medium of the Distington Engineering Company (a wholly owned subsidiary), we have established since the war a large engineering works consisting of an ingot mould foundry, a general iron foundry, a steel foundry and machine and assembly shop for the large-scale manufacture of underground mining equipment and general engineering. The size of the Distington undertaking may be judged by the fact that today we employ 1,100 men in its works and when they are working at full capacity the number will be increased to 1,700.

We have nursed this iron and steel works for nearly thirty years through times when we might well have given it up. We have now established a self-contained undertaking in which all its activities have been centralised and modernised: there remain only the installation of a modern cogging mill, now in progress, the increase of facilities for storing, inspection and loading of railway material and the completion of a boiler plant which are also in course of installation. The only coal used, apart from that needed for locomotives and steam cranes, is the coal for coke making, the gas from which, together with the gas from the blast furnaces, not only supplies all the works requirements but leaves a supply of coke oven gas for use in the district.

UNITED COKE AND CHEMICALS COMPANY

The United Coke and Chemicals Company, a wholly owned subsidiary, was formed more than twenty years ago to build and operate a tar distillery at Lowca near Workington, and for other purposes in Cumberland.

Since the vesting of the coal mines in the National Coal Board the coke ovens and the Orgreave tar distillery of the Rother Vale Collieries Branch and the Sheffield Coal Company, all near Sheffield, have been transferred to the United Coke and Chemicals Company.

The tar distillery at Orgreave distils all the tar made at the company's coke ovens, except the tar from Workington, which is distilled at Lowca. This is one of the most modern tar distillation plants in the country. The recovery of finer chemical products in the distillation of tar, the treatment of benzol and extraction of products from coke oven gas are in the course of development.

"SILENTLY NATIONALISED"

While I am talking about coke oven works and the carbonising of coal it will interest you to be informed of the extent to which in addition to coal gas the other products of coal carbonisation are being silently nationalised. In round figures forty million tons of coal are carbonised annually in the United Kingdom, of which the nationalised gas industry carbonises rather more than 50 per cent., and the nationalised coal mining industry carbonises about 20 per cent., leaving about 30 per cent. in the hands of free enterprise of which the iron and steel industry carbonises more than 20 per cent. If the iron and steel industry were to be nationalised something less than 10 per cent. would be left under free enterprise and nationalised industries would have in their own hands nearly the whole of the products of coal carbonisation, that is the coke, coal gas, fertilisers, motor spirit, tar and many finer chemical products, including bases of dyes and plastics.

The object of the Act to nationalise coal was to own and control the production and sale of coal, and the object of the Act to nationalise gas was to control the making and distribution of gas. In both cases the legislation had the effect of gathering in a part of the coal carbonising industry in addition to accomplishing its specific object. If the iron and steel industry were to be nationalised, among other effects it would complete the side line nationalisation of the coal carbonisation industry to the extent of 90 per cent., and this effect might again pass unnoticed.

There is perhaps no branch of applied science in which the triumph of free enterprise has been more signal than the products of coal carbonisation.

RESEARCH AND DEVELOPMENT DEPARTMENT

Research, and the application of knowledge gained from research, is of considerable importance to an enterprise such as ours and the original central research organisation, which was established in 1932 to supplement the activities of the individual branches, has been doubled since the war to form what is now know as the Research and Development Department of the company. The enlarged department has a staff of 150 people, of whom more than one-third are fully qualified scientists or engineers, capable of applying their knowledge to a wide range of problems covering raw materials, refractories, metallurgical plant and processes, and the development of improved steels to meet the special requirements of the engineering industry.

YORKSHIRE ENGINE COMPANY

We bought this company three years ago. It was our intention to use it to build and rebuild our own locomotives, of which we have 163, to act as a machine shop for Steel, Peech and Tozer's forgings, for which it had acted for a number of years, and to assist in repairs and maintenance for the Sheffield works. We have modernised the works but we have been compelled to change our plans about locomotive building to some extent because of the great demand for locomotives. We are continuing to build industrial locomotives for other industrial undertakings and we have a contract to build locomotives for one of the railways.

Markets.—The products of our branches have many and varied markets of their own, and in addition, either directly or indirectly, they enter into the economy of almost every branch of the industries of this country, whether these industries serve markets at home or abroad.

EMPLOYEES

It is my belief that society cannot progress but will go backwards unless it recognises the individuality of men and families of men and, by analogy, the personal communities into which for convenience and constructive co-operation men form themselves, and unless it retains for them the greatest possible liberty. Industrial units are personal communities composed of proprietors and operators engaged in constructive co-operation.

Fundamentally, initiative and energy are personal, not collective forces. If therefore initiative and energy are to be applied effectively in an industrial unit there must be friendly and intimate co-operation among its members, and the unit should be as far as possible self-contained. No mechanical connection, no books or figures, can take the place of this intimacy for the simple reason that man was not made to be the servant of arithmetic, but to be its master. Even so it may well be that there are limits to the size of units in which this essential intimacy can be maintained and in fact we have found it so.

Each of our main branches has its own works, bearing a distinctive and time-honoured name. These works and these names are the real ties and we have found it necessary to keep them separate, they have facilities for meeting one another and making friends, but each retains and is jealous of its own individuality.

Within each branch for a long time we have been engaged in building up the conditions of life which engender and retain the intimate co-operation which appears to us the mainstay of industrial efficiency, and we are still building. For this purpose we have a complete personnel organisation which is charged with promoting and guarding the welfare in the literal sense of the word, of all operators. I had intended to give you a short account of this organisation and I had asked our chief personnel officers to give me a memorandum from which I could make a precis, but I found the notes so comprehensive and so clear that I felt some proprietors would like to read them as they were presented to me, and so instead of telling you more myself, I have arranged to attach them to the copy of my address.

ACCOUNTS

The accounts including the consolidated balance sheet and consolidated profit and loss account have been prepared in accordance with the Companies Act, 1948. This has required a certain number of changes in the form of presentation on the face of the accounts, and comparative figures for the previous year have been shown in the same form.

There is very little of an abnormal character in the year's accounts apart from technical adjustments brought about by the Act, and the changes which have arisen from the nationalisation of the coal mining and transport industries.

The provision for depreciation must now be deducted from the fixed assets, and it seemed a convenient opportunity to apply at the same time the provision under shares in and amounts owing from subsidiary companies to the advances to which it referred. Under trade investments in and advances to associated companies the amounts advanced less written off appearing last year at £247,991 have been converted into an investment and there are now no advances.

COMPENSATION FOR WAGES

Compensation has been received for railway wagons which have passed to the Transport Commission, in the form of Transport Stock, and this stock has been converted into cash. Payments in cash on account of part of the stocks and stores at coal mines on January 1, 1947, when they vested in the National Coal Board have been received from the Ministry of Fuel and Power. A substantial portion of the company's assets remains sterilised in the form of compensation not yet ascertained, and no indication can be given as to when they will be freed.

The compensation to be received for these assets is to be assessed in two different ways. The compensation for what may be described as the coal mines themselves, is to be arrived at by carving up the global sum of £164,660,000, which is the total amount of compensation to be divided among all mines. The compensation for other assets is to be separately assessed in the case of each colliery undertaking by district valuation boards. The procedure for making these valuations is lengthy, and although some progress in presentation of cases and arguments has taken place no decisions have yet been made which can be any guide to individual colliery undertakings.

ASSETS VESTED IN COAL BOARD

The assets of our company and its subsidiaries which are vested in the National Coal Board and for which compensation has yet to be assessed stand in the consolidated balance sheet at £3,840,419. The only thing that can be said about this figure is that the directors will be disappointed if the compensation is assessed at less than this amount.

The larger amount of advances to subsidiary companies is a reflection of the amounts lent to finance capital expenditure and the rising value of stocks.

It has been the company's practice to value what is regarded as a basic quantity of stocks of raw materials at the prices ruling in 1934. The volume of such materials carried at any time is large, and in the event of a fall in price, losses on the stock might be incurred. This policy provides insurance against such an eventuality and it will be a matter of interest and satisfaction to you to be informed of this arrangement.

The increase in creditors, bills payable and provisions arises from higher prices and a greater volume of purchases, including coal, of which a large quantity which at one time was raised in the company's own mines must now be purchased.

BALANCE OF TRADING PROFIT

On the consolidated profit and loss account you will see that the balance of trading profit, including income from investments, is £4,291,202, compared with £3,713,476. From this has to be deducted the items shown on the account, leaving a balance available for appropriation of £888,847.

The remuneration of directors, now shown in accordance with the Companies Act, includes remuneration of the seven directors who hold executive office under the company and its subsidiaries.

It will be remembered that last year £1,500,000 provision for taxation no longer required was brought into account, one-half of which was applied to general reserve and the other half, namely, £750,000, was applied as additional provision for depreciation.

The amounts by which tax liability has been reduced by the initial allowances on capital expenditure has again been treated as additional depreciation.

You will notice particularly the large amount, namely, £467,000 payable as profits tax, which with income tax amounts to no less a sum than £1,769,000. This is a heavy drain on our liquid resources on which we depend to finance the regular and continuous process of keeping up to date.

Of the balance available for appropriation it is recommended that £307,372 be appropriated to general reserve.

DEPRECIATION

Over a number of years we have built up what has been called a central reserve for obsolescence until it amounted to £2,375,000, but now that the provision for depreciation is dealt with as a deduction from fixed assets, which appear in the balance sheet at a net figure, it appears confusing to have a specific reserve for obsolescence. Your directors have thought it well therefore to merge the general and obsolescence reserves, which, if the recommendation is adopted, will then stand at £5,850,000. In order to reconcile this figure with the sum of the two reserves shown in the balance sheet of last year, it is necessary to read Note 2 on the balance sheet, which informs you that premiums on the shares, formerly included in the general reserve, amounting to £532,372, now appear in the account called premium on shares.

The dividend recommended is the same as last year. The amount to be carried forward is £613,485, compared with £606,696.

In response to a general appeal made by the Government in its executive capacity, your directors undertook in March last not to recommend to their stockholders an increase in the rate of dividend to be paid in the current year. This appeal it will be remembered was not confined to the declaration of dividends. It was part of an appeal to manufacturers and traders and to wage earners to assist in arresting inflation. Accordingly your directors undertook not to recommend an increase in the rate of dividend, a course which they believed the stockholders would approve.

DIVIDEND POLICY

In this connection I should like to refer to the policy of your directors in recommending dividends during the period of emergency through which the country has been passing since the outbreak of the war. At the outbreak of the war the uncertainty made it advisable to conserve the company's finances and the dividend was reduced from 10 per cent. to 8 per cent. From then onwards the need to conserve financial resources has remained, and has been accentuated by high taxation and inflation and the danger of still further inflation. For these reasons your directors, after very careful consideration especially in recent years, have concluded that the best interests of the company as a whole would be served by refraining from increasing the rate of dividend.

So far as your directors can judge this policy has met with the approval of the stockholders. It is true that from time to time one or two stockholders have written to me or to the secretary suggesting that the rate of dividend should be increased, and some of them have pointed out that the rate of dividend affects the market price of shares: but these expressions of opinion have been few and far between and the directors have believed, and still believe, that they have rightly interpreted the wishes of the large body of stockholders in shaping a dividend policy aimed at conserving the resources of the Company, which is an important factor in maintaining its manufacturing efficiency and the value of its assets and in addition has regard to general financial stability.

A year ago I gave details of the way in which the Company's gross income was disposed of and I now repeat this information.

	1947/48 Total Amount £	Equivalent Proportions per cent
Gross Income received	43,927,120	100
Amounts expended on:—		
Raw materials, fuel and services	25,963,662	59·2
Wages, salaries and state insurance	10,889,333	25·8
Holidays with pay	320,066	
Pensions for staff and workmen	140,000	
Rents, rates, insurance, stationery and general trade expenses	777,659	1·8
Delivery charges	1,813,570	4·1
Taxation	1,769,000	4·0
Dividends to stockholders	574,686	1·3
Retained in the business for depreciation of plant and machinery and other purposes	1,678,844	3·8
	£43,927,120	100·0

Number of employees ..... 32,056 Number of stockholders 26,750

In the previous year the trading of the collieries was included for half a year. In this year they no longer appear in our accounts. The consequences are that more is expended on raw materials because we have to buy more coal, and the wages bill is less because there are no coal miners' wages to pay.

There is a large increase in the amount of taxation and the equivalent percentage of taxation is approximately one-third higher.

THE BILL

Since I prepared this address the Iron and Steel Bill has been published and is now before Parliament. The Bill is to bring under public ownership the main producing undertakings in certain sections of the iron and steel industry. It differs in principle from previous nationalisation measures, which applied to a clearly defined class of enterprises. This nationalisation measure expropriates certain specified companies and firms engaged in all kinds of activities if at the same time they are engaged in the manufacture of iron and steel in quantities exceeding a specified datum output. Previous nationalisation schemes have applied to what may be called services.

The Iron and Steel Bill is the first nationalisation scheme designed to acquire what, so far as it can be defined, may be regarded as a single industry. It is also the first scheme which has for its object the expropriation of selected companies or firms. For these two reasons, if for no other, the Bill should be strenuously opposed

by all who are concerned to maintain industry in the hands of free enterprise and to defeat any attempt by the state to select and expropriate selected firms or companies.

If you have followed what I have said already you will see not only that the nationalisation of our Company would bring the state into competition with a great range of free enterprises, but that we are doing as much as the state itself could do in production and in modernisation and extension. You will see also that our conception of the relationship of employer and employee is essentially personal and inconsistent with the conception of state ownership.

Your directors are opposed to nationalisation and will assume that in this attitude they have the full support of all the stockholders. At the same time they would like to point out that if, as appears, the proposed nationalisation of our industry arises from political motives, the proprietors of the companies selected for expropriation can, and should, every one, assist in making their views known to the legislature and to the public in every way open to them.

The purpose of the Iron and Steel Bill is to acquire compulsorily the shares or stock of the companies named therein, of which The United Steel Companies Limited is one. This would mean that if the Bill were to become law, all the stock of this Company would pass to a proposed Iron and Steel Corporation of Great Britain which would thereby step into the shoes of the present stockholders. None of the Company's assets of any description would be saved and none can now be sold for the stockholders' benefit unless and until the Bill is rejected or withdrawn.

EFFECT ON STOCKHOLDERS

Shortly if it becomes law, the effect of the Bill on the stockholders of this Company, as such, would be:

(1) They would be compelled to transfer their stock to the Iron and Steel Corporation of Great Britain.

(2) The date of the transfer would be the 1st of May, 1950, or some later date which would not be more than eighteen months from the passing of the Bill into law.

(3) The compensation to be paid would be 22s. 10d. for each £1 preference stock and 30s. 4d. for each £1 ordinary stock.

(4) The compensation would not be paid in cash but in British Iron and Steel stock which would in effect be a Government stock like the transport and electricity stock carrying a similar rate of fixed interest, and until the forced sale takes place, or the Bill fails to pass, the stockholders may not declare a dividend exceeding 8 per cent.

The fixing of the rate of compensation by reference to stock exchange quotations on certain dates, repeats the method of fixing compensation in the case of transport and electricity. This is arbitrary and unfair. The stock exchange quotations are the records of prices paid to willing sellers of stock who from day to day wish for personal reasons to liquidate their holdings. The amount of stock which is sold in this way is relatively small and cannot be regarded as a fair measure of compensation for expropriated stockholders.

The fact that the British Iron and Steel Corporation might keep in being the companies they would acquire, may suggest at first sight that the Bill is not a nationalisation measure, but this is an illusion. Those who support the Socialist creed are carrying into effect the nationalisation of British industry, and if this Bill becomes law it is just another step along a road which may have no end. Those who hold the view that nationalisation is bad for British industry must oppose the Iron and Steel Bill.

EMPLOYEE SERVICES

We have always held the view that those responsible for the well-being of any industrial organisation must not confine themselves merely to ensuring that their employees are able to do their work under the best possible conditions. They have a wider obligation to see that the individual employee is encouraged to take his proper place in the life of the community of which he forms part.

After the insurance of safe working conditions, we believe that the efficiency of an industrial undertaking is the first and most important part of a sound plan for welfare. By no other means can the greatest human requirement, that of constant and purposeful employment, be satisfied. We, therefore, direct our resources first to the ancient and honourable task of trading successfully, for upon this alone depends the ability of the industry to support other benefits, however desirable they may be. Moreover, that which advances the well-being of the nation or the community is also that which provides for the greatest health and happiness of the individual. Just as the first call upon the nation today is to produce economically and abundantly so also must it be of each industrial unit.

ENCOURAGING THE BEST

It is not enough in modern civilised society to prop up its weakest and most helpless members, and such an aim by itself can only lead to deterioration of our strength and to disaster. We have also to encourage the best and most gifted men so as to make them of the greatest service to industry and thus to their fellow men.

This realist conception of welfare in no way detracts from the importance of good working conditions or of improved social standards. It does in fact bring us nearer to the achievement of these things. It brings the vast sea of social and industrial reform within limits that can be charted and it allows freer development for those schemes that are considered most necessary for the promotion of human happiness.

In following out this policy we have introduced improvements over a large number of years, and in such a way that they now form part of the background against which the company's manufacturing processes are carried on. They are an integral part of our organisation and not, as is sometimes the case, an imposed and artificial adjunct to the whole.

It is, therefore, necessary from time to time to detach these from their surroundings in order to review the position reached so that the progress made over the whole field of employee relationships is not obscured by the attention given to particular aspects at particular times.

CANTEENS

Starting with the more concrete amenities provided, we have at each works one or more fully equipped canteens which compare most favourably, both in design and quality of service, with those of other industrial concerns. Good quality meals can be enjoyed in these congenial and clean surroundings both during the day and during the night. A three-course dinner costs 1s. and a cup of tea 1d. The costs are, of course, subsidised by us, and similar facilities outside the works would cost three or four times as much as our workpeople pay. We subsidise still further the meals for juveniles and as far as possible we ensure that boys and girls have a good dinner whilst at work.

The management of the canteens varies from plant to plant in accordance with local requirements. In some cases the fully equipped buildings have been handed over to the employees, who run them themselves with clerical assistance from the company, in others they are run by the company, and yet others are run by contractors. In all cases, however, there exists a committee of employees who watch the interests of the canteen users and help us by their close knowledge of plant conditions to provide services of the type desired.

AMENITY BUILDINGS

Since the end of the war we have been rebuilding and extending our amenity buildings, in which locker accommodation, washing facilities, shower baths, clothes drying, etc., are provided. A certain amount of this work is necessary under the Factories Act, but the standards at which we are aiming are much higher than the bare legal requirements. The present stringency of building restrictions has so far prevented the completion of many of our schemes and progress in this work is somewhat uneven. We still have some of the old types of cabins in our works, often alongside a fine modern building for the same purpose. Eventually if our plans are not interrupted by circumstances over which we have no control we shall be equipped with buildings and services that cannot be surpassed in this type of works.

ARCHITECTURAL ENVIRONMENT

In the field of general architectural improvements we have also made satisfactory progress. Good roads and pathways are replacing the muddy or dusty tracks of the past. Roofing, heating and lighting are improving and attention is being given to cover over places where men have to stand, such as pay windows and bus stops. Lawns and gardens in the works have been laid out where practical. Colour schemes have been adopted in workshops. In this connection the new melting shop at Appleby-Frodingham is widely recognised as a fine example of modern industrial design. These things would have been considered entirely unnecessary and extravagant fifty or a hundred years ago, but we think differently today. We believe that improved environment can contribute to the well being of the people and we shall continue to experiment in this direction in order to mollify, if not finally to overcome, the inevitable dirt and ugliness of some parts of a steel plant.

CLUBS AND PLAYING FIELDS

At each of the works the company has provided and encouraged the formation of social clubs and recreational facilities. These are organised under their own elected committees, though the company takes a continuous interest in their activities. There are splendid playing fields and clubrooms in existence or planned at our main branches and these have proved great social assets to the districts in which they are situated.

ACCIDENT PREVENTION

Although for many years we have had our accident prevention committees, comprising representatives of management and workpeople who met monthly to discuss matters relating to safety, in 1941 it was felt that more positive action should be taken, and we added to our staff an industrial consultant to advise on reducing the risks in our works and the promotion of a planned system of accident prevention.

Propaganda was instituted with the object of getting our men to co-operate in the movement and at each of our main branches a man of the right type, combining tact with knowledge of the plant processes and personnel, was appointed to act as a full-time accident prevention officer. His duties comprise the investigation of all accidents with a view to preventing recurrence, inspection of the works to make suggestions for decreasing the risks, maintaining liaison with the Inspector of Factories and the Royal Society for the Prevention of Accidents to ensure that statutory and other requirements concerning safety are complied with in the best possible manner, and organising the distribution of necessary special clothing and equipment.

The result has been that whereas in the year 1942 there were 2,441 accidents, causing absence from work for at least one day this number has progressively decreased to 1,428 in 1947, the total personnel remaining practically constant. When it is remembered on the one hand that ours is a heavy industry, and on the other hand that many of these accidents are minor mishaps, such as foreign bodies in the eye, this reduction of about 40 per cent. is most gratifying.

MEDICAL SERVICES

At each of our main branches we have a full-time medical officer. His work is closely associated with safety and is preventive rather than merely curative.

He is responsible for the running of the medical department, where injuries and indispositions are treated by qualified nurses, of whom we have about 50. This prompt treatment tends to lessen the severity of accidents or illnesses. He also supervises the work of our voluntary ambulance brigades.

The medical officer gives special study to particular health risks arising from processes in the works and advises generally on all matters of hygiene and sanitation.

The examination of all new starters, youths and adults, before commencing work so as to grade them for the most appropriate class of employment is also one of his functions.

At one branch we have established a physiotherapy department where skilled treatment is given free, and this is so much appreciated by our employees that about 50 patients are dealt with each month. It is hoped to set up similar departments at the other branches in the near future.

PERSONAL SERVICES

One of our aims is to adjust the individual to his work and his environment. Various procedures are used for selection, training, elimination of fatigue, removal of hazards, frictions and personal anxieties and for the improvement of working conditions of all kinds, but these would be insufficient without some provision for a personal approach to individual problems

Welfare departments are organised to represent the difficulties of workers to the management and to give assistance and advice where necessary. They deal with every type of individual and group problem that affects the workmen's health, happiness and efficiency. There can be no hard and fast rules to govern such work, since every case presents a different problem and requires separate treatment. This personal service can only be judged by its quality and would never receive any serious recognition from an impersonal bureaucratic control. Nevertheless, there are many in our organisation who have benefited by it and there are many of those, least able to express themselves, who would bear testimony to the help we are able to afford them through these channels.

PENSIONS

In 1935 the company instituted contributory pension schemes for all staff and employees and at the same time made provision for the older employees who, owing to the date of their retirement, were unable to acquire adequate contributory pensions. By this scheme the company bears a very large part of the cost and, in addition, provides free life insurance cover for all contributors. Our expenditure last year in this respect was approximately £140,000.

We are glad to state that the introduction of the National Insurance Act has not produced a shortsighted desire to withdraw from the scheme and those employed on a permanent basis are all covered in this way.

EDUCATION AND TRAINING

Before the 1944 Education Act was placed on the Statute Book we had established the practice of releasing from work for part-time education many of our young employees, on the basis of one day a week for attendance at technical college or day continuation school. Our steadfast aim is to make the conditions of employment of all young people in our works such as to be of training value to them and complementary to the technical and general education which the local technical colleges and day continuation schools associated with our works respectively provide. In this way the young employees' whole industrial experience can be of practical educational value, and in this connection we welcome therefore the Employment and Training Act recently passed by Parliament, which seeks to encourage the establishment throughout industry of such conditions of employment for all young people. To carry out the provisions of our education and training policy and to ensure a sympathetic supervision of all our young employees, education officers with assistant staff have been appointed at all our main works and general supervision is maintained by a Chief Education Officer for the company as a whole.

The training arrangements include not only provision for craft and technical apprentices and the young operatives, but for student and graduate apprentices and training courses for foremen and junior executive staff.

Scholarships are awarded to exceptional apprentices to enable them to take full time university courses and nine young men are at present benefiting by such awards from the company. Furthermore, in addition, fifteen other young men employed by the company are at present studying full time at universities, having won scholarships awarded by education authorities on the results of their technical college examinations. Other forms of reward include sending selected boys to attend courses at the Outward Bound Sea School and other similar centres for training in self-reliance and enterprise. Indeed, the fostering of enterprise and self-reliance, in addition to technical efficiency, may be said to be the central aim of our educational policy.

JOINT CONSULTATION

In this much discussed sphere of joint consultation we have long recognised the necessity and the value of discussion with our workpeople of all aspects of industrial life. There is today a great deal of misconception in the public mind of the meaning of this hackneyed phrase, joint consultation. It is not something that can be called into being by Act of Parliament or even by the Board of the Company which has an intimate knowledge of the industry. It is a form of social structure that has to grow naturally from the works community itself.

The formal joint consultative scheme was started in this organisation in 1928 and we are not at all dispirited by the progress which has been made in this important and difficult art of management. We are, however, continually seeking new methods to encourage its development and to make it a more integral part of the managerial system. One of the greatest problems we have to overcome is that of breaking down out of date suspicions and of conveying true information to the workpeople.

In all this we have received valuable help from the Trade Union officials and if the Unions will approach the matter with more singleness of purpose we may look for a steady advancement in this direction. There is any amount of goodwill on both sides in this industry and every day our common purpose emerges more and more clearly. We must always remember, however, that short of training him to be a fully qualified technician, the average workman is not competent to advise management on many aspects of the industry. Where his experience and training do so qualify him, his advice is always acceptable.

WORKS MAGAZINES

We are continually striving by different procedures to supply to all those in the industry current and accurate information about our work and our plans. Each of our branches has its own periodical which publishes information of works interest at regular intervals. By this means we are able to show achievements in production, target requirements, as well as trade reports, schemes for development and other matters affecting the lives of the people. Employees are encouraged to contribute articles and a number of stimulating controversies on works affairs have appeared during the past year.

SUGGESTIONS

Suggestions are at all times welcomed. We have formal schemes for their encouragement and reward which are administered by joint committees. Many useful ideas have come forward in this way and through the normal daily contacts between management and men. We wish for more of this sort of co-operation but it must be stressed that the process cannot be hurried. We have to build up attitudes of confidence and to educate opinion before a full state of co-operation can be achieved.

LABOUR TURNOVER

Investigations have been made into the percentage turnover of the company's labour force. The results give some indication of the stability of employment with our company and are thought to be a pointer to the effectiveness of its welfare policy and to its standard of management in general.

Over the year ending in June, 1948, the number of employees leaving the four main branches was 3,464, of which 2,498 were men, the remainder women and juveniles. This figure of 2,498 men included 1,020 who for one reason or another stayed with us for less than one year. The remainder, 1,478, who left after more than one year of employment represent 7.9 per cent. of the adult male labour force. We believe that this figure which includes those who left because of death, disablement or retirement represents a considerable degree of stability amongst our employees.

It is thought that many of those who left did so for reasons which would not obtain if circumstances were normal: some of them were brought to leave by housing difficulties, others were temporary employees engaged on new work. These tend to inflate the annual leaving rates and it seems probable that under more settled civil conditions these rates would be appreciably lower than they are at present. Even as they stand they are satisfactorily low, but every aspect of the question is being carefully studied to discover methods by which they can be diminished.

It is only possible to indicate here some of the main headings under which our employee services operate. There are, of course, many others in existence or being planned and there is an inter-relationship between them all and the work of production.

We want to make it clear that we are continually advancing in this difficult work of improving industrial life and of achieving human satisfactions. There is no royal road to success. Only patient and painstaking effort will bring about the results that we all desire.

The report was adopted.

KEYSTONE KNITTING MILLS (1928), LIMITED

CONTINUED INCREASE IN SALES

The twentieth ordinary general meeting of the Keystone Knitting Mills (1928), Limited, was held, on the 17th instant, at Elstree.

Mr H. N. Lewis, chairman and managing director, in the course of his speech, said: It is with much pleasure that I can report to you today a continuance of the good progress to which I referred last year. Sales for the year have increased by over 30 per cent. on the preceding year's total. This considerable increase has been brought about despite the continued difficulties under which we are operating.

The raw materials necessary for our commodities are still controlled and our output is limited by the quantity made available to us. Our allocations of pure silk yarn (of which 50 per cent. has to be exported) have made it possible for us to revert to some of the types of hosiery in which we specialised in the prewar periods. Our nylon hosiery production is increasing, but at the present time all of it is being exported. We hope, however, that next year we will be in a position to offer some nylon stockings to our home trade customers.

During the year the labour position has materially improved and it has become possible for us to increase the company's labour force to deal with increased production.

In spite of the difficulty of obtaining new plant, your directors have faced the problem of modernising certain portions of the company's plant, and a small portion of the items ordered were delivered before June 30, 1948. Many more items have been delivered subsequent to that date and, in fact, the capital commitments for plant ordered and not delivered at June for about £50,000, represented plant which has now been delivered and paid for.

Keystone products, both in the hosiery and the lingerie ranges, continue to enjoy the great popularity which they deserve. In fact, the increasing demand is a sure sign of this, and this demand is still far in excess of the quantity we are permitted to manufacture.

PROFIT AND DISTRIBUTION

The profit on trading amounted to £131,394. The net profit for the year is £25,211, which compares with £6,157; for comparative purposes, however, a figure of £15,867 should be taken, for in arriving at the former figure the taxation charge brought in was greater than the amount due on the year's profit

Funding Certificate interest has been paid for the six months to June 30th last, and a dividend of 2½ per cent., less income tax, has also been paid to the preferred ordinary shareholders for this same period. The further dividends which are proposed are 2½ per cent. to the deferred ordinary shareholders, and then a further 2.06875 per cent. to the preferred ordinary shareholders and 7½ per cent. to the deferred ordinary shareholders.

The balance sheet at June 30, 1948, discloses an extremely satisfactory position. It will be observed that the fixed assets stand in the company's books at £136,321, but that the total original cost was no less than £312,704, the total amounts written off being £176,383.

I can inform you that sales have continued their upward tendency and that the total for the period subsequent to June 30th last shows a substantial increase on the figures for the same period in the previous year. While one is always very diffident in making prophecies, and the present unsettled state of the world makes one even more reluctant to do so, I am confident that in the present year the results which were achieved during the year to June, 1948, will be maintained.

The report was adopted.

NOURSE MINES, LIMITED

(Incorporated in the Union of South Africa)

AMALGAMATION WITH CITY DEEP

EXPECTED BENEFITS

MR P. H. ANDERSON'S SPEECH

The annual general meeting of Nourse Mines, Limited, was held in Johannesburg, on the 12th instant.

Mr P. H. Anderson, the chairman, who presided, said that the shortage of both European and native labour, which the company had experienced during the past few years, continued throughout last year. As a result, development operations had to be restricted still further and ore milled at 846,000 tons had been only 7,000 tons higher than that of the previous year, when operations had been seriously curtailed by a strike of European miners.

THE PROFIT

Total profit was £57,881. That amount, together with the balance of £181,145 unappropriated at the beginning of the year and £700 withdrawn from shareholders' contingency reserve, had given a total of £239,728, which had been dealt with as follows: Net expenditure on capital account, £10,119; provisions in respect of silicosis outstanding liabilities, £11,445; and provision for taxation, £1,581. There had been a refund of forfeited dividends of £682 and dividends had absorbed £58,775, leaving to be carried forward an unappropriated balance of £157,126.

Shareholders would have noticed that some alterations had been made in the form in which the annual accounts were presented. That had been done with the object of giving shareholders a more easily comprehensible picture of the company's financial position. In order to facilitate comparison, figures relating to the previous year were shown in the left-hand margin of the accounts. More detailed information was given regarding creditors and reserves, abnormal costs reserve (previously known as renewals and replacements reserve), creditors and provisions and shareholders' contingency reserve now being shown under three separate headings.

DEVELOPMENT LIMITED

Development operations had been limited by an inadequate labour force. Total footage accomplished at 19,374 had been 1,704 feet less than the figure for the previous year and had been insufficient to maintain the ore reserve. Of that footage, 12,120 feet had been sampled and 6,220 had exposed payable values. Good values had continued to be disclosed on the Main Reef Leader in the lower levels of the mine. Drilling to test the South Reef had been continued on levels 47 to 51 but the results had been disappointing, with occasional exposures of payable reef at irregular intervals. Prospects of some payable tonnage on the main reef in the area to the west of 3 D incline had been disclosed by drilling on levels 48 to 51. On the pyritic quartzite zone in the upper portion of the mine disclosures had continued to be patchy, but satisfactory values had been disclosed in certain areas and a small amount of stoping had taken place on that horizon.

The construction of the main pumping station of the 48th level and the sinking of No. 3 D incline had also been held up by the shortage of labour. However, the pumping station was now practically completed and work on the incline had been resumed in April after a stoppage of six months. During the year, the shaft had been sunk 212 feet to within 39 feet of the 53rd level and at the end of June it had reached a depth of 4,255 feet below the collar. Since the close of the year, a further 115 feet had been sunk and work had commenced on the cutting of 53 level station.

ORE RESERVE

Payable ore developed during the year had amounted to 338,000 tons, averaging 4.4 dwt. per ton, which was 195,900 less in tonnage and 1.1 dwt. less in value than that opened up during the previous year. At June 30, 1948, the available ore reserve had been estimated to be 2,269,000 tons averaging 4.7 dwt. over a width of 46 inches.

Compared with the previous year, the available ore reserve had decreased by 120,600 tons and the average value by 0.2 dwt. per ton, while the width had remained unaltered. It was encouraging that ore developed on the Main Reef Leader during the year in the lower levels at 3 D incline had continued to be above the average value of the total ore reserve.

A TAXATION CHANGE

In his budget statement in August, the Minister of Finance had announced certain changes in gold mining taxation. With effect from January 1, 1948, the Formula Tax, which was based on a ratio of profit to recovery, had been reduced and the redemption allowance in respect of capital expenditure had been increased from 22½ per cent. of 27½ per cent. of the unredeemed balance at the end of each year. Those changes had no effect on the tax liability of the company in respect of the year under review, as the ratio to recovery had been less than 6 per cent.

The review that he had just given shareholders of the company's operations, and information given in recent years, indicated in respect of the company's mine serious consequences of progressive deterioration of the economic position of the gold mining industry of the Witwatersrand. The Nourse Mines mill was now operating at only 79 per cent. of its capacity. During the past seven years, working costs had increased by 5s. 7d. per ton and profits had decreased by 7s. 1d. to 1s. 4d. per ton milled. Consequently, dividends had been reduced by two-thirds and had totalled £58,775 in respect of the year ended June 30, 1948. In addition, net earnings for the past financial year had contributed only £34,755 to that dividend distribution, the remaining £24,020 representing a further reduction in the unappropriated balance.

BENEFITS OF AMALGAMATION

After a careful consideration of the position at the mine and on the recommendation of the company's technical advisers, the board had decided to enter into a provisional agreement with the board of City Deep Limited, whereby Nourse Mines and City Deep properties would amalgamate. On September 17, 1948, circulars had been issued to shareholders of both companies, setting out the position very fully and detailing the proposed terms of amalgamation.

Generally speaking, the shortages of labour and materials and the steady increase in working costs had resulted in both mines milling very much below capacity and at very reduced margins of profit. It was confidently expected that by amalgamating the two companies it would be possible to use the available labour force to better advantage, to achieve certain savings in overhead costs and to win gold more economically, particularly from the deep levels of Nourse Mines. Profits which would be earned by the amalgamated company would therefore be greater than the combined profits that could be earned by the two mines working separately.

The proposed terms of amalgamation provided that the company would receive for its undertaking 391,832 shares in City Deep, Limited, and, if after handing over possession of its business shareholders decided to place the company in voluntary liquidation, Nourse Mines' shareholders would be enabled to receive one City Deep share for every two Nourse Mines shares. That would give shareholders an opportunity to participate on a favourable basis in the increased profits which it was expected would be derived from the amalgamated property and, in addition, give them an interest in a mine having a very much longer life.

The directors, therefore, had no hesitation in recommending the acceptance of the proposals which would be submitted for approval at today's extraordinary general meeting.

A report of the proceedings at the meeting would be published in the press and copies could be obtained on application to the secretaries in Johannesburg or in London.

The report and accounts were adopted.

EXTRAORDINARY GENERAL MEETING

At the conclusion of the annual general meeting, an extraordinary general meeting was held during which the resolution was passed ratifying the provisional agreement entered into by the directors of the company and City Deep with reference to the amalgamation of the two companies as set out in the notice to shareholders dated September 17, 1948.

BLYVOORUITZICHT GOLD MINING COMPANY, LIMITED

(Incorporated in the Union of South Africa)

PROGRESS DESPITE DELAYS

NET PROFIT EXCEEDS £2,486,000

MR W. M. FRAMES'S ADDRESS

The annual general meeting of the Blyvooruitzicht Gold Mining Company, Limited, was held in Johannesburg on the 12th instant.

Mr W. M. Frames, the chairman, who presided, said that operations during the year had been seriously handicapped by delays in delivery of plant and equipment and by shortages of essential materials and of European and native labour. Nevertheless, in so far as conditions had permitted, satisfactory progress had been made in equipping the mine and in expanding the scale of operations. Net profit amounted to £2,486,519. Dividends had absorbed £1,423,750, provision for taxation had amounted to £873,416, provision for mineral lease consideration had accounted for £174,524, and amounts set aside in respect of silicosis outstanding liabilities had totalled £3,974.

Shareholders would notice that the form of the company's accounts had been altered to show as separate amounts two items which in previous balance sheets had been grouped under a general heading. Those items were creditors and provisions and abnormal costs reserve (formerly shown as renewals and replacements reserve). In addition, comparative figures for the previous year were shown in the margins of the accounts.

INCREASE OF CAPITAL

At the extraordinary general meeting held in January last, the company's authorised capital had been increased to £3,300,000 and to finance the company's capital requirements a share issue had been made in March, the proceeds of which had amounted to £4,575,000. Issued capital now stood at £3,000,000. Expenditure charged to capital account during the year had amounted to £975,426.

Major items had been in connection with additional housing accommodation for European employees, sinking and equipping No. 3 circular shaft, hoisting equipment, a native hospital and compound and extensions to increase the milling capacity of the reduction plant. The balance of working capital on hand at June 30, 1948, had been £4,215,295, and it was estimated that capital expenditure during the current financial year would amount to £1,164,000. It would be incurred principally in respect of housing for Europeans, extensions to reduction works, workshops and equipment, pump chambers and equipment, power supply and distribution and the installation of winding equipment.

DEVELOPMENT FIGURES

Development accomplished during the year had totalled 31,943 feet, which represented an increase of 4,971 feet compared with the previous year's figure. Of the total footage developed, 12,577 feet had been in country rock, and vertical and incline shaft sinking had accounted for 2,122 feet. Footage sampled on the carbon leader had amounted to 13,850 feet, all of which had been classed as payable, the average value being 60.3 dwt. per ton over a channel width of eleven inches; equal to 663 inch-dwt. In the area to the west of the slightly lower grade zone between Nos. 1 and 2 shafts improved values had been maintained. Further west in the immediate vicinity of No. 2 shaft, the average value of 3,455 feet of reef development had been 497 inch-dwt.

Payable ore developed during the year had totalled 818,700 tons of an average value of 10.8 dwt. per ton, which was an increase of 188,700 in tonnage and 0.9 dwt. in value when compared with the previous year's figures.

ORE RESERVE

The available ore reserve as re-estimated at June 30, 1948, had been 6,043,000 tons, averaging 13.8 dwt. per ton over a stoping width of 45 inches. That represented an increase of 190,000 tons on last year's figure. The assumed stoping width remained unchanged, but the average value was lower by 0.4 dwt. Developments and stoping operations had been retarded by an increase in the number of water-bearing fissures which it had been necessary to seal off by cementation.

No. 3 circular shaft which was to serve as the main ventilation upcast for mine workings had been sunk to a depth of 3,949 feet below the collar by the end of June, 1948. Since that date, the shaft had been sunk to its final depth of 3,984 feet and connected with No. 1 level. It had been stripped and the headgear was being dismantled. When that work had been completed, the main fans would be installed and the shaft would be brought into commission.

REDUCTION PLANT

Extensions to the reduction plant to enable it to handle 80,000 tons per month had been completed and the number of stope faces available for current production would permit the mine to build up to that tonnage when an eight-ton winder at No. 1 shaft had been installed. Despite every effort to expedite delivery from overseas, the company still awaited certain essential items required to complete the installation of that winder, which had been ordered early in 1945 for delivery in January, 1946. The non-delivery of that ancillary equipment for the hoist was a serious handicap to the company, as until that winder was actually in operation there could be no material increase in tonnage milled since the existing hoisting facilities at the shafts were already working to capacity.

Work had commenced on an extension of the reduction plant to a capacity of 120,000 tons per month, but shareholders should bear in mind that some years must elapse before it would be possible to attain that output as it would first be necessary to sink and equip sub-vertical and sub-incline shafts and to carry out a large development programme; to install additional hoisting equipment at No. 2 shaft: and to provide more accommodation for Europeans and natives.

TAXATION BENEFIT

In August, 1948, the Minister of Finance had announced certain proposals relating to gold mining taxation which provided for a reduction of 4.76 per cent. in the Formula Tax with effect from January 1, 1948, and also for an increase in the redemption allowance in respect of capital expenditure from 22½ per cent. to 27½ per cent. of the unredeemed balance at the end of each year. The company would thus benefit to the extent of £65,948 for income tax and £14,365 for lease consideration in respect of the half-year ended June 30, 1948.

Those concessions were welcome but once again he must draw the shareholders' attention to the fact that although the increased redemption allowance would result for a period in lower tax payments by the company, the time must be reached eventually when capital expenditure would to a large extent be redeemed and liabilities for lease consideration and taxation would then be greater.

DEEP BOREHOLES

During the year, work had been commenced on two deep boreholes—B.2 and B.3 — which were being drilled on joint account by Western Ultra Deep Levels Limited in order to test the reef some 2,800 feet to the south of the southern boundary of the company's property.

Borehole B.2 had intersected the Ventersdorp contact reef at 5,479 feet, assaying 7.57 dwt. over a borehole width of 46 inches, equivalent to 348.22 inch dwt. Provided the present rate of progress in drilling was maintained, the boreholes should intersect the carbon leader very shortly between 8,600 feet and 9,000 feet below the surface.

During the first three months of the current financial year, total working profit had amounted to £695,473. Development footage had been 8,448, and 4,540 feet had been sampled, all of which had been classed as payable, averaging 49.8 dwt. over a channel width of eleven inches.

A report of the proceedings at the meeting would be published in the Press and copies could be obtained by shareholders on application to the Head Office in Johannesburg or to the London Secretaries.

The report and accounts were adopted.

EXTRAORDINARY GENERAL MEETING

At the conclusion of the ordinary general meeting, an extraordinary general meeting was held, which passed a resolution subdividing the company's existing shares of 10s. each into shares of 2s. 6d. each, as set out in the notice to shareholders dated September 24, 1948.

NEEPSEND STEEL AND TOOL

MR S. C. GOODWIN'S REVIEW

Mr S. C. Goodwin, J.P. (chairman), presided at the twenty-eighth annual general meeting of the Neepsend Steel and Tool Corporation, Limited, held on the 16th instant at the registered office, Neepsend, Sheffield. In his review he stated the results achieved showed an improvement over those of the previous year. Surplus and reserves of the parent company totalled £461,255, compared with £429,876 the previous year. Current assets totalled £774,231, against current liabilities and provisions £378,109, an excess of current assets of almost £400,000, thus placing the company in a very satisfactory position.

Net revenue from dividends, interest, etc., after deduction of taxation, amounted to £111,855, the figure being very similar to that of the previous year. The consolidated surplus and reserves amounted to £922,427, compared with £769,485. Current assets of the whole group amounted to £1,498,776 against current liabilities and provisions of £565,728 showing an assets excess of £933,048. It would be seen that the Neepsend group of companies was in a very sound position financially.

The consolidated profit and loss account showed trading profits before taxation, £459,430, against £314,724 in the previous year. The burden of taxation had also increased to £235,498, from £148,651 in the previous year. After providing for transfers to reserve and for the proposed dividends and bonus the carry forward was £396,703, against £264,434 brought forward.

Their factories had worked at full pressure throughout last year and the prospects for the present year were satisfactory. Shortage of trainees to replace older skilled workmen caused grave alarm for the future of their industry

The report was adopted.

JOHN I. THORNYCROFT AND COMPANY, LIMITED

SHIPBUILDING COSTS

The forty-seventh annual general meeting of John I. Thornycroft and Company, Limited, was held, on the 17th instant, in London.

Sir John E. Thornycroft, K.B.E., (Governing director and chairman) in the course of his speech, said: The overhead costs imposed by national legislation and the trade demarcation regulations and restrictions imposed on the use of labour-saving equipment, continues to increase costs of shipbuilding and repairing. Unless this is quickly appreciated by our shipyard workers, it will be found that British shipowners will be looking abroad for their new ships and maintenance, and foreign owners will not place contracts in this country.

To combine intermittent repair work with new construction successfully necessitates a new outlook from the trade unions and the different trades within the same union. The apprenticeship of the members of the boilermakers' union covers training in all branches of their trade, and if they were freely available for transfer, there would not be the anomalous position which arises when platers, riveters, and caulkers may be surplus, and welders not available. This would contribute materially to the efficiency of the yard, and great benefits would accrue, not only to the men but also to the company and the nation in enabling work to be done more quickly with an overall limited labour force. I most strongly urge that there should be a general overhaul of all the prewar demarcation regulations and restrictive practices.

The report was adopted and at a subsequent extraordinary general meeting a resolution was passed increasing the authorised capital of the company to £1,050,000 by the creation of 300,000 new ordinary shares of £1 each.

DEBENHAMS LIMITED

SIR FREDERICK RICHMOND'S STATEMENT

The annual general meeting of Debenhams Limited will be held, on the 9th proximo, at the Wigmore Hall, London.

The following are extracts from the statement of the chairman (Sir Frederick Richmond, Bt.) circulated with the report and accounts:—

The balance of the profit and loss account for the year amounts to £1,309,331, and after deducting debenture interest, trustees' fees and directors' fees the net figure is £1,228,776. This compares with £1,285,953 last year, a decrease of £57,177.

After adding £357,999, the amount brought forward from last year, there is available £1,586,775, which, after payment of the preference dividends, the interim dividend of 4d on the ordinary shares paid in May and the proposed final dividend of 11d. on the ordinary shares, amounting in all to £555,200, leaves £1,034,575. From this sum £434,870 has been provided for current taxation, £180,000 reserved for future taxation, a total of £614,870, and the usual allocation of £50,000 to reserve fund, leaving £369,705 to be carried forward, an increase of £11,706 over the amount brought in.

It will be noted that we have shown all dividends net, that is after deduction of income tax, which, of course, has entailed making a corresponding adjustment in the provision for taxation.

In view of the expressed wish of the Chancellor of the Exchequer that dividends should not exceed the amount distributed last year, I have very little doubt that the maintenance of our dividend at 1s. 3d. per share is in accordance with general expectation.

BURDEN OF TAXATION

Taxation, as usual, has taken a heavy toll of our profits. You will observe that the sum of £614,870 provided is shown in compliance with the Companies Act as £434,870 for current taxation and £180,000 for future taxation. Current taxation, again, is divided into two categories, income tax (£163,870) and profits tax (£271,000)

With regard to the profits tax (formerly known as N.D.C.), I think a few words of comment are called for. This tax, originally 5 per cent. on company profits, was raised in April last year to 12½ per cent. on distributed profits, the rate on undistributed profits remaining at 5 per cent. In the autumn Budget these rates were doubled, viz., to 25 per cent. and 10 per cent. respectively, and, moreover, the increase was made retrospective to January 1, 1947. After allowing for the fact that the tax is deductible from profits in the computation of income tax, the two taxes together are equivalent to 11s. 9d. in the £ on distributed profits and 10s. 1d. on undistributed.

As preference dividends are not allowed to be deducted from the company's profits in calculating income tax, the whole burden of the profits tax falls upon the ordinary shareholder. This appears to me to offend against one of the cardinal principles of taxation, equality of sacrifice. It is hardly necessary to point out that it operates with peculiar hardship in the case of our company with its highly geared capitalisation and owning, as it does, the equity shares in a large number of subsidiaries, most of which have their own preference shareholders.

The main influences affecting our trading activities during the period under review have been very much the same as in the preceding year. Like other distributing businesses, we have again experienced a further expansion in turnover; indeed, had it been otherwise it is safe to say that our results would have been much less satisfactory than they are, because the profit margins imposed by the Board of Trade have been lower and expenses have continued to rise appreciably in nearly every direction.

CONFUSION CAUSED BY PURCHASE TAX

I have just referred to the purchase tax and feel I must point out that a considerable amount of confusion and loss is caused when alterations are made in the rates of this tax. As you know, the retailer has to pay tax when he purchases the goods and he is not allowed to make any profit on that particular item. Nevertheless, if the tax is reduced or if and when the time comes for its repeal, he stands to make a serious loss on his tax-paid stocks. At present there is no way open to him of recovering the tax he has paid, and the uncertainty with regard to it is a constant source of anxiety. His position is rendered still worse when, as in the past year, we have had two National Budgets involving two sets of changes in the rates of purchase tax.

The subsidiary businesses in the provinces and suburbs again record substantial increases in their turnover, the trading year in their cases ending round about January 31, 1948. As was to be expected, the increase is most noticeable in the more popular-price businesses. As I have frequently pointed out, diversification of our interests is always a source of stability and strength to our organisation, and while our high-class businesses have felt the impact of the low profit margins and the price ceilings imposed by the various Control Orders, those specialising in popular-priced goods have been able to trade successfully at very low rates of profit.

The upward movement of expenses to which I called attention last year has, I regret to say, shown no sign of slackening. This, I understand, is a feature common to all competing businesses and constitutes one of our most difficult problems. I am afraid any improvement next year must be entirely dependent on an increase in the volume of business.

WHOLESALE BUSINESS

Our wholesale business, catering as it does mainly for the top end of the trade, has been affected substantially by the same influences as the higher-class retail. In view of the uncertainty with regard to purchase tax changes, the tendency of retail houses has been to restrict their commitments, which has not helped to lessen the difficulties of this particular section. In all the circumstances I feel that we have no reason to be dissatisfied with the results.

Our shipments abroad, I am pleased to say, again show a fair increase over the previous year.

THE FUTURE

At our annual meetings I have always endeavoured to indicate in general terms what I considered to be the prospects for the following year. Today the international and internal conditions are so unprecedented and the future so unpredictable that any forecast I might venture to make must be of little value. I can, however, tell you that the volume of trade for the current year to date is well in excess of last year, but price margins are so low and expenses so difficult to control that it would not be prudent to conclude that the continued increase in sales will be reflected, as it normally would, in increased profit. I would also point out that as heretofore the profits made by the subsidiary companies for the first half of their financial year have not been included in the holding company's profits.

Statistical Summary

GOVERNMENT RETURNS

For the week ended November 13, 1948, total ordinary revenue was £48,128,000, against ordinary expenditure of £31,553,000 and issues to sinking funds £60,000. Thus, including sinking fund allocations of £10,573,000, the surplus accrued since April 1st is £288,682,272 against £247,256,000 for the corresponding period a year ago.

UNIVERSITY OF LONDON

TUTORIAL CLASSES COMMITTEE

Applications are invited for Staff Tutorships in Philosophy, Psychology, Economics, and Political Science, from men and women of high academic standing, and with experience in conducting Tutorial Classes. Salary £600-£25-£850 (*also Family Allowances*). Particulars and application forms from Director of the Department of Extra-Mural Studies, Senate House, W.C.1. Completed application forms should be submitted before December 15th.

UNIVERSITY COLLEGE, SOUTHAMPTON

Applications are invited for the post of Research Assistant in the Department of Economics. The appointment will be temporary for one or two years, salary £300-£450 per annum according to qualifications. Further particulars may be obtained from the Registrar to whom applications should be sent not later than November 27, 1948.

THE WEST OF SCOTLAND AGRICULTURAL COLLEGE

The Governors invite applications for the following vacancies in the AGRICULTURAL ECONOMICS DEPARTMENT from graduates in *agriculture or agricultural economics, or from graduates in economics* or commerce with a knowledge of agriculture.

(1) The post of *Assistant Advisory Officer* on the Senior Agricultural Economist scale, with duties including investigational and advisory work in farm economics. Salary, £730 x £25—£875, plus bonus of £90 at minimum.
(2) A post of *Research Assistant*, open to recent graduates prepared to undertake a research project in agricultural economics, preferably for submission for a higher degree. Salary, £350, per annum for a period not exceeding three years.

The posts are superannuable.

Particulars of, and application forms for, the above posts are obtainable from the undersigned with whom applications must be lodged not later than November 30, 1948.

N. B. BAIN, Secretary.

6 Blythswood Square, Glasgow, C.2.

CASSEL EDUCATIONAL TRUST

The Trustees propose to award early next year two or three Travelling Scholarships to persons engaged in Commerce or Industrial Administration to enable them to study or undertake some research in some non-English-speaking country. Candidates should have obtained a good Honours Degree and have had, as a rule, not less than two years' practical experience in business. They will be required to submit evidence of *an adequate knowledge of the language of the* country which they propose to visit.

The value of the Scholarship will not be less than £300 nor, normally, more than £500, tenable for one academic year or proportionately less for any shorter period as the Trustees may approve. The holder will be required to submit a report to the Trustees.

Application forms may be obtained from the Secretary of the Trust at 6, Stanhope Gardens, Highgate, London, N.6, and should be returned to him by December 31st.

SHIPS, PLANES, RADIOS, FURNITURE—See how they are designed at the "*DESIGN OF WORK*" Exhibition, ROYAL ACADEMY. DAILY 10 a.m.-7 p.m. Sundays 2 p.m.-6 p.m. CLOSING DATE NOVEMBER 28th.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees, payable by instalments, if desired.

British Austerity and Europe

THE British Four-Year Plan, kept secret by His Majesty's Government, but now published (as was sooner or later inevitable) in an American newspaper issued in Paris, is the British answer to the American request to be shown just how it is proposed to make the pound independent of the dollar by the end of the European Recovery Programme. The outlines of the Plan, particularly as it affects the internal economy of this country, are discussed in another article on page 889. But there is one large issue of principle and of international concern which needs to be treated separately. This is the accusation—of which much is being heard on the Continent, and especially in France—that the British plan of recovery has been drafted at the expense of the other nations of western Europe, that Britain, so far from assisting its fellow beneficiaries of the Marshall Plan, is deliberately making their plight worse.

It is easy to show how this impression has arisen on the Continent. For the purpose of analysing British trade, the world can be divided into four areas. The first is the western hemisphere, which is virtually co-terminous with the dollar area. With these countries, the British plan envisages that there will still be, in 1952, a deficit of $291 million. The second group of countries consists of the sterling area, where a credit of $816 million is foreseen. The third group is the Marshall countries of western Europe, where a surplus of $49 million is expected. And finally there are the countries that are neither in the dollar area, nor in the sterling area, nor yet Marshall Plan beneficiaries. With them, there will be a deficit of $174 million. (All these figures include "invisible" trade.) In short, Great Britain expects, by 1952, to earn enough from its trade with the sterling area and western Europe to cover its deficits on trading with the dollar area and the fourth miscellaneous group and to leave a final credit balance of $400 million. This is the Plan, and though it cannot be certain whether the figures will be even approximately achieved—since they are based upon a number of very debatable assumptions about the increase in British production and about the relationship of prices in Britain and elsewhere—the document does make it quite clear in which direction the British Government is working.

The sense of outrage with which these figures have been greeted in some Continental circles can be explained by the pattern of prewar trade. Before the war, Europe sold on an average about $600 million more to Britain than Britain exported in return. The countries of western Europe were largely responsible for the size of this balance, and it was made possible by Britain's earnings in other parts of the world, which included a large income from investments. The sterling earned in this way was as much a pivot of multilateral trade as were, say, the dollars that accrued to Britain through Malaya's exports to the United States.

The war has shattered the old balance of European trade. It did so in the short run by depriving Europe of the means to export at a time of phenomenal dependence upon American supplies. The result of these exceptional circumstances was the dollar deficit of some $7 billion incurred in 1947 (of which Britain's share was nearly $3 billion). But even if production and export had been promptly resumed in 1945, the

war would still have undermined the old balance of trade in Europe. The Economic Commission for Europe has estimated that the disappearance of overseas investment income and the falling off of all other sorts of invisible income has reduced Europe's prewar earnings by about $2,000 million. The largest part of this loss has fallen on Britain—partly, it is true, because Britain had more than most to lose, but also because the course the war took laid unusually heavy financial sacrifices on this country. It surely was unrealistic to suppose that the whole of the burden of adjustment should rest where it first lighted. Sooner or later, with or without the Marshall Plan, the problem was bound to arise whether Britain, faced by a gap in its accounts measured in billions of dollars, could afford to carry the $600 million of net deficit to Europe, which was formerly covered among other things, by now non-existent investment income. As the Economic Commission put it:

> The part of the adjustment required to make up for the decrease in invisible receipts falls . . . primarily upon the United Kingdom. To the extent, however, that the United Kingdom endeavours to solve its own balance-of-payments problem by expanding its exports or contracting its imports with Continental European Countries, the overseas adjustment problem is spread all over Europe. . . .

This is in fact what has occurred. The British Four-Year Plan makes it clear that Britain intends to eliminate entirely its old import surplus with Europe. In the long-term adjustment of Europe's trade, the countries of Europe, and of western Europe particularly, are to accept the fact that their share of the general problem of balancing European trade is to be increased by between $600 and $700 million. It is this realisation that has led to the protests in Paris. It is easy to understand the sense of shock with which some of the Continental countries contemplate the British figures and how natural it seems to them that anything that increases the difficulties of the other participants in the Marshall Plan must be contrary to the Marshall principles.

*

Yet the basic obligations that the beneficiaries of American assistance undertook was surely to put their houses in order and to be in a position to pay their way by 1952. The obligation to achieve solvency surely takes precedence over all others, and the British are entitled to say that they have done more than their neighbours to attack the problem of balancing their foreign trade. Alone among the western European nations, they have achieved a phenomenal increase in exports. Alone in Europe, they have drastically cut out of their import programmes all that is not strictly necessary. Again, they are virtually the only western European nation to attempt seriously to invade the American market and the reason that they have achieved some success lies in the fact that they have not allowed inflation at home to make the cost of British goods prohibitive and that they have succeeded in maintaining a stable value for sterling. All this has been achieved at a cost, a heavy cost, to ordinary men and women in Britain. Even if Britain's partners in western Europe protest, they cannot say that Britain is seeking an easy way out at their expense.

If it were possible for Britain to achieve a balancing of its books without cutting down its imports from western Europe—if, instead, imports from other parts of the world could be reduced even more drastically than is proposed—then that would, of course, be the right thing to do. But it is not possible. It happens, unfortunately, to be broadly the case that Britain's essential imports do not come and—as things are—cannot come from Europe. A block of imports cannot be simply switched from non-European to European sources. If more were imported from Europe—again, as things now are—it would not be possible to import less from other parts of the world, and the effect would simply be to destroy the equilibrium of the whole British balance of payments—and, incidentally, make it certain that the western European countries would not be able to convert the sterling they earned in Britain.

The British Plan is not imposing a fresh difficulty on western Europe; it is calling attention to an existing, and serious, difficulty which has existed all along, but which the doctrinal development of the European Recovery Programme has hitherto tended to obscure. At first, the duty of the participating nations was to make a joint estimate of the amount of American help they would need. It was then very sensibly agreed that where European supplies could be used, American equivalents should be dispensed with. But there now seems some danger of slipping into the idea that western Europe's needs can be satisfied by western European supplies, that the 1952 target is to achieve a sort of autarkic western Europe. But Europe has always depended largely on imports from all over the world and since the great majority of the nations are highly industrialised, their needs—for raw materials and to some extent for food—are competitive, not complementary. If Britain were to permit Europe to earn a net balance of sterling and present it for conversion, Britain itself would have not merely to make the gigantic exporting effort already called for in the Plan, but to earn still more dollars to redeem the pledge of convertibility. It simply cannot be done.

*

It is quite true that, if the problem of western Europe is ever to be solved, somebody, somewhere in the world, must be prepared to act as a creditor should do. It cannot be necessary for every nation to increase its exports relatively to its imports; there must be some doing the opposite. If the war has affected the European nations adversely, it must have affected the trade balances of some other countries favourably. But because somebody will have to act as a creditor, it does not in the least follow that Britain, which is now a debtor, should go on pretending that it is a creditor. Perhaps the real moral is that the problem—if it can be solved at all by planning and statistical estimating—cannot be solved until the planning is done on a world-wide basis, until it can be discovered who the creditors of 1952 will be and what they are proposing to do about it.

The truth must be faced by everybody that Britain is a debtor country. The end of ERP will not by magic restore Britain to its old creditor position. On the contrary, the struggle to balance its payments will be all the more intense and if co-operation with Europe is presented to it as a clear alternative to solvency—if the choice is between maintaining sterling by balancing the books and risking insolvency to retain Europe's markets in this country—it is difficult to see how Britain can fail to opt for a sound currency and a functioning sterling area.

But is this the real alternative? Has the British Government in fact made a real effort to assess the effects of such a drastic change in this country's trade relations with Europe? Has there been any consideration of the psychological effect of making such proposals without consultation at a time when, on political and strategic grounds, Britain is becoming more and more closely concerned with the welfare of its neighbours? When critics in Paris complain that Britain is saving itself at their expense, they are less than fair. But they would be on stronger ground if they said that Britain had made no special effort to concert with them the consequences of reversing a trading partnership which existed up to the eve of war.

The answer to this is, presumably, that the British plan is only a first draft, intended for discussion and amendment in Paris. It is not a complete answer, for the main outlines of the Plan cannot be greatly altered, for all the reasons already given. But it can still be modified in detail and, in the process, there may be opportunities for softening the original blow. There is one obvious possibility that should be explored, though possibly it exists only in a run longer than four years. The British objection to taking more imports from western Europe is that, as things are now, they would be non-essential imports. But there would be no objection if western Europe could supply essential goods and raw materials, which would take the place of goods that now have to be paid for in hard currency. Has Britain seriously attempted to expand its future purchases from western Europe and western Europe's colonial dependencies? For some reason, there has been a sort of veto on the discussion of commodities at Paris, yet it is hard to see how Britain's trade figures can be modified without a serious study of available sources of supply and of how they could, with some forethought and some fresh investment, be further expanded.

The investment is probably more necessary than the forethought. Britain intends to undertake about a billion of sterling investment overseas. Most of it is earmarked for the colonies, particularly for the expansion of food supplies. Has the question been asked whether a portion of that investment might be spent in consultation with the countries of western Europe and whether a diversion of it to other areas might not have speedier and richer results? If, as a result of British outlay on agricultural implements and fertiliser, France was in a position to export grain by 1952, the result might be more valuable than problematical groundnuts. Such efforts might, moreover, be expanded in such a way that a group of industrialised nations in western Europe could join in a joint project for the development of non-dollar sources of supply—a development in whose results they would all share. Incidentally, if the Ruhr is to be devoted to the machines of peace while Britain shoulders a measure of rearmament, it is particularly necessary that there should be some pooling of the profits earned by the export of heavy machinery.

Above all, Britain must avoid giving the impression that it is indifferent to the problems it has created by ceasing to be the balancing factor in western Europe's trade. Part of the bitterness in Paris springs from the conviction that Britain really cares very little indeed for the safety and stability of western Europe and is not prepared to modify in any degree plans drawn up on the basis of strict national interest. Has there been an official attempt to say "We see your difficulties and, while we hope you will understand ours, let us attempt to mitigate the effects of our common economic plight"? Negotiations in this spirit will not smooth away all the difficulties, but they can at least remove some of their sting.

Left or Right

MEMBERS of Parliament report that the Steel Bill is not exciting very much interest in the country. Such manifestations of opinion as can be detected are more against it than for it; but the public is much more interested in such things as food and clothes—indeed, there are some who report that these are the only subjects on which the interest of a meeting can be aroused. This is a sad reflection on democracy; but it is not as sad as might appear, because the mechanism of British politics, particularly in its present posture, is admirably designed to put the ultimate power in the hands of a relatively small minority of thinking people, in whose minds the Steel Bill probably occupies a major place.

It is perhaps necessary to recall the evidence for the statement that the political situation in this country is very delicately balanced. That was certainly true at the general election of 1945. The Labour Party and its allies secured just less than 49 per cent of the total votes cast and the parties that are now in Opposition just more than 51 per cent. Labour had what the Americans call a plurality, but not a majority. Even their decisive majority in the House of Commons is more precarious than it looks. Of their 400-odd seats, about 100 are seats they had never won before 1945 and which must therefore rest under the suspicion of being only accidentally theirs now; and there are another 60 or so seats which they hold with majorities of less than 5,000. Every seat lost counts two on a division and a loss of 80 seats would put them into Opposition. It would be reasonable to suppose that since 1945 the trend of opinion has been away from Labour. This is the usual fate of parties in office; general observation would suggest that several types of people who voted Labour in 1945 would not do so now; and, indeed, the Labour tacticians themselves would not deny that they have lost some ground in three years. The question is exactly how much ground they have lost and whether it is enough to make the Conservatives once again the largest party.

It is difficult even to hazard an answer to this question. The visible evidence would suggest the possibility of a Conservative victory at the next general election. The Conservative popular vote in 1945 was ten million to the Labour twelve. It is common knowledge that a great many people who are not natural Labour voters voted Labour in 1945 either out of a sense of irritation with what had been the dominant party or in an excess of postwar enthusiasm for what sounded like new policies. For many of them these emotions, both the negative and the positive, have now faded. How many of them would now return to their more normal Tory allegiance? An estimate of one Labour voter in twelve going over to the enemy in this way would hardly strike the impartial observer as exaggerated; but it would be enough to bring the two large parties level. The long run of Labour successes in the by-elections gives great cheer to the party leaders; and it is, indeed, impressive. But though it is the result of a by-election that gets into the headlines, it is the voting to which the careful student of politics will turn his attention.

In the twelve months after the general election of July, 1945, fifteen seats fell vacant, and at the by-elections the Government actually succeeded in increasing its share of the total vote, which in these seats had been 39.9 per cent at the general election, to 44.9 per cent. It is true that, owing to the dropping out of third parties, the Conservative share of the total vote also increased, but not nearly as much. In the first year, the tide was still clearly flowing in the Government's favour. In the second year, from July, 1946, to June, 1947, there were eleven by-elections. In these the voting shows a significant change. The Labour share of the total vote, which had been 67.1 per cent at the general election, fell to 61.8 per cent at the by-elections, while the Conservative vote rose from 30.0 per cent to 32.9 per cent. What matters is not, of course, the absolute size of these percentages. The fact that the Labour percentage was in the sixties both times and the Conservative figure in the thirties merely shows that these eleven constituencies happened to be natural Labour seats. What is significant is that one percentage was falling and the other rising, though even so the changes were perhaps too small to be clearly significant.

But in the third year (extending it to the present) the shift-over is more pronounced. Since July 1, 1947, there have been 16 by-elections. In these seats the Labour vote had been 55.2 per cent of the total at the general election, and it was only 48 per cent in the third year of the Labour Government. The Conservative vote rose from 38 per cent to 46 per cent. In view of these figures it is very difficult to deny that there is a significant swing away from the Labour Party, and, moreover, that the Conservatives are gaining votes not merely from Labour but also from the other parties. If anything like the voting pattern of the last year were reproduced in the next general

election, Labour's 12 million votes would fall to about 10½ million and the Conservatives' 10 million would rise to 12 million.

But a general election is never a reproduction of the preceding by-elections. It is conducted in an atmosphere that is all its own and a Government in office, which always loses votes at the by-elections, can often rally support when the fight is engaged on the whole front. Moreover, there may be—there probably still is—a year and a half to go before the election, and in that time anything may happen. At the moment, it looks as if a slow improvement in economic conditions might be expected, which would work in Labour's favour. But the postwar depression may arrive, or Marshall aid may be cut off, after two years instead of four. And nobody can tell what Mr Stalin may do.

The only safe conclusion that can be reached at the moment is that the next general election will be, like the Battle of Waterloo, a devilish close-run thing. It does not at present look as if it will be decided by a mass movement of opinion either to one side or to the other but by small margins and close shaves. If that is so, the immediate future of Britain depends upon a small minority, perhaps of no more than four or five voters out of every hundred, or a million in all. The floating vote, in any country at any time, tends, almost by definition, to include a high proportion of independently thinking men and women. But in this country at this time, it is probable that there is an even higher coincidence between the floating vote and the professional and intellectual élite. Every thinking person, not already committed to a party, must already be turning over in his mind which way he will cast his vote, and his sense of responsibility to his country must be enhanced by the knowledge that, so far as can be foreseen, his vote may be decisive.

*

What does the country need in the next few years, a government of the Left or of the Right? It has always been held in these columns that the Labour Party's programme of nationalisation is an irritating irrelevance, with very little bearing either for good or for evil on the real issues of the day. Persistence in irrelevance certainly does Labour no good with the floating vote, but it may be that, up to the present, it has not done them any decisive harm. On the nationalisation schemes already enacted, the judgment would probably be the negative one that they have not—or at least not yet—been disastrous. Even the Iron and Steel Bill, to which there is much more opposition on its merits than to any of its predecessors, is widely regarded as less important for itself than for the evidence it provides of the Labour Party's general approach to the problems of the country.

The real issue before the country is not one of the structures and organisations through which the Government shall act, but of the basic objectives of its policy. For a generation or so, Britain has been moving away from the old acquisitive, economic society towards the welfare state. This change can be seen in a number of ways. It can be seen in the great growth of Social Security, not merely in the enactment of ever more costly schemes of endowment for the individual, but in the growth of the belief in all parties that the object of industry is not to create wealth but to provide jobs, that the aim of public policy should not be efficiency for the community but security and protection for the individual. It can be seen in the enormous growth of the influence of the state—not perhaps, until the last three years, in state ownership, but in state control and state financing. (Before the first war, barely 10 per cent of the national income passed through the hands of central and local government; now it is 40 per cent). It can be seen in the steady neglect of capital creation—both of the thrift that creates savings and of the enterprise that uses them—and in the progressive engrossment of ever larger proportions of the national income in one form or another of current consumption. These ideas have captured all parties in the last generation. The parties have not disputed whether they are right or wrong, but only whether they should be applied relatively fast or relatively slowly. The great issue that faces this country is whether these ideas shall be carried further in the next decade or two, or whether it shall be decided to call a halt and to resuscitate their opposites, to put the emphasis on efficiency rather than on security, on acquisition rather than on equality, on economy rather than on expenditure, on capital rather than on consumption, on thrift rather than on luxury, on the standard of production rather than on the standard of living.

These antitheses can be collected into one generalisation. The policies that have held sway for a generation, whatever the party colour of the Government, are those of the Left. The alternatives are those of the Right. What does Britain need in the next few years? More of the Left? Or a move back to the Right? And when that question is answered, there is another to be asked. Since the issues here under discussion far transcend the doctrines of the parties, which party will best apply the chosen policy?

(To be continued)

German Recovery at Stake

ON November 17th General Robertson warned the German authorities in Frankfurt that German recovery was gravely endangered and implied that the future of the D-mark was a matter for considerable alarm. It is difficult to understand why the General should have been permitted by his advisers to make so serious a psychological blunder. A currency without backing clearly rests on public confidence. Moreover, the whole economic situation in western Germany stands today at a crucial point between conflicting inflationary and deflationary influences. To inject a strong note of pessimism into political and industrial circles at this moment can threaten the whole of west German recovery.

The chief anxiety is caused by the rise in prices. It may be said in passing that the scale of the rise is still a matter of fierce dispute. Compared with the fictitious pegged prices of 1936 which prevailed until the currency reform, prices have risen. But compared with the old black market prices which in fact ruled the market, many prices have fallen. But the trend is upward and it is this that causes concern. It may be asked how prices can rise when the purchasing power has been cut in the ratio of 15.38 to 1? The note circulation is now about 6 billion D-marks, for a population of 45 million. With current accounts, the total ready cash is 11 billion. It does not appear dangerously excessive; nevertheless it is. The reason for the rise in prices is, in the first place, that German industrialists and merchants have entirely failed to play a responsible part. Dr Erhard's hope that the removal of price controls would permit a normal competitive price structure to be formed has been brought to nothing by the activities of the business people in whom he put his confidence. Rather than face price competition, they have banded together to enforce "price discipline"—in other words, to ensure that profits are not reduced by outsiders who cut production costs. The result is that in many sectors which most directly affect the man in the street—for instance, textiles and footwear—there have been exorbitant increases.

There are other reasons for the new threat of inflation. Money is circulating rapidly, through "black" channels, out of reach of the banks. The proportion of notes to current accounts is completely distorted in favour of notes. The banks are therefore unable to squeeze unsound business out by use of the weapon of high interest rates. Individuals are granting each other credits, or demanding payment in suitcases full of cash. The banks themselves are granting short-term credits too freely and budget deficits add to the money available.

The money now circulating is regarded by its owners as a gift for spending or speculation. This is because it resulted from the so-called quotas per head distributed in the course of currency reform, and from the proceeds of the vast stocks of hoarded goods which were put on the market in June. A further injection of purchasing power was made in October, against the sound advice of the German bankers when 20 per cent of the remaining blocked accounts was freed. This lamentable decision, which was made on the insistence of the French Military Governor, was not only inflationary, but dealt a severe blow to confidence. Although the public had been led to believe that the cancellation of accounts was at an end, 70 per cent of the accounts which remained blocked after the first cancellation in June were wiped out. Only 10 per cent were blocked for use in long-term credits to industry, which is starved of capital. The French, it may be noted, are also to blame for another danger to the D-mark. A lively trade in D-marks and smuggled German goods goes on between the French zone and Switzerland.

A result of the new fear of inflation is inevitably the diversion of purchasing power into hoarded goods and diamonds. A new currency reform is expected. It may only take the form of an exchange of notes at par; but it would catch the black marketeer who keeps his gains in cash. Rumours of a new reform have been spread by speculators and Communists ever since the first took place, and have increased lately. At the same time, the so-called *Lastenausgleich*, or capital levy for the purpose of equalising war losses, hangs over the community, and encourages dishonest bookkeeping. All parties are pledged to this scheme, and nobody dares to admit that it is folly. General Robertson has, in fact, once again urged the Frankfurt administration to hurry. But the crying need is to drop it, with all the other illusions that have blocked recovery. The only practical and harmless way of achieving any equalisation is by way of income tax, and then only after the community has begun again to reveal incomes and to pay taxes.

Evasion of taxes is the third reason why goods are being hoarded and books faked. Since money became of value again, only a small proportion of taxes has been collected. This situation in turn is related to the question of occupation costs. Ever since the currency reform gave them a firm base from which to conduct their sorties, the German politicians and press have pressed a furious campaign against the payment of occupation costs, which has convinced every German that he is chiefly asked to pay income tax to keep a foreigner in luxury on his soil. For their part, the State Administrations have an interest in showing Budget deficits with which to confront Military Government. As General Robertson pointed out, some of the states give a picture of imminent bankruptcy. There is no doubt that the occupation costs have been swollen by too carefree military authorities. British troops, for example, receive as much of their pay as they like in German currency, and this portion is then charged to the German budgets. In all, estimates of the total costs at present being borne by the Germans varies between 3½ billion and 5 billion D-marks a year. Either figure represents too high a charge. This is admitted, and the forthcoming Occupation Statute will impose an outside limit.

At the moment, the German authorities appear to pin their hopes for avoiding inflation upon the reduction of occupation costs. They also advocate the handing over of foreign trade, now in the hands of the Joint Export-Import Agency, in the hopes that Germans will buy enough food and consumer goods to saturate the market. General Robertson has, however, declared that no further imports than those already provided for will be forthcoming, and the Agency (though it is handing over exports to the Germans) is retaining control of imports. However, a very generous programme of imports is provided, including ready-made clothing; and the flow of ERP goods has not yet begun. Added to constantly increasing internal production, which officially stands at over 70 per cent of the 1936 figure and is probably higher, these imports should exercise a deflationary effect.

It is typical of the attitude of the Frankfurt authorities that they should pin their chief hopes for combating inflation upon two changes in Allied policy, not on new policies of their own. They appear to watch the struggle between inflation and deflation as spectators while the real decisions are taken by the industrialists and merchants on to whose necks the rein has been thrown. There are, however, signs that another force in modern industrial democracy is prepared to take a hand.

In the present uncertainty, the German working man, and, still more, the pensioners and refugees, see little beyond the fact that they can hardly make ends meet. They have almost forgotten that before currency reform, though they had plenty of money, there were practically no goods to buy at the "legal" prices. All they can grasp is that prices have risen, but not wages. To a people used for decades to the system of "buying permits" and coupons, it seems plain that the state which provides the goods must give the money to buy them.

It is not at all obvious to the German public that the destruction of wealth in Germany means that wages and salaries should lag behind prices. On the other hand, this argument has gone too far in the other direction. Manufacturers, intent on

an easy way of cutting costs, and the Anglo-American controllers anxious to preserve stability, are obsessed with the nightmare phrase "wage-price spiral." In fact, there is no valid reason why a spiral should start if wages were raised to a limited extent above their present level, which is hardly above that of 1938, as part of the general adjustment to the world level. The rise should keep well behind that of prices, but some increase is justified. But so strong is the power of greed and the catch-phrase, any rise now would undoubtedly be seized upon as a reason for a further increase in profits. The German worker, it appears, will continue to have to pay half a week's wage for a shirt. He will also have to bear the fact that in one way the return to a money economy has lowered his income, since the practice of adding goods to the money wage has now almost been abandoned.

The first rumblings of a storm have, however, been heard. The 24-hour general strike which took place last week was a portent. Its real significance has been obscured by the Union's demand for fresh controls to be imposed on prices. In fact, though the demonstration was not, as the Communist Trade Union Federation in Berlin immediately proclaimed, directed against the Marshall Plan, it was largely political. With the strike, the organisers actually launched a campaign to force Military Government to drop its veto on participation of trades unions and works councils in policy-making and management. General Robertson has now proposed that an advisory council of employers and trade unionists should be formed, but this will not satisfy the Union leaders. Lack of funds makes them unable to win victories in the field of wages. They are all the more determined to gain a foothold in the conduct of the German economy.

It is very doubtful whether all the well-known objections to granting these rights to the unions and works councils hold good in the German situation. One may say that they have not been elected by the people. But the German Government is itself a very unrepresentative body, and is moreover handing over real economic power to the industrial associations. A law setting up industrial committees to handle foreign trade and allocate materials was first urged on Frankfurt by Military Government, and then shelved because it provided for 50 per cent trades union representation. This was certainly too great a proportion, but there is no excuse for refusing the unions any voice in shaping policies which affect the workers. Yet the American authorities have created the impression that this is precisely what they intend to do.

This senseless snubbing of responsible trade union leadership cannot fail to be a major factor in the battle against inflation. If the average trade unionist has to bear both economic hardship and reduction in industrial status, he may lose what is today western Germany's most valuable asset —the almost unquenchable desire of the German workman to work. The astonishing rises in production that have occurred in recent months can hardly be maintained if disillusion and disgust spread to the ranks of the workers. The comment has already been made in these columns that two things above all can threaten the stabilisation of Germany's recovery. One is to relax the grip on the volume of money—an error of which there have been some signs. The other is to refuse the moderate wishes of organised labour. The danger signals are out in western Germany. One or two more major mistakes in policy may bring the fine hopes of revival to an end.

The Irish Republic

THE country which, under the name of the Irish Free State, came into being as a British Dominion almost exactly twenty-seven years ago set in motion this week the formal machinery by which to re-constitute itself as an independent republic. The ties linking Eire to the British Crown have been almost invisible for a decade past; but such as they are, they are to be severed. The process of transformation has been protracted. Ever since Mr De Valera's revision of the constitution was promulgated in 1937 and the Irish Free State was renamed Eire, the country has been, in fact though not in name, a republic externally associated with the Commonwealth. It is true that it was not specifically so designated in the Constitution, and it is true also that the External Relations Act—which is now in process of repeal—recognised the existence of the Crown for the sole purpose of accrediting diplomats to foreign capitals. But Mr De Valera, the ingenious architect of the new state, affirmed categorically that it was a republic.

What the British public finds difficult to understand is that it is not Mr De Valera, but the combined Opposition parties who contrived to defeat him at the last election who are now finally cutting the painter. Fine Gael, the strongest partner in the present coalition, is the descendant of the party of Arthur Griffith, of Michael Collins and of William Cosgrave, the party that has always stood for closer relations with the Commonwealth. This apparent paradox has led many people, in Ireland as well as in England, to represent the decision to repeal the External Relations Act as a mere insincere political manœuvre designed to steal Mr De Valera's clothes. There is, indeed, a great deal of Irish internal politics in it. The present coalition is so heterogeneous that Mr Costello must feel himself under great pressure to bring forward the one measure on which all his supporters will be united and which gives Mr De Valera no opening for damaging criticism. But the essential point is that the proclamation of an undoubted republic is supported by all parties. Even as long ago as 1921, when the Free State was set up, the party that supported it did so not as a final solution but as giving "freedom to achieve freedom." And in their decade and a half of opposition, Fine Gael allowed their pro-treaty views to be overshadowed by the necessity to find points of attack on Mr De Valera. They have bitterly attacked the External Relations Act ever since it was enacted. The President was described by Mr McGilligan, now Minister for Finance, not as the head of a state but as "an internal growth and a foreign body." Mr James Dillon, now Minister for Agriculture, said recently that the country had been "living a lie." The advocates of closer relations with the Commonwealth have been the fiercest critics of the continuance of even the most tenuous and symbolic link between Eire and the Commonwealth. When they now say that the repeal of the External Relations Act is a step towards closer friendship between Ireland and Great Britain, the logic of their position may not be apparent, but the sincerity is undoubted.

The time has long since passed when anything that the Irish chose to do in Ireland could awaken any emotion in British public opinion, least of all the emotion of surprise. Most Englishmen will feel a faint twinge of regret that one more strand of union is parted, but it will not be enough to disturb the tolerant indifference with which Irish affairs are now generally regarded in John Bull's own island. Save among a tiny handful of fanatics there will be no desire at all in Great Britain to recriminate with the Irish for their action; neither country will treat the other's citizens as foreigners. So far as the matter lies wholly within British decision, everything will go on as before. This policy of passive indifference has, however, another aspect. The Irish have been plentifully warned that if their persistence in declaring themselves a country only externally associated with the Commonwealth gets them into trouble through the action of other foreign countries, they cannot expect Great Britain or the other Dominions to put themselves to any effort to rescue them. The system of imperial preference rests upon the doctrine that the members of the British Commonwealth, through their common allegiance to the Crown, are not foreign countries to each other. It is only for this reason that foreign countries having most-favoured-nation treaties with the United Kingdom are unable to claim the preferential rates of duty on their goods. If at some future date, say, Denmark claims to be treated on the same footing as Eire, then there can be no doubt at all which alternative will be chosen in London: it will not be to admit Denmark and every other foreign country to the circle of imperial preference but to expel Eire from it. It should be very clearly understood that any harm the Irish may do to themselves in this way is neither the wish nor the responsibility of Great Britain.

*

Mr Costello has declared that the repeal of the External Relations Act will remove a barrier to co-operation. Since it will change nothing on the British side, the evidence of closer co-operation will have to be sought on the Irish side. It would be unrealistic to expect it in the field of Commonwealth relations *per se*, but western Union and European economic co-operation hold out greater possibilities. The Irish have long been attracted towards a more intimate association with their European neighbours; they have a traditional link with the United States; they are fundamentally anti-Communist in outlook; and there is little doubt of their desire for practical co-operation with the peoples of the Commonwealth for particular common purposes. Irish participation in the European Recovery Programme has been whole-hearted and fruitful, and a gradual extension of their co-operation from the economic to the political field would seem to be logical.

But logic breaks in vain against the obstacle of Partition and spokesmen for Eire have made it plain that very little political collaboration, and none at all in the field of strategy (where Ireland has most to offer to western Europe), will be forthcoming so long as the Six Counties remain part of the United Kingdom. Beside this, all other matters are, to them, minor; and this is the reason why, to Englishmen, the friendlier practical relations of recent years have seemed to repose entirely on British tolerance and complaisance and not at all on any softening of the rigid Irish stand. So long as Northern Ireland remains part of the United Kingdom, the Southern Irish will remain dissatisfied and will set limits to their co-operation.

This passion for unity is unquestionably strong and sincere and shared by the overwhelming majority in Eire. But what the Irish fail to realise is how gravely they have prejudiced their chances of putting an end to Partition. They recognise themselves that the only way in which Ireland can be united is by Great Britain being willing to put pressure on the Protestants in Ulster. Until 1939 there was a respectable body of opinion in Great Britain, particularly in the Liberal and Labour Parties, which sympathised with the object of Irish reunion and might conceivably have been stimulated into doing something about it. But if Mr Attlee refrained from making it quite clear that the Partition issue is now utterly dead in Great Britain it was presumably only out of politeness to Dublin.

It is not the constitutional agilities of the Irish that have produced this change, but the neutrality of Eire during the war. The Irish may still feel—as they undoubtedly do—that they were justified in their neutrality. But they ought to realise that, in British eyes, it has wiped quite clean the slate of the centuries. Over and over again, the Irish have been able to get what they want by making a substantial part of the British public feel slightly ashamed of themselves, or at least of their forefathers. That feeling is now dead; in British eyes, Ireland is now a heavy moral debtor. Not only is this so, there are new ties of loyalty and comradeship linking Great Britain and Northern Ireland, and there were the practical demonstrations during the war of the vital strategic necessity of a foothold for British air and sea power on the other side of the Irish Sea. The more foreign and neutral Eire becomes, the more vital to Great Britain is Northern Ireland.

These facts—for so we take them to be—are not, however, recorded in any spirit of recrimination. There is no hostility to Ireland in Great Britain and no sense of grievance against the Irish, however foreign they may wish to become. No limits will be imposed from this side on the development of the closest friendship and collaboration in all fields, political and economic, and the tone both of Mr Attlee's and of Mr Costello's speeches encourage real hope that the relations between Ireland and Britain will indeed be much closer than is usual between "foreign" countries. Whether these hopes will be realised is for the Irish to say. For what is new in Anglo-Irish relations is that it now rests entirely with one party, and not with both, whether energies shall be concentrated on practical possibilities or wasted on sterile grievances.

NOTES OF THE WEEK

Longer Service—

The decision of the Government to make the period of military service, which takes effect at the beginning of next year, eighteen months and not twelve, reflects a change in the purposes for which conscription in peacetime is being instituted. Mr A. V. Alexander, in the embarrassed speech he had to make in May, 1947, announcing the Government's retreat from the eighteen to the twelve month period, averred that the main reason for peacetime conscription was to provide an adequate trained reserve for the future. To boost the size of the forces for the purpose of meeting current defence commitments was regarded as secondary. The new National Service Bill will bring about a change in emphasis between these two aspects of the scheme.

The increased period of service could bring a further 85,000 men under arms each year than would have been in the ranks had the twelve month period been in force. The Services (which means the Army and the RAF) do not, in fact, need all these extra men. What they want is not so much extra men under arms as men under arms for longer periods. For it is clearly impractical to use a man who is called up only for twelve months on duties at any real distance from this country. To do so would mean that a great part of his service was spent in a troopship coming or going. In practice, the Army and RAF did not expect to be able to use any of the twelve month servicemen east of the Central Mediterranean. This meant that all the increased work in the Far East and the still considerable duties in the Middle East would have to be discharged by Regulars, whose service would be in any case heavily in demand to deal with training new conscripts. An increase in the number of men training would cause further strain on training establishments and a further diversion of Regulars from garrison to training duties. For this reason at one time a ballot system was considered somewhat on the lines of American selective service methods. But this is much too chancy a method for an army, and to a greater extent an air force, which needs skilled men, besides having obvious political disadvantages. So recourse is likely to be had to a scheme of much stiffer medical tests, together with a systematic delay in the call up. This, of course, will attenuate the principle of social equity which was one of the original justifications of conscription.

The Government will always, therefore, have to show very clear reasons why it should be continued and in particular if they decide to continue the Act beyond its life of four years. That the Services find it convenient is not a sufficient argument.

The raising of the period of national service to eighteen months represents, in fact, a gamble which the Government has lost. In the spring of 1947, faced not only with the revolt within the Labour Party, but also by the rapidly worsening economic situation of the country, they gambled that increased recruitment at home and improved conditions abroad enabled the shorter period to operate. This gamble they have lost. The sluggishness in recruiting may be partly their fault, in view of their optimistic estimates of the possibilities, and their failure to bring home to the nation the seriousness of the situation, but the worsening of the international situation has been largely outside their control.

There are few signs that the Minister of Defence will have any real back bench opposition to trouble him. The revolt of eighteen months ago was at bottom against the Government's foreign policy. Mr Crossman and the other rebels opposed conscription because they opposed Mr Bevin and because they thought an arrangement could still be made with Russia. This they no longer believe, and so they will presumably keep silent in the debate (which will be punishment indeed for some of them) or else switch their attack to the need for greater economies of man-power within the Services.

* * *

—And More Pay

The increase in the pay of the Forces, announced by Mr Alexander on Wednesday, is a measure, long overdue, to offset the long term necessity for a period of eighteen months conscription, by stimulating recruiting for the regular forces. The increases are designed to place a premium on technical skill and military efficiency for they do not apply to the recruit for his first six months nor to the private soldier. For other ranks of higher qualifications, military or technical, there will be increases in basic pay of between 3s. 6d. and 10s. 6d. a week. For other ranks the marriage allowance will be increased from a range of 35s. to 45s. a week to 42s. to 56s. a week. National Servicemen will receive no increases of pay for their first year's service, although they can qualify for the equivalent of a war service grant. Officers do not get an increase in their basic pay, but only an increase, and quite a generous one, in the marriage allowance. This takes account of the fact that it is the junior married officers who have really been feeling the pinch of the rising cost of living.

These increases are fully justified, although they will cost the Exchequer an extra £10,500,000 at a time when the Budget surplus is being steadily eaten into, by the need to increase the rate of recruiting. They are not, however, justified on the grounds put forward by Mr Alexander that there had been an increase in industrial wages since the pay schedules were drawn up in 1946. That form of reasoning simply leaves the way open for another round of increases in industrial and more particularly clerical wages. The argument for increasing the pay of the forces is to increase their numbers, not to give them some mythical form of parity with other workers. But even more than in other industries, it is not pay alone which determines its attractiveness but also the environment and the prestige attaching to the job. If the nation's leaders would give the nation a clearer idea of the vital importance at this moment of strong and efficient army, navy and air forces, they might get a readier response. This is a task which the Prime Minister and his colleagues cannot delegate to posters and PROs.

As the debate on air power in the House of Lords demonstrated, there would be greater satisfaction at the recent decision of the Government if there was any confidence that in questions of defence the Government were not living from hand to mouth. The climate of opinion in the country has altered considerably over the past year and the nation is prepared to approve any necessary measure to secure the defence of western Europe. But there is little evidence that the Government has a comprehensive defence plan, or, if it has, that the Ministry of Defence knows how to impose upon the three services. Mr A. V. Alexander, who displayed considerable qualities as Mr Churchill's representative at the Admiralty, has as Minister of Defence yet to prove that he can improve upon the record of Sir Thomas Inskip in the years before the war.

Strait-Jacket for Steel

Once the Government had decided to force the Steel Bill through this Parliament at all costs, it was no doubt inevitable, if regrettable, that they should decide to use the guillotine both in Committee and in the remaining stages in the Commons. In order to ensure that the Lords cannot complain of lack of time to consider the Bill, the Government leaders in the Lower House would in any case have had to work to a fixed schedule, and it is probably as well that the Government's intentions should be known in advance. These have been set out in the guillotine resolution moved in the Commons this week by Mr Morrison. It provides that the Committee stage shall be completed by March 17th, that the Report stage should be limited to four days and the third reading to one day. This will give some 11 or 12 weeks in Committee, which means between 100 and 110 hours for consideration of the Bill's fifty-eight clauses and its eight schedules.

Whether this is adequate or not is primarily of importance to the Government, for the Opposition are so strongly opposed to the Bill in principle that there are few if any amendments they would want to make which would be amendments of detail. Clearly all they can do in Committee is to propose the alteration of the whole by a steady alteration of the parts—a procedure the Government is bound to resist. This is not the first time the Government has used this technique of the guillotine. They used it in Committee on both the Transport Bill and the Town and Country Planning Bill last year. But in the case of steel the Government has a great concern to see that the Bill is dealt with thoroughly and in detail in Committee and in its remaining stages, for they will, in this case, have little chance of later revision. Under the Parliament Act, if the Lords reject the Bill on second reading and it has to be forced through against the Lords' veto, it can only become law in the form in which it was first rejected by the Lords. No amendments can be inserted during the subsequent passages through the Commons. This means that the Government cannot rely on the Lords to make amendments as they frequently did in the earlier years of this Parliament, when some 1,000 Government amendments alone were inserted during the discussion of measures in the Lords.

If this timetable is adhered to, the Bill should go to the Lords at Easter. That will give them three months before the summer recess in which to grapple with it. It is, of course, by no means clear yet whether the Conservatives in the Lords will reject the Bill on second reading, or will give it that reading and then change its nature completely in Committee. Either course is open to them, and Lord Salisbury is too wise a political strategist to disclose his hand before he has to. But the immediate fact which emerges is that the Government certainly cannot rely on the Lords to knit up the loose ends for them. When the Bill leaves the Commons at the end of March every clause in it must be technically foolproof. Having challenged the suspensory power of the House of Lords they have deprived themselves of its service as a revising chamber.

* * *

The Ruhr Talks

Since the beginning of the present talks on the Ruhr, three separate points have been at issue. The first is the question of the eventual ownership of heavy industry in the Ruhr, the second and third are concerned with the area and authority of the International Board that is to control the Ruhr in the Allied interest. Strictly speaking, the first point is not on the agenda of the London talks, but it has overshadowed them since few issues have so stirred French opinion and on so united a front.

From left to right, French opinion will not tolerate a decision made at this stage which appears to hand over to some future German government "powers which even Hitler did not enjoy." Above all, the French are indignant that the dictum of two local Military Governors should be held to determine an issue which is essentially a matter for the final peace treaty. Their irritation on this point is all the stronger in that they have long resented the Czar-like attitude of General Clay in all things German and have long suspected that underneath his determination to build up Germany lies a hidden belief that the Germans are a "bastion" against Soviet Russia.

The strength of the French protest has impressed the British and American Governments and it seems likely that while they may not actually rescind their belief that the Germans themselves must ultimately decide questions of ownership, they will not regard the statement of the two Military Governors as binding in eventual negotiations for a peace treaty.

The practical issue of the Ruhr Control Board—which is the real subject of the London talks—is also likely to run into the rough waters of French-American disagreement. The area the Board is to control should not be difficult to determine since the differences of opinion are largely technical. The real problem is the fact that the French wish its powers to go far beyond the simple distribution of German output between home and foreign consumption. They wish the board to control capital investment, development plans, volume of production and other matters essentially the concern of detailed management. The Americans regard this as an impossible degree of interference from without and incompatible with what General Marshall has reaffirmed to be the first aim of American policy—to restore European prosperity by restoring the Ruhr.

In this dispute, both sides appear partially correct. French fears of German industrial domination are legitimate, American apprehension of managerial control from without equally so. It is to be hoped that the British will press the Americans to return to the one really constructive alternative—an international organisation which stretches beyond the Ruhr to include Lorraine and Luxemburg as well.

* * *

Palestine in Committee

The American delegates concerned with the Palestine issue in Paris, are in a very uncomfortable position. They see—as do the British, Canadian, Australian and other western-minded delegates—that a prime factor, now, in the Palestine situation is how to give the Arabs some settlement that they can take home without setting loose a wave of ministerial downfalls, rioting, wrecking and other unwanted crises at least in Syria, Egypt and Iraq. Yet they are receiving, almost daily, instructions from the White House to give the Jews not less than the best they were offered in all past plans, and to leave the situation as fluid as possible.

In the debate to decide what should happen next, which has run for a week in the Assembly's political committee, the Eastern bloc has therefore been able to sit upon the touchline and pleasurably watch the British and American delegations doing their best to paper over two fundamental splits in their policy. The first concerns the actual partition line to be recommended. The British favour the Bernadotte plan, with its compact blocks of territory, and would compensate the Arabs for Jewish gains in Galilee by leaving them the Negeb. The Americans, while paying lip service to Count Bernadotte's "basic premises," prefer the November, 1947, plan which gives the Jews the Negeb. They have not said what they think should happen to the bit of Galilee then offered to the Arabs but since conquered by Israel.

The Second Anglo-American split is over the instructions to be given to the United Nations Conciliation Commission towards the appointment of which most delegations are moving. The Americans want to leave it a free hand. The British think that it should be fortified with knowledge of the Assembly's wishes about the partition line to aim at, that to give it anything less is "lazy optimism" and is causing the Arabs to negotiate under duress. The Israelis, needless to say, agree with the Americans. In any discussion between themselves, the Arabs and a team of Uno "conciliators," they are indubitably the strongest element and they wish for terms of reference that are as fluid as possible.

The Clark Report on China

The report presented to the Senate Appropriations Committee by ex-Senator Clark, who was sent to China as consultant for the Committee, has come at a moment when the Chinese Government is fighting to hold its capital and both the Government and public opinion of the United States have to make a decision whether to abandon China to the Communists or to give effective aid to the forces resisting them. One thing is made clear by the Clark Report, that American aid to China on the scale and in the manner so far provided have merely given the United States the reputation of intervention in China's affairs—which the Communists exploit to the utmost in their propaganda—without producing any substantial result. "Piecemeal aid," the Report declares, "will no longer save China from falling to Communism. It is now an all-out programme or none."

The Clark Report is highly critical of the Chinese Government's military leadership and administration, and boldly proposes direct American advisory aid to the armed forces at both strategical and tactical levels and a loan to be used under American supervision for currency stabilisation. There is now no doubt that, if aid to the Chinese Government is increased, or even continued at present figures, it will have to be made conditional on increased American supervision over its use, if only to meet objections from the American public that the nation's money is simply being poured down the drain. The propaganda in favour of the Chinese Communists is no longer as influential in America as it was two years ago, but as their armies advance there is a strong impulse to "get out from under," and any further measures to bolster up the present Chinese Government—or any other Government opposed to the Communists—will have to show a convincing prospect of success if they are to obtain approval.

Meanwhile, the crucial battle for the Chinese capital continues to be waged in the neighbourhood of Suchow, the junction on the railway from Nanking to Tientsin; after some initial success, the Government army is reported to have had its front broken by Communists who have encircled a large force to the east of the town. Nanking itself lies on the south side of the Yangtse and might be defended along the line of the river if a few light naval craft were available to prevent the Communists from crossing in force; it cannot, however, be assumed that even the most elementary precautions have been taken. From Manchuria, where the Communists are in complete control, some units are reported to have landed in Shantung from the sea to reinforce the Communist army before Suchow, while another force is advancing on Peiping, where the regional Government commander, General Fu Tso-yi, has proclaimed martial law. At present the Communists appear to be concentrating their efforts on breaking through to Nanking, but the conquest of the Peiping-Tientsin area is also an important objective for them, for without it they lack railway communication between Manchuria and their main forces in North China.

Royal Commission on the Death Penalty

In the House of Commons last week, the Home Secretary announced the appointment of a Royal Commission to determine whether it would be practicable to limit or modify the death penalty for murder. This announcement fulfils the Government's undertaking to give further consideration to the death penalty after the House of Lords had rejected its compromise clause in the Criminal Justice Bill last July. It also very skilfully prevents the matter being reopened in Parliament this session through the introduction of a private member's Bill to abolish the death penalty altogether.

Yet it is neither desirable nor necessary that the limitation of the death penalty should await the mature deliberations of a Royal Commission. It is a matter for profound concern that the first two executions since the *de facto* suspension of capital punishment last February should have been of the type of murderer for whom, it is safe to assert, the death penalty never acts as a deterrent—the one, a case of frenzied passion followed immediately by remorse; the other, a case in which there was strong presumption of mental illness. The concern is intensified by the subsequent remarks of the Home Secretary at South Shields. During the passage of the Criminal Justice Bill he said that the death penalty ought not to be abolished now because of the increase in crimes of violence and of the inability of an undermanned police force to deal with them, which is a tenable point of view. Last weekend, however, he is reported as having said that the death penalty could not be abolished until the prison system had been reorganised, because it was difficult for life sentences to be served in existing conditions. In other words, murderers must be hanged, not as a deterrent, but because there is nothing else to do with them. If this is really Mr Chuter Ede's view, it gives added force to the contention that the ultimate responsibility for reprieving a murderer or not should not rest on him alone.

It is not necessary for the limitation of the death penalty to wait for the findings of the Royal Commission because this could be done by a revision of the McNaghten Rules. These rules, which in effect determine whether a defence can be established on the ground of insanity, were laid down by the judges in 1843, and they allow no half-way house between complete responsibility and complete irresponsibility for a criminal action. They have long been criticised as being based on obsolete theories of mental abnormality, and in Scots law they have been modified to the extent of admitting the doctrine of partial responsibility which, if accepted by a jury, reduces the act of murder to culpable homicide. In view of the strong public wish to limit the death penalty, if not to abolish it altogether, is there not a case for a similar modification of the McNaghten Rules by the English judges?

The Two Faces of Trade Unionism

Virtual unanimity marked last week's conference of Trades Union executives, which adopted the General Council's Report on Productivity and resolved to make a practical investigation—

getting down, in Mr Will Lawther's words, to brass tacks—of the productivity and manpower problems of the industries concerned. This is excellent news, for the Report was an enlightened and realistic piece of work, and if the spirit informing it were to become genuinely characteristic of the trade union movement as a whole, a salutary revolution would have been begun. Especially promising is the more positive side of the TUC programme; the training of shop stewards and potential managers, the practical study of redeployment, the spreading of education "on the floor of the workshop." This goes far beyond the highly necessary, but essentially negative or rubbish-removing job of doing away with restrictive practices. It foreshadows a genuine partnership in industry, which could transform the nature of industrial society out of all recognition and make the socialisation of nationalised industry a practical possibility.

Such, evidently, is Mr Herbert Morrison's hope, expressed at the end of his cautious defence of the principles of nationalisation. Such, too, is the constantly reiterated aim of Sir Stafford Cripps—who once brought an avalanche of condemnation down upon his head by saying that trade unionists were not ripe for managerial responsibility, and who with characteristic directness has gone on saying the same thing ever since. Speaking at Manchester last Saturday, he returned to the attack with what must have been a gratifying sense of support from the trade union leadership. Exclusiveness and refusal to learn, pursuit of sectional interests without regard to the public need, slackness and sheer stupidity, might be fatal to democracy's prospects of survival. Absenteeism was equivalent to pilfering. More trained and intelligent trade unionists were needed; and the whole movement must realise the need for a change of outlook and effort. One can but applaud; but there might be less need for Sir Stafford's admirable sermons now had he and his fellow-leaders of the Labour movement had a different outlook, and directed their efforts otherwise, in years gone by. Trade unionism, forged for class war, cannot change its spirit overnight. There could hardly be found in the story of industrial relations a more abject piece of idiocy than the Cunard strike; a strike lacking the justification of even the slightest grievance. The principle inspiring it seems to be that, whenever any organised workers anywhere on the globe see fit to strike, all other workers even remotely connected with the industry concerned should throw themselves into a cataleptic trance until it is over. This nobly nitwitted impulse may, of course, have been reinforced for the crew of the *Queen Elizabeth* by apprehensions of an impolite reception from the New York longshoremen, but in view of the surprise with which the latter greeted the crew's decision it seems to have been unfounded. It might have been better had Sir Stafford changed the venue of his address from Manchester to Southampton.

* * *

Poor Man, Assisted Man

The "poor person" has been translated into the "assisted person." The poor man's lawyer will now serve those whose income may be up to say £12 a week and who may be a small capitalist owning his own house or shop. On the other hand, all but the very poor will have to contribute fairly heavily in proportion to their income to the cost of legal proceedings. Such will be the effect of the two new Bills, one for England and Wales and one for Scotland, to provide legal advice and aid to those who cannot afford to pay the costs themselves. The Bills are the direct, though belated, offspring of the Rushcliffe report which was published in 1945.

The new scheme, strange to relate, will not add to the numbers of civil servants. The circumgyrations of Whitehall will not increase the circumlocutions of the law. The Law Society and the Bar Council are to be left alone to run the new scheme with local committees and panels of barristers and solicitors, subject to reasonable financial safeguards for the control of public money. This was proposed in the Rushcliffe report and has been wisely followed.

The right to free or subsidised legal advice and aid depends on important definitions of "disposable" income and capital. The Assistance Board's rules will apply and disposable income will therefore exclude dependants' allowances, loan interest, income tax, rates and rent over 15s. a week; disposable capital will exclude the value of the applicant's house and furniture. If on these definitions the applicant's disposable income is under £156 per annum and his disposable capital is under £75, he will get legal aid free. If they are above £420 a year and £500 respectively he will be outside the scheme altogether. Between these upper and lower levels he will have to contribute half his disposable income over £156 per annum and all his disposable capital over £75. On this basis litigation is not likely to become an attractive proposition except to the genuinely aggrieved. And a yet further safeguard has been set up making it necessary for an applicant to provide reasonable grounds for taking part in proceedings before the local area committee will grant a "civil aid certificate."

Experience of the National Health Service makes anyone chary of taking estimates of this very limited National Legal Service very seriously, and from the explanatory memoranda it is clear that the Government is nervous of the situation getting out of hand. In the short-term, time within the Courts would prevent an excessive number of cases being taken. But this may not sufficiently dam up demand; and there might be strong pressure for more courts. Meanwhile it is estimated that, apart from certain divorce cases for the very poor, 100,000 cases will be dealt with in a year in England and Wales at a cost of £4.37 million, of which £2 million will be recoverable from contributions and costs of opponents, and that in Scotland the cost will be £250,000. For the redress of genuine wrongs this does not seem excessive.

* * *

New Negotiations in Indonesia?

The news that the Dutch Government has decided to send a new official delegation to Indonesia is a reminder that the crisis created by the proclamation of the Indonesian Republic just after Japan's surrender in 1945 still drags on. The Uno Three-Power Commission of Good Offices has so far little to show for its prolonged endeavours to mediate between the Dutch and the Republic. The Dutch have never really receded from their original refusal to recognise the Republic as an independent state entitled to negotiate for a treaty on equal terms, and they have been particularly irritated by the Republic's development of direct diplomatic relations with foreign countries, Pakistan and Burma being the latest states to seek to establish diplomatic missions in Jogjakarta. The Dutch scheme has been to create a federal United States of Indonesia (USI), which would alone have sovereign rights in the military and diplomatic spheres, and of which the existing Republic would be only one of several constituents; by this means the revolutionary Republic would be put in its place and formal recognition of it as an independent state would be avoided, while concessions would be made to Indonesian nationalism which the Dutch hope would be sufficient to preserve a substantial political link between the USI and the Kingdom of the Netherlands. Behind the rival projects and demands of the two sides is the basic military fact that Dutch troops are in occupation of a great part of Indonesia, including sections of Java and Sumatra, while the troops of the Republic control the parts of the two islands which lie outside the Dutch military zones; yet renewed action to eliminate the Republic by force is forbidden by the Uno-imposed truce. The bargaining is thus between two parties, each with its own area of actual power; the problem is to get an agreed settlement for the whole of Indonesia instead of the present division.

The Indonesian leaders of territories outside the area under Republican rule are generally in favour of a federal system for the country and opposed to the claims of the Jogjakarta Government to represent all Indonesians, but they regard the adherence of the Republic as essential to the success of any federation, and this gives the Republic a good bargaining position. The Hatta Cabinet has emerged morally strengthened from the ordeal of the recent Communist revolt, though materially its position has been made worse by the destruction involved, and Communist guerilla action is still going on. The circumstances seem to be favourable for a fresh effort to reach a settlement, and the fact that both the Foreign Minister and the Minister for Overseas Territories in the present Dutch Government are members of the new delegation, suggests that the prospect of agreement is taken seriously at The Hague.

* * *

Will Sweden Stay Neutral?

The regular meetings of the Northern Military Co-operation Committee inevitably arouse speculation on the prospects of the Scandinavian countries becoming members of the projected Atlantic Union. After the plenary conference in Stockholm last week of the representatives of Norway, Denmark and Sweden, together with their expert advisers, more rumours of vital decisions, more hints of crucial Cabinet changes are current. Certain facts, however, should be borne firmly in mind in considering the probability that Sweden will join the Atlantic Union—for that is what all the discussion amounts to.

The first is that the work of this Co-operation Committee is purely exploratory. It has to report not later than February on the possibility, not the desirability, of military collaboration between the Scandinavian states. It cannot reasonably be expected, therefore, to make any vital decisions on policy. The execution of any measures it recommends will depend on whether, either before or after the Committee makes its report, Sweden decides to move away from its traditional neutrality. Of this there are no signs; and the elections in September can only be interpreted, in their relation to foreign affairs, as a vote of confidence in continued neutrality.

It is perfectly true, of course, as a Swedish Government paper remarked last week, that certain forms of military co-operation in the North could be envisaged, even if Sweden remained neutrally aloof from pledges and alliances. But what value would such a limited effort have? Exceedingly little—according to the Norwegian Government or, at any rate, the main Labour newspaper in Norway, *Arbeiderbladet*. Sweden's adherence to a pledge of continued neutrality by all three countries as the condition of support for a Scandinavian alliance is quite unacceptable to Norway. Norway relies too much on prepared and organised help from the west to agree to any limitation on its freedom to negotiate for it. To a lesser extent this is true also of Denmark; and it should not be overlooked that, while the Co-operation Committee was sitting, the Danes announced that the calibres of their guns would in future be standardised with those of United States weapons. These are different from Swedish calibres.

Sweden nevertheless is too strong materially and geographically to be lightly left out of the reckoning. Not only are Norway and Denmark by comparison weak in *matériel*, but they depend to a far larger degree on outside supplies. Except for fuel and, perhaps, the exposed position of the main iron mines near the Finnish frontier, Sweden possesses considerable strength. And the fact that the Swedes were able to preserve their neutrality in the recent war has confirmed them in the belief that this is still possible. At any rate, they are most unlikely to commit themselves to any departure from this old policy until they have cast-iron guarantees of the success of the new; nor will they do so a day sooner than is absolutely necessary. Nor should the effect of Russia's good behaviour in Finland on people seeking evidence to justify the prolongation of the present situation be in any way underestimated. Meanwhile, Norway and Denmark may be expected to work hard to evolve some formula which would enable them to get help from Sweden while retaining their freedom of action towards the west. It will be a difficult task.

* * *

Jugoslavia and Greece Threatened

A further stage was reached in the anti-Jugoslav campaign conducted from Bulgaria when the "Provincial Committee of the Macedonian Association of Cultural Societies in Bulgaria" recently published a manifesto to Macedonian emigrés living in that country. It accused the leaders of the Macedonian Republic (which is one of the six constituent republics of Tito's Jugoslavia and has a regional government in Skoplje), of "extreme nationalism," which "serves the interests of the Titoist rulers of Belgrade, who are trying to establish the hegemony of Greater Jugoslavia in the Balkans." The "correct and democratic solution" of the Macedonian problem can only be found, the manifesto claims, in a "federation of south Slavs in which Macedonia is a member with equal rights."

As in the past, both Belgrade and Sofia claim to have at heart the interests of the Macedonians, and profess faith in south Slav "brotherhood" or even federation. But, as in the past, these notions are differently interpreted in the two capitals. For Tito, Macedonia is a part of a Jugoslav state, which may or may not later federate with the other Balkan states—Albania, Bulgaria and Greece. For the Macedonian emigrés in Bulgaria—who since Tito became a heretic have been given free rein by Dimitrov's government—Macedonia should be a separate state, equal in status to Jugoslavia and Bulgaria, with which it would ultimately federate on equal terms. This point of view has been supported in the past by Bulgarian governments when they felt too weak to claim what they really desire—incorporation of all Macedonia in Bulgaria. This at least does not appear to have changed just because Bulgaria has become a "people's democracy."

Bulgarian encouragement for the idea of a Macedonian state is important not only to Jugoslavia but to Greece. If there is to be a Macedonian state, it must clearly include also "Aegean" (Greek) Macedonia. As the Sofia Government is now less likely than ever to adopt a new attitude in a controversial matter of foreign policy without Moscow's knowledge, it is safe to assume that the Kremlin is at least toying with the idea of a Macedonian state.

If Tito were not blinded by Marxist dogma and by a sentimental loyalty to false protectors who have nothing but hatred and contempt for him, he would draw the logical conclusions and come to terms with Greece. Whenever Serbia and Greece have been threatened by Bulgarian imperialism, they have stood together, and this solidarity has always benefited both. Instead, Tito joins his Albanian and Bulgarian enemies in building up Markos to destroy Jugoslavia's natural ally. *Quem deus vult perdere. . . .*

* * *

Communist Tactics and Nationalism

The Bulgarian Government's sudden switch from friendship with Jugoslavia to intense hostility resembles a similar switch in the opposite direction which has recently been commented upon in this paper—the sudden swing of the Slovak Communists from hostility to professed friendship with the Hungarians. Real friendship between Czechoslovakia and Hungary is desirable in the interests of the Central European peoples, whatever their regime, but this is a bogus friendship, introduced by Slovak Communists who deliberately for three years incited their people to persecute the Hungarians, far surpassing in their lying propaganda the Fascist Slovaks of Tito. All this occurred because it was Moscow's tactical aim to keep Czechoslovakia and Hungary (two countries with strong "western bourgeois influences") hostile to each other, in order to weaken the resistance of both to sovietisation. When, however, it became convenient to Moscow that Hungary and Czechoslovakia, both sufficiently sovietised, should be brought together, the word was given, and honeyed words were exchanged from Bratislava, Budapest and Prague. Similarly in the Balkans, when it became inconvenient that Serbs and Bulgars should fraternise, again Moscow gave the word and insults were hurled from Sofia at Belgrade and Skoplje. And doubtless, should it ever be convenient in the future, Moscow would give similar orders to disrupt the idyllic friendship which now appears to prevail between Rumania and Hungary.

To ordinary Slovaks, Hungarians, Macedonians and Bulgars, Moscow's sudden changes must be confusing. To democrats who have worked for years for friendship between the nations of eastern Europe they are heartbreaking. The Communist leaders have stolen their programmes, turned them into dishonest slogans to mislead their peoples and impose their own yoke. Their nationality policy is insincere and empty because the only national feeling of which they themselves are capable is "transferred nationalism" for the Soviet Union. Marx once said that the workers have no fatherland. Today it is more true that Cominform agents have one, the same for all.

Safer Milk—

The Milk (Special Designations) Bill, which was introduced in the House of Lords this week, fulfils a long-standing intention of the Government—not only of this Government but of the Coalition Government as well—to improve the quality of all milk sold for liquid consumption. It also goes some way to meet the even longer-standing demands of the medical profession, justifiably shocked by the 2,000 preventable deaths, mainly of children, from bovine tuberculosis each year and an unknown amount of illness and disablement.

In areas to be specified by the Minister of Food all milk to

A year's subscription to The Economist would make an excellent Christmas or New Year gift; the cost, including surface mail postage to any part of the world, is £3.

The Economist, 22 Ryder St., London, S.W.1

be supplied retail will have to be tuberculin-tested (TT), or accredited milk from a single herd, or pasteurised. The shortage of pasteurising plant will prevent these provisions from coming into force immediately, and it is likely to be at least five years before all the areas required to be specified can be. This shortage of plant is also the reason why accredited milk is allowed as a designated milk for the time being. Accredited milk is milk from a herd that undergoes a regular veterinary inspection but not a test for tuberculosis. It may, therefore, be anything but safe milk, and after five years it will no longer be recognised as a designated milk.

The extension of pasteurisation is sometimes objected to because, for one thing, it may discourage attempts to wipe out tuberculosis in dairy herds. But this objection cannot be sustained. First, it will probably take at least twenty years to free all herds of cows that react to the tuberculin test. Secondly, the elimination of bovine tuberculosis should go on in the interests, not only of safer milk, but also of obtaining a larger yield from the country's dairy herds. Thirdly, the milk from tuberculin-tested herds, though free from the bacillus of bovine tuberculosis, may easily be contaminated by other organisms before it reaches the consumer. It is a defect of the new Bill that it does not provide for the eventual pasteurisation of tuberculin-tested milk.

* * *

—And Food?

Another piece of preventive medicine started by the Government is the setting up of a working party to make recommendations for securing "the observance of sanitary and cleanly conditions in the catering trade." The number of cases of food poisoning in England and Wales went up from 83 in 1939 to 598 in 1946; in fact, with the exception of 1945, there was a steady rise from 1940 onwards. Part of this increase can be attributed to the shortage of food and the consequent tendency to eat and supply food of doubtful freshness and wholesomeness; but it is widely held that it is also associated with the increase in communal feeding in restaurants and canteens.

Last week's debate in the House of Commons on clean catering was chiefly concerned with washing up, and it is true that the methods of washing up in the average eating place are totally inadequate. The *British Medical Journal* of January 25, 1947, contained an account of a survey made of the washing up equipment in various kitchens supplying communal meals, from which it was found that most of the dishes were being washed in water that bacteriologically was equivalent to sewage, and that pathogenic organisms could be isolated from the eating utensils. But probably most food poisoning arises from direct infection by people concerned with the handling of food. The working party will have to find out whether it is possible to place a greater check on the cleanliness and freedom from infection of all persons preparing and serving food for public consumption.

* * *

Right of Entry

The Englishman's home may be his castle, but the number of people who already have the right to force their way into it would amount to a sizeable army. The latest recruit to their ranks, if the Wireless Telegraphy Bill becomes law, will be the Post Office official looking for defective electrical apparatus—a case of interference breeding interference.

In point of fact, neither the land nor the dwelling of the private individual has ever been sacrosanct. From earliest times some people have had a right to enter it, free from any liability for trespass. The sheriff in search of a debtor's goods to seize for debt may not break into the debtor's own house simply to seize them, but he may break in to rescue his own officer if he is detained there, and, once inside, he may break open any locked door. But it was not until the last century that the official inspector appeared on the scene in any large numbers. The food inspectors can inspect food exposed for sale; they acquired that right under the Public Health Act of 1875. The health officials of local authorities can be given the right to enter any premises where there are infectious diseases, or to abate a nuisance on the premises, or to protect the interests of children under the Children and Young Persons Act of 1933. Similarly, officials of the Metropolitan Water Board were first given a right of access to inspect water apparatus, even in a private house, as early as 1871. The electricity supply companies acquired their rights in 1909. Under the prewar Unemployment Acts, a Ministry inspector can go anywhere where people are employed. Even a railway company has the right of access to any property adjoining a railway line when an accident has occurred or movements of land are threatening the permanent way.

From the citizen's point of view, it is equally important how these rights are enforced. In some cases it is necessary for the official who wants to enter private property to persuade a magistrate to give him a search warrant. In others, notably under the public health laws, it is sufficient for a local authority to authorise its own officers to enter. Under the Wireless Telegraphy Bill, Clause 14, the Post Office official who wishes to search for the cause of radio interference must first obtain a magistrate's warrant giving him the right to demand entry. Yet, under the Prevention of Damage by Pests Bill, Clause 24, also introduced this session, any person may be authorised by a local authority to enter any lands or buildings to inspect the precautions against pest infestation or to see whether any regulations that the Minister of Agriculture may choose to make under the powers given in the Bill are being carried out. He can also enter land which is not itself infested, or suspected of being infested. He can enter if the land has recently harboured a vehicle or aircraft which was infested. And all that by note of hand alone, and the penalty for resistance is a fine of £5. Yet it seems likely that, so far at least, there are quite as many houses with mice in them as there are with electric irons installed. There is a strong case for saying that these powers are too freely given by Parliament. There is also a strong case for saying that protests against them would have greater weight if they attained greater consistency.

* * *

A Communist for the Cape

The lesson which Dr Malan should learn from the election of a Communist as one of the natives' three representatives in the South African House of Assembly is so obvious as barely to need stating. Mr Sam Kahn, the successful candidate, routed his rivals to the extent of causing both of them to lose their deposits. He has been an active Communist in the Cape since 1932, but only now has he achieved the goal of becoming the first Communist member in the South African Parliament. He has set himself up as a European protagonist of non-European interests, and his election at a time when the Nationalist Government are preparing the preliminary moves for bringing into force their policy of *apartheid* is particularly significant.

However deplorable Communism may appear in western eyes, its appeal to the backward peoples of the world is undoubtedly strong. The easy promises of wealth and plenty which are held out as a reward for the revolutionaries are accepted at their face value. In South Africa, where the extremes of wealth and poverty exist side by side, the Communists can put forward a particularly strong case. And when, to the promise of material advantage, they add the fact of racial oppression, their case is almost unanswerable. Hitherto, Communist activity in South Africa has been slight. The Bantu are a conservative race who do not readily accept revolutionary ideas, but the old tribal system has disappeared in large areas as a result of the drift to the mines and cities during the past thirty years. In its place is a mass of undisciplined, impoverished people, ready for any demagogue who pretends to point the way out of their squalor.

In such circumstances, what can be said of Dr Malan's proposals to hold the natives down even more firmly? Such proposals are not only inherently unjust. They provide fuel for the Communists, whose intentions in Africa are not very different from those already realised in Asia. There is no easy solution to South Africa's racial problem, but one thing at least is certain—that oppression will make it even more intractable. Dr Malan may not be disturbed by the presence of a single Communist in a Parliament which, however else it is divided, is solidly anti-Communist. But this particular swallow, even if he cannot make a summer, is still a warning of particularly unpleasant summers that may come.

Shorter Note

The number of recruits who have come forward for service in the Territorial Army during October, the first month of the intensive recruiting campaign, is only 7,355, or considerably less than half the monthly figure needed to be reached of 100,000 recruits in six months. However, reports from commanding officers indicate that the quality of both men and women is high, and in particular that the experienced young non-commissioned officers are beginning to return to the colours.

Producers and manufacturers of every nation are invited to show their products at the new world market-place — the Canadian International Trade Fair — to be sponsored again in Toronto by the Canadian Government, from May 30 to June 10, 1949.

Exhibitors' applications should be received before January, 1949, in order to permit the most equitable allocation of available space. Later applicants will risk disappointment.

Letters to the Editor

The Cost of Justice

SIR,—In 1946, MGM Pictures Ltd. wrote to the Talks Director of the B.B.C. alleging that I was "out of touch with the tastes of the millions of cinema-goers who are also radio listeners," and that my criticisms were "unnecessarily harmful to the industry as a whole." Believing that it was in the interests of all those to whose way of life freedom of speech is essential, to limit interference with the critic's expression of opinion, I sued them for libel, as the only legal redress open to me, and won, with £1,500 damages. The reversal of this judgment, in the Court of Appeal, has left me with the costs for both hearings to pay—for the case I won as well as the case I lost. They amount to about £5,000.

Fellow critics rallied to help me, issuing an appeal to other members of the Critics' Circle for aid to take this case higher, where, if I lost, it would cost me approximately another £2,500. Last week MGM's solicitors wrote threatening action for libel against all five signatories of the letter in which this appeal was made—Miss Dilys Powell of the *Sunday Times*, Mr Richard Winnington of the *News Chronicle*, Mr A. V. Cookman of *The Times*, Mr Stephen Watts of the *Sunday Express*, and Mr Milton Deans, hon. secretary of the Critics' Circle Film Section.

There are means by which technically "poor persons" in Britain can afford justice. What chance has the individual up against great wealth, when he or she is not officially a poor person, but is merely ruined by previous hearings, of getting a case like this decided in the Lords, however desirable it may be?—Yours faithfully, E. ARNOT ROBERTSON

Guyon House, 98 Heath Street, N.W.3

Votes and Votaries

SIR,—Your leading article of November 13th criticises the comparison of British and American politics made by "certain enthusiastic journalists of the left wing" since the Presidential election. Obviously there is no analogy between the particular issues at stake in the two countries. But there is an analogy—which you do not mention—between the Republicans, who accepted the Democratic programme, campaigning for the New Deal without the New Dealers and Marshall Aid without Marshall, and the Conservatives, who are at present no nearer to evolving a policy of their own.—Yours faithfully, D. V. DONNISON

Magdalen College, Oxford

British Farming

Sir,—I am a tenant farmer with over 500 acres, and have been considering how I could increase my efficiency, and have arrived at the following conclusions:—

(1) If my landlord would and could afford to build me two modern cottages and modernise my existing ones, I could increase my production 15 per cent.

(2) If a pool of sufficient labour was available for seasonal work, I could increase my production a further 7½ per cent.

(3) If there were a co-operative grass drying plant available, I could increase my milk by 5 to 7½ per cent.

As to subsidies, good potato land needs no subsidy, but good potato land would only provide for 15 per cent of the country's requirements.

I think I am efficient. I am mechanised as far as possible, but here again, given two further cottages, I could contribute to the efficiency of my neighbours by hiring machinery to their benefit and my own.

What can I do to be saved?—Yours faithfully,

"A BERKSHIRE FARMER"

Public Opinion Polls

SIR,—Most of the articles and letters on this subject that have been published since the American Presidential election seem to miss the main point. Even some of the defenders of opinion research appear to accept the verdict that on this occasion the opinion polls were wrong. This is highly questionable. The fact is that the sounding of public opinion on political preference is one thing, the use of the results to predict an election result is quite a separate issue. The former is quite feasible, and, in this sense, the poll results may easily be a more accurate reflection of American political sentiment than the election results themselves. The latter is, at the best, extremely difficult and probably impossible, at any rate by sample research techniques, particularly in America. The reasons for this are:—

1. The pollers interrogate a representative cross-section of the population, but they cannot guarantee that a representative cross-section will vote. Nor can they even discover which members of their own cross-section will, in fact, vote.

2. The publicity given to the very consistent findings of all the polls over a period of months, and to the corroborative views of independent political commentators, is itself capable of influencing the extent to which people bother to record their vote. It may operate to reduce the likelihood that a representative cross-section will vote.

3. There is a space of time, possibly only a matter of hours, between the last opinion poll and the recording of a vote in which a voting intention may change.

The public opinion experts are open to criticism, not because their research techniques produce false results, but because, knowing better than most that the further act of prediction is so hazardous, they still so gaily don the prophet's mantle.

In any case, it is quite absurd that the techniques of sample research, which can claim such solid and incontrovertible achievement in the fields of sociology, public administration and marketing, should be called in question for sins they have not even committed in one of their most questionable applications.—Yours faithfully, A. G. JONES

BETRO, 48, Dover Street, London, W.1

Contractional Engineering

SIR,—Some little time ago I did a small service for an official body. I have now had a letter enclosing my modest fee, for which I am duly grateful. The letter finishes with the sentence: "Our contractional letter dated the 15th November refers." Should I contact Sir Ernest Gowers to obtain a construction of this contraction?—Yours faithfully, ASTRA

From *The Economist* of 1848

November 25th, 1848

MARY BARTON*: *A Manchester Tale.* Chapman and Hall, Strand.

In this work the reader is presented with a most melancholy, nay, an appalling picture of the lives of the operatives in Manchester, and we fear in other manufacturing cities. The impress of truth is not to be mistaken, and, therefore, the perusal of the book has a most depressing influence, and we must overcome our own feelings ere we can form a judgment on Mary Barton. The task of depicting not only the condition of the operatives in the different phases of their existence, but of tracing that condition to its causes and ultimate results, has evidently not been lightly undertaken. Mary Barton has *not*, we believe, flowed from the pen of a noble author; it is *not* a love story, although, as a true picture of life, that master passion plays its part; it is *not* a fashionable novel; but it is an attempt, and we should say a successful one, to create in the reading public an interest for the miserable operatives, by showing their domestic virtues, their industry, their unwearied but too generally ineffective struggles against the fate which, sooner or later, overtakes them. It is not our duty, nor is this the place to inquire into the sources of the social anomaly presented, by a large body of men, industrious, prudent, saving, and virtuous, being reduced by no fault of their own to the most abject want, and but too often driven to crime. The moral philosopher, the political economist must solve this knotty point; we only draw the attention of our readers to the striking peculiarities of Mary Barton, hoping that its pages may inspire them with the wish to contribute their mite towards the lasting relief of the class depicted there. We fear the author has but little hope of a speedy realisation of that object, for he has not been able to find any other means for securing the happiness of his hero and heroine, than that of sending them to Canada, into voluntary banishment. . . .

The book is intensely and painfully interesting, and will be, we have no doubt, the parent of many similar works.

* Mrs. Gaskell's first novel.

Books and Publications

The Law and the Prophet

"The New Economics. Keynes's Influence on Theory and Policy." *Edited by Seymour E. Harris.* Dobson. 686 pages. 30s.

"THIS volume," says the editor in his introductory chapter, "was conceived as a tribute to the man and to the economist. But it is more than that. We intend to appraise Keynes's contributions to economics; to add up the gains and explore the weaknesses." A formidable, fascinating and beautifully handled job. This encyclopaedic volume contains key writings by Keynes himself, contributions to controversy by his disciples and opponents, a carefully chosen anthology, that is to say, of original documents; these take up sixteen of the forty-seven chapters. The remainder is new material, appraisals in the light of subsequent events and developments of theory, offering contrasting views by Keynesians and non-Keynesians, expanding special points regarding technique or application, relating various aspects of the master's work not hitherto adequately linked.

It is not, of course, merely a pious elaboration of variations on the Keynesian theme. If Mr R. F. Harrod and Mrs Joan Robinson are there, so are Professors Schumpeter and Sweezy, one attacking from the Right, the other from the Left. Professor Seymour Harris himself keeps his treatment of his hero well on this side of idolatry; his economics emerges warts and all. An authoritative full-length biography of Keynes, when it comes, will cast more light on the influences which led him to leave some ideas partly developed, to contradict in 1936, wholly in appearance and partly in reality, the conclusions stated in 1930; to swing from internationalism to something perilously near autarky and back again. Never did a theoretician live less in an ivory tower, or draw more fully upon the current preoccupations of his time; Keynes the economist reflected Keynes the administrator, the business man, the adviser of statesmen, the diplomat. His achievement, partly for that reason, lacks the consistency and majestic unity of his master, Alfred Marshall. There is all the more need for such a book as this, in which the student can both trace the development of particular interests—in money, in the savings-investment relation, in the foreign exchanges, in public finance—and find an opportunity of constructing, however tentatively, a synthesis which Keynes himself never conclusively provided.

Pride and Prejudice

"Prejudice and Judgment." By Sir James Grigg. Jonathan Cape. 447 pages. 16s.

SIR JAMES GRIGG is commonly remembered as the Permanent Under-Secretary of State for War whom Mr Churchill converted into the Secretary of State for War in 1942. Such summaries are rarely just and still less rarely kind, yet this much of it is true. Sir James was a permanent civil servant and it is doubtful if anyone but Mr Churchill would have thought of translating him directly into the Cabinet, even in 1942.

An autobiography always has two major interests; the things seen and done by the man who writes it and the picture of the author himself that the reader distils from its pages. On the first, Sir James is disappointing. He has fallen between two stools. His book is neither a frank account of what he knows to have happened (perhaps no civil servant could be so indiscreet) nor is it a documented history. What gives the book life—and its life is mainly confined to these sections—are the chapters dealing with Mr Snowden, for whom he had a profound admiration, and Mr Churchill, for whom he has a profound affection and respect.

And what of the author himself? No man can be discreet enough to hide himself completely when he writes his autobiography. Sir James is clearly an exceptional man. With the minimum of financial aid from his father, he made his way from a secondary school in Bournemouth to Cambridge, passed first in the Civil Service Examinations for 1913, and made his way through the Treasury to the summit of his profession. He is the perfect civil servant—probably no one realised this better than Mr Churchill when he made him his War Minister, for that was the kind of man Mr Churchill wanted in that office. No one interested in public affairs could fail to be interested by this record. No one interested in people could fail to like Sir James, for he is honest, tenacious, clear-sighted, obtuse and irritating.

A Massive Record

"The Memoirs of Cordell Hull." Hodder and Stoughton. 2 Vols. 1804 pages. 50s.

MR CORDELL HULL, as Secretary of State from the beginning of Roosevelt's Presidency until nearly the end of the third term, held that office longer than any of his predecessors. The account of his stewardship is correspondingly massive and with the exception of the chapters on his early political life hardly belongs to the category of memoirs at all. What we have instead is a detailed account of the conduct of American foreign policy from 1933 to 1944, authenticated by quotations (more frequently by paraphrases) from the records of Mr Hull's official conversations and from the relevant documents.

For those concerned with current problems, rather than with history, the main interest of the memoirs lies in their relevation of the basic ideas and prejudices which underlay Mr Hull's policy, and which may well underlie that of his successors. There was the insistence that nothing justified interfering with the sacred principle of non-discrimination and the complete inability to understand or make allowances for Britain's economic position; there is the absolute hostility to the idea of empire without attention to the need of substituting some other form of power if Soviet communism is not to benefit by its collapse; there is the assumption of the inherent wickedness of all spheres of influence without an examination of how, when dealing with countries as different in their approach as the Soviet Union, joint action can be possible; there is the refusal to become involved in territorial issues between foreign Governments without a realisation of their importance in the establishment of peace. Nor does Mr Hull always see that the exceptions he claims from his rules of conduct in the name of the overriding demands of the allied war-effort were equally applicable to other cases. Thus his laboured defence of the "Vichy" policy—much more convincing than the later American policy on France, which seems to have been largely the product of Roosevelt's dislike of de Gaulle—only stands up according to premises equally applicable to Britain's closure of the Burma road, and appeasement of Argentina and Spain—policies Hull regarded as inexcusable. For all their over-elaboration and tediousness, the Hull memoirs are compulsory reading for students of American and international affairs.

The New India

"The New India." By Sir Atul Chatterjee. Allen and Unwin. 201 pages. 8s. 6d.

OVER thirty-five years ago the late Sir Thomas Holderness wrote for the Home University Library a little book, entitled "Peoples and Problems of India." Since that time the political face of India has been completely transformed. A new book was called for, and Sir Atul Chatterjee has produced it, and presented within reasonable compass an admirable picture of India at the time of the transfer of power. His book will meet the needs of many in this country who wish for an experienced guide to help them to realise the complexities of the Indian scene.

The book falls broadly into two sections. The first covers the religious, literary, social and ethnographical aspects of Indian life. These are largely outside the influence of politics and will continue dominant for many years. The story has often been told before, but it may be doubted whether so much knowledge has been previously stored in so few pages. The latter part of the book deals largely with administration in its broadest sense. Here the future is likely to witness rapid changes, and Sir Atul has points to make on the line they may take. All the leading questions of the day are covered in chapters dealing with agriculture, industry, defence, health and the other fields of state action. On all these matters the book states the position at the time of the transfer of power, and thus provides the background from which future progress must be judged after the close of the British epoch. It may be hoped that when a new edition of the book appears Sir Atul Chatterjee will be able to add a fresh chapter showing how the problems he has so lucidly set forth have been tackled by the new Indian and Pakistan Governments.

American Banking System

"American Banking System." By R. S. Sayers. Oxford University Press. 130 pages. 7s. 6d.

THE appearance of yet another book on American banking to swell still further what is probably the most swollen bibliography on any banking subject is bound to arouse suspicion and cynicism. These reactions quickly disappear on reading Professor Sayers' book. The author describes it as "a sketch" and this is what it is. It says nothing new but it reflects knowledge distilled from what has obviously been a painstaking study of the literature on American banking and from an almost non-academic interest in its most recent evolutions. The book is designed to provide an account of its subject within the compass of an evening's reading. It succeeds in doing so and—an even greater achievement—it succeeds without in any way distorting the perspective. As an introduction to its subject this little book will take a great deal of beating. Professor Sayers, in these 130 pages, has done more than merely distil and summarise. In a last reflective chapter he ruminates on some of the implications of the dynamic sequence of events and evolution he has described. He asks himself whether 1933, with its thousands of bank failures and its virtual paralysis of the whole mechanism of banking in the United States, can come again. His answer is reassuring. He still detects traces of weakness in the multiplicity of small unit banks. But the development of deposit insurance, the greater elasticity of the facilities offered by the Federal Reserve banks, and last but not least, the revolution in the distribution of banking assets, convince him that American commercial banking is in a much stronger position than it was twenty years ago.

World Air Picture

"World Aviation Annual, 1948." Published by the Aviation Research Institute, Washington, D.C., and the James Jackson Cabot Professorship of Air Transportation of Norwich University, Northfield, Vermont. London, Faber and Faber. 544 pages. 84s.

THIS encyclopaedic handbook, edited by a former Director of Aviation Research at the Brookings Institution, surveys by countries the civil aviation and aircraft manufacture of the world and gives much information about the world's principal military air forces. Particulars of air engine and air frame manufacturers and their main products are remarkably full; all scheduled air lines in the world—some 250 in number—are listed; the organisation, equipment and routes of the major air carriers in all countries are individually described.

Especially interesting is the section on the USSR. "Even by American standards," states the *Annual*, "the Soviet aircraft industry is large and modern." In 1948 competent authorities estimate that its production, though smaller than the wartime peak of 40,000, should include about 1,000 B-29 type bombers (Superfortresses) and about 200 jet planes a month. European Russia is believed still to contain most Soviet air engine and air frame plants. The Soviet Air Force today is said to comprise about 400,000 men and 14,000 first-line planes, and—as during the war—to be primarily trained and equipped for co-operation with land armies.

Propaganda for Uno

"Australia." Edited by C. Hartley Grattan. 444 pages. 27s. 6d
"New Zealand." Edited by Horace Belshaw. 329 pages. 27s. 6d.
"Brazil." Edited by Lawrence F. Hill. 394 pages. 27s. 6d.
All published by the University of California Press, and the Cambridge University Press, London.

THESE copiously illustrated books form the second group of volumes in the United Nations series which the University of California is putting out under the general editorship of Robert J. Kerner. Nothing in the way of print, paper, binding or photographs has been spared to make them as attractive as possible. Each book contains a number of essays by different authors who describe the various aspects of each country. The essays are both informative and authoritative, for the most part written by eminent scholars of the country concerned, and, as a whole, they give a comprehensive account of almost everything one would like to know about a strange land. If any of the books can be said to have a fault, it is that their avowed impartiality is of the type which describes only what is pleasant and leaves out what is unpleasant.

THREE IMPORTANT BOOKS
PUBLISHED BY NELSON

GEOFFREY CROWTHER'S

An Outline of Money
NEW AND REVISED EDITION

'An explanation in language intelligible to the uninitiated, of modern monetary theory and practice represents a formidable task. In a very high degree Mr. Crowther has succeeded.' *Sunday Times* 12s 6d

Poor Little Rich World
BERNARD HOLLOWOOD

The author deals with the economic problems that are puzzling the layman in his own lucid and individual fashion and with the complete mastery of his subject which one would expect from a writer who was for a time Assistant Editor of *The Economist*.
Illustrated by the author 3s 6d

Quality Control
DR. G. HERDAN

A practical guide to the use of statistical methods in the control of actual operations in manufacture. These methods have achieved remarkable results in the saving of material, time and money.
'His work makes a timely appearance when higher output per man-hour is an urgent need of today.' *Weekly Scotsman* *Illustrated* 21s

Thomas Nelson & Sons Ltd
Parkside Edinburgh

The battle for exports *can be won*
AND THE U. S. MARKET CAN BE CULTIVATED

The recent study by TIME Incorporated on *The Market for United Kingdom Consumer Goods in the United States* will help British manufacturers plan their operations in the American market with greater confidence, and with a more specific idea of the methods to be used in achieving their full U. S. Sales potential.

AMERICAN SURVEY

Trade and the Marshall Plan

(From Our US Editorial Staff)

DURING the past few weeks there have been several developments in Washington which have shown how necessary it is that agreement should be reached on the principles to be followed in making arrangements concerning foreign trade, not only with the western European countries, but between the numerous Government departments which are dealing with this problem. On November 5th it was announced that the United States would participate in the negotiations for reciprocal reduction of tariffs and other trade barriers with eleven countries—Denmark, the Dominican Republic, El Salvador, Finland, Greece, Haiti, Italy, Nicaragua, Peru, Sweden and Uruguay—in connection with the accession of those countries to the general agreement on tariffs and trade which was concluded last year. The new negotiations will begin at Geneva in April and the American announcement contained a list of the imports on which the United States is proposing to discuss tariff changes. During the next few months the US Tariff Commission and the interdepartmental Committee for Reciprocity Information will hold the hearings now required under the Reciprocal Trade Agreements Act, at which producers likely to be affected by such changes can present their evidence.

The outcome of the election makes it unlikely that these negotiations will proceed under the sword of Damocles which the Republicans had apparently been prepared to dangle when the Act came up for renewal next year. But the clash between general policy and special interest groups will be as sharp as ever, and the Californian walnut growers who, finding Italy on the list of prospective bargainers, are prepared to see disaster in a nutshell, will not be alone in pressing their claims upon the negotiators. While some special interests oppose any reductions in the prices of some imports, others—or in some cases even the same ones—will press vigorously for greater favours for US exports than the representatives of some of the eleven will feel is warranted by their dollar position.

Almost simultaneously, the current confusion of US policy and the contribution which special interests make to that confusion were illustrated at the Washington meeting of the Food and Agriculture Organisation. There was a sharp exchange when Mr Loveland, the Under Secretary of Agriculture, made a case against bilateral agreements covering long-term bulk purchases of foodstuffs such as those of Britain with the Dominions, and heard in return the case of the nations who signed last year's multilateral Wheat Agreement, only to have it wither on the vine of a Senate Foreign Relations Subcommittee until the time limit for approval had passed. It is in agriculture that the pressure of the transition from a sellers' to a buyers' market is most clear. Mr Loveland was just back from a visit to his own Iowa farm where some of the neighbours had offered him cash corn for 70 cents a bushel, less than half the official support price. Stabilisation is more and more pressingly desired by the farmer and by those who are aware of the perils of depression. It is a less pressing matter to the grain trade, for which fluctuations are no great disadvantage. The grain trade and some of the railroads, with the able assistance of Mr Slaughter, a former Congressman who is now under indictment for failing to register as a lobbyist, are credited with writing the clause in the new charter of the Commodity Credit Corporation which forbade it to acquire more storage space and forced many farmers to move corn for cash this autumn. The same interests are believed to have had influence in keeping the Wheat Agreement from coming to a vote until the date for effective action was passed.

Grains are the problem now, but sugar, cotton and wool are accumulating. It is not easy to choose a satisfactory stabilisation policy: a single price system for those farm commodities which are likely to be in surplus very soon, if fixed at a level low enough to enable them to compete unassisted in the world market, would seriously depress the agricultural segment of the American economy and would therefore threaten internal stability. A two-price system, with subsidies for commodities being sold abroad, unless accompanied by strict controls of production at home, would merely encourage the export of fertility at a rate which troubles thoughtful farmers. One group of farm economists has suggested that farmers who sell abroad at world prices should be compensated by payments which bring their incomes up to those of farmers who sell at home at domestic prices, but this alternative has little political appeal. When the Wheat Agreement was discussed by the Senate Foreign Relations Committee during the special session of Congress after having been favourably, if also retroactively, reported out, Senator Vandenberg suggested that it was a worth-while programme of a sort the United States was likely to approve. This comment may indicate the direction in which opinion is moving.

★

The immediate pressures now evident in the agricultural segment of US trade perhaps give a preview of a more far-reaching development, to which the questions recently addressed to the US Government through the Organisation for European Economic Co-operation are pertinent. These questions dealt with probable American markets for the goods and services of the European countries which are participating in the Marshall plan; they dealt with the ability of such countries to sell their goods in the United States, with whether the more saleable categories of goods would be traditional exports or new types of commodities, manufactures or raw materials, with the extent to which a US tourist trade could be relied upon, the degree of subsidised competition which must be anticipated from the US merchant marine, the amount of US capital likely to be invested abroad, the probable routeing of trade, whether direct or triangular. These are all factors of primary importance in the European national programmes now being planned for the next four years at the request of the United States, since one of the purposes of those programmes is to restore a viable system of international exchange and thus to overcome the present dollar deficits.

The reply to these European questions was consistent with American multilateral theory. It included forecasts of the total size of the US market at the close of the Marshall plan period and the probable levels of employment, production and prices at that date. From those overall figures, estimates of imports were deduced by major classes and by specific items in the case of a number of basic commodities; figures were suggested with regard to tourists and their expenditures, vessels under subsidy, and investments likely to be made abroad. But along with

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

these estimates went a warning that such trade was on a come-and-get-it basis: that the aggressiveness of European sales policy, the extent to which styling is undertaken for the US market, and other factors, including prices, would count heavily in determining the actual results. The total sales, in other words, would be determined by market action, not government commitment.

Such a reply is disconcerting to planners. It is all very well to demonstrate statistically that increasing production means rising prosperity, and rising prosperity means rising world trade; to say that if production can be greatly expanded in Europe and sustained in the United States, the volume of exports will be large everywhere. But such a statement cannot be reduced easily to specific cases and specific amounts, to estimates of the extent to which the British motor car industry, or the Italian shipbuilding industry, can find markets if enlarged. Yet if the answer is inadequate, what better one, short of omniscience, can be produced? Actually, most of the long-term plans currently in circulation among the participating countries are fairly open-ended when it comes to 1952, and perhaps in being so they avoid the over-optimism of Italy with its assumption that the national product can be raised from 5½ to 12½ billion lire during the next four years. But the questions now being raised in Washington and in western European capitals must receive answers, at least to some extent; very large amounts of money are going to be spent on the answers given and the questions are likely to become more and more pointed.

To what extent is the planning now going on in Europe, in an effort to correct the exchange situation, planning in which each country is anticipating enormous exports and minimal imports? Is the autarchy of the nineteen-thirties becoming visible again in the European effort to surpass 1938 and in the British austerity which is causing so much Beneluxurious anxiety at the moment? If the capacity of the US market to absorb imports proves to be less than is needed, where can the vastly increased European exports go? Will the competition for markets by 1952 be so great that the very premise of the European recovery programme is seriously to be doubted? These questions were put in Congress fairly quietly but with some persistence early this year. They may be revived more vocally and more persistently in 1949 as constituents ask Congressmen about the extent to which American production can be sold abroad, and the extent to which American producers are to be subjected to foreign competition, and as members of the House and Senate pass these questions on to the official advocates of international programmes.

American Notes

Mr Truman's New Deal

The appointment of the Republican expert on foreign affairs, Mr John Foster Dulles, to lead the American delegation to the United Nations Assembly during Mr Marshall's absence from Paris has allayed the apprehensions of those who feared that Mr Truman, overflushed with victory, might decide that Republican co-operation was a liability abroad as well as at home. However, the President's press conference before returning to Washington did not allay the apprehensions of those who fear that his promised New Deal will take as drastic a form on Congressional floors as it has on political platforms. Mr Truman made it plain that he shares the faith of the American voters in the programme which he has offered without success to Congress ever since he succeeded to the Presidency, and that he sees no reason to abandon it now that there is at last a prospect of putting it into practice. But now that the prospect is so good, there will be a need for more precision and consistency in the programme than has sometimes been apparent in the past.

Mr Truman said that his proposals would be based on his first Message to Congress in September, 1945, and on the pledges in this year's Democratic platform. But the Message is now out of date, although its declaration of governmental responsibility for the national prosperity is not, and the platform is as vague as tradition requires. Forecasts of the Messages which Mr Truman will send to Congress in January can therefore more usefully be founded on his requests to the special session of Congress, at which he opened his election campaign in July.

The most pressing of these requests dealt with inflationary controls, which are nearly as urgent now as they were then, although no more easily translated into effective legislation. This applies especially to price controls for scarce commodities, particularly hard to implement since Mr Truman's present obligation to the labour movement makes wage control even less politically expedient than usual. In the end the Administration may ask only for "stand-by" powers and for a voluntary scheme of price controls, similar to that which was not altogether unsuccessful in 1941. Much of the present despondency in the business world arises from the belief that the President will insist on an excess profits tax, although it will meet with as cool a reception from the conservative Democrats, who now control the Congressional finance committees, as it did from their Republican predecessors. Other controls, about which there may be less dispute, are the regulation of the commodity exchanges, the strengthening of rent controls, the allocation of scarce industrial commodities and "stand-by" rationing authority for certain consumer goods. Mr Truman has also attached great importance to assistance for the construction of low-cost housing. More will also certainly be heard of federal aid to education, a comprehensive national health programme, increases in minimum wages, pensions and federal salaries, and the development of electric power.

*

The election campaign, and even more the debt which Mr Truman and his liberal supporters in Congress owe to labour and Negro voters, make it almost certain that priority will be given to two measures on which there is great danger of bitter controversy—civil rights for Negroes and the repeal of the Taft-Hartley Labour Act. In both cases, however, the danger may possibly be avoided by private discussions resulting in a compromise and the presentation of agreed legislation. If not, the question of civil rights may be left until late in the session, in order to avoid the delays which would be caused by the inevitable filibuster.

On civil rights, as on much of his social programme, Mr Truman can expect some Republican support. But he cannot count on this when it comes to repeal of the Taft-Hartley Act, and here he will also have to contend with the opposition of those Democrats whose votes ensured the original passage of the Act. Labour leaders apparently accept the Administration's view that labour cannot hope to resume the privileged position which it was given by the old Wagner Act, which must be amended if Mr Truman's promise to establish a sound system of labour-management relations, fair to both sides and to the public, is to be carried out. The unions, however, want the Taft-Hartley Act repealed at once and the Wagner Act reinstated, while new legislation is worked out at leisure. This would leave the President during the interim period without any of the powers to deal with strikes affecting the national welfare which he has used so frequently during the past year. The Administration is already drafting a new law which it proposes to ask Congress to pass at the same time as the Taft-Hartley Act is repealed. Even if labour is induced to agree to this procedure for repeal, it is by no means certain that all the provisions of the new law will be welcomed by union leaders.

* * *

Labour Tackles its Communists

About one-fifth of the members of the Congress of Industrial Organisations belong to unions headed either by Communists or fellow travellers, though actual carriers of the party card number only about 30,000. These leaders have defied official CIO policy by criticising the Marshall plan at every turn and working for Mr Wallace. With the Truman victory and the Wallace fiasco the CIO has speeded up the house-cleaning which has been proceeding in the individual unions, sometimes to the extreme discomfort of the ordinary citizen, compelled to walk home during a bus strike or cross picket lines before the big New York stores.

The executive board of the CIO has voted, by 38 to 5, to revoke the charter of the Greater New York City CIO Council, for its "slavish adherence to the Communist Party line." The council, like some others, had come under the control of such left-wing unions as the United Electrical Workers, the Public Workers, the Office Workers, and the Fur and Leather Workers. This boarding of the Communists in their stronghold, New York City, is taken as a sign of CIO policy elsewhere, though the west coast shipping unions, under Mr Harry Bridges, may prove harder to discipline. The fact that the decision is not to be appealed to the CIO convention now meeting in Portland, Oregon, suggests that the Communists may decide to go peaceably along, rather than risk secession. In its convention the American Federation of Labour also has started a drive against Communists in its Canadian affiliates.

The struggle to clean out the New York City Council was led by two labour leaders who until very recently had not seen the light themselves, Mr Quill, president of the Transport Workers' Union, and Mr Curran, who, unlike Mr Quill, has already succeeded in ridding his organisation (the National Maritime Union) of its leftish tinge. The Transport Workers are still embattled, but a final decision may be reached at their convention in December. It is significant that Mr Quill has been "pushed, prodded, and encouraged" in his fight by a rallying of Catholic trade unionists inside the TWU.

*

Another CIO union rent by the Communist issue is the Retail, Wholesale, and Department Store Union. Eight left-wing unions covering New York stores, with 30,000 members, seceded this summer from the international to avoid being taken over after the failure of their officers to sign anti-Communist affidavits had led to the loss of contracts. In one important case an AFL union won the ensuing election. Mr Wolchok, the president of the international, is trying desperately to regain his lost flock (without its black, or rather red, sheep) while defending himself against charges—chiefly from Catholic members—of having been too easy with the Communists.

The requirement that union officers must sign an anti-Communist affidavit before their union may avail itself of the services of the Labour Board has struck heavy blows at the left-wing unions. Not only have employers used the failure to sign as an excuse for failing to renew contracts with these unions, but locals have seceded to secure the advantages of compliance, and unions like Mr Reuther's Automobile Workers have welcomed the fugitives. This "cannibalism"—a sin against union ethics—will be brought up on the convention floor, but Mr Murray, the president of the CIO, has already declared that the raided unions have only their own undemocratic practices to blame. The bulk of organised labour may even be willing to retain the anti-Communist affidavit out of the wreckage of the Taft-Hartley Act if some face-saving device can be found, such as Mr Tobin's ingenious suggestion that employers also be required to sign.

At Portland, Mr Murray called the Communists filthy and vicious. But no purge—beyond a flood of words—seems imminent. There is no desire to make martyrs out of the Communists, or take the risk, like Mr Wolchok, of losing unions whose leaders, but not their members, are Communists. Nor is the CIO altogether indifferent to the charge of "company unionism—1948 style." Thus the national body has joined in the $1,000,000 suit brought by the United Electrical Workers against the Atomic Energy Commission. This follows the Commission's order to the General Electric Company to withdraw recognition from the UEW both in new and established laboratories for atomic research. The union protests that all workers actually employed have already met loyalty tests. But the Commission insists that officers, who exercise control over union members, must also be above suspicion and the officers of the electrical union have refused to sign the anti-Communist affidavits. But in this case they enjoy CIO support on the grounds that the directive goes beyond the requirements of security and establishes a dangerous precedent.

The Republican Inquest

The preliminary verdict at the inquest on the Republican Party places the blame for the disaster on the party's leadership—or lack of it—and Mr Dewey has anticipated the inevitable sentence by announcing that he will not stand for the Presidency again. The jury also agrees that the party must find new blood and a common purpose behind which it can rally, but the attempts that have so far been made to define that purpose have illustrated only too clearly the complete lack of cohesion which the disaster left behind it. Lack of cohesion has been a regular concomitant of the equally regular defeats which the party has suffered during the last twenty years, and there is as yet no reason to suppose that in four years' time it will fail to find that semblance of unity which it has always managed to maintain during the actual election campaigns.

But just as the defeat this year was more bitter than usual, so the divisions within the party are more extreme than usual.

therefore reckon with very *ill-informed public opinion*, labouring under the delusion that, if only taxes were abolished and controls relaxed, France could slide back to the good old days. It will take a long time to eradicate this misconception for which the French press must take a substantial share of the blame. Meanwhile French ignorance of the economic facts of life is illustrated in the Communist success in presenting the Marshall Plan as "a burden" on France and in an unchallenged remark recently made by General de Gaulle, that France managed very well for centuries without American aid. The present government is giving a lead, but it cannot afford to race altogether out of sight.

Besides the weight of public ignorance the government has another cross to bear in the form of an ill organised, inefficient, frequently corrupt and too frequently purged civil service. There is, therefore, no reason to suppose that inflation can be suppressed overnight, or that order will emerge from chaos at the touch of a socialist or any other wand. Yet it is reasonable to point to progress already attained, to evidence of vitality and energy, and to signs that responsible leaders know what the trouble is and are preparing to take every politically practicable measure to meet it This being so, it is not altogether far-fetched to deduce that the magnificent recovery which marked the end of the war will continue and expand towards, if not up to, the targets laid out in France's long term plan.

But France's unquestionable possibilities as a partner in European recovery are the answer to only one aspect of the British dilemma: it can still be asked whether the country is a reliable ally in the event of war.

New Spirit in the Army

The French army—in reliable French opinion—is at present under-equipped and too small to resist a full scale onslaught. On the other hand, adequately provided with heavy armour and fully supported in the air, these same experts believe it could be quickly transformed into the best land force at the disposal of the Atlantic Union. French conscripts are now training in modern warfare in the new de Lattre de Tassigny camps, from which they emerge after a few months in high spirits and fine physical form. Contrary to earlier fears, recent evidence suggests high morale and undivided loyalty even when the troops were sent to operate against Communist compatriots pleading bread-and-butter arguments for strikes and sabotage. No incident of mutiny and sedition has been reported despite intensive propaganda to which the men were subject, a fact which suggests that the nucleus of former officers and men of the *Francs Tireurs et Partisans* (the Communist underground which joined the regular army after the liberation) has not achieved positive results.

There is, however, a wider question of French civilian morale and the wisdom of riveting defence plans and establishing land and air bases in a country in which one quarter of the population votes Communist. This hesitation, however, ignores the fact that the elector who votes Communist is certainly not notifying his desire to be occupied by the Red Army. If, in the event of invasion, France was not left undefended and alone to meet the first brunt of attack while its allies—in their usual way—began preparing for some future action, the French are as likely to resist as any other menaced area in the Western Union. If on the other hand, the Germans and Russians turn on France together before the western allies could come to its aid, then a crack in French morale or indeed in the morale of any other isolated and vulnerable victim can be safely predicted.

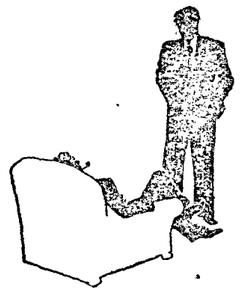
The real threat to French cohesion in the event of war is neither the general public nor the army itself, but rather the strategic industries, notably transport, electricity, armaments and aircraft, where the communist CGT, whose leaders unquestionably would welcome the Russians, still occupy dominant posts. This threat is real and imminent and is fully appreciated by the present government which is now engaged in fighting it on physical and political levels simultaneously. It is too soon to say whether this struggle will be successful, but it is not too soon to observe that marked progress has been made in the mines and ports during the past few days and that Communist control is less complete than it was one year ago.

Calling the Communist Bluff

The government is proceeding slowly: far too slowly for many of its internal and external critics. Yet here again—as in the battle against inflation—the fight will only be won if the Government has national support. The Communists, *le parti des fusillés*, ended the war with magnificent prestige, when allegations of their dependence on a foreign power were dismissed automatically as Fascist and Hitlerite. Since that time their frantic opposition to recovery and Marshall aid, the recent evidence of financial support from Moscow and irritation at the avowed political aims of the strikes has reversed opinion.

The time has come when the government can call Communist bluff without risking civil war. The Socialist Minister of the Interior, Jules Moch, has assumed the tragic responsibility of organising the "show down"—tragic because the rank and file of fighters against whom he has mobilised the army are *bona fide* trade unionists, unaware of the giant hoax played upon them by the Cominform, compelling them to rip up their own economy, destroy their instruments of work and sabotage aid to themselves. He has incurred the eternal hatred of the mining villages but his timing has enabled him to isolate resentment and carry the country.

Defying international Cassandras, France has not fallen apart. Weakened and divided by the two wars, excessively sensitive to external pressures, unreconciled to impoverishment and the elimination of France as a Great Power, the people remain bewildered with a sense of injury and grievance quick to respond to demagogy and fanaticism. Yet there has been an unsteady but certain improvement in the way the people live and, even more astonishing, that improvement has been achieved without serious encroachments on *democratic liberties and human rights* which almost any other country in similar conditions would have thrown overboard in the struggle for survival.



That struggle for survival—against internal and external enemies common to Britain and France—cannot leave Britain either indifferent or in any way complacent. Already the political implications of the struggle have been grasped and the British are *fully committed* to aiding France. Hundreds of millions of pounds sterling are already being invested: it is time to invest confidence as well.

The Mind of Israel—I

[BY A GENTILE RECENTLY IN PALESTINE]

A VISITOR to Palestine very quickly sees signs of the revolution that has taken place there this year. As he motors through Haifa, scarred with broken buildings, it looks to him as though the number of Arabs in the streets is no greater than the number of Arabs he would expect to find any weekend on the front at Brighton. At the airport he is met by young Belgians earnestly watching things in the name of Uno, and later on at Tel Aviv he will see Americans everywhere driving cars—oh, so busily—in the name of Uno, and swapping rather noisy wisecracks in the public rooms of his hotel. On the coastal road he rushes past truck after truck filled with Jewish troops, male and female, and his chauffeur refuses lifts to more hitchhiking soldiers than ever we saw on English roads in our war. He sees fields thrown out of cultivation by lack of manpower and a number of Arab villages in which every house has been methodically destroyed by Jewish explosives. When he reaches Tel Aviv he sees no more damage; but he may with a certain nostalgic thrill, troop down with fifty others to a basement air raid shelter at the sound of the alert. How has the mentality of the Jews been affected by the swift march of these events since last May?

To an Englishman it may sound strained to compare the mental state of the Jews in May, 1948, with our own condition in May, 1940, but unless the forebodings of last spring are being vastly exaggerated today, the parallel is in fact remarkably close. Throughout a large part of the population there was in Palestine, as in England, a confidence based on a kind of faith in destiny. But many Jews believed, as we believed eight years ago, that the danger of national extinction was imminent. They knew that there would be an invasion and that they would be attacked by five nations, outnumbering them by 20 to 1; armed as they thought more adequately than themselves; supported, as they feared, by outside help greater than they might hope for. The best informed among them did not think the invaders could be driven back, and they tell you today that six months ago they expected massacre and extermination. As in 1940 we peered across the Channel for an invader whom, once landed, we saw little chance of repelling, so they looked north and east and south for invaders who would start with all the odds in their favour. We escaped invasion. They drove it back. We had to endure sufferings, hardships and casualties far greater than anything they have known; and we waited five years for a victory which came to them in less than five months. But in quality, if not in degree, their experience in the summer of 1948 is comparable to what we in Britain passed through from 1940 to 1945.

"I think I'd like a White Horse better than anything"

MAXIMUM PRICES:—Bottles 33/4, ½-Bottles 17/5 as fixed by the Scotch Whisky Association

CENTRAL LINE EXTENSIONS

LONDON TRANSPORT announces that a further nine stations on the Central Line are now open to traffic. In the west, four stations, Northolt, South Ruislip, Ruislip Gardens and West Ruislip, complete the present programme of extensions. In the east, Roding Valley, Chigwell and Grange Hill complete the loop to Hainault, and Buckhurst Hill and Loughton point the way to Epping.

To reach Oxford Circus direct from West Ruislip takes 39 minutes, from Loughton 40 minutes.

Since the opening of the first post-war extension from Liverpool Street to Stratford in December, 1946, the Central Line has grown into the longest of the Tube lines with 46 stations in its 40 miles.

Anybody in the office got four 2½d stamps?

They've run out of stamps again, and there are four urgent letters just about to miss the post. Tomorrow the accountant will have his usual struggle to put the post-book straight. The best place to put a post-book straight, is straight in the wastepaper basket. Then install a Neopost Franking Machine. It prints its own stamps! It never runs out of them! It keeps its *own record!* The post leaves the office sooner and goes straight to the sorters to catch the early train. A Neopost costs very little and even the smallest business will find it pays its way. Approved by the Postmaster General. Send for particulars now.

That many of the well-informed Jews have been astonished by the speed and completeness of their success is beyond question. Whatever the reason for the victory may have been, whether it was their own skill and determination, or the clumsiness and lack of interest among the rank and file of their enemies, or the jealousy and divisions among the five Arab nations, it is not surprising that the Jews should put their triumph down to the transcendent justice of their cause, or even (among the orthodox and fundamentalists) to the arm of the Lord. Within a few months they saw Galilee cleared, the way to Jerusalem kept open and a new and safer road built, Nazareth and its district administered by a Jewish military governor, and the strong Arab forces in the Judaean hills contained. They saw Kaukaji the brigand, who had resisted British arms for three years in the Arab revolt, dislodged by their troops in three days from a position that was thought to be impregnable, and driven helter-skelter with his fighting men back to the Lebanon frontier and well beyond it. They speak of the campaign as a second fall of Jericho, or a second collapse of Sennacherib; for it came to pass that the angel of the Lord went out and smote the Assyrians and when they arose early in the morning, behold they were all dead corpses.

Heroes of the Settlements

The story of this fighting is studded, as we might expect, with tales of heroism and local victories against fearful odds; and many of these tales come from the settlements—those institutions which probably for the first time in history have succeeded in the attempt to lead a purely communal life. They are, many of them, scattered in remote places far removed from outside help, and in peculiar danger from the invasions. The oldest of them is at the south end of the Sea of Galilee, a mile or so from the place where Syria, Transjordan and Palestine meet—an uncomfortable spot in wartime for 450 unwarlike farmers, farmers' wives and farmers' children. On May 15th these settlers possessed a few rifles and had dug a few trenches. They waited for the attack, and, sure enough, three tanks or armoured cars appeared that day from across the Jordan. Luckily for the settlers the Arabs retired without action taking place. Five days later eighteen tanks and armoured cars appeared again, but by this time the Jews had received a mortar and made a few Molotov cocktails; and, so armed, the defenders waited for the attack in a coppice at the edge of their land. Some tanks, it is said, were turned back by the mortar, but two crossed the trenches and broke into the wood. And there a Jew, who may have learnt the trick with our Eighth Army, dropped from a tree on to a tank, pushed a cocktail inside, killed the crew and smashed the engine. The other tank caught fire; the invaders went back across the Jordan; and the Jewish farmers resumed their farming. It was almost as though panzers had landed at Dymchurch and been driven into the sea by a few men of the Home Guard from the Romney Marshes.

That is a picture of the fighting as seen by Jewish eyes. For a young self-conscious people the raw wine of these uncovenanted victories is clearly a heady drink, and the Jews naturally enough are telling themselves that they must be far better men than they had hitherto realised. For years they have known that they could drain malarial swamps, make the land as rich as any in Asia, and increase ten-fold the crops their predecessors got out of the soil. But now they believe that they are a great fighting nation, able to win campaigns against much greater numbers and far superior arms.

Bitterness Against the British

What effect is this new self-confidence having on their policy? That it has increased their bitterness against the British is patent. Although many of the English-speaking Jews tell you, no doubt with sincerity, that what they feel is not hatred, but the bitterness of disappointment in an old friend, it is still true that bitterness is bitterness from whatever source it springs, and ardent patriots may find it difficult to keep bitterness and hatred in watertight compartments.

Politically, men react differently according to their temperament and background. Some say that the Bernadotte plan, with a little adjustment, is still acceptable. The extreme orthodox are said to demand all Palestine, because the scriptures say "everything from Dan to Beersheba"—and the influence of orthodoxy is on the increase. Between the limits of the extremists and the moderates one gets the most various opinions. At one recent gathering a politician of high standing declared, with unmistakable sincerity, that nothing but the United Nations stands between the world and another war; and half an hour later another politician of not less standing said that the Jews, having tried negotiation and failed, having tried force and succeeded, have now learnt their lesson. From now on, he announced, every week that passes without a settlement the Jews will raise their terms. Here clearly was a man of high influence ready to cock a snook at Uno.

These two men, one a man of reason and the other an apostle of violence, both stand high in the counsels of Israel and they are close associates in their work; but in the tug-of-war, that was at that moment going on in the arena of Jewish opinion, they were at opposite ends of the rope. From what has been said publicly since then it looks as though the man of reason has been pulled nearer to the chalk line of defeat, but we may do well to remember that he is probably still hanging on to the rope.

(To be continued.)

Communism in Australia

[FROM OUR MELBOURNE CORRESPONDENT]

THE failure of the Communists to bring off a general coal strike in New South Wales two weeks ago should not be accepted too readily as a sign of the ineffectiveness of the Australian Communists. They came near to success, and they still control the Miners' Federation. They were able to force a strike, not on the issue of higher wages or better conditions, but on the issue that men engaged in driving a tunnel in a mining area were members of the Commonwealth-wide Australian Workers' Union, which is unequivocally anti-Communist, and were not members of the Miners' Federation. The Australian Workers' Union won the tussle between the two unions and resisted the attempt by the Communists to seduce its members. But the fight was close, and it is important to realise the extent of Communist control over the Australian trade unions.

In no single instance do the Communists dominate a union through a majority membership, but there are a number of strategic unions which they either control directly or exercise a strong influence on policy through Party members in key positions on the executive. These unions include the following:

Waterside Workers' Federation
Seamen's Union
Ironworkers' Federation
Amalgamated Engineering Union
Australian Railways Union
Federated Clerks' Union
Sheet-Metal Workers' Union
Miners' Federation.

According to a recent survey, the unions which are either dominated or strongly influenced by Communists (representing 26 per cent of union membership) were responsible for 84 per cent of the man-days lost in all industries in the State of New South Wales from September, 1945, to December, 1947. The average number of days lost per member of the unions other than Communist controlled was 1.5, compared with 23.1 days in the Communist group—or 16 times as great.

The eight unions named above occupy key positions in the industrial structure of the Commonwealth. By their control over rail and sea transport, engineering, coal and clerical work, they are able to paralyse the industrial life of the country by their strikes. These unions are assumed to be Communist-controlled because professed Communists occupy executive positions in them and because the unions concerned have never denied public statements in Parliament and elsewhere to the effect that they are in fact dominated by Communists.

The accredited leader of the trade union movement in Australia is the Australasian Council of Trade Unions (ACTU). Moderate unions have prevented the Communists from gaining control of this body which is uncompromisingly anti-Communist. Moreover, no Communist can be a member of the Australian Labour Party which has even forbidden its members to belong to near-Communist bodies such as the Friendship with Russia League and the Friends of the Soviet Union. Nevertheless, the Commonwealth Government has resolutely refused to ban the Communist Party in Australia. The party was banned by the Menzies Administration after the outbreak of war, but when the Labour Government was returned in 1941, the ban was removed.

Both the Federal Government and the leader of the trade union movement, the ACTU, are, therefore, firmly anti-Communist. Nevertheless, the policy and indeed the day-to-day control of some of the key industrial unions is strongly influenced and, in some cases, dictated by the Communists whose influence is strongest in New South Wales where coal mining and heavy industry is almost exclusively concentrated.

THE BUSINESS WORLD

Britain's Four-Year Plan

IT is a thousand pities that the British four-year plan (which was submitted some weeks ago to the Organisation for European Economic Recovery) should have been left to leak out in Paris, instead of enjoying the dignity of proper publication. The Government, it seems, promised OEEC to keep silence until all the eighteen plans had been correlated in a master document for submission to the Economic Co-operation Administration. But planning in the security of Whitehall is one thing; the privacy of plans once they are deposited with an international organisation is quite another. That is not to blame OEEC for the leakage, for it was almost inevitable and it has done no great harm. But the Government have lost a valuable opportunity to explain the contribution of the British people towards their own, and Europe's, recovery. The British were first in the field with their plan. It is, as plans must be, provisional and subject to revision, and it requires, like all such exercises in economic arithmetic, the closest examination in detail. Nevertheless, its decent publication would have been some answer to the wearisome allegations that it is always Britain which hampers European co-operation.

There is no doubt that the extracts from the British plan, published in Paris last weekend, are authentic. They appear to cover an important part of the plan, though evidently not the whole of it. Of the five tables which have been published, three relate to Britain's external payments; there is some evident duplication between them, and also a tantalising lack of detailed estimates for the years between 1948-49, and the demonstration of planned "viability" in 1952-53. It is hard to believe, moreover, that the full plan will not provide more detailed material than has so far been unofficially published about the expected course of British production during the next four years, and about the division of the nation's income between consumption and capital investment. These are the real considerations on which the success of the plan depends. By 1952-53, it is expected, Britain's account with the rest of the world will show a credit balance of £100 million. But the suggestion that the plan hopes to provide an improvement of 15 to 20 per cent. in the British standard of living in that year, compared with the middle of this year, is palpably unsupported by any of the detailed figures. Such evidence as exists suggests that 5 per cent might be a more plausible measure of any improvement. The figures which have been published show that there are three main preconditions: the restriction of imports to a volume, even in 1952-53, of little more than 80 per cent of the volume of 1938; the attainment of a 50 per cent increase in the volume of exports compared with 1938; and the transformation of the invisible account into a big earner. To these might be added the need for a generous dose of good luck if the planning is to be realised in practice.

It is natural, since "viability" is the object of the exercise, that attention should be fastened on the estimated balance of payments and the distribution of British trade in 1952-53. In the first table, the summary figures of the balance of payments published last weekend have been recast into more convenient form, and converted from millions of dollars into millions of pounds sterling. It is stated that the figures are at current prices, except for 1952-53 which are at "programme prices." This formula does not reveal what assumptions have been made about the terms of trade, but it is probable that the "programme prices" do not depart very far, if at all, from the current relations between import and export prices. In other words, the optimistic assumption in the Paris report of last year that the terms of trade would move by 10 per cent. in Britain's favour by the early 'fifties has been discarded, and the harder assumption—perhaps it is a little too hard—that Britain and the other OEEC countries will obtain no relief from a change in the terms of trade has taken its place. That is one of the hazards of four-year planning. The other is to achieve the planned volume of exports. There is a flourish of magic about the appearance of a surplus of £100 million for the year after Marshall Aid ceases. One would like to know much more about the planners' estimates for the next three years before classifying the estimate for 1952-53 as realistic, hopeful, or downright optimistic.

*

Compared with the rate of purchases abroad for the first six months of this year, the 1952-53 estimates show an increase of 12½ per cent—from £1,787 million (annual rate) to £2,007 million. But it is evident that this increase is accounted for largely by higher prices. In exports, the planned increase is 25 per cent in value, compared with the projected 1948 rate. To a much greater extent than in the case of imports, this export figure takes allowance for an increase in volume; for the first half of 1948 the volume of exports was running at 30 per cent above the 1938 level, and to raise that percentage to 50 by 1952-53 implies an increase of 15 per cent in the volume of exports, compared with the first half of this year. Even so, there will remain a deficit on visible trade, four years hence, of £163 million, and the surplus of £100 million will be achieved only if the invisible account produces the estimated credit of £263 million.

The second part of the table, relating to the balance of payments between Britain and the western hemisphere, contains figures which are even more remarkable. Purchases from the western hemisphere will cost 20 per cent less in 1952-53 than they were costing in the first part of this year. If a rough allowance is made for changes in prices, this seems to be equivalent to a reduction of nearly 30 per cent in volume. But for exports to the western hemisphere the plan is very different. The assumed increase is from £236 million (annual rate for 1948) to £364 million in 1952-53; allowing for a rise in prices of 10 per cent, this corresponds to an increase in the volume of exports to the western hemisphere of 40 per cent in four years—a task of the most formidable difficulty. There will still remain a deficit on the western hemisphere account, after crediting £35 million for invisibles, of £73 million. Thus the planning for 1952-53 assumes in effect the resumption of convertibility, by which the deficit on western hemisphere (that is, largely, dollar) account can be offset against the credits earned by Britain in trade with other areas. The total surplus of £100 million is in fact made up of surpluses of £204 million with the sterling area, and of £12 million with the countries participating in the Marshall programme, and of deficits of £73 million with the western hemisphere and of £43 million with other countries not in OEEC. Thus the biggest surplus will be earned with countries in the sterling area which will be expecting loans for colonial development and some reduction of the balances they hold in

sterling. Even on the basis of the plan as presented, therefore, it is not self-evident that the conditions for "viability" will have been achieved with the western hemisphere.

There remains, too, much room for doubt whether the planned credit of £263 million on invisible account will be secured. Some prodigious changes are expected in invisible earnings, which are set out in the second table, together with an analysis of the import programme. This table is worth closer study because it alone provides any evidence whether invisible items will together produce so large a credit to swell the account. The main factor is the omnibus "other items," which are estimated to cost £74 million in 1948-49, but to yield no less than £175 million by 1952-53. It would seem that this is a miscellany of Government overseas expenditure, films, overseas transactions of British oil companies, insurance, commissions and royalties and other (mainly debit) items. It is difficult to see how such a resounding change in the size and sign of this miscellaneous item can occur—at least on the basis of what is publicly known about its composition. And it is on this item that the whole issue of solvency and surplus in 1952-53 really depends.

★

It seems that the plan includes a lengthy examination of Britain's recent achievements in industrial production. They have, in many respects, been commendable, but there is a long way to go before the production targets which are necessary to sustain the level of trade postulated in the first two tables can be hit. The national income is to be increased by 12 per cent by 1953—but the present level of national output is showing an awkward tendency to become stabilised, partly owing to the effects of full employment and partly because of the inability of the Government and industry to redistribute manpower to the best advantage. In these circumstances, the assumption that productivity will increase at a rate of 2½ per cent per annum during the four-year period seems decidedly hopeful—though it is not indeed impossible. But it will not be possible without better equipment, better work, and better management. The plan assumes an increase in industrial production of 40 per cent compared with pre-war and of 25 per cent compared with 1947. Unfortunately, the official index of production this year has shown no change compared with the average for 1947, and the omens for achieving the planned increases in production are not, at this moment, as propitious as they could be. These increases in output are set out in the third table. Grain production is to increase by 10½ per cent between next year's harvest and 1953—though there are already signs of over-addiction to straw cropping on British farms. The 50 per cent increase in meat and bacon will be most acceptable, though it will only restore the prewar average. In milk and dairy products, the plan counts on a 12½ per cent increase. The coal target (257 million metric tons, or 253 million long tons) presupposes—without any supporting evidence—a radical improvement in productivity from the existing labour force, and apparently the whole increase in output is to be sold in overseas markets. That may be a more difficult task in four years' time than it is now. The planned increase in steel capacity makes its due appearance. The rest of the plan follows a pattern which has now become fairly familiar—large increases in the consumption of copper (for exports of metal manufactures and capital construction), of cotton and synthetic fibres (largely for exports) and in timber. To back up these various hopeful estimates of production at home, the document includes also a table (examined on a later page) showing the expected increase in colonial production, which itself is no less hopeful in character.

Estimates of this kind have become the staple of national planning. It will be interesting indeed to compare them with those put forward by other countries, and to see whether any adjustment has been, or should be, made to align them with the intentions and requirements of the other participants in European recovery. Such estimates of production will tend to be regarded in some European countries if not as a guarantee, at least as an honest assurance, that British economic policy will seek to fulfil the plan put forward in Paris. Countries which are expecting Britain to meet their deficits of essential materials and manufactures will comment critically on any failure to hit the domestic production targets of these goods. Equally, they will be critical of any increase in British production which might reduce the need for imports from other participating countries. The process of correlating the various plans, indeed, is scarcely less difficult than the task of economic

* 1934-38.

statesmanship in making them work at all. In Britain, there has been a moderate degree of success in domestic planning—though the results have not been so impressive as the planners would like to claim. But it has become possible roughly to secure that 20 per cent of the national income is devoted to capital investment (a figure which is apparently to be maintained) and broadly to determine its application. It is on grounds such as these that there may be some confidence that what is said in the plan about domestic investment and the prospective output of at least certain industries, can be broadly accepted without too great a strain on credulity. But even so, many targets will be missed. And, so far as the balance of payments is concerned, the plan is likely to want much drastic revision before its term expires in 1953.

The Structure of the Coal Board

"A SOUND scheme of organisation does not in itself ensure efficiency," observed the Burrows Committee after some months' study of the structure of the National Coal Board. This is so. In the mining industry itself the causes of inefficiency are both deeper and wider than questions of organisation; they are evident in foreign coalfields as well as in the British, and they were evident in the British coalfields before the National Coal Board was created. And if it is possible (as it clearly is) to find ways in which the National Coal Board works less efficiently than might be desired, the question still remains how far the blame rests upon the administrative structure of the Board. The men operating the structure may not all be the right men, and it is probable that they have yet to accustom themselves fully to their tasks and learn how to operate as members of the team. Setbacks in the mining industry, therefore, do not automatically call for changes in the organisation of the Coal Board.

It does, however, remain to be demonstrated whether it is possible for a single central authority, however organised, to take over and operate in any direct sense and without loss of efficiency an industry as large as the British mining industry. Not only the Burrows Committee but the Coal Board itself have used words which suggest that for them, too, the answer is uncertain. Two other serious criticisms published this week have raised the same central question. Only a brief and general summary of the report of the Burrows Committee has been published by the Board. This says:

> The Committee have stressed the size and difficulties of the task which the Board had to undertake at short notice. They realised that in the autumn of 1946 the Board had to build a new organisation stretching from London to the collieries, and the fact that the Board set it up so rapidly was, in the Committee's view, the chief reason why they were able to take over the industry on January 1, 1947, without disaster.

The Board, in outlining the Committee's criticisms, makes a number of remarks to the same effect:

> It would be a matter for surprise if criticisms of this kind were not current in so large and so young an organisation as the nationalised coal industry. . . . On nationalisation, the collieries, with their managers, were severed from the authorities to whom they were previously responsible and were attached to new directing authorities, pursuing new objectives and of necessity using new techniques. Great credit is due to all the Board's officials in the coalfields for the way they have supported the strains inseparable from so radical a change.

It is true that no previous example exists of placing an industry of this size under a single management. The wonder is not that the organisation stumbles, but (like Dr Johnson's dog) that it can walk on its hinder legs at all.

To place the industry under a single management was, however, a deliberate act, presented to the public as having certain advantages, and to be followed possibly by measures of a similar kind for other industries. Its difficulties, and the rate at which they are overcome, are matters of public concern not only because their direct economic importance is immense, but also because they provide lessons for other experiments which may follow. The committee under Sir Robert Burrows was set up in May (at the time when Sir Charles Reid resigned from the Coal Board) as a result of widespread expressions of anxiety about the way the Board was working. The Board's decision not to publish the bulk of the report of the Burrows Committee deprives the public of some useful evidence on the matter; instead, the Board confines itself to a statement setting out the main recommendations with the Board's comments and "an indication of the Committee's views on certain questions of principle and fact." This is unfortunate, and the attempt to treat the report as no more than "confidential advice . . . on their own internal organisation" is misguided.

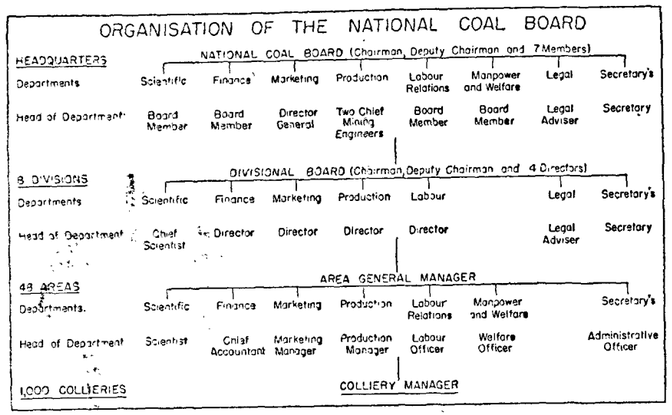
★

What is published of the comments made by the Burrows Committee, and the general tenor of its recommendations, confirm that the National Coal Board has still to overcome the weakness of structure which became apparent early in its life, and on which Sir Charles Reid commented pungently before and after his resignation. The Board realises in general, no doubt, what the principles should be. They are, in its own words, "the principles which should govern the setting-up and working of any large organisation," and the Burrows Committee has restated them: as much devolution of responsibility as possible; the creation of a clear channel of command; a clear distinction between policy-making and execution, maintained in a way which does not exclude the executive from association in policy-making. The Board has been striving for some time past to embody these principles, but without decisive success. As a beginning the committee proposes to carry a stage further the process begun in May of freeing members of the Board from functional responsibilities. It recommends the appointment of three new part-time members and a second deputy chairman. The Board has agreed to this, and it forms part of the enabling Bill which was to have had its second reading on Thursday.

More important, because it attacks the more fundamental question of the hiatus between the brain and the limbs, is the Committee's recommendation that the Board should be further enlarged by including the eight chairmen of the divisions. This is turned down, as is the analogous recommendation, lower

The Economist DIARY

The ideal present for the busy man



A memorandum book, an appointments register, and a complete reference book, combined in a diary for the desk. Published by Messrs. Charles Letts & Co. Ltd. Price: in the U.K. (including Purchase Tax) 36/8, or 37/6 post free; overseas 30/-, or 32/6 post free.

Full details are given in the illustrated pamphlet available from:

The Economist Intelligence Unit,
22 Ryder Street, St. James's, London, S.W.1.

down in the chain, that the area general managers should be members of the divisional boards. The reasons given relate partly to physical difficulties—time wasted in travel, and the drawbacks of excessively large boards—and partly to general considerations which are less easily intelligible but more significant: the "clear channel of command" would be obscured or distorted; in making policy and deciding between the competing claims of various coalfields, the participation of representatives with loyalties to particular coalfields would be a hindrance rather than a help. Instead, the Board proposes to extend the system of conferences at which the National Board meets the divisional representatives and the divisional boards meet the area representatives.

The Burrows Committee suggests a national executive committee to supervise the execution of policy, and four advisory policy committees to lighten the burden on the enlarged Board. Here the Board's counter-suggestion will not fully serve the same purpose, and it needs careful examination, bearing in mind the decision already made to appoint three part-time Board members. The existing general purposes committee is to be enlarged to include all full-time members of the Board—the members who will still have departmental responsibilities attending "when their engagements permit and more particularly when business is discussed with which they are concerned." It will be responsible for the management of the industry between Board meetings, and will continue to have power to deal with policy. The full Board will meet only once a month. It may be asked whether under this arrangement the part-time members—including Sir Robert Burrows himself—will not be excluded from the conduct of business to an extent that the Burrows Committee can hardly have intended.

A recommendation that directions from the Board should be passed down to divisions through a single channel only—from the chairman of the National Board to the chairmen of the divisional boards—is aimed clearly against the functional structure which has come under heavy criticism. It is not accepted; the Board thinks that it would produce congestion and delay. The present system by which "departmental business is conducted through departmental channels" is to continue. It would seem businesslike enough in principle—granted that management needs to be centralised at all. But too many critics, having seen the working of the Coal Board's "channel of command" at close hand, have observed the weakness of the position of divisional and area chiefs, the extent to which their authority is by-passed by the technical officers, and the lack of full local responsibility squarely placed on local management. The Burrows Committee has added its voice to many other voices, and it has been turned down. It can hardly be supposed that the question will not arise again. In another recommendation, that the divisional deputy chairman should become chief executive for the division under the divisional chairman's authority, can be seen the same desire to settle the same question in so far as it concerns the intermediate (divisional) organisations. But this proposal gets an inconclusive answer:

> The board agree that the chairman and deputy chairman should be regarded as the senior members. While members of a divisional board must retain their collective responsibility to the National Board, they may empower their chairman and deputy chairman to act on behalf of the divisional board as circumstances require.

Is this enough? It suggests that the old trouble is to go on: nebulous responsibility; too many parallel channels of authority; too many voices cancelling each other out. It recalls a sentence from the Board's first annual report:

> The principle is to delegate but not to diffuse responsibility, but the application of the principle in an organisation so suddenly created and so large and complex as the nationalised coal industry presents difficulties.

Although the Coal Board does not accept the whole of the criticisms made by the Burrows Committee, it is acting on some of them. It has made changes in its organisation before in the hope—as now—of achieving the flexibility and effectiveness in action which are so difficult to attain on the huge scale on which the Board has to operate. No doubt it will make more changes in the light of further experience. But its readiness to accept criticism must be limited by the constitutional outlines on which it was created; the Board, as it is, has to bear central responsibility for the conduct of the mining industry, and for that reason cannot allow authority to slip from its hands. Hence the preoccupation with day-to-day control from London, and with keeping the "channels of command" capacious and uncongested. Hence, perhaps, the anxiety to preserve the divisions as intermediaries between London and the coalfields. It has to be left to outside observers to look critically at the main outlines, and to ask whether the whole idea of managing a varied, large, and nation-wide industry from an office in London was not perhaps a delusion from the start.

Two pieces of constructive outside criticism which have appeared this week question this basic assumption. Colonel Lancaster's scheme, outlined in Parliament in June and now published as a pamphlet, would abolish the divisions and with them the "chain of command." It would place coal mining in the hands of 20 to 25 area boards, each established by Parliament and enjoying substantial autonomy. The national board would abandon the attempt to act as an executive body. Certain inescapable functions would be left to it: it would lay down the limits of expenditure and development for each area, make "broad plans of large-scale development" for the coal industry as a whole, co-ordinate selling prices, and conduct national wages negotiations. It would initiate and supervise research.

Sir Charles Reid, who left the Coal Board in May precisely because he despaired of getting effective action through an organisation which he thought to be misconceived, has put forward in three important articles in *The Times* his view of how the industry ought to be run. He, too, would eliminate the divisions and place the conduct of mining in the hands of area corporations. The members of his 26 corporations would be appointed by the national board. But they in turn would appoint their own staffs, and the attempt to recruit for the industry from London would be abandoned. Members of the staff of one corporation would be free to leave it and join another, so that the oppressive effect on the individual of working in an industry in which there is only one employer would be ended. The areas would buy their own equipment and materials, with the national board performing only the duties of liaison between ministries concerned in procurement. They would handle their own affairs in welfare and training. They would make their own development plans, for which they would be fully responsible once the approval of the national board had been obtained.

Thus the national board would be confined to far more manageable functions than it has now: the national finance of the industry, the general control of development, national wages policy, the appointment of area managements and the provision of research and other central services of an advisory kind. It would consist of a chairman, possibly three vice-chairmen (who would be the full-time members) and eight part-time members with business or labour experience.

These two schemes, which are fundamentally similar, would remove the structural difficulties of the National Coal Board by removing the structure. Each would produce new difficulties—which would, however, be different in kind from those with which the board is now struggling. Instead of canalised policy and checks on action there would be local initiative and some risk that local initiative would run to excess. In the competition between areas, some coalfields would be frankly unable to compete; the task of bringing them on to an economic basis, which can now be dealt with at an easy pace over a long term, would become immediate. Plans would become less easy to co-ordinate between one coalfield and another, and the answerability of the nationalised industry to Parliament, already questionable, would become more nebulous than ever. But it is not to be supposed that the Government or the board will undertake such fundamental changes, with the obvious risks of disturbance which they would carry, after a mere two years of the first experiment. The attempt to make the present structure workable will continue. While it proceeds it will do no harm to bear in mind that the structure is not the only possible one; its basic merits have yet to be proved.

Business Notes

Hesitancy in Stock Markets

A more cautious mood has this week spread through the Stock Exchange, where the most notable feature has been a pause in the recent advance in both gilt-edged securities and equities. Gilt-edged prices over the week show some further minor gains and a few fractional losses, while the ordinary share index of the *Financial Times* has been approximately maintained at the high point reached a week ago—or fully 10 per cent above the year's low point touched last July. This hesitancy is not, indeed, unexpected, for the recent behaviour of markets, and particularly of gilt-edged, is not easy to explain. Dividend limitation may have altered the natural relationships between gilt-edged and equities, but it is hardly a justification for their simultaneous advance in a phase in which disinflationary forces have been exhausting themselves and expectations of renewed inflationary pressure have been rising steadily. Given dividend limitation it is, indeed, only on this hypothesis that it is possible to justify the strength of equities. But though the attractions of equities in an inflationary phase may be less than they would be without dividend limitation, this does not make gilt-edged correspondingly less vulnerable in such a phase.

Earlier in the year, when the Chancellor's disinflationary formula seemed likely to be sufficient to achieve approximate equilibrium in the capital budget, there was good reason to expect the fall in gilt-edged to be arrested, but disinflation was not likely in itself to provide positive support for the market. Given, therefore, the fact that the disinflationary formula has proved, in the event, to be far from sufficient—so that there is again a deficiency in the capital budget—it might have been expected that the initial recovery in gilt-edged would have proved short-lived. In these circumstances, the continued strength can be explained only in terms of changes in the liquidity habits of investors. It is generally assumed that the capital levy on the one hand and the Berlin crisis on the other provoked a marked increase in demands for liquidity—a tendency which undoubtedly would have put pressure on the gilt-edged market but for the easy monetary policy which permitted a further large expansion in bank deposits. Now, it must be presumed, the liquidity pendulum is swinging in the other direction, and investors are trying to turn cash into securities. Such, at any rate, seems to be the conclusion from the handsome response—of £70 million—to the Southern Rhodesia issue, which opened at ¼ premium on Thursday. While this influence lasts, equities and gilt-edged may continue to march in step. But, apart from this, it seems that a firm gilt-edged market still rests in principle on the same rather shaky basis as it did in the Daltonian phase—upon the willingness of the Government to countenance an increase in the volume of credit whenever a pressure is threatened.

* * *

Truce on Stock Exchange Commissions

The sorry spectacle of a public clash between the Stock Exchange and the banks, unexpectedly and suddenly revealed last week, has been as suddenly veiled again—in the only manner consistent with the dignity and traditions of a money market which has long prided itself on the smoothness of the relationships between its principal organs and the discretion with which any differences are resolved. A few hours before Thursday's meeting of members of the Stock Exchange—called to vote upon the resolution for postponement of the new commission-sharing rules which would exclude the banks' trustee departments, among other agents, from any participation—the Governor of the Bank of England invited the chairmen of the Stock Exchange and of the Clearing Bankers' Committee to confer. His suggestion that action should be postponed for three weeks was accepted by both parties and was later endorsed by an overwhelming majority at the meeting of Stock Exchange members.

At this meeting the chairman said that "there was a prospect of agreement if the Stock Exchange, whilst maintaining the principle of their rules, were able to admit to rebate certain trusts of long standing in connection with which the banks had no power to charge for the buying and selling of investments." Presumably this is a line of compromise with which the banks had expressed some sympathy at the conference with the Governor. And if, indeed, there is room for agreement on some such basis, it is the more regrettable that the possibilities were not fully explored before the differences reached the point of public debate. It is possible, however, that it is not by this route that the real solution will be reached, after all. Long before the complicating factor of the banks' projected increase in charges to the Stock Exchange become generally known, the opposition among members to the new commission rules had become widespread. The interval of three months for reflection may yet lead to a change in policy.

* * *

Colonial Production and the Four-Year Plan

Britain's plan to achieve viability within the next four years depends to a large extent on the development of colonial resources. The colonies are important suppliers for the United Kingdom, but their main contribution is probably their dollar-earning capacity. The targets set by the British four-year plan for seven commodities are shown in the table overleaf. The first half of the table reproduces the statistics contained in the plan, except that the figures have been converted from metric tons to long tons and rounded off to the nearest thousand. The second half of the table is based on current statistics which have been collated with the 1946 figures contained in the four-year plan. The production figures for 1947 and 1948 are shown as monthly rates, against the corresponding monthly rates forecast for 1952-53. The results, though they may be statistically approximate, gives a useful measure of the scope of colonial development assured in the four-year plan.

The general impression is that the forecast of expansion in colonial production is optimistic. The achievement of the groundnuts target is obviously dependent on the success, by no means

certain, of the East African project, which is discussed elsewhere in this issue. The timetable has already gone awry, and it is apparent that full production will not be achieved before 1953, if then. Sugar production, it is forecast, will expand by nearly 30 per cent within the next four years, but output from colonial areas is already high and above its prewar level. Further development will require a virtual reorganisation of the sugar industry in the West Indies and elsewhere. Rubber and bauxite

COLONIAL PRODUCTION UNDER FOUR-YEAR PLAN
('000 Long Tons)

Commodities	Four-Year Plan Figures			Currently Published Statistics		
	1938	1946	Target 1952–53	Monthly Rate 1947	Monthly Rate 1948	Monthly Rate 1952–53
Groundnuts*	295	330	866	...	...	72
Sugar	965	881	1,378	75	90	115
Rubber	394	428	817	56	60	68
Tin	77	27	93	4	5	8
Copper	156	199	350	17	19	29
Bauxite	157	1,230	1,919†	120§	155§	160
Lead	1	16‡	34	1	1	3

* Exports only. † 1950. ‡ 1947. § Partly estimated.

are the only targets which seem to be comfortably capable of attainment. The increase of 13 per cent in rubber output can be easily achieved before 1952 provided that economic and political conditions in Malaya permit and that no restriction scheme is introduced. In the case of bauxite, the development of Gold Coast supplies may lead to an output well above the target figure. Increased outputs of tin, copper and lead depends on the supply of capital equipment which is unlikely to be available and in operation by 1952. For copper, the problem is less to expand total output than to expand the output of electrolytic copper. Even when the new Rhodesian refinery comes into operation only about half of Britain's electrolytic requirements will be met from sterling sources.

* * *

The First European Compensation

The first monthly compensation of intra-European payments under the new scheme agreed by OEEC was completed on Wednesday of last week. The compensation covered transactions in the month of October. The payments scheme though only agreed on October 16th was made retrospective to the beginning of that month. The British Treasury has announced that as part of this first monthly compensation the Bank of France was credited with £7,000,000 in respect of the total contribution of £50 million granted by Britain to France for the twelve months to June 30, 1949. At the same time Britain drew the Belgian franc equivalent of $13,263,000 out of the total Belgian contribution of $30 million to Britain. These drawings, it will be seen, are above the average monthly rate that would have to be maintained in order to exhaust the contributions and corresponding drawing rights in the nine months from October 1st, when the new scheme came into operation, to June 30, 1949. The British drawing on Belgium was even in excess of the figure that would have been provided by apportioning the total of $30 million back to cover the deficit with Belgium as from June 30, 1948. For the four months in question, namely from June 30th to October 30, 1948, the proportionate allocation would have been equivalent to $10 million. These substantial British drawings show how close to the "gold ceiling" Belgian accumulations of sterling must have been running.

On the evidence of British contributions and drawings for October, the total compensation for the month would appear to have exceeded the average level indicated by experience of the earlier and more restricted European compensation which began to function at the beginning of 1948. According to the report of the Bank for International Settlements, the turnover of this compensation was given at $39 million for the first four months of this year, or an average of about $10 million a month. These included both first and second category compensations. Under the new scheme only first category compensations are automatic, but since the scope and membership of the agreement has been widened it is probable that the normal compensations—that is the clearing of debts before the intrusion of contributions and drawing rights—under the new scheme would be of the order of $10 million a month. The total drawing rights for the twelve months to June 30th next amount to $810 million, which if used evenly over this period would average slightly under $70 million a month. The difference between the total of these two items, namely about $80 million and the appreciably larger total which, on the evidence of the British figures, was turned over for October is probably accounted for by the retrospective character of the contributions and drawing rights made and used in this first monthly compensation.

"Hiving Off" under Steel Nationalisation

In the second reading of the Iron and Steel Bill and subsequently at a press conference, the Minister of Supply amplified the provisions laid down in Section 14 (sub-section (9)) of the Bill relating to the splitting of steel companies whose names appear in the third schedule. The Minister has named six companies—Thomas Firth and John Brown, Guest Keen and Nettlefolds, Hadfields, John Lysaght, Lilleshall and Barrow Haematite—which had announced schemes of segregation before the publication of the Bill. Sympathetic consideration will be given to these schemes. In general, the schemes of segregation fit in with the main intention of the Bill to confine its activities to iron ore working, the production of pig iron and ingot steel, and the hot rolling of steel. But "hiving off" schemes submitted by other companies up to the vesting date will also be considered sympathetically. The main test to be applied to future applications for omission from the schedule will not differ from that for the six schemes which have already been announced. The Minister intends to judge all applications by whether the segregation of activities would prejudice the most economic integration of the activities of a company. Thus the six companies above have in no sense stolen a march on the rest and conceivably a considerable number of schemes may be submitted before the vesting date.

The procedure for the valuation of "hived off" sections is clearly laid down in the Bill. If agreement cannot be reached between the Minister and stockholders' representatives the matter will go to an Arbitration Tribunal. It is then up to the tribunal to ascertain the proper proportion of the total compensation sum which pertains to the segregated part. Where the segregated section of a company itself appears in the third schedule, it is understood that its name will be deleted from the schedule and the name of the section to be nationalised will be inserted. In such a case the valuation of the segregated section will be a proportion of the stock exchange value of the original company included in the schedule. In arriving at the proportion to be attributed to segregated assets the tribunal may take "all relevant factors" into consideration. If net asset value or earnings capacity are valid considerations in determining the valuation—which they certainly should be—is it not possible that in some instances the value to be attributed to the segregated part might even exceed the total compensation awarded under the Bill for the whole? Such a situation would place the tribunal in an uncomfortable dilemma.

Simplified Steel Distribution—an Instalment

The simplified procedure for steel distribution announced this week by the Ministry of Supply concerns a large number of firms but a very small proportion of the total consumption of the steel-using industries. A recent Ministry of Supply survey showed that 65 per cent of industrial consumers of steel used less than 25 tons a quarter, and that they used less than 3.5 per cent of the total of steel used for industrial purposes. These firms, perhaps 30,000 in number, will now be relieved of the necessity of direct authorisations and sub-authorisations; each will receive a single authorisation from the Ministry of Supply regional office to cover its requirements for the year.

It is inevitably for these multitudinous small users that the steel allocation system has in the past been at its most ineffective, and the Ministry of Supply's own estimate of the number of licences, authorisations, and sub-authorisations which will be saved—nearly 250,000 a quarter—is a measure of how overdue the simplification is. Many of the firms have been obliged to secure "scores of authorisations every quarter," often from different Government departments according to the end-use of the product.

Exceptions to the new arrangement make a formidable list. Tinplate, terne-plate, and black-plate steel are excluded altogether; for them the present system will remain in force. The application of the arrangements to sheet steel distribution is restricted: to qualify, a firm must not include more than 10 tons of sheet in its quarterly requirement of not more than 25 tons of steel. Steel for building will continue to be subject to the same licensing system as at present. Public authorities, builders, civil engineers,

THE CONDITIONS which interest the modern exporter are those prevailing in his market, the 'commercial weather' in which he must trade. British products will always sell in Australia and New Zealand provided they are adapted in both quality and price to the Dominion markets. The Overseas Department of The Bank of Australasia can put at the disposal of the British exporter accurate up-to-date information from the Bank's Branches 'down under' giving him a picture of prevailing conditions upon which he can base his export programme.

THE BANK OF AUSTRALASIA

A French Market.

LIKE THEIR ENGLISH counterparts, the markets of France have their own individuality and reflect the needs and habits of those who use them. The Frenchman is a careful buyer and those who would sell to him need first hand information on the state of the French market. Barclays Bank are particularly well placed to help exporters to France and to Europe generally, through their Associated Companies in France and Italy and their close links with the leading banking houses on the Continent. Details of the foreign banking services provided by the Bank may be obtained through any local branch. Alternatively, please write direct to the address given below.

Chief Foreign Branch: 168, *Fenchurch Street, London, E.C.3*

BARCLAYS BANK LIMITED

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

electrical contractors, oil companies, and firms working under licences from the Iron and Steel Board are among those excluded. Many branches of production are also excluded: among them surgical equipment, and space or water heaters whether electric, gas, or coal-burning. Firms who do come under the new arrangement will be required to make a half-yearly return of steel receipts, consumption, and stocks; but in general their clerical work should be perceptibly reduced. The field open to the Ministry of Supply for further simplification, in steel distribution alone, is still wide.

European Scrap Prospects

The efforts of national and international planners in reducing the amount of coke used in iron- and steelmaking have to some extent transformed the European coke shortage into a scrap shortage; and steel scrap, as Mr Gunnar Myrdal observes in his foreword to a report on the European scrap situation prepared by the Economic Commission for Europe, "developed into a raw material of major importance for the reconstruction of Europe." But the Commission's report, which analyses the general trends in the supply and consumption of scrap by the European iron and steel industries, arrives at more hopeful conclusions than might have been feared. It anticipates that the part played by scrap in the supply of materials for steelmaking in Europe will continue to increase. The following table shows the relation between the main sources of scrap supply before the war:—

	Per cent of total scrap consumption in Europe	in USA
Circulating Scrap	45	53
Process Scrap	22	19
Capital Scrap	28	28
Imported Scrap	5	0

Supplies of circulating scrap (which arises in the steel works from ingots' crop, waste in rolling, spilt metal, and similar sources) will increase pro rata with steel production. A decrease through the improvement of rolling-mill equipment will proibably be offset by the tendency to produce more light and flat products from which the scrap yield is higher. Process scrap, arising from the metal-working industry, may also be expected to increase with the general expansion of the engineering industries. Supplies of capital scrap should tend to rise with the accelerating rate at which capital equipment is declared obsolete and replaced. But imported scrap has for the most part gone.

The present deficit can be partly traced to the drying up of the trade in scrap between the European countries, and partly also to the cessation of imports from the USA. The various national import requirements this year are:—

	Thousand tons
UK	1,040
Italy	775
Belgium-Luxemburg	625
Czechoslovakia	545
Poland	400
Austria	120
Others	445
Total	3,950

Against this are set—though the factual justification for doing so seems doubtful—planned exports from the Bizone of Germany (1,200,000 tons) and from the Soviet zone of Germany and other countries (845,000 tons); these figures presumably relate to the twelve months ending next autumn.

A deficit for the next year or two is unavoidable. But the ECE report considers it possible that greater scrap accruals and improved collecting effort within Europe, together with an increased production of pig-iron, may remove the deficit and make Europe self-sufficient in scrap by 1951. This will depend, however, on the retention of all European scrap for use in Europe—in other words, on the abandonment by the American steel industry of its insistence on a large share of the anticipated German exports. The report does not explore that possibility further; but the impression has lately begun to prevail at Geneva that the Americans have over-estimated their own need for imported scrap and may therefore not prove intransigent.

The Trend of Savings

The approach of the Christmas holidays, which nowadays appears to exert its effect on spending habits earlier than it used to do, seems already discernible in the trend of national savings and demands for currency. In early September, when the National Savings Committee issued its last full survey of savings experience in the current financial year, it was at least possible to hope that the poor performance of the spring and summer might be largely compensated by a good response in the autumn, for this is seasonally one of the most intensive periods for saving. But these hopes have been disappointed. In the first 5 months of the current fiscal year, withdrawals and encashments of past savings exceeded new subscriptions by roughly £18¾ million. With only one exception, in each of the subsequent eleven weeks there has been a small net excess of new savings, thus plainly marking the end of the holiday season and the phase of recuperation in family budgets from the demands of the summer. But the seasonal response this year has been very much less than in the corresponding period of 1947. In these eleven weeks net saving, as officially computed, has totalled a little under £13 million, compared with almost £32 million in the corresponding weeks of 1947. For the financial year to date, therefore, there is still a net dis-saving of £5,900,000—before allowing for the repayments, totalling nearly £50 million, of Defence Bonds at maturity, and also before charging the interest portion of encashed Savings Certificates. In the first week of November the week's net saving just surpassed £2,000,000, a figure which has been exceeded only four times in this financial year; during 1947, it was definitely unusual for the week's total ever to fall so low as £2,000,000. The latest figure, for the week ending November 13th, was under £1,250,000.

Earlier in the year, it seemed reasonable to feel that the adverse trend of national savings was a misleading guide to the trend of personal savings as a whole. It was widely believed that political and other influences were leading people either to keep more savings in cash or to save through other channels. The recent slackening in demands for life assurance, discussed in these columns last week, suggests that this may no longer be true. Meanwhile, parallel indications are to be found in the statistics of the note circulation. The momentum of the big fall which began last year in total demands for currency seemed to have spent its force before this year's holiday season; yet the reflux of notes from circulation after the summer's peak demand was actually rather larger this year than in 1947. Between early August and end-September the total net circulation fell by £8 million compared with £46 million in the similar period of last year. The experience of the past eight weeks has been in marked contrast to this: the circulation has fallen on balance by only £3,000,000, whereas in October and November last year it dropped by no less than £36 million. It is true that the steep contraction in 1947 was due mainly to special causes; but in several weeks recently the circulation has shown a tendency to rise at a time when seasonal influences would have led one to expect a contraction. Certainly, it seems clear that there is no longer a downward impetus. The fractional decline shown by this week's Bank return carries the total to £1,233 million, compared with £1,363 million a year ago. This is the moment when, normally, circulation touches its lowest point for the second half of the year. Next week's return may therefore be expected to give the first clear evidence of the Christmas spending demand. The experience of the next four or five weeks of increasing note circulation, and the ensuing phase of seasonal contraction, should demonstrate whether the underlying trend is changing and giving place to a phase of re-expansion.

No Film Studio for Freelances

Exuberance in setting up committees has marked so many of the Government's dealings with the film industry that it is hardly surprising to find Sir George Gater's committee, in its report published last week, showing some embarrassment over the evident unreality of the purpose for which it was formed. The committee was appointed in July—not to consider whether a new studio for independent film producers was necessary, but, on the assumption that such a studio was to be built, to advise whether the Government ought to own or control it. "We have to record," reports the committee, "that the evidence submitted to us showed clearly that there is at the present time no lack of studio space." The absurdity of its terms of reference must have become evident at an early stage. Still, it visited studios diligently, finding many of them empty—"there has never been a time when so much studio space has been available to the industry as now"—and studio managers everywhere anxious to welcome free-lance producers, or any other producers, as tenants. It studied memoranda from the British Film Producers' Association, the independent film producers' Association, and the film trade unions.

The result is an exceptionally lucid exposition of the elementary economics of the film industry. At an early stage the term "independent producer" is abandoned for the term "free-lance producer"—"there are producers whose independence is fitful." The free-lance producer's existence is found to be necessarily more speculative than the existence (speculative though that is) of the vertically integrated concerns which group production, distribution and exhibition within one organisation. He has not the assured exhibiting outlet, nor the chance of balancing a loss on one undertaking with a profit from another, which they enjoy. His activities are restricted not by lack of studio space, but chiefly by lack of finance. The amount of capital to be invested in first-feature production "must to a large extent be determined by the size of the home market, and of the net box-office receipts," and therefore the number of first-feature films cannot be indefinitely expanded. Further, free-lance producers are small in number, and few of them are really able to produce what the Gater Committee calls "international scale" films. One of their grievances (more substantial than the difficulty of getting studio space) is the prevalence of high studio rents, but "a reasonable studio rent can be established only by the planning of continuous production." If the Government set up as a studio owner it would be confronted with the same problem as any other owner, and a costly unemployed studio would be the penalty of failure. To avoid this, the Government might be forced into film production itself.

At this point, having reduced *ad absurdum* the proposition that Government entry into the business can secure a fair field to individualism in a hard world, the report suggests that the Government might at least delay action until the Film Finance Corporation has been at work for some time and the effect of its work upon the output of films can be estimated. If one thing can be predicted of the Film Finance Corporation, it is that it will not adventure much money on projects which lack a guaranteed retail outlet; and there is no recent example of a film project which enjoyed a distribution guarantee failing to find studio space.

But the committee, after all, does more than merely demolish. If as a matter of policy the Government decides to provide a studio for free-lance producers, then, it says, the Government must own the studio itself and must set up a company to manage it. But as a matter of economics it must first insist that the free-lance producers set up a co-operative organisation which could plan a common production programme, and by ensuring continuous production make economic rents possible. Thus are the frontiers of independence inexorably delimited and circumscribed.

* * *

Dorman Long for Nothing

Record figures from the big iron and steel companies follow one another in impressive succession. At the end of last week South Durham Steel and Iron caused a mild stir in the City by raising its dividend from 8½ per cent to 10 per cent following an increase in profit from £165,806 to £531,527 for the year ending September 30, 1948. This week it has been the turn of Dorman Long to announce a striking increase in profit—but not, however, in the dividend. The absence of interruptions to production such as the fuel crisis occasioned in 1946-47 has enabled Dorman Long to make full use of its growing capacity in the year to September 30th last with the result that the group trading profit has increased to a new record of £4,118,442—an increase of more than one-third compared with the previous year. Group earnings on the parent company's ordinary capital have risen from 23.6 per cent in the first postwar year to 38.2 per cent in 1946-47 and in the past year to 54.3 per cent. The latest earnings provide nearly sevenfold cover for the dividend which is restricted to 8 per cent by dividend limitation.

The total estimated compensation to be paid under the Iron and Steel Bill to the ordinary shareholders of the company amounts to little more than two years' purchase of the latest profits. And it is certainly probable with steel production for the whole country running at the rate of 15½ million tons a year that Dorman Long, which produces more than 16 per cent of the country's total output of basic iron and over 10 per cent of its steel ingot production, will be earning considerably more in the current year. Further evidence of the gross inadequacy of the compensation to be received on the basis of stock exchange values is provided in one group balance sheet. This shows that after the deduction of net liquid assets amounting to £9,735,786 from the total estimated compensation of £13,094,000 for all classes of stockholders, a net amount of only £3,258,214 remains to cover all other assets. This sum is considerably less than the group's expenditure on fixed assets in the past three years. Moreover, a valuable claim—probably worth over £2,000,000—is outstanding for coal compensation. Hence there can be no doubt that the State is acquiring one of the largest steel producing plants in the country, its associated engineering works, and Dorman Long's overseas subsidiaries for nothing.

* * *

Tube Investments Fixed Assets Revaluation

The First Schedule to the Companies Act, 1947, expressly states that "the method of arriving at the value of a fixed asset shall be to take the difference between its cost, or if it stands in the company's books at a valuation, at the amount of the valuation—and the aggregate amount provided or written off since the date of acquisition or valuation, as the case may be, for depreciation or diminution in value." But where the amount of depreciation relating to the period prior to July 1, 1948—when the schedule came into force—cannot be obtained "without unreasonable expense and delay," the net amount at which assets stand in the company's books on July 1, 1948" (after deduction of the amounts previously provided or written off for depreciation or diminution in value), "shall be treated as if it were the amount of the valuation." Tube Investments appears to be the first important company to undertake a revaluation at the given date. In the consolidated balance sheet of the company at July 31, 1948, fixed assets are shown at a valuation made on July 1, 1948, with the result that these assets are stated to have a value of £16,721,160 gross, after deducting a mere month's depreciation from the valuation. The new figure presents a striking contrast to the net figure of £5,477,532 for fixed assets given in the previous balance sheet as at August 2, 1947. The surplus arising from the revaluation, which amounted to £10,078,510, has been entered on the liabilities side of the balance sheet as a capital reserve, bringing total capital reserves up to £13,842,344. In addition, revenue reserves amount to £7,757,287.

This revalution by Tube Investments was fortuitous in that presumably the company has not been able readily to ascertain figures for past depreciation in order to meet the requirements of the First Schedule of the Companies Act, 1947, in the more usual manner. But since the resulting figures have been published at a time when the method of Stock Exchange valuation as a basis of compensation is under heavy fire, the impressively high value placed on the fixed assets of Tube Investments by an independent valuer as recently as July 1, 1948, should provide useful ammunition for the many opponents of the method of compensation provided in the Iron and Steel Bill.

* * *

A Wages Experiment

The agreement for a new wages structure, reached this week between the Standard Motor Company and the Confederation of Shipbuilding and Engineering Unions, may have repercussions far beyond this particular company. It sets a precedent which might well be adopted throughout the engineering industry, where negotiations for the simplification of the wage structure have been dragging on for years.

The present scheme has a dual purpose—to simplify the basis of payment and provide an incentive to greater output. Instead of the former 92 different bases of payment, there will be a scale of only eight basic wage rates, and instead of the complicated system of differentials, bonuses and merit rates, there will be a special bonus payable to production teams, directly related to their productive effort. The scheme covers all the firm's 10,000 employees, including sweepers and cleaners, and was approved by 75 per cent of the workers in a ballot taken last month. Men will have a guaranteed weekly minimum of £5 and women £3 15s. It remains to be seen what practical effect the scheme will have in increasing output. Incentive systems of payment have not yet been sufficiently considered by industry and the unions, and the experiment of Standard Motors is welcome.

* * *

International Agreement on Screw Threads

When the drawings of the Rolls-Royce Merlin engine were sent to the United States during the war for production of the engine by the Packard company, nine months had to be spent on redrawing to incorporate American standards; and a substantial part of this was spent in substituting American for British screw threads. The conferences which led up to the agreement, announced this week, between the United States, Britain and Canada for a new unified screw thread system began in 1943 and were prompted by the great losses in time, cost, and servicing efficiency during the war which were traceable to the different national screw standards in engineering use. They originated between the Governments and had a Service background; of necessity, however, the standards institutions have become more

and more involved, and the British delegation which signed the agreement at Washington on November 18th consisted of three representatives of the British Standards Institution and one of the Ministry of Supply. The new system of screw threads will be made mandatory by the service department for equipment ordered by them, but over the greater part of the industrial field its adoption, and the timing of the change, will be at the discretion of the engineering firms.

It is a major change in engineering practice and will require a great deal of retooling; the unified system is much nearer to present American practice than to British. The change will be facilitated to some extent by the fact that British toolmakers have already for some time past been making a proportion of screwing tools to American standards, since these are already in use by some firms in this country. In the motor industry the two American-owned undertakings, Ford and Vauxhall Motors, have used American screw standards for some time, and the Standard Motor Company went over to the American standards last winter when the Vanguard and the Ferguson tractor were put into production. No doubt other British motor manufacturers will be among the first firms to follow suit, since the greater part of their product is now exported and the servicing advantages in countries using American screw standards are obvious. Makers of goods mainly for the home market, and heavy engineers making large fixed installations, can be expected to take longer, and the whole change will take many years.

The change applies only to screws of ¼ inch and over, for which the Whitworth thread has been generally used. For these the British Standards Institution will issue a new provisional British standard early in the new year. Screws below ¼ inch are a separate problem still to be negotiated. The Americans have put forward propesals for two series in sizes below ¼ inch, one having a finer and the other a coarser pitch than the British B.A. series. The British engineers doubt the necessity for two new series so close together, the possibilities of compromise have still to be fully explored.

* * *

Departmental Holdings of Gilt-edged

The meagre information which each year is released, by Parliamentary answer, about the internal or "departmental" holdings of Government securities is this time more bewildering than usual. The Chancellor stated last week that at March 31st last Government departments held £405 million of floating debt and £3,217 million of "other" debt—a total of £3,622 million compared with £3,847 million at end-March last year. It is, of course, from the point of view of the gilt-edged market that information about official holdings is most significant; but these annual releases have been carefully devised to ensure that they reveal nothing about official tactics in this sphere. There are many exclusions from them, the most notable being the Issue Department of the Bank of England and the Exchange Equalisation Account. But these exclusions do not of themselves impair the comparability of the several published figures, which afford some guide to the volume of resources at the disposal of the Government for market operations—resources accumulating in the social insurance and other extra-budgetary funds and employed through the National Debt Commissioners.

The decline in the total during 1947-48 is therefore, at first glance, somewhat unexpected, for there is little doubt that funds continued to accumulate through these channels. As will be seen from the accompanying table, this is the first decline in the whole nine-year period over which the series extends, and contrasts with the record increase of £649 million in the previous year. Both these changes, however, point to further weaknesses in the basis of computation. The figures embrace only direct obligations of the central Government, and a substantial part of the big increase in 1946-47 reflected the conversion of official holdings of Local Loans Stock (which had never been included) into "Daltons," which necessarily were included. Secondly, the holdings embrace a large but unknown volume of purely nominal debt due to the accumulation of departmental credits which instead of being rapidly extinguished by return to the Exchequer are temporarily "lent" to it on Ways and Means advances or in other forms. There is little doubt that this year's seemingly paradoxical decline arises from this nominal element in the holdings. It certainly does not, as some have suggested, result from the £150 million decline in the fiduciary issue, because the Bank's holdings are excluded. The true explanation, it would seem, is to be found in Dr Dalton's vaunted "clawing-back" of unspent votes and accumulated credits, which means that this apparent reduction is merely the nominal counterpart of the nominal revenue surplus in which he took such pride in the summer of 1947.

This assumption, it will be seen, is supported by the fact that the fall occurred wholly in the floating debt holdings, which declined by £290 million—£80 million more than the fall in the total outstanding ways and means advances. But for this technical influence there is little doubt that the total internal holdings would have shown a further, though moderate, increase. It may be noted, too, that the relatively small increase in "other" debt—by £65 million—probably tends to understate the growth of the funds employed by these departments in the investment market during the year. Only a month before the return was made up the Government had redeemed the 3 per cent Conversion Loan—which means, of course, that departmental holdings of this loan were temporarily replaced by floating debt until occasion arose for re-employing the proceeds in longer securities.

DEPARTMENTAL HOLDINGS OF PUBLIC DEBT

World Bank and Colonial Loans

The Colonial Loans Bill which was given a second reading towards the end of last week is intended to give the Treasury authority to guarantee loans made to colonial governments by the International Bank for Reconstruction and Development. Although the Bill is specific in such respects as the limitation of guarantees to a maximum of £50 million, it must be regarded as in the nature of an enabling bill and not as envisaging an early approach to the International Bank for colonial loans. This fact was made clear beyond all doubt by the Under-Secretary of State for the Colonies who gave two reasons for the unlikelihood of such financing in the near future. The first was the high rate of interest which the Bank is charging for its loans, namely 4½ per cent, a figure which includes the 1 per cent guarantee commission which the Bank takes on all loans. The second deterrent mentioned by Mr Rees-Williams was of somewhat more surprising character. It was that the policy of the Bank at the moment was to restrict any dollar loans it made to purchases in the dollar area. This assertion gave rise to considerable discussion but time and again Mr Rees-Williams returned to the point that although the International Bank was bound by its statutes to place no restrictions on the country in which the proceeds of its loans are spent the Bank was in fact, as a matter of policy, requiring that the proceeds of loans made in US dollars should be spent in the dollar area.

The statutes of the Bank are perfectly clear on this point. Section 5 (a) states that "The Bank shall impose no conditions that the proceeds of a loan shall be spent in the territories of any particular member or members." The last annual report of the Bank showed that although most of the expenditure financed by the Bank's loans was made in the United States, substantial amounts were spent in other countries, including over $47 million in Europe and $50 million in Latin America. It is possible that the extraordinarily detailed provisions made by the Bank for supervising the expenditure of every dollar which it makes available is being used to circumvent one of the basic provisions of the final act signed in Bretton Woods. If this be so, the matter should be made the subject of a definite statement of policy on the part of the Bank. Sir Arthur Salter, who intervened in the debate and who is chairman of the Bank's Advisory Council and in that capacity went to Washington some weeks ago, certainly did not appear aware that so fundamental a change in the policy of the Bank had in fact occurred.

Troubles in Groundnuts

The East African groundnut project is generally recognised as a brave experiment which for political or other reasons was planned to produce too rapid results. The lack of foresight, the lack of appreciation of the size of the problem or its ramifications, the lack of equipment and the various other troubles which have afflicted the scheme since its inception have all been given ample publicity. And the publicity has been effective in securing certain remedies. The supply of equipment, for example, has greatly improved in the last twelve months and the "Shervic" tractors—converted Sherman tanks—are proving valuable. An efficient repair organisation has at last been set up, with modern workshops housed in hangars made of landcrete blocks and sheet aluminium—materials also used for married quarters for the Europeans.

But conditions still appear to be far from satisfactory. A recent visit by Mr Clyde Higgs on behalf of the *Farmer and Stockbreeder*—his second in nine months—raises several points of criticism. Whether these are all justified or not, it is obvious that considerable reorganisation is necessary. Mr Strachey again confirmed in the House only this week that the Overseas Food Corporation was investigating the whole project and particularly the surplus administrative staff. Its report will be awaited with great interest.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'c'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (a) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) To latest redemption date. (m) 15 months. Yield basis 25%. † Free of tax.

THE
STANDARD LIFE
ASSURANCE COMPANY
For Mutual Assurance

Established 1825 *Assets exceed £54,000,000*

SPECIAL ATTENTION IS DRAWN TO THE FOLLOWING CONTRACTS:—

1. **BUSINESS MAN'S POLICY** Inexpensive Life Assurance with options to convert at a later date to an endowment assurance either with or without profits.

2. **FAMILY INCOME POLICY** The ideal contract for a young married man: maximum life cover at minimum cost.

3. **POLICIES FOR CHILDREN** (a) "Public Schools" Policy. Provision for education by means of premiums spread over the early years of a child's life.

(b) "Early Thrift" Policy. Should be effected as soon after birth as possible to provide a splendid life or endowment assurance policy when the child attains the age of 21.

(c) "Family Protection" Policy. A policy on the life of a parent incorporating valuable options on the life of his child at age 21. Income tax rebate is allowed on the premiums.

An enquiry will bring full particulars.

HEAD OFFICE: 3 GEORGE STREET, EDINBURGH

LONDON OFFICES: 3 Abchurch Yard, Cannon St., E.C.4, 15a Pall Mall, S.W.1.

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his 'General' Personal Accident Policy he received £10 a week until he was fit.

Peace of mind costs very little

£1 a year covers you for £10 a week accident benefit. Are you wise to face the risk—and all that it means to your dependants—without this cover? It's worth while finding out more about this and other benefits of the 'General's' Personal Accident Policies—just send the coupon. PA/6

Please send me full particulars of 'General' Personal Accident Policies.

DOUBLE TAXATION BURDEN

MR. F. M. G. GLYN'S ADDRESS

The eighty-sixth annual general meeting of the Bank of London and South America, Limited, will be held in London on the 21st proximo.

The following are extracts from the address to the stock-holders by the chairman, Mr Francis M. G. Glyn, were circulated with the balance sheet. Copies of the full address are obtainable from the head office of the bank at 6, Tokenhouse Yard, London E.C.2.

Latin America as a whole can provide no exception to the present almost universal shortage of dollars; the situation has indeed changed rapidly, and in some cases disastrously, in countries which, not so very long ago, possessed substantial reserves with which they would normally expect to pay for essential imports of both capital and consumer goods from the one country, the USA, that was able after the war to supply their requirements.

Nor has the dissipation of these accumulated reserves been alone responsible for present difficulties, for the failure to produce and adhere to a practical programme of dollar income and expenditure has led not only to a rash over-spending of available resources, but has also tempted the various administrations to anticipate sources of dollar revenue which a more realistic appreciation of the world situation would not have allowed them to take so much for granted.

RAMPANT INFLATION

Lord Wardington referred last year to the ever-rising price levels and this year again it would be impossible to avoid commenting on the rampant inflation that now prevails in every country, almost without exception, in which the bank is established. From time to time various price-controlling or restrictive measures are introduced, but frequently their effectiveness is negatived by further Government expenditure which is not immediately productive or by the expansion of extravagant social services.

This has led to a reduction in the internal purchasing power of the currency, with a consequent rise in the cost of production of exportable commodities; exports could, therefore, only be maintained either by some form of internal subsidies or else, which was the more usual course adopted, by a depreciation of the international rate of exchange. In many cases, moreover, the necessity of simultaneously encouraging exports and restricting imports has opened the door to the introduction of multiple exchange rates. As in nearly every case the most depreciated rate is that which is applicable to the remittance of profits and is, therefore, the rate at which we convert our figures for balance sheet purposes, we have in several cases been called upon to provide very considerable sums to cover depreciation of our capital employed in those countries.

THE REMITTANCE DIFFICULTY

There can be very few British shareholders of companys operating in our zone who have not in recent times seen there dividends or interest payments delayed, reduced or even cancelled owing to difficulties abroad in obtaining remittances to meet financial services. This has been usually due to a shortage of foreign exchange, which has arisen not from any difficulty in finding a market for the exports of those countries but because they have allowed the demand for imports of all kinds to take precedence over all other commitments in foreign currencies even to the extent of allowing their trade balance to become unfavourable.

Whatever the cause, the result to this country is always the same, namely a reduction in a potential supply of foreign exchange. The emphasis at present laid on the necessity for great Britain to export, essential though that may be, tends to blind us to the fact that exports are only the means to the end of acquiring foreign exchange with which to purchase essential imports of food and raw materials. If the same end can, to a small but appreciable extent, be achieved without drawing on our productive capacity, it is our duty to use every possible endeavour to ensure that this country receives without deduction all the profits of British labour and enterprise abroad to which we are legitimately entitled.

NEED FOR TAXATION RELIEF

It is not always appreciated how crippling is the cumulative effect on profits of a double tax liability. Profits earned abroad are subject to local taxes and what is left must bear the brunt of British taxation. As far back as 1920 certain reliefs were provided for in respect of Dominion income tax and in 1945 the Finance Act (No. 2) afforded relief from double taxation in the case of income from any territory outside the United Kingdom with which reciprocal arrangements are made. Since the principle has been admitted, I find it hard to understand why similar arrangements have not been extended to all foreign countries or why relief is not provided for in cases where no recriprocal agreements are in force. It does not seem equitable that companies trading in areas of the world which are not prepared to agree to recriprocal taxation agreements should be penalised in comparison with those whose business is carried on in territories with such agreements. I hope that H.M. Government will give this matter early consideration.

The year's profit amounts to £350,000 compared with £373,902 for the preceding year. The gross earnings of our branches abroad have in the aggregate shown an increase, but this has been more than offset by additional charges and less favourable exchange rates.

A TRADE OPPORTUNITY

Latin-American countries are finding themselves obliged to look to sources other than the USA for more of their requirements of manufactured goods and raw materials. I am sure that the implications of this change will not have been lost upon the British exporter, and that he can be relied on to do his utmost to be among the first in the competition for this trade, and one may also hope that we shall thereby be able to restore this country to the position she once held of being among the leading suppliers to the South American Republics.

I make no apologies for stressing the importance of the contribution of British invisible exports to the British balance of trade. When shortage of manpower rather than the maintenance of full employment is one of our major problems, we can afford to pay greater attention to insisting on our rights to these sources of foreign revenue and correspondingly less to the volume of our physical exports which we are in any case not always able to produce. When the day returns that this country can take a stronger line in settling the conditions on which she will trade with countries who are in need of her products, greater emphasis on this point may well pay big dividends.

HORLICKS, LIMITED

INCREASED TURNOVER

The annual general meeting of Horlicks, Limited, was held, on the 17th instant, at Slough, Bucks.

Lt.-Col. J. N. Horlick, O.B.E., M.C., the chairman, in the course of his speech, said: The net profit of the parent company before taxation shows a reduction of £83,119 as compared with the preceding year, wholly due to the fall in trading profit. The reasons for this decline are the rising costs of supplies and the increased expense of marketing and distributing the company's products. Turnover during the year has shown a satisfactory increase and once again we can regard ourselves as fortunate in having overseas plants to satisfy the demands of those markets which cannot be met from this country until the essential raw materials are in freer supply.

Despite the somewhat less favourable results of the year under review, however, profit after taxation comfortably covers the dividend at the same rate as has been paid in previous years. Although this company's dividend, as quoted by reference to its nominal capital, is at the rate of 30 per cent. per annum, in actual fact, the rate approximates to only 7 per cent. of the capital employed in the business at March 31st 1948.

THE CURRENT YEAR

As to the current year, the figures for the first six months are slightly less favourable than those for the same period of the preceding year and in view of the present troubled state of world conditions I feel that it would be unwise for me to attempt any forecast. At home the company's activities are limited by the continuing shortage of raw materials, while taxation, which takes no account of the increased costs of replacing plant and other fixed assets, leaves an insufficient margin to provide the means for progress and expansion.

Overseas, where the company carries on an extensive trade, constitutional changes in some of the Far Eastern countries have confronted us with many problems. Difficulties still lie ahead. In regard to the American Subsidiary, much has been done to reorganise the business and to modernise the factory and plant but very keen competition and the high cost of raw materials and labour make the American market a difficult one.

Our Australasian Subsidiary, with its factories at Nowra, N.S.W., and Tokomaru, New Zealand, continues to provide us with the supplies with which to meet the heavy demands for our product in India and the Far East.

A SUCCESSFUL SUBSIDIARY

Another subsidiary which is making progress is Horlicks Farms and Dairies, Limited. This company now operates four milk depots in Somerset, and because we are confident that the breeding of better dairy cattle will ultimately increase the throughput of milk to the advantage of these depots, the company has created the largest single organisation in this country for the artificial insemination of dairy cattle.

With its main centre at Ilminster and another recently opened in the north of the county at Langford, the services they provide are now available to farmers throughout almost the whole of Somerset. Some idea of the progress of this service, which was started only three years ago, will be gauged from the fact that for the year ended September 30th, 1948, there were 3,800 subscribing members and 32,450 of their cows and heifers were inseminated. The calves born so far number nearly 20,000 and almost all of them show definitely better breeding than their dams.

We believe that by providing this service to farmers on a country-wide basis we are ensuring increased milk production for the future.

The report was adopted.

FERRANTI LIMITED

INCREASED NET PROFITS

The annual general meeting of Ferranti Limited was held, on the 18th instant, in London.

Sir Vincent de Ferranti, M.C., M.I.E.E. (chairman and managing director), in the course of his speech said:

The trading profit (including dividends on investments) at £397,201 compares with £406,651 a year ago and, after providing for depreciation, directors' and auditors' remuneration and taxation, the net profit amounts to £143,388, as against £105,293 last year. The increase in net profit is mainly the result of a reduced charge for taxation and the absence of necessity to provide for deferred repairs. After inclusion of the subsidiary companies' results, the combined trading profit is £464,816, as against £455,704 a year ago, and the consolidated net profit at £181,708 shows an increase of £47,171 over the 1947 results.

INCREASED NET ASSETS

The consolidated balance sheet shows total net assets of £1,984,549, an increase of £180,000 on last year's figures represented by an increase of £249,000 in fixed assets, and a decrease of £69,000 in net current assets.

During the year the output of our commercial departments has increased 20 per cent. Whereas last year all departments contributed to this increase, this year there is a sharp division between those departments producing transformers, electricity service meters, instruments and castings for the electricity supply industry and these producing radio, television, domestic appliances and clocks for the general public. In the former there have been marked increases in turnover, and in the latter marked decreases.

The company is playing its part in the rebuilding of the country's generating plant, as is instanced by orders received for two 75,000 k.v.a. generator transformers for the new Carrington Power Station at Manchester, three 58,500 k.v.a. generator transformers for the Braehead generating station, Glasgow, and two 66,000 k.v.a. generator units for the new Deptford station.

The size of the modern power transformer continues to increase. An order has been received for two 100,000 k.v.a. 132 k.v. transformers with on-load tap changing gear for the British Electricity Authority. These are the largest units bought for use in Britain.

INCREASED EXPORTS

The total volume of our export orders shows an increase of three and a-half times over that of the last year before the war, and 40 per cent. of our commercial output has been exported. As an indication of our activity in the export field, 30 of our senior staff have been abroad during the year, either obtaining orders, studying market conditions, or increasing our technical knowledge, so as to improve our products and manufacturing skill. The output of the meter department has been a record both in numbers and value.

The demand for radio, valves, and clocks has been curtailed by economic policy, and that for electric fires and water heaters as the result of the shortage of generating plant. This decline of demand became apparent in March, and so has only been effective for one quarter of our financial year. It is likely to have a much more serious effect on next year's results. In particular as the demand for electricity meters has decreased in recent months. Every effort is being made to adjust ourselves to the new conditions, and we hope by making economies in departments suffering from falling demand, and greatly increasing our output of heavy plant, to surmount our difficulties. We know that we can rely on our excellent staff and workpeople to help to make the necessary adjustments, and we thank them for their good work during the past year.

The report was adopted.

JOHANNESBURG CONSOLIDATED INVESTMENT

FACTORS AFFECTING PROFITS

The annual general meeting of shareholders of Johannesburg Consolidated Investment Company, Limited, was held, on the 23rd instant, in Johannesburg.

Mr H. J. Joel, who presided, in the course of his speech said:—Markets were considerably less active during the year under review, and that fact largely accounts for the fall of £412,673 in the profit before providing for taxation. I would add that since June 30th political and economic difficulties have exerted an increasing influence on the volume of business on the stock markets so that opportunities for selling have been further reduced since that date. The amount of £677,662 provided for taxation this year includes United Kingdom income tax deducted from dividends, which are included at their gross amount of £760,869 in the figure of £1,414,609 shown in the profit and loss account. An amount of £300,000 has been transferred to general reserve, which now stands at £4,700,000, after transferring to capital reserve therefrom £200,000 in respect of share premiums. Dividend No. 56 of 3s. 6d. per share, plus a bonus of 6d. per share, less United Kingdom income tax at the standard rate of 9s in the £, absorbed £434,500, and after these appropriations the balance of undistributed profits carried forward showed an increase of £2,447 to £339,952.

INCREASING COSTS

With regard to profits, increasing costs rather than a decreasing value of the ore milled have reduced profits from £23 million in the first six months of 1947 to £11,875,000 in the first six months of 1948, a decrease of £11,125,000. The decrease in the profits is equivalent to a decrease of 5s. 5d. per ton milled, a decrease almost entirely accounted for by an increase in working costs of 5s. 3d. per ton. Profitability is of importance in many ways. It is of importance to the shareholder who has risked or is to be asked to risk his money in investments in the gold mining industry. It is of importance to the state, to which the industry contributes a considerable revenue from direct taxation. It is of importance in relation to the scale of production to which I have just referred.

ORANGE FREE STATE INTERESTS

Although there have been delays in deliveries of machinery and in the completion of contracts, which have tended to retard the programme in every direction, progress on the two mines in the Free State, Freddies North Lease Area, Limited, and Freddies South Lease Area, Limited, has been reasonably satisfactory. The branch railway line to Odendaalsrus was opened on June 7, 1948, and power from the Victoria Falls and Transvaal Power Company, Limited, became available in the early part of this year.

PLATINUM

As a result of speculation in the United States of America early this year, the price of the metal has been forced up and the official price in the United Kingdom is now £19 10s.

The production of Rustenburg Platinum Mines, Limited, is largely for the industrial market and only a small proportion goes to the jewellery trade. The optimum market conditions therefore involve a steady demand and a stable price. Fluctuations in price tend to make consumers consider substitutes.

Good progress is being made with the additions to the plant of Rustenburg Platinum Mines, Limited. Although a substantial amount of profit was earmarked for capital expenditure, the company was nevertheless able to declare a dividend of 31½ per cent for the year to August 31, 1948.

The report and accounts for the year ended June 30, 1948, were unanimously adopted.

EASTWOODS LIMITED

RECORD OUTPUT AND SALES

The annual general meeting of Eastwoods Limited was held on the [illegible] in London.

Mr G. W. A. Miller, F.C.I.S. (chairman and managing director), in the course of his speech, said: The surprise decision of the Government to proceed with the clearance of the south bank area during the next few months will result in our ejection from the Belvedere Road site, near Waterloo, upon which the business was founded in 1815.

Under conditions akin to duress, we have been searching for another home and have only recently found suitable premises in the London, E.C.1 area which require major modifications and the expenditure of much time and money to adapt them to our requirements, but we hope to effect the complete removal by Michaelmas, 1949.

TOWN PLANNING

The 1947 Town and Country Planning Act has already given rise to new problems related to properties and to the many development projects essential for the protection of our manufacturing interests, but the most serious difficulty and confusion have occurred in attempting to operate the regulations for the working of minerals which are vitally necessary to us, as providing the raw materials without which production cannot proceed.

While admitting the necessity for an overall plan following extensive war damage, redistribution of population and industry and similar problems, it is felt that what is required is a much greater sense of urgency and a more realistic and practical approach to the whole problem of mineral planning.

Our programme of expansion and reconditioning the works and plant for the post-war recovery was commenced as long ago as 1943 and has been proceeded with so far as plant, machinery and building licences have become available. In consequence we have been able during the past year to achieve the maximum efficiency from the available facilities coupled with a high level of production and technical control of the products, the results of which are now becoming apparent for the first time. Up to the close of our year at March 31st last we reached in nearly all departments a new high level of output and sales.

MEASURE OF RECOVERY

Sales margins generally have been reduced as our contribution to the common need as current increases in manufacturing costs tend to be borne by the producer, and are no longer reimbursed automatically within the orbit of a controlled price structure. The expansion of turnover from our manifold activities is naturally reflected in the net revenue account in a pronounced degree, with an increase in the trading revenue balances from £111,618 to £274,491. The comparison between the trading accounts of the two years is the best possible proof both of the measure of the recovery and of the efficacy of the steps taken to achieve it. The board therefore have had no hesitation in recommending a dividend on the ordinary stock at the rate of 8 per cent. After making the provisions to which I have referred, we are able to increase the carry-forward from £26,587 to £30,303

Out of every pound realised last year from services and sales rendered by your group, 17s. 10d. was expended on raw materials and transport, maintenance and repairs, wages and salaries, local rates and taxes and general costs of manufacture and distribution. This is increased to 18s. 8d. after provision for depreciation. Taxation takes 8d. of the small balance remaining and after setting aside 2½d. for essential reserves there is left only 5d. in the pound for distribution as dividends with the odd ½d. remaining to be added to the carry-forward.

The report was adopted.

TRINIDAD LEASEHOLDS LIMITED

BRIG. R. S. G. STOKES' REVIEW

The thirty-fifth annual general meeting of Trinidad Leaseholds Limited, will be held, in London, on the 14th proximo.

The following is an extract from the chairman's statement, circulated with the report and accounts for the year ended June 30, 1948:—

The period under review has been one of continued expansion for the company, in all spheres of activity. Features of outstanding significance have been the record refinery throughput for the year; the extension of exploratory drilling, with some encouraging results; and the formation of the Regent Oil Company Limited—upon the dissolution of the petroleum board—for the optimum expansion of marketing facilities in the United Kingdom.

The higher prices obtained for our oil products, offset in large measure by the increased cost of the crude oil purchased for refining, and the bigger scale of operations combined to produce a heavily augmented working profit, not reflected, however, in any improvement in total dividend recommendations for the year.

Before arriving at the net profit of £653,510, an amount of £1,750,000 has been provided for taxation. A liberal allowance of £641,979 was made for depreciation. The debit of £304,274 for contingencies considerably exceeded the corresponding figure in 1946-47, and comprised additions to internal reserves relating to shipping operations and insurance and currency risks.

£300,000 has been transferred from profits to the exploration and plant replacement reserve, and £100,000 to general reserve.

Your board proposes the limitation of the final dividend to 6d. per 5s. stock unit, free of income tax, making a total of 8.4d. for the year, which is the same as the amount distributed during the previous twelve months.

CEDAR INVESTMENT TRUST, LIMITED

MR DONOVAN M. TOUCHE'S CRITICISMS OF STEEL NATIONALISATION

The thirtieth ordinary general meeting of Cedar Investment Trust, Limited, was held, on November 19th in London, Mr D. M. Touche, chairman and managing director, presided.

The chairman, in the course of his speech, said:—The gross dividends and interest received during the year amounted to £88,533, which constitutes a fresh record in the history of your company. The net revenue for the year works out at £36,363, which is an increase of £1,045. We again recommend the payment of an ordinary dividend at the rate of 6½ per cent., which will enable £14,336 to be added to the carry forward.

After dealing with various items in the balance sheet, the chairman continued:—

Now I wish to refer to some aspects of the disruptive proposals for the nationalisation of the iron and steel industry at a time when it is breaking records while the National Slate Board is missing very modest targets. The first is that the ramifications of this measure are so extensive that in my belief it will make the continued existence of the system of private enterprise impossible in the long run. In other words, the crucial battle for freedom is now on. Secondly, the directorial penalty clauses will kill stone dead all initiative outside of the daily routine. Thirdly, the withdrawal of another great industry from the contracting field of private investment is just one more step in narrowing the scope of our operations, which have already been sufficiently curtailed by previous nationalisations and by the closing of so many overseas investment outlets. Fourthly, informed opinion is unanimously agreed that to take over the assets of these companies at share prices which have been held down by nationalisation fears and dividend limitation is fraudulent.

In the words of *The Economist*, which is not a Tory organ, "To rig the market first and then to make compulsory purchases at the market price is more than sharp practice, it is plain dishonesty." Steel shows what happens to companies which abide by voluntary dividend limitation. Proudhon, that revered prophet of Socialism, laid it down that "property is theft," which you will find on consideration is a little illogical as there can be no theft unless there are genuine property rights to infringe. What is abundantly clear after the treatment meted out to the electrical supply companies, and which it is intended to mete out to the iron and steel companies, is that nationalisation is theft. British industry, dependent upon inefficient public monopolies for dear fuel, dear steel, and dear transport, will stand little chance of competing in world markets. Universal impoverishment is likely to be the end of Socialist policy as it is the aim of Communist policy. If Left understands Left it can only be because the affinity between Socialism and Communism is so close.

The report and accounts were unanimously adopted.

(*Continued from page 899*)

There are broadly four different problems to be solved. The first is over-centralisation in an administration that is too large. Although nobody can hazard more than a guess whether economic production of groundnuts in these two areas of East Africa is possible or not, many of the day-to-day problems could be overcome by proper leadership and the delegation of responsibility to the lower levels of the administration, coupled, no doubt, with better use of existing staff. This is apparently under investigation by the Overseas Food Corporation. The second problem is native labour. Conditions for these workers are acknowledged to be far from satisfactory. New villages have been built, but there are far-reaching sociological problems in any large scale resettlement of populations. The labour turnover is high, but this may be due more to the desire of the natives to return to their former settlements, than to inferior management.

The other two problems are technical. The project is rapidly becoming a sunflowerseed rather than a groundnuts development scheme. Almost half the area is being devoted to sunflowers, in spite of their lower oil yield per acre than groundnuts and although they have no valuable residue. They are less exacting to grow and have so far given better returns than groundnuts. In an arid area where the ground tends to bake hard there are many technical advantages in growing a crop above ground, though the total supply of oils will be less than anticipated. The optimum rotation of crops and the type of tillage to be adopted also need more thought. Finally there are difficulties in providing adequate transportation, storage and shipping facilities. To a large extent the supply of equipment will help in the solution. But the creation of an efficient administration on the spot is at least as important as sending Ministers from Britain.

* * *

Improvement in Overseas Trade

Considerable progress has been made in the last twelve months towards solving Britain's trading difficulties. The expansion in exports has enabled imports to be maintained at a relatively high level despite their rising cost, and at the same time it has enabled the deficit to be appreciably reduced. The gap in October amounted to only £29 million with imports valued at c.i.f.; if allowance is made for insurance and freight the visible deficit was probably around £12 million. The deficit for the first ten months of the year calculated on this latter basis amounts to £209 million—a far more manageable figure than the corresponding deficit of £371 million a year ago. There are, moreover, indications of an improvement in the terms of trade. Measured by value, imports this year have been running at a monthly rate of 15 per cent above last year's, whereas for exports the monthly rate has increased by 37 per cent over 1947. The volume of retained imports has so far averaged 81 per cent of 1938 compared with 78 per cent last year, while the volume of exports has expanded from an average of 6 per cent above the prewar level in 1947 to 33 per cent above this year.

More important than the change in the total deficit is the change in the dollar deficit, of which a large part is now met by ECA grants and loans. During the third quarter, the deficit with the United States and Canada declined further, but the gap with the rest of the western hemisphere increased, and the total deficit for the whole area was slightly higher. The value of exports to the United States, Canada and Argentina during this period has shown a welcome expansion and a larger proportion of total exports went to those markets. But the increase in exports to the United States was more than offset by the large increase in imports, especially tobacco, from that country. Up to the third quarter of this year the proportion of total imports coming from the United States has fallen continuously since the beginning of 1947. But between June and September it jumped from 7½ per cent of the total to 9 per cent. Part of this increase represents ECA supplies—in particular, apparently, of tobacco.

Statistical Summary

GOVERNMENT RETURNS

For the week ended November 20, 1948, total ordinary revenue was £57,163,000, against ordinary expenditure of £69,636,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £10,573,000, the surplus accrued since April 1st is £276,209,912 against £231,614,000 for the corresponding period a year ago.

Established over 80 years

BANK of NEW ZEALAND

Incorporated with limited liability in New Zealand

Represented at over 460 points in New Zealand and at Melbourne, Victoria; Sydney, New South Wales, Suva, Fiji; Apia, Samoa.

London Office. 1, Queen Victoria St., E.C.4 O M Samuel, Manager

Head Office: WELLINGTON, N.Z P. L. Porter, General Manager

COUNTY BOROUGH OF SOUTHEND-ON-SEA EDUCATION COMMITTEE

MUNICIPAL COLLEGE

Principal: R. W. WILSON, B.Sc.(Eng.), A.C.G.I., Whit. Sch., D.I.C., A.M.I.E.E.

DEPARTMENT OF COMMERCE

Applications are invited for the post of LECTURER in ECONOMICS and cognate subjects to Intermediate Degree standard, to commence duties at the earliest possible date. Candidates should be graduates in Economics or Commerce and experience in business and teaching is desirable. Salary in accordance with the Burnham Technical Scale. Application forms, together with further particulars, may be obtained from the undersigned on receipt of a stamped addressed envelope, and should be returned to the Principal of the College, Victoria Circus, Southend-on-Sea, within a fortnight of the date of this advertisement.

H. BOYES WATSON, Chief Education Officer.

Education Office, Warrior Square, Southend-on-Sea.
November 10, 1948.

LEICESTER COLLEGE OF TECHNOLOGY AND COMMERCE

Principal: H. L. HASLEGRAVE, Wh.Sc., M.A.(Lond.), Ph.D.(Lond.), M.Sc.(Eng.), M.I.Mech.E., M.I.E.D.

Applications are invited for the post of Assistant Lecturer on the staff of the School of Commerce.

Preference will be given to the holder of a degree or diploma in Social Science (including Psychology), but candidates with other qualifications will be considered. Salary in accordance with the Burnham Award.

Particulars and forms of application may be obtained from the Registrar, College of Technology and Commerce, The Newarke, Leicester, to whom completed forms should be returned within two weeks of the date of this advertisement.

ELFED THOMAS, Director of Education.

APPLICATIONS are invited for the post of General Works Manager of a large, well-known and progressive manufacturing concern in the Home Counties. The successful candidate will be appointed to the Executive Board of Directors after a probationary period. Applicants should have Hons. Degree in Engineering, Maths. or Chemistry, wide technical and executive experience in process type of industry (preferably foodstuffs). The position will involve the co-ordination at highest level of the work of an executive team of high calibre and proven ability in similar capacity is necessary. The position will carry a big salary as well as pension, life insurance and other benefits. Only men with drive, wide executive experience and a flair for getting things done can be considered. The vacancy is already known to all executives within the Company.—Applications, giving full statement of education, career and current salary level, should be marked "Confidential" and should be addressed to the Managing Director, c/o Masius and Ferguson Ltd., 40 Berkeley Square, London, W.1.

ACCOUNTANT: A small manufacturing firm requires an accountant whose responsibilities would include:—Preparing balance sheets. Keeping normal financial accounts. Maintaining production cost control procedure. Applicants should be between 30 and 40 years of age. Must have had experience of cost accounting, should preferably hold some recognised accountancy qualification. Salary will be between £500 and £750 per annum according to ability and the post affords ample opportunities for the exercise of personal initiative. Written applications, giving age and details of experience, should be addressed to: The Managing Director, A. Garstin & Company, Limited, Colindale Avenue, London, N.W.9.

CHARTERED or Incorporated Accountant required in London as Secretary and Accountant to important group companies marketing colonial produce. General business or administrative experience an advantage. Age about 35 to 40. Substantial salary commensurate with responsibilities will be offered to suitable candidate. Write full particulars to: Box 3875, c/o Whites, Ltd., 72, Fleet Street, E.C.4.

NORANDA MINES LIMITED

DIVIDEND NOTICE.

Notice is hereby given that an interim dividend of One Dollar ($1·00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable December 15, 1948, to shareholders of record at the close of business November, 25, 1948.

By Order of the Board,
Toronto, November, 17, 1948. J. R. BRADFIELD, Secretary.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22 Ryder Street, St. James's, London, S.W.1. U.S. Representative: R. S. Farley, 111, Broadway, New York, 6.—Saturday, November 27, 1948.

(1947 Accounts)

HIS MAJESTY'S COLONIAL SERVICE

GOLD COAST STATISTICAL OFFICE

Applications are invited for the following vacancies in the Office of the Government Statistician in the Gold Coast:—

(1) *Superintendent of Organisation and Methods:* to be responsible for carrying out investigations into departmental methods of keeping records and statistics, and into accounting and cost accounting procedure, for the study of routine business in order to ensure efficient use of staff, and for inquiring into problems of mechanisation. He will advise on the planning of new work, and on all important changes in the organisation of existing work.

Salary: £1,400-£1,600 according to qualifications (including overseas pay). In the first instance on contract of 18-20 months, to be renewable at the discretion of the Government.

(2) *Statistical Officers* (3): to be responsible for the planning and analysis of statistics. First- or second-class honours degree (or equivalent qualification) required, in Statistics, Mathematics, Economics or other appropriate main subjects combined with statistics. Candidates should have had wide practical experience in statistical work.

Salary: Two posts at £1,000 and one at £1,200 (including overseas pay). In the first instance on contract of 18-20 months, to be renewable at the discretion of the Government.

(3) *Administrative Assistant:* to relieve the Government Statistician of work connected with routine administration. Candidates should possess a degree in Economics or Commerce (or equivalent qualification), and some experience in administrative work preferably in Government Departments or large local authority.

Salary: Starting salary in the scale £600-£[illegible] according to experience but not higher than £800 a year, including overseas pay. Pensionable appointment.

(4) *Supervisor of Calculating Pool:* to be responsible for the organisation of computing work, and the training of staff. Candidates should have had wide experience in advanced computing work.

Salary: £600 a year (including overseas pay). In the first instance on contract of 18-20 months, to be renewable at the discretion of the Government.

Write for application form, giving *brief* details of age, qualifications and experience, quoting this advertisement, to the Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1, within two weeks of the appearance of this advertisement.

EXPERIENCED executive in Marketing, Merchandising and Advertising field seeks permanent position in U.S.A. with British Company having established American connections. Advertiser is British subject with U.S. Resident Alien Status and has background of 15 years' business experience in America.—For all particulars write Box 898.

APPLICATIONS are invited from University Graduates (under the age of 25) in statistics or mathematics, for a position in the Market Research Dept. of a large nationally-known manufacturing Company. The position is one in which wide scope for individual work will be offered after a preliminary training, and candidates must possess the capacity for independent work. The person appointed will be required to reside in the North of England. A good commencing salary and prospects are offered. Send complete particulars of education and qualifications to Box 885.

CHIEF ACCOUNTANT required by manufacturers of electrical appliances in the Midlands, employing 3,500. Chartered or Incorporated Accountant preferred with industrial experience, including mechanised accounting and standard costing. Salary £1,500-£1,750 per annum, according to experience. Contributory pension scheme in operation. Firm's own staff have been advised of the vacancy.—Write, giving full particulars, to Box No. N.8591, 43 Hertford Street, London, W.1.

INDUSTRIAL ADMINISTRATION OR TRADE ASSOCIATIONS.—Scotsman (19), available now. Chartered Accountant and Cost Accountant. Twenty-five years' experience Glasgow and London in professional, commercial and Trade Association secretarial work, including six years secretary/manager wartime Pool trading Company, turnover £250,000 p.a. Accounting, investigations and reports, statistics, industrial organisation, price agreements, negotiations Government Departments and Trades Unions.—Wm. Endie, 1 London Terrace, Glasgow, W.2

WELL-KNOWN public company has vacancy for well educated man as assistant to an executive. Public School and University education an advantage. The post which offers excellent prospects will entail a thorough training leading to an executive position. Applicants must have real interest in organisation and management. Previous experience essential.—Box 892.

South-East Asia

THE British officials who recently assembled in Singapore to discuss, under Mr Malcolm MacDonald's chairmanship, the situation in south-east Asia have done so against a gloomy back-cloth of violence, political unrest, economic disintegration and universal extension of Communist power and pressure. The situation seems all the more dangerous when it is remembered how frail and superficial are many of the links established between the western world and the Far East. The men who went out to trade in the nineteenth century had no very clear idea of their ultimate relations with the communities which, as a result of their intervention, were to be forced out of primitive or traditional patterns of society. Many of them assumed that a purely colonial status would prove permanent. Most of the rest worked on the assumption that it would prove possible, in time, to reproduce in Asia all the characteristics of western European democracy and to admit the peoples of south-east Asia to full equality of status. British and American theory conceived equality in terms of independence, French and Dutch of assimilation. But in both cases, the purely colonial relationship would be left behind.

At the root of the present crisis in south-east Asia lies the fact that none of these expectations has been fulfilled. In general, no eastern version of a fully fledged western economy has grown up. In large parts of south-east Asia, industry, such as it is, has remained in foreign hands. Commerce and banking has been shared between the westerners, the Japanese and the Chinese. Everywhere the base of the social pyramid has remained the peasant. Upon this basis, no strong middle class could be built. The peasants remained outside the political system. Trade unions were weak or non-existent. The officials and managers were European. Chinese traders, bankers and industrialists, both in their own country and in the lands to the south-east, showed more capacity for amassing fortunes than for exercising political responsibility.

The consequence of these shortcomings was that in most lands in south-east Asia there was no basis for national equality with the western world, and the very factors which made western patterns inapplicable —the forgotten peasantry, the irresponsibility of the industrial and commercial classes, the weakness of the trade unions, and the prevalence of foreign interests and foreign rule—have played straight into the hands of the Communists, who are able to canalise into their movement both the economic grievances of the masses and the hatred of foreign rule felt by the more educated. Today, the sure outcome of the disappearance of western influence and control would not be independence or assimilation but absorption into the Soviet world.

This is the situation which confronts the western Powers in south-east Asia. They can hardly be indifferent to it. But even if the issue is vital, can anything be done? One of the most discouraging features of the Nationalist débâcle in China is the impression it creates of a regime so inwardly weakened that no amount of outside assistance can shore it up. May not the failure of the west in the past to create the social pattern of western society mean that it is now too late to make the

attempt? The western Powers can hardly accept such a verdict. Nowhere—not even in China—is the battle decided. It cannot, therefore, be abandoned. On present showing, however, it can be questioned whether it is being waged in the right way.

In the first place, although the Communist threat presents an almost equal challenge to all the western Powers concerned with south-east Asia, there is little or no sign of them making a genuinely concerted effort to beat it back. On the contrary, to give only two examples, there have been very strong divergences of policy between the Americans, the British and the Dutch during the long-drawn-out mediation in Indonesia, and a constant refrain of transatlantic criticism is that Britain is either doing too little, as in Burma, or too much, as in Malaya. The time for such disunity is surely past. The western nations most closely interested in the Far East are actively concerting their defence and economic policies in western Europe in order to give a firm and progressive answer to Soviet threats. Meanwhile Communism kicks open the back door and it is hard to say whether the Allies are even in agreement on the necessity of closing it again. Of a strategy for doing so, there is no trace.

It is one thing, however, to say that the door should be closed, quite another to know how it can be done. There is both an immediate problem—to hold the vast areas that are still under western control—and the longer-term, more fundamental problem of pacifying those areas and of permanently excluding Communist infiltration. There is no need for pessimism over the former task. It may still be possible to preserve southern and western China from the Communists, the Philippines are firmly under western influence, and almost everywhere else Communism is, temporarily at least, on the defensive as in Malaya and Indonesia or divided within itself as in Burma. A more vigorous defence policy can certainly enable the western Powers to hold the line. The real difficulties arise when they ask themselves what they intend to do behind it.

★

The safest course is, surely, to return to the reasons which have led to the weakening of the western position. The west's failure is above all a social failure. It is this that the western nations must remedy if they are not to accept defeat. Hitherto, the policy of the western governments in the south-eastern dependencies has been one of honest progressivism in political matters; it has taken a positive interest in commerce and finance; but it has tended to leave basic production to private agencies and the play of economic forces. This has led, until recently, inevitably but quite unconsciously, to a certain neglect of the basic element of the population, the peasantry. The peasant was too ignorant to provide raw material for experiments in responsible government, and too poor to be a major factor in commercial matters. In Malaya, this unconscious bias in western policy has had the further effect, now seen to be unfortunate, of favouring the Chinese and Indian elements of the population rather than the native Malay.

Possibly the first step to be taken in a new policy is to revise some of these emphases, to found hopes for the future rather on economic and social stability than on political liberalism and to seek the stability of the social system at its base rather than at the top. There can be little doubt that the support and extension, throughout south-east Asia, of the land-owning peasantry could provide a more solid base for lasting co-operation with the west than the patronage of landlords who are no defence against Communism or of commercial classes who are often alien to the soil. No peasant will turn to a Communist party pledged beyond recall to collectivisation (by the most brutal methods) if land for personal ownership can be had from another source. A policy of land reform is obviously beset with difficulties. For instance, in expropriating the existing landlords of south-east Asia, the authorities must pay compensation. Yet how is its burden to be borne? Similar problems of compensation are proving very difficult in Burma. Another set of difficulties is concerned with possible losses of wealth. If the extension of small peasant farms in Malaya, Indonesia and elsewhere in south-east Asia were to disrupt the plantation industries, the world would be gravely impoverished as a result. Of this, two things may be said. The first is that the damage done by the diffusion of ownership might be much less in south-east Asia than it has been in Europe. It is not certain, in rubber at least, that the big plantation is any more efficient than the small producer. Mr P. T. Bauer, in the Report on his investigation into smallholdings in Malaya, which has just been published in the Colonial Office research series, expresses the opposite opinion. It may be that, for once, social and economic objectives march together. The second point is that a temporary fall in production, if it were moderate, would hurt the western world very much less than the permanent and total cutting off of supplies that would be the probable result of Communist domination.

A thriving economy in south-east Asia also requires an expansion of native industry—particularly of light industry. But industrial development will hardly contribute to the general objective of building a stable society, if it is left, as in the past, to foreigners. The British have started to find part of the answer in their efforts in Malaya to build up responsible trade unions and to introduce at least the first outline of social services. But trade unions cannot be responsible in a framework of irresponsible industrial management, and it is here, perhaps, that American experience can be of use. There is, perhaps, an example to be followed in the efforts that are now being made, largely under Mr Nelson Rockefeller's leadership, to associate United States and Latin American capital on partnership terms. In time, no doubt, the United States side of the partnership may diminish, leaving behind businessmen capable of playing a constructive part in a modern democracy. There has been very little partnership in south-east Asia in the past. Full partnership may be impossible overnight; but it could at least be recognised as an objective.

If the western Powers are wise they will reinforce this policy by making full use of the economic organs of the United Nations. The World Bank, the FAO, the ILO can all be agencies of western policy provided the western Powers have the plans and the funds ready for the purpose.

In these ways, the emphasis of western policy, which has been progressive in political matters and very hesitant in social and economic, could be reversed. But what does this mean in the political sphere itself? Independence in the old-fashioned sense entails the risk of Russian domination. But can independence be refused? To make it the goal of colonial policy has been one of the chief glories of the liberal tradition in the west, and it is only with the utmost hesitation and heart-searching that any retreat from it—or anything that might be interpreted as retreat—can be contemplated. Is it not more important to stress economic and social policies which will make eventual political independence a reality and not the mock of near-anarchy into which it is slipping in Burma today? It will admittedly be extremely difficult to persuade American opinion that alterations in the time-table of independence are in the best interests of both governors and governed and, again, it may be difficult to pursue economic and social improvement with enough energy and success to prove that the goal of independence is not abandoned, but simply postponed. Even so, the colonial time-table is not already so precise that a measure of caution cannot be injected into it. What is urgent is the immediate launching of new policies in the economic and social field. It is here that western policy faces its real test. In the next twenty years the western Powers can either lay the economic and social foundations of genuinely free communities in south-east Asia or they must watch the area slip, by penetration from within and pressure from without, into the Soviet sphere.

Left or Right—II

THE first article under the above title, which appeared last week, set out some of the evidence for the belief that the political situation in this country is now very delicately balanced between the two major parties. Anything may happen in the general election when it comes; the only thing that seems to be a probability is that the result will be decided by a small majority of votes. The intelligent undecided voter, not a clear motion of mass opinion, will tip the balance one way or the other. The greater is the responsibility that rests on the central body of independent opinion to make up its mind carefully. The article went on to assert that though there is a very real issue to be decided, it is not the tedious irrelevancies of public *versus* private ownership, of "control" *versus* "freedom," which engage the parties, neither fully believing in the side it takes. Faced with these artificial antitheses, the honest observer can only answer that sound policy requires a bit of each. The real issue lies between two antithetic orders of ideas which were christened (for lack of better labels) those of Left and Right. The ideas of the Left start from the belief that production is a matter of little importance—indeed, that there is a danger of over-production—and that the chief exercise of public policy is satisfactorily to distribute the fruits of abundance. The Right stresses thrift and productivity; the Left consumption and welfare. Social security is an idea of the Left; productive efficiency of the Right. The Right exalts enterprise, the Left equality. To the Right, inflation is the chronic danger; to the Left, deflation. The Left is idealist, the Right realist; the Left is spend-thrift, the Right miserly. Put in these terms, the real question that will be before the country is whether it needs, in the next few years, a policy of the Left or the Right.

Alfred Marshall once said that there was no statement in economics that was both brief and accurate. He might have added that there is no economic policy that is right at all times. The economic climate alters as completely, though not quite as rapidly and regularly, as the natural seasons, and a policy that is entirely correct at one time may at another be as foolish as stoking the furnace in July. There is one corner of the economic field—but one almost alone—where this alternation is now widely admitted. Everybody knows that there are booms and slumps, and almost everybody agrees that a budget deficit is right in a slump and a budget surplus in a boom. Similarly, over longer periods of time there is a tendency for the outward economic circumstances of a country, or even of the whole world, to have a fairly steady bias one way or the other and Governments are compelled or enabled (as the case may be) to adjust their policies accordingly. A policy, or a set of ideas, may have been perfectly well adjusted to the circumstances of a past period without that establishing any presumption at all that they will be equally adjusted to another period.

It is easy now to see, looking backwards, that policies of the Left were both inevitable and desirable in Britain in the two decades between the wars. They were desirable, on the economic plane, because the period was one of chronic deflation and emergent over-production, and on the social plane because the great productive spurt of the late Victorian and Edwardian days had undoubtedly left human welfare in arrears. And they were in any case inevitable because universal suffrage was bound to bring after it, with a time-lag, a demand for public guarantees of individual security. What completed the inevitability of a period of Left policies was that, through a fortunate accident, the country could afford them. The inter-war period coincided fairly exactly with the long depression in the primary producing countries of the world. Save for one or two exceptional years, the terms of trade—the decisiveness of which for the British economy is at last becoming generally recognised—tended to turn steadily in Britain's favour. There was each year an uncovenanted bonus of real income for the British community and it was this, by and large, that paid for the welfare projects of the Left-minded governments of those years. It was this which enabled the country, in its external relations, to sell steadily less to other countries while importing steadily more, and in its domestic concerns to convince itself that the problem of production was solved.

★

It is always more difficult to look ahead than back. But unless all the visible economic weathervanes are liars, the wind is now firmly set in another quarter. If the policies of the Left were those best suited to the 1920s and the 1930s, it seems no less certain that policies of the Right will be needed in the 1950s. There are two main reasons for saying this. The first is that the country's external circumstances have changed. It would probably be easy to establish that, in the first war, the damage done to the British economy's earning power by the actual fighting was less than the gain it derived from the cheap food and raw materials that the subsequent agricultural depression made available. But the effects of the second war are certainly different. The economic losses of the war itself were far greater, and the consequential dislocations seem likely this time to work against Britain. The terms of trade will doubtless swing back to some extent, but that they should revert so violently as actually to be more favourable than in 1938 seems barely possible. The British community, in short, is impoverished; it can afford less leisure and luxury, and it needs all the effort and enterprise, all the thrift and efficiency, it can contrive.

Secondly, even without this impoverishment, the policy of the Left has been overdone. In its social security manifestation, the nation has blessed and burdened itself with a formidable array of the most expensive welfare schemes. The idealist labours of the last five years completed the edifice at breakneck speed and with inadequate thought of the cost. In another manifestation of the ideas of the Left—the desire for egalitarian collectivism rather than for the perils and pleasures of private enterprise—the country has built up an edifice of state control and state expenditure which is barely supportable. A position has been created in which there is neither reward for enterprise nor penalty for unenterprise. It is high time that the ship of state were set, if only for a period, on the opposite tack. The independent voter will certainly be safe, when the election comes, in casting his vote for policies of the Right, in the sense in which the term has been used here.

But it does not in the least follow that he must necessarily cast his vote for the Conservatives. The period between the end of the first war and the onset of the second has been described as a period of the Left in policies; but it was a period of steady Conservative rule—for eighteen out of the twenty-one years. If this appears to be a paradox, it is only because of the somewhat unfamiliar way in which the terms Left and Right are being used in this article. But that the Conservative governments of these years, under Baldwin's inspiration, took large strides towards the basic Left concept of the paternal welfare state can hardly be questioned. Indeed, it can be argued that, if Left policies were inevitable, it was a very good thing that they were executed by governments of the Right. The unity of the nation was thereby maintained and the policies themselves preserved from the disaster of being driven to their logical conclusions. Without going so far as to propound a doctrine of economic

determinism, one can assert that all political parties feel, in greater or less degree, the pressure of external circumstances; they all respond to changes in the economic climate. The choice between the parties, in this country, is not usually one of the direction in which policy shall move, but of the speed at which it shall travel. Whatever party had been in power in the 1920s and 1930s would have pursued a policy of the Left. The nation can count itself fortunate that it had, in this period, a succession of governments of the very moderate Right.

★

Now that the tide has turned, it is tempting to say that the path of wisdom would be to have policies of the Right executed by Labour governments. That, certainly, would be far less dangerous than to install anything in the nature of a deliberate Conservative reaction, encouraged by the electorate to run to extremes. There is nothing inherently impossible in the conception of a Left government pursuing Right policies; that is what Sir Stafford Cripps has been doing for the past twelve months. Nor is it the suggestion that the Labour Party should publicly abandon any of its major tenets. Neither a belief in public ownership nor a tenderness towards the wage earners and their organisations is necessarily incompatible with what is here being advocated. What is necessary is not that the Labour Party should be willing to abandon its principles but only that it should be willing to subject them to the test of reality, not that it should reverse the nationalisation of industry but that it should clear its mind about what it is going to do with the nationalised industries; not that it should stop trying to secure a larger slice of the cake for the working man but that it should stop pretending that the cake is larger than it is. On the other hand, it will not do if the Labour Party is too rebellious against the compulsions of reality. Any government that is in office in the next few years will be forced by hard facts to move to the Right; but the country will suffer if this happens only in Dr Dalton's fashion—by periods of sublime unconcern alternating with sharp crises of surrender. Before the floating voter can feel happy about entrusting the Labour Party with the duty of putting the helm to starboard and of getting the national economy back on to course, he needs to be assured that it will not kick against the pricks of its duty any more than, say, the Baldwinian Conservatives did against the pressures towards a Leftish policy in the interwar years.

This, then, is the question. Can the Labour Party withdraw its eyes from the long perspectives of facing the future and, instead, face the facts of the present? If it can, then it might be a better guide for the nation in the next few years than the Conservatives. It is certainly better that the tack to the Right, which is inevitable in any case, should not have to be executed in the teeth of blind opposition from the whole labour movement.

But can the question be affirmatively answered? Is the Labour Party a group of responsible statesmen, willing to face reality and to do their duty, even if it means putting a brake on the party fanatics? The Iron and Steel Bill says No.

The Official Spokesman

THE annual report of the Central Office of Information is the first such report that has ever been presented to Parliament since the creation of the Ministry of Information in 1939 coincided with the suspension of departmental reports. While the Ministry of Information was born of the wartime necessity to centralise the information services of the Government and to control the publication of news, the creation of an information service in time of peace, as a permanent adjunct of the Government, is the result partly of special postwar conditions and partly of a wider definition of the functions of government. In the first place, there is an undoubted need for a publicity service to undertake campaigns of persuasion, largely in matters of health and public safety, and in fields where coercive legislation is impossible. The argument for applying publicity techniques to the tasks of persuasion is not invalidated by the fact that at present many Government campaigns, such as that to increase productivity, to attract people into undermanned industry, or to make them contented with the current level of wages, are merely weak substitutes for a courageous policy. Equally in questions such as recruiting or cuts in imports, which require authoritative explanation by the Government, no amount of posters, pamphlets or films can take the place of plain speaking from the leaders of the Government. Nevertheless, there are departments of public policy where patient persuasion is the right technique to employ.

Secondly, in a tightly knit community living under a complicated administrative code, the Government has a direct duty to explain its policy and its laws. The old dictum that it is the duty of the subject to know the law is quite inadequate in a period of far-reaching positive legislation. The subject who in one year has had to master the effect upon his own affairs of transport nationalisation, of the introduction of the health service, and of the Town and Country Planning Act, may feel that the Government spends too little rather than too much effort in giving clear and comprehensible information about its operations.

Thirdly, the Government has for many years accepted the responsibility of improving technical standards in industry and agriculture, as well as for vocational training. As the state becomes more involved in both adult and juvenile education, the techniques of mass information—films, books, and lectures—grow equally in importance.

It is estimated that in the year 1948-49 the Government will spend about £17 million on its information services. Of this, £11½ million will be accounted for by overseas publicity, including the BBC Overseas Service, the British Council, and the overseas work of the Colonial Office and the Foreign Office. Of the balance, £435,000 will go on the information staffs of the home Government departments, who will carry another £2,000,000 worth of expenditure for publicity media upon their own votes. It is estimated that COI will spend about £2,400,000 for publicity work in Great Britain on behalf of Government departments. This does not take account of the cost of the department itself.

The COI is designed as a technical agency, as the advertising and publicity manager of the Government. It possesses the facilities for producing and distributing films, for organising advertising and lecture campaigns, designing and producing exhibitions and conducting social research. It undertakes not only the active production of material but also the commissioning of work by commercial firms and artists and technical advice upon the material which Government departments produce themselves. To perform its duties it had in 1948 a staff of 1,698½ as compared with 2,481 for the Ministry of Information in 1945 (whether the half represents a halfwit, an office boy, or a part-time adviser, is not explained in the report). Its overseas division is designed to supplement the works of the other Government departments and is devoted largely to the supply of photographs and feature material for the overseas press, and the production and sale of books and pamphlets.

The theory upon which the COI was created is undoubtedly a sound one. It is right that there should be a central agency capable of co-ordinating the demands of forty-odd Government departments for publicity material and of providing expert advice on the use of highly complicated and expensive techniques. The greater is the necessity to account for the undoubted unpopularity of the COI with the main Government departments and for the poverty of ideas which characterises so many Government campaigns. In the first place it is hardly surprising that policy is so undecided and contradictions so frequent when Government public relations are co-ordinated by three separate committees. Mr Morrison is in charge of the one ministerial committee (until recently there were two), and as he is the Minister responsible to Parliament for the COI he has thus a double role. To assist him he has Mr Gordon-Walker, the Under-Secretary of State for Commonwealth Relations—a combination of activities which appears peculiar to the outsider. Below Mr Morrison there are two official committees, one for home and one for foreign affairs. The official committees consist entirely of heads of information divisions in the different departments, with the Director-General of the Central Office of Information as chairman of both. There is a further apparent complication in the fact that the Economic Information Unit, which was designed to co-ordinate the Government's publicity on economic affairs, was originally responsible to Mr Morrison, but now reports to Sir Stafford Cripps. But this particular duplication seems less unreasonable if the Economic Information Unit is regarded, in spite of its lofty title as the departmental public relations section of Sir Stafford in his capacity, not as Chancellor of the Exchequer, but as general co-ordinator of economic policy.

In the second place, campaigns of a departmental nature such as road safety or recruiting which involve an administrative Government department, are extremely difficult to plan as a whole. The COI is responsible, apart from lectures, only for visual media—films, press advertising, posters and exhibitions—and is therefore not equipped to advise on the general planning of a campaign, for it has no authority over the most powerful organ of persuasion, the BBC. Unless a Minister or the head of his Information Division has real experience of persuading the public, they are too often led into accepting from the COI a stereotyped plan of campaign, using expensive visual media where a more original approach would be both less costly and more effective.

Government publicity campaigns make a much greater use of posters and press advertisements, which are very expensive, than would seem warranted by the response they create. Whether it be the fault of the COI or of the Government generally, there seems to be little recognition of the fact that the Government, in campaigning for an idea or a course of action, is faced with a very different problem from a manufacturer anxious to increase his sales. The complaint is not that the Government is using the methods of Dr Goebbels for political ends, as the factious charge, but rather that they have adopted the methods suitable for advertising branded goods but not for propaganda.

Finally, the COI is in danger of undertaking with doubtful efficiency what the various trades connected with publicity and information do very effectively. A good exhibition contractor employs better designers than the COI can afford to pay, and who are capable of translating the needs of Government into terms of paint and plywood without the necessity of an intermediary. The COI, since it is not responsible for policy, can contribute little to the discussion between a department and an advertising agency on the size or subject of a press advertisement, and the necessity to route material via the COI causes unnecessary delays. On printing and book production there is no one in the COI who can improve upon the work of the best British firms, and relatively simple operations when dealt with by the COI become unduly laborious.

> The largest single enterprise of the year was the launching of *Coal*, a 32-page illustrated monthly . . . . . The preparation and production of so ambitious a project was a severe test of publishing competence.

Such a statement would have brought a derisory smile from the late Lord Northcliffe or from half a dozen Fleet Street publishing houses. Only in its documentary film production can it be said that the COI, inheriting the excellent tradition of the Empire Marketing Board, is ahead of its commercial competitors.

★

The need for a Central Office of Information is firmly established, to prevent overlapping or contradictions in Government publicity at home, to perform certain common services such as film production, space and material buying while these remain scarce, and the commissioning of commercial firms and agencies. There is also no doubt of the usefulness of its overseas work. But it can be asked whether these are not the limits of its usefulness as an executive agent of the Government. Many of its present functions can be exercised equally well by Government departments who, for instance, handle the release of news to the press very much more efficiently than the COI. Equally there is an urgent need for a body of men, whether as civil servants or as advisers, whether as part of the COI or as a cell of the Cabinet offices, who are concerned not with routine but with the whole range of the Government's public relations and of the effective means—oral as well as visual—by which it can be implemented. It is only by some such means that the decline towards the fatuous and the second-rate can be arrested. There are at present 400 civil servants in the COI earning over £700 a year: it is arguable that it would be better and cheaper if there were 40 men earning £1,700 a year and four men receiving from the Government the very large salaries that their creative attainments would fetch in the free market.

OUTSTANDING VALUE IN LIFE ASSURANCE

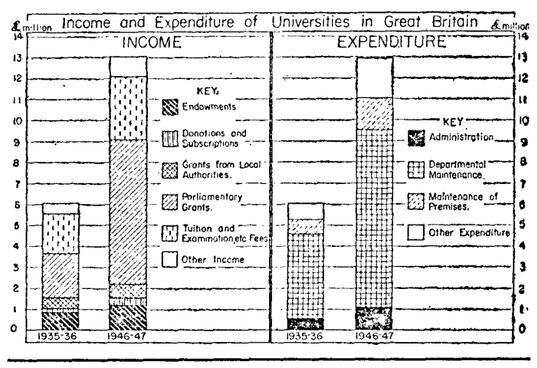
LIFE ASSURANCE SOCIETY

20, LINCOLN'S INN FIELDS, LONDON, W.C.2



The Price of Learning

THE universities have been in the news more often in the past three years than ever before. This is partly because of their own achievements, partly because the part they play in the political and economic efficiency of the whole nation is much more fully appreciated; politicians and businessmen have awakened to their value as breeding grounds for "backroom boys" and bureaucrats. The whole picture of university progress is now brought into focus—for the first time in twelve years—by the publication of a comprehensive Report by the University Grants Committee.*

Very great progress has been made. Before the war, or even in the middle of it, no one would have dared to predict that the numbers of students enrolled in the universities would increase from 50,000 in 1938-39 to 83,000 in 1948-49, or that the Government would be ready to increase its recurrent grant from £2 million a year in 1938-39 to £6.8 million in 1946-47, and that it should promise a further increase to £13 million a year in 1951-52, with a further £30 million over five years for buildings and equipment. Indeed the predictions of the universities themselves have been overtaken by the momentum of change. When the Barlow Report on Scientific Manpower recommended in May, 1946, that the numbers of students in the faculties of science, technology and the arts should be doubled at the earliest possible moment the proposal was widely regarded as impracticable. The numbers of medical students cannot expand quite so rapidly, and when allowance is made for this, the Barlow proposals involved an increase in the total number of students in all faculties from the prewar figure of about 50,000 to 90,000. The university authorities responded valiantly and promised an expansion to 88,000 by the end of ten years. But by the beginning of the current term student numbers had already risen to 83,000, and this only two years after the Barlow Report. An expansion of 66 per cent in so short a time, and with all the prevailing limitations on building and recruitment of staff, is a great achievement. Indeed so far as the particular requirements for scientific and technical students were concerned the Barlow targets were all but achieved a year ago. In the autumn term of 1947 there were 14,520 students taking courses in pure science and 10,143 in applied science, compared to 7,767 and 5,288 respectively in 1938-39. The arts faculties do not show the same rate of expansion. It may be that the proportion of students studying the pure and applied sciences is likely to remain permanently higher. If this became a marked tendency, it would be a matter for concern.

This transformation has of course been effected only by a mass of improvisations and makeshifts, many of which have temporarily affected standards of teaching and accommodation. But any such scale of improvisation would have been impossible, as would the recruitment of new staff and the creation of new departments and new chairs, if it had not been for the heavy financial backing of the Government. The diagram shows clearly how the balance of university income and expenditure has altered over the past twelve years, and how large a share of the cost is now borne by the state. Over the twelve years the expenditure of the universities has more than doubled from £6.1 million to £12.9 million, while Parliamentary grants have more than trebled. The figures for 1946-47, which are the latest that are yet available, show only a part of the trend; whereas the proportion of the universities' income derived from the Exchequer was 34 per cent in 1935-1936, and 52 per cent in 1946-1947, it may well be over 60 per cent by 1951-1952. And to this must be added the government grants for capital expenditure, which before the war were as low as £30,000 a year and are now expected to amount to £30 million over the current quinquennium; £50 million would have been available had building shortages permitted it.

Such a heavy degree of dependence of the universities on grants from public funds raises very important questions of government control, which are discussed at considerable length in the University Grants Committee's Report. Complete financial dependence on the state, of course, is still some way off. During the twelve years under review the universities received private benefactions amounting to over £14 million, and their endowments even now provide 9.3 per cent of their income. But the total figures mask the great variety between the different universities: Oxford and Cambridge still draw 24 per cent of their income from endowments, while Wales draws only 3 per cent. Against this, however, it should be remembered that the income from fees also comes to a large and increasing extent from the pocket of the state. In 1935-36, although 41 per cent of all students received some sort of assistance towards their fees from public or private sources the amounts were often very meagre, and might only amount to a part of the cost of tuition. In 1946-47, 67 per cent of all students were assisted, of whom a large proportion were receiving full maintenance. The 22,000 ex-service students who are now receiving grants for further education and training from the Ministry of Education to cover their studies will gradually be passing out of the universities. The report is quite definite that their places cannot be filled by students of sufficient private means to finance their own education. This gap between supply and demand is being considered by a committee on the future provision of state awards and scholarships which was recently set up by the Minister of Education and whose report is expected very shortly. It is expected to recommend that something under two-thirds of each year's entry should receive state or local authority grants. These grants will inevitably limit the universities' choice of entrants.

In spite of the large increase in the state's assistance to the universities, its direct intervention through the University Grants Committee in their affairs has remained admirably restrained. The report redefines the function of the UGC as "not one of direction but of stimulation, co-ordination and advice," and to the spirit of this definition it has undoubtedly tried to keep. But at this juncture it is not the UGC alone which brings pressure to bear upon the universities. The demands for specialists of university quality have turned the eyes of government, of industry and the professions towards the universities. Report after report has recommended that the universities should increase their output of students or extend their facilities for medical studies, for dentistry, for pure science, for technology, for social science, for slavonic and oriental studies, and for the training of teachers and industrial managers. The pressure has not been concerted but it has been cumulative and the room for free manoeuvre left to the universities is decreasing.

The University Grants Committee is rightly concerned about the strain put upon the university staffs first by the absolute increase in numbers, and secondly by the relatively larger part that the universities now play in local or national life. Before the war there were some 4,000 full-time university staff to 50,000 students or, a ratio of 1:12½. By 1946-47 there were 5,500 staff to 77,000 students, giving a ratio of 1:14. By 1951-52 the UGC reckons that it would be desirable to have 10,000 staff, which would give a better ratio than before the war, in order to provide more individual tuition than is now possible outside Oxford and Cambridge, and to set free a greater part of the teachers' time for research work. In practice, the committee estimates that by 1951-52, when the numbers of students may be up to 88,000, it will only have been possible to increase the staff to 8,000, giving a ratio of 1:11.

To raise the figure to 8,000 would in itself be no mean achievement, since teachers are trained far more slowly than students. But it might not represent a doubling of effective teaching capacity. The time of all members of university staffs is being steadily eaten into by outside claims and committees, administrative duties and the heavy work of selecting students. The UGC is rightly concerned about the load on the shoulders of senior staff, who ought to be spending their time more profitably in teaching and research. The administrative arrangements of most universities are unreasonably cumbersome and inefficient, thanks largely to the academic staffs' suspicions of non-academic administrators. The suspicion is understandable, but it leads to quite ridiculous clerical and executive duties being handled by distinguished professors.

Though it is teachers more than buildings that make a university, it must be admitted that the overcrowding, not to say genuine slumdom and squalor, in which many teachers and students have to work make a mockery of some of the aims of a university education. Money, which proved the stumbling block to the civic universities before the war, is now no difficulty. The universities asked for £40 million for new building and £10 million for sites and equipment, to cover the five years up to 1951-52, and the schemes involved in this expenditure were approved in principle. Restrictions on building will make only a fraction of this expenditure possible, and the universities will have to be content with only a very slow rate of improvement. Fortunately, however, progress is likely to accelerate gradually and there is no reason to doubt that, short of a major economic collapse, financial support will be continued.

*

The Committee concludes its report with an interesting discussion of the new and intimate relationship between the state and the universities. The question at issue is whether central planning and the necessary control of public money are compatible with the academic freedom which is essential to the independence and vitality of the universities. The Committee maintains that central planning and academic autonomy are not irreconcilable opposites, and it has indeed been extremely successful, by means of its many sub-committees on which the universities are heavily represented, in carrying the universities along with it. To a hardened planner some of the developments may appear unnecessarily duplicated; once established chairs and departments never wither away; ruthlessness and slick efficiency are not university hallmarks. But few can complain of the way in which the universities have tackled their post-war problems. The record is one of great achievement of which both the universities themselves and the country can be proud.

NOTES OF THE WEEK

Berlin—

Dr Bramuglia has continued his patient efforts at mediation ever since his first attempt broke on the Soviet veto in the Security Council. He and the six "neutral" countries who support him have concentrated on the currency problem, and have sought ways to combine the extension of the Soviet mark to the whole city with a progressive reduction of the blockade. So far these efforts have achieved nothing more than an agreement on the part of the Four Powers to consult with United Nations experts on the currency issue.

Dr Bramuglia's term of office as chairman of the Security Council has come to an end, but it is believed that efforts of mediation will continue until at least the end of the Assembly. Yet, as the western Powers have pointed out, mediation on the issue of currency alone is hardly relevant. In August, the biggest division between the eastern and western sectors was still the difference in currency. Today this is no longer the case. The division between the Russian sectors and the rest now resembles much more closely the split between the zones themselves. The Russians have steadily dismantled the structure of German self-government in Berlin. First, the freely elected *Magistrat*—with its "western" majority—was driven to take refuge in the western sectors. Then officials working for the *Magistrat* were imprisoned by the Russians, and like Dr Mueckenburger, head of the coal office, who was sentenced last week, tried for "sabotage," for supporting "the imperialists" and for "dividing the city." This process has been brought to a head by the fact that municipal elections fall due next week.

The *Magistrat* determined that elections should be held. The Russians, fearing that any vote, however controlled, would reveal the blatant unpopularity of their own Socialist Unity Party, agreed to elections on one condition only—that all parties which the Communists choose to call "fascist" should be disfranchised. Since this ban extends to all the free parties in the western sectors (and with particular virulence to the Social Democrats), neither the *Magistrat* nor the Allied Powers accepted the condition, and plans were made to hold the elections in the western sectors alone on December 5th.

The Russians instantly unleashed every calumny of propaganda to attack the western Powers for splitting the unity of Berlin, "the capital of Germany." The climax of this campaign came last Tuesday when all the Communist and fellow-travelling members of the old city Assembly—who together form a small minority of the original freely elected City Assembly—were summoned to the State Opera House in the Soviet sector and there "elected" a new *Magistrat* and a new Burgomaster, Herr Fredrich Ebert. Thus Berlin is now split by the most absolute of all divisions—that of political sovereignty. There are two governments, one, democratically legitimate, in the western sectors, the other, illegal and manufactured, in the Soviet. Both claim jurisdiction over the whole city. Each has effective sovereignty in only a part.

In these conditions, mediation on the single issue of a currency for Berlin grows daily more irrelevant and ineffective.

* * *

—And Bonn

There has been more than a hint in the Russian zone that the Communist administration established in Berlin may open the way to more than mere city government. It may be flanked by a wider administration, claiming to govern the city, the Soviet zone and Germany as a whole. The recent references to "the capital of Germany" are significant and the movement for German unity worked up by the Communists in the summer has still to find an outlet. The "People's Council" which crowned the agitation and was supposed to penetrate deeply into the western zones may now be found a job—as an assembly in Berlin claiming to speak for Germany as a whole.

The reasons for such a Russian move are obvious. Economically, their zone is at a low ebb. The Allied counter-blockade has

cut off vital supplies of steel and coal and machinery and the Russians have no reserve from which to make good the loss. They must therefore seek with all the more vigour to counter economic shortcomings by securing the political lead. Yet here, too, the western zones have the advantage. The Russians have only to look across the zonal frontiers to Bonn to see popularly elected representatives of western Germany concerting together the form of a central government which will have a better claim than any other body to speak for the whole Reich. This challenge to Russian authority is quite sufficient to drive the Communists to take a lead in establishing some sort of central government of their own and on a recent visit to Moscow the Socialist Unity leader, Herr Grotewohl, received assurances from Mr Molotov that Soviet Russia would be ready to conclude a treaty with a Central German Government—naturally under Communist domination—and to include in the settlement conditions for the withdrawal of the Russian army of occupation.

*

In point of fact, the challenge from the western zones, though real, may not be as immediate as the Russians fear. The progress of the German constitution-makers at Bonn is decidedly slow. The split between those who wish a fair measure of centralisation and those who are federalists *à l'outrance* appears in a hundred different forms—in disagreements about the frontiers of the constituent states, in differences over the powers of federal tax collectors, in disputes over the functions of the chamber which will represent the interests of the states. These internal divisions are, however, less decisive at the moment than the delays brought about by Allied policy.

The Occupation Statute which is to regulate the relations between Military Government and the Germans has not been handed to them. They argue—reasonably—that they can hardly define their own powers when they do not know what those powers will be. The Germans are also unwilling to commit themselves until two disputes between the occupying Powers are settled. A persistent belief is current in Bonn that the western Powers may yet untie the Berlin knot by postponing the establishment of a western German Government. At the same time, France's protests over the Ruhr and the unwillingness of the French to fuse their zone with Bizonia create an atmosphere of Allied uncertainty in which the Germans do not feel called upon to be more certain themselves. But perhaps the factor that has had most to do in creating an atmosphere of unreality in Bonn is the Allies' intervention, designed to impose their own views on the future constitution. The Germans have received seven points which they are instructed to include in their draft. In the circumstances, they may be forgiven if they feel a certain scepticism about their real powers.

* * *

A Bench of Neros?

Mr Churchill did one more considerable service for the defences of his country when he transformed the second reading debate on the National Service Amendment Bill into a discussion of the whole field of defence policy. He rested his case on the arguments he put forward in 1945—that, once the Japanese war had been won and the atom bomb discovered, the forces should have been reduced to the foundation level, and then have been rebuilt into a permanent peacetime structure. To these arguments, which have been put forward not only by Mr Churchill but by many Labour back-benchers in party meetings in this Parliament, Ministers made no real attempt to reply. Their contribution to the discussion of general policy consisted primarily of a re-statement of the present shortages of service manpower, but Mr Alexander undermined their case by his admission that the way in which men were used by the Services "left a good deal to be desired." Finally, Mr Shinwell gave some significant information in the closing passages of his speech, which, though hurried, was enough to confirm many of the criticisms which have been made about the state of the forces. Owing, Mr Shinwell stated, to the lack of modern barrack facilities and lack of labour-saving equipment, men have to spend too much of their time on chores. He painted, indeed, a sorry picture of conscripts in good heart during the early months of their service when they underwent intensive basic training, but whose morale sagged when they graduated, as trained men, to peeling potatoes. He also made the very serious charge that the relations between officers and men were not satisfactory—a fact which he ascribed in part to the amount of paper-work which now occupies an officer's time and which leaves him little opportunity for man management—paper-work which is the direct result of the anti-

quity of administrative methods imposed on the Services by their own departments and by the Treasury.

These grave admissions were thrust in at the end of a frivolous party speech. Mr Shinwell, who is never very clear about the relation between cause and effect, perhaps does not realise both how grave a reflection are these statements upon himself and how much they will prejudice his recruitment campaign. It was most damaging to the Government's prestige that the Prime Minister did not accept Mr Churchill's challenge to answer in person the charges about the state of our defences, for which Mr Attlee, as chairman of the Defence Committee, bears direct responsibility.

Nor was Mr Churchill any more successful in goading the Government into informing Parliament about the state of the effective reserves, even though he hinted that he might be forced to return to his prewar role and make the revelations himself. All Mr Shinwell would say was that there are some 200,000 men in all three Services overseas. It was a debate that was deeply discouraging to all who took part. In all, 38 Labour members voted against the Bill, but they were too oddly assorted for their action to have political significance. Side by side with a handful of Nenni telegraphists were pacifists and others who have been supporters of Mr Bevin. The most significant comment on the discussion was that over 120 Labour members kept clear of both the debate and the division. But if this was merely an attempt to dodge an unpleasant issue, the abstaining members are not likely to find support in their constituencies. The framing of a defence policy which will inspire public confidence is one of the most vital tasks of the Government today. If the Labour party lacks the nerve to demand one and the Labour Government the capacity to execute one, then whatever their achievements in other directions they have prejudiced their right to govern at this time.

* * *

European Plans and Trading Realities

Ever since Mr Hoffman suggested that the Organisation for European Economic Co-operation (the OEEC) in Paris should present a four year picture of their future needs, it has not been difficult to predict that nineteen different national economies making nineteen different estimates of their four year developments would not produce a single, neat, well rounded and complementary plan. The attempt has now been made and the inevitable failure realised. As a result, the drafting of a single plan has been postponed and December is likely to bring forth no more than an interim report.

The effort to draw the plans up and then draw them together has, however, proved intensely valuable. Until the scale of the divergences could be measured, neither the nineteen participants nor the OEEC could assess the scale of their problem. Now at least they can see where the worst difficulties and contradictions are likely to develop. The Paris edition of the *New York Herald Tribune* (to whose enterprise this journal was indebted for last week's figures of the British Four-Year Plan) has now published some estimates of the discrepancies which exist between the various plans. Two of these are immediately obvious. The first is the assumption—also implicit in the British plan—that convertibility between the various currencies will have been restored by 1952. In four years time, the ERP area, it is estimated, will have a deficit of $1,296 million with the western Hemisphere. With the sterling area, the ERP countries hope, however, to have a surplus of $664 million. If currencies were freely convertible, the sterling earnings would go to reduce the unfavourable dollar balance. But none of the figures in the plans suggests the possibility of free convertibility. The chance of a billion dollar deficit in 1952—a figure incidentally forecast in the original American estimates published in January—therefore emerges from the present plans unless the buying strategy of the nineteen is radically recast.

Another obvious difficulty lies in the divergence in the various estimates between the sum the ERP nations propose to sell among themselves and the amount they intend to buy. Sales between the nineteen are to amount to $9,120 million, but purchases go no higher than $8,750 million and this difference is reinforced by the nations' intention to provide each other with $420 million worth more in services than they are prepared to accept.

But the problem which may well prove the most unmanageable of all does not appear in the global figures. In fact, it cannot be expressed in purely financial terms. It is that the various estimates of what can be sold abroad mask the fact that the nineteen will be very largely competitive in their sales and will be seeking to buy very much the same commodities. Western Europe's exports must inevitably be manufactured goods, particularly the products of heavy industry. In return the need is for foodstuffs and raw materials. Germany and Great Britain are in peculiarly direct competition now that the Germans have lost their agricultural hinterland in eastern Europe. If this flood of identical exports is to compete on the world market for the same supplies of primary products, the result, measured in the likely evolution of the terms of trade, may be the last nail in the coffin of West European solvency. What will be the prospects of genuine equilibrium if in the 1950's, as one observer put it, "we have to pay a Rolls Royce to buy a bushel of wheat"?

* * *

Sir Stafford Blunders

The Chancellor of the Exchequer, asked by a Parliamentary questioner to explain the principles on which decisions are reached to give or refuse permission for remittances to political bodies in foreign countries, has replied as follows:

> All such applications must be considered on their merits. If there is no exchange difficulty then, broadly speaking, I would approve contributions made for the purpose of strengthening the democratic forces in any country, and I would disapprove contributions made to organizations whose activities are hostile to that purpose.

This is wholly wrong and utterly indefensible. No two people would agree on what is and what is not a "democratic force." The Russians use exactly the same language in a sense precisely the opposite of that in which most people in this country use it. But Sir Stafford evidently has a peculiar definition of his own, for his principle recently allowed him to permit a "charitable" contribution from the Scottish miners to the Communist directors of the French mining strike, whose activities were surely hostile to "the purpose of strengthening the democratic forces" in France.

But though Sir Stafford's principle can be attacked on these grounds, they are not the main reason why it should be regarded with horror and alarm by the public. The main reason is that political considerations—be they never so excellent and never so clearly defined—have no place whatsoever in the administration of exchange control. That control is by far the most powerful in its effects and pervasive in its range of any in the Government's armoury. Once let the suspicion grow that it is being manipulated for political ends, and the structure of public confidence in the honesty of the administration of the country will crumble just as surely as it would if Sir Stafford claimed to set up political principles for the guidance of the Inland Revenue or the High Court. So long as the Communist, Fascist or Conservative Parties have a legal right to exist in this country, they have a right to remit funds to their friends in foreign countries on exactly the same terms as the Socialists. The best thing would be if none of them could send a penny.

This is a vital matter of fundamental principle. Sir Stafford has blundered very badly indeed, and the only satisfactory reparation he can make is to withdraw his answer completely.

* * *

Fogbound

It was an unkind trick of Nature to immobilise the *Queen Elizabeth* for a further four days after, by kind permission of her crew and the New York stevedores, she should have been able to sail. But it had a certain symbolic fitness. It was a truly pea-soup mental fog which held her up in the first place, and which indeed continues to shroud the whole question of the relation between the right to strike and the national welfare. It has become virtually an established principle that the interests of the balance of payments outweigh and override all others. The balance of payments might be endangered by illicit currency dealings; so the sanctity of the mails is discarded—the first such infraction ever ventured upon, in time of peace, by a state not frankly totalitarian. Its achievement requires the concentration of labour power in essential industries; so the Control of Engagements Order, and the still more distasteful direction of labour, circumscribe the fundamental liberty of the individual to choose his own job. It is impaired by an unbalanced tourist trade; so "hard currency" countries are screened off by a financial iron curtain from the British traveller. It cannot withstand the drain of emigrants' capital; so the venturesome must leave behind any substantial property they may possess. It cannot carry the burden of adequate newsprint imports; so free speech itself is muted and clipped by the crippling of its most effective organ, the press. Every basic right is, without misgiving, whittled away, weakened and made conditional—except one: the right to stop work and stop other people working. That, and that alone, is apparently sacrosanct; no matter how expensive its maintenance, no matter how much more the national economy may suffer through its exercise than through that of the rights so readily sacrificed. To pay a Swiss friend's hotel bill in London on the understandinng that he will reciprocate in Zermatt is a criminal offence. To waste a whole Atlantic trip of one of the *Queens* is not. The former action merely gives satisfaction to the parties concerned, the latter involves—hats off, gentlemen!—the Right to Strike.

The Right to Strike is all very well; a hard-won and valuable weapon for labour's emancipation. But is it really more untouchably above the competence of the makers of laws and regulations than other rights won equally hard and once valued equally highly? If national solvency really demands the suspension of these, it is time the goose's sauce was applied to the gander.

* * *

Suspense in Nanking

The latest news from China indicates that the battle for the northern approaches of Nanking has been going badly for the Government, whose forces are now threatened with their usual fate of being encircled and captured by the more mobile and active Communists. Government departments are reported to be already packing up for departure from the capital, and preliminaries for evacuation have also been started in Shanghai as well. The destinations for retreat are two—Canton and Formosa. Whether a defence based on Canton could be maintained for long after the loss of Nanking and Shanghai is an open question; political opposition to Communism is certainly stronger in the south than in north China, but the military forces available are not large—assuming that the Government troops now committed to battle north of the Yangtse are out of the reckoning—and the Communists' military prestige will be so great if they are finally victorious in the battle for the lower Yangtse that it may be impossible to rally an army to oppose their further overland advance. Formosa is another matter; it cannot be taken except by an overseas invasion, and with even the slightest minimum of American aid it should be tenable against Communist power controlling the mainland. High Kuomintang officials apparently think it safer than Canton, as they have been sending their families there.

The Economist
DIARY

The ideal present for the busy man

A memorandum book, an appointments register, and a complete reference book, combined in a diary for the desk. Published by Messrs. Charles Letts & Co. Ltd. Price: in the U.K. (including Purchase Tax) 36/8, or 37/6 post free; overseas 30/-, or 32/6 post free.

Full details are given in the illustrated pamphlet available from:

The Economist Intelligence Unit,
22 Ryder Street, St. James's, London, S.W.1.

Meanwhile, President Chiang Kai-shek has tried to prop up his régime by appointing the son of Sun Yat-sen as Prime Minister. Madame Chiang has arrived in Washington, where she will exert all her powers of persuasion to get American help for the Kuomintang cause. She will be the guest of the Secretary of State, but there is so far no evidence that President Truman has taken a decision to reinforce American support for the Chinese Government. Some of his advisers are believed to hold the opinion that it is now past helping as far as the mainland of China is concerned; Sun Fo's declaration that his Government would welcome the appointment of an American as supreme military adviser removes the main obstacle to American direction of the reorganisation of the Government army, but the concession may by this time be too late for anything to be done before resistance on the mainland collapses. The problem for the United States, however, is not simply whether or not to intervene at this stage; the State Department will have to make its plans for policy on the hypothesis of Communist rule, open or camouflaged, over continental China. Would a Government set up in Nanking by the victorious Communists be recognised as the Government of China—with all that such recognition would imply—or would a Government-in-exile in Formosa enjoy American protection as part of the "cold war" which Communist control of Formosa would bring to the threshold of the Philippines?

* * *

Need Israel Compromise?

When a majority of the United Nations Political Committee decided, as in effect it did, to postpone work on Palestine until the fighting there had run for a further spell, it left open to itself two courses only. One was to throw in its hand and invite winner and loser to negotiate directly. Australia, strangely, was a leading supporter of this sorry choice. The other was to preserve a few shreds of its warrant for the international settlement of disputes by sinking some of the differences that have hitherto divided its Western members. This last has now been done in the name of the British delegation. The price of achievement is capitulation to the American point of view.

The chief American concern seems to be to observe President Truman's pledge that no alteration shall be made to the criss-cross frontiers of the 1947 partition plan without Jewish consent. The new British resolution therefore pays only passing tribute to the more compact Bernadotte frontiers and reverts to the older and—most Britons think—less practical basis. Again, the Americans are anxious to leave the proposed International Conciliation Commission a free hand. The British had felt that it would be in no position to gainsay a victorious Israel unless its hand were strengthened with firm Assembly guidance about frontiers. They now agree that it is not to be so fortified.

But their new resolution, if passed without adulteration, is sufficiently specific to save something from the wreck of Uno's repute. It proposes to empower a Conciliation Commission of three states members to formulate and start running a permanent international regime for the territory of Jerusalem. It "instructs" this Commission to effect any modifications to the frontiers which Israel accepted in 1947 "on a basis of reciprocity." And it instructs the Commission to assist the Arab states to "arrange for the disposition" of the parts of Palestine that the Arab inhabitants are able to retain. The success of its mission as "conciliation" obviously hangs upon its composition. If it is appointed from among weak states, or consists of a jarring trinity, it will further impair the United Nations' fallen reputation. Only if it includes an American who both sets store by Uno's repute and also carries weight with President Truman can it prevent the Israelis from holding their 1947 frontier, yielding nothing of their 1948 conquests, and snapping their fingers at "reciprocity." The British proposal is supported, so far, by the American delegation but is contested by the Russians, who dub it another device to increase the size of Transjordan, and by the Israelis, who want Jerusalem.

The Arabs, whose home publics are still gullibly listening to parliamentary speeches about "driving the Jewish bandits into the sea," are clearly going to need a whipping boy when their discomfiture becomes known. From force of habit, they will blame Britain. To those who do so, the retort is that the Arab cause would have been better served by the Bernadotte plan than by any settlement they can now expect, and that they might have secured this plan had they backed Britain in its support. Without that backing, even their best friends could do nothing for them. They see nobility in their consistent refusal to recognise partition. Admittedly, consistency can be a virtue, but it can also be futile. And theirs, in its futility, has been vastly helpful to Israel.

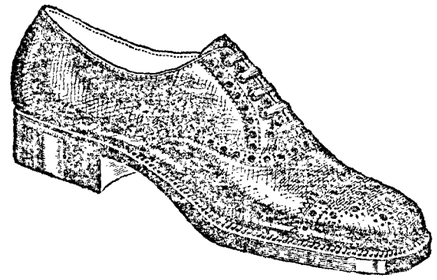
Labour and the Retail Trade

Certain straws in the wind, such as Mr Maurice Webb's campaign for a lower cost of living and the report that discussions on the distribution of food will take place with the co-operative movement, have rightly or wrongly been taken to indicate that Labour's election programme for 1950 will include a plan for reforming and controlling the retail trade in foodstuffs, a plan designed to get food more cheaply from the producer to the consumer. If this plan is indeed contemplated the public have something to be thankful for. The cost of living is a matter of far more fundamental concern, as well as of more immediate electoral value, than the public or private ownership of a particular industry. It supplies, after all, the proof of the Labour pudding—or for that matter of anyone else's pudding; and by any standards it is high time that Labour descended from the ideological empyrean to the humdrum job of making pudding digestible. Evidence that the electors think so is not likely to have been wasted on the Government.

It may be presumed that there is no question of actually nationalising retail food distribution. Politically, there are far too many small shopkeepers for safety. Administratively, even those Labour supporters least chastened by the experience of nationalised industry must realise that the job is impossibly complicated; the inability, or unwillingness, to concentrate the retail trade was the one blot on manpower policy during the war. What is unfortunately true is that all the signs point to increases in the cost of distribution rather than the reverse. The profit margins allowed by the sale of price-fixed branded goods, which long before the war enabled the inefficient retailer to remain in business, are now strengthened by the profit margins allowed by the Government's price-fixing policy. Why is it that food retailing is such a profitable business under rationing if not that retailers are allowed too generous margins? Add to these guaranteed profit margins the trade union demand for shorter hours and higher wages for shop assistants and the average shopkeeper's preference for high prices and low turnover—for selling two lettuces at 6d. each rather than twelve at a penny—coupled with official discouragement of the barrow boy and street market, and there is ample reason for excessive retail costs. No Government will find restrictionism of this sort easy to tackle. What any and every Government can do, and should do, is to attack expensive production. Take care of costs, *tout court*, and the cost of living will, to a certain extent at least, take care of itself.

* * *

Anti-Communist International



The Trade Union offensive against Communism was sharpened last week on both sides of the Atlantic. In Britain, the General Council of the TUC carried its private fight against Communist influence a stage further, and issued a long memorandum, for circulation to all trade unions, urging more specific and drastic measures to oust the Communists than had hitherto been put forward. In America, the American Federation of Labour, at its annual convention, decided to intensify the anti-Communist drive it has been conducting on a world-wide basis for the last few years, and is calling on the British TUC to co-operate in the campaign.

The General Council has asked union leaders to consider whether it is "consistent" that executive or delegate positions in their unions should be held by Communists, who also serve on their own national or industrial committees. These industrial committees, the General Council alleges, are bodies which lay down policy and tactics for Communist members in particular industries, and thus create a chain of dual loyalties throughout the trade union movement. The unions likely to be affected are the miners, electricians, engineers, fire brigades and foundry workers, where prominent union officials are also high up in the hierarchy of the Communist Party. The TUC is also perturbed at the extent of Communist penetration in trades councils, though there is not yet any suggestion of resurrecting the "Black Circular," which debarred Communists from membership of these bodies. It also aims at preventing trade unionists from attending conferences abroad and "misinterpreting" official trade union policy to the world outside. Two influential TUC committees (its General Purposes and International Committees) have been charged with the task of watching developments and guiding the campaign.

The problem facing the American Federation of Labour is a different one, because, unlike the TUC or the American Congress of Industrial Organisations, it has no Trojan horses to contend with, and has from the outset denounced the World Federation of Trade Unions (to which both the TUC and the CIO belong) as a Communist-dominated body. The American

THE UNFORGETTABLE GIFT

Federation of Labour regards the trade union committee of the European Recovery Programme as the nucleus of a new anti-Communist International and is urging that this body should be strengthened and developed as a "unifying force of free labour in Europe and elsewhere." The demise of the world federation, as it now exists, seems certain, after the January meeting of its executive bureau, when both the British TUC and the American CIO are expected to withdraw. It is not so certain whether a formal new International, on the lines envisaged by the AF of L, will emerge. But it is true that the break up of the world federation will create a vacuum, which the leaders of democratic world labour should seek to fill.

* * *

Disintegrated Burma

Burma has gone out of the news headlines since the removal of the immediate threat to Rangoon, but the Government's retention of its hold on the capital has not meant any restoration of its authority in the country as a whole, and the present picture is one of continued disintegration. The Burmese Government is now in the position of having to rely for its survival mainly on military units drawn from the non-Burmese peoples, who have naturally taken advantage of the situation to assert in practice an autonomy going far beyond what was intended for them in the recently adopted constitution. East of the Sittang, though Government officials still nominally function, the real power is in the hands of the Karens, and in the far north the Kachins are apparently doing as they please. In the Irrawaddy plains, whence the international rice market was yesterday expecting stepped-up exports of Burma's principal crop, there is now a confusion which leaves little prospect of substantial supplies coming out from the current Burmese harvest.

There have been at least five or six separate armed factions contending for supremacy. The Communists are divided into two groups known as the Red Flag and White Flag Communists, the latter being numerically the stronger of the two. The PVO or People's Volunteer Organisation, which was formerly Aung San's private army, has split into two factions, known respectively as White Bands and Yellow Bands from the colour of ribbons tied round their caps. The White Bands, numbering about two-thirds of the original PVO strength, rebelled against the Government some time ago, while the Yellow Bands remained loyal to it. The White Bands have been co-operating with the White Flag Communists, but not with the Red Flags. Another faction called the Communist Unity Party was formed by the former Socialist Minister for Commerce, U Ko Ko Gyi, who fled from Rangoon after it was discovered that he had embezzled 70 lakhs of rupees. Finally the regular army was split by a mutiny affecting a section of the purely Burmese part of the army; the mutineers have joined the Communists, but play a semi-independent role under their own leaders. The secession has increased the preponderance of the non-Burmese elements of the army. The commander of the army, General Smith Dun, is a Karen, and has been in the habit of taking a Karen bodyguard with him when inspecting Burmese units. His deputy, who is a Burmese, has recently been raising purely Burmese auxiliary forces which will serve as his own political support and also as a check on the Karens. When all these possessors of guns have sorted themselves out, a new ruling authority may emerge in Burma, but for the time being Burma is still far from the degree of stability it had in the time of King Thibaw.

* * *

Western Disunion over the Italian Colonies

Which counts for most in the British scale of values, the wishes of Africans or French and Italian goodwill? This is the conundrum that confronts the Britons who have to think out a happy settlement for Italy's ex-empire. Weighting one side of the scales are a number of promises and moral considerations: the undertaking to the Senussi that Italy should never dominate them again; the feeling (it is not a promise) that Ethiopia, having once been overrun from Eritrea, should not see the old aggressor back on the same frontier; the sense that the wishes of Eritreans and Libyans (both of whom are averse to Italian rule) should be respected. Weighting the other is the knowledge that France fears the spread to the borders of Tunisia and Algeria of the British way of preparing Africans for independence, while the Italians, encouraged incidentally by Russia, simply want their colonies back under the cover of an international mandate. France wants Italian trusteeships in Somalia and Eritrea and a postponed decision for Libya, where it favours eventual restoration of Italian administration. The Italians want virtually the *status quo ante*. To run counter to these desires may weaken Western Union. Can Britain afford it?

Apparently the answer is—yes. For a third—a strategic—consideration affects the scales. In advance of the United Nations discussion of what is to happen to the ex-Italian colonies, the British and American delegations have let it be known that they have a joint view. And this view is at several points contrary to French and Italian wishes. The Anglo-American proposal is that Somalia shall become an Italian trusteeship, virtually in perpetuity; that Eritrea shall be divided into two unequal parts, of which the larger, containing the Christian highlands as well as the lowland ports of Massawa and Assab, shall be ceded outright to Ethiopia, and the smaller, containing the predominantly Moslem peoples of Keren and Agordat provinces, shall remain unallotted for a year; and that Libya shall also be divided, the Cyrenaican half to become a British trusteeship and the decision on the Tripolitanian half, including the Fezzan, to be postponed.

Obviously, strategic as well as moral considerations enter into any judgment that one may pass on this proposition. There are Anglo-American military commitments to Greece and Turkey. Either of these countries would, if attacked, require reinforcement on D+1 day. To provide such help, a further western foothold in the eastern Mediterranean is necessary. There are two means of securing this in Cyrenaica. One is to let Britain observe its promise to the Senussi; the other is to waive this promise and to let Italy run the territory as a member of a western *bloc* and as host to American forces, paying dollars for its desert airfields and training grounds.

The one solution will temporarily satisfy the querulous Moslem and African worlds; the other meets the wishes of the French and Italians. Which should be adopted? The issue is clear-cut only in its moral aspect, which dictates, plainly enough, that promises to Africans come first.

* * *

Local Government Dilemmas

The County Boroughs Association for England and Wales has now declared its unqualified opposition to the plan for a new local government structure put forward last spring by the Local Government Boundary Commission. The Commission's plan was a balanced compromise, which did its best to meet the desires of existing local authorities while improving the general efficiency of the system. It would keep the all-purpose form of government in 17 large cities, while the remaining county boroughs—and some other towns as well—would secure a high degree of automony while joining with the neighbouring county for certain services where rural and urban integration is essential—such as town and country planning, police, fire brigades, and the cost of main highways. The County Boroughs Association's reply is merely to repeat at length, and without evidence, the theoretical virtues of the all-purpose form of government, as if this were a magic incantation to keep off evil spirits. These virtues are not unknown, nor were they unremembered by the Commission. The Association's document is poor local statesmanship.

The county boroughs might, however, extract some support from an interesting analysis of the 1945-46 local elections now issued by PEP ("Local Elections. How Many Votes?")

Type of Authority	Percentage of Seats Uncontested	Percentage of Electors in Uncontested Divisions	Percentage of Electorate in Contested Divisions Who Voted
County Boroughs	7·8	7·5	45·4
Administrative Counties*	41·8	32·5	29·4
Municipal Boroughs & Urban Districts*	6·5	7·0	47·4
Rural Districts	60·7	55·0	45·7

* Not including County of London area.

This analysis—which, as it deals with only one year, is necessarily very tentative—shows that many more seats were uncontested in rural areas and that, in contested divisions, the counties made easily the worst showing, despite their increased powers. Second-tier authorities, however, apparently attract as much electoral interest as the all-purpose county boroughs. Again, electoral interest for some reason is much higher in the north than the south. A further analysis reveals that within each class of authority, the percentage voting is highest in the very small units—the biggest percentage being probably reached in urban districts of under 5,000—and consistently falls as the unit gets larger. This is a very disconcerting fact to the reformer; but at least it gives no obvious support to the county boroughs' case—for if units need to be small to attract local interest, a two-tier system is in any case unavoidable.

* * *

The Under Sixteens

Some Conservative M.P.s have tabled a motion in the House of Commons that no child should be debarred from taking the school certificate by reason of his age. A few impartial facts, which help to clarify this obscure controversy, have been provided by an interesting analysis, published recently in *The Times Education Supplement*, by Dr J. F. Mountford, chairman of the Joint Matriculation Board of the Northern Universities (which includes Manchester, Liverpool and Birmingham) of the ages at which boys and girls took the present school certificate and higher school certificate examinations in 1948.

The figures summarised below show, first, that more than one-third of the boys and one-fifth of the girls would have been excluded from the examination if the over-sixteen rule had been

JOINT MATRICULATION BOARD RESULTS, 1948

	Boys	Girls
I.—*School Certificate* :—		
Total number examined	16,805	16,147
Average age on Sept. 1, 1948	16yrs. 3m.	16yrs. 5m.
Number who passed	12,319	12,752
Percentage who passed	*73·3*	*79·0*
Av. credits of those who passed	4·8	5·0
Number under 16 on Sept. 1, 1948	3,980	1,968
Percentage of under 16s	*23·7*	*12·2*
Number under 16 who passed	3,209	1,655
Percentage of under 16s who passed	*80·6*	*84·1*
Average credits gained by under 16s who passed	5·2	5·5
II.—*Numbers of State Scholars (JMB 1948)* :—		
Total number of State scholars	179	108
Numbers who had taken SC under 16	145	16
Percentage who had taken SC under 16	*81*	*56*

applied, and secondly, that the percentage of passes, as well as the average number of credits, is higher for the under sixteens than the comparable figures for all those who took the examination. The second effect is natural enough, since it is the bright children who take the examination young. This is further borne out by other figures which show that 81 per cent of the boys and 56 per cent of the girls who were awarded state scholarships on their higher school certificate results had taken their school certificate under the age of sixteen, and it is these children about whom passions are aroused. The later age at which schoolgirls begin to specialise partly accounts for the much smaller opposition to the new examination proposals from schoolmistresses.

If it is assumed that the examination under the new scheme will approximate closely to the old school certificate, it appears inevitable that the brighter children will be penalised. But this is a matter which lies principally in the hands of the universities. If university entrance requirements can be so arranged that it is no longer necessary to pass a six-subject hurdle at sixteen as the preliminary to a two or three subject hurdle at eighteen, then the Minister's proposal may be workable, although it lays extremely heavy responsibilities on the schools to avoid over-specialisation. But if this was Mr Tomlinson's intention, why did he not obtain the universities' agreement first? Only two universities appear to be working on these lines: the rest, in an attempt to prevent too narrow an education, are superimposing the old system on the new, with results which can only be retrograde.

* * *

Equality by *Force Majeure*

Freedom is to be sacrificed yet again to equality. Any family which lives within the catchment area of one of Middlesex's new comprehensive schools (grammar, technical and modern school combined) will in future be debarred from sending its children to any other secondary school, however much the parents may dislike the local school or prefer the teaching elsewhere. So much for the lip-service paid to the parents' freedom of choice.

This most improper interference with individual freedom springs from the wish to secure a representative cross-section of children of all intellectual levels for the large new schools with which the County Council is soon to start experimenting. The aim is understandable enough. The method is wholly wrong.

"Virtue itself turns vice if misapplied." For fear that the bright children of grammar school calibre will spurn the new schools and hive off to such well-established grammar schools as exist within travelling distance, the Council propose to use force as the handmaid of equality. To draw all the children of the locality into the comprehensive net no bait will be used; instead, all other schools will be barred by the simple expedient of not allowing children in the area to sit for the grammar school entrance examination.

If the comprehensive schools are to be given a fair trial, they must attract their proper share of intellectual children. But they must do so by voluntary means and not by *force majeure*. It is quite wrong that parents should only be left the freedom of choice of moving house or paying fees elsewhere.

* * *

M. Spaak is Indispensable

One more eight-day crisis in Belgian politics has made little difference to the coalition government. M. Spaak is back in control, having proved yet again that there is no one to replace him. The thorny question of what to do about the monarchy is to be entrusted to a parliamentary commission, while M. Struye, the former Minister of Justice, who caused the crisis by reprieving two notorious collaborators, has been replaced by another Catholic, M. de Meten. The only other concessions which M. Spaak has made to his Catholic critics are to reduce the size of the Cabinet from 19 to 17 members by merging the two Ministries of Food and Fuel with other government departments, and to replace the Socialist Minister of Foreign Trade, not by a Catholic, but by a non-party member. Otherwise the Belgian Government remains much as it was before.

The comparatively petty political differences which brought about this and former crises in Belgium conceal more serious problems which the government has so far been unable to put right. Spending both by the government and by individuals goes on unabated in spite of the urgent need for reconstruction and capital appreciation. The fundamental difficulty—which affects

From *The Economist* of 1848

December 2, 1848

It is said indeed, that we cannot maintain free trade if the rest of the world maintain restriction. The assertion is founded on erroneous views of the reason on which it was adopted. It was adopted to serve ourselves, not to serve others, and as it has done that effectually, why should we not continue it? By its means we have all kinds of useful commodities cheaper and more abundant than otherwise. Food is cheaper, and consequently the nourishment of labour, without deteriorating the condition of the labourers, while it performs any given task, costs less. Thus in a competition between countries in which trade is restricted, and in which it is free, the advantages on the side of the country in which trade is free, will be proportionate to the reduction of the cost of production in all other things, because food is cheap. Free trade, other circumstances being equal, will enable us to beat in competition those who are subject to restrictions . . . Free trade, which supplies one country with cheap food and another with cheap clothing, facilitates and extends production by reducing its cost, measured by the cost of subsistence of the producing agents; it increases employment, profit, rent, and revenue; it is an unmixed advantage to the community and can neither be lessened nor destroyed by the restrictive policy of other nations. Were they to adopt free trade it would be better for them, and is their increased prosperity other nations might find additional advantages; but free trade itself is a good, like virtue, holiness, and righteousness, to be loved, admired, honoured, and stedfastly adopted, for its own sake, though all the rest of the world should love restrictions and prohibitions, which are of themselves evils, like vice and crime, to be hated and abhorred under all circumstances and at all times.

Belgium's international role in the European Recovery Programme quite as much as its internal economic equilibrium—is the fact that too much of the national income is being spent on current consumption and too little to make good reserves of capital and to increase the rate of investment. Internationally, this spending involves the outlay of hard currency upon inessential imports and leads to the accusation that Belgium is a selfish neighbour. In a word, the Belgian economy is buoyant but somewhat out of control, and the internal and external consequences are beginning to make themselves felt.

The issue before the government is therefore to decide on ways and means to get the situation in hand once more. The Minister of Finance, M. Gascon Eyskens, who at one point during the last crisis tried and failed to form a Catholic government, has put forward schemes for improving the system of taxation. He has proposed first that the present heavy rates at which members of the professional and self-employed classes are taxed should be replaced by the normal rates with heavy penalties, going as far as professional disqualification, for tax evasion. (The original plea for these special rates was that evasion by the professional classes was so easy and universal that their taxes should be correspondingly heavy.) Second, M. Eyskens has proposed that the tax on dividends should be reduced in the hope of stimulating the capital market. The Catholics have also insisted that government expenditure should be reduced.

Shorter Notes

The report of the Departmental Committee on Grants for the Development of Marriage Guidance [Cmd. 7566] is a perfect illustration of the theme of Lord Beveridge's third report—that the need for voluntary action is as strong as ever, but that voluntary effort often requires assistance from the state to enable it to achieve its ends. As the committee points out, marriage guidance is a matter that cannot be carried out by officials, but it is also a matter that needs carefully selected skilled workers to be a success, which in its turn means adequate finance. The committee therefore recommends that public funds should be given in support of the National Marriage Guidance Council, the Catholic Marriage Advisory Council and the Family Welfare Association for a limited period, after which the work they are doing should be reviewed, and also that the Government should bear the cost of training their workers for an experimental period of five years.

*

Early in 1949 Africans will be appointed to Nyasaland's Legislative Council for the first time. They thus follow the example of fellow-Africans in the neighbouring dependency of Northern Rhodesia, which has had direct African representation in its Legislative Council from this autumn. Nyasaland's constitution is not being modified apart from the consequent expansion of the Legislative Council. But now that both it and Northern Rhodesia have reached the same stage in their native representation, is it not an appropriate opportunity to re-examine the question of the amalgamation of the two dependencies?

*

Not surprisingly, the Government's proposals to set up a Council for Wales and Monmouthshire, with purely advisory functions, has failed to please the Welsh MPs. The Council will be drawn partly from representatives of local authorities, partly from agricultural, industrial, and other interests. The proposal is not, as Mr Clement Davies put in, an insult to the Welsh people—for it may do worthwhile work in advising the inter-departmental committee on Welsh affairs—but it does not provide a real instalment of political devolution to accompany the administrative devolution which already exists.

Letters to the Editor

British Austerity and Europe

SIR,—Your leading article rightly concentrates on the international implications of the British Four-Year Plan. Together with the equivocal policy pursued by the Foreign Office in Germany, the Middle East and Africa, this Plan bids fair to alienate continental sympathies still further and to undermine such leadership as Britain can give to Europe. The failure to choose a strong team for the OEEC in Paris, convinced of the need to establish a powerful regional area comprising western Europe and the sterling area, has begun to have the unfavourable effects that would have been predicted. Had the OEEC secretariat been permitted and empowered to work out a coherent programme, and this could have been done only under British leadership, Britain would not now stand accused of sabotaging European recovery, and would not, as is now probable, be made to carry an undue proportion of the burden of readjusting the overall European dollar deficit.

The domestic implications of the Plan are equally disturbing. The remarkable recovery of the British balance of payments is causing a wave of optimism which, much as in 1946, threatens to lead to an improper and improvident discounting of further gains not yet achieved. It is agreed on all sides that a further expansion of national income can only come through an increase in productivity. Some progress in this direction will be made through investment, and it is gratifying to note that investment in productive equipment has been given priority in the Plan. But the more recent practice of the Government has moved in the other direction. It adds insult to injury to be told that the relaxation of the licensing of repairs, not merely of factories but also of office and other commercial buildings, has been made possible by the cuts in the Government's industrial investment programme. This comes after the considerable relaxation of domestic house repairs.

The decontrol of steel for small users and the relaxation of utility schemes (for shoes and furniture, for example) also make a strange contrast with the Government's professed intentions. Perhaps the magnitude of resources involved is not large, but the principle is wrong; it will lead to the growth of a "grey" market, a cumulative pull on resources and the growth of a sense of injustice and frustration. Moreover, decontrol will not restore the conditions of a competitive market, since the allocation of resources remains further up the stream of production.

For these reasons, the Government seems to be nearer the truth when it forecasts an increase of only 3 per cent at most, and perhaps less, in productivity in the next year than when, as reported, it looks for increases (over 1947) of 25 per cent in industrial output and between 15 and 20 per cent in consumption by 1953. It is, in fact, relaxing its grip on consumption and increasing its foreign commitments.

We are clearly in danger of drifting towards another 1947 while earnestly proclaiming the best intentions. And if we should encounter a buyers' market, the danger would be still greater, since very few long-term agreements have been negotiated to secure supplies.—Yours faithfully,

T. BALOGH

Can Uno Survive Palestine?

SIR,—Mr Atiyah observes that the general impression in the public mind is that the Arabs have lost the war in Palestine as a result of their incompetence and disunity. He is right; with the exception of the Arab Legion, the remaining Arab forces, fighting on foreign soil, have done very little to bolster up their paper reputation. And it is not only Mr Atiyah, but all others who have read widely among Egyptian communiques who have been shocked by the actual course and result of the fighting.

He expresses satisfaction at your calling attention to the grave duty which rests upon the United Nations to enforce its decisions concerning Palestine. It is a pity he did not concur with this sentiment much earlier this year, when the United Nations Palestine Commission reported to the Special Assembly that Arab interests "both inside and outside Palestine are defying the resolution of the General Assembly, and are engaged in a deliberate effort to alter by force the settlement envisaged therein."

Incidentally, the picture he draws of the Arabs fighting against Zionist forces immensely armed with weapons acquired during the truce requires modification in that at least three Arab states had by virtue of treaty arrangements been stock-piling arms for some time past and that, in any case, Count Bernadotte himself affirmed that: "On the whole, I am satisfied that the provision of the truce concerning traffic in war materials, within the limitations of personnel and equipment available, was substantially implemented and supervised. If either of the two opposing forces did in fact manage to obtain war materials by clandestine methods, the amount obtained would of necessity have been so limited as to have made no substantial difference in the relative strength of the two sides."—Yours faithfully,

DAVID CARRINGTON

The Structure of the Coal Board

SIR,—You mar the value of your otherwise excellent article on the above subject by the complacence implied in the last sentence. Whilst, unfortunately, it may be true that neither the Government nor the Board will undertake "such fundamental changes . . . after a mere two years of the first experiment" this attitude must not be accepted without protest. Neither you nor they appear to realise the increasing harm that is being done, the longer this first experiment continues.

The truth is as Sir Charles Reid states in his recent courageous articles "the coal industry instead of being alive and enterprising is fast degenerating into a dull mechanical form of civil service."

It is the effect of this degeneration on human beings which is the most serious aspect of the matter and makes alteration so urgent a necessity. That coal is still being raised in even the present limited quantities is largely due to the efforts of the old officials. These men, despite soulless treatment and almost constant snubs and pettifogging frustrations, still, in many cases, do their jobs as in the old days with loyalty and unselfish devotion. How long the effects of the old habits and training will remain is doubtful. It is only natural that more and more of the staffs will, for their own peace of mind, eventually accept the new position and fall in with what is apparently required by the all-powerful single employer. It is absurd to expect men, holding what ought to be positions of authority, but in practice made to feel so helpless and baffled, to exert qualities of initiative and leadership. Yet without these qualities the great technical reorganisation certainly can never be carried through to success. Indeed unless these men are allowed to feel a sense of personal responsibility, there will be no efficiency in even the ordinary running of the mines, with proper safeguard of costs both of materials and labour.

The real problem facing the NCB is the psychological one of man management. The technical problems are comparatively easy of solution granted monopoly of markets and large capital resources available at low interest rates. The rub is how to apply the known engineering solutions so that the men of all grades will accept them willingly and thus give a happy and contented industry from which will flow a plentiful supply of relatively cheap coal. The important matter is to save what is left of the old spirit of enterprise and initiative (and to inspire the new men coming on) before it is too late.—Yours faithfully,

J. CECIL MITCHESON

Freasley, Near Tamworth, Staffordshire

German Recovery at Stake

SIR,—May I add three glosses to your leading article, "German Recovery at Stake"? In the first place, the Bizone faces a very difficult balance of payments problem. It is vitally necessary to export much more to pay for essential imports. At present the deficit is being carried by the United Kingdom and the United States. This cannot go on indefinitely at the expense of the British and American taxpayer. Moreover, by the end of Marshall aid, the population of the Bizone will have increased by some ten millions over the prewar population, and the "hinterland" to the east may be greatly curtailed. Secondly, steel production and steel exports could very well be increased. Steel production, it is true, has been increasing satisfactorily in recent months, and is now running at over seven million tons a year, and may reach the permitted level of 10.7 million tons next year. But from the viewpoint of ERP I feel that without endangering security in any way the production could be raised by at least two million tons. If the Ruhr is to supply rolled steel products to Marshall aid countries, it should be left with the capacity necessary for this purpose, and this raises the dismantling of the steel mills in such a way as not to produce bottlenecks. In 1938 the Bizone alone produced 17.8 million tons, and a recent report of the *Vereinigte Stahlwerke AG.* on "The Problem of Dismantling Iron and Steel Plants" gives domestic requirements at some 14 million tons. Capacity used for war material production must be used for reparations, but the present level of 10.7 million tons is too low.

Lastly, you refer to the speech of the Military Governor on November 17th on German recovery and the future of the *D-mark*. May I as one who had the privilege and pleasure of serving under Sir Brian Robertson as Controller-General of Public Revenue and General Finance say in extenuation that directness in thought and in speech is not only necessary in Frankfurt at the present time, but is appreciated and understood by Germans. Doctrinaire and inexperienced officials can upset "the best laid schemes o' mice an' men" which "gang aft agley."—Yours faithfully,

G. FINDLAY SHIRRAS

AMERICAN SURVEY

Words for Wisdom

(From Our US Editorial Staff)

THE American people, told on all sides that the responsibility for national decisions, foreign and domestic, comes home to them in the last analysis, are struggling with an uneasy sense that they need a new education to engage adequately in this new debate. The more responsible react in two ways. Some of them hope to reform the system which educates the young and to guard their children against the gaps they are discovering in their own education. Others search the stream of words and pictures pouring from the printing presses, radio stations, lecture platforms and film studios for wisdom for the adult.

The stream swells daily as new processes make it possible to reach mass audiences at lower costs. Linotype printing is already threatened by a combination of electric typewriting and photography. Facsimile newspaper distribution waits only for the further spread of television. The other day a new process called Ultrafax flashed "Gone With the Wind" across Washington at more than hurricane speed as a demonstration that eventually a million words can be sent in a minute.

The verbal flood has already reached proportions which, if volume alone could do it, should make Americans both well-informed and wise. For a small price, university courses on public affairs come to the citizen's post box. Privately endowed organisations send him magazines, pamphlets and books, some of them for no more than the asking. Forums, local or as comprehensive as that held each October by the *New York Herald Tribune* and attracting speakers from all over the world, offer him discussions of subjects "in the news." Last year 299 publishers (a publisher being defined as one who publishes five or more books a year) presented him with 9,182 books, of which 7,116 were classed as non-fiction. Newspapers, magazines, the cinema and radio add their efforts to provide the reader, the listener or the spectator with whatever he wants to know, including a chance to win something for nothing.

The book trade, which sells school books, paper-bound detective stories and volumes on how to make cream puffs, as well as tomes on foreign relations, complained last year that more books were being bought, but less profit secured, than ever before in its history. This year the numbers are falling off while the costs go on rising. The list of best sellers, which reflects what the public chooses out of this abundance, contained 21 fiction titles out of a total of 45. It was headed by a volume entitled "How to Stop Worrying and Start Living," while the second most in demand was "Peace of Mind." Out of the 21, three books which might be considered aids to international understanding come well down the list. Two of them were written by Professor Arnold Toynbee, and one by Mr Winston Churchill.

*

But books, in spite of various valiant efforts to the contrary, still are read by the few rather than the many. Mass circulation goes to the newspapers, the magazines, the output of radio and cinema, and it is on these that the average citizen relies for light on his problems. "It is," says the newspaper trade journal, *Editor and Publisher*, "a fair assumption that every literate resident of the country reads one or more newspapers daily." Fifty-one million copies of morning and evening papers are sold daily, and each is presumably read by two or more people. This is an increase of seven million since 1943, and might be construed as indicating how profitable to the newspaper trade is the sense of danger that stems from international chaos.

News has, since 1939, become almost equally important in the periodical world, and the magazines which began in the nineteen-thirties by re-sifting the harvest of the daily journals now seek independently for fresh sensations. Four giants dominate the field, of which *Life* (with a circulation reaching almost 5,500,000) and *Time* (with more than 1,500,000) belong to the Luce empire, while the other two (*Look*, with almost 3,000,000 purchasers, and *Newsweek*, reaching towards 1,000,000) are individually owned. All of them offer facts in capsule form, presented with a high degree of technical dexterity and illustrated with pictures in the raw, in the nude and in the sentimental mood. They make their bow to wisdom when it is "newsworthy," but the long view and the comprehensive treatment are almost as strange to their pages as to those of the average daily. Two older rivals, *Colliers* and the *Saturday Evening Post*, serving respectively over 2,000,000 and 3,000,000 subscribers, rely on expanded news stories and on fiction. It is significant that their technique of the factual so overlaps their technique of the fictional that any reader who likes the one can be lured painlessly into reading the other.

Sixteen million people buy the great news weeklies, but only 115,000 buy the two veteran weeklies of opinion, the *Nation* and the *New Republic*. In part, this may be due to the intellectual level on which they are edited, in part to the self-righteous air with which they wear the liberal halo. But more important is the current against which they swim. Americans like to engage in political discussion, listen to it gladly, but regard an entire patented dose of it somewhat as they regard castor oil.

Despite the fervour with which *Time* boasts that it has doubled its circulation since the war, the news weeklies still occupy only a small segment of the periodical world. Against the six giants in that field must be set the six monthlies which offer to 20 million women fact and fiction about food, clothes, love, marriage, babies, gardens and household devices. Even these have made occasional forays into the foreign field; the one with the largest circulation went so far as to publish the autobiography of Mr Stimson, the former Secretary of War.

The *Reader's Digest*, which condenses articles from other publications, is in a rather different class. Its pills are so successfully sugar-coated that it has a circulation of over 8,000,000 in the United States and is published abroad in eleven foreign languages. The more spectacular bidders for mass popularity are the comics, called by their addicts "books," but published weekly, monthly, or at whatever intervals the coloured inks and the papers are delivered to their makers. The comics number 400 titles, deliver 60 million copies a month to the news dealers, account for perhaps a quarter of all news stand sales. They burgeoned during the war, were devoured on troop trains and lonely Pacific islands, and claim that 60 per cent of their readers are over the age of twenty-one. Only occasionally and obliquely do these artifacts of a resurgent savagery touch politics. Adventure, crime, horror, science, are their stock in trade (the General Electric Company is having 3,000,000 copies of its new comic book on atomic energy distributed to the schools) and their effect on the undeveloped mind is still a subject of debate among educators. Meanwhile their circulation figures continue to climb, providing ready texts for those who claim that what Americans really want is not to grapple with facts but to escape from them.

But even the comics pale in terms of mass influence when compared with the radio and the cinema. Seventy-one million Americans go to the cinema each week. Thirty-four million radio sets emit programmes some 18 hours a day for the edification of the 3.5 persons in the average American family. (The average listening time is three hours per person.) The cinema is primarily an entertainment industry. The radio claims to be the servant of the public, but its favourite public is that which buys what the hucksters sell over its sound waves. It sells soap with shining success, but it is understandably doubtful about trying to teach people how to measure up to Mr Marshall's insistence that every citizen should "participate in the decisions that must be taken by his country in public affairs."

Even on foreign affairs there is no lack of the raw material of decision, some of it fresh and much of it predigested. The questions raised concern its quality, how much of it the struggling citizen can absorb and use, and how it affects the citizen who does not make the effort. On the two latter points the psychologists offer testimony that is hardly encouraging. A study made in Sandusky, Ohio, indicates that the better educated the citizen, the more his decisions on public matters are ordained by his family, party and religious background. As for the less educated, they are in danger of gaining from the stream of words and pictures only a drugged complacence which inhibits both thought and action.

Those who trust that wise decisions will emerge from the daily cross-clamour of fact and propaganda might do well to ponder the conclusion of Mr Paul Lazarsfeld, head of the Bureau of Applied Social Research, that "the very conditions which make for the maximum effectiveness of the mass media of communication operate toward the maintenance of the going social and cultural structure rather than toward its change." Apparently the only hope is that the citizen's participation in the making of foreign policy is not yet a part of that structure.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

America's Trade Balance

[FROM A SPECIAL CORRESPONDENT]

TRADE figures for September reveal that the year-old decline in American exports has continued. Coupled with a steady, if more gradual, rise in imports, the export surplus—the visible evidence of the "dollar problem"—shows an even more marked reduction. In dollars, the contributions of declining exports and rising imports to the reduced export surplus were in roughly equivalent proportions—exports were down about 18, and imports up 22, per cent. In real terms, however, exports were about 25 per cent lower than a year ago (according to data for the first eight months of each year), while imports were up about 11 per cent.

At first sight the foreign observer may be inclined to attribute the decline in American exports almost solely to import restrictions imposed by dollar-short foreign governments—especially following the "crisis" of August, 1947. While the relative importance of these measures in reducing dollar purchases should not be underestimated (for instance, they were undoubtedly the major factor in halving exports to the Antipodes), there is ample evidence that more normal market factors were also involved. A number of countries—Sweden, Belgium, the Netherlands, the United Kingdom, Canada and Australia among them—have been able to reduce imports from the United States, while maintaining or even increasing their purchases from all sources combined. Although this shift may have been accomplished largely through direct government intervention in trade, the figures are convincing evidence of decreasing dependence on American supplies as foreign production expands. The decline in exports to Europe has been proportionately and absolutely greater than to any other major geographic area: it is in Europe, undoubtedly, that industrial production and agricultural output have increased most in the current year. American export control is, of course, another limiting factor and one of which it is statistically impossible to gauge the effects. The virtual elimination of exports to the USSR in recent months may be noted, while shipments to all of eastern Europe fell from a monthly average of over $40 million early in 1947 to between $5 and $8 million in the summer of 1948.

Statistics for individual commodities also seem to indicate the importance of factors other than dollar scarcity as such. Of the major groups, textile fibres and manufactures exhibited one of the largest relative declines; world supply—particularly from non-US sources—has probably more nearly approached demand in this field than in any other. Exports of merchant vessels fell from about $400 million to $200 million in the first seven months of the year, the obvious result of the termination of the disposal programme for surplus vessels. Lower exports of foodstuffs reflected the increased availability of supplies from other sources, although the dollar shortage was certainly a major factor here, especially for meat and dairy products. Some indication of the decline in exports by area and major commodity groups is given in the accompanying table.

Of perhaps more interest, at least for the long pull, has been the continued postwar rise in US imports. Even more than in the case of exports, however, the apparent increase is one of price rather than quantity. In spite of an increase in domestic industrial production of some 90 per cent over the average of the late thirties, the quantity of imports has risen only about 20 per cent. The relatively close relationship between the level of imports and real national income in the interwar period was not carried into the postwar era; if it had been, imports would now be about $10 or $11 billion annually instead of the present rate of some $7 billion. Imports at the higher level would presuppose a degree of economic recovery abroad which would probably greatly reduce the need for American goods; as a combined result the dollar problem would be considerably less serious. At the moment, imports from Europe and the Far East form a much smaller proportion of the total than before the war; if those areas had supplied their former (1936-38) share in 1947, the total would have been around the $10 billion figure.

The net credit balance on invisibles (excluding Government and private gifts) has likewise fallen—proportionately even more than the merchandise balance. According to official balance of payments estimates, excess receipts for income on investments

and sales of services fell from $729 million in the first half of 1947 to $406 million in the first half of 1948. Lower net shipping earnings were an important factor in this development; in June, for the first time since the end of the war, American ships carried less than one-half by volume of the country's total dry cargo trade, and this decline is likely to continue. Tourist expenditures are also increasing; like imports, they are far lower than before the war in relation to the national income and should therefore continue to increase as transportation and other facilities improve. In this category the beneficial effect of more rational exchange rates could be substantial, both by increasing the absolute amount of tourist outlays and by channelling a larger portion of them into official reserve balances. With the high and increasing yield on American investments abroad—last year's record total of $1 billion will be surpassed this year—it does not seem probable, however, that the American balance of payments on invisible account will return to the prewar net deficit position for a few years at least.

As compared with the nineteen-twenties, the terms of trade seem definitely to have changed against the United States and by a fairly substantial percentage. Since UK imports and exports, except for foodstuffs, are roughly similar to those of the United States, this development, as *The Economist* has frequently pointed out, makes the sterling problem more difficult—but it may be a major factor in not making the dollar problem any worse than it is.

Unpleasant as the decline of export sales may have been to some segments of the American economy—the fruit and textile producers would certainly welcome more foreign business, as would the shipping industry—there is general agreement among economists that the total effect has been beneficial. With other demands—by consumers, business and Government—high and rising, the fall in sales to foreigners has been the one significant anti-inflationary force at work. However, as expenditure on the European Recovery Plan gains momentum (only $200 million was actually spent in the first three months of the programme), exports will probably rise again, although a return to the 1947 peak is not expected; but if military lend-lease becomes an actuality, the rise will be even more rapid.

American Notes

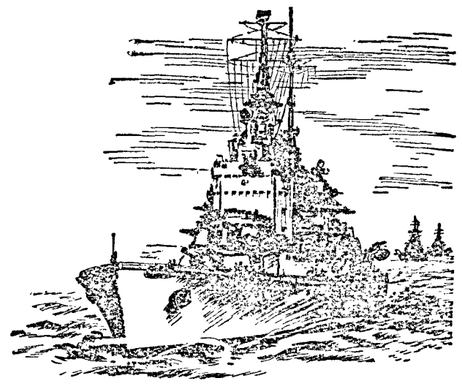
Shipping Pays its Ransom

On the east coast the longshoremen are back at work; on the west coast they soon will be, if they are not already, since the other unions and employers involved in the strike are expected to accept the terms agreed with Mr Bridges. In both cases labour has gained all it could have hoped for, if not all it demanded. In the west, wages go up by 15 cents an hour to $1.82; in the east, the increase is only 13 cents, to $1.88 an hour, but it is retroactive to August 21st. Both settlements include compromises on the complicated overtime and hiring questions and schemes for paid vacations which, it is calculated, will add four cents an hour to the wage rise. The east coast employers, apprehensive at the cost of these concessions, hope for better terms when this new contract expires next September; they do not seem to find its shortness ominous, perhaps because this is the first time the American Federation of Labour's longshoremen's union has ever called a strike in New York and this one lasted less than three weeks. On the west coast, where the strike lasted nearly thirteen weeks and where strikes by the Congress of Industrial Organisation's union have become a habit, the three years' duration of the new contract is regarded as its chief merit. The west coast contract also includes methods of dealing with grievances which gives hope that a new era of peace on that waterfront may be opening.

On both coasts that peace is much needed. Over 500 ships have been immobilised by the strikes and millions of dollars have been forfeited daily. Since the Gulf remained open, New York must have lost further ground to New Orleans, the chief aggressor in the battle which the port of New York is waging against a number of growing rivals. New York still handles far more of America's foreign trade than any other harbour, but since the war its share has been falling steadily in comparison with New Orleans, Mobile, Houston, Philadelphia, Baltimore and others, largely because of the quicker, cheaper and more modern facilities offered by these competitors.

High costs also explain why America's coastal shipping is fast disappearing; nowadays land transport is cheaper than sea, because of the discriminatory freight rates established by the railroads, high ocean freight charges, the expense and trouble of loading goods on ships, and the frequent delays caused by strikes; the recent strike and its settlement will not improve this situation. There are now under 70 vessels, none of them passenger ships, in the coastal trade, compared with 235 before the war, when domestic shipping made up two-thirds of America's merchant fleet. These coastal routes provided many of the supply ships used during the war; in another war their absence would be felt, particularly if in the meantime there had been a decline in the foreign trade fleet, at present far larger than before the war.

That decline is already beginning. The number of ships chartered from the Maritime Commission is decreasing steadily each month and by the middle of 1949 the total active dry-cargo fleet will have been reduced to about 1,000 vessels. This is due not only to the current shortage of cargo, but also to the smaller share of world trade that is being carried in American ships; in October, for the first time since the war, more foreign than American ships entered New York. According to the Economic Co-operation Administration, it now costs $4.50 a ton more to ship coal to France on an American than on a foreign vessel. The difference is explained by the drop in foreign charter rates as well as by the high American operating costs. This widening difference in bulk cargo rates is making it difficult to apply the fifty-fifty division of cargoes between American and foreign ships, which was specified in the ECA legislation. It is therefore being suggested that the Maritime Commission should lower its charter rates. A reduction would be of indirect benefit to the American taxpayer, since ocean freight costs represent ten per cent of total ECA procurement authorisations.



* * *

Labour's Reward

The American Federation of Labour and the Congress of Industrial Organisations held this year's conventions in a self-conscious glow of political triumph. Mr Truman has shown a disappointing reticence in acknowledging the debt labour feels he owes. But the political leagues maintained, not only by the CIO but by the AFL and by the railway unions and machinists, have proved their effectiveness and are to be expanded. The Gompers tradition of political isolation is dead. The AFL is already looking forward to 1950 when it hopes to deal with those who escaped this year's purge (like Senator Taft, in whose home city the convention met), punish those who vote against repeal of the Taft-Hartley Act, and wipe out the "little Taft-Hartley Acts" passed by the states. The project of establishing a third party has suffered heavily, both from Mr Wallace's failure and labour's successes inside the present political framework.

Labour speaks today both with the prestige of victory and the authority of numbers. Trade unionists number nearly 16 million, of which 7,200,000 are claimed by the AFL, 6,500,000 by the CIO. The rest are distributed among 50 independent unions. One in every four workers is now organised. On foreign affairs both conventions overwhelmingly approved the bipartisan foreign policy and registered their suspicion of Russia. The AFL even recommended a complete trade breach until the Berlin blockade is lifted. The CIO demonstrated how little it can now be charged with Communist sympathies by approving by 600 votes to 40 a resolution expressing its resentment of Russian policy toward the Marshall plan and the abuse of the veto. The arraignment of the CIO's own Communist unions was no less vigorous, if somewhat indirect and incomplete. The Farm Equipment Workers have been given 60 days to merge with the Automobile Workers; and "little unions in big industries" (mainly Communist-controlled), which have failed in their organising duties, will be supervised and perhaps replaced. Communist-led unions, which have a strong grip on their industries, whether large or small, have so far eluded Mr Murray's dialectic, but the Communists are clearly on the run.

The immediate reward which the unions expect is, of course, the replacement of the Taft-Hartley Act by the Wagner Act. The CIO, which, unlike the AFL, is pressing for price controls, some rationing, and an excess profits tax (as well as a fourth round of wage increases to sustain purchasing power), admits to the least willingness to retain any of the present curbs on labour in the new Act. The AFL, in some ways less affected by the Taft-Hartley Act, concedes that ways must be found to deal with strikes which affect the public interest, and that employers may rightfully claim some rights of free speech. But this is a period

It takes 250 tons of paint to preserve and decorate a battleship of the Vanguard class.

The enduring preservative qualities in paint are due, largely, to the chemical preservatives used in its manufacture. Today P.C.M.C. (parachlorometacresol) is one of the most efficient preservatives used for this purpose. Monsanto are the only manufacturers of P.C.M.C. in Great Britain.

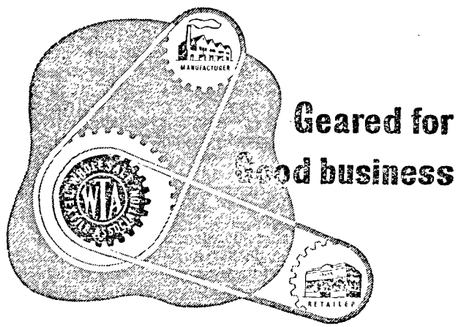
BEETLE Cement—a product of B.I.P. research—enables stronger, lighter skis to be made from laminated wood.

BEETLE IMPROVED PRODUCTS



Now Swedish Skis are better

Once upon a time the Swedes cut their skis from the solid wood. Now, they find that the better way is to use layers of timber bonded together with 'Beetle' cement and moulded to shape. Using these new-type skis, Swedish competitors won many Olympic events at St. Moritz this year. You may not work in timber, but it may sometimes happen that you can't see the wood for the trees. That's when an outside opinion on production problems can be of such value. If amino-plastics can help (and they invariably can) our research and development men, in co-operation with yours, will soon show you how.

Geared for good business

The modern wholesaler has a highly geared, sweetly-tuned organisation which carries the products of the factory to thousands of retail outlets with equity, economy and efficiency. For the manufacturer this means guaranteed continuity of production through stock being regularly ordered in advance of season. For the retailer it means ready supplies of "the pick of the market" in the quantity and price range his trade demands.

of political bargaining, and the industrial experience of labour leaders is not likely to lead them to put all their cards, and possible concessions, on the table.

In fact, with a Congress in which former supporters of the Taft-Hartley Act still outnumber its critics by narrow margins, some restrictions in the public interest will certainly be retained. Among the most likely seem the ban on jurisdictional strikes and secondary boycotts which Mr Truman supported in 1947, continued use of fact-finding commissions in national disputes, with the right to make recommendations as well as report the facts; and definition of some unfair practices by unions as well as employers. On the other hand, there is no question but that the Department of Labour, which the Republicans stripped of money and authority, will be strengthened, as the CIO and AFL both wish, and enlarged by the return of the conciliation machinery and probably of the US Employment Service. The ban on the closed shop will go; the use of the court injunction will be reduced if not abolished (as labour would like); and union shop elections will be eliminated. They served no useful purpose.

On a wider stage, the unions support most of the reforms extending the New Deal which Mr Truman has promised: the extension of social security and higher benefits, Federal aid to education, a higher minimum wage, floors under farm income, low-cost housing, and civil rights. Congressmen tempted to obstruct the New Deal will hardly fail to be conscious of labour's watchful eye, its programme of political education, and its new consciousness of strength.

* * *

The Forgiven and the Forgotten

Senator McGrath, the chairman of the Democratic National Committee, has announced that he is prepared to "forgive and forget" erring Democrats. Even Senator Glen Taylor, who ran as Mr Wallace's Vice-President, is to be included in the amnesty, for, the argument runs, he was elected as a Democrat in 1944 and to deprive him of committee assignments and other privileges would unfairly punish his State and constituents. The same reasoning applies to repentant Dixiecrat Congressmen—though not necessarily to bolters who cannot claim Congressional immunity. But in practice it may be the Dixiecrats who are forgiven, the Wallaceite who is forgotten.

The effective chairmanship of the Senate Banking and Currency Committee is a case in point. Senator Wagner, who has every claim of seniority, party loyalty, and service to the country, is too old and too ill to act as more than a nominal chairman, if that. Next in seniority is Senator Maybank of South Carolina, one of the four southern States which repudiated Mr Truman. Senator Maybank did not openly support Governor Thurmond, but equally he did not take time off from his own campaign to raise the Truman standard. Now, however, that he has declared his support of progressive policies such as rent control, slum clearance and inflation curbs (with the unspoken but conspicuous exception of civil rights), he is said to be "enthusiastically welcome" in official circles. This enthusiasm is certainly traceable to the fact that the alternative is Senator Taylor, the "singing cowboy" who so far has shown no sign of changing his tune.

Senator McKellar, who boasts the longest record of service in the Senate, presents another aspect of the problem of reconciling the seniority rule to realities. The Senator from Tennessee was shrewd enough to avoid the Thurmond pitfall; but both his health and his record are too bad to make him anything but a disaster at the head of the Appropriations Committee. The solution may be to "kick him upstairs" by appointing him President *pro tempore* of the Senate. This is an honorary post, now that the United States has a Vice-President to preside over the Senate, but it is sweetened by certain perquisites. Senator Hayden of Arizona would then become head of the Appropriations Committee, and would work well with Senator Maybank and Senator Lucas of Illinois, who is expected to become majority leader of the Senate.

Another attack seems certain to be made on the chief weapon of obstructive minorities on both the right and left. This is the filibuster, the device by which one Senator or a small group can talk any measure to death in the name of free debate. Senator Vandenberg would outlaw filibusters such as those put on during the last Congress by Senators Taylor and Langer against the revival of conscription and by the southerners against the repeal of the poll tax. His view is that 90 to 95 per cent of Senators present and voting should be able to terminate debate on issues of national emergency, and that the present closure rules, which require a two-thirds majority, should apply to motions to consider a Bill as well as to debate on the Bill itself. Senator McGrath has indicated his general support of this long-needed reform, but while supporters of the filibuster may bow to a national emergency, they are likely to employ the device itself to defeat the more general proposal, which is clearly the advance guard of civil rights legislation for the Negro.

* * *

Un-American Activities

In the House, a bleak future appears to await the Committee on Un-American Activities. Mr J. Parnell Thomas himself, the scourge of the ungodly, has been indicted on a charge of taking part in an Un-American activity of his own, padding his official pay-roll and defrauding the Government by demanding "kick-backs" from these appointees. Nepotism by itself is not illegal; deserving relatives of successful politicians can count upon being added to the Federal pay-roll if they are willing to do the work. Even Mr Truman, when a Senator, appointed his wife to be his secretary. But fraud is another matter. Many of the witnesses whom Mr Thomas harried are now rewarded by the sight of him seeking, as they did, the shelter of the Fifth Amendment. He too has refused to testify before a grand jury on the ground that it might incriminate or degrade him. Mr Thomas is fortunate that his committee never secured the ruling it sought that Federal job-holders who refused to testify before judicial or Congressional investigations should be stricken from the pay-roll.

The elections dealt the committee a series of heavy blows. The political effectiveness of the committee's witch-hunts through Federal agencies was shown to have been much less than had been expected; and the Democratic victory in the House deprives Mr Thomas, even if he is acquitted, or any other Republican, of the committee chairmanship. Three Republican members will be seen no more: Mr Mundt because he was elevated to the Senate, Mr Vail of Illinois and Mr McDowell of Pennsylvania because they were defeated. The southerners now come into their own, for all the former Democratic members were southerners, northern Democrats as well as liberal Republicans fighting shy of appointment to so malodrous a body.

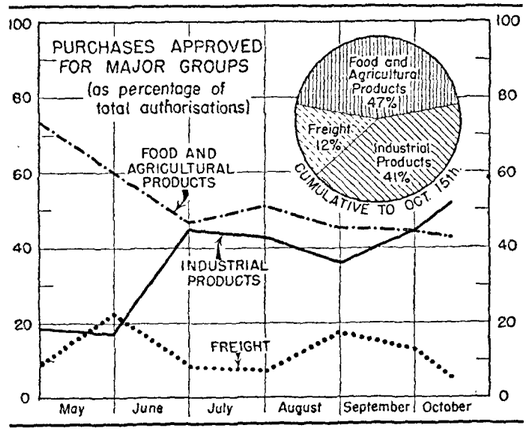
Mr Wood of Georgia, who, according to the seniority rule, is likely to be the next chairman, is a more judicial character than his predecessors, but at his elbow will stand Mr Rankin of Mississippi, a flagrant anti-semite and advocate of white supremacy, who is perhaps the most virulent of Mr Truman's enemies. It is small wonder that Senator McGrath says the committee faces a dismal future unless it is reformed out of recognition. It may even be abolished, as some members desire. But this is unlikely; even Congressmen who feared and disliked it helped to vote it $200,000 last year, lest they be accused of subversive sympathies. It may be reformed and renamed; the Committee on Civil Liberties would smell sweeter. Or, if it proves recalcitrant, it may quietly be starved of funds.

Shorter Notes

For the first time in seven months the Bureau of Labour Statistics has announced a decline in the consumers price index; although clothes, household furnishings and rents were higher, the third month of lower retail food prices produced an over-all decline of half of one per cent for the period September 15th to October 15th. The cost of food, which reached a record high in July, was down by 2.4 per cent since then. Nevertheless, it cost the New York housewife, who wished to duplicate her 1947 Thanksgiving dinner, 12 per cent more than last year (in some stores turkey, the traditional meal, cost over 4s. the pound). Thankfulness for BLS reports was hardly what the founding fathers had in mind, but if November, 1948, is remembered as the beginning of the end of inflated prices a new reason to celebrate the holiday may have been inaugurated.

*

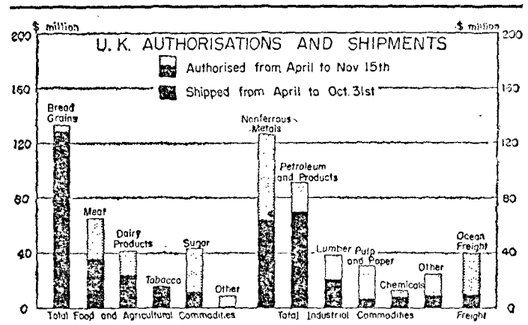
The Chicago printers' strike was a year old last week. It is estimated that the 1,500 strikers have been deprived of $7,000,000 in wages, apart from the overtime which they might have earned. The International Typographical Union has spent approximately $4,000,000 in benefits and another $1,000,000 to run the strike; this is in addition to the $300,000 which the strike has already cost the local branch. Substitute methods have enabled the newspapers to maintain uninterrupted publication, but these methods remain more expensive than orthodox printing.



THE WORLD OVERSEAS

Nine Months of ERP

WHEN the new US Congress meets in January, one of its first tasks will be to consider fresh appropriations for the European Recovery Programme. Eighty per cent of the funds voted last April—in the hope that they would last until next July—have already been allocated during the first eight months of the project. Although the next Congress will be predominantly Democratic, non-isolationist and hence well-disposed to the basic aims of ERP, it is certain to demand a strict accounting of this year's appropriations. Where, it will want to know, has America's money gone and for what has it been spent? Is the programme taking on any shape and direction and, above all, is it producing results? The answers to these questions are no less vital to the Europeans who are compelled to look ahead to the time when Marshall Aid has ceased.



Some disappointments may be in store for those Congressmen who expected miracles in the way of industrial plants springing up overnight or vast development schemes flowering throughout Africa. The record, on the contrary, is one of growing pains followed by the first signs of quiet achievement. It shows that in the early months ERP tended to be what Congress would call a "relief" programme with a heavy emphasis on authorisations for buying such agricultural commodities as wheat and fats. But as the accompanying chart shows, the balance is gradually being redressed in favour of industrial products.

At the start of ERP in April, food and agricultural products accounted for over 70 per cent of European purchases under the programme; by mid-October the percentage had dropped to little more than 40. And at the same time the share of industrial products in total European purchases had risen from 18 per cent to over 50. This trend has been even more pronounced in recent weeks. Industrial commodities made up 60 per cent of the total purchases approved by the Economic Cooperation Administration [ECA] in the first half of November and rose to 92 per cent in the week ending November 24th.

The current high ratio of industrial commodities is due partly to the fact that Europeans are beginning to use their Marshall loans for the purchase of reconstruction goods. In the second half of November, for instance, machinery put in its first appearance on the United Kingdom list of authorisations. The high ratio probably also represents the breathing spell after the first rush to fill the bins, granaries and pipelines emptied as the result of last year's bad harvests and industrial stoppages.

It is far too early to say that the new emphasis on industrial products revealed in November will be maintained, and it is quite probable that for some time to come Western Europe will lean too heavily on the western hemisphere for agricultural products and raw materials. This reliance is particularly true of Britain. For the first seven and a-half months of ERP, that is until mid-November, total approvals for purchases by Britain amounted to nearly $700 million. They were divided in the following ratios:—Food and agricultural commodities, 47 per cent; industrial commodities, 47 per cent; freight, 6 per cent. Within these groups the more important items were:—Bread grains, 22 per cent; non-ferrous metals, 18 per cent; petroleum and products, 13 per cent; meat, 9 per cent. Moreover, in the last two weeks of November, Britain received another $300 million worth of authorisations, and although no exact details are yet available, there are indicatons that bread grains make up nearly a third of this additional sum.

So far very little of the aid to Britain has evaporated in the form of freight charges paid to American shippers. Britain's case, however, is exceptional. Up to mid-October 12 per cent of all aid to Europe was absorbed by freight charges—in the case of France and Italy the proportions were approximately 20 per cent. To some extent this reflects lack of shipping in Europe, but it can also be attributed to the high level of American shipping charges and to the protected position which American shippers enjoy under the Economic Co-operation Act which lays it down that 50 per cent of all Marshall Aid shall be carried in American bottoms. There is concern among ECA officials at this use of American aid, and some effort may be made to persuade Congress to modify the shipping clauses in the original Act.

Another point which will interest many Congressmen is the sources from which ERP commodities are being drawn. When the project was first discussed in Washington, a forceful minority argued that one effect of the plan would be to siphon off goods from the American market and thus lead to further inflation. The story of the first six months will not entirely remove their fears. By mid-October 56 per cent of the commodities made available had been provided from US supplies. A further 25 per cent came from the remaining countries of the western hemisphere, and only 13 per cent were supplied by the participating countries themselves. In recent weeks, however, the relative share coming from the United States has tended to decline while that of Canada in particular has mounted because of large purchases of wheat and metals. What is even more important is that Europe itself seems to be playing an increasing part in providing the participating countries with industrial goods. And as the emphasis of the ERP programme shifts from relief to reconstruction it looks as if these European industrial goods will take much of the strain off the American economy.

In the last resort Congressional critics will have to be shown that ERP aid is no more than pump priming and that once the priming has been done the Europeans intend to help themselves back to economic health. When the indices of European production in October and November are available it should be possible to assess the effectiveness of this effort. Already it is true to say, as Mr Hoffman himself has pointed out, that in western Europe the production of power is 10 per cent above 1947, steel 27 per cent, food 25 per cent and fertilisers 33 per cent.

As a further example of self help ECA can single out the intra-European payments scheme through which the Marshall nations, together with the sterling area, are making available to each other $810 millions in their own currencies. It is also possible that the OEEC officials who are toiling over the four-year programmes in Paris may yet offer the world proof that western Europe is able to think and act as an integrated economy.

However, in one remaining field of endeavour, little has been accomplished over the first eight months. The attainment of financial equilibrium was clearly marked as one of the three principal goals of ERP, together with increased production and trade. France offers the prime example of the failure to curb inflation and the accompanying evils of social unrest, high costs and undue emphasis on non-essential production. But there are fears in Washington that even such a sturdy economy as the British is still vulnerable to the danger of inflation, especially in view of the heavy investments planned for the next few years. Nor has it escaped the attention of US officials that any further inflation in America will have grave consequences for western Europe. It is certain, therefore, that one of ECA's main objectives between now and the end of the first ERP year will be an effort to lay the groundwork for greater financial stability, without which American aid can accomplish no permanent good.

The Mind of Israel—II

[BY A GENTILE RECENTLY IN PALESTINE]

WHEN Palestinian Jews recount today their criticisms of Britain and Mr Bevin they say surprisingly little about immigration. The complaint is still alive, but for the time being it is in the background—sent back, so to speak, to play in goal while the forward line is reconstituted with younger and more active players. Most of the present complaints are less than a year old. If, the Jews tell you, we had laid down the mandate in the right way, we should have left 1,000,000 friends behind us. When Uno's scheme of November 29th was made known, Palestinians danced in the streets and British soldiers were fêted. But instead of helping the British decided that the Arabs could beat the Jews; they looked forward to the result with complacency, and they backed what we thought mistakenly was the winning side. A remark attributed to a high British official is quoted with indignation: "If the Jews want a big slice of the political cake they will have to pay a big price for it"; and, in accordance (the Jews believe) with that policy, Britain held the door open for 10,000 Arabs to flood into the country, gave them modern arms, tanks and maps, and fighting men, of whom seven, all now prisoners of war, are corporal evidence of what the British tried to do to Jewry. Mr Mayhew is quoted as saying that the country's financial position is not good, at a time when the Treasury is sitting on £100 million of Palestinian money blocked in London. From documents discovered—this opening has a strangely familiar ring—it has been established that the mandatory power deliberately cooked its statistics, and used faked figures to show the Arab population as much larger than it ever was. Former British policemen have joined up with a gang of Nazis and are still fighting in Palestine against Israeli troops which will starve them into submission. Such are the stories current today in Tel-Aviv.

With these charges, the Englishman in Palestine is constantly assailed. When he moves over to the attack and speaks of the grievances that rankle in British breasts—young Englishmen murdered, the sergeants hung in cold blood, the innocent brother of a Palestine police officer done to death in England, Folke Bernadotte dead, the sedulous vilification of Britain in America—and when he suggests that the Jewish Agency could have stopped such abominations if it had had the will to stop them, he is given various reasons for the Agency's inactivity:—

(1) You cannot stop men who are willing to die for a cause.
(2) Britain would not accept the Agency's help.
(3) Few Jewish parents could be certain that no son or daughter of theirs was a terrorist and they could not bear the thought of their children being shot by fellow Jews.
(4) The Agency dared not interfere with anyone who claimed to be working for immigration.

Of these reasons the correct one is undoubtedly the fourth, and in fact the Jews now boast that since the Bernadotte murder they have smashed the Stern gang.

When the Englishman reminds the Jews of what we have done for their race, and taxes them with gross ingratitude, he gets the answer that the Jews have not forgotten and are not ungrateful; but they reserve the right to be at once thankful for benefits received and resentful of injuries inflicted. And that (if you admit the injuries) is not after all an illogical attitude.

One thing, however, has shaken the Jews—the trial and sentence of Sylvester. When the talks here recorded took place, he was due in the Court of Appeal within two or three days; and it was clear that thinking Jews anxiously hoped for his acquittal, so that the stain of a flagrant miscarriage of justice might be removed from the young records of Israel. That he was discharged after so short a hearing is not in the least surprising, and the opinion has been expressed that the judge guilty of pronouncing the original sentence should be dismissed from his post.

But these matters, important as they are in their effect on public opinion on both sides, lie near the circumference. The centre of the Palestine problem is the relation of Jew to Arab, and here the prevailing attitude of mind among the Jews may strike a visitor as insensitive. The plight of the refugees is dismissed as propaganda. The rich Arabs are described as having not even a rudimentary notion of responsibility towards their poorer fellow countrymen; and this Arab failing or vice is put forward as a good reason for the Jews also being indifferent. The Jews appear to be satisfied that Arabs, expelled during the war, will creep back to their blown-up homes and resume their old life under a new Government. In the flush of victory Israel, it may be, does not sufficiently appreciate the dangers that can threaten it in future from neighbours embittered and hostile, united as the years go by in a common desire for revenge or a common fear of aggression. Perhaps a study of European history since the rise of Bismarck might pay useful dividends in the future history of Palestine.

But there are, even today, favourable signs which must be recorded. The Jews are very proud of the success of their military government in the district of Nazareth (where the population is preponderantly Arab) and business men in the town, not tied by interest or race to the Jewish regime, will tell you that things are settling down well and that the difficulties are turning out to be much less than they had expected them to be. The Governor, a non-English-speaking Jew, who left his job in one of the Communal settlements for a post in the Army, is clearly a good organiser; and his assistant, a young English-speaking lawyer from Haifa, strikes one as a man of ability and sympathy, anxious to get back to his law, but not till he has finished his present task of reconstruction. The Government seems to be on the right terms with the Moslem mayor. Apart from an occasional military policeman in the streets there is no sign of formal occupation; and travellers, even in the dusk and unarmed, can motor safely through the district, running apparently no more risk of a violent death between Nazareth and Tiberia than they would expect to meet on the road between Perth and Edinburgh.

It is argued from these conditions that Israel is a better hand at government and administration than the mandatory power—of which even on the technical side the Jews thought but poorly. It is early days to make comparisons of generalisations, but if the Government will in a liberal spirit discard the role of conqueror, giving to the Arabs a genuinely equal status and better education, then the futureship of the two races inside Israel may prove to be both economically and politically fruitful.

And what of the future relations between Israel and Britain? Here is the answer of one very high authority whose ties with this country have hitherto been extremely close. "The Jews are not ungrateful to Britain. What Britain has done for the Jewish race is part of the history that all their children have to learn in school; and beneath the present superficial bitterness lies an enormous reservoir of good will, waiting to be tapped. There is still time to tap it, but, as the generations change, the opportunity, lost now, may not recur."

The Sudanese Elections

[BY A CORRESPONDENT]

ON November 15th the Sudanese went to the polls for the first time. They did so in fulfilment of an ordinance of last June granting them an elected Legislative Assembly and a nation-wide Executive Council containing a Sudanese majority. To run a general election at such notice, and in a country of seven million inhabitants educationally and socially so diverse as to require three different types of franchise, was a feat worthy of praise. After five months of serene preparation, polling day was, unfortunately, not quite uneventful. Trouble had been prophesied by Tass. Demonstrations designed to keep peaceable citizens indoors were organised by the pro-Egyptian National Front. But they were small and easily dispelled except in Atbara and Port

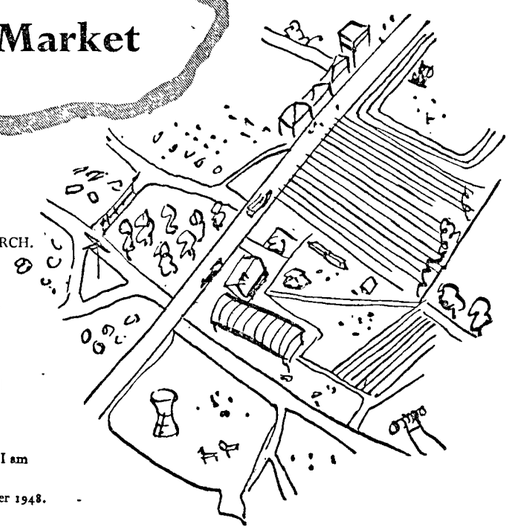
Sudan, where ten people were killed. (The five deaths in Atbara were caused, it seems, by injuries from the explosion of a tear gas container which burst as the crowd surged over it upon dispersal; those in Port Sudan were caused by police fire after a band of Beja tribesmen—ignorant but lusty loaders from the dockside—had been rushed up as reinforcements to the political demonstration, and had used their knives.)

It is not possible to give the exact numbers that now represent each party in the Legislative Assembly. Indeed, it will never be possible because of the considerable numbers of deputies, particularly from country areas, who prefer not to style themselves *Umma* or *Ashigga*—the two main parties—because the leader of each of these flies a sectarian religious banner. It is certain, however, that the Independent Front (of which the *Ashigga* is the mainstay) holds more than half of the 65 elected seats and that the National Front (consisting of four parties wanting four different varieties of link with Egypt) has fallen between two stools—having neither totally boycotted the elections, nor yet won them. This last, it is only fair to add, it never looked like doing. The supporters of complete independence (including independence of any link with Egypt) are, along with the *Umma*, the bulk of the tribal *nazirs* (chiefs) in the Arabic-speaking areas, and all the non-Arab peoples of the deep south. The main difference between these last and the *Umma*, is that the so-called "Black Block" (it is not a block, yet) do not want the British to go so quickly as the fierier members of the *Umma* would like them to do.



The machinery which the ordinance set in motion is as follows. At the base of the pyramid are electors of three types. In the ten principal town constituencies they elect by direct suffrage. In 42 rural areas of the northern and central Sudan the *nazirs*, the *omdas* and certain elected tribal or municipal nominees form a college, and hold a secondary election for each seat in the legislature. In the three provinces of the deep south, the three existing Province Councils elect to thirteen seats in all. The Legislative Assembly also contains ten members nominated by the Governor-General and, as ex-officio members, certain persons with seats on the Executive Council which tops it.

The Legislative Assembly elects its own Leader. This Leader automatically becomes a Minister, and assists the Governor-General in the choice, first, of the other ministers, who may not be officials, and, secondly, of twelve undersecretaries, all of whom must be Sudanese. The ministers, together with the four principal officials and "not more than three Councillors without portfolio" who are chosen by the Governor-General and who need not necessarily be Sudanese (they might, for instance, be Egyptian) form the Executive Council which initiates legislation. The Assembly has power to discuss and amend, but its amendments, if thought unsuitable by the Council or the Governor-General, can be overridden. For the present the Governor-General's powers include the right of veto of Executive Council decisions, the right to dissolve the Legislative Assembly, full rights in reserved matters such as foreign relations, and the right to resume by proclamation all powers delegated to the Council or Assembly. The one restriction upon these plenary powers is that the Governor-General, if acting in any way that is contrary to the Assembly's vote, must before taking action secure the consent of both the co-domini to whom he is responsible—that is, of the British and the Egyptian Governments.

Clearly, to the smart young man in western dress who has been to Cairo, this arrangement is illiberal. Equally, where the vast majority of the population—sensible but illiterate peasants and shepherds—is concerned it is in advance of capacities, and even of desires. How will it work out in practice? Was a nation-wide system over-ambitious? Will it demonstrate, as many townsmen fear, that too much weight has been given to the rural areas? Will the *nazirs* now elected to seats feel able to give the necessary time away from their tribes and local affairs? Will it prove topheavy? These are all risks, but meantime all that is certain is that given the immense diversity of the Sudan from the standpoint of education as well as race and language it is virtually impossible to devise a scheme which takes more fully into account the interests of elements as inharmonious as are the Khatmieh (voting *Ashigga*) and Ansar (voting *Umma*) sects of Islam, and as different as are the Arabs from the Dinkas and Shillooks.

This is a point that is—sometimes wilfully but more often in ignorance—overlooked by all Egyptians. They shout for the unity of the Nile Valley without a thought about its diversity. They never weigh the advantage to a troubled Egypt of a sedate Sudan.

The Rural Market

A compilation of facts relating to the agricultural industry, rural standards of living and purchasing habits.

THE RURAL MARKET is the latest publication by HULTON RESEARCH. It examines the many changes—accelerated by War—in the way of life of the British rural population.
It tabulates material hitherto difficult of access and nowhere collated.
It is the best single collection of facts on the British rural market at present available.
THE RURAL MARKET has great sociological as well as commercial interest. It helps the townsman and the businessman to see the rural facts and figures against their proper background.

"It certainly looks to me as if it will be very useful. I have been feeling the lack of accurate information . . . your investigations will, I am sure, give us just the information for which we have been looking."
L. DUDLEY STAMP, London School of Economics, 2nd November 1948.

PUBLISHED BY HULTON RESEARCH (*Copyright vested in the Farmers Weekly Limited*).

THE BUSINESS WORLD

Report on Disinflation

CONTROVERSY still continues about the results and future of the policy of disinflation. It has indeed been sharpened lately by the knowledge that within a few weeks the Chancellor must begin his preliminary survey of the problem of the next budget. Is disinflation still exerting a positive force, or has it so far given way before opposing pressures that Britain faces renewed inflation unless the Chancellor can devise stronger correctives? It cannot be said that recent discussion had made it much easier to answer these questions than it was three months ago, when the threats to the disinflationary policy were last surveyed in any detail in these columns. Indeed, some of the official pronouncements have been tantalisingly at variance.

When Sir Stafford Cripps affirmed at the Mansion House that the "main structure of the budget is unaffected" by the increases in expenditure, it was widely assumed that he was referring strictly to the state of the Government accounts and was not implying that the whole disinflationary formula was equally unimpaired. But a fortnight later he went so far as to say that the shortfall in the surplus would not be so large as "to counteract the main policies of the budget." In other words, he believed that the degree of disinflation still being exerted, though less than had been expected, would be reasonably adequate. This seemed a much more questionable proposition, for, however true it might be that the Government's own finances had not been seriously undermined, there was and is no doubt that pressure of demand for capital, by the public sector as well as the private sector of the economy, has been significantly greater than the budget estimates envisaged. The Chancellor has recently admitted this; at a press conference last month he estimated capital investment at home in 1948 at £2,000 million for fixed assets alone, whereas the estimate on which the disinflationary formula was founded was £1,800 million for total investment at home, including not only fixed assets but also additions to stocks and work in progress.

The Chancellor's apparent belief in the adequacy of disinflation, despite the heightened pressure of demand for capital, could conceivably be explained in one of two ways. The authorities might be reckoning that sufficient savings are being generated, in a non-inflationary way, to finance the uncovenanted demands, and thus to leave the nation's capital account in as fair an equilibrium as was contemplated in April last. Alternatively, it might be assumed that, even though no such statistical equilibrium can be demonstrated, the general state of the economy, viewed empirically, is in fact being "disinflated" so far as is reasonable and practicable, and in any case sufficiently to ensure no serious revival of inflation—unless entirely new demands arise, such as defence.

★

Since these appear to be the only conceivable hypotheses, it will be well to examine each in turn. The statistical approach is, of course, the one upon which Sir Stafford relied in his budget speech and developed later in the debate, when he showed how his surplus ought to suffice to maintain equilibrium in the nation's capital account as a whole. The figures given then related to the calendar year—as in the National Income White Paper and the "Economic Survey"—and it is impracticable to adjust them to fiscal years. In 1948, Sir Stafford assumed, gross investment at home would absorb £1,800 million, of which £250 million would be financed by the net inflow of goods and services from abroad. This £1,550 million of home-financed investment was to be covered by a current-account surplus of £400 million in the public sector (including local authorities and extra-budgetary funds), by £700 to £800 million of provisions for depreciation and by a residual £350 to £450 million of private saving.

One way of testing the effectiveness of disinflation is to consider how far each of these constituents is departing from estimate. It should be noted that, even if precise estimation were possible, this could not be a wholly satisfactory test, for reasons indicated later. But such an approach is at least an aid to clear analysis. Investment, it is clear, has far surpassed the £1,800 million estimate, but it seems doubtful whether the excess is so large as Sir Stafford's recent figure of £2,000 million for fixed investment alone would imply. During the past year, as the "Statistical Digest" shows, there has been a significant rise in the physical volume of stocks of many industrial raw materials, and an even bigger rise in the values of these stocks, for the wholesale price index has risen by some 13 per cent. Retail stocks have risen in twelve months by about 5 per cent by value, and, on the evidence of published balance sheets, there has been an important increase in the value of stocks and work in progress in industry. Allowing for the fact that stocks of certain raw materials have declined, it seems evident that total investment at home must well surpass £2,000 million. Its excess over the 1947 level is unlikely to be less than £200 million, which would give a total of fully £2,100 million. On the other hand, external disinvestment is running much closer to the estimate of £250 million than had been expected. The external deficit for the first half of this year was at an annual rate of £280 million. This is an incomplete measure, however, of the extent of the deflationary relief which the deficit affords. Of the half-year's invisible "exports," no less than £64 million represented notional credits and inter-Governmental settlements arising from the war. These "exports" made no demands on home resources; nor, for that matter, did part of the expansion in genuine invisible exports. Strictly for the purpose of estimating the current deflationary relief, therefore, the prospective final deficit for the year of, say, £250 million ought to be written up to, perhaps, £375 to £400 million. On this basis, the net volume of investment requiring domestic finance would be, say, £1,700 million, compared with the Chancellor's original estimate of £1,550 million.

On the savings side of the account, a shortfall is certain in the current surplus of the public sector. Revenue is expected to reach estimate, but expenditure will exceed it—perhaps largely. The annual rate of cost-of-living subsidies has been running for some time at over £70 million beyond the estimate for the fiscal year, and there have been important uncovenanted expenditures on defence, the Berlin air lift and other special measures for Germany, and the National Health Service. Nothing has been disclosed about the extent of these outlays—except that deferment of releases from the services will cost about £8,000,000 this year. Perhaps in the calendar year the extra burden will not be large; but it will be surprising if the expected surplus is not whittled down by £100-£150 million.

Depreciation provisions will certainly reach the higher of the two figures contemplated last April—i.e., £800 million—and perhaps should be put at £850 million, or £75 million

more than in 1947, for there has lately been a much clearer recognition of the heavy excess of replacement costs over the charges allowable for tax purposes. On this footing, the sum required from private savings to balance the whole account would be £550 to £600 million, which is actually £100-£150 million below the estimated amount for 1947. Including changes in tax reserves, corporate savings were then put at £210 million and personal savings at £495 million. But these large personal savings in 1947 were admittedly a reflection of the prevalent inflation. Indeed, the particular weakness of this method of testing inflationary pressure is that the whole capital account in retrospect is always balanced—the principal question, when surveying the past, is whether the volume of savings actually generated could have been achieved without the aid of inflation. How far, if at all, has the £550 to £600 million apparently needed this year been thus generated?

Perhaps the best guess for "non-inflationary" corporate savings would be £400 million, after specifically providing the extra £75 million for depreciation. That would leave £150 to £200 million to be provided by personal savings—evidently a much larger sum than was assumed in the Chancellor's estimates. The performance of national savings must have disappointed even the conservative official estimates, for in the financial year to date encashments have exceeded new savings by £5,000,000—before allowing for £50 million of repayments of Defence Bonds at maturity. The trend of these figures is not, however, a reliable guide to the flow of personal savings as a whole. Until recently, for example, the volume of new life assurance business was still rising; and this year there has probably also been a tendency for a larger proportion of savings to be accumulated in cash. It is hard, however, to believe that the total of spontaneous personal savings can be approaching £200 million. In short, this statistical analysis suggests that there was, prospectively, a gap in the nation's capital budget, and that the closing of it is requiring the lubricant of some continuing inflation. It seems, however, that the gap so far has not been large; but it should be noted that almost every one of these estimates is subject to a very wide margin of error.

This conclusion is not, perhaps, inconsistent with the impression given by the alternative and more empirical approach to the problem. On a general view of the business situation, the Chancellor is well entitled to his claim to have introduced a measure of disinflation—in the sense that, whether or not the statistical analysis shows as neat a balance as might be wished, there has undoubtedly been a lowering of the general temperature of inflation. People are still complaining, though less insistently than a few months ago, that there is "less money about"; seasonal sales and "remainder" sales are no longer a postwar novelty; and in many directions the public is showing a much more careful and selective policy in its purchases. Unfortunately, the latest analysis of consumption expenditure relates to the second quarter of the year, which is perhaps the period in which the disinflationary process was most pronounced. But it is noteworthy that, in every one of the groups except food, the rise in expenditure between the first and second quarters was smaller, sometimes much smaller, than in 1947. The rise in prices, too, has slackened. The retail price index, though nearly 7 per cent up on the year, has been almost stable for the past six months; while the wholesale index, which rose by 18 per cent in the twelve months to last March, has since risen by less than 2 per cent.

*

Altogether, it seems reasonable to conclude that, although inflationary pressures are still present, they are exerting only mild effects by comparison with 1946 and 1947. While this improvement has been due partly, but not wholly, to the deliberate effort at disinflation, it poses for the Chancellor a difficult problem. The intention last spring was to use the budgetary weapon and other measures, such as selective pruning of investment to enforce a marked concentration of resources upon the most vital industries. A glance at the manpower figures shows that, judged by this test, disinflation has had very little success. Its main achievement has been to reduce spending pressure at the margins of the economy without compelling either any increase in unemployment or any major transference of workers. The problem which confronts the Chancellor now is to decide whether the whole policy could be reinforced sufficiently to ensure a much closer approach to the original objectives, or whether, alternatively, it would be more realistic to be content with the present limited achievement. Recent evidence suggests that the authorities are leaning increasingly towards the second of these views.

Rhodesian Copper Conspectus

BY ordinary standards, the Rhodesian copper mining industry is reckoned a young industry. So indeed it is. But it has now reached the stage at which it can reach out towards a vigorous maturity. Roan Antelope has attained its majority and has this year produced its millionth ton of blister copper since operations were started in 1931. Rhokana, its senior by five years, has in the year to June last surpassed all previous records of operating profit, and has disappointed an over-optimistic market with a total dividend of 100 per cent payable out of earnings of practically 150 per cent. But it is doubtful if the staffs of the copper companies, taken together, will think of 1947-48 as a year calling for special celebration, for it was a year, too, of exceptional difficulty. For this reason, the latest accounts of the companies deserve closer attention than those of perhaps any other year since large-scale operations began. They are as full of meat as ever, and their conclusions are of particular importance.

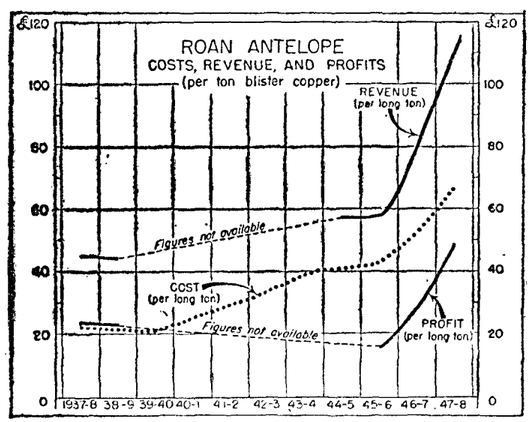
If prices and gross sales were all that mattered, 1947-48 would have to be recorded as a very favourable year indeed. Rhokana's gross sales increased by little short of £2,000,000 to £8,500,000; and the increase in Roan Antelope's sales proceeds to almost £6,000,000 was scarcely less. But the Roan Antelope figures (given in greater detail than Rhokana's) show to what an overwhelming extent this increase was due to prices. Physical sales of copper did indeed increase, but only by 3½ per cent, while the average revenue per long ton of copper sold jumped from £80 10s. 8d. for the year to June, 1947, to £115 10s. 7d. in the latest year—an increase of no less than 43 per cent. The boom in non-ferrous metals has carried Roan Antelope's average revenue per ton of copper sold to two and a half times the prewar figure, and double what was received per ton in 1944-45. Yet inflation is never single gain. Its effects on the Rhodesian copper companies' costs have been significant. They are still efficient producers of copper, but they are no longer cheap producers in the old sense. Last year Roan Antelope's costs per ton of blister copper, f.o.b. Beira, rose from £49 19s. 5d. to £63 14s. 5d. It may be argued that although costs were rising, they did not jump ahead so far or so quickly as prices, and that an increase of £21 5s. in the profit margin, from £30 11s. 3d. to £51 16s. 2d., leaves no room for complaint, either by the company or its shareholders.

But the trend of costs must not be disregarded merely because the profit margin continues to expand. The chairman's statement reveals that costs per unit of output continue to rise. With copper at present prices, the royalty payment per ton is rising fast. For 1946-47 the average cost of royalties per ton of blister copper produced was £3 16s. 9d.; last year it was £9 3s. per ton. This is welcome news for shareholders of British South Africa Company, but the increase in royalties represents well over one-third of last year's increase in costs and the rise in copper prices to the present level means a more than proportionate increase in royalties. The only bigger increase was in mining costs—up from £26 0s. 7d. to £32 14s. 8d. Part of this increase was due to the mining of a lower grade of ore, owing to difficulties underground. The report merely states that "it is hoped . . . to reduce the dilution" (of the grade of ore).

These instances of rising costs from the Roan Antelope report are partly peculiar to the company and partly of general application to the whole of the Rhodesian copper industry. The incidence of rising costs would, indeed, have been less obvious if the companies could have expanded their production to a more satisfactory extent last year. There were, it is true, increases of a moderate order. Rhokana increased its total production from 66,231 long tons to 69,358 long tons, of which the bulk was electrolytic copper, in high demand in the world market. Roan Antelope's output increased by roughly the same modest proportion, from 49,641 long tons of blister copper to 51,757 tons. But last year was dogged, like the previous year, by a continued shortage of coal. The Rhodesian copper companies did what they could, by combined effort, to conserve coal and to use more wood—unsatisfactory and costly, but to be preferred to the closing of mining plants. Both Rhokana and Roan Antelope each saved about 40,000 tons of coal by using wood and making other economies. Some coal was imported via Lobito Bay, to make good part of the shortage of coal deliveries from the Wankie colliery, and there have been constant discussions with the railway and other authorities to obtain an improvement in supplies. In the circumstances, the copper companies did well to increase their output last year, and although the current financial year opened badly, there has since been some improvement in coal supplies. The big expansion of copper output, of which the plants are fully capable given sufficient fuel, will take time and patience.

The past year was at least free from the labour troubles which beset the previous year. But labour costs have risen sharply in consequence of the wages agreements. A reclassification of African wages by Roan Antelope has increased the cost by 24 per cent., and native labour has not been plentiful. The new pension and cash bonus scheme for European employees has meant an addition of 29 per cent to basic wages. There are signs in the report that the rising course of wages may continue, and certainly the financial outcome of the past year will not deter either European or native labour from raising its demands. In sum, there is evidence in plenty that costs per unit are likely to rise further during the current year.

If Roan Antelope and Rhokana are the lusty young men of the Rhodesian copper field, Nchanga is still the backward juvenile. That is not the fault of the company itself, so much as its unlucky date of birth. The war postponed its development, and the difficulties of the postwar period have retarded its expansion. The report puts the best face on the difficulties of obtaining plant and machinery when it records that the expansion programme is progressing satisfactorily. In the year to March 31st, 23,468 long tons of blister copper were produced. Admittedly, this represented an increase of 7 per cent compared with the output of the preceding year, but it was well below the capacity of the plant, which is put at 27,000 tons. Nchanga experienced a double difficulty from shortage of rolling stock on the Rhodesia Railways, for this affected the supply of coal for mining operations and also restricted the tonnage of copper concentrates that could be sent to the Nkana smelter (which is part of the Rhokana plant).



So much for the difficulties of last year's operations on the Rhodesian copper field. The financial results of the year and its predecessors are set out in summary in the table and chart accompanying this article. (The full accounts of Mufulira were not available, but preliminary figures have been given where possible). A note of explanation is called for in the case of Roan Antelope—and conceivably the same point may apply to Mufulira when that company's accounts appear. The latter company appealed last year to the City Commissioners regarding the method of valuing copper stocks, and received an adverse decision. In the light of that decision Roan Antelope has this year valued its opening and closing stocks of copper at cost, and not as hitherto partly at £25 per ton and partly at selling value. As a result, the profit for the past year has been enhanced by £206,452, and profits for previous years by £377,213. These sums have been transferred to general reserve and it is perhaps a fair inference from the chairman's remarks that any similar surpluses due to the effects of rising costs on stock values may be taken to reserve in future. The result will be that profits are brought out into the open, and related more directly to the company's tax liability, but that exceptional profits would be snatched back and not distributed.

One feature common to all these "Cohenised" accounts is the determination of the companies to do nothing which would weaken their resources for the replacement and extension of fixed assets. The chairman of Roan Antelope emphasises in his statement the wisdom of the company in providing for future replacements by reference to estimated future costs, instead of basing the charge on past costs for Inland Revenue allowances.

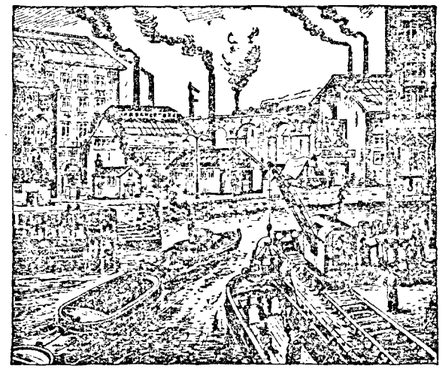
(a) Years to March 31st. (b) Ordinary capital owned by Rhodesian Selection Trust (64 per cent), Rhokana Corporation (26·6 per cent), 150,000 shares by Rhodesian Anglo American. (c) Preliminary figures. (d) Not available.

The same point, though not explicitly made in the Rhokana report, is implicit in the decision to step up the general reserve by £668,488, making the total £3,875,000, which is quite apart from share premium and capital reserves together totalling nearly £9¼ million. If there is a residue of disappointment about the Rhokana dividend, further reflection should surely commend the wisdom of the directors' course. It is pleasant to be free of the inhibitions of dividend limitation, but that does not release the directors from the duty of securing the fixed assets and future development of their undertakings out of the high revenues which they are now earning.

What does the current year hold in store? Some further rise in costs is to be expected, though on present signs it should be comfortably outweighed by the further rise in copper prices. A closer indication of the trend of operating profits will be provided early in the New Year, when Roan Antelope resumes the issue of quarterly statements—a practice which might commend itself to the other companies too. It is difficult indeed to discern any influences which threaten the present level of demand and prices. The key to the copper market is the United States, where consumption is roughly double the prewar record of 1937. Government purchases for the stockpile have to be added to this buoyant commercial demand; these operations are secret, but it is generally supposed that the programme calls for the procurement of 10,000 tons a month. British consumption, too, is well above the prewar level, and the United States and Britain together absorb more than 80 per cent of the world's copper output. At some time in the future, Germany's consumption is bound to recover. All the factors on the demand side—the high consumption in America, strategic purchases, the particular shortage of electrolytically refined copper, and the provision of Marshall dollars by means of which European countries can pay for their supplies—all these factors suggest that, whatever may happen to commodity prices generally, copper is likely to be resistant to any fall and conceivably might enjoy a further rise. So far as prices are concerned, the Rhodesian copper companies should have little reason for anxiety this year. They are likely to be less happy about their costs, for although prices have outstripped costs, the long-term effects of the rapid rise in costs since the war may tell adversely when the acute shortage of copper is remedied. Admittedly, there is no promise of any rapid increase in supplies. Rhodesia's particular problems of fuel and transport can be solved only gradually; the United States, still the world's largest producer, cannot cover more than a part of its own needs; Chilean production is beset with recurrent political troubles; and Canadian output is determined largely by the economics of nickel, with which it is jointly produced. And while copper as a whole is short, electrolytic copper is particularly short. Only one-quarter of Rhodesia's output last year was electrolytic, and although an extension of refining capacity is being undertaken, it will be quite insufficient, in itself, to meet Britain's demand for copper of that quality.

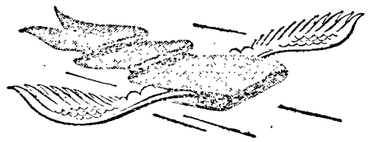
In the past the world copper market has shown itself capable of rapid and bewildering change. But it is difficult to detect many unfavourable signs at present. Until the American recession—so freely forecast and so often postponed—really arrives, a dramatic change in prices seems unlikely. On these grounds, the argument for holding Rhodesian copper shares at yields of between 7 and 7½ per cent as medium-term speculative investments seem quite reasonable. The wise investor will nevertheless take note of the trend of costs, with all its longer-term implications, if and when copper prices eventually fall from today's high level.



European Recovery—VI

Revival of European Transport

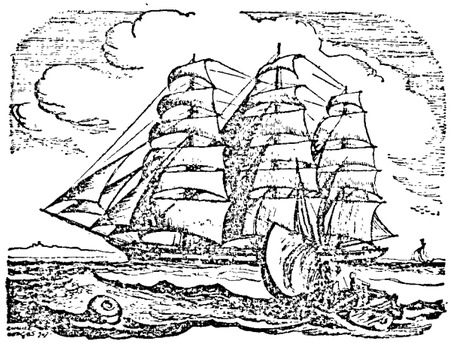
THE European transport system has to prepare for increasingly heavy loads as the expansion of industry and trade envisaged in the recovery plans is realised, but is still engaged in repairing the damage done by the war. The extent of that damage is still difficult to assess accurately. A map of the railway system of almost any of the former occupied countries at the time of its liberation—or, indeed, of the enemy countries when fighting ended—gave an impression of utter disintegration, with hardly a major stretch of line in working order. The performance of the railways since, and the fact that they are even now carrying heavier loads than in 1938, must suggest that the first appalling picture was exaggerated. But a recent and dispassionate estimate by the United Nations (*Transport and Communications Review*, July-September, 1948) stated that, at the end of the war, more than 15 per cent of the European rolling-stock was completely destroyed, that 40 per cent of the remainder was damaged, and that in addition 600,000 wagons were displaced. The majority of motor vehicles, it added, were destroyed or disabled. Many railway lines, railway and road bridges, and fixed railway installations such as repair shops and locomotive sheds were destroyed or put out of action. The proportion of railway and road bridges destroyed or incapacitated ranged between 55 and 100 per cent in various countries which had been fought over. At the same time rolling-stock and installations had been overworked, repair had been kept to a minimum, and the building of new rolling-stock and new installations had been almost at a standstill for five years or more. The canals had deteriorated even more, and were restored to full use more slowly than the railways.



Rehabilitation in transport has been swift, and has for the most part kept pace with the general restoration of economic life in Europe. Ports have been so well restored that their capacity is now well above the overseas and inland traffic to be handled. Railway tracks, main roads, and inland waterways have been largely reconstituted, and a great deal of progress has been made with the intricate task of restoring rolling stock, vehicles and craft to their proper localities and appropriate functions. Among the tasks requiring action today, the overtakings of arrears of repairs still plays an important part and permanent structures have still to replace the emergency structures left behind by the Allied armies. But restoration is reaching the stage where the building of new equipment can begin to have precedence, and where work can be resumed or commenced on schemes of new development held up by the war.

The task is, broadly, to transfer the effort from the disentangling of troubles inherited from the war to the making of a fresh start. The techniques which have served the first purpose may not be those best calculated to serve the second. In large measure the swift recovery since the war was brought about by methods of a decidedly short-term character. It was found that the most rapid expansion could be achieved by repair and by the "cannibalisation" of damaged vehicles, and figures given in the first Paris report showed last year how far the normal programmes of new construction were being cut down to divert energies and workshop space to this purpose. A point must clearly be reached at which "cannibalisation" ceases to give quick returns; for the most part it has now been reached. Large programmes of repair are still necessary. But there is a further need, for improvement and innovation, which pro-

Money is required for the export programme—to keep men and machines working and so ensure the ceaseless flow of British goods to markets overseas. All this vital activity is sustained by the facilities which a Bank alone can provide.



DISTRICT BANK
LIMITED

Export of British Cotton Textiles

The urgency of increasing exports of British Textile goods to the hard currency countries needs no emphasis. How can such exports be financed? What Foreign Exchange regulations are involved? How can the exporter ensure prompt reimbursement? Our intimate knowledge of international trade enables us to offer expert and up-to-date guidance on these and similar questions.

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

grammes of repair do not serve. More standardisation of design is desirable not only between adjoining national systems which have to handle the rolling-stock of their neighbours, but even within each national railway system.

It is on the railways, in spite of their good performance since the war, that the burden of the effort is being concentrated and the most pressing material difficulties have to be met. The entire European standard gauge system had just under two million wagons before the war. It was over-stocked, and each individual system had a surplus to provide for its own seasonal peak requirements. Western Europe today has just over one million wagons, which might be sufficient to meet the traffic demands upon them were it not that 200,000 are unserviceable and the remainder, which include a great deal of old stock, are in a poor state of maintenance. These figures exclude the British railways, but include the 300,000 wagons on the railways of western Germany—of which, however, 86,000 are still unserviceable. Poor maintenance was for a time aggravated by the dispersal of the rolling-stock away from its prewar localities; the Germans began this practice, taking goods wagons and other stock from occupied countries to German centres or, not infrequently, to centres in other occupied countries. Each country thus accumulated claims on German rolling-stock which, at the end of the war, it was

tempted to satisfy from whatever German stock came to hand. The vehicles of one former occupied country thus came to be operated in another as seized German vehicles, along with vehicles which were in reality German. Although the difficulties of repair and operation arising from this state of affairs were generally recognised, to trace the strayed wagons and return them to their original centre is proving a long process. It has been assisted by the existence of good records of the European rolling-stock as it existed in 1938. The Identification Commission which is still working in Paris has by now discharged a substantial part of its task, and the procedure for identifying and reporting wagons is working more smoothly than might be expected. It remains true, however, that the European national railways suffer from mixed rolling-stock which is difficult to operate and maintain.

The mere urgency of restoring the railways to a working condition in the shortest possible time meant that opportunities for the planned restoration of rolling-stock, on more standardised lines than before, were missed, or at any rate had to be postponed. These problems are now being tackled, and arrangements have been begun through the Economic Commission for Europe to standardise at least those parts which require most frequent change, often away from the home railway system. They may lead to a standardised freight car design on which new construction for the greater part of Europe can be based. Requirements of new rolling stock can thus be reduced by making it possible to keep a larger proportion in service; and the resources saved can be used to improve the railway workshops themselves.

Action of this kind has, in the political conditions of postwar Europe, required an expenditure of negotiating effort which often seems disproportionate. The revival of transport followed first a military and later a political pattern. It was in the first place the Anglo-American armies in the west and the Soviet armies in the east which bore the immediate brunt of re-establishing the interrupted main arteries of communication. On either side of the line measures were taken to repatriate dispersed equipment and to facilitate the movement of traffic; but across the line, relatively little passed. The first Unrra supplies to Czechoslovakia, for instance, arrived through the Black Sea ports. For some of the eastern European countries the re-establishment of westward communications was a clear interest, which they did what they could to realise. To Czechoslovakia it was essential that the normal traffic on the Elbe should be resumed, together with road communication with Holland and rail communication with the North Sea ports. Poland and Jugoslavia have shown varying degrees of interest in co-operation on European transport matters. But their interest has never been able to go very far for very long; fresh political difficulties have always supervened. The latest and most severe difficulty has been the crisis over Berlin. In spite of the recurring obstacles to German interzonal traffic, transit traffic had run fairly freely across the bizone between eastern Germany and the western countries. This has now been stopped. But the bizone, though it no longer accepts transit traffic for the Soviet zone of Germany, permits through traffic for eastern Europe. To the south the Orient Express still runs, though not without difficulties and interruptions, between Paris and Istanbul. To speak of the European standard-gauge railway area as having been split completely in two would perhaps be over-stating the matter. But there is no longer, as there was in important senses before the war, a single international traffic system from the ports of western Europe to the Russian frontier. The system is divided irregularly, and the divisions, though they shift, have lately been hardened by the effects of the Berlin crisis.

*

Free international movement has been more difficult to restore on the roads than on the railways. Here again, Germany, with its central position astride so many of the main European routes, presented the most obvious difficulties. To the obstacles to be overcome before drivers and vehicles could cross the German frontiers were added the necessity of providing ways to feed the drivers and maintain and fuel the vehicles on their journey. Thus to restore the important freight traffic by road across Germany between Denmark and Sweden and France, and between Czechoslovakia and Holland, required elaborate arrangements. These had to begin with a system of international petrol coupons which the European Central Inland Transport Organisation established at the end of 1945. They went on to deal with the elaborate frontier formalities and licensing regulations, and with the road taxes, in some cases reasonable and in some exorbitant, which each country desired to levy on foreign vehicles using its roads. The transport committee of the Economic Commission for Europe took over the task from ECITO and succeeded last winter in negotiating the international agreement on freight traffic by road through which the obstacles have been, for the time being, largely overcome.

Among those which remain, taxation is probably the largest.

It is surprising to find the Geneva working party on road transport problems still grappling, in the winter of 1948, with the difficulties experienced by drivers required at frontiers to pay duty on the petrol in their tanks. More serious are the road taxes themselves. The desire of governments to recover from foreign vehicles on their roads a share of the cost of upkeep of the road systems is intelligible, and if it is not met is liable to lead, as it has in the past, to the artificial concentration of transit traffic on the railways and waterways, where freight charges automatically include provision for the permanent ways. Differences of interest have still to be overcome between terminal countries and transit countries: the regular goods service between Czechoslovakia and Holland, which uses the German roads, is an obvious example. Questions of liability for loss or damage in transit, which were settled for rail traffic by the Berne international conventions, are still unsettled for the roads, and international negotiation has yet to establish for the roads arrangements as durable as those long existing for the railways.

On the waterways the progress in physical restoration has been good, but the volume of traffic has not recovered proportionately. On the main navigable rivers—the Rhine, Danube and Elbe in particular—the volume of traffic has been reduced far more than the physical possibilities of navigation. To some extent this can be attributed to changes in the movement of goods which are a part of the general distortion of economic life in times of material shortage and of currency difficulties. It has been influenced too by the persistence of restrictions on water transport—political in origin in eastern Europe, financial in origin in the west—which the railways were able more speedily to overcome. An international approach to almost any waterway problem is hampered by the necessity of dealing with a vast number of authorities and commercial operators without established means of co-ordination, as well as by the absence of an internationally accepted rate structure.

To establish free navigation on the Danube appears at the moment to be a hopeless task. Even to free the Rhine navigation, where there were no vital political differences to be overcome, has taken an inordinate length of time, largely because it became entangled in the controversy between the Low Countries and the Anglo-American authorities in Germany over the use of the North German ports as alternatives to Antwerp and Rotterdam. An agreement signed in October attempted to settle the controversy over the ports and to free the use of inland waterways in the Lower Rhine area at the same time. The Bizonal authorities agreed that foreign exchange and other "discriminatory" factors were not to impede the shipper's free choice of his port; Holland and Belgium, which had persisted in opposing the movement of German barges and crews on the Dutch and Belgian waterways, agreed to lift their restrictions and agreed between themselves on their proportionate shares of transit traffic to the Bizonal inland ports. It may still be doubtful whether the eventual question at issue—the relative parts to be played by Hamburg and Bremen and by the ports of the Low Countries in the intrepôt trade of Europe—has been disposed of in any final sense; but at least the obstacle to full use of the Rhine-Scheldt waterway system has been removed.

Patient work on a number of fronts, with the Economic Commission for Europe playing an unobtrusive but constructive part, has brought about piecemeal improvements of the kind outlined; their importance should not be underestimated. The lack of a general authority with even limited executive powers, which could approach the problem of integrating European transport as a complete system, is still evident, and every international transport question requires separate negotiation. But this is not merely a problem of national sovereignty, for in few, if any, of the European states themselves is it possible as yet to consider the entire national transport system as an integrated unit. The effort required to establish such a state of affairs, even within one set of national boundaries, is illustrated by the scope of the British nationalisation measure, which has for the first time brought the British rail, water, and certain road services under a single authority. The relation between these services, and their eventual integration, is a problem which almost every European country has still to face for itself.

Business Notes

Stock Exchange Bread and Butter

Last week's dramatic postponement of the proposed rules on the sharing of Stock Exchange Commissions for three months (not of course "three weeks" which crept into a note in last week's issue) has produced an immediate break in tension. But if active discussion has subsided, deep reflection still continues, in the search for a constructive approach to the problem of enabling the Stock Exchange to function efficiently and earn an adequate living. The need for a fresh start is obvious, for in some respects the case of the Stock Exchange Council has not been handled as tactfully and co-operatively as might have been wished. But no one is entitled to complain that the Council has not put forward consistently and vigorously its own view of what was best calculated to serve the interests of members. An interval for reconciling the honest differences of opinion on this issue, both inside and outside the "House," is indeed welcome.

Whatever may be secured by way of compromise with the banks, the basic difficulty which confronts the Stock Exchange will still remain. It is to secure for its members a reasonable return for their services, a return which under present conditions cannot be secured except by the fortunate few. The persistent rise in costs and fall in turnover lie at the root of the difficulties which now confront the majority of firms. Speculative business, already reduced by the absence of carry-over facilities, has been severely affected by the doubling of stamp duty. The ever-extending scope of nationalisation has already transferred vast blocks of transport and electricity stocks into the gilt-edged market; and there are others to follow. Private investment is dwindling and institutional investment (which is more closely concentrated on gilt-edged stocks, with lower rates of commission and turnover) is taking its place.

The dilemma is clear. To raise commissions, particularly on stocks outside the gilt-edged category, would be to invite the risk of a further fall in turnover. On the side of costs, the problem is to spread and to reduce the volume of overhead charges. The effect of a dwindling amount of business has this week been demonstrated in the representations made to the Council about high settlement charges, which amounted to 10d. per item in the latest quarter. The Council has undertaken to forgo the rent for office accommodation and to contribute a substantial sum towards the expenses of the Department, which has indeed "served the House well for 68 years"; but this relief involves £16,000 per annum from the general revenue of the Stock Exchange, which in the circumstances is a heavy subsidy to enable the average charge to be reduced to 4d. per item. The Stock Exchange has known lean times before. But it has a long way to go in adjusting its costs and methods to circumstances which seem only too clearly to contain many of the elements of permanent change. It will be a task requiring the highest degree of statesmanship.

* * *

The Coal Industry Bill

The purposes which the Coal Industry Bill is intended to serve have been made harder rather than easier to follow by the fact that its submission to Parliament coincides with renewed criticism of the National Coal Board. The two are not entirely

disconnected, but the "simple little Bill," as the Parliamentary Secretary to the Ministry of Fuel and Power called it, is a miscellany with most of which the clause enlarging the permitted membership of the Board has no close connection. This clause will allow a recommendation of the Burrows Committee to be followed—that up to three new part-time members and a second deputy chairman shall be appointed. It is hardly controversial, and indeed Mr Gaitskell's speech in the second reading debate on Monday showed him to have an open mind on the further Burrows recommendation (which is not adopted) that the divisional chairmen should become members of the National Board. But the criticisms go much too far to be appeased so simply.

Criticism has, indeed, been inflamed by the second clause which permits the Board to engage in overseas operations—to enter, as Mr Brendan Bracken put it, "into competition with the bunkering industry." Mr Robens, in explaining this clause, pointed out that other coal exporting countries which competed with Britain maintained offices abroad. He instanced Poland, which has established a coal sales office in Paris. He also instanced the Rhenish-Westphalian Coal Syndicate which was responsible for selling Ruhr coal in foreign markets. (The Rhenish-Westphalian Syndicate was broken up by British Military Government in October, 1945, as an excessive concentration of economic power.) No one would dispute that—to use another example given by Mr Robens—the Coal Board should be allowed to send an agent to Washington to buy equipment. But the direct entry of the Board into the coal export business is another question and might well have been kept separate. The commercial firms engaged in coal exporting can hardly be blamed for wondering whether, when their sole supplier becomes also their chief competitor, they will not be exposed to some risk of unfair competition.

More generally, Colonel Clarke's argument that before taking on fresh commitments the National Coal Board should "make a job of its present commitments" is not easy to dismiss at the present moment. Other clauses concern contracts and obligations to compensate; under the Coal Industry Nationalisation Act the Board took over long-term contracts and agency agreements which it quickly began to find onerous, and some of which are no doubt an unreasonable burden. Under the present Bill the Board will be able to terminate them, subject to arbitration; and its obligations to compensate persons who have suffered through the nationalisation of the coal industry will be clarified. In this respect the Bill seems to do little more than correct loose phrasing in the original Nationalisation Act.

* * *

Safety and Production in the Mines

Miss Jennie Lee spoke with emotion in support of the second part of the Coal Industry Bill in the apparent belief that it crowns with success the lifelong struggle of the deputy for his integrity—"to be," she said, "a safety man and not a production man." It is not clear that the Bill does anything of the kind, and it seems unlikely that the Ministry of Fuel and Power would intend it. The Bill gives the Minister power to make regulations regarding the appointment and certification of mining officials and under-officials, and Mr Robens explained that the intention is to enable the Coal Mines Act of 1911 to be brought, and kept, up to date. He explained particularly that the qualifications at present required of a deputy are "totally inadequate for the type of man demanded by modern conditions," and that the Royal Commission on Safety in Coalmines pointed this out in 1938. This matter of deputies qualifications was discussed in more detail by Professor A. M. Bryan, HM Inspector of Mines, at the National Coal Board Summer School in August. Professor Bryan then urged not only that "the present farcical examination for the deputy's certificate must be replaced by one requiring a much higher standard of general technical education," but also that the deputy should be advanced in status and should become a "district overman":

> He should act as the deputy for the manager while he is in charge of his particular district and should therefore be responsible for production as well as safety in that district. You cannot divorce safety and production.

When the Bill is passed, the Minister and the Coal Board together will have power to advance the deputy's status along the lines of common-sense progress suggested by Professor Bryan or along the lines suggested by Miss Lee, who offered to supply the House with "a vast array of names and addresses where safety men were beaten down into being production men." The Bill itself does not indicate which is to happen, but there is evidently much prejudice to be overcome before the deputy gets a status and an occupation fitting the new structure of the industry.

Last week's coal output figures brought no reassurance of success for the present campaign for higher output. Deep-mined production was 4,082,400 tons—54,000 tons less than in the previous week—and opencast output, at 178,000 tons, also fell slightly. The cumulative total of deep-mined output for the first 47 weeks of the year is 177,754,500 tons; this leaves 22,245,500 tons to be produced in five weeks to reach the target. A deficiency therefore seems inevitable; it may be of the order of 3,000,000 tons in deep-mined coal. Distributed stocks are, however, adequate (they were 16,440,000 tons on November 20th). Exports and bunkers totalled 14,164,000 tons in the first 46 weeks of the year.

British Shipping Released from Control

With certain reservations, British shipowners are now free to seek business on their own initiative anywhere in the world, and even freight rates for Government-sponsored cargoes will be agreed after normal commercial negotiation in an international market. The dry cargo requirements of the Ministry of Food and other Government departments in the deep sea and short sea trades will be met through normal commercial channels, and the Shipping Advisory and Allocation Committee, established last year by agreement with the General Council of British Shipping, ceases to function. The schedule of controlled freight rates for Government-sponsored cargoes, which for some time has been subject to piecemeal reduction, is abandoned except in the coasting trade, for which the present arrangements continue until the Minister of Transport, in consultation with the Coastal Shipping Advisory Committee, has formulated a new freight structure related to inland transport, as the Transport Act provides.

These important relaxations of control and licensing were announced by the Ministry of Transport on Tuesday. The Minister retains his broad powers over merchant shipping under the Control of Trade by Sea (No. 2) Order, 1939, but instead of licensing individual voyages, he will grant general trading licences, to run until countermanded. Government departments with bulk cargoes to move will continue to charter tonnage through their chartering committees in the freight market; for rates they will be on the same footing as other prospective charterers, though the scale of their activities will give them influence. Given the general scaling-down of European imports, and the return of European tonnage nearer to prewar levels, Government cargoes are not likely to have to pay rates as high as the schedule, though more of the cargoes may be carried in foreign, but soft-currency ships. Such a transfer would leave British ships in a better position to operate on the cross-trades and compete for hard-currency freights. For shipowners, and particularly tramp owners, the end of detailed control will mean keener international competition; this will not be regretted by the more efficient operators.

Credit Expansion Halted

The banking figures for November are in welcome contrast to those of the previous month, which showed the disquieting leap of £90 million in deposits. As noted here at the time, there was some reason to believe this movement to be due partly to an abnormal concentration of payments within the particular period covered by the banks make-up days; there was, therefore, a chance that the ensuing month would benefit correspondingly. So it has proved. The increase in total deposits in November was only £17.4 million and this, moreover, was wholly due to the purely technical effect of an increase in items in course of collection. Net deposits have risen by scarcely more than half a million, in contrast with October's rise of £84 million and one of £73½ million in November, 1947.

It is easier to explain this stabilisation of deposits than October's rise. Just as Governmental demands were the principal source of credit expansion in the earlier months of this financial year, so this month they are the source of the maintenance of the volume of credit. If the Government in November had needed no additional finance, the level of net deposits would have fallen, for advances have dropped by £13.1 million and thus have neatly reversed October's movement. Roughly £5,500,000 of the funds thus released have been employed in net purchases of gilt-edged securities. The decline in advances should not be interpreted as an indication of a receding demand for bank credit generally. It is a direct result of the large British Electricity issue, a significant

December

December is balance month. The last few days of the year make heavy demands upon the staff of the bank, for every account is "balanced" and checked. Modern office methods, involving the use of mechanised book-keeping systems and of photographic records in accountancy, have reduced the time spent in searching for the proverbially elusive penny, but even so, hard work by every officer is required at "balance time". You will soon have an opportunity of studying the balance sheet of the Midland Bank; it is clothed in conventional form, but behind its figures lies the story of great achievements for customers large and small.

MIDLAND BANK LIMITED

National

Savings Certificates

Savings Certificates are a gilt-edged investment. They may be bought in single documents representing 1, 2, 3, 4, 5, 10, 25, 50 and 100 units of 10/- each.

Each Savings Certificate costs 10/-. You can hold 1,000 of these 10/- Units in addition to permitted holdings of Certificates of earlier issues.

£500 invested in Savings Certificates becomes £650 in 10 years time. All interest is tax free.

With Income Tax at 9/- this is equivalent to a taxable investment yielding £4 . 16 . 8 per cent. If you are paying more than 9/- in the £ it is even more attractive.

Why not consult your stockbroker, banker or other professional adviser today?

EASY to buy . . **EASY** to hold . . **EASY** to cash

Issued by the National Savings Committee

Those who wish to invest in a young and growing country, whether by active participation in establishing industries there or by purchase of securities, may obtain a free copy of this booklet from their bankers or direct from:—

BANK OF
NEW SOUTH WALES

GB4805F

proportion of which was required to repay commercial bank advances already outstanding. These repayments have already begun, and are likely to have affected the individual banks proportionately. But for this special influence, it is probable that the advances total would have risen further; two of the Big Five banks do, in fact, show a net increase on the month. Viewed in the light of these banking trends, the BEA issue assumes a new significance. When it is recalled that the amount raised was much larger than the market had at first expected and that, in consequence, the terms had to be made attractive, it begins to assume the character of a credit-funding operation almost in the classical tradition.

If this is indeed a fair reading of the situation, it might not be altogether fanciful to regard this operation as a sign of changing emphasis in monetary policy. Certainly, the extent to which Governmental needs have provoked credit expansion this year provides ample reason for more orthodox tactics. And the season is fast approaching at which such tactics could be most salutary. In November (or, rather, the period most nearly comparable to that covered by the bank statements) the Exchequer above-line surplus was £54 million compared with only £9,000,000 in the previous period, while the below-line deficit dropped to £48 million. It is perhaps unlikely that the balance in the current month will be so favourable; but thereafter, despite the probability of supplementary expenditure provisions, the seasonal impact of the budget surplus should fall with full force upon the month-to-month banking figures.

* * *

The Lira in Line

A mark of commendation should go to the Italian authorities for the financial agreement reached with representatives of the British Government in Rome on Friday of last week. As a result of this agreement the Italian Government has introduced measures which ensure that quotations for sterling and US dollars on the Italian market are henceforth related to one another at the official parity of 4.03. Italy thus joins the countries which have undertaken to put disorderly cross rates behind them. Like all international deals, that with Italy had its element of reciprocity. In the first place, Italy had obtained under the Intra-European Payments Agreement the advantage of £6,000,000 of drawing rights on the sterling area and of a release of some £11 million from her sterling balances. The actual course of payments between Italy and the sterling area in recent weeks has, in fact, tended to drift in the opposite direction to that indicated by these contributions from Britain. But the drawing rights and the authorisation to run down Italy's sterling balances remain effective until June 30th of next year, and will probably be used in due course. In the second place, Italy has, as a result of the new agreement, obtained the advantage of membership of the transferable account group of countries. This should confer considerable benefits on Italy, particularly in the greater freedom it will give to that country to use its sterling in effecting payments to other non-sterling countries. Finally, the agreement signed last week provides for an expansion in trade between Italy and the sterling area, and though no details have been given, it may be assumed that Italy has obtained a greater measure of assurance of an outlet for its non-essential goods to sterling markets.

These advantages to Italy are, however, offset by the loss of the extremely profitable trade which had developed in recent months on the basis of the discrepancy between the official sterling-dollar parity and the cross rate of these two currencies on the Italian market. Another disadvantage to Italy is that as a result of the new arrangements higher prices will have to be paid in terms of lire for goods coming from sterling countries. It is not surprising, therefore, that the agreement should in fact have aroused considerable criticism not only from the Communist wing, where criticism is a matter of course, but also fom the business community. The Italian Government have, therefore, braved some unpopularity in order to accede to the British request for the removal of disorderly cross rates.

The technical arrangements by which the official parity will in future be made to apply to the sterling-dollar cross rate in Italy came into operation on November 27th, when the Exchange Institute became the sole dealer in sterling in Italy. Henceforth 50 per cent of the sterling proceeds of Italian exports will be exchanged at the average export dollar rate of the previous month multiplied by 4.03 while 50 per cent will be exchange at the export dollar rate of the day, also multiplied by 4.03. Sales of sterling to Italian importers will be effected at the day's free market dollar rate multiplied by 4.03. The admission of Italy into the transferable account group of countries will become effective next Monday.

Talks with Egypt

The current payments agreement with Egypt comes to an end at the close of the year and preliminary exchanges are now proceeding to fix the time and place of the negotiations which will produce the agreement for 1949. Egypt entered 1948 with sterling balances amounting to about £350 million. This was the figure given by King Farouk when opening the Egyptian Parliament in November, 1947. The agreement covering 1948 provided for the effective release of £28½ million, of which £21 million was to be used to meet the expected deficit with the sterling area, £6,250,000 to meet Egypt's net hard currency requirements, and a further £1,000,000 to be provided in gold to meet the gold quota in Egypt's subscription to the International Monetary Fund. In addition, £11 million was to be released from Egypt's blocked sterling to raise the working balance from £12 million to £23 million.

All told, therefore, the possible releases for 1948 could have amounted to £39½ million. In effect the figures have kept well below this maximum. Egypt, although a member of the transferable group of countries, has found some difficulty in using the sterling it has accumulated from exports, principally of cotton, to sterling countries. It is therefore probable that the amount maintained by Egypt in its working account has remained high and that no appreciable use has been made of the sterling released from the blocked account to strengthen the working balances. The difficulties experienced in using sterling are a measure of the scarcity of capital goods which Egypt primarily requires. It is more than probable that in the coming negotiations the Egyptian representatives will try to obtain firmer guarantees that they will be able to procure the goods they urgently need.

* * *

Canadian Food and Britain

The Anglo-Canadian food negotiations are again experiencing great difficulties. Before the war Canada depended on multilateral trade to balance its foreign trade accounts. Canada sold agricultural produce to Britain and used the sterling to pay for manufactures imported from the United States. When sterling became inconvertible this system broke down. The annual negotiations between Britain and Canada are an attempt to find a very short-term solution of this particular trade problem, but they have their repercussions on Canadian agricultural production. A permanent solution must rest on the ability to make sterling convertible.

Particular bargaining points, which each side wishes to press home to its own advantage, complicate the negotiations. Britain wants to discuss wheat and livestock products together; Canada wants to discuss them separately. Further, there appears to be a divergence of opinion on each side of the Atlantic between the financial and technical advisers. The Canadian case is fairly straightforward. Under the first contracts—they date from the middle of the war—Britain bought wheat cheaply compared with the world price. Therefore the price for 1949-50 should take this "windfall profit" into consideration and make some repayment to the Canadian farmers; it should therefore be fixed relatively higher. After agreement on wheat, the Canadian Government would discuss livestock products. If Britain wants larger supplies of cheese, bacon and eggs, it must be prepared to pay prices which make it profitable for the farmers to expand output, and must also guarantee to buy over a number of years.

The British case is equally straightforward. Britain has a limited number of dollars available to buy Canadian produce, even with ECA funds; if the price of wheat goes up there will be fewer dollars left for livestock products. Hence the two subjects must be negotiated simultaneously. Britain wants the largest quantity of food for a given dollar expenditure. It is not particularly interested in signing a long-term contract for eggs and bacon because, in its view, other sources should soon be available in Europe. In this bargaining the great unknown factor is the American market. If Britain does not buy the Canadian livestock products, will the United States buy them? The United States has been buying Canadian beef cattle, would also buy Canadian hogs, and might even in the coming months take small quantities of eggs and bacon. But there is no permanent market in the United States for Canadian cheese, bacon and eggs. If, then, Canadian agriculture is to be put on to a mixed farming basis, Britain is its only long-term market.

In this case, either some scheme for convertibility of sterling must be devised, or Canada must re-orientate its trade towards Britain rather than towards the United States. If agreement could be reached on the limit of Britain's dollar expenditure in Canada, Britain could no doubt respond with a long-term contract for livestock products.

* * *

European Coke Shortage Relieved

At the November meetings of the Geneva committees concerned with coke supply and allocations, the novel situation arose that offers of metallurgical coke—mainly from the bizone of Germany, though they included also Belgian and Italian coke produced partly from Ruhr coking fines—were well in excess of what the importing countries were prepared to buy. To conclude from this that the European coke shortage is now over would be an over-simplification. Elaborate measures have been taken during the past year to reduce the amount of coke used in steelmaking, and their first effect was to convert the international competition for coke into an international competition for steel scrap and rich iron ores. Now that coke supplies are improving, steelmakers in western Europe may begin to revert to more normal metallurgical practice; in that sense the demand for hard coke is elastic.

First of all, however, the users of metallurgical coke will naturally want some assurance that the increased supply has come to stay. How far can they rely on this? In the recent improvement of bizonal exports, one factor must be discounted because it may only be temporary; the stoppage of shipments to the Soviet zone, in consequence of the Berlin crisis, has released extra coal and coke for export as well as for consumption in western Germany. Still, the improvement in German coke production which took place in the spring and summer seems likely to persist:

BIZONAL AREA: GROSS MONTHLY OUTPUT OF HARD COAL COKE, 1948
(Thousand Tons)

April	May	June	July	Aug.	Sept.	Oct.
1,468	1,517	1,514	1,632	1,668	1,653	1,743

Ruhr hard coal output has been rising, too, and has lately exceeded 325,000 tons on a number of days; if the coking coal mines keep pace with the general increase, coke supplies should improve further.

Users will also want concessions on the prices of metallurgical coke, and here reassurance is more difficult to find. A proportion of the Ruhr fines is exported to Belgium and mixed with local coal at the cokeries, and complaints have been heard at Geneva of high prices charged for the resultant product. In November, when the allocations for the first quarter of 1949 came to be made, France and other importing countries were offered the whole of their stated requirements of metallurgical coke and were evidently unwilling to take so much. This reluctance may have been due, in some measure, to price resistance, though the bizonal representatives had held for some time that importers' requirements were being over-stated. It should be possible in the next few months to establish what the real requirements are, to achieve a less artificial relationship between supply and demand and to see how soon free coke exports can be expected to return. Already the practice of quarterly allocation is being abandoned and a yearly programme substituted, though the coke working party will continue to meet each quarter at Geneva to review progress. Britain neither imports metallurgical coke nor exports it. No difficulty has yet been encountered in selling British exports of domestic coke, though it is known that some buyers would prefer metallurgical coke if they could get it; it is, therefore, hard to believe that there is a real surplus yet. ...

* * *

The Terms of Trade

The fall in import prices recorded in September—the first since the beginning of 1946—has not been maintained. In fact the Board of Trade index rose by more than one per cent in October, bringing it to a new high level. This was, however, to be expected. In September, lower prices of imported cotton and wool brought the index down; in October higher prices paid for food under various long-term contracts pushed the index up again. The main increase was in wheat and flour; new Canadian supplies are now arriving under the contract for 1948-49 which raised the price by almost 33⅓ per cent to $2 a bushel. Under the new contracts for dairy produce and meat from Australia and New Zealand, prices have been increased by 15 per cent, and their full effects are probably not yet reflected in the index. Among raw materials, prices for non-ferrous metals have again advanced. In some, the rising trend of import prices is not yet exhausted, even though prices of other imports such as cotton and cocoa are falling.

Little improvement in the terms of trade can therefore be expected on the side of import prices. In export prices, until October the trend was upwards but during that month there was virtually no change. The slight rise in price of metal goods was offset by an even slighter fall in the price of textiles, while higher prices for food and drink were counterbalanced by lower prices for exported raw materials. These fluctuations from month

to month have no particular significance in themselves, but the October figures are a stern corrective to the assumption, based on the three preceding months, that a favourable turn in the terms of trade had occurred. Looking further back, between January and June this year the terms of trade deteriorated by some 6 per cent. Since then there has been no further deterioration, but, equally, no improvement.

* * *

The Course of Commodity Prices

American agricultural prices refuse to conform to expectations. Despite the bumper grain crops in the United States and despite the favourable sowing weather for winter wheat, prices for both wheat and maize started to climb slowly upwards during November. Chicago wheat is $2.40 a bushel, some 10 cents above the price which farmers can get under loan, and maize at $1.45 a bushel is also a little above the official loan price. This gentle but steady rise is not confined to grain prices. On November 1st cotton was 31.59 cents a lb. spot, New York; on November 29th the price was 32.44 cents. Non-ferrous metal prices are something of a law unto themselves; only zinc was raised officially in November, but unofficial prices for both lead and copper crept up slowly during the month. Cocoa provides the single exception.

The prophets of falling prices seem once again to have mistimed their forecasts. The rise in prices started at the beginning of November, before the result of the presidential election, though that may have played some part since. The firmness of metals is conditioned by tight supplies, the maintenance of a high level of activity in the United States and the US Government's strategic purchases. It is hardly a matter for surprise. For grain and cotton the causes appear to be more obscure. Some 160 million bushels of wheat have already been put into loan with the Commodity Credit Corporation, and if this quantity continues to be kept off the market the remaining supply would be little above the 800 million bushels required for American consumption and 450 million bushels for export. If, however, the 160 million bushels are not redeemed, this quantity would eventually come on the market. At the moment, it would seem, farmers could make an additional profit by taking their wheat out of loan and selling it on the market. But farm incomes are already at a high level, and a 10 cent margin is probably insufficient to reimburse the farmer for the trouble of selling now. No figures are available for the amount of maize put into loan with CCC, but it is likely to be large, and it would seem that the same explanation holds for maize and possibly cotton. Putting agricultural commodities into loan is the simplest and most prompt method of getting paid.

Experience has shown the unwisdom of forecasting the movement of prices, particularly American prices. But unless inflationary pressure is further reinforced, it is unlikely that agricultural prices will remain much above the loan rates granted by the Commodity Credit Corporation. Prices may tend to follow the normal seasonal rise during December, but it would not be surprising if they reverted after the turn of the year to the support levels.

Dollar Shortage in Latin America

By long tradition, the chairman's statement for each annual meeting of the Bank of London and South America has provided a detailed survey of financial and economic conditions in each of the Latin-American republics. It is good to see that Mr Francis Glyn, who has succeeded Lord Wardington, is adhering to this custom, for these valuable surveys deserve close scrutiny by all who have commercial or investment interests in South America. During the past year most of the Latin American countries have begun to feel a dollar shortage hardly less acute than that of Europe. In this case, however, the shortage is due not to the aftermath of an exhausting war, but rather to the post-war indiscretions of governmental policies. As Mr Glyn points out, Latin America, speaking generally, emerged from the war-time period with substantial reserves of foreign exchange which have since been dissipated by reckless importations of consumer and capital goods the demand for which has reflected not only a natural restocking but extravagant local public works and social experiments. This combination of domestic inflation and exhaustion of dollar reserves has led inevitably to exchange depreciation which has unfortunately often been accompanied by complicated systems of multiple exchange rates. The most severe impact of these changes has been upon foreign capital in Latin America; in almost every case the most depreciated rate is that applicable to remittances of profits. In consequence, the Bank of London and South America has had to provide "very considerable sums" to cover depreciation of its capital employed abroad. It should be noted, however, that, despite the less favourable conversion rates adopted, the balance sheet total rose in 1947-48 by just over £2 million to £156¼ million.

Depreciation of the rates at which profits are remitted is not, however, by any means the only burden which overseas investors have had to bear, for in many cases the proportion of profits which may be remitted has been specifically limited, and, in addition, freedom to remit at all has been made "subject to availability of foreign exchange." In consequence, the remittances are generally much in arrear. This is a matter of considerable importance for Britain's balance of payments. As Mr Glyn emphasised, these overseas earnings represent invisible exports of particular value, for, unlike visible exports, they make no demands upon scarce resources in Britain. In Argentina alone, despite the sale of the railways, the total of British invested capital is still put at over £100 million. It is much to be hoped that the question of better facilities for remittances will take a high place in future negotiations of the various bilateral trade and financial agreements. From the point of view of the investors themselves this is the more desirable because incomes earned in Latin America, unlike those earned in the United States and certain other countries, are still subject to double taxation. It is, apparently, the policy of the British Government to extend the range of double tax agreements wherever possible; but this is a slow process, and, in Mr Glyn's view, relief for investors in Latin-America should not be delayed until it is possible to negotiate reciprocal arrangements.

* * *

Electricity: Spreading or Shedding?

The urgency of the 20 per cent cut in the daytime industrial consumption of electricity was explained on Monday by Mr E. J. Taylor for the London and South Eastern Regional Board for Industry. The alternative to abstinence at peak hours, Mr Taylor pointed out, would be load-shedding with its accompanying chaos and hardships. But it does not appear that the arrangements for peak load reduction have been developed far enough to give a reasonable assurance that the periodic black-out can be avoided. Mr Tayler still found it necessary to urge industrial and commercial consumers to reply to the communications from their working committees which told them of the load-spreading requirements. Consumers who tried to keep out of the scheme would not necessarily get more current, he said; for those who were suspected of using too much electricity, maximum demand meters might be installed.

The difficulty of applying these necessary measures is evident. Maximum demand meters are installed at the more important points of industrial consumption, but in the London area indus-

trial consumption plays a smaller relative part than in the country as a whole. Commercial and domestic consumption are preponderant. For the average office or shop building, exact application of a 20 per cent power cut is impossible, and the regional board has had to ask these consumers to limit themselves to half their installed capacity. For a limitation so arbitrary, meticulous observance is not easy to secure.

The Ministry of Fuel and Power, by making an appeal at the same time for "the utmost economy" by domestic consumers in the peak hours, underlined the uncertainty which hampers the whole effort. No specific target exists for domestic consumers, but the Ministry points out that if they do not co-operate the efforts of industry and commerce may be "completely wasted." These are strong words, though hardly too strong; but what effect will they have? The peak hours for which economy is urged on the domestic consumer are between 8 a.m. and noon and between 4 and 5.30 in the afternoon. It is doubtful how much reduction of the domestic load in the first of these periods can be achieved by a general request.

Over the country as a whole, the balance between electricity supply and demand is no better than last year; capacity has been expanded by 400,000 to 500,000 kilowatts, but demand has increased by about the same amount. Figures given by the Ministry of Fuel and Power show that British consumption rose from 20,401 million units in 1938 to 35,781 million units in 1947—an increase of just over 75 per cent. But domestic consumption rose more than proportionately—from 5,360 million to 12,724 million units; from 26 per cent of the total in 1938 it rose to nearly 36 per cent in 1947.

What Price Newsprint?

The recent concession on newsprint supplies, which Mr Wilson announced in the House of Commons on November 11th, brings out a number of practical problems concerning the price and origin of supply. The price of newsprint has more than quadrupled since 1937 and now stands at £42 a ton. Newsprint is by far the largest single item in a newspaper's cost of production: in 1937 it represented 27 per cent of the costs of production of the *Daily Express*: in 1947, with four and five page papers only, it was still 26 per cent.

It is obvious, therefore, that the cost of newsprint must be one of the newspapers' first concerns. Mr Wilson stated in Parliament that the new increase in the supply of newsprint was due mainly to increased production of the home mills which turn pulp into newsprint. The implications of this policy in terms of the average cost of newsprint should be clear from the table below.

The figures show that there was a difference of more than £16 a ton between home and imported newsprint last February and £11 a ton now (or £10 if the difference in the weight of paper is allowed for). Part of the recent fall in the cost of home produced newsprint is due to higher production, and part is due to a slight fall in the price of Scandinavian pulp. But the main factor making for the difference is the high price paid for pulp, particularly Scandinavian pulp, which is the chief source of supply for the home mills.

The Board of Trade does not publish detailed figures for the prices of imported pulp and this prompts the query whether the figures, if available, would reflect very favourably on the department's buying policy. It is known from a Parliamentary answer on June 15th that Canadian pulp costs 88 dollars a ton as against 95.6 dollars for Canadian newsprint. No figures have been published for the price of Scandinavian newsprint or pulp, but trade sources suggest that in 1947 Scandinavian newsprint cost at the mill about twice what Canadian newsprint costs, and that Scandinavian pulp cost £29 a ton at the mill as against an average of £28 a ton at the mill for Canadian newsprint. Thus, leaving aside differences in freight, the finished newsprint in Canada was cheaper than the raw material in Scandinavia. The dollar saving in taking Scandinavian pulp rather than Canadian newsprint is small and the additional sterling cost is high.

Price of Newsprint (per long ton)	Feb., 1948	Nov., 1948
	£ s. d.	£ s. d.
Canadian newsprint delivered	32 0 0	32 10 0

Expansion in Agricultural Tractors

In addition to the expansion of car and commercial vehicle exports, figures for which were given in a Note on November 13th, the British motor industry has greatly expanded both the production and the export of agricultural tractors this year. British production of agricultural tractors in 1938 is estimated to have been only about 10,000; these were sold in about equal proportions to the home and export markets. In the first six months of this year 53,000 tractors were produced and about 30,000 exported. Figures given in the *Monthly Statistical Review* for December of the Society of Motor Manufacturers and Traders show that 47,000 tractors, to the value of £13½ million, were exported in the first nine months of this year; and the United States was the largest single market. Tractor exports carry with them substantial exports of agricultural implements, which are not shown in the table.

The absence of a substantial home demand for heavy tractors has caused British manufacturers to concentrate on the lighter types, and America's predominance in tracklaying vehicles has not been challenged. Most of the British tractors are wheeled, though a moderate number of half-tracked vehicles and a smaller number of full tracklayers are also produced. The Ford Motor Company and other long-established makers have increased their production this year, and the Standard Motor Company has built up a large-scale output of Ferguson tractors in an extremely short time. Another newcomer, the Nuffield Universal tractor, has entered the market this week. A convertible four-wheeled or three-wheeled tractor in the lighter class, with a four-cylinder Morris Commercial engine burning vapourising oil, it is to be marketed first in Britain. Prototypes of the Nuffield tractor have been undergoing tests since the summer of 1946.

Liquid Guinness

Shareholders in some of the big industrial companies may well feel indebted to those who laboured for so long for the enactment of the Companies Act, 1948. Such a sentiment would be appropriate to the shareholders of Arthur Guinness who this week have before them the first consolidated accounts of the company for the fifteen months ending September 30, 1948. Here for the first time it is possible to get some measure of the real strength of the body corporate of Guinness. Admittedly, there are no substantial disclosures of strength which were previously hidden. The group accounts reveal not only a relatively small contribution by the subsidiaries to the total profit but also the fact that over ninety per cent of the book value of fixed assets pertains to the parent company. Moreover, in the latest trading period, no dividend was received by the parent company from subsidiaries and only £50,670 out of group profit amounting to £6,343,881 was retained by subsidiaries after meeting all charges.

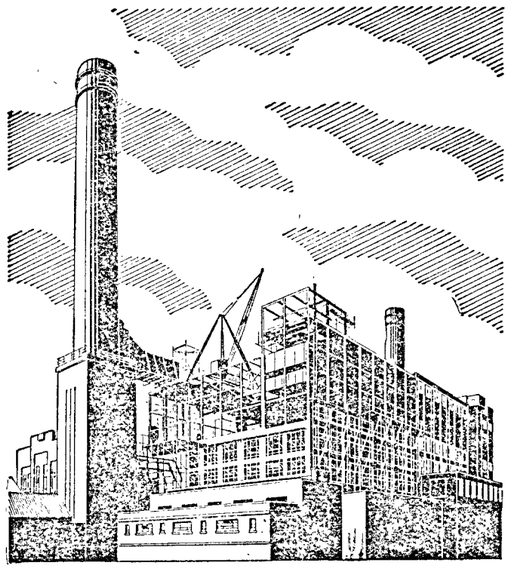
The strength of the group's reserves is outstanding; the total of £9,578,171 exceeds the total paid up capital of the parent company. It includes £1,886,744 against future taxation, in addition to an unstated amount for taxation liabilities to the date of the accounts which is, of course, included among current liabilities. In the view of the directors, taxation provisions are considered sufficient to cover the group's liability for taxation, assuming no upward revision in the rate, for up to two-thirds of the eventual charge for the fiscal year, 1949-50. The liquid position is massive. Net current assets of some £9,245,712 are fully represented by investments (taken at cost), Tax Reserve Certificates and cash, although at a later date some £1,800,000 of the total will be required to fund the provision already made for pensions.

A less auspicious aspect of the Guinness accounts is the implication of lower trading profit in the later period. No direct comparison with the year ending June 30, 1947, can be made, even for the parent company, since trading profit was then shown after the deduction of an unstated amount for taxation. But if earnings on the ordinary capital are calculated on a yearly basis, there appears to have been a modest fall compared with the previous year. If this were to denote a slight recession in trading profit, it would hardly be surprising, for that has been the common experience of most brewery companies during the past year.

* * *

Shipping and the West Indies

The lack of shipping services in the West Indies, which the Commonwealth (then Imperial) Shipping Committee was asked to study before the war, has been accentuated in the past ten years. War losses reduced the number of ships available, British and foreign; the surviving ships are older, and the cost of replacement has become prohibitive. The chief difficulty is in passenger accommodation, since there is enough shipping space for the transport of British imports from the area, which are mainly oil, sugar, bananas and citrus fruit. If the Government's plans to double these fruit exports by 1952 succeed, more ships will no doubt be needed; doubtless shipowners will provide the ships when remunerative cargoes offer, but the Committee suggests that more cold storage will have to be provided so that enough fruit can be accumulated for full cargoes.



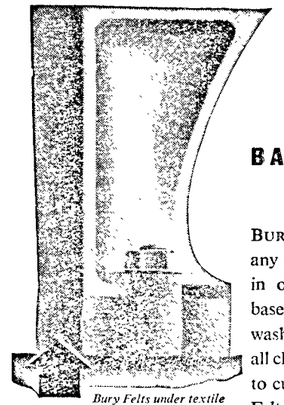
Passengers are a special problem. They are not numerous enough for passenger transport to be economical except in conjunction with regular cargo, and most of the cargoes offering are not suitable. Passengers cannot be carried with oil in tankers or with sugar in tramps. Bananas also require special ships, which can provide only limited accommodation for passengers if they are to be economical in running. Passengers could be carried in the same ships as fresh or canned citrus fruit if the trade in these commodities were large enough, but the ships are costly and the prospects are not attractive enough to shipowners. Before the war passenger liners to the Eastern Caribbean were run by French, Dutch and German lines, subsidised by the French and Dutch Governments because of their colonial connections and by the Germans for reasons of their own. The Committee finds that the recommendations of the West India Royal Commission of 1938-39 should be amplified, that British passenger ships should be provided, each carrying 50 to 75 passengers at 16 or 17 knots, and that "special measures of assistance, at any rate at the outset, may be necessary to encourage shipowners to provide the service." The report does not examine closely the possibility of expanding tourist traffic by sea, which might, if developed, relieve the taxpayers of some of the burden.

* * *

Cheaper Cocoa

For the first time since the end of the war, the Ministry of Food has reduced its selling price of cocoa; from December 5th the price to British consumers will be £35 a ton cheaper at £190 10s. The retail prices for chocolate and chocolate confectionery will in due course be correspondingly reduced. The official announcement attributes the reduction to "more favourable purchase prices for raw cocoa" and indeed, if the New York market is any guide, the price of cocoa has fallen quite sharply over the past fortnight. On November 23rd Accra cocoa stood at 41.00 cents a lb.; it had previously been ¼ cent dearer. By November 29th the price was only 35½ cents a lb. and since then it has fallen by a further cent a lb.

Yet it would be wrong to infer that the Ministry's price has been conditioned entirely by the New York market. The Ministry's buying operations are shrouded in secrecy, its home selling price is fixed so as to yield a moderate profit to cover part of the overhead costs—and only secondarily to keep home prices more or less in line with world trends. But owing to the existence of rationing, maximum prices and distributors' margins, changes in home prices have been made at relatively infrequent intervals of nine or twelve months. In March, 1947, the price was more than doubled—from £51 to £119 a ton, while at the



STEAM

British power station contractors are working all out to hasten the day when industry will no longer be hampered by shortage of electricity, and when it won't matter any more if Mummy forgets to switch it off. Simon-Carves water-tube boilers and coal and ash handling plants are at work in many British power stations, and are now being designed and built for many of the great new stations of the post-war programme. Another million horse-power is on the way to help the world's work forward. Steam power and civil engineering by Simon-Carves are helping to generate the enormous flow of electricity that we need to keep homes bright and make things hum in the factories.

One of many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

beginning of this year, the price was again almost doubled when it was raised to £225 10s. a ton.

The lower world price for cocoa has been induced by an improvement in supplies rather than by any weakening in demand. The preliminary allocation for 1948-49 made by the International Emergency Food Committee was 446,400 tons, or three quarters of a world export surplus provisionally forecast at 595,000 tons. The final allocations for last season amounted to 598,600 tons. Yet it is generally considered that world exports this year will be larger than in 1947-48 and might even reach 615,000 tons. This larger supply would of itself have induced some reduction in the world price. But in addition, supplies in West Africa have been coming down to the coast much more quickly than a year ago. Native producers are receiving a much higher price and this year there has been no labour unrest to hold up shipments. Fantastically high prices for cocoa may be a thing of the past, but the long term problem of "swollen shoot" disease has still to be effectively tackled.

* * *

Beira Railway Disappointment

The chairman of Beira Railway expressed satisfaction this week at the purchase price of £4,000,000 to be paid by the Portuguese Government for the undertaking. In view of the poor earnings and dividend record of the company since its incorporation in 1892 and the recent expropriation of Beira works by the Portuguese—which sooner or later might have affected the efficient operation of the railway—there may be some justification in this view. But it finds few sympathisers on the Stock Exchange. Indeed, the price seems to understate the value of the railway, given the growing importance of the Rhodesian copper-belt and of industrial activity in Southern Rhodesia. The Portuguese Government failed to terminate the concession of 1946 when they had the option to do so and a further eight years would normally have to elapse before the termination of the concession would again come up for consideration.

During the past year there has been considerable speculation in Beira Railway bearer certificates. This was stimulated towards the end of July this year by unconfirmed reports that the purchase price was to be in the region of £6,000,000. But recently optimism has waned. Earlier this week the certificates were an uncertain market at 58s. 6d., some 7s. below the year's peak. On the basis of the purchase price of £4,000,000 (which does not include London assets estimated in the region of £750,000 and the hotel and property at Beira worth probably an additional £50,000), the amount remaining for the 1,050,000 bearer certificates after repayment of the debentures would be approximately 44s. per share. At the most an additional 5s. might become available after paying winding up expenses and meeting the liability for arrears of pension fund contributions. Holders of the certificates have therefore been rudely shaken by the announcement of the purchase price and the certificates have since fallen to 46s. 3d.

Shorter Notes

World rubber production in October showed a sharp reduction to 125,000 tons, but the statistics portray a more bullish situation than probably exists. In September output amounted to 140,000 tons, but this figure was inflated by the heavier shipments from Indonesia, when growers were trying to export as much as possible before the increased export duty became operative on October 1st. Moreover the statistics for Malayan smallholder output relate to the quantity collected up-country rather than to the quantity produced, so that the low figure for October should be offset against the high figure for September. Taking these factors into consideration there is as yet no reason to suspect any diminution in world output, although since the Indonesian export duty will be again reduced at the beginning of 1949, supplies from these islands might therefore in the interim period be smaller. World production of natural rubber for the first ten months of 1948 amounted to 1,247,500 tons—an annual rate of 1,500,000 tons—consumption during the same period totalled 1,145,000 tons.

*

The appointment of an official inspector by the Board of Trade to inquire into the affairs of Richard Crittall is the first case in which the new powers under the Companies Act, 1948, have been put into effect. Previously the Board of Trade could instigate inquiries into a company's affairs only upon the request of shareholders; under the new Act the Board can take action on its own initiative in appropriate circumstances.

*

Union Castle Steamship Company has made an offer to purchase King Line £1 ordinary shares at £5. Before the announcement, King Line ordinary were quoted at 62s. 9d.; they have since risen to 97s. 6d. The directors of King Line have accepted the offer in respect of their own shareholdings, and other shareholders can accept on the same terms until December 14th. The disparity between an unrepresentative market price and the price offered by Union Castle to obtain control might be noted in Government circles.

*

It has been reliably reported from Buenos Aires that the Argentine export price for 1947-48 maize has been reduced from 35 pesos to 31½ pesos per 100 kilos f.a.s Buenos Aires. Warehouses continue to be fully stocked with last season's maize crop.

SECURITY PRICES AND YIELDS

A fuller list containing 371 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Roan Antelope; Rhokana Corporation; Rover; Joseph Lucas; Arthur Guinness; Austin Motors.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

COMPANY MEETINGS

BRITISH CELANESE LIMITED

RECORD NET PROFIT

ALL-ROUND INCREASES IN SALES

REMARKABLE GROWTH OF EXPORTS

MR G. H. WHIGHAM'S ADDRESS

The twenty-ninth annual general meeting of British Celanese Limited, was held, on the 25th ultimo, at Winchester House, Old Broad Street, London, E.C., Mr G. H. Whigham, chairman, presiding.

The chairman said: Ladies and gentlemen, following our usual custom, I propose that the report and accounts be considered as read. (Agreed.)

The report and accounts set out clearly the results for the year and the assets and liabilities of the company together with comparative figures for the previous year.

I will not recapitulate in detail the figures for the year but would state that the net profit before taxation constitutes a record in the history of the company, notwithstanding the setback caused by the fire at our Spondon factory in August, 1947, to which I made reference when we last met.

Working capital at the beginning of the year under review amounted to £4,331,000. This was augmented during the year by £2,997,000 represented by the proceeds of the issue of first preference shares and by trading profits (before depreciation) less taxation and dividends, etc. From these total resources of £7,328,000 the company expended £1,181,000 on capital extensions, buildings, plant, etc., £93,000 on additional investment in subsidiary companies and £89,000 in mortgage redemption and preference issue expenses. These expenditures totalling £1,363,000 therefore left us with net working capital at July 3, 1948, of £5,965,000, an increase of £1,634,000: £1,333,000 of such increase is represented by increase in stocks (attributable partly to higher cost prices and partly to bringing the stocks to an adequate volume relative to trading), £464,000 in debtors and other amounts recoverable, £627,000 in tax reserve certificates, £205,000 in cash, offset by an increase of £995,000 in liabilities, of which £529,000 is represented by increase in taxation and £466,000 by other creditors and provisions. These are the salient features of the changes which have taken place as a result of our trading and capital expansion programme.

EXPANSION IN RECENT YEARS

It may be interesting at this point to deal briefly with certain aspects of the growth of the company during recent years. Reserves, excluding reserve for future taxation, have risen from £604,000 at July 1, 1944, to £1,897,000 at July 3rd last. The ratio of these reserves to issued capital has risen steadily from 6.7 per cent. in 1944 to 19 per cent. in 1948. Over the same period, net current assets, after deducting reserve for future taxation, have increased by £3,410,000, and a ratio of about 2 of total current assets to 1 of current liabilities has been steadily maintained over the period.

The balance sheet shows a further substantial improvement in the position of the company in that all deferred expenditure, such as commutation of royalties, research and advertising expenditure carried forward and new issue expenses, altogether representing a considerable amount, has now been completely written off. In addition, the whole of the cost of war damage contributions and premiums and air-raid precaution expenditure has been written off.

The company has created a reserve towards taxation equalisation to the credit of which has been placed tax on the difference between initial allowances plus wear and tear allowances and depreciation provided on assets acquired in recent years. The amount placed to credit this year is £160,000, bringing the reserve up to a total of £230,000. This reserve can be drawn upon when these taxation allowances for any year fall below the company's depreciation for that year for the assets concerned.

The wide distribution of the company's share capital is evidenced by the fact that the total number of accounts on the register was 28,238 on July 3, 1948, the average holding being £353 nominal.

PLANT REPLACEMENT

Much has been written and said about plant replacement costs and obsolescence, and ultimately a plant, however well maintained, will become out of date and have to be replaced. What the cost will be, as compared with the cost of the original plant, is difficult to estimate, particularly under present conditions.

It is broadly true that the rise in the cost of buildings and plant has been such that these would cost today between two and two and a half times their cost just before the war. The growth of your company's plants, however, has taken place over many years, and more has been spent during some periods than others. Price levels in the 1920s were appreciably higher than they were from 1930 to the war, and the relative rise to the 1948 levels is, therefore, less for equipment acquired in the former period than in the latter; but a broad appreciation of the position shows that to replace the £13,000,000 of land, buildings, plant and machinery, appearing at cost price in our balance sheet, with exactly similar equipment at the price levels ruling in June, 1948, would cost about £24,000,000 as against our depreciation fund which, under normal conditions, will amount to £13,000,000 at the end of the life of such assets.

DEPRECIATION PROVISION

It is clear that the amount set aside by the company each year for depreciation based on original cost is likely to be insufficient to meet the expected cost of replacement. It would be only natural that selling prices should be so fixed as to cover a provision for depreciation based on today's higher cost of replacement. Most of our home prices, however, are controlled and are related to a calculation of cost which includes only depreciation based on the original cost of plant. Any further provision for replacement therefore falls upon net profit after taxation. As in the calculation of both profits tax and income tax, only depreciation based on the original cost of the plant is allowable, the margin, after providing fixed dividends and a reasonable return on the ordinary stock, is insufficient to permit more than a modest appropriation to meet the increase in replacement costs.

Having regard to these considerations, your directors deemed it advisable to set aside this year out of taxed profits the sum of £200,000 to a reserve designated "Plant replacement and special obsolescence," and this will assist in meeting any sudden demand of this nature. It should not be assumed that the same or indeed any amount will be appropriated out of taxed profits in the future; the position will be examined in the light of conditions then existing. In this connection, it should be noted that the large expenditure involved in our present expansion programme is being incurred at current high price levels and, unless the trend of prices during the life of this new plant continues upward, the problem of its replacement in due course should not be so formidable.

Apart, however, from the difficult question of plant replacement, there is also the question of expansion which is needed to meet the continually increasing demands for our products. Under present conditions, large projects of expansion cannot be undertaken except by bringing new capital into the business. The present policy of limitation of dividends makes very difficult the task of raising new capital at a price which is equitable.

TRADING

As mentioned in the directors' report, the total turnover was very materially increased as compared with the previous year and is represented by all-round increases in sales of a variety of products. I would, however, remind you that trading last year was adversely affected by the fuel crisis. Moreover, this year's trading covers 53 weeks instead of 52.

The trend of costs is still upwards and the cost of raw materials used in the manufacture of our yarn has increased by three and a half times since 1939. These materials accounted for 26 per cent. of the cost of production in 1939, whereas they now account for 43 per cent. Further, the index of general average weekly earnings in the principal industries of the country, which is an approximate indication of our own position, has risen by 114 per cent. over the same period. Notwithstanding these factors and the much increased burden of overheads, our list prices of yarns, taking into account the elimination of excise duty, have increased by only 50 per cent. over those of 1939. This compares with a 100 per cent. increase in the prices of food, coal and iron, despite subsidies. Different grades of wool are two and a half to four and a half times their 1939 levels, and the prices of cotton yarns this year have averaged four times what they were before the war.

EXPORT

The rayon industry, as I indicated last year, has been set a very high target under the Government's export programme. Textiles play a very important part in the country's export trade, and amongst these, rayon is of particular importance from the balance of payments point of view, owing to the small proportion of its sales value which is represented by imported raw materials. The export target for rayon products (to be reached by the end of 1948) is provisionally given at the rate of £50,000,000 per year. By way of comparison, the exports of rayon in all forms were £31,000,000 in 1947 and £5,000,000 in 1938. It is a source of satisfaction to us that your company is doing its proper share of the overall target.

It has, however, to be remembered that this remarkable expansion in rayon exports has taken place during a period of world-wide textile shortage and in the virtual absence of foreign competition of the type which was prominent before the war. It is too early as yet to judge how far such exports can be further expanded as more competitive conditions develop or whether the present level of exports can be maintained at present prices. Already in some markets these competitive conditions have necessitated reduction in prices of certain rayon products; further, many overseas countries impose what appear to us to be unnecessarily high import duties on rayon goods—far higher than are levied on other textiles—and in certain countries, which since the war have retained restrictions on imported goods, very few have yet made any satisfactory provision for the import of British rayon products. These and other important factors—such as Allied policy on German and Japanese export trade—are matters which lie outside the control of the rayon industry itself.

To expand and even to maintain the export figures to meet the country's needs necessitates continuous cultivation of the markets. With this in mind, we are increasing our advertising and sales promotion schemes and personal contacts in those markets which are most suitable for development.

We acknowledge the understanding with which our home trade customers have accepted the limited quantities of textiles which we were able to allocate to them owing to the high proportion of our production which was exported.

RESEARCH AND DEVELOPMENT

Our activities in research and development have been carried on intensively throughout the year. As regards chemical research, our main efforts have again been directed to improving existing processes and the investigation of alternative sources for the supply of our basic raw materials. Our main efforts in textile research have been directed towards the improvement of existing processes, machine development in connection with textile operations and to the development of new products. The results of our machine development policy are already beginning to materialise, and the introduction of the most modern machines and the willing co-operation of the workers augur well for the future. A great deal of work has also been done in the field of plastics research.

Concerning that part of the work which is of longer range and more fundamental nature—and this is of course of increasing importance in the conduct of modern industry—satisfactory headway has been made towards future developments and applications.

In connection with our short-term development programme comprising the subjects of more immediate practical significance, we have to record substantial progress during the year in the application of our strong yarn product, "Fortisan." At the same time, the applications of our staple fibre products have been advanced by the activities of the technical service organisation. In another research section we have explored new methods of fabric dyeing and printing which have opened up ranges of dyestuffs not hitherto applicable to cellulose acetate, and we have also completed and are working a pilot plant for the mass-coloration of "Celanese" yarn in the spinning dope with the incorporation of the fastest pigments known to science.

PLANT EXPANSION

The expansion of cellulose acetate and chemical plant at Spondon embodied in our general expansion scheme has been somewhat delayed but should be completed by the middle of 1949. In addition, in plants such as ours there are also smaller projects to carry out each year. Amongst the latter is a new plant for staple fibre spinning at Spondon, which should be completed by the end of 1949.

In addition to the above, further progress has been made during the year on plant modernisation at Spondon, particularly in the textile sections.

The plans for the large spinning plant at Wrexham are well advanced; but the erection of the initial factory cannot be commenced until certain points still outstanding in connection with the services to be supplied and other matters are finalised with the Industrial Estate Company.

At Wrexham the production of knitted fabrics and plastics has continued throughout the year. Whilst all the warp knitting machines are installed, full production can only be attained when we have trained the necessary complement of labour.

At Wigan, owing to the delay in the completion of the factory which we are renting from the Government, we are only now commencing to instal sizing and beaming machinery, so that it will be several months before we can hope for any material output from this factory.

The Government are proceeding with the completion of two factories in the North-East Development Area and we are negotiating for a lease of these for textile operations. These factories are in substitution for that in the same development area mentioned in last year's speech.

GENERAL OUTLOOK

It is the opinion of your board that the long-term outlook for the rayon industry is still favourable. Fundamentally, the outlook for plastics is also good, although in this case there has been a falling off in the demand for certain lines.

Your board, however, keep constantly in mind the question of the increasing costs of production due to rising labour and material costs and will also consider very carefully at each stage of our expansion plans whether the high capital costs of new factories, with the present tendency towards further cost increases, warrant our proceeding with them. Such increased capital costs involve increased financial obligations and depreciation charges, which in turn add to the total cost of the product, and we must envisage in the future more competitive markets than we are faced with at present. If this rise in capital cost per unit of output persists and the resulting annual charges be not offset by reliefs in other directions, the burden will overload the industry, with a dangerous effect upon its stability both as a source of employment for the workers and as an equitable remunerative investment for capital.

ALLOCATION OF INCOME

After the company has paid for its raw materials, power, light, water and other services, rentals, rates and interest, and has provided for depreciation, there remains a certain amount out of each £1 received by the company from its customers for the goods it sells. This is the sum which is available to pay all wages, salaries, taxation, a return on the shareholders' money, and to set aside a sum to strengthen and develop the undertaking, which incidentally will tend to stabilise employment.

If the amount so left over in 1947/48 were called 100 parts, then it would be divided up as follows:

Paid in wages, salaries, national insurance, etc.	60 parts
Provision for national taxation ...	25 „
Interest on and redemption of funding certificates	2.5 „
Preference dividends	5 „
Ordinary dividends	1.5 „
Available for strengthening and developing the undertaking ...	6 „

The normal development of your company during the war and subsequent years was seriously retarded due to restrictions and shortages of various kinds and has of course also been seriously affected by the fact that, owing to our low E.P.T. profit standard, it was impossible to set aside sums which would subsequently have been available for development.

The improved results during recent years are largely due to the technical and commercial development carried out over many years. This development was very costly and for a long period stockholders, particularly the ordinary stockholders, had to forgo any return on their investment. These facts should not be overlooked when considering dividend policy, although it seems that nowadays in some spheres of thought ordinary stockholders are rapidly being relegated to the category of "the forgotten men."

In the opinion of your board, the ordinary stockholders would have been fully entitled to receive a more generous dividend this year than the one proposed, which was in compliance with the wishes of the Government in this respect.

TRAINING SCHEME

In order to secure continuity in our business, it is necessary to provide for a succession of personnel trained in the special knowledge of our various activities. We have in force a scheme of training which enables suitable entrants to equip themselves for posts in all the branches of technology, art and commerce in which we are engaged. Opportunity and assistance are thus provided for the right men to fit themselves to occupy positions of responsibility in the company in the years to come.

I am happy to report that our association with the Dreyfus group and with the American and Canadian companies through our old agreements with the Dreyfus group has been modified and prolonged by a new agreement with Dr Camille Dreyfus and by new agreements directly between the three companies and that the exchange of technical knowledge between the three companies will continue.

I take this opportunity of expressing to all the members of the staff and every employee of the company the board's appreciation of the excellent services which they have rendered and which have largely contributed to the satisfactory results before you.

The report and accounts were approved.

SECOND INDUSTRIAL TRUST, LIMITED

OUTLOOK FOR INDUSTRY

The thirty-seventh annual general meeting of the Second Industrial Trust, Limited, was held, on the 2nd instant, in London.

Mr Lionel A. Stride, the chairman, said that the valuation of their investments at the date of the balance sheet showed an appreciation of £515,281, or nearly 35 per cent. over book figures. They recommended a final dividend of 5½ per cent. on the ordinary stock, making 8 per cent. for the second year in succession. In view of all the difficulties the results were not unsatisfactory. The Trust was essentially interested in industry, and they were in a position to appreciate the great harm which was being done to the country's trade through planning by people unacquainted with the delicate mechanism of international trade. Industry was tied up with red tape by control of capital, raw materials, power and transport, markets and labour. The red tape was full of knots and, unless those knots were cut, they would lead to strangulation. In spite of all those controls, industry was constantly being called on to expand so as to enable full employment, at present only sustained by Marshall Aid, to become permanent. Full employment could only become permanent in a totalitarian state.

He doubted whether the non-Communist members of trade unions realised that everything was being done in their name to facilitate the setting up of a totalitarian state, resulting in due course in slave labour, wages of little real value and the loss of external trade which, in the case of this country, would mean an equivalent loss of available food. The future of industry was going to be saved or ruined by decisions arrived at now or in the future. The answer was vital to all as stockholders and as individuals.

The report was adopted.

THE ENGLISH, SCOTTISH AND AUSTRALIAN BANK, LIMITED

RISE IN ADVANCES

The fifty-sixth ordinary general meeting of this bank was held, on the 1st instant, in London, the Hon. David F. Brand, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to June 30, 1948:—

The trading banks successfully contested the Commonwealth Government's endeavour to nationalise banking in Australia by action in the High Court of Australia, which declared the legislation to be ultra vires of the Act of Constitution. The Commonwealth Government is attempting to appeal against this judgment to the Judicial Committee of the Privy Council. The petition for leave to appeal has been heard by that court, and the decision of the board is awaited.

The most marked change from last year is a steep rise in the total of advances, from £29,157,000 to £44,969,000. This movement reflects the expanded requirements of our customers for bank accommodation as a result of the recovery in trade from war conditions combined with the rise in commodity prices

USE OF BANK CREDIT

The particular business and private interests to which bank accommodation may be made available in Australia are closely supervised by the Commonwealth Government by means of its "advance policy," with the result that bank credit is directed into those channels which, in the Government's judgment, best serve the national interest. The Banking Act of 1945 made it a legal obligation on the bank to maintain certain balances on special account with the Commonwealth Bank earning interest today at one-half of 1 per cent. per annum. The bank has not been permitted to draw on these balances sufficiently to finance the greater volume of advances, and it has consequently been necessary to accept deposits from the Commonwealth Bank of Australia for this purpose.

On these deposits the bank now has to pay interest at 3½ per cent. per annum, as compared with the ½ per cent. per annum allowed on its own special account with the Commonwealth Bank. The figures at June 30, 1948, were £27,168,924 on special account with the Commonwealth Bank, and £15,816,733 taken on deposit from that Central Bank. It will be observed that the latter figure approximates closely to the increase over last year in the total of the bank's advances. While the result in our case has been that bank credit for approved purposes has not been restricted, the adverse effect of this system on the profitability of advance business will be evident.

Other variations in the position disclosed by the balance sheet as compared with last year are a modest increase in deposits, current accounts, etc., which have risen by £3,335,000 to a total of £68,342,000, and a further gratifying expansion in the item of bills receivable.

DIVIDEND REPEATED

The balance sheet continues to disclose a satisfactory degree of liquidity. The total of cash in hand, etc., money at call in London, special account with the Commonwealth Bank and bills receivable represents 12s. 4d. in the pound of deposits, current accounts, etc., compared with 10s. 11¾d. in the pound last year. If the special deposit account of the Commonwealth Bank is included with the public deposits, current accounts, etc., the proportion becomes 10s. in the pound.

The profit and loss account shows that while the gross profit has increased substantially, both the expenses of management and taxation charges have taken sharp upward turns, with the result that the net available profit of the bank is £235,732, compared with £225,920 last year. After payment of an interim dividend of 2s. per share in May last, the directors recommend a final dividend of 4s. per share, less United Kingdom income tax at 9s. in the pound, repeating the distribution made last year. After allocating £35,000 to the officers' provident fund, a surplus of net profit of £35,732 is available to increase the carry forward to £359,273.

The report was adopted.

BETTS AND COMPANY, LIMITED

A YEAR OF EXPANSION

The sixty-eighth annual general meeting of this company was held, on the 29th ultimo, in London.

Mr S. H. Gillett, M.C., F.C.A. (the chairman), said that the production and sales of the company's products had expanded considerably during the year ended June 30, 1948, the comparative increases by volume being capsules 65 per cent., collapsible tubes 49 per cent., and foil 25 per cent. Taking their products as a whole, direct exports had amounted to approximately 23½ per cent. and known indirect exports to a further 32½ per cent., so that well over a half of their production had helped to earn much-needed foreign exchange. The greater output had produced improved results in trading, notwithstanding the continuous advance in the prices of raw materials to, in many cases, record high levels.

The trading profit for the year of £81,009 showed a substantial increase of nearly £36,000, whilst dividends received from the French subsidiary company only showed a reduction of less than £2,000 despite the fact that they were for a year as compared with 18 months in the previous accounts. After allowing for various charges against profits and providing for a final dividend of 10 per cent., less income tax, and the interim dividend of 5 per cent. already paid, there remains £18,675 to be carried forward, an increase of £7,843 over the amount brought from the previous year.

Despite the improved results for the year just ended, he would be lacking in his duty if he did not warn shareholders that he considered that state of affairs was not likely to be reproduced during the coming year.

The report was adopted.

THE BRITISH LINEN BANK

203rd ANNUAL GENERAL MEETING

The annual court of proprietors of The British Linen Bank was held, on the 30th ultimo, at the head office in Edinburgh, the Earl of Airlie, governor, presiding. Lord Airlie said:

Today we present the first full year's accounts since the date of our annual balance was changed from January 15th to September 30th. Subject to minor adjustments necessitated by the new Companies Act, the balance sheet figures may accordingly be compared with those of a year ago, but as regards the profit and loss account the results for the year are not strictly comparable with those of the preceding period of 8½ months.

LIABILITIES

Deposits at £74,282,228 are up by nearly £4,000,000—an indication that monetary expansion continues. On the other hand, notes in circulation at £7,200,545 show a decrease of £1,000,000. This tendency, which is common to all the banks, is difficult to account for, but it may be presumed that bank notes are used to a smaller extent in the settlement of business transactions, and that the hoarding of notes is less common.

Acceptances and other engagements on account of customers at £2,959,811 show an increase of £400,000. The bank's capital, reserve fund and undivided profits are only £20,000 short of £4,000,000.

ASSETS

Cash at £8,126,244 is down by £1,000,000, reflecting the decline in the note circulation. Cheques in course of collection—an item which varies considerably from day to day—at £4,760,353, show an increase of £1,000,000. Money lent at call amounts to £10,665,000. This is an increase of £1,400,000, and shows a very liquid position. Bills discounted at £1,028,879 include £1,000,000 of Treasury bills, Treasury deposit receipts—loans for five, six or seven months to the Government—at £7,500,000 show an increase of £500,000.

The total of investments (other than trade investments) is £40,283,069, all in British Government securities except for £400,000 in Public Authority mortgages. The market value of these investments is in excess of the amount at which they stand in the balance sheet.

Advances amount to £12,451,314, showing an increase of £2,000,000, widely spread over agriculture and a variety of important industries. Growing demands for temporary working capital arise from increased costs of production and enhanced values of stocks on hand, as well as from difficulties in completion of work and delays in obtaining payment when products are delivered. Bank premises and other property as written down stand at the modest figure of £561,871. The balance sheet total of £88,427,542 constitutes a fresh record.

PROFITS

Notwithstanding increased taxation and higher costs in every direction, our larger resources have enabled us to show profits well maintained at £261,224. After payment of the usual dividend it is proposed to contribute £54,000 to the staff pension fund, and to transfer £75,000 to contingency account, leaving £22,224 to be added to the amount carried forward.

I think you will agree that these results are not unsatisfactory, and you will join with me in according to the staff our appreciation of their willing, efficient and loyal services.

The report was adopted and a half-year's dividend at the rate of 16 per cent. per annum, less tax, approved.

STANDARD MOTOR COMPANY, LIMITED

FINANCIAL PROVISION FOR HIGHER PRODUCTION

MR C. J. BAND ON COMPANY'S PLANS

SIR JOHN BLACK ON "VANGUARD" SALES

The forty-fifth annual general meeting of the Standard Motor Company Limited, was held on the 1st instant, at the company's registered office, Banner Lane, Coventry, Mr C. J. Band (chairman of the company), presiding.

The chairman in the course of his address, said: The total capital additions during the year amounted to £2,693,482 and the written down value of the fixed assets now amounts to no less a sum than £5,354,241.

Since the year 1944, a sum approximating £6,000,000 has been invested in capital assets necessitated mainly by the intensive production programme adopted by the directors and the introduction of the most modern plant and equipment. Following the usual conservative policy of the directors a sum of £631,042 has been written off this year for depreciation and amortisation and it should be noted that these charges for the coming years are not likely to be less than those shown in the present accounts.

INCREASED PROFIT

The profit for the year after taxation is £453,833. This is an increase of £264,347 over last year, of which £200,000 is to be ploughed back into the business by way of the reserve for future amortisation of dies, jigs, fixtures, patterns and press tools. You will also notice that the directors recommend that £75,000 should be appropriated to the Employees' Special Fund this year, bringing this fund up to a total of £234,311. This leaves, together with the £34,343 of other income, sufficient balance of profit to pay a dividend limited to the same rate as last year, and to increase the carry-forward by £15,176.

The Government is urging manufacturers and employees to increase their efforts further in order to balance the figures of imports and exports. The company's plans and the production target which it has set itself will fully share in this accomplishment only if the necessary material is made available by the Government. In the opinion of the directors the company is in a position not only to increase its output considerably but to sell at competitive prices throughout the world.

A very special word of thanks is due to the company's managing director, Sir John Black, his colleagues on the board who hold important executive positions, his able and efficient staff and all employees of the company who have worked so well during the past year. The debt of gratitude the company owes to Sir John for his efforts cannot be over-estimated or adequately repaid.

I have great pleasure in proposing the adoption of the report and accounts for the year ending August 31, 1948.

SIR JOHN BLACK AND NEW PROGRAMME

Sir John Black (deputy-chairman and managing director), in seconding the resolution, said: Mr chairman, ladies and gentlemen,—I should first of all like to thank the chairman, on behalf of all of us who are engaged in the day-to-day affairs of the company, for his words of appreciation of our work during the past year. I told you the last time we met of a major alteration of policy. That alteration has now taken place and we have completely changed over to our new programme. In 1939 we sold 50,755 units, in 1947 some 45,000, and this past year we have sold over 80,000 units, together with a large quantity of car and tractor spare parts. Our turnover was just short of 25 million pounds.

FERGUSON TRACTOR

The Ferguson tractor output has been stepped up considerably by the introduction of double shift working and is now running at over 300 a day. This brings our total to date since the beginning of this new enterprise to over 70,000 tractors.

The chairman has already told you that we have invested nearly £6,000,000 in capital assets over the last four years, and our tractor factory is now equipped for the production of 500 tractors a day. That was our objective, and that is what we can do if we are allowed to operate to full capacity by having the necessary material licences made available to us. Now it depends upon the Ministry concerned whether full use is to be made of this outstandingly efficient equipment, in which the Government encouraged us to invest.

THE VANGUARD

Turning to the car side of the organisation, production of the Standard "Vanguard" car is steadily rising, and substantial quantities have already been shipped to 72 countries. Since manufacture started we have introduced a "Vanguard" estate car and we now have commercial counterparts with the introduction of a 12-cwt. delivery van and a pick-up utility model. Both these commercial vehicles have a large export potential. Again, our motor-car factory is now almost fully equipped for our target output of 500 cars a day, and material allocation is the only controlling factor.

Overseas assembly is expanding and, in conjunction with our distributors, plants have been established already in Australia, New Zealand, India, Belgium and Eire. Plans are being formulated for the introduction of similar plants in Canada, South Africa, Sweden and elsewhere.

NEW WAGE STRUCTURE

There has been one important development which has only recently been concluded—actually since the termination of the company's year—and that is in connection with a new wage structure for the whole of the company's employees in the Coventry area. We have, for a long time, realised that the greatly increased capacity of the company, which has resulted in line-production methods throughout the organisation, has caused what is known as "the piece-work system" to become obsolete. We have recently introduced a system which provides a new incentive to our employees, and will create a greater team effort within the organisation and the reduction of the number of rates of pay in the company from 100 to 8. The production per man-hour throughout the company is higher than pre-war, and with the new wage system, together with our modern machinery, I am sure it will improve still further.

I sincerely trust that stockholders will agree with the directors' proposal to allocate the sum of £75,000 to our Employees' Special Fund, which as you know is administered by a committee of employees and is doing splendid work.

TRIBUTE TO CO-DIRECTORS

I would also like to take this opportunity of expressing to you how grateful I am for the hard work and co-operation I have received from our four active directors. Mr Dick, as assistant managing director, has relieved me considerably in the general administration of the company's affairs. Mr Grinham, our technical director, who is responsible for the Vanguard design—his masterpiece to date—has many new projects in hand, which one day will see the light of day and which will still further enhance the company's reputation and strengthen its position, both technically and financially. Mr Martin, as sales director, is developing a sales organisation throughout the world that is capable of dealing with our future production plans and is strengthening his staff with new and young men, particularly for the export drive. Mr Woodall is supplies director; he is new to the board and you will be asked to re-elect him to-day. Supplies, as I have said, are the controlling factor in our increasing production and his personal contacts with our suppliers and the various ministerial departments are proving invaluable.

To the management, executive, and staff I say, thank you for your splendid efforts and loyalty to the company throughout the years.

I would also like to record my appreciation of all our suppliers of components and materials as well as our distributors and dealers, both home and overseas, for all their support during the past year. I know that our suppliers have made tremendous progress in their methods and production since the commencement of our new programme, and I trust that they will go forward with us with the same determination to reach our ultimate target in the production of both cars and tractors.

The report and accounts were adopted.

JOHN CARTMELL AND SONS (1947), LIMITED

A DIFFICULT YEAR

The first annual general meeting of John Cartmell and Sons (1947), Limited, was held, on the 1st instant, in London.

Sir Hugh Trevor Dawson, Bt. (chairman), presided, and in the course of his speech, said:—

As regards stocks of timber, a substantial part of this is subject to rectification if prices should move against us while the balance is held against licence. To summarise the position, the timber importation and merchanting position has more than justified your directors' anticipations.

Increased prices of raw materials and the necessity of acquiring and conserving stocks when materials are available have resulted in a substantial increase in the current asset position, the total of £237,055 at June 30, 1948, showing an increase of £84,542 on the figures at the date of acquisition. Your board have considered it prudent to conserve all available resources by retaining the profits in the company.

Your directors regret that the net trading profit of £27,771 is substantially below their forecast, but in view of the extreme difficulties experienced it is considered that the result is not wholly unsatisfactory. The company's business, which includes that of timber importers and suppliers of textile factory equipment, is also highly organised for the production on a large scale of woodwork and joinery for the building trade. This section of the business suffered severely from the effects of the change in Government policy within two months of the company's incorporation.

Given normal conditions, your directors have every confidence in the future.

The report was adopted.

ROAN ANTELOPE COPPER MINES LIMITED

MR A. CHESTER BEATTY'S STATEMENT

The following is an abridgment from the statement of the chairman, Mr A. Chester Beatty, issued with the directors' report and accounts.

PRODUCTION AND COSTS

The production of blister copper for the year ended June 30, 1948, was 51,757 tons compared with 49,641 tons during the preceding financial year. The year was once more marked by a shortage of coal supplies.

Five days were lost in the mine at the beginning of April when operations were suspended as a safety measure following the abnormal flooding of the Luanshya river catchment area.

The cost of production for the year was £63 14s. 5d. per ton of blister, f.o.b. Beira, compared with a cost for the previous year of £49 19s. 5d. Costs were adversely affected by the lower grade of ore mined, and other increases were caused by the higher cost of supplies, wages and power. No less than £5 6s. 3d. per ton rise in cost was due to the increase in royalty. The trend of costs on a unit basis continues to be a rising one.

THE ACCOUNTS

The revenue on our deliveries of copper, which were made entirely to the Ministry of Supply, was £115 10s. 7d. per ton, compared with £80 10s. 8d. during the previous year. The profit margin per ton of blister f.o.b. Beira was thus £51 16s. 2d.

The replacements reserve appropriation for the year has been increased to £450,000—that is, an increase of £100,000 over the previous year.

Taxation for the year amounts to £1,312,151, an increase of £685,000 over the previous year, which is a direct reflection of our increased gross profit.

After transferring to general reserve £600,000, which includes certain book profits on copper stock revaluation, there remains a net profit of £748,262. Adding the balance of profit brought forward from the previous year, there is a sum of £861,822 available. Out of this the directors recommend a dividend of 1s. 1½d. per share, less income-tax at 9s. in the £, absorbing a net amount of £617,904. The carry-forward will be increased to £243,918.

FINANCIAL RESERVES

I think it will be generally agreed that even on a conservative basis, the net reserve position is satisfactory. Attention has recently been focussed in the press and elsewhere on the increasing difficulties which many companies have had in financing their replacement expenditures without having recourse to new issues of capital. We have fortunately been able to avoid this position so far because we have for many years past provided for future replacements on the basis of estimated future costs instead of only charging depreciation on the basis of past costs.

Furthermore, we have either used prewar costs in valuing our copper stocks and therefore have not created book profits by writing up the stocks to current cost, or we have valued our stocks on a rising cost but have immediately eliminated the apparent profits resulting from the rise in costs.

These two essential points of our financial policy have had the result, by comparison with other book-keeping methods, of depressing our published profits in order to maintain a sound actual cash position.

INTERIM REPORTS AND DIVIDENDS

The Board has decided to revert to the prewar practice of issuing quarterly statements of production and profits. The Board will also give consideration in due course to the possibility of declaring an interim dividend if the profits so warrant.

ORE RESERVES

Ore reserves at June 30, 1948, were about 95,000,000 tons of 3.26 per cent. total copper, and the developed ore reserve position remains satisfactory.

POWER

As a result of a thorough survey of the Copperbelt power position, an agreement was entered into with the other Copperbelt companies providing for the installation of transmission lines interconnecting the four power plants of the Copperbelt. At the same time certain additions to the steam power plants were agreed upon.

This agreement covers only the first stage in the provision of more power.

GENERAL

The new pension and cash bonus scheme for European employees operated throughout the year. Under this scheme employees received a 29 per cent. addition to basic wages as their cash bonus which is based on a Copperbelt profit formula.

The health of employees continues to be excellent.

In conjunction with the other Northern Rhodesian copper mining companies we have sponsored the production of four films made by G-B Instructional, Limited. All are sound films. The first two are technical films which we believe will prove of interest to mining and metallurgical men throughout the world and will be of value and assistance to professional associations and technical colleges. The third film is in colour and deals with general living and working conditions on the Copperbelt, while the fourth is a documentary film. Arrangements will be made with a view to showing them to stockholders at some future date.

MARKET

Our copper continues to be sold to the Ministry of Supply for six months' forward delivery. The price basis is the world price for electrolytic copper, although payment to us is made on a blister basis, f.o.b. Beira. I should like to correct a misunderstanding which appears to be somewhat widely held regarding the relationship between the price received by us from the Ministry of Supply on this basis and the price quoted by the Ministry from time to time in this country. The latter price represents the Ministry's resale price for refined copper at consumers' works and therefore includes provision for transportation, insurance, refining, distribution, etc., incurred by the Ministry between receipt of the raw material from the producer overseas and delivery of the refined product to the consumer in this country.

Further, the Ministry's price is a composite one based on the intake from a number of producers, and thus has no direct connection with the price paid by the Ministry to any one producer.

ADMINISTRATION AND BOARD

During the year Sir Cecil H. Rodwell, G.C.M.G., retired from the Board. We are grateful to Sir Cecil for his valuable services during his years as a director. In his place Mr R. M. Peterson was appointed to the Board. Mr J. P. Norrie has been appointed consulting mining engineer and Mr R. H. Bauld consulting metallurgical engineer.

KOLOK MANUFACTURING COMPANY, LIMITED

A RECORD YEAR

MR E. S. DUMONT'S SPEECH

The fortieth annual meeting of Kolok Manufacturing Company, Limited, was held, on the 26th ultimo, at the company's offices, Tottenham, London, N., Mr E. S. Dumont (chairman and managing director) presided.

In the course of his speech the chairman said: It gives me particular pleasure to report that we have again achieved a new record of sales output and profit for the year. The net profit of the company amounts to £84,012, as compared with £59,071 for the preceding year, which, in turn, was a record.

The demand for our products—namely, carbon papers and inked ribbons—for which your company has a world-wide reputation, continued at a high level throughout the year both in home and export markets.

While I am sure you will agree that this is a very satisfactory result, I feel that it must be considered exceptional in view of increasing competition and import restrictions in many export territories which may affect the profit for the current year. However, I am glad to say that the volume of business in hand is satisfactory and, subject to the uncertainties of the future, there is no immediate reason to believe that we will suffer a setback.

The accounts submitted are generally self-explanatory, requiring little comment, but there are a few items to which I draw attention. It will be noted that trade investments are reduced by £3,000 resulting from a sale at a profit of £4,500 which we recommend carrying to realised capital profits reserve. The stock-in-trade is higher, partly on account of the rise in the cost of raw materials and of the substantial increase in sales.

STRONG FINANCIAL POSITION

We have had under consideration the institution of a superannuation scheme. Plans are not as yet completed, but, with a view to making an initial provision in this connection, we have transferred £10,000 to a superannuation reserve.

The financial strength of the group has been well maintained, as shown in the consolidated balance sheet by the current assets £315,730, less the current liabilities £105,128, leaving a surplus of £210,602.

Your directors feel that they should conform with the Chancellor's desire that dividends should not be increased for the present and, therefore, they recommend the same rate of dividends as was declared for the preceding year. You will remember that the dividend on the deferred shares was increased last year to a total of 150 per cent., as compared with 120 per cent. previously. The final dividends will absorb £8,801 net, leaving a balance of £35,774 to carry forward, as against £23,933 last year.

Incidentally, it will be seen that, whereas in the past gross dividends have been shown in the appropriation account, this year they are shown net, the tax on the dividends being included in the tax reserve.

Finally, you will desire to join with me in extending thanks to those in our service, executives, staff and all other employees, for their loyalty and the efficient manner in which they have carried out their respective duties. I also wish to thank my colleagues on the board for their support, and our local boards in South Africa and Australia for their continued efforts and assistance in our affairs.

The report and accounts were adopted.

At a subsequent extra-ordinary meeting new articles of association were adopted.

CONSOLIDATED AFRICAN SELECTION TRUST, LIMITED

ANOTHER SUCCESSFUL YEAR

The twenty-fourth annual general meeting of the Consolidated African Selection Trust, Limited, will be held on the 23rd instant, in London.

The following is an extract from the statement by the chairman, Mr A. Chester Beatty, circulated with the report and accounts for the year to June 30, 1948:—

As the accounts show, this company with its wholly owned subsidiaries has completed another successful year of operation. The combined profit for the year ended June 30, 1948, was £2,091,191, before providing for taxation and depletion. In addition, there has been brought back to the credit of the appropriation account £162,000 over-provided for taxation in respect of previous years.

A surplus of £973,941 is available for distribution after making appropriate provision for taxation. A sum of £310,000 has been allocated for replacements and extensions to fixed assets and for development. After making these allocations the directors recommend a final dividend of 2s. 6d., making a distribution for the year of 3s. 6d., which is the same as for the preceding year. These dividend payments of 3s. 6d. a unit involve a net distribution of £583,874.

REPLACEMENT RESERVES

Our replacement reserves now stand at £250,000 for the Gold Coast and £100,000 for Sierra Leone. Your directors have thought it proper to provide these relatively large sums out of taxed profits, in view of the very heavy increase in the cost of replacing or renewing equipment of all kinds, labour and transport. It is, however, to be regretted that the present taxation system, which makes no sufficient allowance for remissions on account of the capital cost of replacement equipment, thus renders inevitable the utilisation in this way of savings which should be available as capital for investment in new enterprise.

The programme of prospecting, which has been developed both in Sierra Leone and the Gold Coast since the end of the war, is now well under way, and certain areas, considered to be promising, have been outlined. The mining reserve position may in the circumstances be regarded as satisfactory.

Your directors continue to pay great attention to the improvement of the living standard and conditions of their African employees, and a construction programme, which includes improvements in the African hospitals, clubs for African employees and additional living quarters, is now making good progress.

SUPERANNUATION SCHEMES

It has always been the policy, both in the Gold Coast and Sierra Leone, to reward long service by our African employees with a gratuity on retirement. As the companies have now been operating for a considerable length of time, it became desirable to systematise thees arrangements to meet the growing number of superannuation cases. Schemes have therefore been introduced to provide for the grant of appropriate retirement gratuities, based on length of service. In order to meet the initial cost, the sum of £25,000 has been set aside in the Gold Coast, and similarly of £30,000 in Sierra Leone.

World sales, both of industrial and cuttable goods, again reached a very high level during the period under review, and the sales of your companies achieved a record. This was only rendered possible by the disposal of accumulated stocks, some of which had formed part of the wartime United Nations Reserve. These stocks are now greatly reduced, and the quantities available for delivery to the market will be dependent largely on current production. The indications for the current year's trading are nevertheless again satisfactory.

SIAMESE TIN SYNDICATE LIMITED

ENCOURAGING OUTLOOK

The forty-first annual general meeting of the Siamese Tin Syndicate Limited, was held on 1st instant in London.

Mr Kenneth O. Hunter, the chairman, presided.

The following is an extract from his statement which was circulated with the report and accounts for the year 1947.

An output of 316.69 tons of tin ore was obtained by three dredges during the periods from their respective dates of resuming work up to the close of the year; on this we have recorded a mining profit of £28,616. The net profit for the year before taxation amounted to £26,085.

Expenditure on repairs, replacements and restoration since we regained possession of our properties amounted to £203,963 up to December 31, 1947. Current assets include the sum of £368,861 as receivable from the Siamese Government. This is the amount we agreed to accept, and have since received, as compensation in respect of the depletion of our mining areas in Siam due to the extraction of ore from them during the period while they were in Siamese occupation. The settlement of this claim brought relief to our financial situation.

The information I have leads your directors to feel that the position is sufficiently encouraging to justify an interim dividend on account of the year 1948.

The report and accounts were adopted.

A hearty vote of thanks to the general manager and his staff in the East was passed.

At a subsequent extraordinary general meeting a resolution adopting new articles of association was approved.

BANGRIN TIN DREDGING COMPANY, LIMITED

POSITION STRENGTHENED

The twenty-eighth annual general meeting of the Bangrin Tin Dredging Company, Limited, was held on the 1st instant in London, Mr Kenneth O. Hunter, the chairman presiding.

The following is an extract from his circulated statement:

The working account reflects the results of the partial resumption of operations in Siam during the year 1947. An output of 106.76 tons of tin ore was obtained by our No. 2 Dredge, which resumed work on June 28, 1947; on this we have recorded a mining profit of £9,104. The net profit for the year before taxation amounted to £7,955. The amount required for United Kingdom taxation relative to the profits of the year 1947 is £5,154, less relief in respect of certain expenditure charged in our accounts to restoration, but regarded as allowable for taxation purposes; thus the net amount set aside for taxes becomes £2,127. Including the profit brought forward from the year 1946, £7,599, the balance at the credit of appropriation account at December 31, 1947, was £13,427, which we propose to carry forward to the current year. When the results for 1948 are known your directors hope that it may be possible to pay a small dividend for that year.

Current assets include the sum of £127,552 as receivable from the Siamese Government. This is the amount we agreed to accept, and have since received, as compensation in respect of depletion in value of our mining areas in Siam due to the extraction of ore during the period while they were in Siamese occupation. The settlement of this claim strengthened our financial position which had been affected by the heavy cost of restoring our plant and machinery.

The report was adopted and at a subsequent extraordinary general meeting new articles of association were adopted.

HERRBURGER, BROOKS, LIMITED

PROPOSED CAPITAL REDUCTION

The twenty-eighth annual ordinary general meeting of Herrburger, Brooks, Limited, was held, on the 30th ultimo, in London, Sir Louis Sterling, the chairman, presiding.

The following is an extract from his circulated statement:—

The directors are pleased to report an increase in the profit earned over that of the previous year. The balance sheet reveals a strong financial position.

Under the present conditions it appears to be doubtful as to whether building operations or the purchase of new factory premises will become possible or at any rate desirable for some time. They consider it right, therefore, that a portion of the cash represented by Government investments should be passed to the shareholders. They propose, therefore, that 5s. per share of the issued capital should be repaid to the shareholders and the issued capital of the company accordingly reduced. The shares of the company will then stand at the nominal figure of 10s. each, and the necessary steps will be taken to give effect to the proposal. After realising such investments as required to provide for this repayment approximately £51,000 will remain, and your directors are of the opinion that this sum will be sufficient to provide for any expenditure of a special capital nature, whether for factory premises or other purposes, which is likely to be necessary for some time to come.

The piano trade is still wholly devoted to export, and there does not appear to be any lessening in demand for British instruments, which are maintaining a very high standard of quality.

The report and accounts were adopted.

NOTICES

UNIVERSITY COLLEGE, EXETER

Applications are invited for the post of Lecturer in Economics. Further particulars may be obtained from the Registrar.

CIVIL SERVICE COMMISSION

The Civil Service Commissioners invite applications from suitably qualified men and women for appointment as Economic Assistants in the Economic Section of the Cabinet Secretariat on the inclusive scale of £400-£750 (men) or £400-£650 (women). Age limits 20½-24 on January 1, 1949, with extension for regular service in H.M. Forces, and, up to two years for voluntary service in H.M. Forces otherwise than on a regular engagement or for compulsory national service under the National Service Acts. Candidates must have obtained a University degree in economic subjects with at least Second Class Honours, except that those taking a final degree examination up to the end of 1948 will be provisionally considered. Superannuation arrangements will be under the Federated Superannuation System for Universities.

Further particulars and forms of application from the Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1, quoting No. 2225, by whom completed applications must be received by December 15, 1948.

THE COUNCIL OF BRITISH MANUFACTURERS OF PETROLEUM EQUIPMENT invite applications for the post of Director. He will be required to implement the policy of the Council, and his duties, while mainly in London, will involve travelling at home and abroad. The salary contemplated is £1,500 upwards p.a., according to suitability and qualifications.

Qualifications for the post should include administrative ability, wide knowledge and experience of industry and preferably an engineering or similar background. Testimonials need not accompany the application in the first instance, but applications should, nevertheless, be detailed ; they will be treated as in confidence, and should be addressed to the Chairman of the Council, at 40, Palace Chambers, Bridge Street, London, S.W.1.

YOUNG man (28), taking final C.W.A. June, 1949 seeks administrative position in progressive business organisation. Knowledge of cost and financial accounts, budgetary control, and presentation of statistics. Enthusiastic hard-worker capable of assuming responsible post. Excellent opportunity for enterprising company to acquire first class potential executive. Box 891.

THE CUNARD STEAM-SHIP COMPANY LIMITED

FIVE PER CENT CUMULATIVE PREFERENCE STOCK.
SIX PER CENT SECOND CUMULATIVE PREFERENCE STOCK.

NOTICE IS HEREBY GIVEN that the Transfer Registers in respect of the above Stocks will be closed from December 8 to 14, 1948, both dates inclusive, for the purpose of preparing Warrants in respect of Dividends for the half-year ending December 31, 1948, to be paid on January 1, 1949.

By Order of the Board,
H. J. FLEWITT, Secretary.

Offices: Cunard Building, Liverpool, December 2, 1948.

CROWN AGENTS FOR THE COLONIES

Applications from qualified candidates are invited for the following post:—

ACCOUNTANT required by the Government of Nigeria for the Department of Commerce and Industries for one tour of 18 to 24 months in the first instance, with prospects of permanent and pensionable employment. Commencing salary according to war service, experience and qualifications in scale, £600, rising to £1,200 a year, including expatriation pay. Outfit allowance, £60. Free passages and liberal leave on full salary. Candidates should be Chartered or Incorporated Accountants or possess similar professional qualifications, and should preferably have had up to four years' professional or commercial experience since qualifying. Familiarity with Government procedure is also desirable, but not essential. Apply at once, by letter, stating age, whether married or single, and full particulars of qualifications and experience and mentioning this paper to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting M/N/21257(3C) on both letter and envelope.

BUSINESS MAN (Wykehamist), of proved ability and adaptability, with fine record in peace (sales and advertising administration) and war (lieut.-colonel, staff), seeks scope for creative thinking, initiative and modern methods of marketing and sales promotion.—Box 820.

The Assembly Adjourns

THE General Assembly of the United Nations adjourns this week after three months of debate during which it has accomplished virtually nothing. An endless stream of reports has been considered. Major political problems—the civil war and foreign intervention in Greece, for instance—have been left in the air. A promising discussion of disarmament has petered out with only one positive result, the recall to life of the moribund Atomic Energy Commission. Probably no single issue has been so severely mauled as that of Palestine, which has occupied the bulk of the Assembly's later debates. Yet in spite of this record of futility, the Assembly is only to adjourn. It will meet again on April 1st—was there malice in the choice of date?—and the rendezvous is New York, where more dollars can be spent in less time than in any other place on earth. It is hardly surprising that the wisdom of this decision is being widely questioned—or even that some should ask whether the Assembly itself serves any useful purpose in international life.

Its defects are indeed painfully obvious. Among the first must be counted a truly appalling waste of time and energy on the part of men —Mr Marshall, Mr McNeil, Mr Vyshinsky—who must be presumed, from the offices they occupy, to have something better to do. While they or their deputies wrangle in the Political Committee and repeat the arguments virtually unchanged in the full Assembly—an exhausting duplication—they are dissipating energy which might have been devoted to careful and factual examination of the problems that confront them in the foreign field. But the precious hours have now gone by in the political atmosphere of the soap box and the thumping tub. It is hardly to be hoped that out of it should come solid policy or constructive diplomacy.

The debates do not only absorb precious energy. They generate avoidable friction. At times, the competition between leading statesmen to shout each other down has been positively unseemly. The deep cleavage in international life is only too palpable, but is it helpful to illuminate the chasm with so many flashes of vituperation ?

Yet these criticisms only touch the surface. Even if debates were speedy and the decencies observed, it would still be true that the General Assembly is failing to fulfil the functions mapped out for it in the original plans for the United Nations. The foundations of the United Nations were laid on the hope that the Great Powers would agree. The Security Council was to express their agreement and would act as a species of Executive Committee for the nations in general; these latter were to gain their chance to air their views in the Assembly, which would meet to receive reports and debate general issues of policy. But the pre-existing agreement in the Security Council was expected to give the Council the means of guiding, stimulating and controlling the Assembly's debates. In fact, this essential "committee work" on the part of the Council has been rendered impossible by the same reason that has divided the Assembly on most occasions into two rival camps. The division between East and West has left both the Council and the Assembly leaderless and floundering—a condition which is at the root of both the length and the inconclusiveness of their discussions.

The lack of unity in the Security Council has also had the result of saddling the Assembly with problems which should, for effective decision, have been handled in the Security Council alone. The need for Great Power unity has been nowhere so clearly demonstrated as over the issue of Palestine. Here the division did not follow the cleavage between East and West. The inability of Britain and America to concert their views proved almost as baleful as the much more publicised division between Russia and the West.

Must the conclusion then be that, given the existing division between East and West and the inability of the Great Powers to agree on lines of general policy, the General Assembly has no functions to perform and an indefinite adjournment is the best that can be hoped for the unlucky institution? Such a conclusion might be justifiable on a strict examination of its record, but the issue of the United Nations cannot be simply dismissed on the basis of its former and present behaviour. In times of tension and uncertainty such as these, an institution which both symbolises ordinary people's hopes for peace and also brings together the divided nations into some sort of fellowship, however minimal, cannot be voted into oblivion. Even if it does no more than unite the statesmen of the world in the same building, it does so under the visible sign of peace and must, therefore, be assisted to continue. But since it is to continue, some effort must be made to end those of its inefficiencies that can, even in the short run, be cleared away.

The split between East and West cannot be cured by any action inside the Assembly. In so far as its basic incapacity springs from that cause, inefficiency will continue. But some things can be done. In the first place, its meetings can be reduced to a maximum of once a year. It would have been infinitely wiser to have finished with the Palestine debate this week and to have adjourned the Assembly until September or October 1949 at the earliest. Secondly, a strict term can be set to its reunions—a fortnight is surely sufficient—and the duplication of debate in committee and in full Assembly can be cut out. Thirdly, the Secretary General can make a better effort to draw together and drastically reduce the material that is laid before the Assembly. At present, too many papers of too little importance are churned out, largely as a result of excessive resolution-making in earlier meetings. Since the error is in the first place an error of governments, they will give little or no lead in the direction of greater concentration of effort. It must, therefore, come from the secretariat and although it demands a degree of clarity and resolution not conspicuous so far, the task is not impossible.

Last of all, the statesmen themselves who frequent the Assembly can take a different and more constructive view of their own responsibilities. There is no law written into the Charter that the speeches made must be vindictive and inflammatory. If one side of the divided world sets a pattern of abuse, there is no reason why the other should follow so bad an example. If the great crashing waves of invective can be dammed up, a little trickle of common understanding may yet make its way to the surface. The Assembly's claim to continued existence lies in the fact that in spite of every defect and disadvantage, it is still a place where all the statesmen of the world can meet. It may yet serve a more constructive purpose if when they meet they make it their aim to talk and not to shout, to discuss and not to hurl abuse, to think and not to perorate. At present at least the Assembly's best hope of survival lies in this change of heart.

A Turn of the Screw

IT is just over a year since the Crippsian Revolution in the economic policy of the Labour Government began; and already voices can be heard asking whether the counter-revolution is not gaining the upper hand. There were months, earlier in the year, when fresh testimony of the effectiveness of Sir Stafford's disinflation could be collected almost daily. That is no longer true; but it does not follow that the policy has been reversed. The technical evidence was examined in an article last week. What it adds up to is that the British economy is certainly not back in the inflationary current of 1947; indeed, it may be that the net effect of official policies is still, by a small margin, on the right side. But there are a number of disquieting symptoms: the market prices both of gilt-edged and of industrial securities are rising together—which argues a "pressure of money" sufficient to force the hands and override the judgment of investors; and there is an uninterrupted rise in the total of bank deposits. And, whether it has exhausted its impetus or not, the disinflationary policy has certainly not attained the targets that were set for it in the transfer of manpower and of other economic resources from the less to the more essential industries. The present position may perhaps be summed up by saying that, if the British economy is probably not inflating, it is equally probably not disinflating. Many of the distorting pressures that existed a year ago are still present; the best that can be said is that they do not seem to be increasing.

There is very little room for doubt that Sir Stafford's policy of disinflation was right a year ago and is still right today. Many even of those who were sceptical a year ago must have been converted by the contrast between the gathering disaster of 1947 and the sober recovery of 1948. If the matter could be examined without any reference to political pressures, the right prescription for today would undoubtedly be to reinforce the policy, to make a second, and bolder, attempt to make it work. But with every week nearer the general election, the atmosphere gets more highly charged with politics. Another bout of disinflation would mean either cuts in expenditure or increases in taxation. Politicians can propose such unpopular things only when they are very firmly in office or when the public is badly frightened. Such willingness to accept heroic measures as there was a year ago has largely evaporated; in this sense Sir Stafford's policy has been its own undoing, and he is under considerable pressure from his own party to take the opposite course.

Since there is so little willingness at Westminster to consider another turn of the disinflationary screw, there is a noticeable tendency in Whitehall to seek some scapegoat for the fading away of the disinflationary policy—or at least to find some mechanical device for restoring it without hurting anybody. The most disquieting symptom in the present situation being the continued rise in bank deposits—the total passed the six billion mark for the first time in November—there is a certain desire in official quarters to hold the banks to blame ; they are said to be far too free in making advances to industry ; and there are rumours afloat of stricter controls on bank lending. But no such argument can stand up to the test of the figures. Although, in the seven months from the Budget to November, the increase in net bank deposits this year has been almost exactly the same as it was in the same period of last year (£178 million against £175 million), the total of bank advances has risen by only a quarter as much (£35 million against £141 million). Whatever it is that is causing the continued monetary expansion, it is not the lending policy of the banks. The Quantity Theory dies hard and the temptation to find the root cause of all economic phenomena in changes in the quantity of money is still very strong. But the size and shape of the banking figures are still today, as they have been for a decade and a half, mere consequences of the wider economic policies of the Government. To blame the banks for the recurrence of the inflationary threat is like blaming the thermometer for the relapse of a fever patient.

The real causes of what has happened are, in fact, fairly easy to identify. Inflation exists when the stream of money that the comunity is trying to spend, for all purposes combined, exceeds the supply of goods and services on which it can be spent; it is an excess of total demand over total supply, and it does harm to the community either (in the free economy) by pushing all prices up or (in the semi-controlled economy) by creating an intolerable congestion in which neither the offer of money nor the issue of priorities can protect essential work from being impeded. The disinflationary policy seeks to reduce demand relatively to supply and its chief weapon was intended to be the budget surplus that Sir Stafford created with so much political courage last April. But the surplus has been nibbled away, and meanwhile a number of factors have combined to frustrate its purpose. The total of demand has been increased. In spite of Sir Stafford's attempts to prevent it, one-third of the wage-earners have had their rates of wages increased. The programme of capital expenditure has not been kept within the bounds that were set for it. These have been the Government's misfortunes rather than its deliberate actions; but it is right to add that the "once-for-all" capital levy has certainly discouraged saving and may have encouraged the consumption of capital. On the other side of the equation, the supply of goods and services has either diminished or not increased as much as was hoped. The figures of total industrial production, which were so encouraging earlier in the year, have tended to level off. The success of the export drive has exerted an inflationary effect inside this country, for though the production of export goods generates British incomes, the goods are not available for the incomes to be spent on. The reduction in the supply of unearned dollars works in the same direction.

In short, the object of Sir Stafford's policy was to stop the country from trying to get more than a pint out of a pint pot. The pot has turned out to be a trifle smaller than was expected and the public thirst for expenditure has not been as successfully reduced as was hoped.

This being so, what is one to think about the campaign for "reductions in the cost of living" which Mr Maurice Webb, the chairman of the Parliamentary Labour Party, is leading ? Its political attractions are obvious—they are even creditable, in so far as the endeavour is to find some election programme for the party other than more nationalisation. But the economic logic of any such move is simply crazy. A "reduction in the cost of living" means an increase in the spending power of the mass of the people; Mr Webb's method for achieving this is by a reduction in indirect taxation. But one of the major difficulties in the present state of affairs is that the spending power of the people is already too large—too large, that is to say, for the supply of goods and services that is left over when the requirements of the Government, of the capital programme and of the export drive have been met. No doubt it is possible to prove by family budgets that a number of people are very hard up. But if Mr Webb wants to give these people more to consume, where will he find his balancing factor ? Will he take it out of Government expenditure—the education programme, perhaps ?—or out of capital—Mr Bevan's housing plans ?—or out of exports ? Or is it merely one more proposal that everybody with an income of more than £5 a week shall be mulcted for the benefit of those with less ? This surely cannot be Mr Webb's intention, unless he is as innocent in electoral strategy as he is in economics.

The public has so often been told that economics is a complicated as well as a gloomy science that it is difficult to secure acceptance of the very simple propositions that govern economic policy. There have been times in the past when it was right to insist that expenditure could safely be increased—indeed, that it ought to be increased—so long as resources were unemployed and those times will doubtless come again. But for the present, and for some time to come, the chief need is to insist that the community will only hurt itself if it tries to buy more goods and services than there are. Sir Stafford Cripps has, at best, achieved a precarious balance between demand and supply. There is no relief yet visible from external circumstances ; the greater part of any increase in the national output in the near future will be needed to replace the free goods that are now coming from America, but will not go on coming for ever. If, therefore, there is any relaxation in any domestic sector—whether it be a remission of indirect taxation on Mr Webb's constituents or an extension of the capital programme—there must be a tightening up somewhere else. No request for the one should even be listened to unless it is accompanied by proposals for the other.

This is a hard doctrine, and no one who enunciates it can take any pleasure in doing so. But it is no more inexorable than the facts on which it is based. There is, indeed, room for disagreement about the methods by which the objects of avoiding inflation should be achieved. There are those who would not bother about the total of money incomes or the balancing of the budget and would avoid the consequences of inflation by strict quantitative controls on everything and everybody—in short, by going back to a total war economy. There are those, like Sir Stafford Cripps, who would achieve the balance between demand and supply by reducing demand—that is, by reducing the flood rather than by erecting new dams against it. There is a case in logic for the "set the people free" school if it can prove (as will not be easy) that a grand act of economic liberation would increase the supply of goods and services just as much as it would increase the demand for them. The only school of thought for which there is nothing whatever to be said is the devotees of wishful thinking, either those who think that the great mass of people can be better off when the country is impoverished or those who simply say that the country is tired of austerity. Of course it is. But it would like the consequences of admitted bankruptcy even less.

Germany and the Powers

IN recent weeks, the fear has grown in western Europe that in spite of devastation, in spite of occupation, in spite of plans for the level of industry, the German people may yet regain their former dominant position in European affairs.

Anxiety on this score is strongest in France, but the uneasiness is also infecting France's neighbours. It is to some extent the result of the snowballing effect of earlier decisions on Germany. The Americans and the British decided over a year ago to revive German industry and to include western Germany in the Marshall plan. Soon after, the permissible levels of industry were raised. Six months ago the currency was reformed and this gave economic expansion a tremendous fillip. This step was followed by two others: by the announcement that the management of the German coal and steel industries would be handed back to the Germans, pending a final decision —by a future German government—about their ownership; and by an American move to put an end to dismantlement on the grounds that the continued delivery of reparations would impair "the contribution Germany can make to the European Recovery Programme." The Humphreys Committee, appointed by Mr Paul Hoffman, has toured the Ruhr and now proposes that two-thirds of the present (already reduced) list of plants which are to be disposed of as reparations should escape dismantlement and remain in Germany. The cumulation of all these developments—all coming to a head within a few weeks—has been to bring about in Germany an industrial revival which in the crucial category of steel now surpasses France's own and to create a new mood of aggressive self-confidence among the Germans.

Unhappily the restoration of some freedom of action to the western Germans has coincided with the steady deepening of tension between the western Powers and Russia—a tension which is inevitably centred on Germany. The Germans are very naturally considering what their role should be in this struggle between east and west, and the Soviet decision to arm the police of the eastern zone has set off in the western zones demands for similar protection and speculations on the "value to the western cause" of a strong rearmed Germany. There has been no trace in the official Anglo-American attitude of any readiness to listen to this talk. On the contrary, the continued disarmament of the western police forces has been reaffirmed. But many Frenchmen—and other western Europeans—argue that, eighteen months ago, the control of German industry at a low level was the Allies' gospel. Yet the needs of European recovery have led to a revision of the whole programme. May not "the needs of European defence" have the same effect?

It is no use dismissing this fear of a resurgent Germany as panic-stricken and unrealistic, on the grounds that western Germany is a heap of ruins where the male population has been decimated into harmlessness. It is not Germany alone that people fear but the use Germany could make of a strong central position to manipulate the European balance of power in its own interests. A western Germany which was strong enough to offer any real increase in security to western Europe would also be strong enough to negotiate with Russia on its own terms. And nothing in Germany's past—neither the Treaty of Rapallo nor the Molotov-Ribbentrop Pact—suggests that German loyalty to "western ideals" is such that it excludes separate arrangements with the enemies of the west.

The crisis of confidence created by this sudden unfolding of possible vistas of German expansion and strength must be overcome with all speed. It has bred uncertainty and suspicion between the members of the actual Brussels Pact and the potential Atlantic Pact. It is sapping the psychological preconditions of partnership. It is a menace both to the hope of successful western defence and to the European Recovery Programme. But how can the atmosphere be improved? Where has the policy gone wrong?

The fundamental dilemma of western policy towards Germany has long been apparent. On the one hand, to impose all manner of restrictions and discriminations on the German people is to run the risk—indeed, the certainty—that they will one day resume Great Power status burning for revenge. On the other hand, after two German aggressions it is impossible to re-admit the Germans to an equal place among the nations on the sole guarantee of their promise to be good. But if the dilemma has long been clear, so has the only possible ultimate way out of it—that all the countries of western Europe should themselves submit to the same restraints on their sovereignty as they find it necessary to impose on Germany, which could then be free and prosperous without being dangerous. It was partly because it pointed in this direction that many Europeans welcomed the Marshall plan. But at the moment one aim of the plan—the quick restoration of prosperity—is being allowed to overshadow another—that western Europe should be sufficiently unified in political matters to prevent German recovery from being a menace to Germany's neighbours. What is needed at the present moment is a clarification and formal restatement of the western Powers' policy for Germany. At present, policy in Germany is coming up for discussion all over the place—in the Humphreys Committee on dismantlement, in the fusion plans for Bizonia, in western Germany's claims put forward to the Organisation for Economic Co-operation in Paris, in the Six Power talks on the Ruhr. But the result is not so much a policy as a piece of patchwork that is being pulled and picked in different directions by rival interests and diplomacies. What is needed to end this confusion is a Foreign Ministers' conference of the three major Powers of the west, together with the smaller countries concerned, to pull all these rough ends together into a coherent whole.

Such a clarification requires two things of the British and the Americans. The first is a clear statement that they do not intend to make western Germany a "military bulwark" and that the offer of a pact of demilitarisation put forward by Mr Byrnes eighteen months ago still stands. The second is more speed and inventiveness in securing a settlement for the Ruhr. The only solution which can at once reassure Germany's neighbours and avoid exasperating the Germans' aggrieved nationalism is one that extends to the steel industry in western Europe as a whole the forms of control which are to be imposed upon the Germans. A modest first step in the direction of an agreed statute for the Ruhr has been taken in admitting France to the Anglo-American boards of control responsible for German coal and steel in advance of the French zone's fusion with Bizonia. This step gives France an equal voice in the present essentially temporary organs of control and as such has been welcomed by the French Government. But the question of ultimate safeguard, when military occupation has come to an end, will still remain. Only if the international control of the Ruhr does not depend upon external agencies but is inherent in the structure of the steel industry will it last beyond the withdrawal of the Allies. It is agreement on this type of internationalisation that the Ruhr talks in London should aim to achieve.

A clarification of policy for Germany does not however depend simply on British and American action. The attitude of France is crucial. Geographically, politically and militarily there can be no solution of the German problem without France's concurrence, yet grave psychological difficulties still stand in the way of an agreed policy. French opinion itself is divided between those who hardly admit that Germany should revive at all and believe that permanent repression is still possible, and the rival opinion, of which there are strong traces in Gaullist circles, that if only France and Germany could form a firm alliance, Europe could be organised on an anti-Russian basis without the interference of the Anglo-Saxons. And through both extremes runs the crippling strand of profound distrust for France's two chief allies and best—indeed, only—friends, Britain and the United States.

From France, therefore, the present situation also demands two things. The first is to accept a German policy in which a measure of German revival and independence is rendered safe by including the core of the German economy—the Ruhr—in a wider European industrial framework. At present, French policy attempts to obstruct German revival and at the same time to impose external international control on the Ruhr alone. This policy doubly defeats the hope of French security, for on the one hand it ensures a resentful Germany and on the other, proposes a type of control which resurgent German nationalism will sooner or later easily throw off.

France's second task is even more urgent. It is to cement the alliance of the western Powers by making an act of faith in its efficacy. So much in France's relations with its allies is riddled with distrust. As a result, the French never reach the point of intimacy and confidence at which ideas can be freely exchanged and difficulties genuinely examined. By remaining in a sense psychologically apart from their British and American friends, the French miss day by day the chance to mould the alliance into a real instrument of security. M. François-Poncet, a wise Frenchman whose experience of Germany is unrivalled and who is now advising General Koenig in the French zone, put his finger on the real weakness in the French position when he wrote recently:

> If France artificially isolates itself out of sheer mistrust of itself and of the others, it will be undermining its security at the very moment when there is a general desire to give it a fresh foundation. There is one thing we should have learnt from our experience—France only owes its salvation in part to itself. The rest it owes to its foreign friends.

PRESENT PROBLEMS

We all number among our friends at least one who seems to have everything he could want: the Christmas present for him is the most difficult of all to choose.

The Economist Diary — which combines in one volume a memorandum book, an appointments register, and a complete reference book — is the ideal present for the busy man. It will be in constant use on his desk throughout 1949.

Price: in the U.K. (including Purchase Tax) 36/8, or 37/6 post free; overseas 32/6 post free. Published by Messrs. Charles Letts & Co., Ltd.

Full details are given in the illustrated pamphlet available from:

The Economist Intelligence Unit,
22 Ryder Street, St. James's, London, S.W.1.

The Gospel of Work

HUMAN nature, it is often said, does not change. The proposition is obviously false if taken literally, needing to be qualified by the rider that such small changes as do occur may be of enormous practical importance. Such a change undoubtedly seems to be occurring, in this country at all events, in the very practically important field of the attitude to work and self-betterment. The British workman, it is said, does not work as hard as he did, could, or should; the British businessman lacks enterprise and energy. The former is sometimes excused on the grounds that he is inadequately fed, the latter invariably excuses himself on the grounds that no one can be properly enterprising and energetic when swaddled and strangled in red tape. There is substance in both excuses, but they do not go to the root of the matter. Any traveller abroad can observe workers much less well fed than the British working with incomparably more zest; and the decline in British business enterprise goes back far beyond the frustrated forties. Socialist teachings and the bureaucracy they bring in their train may rightly bear a share of the blame, but they cannot be saddled with the whole. On any wide view, both Socialism and bureaucracy (which is by no means of exclusively Socialist origin) must rank as symptoms, as well as causes, of the change.

There have, of course, always been ants and sluggards, idle and industrious apprentices, keen and somnolent business men. But social pressures, social climates, may favour one trait as against another. Readers of Professor R. H. Tawney's *Religion and the Rise of Capitalism* will remember his analysis of the change in moral and ethical climate, caused by the Reformation, which equated righteousness with economic self-betterment and made acquisitiveness respectable. At present a partial and dangerous reversal of the Reformation's climatic change is taking place. There is certainly no return to the pre-materialistic outlook of mediæval times—on the contrary, never has happiness been measured so exclusively in material terms. But individual acquisitiveness, the channel through which, for three hundred years or so, western humanity sought material betterment, is no longer really admirable. "Conspicuous consumption" in Veblen's sense, is in unmistakably bad taste. To outstrip and outbuy one's fellows is frankly unethical. To outwork them is bad practice. To "found a family" by the accumulation and passing on of a fortune is a piece of anti-social behaviour which the whole fiscal apparatus is successfully designed to frustrate. To own and enjoy luxurious and costly possessions, even inconspicuously, is something to apologise for. The outward and visible sign of the change of climate is the material shrinkage of rewards and the lightening of penalties, the whittling away of stick and carrot; but the inward reality is something deeper, a genuine reaction against the whole ethic of Acquisitive Man, which is by no means confined to the class-warrior champions of the underprivileged.

*

In this there is undoubtedly much gain. Acquisitive Man is not, and never was, a particularly exalted or attractive avatar of humanity. It is unfashionable today to talk of progress, other-than the two-edged progress of the physical sciences; war and revolution and their increasingly horrible concomitants have written an ironical gloss to the nineteenth century creed of optimism. But it can hardly be denied that in this country, at all events, there is more compassion and human solidarity, more mutual responsibility, respect and tolerance, less snobbery, avarice and callousness than a hundred years ago; and this gain is unmistakably linked with the decline from favour of the acquisitive instinct. Ethically speaking, the change is surely all to the good.

Its practical inconveniences, however, are obvious. It would

be too much to say that the mainspring of economic activity has been broken, but its weakness is undeniable. What, asked Mr Nigel Balchin at this year's meeting of the British Association, makes a man dig in his garden? In fact, why work anyway? Ideally, perhaps, for the fun of the thing and *ad majorem Dei gloriam*, but these motives are regrettably rare outside the pages of William Morris. Personal honour and glory, at any level from that of the appreciation of a few fellow-experts to that of world fame, is a spur relevant enough in the professions, in politics and administration, in the higher managerial and entrepreneurial ranks and, intermittently, among the rare Stakhanovs of industry; but it is hardly likely to be effective among the mass whose pace is set by the machine and whose personal contribution cannot be isolated. The desire for power, power over environment, power over other men, is another possible motive; but it is one which can apply only to few and whose implications may well be sinister. Or there is the desire for material gain, the old, reliable incentive of the Economic Man. Unquestionably, this is a powerful incentive, but it is one that shows in practice certain erratic and unpredictable characteristics. And under all these is the hardly analysable social drive, as it were an inertia of motion, appearing in each individual as a conviction that work of a certain intensity, concentration of a certain degree, is the done thing, the respectable norm. If that norm rises, all other incentives are intensified; if it drops, all lose force. But it would take a profounder and better documented social psychology than any now available to determine how far the norm is a mere resultant of the sum of isolated motives, and how far an independent substructure to these.

Some more general elements may be picked out. It is surely relevant that from the earliest days of the industrial and commercial revolutions the mark of the greatest business success has been success in getting out of the business environment. The successful British magnate has not, on the whole, aimed at becoming a merchant prince, an honoured burgess; he has aimed at becoming a country gentleman. His sons have had a public school and university education whose whole tone and bias has been set by the aristocracy and the professional class—a tone and bias strongly calculated to influence those subjected to it away from business and from a sense of the importance and dignity of business. This has been a most excellent thing for the aristocracy and the professions. But it has, generation by generation, creamed off from business life the pick of the country's economic ability, and impressed upon the national consciousness a conviction that business is an occupation for the second-rate.

*

So far as the workers are concerned, the causes of the drop in the norm appear at once more numerous and more elusive. The lesson of the interwar decades—that he who works hard works himself and his mates out of a job—might be expected to fade from memory after nearly nine years of full employment. The fact that the norm remains low, lower than ever, and that in America, which over half the interwar period suffered far more acutely from unemployment than did Great Britain, little similar effect can be observed, makes one suppose that some other influence is at work. Disillusionment engendered by the discovery that Labour in power does not mean an immediate Elysium must be shared by the workers of plenty of other countries with governments of the left; but whatever undesirable things may be found in Poland or Jugoslavia, no one has ever suggested that lethargy is one of them. By the same token, it would be absurd to lay all the blame on postwar reaction against strain and over-exertion. The slackest members of the labour force are those new entrants who were too young to be concerned in carrying the wartime load. The time-wasting and shirking encouraged by Army routine have also been blamed; but countries which had conscription for generations before Britain finally accepted it have not visibly suffered from those ill effects. The general social components of the problem, in fact, baffle inquiry.

Not so, surely, the more specific questions of motive. Economic incentive has, for the last hundred and fifty years and more, increasingly filled the vacuum left by the progressive atrophy of the others. Joy in work, a sense of the sacramental in work, a sense of social and commercial responsibility in work, the achievement of mastery through work—all these have faded. Industrialisation, mechanisation, centralisation, proletarianisation and other cacophonously-named ingredients of modern life, have banished them from the normal worker's universe, leaving behind only the straightforward calculus of effort and reward. And the effort-and-reward mechanism has developed curious creaks and eccentricities under the pressure of new social ideals. The narrowing of the gap between skilled and unskilled labour, the levelling of the rewards of the assiduous and the slack under collective bargaining, the tempering of economic penalty by unemployment insurance, are all obvious influences.

Only a little less obvious is the weakening of material incentives by rationing, allocations, controls and shortages in general, of the things on which the worker could really be expected to be enthusiastic about spending his money. True, money will still buy many desirable things and make a great difference to one's standard of living; but outside the range where money is not allowed to make a difference at all, the range of control and social allocation, a great deal of money is needed to make a difference really worth noticing. It would take four or five times the average skilled worker's income to justify a move from an ordinary council house (to which more money gives no title) to something better rented on the private market; it would take a year's income or more to buy the car which his American counterpart takes for granted; new furniture, carpets and major household equipment generally are simply not practical politics. A too-distant carrot is no carrot at all. There remain, as practical spending outlets, the various forms of commercial entertainment which, as an incentive, have the obvious disadvantage that their enjoyment competes directly for the worker's time. Why earn the price of a football game by overtime which prevents you from attending it?

When to these considerations are added all those as yet little-investigated group and social forces which, in mine or factory, set the workers' loyalties or antagonisms in opposition to his individual self-interest, the decline of the material incentive is obvious. Nor is there any likelihood of that decline being drastically reversed. The British people are not going to scrap social insurance; heaven forbid that they should. Industry is not going to scrap collective bargaining. Much could be done to get the prices of controlled and uncontrolled goods into a relationship that would make the carrot really tempting, but this will take time. More goods on the home market must await precisely that increase of production which they themselves might help in eliciting. It would seem that the attack on the incentive problem must in the long run take other forms, working through industrial relations at all levels, educating workers and business men alike to general, as against sectional, economic realities, supplementing the old, narrow acquisitive drive with a self-interest more enlightened and more social. But the matter is too urgent for any means to be neglected. Hard work may no longer be an essential passport to individual respectability and the one self-evident means to individual betterment, but it remains as essential as ever it was. The gospel of more and more for less and less, of squeeze-the-boss and squeeze-the-public, letting Them see to it, is no better morally, and a great deal worse materially, than the nineteenth century gospel of plod, push, grab and hold; and behind them all there stands, in spite of all scientific and technical advance and all social ameliorations, the grim old gospel which events must in the end bring home—it is to be hoped not too late: he who will not work, neither shall he eat.

NOTES OF THE WEEK

After the Berlin Election

The people of western Berlin have given, by an overwhelming vote, their preference for freedom under the airlift—whatever its inconvenience—rather than for more normal conditions under possible Soviet control. About 88 per cent of the electorate went to the polls, and, whatever else their voting signified, its chief purpose was to demonstrate their dislike of Communism and their resentment of Russian tactics in Berlin.

In the short run, therefore, the Allies are now more committed than before to the policy of keeping the western sectors of Berlin supplied and of preventing the achievement of the Russian blockade's chief end—the exclusion of the western Powers from the city. Nevertheless, the vote does nothing to simplify the desperately serious problems presented by continuing to supply some two million people from the air. With the best will in the world, the airlift cannot provide normal conditions of work and food, and the newly elected German city council must consider the endurance test to which the people of Berlin are being submitted. The Socialists, who won over 60 per cent of the vote, already realise that something more than discontent with the Russians will be needed to keep morale high. Dr Reuther, the former Lord Mayor whom the Russians would not permit to take office in the old *Magistrat*—he is an ex-Communist—is now formally installed, and his first request has been for a doubling of the airlift to bring supplies up to a daily volume of 8,000 tons. General Clay believes that enough aircraft will be available, but it is a formidable undertaking.

It is also a very costly one. At what point will public opinion at home—particularly in the United States—begin to question the very great diversion of resources which the airlift represents? Senator Connolly, who will be chairman of the Senate Foreign Relations Committee, has already questioned the expense and confidently predicted a settlement with the Russians. The mood may spread. Altogether the problem of Berlin appears as intractable as it was the day the airlift began, and the alternatives before the Allies are not one whit more reassuring.

* * *

The Vote on Palestine

Any visitor to the Palestine debate in the Assembly's political committee may be pardoned for coming away in a fine muddle as to who wanted what, and why. Again and again last week's voting offered the curious spectacle of the Russian and Latin American friends of Israel, and of the Arabs and their Moslem friends, voting on the same side for opposed reasons—the first because they would brook no truncation of Israel, the second because they wanted no Israel at all. The occasion of the voting was a last effort—attempted by the British and American delegations—to produce a compromise resolution which preserved the principle that disputes shall not be settled by force, nor settlements negotiated under duress. By the terms of the Anglo-American resolution as originally drafted, the Arabs had their last chance to negotiate for the retention of some of the lands allotted to them under the 1947 partition scheme, but since lost in war.

But by the time they had voted against every clause that admitted the fact of partition—their six votes, incidentally turned the scale, for the voting was close—they had mulcted the resolution of its three most advantageous clauses from their point of view. These were the clause providing a UN conciliation commission with specific terms of reference (lost by 22 votes to 25); the clause stating that alterations to the 1947 partition plan should be negotiated on a basis of reciprocity (lost by 23 votes to 23) and the one suggesting that the rump of Arab Palestine should be joined to Transjordan (lost by 18 votes to 26). Of the Anglo-American resolution there remained, therefore, only the clauses providing for a conciliation commission charged merely with encouraging the parties to agree, for the internationalisation and demilitarisation of Jerusalem, for free ports at Haifa and Lydda, for United Nations supervision of the Holy Places and for the restitution of property, or alternatively, for the provision of compensation to refugees. Even this emasculated text was passed only by 25 votes to 21 with nine abstentions—a majority that was sufficient in committee but does not promise the two-thirds margin that is necessary for acceptance in full Assembly.

To any western mind, the Arab vote was suicidal and incomprehensible. To many orientals it was logical. "They know only black and white, truth and untruth," wrote T. E. Lawrence, "without our hesitating retinue of finer shades." How, asks the average Arab politician, is he to go home and tell his people that he has compromised? If he does so, a shouting crowd will hound him from office. Better, therefore, to throw away the chance of half a loaf than to have to say he broke bread.

* * *

Arab Opinion Divided

To lessen the prevailing confusion, it is now best to call spades spades and to stop talking, in the singular, about "Arab opinion" and "the Arab view." The Arab states have no single common element of policy. They are not even all agreed that there should be no compromise with Israel, for King Abdullah (who is virtually an absolute monarch and has not the handicap of facing a half-educated electorate) can afford to take the common-sense view that the state of Israel is a reality.

At least four conflicting views are discernible in the *mêlée* of Arab speeches and recriminations. One is held by the supporters of the "perpetual war" faction who say they are ready to shout at and sabotage Israel in perpetuity. This is strongest in Syria but present also in Iraq and Egypt; it has a membership composed of students and the more ignorant and irresponsible politicians. A second view is held by those who accept the "practical realities." They believe that the annexation of the Arab hills to Transjordan is the only alternative to its annexation by Israel; this is, so far, little current except in Palestine and, of course, Transjordan. A third is the view of the foreign realists who would like to see their armies extracted from the expensive impasse in Palestine: whispers to this effect are current in both Cairo and Baghdad. A fourth view is held by the red herring and scape-goat seeking school, which asserts that the Egyptians lost the northern Nejeb only because the Jews attacked during the Moslem festival of Aid-el-Kebir and which is only waiting for some step towards settlement by King Abdullah in order to turn upon him as the man responsible for failure everywhere.

The events of recent weeks are all of them reflections of one or other of these states of mind. In Syria, the government has fallen to the shouts of the perpetual war party and none but nonentities can be found to take its place. In Egypt, the stability of the government is affected by its Palestine mistakes. Its many enemies have organised well-armed riots (in which the Cairo Chief of Police was killed last week) and it has been obliged to declare a state of siege. In Jericho, a congress of men-on-the-spot—the mayors and notables of the rump of Arab Palestine—has asked King Abdullah to take them over and "solve their problems by whatever means he thinks best." In Amman, the prudent Abdullah has said that he will consider giving effect to their suggestion "by constitutional international means and at the proper time." But in Paris his six fellow members of the Arab League have voted against any such extension of his territory. The further outlook for allies so divided is highly unpromising. The Iraqi and Egyptian Governments are the most likely to suffer by it. King Ibn Saud is too far away to be deeply affected, and the Lebanese, though voting *pro forma* with their Arab friends, have always—so far as the Christian half of the country is concerned—had an inner feeling that it would be no bad thing to see other non-Moslem element established with a state on the coast. Their Patriarch has publicly said so.

* * *

Alarm and Confusion

If Mr Alexander is even half as uncertain and obscure in his discussions with the Chiefs of Staff as he was with the Commons on Monday, when military service was discussed in Committee, it is not surprising that there is confusion in the Services. By the time the division was taken on the clause extending the period of service from 12 to 18 months the Minister of Defence and Mr Shinwell had, between them, succeeded in leaving the House not only uncertain as to the reasons for its necessity, but had even aroused doubts about the whole basis on which the Government has introduced conscription.

Mr Alexander was urged on Monday from all sides of the House to clear up the confusion created in last week's debate as to whether he still envisages conscription as a method of training reservists, or of eking out the exiguous numbers of Regulars available for emergencies, and whether there was anything in Mr

Shinwell's hint that they intended to abandon conscription when the Regular forces were large enough. He responded with a *tour de force* of obscurity which deserves to be set beside some of the classic passages of Mr Ramsay MacDonald in his declining years. This stung Mr Crossman into a speech which expressed very well the feeling of a considerable section of the Labour members. He said that in supporting the Government on 18 months as a national necessity, he was giving no vote of confidence whatsoever in the Minister of Defence. But many of Mr Crossman's colleagues refused to go even so far as this. Seizing the excuse that it was a Monday (" sorry, I was delayed in my constituency ") and that the Whips, determined to avoid an embarrassing revolt, had sent merely a two line whip, only 138 Labour Members out of a voting strength of 390 voted for the Third Reading of the Bill.

The debates on the Service estimates next year will, however, provide a test of back bench opinion, for it will then be open to Labour Members, if they wish, to attack the administration of the Forces without challenging the immediate necessity for an increase in the period of service.

A Mistaken Measure

The Agricultural Marketing Bill, published this week, is a disappointing and harmful measure. The Lucas Committee* pointed out that, now that three-quarters of the farmers' output is purchased at guaranteed prices, there can be no case for the continuation or revival of the producer-controlled Marketing Boards, whose main activity before the war was to manipulate supplies in the interest of raising the return to the grower. To do so would give the farmers a double protection at taxpayers' and consumers' expense. The Government has not heeded this advice. The new Bill proposes to continue the prewar system, with certain safeguards. Thus, not more than a fifth of the members of a Marketing Board may be appointed by the Minister of Agriculture, the remaining four-fifths being drawn as before from the producers. This puts the Minister's representatives in a tiny minority, while leaving the Minister of Food and the Chancellor of the Exchequer—supposedly the guardians of the consumer and the taxpayer respectively—completely unrepresented in matters vitally affecting the interests of their departments.

A stronger safeguard is contained in the Minister's power to overrule any Marketing Board which he deems to be acting against the public interest through its adoption of restrictive practices. Any such Ministerial intervention has further to be referred to an independent Committee of Investigation, which, in the case of non-guaranteed (i.e. horticultural) produce only, can in its turn overrule the Minister. But the most that this innovation can secure is to stop the producers' Boards from doing active harm—and whether it does that much depends on the courage of the farmers' Ministry. This clause may serve to inhibit the producers from reorganising marketing their way ; it will not help—and the Bill in no way helps—to ensure that the necessary technical reorganisation of marketing is in fact carried out.

This Bill may be regarded as the issue of a long tussle in which the National Farmers' Union is the victor and the Ministry of Agriculture comes second, having outmanœuvred the other departments on the theory that marketing is its responsibility. But agricultural marketing is only one link of the whole chain of food distribution, which collectively concerns the consumer buying food, and the taxpayer subsidising it, quite as much as the farmer growing it. This Bill may be less potent and less permanent than appears. At present two marketing schemes—bacon and potatoes—are in abeyance, one—hops—is in operation, and the most important—milk—is bent to the Government's will. By the terms of the new Bill these schemes can, under Defence Regulations, be suspended or modified and before they are put into full operation it is to be hoped that the Government will think again—or think at all—about the problem of food distribution as a whole.

" We Got Rhythm "

The Fabian Society can be counted on to supply those straws which not merely show which way the wind blows but also get incorporated in Labour Party bricks. Much interest therefore attaches to its pamphlet " More Socialisation—or Less ? ", first of a " Challenge Series " of pre-election documents. As an indicator of blowing winds it is depressing. True, it leads off with the welcome recognition that the great game of soak-the-rich is practically played out and that only increased production can raise working class standards (no others matter). But from this novel discovery it proceeds, through successive non-sequiturs question-beggings, and displays of general unrealism to a thoroughly irresponsible conclusion, while the whole argument rests on the major premise that justice and truth are merely what, at the moment, the proletarian rank and file consider such—an argument stated with greater precision some time ago by a Mr Engels.

This conclusion is, in a word, that socialisation must be pushed on for fear of breaking the rhythm. The four familiar criteria for testing the fitness of an industry for nationalisation are restated—low efficiency calling for the use of state resources for modernisation ; need for unification ; monopoly powers actually misused ; and, most sinister in its vagueness, the existence in private hands of control over basic services " capable, with misuse, of threatening the continuance of democratic government." (It occurs to one that this would justify an immediate and ruthless *Gleichshaltung* of the unions). To these are added the general consideration that Governments must have sufficient power to plan effectively. But suppose no industries were found to fit any of the four categories, or that the Government should prove to have already all the power it can use ; should " consolidation " replace expansion ? No. The " moral and spiritual " basis of Socialism is invoked ; there must be " an ever-powerful moral force at work *strengthened by the sense of speeding towards an objective.*" Private enterprise must indeed be allowed some incentive, but " many organised workers " accept this necessity " only out of general loyalty and only under duress." Therefore the area in which these incentives operate must be increasingly narrowed. Whether industry will be efficient under public control, or whether (as the authors, blithely ignoring all the evidence, consistently imply) industrial relations will be improved, is immaterial. The organised workers don't like seeing people make profits. They will only " respond " (i.e. stop slacking, skrimshanking and striking) if they are sure no one but themselves will benefit. That settles the question. The " steady rhythm of change " must be maintained, regardless ; because otherwise the workers will be provoked to what most people would call sabotage. This headlong, unashamed and unregretted surrender to the combined forces of stupidity and spite is unworthy of the Fabian tradition.

The Bizone Plan

The plan presented to the Organisation for European Economic Co-operation by the Bizone authorities, which has once again been secured and published by the Paris edition of the *New York Herald Tribune,* underlines the startling resemblance that now exists between the British and German economies. The fundamental problem is the same—how to earn enough by exports of manufactured goods to buy the food and raw materials which are not produced within the national territory—and the methods proposed for solving the problem are also virtually identical.

Western Germany, like Britain, has plans for a big increase in domestic production, which is to be based on a $12 billion investment programme, three-quarters ear-marked for industrial expansion. The result should be an increase in production of 64 per cent above the present level and 10 per cent above German production in 1936. Apart from the continued limitation of steel production to the present agreed figure of 10.7 million tons annually, there is little trace of the restrictions envisaged in the old level-of-industry plans.

Again like Britain, Germany hopes to increase its exports to a target 60 per cent above the prewar level. About 75 per cent of these exports will take the form of various types of manufacture ; mining (which accounted for 55 per cent of Germany's exports in 1947 and 45 per cent in 1948) will fall to 15 per cent. In return 75 per cent of Germany's imports will be devoted to food and raw materials. Finished products represent only 5 per cent of the imports for 1952-53. This trading pattern is expected to leave Germany with an adverse balance of only $72 million and this figure is believed to be manageable. But again the Germans, like the British, reach their conclusion only by assuming that all currencies will be convertible. The adverse balance with the United States will be $250 million, with Britain $142 million. But credit balances with Europe and the rest of the sterling area are to offset the unfavourable figures.

Like all the OEEC plans, the Bizone plan turns on a number of assumptions of which the assumption of convertibility is only one. Can so great an increase in manufactured exports be secured in the teeth of British, French and Benelux competition ? Can the raw materials and foodstuffs which everyone seeks be made available in sufficient quantities ? It is true that the proposed German trading pattern differs significantly from Britain's, in that eastern Europe plays a much larger role and the biggest credit balance is to be earned among its European neighbours in ERP. But these two provisos also rest on assumptions—the assumption that eastern Europe can be a large provider of primary products by 1952 and that western Europe, deprived of a favourable balance with Britain, can afford an unfavourable balance with Germany. The plan in short, like all the other plans published so far, states the problem rather than solves it. Valuable ground has been covered. The really rough country lies ahead.

* * *

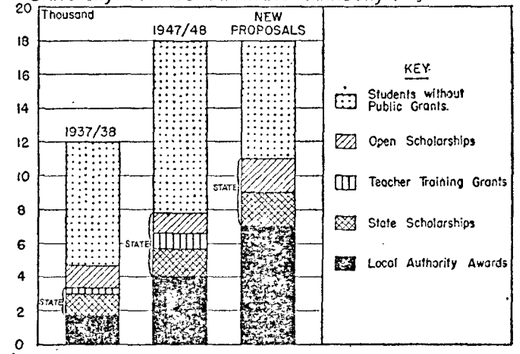
Uno Contemplates Korea

The Political Committee of Uno has now passed a resolution tabled by the United States, Australia and China calling for withdrawal of foreign troops as early as possible from Korea, conditional on the appointment of a permanent Uno commission with power to unify the country and build up its defence forces. It does not seem likely that this resolution is meant to serve any other purpose than to put on record the willingness of the United States to withdraw its forces from South Korea if the two halves of Korea can be brought together under the auspices of Uno. For there is no prospect of Korea being reunited except through civil war or of a new Uno commission receiving any more respect or consideration from the Communist-controlled regime in North Korea than did the previous commission sent out to supervise Korean elections. The attitude of the Soviet Union and its Korean *protégés* has been simply that they do not recognise any Uno jurisdiction in Korea and, whatever Uno may decide, it has no power of enforcement in North Korea. Any armed intervention there after the withdrawal of Russian troops would be liable to bring on a most dangerous crisis. The real question is whether American troops are to be kept in South Korea to support the regime which has emerged from the elections held under Uno supervision. It is not known what are the intentions of the American Government, but the problem facing President Truman and his advisers with regard to Korea is closely related to that of deciding whether to abandon, or give further aid to, the anti-Communist forces in China. There is a school of opinion which holds that America should not try to retain any foothold on the mainland of Asia, which would be untenable in time of war, but should concentrate on a purely oceanic defensive system in the Pacific ; implicit in this theory is the idea of Japan as the future bastion against a Communist-dominated continent. There is another, less defeatist, school which holds that it is possible to resist Communism and keep a balance of power in both China and Korea. A decision between these policies cannot be much longer delayed, if it has not been made already.

* * *

Fresh Failure in Indonesia

After a promising start, the renewed negotiations between the Governments of the Netherlands and the Indonesian Republic have again broken down, and this time there seems little prospect of a fresh approach from either side. The Uno Committee of Good Offices, consisting of representatives of Australia, Belgium and the United States, has done its best to bring the two parties together, but its terms of reference have precluded it from any kind of arbitral procedure. The final breakdown of the talks apparently came on the question of the control of armed forces during the interim period before the inauguration of the proposed federal United States of Indonesia ; the Dutch insisted on appointment of a Dutch Commander-in-Chief, while the Republic refused to modify the military independence which it now has in the territory it administers by submitting its army to a supreme Dutch command.



This dispute reflects a deeper opposition of aims which it has never been possible to bridge over. The Renville Agreement, on which the existing military truce is based, affirms the sovereignty of the Netherlands in Indonesia, and it is on this unabrogated right in international law that the Dutch take their stand, while the Republic claims all the attributes of sovereignty in the name of the Indonesian people and as a result of a successful revolution. The Dutch deny that the Republic has even a *de facto* reality, because in their view they could have put an end to it by force long ago if Uno had not intervened to stop the fighting, treating the Republic as a legally constituted Government, even though none of the nations on the Security Council had formally recognised it. What in fact happened when the Security Council intervened to halt the Dutch " police action " in Java was that Uno superseded existing international law by asserting a general right of intervention in any conflict within the admitted sovereign jurisdiction of a nation if it can be classified as colonial. The question today is whether the Dutch, who are confident of their ability to complete the reoccupation of Java by force of arms, will resort to a second " police action," now that negotiations have been broken off. If they do so, the Security Council will either have to take some vigorous action or accept the verdict of events, as it has done to a great extent in Palestine.

* * *

Highway to the Universities—

The recommendations of the Working Party on university awards* published this week by the Ministry of Education would virtually open the universities to all who can reach a defined intellectual level and irrespective of their means. As such it is an extremely important document in the history of higher education. On the estimates which the working party provides, the percentage of university places for which public aid will be available annually will have risen from 28 per cent in 1937/8 to 61 per cent under the new scheme—or even higher if the number of people who can finance their university education independently proves to be lower than the working party calculates. Moreover, not only will the volume of awards increase, but their value will rise as well, so that the student too poor to reap the full benefits of university life should become a memory of the past.

University Awards Available Annually. (England and Wales)

As the diagram shows, the proportion of awards to places (which was discussed in greater detail in an article on July 17, 1948) has already increased over the past ten years from 28 to 45 per cent. According to the new scheme, the unpopular teacher-training grants will disappear, and it will no longer be necessary for students to sign a declaration morally committing them to teaching in return for the grant they receive. Instead, their fourth year's special training will be determined at a later stage, and they will receive the appropriate grant from the Ministry for it. Consequently there will now be only one kind of state university scholarship.

As the basis of its calculations, the report assumes an annual entry of 18,000 for England and Wales as against 12,000 before the war. Having recommended 4,000 state scholarships, it forecasts tentatively that there will be some 2,000 overseas students and 5,000 students who can pay their way. This leaves a residue of at least 7,000 places which are to be covered by local authority awards. This last figure is very speculative, and if paying students fall short of the estimates the number of county awards can be increased. The arrangements are elastic, since local authorities are urged

> to extend their arrangements to include all eligible students accepted and recommended by universities who have reached the advanced standard in two subjects in the examination for the General Certificate of Education. . . .

* Report on the working of the Agricultural Marketing Acts. (HMSO. 1947. 2s.)

*University Awards: HMSO. 9d.

In effect, this means that all the financial barriers are down. Some will quarrel with the continued predominance of county awards, with all the anomalies to which they have given rise. The working party has attempted to meet this criticism by clarifying the principles upon which the state awards are to be assessed; by recommending increased maintenance grants and allowance; and by raising the ceiling of parents' income, below which grants are paid, from £1,500 to £2,000. Having suggested such improvements for state awards, local education authorities are expected to follow suit. This may not satisfy the critics, but it is better than a single system of grants canalised entirely through a government department, and will foster local interest in the candidates. Taken as a whole, the new proposals are courageous and should go a long way towards providing equality of opportunity.

* * *

—And the Entrance

One particular feature of the report requires special emphasis. It is assumed throughout that both for state and county scholarships the recommendations of the universities will be the governing factor for the award of scholarships. In a sense this merely recognises an existing fact, for no county or state scholarship can be effective unless a university will accept the student. In practice, the universities are now required to take a much more active part in selection. For example, as the quotation in the Note above shows, before a county award is given by a local authority, the candidate must secure a provisional acceptance by a university, and the university must send its recommendations to the local authority. This will mean a heavy pressure of new applicants at the gates of the universities.

The burden on the universities in selecting students is already very heavy. It may be that there is no alternative to their carrying this additional burden as well. But the working party of sixteen contained only three members from the universities, and represented them inadequately. There are likely now to be many protests. It is to be hoped that before the Minister accepts the report he will consult the universities fully, and not repeat his precipitancy over the new school certificate proposals.

* * *

Teething Troubles

The Minister of Health may well be right in claiming that some dentists are earning too much under the health service. The scale of fees laid down for each item of treatment roughly corresponds to what the average qualified dentist charges a private patient of middle-class income. But recognition that this scale is appropriate for the risks and rewards of private practice does not mean that it is also appropriate for the guaranteed receipts of public practice with a guaranteed flood of patients told that they are now entitled to free treatment and encouraged to take advantage of it.

Where Mr Bevan and his Ministry have apparently made a mistake is in not realising that the introduction of a free dental service would lead to the enormous demands now being made upon it, with the result that the 33 "chairside hours" a week recommended by the Spens Committee, whose report is the basis of the dentists' pay, are at present frequently exceeded. It was known that there was a shortage of dentists; it ought, therefore, to have been expected that too many teeth chasing too few drills would inflate dentists' incomes. Is the Minister right in attempting to check this inflation by halving gross earnings in excess of £4,800 a year? It will probably mean that fewer people will be treated in a week, and postponed treatment, as the private patient knows, means costlier treatment in the long run. It is certainly arguable that the amount of treatment necessary to bring in £1,000 gross (£500 net) a month, as a few dentists are said to be doing, cannot be performed with proper skill and care. But the remedy for shoddy work lies with the patient, who can always change his dentist, and with the executive councils and the profession itself, and not in an attempt to curtail all dentists' earnings and hours, which penalises those who can work both speedily and carefully.

The effect of Mr Bevan's decision, finally taken, it seems, in a high-handed manner, is that the dentists may claim that they were bribed into the health service by the offer of attractive pay, which was immediately cut as soon as it looked like becoming too expensive for the taxpayer. Nor does the decision, even had it been made with the profession's full consent, do anything to check the flow of dentists from the service of local authorities into ordinary practice. In view of the shortage of dentists, it was laid down as a principle of the health service that priority should be given to children and expectant mothers through the school dental service and antenatal clinics. But, now that dentists are leaving this work to earn the far higher pay authorised by the Ministry, which does not seem to have considered its effect on the local authority service, mothers and children will have to take their places in the queue.

Disinflation in Sweden

In these days of docile, well disciplined, nationalised central banks, it is refreshing to see such evidence of central banking independence as has just been provided by the resignation of Mr Ivar Rooth, for nearly twenty years President of the Bank of Sweden. There is no shadow of doubt about the reasons for Mr Rooth's resignation. They are made abundantly and incisively clear in a statement to the Riksdag in which he explains his decision and severely criticises the economic policy of the present Swedish Government. The burden of Mr Rooth's accusation is that the Government's measures against inflation and in support of a sound currency are wholly inadequate and that the Bank of Sweden, far from being an element of stability in the situation, tends increasingly to become a passive instrument for carrying out the policy of the governing party. If the former President of the Bank of Sweden had his way he would first of all aim at a much bigger budget surplus to be used in repayment of debt. He would then reduce the capital programme and take new measures to stimulate exports. Finally he would go even so far as to raise the bank rate slightly.

In many respects the general economic position in Sweden is comparable with that in Britain but with this important addition: that the appreciation in the value of the Swedish crown in 1947 has lent even greater urgency to a disinflationary policy in Sweden. That urgency can be measured by the balance of payments difficulties into which Sweden has fallen. The import plan for 1949 shows that total imports must be cut by 500 million to 4,200 million crowns.

Imports from dollar sources will be kept down to 500 million crowns next year, as compared with 850 million this year and 1,750 million in 1947. These promises of curtailed imports have caused apprehension in Swedish industrial circles where it is felt that the cuts can hardly fail to have serious repercussions, particularly on the highly specialised Swedish export industries. The clash between Mr Rooth and the Government symbolises the conflict between those who would tackle difficulties of this kind by attacking the symptoms of the disease, i.e. by quantitative restriction of imports, and those who suggest more fundamental remedies designed to restore the conditions of equilibrium and thus establish a solid basis from which expansion can again take place. It is a conflict of views which has highly topical significance for Britain.

* * *

Party Politics in Italy

Signor de Gasperi has returned from his visit to Brussels and Paris to face more political squabbles at home. The new foreign policy which he and Count Sforza have been vigorously pursuing and which amounts to a wholehearted drive to link up Italy's fortunes with France, Belgium and possibly Spain, has met with the approval of all Italians except the Communists. In the foreign affairs debate last week, Signor Nenni's motion of no confidence in the Government's foreign policy was defeated by 302 votes to 140. But the Government's domestic policy—or the absence of one—is causing serious dissensions in their own party, the Christian Democrats, and in the country at large.

The two chief evils in Italy—the pitiful state of the peasants and the ever-growing toll of the unemployed—have shown little sign of improvement since Signor de Gasperi won the eventful elections last April. As a result critics within the Christian Democrat party itself have become far more outspoken. Giovanni Gronchi, the President of the Chamber of Deputies and leader of one of the two left-wing groups in the party, has strongly attacked the conservative members of his party for their attitude to agrarian reform. The leader of the other left-wing group, Signor Dossetti, has also taken up the cry against his own party on the grounds that government posts should not have been given to Signor Saragat and his socialists. His argument is that there are enough left-wing members in the Christian Democrat party to fill what might be called "socialist" posts without calling in help from outside. As a result of these and other disputes the resignation of some eight Ministers has been predicted by political gossips. Even Count Sforza's disappearance has been foretold by all those who are prejudiced against him—Communists, Nationalists and Clericalists.

Signor de Gasperi's own prestige is increasing, thanks, perhaps, to the persistence with which he has put Italy's case abroad. But it is nevertheless true that he has not been able to follow up his success against the Communists last spring with any substantial improvement in Italy's economic health. His international successes will have to be very much greater if they are to turn the minds of Italians from the poverty and muddle which still surround them.

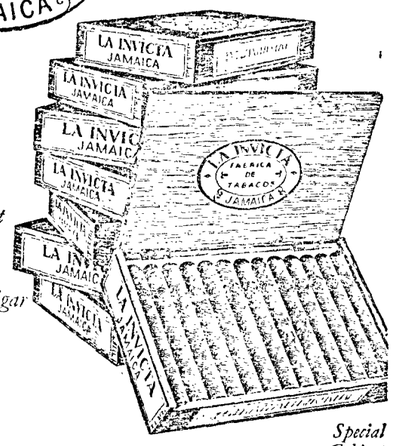
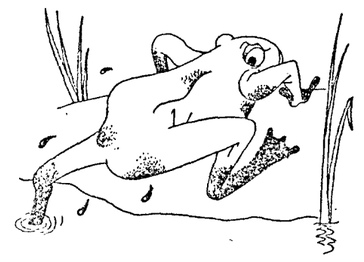
Greek Deadlock

Three months ago Mr Truman, in his fourth quarterly report on American aid to Greece, said that the aid programme had been "a conspicuous success." Now, in his fifth report, he says that an opportunity to bring the guerilla menace under control this year has been lost, that "much hard fighting lies ahead," and that Greek morale has suffered a serious blow. Three months ago the Greek Army was inflicting serious defeats on the rebels on Mount Grammos. Now renewed rebel activity is reported all over the country, from Macedonia down to the Peloponnese, while a large part of the Greek Army is being pinned down round Mount Vitsi, principally by those rebels who were able to extricate themselves from the Grammos debacle via Albania and Jugoslavia. The Greek reaction to this renewed activity is to seek permission from the Americans to enlarge the Army still further. In his report Mr Truman bluntly turns down this request. He says that the American authorities in Greece are convinced that the Greek armed forces are now strong enough and well enough equipped to restore internal security, and that they must now devote themselves to improving the quality of their training and leadership.



Mr Truman's cold douche will do no harm, for the Greeks must be made to realise that they cannot rely on American generosity for ever. Yet even if the Greek Army as it stands is capable of restoring internal security, it is certainly not also capable of performing the equally vital task of sealing off Greece's 500-mile mountain frontier. The Greeks must have help to deal with this problem; and the sort of help they need at the moment is not offers of mediation between the Greek Government and the rebels—a suggestion put forward by a group of Labour MPs, which Mr Attlee has quite rightly turned down—but military assistance under the ægis of the United Nations in closing the northern frontiers. All the lengthy debates on Greece in the Assembly, however, have resulted in nothing more than the initiation of mediatory talks in Paris between Greece and its three northern neighbours and the renewal for another year of the mandate of the Special Committee on the Balkans. Neither move will make much difference, and only an international force working under the authority of the United Nations can put an end to the endless frontier violations which make the Markos campaign possible. It is a measure of the Assembly that it has dispersed without even considering such a proposition.



Although the Greeks may justifiably feel that they are to some extent the helpless victims of the cold war between East and West, and that economic reconstruction is doomed to failure until internal security is restored, yet they cannot be absolved from the necessity of making every effort they can to put their house in order. Civil war is no excuse for corrupt administration or incompetent government, and the recent Cabinet reshuffle holds out no hope that there will be any real improvement in either. An article on page 975 discusses this problem of internal reconstruction and assesses its chance of success. It is now clear that without some reform, not even a beginning of genuine pacification can be made.

South Africa's Loss

The death of Mr Jan Hofmeyr, at the age of 54, has left a gap in South African politics which cannot easily be filled. In a country divided by emotional hatreds and racial prejudice, his liberal and balanced views were unique. He was the appointed successor to General Smuts, and it is no exaggeration to say that

Water pollution..?
More attention is being given by Rivers and Catchment Authorities to the quality of trade effluents, and the treatment of waste waters presents many problems to industrial concerns. For many years, Peter Spence & Sons Limited have specialised in the chemical treatment of water and waste water, and their technical service is at the disposal of concerns which require advice upon effluent problems.

the chief hope of a peaceful settlement of South Africa's complex and embittering problems rested in him.

Paradoxically, Mr Hofmeyr's death may lead to a temporary easing of the unpleasant situation which has been building up in South Africa. Dr Malan's determined pursuit of the policy of *apartheid*, or racial segregations, of abolishing the seats of the three representatives of the natives in the House of Assembly and of setting up the paramilitary organisation known as the *Platteland* army, depends on a small parliamentary majority which his electoral ally, Mr Havenga, controls. During the past few weeks there have been clear signs that Mr Havenga is dissatisfied with the route which Dr Malan is following and that he would be willing—at a price—to upset the Government by throwing in his lot instead with General Smuts's United Party. The obstacle to such an alliance was Mr Hofmeyr, who distrusted the Afrikaner Party's intentions towards the natives as much as he distrusted the Nationalists. Now that Mr Hofmeyr's death has—tragically—removed this obstacle, it is likely that Mr Havenga will speed up his negotiations with General Smuts. The results of the negotiations cannot be foretold, but it should be remembered that Mr Havenga wears the mantle of General Hertzog and that for some years General Hertzog and General Smuts governed the country amicably enough together. A coalition government of the United and Afrikaner parties would certainly put a stop to the more extreme measures of the Nationalists, but it will not mean a radical swing towards more liberal policies. The fear of the native which underlies Dr Malan's policy is felt throughout South Africa, and it is only the few men without fear—men like Jan Hofmeyr—who would risk the liberal reforms which are so urgently needed.

New Formula for Film Production

The British film industry has still to overcome its major economic difficulty: the lowest cost of producing a film of quality and the highest amount it can earn in British cinemas are roughly equal—too nearly equal for the nerves of possible backers. A new production technique for which the inventor claims that it can cut production costs by more than half is therefore of more than technical interest. This is the "independent frame" method, devised by Mr David Rawnsley, a consultant to the Rank Organisation and head of his own firm of production specialists.

It begins with the detailed planning of studio work, on lines which some American and other producers have already put into practice, to save time on the floor. All that can be done before actors are engaged and studio space required is carried out to the last detail: the script, for example, is prepared so fully as to become, with its sketches for each scene, almost a cartoon version of the finished film. Every piece of property, wardrobe and make-up is assembled and put where it will come most easily to hand. Beyond that is the "independent frame" itself. Not only are properties and make-up assembled, but so too is the background on film. The fullest possible use is made of such special devices as back projection. As much of the film as can be made without actors is prefabricated: the actors take their place in the frame only for the last and briefest phase of production. Even in this phase there are fewer technicians on the studio floor than there are in the usual method of production; the actors have been rehearsing whilst the floor was got ready; the film is already clear in the director's mind—thanks to the full script and the prefabricated frame. This phase should occupy the production floor for no longer than four weeks.

"Warning to Wantons," which has been made in this way at Pinewood for Mr Rank, is likely to be shown at the end of the year. Mr Rawnsley claims that it took half the time, half the studio space, and less than half the money (it was made in six weeks for some £100,000) that the film would have cost by traditional methods. He expects that familiarity with the method can bring this cost down to as low a figure as £25,000—which would mean not only a firmer financial basis for the film industry but a degree of artistic freedom hitherto unknown. If costs can be brought so low it should become possible to make films commercially for specialised audiences and not only, as at present, for the lowest common denominator of taste.

Shorter Notes

Correction: In the article on the Sudanese elections last week, the party representing the Independent Front was wrongly given as the *Ashigga*. This should, of course, have been the *Umma* party; the *Ashigga* are those who seek some form of union with Egypt.

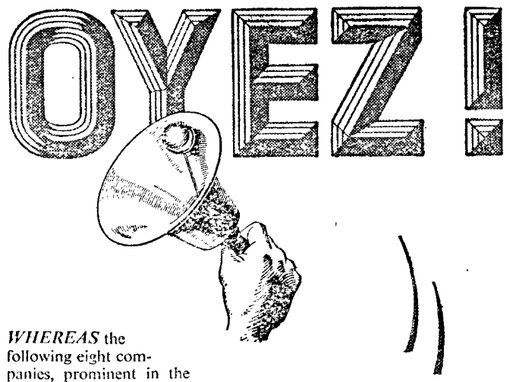
Sir Stafford Cripps is the most famous member of a family distinguished for its political and personal courage. It was to be expected, therefore, that he would stand up, like St. Stephen the martyr, to the slings and arrows which the House of Commons launched against his decision to permit trade union and political funds to be remitted to similar organisations in France. His decision (which was commented upon in *The Economist* last week) is, in fact, indefensible, and Sir Stafford would have displayed even greater courage had he re-examined it and not attempted to defend it by arguments which were more suited to a professional advocate defending an impossible case.

*

The Ministry of Town and Country Planning has issued a draft designation order for the creation of another new town for the London region—this time at Bracknell, Berkshire. It will be a small one, absorbing no more than 200,000 persons from crowded areas in West Middlesex, which will no doubt require further outlets. Agricultural interests are complaining about the scheme, although it is claimed in reply that the alternative site, the one proposed by Sir Patrick Abercrombie at White Waltham, would absorb still better land.

*

By 29 votes to none, with seven abstentions, the Social Committee of the UN Assembly this week adopted a Universal Declaration of Human Rights. If it is allowed that there is some value in transmitting these rights to paper in a world that so variously interprets important words such as "freedom," the Declaration is a good one. It lists the most important of the rights of man. It is woolly only where it attempts to include among them rights that virtually defy definition, such as the right to "social security." The seven members who abstained from voting in committee were Canada (upon the constitutional point that the Federal Government cannot bind the provinces) and the Soviet Bloc. These last oppose the whole western conception of individual rights on the ground that the state, which comes first and knows best, is the proper and impeccable guarantor of all good things.



From *The Economist* of 1848

December 9, 1848

An event, equally horrible and astounding, has happened on the coast of Ireland. The *Londonderry* steam vessel left Sligo on Friday morning, and crossed the bar in the evening with 174 steerage passengers, three cabin passengers, and a number of cattle and sheep, for Liverpool, coming round the north of Ireland. She had a crew of twelve persons, including the carpenter, two boys, and the captain. After leaving Sligo, the vessel encountered a heavy storm, attended by hail, rain, and snow. From nine o'clock on Friday night till nine o'clock on Saturday night she was in imminent danger, and all the exertions of the crew were needed to save her. This was accomplished, and the vessel got into Moville on Saturday night in safety, but only then to reveal a calamity as appalling as the destruction of the *Ocean Monarch*.

At an early period of the voyage the steerage passengers were desired to go below, and in the evening, after some ineffectual attempts had been made to stop up the entrance to their cabin, that appears to have been effectually done about ten o'clock, and the next morning no less than 72 men, women, and children, were found heaped on one another stifled to death .... There was less space in the steerage of the *Londonderry* than in the Black Hole, and the victims were a fifth more numerous....

It is a matter of course that our contemporaries, who look to the Government as a great protective and guiding power, instead of that mediatory one, or judge, settling disputes and quarrels, which was its earliest character, should take the opportunity of urging it on to assume some more definite control over steamboats, and make itself responsible for preventing or for causing all such calamities. Betwixt them and us there can be no difference whatever as to the desirableness of avoiding all such horrors; but our unflinching adherence to the great principle of leaving the people to manage their own business makes us differ from them as to the means. For many years the tendency has been to substitute the regulations of the Government for the discretion of the people, and we cannot say that the results have answered expectations.

WHEREAS the following eight companies, prominent in the British Lead Industry, have hitherto carried on business under their individual names, to wit:— **The Cookson Lead and Antimony Company Ltd., Locke, Lancaster and W. IMPERIAL CANCER RESEARCH FUND

Incorporated by Royal Charter, 1939.

Patron—HIS MOST GRACIOUS MAJESTY THE KING.
President—The Rt. Hon. The EARL of HALIFAX, K.G., P.C.
Chairman of the Council—Professor H. R. DEAN, M.D., F.R.C.P.
Hon. Treasurer—Sir HOLBURT WARING, Bt., C.B.E., F.R.C.S.
Director—Professor W. E. GYE, F.R.S.

The Fund was founded in 1902 under the direction of the Royal College of Physicians of London and the Royal College of Surgeons of England and is governed by representatives of many medical and scientific institutions. It is a centre for research and information on Cancer and carries on continuous and systematic investigations in up-to-date laboratories at Mill Hill. Our knowledge has so increased that the disease is now curable in ever greater numbers.

LEGACIES, DONATIONS AND SUBSCRIPTIONS **are urgently needed for the maintenance and extension of our work.**

Subscriptions should be sent to the Honorary Treasurer, Sir Holburt Waring, Bt., at Royal College of Surgeons, Lincoln's Inn Fields, London, W.C.2.

FORM OF BEQUEST

I hereby bequeath the sum of to the Imperial Cancer Research Fund (Treasurer, Sir Holburt Waring, Bt.) at Royal College of Surgeons of England, Lincoln's Inn Fields, London, W.C.2, for the purpose of Scientific Research, and I direct that the Treasurer's receipt shall be a good discharge for such legacy.

Letters to the Editor

The Cost of Justice

SIR,—Readers of the letter from Miss E. Arnot Robertson, published in *The Economist* of November 27th, would receive the impression that we had threatened an action of libel with a view to stopping people from subscribing to a fund instituted to assist Miss Robertson in fighting her appeal. Such an impression would be entirely wrong. The appeal made to members of the Critics' Circle, by the five persons named in Miss Robertson's letter, with a view to inducing people to subscribe, contained a number of statements which are plainly untrue.

The untrue statements are:

(1) That we had "so far succeeded in removing a critic from her post by alleging to her employers that she was incompetent."

(2) That Mr Justice Hilbery held that our letter to the BBC definitely imputed incompetence to Miss Robertsen.

(3) That Mr Justice Hilbery held that our letter was actuated by malice.

(4) That "The Fund now stands at over £2,000, without any appeal having been made."

With the exception of the figure at which the fund stands, as to which we have no knowledge, the whole of the remainder of the statements are directly contrary to the facts.

The appeal was also misleading in other respects, notably in its statement that the Court of Appeal allowed our appeal "by a majority of two to one." In fact, the Court was unanimous in allowing the appeal, the only difference of opinion being whether judgment should be entered for us or whether there should be a new trial.—Yours faithfully,

Managing Director.

British Farming

SIR,—"Berkshire Farmer" says (*The Economist*, November 27, 1948) that if his landlord would and could afford to build him two modern cottages and modernize his existing ones, he could increase his production by 15 per cent.

From the owner's point of view, the question must be: is this an economic proposition? In the first place, the heavy capital expenditure entailed must be justified on the grounds that it will bring about a corresponding permanent increase in the value of the farm. In the second place, the tenant must be prepared to face paying adequate interest on the improvements in the form of increased rent. Given these conditions, the tenant would be justified in suggesting that the owner should, if necessary, borrow the money to finance the capital improvements. Should the latter disagree, the tenant can have recourse to the Agriculture Act and appeal to his County Agricultural Executive Committee for help. They will be in a position to judge whether his claims are reasonable and whether other farmers' needs are more urgent.

At the same time, it is only fair to this owner (as to every other) to point out that he will in any case have to go through a lot of hoops before cottages can be built or improved. Having employed an architect to draw up the necessary plans and specifications, he will have to go to his local authority to get planning consent, and building licences—which are still hard to obtain because of continuing shortages of labour and materials, and the handicaps imposed on private building. And the cottages will have to be assessed for development charge (although so long as they are occupied by agricultural workers the charge will be nil).

In fact it now takes approximately a year from the time when an owner applies for the necessary permits to build before the first brick can be laid. Is it surprising that there is a hold-up of schemes for increased production on farms which are contingent upon new housing accommodation for workers?—Yours faithfully,

"A BUCKINGHAMSHIRE LANDOWNER"

Reality and Illusion

"Inquest on an Ally." By Paul Winterton. Cresset Press. 288 pages. 12s. 6d.

MR WINTERTON was *News Chronicle* correspondent in Moscow during the war, and he has already related in another book how he became disillusioned about the prospects of postwar Russian-Western friendship by observing the contrast between the wartime popular pro-Russian enthusiasm in the West and the studied hostility on the Russian side. In this book he has written an indictment of recent Russian policy. It is definitely a book "for the record"; it is slightly reminiscent of the piling-up of offences by the prosecution in the Nuremberg Trial. Mr Winterton is aware that he may be accused of "wearisome restatement" of well-known facts and justifies himself on the ground that so many people, "finding the facts distasteful, have refused to believe them." Actually, although there are few items in the book which will be unknown to anyone seriously interested in international affairs over the last five years, there has not been any other presentation of the whole story in so complete and orderly a form, and the facts gain in significance when seen in their sum total and not merely as fragmentary episodes. Any one act of Russian policy can perhaps be explained away as due to misunderstanding, diplomatic misdirection or the particular circumstances of the case, but Russian behaviour in bulk shows such constant repetitions of pattern that we can only attribute it to an overall plan and method.

Mr Winterton does not find a puzzle in Russia's actions; he considers them fully consistent with Communist doctrine and not otherwise to be explained. He quotes from authoritative text-books, such as Stalin's own *Problems of Leninism* and the official *History of the Communist Party (Bolshevik)* published in Moscow in 1939, to show that Russia's actions since the Teheran Conference have been just what they ought to be according to the political code which the rulers of Russia profess to follow. He recognizes that Russian nationalism has played its part, but he holds that, far from it being an alternative course to Communism, it simply reinforces and intensifies the urge of world-revolutionary Communist faith.

Mr Winterton thinks it is "a remarkable fact that while no one would attempt to understand a book without first learning the alphabet of letters, many people seek to understand the post-war behaviour of Soviet Russia without first studying the alphabet of Communism." He is ruthless in his criticism of western statesmen who, despite the ever-mounting evidence of Russian ill will, made so many sacrifices on the "unresponsive altar" of Big Three unity, and, above all, of "the political leaders, British and American, who for two and a half years—at enormous cost to their own countries—allowed western Germany to stagnate in a futile attempt to stave off the division of Europe." It is painful to be reminded of all these humiliating episodes, but it is also salutary to be shown how much of our present international troubles is our own fault for lack of a clear policy of our own and for gross misreading of Russia's.

"Soviet Politics." By Frederick Schuman. Robert Hale, 1948. 663 pages. 21s.

MR SCHUMAN'S lengthy conspectus of Soviet ideology and practice went to press in America at the time of the first meeting of the Council of Foreign Ministers in London in December, 1945. It has now been published in Great Britain. The book therefore antedates the important series of memoirs and of official documents dealing with the Soviet Union's role in the Second World War that have appeared during the last two years. But if Mr Schuman's book cannot claim complete authenticity as to events, it nevertheless makes interesting reading. For his own brand of idealism, much akin to that of Mr Henry Wallace, represents one typical American reaction to Soviet politics.

Mr Schuman writes hopefully and enthusiastically in terms of political and economic generalities, in which he totally submerges the real problem, that of Russia's extreme psychological and social immaturity. Thus his account of, for instance, Stalin's seizure of power or Molotov's foreign policy between 1939 and 1941 remains utterly unconvincing. The author is at his best, on the other hand, in his descriptions of the Revolution, the Civil War and the defeat of the Nazi invaders in which his dramatic sense of the heroic quality in Russians is entirely appropriate.

Whatever value, therefore, Mr Schuman's book may have for the student of diplomacy or constitutional theory (the author pays much attention to the juridical basis of Soviet Communism), it can scarcely be said to contribute to the "clearer comprehension of Russia" advocated on the dust-cover. As to international relations, Mr Schuman's prophecies in 1945 have proved as wildly erratic as those of the majority of mankind. His confident assertions regarding Stalin's burial of the weapon of Marxist Revolution have the ring of President Roosevelt's dogmatic optimism. Events have since shown us that in politics bygones cannot be made bygones through the mere agency of a handful of great personalities: that the destiny of great nations is guided not by the conscious machinations of the present but by the unconscious, massive accumulations of the past.

Europe: Past and Present

"The Unity of European History." John Bowle. Jonathan Cape. 383 pages. 18s.

MR BOWLE'S choice of title hardly does justice to the scope of his book. He has written a broad survey of European history from its beginning in the Mediterranean area. This survey provides the means of showing, as it were *ambulando*, the unity, or rather the unity in diversity, of European civilisation. Mr Bowle writes quietly and honestly; he is not obsessed by "pattern-making" and does not strain or distort facts. He realises that there are questions which, at all events in the present state of knowledge, no prudent historian will feel himself competent to answer.

Mr Bowle's facts are not new, and there is nothing new about the orderly sequence in which they are arranged. He has indeed maintained an unusually good sense of proportion; his craftsmanship in joining the chapters and sections of the book is excellent. The main thing, however, is that by taking this multitude of known facts and commenting upon them, Mr Bowle gains the reader's confidence and interest, and leaves him with the impression that, in spite of past or present crimes and follies, there is no reason to despair of Europe. Mr Bowle concludes with these two sentences: "Though the problems of our time are on a great scale, they are not mysterious. They are capable of practical solution in the light of the moral and political principles emergent in the history of Europe." To those sentences he might have added a wise saying by one of the noblest of French historians and statesmen: "God does not cheat the human race."

It may be that Mr. Bowle, looking serenely across the centuries, underrates the number and complexity of our problems. He cannot help us directly to answer our most urgent question: "Who will bell the cat?" He does not suggest any immediate way of ending the dangerous schism between the western and eastern traditions of European civilisation. Yet he could reasonably reply that his business is not to suggest remedies but to give the background or diagnosis which will convince others that remedies are possible. In the last few years we have had, perhaps, too much easy optimism from scientists who know too little history, and too much pessimism from learned humanists. It is encouraging to find a historian who can make so lucid and comprehensive a survey of the European past and, at the end, remain convinced that we are more likely to be entering upon one of the grander ages of civilisation than to be hurrying to utter destruction.

M. Halévy's Lectures

"Histoire du Socialisme Européen." Edited from Lecture notes by a group of friends and students of Elie Halévy. Librairie Gallimard, Paris. 367 pages. 440 Francs.

IN the summer of 1937 M. Halévy had decided to make a book out of the lectures on the history of European socialism which he had given regularly since 1898 at the Ecole des Sciences Politiques. He died in August, 1937, before he had done more than draw up the plan of the book. Only a few lectures, written out in book form at earlier dates, were therefore available for publication. M. Halévy was accustomed to speak from short

notes, and also to vary the treatment of his subject from year to year. Thus the editors who wished to carry out M. Halévy's project had to put the lectures together mainly from the notes taken by pupils. The editorial work was interrupted by the war; one of the most brilliant collaborators—M. Etienne Mantoux—was killed, and another died in 1940. The manuscript itself was destroyed by fire, but, fortunately, a copy had been made.

The labour spent on preparing the book for the press was more than an act of friendship in memory of a great scholar and teacher. The lectures are very good, and well worth preserving. The text obviously suffers from the circumstances in which it has been pieced together. Some sections are a little scrappy, or overloaded with the facts and dates which an audience of undergraduates tends to note more easily than the comments and *obiter dicta* of the lecturer. Other chapters—for example, a short account of historical materialism written by M. Halévy in 1910—would certainly have been revised.

On the other hand the lectures as a whole give a full and varied treatment of a subject upon which M. Halévy was a leading authority and there are pages in which, suddenly, one can hear him talking in his acute, friendly way, or summing up in a sentence his considered judgment of a man or a movement. Thus "*le parti communiste russe ressemble à un Pierre le Grand collectif.*" Or "*Marx, esprit puissamment systématique, n'est pas un grand créateur d'idées. Ce n'est pas à son originalité mais à son rôle historique que le marxisme doit son importance.*" Or again "*le syndicalisme révolutionnaire a réveillé dans la classe ouvrière le sens de l'héroïsme.*" Perhaps, however, the most interesting thing in the book is an extract from a letter written by M. Halévy in 1913: "*Pour ce qui est de moi, je reconnais bien que le socialisme renferme le secret de l'avenir. Mais je ne déchiffre pas ce secret et je suis hors d'état de dire si le socialisme nous conduit à la république suisse universalisée ou au césarisme européen.*"

South Africa's Resources

"Economics in South Africa." By N. N. Franklin. Geoffrey Cumberlege, Oxford University Press, Capetown. 253 pages. 15s.

THIS admirable book is packed with useful information about South Africa's resources, agriculture, industries and economic problems. The author has collected a mass of information from Blue Books and Government reports which he has put together in a clear, readable form, presenting a general picture of South Africa's economic health. He underlines the paradox of poverty in the midst of wealth, and he shows that in South Africa at least all that glitters is not gold.

The book is divided roughly into two parts. In the first few chapters, the author describes and analyses the complex structure of the South African economy. He shows, for example, that in Capetown five out of every ten Coloured households, five out of every ten Native households, two or three out of every ten Asiatic households and one out of every ten European households fell below a very rigorously defined poverty datum line—an income of £7 15s. per month. He stresses, too, the poverty of South African agriculture. Only 15 per cent of the land is arable and only about six per cent is in fact cultivated. On the other side of the balance sheet, the author points out that South Africa is particularly rich in mineral resources. Apart from gold, there are large deposits of coal, iron, copper and manganese ore, though there are no known oil deposits. Helped by substantial protection, the factories more than doubled the value of their output during the 17 years before the war.

The second part of the book is devoted to a closely reasoned argument for curing the economic diseases which are diagnosed. The training of natives in technical trades, the encouragement of the immigration of skilled workers, measures against monopoly and extensive borrowing from abroad are all recommended. The argument is sound, but, as the author himself admits, political difficulties will hamper it in practice.

Refresher Course

"A Survey of Contemporary Economics." American Economic Association. Edited by Howard S. Ellis. The Blakiston Company. 472 pages. $4.75.

VERY broadly, the purpose of this formidable but invaluable volume is to answer the question "What has been happening to economic theory over the last ten years or so?"—a question often and dispairingly asked not merely by laymen whose education included at some stage a nodding acquaintance with elementary theory, but by many indubitably qualified economists. The division of labour, as Professor Ellis points out in his witty preface, has reached a point where specialists may be appallingly ignorant of developments outside their own chosen field—the expert in monopoly theory being all at sea in econometrics, the monetary theorist finding himself completely foxed by discussions of national income, and so on. This *Survey* is designed to give a general conspectus or refresher course, summarising and relating to one another the theoretical advances in each special field; its authority is strengthened by associating with the author of each essay two critics distinguished in his own expertise; the result is not an official statement of the views of the American Economic Association, but a combination in almost ideal proportions (though these vary) of the venturesome and the "sound."

Detailed criticism, in the space of a short review, of work which is already a wonder of critical compression, would be virtually impossible, even were an Admirable Crichton among economists available to provide it. It is possible for an English reader to feel that a task of this importance might have been better shared between the American Economic Association and the Royal Economic Society, had this been administratively possible. British economists get a perfectly square deal from the AEA team, but in certain fields—e.g., the fiscal—it is arguable that British experience would have provided the more instructive background; and the admittedly "somewhat arbitrary" choice of subjects might, without net loss to the reader of high qualifications and with considerable gain to the near-layman, have been made so as to exclude higher mathematics.

A Study of Ceylon

"The Economy of Ceylon." By Sir Ivor Jennings. Oxford University Press. 217 pages. 10s. 6d.

FEW studies have hitherto been made of the economic condition and problems of that beautiful and romantic island—Ceylon—which is the first British "colony" (in a restricted sense) to achieve Dominion status. Ceylon is remarkable for its provision of free secondary and university education, and for the valiant efforts made, under the wise guidance of Sir Ivor Jennings its vice-chancellor, to establish for its university a standard equivalent to that of British universities.

Sir Ivor Jennings, although by his own submission "no economist," has performed the task of assembling, analysing and interpreting the available (though most incomplete) economic data, in a manner of which the most austere economist might well be proud. His object is to provide a textbook which will make students aware of the main factors affecting the economic and social life of Ceylon and determining the standard of life of its inhabitants. But no one should be deterred by the expression "textbook." This is no dry description of the material facts of life in Ceylon. The book provides vivid accounts of, for instance, the life of the peasants and the organisation and role of the plantation industries, whilst at the same time, it deals competently with such topics as national finance and employment. Indeed, in treating each of his twelve main subjects, the author contrives to enunciate and illustrate many of the fundamental principles which explain the functioning of economic society, and must be understood before an appropriate national economic policy can be devised.

The First Austrian Republic

"The Tragedy of Austria." By Julius Braunthal. Gollancz. 216 pages. 7s. 6d.

THE declared purpose of this little book is to sketch the history of the First Austrian Republic so that the prospects of its successor may be better understood. In fact, the work is an able and fervent defence of the record of the Austrian Social Democratic Party since 1918, and Mr Braunthal, one of its leading members, sees no anomaly in this. He argues that the Social Democrats alone among the parties in the First Republic genuinely believed in democratic government and sought to practise it. Their collapse after 1934 heralded the dissolution of the state, and now their revival is the only hope of its proper restoration. On this view the tragedy of Austria has been the tragedy of the Social Democrats.

Those who do not share the author's Socialist convictions will dissent from his rigid analysis in the sinister terms of the class

struggle. Apart from this, however, there is much of value in the book. A long appendix, contributed by Professor Paul Sweet, contains the text of letters which passed between Dollfuss and Mussolini from July, 1933, to February, 1934. These show beyond question that the Chancellor engineered the suppression of the Social Democrats in Vienna with full encouragement from Rome. Of more immediate importance is the author's reminder that the Austrian Social Democrats sought vainly for an *Anschluss* with Germany in 1919. Then they were moved by the millenary hope of joining a German Socialist commonwealth, but they also realised that the independence of their state had no other justification than the needs of allied policy. Subsequent events showed that in this, at least, they were not mistaken.

Location of Economic Activity

"The Location of Economic Activity." By E. M. Hoover. Economics Handbook Series. McGraw-Hill, 1948. 310 pages. 22s. 6d.

"THE time has come," the Editor writes in the introduction to this volume, "to redress the balance between the energies spent on the creation of new ideas and on their dissemination." The aim is to avoid the detailed analysis of a technical treatise, and produce good background reading for non-specialists in the Universities and material for adult education outside. This is the first of the series to appear, and it sets a remarkably high standard. Mr Hoover needs no introduction to students of location. His *Location Theory and the Shoe and Leather Industries* was a classic of economic research, a brilliantly successful attempt to turn the footloose theories of his predecessors into tools of analysis capable of handling practical problems. Having forged his tools and accumulated more general material over several years, he presents the results here in what is very much more than a popular exposition. He covers the complete range of location problems, including the effects of transfer and processing costs, the economics of land use, labour costs, the economic structure of communities, problems of change and adjustment, the effect of political boundaries on location, and questions of location policy. His style is clear, and the presentation of his material excellent. And it is rare and refreshing to one engaged, alas, in teaching Hicksian economics (since that is what examiners demand) to meet a textbook in which a cost curve means that costs do in fact look like that.

Mr Hoover's weakness belongs as much to his country as to himself. He is a little too quick to push sociological factors into the background, only to re-emerge in the last chapters. If the "provincialism" he attacks means the culture which inhabitants of Slough or Cowley left behind them in Wales, we need far more of it and not far less. And, since American experience of actually controlling the location of industry is so much smaller than ours, it is not surprising that his chapters on this lack the sureness of touch found where he is dealing with the experience of business in a *laisser faire* economy.

In effect, these criticisms mean that Mr Hoover has failed to take enough account of the special experience of this country. And it would be unfair to blame him for this; for no one has yet written this experience down in full, least of all the Government in its White Papers. To do this—so one feels after an evening with this excellent book—would at the moment be the best contribution that students in this country could make to the theory as well as the practice of location.

Greek Tragedy

"Report on the Greeks." By Frank Smothers, W. H. McNeill and E. D. McNeill. 226 pages, 13 illustrations. $2.50.

THIS book contains a comprehensive summary of the economic, social, political and historical background of the Greeks. It was compiled jointly by a team of three investigators—two of them already well acquainted with the country—who were sent to Greece for three months in the spring of 1947 by the Twentieth Century Fund, so that "the Fund should do what it could to give the American public a better understanding of the people of Greece." The report inevitably suffers from being well over a year out of date, but this does not affect its excellent account of the Greek economy, which rightly emphasises the very great difficulties involved in the long-term reconstruction of the country. The style of the book is not distinguished, probably because it is a joint compilation. Its value is impaired by the lack of an index, and its readability by the praiseworthy desire of the authors to omit no aspect of any situation which they are describing

Nevertheless, they are unable to remain completely impartial. The report is definitely more pro-Left than pro-Right. In fact, on one occasion, two of the authors admit in a footnote that the report "highlights" the violence committed by the Right, and glosses over that committed by the Left. And when visiting a band of rebels, the team seems to have allowed the charm and hospitality of the individual bandits to blind them to the folly and danger of the path they had chosen to pursue. However, it is now so common to regard the Greek civil war simply as an incident in the cold war between east and west that it can do no harm to be reminded of the tragic complexities of foreign occupation, economic ruin, and political extremism, which, far more than the tenets of Marx and Lenin, have driven many young Greeks to armed rebellion.

Shorter Notice

"Documents and Materials Relating to the Eve of the Second World War. Vol. II." Dirksen Papers, 1938-9. Moscow, USSR Ministry of Foreign Affairs. 243 pages. 2s. 6d.

THE second volume of Moscow's counterblast to the American publication of documents on Nazi-Soviet relations is a good deal more interesting than its predecessor. The bulk of the documents consists of the correspondence of the German Ambassador in London, von Dirksen. Even in the absence of corroboration they serve to throw some important light on the foreign policy of the British Government in the period, 1938-1939, and particularly on the perseverance with which Mr. Chamberlain pursued the policy of "appeasement"—not simply as a means of dealing with particular crises, but as the counterpart of building up British strength to a point at which an all-over agreement would be possible.

The editing of the documents seems to have been very competently done; but the "Dawson" mentioned among the pro-German publicists on page 98 is of course William Harbutt Dawson, and not Geoffrey Dawson, as the editor believes. The very low price of the book reveals the anxiety of the Soviet authorities to secure a public.

OXFORD ECONOMIC PAPERS
[NEW SERIES]
VOLUME I NUMBER 1 JANUARY, 1949
CONTENTS
SIR HUBERT HENDERSON: The Function of Exchange Rates.
G. D. A. MACDOUGALL: Notes on Britain's Bargaining Power.
T. WILSON: Programmes and Allocations in the Planned Economy.
P. W. S. ANDREWS: A Reconsideration of the Theory of the Individual Business.
J. M. D. LITTLE: A Reformation of the Theory of Consumer's Behaviour.
G. L. S. SHACKLE: The Nature of Interest Rates.
B. R. WILLIAMS: Types of Competition and the Theory of Employment.
Starting with this number, OXFORD ECONOMIC PAPERS will be enlarged and published as a periodical twice yearly. The prepaid subscription price for two consecutive numbers will be 21s., post free. Single copy, 12/6 net. The Journal will consist in the main of articles by Oxford authors, but the Editors will also be glad to consider contributions from elsewhere.
Correspondence on the subject-matter of the Journal should be addressed to the Editors, c/o The Clarendon Press, Oxford, and all other correspondence to the Publisher:
GEOFFREY CUMBERLEGE, OXFORD UNIVERSITY PRESS,
Amen House, Warwick Square, London, E.C.4.

AMERICAN SURVEY

The Good Creditor

(From Our US Editorial Staff)

FOR a generation, the United States has been warned that, since it is a creditor nation, it would do well to act like one. Acting like a creditor nation involves, among other things, a disposition to look for opportunity outside the United States, and also agreement on what constitutes a sound lending policy. Since the war, the United States has established, or taken part in the creation of, new institutions to direct the foreign investment of public funds. In addition, the private agencies of capital formation, the banks, the insurance companies and the large corporations, have explored or re-explored the possibility of putting their money, or their money in combination with their technical knowledge and business experience, to productive use abroad.

But over the new ventures, the cloud of memory hangs heavy. The first experiences of the United States as a creditor, in the decade after 1918, were neither greatly to its credit nor greatly to its liking. The unwise borrowing and unwise lending of that time embitter the present. Both the American banking community and the investors who took its offerings, wryly remember some of the loans of the "New Economic Era," which equipped the municipalities of the New Germany with swimming pools not wisely but too well. Public as well as private toes were stubbed. The record of government default on the war debts prompted the conclusion that "Finland is the only one that pays." If there is dragging of feet today, it is over the frictions of the past as well as the stumbling blocks of the present (though companies long accustomed to doing business abroad sigh for the unrestricted entry, unfettered operation, and unlimited profits, freely withdrawn, of an earlier period).

In the nineteen-twenties, foreign lending was gilded by the optimism of the domestic boom, and the lenders ignored the dependence of American prosperity not only upon that of the rest of the world, but upon that of the American farmer. Agricultural exports were neglected and tariffs raised with only a twinge of suspicion that they would affect the repayment and servicing of foreign loans. In varying degrees, private companies carried into remote places the pattern of exploitation which had opened up the American West.

During the nineteen-thirties, the Reciprocal Trade Agreements programme, the fore-runner of the International Trade Organisation, began the gradual retreat from protectionism. By 1949, the US Chamber of Commerce points out, the average *ad valorem* tariff on dutiable goods will have dropped from 53.2 per cent under the Hawley-Smoot Act to 15.3 per cent under the Geneva agreements signed last year. As part of the Good Neighbour policy, the Export-Import Bank was created, primarily to further trade in the Western Hemisphere. But little foreign trade and less foreign lending was undertaken during the depression years. The first major revision of the principles of foreign lending came with the invention of lend-lease, which recognised a distinction between credits granted for the non-economic purposes of war, and credits in the traditional economic sense of the term. This freed the world of a war debts incubus like that of the nineteen-twenties, and marked the progress from the time when President Coolidge met a request for war-debt adjustment with the classic retort, "They hired the money, didn't they?"

The institutions developed since the close of hostilities, the World Bank and the Economic Co-operation Administration, indicate the need of further distinctions, despite the difficulties of maintaining them in the no-man's land between war and peace. The climate of opinion in which the new principles of trade and finance are taking shape differs sharply from that of the first decade in which the United States realised it was a creditor power. During the depression, business and the profit system lost much of their moral and political influence in the United States and elsewhere. Workers driven to sell apples on street-corners and farmers who, unlike the industrialists, could not easily curtail production, turned to the ballot box and discovered that economic have-nots could become the political masters. The Wolf of Wall Street, battered in the subsequent encounter, licked his wounds reminiscently, even after some of them had healed, and ventured with increasing caution from his lair. The profit system is wholly endorsed, as an alternative to communism, not only by businessmen in trade associations assembled, but by labour leaders, the farm community, and professional groups. But to those who have discovered that economic aims can be furthered by large-scale political programmes, financed by taxes or government borrowing, its rigid standards of profit and loss seem unduly severe.

*

Of the three institutions working out the new principles of foreign lending, the World Bank is doubly bound to business standards, first by its charter and again by its dependence on New York financial opinion for the sale and standing of its bonds. The Export-Import Bank is cut out of the same cloth, but financed by the Treasury. ECA, inaugurated from political motives, is primarily a postwar form of lend-lease, a device to provide goods for countries whose solvency and living standards affect the national interest of the United States. But because of the devotion of Congress to sound business principles, it is operating a programme of loans as well as grants.

It is clear that while the money of political origin is all at work, the money of economic origin is slow to emerge. The World Bank, with its galaxy of impressive officers, has made half a dozen loans, totalling about half a billion dollars, in its two and a half years of life. The possibility that there may be a difference between an economic loan and one from which the borrower may confidently expect political relief is one of which all these agencies are aware. How much right has a defaulting borrower to claim that the lender received, in return, something more valuable than repayment? And does Gresham's Law apply to loans as well as money?

The terms on which ECA makes loans undercut those both of the World Bank and the Export-Import Bank. In addition, ECA is lumping its grant and loan funds together for accounting purposes, and the part which it was anticipated the Export-Import Bank would play in extending loans under the Foreign Assistance Act has become little more than nominal. The gentlemen's agreement between the World Bank and the Export-Import Bank, under which the first handles longer-term and the latter short-term projects, has worked well. But if the World Bank is to proceed with its loans for reconstruction, some comparable arrangement regarding priorities for repayment will clearly have to be worked out with countries receiving ECA loans.

Yet the purpose of present political expenditures is to pave the way for a restoration of self-sustaining economic activity in European and other countries. Both the World Bank and the Export-Import Bank are planning ahead to that time. Much searching of heart is going on about how more projects of clear economic value may be stimulated, and how funds that are bound to be small in comparison with the claims upon them may best be placed to serve as centres of further capital formation.

One new development is the use of consultative missions, to analyse not only the specific project proposed by a potential borrower, but his other resources and those of the region involved, as well as the administrative skill with which they are handled. Another is the World Bank's effort to persuade applying countries burdened by past defaults to clear their credit records for a fresh start. The banks may also recommend, to carry out forthcoming projects, private firms with records of efficiency without exploitation. It is even possible that if a survey of a country for one project suggested that the time was ripe for another, the bank might induce a reliable firm to undertake it, offering as an inducement a guarantee of the transferability of its profits.

In the United States, the Export-Import Bank might develop the consultative industry committee along lines pioneered during the war, especially to develop foreign sources of materials increasingly required at home. The bank, in its search for sound economic ventures serving larger national purposes, might also support surveys and developments in the raw materials field too risky or too remote in their yields for a single corporation to attempt. The numerous private companies going ahead with foreign development, despite all their huffing and puffing about government red tape, suggest that industry would not oppose such initiative on the part of the bank.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

American Notes

How Much for Defence?

The Service Departments have been warned by President Truman that their financial hopes and fears are not to be discussed publicly and this year's manœuvres for position and allies in the budget campaign will therefore have to go underground for the present. The Services have not yet succeeded in inducing the President to add to the $15 billion, about one third of the total, fixed some months ago as their share of government expenditure in the 1949-50 fiscal year. Defence is one of the more flexible items in the budget, as well as being the largest, and its share has been fixed at the highest level compatible, in the opinion of the Administration, with the maintenance of a healthy national economy. Dr Nourse of the Council of Economic Advisers, who is drafting the new anti-inflation programme, has recently endorsed the view that $15 billion is all that can be spent on defence if it is desired to avoid both inflation and extensive controls on materials, prices and labour; very heavy taxation and perhaps forced saving would be the only alternative to the latter, if this sum were substantially exceeded.

The threat of economic defeat—"defeat by bankruptcy"—in the struggle with Russia is taken as seriously as is that of military defeat. But Dr Nourse recognises that, without the defence programme, deflationary influences would be evident by now and there are some who believe that they will develop with such rapidity during the next year that higher defence expenditures will be a useful antidote. Others wonder why the President is so reluctant to impose controls and increase taxation, when the voters gave him a mandate to do both; a few go so far as to suggest that he is in danger of neglecting the international responsibilities of the United States for the sake of New Deal-as-usual.

On the other hand the demands of the Defence Department for a military budget of $23 billion—"a desirable figure"—or $17.5 billion—"an irreducible minimum"—seem to presuppose an imminence of war which is not felt to be justified. No one wishes to endanger the national security and it is taken for granted that Mr Truman's limit will be lifted if necessity arises. But that necessity must be proved and so far no evidence has been offered that $15 billion, if spent prudently and efficiently, is not enough. Admittedly, after $600 million has been used for strategic materials, the remaining $14.4 billion will be only a little more than was allocated for the current fiscal year, while the new defence programme, begun last spring, presupposed a steady annual increase in expenditure during the five years it was to last, and prices have gone up meanwhile. But Congress gave the President more than he asked for in the current fiscal year and expenditure is running at an annual rate of only about $12 billion.

*

Once Mr Truman has presented his proposals to Congress in January, the second front will open in the budget campaign. The individual Service Departments will no longer have to rely on the Secretary of Defence to present their cases, but will be able to explain to more sympathetic Congressmen the desirability not only of an increased total expenditure on defence, but of a larger share for such cherished projects as the Navy's giant aircraft carrier or the 70-group Air Force (which will in any case not be a reality until 1952). A preliminary example of the lines on which such arguments may run was provided by the Army's announcement, followed immediately by the President's ban on such discussion, that the enlistment of conscripted men would have to be reduced as a result of the $15 billion limit, so that there might be only 667,000 men in the Army by the middle of 1949, instead of the 900,000 authorised by Congress.

If these customary tactics are a feature of the budget campaign this year, the first in which a unified defence budget is to be presented to Congress under the so-called Unification Act of 1947, those who advocate the strengthening of that Act will have new evidence that it is not fulfilling its purpose. It was hoped that under the Act Congress would no longer have to decide between the conflicting claims of the three Services or to pass judgment on the technical details of their efficiency and economy. If the legislative budget, set up under the Reorganisation Act of 1946, is abolished as is being proposed, Congress will have added difficulty in relating the Service demands to the national economy, since by means of this legislative budget Congress has been making an overall survey of the country's expenditure for the first time.

There is one further element of doubt this year, not only in the defence budget but in the national budget as a whole. Apart from the pressure for additional and substantial aid to China, which the Administration so far seems able to resist, there is the question of possible obligations under the North Atlantic Pact, which is unlikely to come before Congress until March. The current defence programme will probably cover any military commitments which the United States may assume, but Mr Forrestal has already promised that a "generous measure of equipment" will be given to Western Europe. Press estimates of the cost, at present only guesswork, vary between $1 and $3 billion, but there is no indication whether this is to come out of the defence budget or be in addition to it. If it is additional, and if Dr Nourse is right, a return of wartime economic controls will be hard to avoid.

* * *

The Pumpkin Papers

On this side of the Atlantic there is something irresistibly humorous in the harvest of ten-year-old secret state documents unearthed by Mr Whittaker Chambers in a hollowed-out pumpkin on his Maryland farm. Leading the investigators of the Committee on Un-American Activities up the garden path (literally, if not figuratively), Mr Chambers produced, at the eleventh hour, what might prove to be the pot of red gold at the end of the Communist rainbow for which the committee has been searching so long. The finds consist of microfilm of stolen State Department documents, one said to be a report from Mr Bullitt, former Ambassador in Paris, and another a statement conveyed by Mr Sumner Welles to the German Ambassador. More than this may never be known, for as one investigator darkly suggests, they may be such top secrets that they will never be made public.

What is perhaps the most extraordinary aspect of this bizarre episode is that the documents were brought to light only casually as a result of the libel suit brought against Mr Chambers by Mr Alger Hiss, the former official of the State Department whom Mr Chambers charges was a Communist. Some of the documents appear to have been produced at the trial in Mr Chambers's defence. The puzzle is how their existence escaped the eagle eyes both of the committee and of the Department of Justice during the months that the Hiss-Chambers case was a *cause célèbre*. According to Mr Karl Mundt, a member of the committee, the Department of State has been hunting its lost treasures for ten years.

The find is taken with immense solemnity, not only by the committee, which hopes, like the Phoenix, to rise from its ashes, but by responsible newspapers, particularly of Republican persuasion. Proof now exists, it is argued, that important informa-

tion was spirited out of the State Department to a Communist espionage ring (though whether it reached the Russians or merely vegetated in Mr Chambers's kitchen garden is another matter). It is said that the documents themselves are less important than the risk that they might have enabled the Russians to break the State Department code (though it is known that suspicions concerning the inviolability of the code existed during the war). Even Mr Chambers's own armour as a reformed Communist is now considered to have loopholes, for he is shown to have been a less than candid witness. What is not known is who it was who "fed" the papers out of the Department of State. On the eve of its reformation, the Committee on Un-American Activities has been enabled to renew its breathless spy serial and perhaps take on a new lease of life.

* * *

The Farmer's Reward

The farmer, as becomes the leader of the Democratic victory parade, has been the first to receive his reward, or at least a first instalment of it. The Administration has taken two steps designed to protect the export market for some part of the agricultural output. Exports of grain under the Marshall plan will remain in the hands of the Commodity Credit Corporation, instead of returning to private channels as had been expected. This is not only a severe disappointment to the grain traders, a disappointment which will not be unwelcome to the farmers, but it also guarantees that the CCC will be able to dispose of at any rate some of the quantities of grain which are now piling up under the farm price support programme. Secondly, Mr Truman has announced that Congress will once more be asked to approve the International Wheat Agreement and has suggested that similar agreements might be considered for other commodities. However, the necessary two-thirds majority in the Senate may not be easy to obtain if the ceiling price of $2 a bushel for wheat is reduced during the new negotiations.

The surpluses that have appeared this year (about 3,000,000 bales of cotton and nearly 300 million bushels of grain have already been placed under government loan) will be increased next year and may threaten the price support system with collapse, unless of course the harvest fails. In spite of government efforts to restrict wheat acreage and to restore a more satisfactory rotation of crops, farmers are planting more wheat this year than last. However, they frankly confess that they are doing this in order to take advantage of the last year of the high wartime price supports. The Agricultural Act passed by the Eightieth Congress extended these for a year, but in 1950 (in some cases before that) they will be replaced by a much more flexible system designed to develop an agricultural pattern more closely related to present day demands, and to limit the government's financial commitments under the farm price support programme. This new Act was approved by the Administration and Mr Truman was careful not to criticise it during his campaign attacks on the Republican Congress. The Secretary of Agriculture has just taken advantage of it to announce a reduction in the price at which potatoes will be supported. Potatoes have provided a classic example of how the present price support system can encourage overproduction and waste the taxpayer's money.

*

Mr Brannan's policy on potatoes may have been inspired by a desire to test the farmer's reaction to, as well as to build up the taxpayer's support for, the new Act in advance of the attack which is likely to be made upon it in the next Congress, and which will be embarrassing to the Administration. The Republican chairmen of the Agricultural Committees in the Eightieth Congress were very co-operative and ready to take a broad and constructive view of the farm problem, but the incoming Democratic chairmen, Senator Thomas of Oklahoma and Mr Cooley of North Carolina, particularly the latter, represent the entrenched but decaying cotton interests of the South, which are deprived under the new Act of the privileged position built up during years of Democratic control of Congress. The new chairmen have already announced their intention of maintaining permanently the present system of high price supports for the six basic crops, wheat, maize, rice, tobacco, cotton and peanuts, the last three of which are the staples of southern agriculture. They recognise, however, as the wheat farmers are demonstrating so convincingly at the moment, that these high price supports must be accompanied by strict acreage limitations if the country is not to be faced with bankruptcy as a result of them.

Such limitations have never been popular with farmers. New York dairy producers have just asked permission to reduce the price of their milk, since demand has fallen and supplies have increased. The majority of farmers would probably agree with them in preferring high income to high prices. Both the Farm Bureau and the Grange have come out since the election in favour of the new system of flexible price supports which they helped to draft. Even southern farmers, aware of the need for diversification of crops, may repudiate the legislators who seek to prolong the agony of the cotton economy. The farmer, who is, after all, a consumer and a taxpayer as well, must be aware that his present privileged position cannot last forever. The Administration's recipe for the prosperity which Mr Truman has promised the farmer is "realistic abundance," to be obtained by means of changes in types of crops, soil conservation, crop insurance, and better distribution and increased consumption of farm commodities. Many farmers, and perhaps most, will prefer this reward to the one which Senator Thomas and Mr Cooley propose to give them.

* * *

Reconstruction in the South?

When General Lee surrendered at Appomattox, there was ushered in the painful period of "Reconstruction"—the imposition on the prostrate South, by a Republican Congress, of army rule and the insistence that the Confederate States must redeem themselves by giving the Negro the vote and other rights before they could be readmitted to the Union. It was the harrowing nature of Reconstruction, rather than the abolition of slavery or the humiliation of defeat, which made the pattern of white supremacy impregnable and the South solidly Democratic.

The South met a second defeat this year in the Democratic Convention, which wrote an uncompromising bill of civil rights into the platform, and in Mr Truman's victory despite the intervention of Governor Thurmond's States Rights party. Once more the South has found that it is not free to maintain its "peculiar institutions"—once slavery, now discrimination—in defiance of opinion elsewhere. Southern liberals have been quick to interpret the election as a warning that the South must set its own house more nearly in order or submit to interference from Washington. Civil rights are not, however, indivisible. Most observers report that it would be disastrous—and unenforceable—for Congress to legislate complete equality for the Negro in the South. It is probably fortunate that the Democrats may be forced to temper their civil rights programme to the shorn South for the sake of other liberal measures on which southern co-operation in Congress is needed. There is room for manœuvre. The Democrats are committed to repeal the poll tax. But the poll tax, which is levied in the South as a condition of voting, and is therefore a convenient way of excluding Negroes, is today not much more than a symbol of southern resistance to northern meddling. The tax was established in times when the dollar was worth much more; today it operates to restrict voting in not more than three of the seven States in which it still exists. Repeal of the poll-tax—perhaps by the slower and more dignified method of constitutional amendment—as well as an anti-lynching law based upon co-operation between the state and Federal governments, might be acceptable to the South if it were assured that the issues of segregation and discrimination in employment were left to a later time.

The Southern Regional Council, a highly respected body, while approving civil rights laws, insists that race prejudice can be defeated only if economic improvement and equality in education go hand in hand with the law. It sees the provision of equal education for the southern Negro as a most urgent task. What "equalisation of educational facilities" might mean was demonstrated recently when a Virginian county—one of the poorest—under injunction to provide equal education for whites and Negroes, proposed to abolish all the advantages of the white school to meet the Federal ruling that Negro education must be equal, if separate. This prospect of "equalising down" so horrified white parents that a $150,000 bond issue has been approved for a new Negro school. The need for two schools—and two school buses travelling down the same road—for 250 black and white pupils demonstrates forcibly both the costliness of segregation and the determination of the South to perpetuate it. Even the victory recently won in Oklahoma, which has agreed to permit Negro graduate students to attend the white university when no comparable courses are offered by the Negro colleges, is conditional upon Negro students listening to lectures from adjoining rooms.

Electoral Reform

The presidential election, while a real debacle for the Republican Party, was not, according to post-election surveys, the easy victory for the President that it at first appeared. The game of "what might have been" is a favourite among political analysts but it is not an exaggeration to say that a very few reversed votes in the right places could have completely changed the result. With 35,300 additional supporters correctly distributed among California, Ohio and Illinois the Republicans could have carried these states and their combined electoral vote of 78 would have given the presidency to Mr Dewey. Even another 19,000 votes in Ohio and Illinois would have meant that neither party had sufficient electoral votes to win and the next President would have been chosen by the House of Representatives. On the other hand such speculations are double edged, for if the Wallace votes had been given to the Democrats in Maryland and New York, Mr Truman could have carried both States. The experts are now so involved in their post-mortems that the 2,000,000 people who gave Mr Truman his lead over Mr Dewey are almost forgotten.

The controversy as to how the electors in the states which gave a majority to the States Rights party shall cast their votes has provided the country with an example of the defects in the traditional procedure of the Electoral College. It was supposed that the electors from these states—South Carolina, Louisiana, Mississippi and Tennessee—would support the Dixiecrat candidates in the Electoral College. Now, however, Senator Ellender of Louisiana is publically campaigning to persuade them to repudiate their pledge and cast their ballots for the President. It is politically understandable that the Dixiecrats would like the best of both worlds—though they have had the pleasures of dissent, they do not relish its punishments. In the case of Alabama, where Mr Truman did not appear on the ballot, three citizens have petitioned the Supreme Court to grant a writ requiring that the State's eleven electors cast their votes for Mr Truman. The Court has decided that it has no power to force the electors to cast their ballots for the States Rights candidates, even though Mr Truman was the "duly nominated candidate of the Democratic party."

The risk that neither party would secure a majority in the Electoral College, the conspicuous courting of minorities during the campaign and the present wriggling of the Dixiecrats has revived a belief that there is need for reforming the electoral system. Many people are reminded for the first time since school days that that system is obsolete. Senator Lodge has proposed already a constitutional amendment intended to improve it. The electoral unit, which gives each state one electoral vote for each of its Senators and Representatives in Congress, would be retained, but it would be related proportionately to the popular vote; that is, New York's 47 electors would have been divided at the last election among Messrs. Dewey, Truman and Wallace in accordance with the popular votes they each received, rather than all 47 going to Mr Dewey who had only a few thousand more votes than Mr Truman. The direct choice of Presidents would be unpopular because some twenty small States benefit by the constitutional provision that they have one elector for each of their two Senators. However, the elimination of the Electoral College would remove the influence on national elections now enjoyed by minority groups in populous States. It would also prevent the present disfranchisement of the more than 2,500,000 New Yorkers who voted for the President. Though it is unlikely that the next Congress will actually legislate for these reforms, the subject deserves attention before the day when a President takes office with a minority of the popular vote.

Shorter Notes

Ship are now arriving regularly at east coast ports carrying Displaced Persons under the programme designed to resettle 205,000 refugees in the United States by 1950. Twelve nationalities and seven religions were represented in the first batch. Before leaving Germany they are instructed in such American practices as that cigarettes cannot be used for currency there.

*

A recent analysis of population trends in New York City states that 13½ million people live in the city and its environs, which include metropolitan districts of Long Island, New Jersey and Connecticut. This is an increase of over 1,000,000 people since 1940, and migration is responsible for one-third of it.

Russia's Economic Revival—I

(By a Special Correspondent)

THE third year of Russia's postwar Five-Year Plan is nearing its end. This year has in many respects been decisive for the success or failure of the whole Plan; and its results are therefore watched with understandable eagerness. Unfortunately, it is not easy to evaluate those results on the basis of Russian statistics. This is so not because the statistics are essentially false, but because they are presented in propagandist fashion and because the sets of indices, published by the *Gosplan* at quarterly and annual intervals, are as a rule not related to one another. They therefore fail to reflect directly the dynamics of production and consumption, the size and distribution of the national income and the exact use of the national resources for divers economic and political purposes. Information on Russia's economic situation is like a crossword puzzle, to the solution of which too many clues, and at times contradictory ones, are offered. Yet the two or three crucial clues are usually withheld. This series of articles is intended to offer the results of an arduous attempt at a critical analysis, correlation and recalculation of such official Russian economic information as has been published since the war.

The margin of possible error seems to be reasonably small in the general comparison, given in the table below, between Russia's industrial production before and after the war.

INDICES OF GROSS INDUSTRIAL OUTPUT

	1940	1945	1946	1947	1948	1950 Planned
Output in the whole of the USSR	100	58	70	92	114	148
Output in western provinces formerly German occupied	100	—	40	53	73	115

The years 1945 and 1946 were those devoted to the conversion of the Russian economy from war to peace. In 1945 the total output of industry in the whole of the USSR was lower than the peak wartime output of eastern and central Russia alone. The conversion of industry had been completed by the end of 1946, but the plan for that year had, according to official admissions, not been fulfilled. Nor were the overall targets for 1947 reached, despite official claims to the contrary. This emerges from a comparison of the targets for the year announced by the government on March 1, 1947, and the *Gosplan* statement of January 18, 1948. Nevertheless, the percentage of non-fulfilment was, on the whole, not large. In the middle of 1947 the critical condition in Russian industry, caused by demobilisation and general postwar apathy, was overcome, to a large extent in consequence of emergency measures taken in the spring of 1947.

The story of that year shows a close parallel to the economic developments in several capitalist countries, despite the claims of Mr Voznessensky, the head of the State Planning Commission, that Russia has not had to contend with the economic consequences of war that have troubled the capitalist countries. Although officially no postwar unemployment has been recorded, the low figures of production clearly indicated the existence of considerable "hidden unemployment." The situation was especially difficult in the formerly occupied territories where, in view of the widespread destruction, industrial output rose only slowly to reach half the prewar volume. The figures for 1948 are based on the indices for the first three-quarters of the year, and they may overstate this year's advance. Mr Molotov, in his anniversary speech on November 7th, certainly overstated it when he claimed that industry was now producing 17 per cent more than before the war—his statement is disproved by the *Gosplan* itself. Nevertheless, the curve has been rapidly and steeply rising, and to this extent the tone of self-confidence of Russian official spokesmen seems to be justified. It contrasts sharply with their own alarming statements made in the beginning of 1947.

During the last eighteen months there has been a remarkable recovery. But it has been one-sided, because the main progress has been achieved in the eastern provinces, while in the formerly occupied lands the output of industry is only now approaching three-quarters of its prewar size.

The increase in the output of basic materials and fuels, with the exception of cement, has amounted to 40-50 per cent since the war. This is much lower than the overall index of industrial production, which now stands at 200 compared with 1945. This discrepancy between the rates of expansion in basic materials and in manufactures is a familiar and characteristic feature of the Russian economy: it reflects the Russian attempt to build up a vast manufacturing industry on a relatively narrow basis of steel and coal resources immediately available and the consequent chronic famine of steel and fuel in consumers' industries. The 50 per cent rate of expansion does not seem exaggerated in view of the fact that so much of the plant for the production of basic materials and fuel was located in the formerly occupied areas and in view of the continued industrialisation of the East. It roughly fits in with the *Gosplan* indices for rail freight which stand at 140-145.

OUTPUT OF BASIC MATERIALS, FUEL AND POWER

	1945	1946	1947	1948
Pig iron	100	112	128	150
Steel ingot	100	109	119	149
Rolled steel	100	113	130	164
Coal	100	110	123	140
Oil	100	112	133	145
Electricity	100	110	126	145
Cement	100	185	259	339
Timber	100	106	133	153

On the basis of some clues it is possible to estimate roughly the absolute figures of production for some of the basic materials. The estimates are more likely to underrate than to overrate the actual output.

PRODUCTION IN ABSOLUTE FIGURES

	1945	1948	1950 Planned
Pig iron (millions of tons)	7—8	11—12	19·5
Steel " "	12	18	25·4
Coal " "	120	170	250
Oil " "	15—16	22—24	35
Electricity (billions kWh)	40	60	82

The striking feature here is the wide gap between the probable present output and the targets set for 1950. It would, nevertheless, be rash to deduce that the Five-Year Plan targets will not be reached. Much new plant is now under construction or on the point of completion; and the output of that new plant may weigh on the scales before 1950. What is not likely to be achieved is the target for oil. Incidentally, most of the targets for oil production in the past Five-Year Plans were not reached either.

The table below shows the indices for some crucial items in engineering and chemicals.

ENGINEERING AND CHEMICALS

	1945	1946	1947	1948
Tractors	100	172	359	696
Agricultural implements	...	100	206	430
Lorries	100	138	180	257
Electrical Motors :—				
Of less than 100 kw.	100	169	257	385
Of more than 100 kw.	100	138	192	253
Machine tools	100	134	174	205
Weaving looms	100	3,200	...	...
Artificial fertilisers	100	152	205	293
Dye stuffs	100	129	186	251

Some unusually high indices for 1948 are explained by the fact that in the base-year, 1945, production in the relevant lines was negligible or nearly so. In those few items where it has been possible to relate the current output to that of 1940, instead of to that of 1945, the indices obtained are much lower. Thus, compared with prewar the present output of tractors stands at 280 and of agricultural implements at 200 and not at 696 and 430, as in the table. On the same basis the index for lorries is 200 and not 257. But even compared with 1940 the rise in output has been formidable; it reflects the great effort that is being made to re-equip collective agriculture, the technical basis of which was shattered in the years of the war. The probable output of tractors this year is 60-70,000 (30 h.p. units) with a target of 115,000 set for 1950. The greatly increased production of small electrical motors is also connected with the electrification of the countryside, in which the rural areas of the Urals have so far made the biggest advance.

The extraordinary expansion in the output of weaving looms in 1946 was probably an all-out effort to re-equip the textile mills, the Cinderellas of Russian industry; and, to judge from the fact that no indices were published for 1947 and 1948, that effort may have been discontinued recently. The increase in the output of machine tools has been less great, probably because output was relatively high in 1945. It is estimated that current production is of the order of 100-120,000 machine tools a year. The total number of machine tools in Russian industry is to reach 1,300,000 in 1950, which is, according to M. Voznessensky, what American industry possessed in 1943. It seems likely that reparations must have made an important contribution to this sudden increase in the total of machine tools.

While the indices for engineering range from 200 to 600, those for consumers' industries are roughly between 150 and 200 only, even though an extremely low level of output, that of 1945, is taken as basic:

CONSUMERS' GOODS

	1945	1946	1947	1948
Cotton fabrics	100	117	156	184
Woollen fabrics	100	130	173	218
Leather footwear	100	128	176	220
Paper	100	161	201	239
Meat	100	118	...	...
Sugar	100	100	210	...
Animal fats	100	169	189	223
Vegetable fats	100	119	167	178
Soap	...	100	128	174
Retail sales	100	130	152	200

The meat and fat position has been extremely critical. The increase in retail sales in 1946, the year of the drought, was due to a better supply of industrial goods, whereas the increases in the later years reflect mainly, though not exclusively, more abundant food supplies. The consumers' industry that seems to have completely disappointed the Russian townspeople is housing. According to all reports only one-fourth or at the most one-third of the housing programme for the towns for the whole five-year period will have been fulfilled in the first three years. This may or may not be made good within the next two years, when the plant, now under construction, for pre-fabricated houses will come into operation. Housing in the countryside is said to have made better progress.

Employment is reported to have risen from about 27 millions in 1945 to 33 millions this year, and to have thereby reached the target set for 1950. Effectively, employment is now about 25 per cent higher than before the war, because of both the increase in the actual number of employees and longer hours.

(To be continued)

American Responsibility in Greece

[BY OUR SPECIAL CORRESPONDENT RECENTLY IN ATHENS]

THE repeated accusations of Mr Vyshinsky and Mr Bebler that the western imperialist Powers are in occupation of Greece and are exploiting it as a colony, are in one sense untrue. British troops are very few, and America has no complete military units at all. The Greek Government moreover often obstinately and successful obstructs its American advisers in important matters. Yet in another sense the accusations are not unfounded. Since the departure of the Germans, Greece has been dependent on aid first from Britain and then from the United States. The representatives of both Powers have exercised great influence, and Greek governments have often found it convenient to hide behind their authority. "We really don't want to do this, but the British insist," or "We should like to do that, but the Americans won't allow it" have been admirable excuses towards disappointed supporters or impatient opponents. So most Greeks believe—they may approve or disapprove—that the "Anglo-Saxons" run their country, and international opinion outside Greece, whether friendly or hostile, agrees with them.

The Americans have, in fact, assumed an obligation to help Greece out of its troubles, which are greater now than when the Germans left. A brief survey of the consequences of British and American intervention may help to explain the problems with which the Americans are faced today.

In December, 1944, British troops suppressed the Communist army ELAS. For over a year various "non-party" or "middle-of-the-road" governments succeeded each other. Then the Foreign Office decided that elections must be held, and these resulted in a victory for the Populists and the return of the King. The trends of this period were a general movement of opinion to the Right. After the elections, the Communists once more took to the hills, and Markos' civil war began.

Then came the Truman Doctrine, and the Americans took first place. They broadened the government by bringing in the Liberal Party to share power with the Populists. More economic help poured into the country, and found its way down the same drain. Gradually the American economic mission began to tighten its grip, pursuing on the whole a policy of recovery through financial orthodoxy. The trends of this period were similar to those of the first. The Liberals have only the appearance of power: in Athens they have installed their followers in government offices, but in the provinces they are liable to be denied free speech by Populist bureaucrats. The civil war has swallowed up large funds for the care of refugees as well as the equipment of the army. Social tension increases as the cost of living rises and the rich refuse to disgorge. The extreme Right claims a monopoly of the patriotic virtues and does good business out of them. Lyrical outbursts of chauvinism cover up inefficiency and dishonesty.

Need to End Corruption

What ought to be done is easy enough to see. First, the bureaucracy must be both purged and improved. Corruption is of two types. At the top it is due to dishonest transactions with the big merchants and industrialists: at the bottom its cause is bad pay. The first type cannot be tolerated. Those who practise it must at all costs be removed from key posts. The purge must also extend to party fanatics, who use their positions to discriminate against all who do not subscribe to their peculiar brand of extreme right wing ideology. Neither technical skill nor charming manners can compensate for the demoralising effects of high level corruption and fanaticism. The second type of corruption can only be removed by the dismissal of redundant personnel and an increase in pay for those who remain. The chain of command must also be modified so as to encourage individual responsibility and initiative at all levels. The recent law on decentralisation, a result of American pressure, is a step in the right direction, but vigilance will be needed to ensure that it is enforced.

Second, some social reforms are urgently needed. The big merchants cannot be permitted to exploit the people. Unfortunately, this favourite phrase of Marxist agitators is a sober description of the facts in Greece. The American economic advisers are probably right to recommend orthodox financial measures—restriction of credit, increase of state revenues from recoverable indirect taxes, stability of wages. But social problems cannot be treated by economic means alone. As the fiscal administration is at present incapable of discovering hoards and collecting direct taxes, only crude measures can succeed. The Greek people must be shown, by a few drastic examples, that political connections and wealth will not save those who swindle the State and rob the consumer from punishment. Apart from this, a far more effective government control must be established over all exports and imports. Hitherto, behind the cover of various official bodies, the big merchants have feathered their nests undisturbed. Finally, something must be done about the trade unions. The strength of secret Communist influence makes this a dangerous task, but it must surely be possible to find better non-Communist leaders from among the Greek working class than the gang who at present make a laughing-stock of trade unionism.

How much of this can in fact be done? It is a question of leadership. The Greek people feel no firm hand at the top, see no clear aims of policy towards which it can strive. Reshuffles

of personnel within the present Parliament will bring no change. In Britain in 1940 Mr Churchill formed his government without undue regard to the election results of 1935. Greece's crisis is no less terrible than was Britain's eight years ago. New elections cannot be held with half the country menaced by Markos' bands. The only way out is for the King to form a government not based on a Parliamentary majority and composed of men chosen for ability alone.

Such men could be sought from various directions. The official opposition are more remarkable for rhetoric than for statesmanship, but need not necessarily be rejected without trial. There is much to be said for increased participation of the army in government at a time when national independence is in danger. But the obvious pitfalls should be avoided. Political generals have been the curse of Greece, and perhaps even more pernicious would be dependence of government on a junta of ambitious young staff officers perpetually squabbling for position. Third, there are younger men, both in government service and outside, with knowledge of economics and experience of administration, some of whom proved their patriotism under Axis occupation. Wherever the new leaders come from they should have certain minimum qualifications. They should not be ideologists and they should be more interested in work than in speeches.

If King Paul, on American advice, were to choose such a team, this would be a more flagrant act of foreign intervention than has yet taken place. But Greece's misery is too deep, and has lasted too long, to permit of false modesty. The fact must be faced that Greece can only be saved by still further intervention. There are great risks. The new team would have to purge the higher ranks of the bureaucracy and be ready to take drastic action against obstruction by business. There is a danger that under the pretext of "democratisation," fellow-travellers might infiltrate with the set purpose of disorganising, the state machine, thus to pave the way for Zachariades and his friends. But vigilance can detect the fellow-travellers, and at the highest levels the Greek police is neither politically illiterate nor ill-informed. The danger of change is less than the danger of stagnation. If the Americans cannot now see better leadership, they must search until they find it, and there is no time to waste. The salvation of Greece depends on three things—increased assistance by the United Nations on the northern frontier, intelligent political warfare by the Western Powers in the northern Balkans, and internal reorganisation in Greece. The first two are essential, but they will not suffice without the third. And initiative for the third cannot at present come from the Greeks.

ERP Exports to the US

THE dollar shortage promises to be the most unwieldy challenge facing the 19 ERP nations. Even the optimists among them doubt that Marshall aid can solve the problem in the next three years. Nevertheless, there is one direction in which the Marshall countries have made encouraging strides towards the goal of dollar solvency, and that is by the expansion of exports to the United States.

The value of this year's exports to the United States by the ERP countries as a whole is 36 per cent above last year's level, and for certain individual countries the increase is even more marked. Italian exports in the first seven months of this year are double the rate achieved last year. The Netherlands has raised its exports by 70 per cent, and the German record shows a more than fivefold rise—chiefly because the Bizone had more ground to regain than the rest.

In the three-year period before the war, the seven-monthly average of exports from what are now the ERP countries to the United States amounted to $354 million f.o.b. For the same period of 1947 their exports by value had returned to the prewar level, but by volume they had reached little more than half the prewar level. Twelve months later ERP exports to America had reached 65 per cent of their prewar volume.

Those who are responsible for the integration of the 19 four-year programmes aim not only to restore these exports to their 1936-38 level, but to boost them a further 50 per cent by 1952-53. In recent months exports to the United States have continued to expand, but, even so, the task ahead is formidable, since the target set for 1952-53 means that the volume of ERP exports must be double the 1948 achievement.

Two further questions immediately come to mind. First, can and will the American market absorb this expansion of imports from western Europe? United States officials have told the Paris delegates that in 1952 the United States might well import from all countries goods to the value of some $10 billion (for 1948 imports are running at about $7 billion). Theoretically, then, there will be no difficulty in taking the goods the ERP countries plan to sell on the US market—approximately $2½ billions' worth. However, it must be remembered that these goods will be largely manufactured articles.

EXPORTS TO THE US ERP COUNTRIES
(Thousands of Dollars)

	1936-38 7-mth. av.	Jan.—July 1947	Jan.—July 1948	1948 as % of 1947	1948 as % of 1947
Belgium	34,153	30,756	42,881	126	139
France	37,898	29,722	39,098	103	132
Germany	46,027	2,398	13,557	29	565
Italy	26,578	23,504	49,671	187	211
Netherlands	26,194	10,516	18,520	71	176
Sweden	29,547	44,857	63,485	215	141
United Kingdom	101,357	119,792	162,651	160	136
Total	300,402	261,945	389,861	130	165
Total all ERP countries	353,787	389,594	527,249	149	136

The second query is how far can the pressure to increase exports to the United States be relieved by reducing ERP imports from America. Many of the Marshall group have based their plans on such a transfer of purchases, mainly through developing alternative sources of supply. But this is a long-term project involving ambitious schemes in what are now backward areas. In the short run, therefore, ERP countries must depend for dollar solvency on expanding exports to the American market.

Industrial Development in Pakistan

[BY A SPECIAL CORRESPONDENT]

FOR a yardstick of Pakistan's industrial status at partition it is hardly necessary to go beyond the fact that out of a population of about 70 million only 26,000 persons were employed in factories. The industry of the Indian sub-continent had tended to concentrate near the coalfields and the major ports, while the area which was to become Pakistan remained predominantly agricultural. The new Dominion found itself self-sufficient only in one industrial product, cement. Its fourteen cotton mills, together with handloom production, accounted only for 90 million yards of the country's total requirements of 1,040 million. Its nine sugar factories produced only 25,000 tons against annual requirements of 245,000. There was very little else, beyond processes ancillary to export such as cotton ginning and pressing and jute baling; and these do not properly belong to the industrial field.

Pakistan, therefore, started with a virtually clean slate, which at least gave the Government the advantage of being able to plan industrial expansion on sound economic lines and to profit by the mistakes of others in framing its industrial policy. The main material obstacles to industrial development were a total deficiency of iron and steel, of which 200,000 tons are needed annually, and an almost complete lack of coal, of which 3,400,000 tons are required. On the side of assets must be placed abundant raw materials for developing the jute, cotton and woollen textile industries, and for the tanning and leather, paper and tobacco industries. The potentialities of these industries appeared to Pakistan so attractive that at the outset the Government found difficulty in understanding why foreign capital was proving so slow to exploit the Pakistan field. There was accordingly a good deal of impatience and British business in particular incurred the criticism of having lost its spirit of enterprise. Pakistanis showed insufficient appreciation of the numerous practical difficulties which the prudent business man would have to take into consideration, and were inclined to suspect that foreign capital was being deterred by doubts regarding Pakistan's political future. The truth of the matter was that the foreign entrepreneur really wanted to know what Pakistan's policy was to be in regard to such questions as nationalisation and admission of foreign capital, and required time to study practical problems of delivery dates and prices, marketing scope, power supply, skilled labour and similar matters the importance of which does not always occur to

John Dalton, an English Quaker, was the first to propound the theory that the atom was the smallest particle of matter imaginable—a theory that was not assailed until more than a century later. Even in Dalton's day, the idea that matter was composed of small indivisible particles was not new. A similar theory had been put forward by the Greek philosopher Democritus two thousand years earlier. Sir Isaac Newton had restated it as the "corpuscular theory" a hundred years before Dalton. Where Dalton excelled them was in formulating these theories in a way that explained known chemical processes, and enabled deductions to be made which could be submitted to the test of practical experiment. In short, he translated them from philosophical abstractions into a method for accurately forecasting and controlling chemical reactions and manufacturing processes.

Dalton, the son of a weaver, was born in 1766. He went to work at the age of 12, but studied in his spare time to such effect that in 1793 the Manchester Academy appointed him tutor in mathematics and natural science. Six years later he set himself up as a private teacher, devoting his leisure to research and the fashioning of his Atomic Theory, which was first published in 1808 in his book "A New System of Chemical Philosophy". Dalton's theory, unaltered in its essentials, is still used to explain the laws of chemical combination. Dalton's work was the basis of the knowledge which enabled British scientists to contribute so much to the startling developments of atomic disintegration.

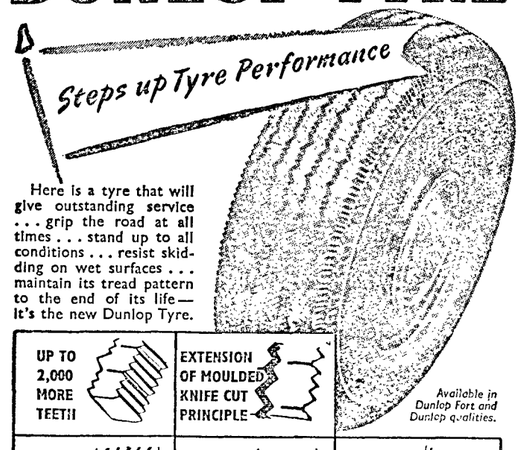
Valenta



the luxury cigar from Jamaica

Among men who appreciate the distinctive qualities of a fine cigar, Valenta is recognised as the foremost imported brand of today. Skilfully rolled, sumptuous in flavour and aroma, Valenta is a cigar to linger over with supreme enjoyment. Available from your usual cigar merchant in any of three favourite sizes, *all* in boxes of 25 and the handy 'Fives' pocket carton. To secure these luxury cigars, ask for your Valenta *by name.*

Guaranteed by the Government of Jamaica

The NEW DUNLOP TYRE

official programme framers. The stage of early impatience and optimistic planning is now over; Government no longer expects to see factories springing up like mushrooms and is now soberly working out the practical aspects of development. It has, moreover, become evident that capital for industrialisation, whether foreign or indigenous, is not to be had for the asking.

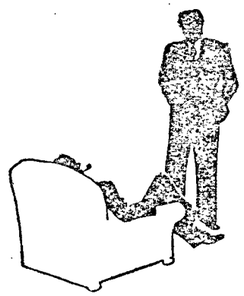
Private Enterprise Encouraged

The industrial policy of the Dominion did not take shape until April, 1948. The Statement then issued had two great virtues: in the first place, it was realistic and free from ideological complications, and, secondly, it defined clearly the scope for private enterprise. The Posts and Telegraphs, Wireless and Broadcasting, and the Railways were already state-owned, and road transport was in process of nationalisation by the Provincial Governments. Besides these, the Government announced that industries relating to arms and munitions of war, generation of hydro-electric power, and manufacture of railway wagons, telephones, telegraph and wireless apparatus would be owned and operated by the state. The remainder of the field would be left to private enterprise, though the Government naturally reserved the right to take over or participate in any other industry vital to the security or economic well-being of the state. Private enterprise was given further encouragement by certain measures of tax relief. The special initial depreciation of 20 per cent allowed for income tax purposes on machinery and plant brought into use for the first time in Pakistan was made applicable also to secondhand machinery, and it was announced that new industrial undertakings would be exempted during their first five years from all direct taxation on profits not exceeding 5 per cent of the capital employed. Foreign capital was to be welcome, provided it did not claim any special privileges, but industrial concerns were required to offer a certain percentage of the share capital to nationals of Pakistan; in the case of thirteen specified industries, the percentage was fixed at 51, and the remainder at 30. With regard to remittance of profits to countries from where capital is drawn, the original policy statement was not encouraging as it contained no more than an assurance that facilities would be given for a "reasonable proportion" of the profits to be remitted, but later on, as a result of protests, this was modified and it was made clear that there would be no restriction on remittance of profits except to the extent necessitated by foreign exchange limitations.

The reactions of foreign interests to this statement of policy were, on the whole, favourable, but the percentage rules were found a deterrent to some classes of enterprise, particularly those in which the preliminary risks are great. It is, for example, manifestly unfair to require oil companies, which incur enormous expenditure on survey and prospecting operations in a country where over 25 years of prospecting have yielded very small results, to share the profits of success with those who have not shared the preliminary risk of failure. As a matter of fact, indigenous capital remains obstinately shy owing to the traditional Muslim reluctance to invest money in industrial shares. The ordinary Muslim will readily risk his capital in trading ventures or invest it in land and buildings, but would rather leave it lying on deposit (even sometimes refusing to draw interest on religious grounds) than buy industrial shares. This tendency has recently obtruded itself strongly on the Government's notice owing to the failure of some attractive industrial issues (at a time when the banks report a very great increase in idle money lying on deposit) and it is clear that the Government will have to rely largely on foreign capital. In the circumstances, they would be well advised to scrap the percentage rules altogether. In other ways, too, there is a feeling in business circles that the Government has not sufficiently appreciated the necessity of removing all obstacles to expansion of foreign enterprise in Pakistan. To take the case of the oil companies again, these could, if their prospecting operations are successful, make a valuable contribution to the economy of Pakistan, yet it is surprising that the Government has not hitherto been able to draw up final petroleum rules; the oil companies are anxious to extend deep-well prospecting operations in several parts of the country which may hold out prospects, but are unable to go ahead for this reason, and a year has been lost. Apart from a few such stray instances of bureaucratic myopia, foreign companies are generally accorded all reasonable facilities and encouragement, and the genuine spirit of goodwill which they encounter makes up for many practical headaches.

New Hydro-Electric Stations

What progress then has actually been made, in little over a year, against this policy background? The Controller of Capital Issues has sanctioned the issue of over Rs 15 crores for industrial purposes, but this is not much, considering that a single jute mill will require Rs 3 crores and, in any case, sanction does not necessarily mean that the capital is actually issued. There have, in fact, been very few important public issues, but nevertheless some advance is apparent. The Pakistan Government is attending to first things first and are giving highest priority to the development of hydro-electric installations, which must provide the main motive power for industry. The seven-year target is 500,000 kw, and the Government have wisely appointed a consortium of Consulting Engineers, consisting of two British firms and one Swedish, to advise them regarding this and other important engineering programmes. In the West Punjab, the Rasul scheme will make 14,000 kw available by the end of 1949, and the Mianwali project is to be developed, giving ultimately a firm power of 65,000 kw. In the North-West Frontier Province, work is to start as soon as possible on the Warsak and Dargai schemes, and the capacity of the Malakand station is to be doubled. In East Bengal, the multi-purpose Karnafulli project, which will yield 40,000 kw. of power and irrigate over 70,000 acres, is expected to be completed in about six years. Thermal plants are also being established in half a dozen places. In the supply of heavy electrical equipment, British manufacturers have hitherto held the field.



Growth of Textile Industry

Among the industries left to private enterprise the cotton textile industry is making the best progress, and by the end of next year the number of spindles will have doubled itself; even so at 332,000 it will still be far short of the ten-year target of 2,500,000 spindles. This industry is blessed with an ample supply of the raw material and an insatiable demand for the finished product, and it is not surprising that it has proved the most attractive to indigenous capital. Offers of textile machinery have been received from the United Kingdom, Japan, France, Italy and Czechoslovakia, and there are hopes that the rate of progress will be accelerated. On the other hand, steps towards establishing a jute industry are proving difficult, despite the fact that Pakistan produces nearly 7,000,000 bales of the raw material; the Government will probably find it necessary to give a lead and set up one or two mills as a national enterprise, though there is still a possibility of sufficient private capital being forthcoming. Similarly, the Government is determined to establish a paper mill, with or without co-operation of private capital, and has employed the services of Canadian and Swedish consultants to prepare plans. Two woollen and worsted mills have been sanctioned and five firms to spin yarn for the manufacture of rugs, carpets and blankets are to be established. The Government is also considering the grant of financial assistance for the development of the tanning and leather goods industries. A 50,000 tons sugar factory is now in process of erection in the North-West Frontier Province and this should be in production next year. In regard to heavy chemicals, the market will be limited until there has been a general expansion in industrial activity, but three sulphuric acid plants are being set up and one caustic soda plant. Soda ash is already being manufactured in the West Punjab. The tobacco industry is being developed by a British concern and has a great future.

Pakistan has thus made a modest advance in the short period of its existence, and it is really better that the rate of progress should be steady rather than spectacular. Speculative and unsuccessful ventures would tend to destroy what little confidence there is among Pakistan's investors. The Punjab, a land rich in rustic proverbs, has a saying that the fruit which ripens most slowly is the sweetest, and Pakistan can take comfort from this. Meanwhile, it is, and for some time to come will remain, a land of opportunity.

A year's subscription to The Economist would make an excellent Christmas or New Year gift; the cost, including surface mail postage to any part of the world, is £3.

CENTRAL LINE EXTENSIONS

LONDON TRANSPORT announces that a further nine stations on the Central Line are now open to traffic. In the west, four stations, Northolt, South Ruislip, Ruislip Gardens and West Ruislip, complete the present programme of extensions. In the east, Roding Valley, Chigwell and Grange Hill complete the loop to Hainault, and Buckhurst Hill and Loughton point the way to Epping.

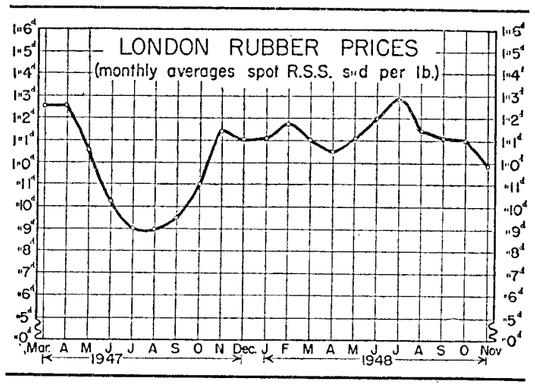
To reach Oxford Circus direct from West Ruislip takes 39 minutes, from Loughton 40 minutes.

Since the opening of the first post-war extension from Liverpool Street to Stratford in December, 1946, the Central Line has grown into the longest of the Tube lines with 46 stations in its 40 miles.

THE BUSINESS WORLD

Challenge to Natural Rubber

RUBBER has been anything but stable this year. In July it touched 1s. 3d.—a postwar peak. Then the fall set in. For a time, the commodity was resistant, at 1s. or so, but in the last month a further fall has carried the price to 11¼d. There may be plenty of confidence in the commodity markets generally, but not in rubber. The unrepentant optimists—a dwindling circle—put great emphasis on the high level of consumption, on the strong Russian demand for natural rubber and on the purchases of the American Government for its stockpile. But at the moment the pessimists seem to be getting the better of the argument, for while demand is high, the consumption of general purpose synthetic rubber (GRS) in the United States has not declined as much as was expected, while the output of natural rubber from native holdings in Indonesia and from estates and smallholdings in Malaya is expanding faster than consumption is likely to expand. Add to these factors the political strains in south-east Asia, and it becomes clear that a particular kind of courage is needed at this moment to argue the case for shilling rubber.



All the present signs, indeed, suggest that natural rubber faces a decisive trial of strength in the next year or two. The statistics already show the nature of the problem. World production of natural rubber for the first ten months of 1948 has recently been estimated at 1,247,500 tons—an annual rate of 1,500,000 tons. Consumption for the same period, however, is put at 1,145,000 tons or an annual rate of 1,375,000 tons. Thus if output of natural rubber continues to expand, even at a slower rate, surplus production may well become a serious matter in 1949. The world's potential production of natural rubber almost certainly exceeds 2,000,000 tons a year.

What of the potential demand? To assess it requires some careful dissection of the various components of demand. In the first place, little information is officially available about strategic purchases either by Russia or America. According to a Parliamentary answer given last week, Russia purchased 37,024 tons of rubber from Malaya in 1947 and a further 60,406 tons up to September this year. Russian requirements have been put at 80,000 tons a year, but this figure must reflect the limited amount of sterling which Russia is disposed to spend on rubber, rather than its total requirements of natural rubber—these must be far greater, even when allowance is made for Russia's own synthetic rubber production. Only the Russians know how these purchases are divided between current consumption and reserves.

America's strategic purchases are more important to the rubber market. In quantity, they may not be much larger than Russia's purchases have been this year, even though buying by the United States is not restricted by any shortage of foreign exchange. In the third quarter of this year, the US Munitions Board bought 25,000 tons of rubber through the market and also made a special purchase of 26,000 tons direct from the British Government under the ECA agreement. Total purchases in 1948 probably will not exceed 100,000 tons, though this quantity would equal nearly 17 per cent of America's current consumption of natural rubber. In any case, the United States is not counting on natural rubber to meet its full needs for defence; in an emergency, and even before, the United States will undoubtedly rely more on its own production of synthetic rubber.

It remains true that American and Russian purchases, whatever their primary purpose, have given appreciable support to the rubber market this year. Not all these purchases represent a net increase in demand for natural rubber. In the United States, for example, the consumption of synthetic rubber is above the minimum level of 222,000 tons prescribed by law and has exceeded it to the extent of 110,000 tons in the six months since April 1st. So long as the price of natural rubber remained above 1s. a lb. it apparently paid manufacturers to substitute synthetic for the natural product—given the fixed selling price of 18½ cents a lb. for GRS. Thus is American strategic purchases helped to keep the price of rubber above 1s. a lb for the greater part of this year; they also helped to divert supplies of natural rubber from commercial consumption to the government's stockpile. The interesting point is that GRS is competitive with natural rubber at a shilling a pound; if the promise of the new "cold" synthetic rubber is fulfilled, it may compete at an even lower price.

The United States still dominates the world demand for rubber. American consumption of natural rubber this year has equalled an annual rate of 630,000 tons, while consumption

of synthetic rubber has been running at an annual rate of 450,000 tons. Synthetic production has, however, been somewhat larger at 490,000 tons, and the surplus is available for stockpiling. Britain is the world's second largest consumer of natural rubber; its consumption has been running at 195,000 tons a year. (There is virtually no production of synthetic rubber in the United Kingdom.) A further expansion in the motor industry would increase the consumption of rubber in Britain, though the extent of such an increase could hardly affect world consumption very materially. Britain's share of world rubber consumption is only 14 per cent, while the United States accounts for 45 per cent. Thus, if the use of natural rubber is to be considerably increased, it will have to be directly competitive with GRS in price. Admittedly, if synthetic rubber were not specially favoured by American legislation, the advantages of natural rubber would have a better chance to show themselves. As it is, the American Government intends to preserve its capacity for producing synthetic rubber, and has safeguarded the industry by insisting on a minimum quota for its use, at a favourable price.

Natural rubber, like other primary commodities, is dependent in the last resort on the level of American demand. But unlike them it has to compete with a new material which, a few years ago, was a mere substitute and is now in many uses a satisfactory alternative. The adjustment of natural rubber to this new situation has scarcely begun, and it is likely to be prolonged. Some 85 per cent of the world's output of natural rubber comes from Malaya, Indonesia, Siam and Indo-China. Production has expanded in all these areas this year. In Malaya the increase in output has come largely from estates rather than smallholdings. In the period to the end of October, the estates produced 33,000 tons a month, equivalent to 57 per cent of Malaya's total output. Rehabilitation is virtually complete but much has still to be done to make good the ground lost during the war. Most of the stock of rubber trees has passed its best and less than 20 per cent consists of high-yielding varieties. In Indonesia, recovery has been retarded by political unrest, but as a greater proportion of the estates was already replanted with high-yielding stock before the Japanese invasion, expansion in output should be rapid as soon as conditions allow. Although many of the estates are still in the hands of the Indonesian Republicans, the course of exports shows that total output has made a welcome improvement during the year. And a further expansion may be expected in 1949.

Smallholder or native production vitally affects the rubber market. Mr P. T. Bauer contends both in his book and in a report recently published by the Colonial Office* that the smallholder in Malaya and Indonesia bore the brunt of the prewar restriction scheme and that the interests of the estates were relatively favoured. It may be argued whether native rubber can be produced as efficiently as plantation rubber; but beyond question it can be marketed more cheaply. There is room for argument too whether or not a higher price induces a smaller output from the smallholder (Mr Bauer suggests, contrary to general belief, that before the war this was not so). This is an important point, for there is no doubt that political and social development in south-eastern Asia is away from the large, foreign-owned estates and towards smallholdings, even though—as in Malaya—they too may be foreign-owned. This does not imply that there is no longer any place for efficient rubber plantations in these areas. But it might well mean that policies which under-estimated the part which the smallholder is likely to play in future could have serious consequences.

The outlook for natural rubber is now more clouded than at any time since the war. Production is expanding; in Indonesia it is expanding very rapidly. Natural rubber has drawn much support from strategic purchases, but sooner or later adequate reserves will have been built up. An immediate and large-scale expansion of commercial consumption seems improbable. Meanwhile, synthetic rubber production is being fostered for strategic and technical purposes. Thus there is a double set of competitive factors—the first between natural and synthetic rubber, and the second between estate and smallholder production of natural rubber If smallholders plant new areas—as they have been allowed to do in Malaya since April, 1947—and if they can plant high-yielding stock, their output is likely to increase considerably in the long run. But although smallholders' production is a threat to estate production, the one cannot replace the other. An accommodation has somehow to be secured within which both have a chance to live and to satisfy the needs of consumers efficiently.

It will be difficult, no doubt, to persuade smallholders to take part in a co-operative marketing scheme—their experience before the war has left its legacy of prejudice. In any case, any new scheme would have to provide the most adequate safeguards for consumers—and not least for British consumers who cannot obtain synthetic rubber in any quantity. The competitive threat of synthetic rubber, which seems likely to increase rather than diminish, makes no distinction between estates and smallholders: it is ranged against natural rubber, from whatever source.

European Recovery—VII

Who Supplies the Machines?

BEFORE the war, Germany was the largest European manufacturer of machinery, and by far the largest supplier to Continental countries. Since the war German supplies have virtually ceased; they are only now beginning to recover, and are still very small in scale. The difficulties of European industry in re-equipping itself are largely a reflection of the disappearance of Germany's output of machinery. Its extent before the war is not easy to measure in present-day terms. The statement that output of engineering and allied products in Germany in 1936 was valued at RM.9,400 million is accurate, but not very illuminating today. Its composition gives perhaps a better idea of what Europe now lacks. Of the total, about one-third consisted of prime movers, boilers, machine tools, bearings, electric motors, cranes and conveyors, agricultural and constructional machinery. Perhaps a third of the output in these classes was exported.

The entire British output of engineering and allied products in the same year, including repairs, amounted to £452 million, of which the groups mentioned above accounted for just over one-quarter; at most a quarter of this quarter was exported. Precise comparison between German and British output of machinery in 1936 is impossible, and would hardly be worth making even if it were. But roughly German exports were more than twice the British. Moreover, the greater part of British exports of machinery went to distant overseas markets; Europe was mainly supplied by the Germans. Thus any

attempt to assess Europe's needs and prospective supplies of machinery must begin with some estimate of the present state of the German industry and of what can be expected from it. A correspondent of the *Neue Zürcher Zeitung* has estimated that nearly 40 per cent of Germany's machine-making capacity before the war was in the Russian Zone and Berlin, and that about four-fifths of the capacity in those areas has been destroyed by war or removed by the Russians. Statements of this kind are hard to verify, but the scale of Russian dismantling in the western sectors of Berlin before the western Allies arrived, together with what is known of the removals from the Russian Zone itself, gives them some support, and if the losses in the ceded eastern territories are included, it is probably an accurate estimate. Removals in the French zone have also been proportionately heavy, but the French zone did not contain more than a small part of German capacity. Substantially, the German machinery industry is now the industry of the bizone.

The bizone housed 54 per cent of prewar German capacity for making machinery; during the war it was enlarged by war expansion and reduced by bombing, with the net effect that before dismantling for reparations began less than a tenth of it had been lost. The full extent to which the remaining plant is to be depleted by dismantling has still to be finally settled; the present revised level of industry plan is mainly distinguished by the unevenness with which it will fall upon different branches of machinery production. The most important reparations measures so far have been the dismantlings of single machines for the "multilateral deliveries" scheme. Such dismantling has been of more use to the receiving countries than the few large-scale dismantlings of heavy installations but, simply because it has naturally been concerned with the special-purpose machines which are most difficult to obtain, it has had disproportionate effects in dislocating German industry.

Material shortages, however, were mainly to blame for the fact that the existing machinery capacity in the bizone immediately before currency reform last summer was only employed to the extent of about 40 per cent. Since then, shortages of steel and labour have been greatly eased and, though the shortage of electric power persists, output has risen. Repair of war damage to buildings and plant has been accelerated, and defective equipment has become easier to replace. But even when the remaining plant is fully employed, output of machinery in western Germany is not likely in the next few years to exceed 50 per cent of the prewar output of Germany as a whole.

For some time to come production is likely to be unevenly distributed, for output is dictated less by what is economically necessary than by what is technically—and to some extent politically—possible. Machinery output in the bizone in 1947 represented 34 per cent by weight of production in the corresponding area in 1936. Within this total output woodworking machinery (by weight) reached 101 per cent of prewar output; pumps 63 per cent; food processing machinery 57 per cent; but machine tools and steel rolling equipment only 11 per cent.

*

Exports of machinery from the bizone last year, at RM.9,000,000, represented only 1 per cent of production. Holland and Belgium were the leading importers, followed by Britain and Switzerland. Such quantities, however, are trifling compared with prewar imports and with the pressing needs of most of the importers. Planned exports from the bizone in 1948 are substantially greater—$35 million, but for the first half of this year they were still below $6,000,000. The four-year export plan for the bizone provides for a rapid expansion, but the details have not yet been made public officially. Under the broad heading "equipment" in the four-year plan (as reported) bizonal exports in 1952-53 are to reach $990 million a year. But "equipment" probably includes a wide range of engineering and allied products. Of this total, $267 million is to go to the ERP countries.

Although many of the German makers are themselves anxious to resume their old export business, great difficulties still stand in their way. Even when the hindrances to full production are overcome, the factors which have raised home demand abnormally high will continue to operate, and it seems unlikely that a German or west German government would allow its machinery firms full freedom to export. If the bizone is to have half the former German machinery capacity, it will have more than half the former German population and far more than half the former German home demand. The need (also expressed in the four-year plan) for a higher total industrial production even to sustain a lower standard of living than before the war will tend to keep exports of machinery down so that production of consumer goods can be increased. The demands of repair and replacement seem at present inexhaustible. Political division in Germany has created abnormal and pressing demands. For example, important parts of the textile industry are in eastern Germany; if they are to remain cut off from trade with the west, some expansion of textile plants in western Germany can hardly be avoided. But the textile machinery plants in the Chemnitz area are also cut off. Western Germany must therefore import textile machinery.

How is the loss of German exports to Europe to be made good? European countries are taking more machinery from Britain and from the United States, but they are getting much less than they need. This conclusion is supported by repeated complaints from Holland, Belgium, Denmark and other countries of the slow pace at which international trade with Germany has been resumed. Total British production of machinery has expanded substantially since before the war; the annual value of output in the machinery group (which is not identical with the classes listed in the first paragraph) has risen from £207 million in 1938 to £690 million in the middle of 1948, and the volume has increased by 60 per cent. In 1938, 28½ per cent of all machinery produced was exported. Today 36 per cent of the increased total goes abroad. Exports have more than doubled, and of these exports a larger proportion than before the war now goes to Europe.

The ERP countries took 18.7 per cent of the tonnage of British machinery exported in 1938. In the first nine months of 1948 this proportion was slightly over 27 per cent. The share of exports taken by the sterling area has fallen correspondingly; in 1938 it was 53.7 per cent, and in the first half of 1947 slightly over 41 per cent; it recovered to 45.2 per cent in the third quarter of 1948. This is, of course, only a relative decline; the export quantities are larger than before the war, and the quantity sent to Europe very much larger. As an importer of machinery Britain has suffered from the disappearance of German production. In 1938 40 per cent of British machinery imports (by volume) came from the Western Hemisphere. Recently this proportion has risen to 73 per cent, while imports from European countries, which were 42 per cent of the total in 1938, have fallen to 16 per cent.

ECA supplies of machinery cannot be expected to relieve these difficulties to more than a small extent. The accompanying table of ECA procurements (Table III) shows that purchases of machinery by ECA for Europe in the first seven months of Marshall aid were worth about $168 million. Mining and electrical machinery, machine tools, and textile machinery, are the largest items. If they are intelligently concentrated on particular machines which Europe finds it difficult or impossible to supply, the ECA contribution should be qualitatively important. It cannot solve bulk needs, and is not intended to do so.

It is when the individual groups of machinery are examined that the real difficulties become apparent. No recovery in German boiler exports seem to be in prospect, and so far as water tube boilers are concerned, European importers are obliged to rely largely on British exports. But the output of water tube boiler plant from Britain is allocated between home and export needs for some years ahead. Overseas countries of the sterling area get the bulk of what remains after the British Electricity Authority's needs have been met; the ERP countries and the British home market share the modest balance, as the following table shows:

BRITISH WATER TUBE BOILER PRODUCTION FORECAST
(Steam-raising capacity in thousands of lbs. per hour)

Year	For Home Market		For Export		Total
	British Electricity Authority	Industrial	ECA Countries	Sterling Area	
1948	9,000	400	600	5,000	15,000
1949	11,000	400	600	5,000	17,000
1950	14,000	400	500	4,100	19,000
1951	14,000	400	500	4,600	19,500
1952	14,000	400	600	5,000	20,000

The deficiency of German production is most heavily felt by purchasers of machine tools. German output of machine tools in 1938—454,000 tons—was more than twice that of Britain and the United States together. Germany exported 100,500 tons of machine tools in 1937 (the highest prewar year) and 71,000 tons a year over the average of the years from 1934 to 1938. Most of these went to European countries; in 1937 Germany supplied 77 per cent of the machine tool imports of the other countries of Europe excluding Britain and the Soviet Union. British output of machine tools is, in weight, little above the prewar level. The productive capacity which it represents has, however, increased, since more single-purpose tools and fewer general purpose models are now made. Of new machine tools made in this country, 40 per cent are exported, and second-hand machine tools have been shipped abroad from Britain to western Europe in not inconsiderable quantities. British machine tool exports have risen from £3,600,000 in 1938 to over £16 million in 1948; the price has risen 2½ to 3 times.

*

As for textile machinery, the division of Germany, the lack of exports from Japan, and the shortage of hard currencies have forced European buyers to rely increasingly on British makers. Delivery of Lancashire looms now takes hardly longer than before the war. Flax and hemp machines are in good supply, and both American and European demands (the latter restrained by sterling shortage) are being met without much delay. British home demand for spinning machinery has never risen to the level which was anticipated two or three years ago; the spinning re-equipment subsidy has not proved an effective inducement. But automatic looms are still strictly rationed, and British output is divided equally between home requirements and exports.

In one machinery group after another the same general

difficulties repeat themselves: the lack of German capacity, the almost universal restriction of steel supplies, and the loss of the industrialist's freedom to buy machinery of his own choice in the market of his choice. The recovery of industrial production in Europe as a whole shows that in one way or another the bare needs for industrial equipment are being met. Some of the unreal pressure produced by the large and optimistic orders placed in the immediate postwar years is being deflated, and a quantitative balance between supply and demand, though it is not yet reached, promises to be in sight by the end of the four-year period. But no recovery of productivity has become evident to justify any belief that the European factories are getting exactly the machines they want. They get the machines which can be delivered first, or which the particular foreign exchange difficulties of their country permit them to buy. The resumption of industrial progress in Europe will depend on the return of a free flow of the equipment of industry; and that is still distant.

Business Notes

Depreciation and Replacement of Capital

The inability of large industrial concerns to provide from their taxed profits sufficient resources to finance their increasing commitments in stocks (reckoned in monetary, not real terms) and to replace their fixed assets at prices which have far outstripped the value of depreciation allowances based on original cost, has been a recurrent concern of company chairmen in recent months. Their exposition of the problem has necessarily been in simplified terms. A paper profit is made on stocks bought at lower prices; half of the profit is taxed away; the company then has to find more money—that is, to raise new capital in one form or another—if it is to keep the real volume of its stocks intact. The point on depreciation is analogous. Allowances for depreciation are based on first (or "historical") cost; when prices rise, these accumulated allowances will be insufficient to replace the asset; and part of the "profits" arising from higher prices will represent the draining away of real capital, of which the Exchequer takes half as "income" tax.

In an article in the latest issue of *Lloyds Bank Review*, Mr S. P. Chambers examines the dangers of these developments to the supply of capital for British industry. Mr Chambers writes with double insight in these problems, for he is a former Commissioner of Inland Revenue, and now is finance director of Imperial Chemical Industries. His conclusions are blunt. The accounts of "many if not most industrial concerns give a false picture," because they include provision for depreciation based on historical cost, and not on current cost of replacement. After examining the figures for capital formation of all kinds, Mr Chambers declares that the amount spent on capital formation in industry is almost certainly less than what is necessary to replace worn-out equipment at today's prices.

What are the remedies? Mr Chambers argues powerfully for a complete revision of "the disgraceful muddle of our obsolete taxation code." That indeed is a fundamental remedy. He rejects, however, the frequently-heard proposal that depreciation allowances should be based on replacement costs. "Accountancy has not yet reached the stage at which responsible professional accountants will trust their reputations on such guesses instead of . . . known figures of actual expenditure." There are other practical difficulties—the possibility that costs of replacement might occasionally fall, and the fact that "replacement" rarely involves the installation of an identical machine. A broadly similar conclusion is reached by Mr Leo T. Little, though by a more theoretical route, in an article in the new publication *Accounting Research*.

Mr Chambers's practical solution is to grant a special allowance for depreciation, equal to the allowance made in respect of 1945-46, on the assumption that the rise in prices since that year is virtually at an end. The allowances for 1945-46 totalled £186 million, so that the net cost of the proposal would be of the order of £100 million a year during the period of its application, though it might be somewhat more if certain other claims were admitted. He argues, too, for the end of the profits tax—"it is in every way a thoroughly bad tax, and should be abolished." There is, finally, "an unanswerable case" for relief of taxation on undistributed profits "at the present time." It is, presumably, in the broad relief of taxation on business profits that Mr Chambers seeks a remedy for the draining away of real capital through the taxation of fictitious inventory profits. It may be argued that these losses are "over the dam" and cannot be made good now, whereas some partial remedy can still be found to augment the depreciation allowances on fixed capital during the remaining years of its life. But the two problems, though technically dissimilar, are economically and fiscally contiguous.

Steel Bill in Committee

The Committee stage of the Steel Bill has opened sedately, as is fitting, and the proceedings have been only slightly ruffled by arguments about the Government's extending power of patronage in the making of appointments to this and other nationalised undertakings. The two days' proceedings which had been officially reported when this issue of *The Economist* went to press brought two important statements from the Minister of Supply. First, he accepted an amendment to raise the minimum size of the Iron and Steel Corporation from four members (excluding the chairman) to six members, with ten members (again excluding the chairman) as a maximum. Mr Strauss argued the wisdom of retaining the minimum of four "in case it might be found in the future that a small, compact, homogeneous Corporation is best fitted to deal with the industry." But since this is at best a remote hope, and more than four members will be appointed in the first place, the Minister's acceptance of the amendment was reasonable.

But he was unmoved by a proposal to limit his selection of candidates to the Corporation to a panel of persons named by the British Iron and Steel Federation and the Iron and Steel Trades Confederation. He has in mind a non-functional type of Corporation, and "it would be wholly wrong and upsetting to put on it anybody who had a special allegiance to a particular interest." There is, indeed a strong case that the responsibility of the Minister in making appointments should be free, subject to a broad definition of the field of choice and to the power of Parliament to review his appointments. Equally, the decision in favour of a non-functional Corporation is clearly right—and in truth, inevitable. For whatever may be the case of other nationalised bodies, the Iron and Steel Corporation will be concerned solely with the broadest questions of policy, and not with questions of working technique. That, after all, is the argument for leaving the companies as separate entities.

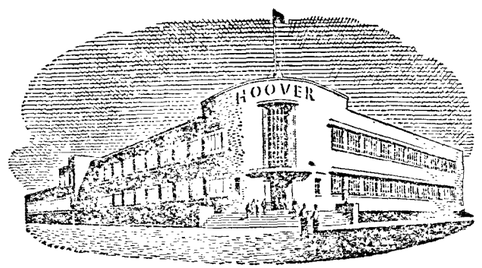
Mr Strauss has declared that, in his opinion, the 88 hours to be devoted to the Bill in Committee are adequate. There are to be 35 sittings, of which seven are allotted to the first four clauses dealing with the constitution of the Corporation, four to the compensation clauses, and four to the schedules and final proceedings. There is, indeed, no hope that under the guillotine procedure, the Iron and Steel Bill will emerge as a polished measure, to which mature consideration has been given. And this time, it will not be possible for the House of Lords to complete the task of revision, as it has done so successfully for earlier nationalisation measures.

* * *

Steel Bill Critics

Outside the Standing Committee, two other critics have attacked the Bill for different reasons. At the annual meeting of Redpath Brown last week, Sir Ellis Hunter referred to the peculiar position of that company whose entire ordinary share capital is held by Dorman Long, while the preference shares are publicly owned. As the measure now stands, only the ordinary shares would vest in the Iron and Steel Corporation. Apart from his objection to the acquisition by the State of some 30 per cent of the structural engineering capacity of the country, Sir Ellis fears that the benefits of the traditional "commercial integration" between Dorman Long and Redpath Brown would be jeopardised. This he sharply distinguished from "physical or technical integration" which is usually put forward as the main argument for taking over steel groups, including their subsidiaries. In the past, both companies have benefited from an arrangement "by which in times of reduced demand orders from Redpath Brown have been a valuable outlet for the products of Dorman Long's rolling mills, and when the demand has been high the arrangement has been of great value to Redpath Brown." It is easy to envisage that the benefits of such an arrangement would lapse under nationalisation, when presumably consumers would have to be supplied on equal terms (though this is not quite explicit in the Bill). And if they did lapse, it would be to the obvious detriment of preference shareholders.

A well-reasoned argument against using Stock Exchange prices to fix compensation has been addressed to the Minister of Supply this week by the Association of Investment Trusts and the Investment Protection Committee of the British Insurance Association. These bodies recognise that the method is "superficially convenient," but they declare that it is at the expense of "that equitable dealing which expropriated owners are entitled to expect." Their first point is that Stock Exchange values are marginal values relating to a small quantity of stock, and not the total issue—a fundamental objection which has been put forward in *The Economist* and elsewhere. They then dispose of the argument (put forward by the Chancellor) that what is fair for death duty purposes is equally fair for compensation, by declaring that any alternative basis for death duties would be "unworkable in practice," not that the method is justifiable *per se*. Thirdly, they point out that "the relationship between earnings and dividends paid is a capricious element which does not always exert its proper influence on market prices"; hence, to use Stock Exchange prices for compensation is likely in practice to prejudice the shareholders in those companies which have in the past followed a conservative dividend policy. The writers deplore the possible consequences of this discrimination on company finance in the future—"consequences which may easily extend far beyond our interests as investors." This protest, coupled with that of the Stock Exchange Council, is an important contribution to the general discussion on the Steel Bill, and it deserves the Government's close consideration.



Coal Export Prices in Question

Price policy for coal exports is, under the Coal Industry Nationalisation Act, in the hands not of the Minister of Fuel and Power but of the National Coal Board. The Board takes advice from the Minister, but the advice up to the present has been in general to let commercial considerations govern the policy—in short words, to charge what the market would stand. This idea, no doubt, was what governed the increase of 25s. a ton in export prices towards the end of last year. The increase was unpopular, but it has not prevented European purchasers from buying the coal. Now, however, the purchasers are growing restive, and members of the Economic Commission for Europe have been commenting unfavourably on the fact that British coal prices to foreigners (between 80s. and 90s. f.o.b.) are far higher than to home buyers. Coal exports from the bizone of Germany are between 5s. and 10s. a ton cheaper than British exports, and Polish coal is also cheaper. British coal in Europe is only a few shillings a ton cheaper than American, in spite of the much lower freight costs it has to bear.

It is probably true that there has been no formal American approach to Britain on the subject, but American representatives at Geneva and Paris have raised it with the suggestion that the Coal Board should reduce its export price even if this necessitates an increase in the home price. This suggestion was discussed in London last week by representatives of the Coal Board, the Economic Commission for Europe, and (since the criticisms are based largely on a comparison with prices of Ruhr coal) the bizonal authorities. The comparison with the bizone is a difficult one, since the finances of the Ruhr coal industry, its home sales policy, and its foreign sales policy are all governed by artificial and arbitrary factors. The Ruhr mines have run for a long time at a loss, the home price for Ruhr coal is artificially low, and the conversion rate between the German currency and foreign currencies is still largely notional.

It is, therefore, a little difficult to say to the Coal Board that it should (so long as its coal will sell) trim its price policy to the German standard. But there are other considerations. The question is not a straightforward commercial one.

Hoover Limited
open a new factory
at Merthyr Tydfil

On October 12th the new Hoover factory at Merthyr Tydfil was officially opened. This is the third new Hoover factory to be opened since the end of the War — the others being at Cambuslang, Scotland, and at High Wycombe.

The Merthyr Tydfil factory has been built for the manufacture of electric washing machines and is the largest factory in the country to be devoted exclusively to this purpose.

At the Company's principal factory at Perivale the entire production facilities are required to meet the huge demand for the world-famous Hoover Cleaners. The factory at Cambuslang, Scotland, is manufacturing Hoover Fractional Horse Power Motors in ever-increasing quantities, while the High Wycombe factory is working at full capacity producing Hoover Shaded Pole Motors, Commutators and Switches, all of which are used extensively by the Electrical Trades. Both for home and overseas markets Hoover production is constantly expanding, thus playing an ever-increasing part in the effort to raise the nation's standard of living.

HOOVER LIMITED

Head Office and Principal Factory: PERIVALE, GREENFORD, MIDDLESEX
Fractional Horse Power Motors: CAMBUSLANG, SCOTLAND
Electric Washing Machines: MERTHYR TYDFIL, SOUTH WALES
Shaded Pole Motors, Commutators & Switches: HIGH WYCOMBE, BUCKS

Politically there are drawbacks in embracing high prices too firmly in the face of the difficulties of the purchasing countries and the declared policy of co-operation in recovery. Even commercially, if it is possible to take the long view, it may be advisable not to accumulate resentment. More German coal, and more Polish coal, is on the way.

* * *

Coal Costs and Production

The profit on exports helped the Coal Board to balance its accounts in the second quarter of 1948, when it showed a surplus (after charging estimated interest and interim income) of £1,000,000 for the quarter. But costs have risen again, and the statistical statement for the third quarter of 1948, published this week, shows a deficit of £372,900. Colliery profits in the third quarter were £3,417,000 (compared with £4,900,000 in the second quarter). Estimated profits of ancillaries fell from £500,000 to £150,000; this fall concerns largely the coke-oven undertakings, and the Board attributes it mainly to holidays, retrospective wage increases, and "heavy costs of repairs to workmen's houses."

Coal, which cost 37s. 11.4d. a ton to produce in the first quarter-year of the Board's operations, cost 46s. 2.2d. to produce in the third quarter of this year. Proceeds, in spite of exports did not keep pace with costs.

COAL COSTS, PROCEEDS, PROFITS AND LOSSES.

	1947		1948		
	3rd Qtr.	4th Qtr.	1st Qtr.	2nd Qtr.	3rd Qtr.
Output (mn. tons):—					
Commercially disposable	39·3	45·9	44·5	45·5	42·1
Saleable	42·8	49·9	48·6	49·3	45·8
Costs (per ton saleable):—	s. d.	s. d.	s. d.	s. d.	s. d.
Wages	27 8·8	28 8·2	29 4·8	29 8·4	30 3·5
Root supports, stores, repairs	6 4·0	6 3·5	6 1·9	6 5·6	6 8·8
Coal and power	2 7·6	2 5·9	2 10·6	2 9·0	2 9·6
Other costs (incl. depreciation)	6 1·5	6 2·8	6 3·5	6 5·3	6 4·3
TOTAL COSTS	42 9·9	43 8·4	44 8·7	45 4·3	46 2·2
Proceeds	40 3·4	42 10·7	46 3·5	47 1·9	47 8·1
Profit (+) or Loss (−) (before charging interest)	−2 6·5	−0 9·7	+1 6·8	+1 9·6	+1 5·9

It would be idle to expect British consumers of coal to regard cheerfully any further increase in the home price. But equally clearly, high export prices are not likely to avert an increase in the home price if costs go on rising. Improved efficiency and higher output per man-shift are the only remedies; and if they cannot be achieved the home market will have to bear its share of the burden.

Deep-mined coal output last week was 4,146,500 tons—an increase of 60,500 tons over the week ended November 27th, and the highest since the week before Christmas last year. Open-cast output improved from 179,000 to 193,600 tons, and the total open-cast output in the 48 weeks to December 4th was 90,000 tons over the target of 11 million tons for the year. But deep-mined output for the 48 weeks was 18 million tons short of the year's target of 200 million tons.

* * *

A Turmoil of Trade Talks

The system of bilateral trading is imposing a severe strain on British officials. At the moment, negotiations are proceeding with at least seven different countries and not all are being held in London. The Russian discussions are still in a preliminary stage and as yet no basis for a new trade agreement has been discovered. Negotiations with Jugoslavia have lasted nearly two years and the Polish talks for three months; in both instances the stumbling block is the compensation to be paid for British properties in the two countries. The trade items have been agreed on both sides, but the British delegations maintain that since compensation payments will affect the foreign exchange accounts of the two countries, this matter must be settled before implementing the agreement. This attitude has produced impatience—reflected last week in the House by Mrs Leah Manning. Clearly if Britain gives way on this point its future bargaining position would be irreparably weakened—in return for the short-term benefit of more bacon now.

The problem with Spain is more straightforward but still no easier to solve. Britain considers Spanish prices for her exports exorbitant. Spain, on the other hand, says it has no sterling and that unless it can acquire sterling by charging high prices it will not be able to afford British goods. In the Swedish negotiations, the same difficulty is differently clothed. British exports to Sweden have increased more rapidly during the year than was originally planned, and Sweden now has an adverse visible trade balance. While Britain would like to maintain trade at this high level next year, the Swedish Government wants to reduce its imports of British goods, particularly of textiles. Discussions with Denmark are not so controversial and mainly cover the examination of the Danish import programme for 1949. Under the recent trade agreement, Denmark is to take up to £45 million of British goods in 1949. The Norwegian negotiations bring up the same point—an attempt to discover a suitable way of spending sterling.

Other negotiations are afoot which equally affect Britain's balance of payments but which do not fall into the category of trade agreements. Such are the negotiations for the new Canadian food contracts, and for a Mexican meat contract. These latter discussions have been continuing for many many months, and there is still no sign of any contract being signed. The problems of bilateral trading for a country like Britain which is so dependent on foreign trade, are now becoming apparent. Agreement has to be reached with each individual country, and each agreement has then to be dovetailed into the other. The task of the negotiators is not to be envied.

* * *

Canadian Food Contracts

Agreement was reached with Canada this week on the new food contracts. The wheat price for the 1949-50 season has not yet been settled, but prices and quantities of livestock products for shipment in 1949 have been determined. Britain is, in fact, taking less at the same or lower prices; it has agreed to purchase 160 million lb. of bacon compared with 224 million lb. in 1948; 50 million lb. of cheese, or the same quantity contracted for this year; and 1,533,000 cases of shell eggs or their equivalent in dried or frozen whole eggs against 2,200,000 cases this year. Bacon and cheese prices have been unaltered, but eggs have been slightly reduced. As the bacon and cheese contracts will be regarded as "off shore" purchases, they must first be approved by the ECA authorities in Washington.

A workable compromise has thus been found which may allow Britain to pay a slightly higher price for Canadian wheat. Reduced quantities of bacon and eggs may not cause any further reduction in British rations next year as larger supplies are expected from Denmark and possibly from Poland and Hungary too. Nor will the new contracts cause any great hardship to Canadian farmers. The 160 million lb. of bacon is likely to be the total quantity available for export, and Canada may experience difficulty in meeting the cheese contract.

NIC—*RIP*

The Chancellor this week confirmed, what has long been suspected, that Dr Dalton's grandiose creation, the National Investment Council, has been allowed to expire unobtrusively—unwept and unsung. Yet now that the sad news is out, a few tears may be shed for what might have been. Some Socialists, no doubt, had still cherished the hope that the Council would one day become the investment "board" which is enshrined in prewar socialist theory. Others had hoped for a precisely opposite development—that the Council might become the means of bringing City opinion and business experience to bear upon Government policy in the planning of the investment programme. The original City members of the Council included the Governor of the Bank, Chairman of the Stock Exchange, Chairman of the CIC, Sir Clarence Sadd (of the Midland Bank) and Sir Clive Baillieu (then chairman of the FBI). This "high power body of collective wisdom," as Dr Dalton described it, was, according to him, to be consulted on all large questions of principle affecting the investment programme as well as upon important practical questions. Its role was not to be the actual control of investment or of capital issues; that is achieved by executive bodies, principally the CIC, which interpret and apply Government decisions on policy. It was to advise upon the policy itself.

Few City men ever believed that Dr Dalton would give the Council much scope for acting in this way; but this final confirmation of their belief that the Council would be a dead letter will perhaps arouse a shade of disappointment that Sir Stafford Cripps has not taken a different view. To the Government, since the institution of the Planning Board, the machinery for formu-

A casual observer of the architecture of the Union of South Africa would probably place more emphasis on the sky-scrapers of the Rand than on the spacious old Early Dutch houses which form such a pleasant decoration to the countryside of Cape Province.

There are, however, numerous examples of this attractive form of architecture still remaining. Many of them, as in the case of Groot Constantia near Cape Town, were designed as chateaux for the vineyards which still surround them and have served as centres for the wine industry ever since the seventeenth century. The wine industry in turn has done much to contribute to the prosperity of the Union in general and of the port of Cape Town in particular, and continues to hold its own to-day in the busy and expanding commercial life of the Union.

Full and up-to-date information from our branches in South Africa on the state and trends of local markets is readily obtainable on request.

lating investment policy no doubt looks adequate. Yet even the Governor of the Bank has lately voiced his doubts about the wisdom and economic merits of some of the projects now afoot; and many others, while not necessarily accepting all the implications of Lord Catto's arguments, are convinced that an objective survey of the whole programme is now urgently needed. In such a survey the advice of City men, and especially of commercial bankers who may see much that is hidden from high-level planners, could be of real value. But, if the NIC was not to be used in this way, there is no reason to regret its disappearance. It had not met since Dr Dalton's departure from the Treasury and, so far as is known, the only specific matter ever remitted to it was the question, in 1946, of the bonus element permissible in the price of issues sanctioned by the CIC. But although on this question it apparently gave useful guidance on market technique, the sequel to the improved procedure then adopted was the notorious bonus issues tax. That, of course, was not the fault of the Council; but if the Government, having taken practical advice, then proceeds to fly in the face of it, it is hardly worth seeking it at all.

Finance for Films

Mr Harold Wilson announced in the Commons on Wednesday the composition of the committee which is to inquire into the distribution and exhibition of films; Lord Portal of Laverstoke is the chairman. The Cinematograph Film Production (Special Loans) Bill is having a fairly smooth passage, largely because neither side of the House can think of an alternative policy. In the second-reading debate last week the President of the Board of Trade sought to show that the borrowing powers of £5,000,000 which the Film Finance Corporation is to have would, with reasonable luck, be enough. He explained that the Corporation would not normally put up more than a quarter of the cost for any one film. He expected the banks to play their customary part by financing up to three-quarters of the cost; this is probably an over-estimate of what the banks are prepared to do at present, but Mr Wilson also pointed out that the distributing companies through which most of the Corporation's advances would be made would still find some of the money themselves.

These distributors would also perform two other services which are in the normal course of their business; they would control costs and they would usually provide a distribution guarantee. In this way the Corporation's £5,000,000 may, as Mr Wilson said, be able to finance more than the 15 to 20 films a year which one member calculated as its limit, though much will depend on the average number of months or years taken to recover the investment. Mr Wilson indicated that he would be prepared to consider asking for more if the £5,000,000 proved inadequate—provided that the scheme was otherwise working well.

He is not likely to come back for more if the generally gloomy mood of the House about the nature of the risks involved proves justified. Many sets of figures were produced by members to show how difficult it is for the producer to get back his costs. Mr Eric Fletcher gave some which are worth reproducing about "My Brother Jonathan," a relatively successful recent film on which, through his connection with Associated British Pictures, Limited, Mr Fletcher doubtless spoke with exact knowledge. From his figures it appears that the £1,020,000 which the British public paid to see "My Brother Jonathan" was distributed as follows:

	£
Entertainment Tax	416,000
Exhibitors	375,000
Renter	57,000
Producer	192,000
Total UK box-office receipts ...	1,040,000

The producer's costs were £198,000, so that the producer was dependent on overseas earnings to cover the last £6,000 of his costs and to clear any profit. Either the committee on film distribution or the new working party on production costs which Mr Wilson announced during last week's debate may have something to contribute towards solving the dilemma. Not less important would be some hope of better relations with the American film industry to end the present virtual exclusion of British films from American cinemas. Mr Wilson could not hold out any prospect of this. His statement that the industry, if it can reduce production costs without reducing quality, can look forward to "an extremely rosy future" is surely too hopeful to bear examination. The outlook is rather that unless it can reduce costs and improve the quality of its average product the industry can barely expect to survive.

Government Trading

Some further information about the Government's bulk buying operations was given this week in a Parliamentary answer. This shows the quantity and value of raw materials purchased by the Board of Trade during 1947 and the amount which arrived in the United Kingdom during the year; some of the arrivals represented purchases made in the previous year. The statistics also include metals bought by the Ministry of Supply and commodities purchased by the Ministry of Food. The full tables are included in this weeks issue of the *Records and Statistics* Supplement.

Last year the Board of Trade spent £256 million on raw materials, consisting mainly of textile raw materials, timber, hides and skins, paper, board and paper making materials. The Ministry of Supply's bill amounted to £72 million, the largest items being copper (£32 million), lead (£14 million), and zinc (£8,000,000). The Ministry of Food's purchases were naturally largest. They totalled £615 million, of which £191 million was spent on dairy produce, oils and fats, £135 million on cereals and animal feeding stuffs and £125 million on meat and bacon. Taking the purchases of the three departments together, they represent almost 59 per cent of the approximate f.o.b. value of Britain's imports in 1947. This figure is close to the estimate (on less exact information) of 57 per cent which was given in *The Economist* of November 20th.

These disclosures reveal very little additional information but it is, nevertheless, possible to make certain calculations from them. For example, by dividing the quantity purchased into the f.o.b. value, an approximate average price is obtained for the various commodities. Thus for copper the average purchase price last year works out at a little over £105 a ton; this includes blister and electrolytic. But the margin between this and the Ministry's selling price (£132 a ton) which admittedly includes cost of freight, insurance, storage and delivery to consumer's works, is surely sufficiently large to prompt the question of what profits were being made by the Government on buying and selling copper—or what earlier losses were being recouped. Similarly, the average purchase price for zinc was £59 a ton and for lead £70 a ton; their corresponding selling prices were £70 and £90 a ton.

The Government is apparently becoming more aware of the need to reveal details of its trading operations. But the information at present published is often misleading because it generally tells only half the story. In most cases it gives the impression that the Government's operations have not been too successful, but this may be due to the inadequacy of information available. If this is so, surely the Government departments could present full and detailed accounts to enable their efficiency to be judged.

South Africa's Reserves

South Africa's Finance Minister, Mr Havenga, caused some surprise last week by a statement implying that the Union is again experiencing a net inflow of investment funds from Britain. In a euphemistic reference to the uneasiness aroused among investors by the advent of the Malan Government six months ago, he remarked that though "there might be isolated instances of nervous British capitalists who, under the influence of the Opposition's propaganda, had withdrawn their money, capital in appreciable amounts was still coming to the Union from Britain." The implication, plainly, is that the South African authorities believe that the Union is now again gaining sterling funds on balance—a tendency which is not easy to reconcile with the recent trend of sterling reserves. As the accompanying table shows, the initial decline in these had spent its force by end-July, the month in which the current strain was augmented by the special payments, totalling about £14½ million, for the taking over of the electricity interests in the Union of the Victoria Falls and Transvaal Power Company. During August and September the Reserve Bank's sterling holdings were falling at the rate of about £1 million per week, while in the ensuing five weeks, to end-October, they actually rose fractionally to just under £51 million. Since then, however, the decline has been sharply accelerated. By end-November, the total was down to under £42 million, making a decline of £9,000,000 on the month; and only £2,000,000 of this loss was made good in the following week, by the monthly adjustment with the Bank of England. Hence there has been a net loss of over £37 million since the Malan Government assumed office.

* Mainly sterling.

If, therefore, it is true that the Union is now gaining sterling on capital account, the commercial deficit with the sterling area must be even larger than has been generally supposed. To judge from the latest Bank return, only a moderate part of the accelerated decline in the sterling reserve has resulted from South African drafts on the sterling area dollar pool for the purpose of meeting its hard currency deficit or from other non-sterling payments effected through London. It is true that since the beginning of this year the Union has agreed to make good any such "third" currency payments by sales of gold to Britain, but these reimbursing transactions do not coincide with the dollar drawings. This explains why, in recent months, the last bank return in each month has shown an exceptionally heavy fall in the gold holding and, simultaneously, some replenishment of the sterling reserve. Last week's gold loss, including the November "reimbursement" sales to the Bank of England, amounted to no less than £8,300,000, yet the gain in sterling balances was only £2,000,000. At £45.3 million, the gold reserve is nearly £52 million below the level at which it stood six months ago, making a total depletion of exchange reserves by £89 million over this period. According to a recent statement by the Department of Customs in the Union, the adverse trade balance, after crediting the value of newly mined gold, amounted to £46 million in the four months to end-October, which is equivalent to a monthly rate of drain slightly less than the past month's decline in total reserves. Presumably, the reserve position has only just begun to feel the effects of the import restrictions announced in early November; but it will be surprising if these measures suffice by themselves to arrest the decline.

No Black Sterling for Vatican

The financial agreement reached with Italy and described in *The Economist* last week does not extend to the Vatican City. The undertaking to maintain the cross rate between sterling and the dollar at the official parity of 4.03 could not apparently be implemented by the authorities in Vatican City, where the control mechanism is somewhat primitive but international transactions and contacts are highly developed. If, therefore, the City had been included with the rest of Italy in the transferable account group of countries, one of the inevitable results would have been not only to transfer the whole of the Italian black market in sterling to the Vatican City but to give it the benefit and advantages of transferability enjoyed by no other such market.

In order to prevent this, separate arrangements have had to be made to differentiate the treatment of Vatican City sterling accounts from that of Italian transferable accounts. The former are to be operated on a bilateral basis. The sterling held on Vatican City account will be available for making payments only to residents in the scheduled territories, i.e. the sterling area, and for transfer to other Vatican City accounts. For all other uses of sterling in these accounts, prior consent of the Bank of England will have to be obtained. Detailed instructions for the operation of the new Italian transferable accounts were published this week. The Bank of England is indicating by letter, to the United Kingdom banks concerned, which Italian sterling accounts are to be designated as Italian transferable accounts. These accounts will be conducted in accordance with the normal procedure which allows freedom of transfer for current operations as between transferable account countries and as between each of these and the whole of the scheduled territories.

Austin Motor Issue

By his exposition of the recent trading experience of the company at the annual meeting of Austin Motor this week Mr L. P. Lord was able to allay some of the doubts which had caused a decline in Austin Motor shares since the new issue was announced. Five months were needed, instead of the expected two, in retooling for the new models last winter. This delay accounted for the fall in trading profit from £2,256,930 to £1,613,304 in the year to July 31, 1948, and its consequences are now being made good. Average weekly output has been stepped up from 2,281 vehicles and 175 tons of spare parts in the first three months of the current year to an average of 2,722 vehicles plus 197 tons of spare parts in October and November. Present capacity would allow for an output of 3,400 vehicles per week if there were sufficient steel.

The chairman also gave a favourable account of sales to North American countries, which have now brought in some $22 million. This satisfactory contribution to the dollar problem is being supplemented by the establishment of an assembly plant at Hamilton, Ontario. Part of the proceeds of the new issue will be required to finance this project, for which £200,000 of new British plant is to be provided.

Apart from the expansion in North America and at Longbridge, funds are required to finance the development of the com-

Tygan

THE NEW WOVEN FABRIC

is tops where treatment is tough

Tygan is probably the nearest approach to an everlasting fabric which has yet been devised. Its resilience, toughness and abrasion resistance ensure excellent wearing qualities, where treatment is particularly severe. It can be used out-of-doors as it has excellent weathering properties. It can be cleaned by sponging with water. It is unaffected by a wide range of chemicals. And it is smart and colourful.
Tygan is suggested for the upholstery of seats in cars, buses and trains; for theatre and cinema seats; for garden furniture; for chairs in cafés, bars, hotels; for fly screens in the tropics, and for larder windows and meat safes.

for the gleam on fur

How much richer we are to-day because of the precious chemicals which scientists are developing from petroleum. Among these chemicals for industry are the new Shell detergents. Almost every industry which involves cleaning processes is finding these new aids of vital value. They enhance the purity, cleanliness, beauty—yes, *gleam*—of so many things you admire. For these very qualities

thank Shell Chemicals

Shell Chemicals Limited (Distributors).

A lasting market —the under 35's

Today's under-35's are eager to know what you have to sell. Their experience during the war years brought them to maturity. But not until now have they been able to assert themselves as adult consumers. The return of the buyer's market gives these under-35's the first opportunity they have ever had to form buying habits. They want to hear about good quality products and to develop common-sense preferences that they can keep for life—and no other age group has a longer buying life ahead. Among this vital third of our adult population, the Daily Mirror is read by over a million more men and women than any other daily paper. Sell your products through the advertising columns of the Daily Mirror and build up a lasting market

Daily Mirror

THE NATIONAL DAILY

pany's business in South Africa, where a new site has been purchased for the erection of a factory. In all, some £2,589,000 is expected to be raised by the new issue of 2,071,556 5s. ordinary shares which are being offered at 25s. a share to existing shareholders at the rate of four new shares for every five held. Austin Motor 5s. ordinary shares became firmer at around 32s. on Thursday on the chairman's declaration that the company should be able to maintain the present dividend of 40 per cent on the increased capital.

Shorter Notes

A Board of Trade Inspector is to inquire into certain matters connected with A. Reyrolle and Company Limited. The matter was raised in the High Court on behalf of Equatorial Trust Limited, a shareholder in the company, whose complaint was entered on grounds of alleged misfeasance on the part of a director. Both the company and the Board of Trade felt that the case should be examined by an inspector, under the powers provided in the new Companies Act, and Mr Justice Vaisey accordingly made the order. It has since been announced by the company that it welcomes the fullest inquiry, and that the chairman, Mr George Wansbrough, has vacated the chair (while retaining his seat on the board) in order to facilitate the inquiry.

★

The total amount of sterling which can be released out of Egypt's accumulated sterling balances for expenditure in 1948 is £21 million, with a further £11 million to strengthen working balances making a maximum of £32 million. In *The Economist* last week the total was brought up to £39½ million by adding to these figures the £6,250,000 million hard currency allocation for 1948 and the additional £1,000,000 of gold allowed to Egypt for payment of its subscription to the International Monetary Fund. In fact these gold and hard currency allocations, insofar as they are financed out of accumulated balances, will have to be provided out of the release of £21 million and their addition to the maximum of £32 million therefore involved a measure of double reckoning.

★

Further progress has been made towards the adoption of a new universal wage list for mule spinning operatives in the Lancashire cotton industry. The remaining objections of the Bolton spinning operatives have been removed in recent discussions, and the Bolton workers in a ballot have adopted the revised terms. The agreement, which will substantially implement in this section of the spinning industry the recommendations of the Evershed Report for a more up-to-date wage structure, is now almost ready for signature by the master spinners and the Operative Spinners' Amalgamation.

★

The Order to establish a Jewellery and Silverware Development Council was approved by the House of Commons on Wednesday. The President of the Board of Trade explained that the general lines of the measure had the approval of the greater part of the trade, but that objections had come from the silversmiths. A Sheffield member, Mr Jennings, made it clear that the Sheffield silversmiths maintained their objection to being classified with the jewellery trade; they would pay their levies to the Development Council and would provide information required, but would take no active part in the Council's work.

Exports in November reached a new postwar peak. Their provisional value at £147 million is £1,400,000 higher than the July figure, the previous best, and £7,000,000 more than in October. As November had only 26 working days against 27 in July, its daily rate of exports was some 5 per cent higher. According to Mr Harold Wilson who announced these provisional figures, "the nation has achieved the export target set for the end of 1948." But despite this achievement, the adverse balance of visible trade was only very slightly reduced compared with October; it was, nevertheless, the lowest for any month since January, 1947. Imports amounted to £181 million or £6,500,000 more than in October and were the highest since the war except for last April and July.

★

Proposals to secure the further standardisation of accessories and components used in the motor industry were announced last week jointly by the Society of Motor Manufacturers and Traders and the Ministry of Supply. The six large motor manufacturing firms—Austin, Ford, Nuffield, Rootes, Standard and Vauxhall—have agreed that "immediate steps shall be taken" to make more use of common accessories and components, and representatives of the six firms, together with the producers of the equipment, will maintain regular contact. This is one part of the motor industry's contribution to the campaign for higher productivity. The other is an agreement to pool production experience, each firm making available for inspection to others not only its workshops, but its other "technical and administrative resources."

Terms of the purchase by Brush Electrical Engineering of Mirrlees, Bickerton and Day, and J. and H. McLaren, two wholly owned subsidiaries of Associated British Engineering, have been announced this week. Subject to the approval of shareholders, Brush Electrical will issue, in consideration of the purchase, £530,000 5½ per cent cumulative £1 preference stock at par and £800,000 ordinary stock at 6s. 8d. per 5s. unit plus a cash adjustment payment of £1,652. As a result Associated British Engineering will hold 50 per cent of both classes of the capital of Brush Electrical. Pending a new issue of capital (not expected until mid-1949) Brush Electrical has obtained bank accommodation for £4,000,000 to finance the expansion in the group's trading.

★

New life assurances written by Standard Life in the year ending November 15, 1948, show a further increase to £18,606,008 against £16,445,187. Sums received for immediate life annuities were £2,160,693 against £1,255,970, but deferred annuities are slightly lower at £4,609,658. The new business figures of Standard Life anticipate those of other life offices by some six weeks. When the results of other offices become known in the New Year it may be found that the total of new business done in 1948 was larger than in 1947, but that individual results have varied.

★

The revised estimates of this season's cotton crop in the United States have fallen; the latest figure announced by the US Department of Agriculture is 14,937,000 bales. The November estimate was 15,166,000 bales. The current crop is, however, still the largest cotton crop since the record of 18,946,000 bales in 1937.

COMPANY MEETINGS

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

BUSINESS ACTIVE AND GROWING

MR J. S. CROSSLEY'S STATEMENT

The twenty-third ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) will be held at 29, Gracechurch Street, London, E.C., on the 29th instant.

The following is an extract from the statement by the chairman, Mr J. S. Crossley, which has been circulated with the report and accounts for the year to September 30, 1948:—

On the liability side of the balance sheet, current, deposit and other accounts have increased by about £32,000,000. On the assets side the main feature is again advances to customers which have increased by a further £28,000,000; investments are lower by some £10,000,000.

The profit for the year is £649,873. We have made a further addition of £231,000 to the reserve fund and we have allocated £100,000 to premises reserve account. The year's dividends, if you approve the recommendations which will be placed before you at the general meeting, will cost an additional £47,212 as the whole of the increased capital of the bank has ranked for dividend for the full year.

DEVELOPMENT CORPORATION'S PROGRESS

Except in Palestine, to which special reference is made later in this statement, the business of the bank has remained very active and has continued to grow. Substantial progress has been made during the year by Barclays Overseas Development Corporation, Limited, and the balance sheet as at September 30th shows that its resources were almost fully employed by that date. Permission has been received from the Capital Issues Committee for an increase in the capital of a further million pounds at a premium of 50 per cent. This will double the corporation's existing resources, and since the date of the balance sheet the new capital has been provided by the bank.

POLITICAL SECURITY

Before turning from the subject of colonial development, perhaps I may be permitted to touch very lightly upon a matter which has an important bearing on the subject and which is already causing some concern. I refer to the question of security in its political aspect. Some measure of political stability is clearly essential if all the plans and policies on which so much emphasis has been laid in recent years are not to be stillborn.

We can do no greater disservice to the people of the Colonial Empire than to encourage them in the belief that political independence is in itself the key to a prosperous and carefree life, or that it can be anything more than a meaningless phrase unless based upon a sure economic foundation. The steps now being taken to stimulate economic progress can only bear fruit over a long period and unless a measure of political stability can be assured, the work of economic development may be rapidly undermined.

POSITION IN PALESTINE

In recent months stockholders have, no doubt, been feeling some anxiety about the position in Palestine. I therefore welcome this opportunity of saying something about our affairs there. The termination of the British Mandate on May 15th of this year is a landmark in the troubled history of that country, and, perhaps I may be allowed to express on behalf of the bank our feelings of respect for, and sympathy with, those men, British and locally recruited alike, who have worked so patiently during these last thirty years in the government of Palestine. The failure to reconcile conflicting political claims should not be allowed to obscure the many valuable achievements which have been accomplished in other directions.

It is an ironical thought that had the British administration pursued a policy actuated by nothing except greed and self-interest, it might well have turned out that they would have incurred less hostility than in their unsuccessful attempt to balance conflicting claims. Nevertheless, the British administration has brought much that was good into the country and some of this we may well hope will remain as a permanent contribution to its future.

It is not my purpose to say soothing words about our affairs in Palestine. It was only to be expected, in present conditions, that business activity would decline sharply and there will certainly be many difficult and novel problems to confront us in the future but this itself is hardly a new experience for our bank. While we must expect to suffer some losses, I think it can be said that no bank, however prudent, could go through such a period entirely unscathed. It is important, however, to maintain a proper perspective in this matter. Great care has been taken in our lendings in Palestine, which have never been large in relation to the bank's total lendings. The figures involved are, therefore, not of such magnitude as to prejudice the bank's operations in any way, even in the most unfavourable circumstances, and we have taken the precaution of allocating a substantial sum this year to meet contingencies.

THE FUTURE

As regards the future, you will not expect me to indulge in political forecasts. In spite of temporary difficulties, we hope it will be possible for us to continue to serve the needs of the people of Palestine, as we have tried to do in the past. Meantime, the difficulty of communication with some of our branches constitutes a serious problem, and our main anxiety has been in regard to our staff. I regret to say that there have been several casualties in the ranks of our local staff, both Jew and Arab, and we shall not easily forget our debt to those who have lost their lives in the course of doing their normal business and their duty to the bank.

I would like also to take the opportunity especially to thank the members of our staff in Palestine who have shown their loyalty and devotion to the bank through many difficult years. It has been a matter of deep concern to us, as well as of the most profound personal regret to the members of our British staff in Palestine that, acting under strong pressure from the Mandatory Government, we were obliged to withdraw them just prior to the date of the termination of the mandate. I am pleased, however, to be able to tell you that Mr Clark was able in October to visit some of our branches, and the value of regaining personal contact by this means cannot be over-estimated.

A CHAPTER CLOSED

May 15th closed a chapter of history, a chapter, too, in the history of this bank, into which so much that is unusual has been crowded within so short a time. It is 30 years since Mr Clark first went up to Palestine following General Allenby's entry into Jerusalem. We have the satisfaction of knowing that our bank has played a useful part in helping in the tremendous development of the country since that date.

THE NATIONAL BANK OF AUSTRALASIA, LIMITED

BANK'S NINETIETH ANNIVERSARY

The annual meeting of the National Bank of Australasia, Limited, was held in Melbourne on the 24th ultimo.

Mr H. D. Giddy, the chairman, said that it was the ninetieth anniversary of the bank. The first balance sheet published in 1858 recorded a capital of £90,563 and total assets of £97,924. Today, shareholders' Funds stood at £12,153,625 and total assets at £158,044,010. The union with the Queensland National Bank, Limited was almost completed and the goodwill of the customers of that bank had been retained to a remarkable degree.

Referring to the struggle against nationalisation of the Australian Trading Banks, he pointed out that although final victory had not yet been won valuable successes had been achieved. He felt that ultimately the decision would be made in the political field by the Australian people. The bank's staff were wholehearted in their determination to fight nationalisation.

TOWARD A "BUYERS' MARKET"

He believed that the domestic market was swinging slowly but surely from a "sellers' market" to conditions nearer to a "buyers' market," but he did not think that Australia was heading for a slump. The buoyant economic conditions reached after three years of peace were by no means "Utopian" because new conditions bred new problems. Perhaps the most immediate problems were an acute shortage of labour and a low volume of production, though everyone desirous of working was able to earn a fairly good income—in terms of money. Yet most people were feeling the sting of high prices. Hours of work might be shorter but facilities for comfortable recreation were miserably inadequate. Australia's postwar economy seemed to have a bias towards higher and higher monetary incomes, with poorer and poorer results when people spent them. This phenomenon was baffling the community and leading to frustration and disappointment.

As a result of this atmosphere the moral code of the community had been affected. Men and women failed to derive full satisfaction from their daily task and doubts about one's daily task meant doubts about life itself.

PLEA FOR A NEW FREEDOM

Continuing, he said: Unless we are to remain bogged in a morass of socialistic inefficiency with a mounting crisscross of controls and counter-controls and their resulting "economics of poverty," sturdy strides will have to be made, and made rapidly, toward the cleaner atmosphere of a new freedom for individual development, for the exercise of enterprise and initiative, and for a full restoration of the competitive effort in industry and commerce.

Our country's experiments of late years show clearly that Government attempts in peace-time to plan the whole economy and to control business and the individual create problems which do not diminish but which add to the average person's struggle to improve his standard of life. My urgent plea is that instead of stubbornly trying to remedy the proved defects of centralised state control by venturing further in with a socialist programme of nationalisation, our leaders revise their present outlook and set about establishing such conditions as will permit the rightful expression of the individual's energy, initiative and personal ambition and give him every opportunity for reasonable reward.

The report was adopted.

AUSTIN MOTOR COMPANY, LIMITED

EXPORT SALES £18,000,000

The thirty-fourth annual general meeting of the Austin Motor Company, Limited, was held, on the 8th instant, at Longbridge Works, Northfield, Birmingham. Mr L. P. Lord (chairman and managing director), who presided, in the course of his speech said:

First, may I draw your attention to the item in the current assets of "Stock and tools" shown at £4,521,600. The increase over last year reflects the higher level of production in the later months of the period. No doubt you have wondered how much of this represents stock and work in progress and how much tools. I am sure you will be pleased to know that tools, dies, jigs, fixtures and press tools are included at less than £200,000. In common with others, your directors are concerned at the problem of financing the replacement of prewar fixed assets at the higher price levels now ruling. In order to provide the cash resources for this increase the sum of £500,000 has been transferred from special depreciation appropriated during the war to a capital reserve and a further £200,000 has been allocated to this reserve from profit and loss account. The general reserve has at the same time been increased and now amounts to £1,450,000.

By the appropriation of a further £100,000 the sum available as a reserve for the equalisation of dividends is now £400,000. The company's contribution to staff pension and benefit schemes has reached a total of £595,931 by the expenditure of £66,372 during the year under review.

PRODUCTION

In my statement last year I forecast that during the change-over of production from the old 8 h.p and 10 h.p. models the lowest point in the production curve should be during November.

The change-over started according to programme, but instead of production getting under way and rising after November, output continued low during December and January, and it was not until February that the factory settled down to a steady and rising flow of production. By July we were exceeding all previous weekly records of the company.

The causes of this delay were quite beyond our control, and are a reflection of the conditions and restrictions under which industry is labouring to-day. In spite of the most careful planning and scheduling on our part, the change from start to finish took five months instead of the normal two, with a consequent loss of export sales, loss of wages to our employees, increase of costs and loss of turnover to the company, and finally loss to the Exchequer of foreign currency from exports and revenue from taxes on wages and profits.

Since the end of the financial year, July 31st, production has been maintained at a high level. The average for August, September and October was 2,281 cars and commercial vehicles a week, plus 175 tons of spare parts per week. During the six weeks from October 4th to November 15th, the average was 2,722 per week, plus 197 tons of spare parts. This may be considered satisfactory, although allocations of materials are restricting us below our capacity of 3,400 per week.

With regard to the actual models we are making, the "A.40" announced last year has built up for itself a world-wide reputation for quality of workmanship and economy of operation, and is undoubtedly the most popular car we have ever produced. The new "A.70 Hampshire" and the "A.90 Atlantic Sports," which are just coming into production, have been extremely well received everywhere, and our output has already been covered by orders a long way ahead; in fact, the demand for all our products—cars, commercial vehicles, utility models, pick-ups, marine engines, etc.—is so phenomenal that figures giving the value of these orders become meaningless. If we sought more orders these figures, and our consequent embarrassment, could easily be increased. At the same time, manufacturers cannot estimate the true value of the business on their books because everyone is tempted to order far ahead of possible delivery.

INCREASED EFFICIENCY

The process of increasing production efficiency at Longbridge continues as rapidly as circumstances permit. New machinery is arriving constantly, although not as quickly as we could wish. The site for the new chassis erecting and body mounting and finishing shop is being levelled and prepared. When completed next year we believe this shop will be the most modern of its kind in Europe, and will certainly compare most favourably with anything of its kind in the United States.

Your staffs were gratified and encouraged by the very favourable comments passed on the Longbridge plant by the American members of the Productivity Council. We are indeed fortunate in the very friendly contacts we have preserved through the years with the large American automobile manufacturers, and in the kindness and courtesy with which they always welcome our engineers on their frequent visits to the United States.

EXPORTS

Your company is proud to continue to play a leading part in the country's export drive. We have over 200 main Austin distributors operating in the world markets, and their good will and their orders continue to grow. During the year under review we sold overseas £18,000,000 worth of vehicles and spares, and, most important of all perhaps, this included $12,000,000 for products sent to USA and Canada.

During the week ended December 4th, the Minister of Supply visited the works and saw a batch of cars leaving for the United States which brought our despatches to the North American Continent up to $22,000,000.

Our most important development in that Continent during the year was the purchase in Hamilton, Ontario, of 30 acres of land with very fine buildings of 135,000 square feet. We have options on the remainder of the site which, if taken up, will make a total area of about 100 acres. Chassis and bodies will be assembled from parts sent initially from here, and the planned output of vehicles to be painted, trimmed, finished and tested there is 500 per week.

The value of the new British plant to be shipped is £200,000, and when completed next year this, the first British automobile plant in North America, will be as up-to-date as any to be found there, and we believe will enhance the reputation of British products in that all-important Continent.

You will also have noted that our Australian factory in Melbourne is doing well, and that we have just bought a 112-acre site near Cape Town in South Africa in readiness for further developments in that country.

NEW CAPITAL ISSUE

You will have received with the notice of meeting a resolution to sub-divide 625,000 of the unissued shares of £1 each into 2,500,000 shares of 5s. each and authorising the directors to issue them as ordinary shares or "A" ordinary shares as they may think fit.

Arrangements have now been completed for the issue of 2,071,556 ordinary shares of 5s. each, subject to the passing of this resolution.

The report was adopted and the proposed sub-division of shares approved.

WALLPAPER MANUFACTURERS, LIMITED

CHAIRMAN'S ADDRESS

At the forty-ninth annual general meeting at the Midland Hotel, Manchester, on the 1st instant, the chairman, Mr Alfred Whittle, F.C.A., dealt in detail with the accounts, which showed a net profit for the group of £3,042,251, an increase of £154,747. Mr Whittle said that the directors recommended the same rates of dividend as last year. An increased dividend would have been recommended on the deferred stock had it not been for the standstill request made by the Chancellor of the Exchequer and sponsored by the Federation of British Industries.

The directors, Mr Whittle said, had long had in mind the difficulty and uncertainty of providing vital raw materials for some of the manufacturing units, and, as previously reported, the whole of the share capital of the Darwen Paper Mill Company and that of James Ferguson & Sons had during the past two years been acquired by the company.

Continuing the policy of ensuring reasonable supplies of vital raw materials, and particularly paper, the main raw material for wallpaper, the company purchased in March last, in conjunction with another paper maker, buildings and plant capable of producing pulp from home-grown straw, of which there was an abundance in this country. The undertaking operated under the name of Straw Pulp Manufacturing Company, Limited and the company held a controlling interest.

TAXATION AND SALES

The board was very anxious to see the purchase tax removed. The product of the industry could very properly be regarded as essential to homes, both large and small, throughout the land. The abolition of the tax on wallpaper would have a direct effect on the cost of living, and the directors felt that brighter and cleaner homes were most desirable from a psychological and hygienic point of view.

An outstanding feature of the period under review had been a substantial fall in production due to the cuts in supplies of paper for the home trade. As regards the future there seemed some ground for hope that production would run at a higher rate, following a recent increase in the wallpaper quota which will bring production up to 50 per cent. of the 1939 level.

The profits tax of 25 per cent. on the amount distributed is intended to act as a deterrent to the payment of dividends. One appreciates the reason for it, but questions the wisdom of levying 10 per cent. on profits retained by companies, because with the heavy additional burden of income tax there is very little left to allow companies to build up reserves for expansion, restocking and replacement of fixed assets.

As reported last year, very serious consideration has been given to the future of our export trade, and after intensified market research a policy has been adopted of producing special collections of wallpaper for individual markets, and this policy is still being pursued at the present time. There are indications that it is meeting with some measure of success, particularly in the United States, although efforts of this nature tend to increase manufacturing costs. Moreover, there are signs of improving demands from the Dominions, but there seems little scope for optimism as to the Continent.

The report and accounts were adopted.

MUFULIRA COPPER MINES

The following is an abridgment of the statement by the chairman, Mr A. Chester Beatty, issued with the directors' report and accounts for the year ended June 30, 1948:

The production of blister copper for the year ending June 30, 1948, was 53,360 tons, compared with 47,498 tons during the preceding financial year. The year was once more seriously affected by the shortage of coal supplies. As a result of this shortage the mine was shut down for fourteen working days, the mill for twenty-one days and the smelter for sixty days.

As from April 1, 1948, the copper mining companies entered into a new arrangement among themselves for the pooling of coal and wood-burning facilities.

The cost of production was £56 3s. 4d. per ton of blister, f.o.b. Beira, compared with £46 8s. 10d. for the previous year. The trend of costs on a unit basis continues to be a rising one, but we have hopes of offsetting this by increased production once fuel is available without restriction.

The revenue on our deliveries of copper, which were made almost entirely to the Ministry of Supply, was £115 8s. 9d. per ton, compared with £83 7s. 7d. the previous year. The profit margin per ton of blister, f.o.b. Beira, was £59 5s. 5d.

COPPER STOCK VALUATION

Last year I reported that the City Commissioners had dismissed the company's appeal on the question of the method of copper stocks valuation and that we were considering an appeal to the High Court. After the fullest consideration and discussion with the company's legal advisers the directors have regretfully come to the conclusion that the prospects of establishing an error in law are so remote as not to justify an appeal to the High Court.

THE ACCOUNTS

The replacements reserve appropriation has been increased to £400,000, an increase of £100,000 over the previous year.

Taxation for the year amounts to £1,612,000 an increase of £790,000 over the previous year, which is a direct reflection of our increased gross profit. The sum of £850,000 has been transferred from appropriation account to general reserve. The net profit is £1,025,302 and adding the balance of profit brought forward from the previous year there is a sum of £1,218,760 available. Out of this the directors have declared a dividend of 7s. 6d. per share, less income-tax at 9s. in the £, absorbing a net amount of £1,008,330 and increasing the carry-forward from £193,458 to £210,430.

FINANCIAL RESERVES

It is a matter of opinion as to how the net financial reserves may be calculated from this balance-sheet. I think it will be generally agreed, however, that even on the most conservative basis, the net reserve position is not unsatisfactory. This matter is specially important under present conditions when the costs of new capital works are so greatly inflated and when there is so large a volume of such work ahead of the company. The replacements reserve now amounts to £1,600,000.

The Board has decided to revert to the prewar practice of issuing quarterly statements of production and profits before taxation. The first of these statements will be published as soon as possible in the New Year. The Board will also give consideration in due course to the possibility of declaring an interim dividend if the profits so warrant.

THE MINE

Ore reserves at June 30, 1948, were estimated to be 86,197,000 tons of 4.05 per cent. total copper at Mufulira or 132,197,000 tons of 3.85 per cent. total copper if we include Chambishi and Baluba.

Given adequate fuel, the mine is in a position to reach maximum output of 7,000 to 7,500 tons of blister copper per month, depending on grade, within a short period of time.

REFINERY

The Board has decided to proceed with the construction of an electrolytic copper refinery to be erected at Mufulira with an initial capacity of 36,000 long tons of electrolytic copper per annum. The refinery is expected to commence production of cathodes in 1952.

The cost of the refinery is estimated to be about £1,500,000, of which £1,140,000 will represent the cost of materials, construction and labour, and £360,000 the tie-up of copper which will be necessary for its operation. The Board still have under consideration the question of financing this refinery.

POWER

As a result of a thorough survey of the copperbelt position, an agreement was entered into with the other copperbelt companies providing for the installation of transmission lines interconnecting the four power plants of the copper companies. At the same time certain additions to the steam power plants were agreed upon.

PROSPECTING

The programme of prospecting and drilling on the outside properties of Mufulira represented by special grants got under way during the year. Interesting results have been obtained by the use of geophysical prospecting methods, which have led to recommendations for the prospecting of further areas which are not yet covered by prospecting licences. This matter is the subject of discussions with The British South Africa Company and other interested parties.

GENERAL

The new pension and cash bonus scheme for European employees operated throughout the year. Under this scheme employees received a 29 per cent. addition to basic wages as their cash bonus, which is based on a copperbelt profit formula.

In conjunction with the other Northern Rhodesian copper mining companies we have sponsored the production of four films made by G-B Instructional, Limited.

MARKET

Our copper continues to be sold to the Ministry of Supply for six months forward delivery. The price basis is the world price for electrolytic copper, although payment to us is made on a blister basis, f.o.b. Beira. I should like to correct a misunderstanding which appears to be somewhat widely held regarding the relationship between the price received by us from the Ministry on this basis and the price quoted by the Ministry from time to time in this country. The latter price represents the Ministry's resale price for refined copper at consumers' works and therefore includes provision for transportation, insurance, refining, distribution, etc., incurred by the Ministry between receipt of the raw material from the producer overseas and delivery of the refined product to the consumer in this country. Further, the Ministry's price is a composite one based on the intake from a number of producers, and thus has no direct connection with the price paid by the Ministry to any one producer.

HARRIS LEBUS, LIMITED

FURNITURE POSITION

The first annual general meeting of Harris Lebus, Limited, was held on the 2nd instant, in London, Sir Herman Lebus, C.B.E., J.P., chairman and managing director, presiding.

The following is an extract from his review circulated with the report and accounts for fifty-three weeks to July 16, 1948:—

The profits (before charging profits tax and income tax) are £421,148 as against the comparable figure of £455,350 computed from the provisional estimate in the Offer for Sale of July, 1947. This is the first trading period of the company and the final position is that, out of the profit of £421,148, profits tax and income tax together absorb no less than £262,250; this leaves a net profit of £158,898. The preference dividend of 4 per cent. has been paid. A dividend of 8 per cent. on the ordinary stock is recommended by the directors.

THE FUTURE

If I were to refer to the long-term prospects of your company I could speak with considerable confidence, conviction and satisfaction, but the trading conditions today are still similar to those which obtained in July, 1947. Your directors said at that time and desire to repeat now, "as regards the future, the furniture industry is still under the control of the Board of Trade and is dependent upon the Government for the supply of most of its materials, in particular timber which is allocated to individual manufacturers by licence to purchase and consume. The demand for furniture and other goods far exceeds supplies, but the manufacturer is not at liberty to purchase his own timber in the world's markets, or design, make and sell domestic furniture without restriction. In such circumstances, the decisive factors in productive activity are outside his control."

It must always be remembered that your company, employing as it does mass and flow methods, can only achieve the maximum efficiency and economy in production if it has an adequate supply of suitable timber and can plan months ahead. In today's circumstances, when the amount of timber that the company may consume is seriously limited and only allocated by the Board of Trade from quarter to quarter, and when much of the timber available is unsuitable for large scale production of furniture, you will appreciate that the nature of the problems your directors have to deal with from month to month is formidable.

EXPECTED CHANGES

Another factor has to be taken into account for the immediate future, namely, the changes the Board of Trade are expected to announce at an early date to the utility furniture scheme. These changes, it is believed, will give the industry a certain measure of freedom of design and construction, but since so far as is known the individual manufacturer will not be free to acquire and consume the quantity and kind of timber he needs to fulfil the volume of orders he may receive, it is difficult to say at this time to what extent your company's business may benefit or suffer.

It has always been the aim of Harris Lebus to provide, especially for the low income groups, an ever growing volume of better furniture, of better design and of better value, whilst maintaining a high standard of conditions for its workers. When your company is permitted to purchase the volume and kind of timber it needs, and when freedom from hampering restrictions returns, then further development of your company's affairs can be confidently expected, and a fair return to the stockholders be maintained.

The report was adopted.

CALCUTTA TRAMWAYS COMPANY, LIMITED

DIVIDEND PROSPECTS

The annual general meeting of The Calcutta Tramways Company, Limited, was held, in London, on the 7th instant.

Sir Geoffrey R. Clarke, C.S.I., O.B.E., the chairman, said:—Mr D. E. Webb joined the board last year, and we have sent him to Calcutta, where he is at present, in order to gain first-hand knowledge of the working of our undertaking and make the acquaintance of our staff. There are also many very important matters that Mr Webb will have to consider and report upon. As he knows the views of the board on all outstanding questions, he will have an invaluable opportunity of discussing them with the heads of the Government in Bengal.

The position at present is not very clear to us, and I am doubtful if the Bengal Government itself has any settled policy, so that it is of the utmost importance that Mr Webb should try to get the whole position clarified, and his visit will, in my opinion, be of the greatest service to the company.

NEGOTIATIONS WITH BENGAL GOVERNMENT

Since the printing of the directors' report and accounts the company's application for the approval of the Bengal Government for the proposed increase in fares has been submitted by the Premier to his cabinet, with the result that they have decided that they cannot accept any increase in the second-class fares, but they have proposed that the company should introduce an all-round increase of one pice in all first-class fares. This, of course, will be a help, but the restricted increase means that the company will take longer to build up its revenue reserves, which were so seriously depleted by the strike and communal rioting, and consequently it will take longer to implement in full the extensive programme of renewals.

As I have said, Mr David Webb will have many matters to discuss in Calcutta, especially that of the intention which the Government announced some time ago of forming a Transport Board for Calcutta. Up to date no definite steps have been taken to create such a Board, but the Government have ordered two hundred motor buses to be put on the streets as quickly as possible, of which I understand there are only about fifty in operation. The rest will undoubtedly be procured, and we, at the request of the Government, are assisting them to train drivers and conductors. These buses naturally run in competition with our trams, but as we are already overloaded and unable to collect all our fares, I do not think the revenue will be materially affected.

For two years now, the ordinary shareholders have been without a dividend, although in normal times the earnings of the year 1946 would have warranted the payment of a dividend of 10 per cent. for that year. I explained at the time our reasons for passing the dividend, in order to conserve our cash resources, and it is as well that we did so, otherwise our finances would have been seriously embarrassed by the disasters of 1947.

I am glad to say that during the current year traffics have recovered, and it is estimated that a reasonable surplus will be earned after paying prior charges. In the circumstances, it is hardly fair to ask the ordinary shareholders to remain without any dividend for a further twelve months, and the board are examining carefully the possibility of paying an interim dividend in the near future.

The report was adopted.

ANGLO-SCOTTISH AMALGAMATED CORPORATION LIMITED

PROBLEM OF UNPRODUCTIVE WORKERS

The twenty-third ordinary general meeting of the Anglo-Scottish Amalgamated Corporation, Limited, was held on the 9th instant, at Winchester House, London, E.C., Mr H. C. Drayton, the chairman, presiding.

The Chairman said:

The gross profit of the Group for the year ended September 30th amounts to £102,090; deducting therefrom directors' remuneration and the auditors' fees, leaves a sum of £92,760. The best comparable figure I can give you is that last year the balance was £69,000. From the figure of £92,760 has to be deducted income tax and profits tax totalling £41,900, leaving £50,800 as the net profit of the Group. £16,000 must be deducted from this, being the profits retained in the accounts of the subsidiary companies, thus leaving £34,500 as the net profit of this company. The amount brought forward from the previous year was £35,900, making an available balance of £70,400.

As a finance company we are in close touch with the industrial life and problems of the country. One of the greatest problems today is the need for higher production and consequent increased exports to allow this country to buy its food, and to achieve that it is estimated that we are short of 150,000 personnel in productive industries. Before the war we managed to grub along on about 380,000 civil servants; today the number is approximately 800,000. *The Economist* newspaper a short time ago made an estimate of the non-industrial civil servants and municipal employees, and brought the figure out to approximately 2,000,000 people. A great number of these are busy enforcing controls. In addition, there are a great number of employees non-industrial in industry today whose sole job is to make applications and work the control systems put in force by the Government.

RELAXATION OF CONTROLS

Certain controls have been relaxed lately, and it would be understandable if one saw a reduction in these non-productive civil servants and municipal employees and that they were re-employed on productive work. I know to transfer men from one industry to another means that one has got to fight vested interests, especially in the trade unions, where it means leaving one trade union and joining another, with a consequent decrease and increase respectively in the contributions to those unions. Nevertheless, it is necessary that these vested interests should be fought, and I am quite certain that if we could see that movement, it would be the greatest fillip this country could receive, and I am certain it would be a big fillip to everyone engaged in industry.

The position today is that all of us in industry, before we can either feed ourselves or our families, have got to put in a certain amount of work to see that these non-productive workers and their families are fed. I leave out the question of taxation, but that is an added burden to industry, and arises, to some extent, through paying the wages of these non-productive workers.

The Chairman concluded by moving the adoption of the report and accounts.

Mr Douglas Hewitt, managing director, seconded the resolution, which was carried unanimously.

A dividend of 6 per cent. and a cash bonus of 8 per cent., both less tax, were declared, and the meeting terminated with a vote of thanks to the chairman and directors.

IDEAL BUILDING AND LAND DEVELOPMENT COMPANY, LIMITED

SATISFACTORY OPERATIONS

The fourteenth annual general meeting of this company was held on the 7th instant in London, Sir Thomas Keens, D.L. (the chairman), presiding.

The following is an extract from the circulated statement by the chairman:

The combined trading profit of the group was £164,547, to which has been added the profits, less losses, on the sale of fixed assets and the income from investments, making a total of £172,932.

The board again recommend the payment of an ordinary dividend for the past year of 5 per cent., less income tax, which entitles the preference shareholders to an additional dividend of ½ per cent., less tax, in respect of their shares. £24,280 is left to be carried forward to the current year.

The trading operations of the company during the present year have been satisfactory and indicate that the profits for the year are not likely to be less than those of the past year. The outlook is still obscure, and I cannot forecast to what extent private enterprise may in future be permitted to play its part in providing the houses which the country still so badly needs. At the present time, however, some small amelioration has been provided by a recent Ministry of Health instruction to local authorities which has reinstituted the ratio of one house built by private enterprise to every four built by a local authority.

As reported at our last meeting, New Ideal Homesteads, South Africa (Pty.), Ltd., was incorporated in the Union during 1947. A nucleus organisation has been formed and steady progress has been maintained.

The report was adopted.

PRICES TAILORS, LIMITED

PROMISING FUTURE

The twentieth annual general meeting of *Prices Tailors, Limited*, was held on the 6th instant, at Leeds, Sir Henry Price (chairman and managing director) presiding.

The following is an extract from his circulated speech:—

The Board has given very considerable attention throughout the year to the building up of adequate stocks which are indispensable to continuity and expansion of trade. The balance sheet reflects our efforts in this direction. The trading profit is £607,491, and having regard to prevailing conditions your Board considers this satisfactory.

The net profit of the Group amounts to £247,007. After deducting the dividends payable and after crediting sundry taxation reserves, there remains a balance of £207,117 of which, as in the previous year, approximately 57 per cent. has been appropriated as ordinary dividend and 43 per cent. has been retained in the Group.

Our efforts have succeeded in keeping out trading in a virile condition and where possible there has been no halt in our work of planning for large-scale expansion of our business in the future. Our large new factory at West Hartlepool is now fully staffed and is producing clothing of a high quality. Our new factory at Sunderland which was opened in July, 1947, is also developing well and gives promise of becoming a keen rival to West Hartlepool. The third of these new factories is now nearing completion at South Shields and we anticipate moving in from our small training factory there early in 1949. I cannot overstress the importance to the business of having these new factories equipped with the latest and most scientific machinery.

On the whole, the future is full of promise for all of us.

The report was adopted.

WALTER SPENCER AND COMPANY, LIMITED

INCREASED TURNOVER

The twelfth annual general meeting of Walter Spencer and Company, Limited, was held at Sheffield, on the 8th instant, Mr E. Ransom Harrison, F.S.A.A. (the chairman), presiding.

The following is his address which has been circulated with the report and accounts for the year to September 30, 1948:—

Considering that the press and hammers were out of production for a considerable part of the year, due to a complete overhaul of the press being necessary and a renewal of the foundations for two of the hammers, the cost of which is included in the accounts, it is highly gratifying that the results of last year have been maintained through this extremely difficult period.

Expenditure on new plant during the year has been considerable, and while the complete scheme of reorganisation will not be possible for some considerable time, temporary improvements have been carried out during the year and put into operation towards the end of the period under review, and the results already justify the anticipation of considerable saving in the consumption of fuel and greater efficiency in production. The commitment for new capital expenditure is approximately £30,000, and I feel sure that the financial resources of the company are adequate to meet this.

With regard to taxation, members will observe that estimated taxation on profits earned for the year to September 30, 1948, has been charged in the profit and loss account and excess profits tax refunds to September, 1946, have now been received and credit taken. The allowance in respect of deferred repairs has not yet been agreed. A substantial increase in turnover for the year has again taken place and our export trade, although hindered by restrictions of import licences, has proportionately increased.

SUBSTANTIAL ORDERS IN HAND

The volume of orders in hand is substantial and we look forward to the future with confidence, although it is impossible to predict what the effect of political policy will have upon business. We have inaugurated during the year a scheme whereby our employees benefit in the prosperity of the firm and this is greatly appreciated, as is indicated by the increased production.

It is with great regret that we have to record the death of Mr Walter S. Thompson, deputy chairman, and grandson of the founder of the firm. We have also to announce the retirement of Mr Joseph Harrison, through ill-health. He had many years of service with the company and we trust his health will improve and enable him to enjoy his leisure. The directors desire to retain the services of Mr Winskill, and to comply with the new Companies Act a special notice of resolution has been received from two shareholders, which will be submitted to you. In this connection, I must mention the great help given by Mr Winskill during this very difficult year of trading.

Your directors recommend a final dividend of 10 per cent., less income tax (making with the interim dividend of 5 per cent., less income tax, paid on May 28th last), a gross dividend of 15 per cent., less income tax, leaving a sum to be carried forward of £7,640. The board wish to place on record their appreciation of the service and co-operation rendered by the staff and workpeople during the year.

The report was adopted.

PEERLESS AND ERICSSON, LIMITED

HEALTHY ORDER BOOK

The twentieth annual general meeting of Peerless and Ericsson, Limited, was held, on the 8th instant, in London, Mr W. J. Merifield (the chairman) presiding.

The following is an extract from his circulated speech: Notwithstanding obstacles, the output from the company's works during the year reached a very substantial total.

In 1947 the company purchased the old-established business of Holbrooks Foundry, Limited, of Coventry. This purchase has been justified in full measure.

The disposal of the company's works at Watford owned by this company's subsidiary, Novobax, Limited, has been completed, resulting in a net purchase price of £152,625 being received subsequent to December 31, 1947. The company's subsidiary, Novobax, Limited, together with that company's two small subsidiaries, Watford Metal Pressings, Limited, and Electro-Plastics, Limited, which operated within the Watford works and were not engaged upon the production of feed preparation machinery, have ceased to trade as a result of the sale of the Watford factory.

Throughout the year under review the order book of the company remained healthy, both for home and export markets.

Production during the present year has been 50 per cent in excess of that of 1947. Sales have been maintained and are being secured at a rate well in excess of the target figure originally set—that is, £1,000,000 per annum. The company has a very large potential market in many countries of the world, and much attention is being paid to expansion of business in these markets.

Your Board feel justified in saying that the results for the present year, 1948, will be ahead of those disclosed for the past year.

A dividend of 30 per cent. less tax was declared, and the report was adopted.

MALAYALAM PLANTATIONS, LIMITED

STRONG POSITION

The twenty-seventh annual general meeting of Malayalam Plantations, Limited, was held, on the 9th instant, in London, Mr H. J. Welch, the chairman, presiding.

The following is an extract from his circulated address:—

Trading profit, before taxation, increased by £36,921, but this increase was more than absorbed by the considerably higher amounts required for taxation. The Board again recommends the payment of a final dividend of 10 per cent., making 15 per cent. for the year. If the current liabilities at March 31st last plus the reserve for the estimated future liability for Indian and U.K. income tax are deducted from the total of the liquid assets the surplus assets amount to £707,784. Subtracting these from the amount of the total issued capital, the properties and equipment, etc., of the company are seen to stand in the balance sheet at the record low net figure of £27 per planted acre. Their replacement value would, of course, amount to many times this figure.

13,204,600 lb. of tea were manufactured during the year and 5,423,793 lb. of rubber. The cost of our tea shows a further rise of about 2.82d. per pound, and that of rubber about 0.36d.

We estimate to produce during the current year 14,400,000 lb. of tea and 5,840,000 lb. of rubber. On the facts known to the Board at present it appears the current year's results should not be unsatisfactory to the members. It is consoling to know that the company has never been in a stronger position than it is today to meet whatever fluctuations of fortune it may experience in the future.

The report was adopted.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

THE INDUSTRY'S PROBLEMS

The annual general meeting of this company was held, on the 9th instant, in London.

Mr Robert Annan, the chairman, in the course of his speech, after expressing regret at the death of Mr Guy Carleton Jones, said: The operating company, New Consolidated Gold Fields, Limited, having declared a dividend of 12½ per cent., less tax, on its ordinary shares, your directors recommend the payment of a like dividend to members of the parent company.

The gold-mining industry throughout the world has had to face a steady advance in working costs with no increase in the value of its product. Everywhere the margin of profit has continued to decrease and the output of gold to decline. It is no exaggeration to say that the industry, so far as its earning capacity is concerned, is now back to the position in which it was 16 years ago, and that increasing costs have completely offset the rise in the price of gold which has taken place in that period. Only a general decline in costs or an increase in the monetary value of gold can alter this situation, and there is no present indication that either is likely to occur in the near future, though some adjustment seems to be inevitable in the long run.

The producing mines managed by our group showed in the aggregate higher figures for tonnage milled and gold produced than in any of the previous five years. The total profit earned, though better than in the previous period, still shows a declining tendency, but the dividends paid by these companies, due mainly to tax reductions, were the highest since 1942.

The report was adopted.

DICTOGRAPH TELEPHONES, LIMITED

RECORD NET PROFIT

The twelfth ordinary general meeting of Dictograph Telephones Limited was held on 9th instant, in London, Mr. Philip V. Summer (the chairman) presiding.

The following is an extract from his circulated statement for the year ended 31st August, 1948:—

In spite of increased international tension and continued austerity at home, your directors are able to place before you trading results which are substantially better than those of any previous year. Although the flow of supplies has been irregular, the rate of production has steadily increased, and during October a record number of telephones was produced.

Having regard to the heavy calls on the liquid resources of the company, caused by increased taxation and expansion of the rental business, the directors recently decided to issue one half of the remainder of the unissued Ordinary shares. There should be no difficulty in maintaining the current rate of dividend on the increased capital.

After providing £54,955 for taxation, there remains a net profit of £48,128. This net profit constitutes a record in the history of the company. A first interim dividend of 6 per cent., less tax, was paid in June last and the directors decided to declare a second interim dividend of 10 per cent., less tax. Thus a distribution of 16 per cent. has been made (same). The directors do not recommend any final dividend.

Given freedom from international complications and the maintenance of normal trade relations and supplies, I look forward with confidence to even more satisfactory trading results for the current year.

The report was adopted.

Statistical Summary

GOVERNMENT RETURNS

For the week ended December 4, 1948, total ordinary revenue was £57,688,000, against ordinary expenditure of £90,489,000 and issues to sinking funds £260,000. Thus, including sinking fund allocations of £10,833,000, the surplus accrued since April 1st is £268,844,217 against £196,266,748 for the corresponding period a year ago.

On December 3rd applications for bills to be paid on Tuesday, Wednesday, Thursday, Friday and Saturday were accepted as to about 31 per cent of the amount applied for at £99 17s. 5d. and applications at higher prices were accepted in full. Applications for bills to be paid on Monday were accepted at £99 17s. 5d. and above in full. £170 million (maximum) of Treasury Bills are being offered for December 10th. For the week ended December 11th the Banks will be asked for Treasury deposits to the amount of £60 million (maximum).

NOTICES

BURSARSHIP AT ST. JOHN'S COLLEGE, OXFORD

The College proposes shortly to elect a Bursar who will be eligible for an official Fellowship. The qualifications desired are experience of administration and finance, and of the management of urban and rural property. The salary offered will be not less than £1,000 per annum, rising to a maximum of £1,500, with children's allowance, the initial salary being fixed according to age and experience. The holder of the office qualifies for a pension at the age of 65. The College is in a position to find accommodation. The person elected will be expected to take up his duties on August 1, 1949. Applications, which should give the names of three referees, should be made to the President not later than February 1, 1949.

UNIVERSITY OF CAMBRIDGE

UNIVERSITY LECTURESHIP IN ECONOMIC HISTORY.

The Appointments Committee of the Faculty of Economics and Politics give notice that they intend to appoint a University Lecturer in Economic History to take office from October 1, 1949. The appointment will be subject to the Statutes and Ordinances of the University. Further particulars can be obtained from the Secretary of the Faculty, the Marshall Library, Downing Street, Cambridge, to whom applications should be sent so as to reach him not later than December 31, 1948. Eight copies of the application should be sent, and, if so desired, one copy of any published work. Testimonials are not required, but a candidate may give the names of two persons to whom reference can be made.

UNIVERSITY OF CAMBRIDGE

UNIVERSITY LECTURESHIPS IN ECONOMICS

The Appointments Committee of the Faculty of Economics and Politics hope soon to be in a position to appoint at least two University Lecturers in Economics. The appointments will be subject to the Statutes and Ordinances of the University.—Further particulars can be obtained from the Secretary of the Faculty, the Marshall Library, Downing Street, Cambridge, to whom applications should be sent so as to reach him not later than January 31, 1949. Eight copies of an application should be sent, and, if so desired, one copy of any published work. Testimonials are not required, but a candidate may give the names of two persons to whom reference can be made.

UNIVERSITY OF LONDON.—The Senate invite applications for the Readership in Demography tenable at the London School of Economics and Political Science (salary £800-£1,000-£1,200). Applications (10 copies) must be received not later than January 20, 1949, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER IN ECONOMIC STATISTICS in the Faculty of Economic and Social Studies. Salary £450 per annum. Membership of F.S.S.U. and Children's Allowance Scheme.—Applications should be sent not later than January 14, 1949, to the Registrar, the University, Manchester, 13, from whom further particulars may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the newly created post of READER IN SOCIAL ANTHROPOLOGY in the Faculty of Economic and Social Studies. Candidates should be interested both in Modern and in Primitive Societies, but their main interests may lie in either field. Salary scale £950 to £1,100 per annum. Initial salary according to qualifications and experience.—Applications should be sent not later than January 14, 1949, to the Registrar, the University, Manchester, 13, from whom further particulars may be obtained.

ASSISTANT COMMERCIAL OFFICERS

Vacancies exist for three Assistant Commercial Officers in Nigeria. Candidates for the first vacancy should possess general commercial experience connected with small industrial enterprises, preferably in a managerial capacity. The chief duties of the post will be to analyse propositions from individual Nigerian business men for the loan of money from the Nigeria Local Development Board to establish new industries, and also to pick out potential new industries capable of being developed by Nigerian capital and to persuade Nigerian operators to invest money therein. Sound commercial judgment and a knowledge of manufacturing processes are essential. For the second post the duties will be to edit a Trade Journal, to write occasional articles on business aspects of the African import and export trade and to guide and generally to advise African exporters and importers. A wide knowledge of business practices, banking, shipping, etc., will therefore be required. For the third vacancy, the duties will be the general supervision of established Government industries such as Palm Oil Mills, Dairies, and Restaurants or the investigation and establishment of new schemes such as Rice Mills and Textile Mills. All three posts are permanent and pensionable, and the salary for each would be at a point on a scale £600—£1,200 (including expatriation allowance) according to qualifications and experience. Candidates should be under 45 and should preferably possess a University degree in Commerce or Economics. —Write for application form, giving *brief* details of qualifications and experience to Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, S.W.1, within two weeks of the appearance of this advertisement.

MARKET RESEARCH MANAGER required by manufacturer in Home Counties. Applicants should have had experience in, if not sole responsibility for, planning questionnaires, controlling field work and writing reports. Salary according to experience, but not less than £850.—Write, Box 906.

A YOUNG executive recently returned from the U.S. now desires a change in employment and seeks post with progressive company with good prospects. Prepared to go abroad. Two-year post-graduate degree in Business Administration from Harvard University. Knowledge of U.S. industry and markets. London University B.Com.(Hons.). Seven years' industrial experience.—Box 911.

THE BOND STREET STAMP AUCTIONS

The H. R. Harmer Saleroom is the Mecca of all serious Philatelists. The auctioneers of the "Find" and "Roosevelt" Collections invite you to contact them if you have fine stamps or Collections for disposal. If you wish to buy, write for Catalogue subscription blank. Airmail editions of Catalogues are available six to seven weeks in advance of Sales. To all serious Philatelists, the H. R. Harmer Service is indispensable.

H. R. HARMER, LTD., 39/42 New Bond Street, London, W.1.
Tel. No.: MAY 0218. Cables: "Phistamsel London."

ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

APPOINTMENTS REGISTER

Employers seeking the services of Certified Accountants are asked to write to the Secretary of the Association, 22 Bedford Square, London, W.C.1. (Telephone: Museum 5163.)

LONDON COUNTY COUNCIL

Applications are invited for the post of principal of the L.C.C. College for the Distributive Trades, 107, Charing Cross Road, London, W.C.2.

The activities of the College include day and evening classes for men and women engaged in or preparing to enter, the distributive trades. The College is equipped with laboratory and commodity rooms, model shops and showrooms. A secondary (mixed) school is also temporarily part of the principal's responsibility.

Business experience and ability, to command the confidence of employers and employees' organisations are required in addition to experience in education or technical training.

Scale of salary: Men £966—£25—£1,050; Women £720—£20—£840.

Application form and further particulars (stamped addressed envelope necessary) obtainable from Education Officer (T.1), County Hall, Westminster Bridge, S.E.1. Form to be returned to the Education Officer by January 15, 1949. (2225)

APPLICATIONS are invited for position of the Executive officer on the International Wool Secretariat. The duties of the post require administrative ability of the highest order, experience in business management and a knowledge of world affairs. The ability to speak French will be an advantage.

The work of the International Wool Secretariat is to promote the use of wool throughout the world by means of a fund provided by Dominion woolgrowers. Branches of the Secretariat are established in Europe, India and North America.

Salary at rate of not less than £3,000 per annum and entertainment allowance.

Applications, stating age and giving full particulars of qualifications and experience and including photograph, should be addressed to Jaques and Co., 8 Ely Place, London, E.C.1, not later than December 31st.

APPLICATIONS are invited for the post of General Works Manager of a large, well-known and progressive manufacturing concern in the Home Counties. The successful candidate will be appointed to the Executive Board of Directors after a probationary period. Applicants should have Hons. Degree in Engineering, Maths. or Chemistry, wide technical and executive experience in process type of industry (preferably foodstuffs). The position will involve the co-ordination at highest level of the work of an executive team of high calibre and proven ability in similar capacity is necessary. The position will carry a big salary as well as pension, life insurance and other benefits. Only men with drive, wide executive experience and a flair for getting things done can be considered. The vacancy is already known to all executives within the Company.—Applicants, giving full statement of education, career and current salary level, should be marked "Confidential" and should be addressed to the Managing Director, c/o Masius and Fergusson Ltd., 40 Berkeley Square, London, W.1.

YOUNG man, at present assistant to Company Chairman and Secretary, seeks similar position of greater scope and responsibility.—Box 883.

WOMAN Barrister (26). Requires administrative post. Box 899.

LONDON STUDENT, specialising in Economics, seeks services of Tutor (University teacher or equivalent standing). Mainly needs an opportunity for critical discussion of whole field of theoretical economics and current problems.—Box 904.

MANAGING DIRECTORS. A young man (39) of proved executive ability in war and peace, with extensive experience in advertising, marketing, public relations and personnel management, offers his services preferably as No. 1 to a managing director or as top executive of a marketing section or a public relations department. Present salary £1,200. Prospects for substantial increase in earnings are desired but the essential condition is that the job should be worth enthusiasm, hard work, and wholehearted concentration.—Write to Box 908.

ADVERTISER in middle thirties has ten years' administrative and executive experience of Market Research-Planning-Development. He desires change. Scope of present position is too limited. Minimum salary considered £1,100-£1,250.—Box 909.

ASSISTANT MANAGER.—First-class experience of Textiles and General Merchandise. Able to work on own initiative, fully experienced with Export Regulations, wanted by Export Merchants for position with great prospects for ambitious man. Offers treated confidentially.—Write, Box A.C. 35262, Samson Clarks, 57-61, Mortimer Street, W.1.

GENTLEMAN, at present Managing Director, Export Company, established 60 years, wishes buy directorship or partnership in firm Merchant Bankers or Private Bankers.—Write, Box P.Q. 254, Deacon's Advertising, 36 Leadenhall Street, E.C.3.

FOR SALE.—*THE ECONOMIST*, 1944, 5, 6, 7, 8.—Box 907.

CHESHIRE.—Georgian Mansion in rural setting; modernised fittings; central heating, mains electricity, public water; ideal for institution, offices, research, hostel, etc.; 5 large reception rooms, 20 bedrooms, 9 bathrooms, excellent domestic offices, about 4 acres (part ornamental lake), greenhouses, etc.; freehold price, £18,500. (Complete furnishings at valuation if required.)—Photos and particulars from Garner and Sons, land agents, Stockport, Cheshire. (Tel.: 2013-4.)

VOGUE'S Cookery Book. Price 10s. 6d. Not available since 1940; now reprinted with added section on wine. Over 400 recipes, carefully selected for all who love to serve good food.—From bookshops or post paid 11s. 3d. from Vogue, 37 Golden Square, W.1.

Financial and Administrative Executive (Chartered Accountant) with extensive experience would like to hear from commercial concern willing to utilise his services in a managerial capacity in U.K. or Overseas where climate temperate. Only an appointment carrying a four figure salary considered. Write Box E619 c/o Streets, 110 Old Broad Street, E.C.2.

ANNUITIES

(Single lives; Last survivor; "Capital-protected"; "Capital-redemption"; Reversionary; Certain; Deferred, etc.)

Circumstances have made annuities an attractive proposition to an increasingly large number of people, particularly now that the capital invested in them can be safeguarded against loss due to premature death. Very considerable loss (up to £2,000 and over in individual cases) has been and is being sustained by the public due to their entrusting the purchase of their annuities to inexperienced and unrepresentative part-time agents. The undersigned has specialised for many years in every kind of annuity issued by the various Life Offices (for all of which he acts impartially and in the sole interests of his clients), and is therefore in a position to advise on those giving the highest NET yield with complete safety.

Descriptive brochure, without obligation, to bona-fide applicants. Box 712.—H. A. OUTHWAITE, Assurance Broker. 'Phone: WES. 3092. Interviews by appointment only.

THE BRITISH BOOT, Shoe and Allied Trades Research Association require an Economist or Statistician for operational research on productivity in the shoe manufacturing industry. A man with a few years' research experience will be preferred. The post is expected to be a permanent one, and is eligible for superannuation under F.S.S.U. —Applications to the Director, Satra House, Rockingham Road, Kettering.

MARKETING, Sales Promotion, and Advertising enthusiast. Manager for front rank manufacturers, also advertising agency experience. Public school man (Winchester) and lately Lt. Col. (Staff). Eats work, welcomes responsibility, uses brains. Seeks new executive post.—*Box 821.*

OTHER NOTICES APPEAR ON PAGE 999

NATAL UNIVERSITY COLLEGE

DEPARTMENT OF ECONOMICS

Applications are invited for a Lectureship in *Economics* which will be either in Pietermaritzburg or Durban. Duties will include encouraging and taking part in Departmental research schemes.

Should the post be in Durban, duties will also include giving lectures to non-European students.

The salary scale is as follows:

Men: £550 x 25—£725
Women: £425 x 25—£600

In addition a cost of living allowance will be paid. The commencing salary will depend on qualifications and experience.

Membership of the University Teachers' Provident Fund is compulsory.

Further particulars and information as to the method of application can be obtained from the Secretary, Association of Universities of the British Commonwealth, 32, Woburn Square, London, W.C.1. The closing date for the receipt of applications is January 7, 1949.

Conciliation in Palestine

TO all intents and purposes, the United Nations has washed its hands of the Palestine problem. The office of Mediator has been brought to an end. In its place a three-power commission—consisting of the United States, France and Turkey—is entrusted with the task of securing a peaceful settlement. But the commission has virtually no instructions and no terms of reference. True, it is to attempt to find a solution for the refugee problem and it has also been asked to work out an international regime for Jerusalem. Otherwise, the Assembly has carefully deleted all reference to any previous recommendations put forward in the name of the United Nations. The partition plan proposed by the first United Nations Commission is not mentioned. The proposals put forward by Count Bernadotte are specifically excluded. The Commission must therefore put out into the stormy seas of Palestine without a compass or a chart.

It is difficult to be optimistic over its chances of securing a settlement by consent. The situation inside Palestine is unsettled and explosive. Rival armies are in the field, sporadic fighting flares up in the Negeb, one dividing line between Arab and Jew runs across the very centre of Jerusalem. Since all previous efforts at mediation have done nothing either to check the victorious advances of Israel or to convince the Arabs that the enemy who is conquering them is a force they must recognise and reckon with, why hope that the present emasculated version of previous policies will have better effect? There do seem, nevertheless, to be two reasons for hope of some kind of settlement. The first is the degree to which both sides are growing weary of fighting. On the Arab side, it is the weariness of disaster, on the Jewish, it springs from the economic strain of maintaining armies in the field. There is, therefore, a mood for at least prolonging a truce, and perhaps it can be exploited. The other factor is the possibility that, in an agreement between Israel and Transjordan, the basis of a settlement exists.

King Abdullah has taken a more realistic view of the Palestine problem than any of his Arab colleagues. His interests are more directly involved. If he looks out from his own mountains of Moab, he can see the tents of Israel on his western skyline. The ostrich attitude of his neighbours—who still refuse to recognise even the physical existence of Israel—is a luxury he can hardly afford. Moreover, he realises that however much the Arab "Government" set up at Gaza under Egyptian and Syrian influence may proclaim the independence of an Arab rump state in Palestine, such a territory could not be self-supporting and would be swallowed up by Israel. That an influential part of Arab opinion in Palestine shares his opinion was shown on December 10th when a congress of Arab mayors and notables held at Jericho invited him to extend his rule to Arab Palestine. More recently his own parliament has agreed that such a solution should be sought "by constitutional methods at the proper time and in accordance with the principles of self-determination." These moves are of course written off by Abdullah's enemies as a mere lust for aggrandisement. But, for lack of other ways out of the wood, ought not this argument to be discounted? Is there not

62862

the outline of a solution to be found in them, and is it not perhaps here that the Conciliation Commission should concentrate its attention and influence?

If a settlement by agreement, and not by conquest, can be assured at all—which is still by no means certain—it is difficult to think of any other basis than that of a compromise between Transjordan and Israel. But no one should underestimate the difficulties in the way of its achievement. The great obstacle on the Jewish side is the fact that Israel is victor—though not over King Abdullah's forces—and may still be unwilling, in spite of the cost, to abandon the military methods which have brought so many gains in recent months. It is a disturbing fact that Israeli opinion regards Transjordan itself, as well as the Arab part of Palestine, as belonging to the area originally promised to the Jews, and Mr Moshe Shertok has mentioned the claim in recent weeks. A Jewish invasion of Transjordan would have to overcome the opposition of Transjordan's still unbeaten army. It would also involve consideration of Britain's military commitments to Transjordan. But the Jews are elated by victory. They are new to statecraft. They are under extreme pressure from the extremists inside Palestine. Their American supporters are not among the more moderate sections of public opinion in the United States. While it is true that every hope of a peaceful settlement now turns on the wisdom and modesty of the Jews' intentions, it is not easy to find much evidence of either in recent manifestations of their policy.

Great as are the obstacles on the Jewish side, it begins to look as though Arab objections will prove even more formidable. If King Abdullah goes forward to negotiate what is—given the wreck of the Arabs' hopes—the only reasonable compromise left open to them, he will do so in the teeth of the opposition of all his fellow leaders. In the first place, it is impossible to reach a compromise with Israel without recognising its existence as a state. This the Arabs have determined not to do, and if King Abdullah "breaks faith," he will incur the wrath of men whose anger is easily directed by religious zeal or tribal fanaticism towards a policy of assassination. King Abdullah's neighbours are also moved by ancient grievances and by their present need to find a scapegoat for the debacle in Palestine. In the past, the King has not always been wise in his attempts to extend his own Hashimite dominion. He has intrigued with the tribes in Syria against the government at Damascus. He has offended Ibn Saud, and, despite a recent rapprochement, a long standing dispute divides them over the ownership of the Transjordan roadstead at Akaba. These difficulties are not confined to the monarchs themselves. The excitable "democracies" of Syria, Iraq and Egypt must explain to an ignorant electorate why Israel has not been driven into the sea, and there will be no easier explanation than that "Transjordan betrayed the Arab League."

All the Arab countries will also be at one in accusing King Abdullah of "selling out" to the British, of being their "stooge," and of providing an opening for that well-worked catchphrase, British imperialism. It is therefore difficult at this stage to see how Arab opinion can be won over or how King Abdullah can fail to become isolated in the heart of the Arab world, an isolation which will be all the more dangerous to him since his outlets for trade must pass through neighbouring Arab or Israeli territory. His only seaport on the Red Sea, Akaba, is no more than an anchorage linked to the main highlands by a single road which is long, bad and uneconomic to maintain because it passes through the desolate Wadi Akaba.

*

The task which faces the Conciliation Commission is thus formidable. On the one hand, they have the Jews confident and ambitious as a result of victory, on the other, a majority of the Arabs who do not accept defeat and therefore can see no point in seeking a settlement. In between lies a possible basis of agreement with Transjordan which moderate Israeli opinion might consider, which King Abdullah would almost certainly accept but which, in their present mood, the rest of the Arabs may violently reject, thus opening the door to further fighting and to an Israeli absorption of all Palestine and possibly more. What, in such a situation, is the Conciliation Commission likely to accomplish?

They appear to have three cards to play. The first is to bring home to the Arabs the consequences of a further Israeli advance. The second is to persuade the Jews that internal stability and international and particularly American support will depend on not extending Israel's frontiers to a point at which King Abdullah himself will be forced to turn and fight again. The third is to convince non-Communist opinion in Israel and educated Arab opinion—what there is of it—that the continuance of war and turmoil can have one consequence only—the despair of the masses, the rise of Communism and the extension of direct Soviet influence into the Middle East. Already, particularly among the refugees, social dissatisfaction is flaring up and taking either of the two available forms—Utopian Communism or Moslem fanaticism. The whole ground is beginning to quake, and the various states' only hope of peaceful evolution is to put an end to the present disorder and to begin, with all the assistance western capital can offer, to rebuild a more prosperous and inviting future for the mass of the people.

These are not, admittedly, strong cards to play. They demand from the Jews a moderation and from the Arabs a logic which are not conspicuous at present. Above all, they demand the utmost unity and forcefulness within the Conciliation Commission. The Turks will certainly see the absolute necessity of pacifying their Middle Eastern hinterland. The French are a doubtful factor since their resentment at British mishandling of their Levantine aspirations in the past may prove stronger than the solidarity which Western Union might be supposed to create today. The Americans are at once the key and the question mark of the whole Commission. Their influence with Israel could be immense. It is from them—and particularly their oil interests—that capital for the peaceful development of the Middle East could come. But on no subject have the Americans proved more unpredictable than in their dealings with the Palestine problem. All in all, there seem to be very few grounds for supposing that the Commission will fare better than has any previous effort of pacification initiated by the United Nations and if this disappointing possibility in fact proves true, the situation in Palestine will be determined, as it has been throughout 1948, by force of arms—with incalculable and disastrous consequences not only for the Middle East, but for the west.

PRESENT PROBLEMS

We all number among our friends at least one who seems to have everything he could want: the Christmas present for him is the most difficult of all to choose.

The Economist Diary — which combines in one volume a memorandum book, an appointments register, and a complete reference book — is the ideal present for the busy man. It will be in constant use on his desk throughout 1949.

Price: in the U.K. (including Purchase Tax) 36/8, or 37/6 post free; overseas 32/6 post free. Published by Messrs. Charles Letts & Co., Ltd.

Full details are given in the illustrated pamphlet available from:

The Economist Intelligence Unit,
22 Ryder Street, St. James's, London, S.W.1.

The Cost of Parenthood

RATHER reluctantly and with a sense that there are much more important things to attend to, public attention is being focused again on the status of the family. Between the wars, the connection between family size and primary poverty was made painfully clear by successive surveys; now interest is stimulated by the equally evident connection between the decline of family life and the growth of juvenile delinquency. Experts on population, intent throughout on the long perspective of demographic trends, are renewing the warnings of the inter-war years as, quarter by quarter, the evidence emerges that the war and postwar boom in births is over. Within a few months the long-awaited report of the Royal Commission on Population will bring the subject right back to the centre of the stage.

The elements in modern industrial society which are hostile to the family have been generally recognised for a long time, and successive governments of recent years have been trying to counter them. Family allowances, income tax relief, food subsidies, free school meals and milk, housing subsidies, maternity benefits and other social services, not to speak of the double-edged institution of free education, have all been directed to this end. The "disinherited family" has received an earnest of reinstatement. But it is far from certain that the state has been clear about its motives in so acting; on the contrary, two quite distinct motives have been hopelessly confused. The first of these motives, which is the older and still the stronger influence on social legislation, springs from the desire to prevent poverty. It is in the large families of the wage-earners that the bitterest, and least deserved, poverty appears. So long as it is impracticable to vary wages according to the size of the employee's family, standards of living must necessarily be lower in the large family. It is therefore the children who feel the keenest edge of poverty and the humanitarian state must step in to assist.

The second motive, more recent in origin but gathering in power as population problems come to the fore, is an attempt to influence the birth rate—not, indeed, to bribe parents into having children, but to remove some of the heavy economic burdens that might deter them from doing so. From this aspect, absolute needs are less important than relative disadvantages. If the object is to influence the birth rate, it is not enough—except at the very lowest income levels—to assure the parent that the child will not actually starve; the father and mother must also be assured that the child's standard of living—and their own—will not fall disastrously below what they are accustomed to, or below what they could achieve if they limited their family.

Thus both policies—the relief of destitution and the influencing of the birth rate—require the support and rehabilitation of the family. But they require very different methods of accomplishing this purpose. The two policies do coincide, it is true, in the case of the very poorest families. Five shillings a week for each child is an important addition to the family income where the breadwinner's wage is only £5 a week. Indeed, it has been calculated that the five shillings fairly exactly equals the extra cost, to such a family, of a second child. If this is so, the family standard of living is not lowered as the family grows—not, that is, in terms of money, though it well may be in terms of congestion and lost leisure. But if the policy of rehabilitating the family stops short at this point, it will influence the birth rate only at the lowest levels, where an increase is least necessary and often least desirable.

This, perhaps, is the most compelling reason why the policy of family rehabilitation, if it is to exist at all, needs to be thought out again from the start. It would be wise to recognise that there will be strong resistance to any suggestion of helping the large families of the more well-to-do. It is so easy to miss, or to misrepresent, the essential point. If, for example, it were proposed that the children's relief from income tax, instead of being a fixed sum of £60, were to be a given proportion of the taxpayer's income, so that a man with £1,500 a year would get a bigger relief than one with £500, then the cry would go up that the children of the rich were to be subsidised at the cost of the poor. But that would not be so; for larger allowances would mean that the standard rate of tax would have to be higher than it would otherwise have been; and that in its turn would mean that the childless taxpayer with an income of £1,500 would find the relief for his quiverful colleague.

*

The test of any policy, after all, is in its effect. If, for the £1,500-a-year man and his wife, a large family means a sharp fall in standards of living, then *pro tanto* they will be induced to limit their family. If they are to be relieved of this disincentive, it must be by methods that apply, and appeal, to them, and not by those that have relevance only to the farm labourer. It is probably too much to ask, at this juncture, that the hard-pressed state should provide any positive assistance for a family not of the very poorest class. It might, however, be asked to pause and realise how many of its actions actually make the position of the family worse instead of better. Even at the income level of £9 or £10 a week is has been calculated that the gap in welfare between the large and the small family has actually widened since before the war. *A fortion,* to the salaried worker and to the wealthy, the changes in prices and in taxation have imposed an enormous new burden on the large family relative to the small family in the same range of income—apart altogether from the powerful effect of labour shortages and the general difficulties of housekeeping in the modern age. Whatever the state's intentions may have been, the actual effect of its measures, combined with external circumstances, has been to put an enormously increased premium on sterility.

The illogicality, viewed from this angle, of many of the existing measures is rarely realised. The food subsidies, for example, are often cited as a practical and automatic grant-in-aid to the family. But they are an uneconomic and haphazard way of either preventing hardship or removing the differential between the small family and the large. They make just as much difference to the household expenses of a wealthy and childless couple with five servants as they do to those of a £4-a-week breadwinner with half a dozen dependants to support. Indeed, they actually represent a progressively increasing subsidy to the wealthy, for the money saved to the surtax payer represents, when grossed up at the ratio appropriate to his income, anything up to forty times its nominal total. In so far as the larger family spends a greater proportion, at all income levels, on food than the smaller family, the subsidies do favour parenthood; but once the family income has reached an amount ensuring that rations can be taken up, they become subsidies to general spending rather than nutrition, and at no point do they subsidise dependants as such. Large families and the poorest consumers generally would benefit much more from an increase of family allowances and social security payments—which *The Economist* has consistently advocated as a concomitant to any serious cut in the subsidies.

Maternity benefits and other social security payments referring directly to the family situation are, of course, more discriminating. They both help to avert or alleviate hardship and, at the lowest income levels, significantly reduce the differ-

ential. Higher up their equalising effect is, once again, welcome but insignificant. No taxpayer, whatever his income, can get more than £27 a year net relief for each child which, in the upper range of income, may be little more than a tenth of what the parent actually thinks it necessary to spend. It is open to anybody to say that the professional man ought not to spend hundreds of pounds a year on a child. The fact is that he does; and so long as the size of his family makes no perceptible difference to the taxation he pays (at an income of £3,000 the married man with three children pays 93 per cent of the taxation of a childless couple) he will consider himself severely penalised by every increase in his family; and he will act, or refrain from acting, accordingly.

This is not the end of the present illogicalities. It has long been apparent that the law of income tax, in persisting in regarding husband and wife as one person for tax purposes, has in fact been putting a financial premium on unions unblessed by church or state; and even in this tolerant age an obstacle to marriage is still a brake on child-bearing. But, as a recent letter to *The Times* pointed out, the state's recent attempt to remove the penalty on marriage has resulted in inflicting a stiffer comparative penalty on parenthood. Since the extension of the wife's earned income relief a childless couple, each earning half the family income, actually pay less tax than the single breadwinner with two dependants. The margin of advantage to the childless increases rapidly with income. In the upper reaches, indeed, the childless working couple actually pay less tax than the single breadwinner with *five* dependants. When one considers these figures one really marvels at the strength of that philoprogenitive instinct which, in a world of largely optional parenthood, keeps the family in existence at all.

The various social measures that are aimed less at rehabilitating the family than at doing the jobs which the family in its decline is failing to do—youth services, welfare services, school meals and transport, and so on—undoubtedly benefit their recipients. It is arguable, however, that in the long run they set up a vicious circle, both economically and psychologically. The taxation needed to run them comes, after all, out of the pockets of family breadwinners among others. And psychologically the sense that *They* will provide, that *Our* wellbeing is *Their* business, has a way of seeping down from the older to the younger generation, with unhelpful effects on the self-reliance and responsibility which make good citizens now and good family heads later.

The long-run problem of the family is obviously not urgent; not as the coal problem is urgent, or the productivity problem, or the balance-of-payments problem, or for that matter the problem of today's undernourished, ill-housed, neglected or dishonest children. It is difficult to ask that attention should be diverted from these problems and that measures should be taken which might make their solution harder, in order to re-establish those foundations of national life which, though cracking, have not actually given way yet. Statesmen are busy, resources are overstrained, and there is no conveniently appointed harmony between long-run family welfare and immediate national needs. No single change would do more for family life than an end to the housing shortage; but present families will be ill served if the swollen housing programme contributes to driving Britain into international bankruptcy. The radical fiscal changes needed to abolish the economic incentives to sterility might easily wreck what remains of the economic incentives to productivity, with similar results.

Nevertheless, it is reasonable to plead that the interests of the family, as such—and of the family at all levels of income—be rated higher than they are now; that, for instance, higher children's allowances be preferred, in any lightening of the tax burden, to a cut in standard tax rates; that the large family be the first to benefit by any expansion of the social services and the last to suffer from any "axe"; that measures designed to enable the family to do its own job be given precedence over measures designed to compensate for its failures. Equity apart, it will be poor consolation to the Britain of a couple of generations hence—Caroline Britain, one might say—to possess splendid schools, spacious playgrounds, well-equipped social clubs, a whole apparatus of protective legislation and all the rest of the furniture of Utopia, if there are neither enough children to use them nor enough productive workers to pay for their upkeep.

Paramilitary

AMONG the mysteries of the Iron Curtain none has been more baffling than that of the "Paulus army," the German force alleged to have been organised within the Soviet Union from German prisoners of war under the direction of captured German generals who gave their services for anti-Nazi propaganda from Russia after the disaster at Stalingrad. Many political observers are disinclined to believe in the existence of such an army, partly because they doubt whether Russia would permit any considerable body of Germans to bear arms and partly because there is some evidence that the Communists in Germany have themselves been spreading the story of the Paulus army for purposes of intimidation. On the other hand, the Russians have achieved an astonishing degree of secrecy with regard to every kind of military preparation, and the prewar ignorance about Russian armaments and strategic facilities—which, as we now know, affected the calculations of all the General Staffs, including the German—should teach us to be cautious in dismissing outright possibilities of surprise from behind the Iron Curtain merely because adequate direct evidence is not forthcoming.

The question whether any German armed force exists within the Soviet Union ready to be moved into Germany when required by Soviet policy is distinct from the issue raised by the formation in the Soviet zone of Germany of a *Volkspolizei* armed with light automatic weapons. The two questions are indeed connected, for the *Volkspolizei* has been largely recruited from German prisoners of war who have passed through courses of political training in Russia and have recently been sent back to Germany; General von Seydlitz and other high-ranking officers of the former German army have been assisting in the organisation of this new force, which, though nominally a police corps, is to have a definitely military quality and discipline. Its members are encouraged to join, not the Socialist Unity Party, but the National Democratic Party, which was recently formed in the Soviet zone to attract ex-Nazis, and which specialises in a pro-Russian nationalist appeal, with emphasis on the unity of Germany to be brought about with Russian support.

In discussing the significance of this trend it is necessary for anyone brought up in a liberal democracy to free his mind from certain preconceptions about the use of force in politics. The liberal mind instinctively clings to the belief that somehow violence is not effective, that the pen is mightier than the sword, that truth will prevail and that the public opinion of a country is what really matters, whereas on the side of the totalitarians, whether Fascist or Communist, there is ever the faith in the ascendancy of the armed and disciplined minority over great masses of human beings. In the totalitarian camp, moreover, there is a clear perception that force as a political instrument is relative. A man who is totally unarmed does not need an atomic bomb or a heavy tank in order to be intimidated; a revolver or a rubber truncheon may be quite sufficient. For actual war against a nation of comparable strength the maximum of manpower and armaments must be brought to bear, but when it is a question of dominating civilian populations—especially where a previously established state structure has been disintegrated or greatly weakened—decisive results can be achieved with very small and lightly armed forces, provided that they are well organised and used ruthlessly.

The term "paramilitary" may be used to cover all formations, private or state-supported, organised for the bearing of arms outside regular army establishments. Paramilitary forces are significant for external war only if a nation has by treaty been subjected to some degree of military disarmament. Normally, when a nation is free to have as many soldiers as its legislature will budget for, there is no advantage in having armed forces which are not part of the regular army or legally under its control; the existence of irregular units under ordinary conditions is as distasteful to the military authorities as it is alarming to those responsible for civil order. But when a country is subjected to a compulsory limitation or abolition of its regular armed forces as a result of defeat in war, the militarisation of the civil police and the encouragement of private irregular organisations of a military type may be ways of evading the treaty obligations and increasing military strength beyond the permitted limits. In Germany after 1918 there was an incessant effort by the military authorities and nationalist political groups to revive German military power, or prepare for its revival, in defiance of the Versailles Treaty, and it was in the early days of the Weimar Republic that the "Black Reichswehr" and Freikorps provided the environment in which Hitler and the Nazi party passed their political infancy.

*

Generally speaking, paramilitary formations are of very little use to a regular army which has to prepare for the fighting of pitched battles against a foreign foe. If the irregular units cannot be incorporated in the regular army for training purposes and given experience in the tactical handling of all kinds of weapons, they cannot be employed in the field without retraining and reorganisation. From the point of view of supplementing national military strength their most important function in Germany under the Weimar Republic was to keep alive the martial spirit and accustom a number of young men to military discipline, which, in the absence of conscript service, they would not otherwise have undergone. If, on the other hand, any German units are now being trained in Russia, they could be kept in a state of military efficiency as part of Russian army formations.

It is, however, for civil war or for political terror that forces of the Freikorps type are most effective, as the recent history of Europe has abundantly shown. From the beginning the "Black Reichswehr" groups in Germany had a certain political alignment; they were necessarily against pacifism, against all parties which wanted to fulfil the obligations of the Versailles Treaty, and in general against the democracy which was regarded both as a cause and as an effect of Germany's defeat and humiliation. Later, with the rise of the Nazis, the various chauvinist paramilitary groups were largely merged into the paramilitary formations of the party, the SA and the SS. The private army of a political party is not intended primarily for foreign war, but for the coercion of political opponents and the seizure of power in the state. It is a phenomenon of very recent history, with hardly any precedents in the eighteenth or nineteenth centuries.

The strong monarchies which replaced feudalism tolerated no private armies, and the liberal state inherited a political order from which private warfare had been eliminated, quite apart from its own principles of peaceful persuasion and free election. But with the emergence of political parties organised as mass movements and yet aiming at exclusive dictatorial power, there naturally appeared forms of military organisation designed to give such parties the means at least for the "conquest of the streets," if not for a direct *coup d'état*. In Russia the Bolshevik party was intended by Lenin to be a military, as well as a political, organisation; having to work underground under the Tsardom, it could not build up openly a party militia, but when the regular army dissolved after the fall of the monarchy, it was able to form the "Red Guard" detachments from which were created later the Red Army and the internal security forces under the control of the party-state department successively known as the Cheka, the GPU, the NKVD and the MVD. In Italy and Germany a somewhat different development took place; the Fascist and Nazi parties, taking advantage of conditions of political freedom, openly organised their street-fighting formations, the *squadristi* and the SA. These forces could never have seized state power in direct collision with the regular army in either country, but in neither case was the army used to prevent the creation of the party dictatorship. When the Fascists and Nazis came to power, their paramilitary forces were given official status and police powers for dealing with the party's political opponents.

During the war national guerilla resistance to Nazi domination in various countries was mingled with the rise of political party armies, mostly Communist, which had in view a post-war struggle for power. In France fighting groups of the Resistance have remained as potential civil war combatants in both the Communist and Gaullist camps, and there is reason to believe that both are well provided with small arms. In eastern Europe the Russian armies everywhere disarmed non-Communist Resistance forces and gave the Communists a

monopoly of armed strength. In Czechoslovakia the decisive instruments of the seizure of power were the special Communist police detachments organised by the Communist Minister of the Interior in what was nominally a coalition government and the factory militia units formed from workers. In Germany the Soviet zone will soon have in the *Volkspolizei* and in factory militias which are being formed civil combat forces exclusively in the service of the Communist party and its fellow-travelling National Democrats, and these forces are significant because there are elsewhere in Germany virtually no German armed elements to oppose them.

It is very important that the public both in Britain and the United States should clearly understand the issue with which they may be confronted if Russia proposes the withdrawal of all Allied armies of occupation from Germany, or even simply from Berlin. Russia certainly will not make such proposals unless there is confidence in Moscow that in a Germany emptied of Allied troops and devoid of a regular army the Communists will have a decisive advantage in a competition of violence and terror. There can be no doubt from all available information that free and peaceful politics throughout Germany would put the Communists in a small minority. But it does not matter that 90 per cent of Germans would vote against Communism if Communism has 90 per cent of the armed power. The Communists believe in getting power first and holding elections afterwards. The question is whether there would be any way of guaranteeing a balance of power in Germany after withdrawal of Allied armies from Germany except by building up in western Germany paramilitary forces strong enough to resist those under Communist control. Such competitive arming of Germans would not only tend towards an unlimited remilitarisation of Germany—of which ex-Nazi and militarist elements would take full advantage—but would be preparation for a civil war which in its threat to involve the backers on both sides would be a far more dangerous threat to peace than the present struggle for Berlin. The only rational policy is for the western Allies to resolve to maintain, pending a radical change in international relations, some form of military occupation of their zones in Germany. So far there has been no adequate consideration in western countries of the consequences for internal order of the complete demilitarisation of a state, such as has been decreed for Germany and Japan. In a really peaceful and harmonious world the policeman's truncheon might be enough to uphold the authority of the state and secure the rights of all citizens, but in the arena of actual politics a vacuum of regular military power is simply the gangster's dream.

The Northern Coalfields

(By a Correspondent)

THE National Union of Mineworkers is now collecting evidence from its branches about the measures they are taking, or propose to take, to deal with absenteeism. This inquiry follows the rejection by the majority of districts of the Joint Output Committee's scheme for setting up joint attendance committees at the pits, with power to impose fines on persistent absentees. As soon as the union reports have been completed, the output committee will meet again.

There is certainly no time to lose. It is true that last week's total output was the highest for eight years and that output per manshift is above its 1938-39 average. But the weeks before Christmas always produce a spurt in production and are followed by a slump. And it would take more than a spurt to bring production for the year up to the target, since, with only four more weeks to go, the output of deep mined coal was 18 million tons short of the target of 200 million tons. For the country as a whole, absenteeism is still above last year's level, and nearly twice as high as before the war. In the New Year, involuntary absence will increase with the onset of the sickness season, and voluntary absence will no doubt be affected by the prolongation of holidays. If the 1949 targets for home production and exports are to be reached, drastic action against absenteeism will be needed. This is the most direct way of securing a short-term increase in output, for a reduction of only one point in the absenteeism percentage would add 2,000,000 tons a year to output.

The degree of absenteeism varies widely throughout the country. The coalfields with the best attendance records are Durham and Northumberland (which compose the Board's northern division) and Scotland. The north-east division, with about 18 per cent absenteeism at the coalface, is the worst offender. If Yorkshire's rate of absenteeism at the face were reduced to 10 per cent, another 4,000,000 tons would be added to the nation's annual output.

The salient facts about absenteeism are well known. It is more serious among the younger men (between the ages of 21 and 35) than among the older men. It is higher among contract men—that is, piece workers—than among day wage men, and among men who are new to the pits than those drawn from the mining community. It is lower in collieries near mining villages than in those in the neighbourhood of towns, and tends to be lower among men who live in good housing conditions. It is at its highest on Mondays and Friday afternoons, and it assumes grotesque proportions on the voluntary Saturday shift. It is not uncommon then to find a rate of 40 to 50 per cent among piece-workers, which means that the men who do turn up and are anxious to work overtime often have to be sent home. Colliery after colliery in Yorkshire is abandoning Saturday working as hopeless and uneconomic; the same is true in Durham, though not in Northumberland, where the extra half hour is worked.

Absenteeism bears a direct relation to wage rates. Hewers at the coal face and many other piece-workers frequently earn such good wages that they do not mind missing occasional shifts, especially on a Monday. The incidence of PAYE is certainly another strong disincentive. The average miner is a fairly heavy spender, but when he has earned up to a certain point (say £8 or £10 for four shifts worked) he prefers to buy leisure rather than goods or savings.

Shortage of food is sometimes cited as a cause of bad attendance. This is less easy to establish. It is certainly claimed that shortage of fats is having a bad effect, and at some collieries which were visited on a recent tour of the northern and north-eastern divisions, men were starting their shift on bread and jam—hardly the most sustaining diet for an arduous day's work. But, generally speaking, if the men made more use of their canteens—many of which are excellent—this excuse could not be sustained. There is still a great deal of hostility towards canteens, just as there was until very recently towards pithead baths; the men prefer to take their meals at home and point out that they are in any case giving their wives the housekeeping money with which to feed them.

Absenteeism, whether during the week or on Saturday, is not the only obstacle to production. Other forms of indiscipline, such as late arrival and early knocking-off, failure to complete a stint or to prepare the face for the next shift, are all receiving the attention of pit committees, without so far yielding much improvement. Far too much output is still being lost by unofficial stoppages, which coal board and union officials alike agree could be avoided if the men made use of their conciliation machinery. This machinery, established under national agreement, consists of nine stages, with time limits set for each. These range from the settlement of a dispute on the spot between the deputy and the men, to arbitration before an umpire. Yorkshire is again one of the black spots. Last year (largely because of the Grimethorpe dispute) it accounted for 872,700 tons of the national total of 1,643,000 tons lost through stoppages. This year, with a national figure of 861,000 tons lost, Yorkshire is again responsible for more than half. In the northern division, on the other hand, relatively little output has been lost through disputes. Last year there was the unfortunate winding enginemen's strike (which cost 90,000 tons), and altogether 84,763 days and 115,952 tons were lost. This year, industrial disputes have been kept at a minimum and only 31,000 tons have been lost through disputes so far. This is attributable to the prompt settlement of grievances in the division before they develop into major issues and to a high standard of trade union leadership.

There is no doubt that fatigue and strain, particularly among the older men, play a part. This is especially true in the pits where the seams are narrow and conditions cramped, or where, as in the deep pits of South Yorkshire, men work in an excessively hot and dusty atmosphere. But even when all the natural and physical drawbacks are allowed for, the truth must be faced that a large part of absenteeism is due simply to a minority of men who will not co-operate with any system of industrial discipline. In Yorkshire, absenteeism is spread over about one-third of the men: perhaps 10 per cent might be regarded as non-cooperative.

*

Many of the older miners, who have vivid memories of the long struggle for nationalisation, resent the irresponsible attitude of the minority. They object to the type of postwar recruits who have been "wished upon" them, even more than to the Poles and other foreign workers, and are anxious for stern measures to be taken against them. The pit consultative committees regularly review the absenteeism records and discuss how to improve them. In Yorkshire, the most usual method of dealing with absenteeism is to dismiss the hopeless cases, after they have been interviewed and given fair warning. Since January, 600 men have been dismissed from the division, on the advice of the pit committees. Some have left the industry altogether, after consultation with the Ministry of Labour, which still maintains a ring fence round the mines. Others, sacked from one colliery, may find work in another, unless they have been black-listed in the neighbourhood. In many cases, of course, dismissal is no punishment, but rather the easiest way for the reluctant recruit to the industry to get out of it.

Another method, which is probably more effective, especially in dealing with marginal cases, is that of "down-grading" piece-workers to day wages for a stated period. This practice is widely adopted in the northern division. It is undoubtedly an effective sanction. This method does not, of course, apply to haulage workers or other men on day wages, and in the northern division day workers are warned or fined, on the initiative of the pit committees.

Some union leaders are now pressing for the re-introduction of the wartime system of fines, imposed by Regional Investigation Officers, assisted by an assessor from each side. In Durham, between August, 1943, and August, 1945, more than 36,000 cases of absenteeism and indiscipline were dealt with in this way. About half were fined £1, which was refunded if the men made good, the remainder being placed on probation, warned or left alone. This scheme, which was undoubtedly effective, was abandoned by Mr Shinwell, who thought that the miners should be put on their honour. It is interesting to note that the demand for the revival of this scheme comes from Yorkshire, which was the first to reject the output committee's scheme for joint attendance committees. The miners' objections were not, in fact, due to the proposal to impose fines, but to the saddling of union officials, who rely upon popular support for re-election, with responsibility for penalising the men.

It is to be hoped that as conditions in the mines become more settled, and miners more willing to accept the obligations which the necessity of a high output under nationalisation imposes, absenteeism and irresponsibility will decrease. But they will not do so without resolute efforts on the part of the miners and the Coal Board to remove the causes which give rise to them. At present, there is too great a tendency to sit down under the problem and to assume that absenteism is either irreducible or will reduce itself. If the National Coal Board is anxious to prove that it is a businesslike concern, it will apply itself to the task of eliminating a cause of wastage which would be intolerable in private business, and the joint output committee will have done little to justify its existence if it confines itself to a series of reports. This is not a question that can be solved by paperwork.

NOTES OF THE WEEK

Christmas Recess

Parliament adjourned this week for Christmas after eight weeks of a session which has been typical of the fourth year of a Parliament. Apart from the Steel Bill, almost all the thirty odd Bills presented so far are either minor ones or, like the Coal Industry Bill and the National Service Bill, are tidying-up measures or non-controversial ones such as Legal Aid and Civil Defence. The truth is that the decks at Westminster are steadily being cleared for the battle of the general election. One election issue is ready to hand in the Steel Bill. The Opposition onslaught on the Minister of Defence is an indication that a general charge of Labour's inefficiency will be one of their main lines of attack. In the foreign affairs debate, also, Mr Churchill, though urging a bi-partisan foreign policy, underlined a separate Opposition policy on Palestine and hinted at one on Spain. The Opposition will also have to make up their minds shortly on their policy towards the Government's Four-Year Plan, to be published shortly as a White Paper. The Opposition are committed to American aid in principle, but are they to accept the Four-Year Plan for using that aid as it stands? If so, they may find, if they win in 1950, that their economic policy has been largely decided for them in advance.

On the Government side, Mr Morrison is reported to be about to retire to the Cornwall coast to meditate his strategy. One likely development in Labour's 1950 election policy will be some scheme for greater control of food distribution, based in principle on the Lucas Report. Mr Strachey hinted at this last year, and the present Agricultural Marketing Bill has been designed largely as an interim measure until wider and more definite action has been discussed. What other measures will be put forward depends upon the relative strength of Mr Morrison's own doctrine of consolidation as against Dr Dalton's and Mr Mikardo's desire to press on with the creation of the Socialist State. In the meantime Mr Morrison, following out the recommendations of the last committee on Standing Orders, has performed a service to the House by announcing the provision of seven days between Christmas and Whitsun for the second reading of private members' Bills, and three days after Whitsun for the third reading of those that survive. What cuts are waiting in the bag has not yet been revealed.

* * *

Mr Bevin's Report

From time to time, Mr Bevin reports to the House of Commons on the state of international affairs. He wanders from subject to subject in a somewhat aimless and disconnected fashion, picking up here a topic, there a topic, as though his speech were

simply a sum of different paragraphs contributed by the various departments in the Foreign Office. His speech in last week's debate on foreign affairs was no exception. It had the same formlessness and the same departmental stamp. And it illustrated all over again two features of the method which present severe disadvantages to the discussion or even perhaps to the effective prosecution of foreign policy.

The first disadvantage is that the totally discursive method gives no true picture of the general shape and direction of the Foreign Secretary's policy. In the last 18 months, Mr Bevin has had a hand in developments which can genuinely be seen as part of a rounded and consistent policy of western association and defence. Little of the present achievement—in ERP, in Western Union, in the Atlantic Pact—could have come about without British initiative and pressure. Yet the sense of a grand strategy was totally absent from Mr Bevin's remarks. Nor did he make much attempt to relate certain phases of current policy to the wider interests of Western Union. In the matter of the Ruhr, it was left to Mr Eden to raise the question whether the integration of the heavy industry of western Europe as a whole might not prove a more constructive method of combining German recovery with control of German power. Mr Bevin gave the impression that his thinking had not moved from the vague ideas on nationalisation of Ruhr industry which were no more than ideas two years ago when Britain still had the last word in the management of the Ruhr. Yet the political scene has changed and developed out of all recognition since those days. Again, Mr Bevin did less than justice to the French as partners in European recovery when he bluntly warned them off the production of luxury goods and sniggered at innuendos to be discovered in the importing of French literature.

These shortcomings in dealing with the French and German aspects of British policy illustrate the other great defect of Mr Bevin's approach—that he gives no picture at all of future developments. The British people are, in fact, engaged on a most striking and fateful adventure—that of finding ways of linking themselves with their neighbours on both sides of the Atlantic in a fashion previously unheard of in time of peace. The adventure could be stimulating and enthralling if some of the right words were found to propound it, if some spirit of courage and hope were breathed into the dry diplomatic forms. But Mr Bevin seems to have lost—for the time being—some of those flashes of imagination which have in the past illumined his reports. The British are doing a very remarkable thing in a very dull way—so dull that their neighbours have not an inkling of how remarkable it is. Can such ignorance and flatness really serve the Foreign Secretary well?

* * *

Bipartisan Policies for Britain?

It is difficult for the Opposition to raise the issue of general foreign policy when the Foreign Secretary has steered studiously clear of it. Yet in last week's debate on foreign policy, both Mr Eden and Mr Churchill succeeded in raising their speeches above the level of simple variations on Mr Bevin's various themes. Mr Eden gave a far greater impression of having attempted to think out the implications of closer association in the west and one of his suggestions—that a way out of the deadlock over the Italian colonies might be found in attaching the trusteeship to Western Union—certainly deserves careful examination. Mr Churchill, too, raised issues of general importance. He made a strong attack on the Government for excluding the Opposition from the conduct of foreign policy and appealed for the spirit and practice of bipartisanship which has given such notable strength to American foreign policy since the war. In particular, he resented and attacked the attempt to "unite Europe on a Socialist basis" and accused the Government of purposely excluding non-Socialist opinion from the achievement of the great aim of European unity.

Mr Churchill's irritation at feeling himself excluded from close consultation on foreign policy is understandable, particularly when one remembers the degree of confidence with which the wartime coalition—largely consisting of the same men—managed its affairs. But he is hardly justified in suggesting that bipartisanship is a cardinal principle of British policy, now abandoned by the nefarious Socialists. Continuity there has been, but bipartisanship is quite new. Throughout the twenties and thirties, the Government pursued its own policies in an independence which probably reached its height when Mr Chamberlain flew to Godesberg. This is not to say that the new principle of bipartisanship is wrong. On the contrary, unity in foreign policy is essential. But Mr Churchill put more indignation into his attack than is warranted by Conservative methods of conducting foreign affairs in the past. There is a similar ambiguity in his attack on the Government's handling of the proposed Assembly for Europe. It is true that Dr Dalton is an easy target, for he has in fact stated that only a Socialist Europe can become a united Europe. But such is not the policy of the official delegation at present engaged in Paris on discussions on European unity with France and Benelux. Dr Dalton and Mr Churchill are at one in wanting the proposed Assembly to keep within proper limits. Mr Churchill does not wish it to interfere with "the proper sphere of governments." Dr Dalton has instructions to see that the form in which it finally emerges effectively prevents it from doing so. The real quarrel is over the composition of the official delegation and over Mr Churchill's plea that it should have included members of the Opposition. On this point the Government is not altogether unreasonable in claiming that it is strengthened by being a purely Government team.

* * *

Lion versus Shamrock

Common sense was the chief quality of Wednesday's debate on Ireland in the House of Lords. Eire has withdrawn from the Commonwealth and even if it were not perfectly within its rights to do so, as it undoubtedly is, the Government had no practical means of preventing it. The question now facing both Governments is how to arrange their new relationship to the best advantage. Mr Attlee has followed the example of Mr Baldwin's Government, which decided in 1937 that the Irish Constitution Amendment Act, eliminating the Crown from the constitution of Eire while authorising the Executive Council to continue to employ the King's services for diplomatic purposes, should not be allowed to bring about any fundamental change in the relations of the two countries. It is true that the English Courts still held that Eire was a member of the Commonwealth and therefore the situation presented none of the legal difficulties which it does today. If these difficulties can be overcome, however, there is clearly a great deal to be said for Mr Attlee's resolve to keep Eire within the fold for practical purposes. Britain has no interest in penalising itself or Eire or in suddenly converting a large and useful section of the British population into aliens.

The argument that Eire should not be allowed to have the rights of a member of the Commonwealth without its duties is in the abstract very impressive. In practice it is meaningless, since membership of the Commonwealth carries with it no legally enforceable duties and any rights which arise out of it, being based on the free consent of Governments, are almost automatically reciprocal. The Opposition appears to be on safer ground when it argues that it is not within the British Government's power to treat the citizens of Eire as British subjects since the question of a man's nationality must be decided by the Courts in the light of precedent and of statute. Even this argument, however, is dubious. In the case of Murray *vs.* Parkes, 1942, in which Murray, who was born in Southern Ireland in 1908, attempted to prove that he was not liable for national service, it was held that a decision of the Judicial Committee of the Privy Council in 1935 did not mean that a Dominion Parliament could deprive a British subject of his status "wherever he might be." Legal authorities have interpreted this decision as meaning that a Dominion Parliament cannot deprive a British subject resident in the United Kingdom of his nationality though the question of its rights to deprive subjects living within its own jurisdiction of British nationality is still open. The essential point is that British nationality is a status conferred by United Kingdom law and regulated by statutes passed at Westminster, and this view has been confirmed by the British Nationality Act of 1948. The Lord Chancellor is therefore probably right, in spite of Lord Simon's objection, in holding that unless this Act is deliberately amended, Irishmen living in the United Kingdom will automatically remain British subjects. Whether or not they remain subjects of Eire depends on the Eire Government. As for imperial preference, it will in the last resort be for The Hague Court to decide whether Eire is for commercial purposes a foreign country in relation to the United Kingdom, and since there are no precedents to guide it, its decision would probably be influenced by the actual state of Anglo-Irish relations.

* * *

State Pubs

The proposal in the Licensing Bill to extend to the new towns the scheme of state management of licensed premises, which at present operates in the Carlisle area and round Gretna and Dornoch, has aroused heated opposition from the trade and some of its patrons, mixed with a very qualified approval from temperance interests. Like all interventions of the state in matters of liquor it may be counted a political vote loser. Nevertheless, there are two legitimate arguments in its favour. The Carlisle experiment—introduced to deal with the special problem of drunkenness among munition workers in the 1914-18 war—may be counted a qualified success. It has improved the appearance and reduced the number of the public houses and given the city a good reputation for sobriety and orderliness. There is some dispute about their colourfulness and variety—some denying them those qualities, others defending them—but the scheme is not unpopular locally. The Royal Commission on Licensing of 1931 recommended that public ownership should be submitted to a further test in some different area. The new towns provide an obvious field for doing this, partly because they are themselves a new social experiment, but mainly because no satisfactory way has been found of allocating licences in them among the different brewing interests. Mr Chuter Ede, moving the Bill's second reading, spoke as if this difficulty made state management almost inevitable. That is a nonsensical exaggeration; but it does provide a subsidiary argument for making a further experiment.

The Government's actual proposals, however, are open to some strong objections. Why run the scheme by remote control from Whitehall, with the aid of an advisory council which will not even contain representation from some of the affected towns, when there are local and more democratic agents on the spot—the new town development corporations and the local authorities—able and fitted to do the job? This is just a blind following of precedent, and centralisation for its own sake. Moreover, the rates are a more deserving and popular cause than the Exchequer to absorb the profits of the scheme. Secondly, why cast the net of public ownership so vaguely and widely over undefined "adjacent areas"—a proposal that can be used to nationalise half the pubs in Hertfordshire? Thirdly, and most important, why insist on a complete public monopoly? The number, location, and appearance of the pubs can now all be controlled under town-planning powers. Public and private competition in a new town would both give variety and be a proper test of the virtues of each. So why go farther, unless to satiate the gargantuan appetite of the indiscriminate nationalisers?

It is a serious matter that the Government has made no effort to answer these criticisms. Mr Ede was content to argue the Bill's inevitability and triviality, Mr Morrison to be flippant. This is impossible statesmanship.

*

The Bill's other contentious proposal—to eliminate the legal loophole whereby "bottle parties" supply liquor after midnight—is sound enough—on condition that it is accompanied by a greater willingness to permit late-night licensing extensions to properly conducted restaurants and night-clubs.

* * *

Transport Strike

The three hundred porters, vanmen, and hotel staff of Euston station could not have chosen a more unfortunate time or a worse case upon which to stage an unofficial strike. The cause of their grievance was that one of their branch officials was left by a new schedule, agreed between the Railway Executive and the National Union of Railwaymen, with too little time to conduct his union activities. The men, aggrieved that their chosen representatives should have to drive a van as well as represent their interests, began a strike on December 6th which for a time disorganised the delivery of Christmas mail and parcels. The union expressed no sympathy whatsoever with the strike and suspended the men from any union benefits and their branch officials from office. The Railway Executive, their employer, after considerable efforts at conciliation, sacked the strikers on December 14th. The strikers, with a fine sense of quixotry, have refused all efforts at conciliation and have tried to rouse their fellow-workers, whose sense of solidarity is somewhat dulled by the approach of Christmas, to joint action.

At the same time but for quite different reasons, London's bus drivers and conductors are threatening that after the New Year they will not work on Saturday afternoons without extra pay. Envious of the five-day week in other industries, whose workers throng their buses on a Saturday afternoon, they are demanding compensation for the loss of the amenities available to others. The employers point out that the necessity of working a five-and-a-half-day week has long been taken into account in calculating their wages, and their unwillingness to give way will probably lead to an unofficial strike in the New Year.

Transport workers are in a way unfortunate. The slow economic attrition which results from industrial disputes in basic industries is reflected only in statistics of costs and output, and affects the general public through the indirect channel of economic malaise and high living costs. But the man whose recalcitrance or irresponsibility condemns the Christmas turkeys to rot upon the platforms of Euston, or who leaves the Saturday afternoon football crowd stranded for lack of buses, earns the direct and bitter condemnation of society, although the harm that he has inflicted upon the national wellbeing may be possibly less than that caused by the skrimshanking miner.

But it raises the question once again of how the irresponsible acts of the workers—condemned alike by trade union, employer and public opinion—can be dealt with. The whole theory of labour relations has in the past been based on the assumption that the unions representing the workers are the natural enemy of the employers. The problem of the future is how to deal in times of full employment with the minority of irresponsible and anti-social workers whose actions are harmful to the public and to the unions themselves. Ten years ago any socialist or union leader would have denied the possibility of such a problem. It is now one of the most urgent which they have to solve, and no amount of oratory about co-operation will do so.

* * *

Russia Foots the Bill

By granting the Czechoslovak Government a loan of gold and "free currency," and by agreeing to supply some capital equipment under their greatly enlarged trade pact, Russia has saved its satellite from an increasingly disastrous position. To an extent which cannot be judged, since the amount of the loan is kept secret, Moscow has assumed a liability which arose when Stalin ordered the Czechs to leave the first Paris conference on the Marshall Plan.

It became inevitable that Russia would have to give some aid to the Czech government when it undertook to increase heavy industrial output four-fold in the next five years, for the benefit of Russia. Every increase in Czech manufactures means increased dependence on imports of raw materials and capital equipment from the West. Without Marshall aid or fresh British credits to take the place of help from Unrra, these essential imports can only be secured to the extent of Czech sales to the West. But the engineering products which the West would willingly buy from Czechoslovakia are for the most part reserved for Russia and the Russian sphere, under treaties which account for nearly fifty per cent of the Czechs' foreign trade. High-priced light consumer goods do not tempt the British into granting credits or a trade treaty to a country which has outraged political opinion ever since the Communist *coup* of last February. In the United States, also, there is no willingness to aid the Czech Government. The Czech delegate at Uno has bitterly complained that even goods which have been paid for have been held up under the American export licence system, in favour of ERP countries. Trade between Czechoslovakia and the United States has been falling off rapidly lately, although Czech foreign trade in general has considerably expanded, and a deficit with both Britain and America remains.

The Prague Government is therefore faced with a crisis in spite of the fact that the overall deficit in its foreign trade has been reduced up to the end of October to 2.3 billion crowns (after balancing in 1947). Moreover, Czechoslovakia's internal financial position has become rapidly worse since the "workers' government" took over. Inflation has been growing, and the public have been taking the usual measures, as far as terrorism allows, to express their lack of confidence in the Gottwald crown. Constant railing from the leaders have not induced the working classes to increase output to the essential extent; and the announcement this week that thousands of administrative employees would be ordered into the mines and factories is an admission of the extreme shortage of labour and low productivity.

As an emergency measure, the Czech Government recently obtained $6 million from the International Monetary Fund. It has also signed a treaty with Bizonia, by which Czechoslovakia will earn dollars by selling more than it buys. But the mission to Moscow and the Russian loan which has come out of it are clear evidence that these palliatives are not enough.

The price that has been paid for the loan is not known. It will certainly not be low. The high level of the Czech mission, and its elaborate reception by Stalin and Molotov, point to the political importance of the occasion. In all probability the Russo-Czech alliance against Germany, which was concluded by the Benes Government during the war, will now be tightened to cover all possible western foes.

M. Queuille's Budget

On Monday next the French Prime Minister, M. Queuille, will present to a highly critical National Assembly his budget for 1949—the first in French history to run into thirteen figures. The debate is expected to be long, stormy and, from the Government's point of view, perilous: M. Queuille will be exposed to solid Communist and Gaullist opposition so that quite a small group of waverers, representing any particular interest, can, if it joins the "unholy Alliance," spell the downfall of the Ministry.

Even if it forgoes the Christmas festivities, the Assembly can finish its debate on the budget by the New Year, which has been fixed as the "dead line," only by adopting a novel and curious procedure: the deputies will be asked to vote bulk sums representing the maximum expenditure and revenue tabled under comprehensive headings, and they will then leave the detailed analysis of each Ministry's accounts until next month.

Hopes of a radical revision of the socially iniquitous fiscal system, which has vitiated French finances for a generation and exacerbated inequality and class antagonism, are once more postponed *sine die*. The fiscal reform tabled with the budget is merely a simplification of certain taxes with no redistribution of the burdens. The present government, however, is not responsible for the circumstances which impelled this decision. The inflationary pressure inexorably drives them on to higher outlay, and higher revenue consequently must take precedence over any other consideration. The abolition of certain sources of revenue, before new sources could be effectively tapped, would almost inevitably have meant a provisional loss to the Treasury—a prospect which the "trillion" budget itself precludes. A ten per cent rise in all taxes and an exceptional twenty per cent increase in the production tax are justified exclusively by dire necessity and in no way whatever by social equity.

The device of separating "ordinary" from "extraordinary" expenditure, an inadequate fig leaf to conceal the real deficit, is to be maintained, although more items are to come under the first heading. In spite of this shift, France is still living beyond its income, as M. Monnet has warned the Government in presenting his report on the development of his plan for the first half of 1948. The items in the extraordinary budget, which are mainly made up of investments in basic industries and reconstruction, will be covered by withdrawing money from the franc counterpart funds set up under Marshall Aid and to a much lesser extent by a public loan. As long as the French internal investment programme rests on month-to-month decisions made by the officials of ECA to release the counterpart funds, the Americans retain the virtual power to decide who shall govern France. It is an immense political responsibility whose exercise will require the maximum sagacity and restraint in the coming months.

* * *

The Oracle Speaks in Shanghai

While Washington has been giving a distinctly frosty reception to the wife of China's President seeking increased American aid for her husband's failing cause, Mr Hoffman, the head of the ECA, has visited Shanghai, and has given China and the world what at first appeared to be a declaration of American policy in the new situation brought about by the Chinese Communist victories. At a press conference held a few hours after an interview with the stop-gap Prime Minister, Dr Sun Fo, Mr Hoffman said that the American aid now being given to China would still be available to a coalition government if it represented "all the Chinese people" and preserved freedom of religion and of the press, but added that "if the coalition was obviously completely Communistic, the chances are that our Government would not be in favour of continuing such support."

This statement seemed to be an American bid for a coalition of all important Chinese parties and groups, including the Communists, as a solution for ending the Chinese civil war and as an alternative to continued or increased aid for Chiang Kai-shek's régime. But at once the State Department in Washington issued a denial that Mr Hoffman's remarks represented American policy; he was stated to have been speaking off the record. That a man in his position should thus speak off the record to a press conference in a foreign country at the crisis of a civil war would indicate an almost inconceivable levity and irresponsibility, and it seems more likely that the United States Government is, as has been reported, torn between rival policies, and has been unable to reach a definite decision. The Defence Secretary, supported by General Wedemeyer, who was President Chiang Kai-shek's military adviser in the last stage of the war against Japan, is said to have favoured increased aid to the Nanking régime, but to have been opposed by Mr Marshall, partly because of his low opinion of the régime, and partly because of his fear of weakening American policy in Europe by a diversion of funds which are by no means unlimited. President Truman has doubtless had great difficulty in making up his mind what to do, and the line of least resistance is to wait and see, hedging bets as far as possible. Mr Hoffman's statement, even though repudiated officially in Washington, must have had the effect in China of further weakening the anti-Communist cause by giving currency to the idea that America is ready to accept and give economic aid to a coalition Government, including the victorious Communists, on the understanding, of course, that it represents (for the time being) "all the Chinese people."

* * *

Japan Looks On

The dramatic course of events in China cannot fail to have its echoes in Japan, and General MacArthur is reported to have expressed his concern in a message to his Government about the encouragement and added prestige given to the Japanese Communists by the victories of their fellow-believers on the other side of the Yellow Sea. Nothing succeeds like success, and a power which, in defiance of American intervention, has already won so much of the mainland recently dominated by Japan will have a strong appeal, not only to the discontented elements of Japanese society but also to all those in Japan who dream of an anti-American *révanche*. The anti-American propaganda of the Chinese Communists is often almost word for word the same as that poured forth by the Japanese radio during the Pacific war, and Japanese minds long conditioned to think of the United States as the imperialist invader of East Asia, using Chiang Kai-shek as its puppet, are fertile soil for the new gospel.

On the other side, Japanese who are hostile to Communism can also derive much satisfaction from current events on the mainland, for they foresee that a Communist domination of China, leading to an international alignment of China in the Russian *bloc*, will compel America to rely more and more on Japan as the pivot of its Asiatic policy. In Europe there are Britain and France to build up Western Union, and American policy does not need to depend on Germany as the only barrier between Moscow and the Atlantic; but in the Far East, if China passes into the Russian orbit, Japan is the only possible counterweight. The Japanese will no doubt exploit this situation to the full to obtain from America more copious economic assistance and later on perhaps also permission to create a new Japanese army.

Even so, the situation is not without its disadvantages for Japan, for the economic bonds between Japan and its natural markets and sources of supply on the Chinese mainland are being still further loosened by the Communist conquests. Even at a low level, Japan's heavy industry is threatened with great difficulties for lack of the coking coal and iron ore which under conditions of normal economic exchange would be available from Manchuria and north China. It remains to be seen whether a cessation of civil war in China will be followed by any revival of foreign trade; to judge from the economic policy of north Korea, far eastern Communists aim at an economy quite as insulated as that of eastern Europe.

* * *

The Nation's Food

Last autumn the people of this country were seriously worried about their food supplies. In the interval between the breaking of the dollar crisis in the summer of 1947 and the arrival of Marshall Aid, there were general expectations of a big cut in rations, and when these did not happen and, instead, there seemed to be a gradual improvement in supplies, leading to the end of bread rationing and of potato rationing, the public were lulled into the belief that their food was assured—at least until 1952.

Parliamentary discussions of food have reflected this relief of public anxiety. They are now far more concerned with minor administrative matters and the details of rationing than with the big question: what will happen to Britain's food when Marshall Aid comes to an end? This week's debate was no exception. The Opposition criticised the Ministry of Food over its ineptitude in the buying of food; the Labour backbenchers were more concerned with the cost of food to the consumer; and both the Minister and the Parliamentary Secretary were content to answer these criticisms rather than to discuss food supplies in relation to Marshall Aid. Dr Summerskill did, it is true, give a brief survey of the rations it is hoped to maintain during the coming year. (Her account of the negotiations with Argentina over meat is discussed on page 1032.) But even in this limited context, food subsidies were barely mentioned, and then only to enable Mr Strachey to say that they reduce the cost of living to a family of four by 14s. 6d. a week—a most dishonest way of regarding the burden of nearly £500 million a year that they place on the national exchequer. Yet the debate was the main business of the House of Commons on that day. It was surely incumbent on both the Government and members to make it an opportunity for discussing questions of policy.

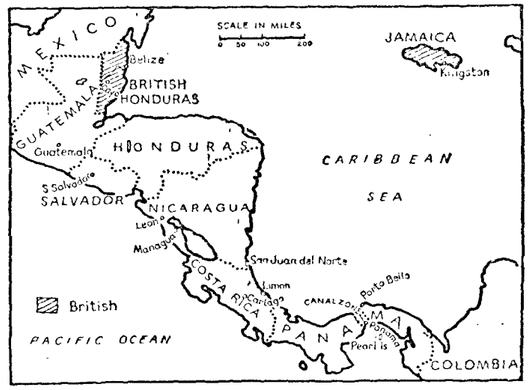
* * *

Newfoundland

The agreement signed last Saturday in Ottawa between the Canadian Government and the representatives of Newfoundland is the first step towards the incorporation of Newfoundland as the tenth Province of the Dominion, which is due to take place next March. The terms of the agreement are generous to Newfoundland. Newfoundland will be represented at Ottawa by six senators and seven members of parliament, and its legislature—*dormant since 1933*—will be revived as a Provincial Parliament. The federal government will assume Newfoundland's sterling debt, but its internal budget surplus will be retained with certain reservations under provincial control. The province will receive annual subsidies totalling about two and a half million dollars, and if it wishes may compound its right to levy provincial taxation in certain fields in return for a federal grant, on the lines of contracts already in operation with the less wealthy Canadian provinces. In addition, for a period of twelve years Newfoundland will receive special grants totalling nearly $43 million. The position of Newfoundland's internal finances will be reviewed by a special commission in eight years' time.

Although Newfoundland's accession to Canada will greatly improve the latter's strategic position in the North Atlantic, Canadians are under few allusions as to the nature of the financial obligations which it will involve. Canada's major problem of how to finance its European trade, or alternatively how to reorientate its economy so as to compensate for the loss of such trade, will be accentuated by the inclusion of the Newfoundland fishing industry. The burden of raising the inadequate social services of Newfoundland to the Canadian level will fall primarily on the taxpayers of Upper Canada. Only if the iron ore deposits of Labrador achieve and surpass the expectations of their preliminary survey will the province of Newfoundland become a viable unit and a net contributor to the economic strength of Canada. But on balance there is a feeling that Canada is where Newfoundland belongs, and although the smallness of the majority in favour of confederation in the Newfoundland plebiscite caused Ottawa to be very cautious, it was agreed that if the opportunity was not taken now it would never recur.

In spite of the protests of the minority—some of which are legitimate but most of which are factious—against the method by which confederation has been brought about, Newfoundland will gain substantially from confederation. Now that its brief wartime prosperity has passed, there is no doubt that it is not a strong economic unit to support complete autonomy and the assistance which the United Kingdom could give would be very limited. The merchant class, who have grown prosperous behind a stiff local tariff, may suffer an uncomfortable diminution in profits and prestige, but the fishing population, whose standard of living must be the lowest of any white community in the British Commonwealth, should gain enormously from absorption into a larger and more stable country, which is motivated by a more liberal view of society than that obtaining in St. John's.



* * *

Central American Explosions

Pacifists in Costa Rica have had an unpleasant reminder that unilateral disarmament is a dangerous policy. Eleven days after dissolving its army Costa Rica was invaded from Nicaragua last Saturday by opponents of the present provisional government. Fortunately, Colonel Figueres, the provisional president, had retained a standing police force of 1,000 officers and men. There are also about 700 *Resguardos*, or armed coastal guards, who, together with the many volunteers who have offered their services, should form at least as large a force as the invaders.

The macabre humour with which the world has greeted Costa Rica's discomfiture has tended to conceal the dangers involved. Costa Rica itself has appealed to the signatories of the Rio Pact of Pan-American Defence, which includes the United States and which was ratified last month, for help to repel the invaders; Guatemala has announced its willingness to attack Nicaragua; and unconfirmed reports say Mexican Communists are helping the invaders. There is therefore some danger that the whole of Central America will be up in arms unless steps are taken quickly to restore order.

The Nicaraguan Government has denied any part in the invasion. It claims that the invaders are being led by the former president of Costa Rica, Calderon Guardia. He was defeated in the presidential elections last March by Dr Ulate but had to be forcefully removed from office by Colonel Figueres, Dr Ulate's chief supporter. Since then, Colonel Figueres has been ruling the country as provisional president with the intention of restoring

order so that new elections could be held. Elections for a constituent assembly were in fact held on December 8th, three days before the invasion. The votes gave Dr Ulate and Colonel Figueres 33 out of the 45 seats and, to outside observers, the invasion followed as a direct result of these figures.

The situation in Central America is immensely complicated. Besides the immediate antagonists, there has been trouble between the Dominion Republic and Cuba; last Tuesday, a revolution in Panama deposed the government; and Britain, too, is involved in the clash between Guatemala and British Honduras. The whole is linked together with a patchwork of treaties and military alliances so that events in any one country are liable to have repercussions throughout Central America.

* * *

Sulky Boycott?

The Israeli request to the Security Council that the new Jewish state should be admitted to the United Nations raises two issues for Britain—whether to support or reject the request in the Security Council and further, whether to go forward to any sort of recognition of Israel on its own account. The United Nations issue is relatively straightforward. Until a state has fixed frontiers and a stable legislature, it is hardly ready for inclusion in an assembly of sovereign nations, particularly since some of the frontiers it possesses today have only recently been acquired by force. Moreover, a United Nations conciliation mission is about to start work in an atmosphere already poisoned by the Arabs' frenzied hatred of an Israeli state; there are therefore strong reasons for delaying full international recognition of that state so long as any hope of a peaceful settlement lingers on.

The dilemma before Britain is more delicate. On the one hand, it is as necessary for the British as for the Arabs to come to terms with the idea of an Israeli state, and to come to terms with it in such a way as to preserve all the links of friendship which ought to unite the Jewish community to the nation which first sponsored it and under whose ægis alone it was able to grow up. If the Government's policy towards Israel is really no more than what Mr Churchill calls a "sulky boycott," the attitude has neither good sense nor self-interest to recommend it. But the problem of Israel cannot be isolated from that of the Middle East as a whole and at a time when Britain may well be the only Power able to coax, prod and lure the Arabs along the path of

reason, a recognition of Israel that would instantly put an end to British influence in every Arab capital and would not serve the cause of general pacification.

Is there then nothing that Britain can do to mend its relations with Israel while maintaining what weight it can with the Arab world? The case seems to call for some sort of exchange of envoys which, while perhaps not strictly amounting to a *de facto* recognition, would pave the way to it and re-establish contacts which have been temporarily and rudely broken off. Mr Mayhew has assured the House of Commons that the Government is seeking ways and means of re-establishing closer relations. It is to be hoped that some satisfactory if informal arrangement can speedily be worked out.

* * *

Electoral Farce in Spain

Spain has now held its first "popular elections" since 1936 when the victory of the Left precipitated General Franco's revolt a few months later. The present municipal elections have taken place in three stages. On November 21st about a third of the municipal councillors were elected by heads of families, or other adults who had been legally declared to be domestically and economically independent. On November 28th another third were elected by the officers of the syndicates—provincial bodies uniting management and labour—and on December 5th the councillors already elected chose the remaining third from lists submitted by provincial civil governors. Thus, proclaims the Spanish press, General Franco has fulfilled his promise to found the Spanish state on "the two basic institutions of the municipality and the syndicate."

In fact, he has carried out one more measure designed to cover up his dictatorship with some sort of decent constitutional cloak. In this, it resembles the referendum held in July, 1947, which determined the so-called "Law of Succession" and established the basis for the Council of the Republic set up last February. The performance which was staged in every municipality in Spain was called an election, but neither the Spanish people themselves nor any outside observer in the west can be expected to regard it as anything but unconvincing make-believe. All the chief ingredients of an election in the western sense were missing. There was no freedom of the press or of assembly. There were no electoral campaigns and these would, in any case, have been superfluous since only one party, the Falange, was allowed to participate, and since all candidates, whether they belonged to the Falange Party or to some other group, called "the opposition" by courtesy, had to be officially proclaimed and nominated in the official lists. In some districts even the need to vote was eliminated by nominating only as many candidates as there were seats. The only way open to the Spaniards to express their disapproval was to cast blank ballot papers, which does in fact seem to have been done to a considerable extent.

In view of the underlying disillusionment of the Spanish people with the Franco regime, it would perhaps be too much to expect General Franco to hold free elections, but he is surely mistaken if he thinks the recent sorry farce will improve his eligibility for membership of the United Nations or for Marshall aid. On the internal front he may consider his huge army and police force, as well as the disunity and weakness of his opponents, as sufficient props and safeguards for his regime. But he should also remember that the best-organised and most forceful of his opponents—the Communists—thrive on such travesties of democracy as he has just perpetrated. Moreover, by calling attention to his sorry regime, he undermines the case of those abroad who, like Mr Churchill, would like to bring him back into the community of nations.

* * *

No Turkeys

Present indications are that few law-abiding citizens are going to carve a turkey this Christmas. The total available, theoretically, is estimated at only 5 per cent or so less than last year, but the fall in supplies to the shops is of quite different, indeed catastrophic, dimensions. The trouble is that the estimated total supply of some 10,500 tons of turkeys consists, this year, of many fewer imported birds, whose numbers were further thinned when 1,800 Turkish turkeys fell over a cliff on their way to England. These are distributed, from start to finish, through channels controlled by the Ministry of Food—but the home product, of which more will be available, has its distribution controlled by nothing except the price tag. The black market, confronted with this promising expansion of its field of operations, has gone into action with characteristic energy. Just how many home-raised birds melt away in local retail sales, how many are sold at illegal prices by the farmer, how many by purchasers who have themselves bought at the legal prices, how many by outright thieves and fences, is naturally not known—least of all by the authorities. What is certain is that the blameless residue will go a very short way to meet the public demand.

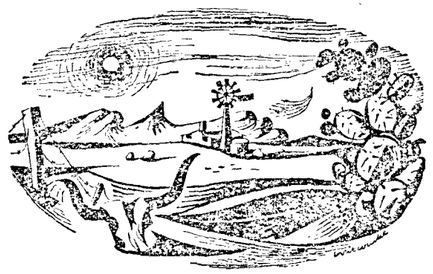
The situation supplies a perfect example of the paradox of partial control. There may be objections, both economic and political, to the complete canalisation of any particular trade through officially determined stages. It is apt to be clumsy, administratively expensive, and wasteful. But it does at least achieve its immediate aim of getting the product from the producer to the general public in quantities, and at prices, bearing some relation to the ideal of "fair shares"—an ideal which has its merits as well as its absurdities. To impose maximum prices on goods otherwise uncontrolled is to get the worst of both worlds, ensuring that those goods shall go elsewhere than to their intended destination. The maximum price on turkeys (though partly calculated as an encouragement to egg-production rather than the rearing of table birds) is presumably intended to keep turkeys within the reach of the ordinary consumer. In fact, it removes them from his scheme of things far more effectively than a free price would do, since it debars him from competition with the knowledgeably dishonest. The turkey-eaters this Christmas will not be those who have thriftily contributed to a turkey club or energetically earned a couple of pounds by overtime and odd jobs. They will be the well-fed frequenters of hotels and restaurants. The wheel has, in this instance, as in so many others, come full circle; the high moral objection to allowing money to buy money's worth has penalised all but the longest purses.

* * *

Corrigenda

A note in *The Economist* of December 11th commented upon a new publication of the Fabian Society "More Socialisation—or Less?" This pamphlet will not in fact be available until January 3, 1949, when it will be published by Fabian Publication, Limited, price sixpence.

*



The proposed expansion of population of the new town at Bracknell, Berks, which was given as 200,000 in a Shorter Note last week, should have read as 20,000.

From *The Economist* of 1848

December 16, 1848.

Considering the election of Louis Napoleon as the consequence of the veneration of the French for the Emperor, it is honourable both to their gratitude and to their character. If Napoleon were the idol of a mere vain love of war and glory, the election of his namesake might be deeply regretted and Europe might at once have reason for alarm; but on the French he has far more powerful claims for love and respect. For all Europe it must be consolatory to reflect that he was idolised as the emblem of order after a bloody and anarchical revolution. He was associated in the minds of the bulk of the French with personal security, internal peace, and great material prosperity as well as with foreign conquests. Had his reign been as disastrous to France as to the rest of Europe, his glory would not have fed them, and it would have been as unpopular as it was popular till its very close. If this be an approximation to their feelings, the new President is to be considered much more a representative of their enduring love of order, of their demand for internal peace and material prosperity, than as a representative of a love of conquest and war. So his election appears to be considered in Paris. It has at once restored great confidence among the commercial and monied classes; and so we hope it will be found for Europe and the world. If the predominant sentiment be derived from the order Bonaparte restored, the internal tranquillity he preserved, and the general prosperity that was connected with his Government, it prescribes a line of duty to the heir of his name and power, unless he wish, in the end, to meet with a more shameful fate than his great namesake, which must give prosperity to France, and preserve her at peace with the world.

20,000,000
more mouths to feed
each year

While man multiplies his race by 20,000,000 people a year, the world rumbles on to disaster. Mass starvation and world strife are constant threats unless enough food is produced to feed today's and tomorrow's hungry millions.

Until man can repair the damage of soil erosion, and the antiquated production methods of the majority of the world's farmers are modernised, every acre of still arable land must be made to yield up more food than ever before. The "Ferguson System" of *complete* farm mechanisation can play a constructive part in this world-wide objective.

The "Ferguson System" co-ordinates the action of "Ferguson" tractor-implement units. It gives more traction without built-in weight that packs the soil. It gives finger-tip and automatic hydraulic depth control of implements carried by tractor. Its versatility and manœuvrability enable farmers to produce more food at less cost from every available acre.

* Every week, for Harry Ferguson Ltd., more than 1,000 "Ferguson" tractors are manufactured by The Standard Motor Co. Ltd., and more than 5,000 "Ferguson" implements by foremost British manufacturers.

B6

The fable of the songsters

A tenor Tabby Cat and a baritone Barnyard Cock quarrelled about the sweetness of their respective voices, and called upon the rest of the farm to take sides. But the horse was too busy ploughing, the cows milking, the hens laying, the sheep browsing and the farmer mending a waggon wheel. "How irresponsible!" said the Cock. "No sense of values," growled the Cat.

From every corner of the world comes the clamour of voices in dispute. Without prejudice to any cause, T.I. prefer the hum of industry. And, since Britain's very life depends upon production, T.I. are producing . . . precision tubes and bicycles, paints and water heaters, locomotive parts, electric cables, bus bodies, traffic signs . . . a great range of fabrication in steel and aluminium alloys for the markets of the world.

UNDERWOOD SUNDSTRAND
CLASS 'D' ACCOUNTING MACHINE

An all-purpose, fully automatic Accounting machine equipped with two cross-computing Registers, eight accumulating Registers, and Front-Feed Carriage. Maintains accounts in perpetual balance, and enables up-to-the-minute totals, sub-totals and balances to be obtained instantly without extra work. Ideal for Pay Roll, Stores Accounting, Costing, Analysis, Public Utility Billing, Municipal Accounting, etc.

Two machines

that, between them, supply the answer to every problem connected with the writing and simultaneous computing of accounting records, giving greater speed, simplicity, and complete mechanical control over accuracy. Both machines have extreme flexibility of operation and quickly pay for themselves in improved efficiency and lower costs.

UNDERWOOD ELLIOTT FISHER
ALL ELECTRIC
ACCOUNTING MACHINE

For all records that require typing, adding, subtracting, with simultaneous accumulation of individual column totals and simultaneous cross-computation of one or more balances. All electric operation. Standard typewriter keyboard. Exclusive Flat-Writing Surface gives unequalled speed in handling forms which may be of paper or card stock, in original only or with copies alike or different in shape and size.

Letters to the Editor

West Indian Unemployment

SIR,—May I be permitted to comment on the criticism on page 830 of *The Economist* of November 20th of the Report of the Settlement Commission to British Guiana and to British Honduras [Cmd. 7533], of which I was a member?

While it is reckoned that only 25,000 workers could be employed in the industries, almost all of them agricultural, recommended in the report and that they and their families would number about 100,000 people, sight must not be lost of the fact that an equal number at least could be employed in secondary ways. For example, the census of 1943 shows that Jamaica had then a population of 1,237,000, of whom 505,100 were gainfully employed. Of these 221,400 were engaged in agriculture and 59,200 in manufacturing industries and the remaining 224,500 made a living in various secondary ways and supported their dependants among the 731,900 not gainfully employed. Again, Barbados has a population of 193,000, of whom only 26,148 are employed in its single agricultural industry, the sugar industry, and 1,473 in manufacturing industries. Yet the remaining 166,693 make a living in various secondary ways. Moreover, besides the industries recommended, which could employ 25,000 workers, the Commission also recommended making certain geological and hydro-electric surveys and experiments with crops not at present grown in the two colonies investigated, which, if successful, might make it possible to develop other industries, and employ more people with their complement of secondary workers.

The estimated cost of carrying out the Commission's recommendations is a minimum of £14 million and a maximum of £22 million. Your comment on this, that "it is much more doubtful whether Britain in the foreseeable future could carry out this new overseas investment," is astonishing. Britain has no difficulty, even in peacetime, in furnishing fantastic sums for armaments, which use up steel also needed for tractors and other implements. Moreover, it is not suggested that the capital required should be a gift, but investment capital. The investing public has recently shown not only its capacity but its enthusiasm for colonial investments. A loan of £3,000,000 for Trinidad was over-subscribed 27-fold and one of £5,000,000 for Southern Rhodesia 14-fold and an issue by private enterprise was also over-subscribed.

The number of registered unemployed in Jamaica would be equivalent to 2,500,000 unemployed in the United Kingdom, and there is no "dole" in Jamaica. Throughout this year there have been disturbances in the West Indies, from Jamaica to British Guiana, a warning of the unrest existing. Will it be allowed to go unheeded, as in 1938, until it flares up into rebellion?—Yours faithfully,

C. W. W. GREENIDGE

Denison House, Vauxhall Bridge Road, London, S.W.1

[No criticism of the Commission was intended; in fact, we expressly commended its cautious approach to its task, which was in refreshing contrast to the wildly optimistic views on colonial development and settlement often put forward. As for the question whether Britain can "afford" this new overseas investment, we were, of course, referring to the physical outlay represented by this £14 million to £22 million. It is becoming abundantly clear that Britain today has to impose priorities and selection in its overseas investment in the interests of its balance of payments, and it is doubtful whether the Commission's schemes should have a very high place.—EDITOR.]

Teething Troubles

SIR,—You surely condone the major fallacy when you say "the dentists' . . . attractive pay was immediately cut as soon as it looked like becoming *too expensive for the taxpayer*" (my italics). No industrialist would fall into this error. The problem to him is an everyday one.

When the rate fixer fixes a "soft" rate and the operator races away to earn double time or over, the employer realises that particular job is costing more than it should. It is unimportant to him that the operator may be earning more than the foreman; it may seem important to the foreman.

In general the employer has to stick to his contract unless an opportunity occurs for amicable adjustment of the rate or method. Even a shortsighted employer would not dream of putting a ceiling on the earnings of the operator. That is not saving cost at all but merely limiting output. Mr Bevan is therefore inviting the efficient dentist to take it easy and play more golf. He is not reducing the cost of pulling teeth, but merely lengthening the queue.—Yours faithfully,

D. W. MORPHY

Chatwin, Wilderness Road, Chislehurst, Kent

Entente Cordiale?

SIR,—Articles by "Your Correspondent in . . ." generally end in a laudatory note about the country concerned. This current journalistic etiquette is not in line with "diagnosis without pious lies" which has put your paper in a class of its own. France's somewhat baffling recovery is of its own peculiar brand of muddling through and we might continue tolerably well, in spite of our vacillating governments, unintelligent controls and general frivolity, if the context was quiet and neutral. But in the insidious Russian century in which we live, nothing is neutral and our parochial way of aspiring towards some tranquil backwater of history with a Louis XV façade, is as unrealistic as Swiss neutrality or Swedish fence-straddling.

The assumption of your correspondent that we will fight in a new war is misleading. The weekly *Carrefour* published last month scores of answers by prominent Frenchmen from all classes and professions, to the query: "What would you do if the Red Army invaded France." These answers made instructive reading. Alas Sir, we won't fight, don't make any mistake about it. The charming Italians won't fight, either (not that it would make a great difference). The Belgians won't fight, and the Germans look as if they were fed up with *Kriegspiel* for a generation.

So why not be honest about it. Why pour millions of pounds and dollars for creating a handful of divisions which at best would be sacrificed in a futile and short-lived delaying action, and which would *not* have the country behind them. Don't squander your and America's resources on groggy partners with cold feet, with lip service and no performance. Concentrate in the US and the Empire. Hold the Russians by remote control, if you can. But don't count on us. And if you want us to put on a stern façade and help you in this dangerous—and possibly decisive—phase of the cold war, then stop visualising continental politics as variations of the British Labour Party.

Politically and as an antidote to the Communist termite, the choice between Right and Left has to be made *now*. Unpalatable as Charles of Arc may be, he is the logical, inescapable and urgent solution. So is Franco.

All this is hardly pleasant but it is time that Britain, the still healthy leader of the aging West European Group, should return to its great tradition of political realism. My only excuse for this blunt and, by blimpian standards, unpatriotic language is that I am an obscure Frenchman with no axe to grind.—Yours faithfully,

GEORGES ARCHAMBAUD

54 *Rue Pierre Charron, Paris*

Exchange Control

SIR,—The questioning of Sir Stafford Cripps in the Commons on November 30th regarding large sums of foreign exchange released for the benefit of French miners and other so-called charities seems a most opportune moment to call attention to the very different kind of treatment meted out to thousands of wretched holders of blocked sterling accounts.

My own painful experience of the ruthless methods of the British Exchange Control in applying the rule of "no exceptions" does *not* bear out the affirmation of the Chancellor that every application for foreign exchange is considered "on its merits."

Does the man in the street in England realise that there are thousands of people—the majority of them British and Canadians—who hold bank accounts in England or other property which they are forcibly prevented from disposing of; that they cannot draw a cheque without a Bank of England permit, or spend the money in the sterling area on purchases, or come to live in the sterling area till these funds are used up, or invest the money to the best advantage in order to eke out a living from it?

It is very handsome of HM Treasury to use up precious foreign exchange in largesse to the French miners; now that Sir Stafford Cripps has ruled that every case is to be considered on its merits, we holders of blocked sterling accounts will be grateful, not for his charity, but for a square deal.—Yours faithfully,

Pembroke, Bermuda H. LOUIS CARTER

"Here's another reason why I put my trust in B.O.A.C."

I jumped at the chance when I was invited to watch B.O.A.C.'s maintenance engineers at work. And what I saw amazed me . . . Their skill, precision and teamwork are incredible. Nothing is left to chance, nothing escapes their scrutiny. Every smallest detail of every Speedbird's engines, and of all the other equipment, is checked, rechecked, supervised and inspected.

Yes, I say in all sincerity, no doting mother ever gave her child more loving care or undivided attention than these experienced technicians give B.O.A.C.'s great fleet of Speedbirds. Each aircraft, for example, is inspected daily by a qualified engineer. When he is satisfied that it is 100% perfect in all respects, he certifies in writing that it is ready to fly. So rigid is this inspection routine, that each certificate must be renewed every 24 hours, even if the aircraft has not flown since the last certificate was issued!

B.O.A.C. developed this unvarying system of aircraft checks and cross checks during 30 consecutive years of flying experience. And the same maintenance procedure prevails for a Speedbird flying between Singapore and Sydney as for a Speedbird in the transatlantic service. This is one reason why I put my trust in B.O.A.C.

AMERICAN SURVEY

The China Cult

(From Our US Editorial Staff)

THE enlightened self-interest which is supposed to be the basis of American foreign policy is tempered, according to the area in which it operates, by certain popular beliefs and prejudices. Where Europe is concerned, there has existed, until the last two years, a fear that the greater experience and cunning of European diplomats would always prevail against the simpler and more honest methods of American negotiators. In a hundred years of American policy towards China the tempering agency has been sentimentality. It is as hard for a foreigner to understand the American ability to forgive Chinese peccadilloes as it is for the rest of the world to understand the continuing British preoccupation with the Arab countries in the face of insults and betrayals. The American equivalents of such exotica as T. E. Lawrence or Glubb Pasha are the flying General Chennault and a small band of missionaries or sons of missionaries. In the second group Representative Walter Judd, a former missionary, and Mr Henry Luce, born in China of missionary parents, preach the interests of China regardless of the merits of the regime in power.

If, as now seems apparent, Mr Marshall has lost hope that the present Chinese Government can govern and President Truman has lost patience, it does not follow that the American people have lost either. Should a new alternative to the Generalissimo appear, or Russia's ambitions cover themselves with even the thinnest veil, the present coolness would disappear, the long wait for Chinese rehabilitation would be resumed, and America would again pick up the bills and pay for the waiting time.

The illusion, after so many disappointments, that rehabilitation is still possible is compounded of many factors. From 1784, when a small merchantman bearing the grandiose name *Empress of China* slipped out of New York Harbour with a cargo for Canton, to last June, when the wheat ships sailed, American interest in China has been far greater than cold reason can measure. An early desire to beat England at her own game, the memory of clipper ship records, the missionary spirit, the businessman's dream of winning four hundred and fifty million customers, a sense of national virtue dating from the Boxer Rebellion—all these play their part. To them should be added the perennial American belief that any people who admire the American form of government should be helped to emulate it. Chiang Kai-shek owes more to Sun Yat-sen than it is convenient to admit. Writers from Bret Harte to Pearl Buck have done their share in giving China a good press in the United States. A flood of admiration for Chinese patience, Chinese courage, Chinese endurance stands ready to be turned on at will by almost any ambassador. That it should be withheld from Madame Chiang Kai-shek at this juncture, remembering its sticky abundance on her former trip, is the surest measure of China's present plight.

★

The China cult still draws colour from the days when the captains of clipper ships set up records for the China run from Salem or San Francisco that only the airplane can make seem slow. China was then a mine of varied riches which could be bought cheap and sold dear. A single run brought huge profits, and left a sediment of silk, teak and ivory in American seaport towns that still plays its part in handing on the tradition. The "Opium War" between China and England enlisted American sympathy on the Chinese side. The importation into California of "Chinese cheap labour" to help build the western railroads, and the appearance of Chinese gold hunters in mining towns added economic bitterness, and the Chinese Exclusion Act a slight tinge of guilt, to the romantic brew. Charity and religion went into it, spread by missionaries who reached deep into prairie towns and mountain villages for the barrels of clothes and boxes of hoarded pennies with which Chinese heathen were to be clothed, fed and converted. Little boys fingered souvenir opium pipes, little girls shivered at tales of bound feet and drowned girl babies.

The Boxer Rebellion, which followed hard on the famous policy of the "Open Door," crystallised this complex of attitudes into its present form. There, for the first time, American troops on foreign soil measured their behaviour against that of European allies; they emerged with admiration for the Chinese enemy. When an indemnity was levied on China for having failed to keep her rebels in hand, the United States remitted $18 million out of its $25 million share, on condition that the money be used to send Chinese students to American schools and colleges. They are still coming. Like many a benevolent relative, Uncle Sam gave his heart with his shilling, and is to this day paying interest on that gesture.

The "Open Door" policy, a phrase still used to describe the official attitude towards China, dates from 1899 when John Hay, then Secretary of State, brought it into being after vigorous British urging. It was, in substance, a demand that the powers then staking out spheres of influence in China declare their intention not to interfere with the Treaty Ports and not to discriminate in favour of their own nationals. In the words of America's diplomatic historian, Mr Thomas Bailey, the Hay communication was "like asking all persons in a room who were not thieves to stand up." The bluff worked, and England Russia, Japan, France and Italy were declared by Mr Hay to have signed the assurances desired.

The first American treaty with China (the treaty of Whanghai signed in 1844) had given all powers equal precedence before the great wall of Chinese isolation; this second "Open Door" treaty gave them equal rights to enter the doors which the existence of Treaty Ports had made in the wall. The Nine-Power Treaty signed at the Washington Conference in 1922 marked the next step—an agreement not to cut any more doors in a wall which by this time had been flattened in many places. Specifically, the powers agreed to "respect the sovereignty, the independence and the territorial and administrative integrity of China" and to help and encourage the development of stable government, and to refrain from taking advantage of conditions in China to seek special rights and privileges. The fourth stage —the 1943 treaty—was an agreement to recognise the open doors and the flattened walls (not to mention the exhausted spheres of influence), by abolishing the principle of extra-territoriality.

★

Official figures of what the China cult has cost the United States in the last decade are incomplete and vary with the agency that issues them. An unofficial source estimates that the US government has spent $3.6 billion in aid to Chiang Kai-shek's government since the start of the war. Another puts the cost to American taxpayers as upwards of $4 billion since 1937. The most recent grant was the $463 million authorised by Congress last April to be spent for military and economic assistance before April, 1949.

Friends of China never weary of pointing out that compared to expenditures in Europe these sums are small. Meanwhile it is worth noting that American investments in China are rather less than one might assume from the heat which they sometimes generate. In 1930, commercial investments were estimated at $197 million while religious, educational and benevolent organisations valued their properties at about $41 million. In 1943, American assets in China reported to the Treasury were valued at $122 million; included were $47 million belonging to non-profit-making organisations. As for trade, the 1931-35 average showed exports to China to the value of $66 million and imports to the value of $8,000,000. In 1945, the exports totalled $92 million, while imports had fallen to $6,023,000.

Obviously in casting up any such account the intangible factors weigh heavily. When this long tale of friendliness began, China was a great power and the United States a very small one living more by its wits than by demonstrable strength. Theoretically China still ranks as a great power, but the theory is little protection against internal disintegration or external pressure. The face-saving intent of the 1943 treaty, the repeal of the Chinese Exclusion Act two months later, the repeated loans and grants have only served to emphasise the reversal of positions that has taken place between the two countries.

★

The "Open Door" is now in China's keeping, but there is some doubt as to which way it opens. Since Mr Marshall's return from China and the publication of his disillusioned report on his months of unsuccessful effort to fulfil the President's instructions, there has been a determined attempt on the part of the Administration to divorce itself from the present Chinese government. This attempt would have been successful had not the small and determined minority of Sinophiles inside and outside Congress forced a programme of aid to China totalling $463 million into the Foreign Assistance Act of 1948. This programme was not large enough to have much effect on this year's campaign against the Communists, but it strengthened Asia's belief that American prestige was bound up with that of the Chinese government. Chiang Kai-shek's disaster has become partly America's disaster.

That this should have happened is unfair to the State Department and to Mr Truman, whose decision that the Kuomintang was no longer worth America's continued support has now been justified. The Chinese Ambassador is believed to have proposed that $3 billion be given to China in the next three years and that an outstanding American military leader should go to China. But both the President and Mr Marshall have been firm in their refusal to be rushed into further large expenditures of effort and seem to have decided to wait until some successor to Chiang Kai-shek appears. When and if that happens the traditional American friendliness will reassert itself. Mr Hoffman, the Economic Co-operation Administrator, who has flown to China, has suggested that further American aid might be granted to a Coalition between the Nationalists and Communists provided it did not in fact merely cloak Communist domination, did not suppress religious and political freedoms, and fairly represented the Chinese people—a tall order and one which the State Department considers to be too hypothetical to be worth consideration at the moment.

Had the Republicans won the election the present policy would have been reversed and China would have become the recipient of large grants of military and economic aid. If the recent disasters had taken place before November 2nd, Mr Truman would have had to weaken in his determination not to try any longer to shore up the present regime and would have had to make promises to match Mr Dewey's. As it is, there is no likelihood of Mr Marshall recommending even token aid to the token resistance of the Nationalist forces. He is accused of undermining Chiang Kai-shek's position by his refusal to promise help. In fact, by his silence he is giving him all the help within his power, for if all the information available in Washington on the exploits of the Nationalist government were published the effect would be fatal. By her ill-timed mission (undertaken, it is understood, on the advice of Mr William Bullitt) Madame Chiang Kai-shek has done her husband no good. The melodrama of her flight, followed by the unconcealed frigidity of her welcome, have advertised his plight but will do nothing to ameliorate it.

Malthus Goes West

[FROM OUR US EDITORIAL STAFF]

EVERY once in a while a doctrine which has aroused only mild curiosity in older lands takes on the virulence and high excitement of a fever when it reaches American shores. So it is with neo-Malthusianism which, grafted onto conservationist theories, has suddenly produced a rash of three books and an inter-American conference. The books* range in tone from an apocalyptic tirade calling for the immediate protection of nature against the menace of human fertility to a careful volume bent on establishing a theory that wars come from a lack of balance between farm and factory.

The neo-Malthusian arguments are familiar enough, but the figures used to illustrate them grow more fearsome with every presentation. The world which had, in the age of Queen Anne, some 400 million people, is now heading rapidly toward its third billion. Every day 175,000 babies are born, though many of them will starve to death before reaching maturity. India alone is increasing her population at the rate of 14,000 per day. China, which lost a hundred million through starvation in the last century, continues to breed toward a population of 470 million in 1950 though it has less than half an arable acre on which to raise food for each of them. The Russians will have 200 million in 1950, with arable land enough to feed half that number adequately. Will they embark on conquest and migration? But where? "There are few areas remaining which have not reached the human saturation point," says the author who most clearly prefers nature in the raw to man in any state. This ardent beater of the drums of doom finds Britain, with a population of 2,500 per arable acre, nearly as badly off as in 1600. "Unless we are willing to place fifty million British feet beneath our dining table we may well see famine once more stalking the streets of London."

The fight is joined in America between these neo-Malthusians on the one hand, and on the other those who have "an extravagant faith in scientific agriculture." The neo-Malthusians include yesterday's conservationists, who have added to their indignation over land erosion and stream pollution the long vision of demography. Their scorn for economics is equalled only by their faith in the virtues of planning for the ecological whole. Their opponents, in turn, stake their faith on the ingenuity of man with such miracles as soil-less gardening and the nutritive values to be found in sea water. They are confident that science will solve the final riddle and "provide a substitute for the elemental workings of nature."

In the public realm the fight seems more distinguished for heat against what has been done than for light on practical measures to be undertaken in the near future. The emotion which burns in these three books is more than personal. Since conservation first became a matter for national slogans under that ardent big-game hunter, Theodore Roosevelt, the American attitude towards it has suffered from ambivalence. Those who spent freely in public, who wasted resources with abandon, were not infrequently the ones who kept Benjamin Franklin's thrifty maxims tacked most tightly to their office walls. None was more shocked than they when the New Deal urged Americans not to save but to spend their way out of the depression of the nineteen-thirties. That the government should, at the same time and as part of the same campaign, initiate projects for the conservation and reclamation of public resources was merely an example of the same ambivalence in reverse.

★

Some of the heat which such fission creates has gone into the writing of these books and will go into their reading. Thus Mr William Vogt, in *Road to Survival*, makes the admiration of Americans for the American past seem almost treasonable. Our venerated forefathers, says he, were "one of the most

* "Road to Survival," by William Vogt. Wm. Sloan Associates. New York, 1948. $4. (To be published shortly in London by Victor Gollancz, Ltd. 15s.) "Our Plundered Planet," by Fairfield Osborn. Little, Brown and Co. Boston, 1948. $2.50. "Plowshares Into Swords," by Arthur P. Chew. Harper and Bros. New York, 1948. $3.00.

destructive groups of human beings that ever raped the earth. They moved into one of the richest treasure houses ever opened to man, and in a few decades turned millions of acres of it into shambles." Mr Vogt's god is Demeter, his devils the steel axe, the mould-board plough, the flush toilet and the pregnant woman. He would have man study the disastrous road on which he is travelling, and act at once to make known to all the dilemma caused by rising populations and dwindling resources. We must, he says, "stop blaming economic systems, the weather, bad luck or callous saints. This is the beginning of wisdom, and the first step on the long road back." The second is to limit population and restore resources. Otherwise, "we may as well give up all hope of a continuing civilised life."

Mr Fairfield Osborn, president of the New York Zoological Society and author of *Our Plundered Planet*, is milder, more philosophic, more hopeful. Though the United States has not "even begun to strike a balance in preserving the living assets of this country," yet it has made a start. More has been done in the last decade than ever before, and if not enough has been done, that is because of the potent and soporific belief "that the marvels of modern technology can solve any of the riddles of life." Mr Arthur Chew, of the Department of Agriculture, is also a Malthusian, but more concerned in his book, *Plowshares Into Swords*, with establishing the thesis that the cause of war is the lack of balance between farms and factories, and that peace will only come to stay awhile when that balance is restored between, as well as within, the nations.

As for the conference, it was conducted in Denver by the State Department and the Pan-American Union, whose Conservation Chief, Mr Vogt, is the most alarmed of the three authors. It brought together delegates from the Latin American countries who were told by conservation officials the horrid tale of soil destruction in the United States (they still use the figure of 100 million acres of top soil lost through marginal farming, dust storms, over-grazing and erosion) and the hopeful tale of recent soil reclamation which has cut the annual rate of soil losses at least in half. In return, the Latin Americans confided the dire details of their own situation, which was bad when the first Spaniard noted in the early days that the sea at the mouth of great rivers was the colour of earth, and which has not grown better since.

Delegates were shown destruction wrought by forest fires, by machines that dredged in the valleys for gold and left the land a grey waste. They saw reclamation projects, and a farm of 850 acres "re-made" in a single day according to the best advice of the soil conservationists and with machinery and men loaned by machinery manufacturers. Latin American enthusiasm for soil conservation and reclamation was marked, though they were not agreed as to how far a government might interfere with a private owner's right to waste his, and the nation's, resources if he chose. Nor, as Catholics, were they willing to concede the other branch of the dogma, that limitation of population should go step by step with practices designed to hold top soil on the land. Experts estimate that by 1980 the Latin American population will grow from its present 153 million to 240 or perhaps even 290 million, while the North American population will grow from 158 million to 185 million. In spite of warnings that such a population in the southern continent means lower standards of living, the best support that could be mustered for the prophets of doom was a resolution recommending that, if the member governments asked it, the Pan-American Union should set up a committee to study population growth in general. The United Nations, under whose auspices three international meetings on the subject are to be held in 1949, may have more success in stirring man to protect nature against his excesses and for his good.

American Notes

Mr Truman's Team

Those who have been rearranging the Cabinet according to a system of rewards for the faithful and punishment for the faint-hearted have been disappointed. Mr Truman has announced that he has asked all the members of his Cabinet to stay on, and all have accepted. Mr Marshall's willingness to remain as long as his health permits, and the retention of so able an administrator as Mr Forrestal as Secretary of Defence, are particularly welcome at a time when foreign affairs and questions of defence are likely to be paramount. In time, however, changes in these, as well as other, posts are likely, for both Mr Marshall and Mr Forrestal are known to wish to retire. Then it will be possible to see whether there is any truth in fears of a new invasion of Presidential cronies, or whether the President will feel strong enough to secure able men to strengthen his official family.

Now that Mr Truman's Administration has a life expectancy of four years rather than a few weeks, this should be easier. But the low level of official salaries remains to discourage men who possess ability but no independent means. Two Republicans have come to the rescue. Senator Flanders has opened hearings on a Bill he is sponsoring to increase government pay in the top brackets, and his star witness has been Mr Herbert Hoover, now putting the finishing touches to the recommendations of his commission for the reorganisation of the executive branch.

General salary increases to secure better government servants at high levels will be one of the recommendations of this commission, but Mr Hoover's immediate concern is the salary of the President himself. The salary of $75,000 was fixed in 1909, travelling expenses of $25,000 in 1907: no man is more plainly entitled to a cost of living bonus. In addition, most of the $30,000 left after present taxes is eaten up by the upkeep of the White House. Under the Constitution, however, the compensation of a President can be neither increased nor diminished during the term to which he has been elected. The Democratic majority coming in on January 3rd has only until the 20th to show its gratitude to Mr Truman in a practical form.

Increases in other salaries are nearly as urgent, and there is a bi-partisan move to raise them quickly to strengthen Mr Truman's hand in seeking new recruits. Only 2,000 officials receive more than $10,000 a year; the heads of the nine executive departments receive $15,000. The Secretary of State, that is, is paid no more than any Congressman; Mr Acheson, mentioned as a possible successor to Mr Marshall, left the Department of State last year because he could not afford to remain. Justices of the Supreme Court, at $25,000, receive less than some judges in New York State. Congress has often been more willing to raise salaries at the lower levels than at the top, so that some men today earn more than their policy-making superiors. The salary exemptions for certain ECA officials recognised the need, however, of making Federal posts of responsibility more attractive and of competing with business for able administrators. There will be some hostility in Congress at the prospect of appointed officials receiving more than the direct representatives of the people. But the raising of salaries in the name of efficiency and economy will be easier to swallow than the sacrifice of the right to patronage that will be involved in the wider recommendations of Mr Hoover's impending report.

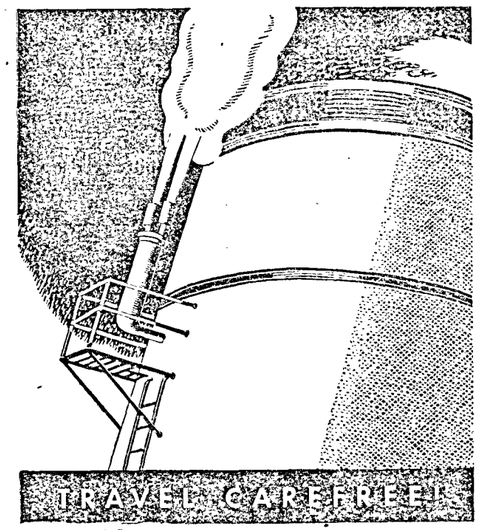
Discarding the Jokers in ECA

To conserve his appropriation for European aid Mr Hoffman, the Economic Co-operation Administrator, has challenged the clause in the Foreign Assistance Act which provides that at least 50 per cent of all aid cargoes should be carried in American ships—a provision which might be characterised as a little Marshall plan for the foundering American merchant marine. The provision has been criticised, both because the use of American ships, with their higher operating costs, consumes an unnecessarily large proportion of Marshall money, and because it deprives Europe of one means by which it might earn dollars (by taking in its own aid, so to speak).

When the Assistance Act was passed, the lobbyists for special interests were routed on most fronts, but in a few instances they were successful in obtaining domestic subsidies through foreign aid. Shipping was the outstanding example (as well as the most defensible, on the score of national security), but the Act also included a direct sop to the millers and live-stock interests in the requirement that one-fourth of the wheat sent abroad must be in the form of flour. The farm bloc was appeased by the limits placed on the export of farm machinery and the provisions concerning surplus agricultural commodities. Like the clauses deprecating the dismantling of German plants, such concessions were designed to win votes for the Act as a whole. With a new Congress to be installed on January 3rd, from which many of the isolationist critics have been dropped, the Administration may feel the moment opportune for streamlining the Assistance Act and discarding some of its jokers. Mr Hoffman already has suggested that the purchase of strategic materials, a long-term project, should be transferred to another agency, perhaps the Treasury.

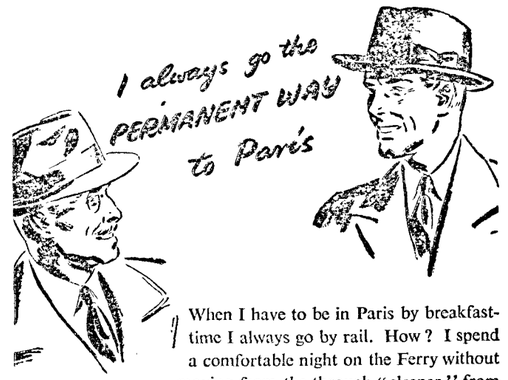
As all the money appropriated last June is now allocated, Mr Hoffman is expected to ask for a supplementary appropriation of $1.25 billion for the rest of this fiscal year, and for $4.5 billion for the twelve months beginning in July. When Congress debates these requests, it will examine the record of European co-operation and achievement, including presumably the current charges that Britain and other European countries have been reselling to the United States, at a profit, aluminium and lead bought with Marshall funds. The new Congress may also be glad to tidy up the Act which was passed by its Republican predecessor. Such an opening of the Assistance Act to revision will lead, of course, to new lobbying. Already the farm equipment manufacturers hope to eliminate the restriction on their exports; the airlines are said to be fishing for a guaranteed share of the available freight; and the grain trade, frustrated by Mr Truman's decision to continue government purchasing, wishes to substitute for the Act's generalised preference for private trading an express prohibition on government buying.

* * *



No Marshall Aid for US Ships?

Mr Hoffman has decided to cease allotting 50 per cent of the bulk cargoes in foreign aid to US ships after January 1st unless their rates become truly competitive by then. If Mr Truman, so far non-committal, supports him, members of local chambers of commerce and the shipping operators may join unaccustomed hands with the maritime unions on their threatened picket line. They are almost as alarmed as the Seafarers' Union at the vision of "mothballs for ships and berry-picking for captains and crews." The 50 per cent provision was written into the Act under pressure from both maritime unions and operators; the objections of the Administration were met by two escape clauses. The American ships must be available at "market rates," and their use was to be encouraged "so far as practicable." Most of the bulk carriers are ships chartered from the Maritime Commission. To the industry "market rate" means the charges fixed by that body; to Mr Hoffman it means "worldwide competitive tramp rates."



The 50 per cent clause is only the most recent of several attempts to reserve American cargoes for American ships. But in the past they have failed, either because the cargoes were unattractive or the ships to carry them did not exist. Wartime shipbuilding, however, left the United States with a large bulk carrier fleet and in the interests both of a reserve for war emergencies, and employment in the shipyards and at sea, it was decided to keep it in being. ECA is at present the largest market for these freighters; it employs 150 of an estimated total of 700 US dry cargo ships now engaged in foreign trade. The Maritime Commission will fight hard to keep them alive.

The protected market and rate preference granted these ships through ECA were designed to discourage the operators from handing them back to the Commission, but it has not succeeded, owing to high and still rising costs. Mr Hoffman's view is that in the past the preferential treatment was excusable because of the worldwide shipping shortage; every US ship was needed. Today, he argues, not only are there insufficient American ships to carry half the bulk aid cargoes, but foreign ships are available in adequate numbers.

Mr Hoffman puts the difference between American and foreign shipping charges as high as $4.50 a ton for coal to France (a figure which the industry disputes; it also argues that without American competition foreign rates, now artificially depressed to impress ECA, will rise). As ECA Administrator, Mr Hoffman believes it is his duty not to subsidise the American shipping industry to the tune of some $50 million a year at the expense of European recovery. It seems likely that his ultimatum is directed, not at the shipping industry, the unwilling prisoner of

Fifteen Years of Repeal

Last week it was 15 years since the repeal of the constitutional amendment which prohibited the sale of alcoholic liquor in the United States. The advocates of prohibition have no difficulty in finding statistics to support their refusal to regard their defeat as more than a set-back. Not only are there perhaps 60 million drinkers of alcohol in the United States today, compared with about 43 million in 1940, but the amount each consumes in a year has increased from about 60 quarts in 1919 (the year before prohibition came in) to 90 quarts this year (but of this over 80 quarts will be beer). The nation is said to spend 5 per cent of its income on liquor. On the other hand, in 1929, at the height of prohibition, deaths from alcoholism were 3.9 per 1,000, compared with 1.6 in 1946, and the highest recorded number of deaths per traffic mile in road accidents occurred in 1925, the lowest in 1947. It can be argued that it was prohibition, not repeal, which encouraged the increase in drinking that has undoubtedly taken place in the past generation. Once it had become fashionable to break the law and drink spirits, drunkenness was no longer socially degrading; the new consumers of alcohol are probably most of them women, who now drink nearly as freely as do men. Then, too, American drinking habits are in part the legacy of a pioneering country which did not produce wine; when alcohol was not easily obtainable, it was drunk occasionally in excess rather than regularly in moderation.

The modern method of dealing with the economic liability, represented by the six million citizens who drink too much and the three million who are pathological alcoholics, is to transfer alcoholism from the realm of sin to that of science, to remove the causes rather than punish the victim. Yale University holds an annual School of Alcoholic Studies, and doctors and lawyers in New York are drafting a Bill which would legislate for alcoholism on a medical rather than a criminal basis. Several well-known industrial concerns deal with drunkenness amongst their employees through Alcoholics Anonymous, the society of about 80,000 reformed drunkards who help others to follow their example by a combination of faith and fellowship—faith that a cure is possible and fellowship in carrying out the mental and physical adjustments which abstention requires.

* * *

When prohibition was written into the Federal Constitution in 1920, it was already in force in 33 of the 48 States. Now there are, or shortly will be, only two States which impose it, Oklahoma and Mississippi, but there are many smaller districts where the sale of spirits is prohibited, chiefly in rural and southern areas. Nearly 20 per cent of the population live under supposedly dry conditions, and there are only 16 States which are entirely wet; even in the dry states there are nearly 3,000 bootleggers who defy the State laws, yet meekly pay the Federal tax. This tax averages $9 a gallon and State taxes $1.40, on whisky which costs only about $1.50 a gallon to produce; so that there is an economic incentive for the trade in illicit whisky even in wet States.

Repeal was accompanied in 1933 by good resolutions that it would not involve the return of the notorious saloon. But in many places the modern tavern differs little from it. The hours during which liquor can be sold and the places in which it can be bought are steadily increasing. There are many local variations, but it is often sold more freely than food. It is not uncommon for the motorist to fill his tank with petrol and his flask with whisky, if not from the same pump, at least at the same stop. Alcoholism will probably always be easier to catch than to cure in a country where bourbon is easier, even if dearer, to buy than bread.

* * *

Christmas Shopping

The white reindeer which this year remind Chicago shoppers of the imminence of Christmas were decorating the streets by the end of October, soon after the "Sweetest Day"—on which two lumps of sugar were meant to go where one went before—and when "Apple-Eating Week" was about to take the place of "Letter-Writing Week." The premature arrival of the reindeer did not, however, encourage shoppers to make up for the lack of energy which they had shown in October. In that month, contrary to postwar custom, retail sales were running at the same rate as, instead of well above, those of the same month in 1947. In November, when the Christmas spirit is really supposed to make itself felt, sales all across the country were from six to ten per cent lower than last year. After the Thanksgiving holiday had given time for writing both letters to Santa Claus and more prosaic shopping lists, December sales began to draw closer to last year's, but were still well below the retail trade's rosy forecasts. This decline in sales is spreading from the high-class department stores to the mail order houses and the variety chains (as, in the interest of truth, the "five and ten-cent" stores now call themselves).

The first cloud, and a very black one, had been the sharp drop in purchases of electrical household appliances which followed the renewal of controls on instalment buying. Salesmen put much of the blame on those controls, but they also complain that television sets have stolen the market for other durable goods. Apparently the housewife whose eyes are glued to her television screen has neither time nor money for a new washing machine—and perhaps her husband can do without a clean shirt if he does not have to take her to the movies. The next storm warning was the decision of a chain of men's clothing stores to cut its prices by 20 per cent: no one believed that this was an altruistic contribution to the fight against inflation. After that the downpour became fairly general, although the women's wear departments still provided welcome dry spots. Retailers are seeking shelter under the warm weather, which has not encouraged thoughts of Christmas, and the hope that the prewar habit of a last minute rush to the shops is going to reappear, now that scanty stocks no longer make it necessary to buy early.

The election results probably had a good deal to do with the disappointing sales in November. Prospective purchasers of mink coats and diamond rings were disheartened by the decline in the stock market and the fear of new taxation, while buyers of more essential items were waiting for the lower prices promised by Mr Truman. The good business being done in bargain basements, and at the many well-advertised sales which have already begun, show that the consumer is becoming price and quality conscious, now that plentiful supplies enable him to pick and choose, his urgent needs have been filled and his war-time savings used. The rising retail price curve has flattened out since August and two big mail order houses are planning to reduce prices in their spring catalogues by from five to ten per cent. They cater for the rural market and are aware that farm incomes have begun to fall. But consumer incomes as a whole are still rising and employment remains higher than last year, even though it did drop below 60 million in November.

There is more than a suspicion that the publicity being given to the fall in retail trade and in employment in certain factories is designed to provide evidence of approaching deflation, in order to discourage the demands of labour for higher wages and of the President for economic controls. Retailers can hardly have expected to go on breaking Christmas records for ever. Even if Christmas trade actually declines for the first time in eleven years, total sales for the year are still running at exceptionally high levels, well above 1947. So far the Christmas shoppers are only telling the business man that easy times are over, not that hard times are coming.

Shorter Notes

Mr Truman will be the first American President since 1916 who has not had a popular majority over all his opponents; the 24,104,836 votes which the final official count gave to him were only 49.5 per cent of the total cast. If, however, the 2,326,412 votes, which went to the two rebel Democrats, Mr Thurmond and Mr Wallace, in almost equal proportions, had been given to Mr Truman, he would have had his clear majority. Mr Dewey, with 21,969,500 votes, had 45.1 per cent of the total. The votes given to the Socialist (132,138), Prohibitionist, Socialist Labour, Socialist Worker and other candidates amounted to 279,668. The 48,680,416 people who voted in the Presidential Election were only 51.2 per cent of those eligible, but another 683,382 people, who did not have sufficient enthusiasm for any of the Presidential candidates to support them, voted for Congressmen, Senators or local officials.

*

If tax receipts and Federal expenditure continue at their present estimated rates, the 1949 budget year should close on June 30th with a surplus of $3 billion. With the national income running at an annual rate of $250 billion, more than $45 billion should be collected in taxes during the year, in spite of the tax reductions approved by the last Congress.

THE WORLD OVERSEAS

Winter of Discord

(From Our Rome Correspondent)

As the fourth postwar winter rolls fog into the Lombard plain, the national perplexities of Italy stand out more clearly and starkly than they did a year ago. The excitement of the impending elections then encouraged the feeling that all was merely provisional. In the winter of 1948-49 there are intolerable tensions, and no promise, however fallacious, of resolving them. One of the recurrent nightmares of this highly self-insufficient country, lack of raw materials, has, it is true, been exercised for as long as Marshall aid continues in its present profusion. To that extent *there is a basis for rebuilding a balanced economy.* Agriculture, moreover, has almost regained its prewar productivity, and city life displays few scars to recall the disasters of five years ago. *The visible flow of goods and services is abundant.*

But equally visible is the capriciousness of its distribution, judged not only by social ideals but by habit and tradition. Among capitalists the owners of house property are reckoned collectively to enjoy a negative income: but a current scandal concerns tax evasion by a Milan textile industrialist to the tune of 5 milliard lire (over £2,000,000), and it is a "capitalist" newspaper of the North which describes this case as "typical." In the middle classes, while medical men, for example, appear to be earning comfortable incomes, the employees of the state are reckoned to be receiving the same total purchasing power as before the war, but it has to be shared by more than a million recipients against threequarters of a million in 1938. Meanwhile, whatever be the true numbers of the unemployed (one and a half million by the smallest of many computations) their presence pervades daily life. Those who have in recent years employed secretaries, clerks, chauffeurs, servants or artisans, must expect a flow of these old acquaintances to their doorsteps, seeking work, recommendations, or advice about emigration for themselves and for young relatives entering the labour market as newcomers in their hundreds of thousands. By no means all these unplaced persons are hungry or ragged. In rich districts like Emilia many of the unemployed look blooming. But they desperately lack a function and a focus for their energies, and, no less than the impoverished, clamour for justice. Since "austerity" is regarded as an impossible attitude to expect from a hedonistic nation, rationing consists solely in the distribution of limited quantities of bread and sugar at subsidised prices and of occasional Unrra surplus clothing. Quantities of every kind of commodity for unrestricted purchase abound and inequalities of income (in which must be included the utterly capricious inequality between those who hold standing leases at a negligible figure and those who pay a huge part of their income as rent on exorbitant new leases) translate themselves with a crudity that has been forgotten in England into enjoyment or lack of food, clothing, shelter and warmth.

Planning or *Laisser Faire*?

In seeking a remedy for this widespread discontent and a method of coping with its causes, the Government is torn between its *laisser faire* wing and its planning wing. The *laisser faire* wing has haunting dreams of a "classical" recovery comprising the demise or shrinkage of unprofitable enterprises (in particular of the survivals of autarky and of the war economy in the heavy and mining branches of industry), the shift of labour from where it is redundant to where it could be employed on terms within the employer's means, with the background of a state spending only its revenues and not debauching the currency. The dream of the planning wing is on the contrary to keep existing enterprise in existence; to draw the energies of the unemployed into additional production; to make full immediate use of the ERP deliveries of coal and fuel oil which are piling up in unprecedented masses; to bring roads and water into neglected provinces; and to pump a vivifying stream of public works into war damaged towns or those still unhappier places, like the large Apulian townships, Andria and Corato, where thousands have always lived in cavern dormitories. As Signor de Gasperi labours to reconcile these divergent approaches, he cannot forget Mr Zellerbach, the ERP Administrator for Italy, who has to sanction drafts upon that ERP lira fund which represents the Government's main availability for any kind of imaginative expenditure. Mr Zellerbach is against any investments which do not promise rapid returns or help to reduce Italy's dependence upon foreign aid in the next few years.

A statement of general economic policy issued by the Government in July embodied the compromise reached between the rival doctors in the Government in the following five-point prescription: (1) currency stability and balanced budget, (2) reduction of expenditure, (3) severe fiscal policy, (4) campaign against unemployment, (5) production policy calculated to raise the total of wage incomes. There has been a measure of success under the first heading, an effort to achieve the second, offset by some yielding to the irrefutable claims of the civil service to better treatment. As to the third, the tax evasion in Milan has given the Government a wonderful cue if it can muster the strength to follow it up. But no clear victories, or even hints of success have been achieved under the fourth and fifth headings. The Government thus remains exposed to the furious denunciations of the Communist and "Fusionist" (fellow travelling) faction that it has no policy at all for remedying economic debility and distress.

Communist Propaganda

The popular propaganda of the "Communfusionists" unblushingly measures the present state of affairs ("hunger and terrorism") against the alternative of happy peasants cultivating their several acres apiece in a land quit of landlords, and of happy workmen working factory plants at full blast on the strength of a withdrawal of American tutelage and a roaring trade with the countries of eastern Europe. It is in tune with that level of sentiment that the Communists utter their full-dress denunciations of every detailed effort by the Government to stimulate recovery—from the "Fanfani Scheme" for employing 50,000 men on a working-class housing programme over seven years (the scheme has now been amended to give work to 27,000 only) to the Segni land reform plan which is radical enough, at any rate, to frighten a large wing of the Government, and may cost it the loss of some Ministers.

The automatic anathematisation of every Government proposal called for by the Communist headquarters is based on a dogmatic denial that the Government is taking any real steps at all, except those of breaking down the guarantees won by labour in the last five years. This dogma admits of the unleashing of strikes or, a recent refinement, of "non-collaboration" campaigns, whenever and wherever political strategy calls for them.

The desperate "separatism" (in General de Gaulle's use of the term) of the hard core of the Communist leaders is an irreducible surd in the economic problem. Every effort towards economic recovery thereby requires so much additional expenditure of energy because of this organised design to defeat it. But the human material, the political strike-fodder of the Communists, is not isolated from the body of the nation, and those who conduct the strategy have to take account of millions of workers whose ideological fidelity cannot be stretched indefinitely in the opposite direction to their workaday interests. Even the high Communist dignitary, Giuseppe di Vittorio, when speaking as general secretary of the General Confederation of Labour, has to remember that there are non-Communist officials in his own organisation, eager to show themselves better stewards than the Communists who hold most of the directing positions; there is also a new Confederation of Catholic inspiration, which is waiting to benefit from any blunders by the Communists. Accordingly di Vittorio, as a trade unionist, has on occasion disclaimed the total opposition to the Marshall aid plan which is inscribed

on the tables of the Party and there are many examples of local give and take between political opponents. After the blunder of the insurrectionary general strike in July, the agitation campaign was broken down into a succession or chain of local and partial strikes, and in the autumn came the refinement of "Non Collaboration," or planned sabotage of production by pedantic adherence to factory routine and refusal to deal with manufacturing problems by common sense and flexibility. There has been a vigorous reaction against this method which is felt to be shabby and unworthy of a virile worker who, if he works, likes to put his back into the task. It is possible that the Communists may go slow in imposing this unnatural slowness, sooner than face a threatened debate on the subject at a high level in the Confederation of Labour.

Clearly, Communist domination of the trade unions and of many of the organs of local government is a powerful drag upon the Government's well-meant if somewhat patternless efforts to pull the country into an atmosphere of expanding opportunities and diminishing social animosities. And clearly the high Communist leadership is playing for stakes which transcend any consideration of their followers' earthly interests. From the fact, however, that Communism must solicit support by masking itself as a practically beneficial programme (as many even of its higher ranking adherents believe it to be), the Government draws the hope that its own beneficial measures may gradually damp the revolutionary fevers and help to heal the terrible *frattura* (split) which in the winter of 1948-49 runs through the mind and body of the country.

Russia's Economic Revival—II

[BY A SPECIAL CORRESPONDENT]

IN last week's issue of *The Economist* it was suggested that Russia's industrial output has reached and surpassed the prewar level. In his anniversary speech in November, Mr Molotov stated that agriculture, too, had this year yielded a crop as large as that of 1940. (The recovery of cattle and dairy farming has been much slower, but even before the war its share in the Soviet national income was not more than four per cent.) It may, therefore, be assumed that the national income of the Soviet Union is now as large or even slightly larger than it was in 1940. Only an income considerably higher than the prewar one may enable Russia to meet the chief demands of its national policy: to repair the ravages of war, to expand its productive apparatus, to achieve even a modest improvement of its low standard of living and to allocate a portion of its national resources to military purposes.

The Five-Year Plan is therefore based on the assumption that in 1950 Russia's national income will be 38 per cent higher than before the war.

But how large is this income in absolute terms? How does it compare with the incomes of other countries? In what proportions is the national product allocated to private consumption, to the expansion of the national economy and to armaments? The answers can only be highly tentative. One part of the difficulty lies in the differences between the various methods of computing the national income. Russian statistics, for instance, based on the Marxist concept of what is and what is not productive labour, do not include in the sum total of the national income many of those services which loom large in the national accounts of other peoples. To this extent they underrate, by non-Marxist standards, the annual yield of the nation's economy. No information is available that would show the effect of reparations and foreign trade upon the size of the national income. The main difficulty lies, however, in the fact that the published totals of the national income are all given in constant prices, in those of 1926-1927, while the figures of current governmental expenditure, investment and the wages bill are all given in current prices. For nearly two decades no price indices that would make it possible to correlate the two sets of figures have been published, although the official statisticians possess them. The ensuing confusion becomes a nightmare when official spokesmen begin on top of all the rest to juggle with 1940 or 1945 prices.

NATIONAL INCOME OF THE USSR
(In Constant 1926-27 Prices)

Year	Billions of Roubles	Percentage of Previous Year	Percentage of 1913
1913	21·0	...	100·0
1921 (end of civil war)	8·0	...	38·1
1926 (middle of NEP)	21·7	129·2	103·3
1932 (end of first five-year plan)	45·5	111·2	216·7
1937 (end of second plan)	96·3	112·0	458·6
1940	128·3	...	614·0
1948 (estimate)	120·0	...	—
1950 (planned)	177·0	...	842·9

These figures—and even more the figures of Russian industrial output which show an even steeper increase—have inevitably aroused the statisticians' scepticism. Much of Russia's present industrial output (tractors, machine tools and so forth) was priced very highly in 1926-27 and high pricing continued later when Russia's industrialisation began. Indices calculated on the basis of such prices must exaggerate the increase in the national income. On this nearly all critical students of Russian statistics have agreed. But new confusion arises when an attempt is made to define the degree of the exaggeration. This is illustrated by a series of essays recently published by Harvard University.* One of the contributors, Mr Colin Clark, arrives at the conclusion that in 1938 the Russian national income was only about 50 per cent above the 1913 level. Here the statistician, calculating in "international units," has obviously gone much too far in the attempt to deflate the Russian figures, for according to his calculation Russia in 1938, a year of heavy rearmament, spent on defence and other government services less than it did in 1913, a patently untenable contention. Another statistician, Mr Alexander Gerschenkron, has checked the figures for overall industrial output against the indices for basic industries and suggests that the output of Soviet industry has risen, in comparison with 1913, not 8 or 9 times, as it is officially claimed, but roughly 5 or 6 times. This appears to be much more convincing. Finally, Mr Paul A. Baran has made an ingenious attempt to compare the national income of the USSR in 1940 with that of the United States. From this comparison it appears that in 1940 the Russian national income was nearly four-tenths of the American. "The per capita current civilian outlay in Russia amounted to 153 dollars annually. The roughly corresponding figure for the United States for the same year is about 600 dollars." It may be added that on the assumption that this year's Soviet national income is again what it was in 1940 and that the American income has since then increased roughly by 50 per cent in real terms, the current Russian national income is at any rate less than 30 per cent of the American.

Rivalry with United States

From these figures, even if they happen to under-rate Russia's actual wealth (which does not seem to be the case), the major problem of Russian policy emerges with great clarity. It can be formulated as follows: how can Russia, basing itself on a national income which, for all the impressive achievements in industrialisation, is still so much inferior to the American, maintain itself in the position of a powerful rival to the United States? This is the consideration which governs all Soviet economic policy and especially the distribution of the national income.

It has been assumed in these columns that the 1948 net national income is of the order of 130 billion in 1926-27 roubles. How much is this figure in current roubles? Since government expenditure, wages and some investments are calculated in current prices, the sum total of the national income, too, must be put into current prices before an approximate idea of its distribution can be obtained. On the basis of involved calculations, checks and cross-checks, which cannot even be summarised here, it is proposed to adopt two hypothetical "rates of exchange" between the 1926-27 and the 1948 rouble, the first making one 1926-27 rouble equal the value of 3.5 roubles at the present day, and the second making the 1926-27 rouble equal to four 1948 roubles. (These "rates" seem to reflect the depreciation of the rouble in the early and late 'thirties, and they make allowance for last year's currency reform). The following table gives the total of the net national income and its distribution, calculated on the basis of these "exchange rates" and in the light of information contained in recently published books by N. Voznesensky, Soviet Vice-Premier and chief of the State Planning Commission, and by A. I. Notkin, a noted Russian economist.†

† N. Voznesensky: *Voyennaya Ekonomika SSSR*, Ogiz, 1948, pp. 191, price 3s., and A. I. Notkin: *Ocherki Teorii Sotsialisticheskovo Vosproizvodstva*, Ogiz, 1948, pp. 291, price 3s. 6d. Mr Notkin's book has had a rather unfriendly reception in the Soviet Press, while M. Voznesensky's has been treated as a "revelation."

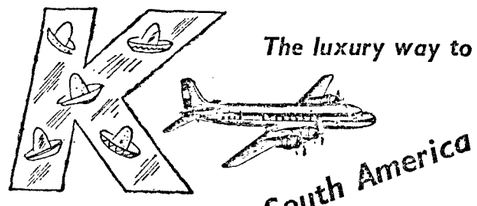
PROBABLE DISTRIBUTION OF RUSSIA'S NET NATIONAL INCOME

	Rate: One 1926 r. =3·5 1948 r. (In billions 1948 r.)	(Percentage)	Rate: One 1926 r. =4 1948 r. (In billions 1948 r.)	(Percentage)
Total national income	455	100	520	100
Civilian consumption	266	59	314	60
Net capital formation	95	21	109	21
Defence	66	14	66	12·5
Building of stocks	27	6	31	6

Of the two "rates" adopted, the first one (1=3.5) seems to be nearer reality. It will be interesting to note that the share of civilian consumption is 9 or 10 per cent lower than the corresponding share of personal consumption in the British national income as estimated in the *Economic Survey for 1948*. On the other hand, net capital formation claims exactly 9 per cent more than the same item in the British national income. Incidentally, Russian economists put the share of civilian consumption above 70 per cent of the national income. But as *Izvestia* (of April 25, 1946) explicitly stated that "consumption" in this context includes defence expenditure, their claim may safely be dismissed.

Not only is Russia's income per head still much lower than that of the western countries, but a much lower proportion of that income is allocated to meet consumers' needs. On the other hand, the proportion of the national income that goes into net investment is 50-75 per cent higher than its counterpart in the western countries (including the United States) has been even in these years of exceptionally high capital formation. This is, of course, the basis for the expected rapid growth of the national income in subsequent years. Incidentally, this year's budget estimates provide that appropriations for "national economy" shall run at the rate of 132 billion roubles, but this figure gives the sum total of centrally planned *gross* capital investment (including some replacement of old capital). It goes without saying that part of the new capital is invested in the armaments industry, but it is impossible to make even the roughest guess of its likely size. As a rule, the outlay on new armament plant is not included in defence expenditure. Such new plant is expected to be financially self-supporting like any other plant. What is included in the defence expenditure is the value of the annual produce of the armament industry which is "bought" by the government. There are some indications that a higher proportion of the total defence expenditure is now devoted to the re-equipment and to stocking munitions than to the upkeep of the armed forces.

About 13-14 per cent of the income appears to be diverted to defence as against 6-8 per cent in the United Kingdom and the United States, and since every percentage of the American income spent on defence represents 2-3 times as much in real armament as every percentage of the Russian income, it follows that Russia can support its present military power out of a lower national income only by spending a higher proportion of it on defence.



An interesting feature is the building up of stocks, which absorbs 6 per cent of the net annual product. This item assumed considerable importance as the methods of planning improved in the late 'thirties; and it has again received much attention in post-war planning. The 6 per cent of the national income are laid aside to build up a "reserve" of food, raw materials and fuel designed to ensure an even rhythm of production in the event of normal winter-time breakdowns in transport and also in the event of war. In the recent war the reserves so built up helped the government to overcome the dislocation caused by invasion, industrial evacuation and the migration of great masses of people to the east. In the course of the war the enormous stocks were depleted. It is significant that so much importance is again being attached to the building up of new stocks. This may be and is justified by the normal needs of planning, but it may also have military implications.

(To be concluded)

Monopoly in Argentina

[FROM A CORRESPONDENT IN BUENOS AIRES]

ON December 5th Argentine voters elected the members of a National Convention which is to be entrusted with the task of reforming the country's Constitution, which has been in force since 1853. What form the amendments to the Constitution will take depends, of course, on what political party gets most of the seats in the Convention (two parties, the Conservatives and

Socialists, are not putting up candidates). Final results are not available, but the official *Peronista* party is assured of a substantial majority. The proposed reform is a *Peronista* project, and one which has aroused not a little opposition from the other parties. Official propaganda has for some time played up constitutional reform, and the new Constitution is already referred to as the "Perón Constitution." The voter is none the less greatly in the dark as to what he is voting for.

Some announcements by party spokesmen have, however, given an inkling of what line the proposed reforms may take. One of these was contained in a broadcast speech by Admiral Teisaire, the president of the *Peronista* Supreme Council, on November 4th. The Admiral referred to a number of projected changes, many of them of a more or less radical nature, but perhaps the most controversial and, from the foreign observer's point of view the most interesting, was predicted in his declaration that with a view to consolidating the doctrine of economic independence, the new Constitution should provide that "the import of essential goods, the export of surplus production, the organisation of manufacture, transport and distribution of our (Argentina's) wealth abroad" is to be a prerogative of the state. Other "manifestations" of the country's economy, he continued, will be left to private enterprise, but public utility services must be "exclusively Argentine."

State monopoly of the import and export trade already exists to a great extent in Argentina through the control of this trade by the *Instituo Argentino de Promoción del Intercambio (IAPI)*, but it is precisely the proposal to give constitutional enforcement to this monopoly which has occasioned the most controversy, and protests have been made not only by the political parties of the opposition but by financial and economic interests. A Buenos Aires financial journal devoted a leading article to the subject in which it was pointed out that, although the former liberal regime had been accused of conniving in the wastage of the country's resources in dividends, commissions, freight and other charges, under it Argentine prosperity nevertheless reached a point where it compared favourably with that of other countries. The article went on to say, the intervention of IAPI in Argentine foreign trade has by no means always served the best interests of the nation. An instance mentioned was the overseas marketing of linseed and its derivatives, for which a price was demanded far above world-market prices and, incidentally, about four times the price paid to the Argentine producer. The result was that the United States, which had for many years absorbed about half Argentina's production of linseed, was induced to encourage home production, and the first crop harvested in the States has exceeded that country's domestic requirements. This important market is now closed to Argentina, with an estimated yearly loss of 250 million pesos. The instance mentioned is, in fact, not the only one in which the operations of IAPI in the Argentine export market have not been conspicuously successful. There is no doubt that, whatever Argentine apologists may say to the contrary, the country's export policy since the war has been based on the belief that decreased production and world-shortages of primary products would compel buyers to pay any price asked by the seller. That this policy, however profitable in its earlier stages, was short-sighted in the extreme is becoming increasingly evident. At a time when Argentina more than ever needs foreign exchange for the development of industry under the Five-Year Plan, exports, with some exceptions, showed a marked decline, a decline which the Argentine Government is beginning to view with alarm.

A privately published economic weekly in Buenos Aires, in a recent issue, devoted much space to comments on this phenomenon, referring especially to the interruption of exports of hides, the sharp decline in meat exports, and the falling off in grain shipments (with the exception of maize shipments, most of which go to Britain at the high prices paid under the Andes Agreement), and the virtual paralysis of the export trade in linseed-oil. At the same time, it was remarked, import permits are being granted with a niggardly hand, and even these importers who have succeeded in obtaining quotas for textiles from Britain, for example, are often faced with the impossibility of securing exchange. This journal (usually well-informed) is of the opinion that Argentina is confronted with the alternative of either lowering the export prices of many of its products, or adjusting official rates for foreign exchange so that prices paid by overseas buyers will fall, with no corresponding decrease of the peso equivalent. It is suggested that the latter alternative will probably be adopted, but statements made by Señor Miranda hardly confirm this speculation.

Bargaining Points

Señor Miranda, addressing the Finance Ministers of Argentine Provincial Governments on November 25th, said that he believed that it would shortly be necessary to reduce cereal prices, but that it should be possible "with ability" (which presumably means by able bargaining) to obtain higher prices for meat, hides and wool. Referring to Italy, a country which, he said, had almost completely paid off its debt to Argentina, he remarked: "Now they say that they do not want our cereals because these can be acquired more cheaply under the Marshall Plan, but in that case to whom is Italy to sell its own products? And the same query will occur to Switzerland and to other countries." Argentina, he continued, although only a nation of 17 million inhabitants, had the purchasing power of one of 50 millions, and Argentina was prepared (in bargaining) to exploit this purchasing power, which he referred to as "preponderating." The speaker then went on to say that if Belgium, for instance, wished to sell rails to Argentina at prices 50 per cent above those asked by the United States, and in exchange wanted to buy Argentine wheat, the latter country would demand 50 per cent more for its wheat (but 50 per cent more than what price is not apparent). Referring to imports of coal from Britain, he said that as the prices demanded were four times the pre-war figure, why should not Argentina demand a price for its meat four times that formerly obtained. These remarks by President Perón's economic lieutenant are, of course, merely variations on a theme which he and other Argentine spokesmen have harped on for the last year or more; but the instance of the "rails against wheat" deal would seem, in view of present world-production trends in wheat, to be not of the most felicitous.

Change in Exchange Rates?

Señor Miranda later had an opportunity of alluding to speculations on changes in official exchange rates, when he was present at a meeting of representatives of Argentine insurance companies with President Perón. In the course of the ensuing discussion one delegate referred to the fact that rumours of adjustments in exchange rates were affecting the sale of Argentine wool in foreign markets, where buyers were holding off in the hope of obtaining supplies at lower prices. In reply, Señor Miranda said that the National Economic Council had already had the matter brought to their attention, and had instructed the Central Bank that no alteration in existing rates of exchange was to be made without first consulting the Council. This, however, does not seem a categorical denial that some such alterations had not been previously considered. A rather unusual note was struck when the questioner remarked that Señor Miranda's assurance would be welcomed by producers as tending to the stability of prices; whereupon the President of the Economic Council, assuming apparently the role of official tipster, interjected; "No, not stability. Prices are going up. . . . It's a pity that it is already after 12 o'clock noon"—alluding to the fact that the market was closed—"but they'll be up on Monday!"

The falling off in Argentina's foreign trade has been accomplished by another phenomenon—suspension of, or at least delay in publication of official statistical figures. The last available figures of foreign trade are those for the half-year ended in June, 1948, published last August; the Central Bank's *Bulletin* (a monthly publication) has not appeared since last August, containing data for the most part up to the end of July. The official monthly statistical summary has not appeared since April. Whether the interruption in the issue of these figures is deliberate or fortuitous is a matter for conjecture.

INDUSTRY MUST MECHANISE

Nothing is any use in the wrong place. Much of the world's work is moving something somewhere else: taking coal from barges, trucks and stockyards to boiler furnaces, wheat from ships' holds to flour mills, components from stores to assembly lines, ingredients from bins to weighing, blending and processing plants. Scientific mechanisation is one of many Simon services to industry. Simon mechanical and pneumatic handling systems put almost anything in bulk, bags or boxes just where it is wanted — saving time and labour by shifting the burden from muscles to machinery, and using brains instead of brute force for higher productivity.

One of many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

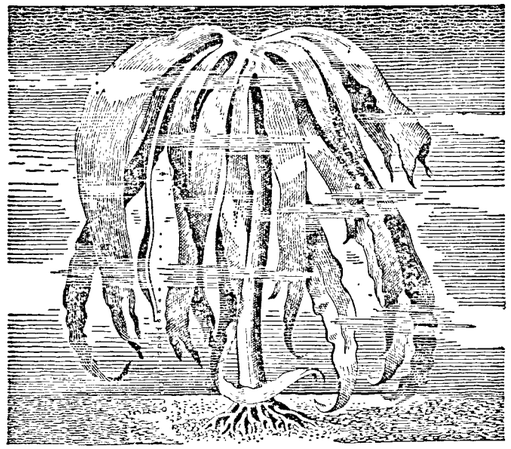
INCENTIVE MEANS BETTER TYRES

A wrinkle like this could ruin a tyre

BUT A KEEN WORKER WON'T ALLOW IT

QUALITY lies in the balance at each of the numerous hand processes in tyre building. Above all it depends on how keen the workers are to do a first class job.



Henley's have started a sound commonsense scheme to make good workers extra keen. Under a co-operative award system as work improves pay rises.

Now output, pay and most important, quality, are all up higher than ever before.

Extra incentive means finer workmanship. Finer workmanship makes Henley Tyres better than the good tyres they have always been.

WRINKLES: A wrinkle overlooked in any one of the fabric layers of a tyre means a poor finished article. Only when attention wanders can wrinkles creep in. Workers who are on top of the job never permit them. One reason why keenness is everything.

THE BUSINESS WORLD

Harder Sterling

ONE of the most significant, though least publicised, economic movements during the past year has been the appreciable increase in the respectability of sterling on the world's markets. A year ago, an early devaluation of the pound was confidently taken for granted in the United States and most countries in Continental Europe. Today the fulfilment of all such expectations or hopes has been relegated to an indefinite future. A year ago, the commercial rate for transferable account sterling in New York was around $3.20. It has since appreciated to $3.50. Over the same period the rate for sterling notes in New York has risen from $2.80 to $3. In Zurich the rate for sterling notes has improved from Frs.9.50 to Frs.12.25. The sterling-dollar cross rate which emerges from free market operations in Hong Kong has moved from $2.80 to $3.10. Comparable improvements have occurred in most of the free commercial rates for sterling. Each of these rates may be highly artificial and related to a comparatively small volume of business. But the force and unanimity of the evidence cannot be disregarded.

These straws in the wind, however flimsy each may be, tend to confirm other evidence that, over a widening area of the world, sterling has been getting scarcer and harder. Some of this evidence takes the disconcerting form of severe curtailments by such countries as Sweden and the Netherlands of their import licences for sterling goods. Statistics of the United Kingdom balance of payments measure the substantial improvement which has taken place in British current transactions with countries outside the Western Hemisphere. This improvement has been most marked in the payments account with other sterling area countries; this showed a net deficit of £30 million in 1946, a surplus of £85 million in 1947, and for the first half of 1948 was running at a rate suggesting an annual surplus of £140 million. The corresponding figures for British payments with the other eighteen countries participating in the Organisation for European Economic Co-operation tell a broadly similar tale. In 1946, an exceptional year dominated by relief rather than recovery, Britain had a surplus of £45 million with these countries. This was converted into a deficit of £30 million in 1947, but in the first half of this year the account was again showing a surplus at the annual rate of £80 million in favour of the UK. These surpluses for the first half of 1948 were, of course, exceeded by the deficits incurred with the Western Hemisphere and other countries, so that in the first half of this year the balance of payments as a whole was still in deficit at the annual rate of £280 million. There is, however, reason to believe that a striking improvement has taken place in Britain's external payments account during the second half of this year.

Some of the increased respectability and hardness of sterling during the past year is relative rather than positive. The improvement in sterling reflects, in part, the unquestioned deterioration which has occurred in the finances and basic economic position of certain other countries, such as France and Sweden. It also reflects the fact that, during the past year, the rise in prices and costs has been more marked in the United States than in Britain, with its suggestion—it is, of course, no more than a suggestion—that sterling might yet be floated into equilibrium with the dollar by the relative depreciation in the internal value of the dollar. The relative character of the improvement of sterling is best illustrated in the market for pound notes in Paris; a year ago, pound notes stood at a small discount compared with the official rate of 876 francs to the £ at that time; today the pound note commands a black market rate of about 1,500 francs compared with the official sterling rate of 1,062 francs. Some of this improvement proceeds directly from the enhanced credit of sterling but the greater part of it must be attributed to a continued loss of confidence in the French franc.

The improvement in the standing of sterling arises from a highly variegated compound of technical, psychological and commercial forces. Underlying them all is the honesty and severity of fiscal policy pursued in Britain since Sir Stafford Cripps went to the Treasury. The budget surplus may not match the original intentions of the estimates and the policy of disinflation may have lost a good deal of its fine edge; but these are still tokens of an orthodoxy in financial policy which is all too rare in the world today. The effects of this policy have been to keep British costs and prices in reasonable competitive trim, to curtail to some extent the domestic appetite for imports and for goods intended for export and to give some partial demonstration to the world that an attempt is being made to back sterling by honest and balanced governmental finances. Again, the qualified achievements of Britain gain by the contrast with what has occurred elsewhere. British fiscal policy may still fall short of the ideal objective that should have been reached; but British performance in this respect compares well with that of wellnight every other country in Europe, and even with the United States. The free exchange markets have given due recognition to this comparison; as a result, they are now quite disposed to take at face value the occasional official pronouncements by the Chancellor of the Exchequer and other Government spokesmen that there is no question and no intention of an early devaluation of sterling.

The technical position of sterling has also strengthened considerably during 1948. A large element in the run on sterling, which preceded and precipitated the convertibility crisis of 1947, was the running down of every available commercial holding of sterling that could be offered for conversion. The whole world (apart from central banks which, by agreement or tradition, were compelled to hold certain sterling balances) went short of sterling. Every sterling debt was left open as long as possible. Every amount due in sterling was collected with the greatest haste and, so far as possible, converted into dollars while the going was still good. A great deal of sterling arising from current transactions in 1946 but left in Britain by overseas interests was repatriated. Every possible opportunity was taken of raising credit in the London market to finance overseas trade. All these operations reflected the view that it was perfectly safe to be a bear of sterling—that at worst the pound would hold its position *vis-à-vis* the dollar, but that its devaluation was much more likely and that such a move would bring appropriate profits to all who owed sterling.

The total effect of these operations was to help in dissipating Britain's dollar resources far more rapidly than could have been anticipated and to shorten the time during which sterling was convertible again to a spell even briefer than the confirmed pessimists had expected. But, once the convertibility crisis was over, a position of considerable technical strength for sterling was created. During this year, the exchange markets have felt the impact of this improved technical position. Many of the bears of sterling have had to run for cover. Much of the sterling required by overseas traders to make their current payments, and which in the normal course they would have been carrying, has had to be bought. Many sterling debts which were purposely left uncovered in 1947 had to be paid in 1948. Even today it is probable that the underlying technical position of the market still favours the pound and that the floating supply of sterling, which should be carried as a working balance by the non-sterling countries, is still well below normal—that is, below the convenient ratio between working balances and the turnover of trade which they serve.

Finally, due importance for the improved standing of sterling must be given to the arrangements which have been made over the past year to immobilise the larger part of the abnormal accumulations of sterling standing to the credit of overseas holdings. It might at first sight appear paradoxical to talk of sterling in terms of hard and scarce currency when some £3,000 million of sterling is still owing to overseas countries and ostensibly repayable on demand. The distinction is between the supply of sterling arising from current transactions and the volume of sterling claims which are outstanding from the war years. The larger part of this latter total is at present immobilised in "No. 2" Accounts at the Bank of England. All the largest sterling creditors—India, Pakistan, Egypt, Palestine, Uruguay, and Iraq—have made agreements or have submitted to arrangements with the object of limiting their available sterling to comparatively modest amounts released to their "No. 1" accounts. In the case of Argentina the bulk of the sterling accumulated in previous years has been used in the purchase of the former British-owned railways, while current accumulations are needed (and therefore effectively immobilised) as backing for the Argentine currency circulation. The balance of abnormal sterling accumulations left uncovered by formal agreements of this kind is in the main held by countries such as Australia, New Zealand and Eire which can be trusted to use their sterling with the greatest discretion, whether for purchases in the dollar area or for current expenditure in sterling countries.

In any review of the improvement of sterling over the past year two major reservations must be made. The first is that the gap in Britain's dollar payments continues. This precludes any suggestion of an early return to unconditional convertibility. The second is that part of the scarcity of sterling depends upon the willingness of large holders to show a proper sense of abstention in their use of sterling. But given these reservations, there can be no denying the steadily increasing confidence in which sterling is held, more particularly on the continent of Europe. In several countries it is now genuinely a hard and scarce currency. Sterling is thus beginning to fulfil the conditions of esteem and creditworthiness which are required to make it once more an international currency, serving far more than the sterling area and providing the basis on which a large part of Europe's trade can be conducted.

Target Practice in Lancashire

THE cotton industry is one of the industries to which the Government, faced with the inelasticity imposed on engineering production by the shortage of steel, was obliged to look this year for an exceptional expansion of its production and of its exports. The targets placed before the industry by the *Economic Survey* in the spring of this year did not at any time look easy to attain. Enough of the year has now passed to make it possible to see by what margins the Government requirements will, in general, be missed. Since the President of the Board of Trade has announced a further export target for the industry for 1949—a monthly export rate of £15 million to be reached by the end of 1949—the Lancashire trader is beginning to inquire whether this too is a possible or an impossible goal, and on what assumptions it is put forward. Has the cotton industry in fact an expanding part to play in world trade? Can its place in the national economy really be expected to grow more important? In some of the newer industries such propositions are unquestioned articles of faith; but not in cotton, which is an old industry and disillusioned.

Any attempt to understand the approach of the Lancashire cotton industry to a target evolved in Whitehall has to begin by taking into account the industry's long history of contraction and decline. In 1913 the industry produced (according to the Working Party's report) 8,050 million square yards of cloth, and exported nearly 7,000 million yards. By 1938 cloth production was down to 3,126 million square yards, and only 1,449 million square yards were exported. "For a major industry," the Working Party commented, "the scale and rapidity of the decline can hardly have a parallel." The war caused a further decline, largely through the enforced concentration of the industry and the enforced diversion of manpower to other pursuits, and the production target towards which the industry is struggling this year—and which will not be reached—represents no more than 79 per cent of the 1938 volume of production. The industry is still large (it employs about 290,000 workers), its place in the national economy is still important, and the reputation of its products in overseas markets is still high. But its members, the survivors of a prolonged and cruel process of attribution, are a body of men not easily impressed by high-pitched targets.

Not only the investors but also the workers in the cotton industry were ground out in the process of attrition, and this (since the hardships which the process carried with it are not forgotten) affects the prospects of success of the ambitious manpower target which the *Economic Survey* placed before the industry. The number of cotton spinners and weavers declined from 572,000 in 1924 to less than 300,000 in 1938. At the end of last year the number employed in the industry was 267,000, and according to the Government's programme it was to be increased to 325,000 by the end of this year. It had actually risen to 288,000 by the end of October, and was increasing at the rate of between 100 and 200 workers a week. This result has been produced with the aid of better wages, elaborate recruiting campaigns, schemes to improve welfare and working conditions in the mills, and the provision of nurseries to make it possible for housewives to go back to the mills.

Both the Government and the industry, however, have been aware that not only a bigger labour force but also higher output per head would have to be attained. In the first months of this year higher output was attained in some districts largely by overtime working; but overtime was never popular, and the trade unions brought it to an end in the late summer. It was not possible until the holidays were over to say what the production trend would be after overtime was abandoned; the December issue of the Cotton Board *Trade Letter* has now stated some provisional conclusions, and they are disappointing:

> It is now clear that overtime working did increase output more or less proportionately to the hours worked, and the additional labour force recruited during the summer months was just sufficient to offset the loss when overtime working

ceased. More recent output figures have been discouraging. Output per head has been falling to a greater extent than can be made up by the regular weekly increase in the labour force.

The accompanying tables of yarn and cloth production, which show the recovery after the holidays, require to be read with this warning in mind. Table II does not show production week by week; but the highest week's yarn output of the year was 18½ million lb. in the week ended June 12th. This was approached in the second week of November (18.44 million lb.), but the second and third weeks did not maintain the improvement. The Cotton Board's conclusion is that, while one of the yarn targets—the production of 900 million lb. of yarn by December 25th—will be reached within a few days of the time-limit, the target rate of 20 million lb. of weekly production will not be reached. "There is no reason why 19 million lb. (a week) should not be reached if recruitment continues at the present rate and if the present downward trend of weekly production can be reversed."

It is perhaps necessary to inquire what the nature of the Government's yarn production target was, and what results can be expected if it is not reached. The rate of yarn production laid down was the rate believed to be necessary to maintain supplies to the home market and at the same time to enable the required increase in exports to take place. It follows that one of these must suffer. Up to the moment, as Table IV shows, exports have not reached the monthly rate of £13 million which is the target for the end of this year. But it is necessary to take into account the length of time taken to prepare an export transaction. In spite of recent relaxations, the apparatus of control is still formidable, and the merchant converter who is to export the cloth has to get official approval before his order to the manufacturer is definitely placed; the manufacturer in turn passes on his yarn order to the spinner. With his application the converter states the destination as well as the quantity and description of the cloth which is to be made. It is thus possible to know the relative trends of production for export and for the home market well in advance of the process of production and trade. For some time (states the *Trade Letter*) "production has been diverted to export at considerably more than the required rate and production for the home trade has consequently been much below the required rate."

The possibility that the home trade may be starved of supplies in the next few months is evident, and this has caused the President of the Board of Trade to oppose further relaxations of clothes rationing at present. It may be avoided if output takes a turn for the better. But it still does not follow that exports will expand as rapidly as is required; clearly, they will only expand if the larger quantities of cloth now being produced for export can be sold. The merchant who has planned the export transaction has a long wait before he can ship his cloth; in the meantime conditions in his market may have changed, and he may be faced with the necessity not only of finding another market, but of getting official approval for it. He may find himself with a frustrated export on his hands.

TABLE I—EMPLOYMENT IN THE COTTON INDUSTRY, AUTUMN, 1948

Because of the nature of the trade it is difficult to tell at any moment how widely situations of this kind are about to arise; traders in Lancashire, seeing the increasing volume of production now earmarked for export and the inelasticity of the actual export figures, are uneasy on the point.

An idea of the quantities involved in these export sales is given by the fact that in the peak export month of this year, August, 71,395,000 square yards of cloth were shipped. Exports in September were lower (67,113,000 square yards) and in October they fell again to 63,430,000 square yards. This is between a quarter and a third of the output. But the rate of production for export is estimated by the Cotton Board for the third quarter of 1948 at substantially more—280 million square yards.

The particular task of expanding cotton exports to Canada which was set to the trade this year continues to present some difficulty. Shipments in the third quarter were 12.8 million square yards, and the Cotton Board estimates that they will reach 16 million square yards in the fourth quarter. These figures compare well with the shipment of 1,500,000 square yards in the third quarter of 1947. But the progress is uphill, and Canadian importers seem to be hoping for a price recession or for the release of more dollars for American goods. Sharp reductions in the textile prices quoted in the past few months by American exporters have strengthened the buyer's hand.

In the world at large the limit of possible exports from Lancashire has still not been reached. But selling has quite ceased to be easy or automatic, and the limit is not far away unless new production and trading policies can open up markets to which Lancashire has for many years had little access. This is the choice which stands in the background of the big questions of re-equipment and expansion. The industry has taken on a pattern far different from that of its old and great days. Most of its production has in recent years gone to the home market, and has been largely standardised within the framework of the utility programme. The export trade has become a specialised trade handling for the most part short runs of high-quality (and high-priced) goods. Along those lines the industry can see a fairly steady market that is not vast or brilliant but is reasonably profitable and reasonably assured. Are they to adventure further into large-scale production of cheaper goods for the mass export market? Without such an adventure it seems doubtful if cotton exports can be expanded very much beyond their present level. In the utility programme, with its detailed specifications of sound standardised cloth structures over a fairly wide range, the industry has a useful basis of mass production to hand. It has not, however, any apparent confidence that a mass export market, if it were gained, could be held for long.

In the past year or two the industry has shown itself much more receptive to changes in technique and organisation. The necessity of redeployment is now fairly generally accepted. Changes in the old wage structures, essential if redeployment is to be fully effective, are being adopted. In the spinning industry these necessary changes were set out in the Evershed Report, and the mule spinners are the main section to which the Evershed recommendations remain to be applied; a new universal wage list for mule spinners is in the later stages of negotiation, and should, once the few outstanding differences between employers and unions are settled, be put into force early in the new year. In the weaving industry the Moelwyn Hughes recommendations for a new wage structure which will embody systematic incentives to greater effort are at an earlier stage of discussion, but the interim report on the first trials of the proposed system should be ready for study by the manufacturers and the unions by the end of this month. Difficulties and prejudices are not dead, but gradually are being overcome. There will remain the crucial problem: will fresh capital investment, re-equipment, and expansion pay their way? On this the cotton industry is evidently not satisfied.

Business Notes

Storm in a Teacup

The first of the inevitable wrangles over the use of ECA funds broke out in Washington on Wednesday when Mr Howard Bruce, the deputy administrator, accused Britain, Belgium and the Netherlands of using ECA dollars to buy aluminium and lead and reselling some of it to America at considerable profit. Mr Bruce announced that, in consequence, their requests for non-ferrous metals under the ECA programme had been reduced by 34,500 tons. At the moment, such a reduction in supplies would be of little concern, and in any case Mr Bruce has since said that the cuts will be restored if the charges prove to be groundless. More important is the procedure which Mr Bruce saw fit to adopt. The charges were made and action taken upon them without consulting the countries concerned. Moreover, this matter had been under investigation for the past few weeks. Continuous and close scrutiny of the use of ECA funds is entirely proper. But clearly all the facts and figures should be submitted to the countries concerned before public accusations are made.

Britain is alleged to have purchased 81,326 tons of aluminium with ECA funds up to the end of September and to have resold 12,812 tons to American firms as scrap. During the same period, it was stated, the Netherlands bought 3,440 tons of which 2,360 tons were resold, while Belgium bought 2,250 tons up to the end of October of which 673 tons were resold. The aluminium was bought in Canada at 16 cents a lb. under the British contract and resold in the United States as scrap at up to 30 cents a lb. Belgium and the Netherlands (but not Britain) were also accused of carrying out similar transactions in lead. The Ministry of Supply has been quick to deny these charges. It points out that

the export of virgin aluminium and aluminium scrap from Britain is prohibited and that none has in fact been sold to USA. Very small quantities of secondary aluminium—recovered from scrap—have, however, been sold to the United States in strictly limited quantities on quota to enable smelters to retain their prewar markets. The total quantity during 1948 is estimated at about 1,000 tons. The ECA mission in Britain has since announced that "the Ministry of Supply has been most co-operative in trying to run down the discrepancy in figures."

For many uses, virgin and secondary aluminium are not alternative materials—they are technically different metals. It is surely not contrary to the spirit or the letter of the ECA agreement that Britain should recover secondary aluminium from scrap and sell it to overseas buyers, including the United States. But even so, the quantities of secondary aluminium involved are far smaller than the 13,000 tons reported by ECA. The American charge may well turn out to be based on a misunderstanding, either between virgin aluminium and secondary metal, or between the countries of origin and the country of shipment. Scrap metal from Germany and aluminium from a British owned plant in Norway could easily have been sent to the United States via Britain and entered in American trade accounts as coming from Britain.

ECA and British Coal Export Prices

The proliferation of international economic committees in Europe, often consisting of the same officials who meet to discuss the same subjects in different places, is no doubt responsible in part for the confusion that has arisen over the discussions on coal export prices. The Minister of Fuel and Power told the Commons on Thursday last week that the Coal Committee of the Economic Commission for Europe had made no representations about the price of British export coal, and this was doubtless strictly accurate.

The representations originated with the Economic Co-operation Administration, which has taken three initiatives in the matter in the last four or five months. Mr Finletter, the head of the ECA Mission in London, approached the Ministry of Fuel and Power in August about the large margin between the home and export prices of British coal. Mr Gaitskell at that time gave an explanation of the British case, which on ordinary commercial principles was, and is, quite a strong one. On September 16th, Mr Harriman's deputy in Paris, Mr William C. Foster, wrote to the Secretary-General of OEEC, M. Marjolin, asking OEEC to examine the level of European coal export prices with a view to determining whether a more rational price structure could be achieved—referring, presumably, but not explicitly, to the differences between German and British prices. M. Marjolin referred the matter to the Coal Committee of OEEC, which thereupon set up a coal prices sub-committee with a Dutch representative as chairman. The sub-committee failed to reconcile the views of the importing and exporting countries, and its report did no more than set out the arguments on each side. Mr Harriman thereupon raised the matter again in London in November—this time with the result that the Minister of Fuel and Power agreed to discuss coal prices with the representatives of the German bizone. At these discussions, which took place a fortnight ago in London, Mr Charles W. Jeffers was present as the coal adviser to Mr Harriman. Mr Jeffers had until recently been director of the Coal Division of the Economic Commission for Europe at Geneva—a fact which may explain the confusion whether the matter originated in Geneva or Paris; but Mr Jeffers is still chairman of the Coal Allocations Working Party of the Economic Commission for Europe, and the importance of the distinction is problematical.

Although American representatives in Europe have drawn attention on three occasions to the high prices charged for British export coal, it would be wrong to suppose that there is a firm American policy on European coal prices. The bizonal authorities—and particularly the American Military Government—have been anxious for some months to get higher prices for Ruhr coal; and the best way to ensure that British export prices do not come down is to raise German export prices. The bizone would welcome more foreign exchange for its coal, for exports are large and increasing, and higher prices would raise the foreign purchasing power of the bizone and eventually lessen the drain on American funds. Since the conversion rate of the Deutschemark is arbitrary and open to revision, the bizonal authorities can hardly base their claim for higher prices on the necessity of covering costs in the Ruhr. They must, therefore, rest upon the simple fact that London is asking, and getting, more for British coal than Frankfurt is getting for Ruhr coal. ECA has a different interest; it is concerned with the general relief of economic pressure in western Europe, and would therefore like to see the price of Ruhr coal kept down. It can hardly expect to bring this about unless British export prices are reduced to approximately the same level.

* * *

Comparisons with Ruhr Coal

Ruhr coal is at present—quality for quality—the cheapest export coal in Europe. Polish coal is for the most part dearer than German and a little cheaper than British; American coal (small quantities of which are still coming to Europe) is the dearest because of the high freight element in its cost. The large range of qualities and sizes sold and the variations between different contracts make it difficult, however, to set down hard and fast price comparisons. The following examples of British and bizonal export prices give an idea of how the comparison stands:

EXPORT PRICES OF RUHR AND BRITISH COALS
(f.o.b. in dollars per ton)

	Ruhr	British
*Longflame** Screened (80mm.+)	15.00	17.00
Gas, Screened	15.00	17.00
Bituminous, Screened	15.00	16.50
Anthracite 2nd class, Nuts 1	20.00	17.75
Anthracite 1st class, Nuts 1	24.00	20.00

* High volatile.

These figures suggest that the gap between British and Ruhr coal prices in Europe is not so wide as has been represented—though it should be remembered that they are not delivered prices, and the freight charge for British existing coal may widen the gap still further by the time it reaches the consumer. In each case, the fixing of prices is broadly a matter of a monopoly decision; for each, the export price is in general a good deal higher than the home price; both in the bizone and in Britain the home price is at the moment insufficient to cover costs. The fear of inflating industrial prices generally makes the authorities in each country reluctant to raise the home price of coal any further.

On the British side, it has been pointed out that the foreign purchaser, though he pays more than the home consumer, is in certain respects favoured. The types of British coal which are in keenest demand in Europe—Welsh anthracite and Durham gas coal—come from the high-cost mines which the Coal Board is working at a loss, and in a normal commercial situation the price would include the whole of those costs. They are sold to the home market below cost, but the home market does not enjoy much freedom to choose the qualities and sizes of coal it would buy: in particular, many home consumers are obliged to take small coal when they would prefer large coal. A greater effort is made to supply the export markets with the qualities and sizes they desire. In fact, there has been no difficulty so far in selling the scarcer coals abroad at the prices asked: the difficulty in selling the poorer qualities, notwithstanding their relatively cheaper prices. For some types of untreated small coal, the export price is even below the home price; but the scarcer, and dearer, coals are easier to sell.

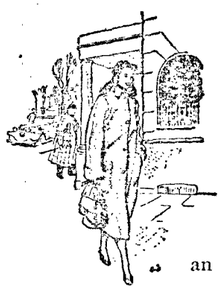
Financing Intra-European Aid

Those who have already wearied of the attempt to understand the intricacies of the accounting for the sterling "counterpart" of Marshall aid would do well, perhaps, not to try to grapple with the further complications which underlie the Bill introduced into Parliament this week—the American Aid and European Payments (Financial Provisions) Bill. If they thus shun the maze of technique—and the provisions do not go beyond technique—they can rest assured that the object of this Bill is simply to ensure a proper discipline of the Treasury's financial operations in implementing the ECA Bilateral Agreement and the Intra-European Payments agreement. Its primary purposes are to ensure that the two accounts through which these transactions pass are subject to annual audit by the Comptroller and Auditor General, involving subsequent report to Parliament, and to authorise the Treasury to make advances for intra-European payments in anticipation of ECA reimbursements.

As for the underlying accounting, the new complications spring from the Intra-European Payments Agreement, under which part of the ECA dollar aid became conditional upon the provision by the recipient of local currency aid for other OEEC countries. Now, therefore, there are three types of ECA aid—grant aid, loan aid and conditional aid. The mechanism of the Special Account, which the Treasury opened with the Bank of England last August, relates only to the first of these types; except for certain adjustments while the new arrangements are being run in, this mechanism will operate as in the past. (It may be noted, however, that the 5 per cent of all credits which is at the disposal of the US Government no longer reposes in the account, but is now forthwith paid out to that Government's private banking account.) Accounting for loan aid is straightforward, and is identical with that employed for the 1945 line of credit. The third category of aid, conditional aid, will, when the new arrangements are approved, be accounted through a further account, the Intra-European Payments Account.

This will differ from the Special Account in two important respects. It will be a purely internal account which will apparently not appear in the weekly Exchequer Return (nor, of course, in the Bank Return). Secondly, the primary operations upon it will not be merely nominal, as is true of the Special Account so long as the funds are released for debt redemption, but will reflect real borrowings by the Treasury from the banking system. The amount of sterling which Britain is required to provide by "drawing rights" for OEEC countries is settled each month by the BIS compensation machinery and notified to the Treasury just before the middle of the following month. These funds must be available by the 17th of the month, and apparently are drawn promptly by the beneficiaries. They must, therefore, be raised by the Treasury as part of its normal floating debt operations. The bookkeeping discharge of these payments comes, of course, from the sterling value of dollars transferred from the ECA as conditional aid; but as the dollar reimbursement (or the notification of the apportionment of the dollars as between the categories of aid) will usually not have been received by the time the sterling payments have to be made, the necessary transfers to the Intra-European Payments Account will be financed by temporary advances from the Civil Contingencies Fund. These advances will, of course, be repaid, through the Payments Account, when the dollar reimbursements are duly cleared; but the consequential repayment of floating debt at that stage will affect only the internal debt. It should be noted, however, that the real creation of debt necessitated by the OEEC transfers may be regarded as merely the counterpart of the real extinction of debt which will have occurred at a much earlier stage, when the Exchange Account first sold dollars (later to be denominated as "conditional aid dollars") for the purpose of meeting Britain's current dollar expenditure.



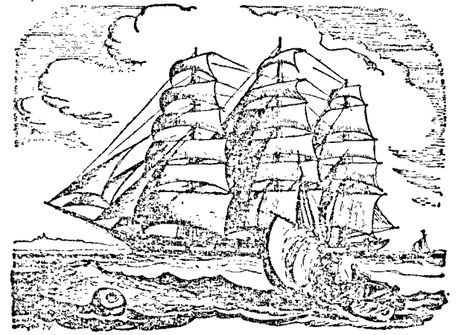
Among other complications of detail, one further point needs to be noted. Britain not only gives drawing rights, but also receives them—from Belgium. The sterling counterpart of these Belgian francs (which are, in effect, ECA grant aid received by Britain indirectly, since Belgium gets equivalent "conditional aid" from the United States in dollars) will be credited, not to the Intra-European Payments Account, but to the Special Account, where it will be treated precisely as direct dollar grant aid is treated now. This follows the ECA ruling that responsibility for segregating the local currency counterpart of conditional aid (and for contributing the 5 per cent. for the use of the US Government) falls on the ultimate recipient of the aid and not upon the country which actually receives the dollars.

* * *

Meat Supplies and the Ration

Britain's meat ration of a shilling a week is in danger. Under the Andes agreement of last February, the Argentine Government undertook to ship to Britain 400,000 tons of meat and 20,000 tons of canned meat in 1948. This quantity represents rather more than a quarter of Britain's annual consumption of carcass meat (which this year is running at the annual rate of 1,500,000 tons) and it is not being honoured. The trade returns do not distinguish between arrivals of meat under the Andes agreement and those which represented late deliveries under the 1947 contract. But since only 250,000 tons had been received in the ten months up to October from Argentina—22 per cent less than in the corresponding period of 1947—a large deficit for the full year is plainly threatened. In explanation of the smaller shipments to Britain, the diversion of supplies to Belgium, Holland and other Continental markets has been mentioned. But these countries are not large customers—the current Argentine contract with Belgium is only for 31,500 tons of frozen meat and that with Holland is probably smaller. Nor are they likely to be permanent customers. But at the moment they are apparently willing to pay higher prices than Britain, and this fact, presumably, is held to justify the diversion of supplies already under contract to Britain.

Many will regard this reasoning as part of the now familiar process of pressure which precedes most of the trade negotiations in which Señor Miranda takes part. There is no evidence point-



FAMILY TRADITION

It is always pleasant to open an account for another member of a family whose name has been on our books for generations. It is still more pleasant to record that the number of such families is considerable. We like to think that this tendency to make 'banking with the Westminster' a family tradition is the outcome of the Bank's constant endeavour to make each customer, however small his account, feel that he is a welcome visitor . . . You can prove the extent of this welcome for yourself by a call at any branch of the Westminster Bank.

WESTMINSTER BANK LIMITED

3F52

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

ing to a sharp decline in Argentine meat production, despite the drought. Last year, the total cattle population numbered 41 million head compared with 33 million in 1937, and although exports of meat were heavier than in the war years they were below the prewar level. Consumption of meat in Argentina has, of course, increased, and better quality steers have been going to the home market in preference to export. Hence the present hold-up in shipments to Britain must be interpreted as a bargaining more by Senor Miranda in preparation for his negotiations in London (according to latest reports, these may be postponed by a month) rather than as a dearth of supplies. Dr Edith Summerskill has described the outlook for meat supplies as gloomy. But in the long run it might be well worth the sacrifice to forgo Argentine meat supplies, even though that would mean reducing the ration to 8d. or 9d. a week, rather than submit to harsh terms for prices and delays in promised deliveries.

Such a policy would require courage, for at present meat supplies throughout the world are scarce and new sources of supply cannot be rapidly developed. The Commonwealth Economic Committee has this week resumed publication of its annual review of world meat supplies, extracts from which are included in this week's issue of the *Records and Statistics* Supplement. In 1947, world exports of beef were 15 per cent smaller than before the war, and of pigmeat only half. On the other hand, shipments of mutton and lamb increased by 30 per cent and canned meat by more than 70 per cent. Total exports of meat were 11 per cent smaller than in 1938, although during the ten years the world population has increased by about 12½ per cent. This decline in exports is not to be attributed wholly to smaller output. Consumption has increased significantly in certain producing countries. In the United States, consumption of beef and veal per head was 30 per cent higher than in 1938, in Canada 13 per cent higher and in Argentina 10 per cent higher. British consumption on the other hand fell by 24 per cent between 1938 and 1947.

* * *

Britain's Aid to Europe

The first of the reports which, under the ECA bilateral agreement with the United States, Britain is required to make of the extent of aid received and the uses to which it is being put, was published last week as a White Paper.* Necessarily, it is impossible in most cases to relate the aid received to specific projects and developments in Britain's economic programme. Hence the White Paper not only sets out the details of ECA procurements and deliveries of commodities and the extent to which the relative dollar reimbursements have been claimed and received, but also gives a brief account of the salient economic trends in Britain, including the role which Britain has played in economic co-operation in Europe. As the report relates to the six months to the end of September, most of the information it contains has already been published piecemeal elsewhere. The White Paper does, however, draw the principal threads together and presents some useful information, extracts from which will be found in the *Records and Statistics* Supplement this week.

Of particular interest is a brief analysis of Britain's exports of capital goods and other essential commodities to Western Europe. The trend of these exports is shown below:—

EXPORTS TO OTHER OEEC COUNTRIES
(Monthly averages: £'000)

	1947		1948	
	2nd half	1st qtr.	2nd qtr.	3rd qtr.
Metals and engineering products	14,759	15,972	17,871	18,394
Textiles and clothing ...	3,703	3,731	4,506	4,937
Other manufactures ...	5,191	5,720	6,432	6,301

It will be recalled that, at the time of the conclusion of the Intra-European Payments Agreement, it was stated that a large part of the unrequited exports which the sterling area is due to make to the OEEC countries would in fact come from countries other than Britain, although the aid ranks technically as British aid. Since Britain's unrequited exports to the OEEC group were very substantial even before the Intra-European Payments Agreement was reached—in the first six months of this year Britain had a total surplus of £40 million in its balance of payments with this group—it seemed that, after the Agreement, Britain's own surplus was likely to decline. The above figures suggest that this is not happening, for exports of capital goods and other essentials have risen further.

* Economic Co-operation. Cmd. 7572.

Difficulties of the Electricity Programme

The electric power programme is making heavy demands on the nation's productive resources and too little attention has been given to the extent to which it restricts the export of specialised plant—water-tube boilers, turbo-generators, transformers, and steel pipes—of which European countries are in particularly urgent need. If those European needs are not to be served—which will mean that this particular trade will go back into the hands of the German heavy electrical industry as soon as the Germans are able to resume it—it is the more important that corresponding benefits should be gained now by the British economy. Mr Gaitskell's statement in the Commons last week admitted that the expansion programme for power plant has fallen behind, and is falling behind further. The target proposed in the *Economic Survey* was a net addition of 1,020,000 kilowatts to capacity. It has not been reached or even approached. The Minister of Fuel and Power attributed the failure partly to the fact that more plant than was expected has to be taken out of service for repair (this accounts for about 200,000 kilowatts) and partly also to the failure to complete between 500,000 and 600,000 kilowatts of new plant within the time. He added that he thought it "most unlikely" that the increase for next year mentioned in the *Economic Survey*—1,450,000 kilowatts—would be attained either.

While nobody could congratulate Mr Gaitskell on these results he is at least to be commended on the frankness with which he has acknowledged the facts. The whole policy for the reduction of excessive peak load has been rendered unreal by the assumption that the peak load problem is a temporary and abnormal one. There has been too much reliance on figures of planned expansion which were obviously too hopeful from the first; it is salutary, though unpalatable, to have it made plain at last that a serious power shortage will continue in Britain for several years to come. The figures in the *Economic Survey* were too high, as Mr Gaitskell said, "in the light of the capacity of the manufacturing industries concerned, their export commitments and shortage of skilled labour and materials." But there is more than that. He mentioned "lack of co-ordination in the placing of orders." This, no doubt, is part of the reason why power plant is now being kept in store until new power stations have been built to receive it. Clearly, some of the capacity which has built this plant could have been employed in building new plant for export, which would have benefited Britain as well as the rest of the world. Mr Gaitskell also mentioned "lack of standardisation"—which, he said, was "to a large extent inevitable while responsibility was diffused and before it was concentrated in the hands of a single authority." On standardisation there is probably something more to be said. The Central Electricity Board, before it was absorbed in the British Electricity Authority, had already gone some way towards standardisation of generating plant. But there are practical limits to complete standardisation of power stations, whatever the authority building them. The ordinary practice of the engineer is to design his power station for the site and for the requirements placed before him. It should be possible for the British Electricity Authority to carry standardisation further; but this will take time, and the possibilities, limited though they are, have yet to be fully exploited.

Negotiations for Canadian Wheat

Negotiations with Canada on the price of wheat for 1949-50 are continuing and a settlement may be announced while this issue of *The Economist* is in the press. The problem is complicated and a compromise satisfactory to both parties is bound to be difficult. If the price is raised above $2 a bushel, Britain must either forgo the purchase of raw materials from Canada (contracts for other foods having been agreed a week ago) or reduce its dollar reserves. But Canadian farmers, having seen three dollar wheat in the past year, are recalling the clause which was inserted into the wheat contract whereby Britain undertook to recompense Canadian farmers in later years if the price in the earlier years proved to be below the world market level. Britain paid only $1.55 a bushel for Canadian wheat up to last June, while twelve months ago European countries were paying over $3.00 a bushel for American wheat. It is hardly surprising that Canadian farmers are asking for a relatively higher price in the coming season as compensation for relatively low prices in the previous ones, particularly as the price in Chicago is still about $2.38 a bushel.

While discussions have proceeded in London this way, a complicating factor has emerged in the form of the new wheat conference which meets in Washington on January 25th. Its purpose is to draft a new international wheat agreement. The focal point of the discussions in Washington will centre on the range of prices to be adopted in the agreement. In its predecessor (which failed to get American sanction earlier this year) the maximum price for five years was fixed at $2.00 a bushel and the minimum at $1.50 for the first season, declining thereafter by 10 cents a season to $1.10 in 1952-53. If the Canadian Government were to accept $2.00 as the 1949-50 contract price, then the schedule of prices in this year's draft might be adopted in the new international agreement. But if Canada were to insist on a higher price for the contract with Britain, the prospects of a new agreement might be jeopardised. In such circumstances, Canada's part in this week's discussions may not have been unequivocally centred on higher prices now.

Currency for Christmas Spending

The banking figures this week seem to belie the reports from some retail trade circles that Christmas spending in the shops this year has been below expectations. The Bank return revealed an increase in the total of the active note circulation during the week by no less than £26.7 million, which must be one of the largest movements—if not the largest—ever shown in a single week. It compares with an increase of only £9,700,000 in the similar week last year. Then, however, the seasonal demands for currency were being obscured by the abnormal reflux of notes which was in progress in consequence of fears among black marketeers and tax evaders that a currency exchange might be in contemplation. A fairer comparison of this year's trends is, therefore, with 1946, for which the corresponding increase was £18.8 million. The total note requirements of the Christmas season in that year were just under £65 million, spread over five weeks. This year's demands, spread over three weeks, and with just over another week to go before Christmas, have already reached £54 million. Unless the past week's withdrawal of notes from the Bank of England reflects unusually heavy precautionary drawings by the commercial banks, it seems likely that the season's total demands may well surpass those of 1946, and may even exceed the record figure of just under £69.7 million reached in the last Christmas before D-day, when public spending was enlarged by the presence in Britain of large numbers of overseas troops.

It seems likely that the week's exceptional efflux has taken the banks by surprise. The effect has been to reduce the reserve in the banking department of the Bank of England from £70 million at end-November to under £17 million, while the Bank's reserve ratio has dropped to 4 per cent. The reserve has only rarely been permitted to fall as low as this without steps being taken to replenish it by raising the fiduciary issue. If the requirements of the current week are as far in excess of the corresponding 1946 demand as they have been in the past week, the remaining reserve would virtually disappear, so that an increase in the fiduciary issue would be inevitable. If, however, the demand slackens, it is possible that the authorities may take a chance, for they have this year the technical advantage that the Bank return next week will be made up two clear days before Christmas and the following return a similar period after Christmas, so that neither return is likely to reveal the full extent of this year's currency demands. The fiduciary issue was last raised two years ago, from £1,400 million to £1,450 million. In 1947, for the first time since the early wartime period, no increase was necessary, while early this year, thanks to the abnormal reflux of currency, there were three successive reductions in the fiduciary issue, to its present level of £1,300 million.

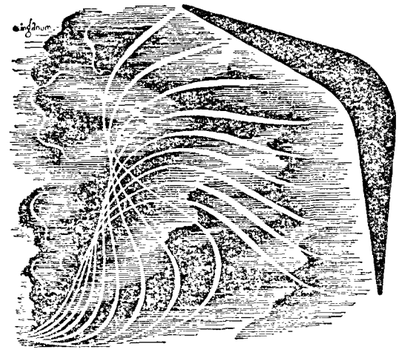
Shell Offer to VOC

Rumour has prevailed in the City for some weeks that the Royal Dutch Shell group intended to make an offer for the shares of Venezuelan Oil Concessions not already held by them. Confirmation has come this week in the announcement that Anglo-Saxon Petroleum proposes shortly to make an offer to the holders of preference and ordinary shares in VOC of £2 ordinary stock of "Shell" Transport and Trading for each outstanding VOC share of either class. This will entail an increase in the capital of Shell for which authorisation will be sought at a general meeting of the company. The offer is conditional on a sufficient acceptance by VOC shareholders; in this connection it will be recalled that a previous offer made some twenty years ago to Mr Gulbenkian, the principal outside holder of VOC shares, was not accepted. The price of VOC shares has been rising in the past month in expectation of the new offer, although the recent revolution in Venezuela has caused speculators to tread rather warily.



In ancient Babylon

BABYLONIAN clay tablets of 4,000 years ago record commercial loans made against the security of the harvest of sesame, the valuable Eastern oil-bearing plant.

Nowadays, trade in every known raw material is facilitated by the banks, whose credit facilities are based on the character, ability and experience of their friends engaged in exporting or importing.

MARTINS BANK
LIMITED
LIVERPOOL, LONDON & 600 BRANCHES

EXPORT BOOMERANG ?

Yes, exports destined for Australia and New Zealand can 'boomerang' if their price or quality is unsuited to the market. For although these Dominions are still eager for British goods and services, their buyers are becoming increasingly selective.
Exporters planning to sell to Australia and New Zealand are invited to consult the Overseas Department of The Bank of Australasia—where they will find up-to-date information from the Bank's branches 'down under' on local markets and conditions.

THE BANK OF AUSTRALASIA
(Incorporated by Royal Charter 1835)

HEAD OFFICE: 4 Threadneedle Street, London E.C.2. (Manager: G. C. Cowan)

Before the announcement, which came late on Wednesday evening, VOC preference were 6½ and the ordinary 6¾ middle compared with the price of 3¾ for Shell ordinary, so that on the face of this comparison, the terms should appeal to VOC shareholders. Apart from any qualification which might arise about rights to current dividends, the attractiveness of the offer might possibly be tempered by other considerations—particularly the effect of dividend limitation in restricting the payment on VOC ordinary shares in 1947 to 24½ per cent from earnings approximately five times greater. Dividend limitation will certainly have had a dampening effect on the price of VOC shares while in the case of Shell its influence has presumably been smaller, since the 7½ per cent tax free dividend in 1947 was covered by earnings of only 10 per cent tax free. There may be some minority shareholders in VOC who might prefer to take their chances in the rapid expansion of Venezuelan oil output in preference to the sheltering umbrella of a giant concern with world wide interests. The fact that VOC is already controlled by the Royal Dutch Shell group, which distributes its products, may limit the importance of this point. From the viewpoint of Shell, the offer obviously has great importance, for it closely follows the arrangement of a $250 million loan in the United States to finance further development of oil resources in Venezuela and to erect a refinery there.

* * *

South Africa's Balance of Payments

Evidence continues to accumulate about the extent of the deficit in the South African balance of payments. The statement of the Reserve Bank of South Africa for the week to December 10th showed a further fall in the gold reserve from £45,301,000 to £43,977,000. Over the same period the sterling holding fell even more sharply, from £45,756,000 to £42,176,000. The reserve ratio has fallen to 29.9 per cent. In the early part of this week it was announced that South Africa had bought $10 million from the International Monetary Fund. Failing the long-term dollar loan for which South Africa has been angling for some time past, it is taking its quota from the Fund. In an attempt to discover exactly what has hit them the South African authorities have recently been making more up-to-date calculations of their balance of payments than they have tried to do hitherto. Preliminary figures published this week measure the balance of payments for the first nine months of this year. Over this period South Africa had a deficit of £134 million with non-sterling countries and of £60 million with the sterling area. These figures are of course exclusive of gold shipments and since a large part of these must be regarded as normal commercial transactions the apparent deficits give an exaggerated picture of the situation. The commercial element in gold shipments may be taken as £100 million a year, or £75 million for the nine months (this being equivalent to the output of South African gold in this period). But even after allowing for this, the situation looks grim.

To cover the deficit with non-sterling countries the Union used £10 million sterling of its non-sterling balances, sold £91 million of gold to the United States, and bought £33 million of non-sterling exchange through the Bank of England. The purchase of exchange from the Bank of England was accompanied by a sale of £24 million of gold to that institution, the balance being presumably financed by drawing down of South Africa's sterling balances. The deficit with the sterling area—£60 million, according to the estimates—appears to have been more than offset by the inflow of capital from other sterling countries which, over this period, amounted to over £75 million. This nine-month figure is, however, likely to be deceptive, since the whole of that inflow must have occurred in the first half of the year and all available evidence shows that there was a net outflow of capital from South Africa dating approximately from the election of the present Government.

* * *

Freight Rates after Decontrol

Since the Ministry of Transport's schedule of freight rates was abolished at the beginning of the month, deep-sea tramp ships have been accepting considerable reductions in certain trades. Tonnage for grain from Vancouver to the United Kingdom has been arranged at rates as low as 82s. 6d., or 11s. 3d. below the former schedule rate; and some vessels have been fixed from Australia to India at 15s. lower than the previous rate, although this was not a scheduled voyage. The Baltic Exchange Chartering Committee has fixed one ship homeward from Australia at a reduction of 7s. 6d. per ton, but business in this market is slow, since owners are reluctant to accept any large reduction in view of the possibility of a long outward voyage in ballast to follow.

These symptoms of weakness are by no means universal. The North Atlantic market, in particular, is showing firmness, and prompt tonnage is at a premium. This is due largely to a bunching of tonnage in the East, which has arisen from the unfamiliar pattern of trade—the Plate homeward markets being moribund—and from the recent steering of British tonnage in that direction. In due course, no doubt, tonnage will redistribute itself more evenly. American charterers from North Atlantic ports to the Continent have been offering higher rates, but some British owners have been content to accept a slight reduction from Government charterers for similar voyages; they have, perhaps, become rather "schedule-bound" and unaccustomed to the idea of looking elsewhere for business. While it is still too early to take a too long-term view of the freight market trends as a whole, there is already evidence that the removal of control was long overdue and that there will be plenty of scope for initiative among tramp shipowners.

* * *

Unearthing Enemy Assets?

The protracted process of segregating enemy-tainted assets in this country is, ostensibly, to be carried one stage further by a new return required by the Administration of Enemy Property Department (a joint department of the Board of Trade and the Treasury). Banks and banking institutions must submit to this department by January 31, 1949, a return of all securities and bank deposits held in London in the name of Swiss, Swedish, Spanish, Portuguese and Tangier banks, in respect of which the authorities have not yet received the declaration ABX. In declaration ABX, which dates from the wartime Defence Regulations, the identity of the ultimate beneficial owner on whose behalf the securities are held in London must be disclosed. Assets probably valued at more than £5,000,000, mainly on Swiss account, appear to be involved, but the enemy interest in these assets is thought to be relatively small. Indeed, if a beneficial owner has not already declared assets by this time, he would no doubt have weighty reasons for not doing so, since income from capital held in London cannot be remitted abroad unless an account is properly certified.

The accounts which come within the scope of the present registration appear to belong largely to Frenchmen and other Continental nationals. These persons envisage a risk to the anonymous cold storage of their London funds as a result of the declaration ABX. Foreign banks are not empowered to submit this declaration to their London agents without the consent of their clients. Up to the present the authorities have required only the registration of accounts still uncertified, and Swiss apprehensions that some further action is contemplated may appear somewhat premature. But Mr Bottomley stated in a written Parliamentary answer last week that he cannot give a categorical assurance that in no case will the information obtained from declaration ABX be divulged. Powers derived from the Defence (Trading with the Enemy) Regulations must remain confined to their proper sphere.

Nationalisation of Dorman Long

Sir Ellis Hunter recently set before the shareholders of Redpath Brown the consequences of steel nationalisation for their company—a subsidiary of Dorman Long, whose preference shares are in the hands of the public. In his speech to Dorman Long shareholders this week, Sir Ellis covered similar ground with a demonstration of the practical advantages which had accrued from the commercial integration of the steel producing business of the parent company with steel using businesses in structural engineering—some of them departments of the company and others subsidiaries of it. By this form of integration, the parent company has obtained a valuable outlet for its finished steel; the subsidiary companies have been able to specialise in different branches of engineering work; and happy and efficient family relations have been developed to the mutual advantage of the parent company, and its offspring and its customers. Today, the group's interests represent approximately one quarter of the structural engineering capacity in this country and 60 per cent in the Union of South Africa; they also include a valuable business in the Argentine.

Sir Ellis Hunter is convinced that no corresponding advantage would accrue to the proposed Iron and Steel Corporation from the ownership or control of such steel-using undertakings. He

suggests that the new Corporation will in fact have to solve difficult problems of adjustment between the "associated" and the "free" firms in the engineering industry. If the new corporation indulged in any form of price discrimination between these two broad classes would there not be an immediate threat to the "public interest"? Might there not, indeed, be circumstances in which the Corporation found itself moved to neglect its own subsidiaries in favour of independent structural engineers? If so, the Corporation would reap no direct gain from the control of engineering companies.

The problem hinges on whether the Iron and Steel Corporation could successfully use its steel-consuming subsidiaries in order to stimulate the demand for steel in subnormal years, and to keep them employed to the best advantage in years of high demand. That is the underlying reason why these interests were acquired and developed by Dorman Long—not as a matter of family favouritism, but as a stabilising influence on the fortunes of the steel producing business of the parent company over good and bad years. The outward form of nationalisation preserves the appearance of this family structure, but appears to underestimate its economic importance. And the compensation which will be paid to Dorman Long is, in the chairman's words, demonstrably inequitable measured even by the book values shown in the published accounts, quite apart from the replacement costs of the fixed assets.

Brazilian Railways and Expropriation

British undertakings abroad have taken punishment enough in recent years, but few have been reduced to the extremity revealed in the Leopoldina report. The directors declare that, quite apart from any agreement about the future ownership of the railway, the heavy working deficit has made it imperative that some short-term aid must be provided. The company has therefore continued to press requests on the Brazilian Government for financial assistance. Such a *cri de cœur* is hardly the best advertisement for an undertaking which expects to be taken over by the Brazilian Government. But there comes a time when even the best British-owned undertakings overseas are unable to finance high wages and uneconomic charges out of their own pockets.

When the directors issued their report on December 9th they pointed out that the committee appointed last June to consider the purchase of the railway had reported to the Brazilian Minister of Transport but that the Brazilian Government's attitude was still unknown. By a coincidence, on that very day the Brazilian President referred the matter to Congress, so that expropriation proceedings should now go forward. But until there is a much clearer indication of the sum involved, and the date and conditions of payment, stockholders of Leopoldina will be wise to exercise continued patience. The same precept applies in the case of Great Western Railway of Brazil, for which a scheme for expropriation will also be submitted to Congress, according to reports from Rio de Janeiro. Some store is being placed on the forthcoming visit to London of Senhor Machado, of the Bank of Brazil, and in particular on whether he will be empowered to discuss the taking over of these companies. Since expropriation would involve the use of sterling balances, a broad examination of the schemes would clearly fall within his general competence as an official of the Bank of Brazil. But it might well be found that their final form, and the allocation of purchase money for which they provide, would still have to be determined in Rio de Janeiro, where the Ministry of Transport has always maintained a guiding hand on expropriation policy.

* * *

Great Universal Stores Finance

The inclusion for the first time of all subsidiaries has produced some striking changes of magnitude in the group accounts of Great Universal Stores for the year to March 31, 1948. Total liabilities in the latest balance sheet are given as £36,062,718 or almost three times the figure for the consolidation in the previous year of the parent company and a smaller number of subsidiaries. Some £7,792,906 of the total represents current liabilities in the form of indebtedness to bankers and "other loans." This high figure has drawn brief comment from the chairman, Mr Isaac Wolfson, who attributes the increase to the need for finance in the normal course of business for the expansion of trade and to the additional companies consolidated. In view of the exceptionally high figure for bank loans, which few companies outside the big tobacco companies and the Odeon group could match, shareholders would surely welcome some more explicit indication of the trend of the group's short-term indebtedness—a trend which cannot be measured in the accounts themselves.

Thanks to a record turnover *in 1947-8*, group profit reached a new peak at nearly £3,000,000 although again precise comparison with the previous year is impossible. This apparently satisfactory trading experience (despite reduced profit margins and increased costs) has necessarily entailed big additions to working capital in the past year. The value of stocks—which are stated to be "in a very healthy condition"—is nearly 50 per cent higher than the total value imputed to consolidated assets at March 31, 1946. Full provision has been made in the accounts for deterioration of stock values "where deemed prudent." Total reserves amount to £4,465,040 and revenue reserves to £1,713,562. No specific provision is shown against a decline in the value of stocks.

GUS continues to extend its interests at a pace which has involved rapid growth of its short term obligations. The interests of the company have this year spread to South Africa where control of general merchanting and multiple shop furnishing businesses has been acquired. In addition, the parent company has acquired control of Polikoff and Willsons (London and Provincial) Stores by share purchases. One feature of the expansion which ordinary shareholders in the parent company may note is the wide extent of outside interests. The preference capital of outside interests in subsidiaries is now £5,346,300 compared with the parent company's total capital of £3,370,607 and ordinary capital of £1,120,607; total outside interests amount to £7,133,193. Payments to outside shareholders together with interest charges absorbed more than a third of group profit after taxation in the past year.

* * *

The Aspro Deal

In their report on the Aspro accounts for 1947-8, the auditors draw the attention of shareholders to the purchase by the company of shares in Ivers-Lee Engineering, a packing machinery company and its subsidiaries, for a sum of £145,000 "from persons including the directors." Their statement read: "We have not received explanation, *in our opinion*, to justify the excess of the purchase price over the values of the underlying tangible assets as shown in the books of the companies whose shares have been purchased." In his statement with the accounts the chairman of the company said that he would welcome questions at the annual meeting on the auditors' qualification to the accounts. Indeed *at the annual meeting last week it* was evident that some shareholders were not satisfied with the explanations proffered by the board for their action, and a proposal to form a shareholders' committee to investigate the circumstances of the purchase was only narrowly defeated.

The accountants explained at the meeting that in their opinion *the excess of the purchase price over the* book values of plant and machinery acquired was £57,897, while £61,121 of the purchase price was attributable to goodwill. But this goodwill had in fact largely arisen as a result of the interest Aspro had taken in the development of a packing machine produced by Ivers-Lee Engineering. This interest had extended first to making a prototype by another concern in which two of the directors were interested, and subsequently to an understanding that should a prototype be successfully developed—as was the case—Aspro would place substantial orders for machines. While it is not in dispute that the directors have taken decisions which have been in the best interests of the company, two separate points have been in debate. The first is that book values are the governing determinent of the value of assets for the purpose of a sale. That could never be admitted. The second is that the chairman and a second director were interested parties in the sale. Here the board took independent valuations as their guide to the purchase price.

* * *

Cotton and Wool Still Firm

Cotton has remained steady in recent weeks and the New York spot price has even risen slightly to 32.95 cents a lb. against 32.44 cents at the end of November. Cotton consumption in the United States during the first two months of the 1948-49 season was at the same level as in the corresponding period last year, and the allocation of ECA funds to western Europe and China to purchase American cotton is sustaining the overseas demand. This season, exports of cotton from the United States are expected to reach 4,000,000 bales or double last year's level. But even if the United States does maintain its high level of consumption—and it is generally thought that

there will be some reduction—cotton supplies should not be tight. The final estimate for the recent American crop is 14,937,000 bales—some 200,000 bales smaller than the November estimate, but still the largest crop since 1937. The grade is somewhat lower than last season's although the average staple length is longer owing to a considerably larger proportion of staples of 1⅛ inch and longer. The bulk of Britain's demand lies between ⅛ and 1⅛ inch. The US Department of Agriculture does not propose to re-introduce production controls for the 1949-50 season and a further expansion in acreage is expected. An appreciable quantity of American cotton has already been put into loan and this may partly account for the recent strength of the market.

The first official estimate of the Egyptian crop is 1,730,000 bales compared with trade forecasts of 1,600,000 bales. This represents an increase of over 30 per cent on last year's crop, concentrated mainly in the long-staple varieties. Although prices in the Alexandrian market had fallen quite sharply, particularly those for Karnak, a steadier tendency has recently been evident. Britain, India, and certain European countries are reported to have bought quite heavily, but there are indications in both the United States and Europe that lower count yarns are being spun.

The upward trend in wool prices has been more marked than in cotton. By the beginning of December, merino prices had not fully regained the peak level of last June, but they were not far short of it. For the finer crossbreds (58s), prices are not much above their April level, while prices of the lower crossbreds have shown quite a significant rise and in most instances are almost back to their January level; for 56s the price reached the record average of 55d. a lb. These price movements clearly indicate a switch of demand to lower quality wools, which will undoubtedly help the Joint Organisation in the disposal of its remaining stock. Demand for wool is still strong but it has yet to be seen whether it can continue—whether all the textiles produced in Europe will find export markets.

* * *

Barcelona Traction Bankruptcy Sequel

The statement made by the chairman of Barcelona Traction in Toronto this week throws fresh light on the involved position which has arisen from the declaration, by a Spanish Court in Reus last February, that the company was bankrupt. The complexities of the battle for control of the company, to which must be added the part which Señor Juan March plays in the affair, have removed it from the normal investment orbit. The original application for bankruptcy on the grounds that the company had failed to meet the interest on its sterling bonds was, to say the least, a legal process distinctly unfamiliar to British law. And it has since been disclosed that the Spanish Government failed to give permission for the transfer of available pesetas into sterling to meet the company's interest obligations despite the fact that Ebro, the Spanish operating subsidiary of Barcelona Traction, held no less than 160 million pesetas in cash in Spain—a sum which would have been sufficient to wipe off all arrears of interest on the sterling bonds. Moreover, since the chairman of Barcelona Traction estimates that the present replacement value of the company's Spanish assets exceeds liabilities by some 2,500 million pesetas, "bankruptcy" is hardly the proper term to describe its financial position.

The March interests, through Helvetia Finance Company, had purchased approximately £1,900,000 of the outstanding £2,684,900 6½ per cent prior lien bonds by September, 1947. Whatever the part which these interests may have played in connection with the application for bankruptcy and whatever may have been at the bottom of a suggestion that a new company should replace Barcelona Traction, in which these interests would control three-quarters of the equity, the position of Barcelona Traction, a Canadian registered company, has been made difficult if not indeed intolerable. Yet events may be working in favour of the company. On the representation of the Canadian and Belgian Governments, the case has been taken out of the hands of the judge at Reus and transferred to a special judge; but proceedings have been delayed. Barcelona Traction have succeeded in their application to enter an appearance to oppose the bankruptcy before the special judge, and they have received legal advice in Spain that the Spanish bankruptcy proceedings at Reus were "wholly invalid and improper." Since Señor March has a controlling interest in the prior lien sterling bonds, the London committee representing holders of these bonds would presumably not be sympathetic to the move to get the bankruptcy rescinded. But the company has a strong ally in the receiver appointed in Canada by the trustee of both classes of sterling bonds, who will contest the bankruptcy proceedings in Spain in conjunction with the company.

* * *

Outlook on the Rand

The first batches of December Kaffir dividends to come from the big mining houses have made a fitting postscript to the address of Mr Robert Annan at the annual meeting of Consolidated Goldfields of South Africa last week. Investors in gold shares will derive only small comfort from either. True, there have been three increases in dividend worthy of note, but all had been expected. Blyvooruitzicht is paying a half yearly dividend of 9d. on the shares in their new 2s. 6d. denomination compared with 2s. 6d. on the old 10s. shares paid in June last—a decision in line with the market's expectations. In the Union Corporation group both East Geduld and Geduld have paid 6d. more than in June; the Geduld dividend is the same as a year earlier, but the East Geduld payment is 6d. higher. A surprising reduction has been made by Durban Deep (of the Central Mining-Rand Mines group) from 1s. 9d. in December, 1947, and 1s. 6d. in June last to 1s. for the latest half year.

There are, indeed, few pointers at present to support the hopes of shareholders in the producing mines. Mr Annan was only able to point to the depressed earning capacity of the mines, which has deteriorated to the level of sixteen years ago. He considers that neither an increase in the price of gold nor a general decline in costs is in prospect, while the shortage of mine workers has become very serious over the past two years. Nor had he encouraging words for the developing mines. He cited the case of Libanon which will require £2,000,000 more than the prewar equivalent to bring extraction up to the projected rate of 100,000 tons monthly. This is not a very favourable background for the investment prospects of established mines, or of the new properties which are being developed in the Orange Free State.

* * *

Grindlays Bank Changes Hands

An interesting banking deal was announced last week. The old-established Grindlays Bank, which since its conversion into a limited company in 1924 has been affiliated to the National Provincial Bank, which held the whole share capital of £250,000, has been taken over by the National Bank of India. An unusual by-product of this deal is that the National Provincial Bank acquires a participation in the National Bank of India, which is also making a cash payment for its purchase of the Grindlay shares. It is easy to see why the National Bank of India should have desired to extend its interests in this direction. The business of Grindlays Bank, although for many years based largely upon personal accounts, has long had important connections in India, and in 1942 extended its sphere to Burma and Ceylon by the acquisition of the banking business of Thos. Cook and Son (Bankers) Ltd. Although the bank has only two offices in London, it has nearly a score of branches and sub-branches in these territories. As a consequence of this overseas development, the bank, while retaining its personal clientele, has been increasingly engaged in commercial and exchange business of a kind similar to that traditionally conducted by the Indian exchange banks, of which the National Bank of India is one of the most important.

Despite this change in its affiliations, Grindlays will retain its separate identity and its own management. No major changes are contemplated in its organisation; in particular, its customers will continue to enjoy the facilities afforded through the branch organisation of the National Provincial Bank. Grindlays' paid-up capital and published reserves at present total £350,000 compared with deposits aggregating rather more than £20 million. To ensure a better relationship between the bank's own resources and the scale of its operations, the National Bank of India intends that the present capital and published reserves of Grindlays shall be "substantially increased" as soon as the necessary formalities can be arranged.

Shorter Notes

The President of the Board of Trade stated in a written Parliamentary answer on Tuesday that he had asked the Association of British Chemical Manufacturers to prepare a report on the chemical industry. This is the first step towards putting the Government "in possession of a comprehensive survey of this basic industry showing its long-term plans, its probable lines of development and the steps regarded as necessary to meet the objectives disclosed by the survey." The scope of the survey has not been indicated and must be difficult to define. The membership of the Association of British Chemical Manufacturers comprises most of the chemical undertakings, but not (except for petroleum chemicals) the oil industry and not the soap and margarine companies.

*

The index of industrial production prepared by the London and Cambridge Economic Service shows a rise of five points in October. The total index for October is given as 125 (1946=100); the figure is, however, subject to revision. The September index is confirmed as 120. While the provisional October index reflects the resumption of full industrial activity after the holidays, it is also an advance on the previous highest level of 123, last recorded in April. A revised index of 140 is given for the motor industry (including cycles and aircraft) for September; this was an increase of 40 points over August, when holidays and the changeover to new models kept production down. The October index for the motor industry is 143.

SECURITY PRICES AND YIELDS

A fuller list containing 371 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Great Universal Stores; Slaters Bodega; Combined Egyptian Mills; Aerated Bread Company; Decca Record.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (m) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) To latest redemption date. (m) 15 months. Yield basis 25%.
† Free of tax.

TO light up but never to flare up, to puff but never to blow, to smoke but never to burn—this is the wisdom of the man who packs his pipe with *Balkan Sobranie*. He hides irritation in the smoke clouds, he sees more clearly through the smoke rings, he finds answers to the unsolvable in its aroma. And when so much discord is piping up, he has the sense to light up and pipe down . . .
SOBRANIE LTD. LONDON. E.C.1.

Pity about young Arnold . .

'The plans his Dad had for him! But, instead of going away to *school and* 'varsity, the lad was sweeping floors and packing parcels not long after his father died. Old Dr. Armstrong did his best—he was trustee of the estate. But an overworked doctor with little or no financial judgment is not an ideal trustee. The estate shrank seriously, and that put paid to young Arnold's chances. Wise trusteeship could have changed that boy's whole life . . .'

Peace of mind costs very little

The cost of expert trusteeship through the 'General' *Trustee Department* is very small. The benefits may make all the difference to the well-being of your dependants. Find out more about this way to ensure permanent, reliable administration of your estate—write today. 7/4

COMPANY MEETINGS

THE COMMERCIAL BANK OF SCOTLAND, LIMITED

ANOTHER YEAR OF STEADY PROGRESS

RECORD BALANCE SHEET FIGURES

THE EARL OF MAR AND KELLIE'S ADDRESS

The annual meeting of the shareholders was held in the North British Station Hotel, Edinburgh, on the 16th instant. The Earl of Mar and Kellie, the governor of the bank presided.

Before commencing the business of the meeting, the governor made reference to the loss the bank had sustained during the year through the deaths of Field-Marshal Lord Milne, the deputy governor of the bank, and of Sir Gilbert Archer, one of the ordinary directors, both of whom had maintained a lively interest in the welfare of the bank and whose wide knowledge of men and affairs would be greatly missed.

In submitting the report the governor said:—

It is a great pleasure to me to meet the shareholders again in annual meeting, and to be in a position to submit for approval a report and statement of accounts which continue to shew steady progress, despite the uneasy condition of the times through which we are passing.

NECESSITY FOR FACING FACTS

A year ago I referred to the stringency of the economic situation in which our country found itself, and expressed the hope that, as the months went by, there might be a gradual bettering of conditions, but there is still much confusion of thought in the public mind as to the actual position and as to the remedial measures which might put us on the road to recovery. On the one hand there are those who realise the gravity of the situation and the dark shadow which lies over the economy and perhaps our whole manner of life; and on the other hand there are those who apparently look for no more than an illusory prosperity which brings with it larger wage payments or some form of easy profit. It is true that the frankness with which the Chancellor of the Exchequer has spoken on many occasions during recent months has done a good deal to make the whole nation aware of the fate which lies ahead unless all sections of the population give of their best; but there is still room for much clearer thinking. I do not feel, for instance, that it is even yet generally realised that the cost of the recent war used up the large resources which we had accumulated overseas prior to 1939—the earnings from which materially contributed towards paying for much of the food and raw materials which we require to import—with the result that we were left so impoverished financially that outside help was required to tide us over. The help which was forthcoming from the United States of America and from Canada did not, however, bring the expected results. By the time the credits were exhausted, the increase in our export trade was still far short of what was required to balance our payments. Failure in many cases—and for various reasons—to reach the export targets which had been set, together with rising prices of imports, left us no better off, and if further help had not been arranged our position would have become precarious indeed.

MARSHALL AID AND INTERNATIONAL TRADE

The Foreign Assistance Act which was signed by the President of the United States of America in the spring of this year to give effect to the Marshall Plan, is designed on broad lines to help a war-torn Europe—including ourselves—along the road to economic recovery; and while it is as yet too soon to express an opinion as to the effect of Marshall aid on our own position, it is hoped that throughout the European countries concerned international trade will be stimulated with a consequent improvement in the economic condition of all. Without such help, our standard of life would have dwindled to a very low level; but it would be well for us to keep prominently in mind that Marshall aid can only be a temporary measure, and that the ultimate solution of our difficulties will be found in better production, which means for all of us harder work whether by brain or muscle; a determined effort to bring about a substantial reduction of government expenditure which is still eating up too great a proportion of the national income; and an easing of the intolerable burden of taxation which is meantime being borne both by industry and the individual.

CRIPPLING EFFECT OF CURRENT TAXATION

So far as industry is concerned the current rate of taxation and the method of its application are having a crippling effect on re-equipment and development from both of which might be expected an increase of production per man-hour with consequent reduction of costs. As it is, costs have risen to such heights that in certain overseas markets, at least, we are now finding it difficult to compete because of our price level. In brief, our prices are too high, and it is time that something was done to lessen the burdens which are being carried by industry.

INCENTIVE NECESSARY FOR SAVINGS

The individual also requires an incentive not only to work, but to save, and although the habit of saving is inherent in the character of the people of this country—particularly in Scottish men and women—there is little margin on any individual income for that purpose at the moment. After a long period of austerity inspired by conditions of war, it is inevitable that family and household needs be satisfied to some extent, and because of that, it is not surprising that new small savings have suffered something of a set-back during the past year; but the fact remains that even the most necessary personal expenditure is now governed largely by price, and business houses are not finding it easy to keep stocks from accumulating. An easing of the taxation situation for all concerned would be welcome, and for the individual might do much to preserve the habit of saving which otherwise might lose some of its prominence and importance in the process of trying to make ends meet over too long a period. Personal saving must be fostered, and one of the finest stimulants would be an example of strict economy in state expenditure.

INCREASE OF NEW INDUSTRIES IN SCOTLAND

Scotland is, of course, of first importance to us as a bank, and I am happy to say that progress continues to be made in the industrial field. For too long, perhaps, we have relied on the heavy industries alone to provide the mainstay of our economy, and while coal, iron, steel and shipbuilding will continue to occupy the key positions, it is most heartening to look at the array of new industries (or old industries come to life again) which are now spreading throughout the country. The peak of development has not yet been reached—there has of necessity been a slowing down because of the cut in the capital expenditure programme—but even so, there is now a diversity of lighter industries which, I am sure, will stand us in very good stead for the future. Added to all this, the North of Scotland Hydro-Electric scheme will, in time, open up other large fields of development and, generally speaking, it looks as if the economy of Scotland will, in the years to come, be much more soundly based than it has been in the past. Various bodies, including the Scottish Council (development and industry) and the Board of Trade, have played a leading part in bringing about this state of affairs, and the result of their efforts is encouraging.

As you would expect, we have not been behind in providing financial assistance, for both old and new concerns, and in that connection, I think you will find adequate proof in the figures of the report which I shall now ask you to consider.

RECORD BALANCE SHEET TOTAL

You will find substantial increases under nearly all headings of the balance sheet, bringing out a total of just under £139,000,000. This figure is greater than last year's total by almost £9,000,000, an easy record in the bank's history.

The Paid-Up Capital is unchanged at £2,600,000, and is held by almost 9,000 individual shareholders, which means that the average holding is approximately £290.

The Reserve Fund, to which has been added £100,000, now stands at £3,900,000 and is £1,300,000 in excess of the paid-up capital.

Notes in circulation, at slightly less than £12,000,000, shew a small decrease on the year, but the figure is still at a high level, and the slight fall has no special significance.

Deposits and other credit balances, amounting to almost £116,000,000, are more than a year ago by over £8,000,000. These are record figures which are well spread over our network of offices, and the steady growth persists despite the heavy drawings upon us by expanding industry.

Acceptances and engagements on account of customers, at £4,465,000, are up on the year by over £1,000,000, which is in line with the increasing business being done by our customers in the international field. There is still room for further development here.

ASSETS

On the assets side, the first five items, representing cash, balances with other banks, money at call and short notice in London, British Government treasury bills and British Government treasury deposit receipts, aggregate over £39,000,000, while British Government securities stand at over £67,600,000. These resources of a liquid character show little change compared with last year; but taken together, they exceed £107,000,000—equivalent to 84 per cent. of our liabilities to the public in respect of notes in circulation and deposits.

The market value of our investments is greater than the figure appearing in the balance sheet, and the investments have been carefully selected with regard to maturity dates.

At over £25,100,000 bills discounted, and loans and advances together show an increase of almost £7,500,000. This is a record for our advances figure, and, while it is a welcome sign that our customers are alive to the necessity for taking their full share of responsibility in meeting the country's needs by extension and improvement of their business interests, and are relying upon us to assist them in their various enterprises, it also points to the shortage of working capital which is becoming generally apparent, and perhaps also indicates an inability under present conditions to turn over stocks as rapidly as formerly.

YEAR'S PROFIT

As to the results of the operations of the year, you will observe that the profit shows an increase of just under £4,000, which may be considered satisfactory when account is taken of the burden of taxation and the heavy drain of ever rising costs. Out of the sum available the directors have allocated £100,000 to reserve fund; £100,000 to increase the fund for Officers' Pensions, and £25,000 to the widows' fund.

DIVIDENDS

Interim dividends on the "A" shares of 7½ per cent., and on the "B" shares of 5 per cent., less income tax, were paid in July last, and it is now proposed that a further distribution of 7½ per cent. on the "A" shares (making 15 per cent. for the year), and 5 per cent. on the "B" shares (making 10 per cent. for the year), both subject to income tax, be approved. After payment of these dividends and allocations the carry forward to next year's account amounts to £91,233.

TRIBUTE TO STAFF

As you have listened to this review it must have occurred to you that the results could not have been achieved without the loyal co-operation of all members of the staff, and on behalf of the shareholders, and of the public whom we serve, I offer them our sincere thanks. The high standard of helpful service which our staff afford to our customers is something which is well worth fostering, and I am happy to tell you that a few weeks ago I had the pleasure of opening Ramsay Lodge as a staff hostel and training centre. Three years ago, as you may remember this historic building was acquired for the purpose of setting up such a centre and, while it has taken rather longer than was anticipated to have the necessary alterations carried out, the venture has now been launched—the first in the annals of Scottish banking. It is our hope that the successive generations of commercial bankmen who will pass through the centre, will be better equipped to deal with the complexities of modern finance; able to advise customers wisely in all matters of business; and ready to play their part in local affairs. All of us wish the new organisation, and all who may be associated with it, much success and happiness.

The governor then moved the adoption of the report and the motion having been seconded by Mr Ian W. Macdonald was put to the meeting and carried.

At the close of the meeting cordial votes of thanks were accorded to the directors and the staff for their services during the year and to the governor for presiding.

INDUSTRIAL CREDIT COMPANY, LIMITED

FINANCE FOR IRISH INDUSTRY

The fifteenth ordinary general meeting of this company was held, on the 9th instant, at Dublin.

The chairman, in the course of his speech, said: After deducting administrative expenses of £12,099 there is a net profit of £105,652. Provision for taxation requires £38,996.

Your directors propose to increase the annual dividend from 3 per cent. to 4 per cent., which, less tax, would absorb £21,463, also to enlarge internal reserves by £40,000, leaving undistributed profits of £19,708 (against £14,516).

One of the main purposes of the company was to assist in the development in Ireland of a capital market for industrial issues. There is in the country a unique position in this respect, by virtue of the fact that every citizen is free to invest his money outside the country. Thus, new Irish industrial issues have to compete as regard attractiveness to the investor with securities quoted in the London Stock Exchange, with dividend records and also securities with speculative possibilities. Despite this competitive element, the new Irish industrial issues have gradually over the years established themselves in popularity with the investing public in this country, so much so that latterly a number of issues sponsored by us have been oversubscribed to the extent that some thousands of applicants have had to be disappointed in the matter of allotment of the shares on issue for subscription or offer for sale, and it may fairly be claimed that by now Irish investors have come to realise that investment in these Irish industries of transformation presents opportunities fully comparable with investment in industrial enterprises outside the country.

The report was adopted.

LAKE VIEW AND STAR, LIMITED

DIVIDEND 47½ PER CENT.

The thirty-eighth annual general meeting of Lake View and Star, Limited, was held on the 16th instant in London.

Mr G. Golthorpe Hay, the Chairman, in the course of his speech said: Costs have continued to rise as a result of wage increases and the ever increasing cost of supplies, together with the shorter working hours and holidays-with-pay granted by the Arbitration Court. Despite this the results achieved show how efficient management has been able to cope with the many difficulties met with in gold mining today.

With such substantial assets, as shown in the balance sheet and the General Manager's report, you will realise that better results would have been obtained had sufficient labour been available to meet our full requirements.

I understand that the Authorities in Australia are endeavouring to attract immigrants. In our own property there are fine opportunities for employment and, if the men devote their spare time to study and training at the up-to-date School of Mines in Kalgoorlie, they would have every opportunity of qualifying to become trained miners and plant operators, thereby allowing the gradual enlargement of the industry, and particularly that of our own concern.

The tonnage milled at 573,131 tons and the average grade at 5.05 dwt. per ton are both slightly below last year's figures, the former being partly due to shortage of underground men and the reduction in working hours, and partly to the floods in February which damaged sections of the mine workings and surface plant. Ore reserves of 3,995,800 tons averaging 4.87 dwt. show an increase of 112,000 tons.

At the Chaffers re-treatment plant 619,926 tons were treated up to June 8th last, when the whole of the dump having been treated along with selected portions of the adjoining dump, operations ceased. Since that date the plant has been operated to cyanide the current flotation tailings and calcine residues from the Chaffers plant, whilst since August 18th the treatment of a further calcine dump has been undertaken concurrently so that the plant worked at maximum throughout.

The mining profit of £389,409 is lower than that for the previous year. After providing for depreciation, taxation and dividends totalling 47½ per cent and transferring £10,000 to general reserve the amount carried forward from mining operations is £28,672, which compares with £36,136 brought in. These results, though satisfactory, would have been even more so had it not been for the heavy burden of present day taxation.

The report and accounts were unanimously adopted.

WALMSLEYS (BURY), LIMITED

SATISFACTORY RESULTS

The sixteenth ordinary general meeting of Walmsleys (Bury), Limited, was held, on the 16th instant, at Bury.

Mr John Parks Wolstenholme (deputy chairman and joint managing director), who presided in the absence, through indisposition, of the chairman, Mr John Wolstenholme, said, in the course of his speech:—

The group profit for the year amounts to £66,108. After providing for a final dividend of 10 per cent on the ordinary share capital (making 16 per cent. for the year) the balance of the group profit to carry forward is £263,169. All the subsidiaries have shown profits on the year's trading, and, whilst I am always hesitant about making promises, I feel sure that we can look forward to improved trading results in the future.

Walmsleys (Bury), Limited, and Bentley and Jackson, Limited, are primarily concerned with the design and manufacture of pulp and papermaking machinery. These two companies have maintained their positions as leading engineers for this type of equipment. During the year under review they have completed several large contracts for home and abroad.

HOME ORDERS

The home orders completed included a very large mill reconstruction by Walmsleys and a complete new paper machine by Bentley and Jackson. The design, construction and successful installations have brought forth letters of thanks and appreciation from both customers. Other substantial contracts have also been dealt with satisfactorily in the same period, and we look forward to the successful conclusion in the near future of several large machine contracts of special priority for the home market.

Ashworth and Parker, Limited, have been fully occupied on the manufacture of their well-known high-speed steam engines, over 80 per cent. of which have been for export. Walker Brothers (Wigan), Limited, have been faced with many difficulties, due to the change-over from wartime to peacetime products, and due also to the fact that they have had to accommodate themselves to some extent, to the manufacture of pulp and papermaking machinery, which was the primary object for acquiring this company, and which has been a great help to us.

Walkers, of course, specialise in the design and manufacture of mining machinery, diesel railcars, municipal vehicles and general purpose vehicles. They have completed many contracts for such equipment, and their order book is in a satisfactory condition. It will take some time to achieve completely satisfactory results, but an excellent beginning has been made, and I have every confidence that Walker Brothers (Wigan), Limited, will turn out to be a valuable member of our group.

EXPORT BUSINESS

Much of your company's present business is in export markets. We have worked on, and brought to an advanced stage of construction several papermaking machines for abroad, and it is expected that these will be completed before long. We have further substantial orders on hand for Australia, New Zealand, India, the Argentine, Denmark, Egypt, Finland, France, Norway and Sweden.

Since our last meeting the chairman has paid a visit to Australasia, and he wishes me to assure you that the reputation of the House of Walmsley in the Continent stands very high indeed. He has expressed his great pleasure at being able to see for himself the excellent results which are being obtained in Australasia from the equipment supplied from your Bury and Wigan companies, and he feels certain that the Walmsley companies will receive more large contracts from this continent.

The report was adopted.

CRITTALL MANUFACTURING COMPANY, LIMITED

LARGER NET PROFIT

EXPANSION OF EXPORTS

LORD BRAINTREE ON THE OUTLOOK

The twenty-fourth annual general meeting of the Crittall Manufacturing Company, Limited, was held, on the 15th instant, in London, Lord Braintree, chairman and managing director, presiding.

The Chairman, in the course of his speech, said: Stocks and debtors again show increases, which reflect the increased turnover in the period and the fact that, anticipating continuity and even increase in the rate of house building at the beginning of the period, we increased our stock of finished windows. It is a matter of record that the rate of house building was reduced as part of the limitation of national capital expenditure. This reduction took place half-way through the period. Uncertainty as to requirement made it difficult to adjust the balance of finished stock before the end of the financial year. Reductions have since been made which will make it possible to run through the winter on an even keel.

INCREASED LIQUID RESOURCES

The net liquid resources of the group, at £1,479,651, show an increase of £199,484 for the year. Excluding the reserve for future taxation, the real capital employed in the company, comprising issued capital, share premium account, reserves and undistributed profits, amounts to £3,538,965, which figure does not take into account the excess in the value of trade investments over their book value at August 31, 1948.

The revenue reserves, other than those for future taxation, show an increase of £171,881 over last year, which is attributable to the increase in the amount of profits retained in the businesses as well as the surplus arising on the disposal of a subsidiary company, Wood Surrounds, Limited, which was redundant to our requirements.

NET PROFIT

The aggregate charge for taxation, £246,836, is some £8,600 lower than last year, due largely to the cessation of excess profits tax at December 31, 1946. The net profit, after deducting the profits of subsidiaries attributable to outside interests or not distributed, amounts to £219,128, an increase of £3,317 over last year. To this should be added the amount brought forward from last year, £91,944, making an amount available for distribution of £311,072. Out of this amount the directors decided to write down the investment in our village at Silver End, which is maintained out of revenue, by £41,273.

After giving effect to this and after deducting dividends already paid, there remains an amount available for distribution of £193,486, as shown in the directors' report. Out of this we recommend a final dividend on the ordinary stock of 10 per cent. actual, less income tax, making 20 per cent. for the year. In arriving at this figure we are again guided by the request of the Chancellor of the Exchequer that there shall be no increase in dividends. The balance on profit and loss account carried forward is £159,111, an increase of £67,167 over last year's figure.

INCOME FROM INVESTMENTS

The net income from investments at home and overseas last year accounted for £61,445. The figure this year is £44,540, a reduction of £16,905, largely accounted for by the liquidation of Wood Surrounds, Limited. It follows that there is a corresponding increase in the net profit attributable to the company's own manufacturing and selling activities. The figure last year was £154,366 and is this year £174,588, an increase of £20,222.

This figure is the more remarkable in view of the adverse effect of the cut in national expenditure which took place half-way through the period. We were geared to produce standard windows for housing at an even greater rate than in the peak prewar years of 1936-37. Almost overnight we had to reduce production, and the despatches of standard windows in the second six months were 30 per cent. lower than in the first six months, whereas the figures for the previous year showed an excess of the second half over the first.

SATISFACTORY EXPORT RESULTS

Fortunately, the spade-work we have been doing to build up an increased export business has borne fruit. You will recollect I told you last year that we were exporting at a rate approximately five times our prewar figure. I am glad to say that we have sent approximately 10 per cent. more goods overseas during the year under review than in the previous year, while the orders received in the period are approximately 50 per cent. higher.

We are satisfied with our export results, principally because of the many new markets we are now serving. During the year we exported to 54 countries. There are still markets from which we are now excluded, but which would be open to us but for the present import restrictions. There is also the effect of the Palestinian trouble on the very valuable Middle East market. There are other markets which are suffering from disturbance, the ending of which cannot fail to improve our prospects. In all the circumstances I believe it will be possible to increase our export in the current year.

Fortunately, we have never regarded production results as static, and we hold to the view that we must and can keep pace with such setbacks as reduction of turnover. It is a source of satisfaction to me that we have not found it necessary to ask for an increase in price on this account, because such increases can only act as a deterrent to the full-time resumption of building.

CALL FOR GREATER EFFICIENCY

The call for greater efficiency in industry is addressed to all trades. Some have already reached a very high state of efficiency, but in many others the margin for economy is great and should certainly take care of a measure of reduced output. There is also the question of absorbing increases in labour and material. I take the line that, where these cannot be met by increased efficiency, consideration should be given to whether a reduction in profit is not better business than passing the increase on to the consumer. The value of such increases is, in my opinion, illusory. They must have an adverse effect on the community in the long run and, particularly in relation to export, cannot be sustained.

ALUMINIUM WINDOWS

We are satisfied with our partnership with the Luxfer Company in Crittall-Luxfer Aluminium Windows, Limited, at Nottingham, where we have concentrated our aluminium development. We believe that there is a future for aluminium windows in a field which has hitherto been regarded as almost exclusively served by wooden windows. So far as the use of aluminium as a substitute for other metal windows is concerned, we hold the view that much yet remains to be proved as to its suitability from a weather resisting point of view. It is already established that there are alloys of aluminium which have a high weather resisting quality, but even with these the question of further treatment subsequent to installation arises. The use of unsuitable alloys simply means that there will be metal windows more vulnerable to the effects of weather than steel windows which have not received some better protection than painting.

There can be no doubt that, short of bronze windows, the best metal window so far evolved, from the point of view of permanence and low maintenance cost, is the steel window treated by the process of hot galvanising. If appearance is a consideration, painting after galvanising is indicated. Because of these doubts as to the performance of aluminium, the largest maker of metal windows in the United States has decided to stick to steel exclusively. We do not go so far, but we believe that prospective users of aluminium should be warned of how necessary it is to ensure that the right kind of aluminium is used.

THE CURRENT PERIOD

In dealing with the current period, so much depends on issues beyond our control. There is the overriding question of the gap between exports and imports. We can only do our best in the field in which we are working. Since the end of last period we have curtailed our production to the point that we can see our way through the winter months, which are, of course, an off season for building. We have now turned on the tap and hope to be able to re-establish and maintain the economic level of employment and production which we had at the early part of last year. We cannot expect as high a rate of house building, but there are indications of increased building in other directions.

I have spoken of the possible increase in export and of using our capacity in other directions. The urge to greater efficiency, if it means anything at all, means cheaper production, and I fail to see what is the use of cheaper production unless, after providing for reasonable profits and reserves for re-equipment, the customer benefits by the result. I regard the figures of the last two years as a target which will be hard to maintain in the current period, but nevertheless I see no reason to doubt that we can produce a satisfactory result.

PENSION SCHEMES

It will be remembered that last year a provision of £80,000 for the extension of pension schemes was made out of the profits. Since the last meeting a lot has been done towards providing all eligible employees with life assurance while employed with the company, and a pension which, with the national pension, will provide a decent standard of living on retirement.

I would particularly mention the contributory scheme for the works employees which came into operation on March 1 last. Of those eligible to join, over 98 per cent. responded, and for the success of this scheme we have not only to thank the staff particularly engaged on it but also the pension committee which was set up to act as a link between the management and those concerned. It is expected that the objectives outlined last year will have been finally completed by the time we meet again.

Last year I referred to the formation of a board of management to act in an executive capacity to carry out the decisions of the directors, and to the inauguration of a regular system of meetings between this board and the men's representatives.

We have achieved a great deal in the way of co-operation and they are doing a very fine job in helping us to meet the problems with which we are beset in these difficult times. Incidentally, as a token of our appreciation of the excellence of the year's result, we are giving all employees a week's wages.

The report and accounts were unanimously adopted.

DORMAN LONG AND COMPANY, LIMITED

SIR ELLIS HUNTER ON NATIONALISATION

ALL BRITISH INDUSTRY THREATENED

The fifty-ninth ordinary general meeting of Dorman Long and Company, Limited, was held on the 16th instant, at Caxton Hall, Victoria Street, London, S.W.1.

Sir Ellis Hunter chairman who presided said:

My first reference must be to the loss the company has sustained by the death of Viscount Greenwood, who was our chairman for fourteen years. He served the company with ability and devotion. His genial presence at board and annual meetings will be missed by us all and I wish to acknowledge our appreciation of his work for Dorman Long and express the deep regret we feel that his friendly counsel and wide experience are no longer available to us.

I should like to express my appreciation of the confidence shown in me by my colleagues on the board in appointing me chairman. It will be my endeavour to serve the interests of the company as actively as in past years and to guide its affairs so that the standing and credit of Dorman Long is still further progressively enhanced.

The late chairman a year ago stressed the desirability of a realistic approach to the relations of the Government with the industry so that a permanent settlement might be achieved which would give the Government effective control of general policy without destroying the advantages of private enterprise. Unfortunately the policy of moderation urged by Lord Greenwood has been rejected.

BOARD UNANIMOUS

It is a melancholy thought that political obsessions have caused the future of the iron and steel industry to become a political issue. The directors of Dorman Long are unanimously opposed to nationalisation and are determined to support to the full the efforts of the British Iron and Steel Federation in its resistance to the Bill. The Government have failed to display any real sense of leadership to which not only the steel industry but industry generally could have responded. The effect of the Government's failure will be to discourage industries from organising themselves and increasing their efficiency so that they could more effectively conform with the Government's general economic plans. In the past fifteen years the steel industry first through the Import Duties Advisory Committee and more recently the Steel Board, built up an organisation able and willing to co-operate with the Government in implementing national economic policy.

The result of the self-restraint and co-operative spirit shown by the steel industry is the present Bill to nationalise it. This is surely the negation of leadership and is bound to have serious repercussions throughout industry, making it wellnigh impossible for industry to respond to the Government's frequent and urgent pleas for co-operation. This is a serious matter. All who are anxious to see our country restored to full economic health and her traditional place in world affairs must hope that the Bill will never be put into effect. The Opposition have declared their intention of repealing this Bill if it becomes an Act and they are returned to office.

It is a thoroughly bad Bill for it interferes with a well organised industry which is securing record outputs and is in the midst of a great development plan. It cannot add to the efficiency of the industry, lead to cheaper steel or more cordial relations between managements and employees. I do not exaggerate when I say that nationalisation of steel would be a disaster for the country. Not only steel but virtually the whole of British industry would be involved.

STRUCTURAL ENGINEERING

In the case of Dorman Long there are two aspects of nationalisation to which you will expect me to refer—our structural engineering interests and the proposed terms of compensation under the Bill.

Dorman Long are a company carrying on all the activities listed in the Second Schedule.

In addition, they have various other activities, outstanding among which is a number of structural engineering businesses. Some of these are organised as departments of the company, while others are separate concerns in which the company owns the whole or a substantial part of the shares. These interests represent approximately one quarter of the structural engineering industry in this country, 60 per cent. in the Union of South Africa and a valuable business in the Argentine.

These businesses have been developed or acquired over a period of many years with the object of obtaining an outlet for the company's output of finished steel in the United Kingdom and abroad.

The advantage of such markets to a steel producing firm in competition with others is evident. The subsidiaries can specialise in different branches of engineering work: the demand for special classes of products can be distributed amongst them: competition and duplication can be eliminated within the group, though use can be made of the name and goodwill of the group firms in obtaining business suitable for the parent company as steelmakers.

Under nationalisation the Corporation as the sole steel supplier could gain nothing from the ownership or control of United Kingdom markets for its steel. The Corporation would, in fact, be faced with difficult problems of adjustment between "associated" and "free" firms in the engineering industry. Any form of price differentiation would conflict with the public interest; the placing of orders in accordance with the public interest, particularly as regards employment, might well require the Corporation to neglect its own subsidiaries in favour of independent firms. The Corporation could gain nothing by its control of the United Kingdom engineering subsidiaries except by way of dividends on this investment, against which would have to be set the risks of loss through idleness of the engineering works in periods of depression, at the very time when the Corporation's own specific activities would be curtailed.

DIFFICULTIES FOR CORPORATION

The Corporation could not gain anything, as an independent competitive concern could have done, by going all out to obtain the maximum share of the engineering business available so as to mitigate the adverse effects of trade depression on the demand for its steel production, because the Corporation would control the whole steel output already, and any business its engineering subsidiaries attracted to any particular steel-producing unit would merely be diverted from some other unit for which the Corporation would be equally responsible.

Difficulties would also appear to confront the Corporation if it continued to control subsidiaries trading abroad. It is no doubt true that increased orders for the steel works might result from the activities of the Corporation's foreign engineering subsidiaries; but in obtaining such orders it would be presenting itself as a state-owned competitor with private enterprise abroad and would be subject to disadvantages on this account from which independent engineering firms would be free. These subsidiaries would inevitably be regarded as conducting their business not on ordinary commercial principles, but in the interests of the British Government—e.g., as an instrument designed to conflict with the development of local heavy steel or engineering industry. Such suspicion would depreciate the value of the foreign subsidiaries concerned.

COMPENSATION TERMS UNJUST

The compensation terms of the Bill completely fail to take into consideration the effect of an individual company's policy on its position and prospects in the industry. Market prices of shares do not reflect the difference between seed-time and harvest. Some companies, and Dorman Long is an outstanding example, have for many years been building up resources in order to improve their technical efficiency while others have been distributing in dividends to their shareholders a far higher proportion of their profits. The terms for compensation strike a crushing blow at those companies whose policies most deserve encouragement in view of the industry's need for progressive reconstruction and development. The terms are demonstrably inequitable to Dorman Long by reference to the published accounts, and it should be realised that because of the conservative financial policy we have followed for several years past the fixed assets are included at book values far below what they are worth today.

The facts clearly demand that should nationalisation take place, compensation should be based on valuation by independent experts.

HIGHER OUTPUTS

Output of ironstone at our Cleveland mines was 773,502 tons, an increase over the previous year of 101,597 tons. Iron production last year was 1,206,401 tons, against 908,820 tons, production of ingots 1,549,270 tons, or an increase of 282,409 tons for the year, and rolled steel output reached 1,261,298 tons, compared with 1,079,178 tons in the previous twelve months. From our larger make of pig iron it has been possible to help relieve iron shortages in other parts of the country.

These increased outputs and the freedom from the transport difficulties and severe weather conditions which particularly affected the first half of the previous year, have been accompanied by improved profits at the Iron and Steel Works. Continued improvement has also been shown by the subsidiary companies at home and abroad. As a result the group profits have increased by £1,208,581, but United Kingdom taxation has increased by £506,093, and depreciation, including initial allowances, by £338,482. Outside shareholders have received a greater amount of profit from the overseas subsidiaries—partly due to the issue to the South African public of shares in Dorman Long (Africa) Limited. The undistributed profits of subsidiaries attributable to the parent company have also increased. After taking all these factors into account the nett profit transferred from the consolidated profit and loss account to the profit and loss account of the parent company was £1,081,577 (an increase of £242,814 on the previous year). The allocation to general reserve has been increased by £250,000.

DEPRECIATION ALLOWANCES

It is of particular importance in the iron and steel industry to make adequate provision for depreciation and to strengthen resources because of the present heavy cost of capital equipment in relation to each ton of output and the important development schemes which are in progress. In the directors' report, attention is drawn to the continuing rise in the level of prices, and its effect on capital requirements. It is more than time the Inland Revenue authorities recognised the necessity of granting increased reliefs for depreciation and reserves; otherwise with income tax and profits tax aggregating over 10s. in the £ the best of efforts to conserve resources must fail to keep up with requirements.

The principal new capital project in hand is the central ore unloading, ore preparation and sintering plant nearing completion at our Cleveland works. Unique as far as this country is concerned and incorporating many advances on the latest American and Continental practices, we confidently anticipate that this plant will result in substantial economies in the handling of imported and home ores. The better preparation of raw materials it will facilitate will greatly improve operating efficiency at our blast furnaces.

This major scheme of development, costing over £1,500,000, has involved a large amount of civil and structural engineering. Our own plant construction department has been responsible for the whole work from the design stage onwards, and a major part of the plant manufacture and installation has been undertaken by our constructional shops and bridge and contracting department.

During the year we have completed the replacement of cooling banks and loading facilities at our Acklam billet and sheet bar mills and have added additional ingot heating capacity, involving an expenditure of approximately £175,000. This has increased our rate of production of semi-finished rolled steel, which is in very short supply.

BRIDGES FOR EXPORT

Our bridge and constructional interests represent a large proportion of the company's activities. The bridge department's tender and design for the Vila Franca Bridge over the Tagus near Lisbon was accepted by the Portuguese Government. We were successful in meeting keen international competition, and we are associated on this contract with the Portuguese firm, Seth, who are responsible for the foundations and approaches. Work on the Kafr el Zayat Bridge over the Nile is progressing, and although the disturbed conditions in the Middle East create difficulties, four of the seven steel spans have been completed. In Iceland a number of small bridges has been finished.

The bridge and constructional works at Middlesbrough and in London have been fully employed. We have a heavy order book including 30,000 tons for steel plant buildings, 22,000 tons for power stations and a large amount of general constructional work.

Although we have a great deal of work on hand the volume of inquiry tends to fall because of the country's general economic situation. Expert inquiry for minor bridge work and steel structures is extensive but it is exceedingly difficult to secure the necessary licences.

AFRICAN DEVELOPMENTS

Last year reference was made to the important developments put in hand by Dorman Long (Africa), Ltd., particularly the new shops at Germiston for the construction of steel railway wagons and the new works at Vanderbijl Park in connection with the contract for the new steelworks for the Iron and Steel Industrial Corporation of South Africa. I am pleased to say that these latter works have been completed and fabrication on the steelworks contract has begun. This work will continue for some years. These shops, known as the Vaal Branch, will later be available for a wide range of steel fabrications and represent a most important addition to the resources of Dorman Long (Africa) Ltd.

Early this year it was decided that these developments would lead to an expansion of business of a sufficiently permanent nature to make it desirable to increase the share capital of the company. In May an issue was made of 479,800 ordinary shares and 100,000 5 per cent. cumulative preference shares. It was considered proper that the South African public should have an opportunity of acquiring a suitable proportion of the shares and a number were allotted accordingly. Your company took up 262,675 ordinary shares and 4,000 preference shares and we are convinced they will prove a sound investment.

The report was adopted.

THE NATIONAL BANK OF SCOTLAND LIMITED

RECORD FIGURES

INDUSTRY AND TAXATION

LORD ZETLAND'S VIEWS

The one-hundred-and-twenty-third annual general meeting of the Proprietors of the National Bank of Scotland, Limited, was held in the Bank's Head Office, Edinburgh, on the 16th instant.

The Marquess of Zetland, K.G., P.C., G.C.S.I., G.C.I.E., the governor, in the course of his speech, said :—

The balance sheet total of almost £118,000,000 breaks yet another record and is by far the highest ever attained, the increase over last year being £12,000,000. This expansion is accounted for by the growth in the deposits which are higher by £13,000,000, and although part of this increase is likely to be of a temporary nature, the greater part represents the normal development of the bank's business, for throughout the year deposit figures have constantly exceeded those of the 1947 balance sheet.

The profits at £291,000 are higher by £13,000 and are a reflection of the greater resources employed. Once again we have pursued our traditional conservative policy of distributing the lesser part in dividends which will absorb £107,800 and of allocating the greater part to reserves, the appropriations recommended being :—

	£
To Revenue Reserve Fund	75,000
„ Heritable Property Account	40,000
„ Trustees for Officers' Pension Scheme	50,000
„ Staff Widows' Fund	10,000
	£175,000

VALUE OF RESERVES

These additions to reserves, and all similar additions in the past, are in truth equivalent to the subscription of fresh capital. In turn they produce revenue and over the years add to the earning capacity of the bank, but more important they strengthen the foundation on which the bank is built and make possible future developments in our service to our country and our customers. The usual high ratio to total liabilities of cash and other funds immediately available for emergencies has been maintained.

Last year I referred to the greater opportunities the bank had enjoyed in assisting trade and industry through advances granted to customers and I am pleased to report that during the year under review we have been able to assist still more, for our advances, including bills discounted, are nearly £3,000,000 higher at £19,600,000.

RAW MATERIAL SUPPLIES

From shipbuilding and engineering, and indeed from many other trades, textiles included, come the same reports that production could be increased and working costs reduced if greater regularity of supplies of essential materials could be obtained in the quantities needed and at the time when they are required to finish the job. The essence of the complaints is that the controls are too rigid and that allocations are for too short a period.

Viewing industry broadly, I for one welcome the first signs of the sweeping away of many of the minor controls that had become irksome and cumbersome. We hear it stated from time to time that there are no reserves of labour upon which to draw for the expansion of our industries, but I venture the opinion that every control that can be dispensed with will set free for productive purposes considerable numbers presently engaged in administering the unwieldy volume of rules and regulations and, what is not generally realised, another large force in the industrial establishments themselves, whose time and energies could be more profitably and usefully employed.

EXPORTS

Last year I made some references to the export drive when I suggested that the sellers' market was passing. Unfortunately all the evidence since has shown that it is much easier to fix a target which looks impressive than to achieve it. It is true that improving figures have been shown month by month but from some trades come the reports that the exports now being made are in fulfilment of orders placed a long time ago and that fresh orders are not being received in sufficient quantity to take their place. And that leads me to emphasise once more that if we are to sell our goods abroad and to give satisfaction in the home market also, constant and increasing attention must be paid to price, quality and punctual delivery. These are the standards which mark the difference between efficiency and inefficiency and are the real test of planning.

Perhaps if I may venture upon a brief incursion into the political sphere, I may be allowed to say that one of the most hopeful signs is that organised labour in its higher and more responsible circles is beginning to concern itself over the removal of restrictive practices and lines of demarcation and to realise the importance of output per unit.

TAXATION

I make no apology for referring once again to the burden of taxation. The remarks from chairmen of many of our leading companies to the effect that heavy taxation is depriving industry of essential capital for modernisation and replacement of plant have received wide publicity, but there is another aspect which also deserves attention. Viewing the position as a banker, I might fairly assert that every large industry had its small beginning, springing perhaps from one individual who introduced some new idea which satisfied a public need. That individual had a little capital of his own, he received some assistance from his bank, and in course of time he prospered, enlarged his establishment and provided employment for many.

That same person beginning now has but little opportunity of adding to his capital since taxation takes so much away, he is prevented from expanding and he is deterred from entering into obligations which would provide the means of enlarging his business by introducing new and up-to-date plant because taxation deprives him of the ability to repay within any reasonable period of time. The result is that enterprise and initiative are thwarted and many a new and promising venture is stifled at birth. Neither, may I add, is the growing habit in certain quarters of denouncing the profit motive as something discreditable of which a man should be ashamed, calculated to encourage either initiative or enterprise.

Reduction in Government expenditure which would bring about some relief in taxation would be the greatest boon that the Government could offer to industry and would go far to relieve our present distresses. But all new planning means more spending and all new spending adds to the burdens which industry already has to bear. Savings on public expenditure are quite as important as individual savings out of income.

The report was adopted.

GLAXO LABORATORIES, LIMITED

RESEARCH AND PRODUCTION SUCCESSES

FLEXIBILITY OF FREE ENTERPRISE

The fourteenth annual general meeting of Glaxo Laboratories, Limited, was held on the 14th instant, in London, Sir Harry Jephcott, M.Sc., F.R.I.C., Ph.C. (chairman and managing director), presiding.

The following are extracts from his statement circulated with the report and accounts for the nine months ended June 30, 1948 :—

The period has been characterised by a continuing insistent demand for the company's products and it has been possible, thanks to expansion of production facilities, to increase turnover by a little less than one-third. The effect of this is clearly reflected in the trading profit which, for nine months, closely approaches that for the previous full year.

The provision for obsolescence has been increased. It is very necessary that this provision should correspond with the increased investments in plant and buildings in order to maintain the highest efficiency in production units.

Replacement of obsolete plant and buildings places, at to-day's prices, a heavy burden upon industry. The initial tax allowances provide a very welcome contribution to the cost, but they do not go nearly far enough; to extend them to the second and even the third years, on possibly a modified basis, would greatly ease the burden without introducing any new principle.

The very substantial increase in fixed assets is mainly related to the new factories at Barnard Castle and Ulverston. There are still considerable expenditures to be incurred at Ulverston and the value of buildings, plant, etc., is likely to exceed £2,000,000 net in our next accounts.

Investments in subsidiary companies increased by some £144,000 principally by the acquisition of a fish-liver oil extraction business in New Zealand, the reinstatement of the Italian subsidiary company and provision for new plant and buildings under construction in India, New Zealand and Italy.

CAPITAL INCENTIVE AND GOVERNMENT POLICY

The board considered it their duty to accede to the request of the Government and the F.B.I. not to increase dividends, to avoid price increases and to reduce prices wherever possible. The final dividend in respect of the nine months' period will make the total distribution equal to three-quarters of that of the preceding twelve months. Nevertheless, and indeed because we take this action, we express the hope that the Chancellor will recognise the desirability of an incentive for capital as well as labour. For not otherwise will capital be made available to nourish the development and finance the other risks which are properly the sphere of private enterprise.

In respect of prices, our response has been no less sincere and effective. Efficient production and economic selling prices are the fundamentals of our sales policy, but it is obvious that, during a period of steadily rising costs, prices can only be reduced after increased costs have been absorbed.

During the past ten years, of the many products we market, in four cases only has there been any price increase and each has been less than the additional costs. As against this, prices in four groups have actually been reduced, the most recent and substantial being in respect of penicillin.

The effect of this price policy is that we are trading to-day at gross profit margins much lower than at any previous time in our history and the customer is reaping the benefit. This has been the company's policy for many years and we propose to continue it.

I hope the Chancellor will feel that we, in common, I am sure, with the vast majority of industrial concerns, have fully lived up to the spirit of our undertaking and that, in these experiences, he will be encouraged to leave a large measure of freedom with industry rather than to enforce his policy by arbitrary regulation.

EXPORTS 503 PER CENT. OF PREWAR

Export and overseas sales have reached more than five times the turnover in 1938. We believe there is still plenty of scope for further increase, but, and I must emphasise this, import restrictions and increasing competition will make further advances more difficult.

Extensions at Barnard Castle, and the reconstruction of the serious war damage at Greenford, have now been completed. Work has consequently been greatly facilitated, although at Greenford there still remains great congestion. At Ulverston one section has been operating since May and the completed factory, as now planned, should be in production by April, 1949.

NOTABLE CONTRIBUTIONS TO MEDICAL PROGRESS

The work of our research laboratories continues to expand, and after many strenuous years we have isolated from liver the anti-pernicious anæmia factor in pure crystalline form. From one ton of liver there can be extracted but a few grains of this substance —less than would cover a threepenny piece.

Such work is of a fundamental character rather than of a development which has immediate application. However, fortified by this new knowledge, we hope to make a further practical contribution to the treatment of pernicious anæmia.

The continuous problem, however, is how we may the more rapidly give practical effect to results of our research work. The development of scientific discovery to the point at which there becomes available a product for the benefit of mankind may present as great difficulties as the discovery itself. This is especially so since development necessitates plant and, often, buildings.

You will learn with pride that we are now producing sufficient streptomycin to meet this country's needs; we hope in the months to come greatly to increase our output. Present production has only been attained in so short a time by the greatest efforts of all concerned, an achievement in the face of many and great difficulties.

ENTERPRISE AND THE FUTURE

Our achievements in the period under review indicate that there are alive within our organisation qualities which it is more than ever essential to cherish. We are in a world of hazards, both economic and political. By the same token, however, it is a world of abounding opportunity for a virile working unit imbued with faith and vision. Such qualities can flourish at their best in the realm of private enterprise; that is a matter of fact and not of dogma. But if we are to justify the freedom that we need and claim, we must be realistic; in particular we must not fear to face reverses should they come but take them as a stimulus and a challenge to further effort.

In such fashion, let us go forward. In the result our actions will demonstrate the intrinsic worth, the natural strength and the flexibility of free enterprise in an era of centrally regulated endeavour.

The report was adopted.

LEACH'S ARGENTINE ESTATES LIMITED

RECORD PROFIT

The thirty-sixth ordinary general meeting of Leach's Argentine Estates Limited will be held in London on 31st instant.

The following is an extract from the circulated statement by the chairman, Mr H. Roy Leach:

The profit on trading is up by £152,688 ($2,590,908) compared with last year. This is a record profit in the history of the company, but I must point out that the Argentine currency has now further depreciated, and increases in wages and social payments will tend substantially to reduce our profits.

1947 Sugar Crop: The production of sugar, namely, 37,437 tons, was a record in the history of our company. We were favoured last year with exceptionally good climatic conditions during the whole period of harvest and we reaped the benefit from the rotation system in our canefields, the cultural yield being 1,107 kilos per line, compared with 1,011 kilos in 1946.

Fruit, Alcohol, Timber and Shops: The results from these subsidiaries show in total a satisfactory increase when compared with the previous year. During the year under review we have installed at our Fruit Estate in Calilegua cleaning and packing machinery.

1948 Sugar Crop: In spite of the long period of drought and the consequent difficulties experienced in our factory regarding fabrication, this crop terminated satisfactorily in October last with a production of 36,970 tons of sugar.

The Outlook: As far as growing cane, milling it, producing sugar, fruit and alcohol are concerned, we are progressing on very satisfactory lines. Costs in every direction are continually on the increase, however, which coupled with increasing taxation both in Argentina and in this country will make profit distributions to stockholders very difficult.

BIRMINGHAM SMALL ARMS COMPANY, LIMITED

GRATIFYING RESULTS

The annual general meeting of the Birmingham Small Arms Company, Limited, was held, on the 9th instant, at Birmingham.

Sir Bernard D. F. Docker, K.B.E., the chairman, in the course of his speech, said: It is gratifying to report a trading profit for the year to July 31, 1948, before charging depreciation, of £1,146,383. This compares with £654,490 for the previous year, an increase of £491,893. This satisfactory result reflects an increase in sales of more than 20 per cent. Out of a total net profit of £889,630 the Government takes in profits tax and income tax no less than £460,000, or 52 per cent.

In the works grouped on Small Heath both production and trading in motor cycles and cycles have been very satisfactory.

The Daimler and Lanchester Companies are still hampered by shortage of materials. The quality I believe to be higher than at any time, and I go so far as to claim that there is no better car made in the world today than the Daimler car as supplied for the Royal Tours. The vicious double purchase tax on all cars over £1,000 is a monstrous handicap to the sale of such cars and militates against the free development of the best in British automobile design.

Jessop-Saville, the steel interests of the group, achieved their highest sales, production figures and turnover in spite of increased competition and changes in type of demand. They are named as one of the firms threatened with nationalisation. It is a sorry thing when the blind prejudice of politicians is able to disrupt an industry vital to the country's prosperity.

The report was adopted.

ASPRO LIMITED

The thirteenth annual general meeting of Aspro Limited, was held at Winchester House, Old Broad Street, E.C.2, on the 10th instant.

The following are extracts from the statement by the chairman circulated with the report and accounts.

The net profit for the year, before charging income tax thereon, was £320,684 as compared with £544,353 earned in the previous year, while the year's surplus before income tax (i.e., after incorporating net income relating to prior years) was £355,489 as against £593,557. Allowance made for a saving of £49,000 in profits tax, this decrease in profits was mainly due to (a) higher operating expenses of approximately £150,000 including increased cost of advertising in foreign markets and of maintaining publicity space in the U.K.; (b) special non-recurring charges of £60,000 from which some benefit will be received in subsequent years; and (c) the fact that last year's profit included a dividend of £82,000 from accumulated revenue of our South African subsidiary. The parent company derived no revenue from this source for the year under review mainly due to technical complications which are receiving attention.

Income tax takes £182,531 leaving a balance of £172,958. The balance of profits brought forward was £67,604, so that, after appropriating £56,375 for the net preference and interim ordinary dividends, the amount available is £184,187. After very careful consideration of the many pertinent factors, your directors have decided:—

1. To continue the policy of adding to general reserve each year by transferring a further £100,000 thereto, as against £140,000 last year.

2. To recommend a final dividend on the ordinary stock of 20 per cent. less tax, making a total of 35 per cent. for the year, and leaving a balance of £29,187 to be carried forward on profit and loss account.

We are thus proposing to maintain the increased rate of 35 per cent. initiated in 1945-46. In the light of events, we must regard last year's distribution as having been made possible by extraordinary receipts.

PAST YEAR'S DIFFICULTIES

In his last statement the chairman reported the highly satisfactory trend in trading results during the first months of the financial year 1947-48. Unfortunately, our expectations have not been fulfilled. It seems, in retrospect, that there was an inflated buying wave in October in anticipation of the Autumn Budget, after which the temporary uncertainty regarding the applicability to our business of the increased purchase tax and the technical complications attending its implementation caused a recession in sales, which continued during the mild winter. Nevertheless, the turnover for the year showed a small increase on the previous year due to a rise in home sales.

There has been considerable comment in the Press as to the possible effect of the National Health Service Act on pharmaceutical products in this country. I am pleased to inform our stockholders that Aspro turnover during the first three months of the current financial year shows an increase over the same period last year. (Trading profit is down, but this period does not in fact afford an accurate basis of comparison).

The consolidated profit and loss account shows a group surplus for the year of £173,410 (£159,284 being attributable to Aspro Limited), after full provision for U.K. and overseas taxation, accumulated exchange losses in respect of our French subsidiary, and inter-company profits in stocks at June 30, 1948. Subsidiaries' operations are, on the whole, progressing satisfactorily in spite of difficult conditions prevailing in certain territories, notably on the Continent.

A substantial reserve of profits for Aspro Limited, amounting to £120,441, is carried forward on the profit and loss accounts of subsidiaries at June 30, 1948. The actual net profit of subsidiaries, for the year (Aspro Limited's proportion, after provision for taxation and exchange losses, was £51,328.

IVERS-LEE (GREAT BRITAIN) LIMITED

As expected, our subsidiary, Ivers-Lee (Great Britain), Limited, shows improved trading results. A packaging service business of this nature will, however, require at least three to four years to establish itself. This subsidiary is fortunate in being able to count, in its early stages of development, on assistance from Aspro in all fields of operation.

The acquisition in December, 1947, of Ives-Lee Engineering, Limited, and its subsidiaries, was reported last year, and among other advantages, guarantees prompt deliveries for Ivers-Lee and replacement when necessary of machines in the various Aspro plants, as well as elimination of third-party profits. Up to date machines and equipment have been produced for the U.K. and overseas packaging services to a value of £93,000.

A fire occurred in the packaging service in Slough in September, 1948, and the main store rooms were destroyed. Fortunately, your directors, as a measure of prudence and also with a view to bringing eventually the Ivers-Lee manufacturing units together under the same roof as the packaging service, had accepted the opportunity a few months previously to acquire further substantial leasehold space on the premises at a cost of £40,000, so that the ill-effects of the fire were considerably mitigated.

Ivers-Lee subsidiaries or associated companies have already been formed to operate the patents in certain overseas territories, using machines and equipment manufactured in the U.K. Thanks to facilities recently afforded by the Bank of England Exchange Control it will be possible to secure a controlling interest in additional foreign subsidiaries.

BALANCE SHEET ITEMS

The balance sheet of Aspro Limited, shows an excess of current assets over current liabilities of £257,946 (excluding current accounts with subsidiaries), compared with £454,493 at June 30, 1947, the difference being chiefly explained by the purchase and financing of Ivers-Lee Engineering, Limited, and the associated foundries, and the acquisition of the additional leaseholds, entirely out of our own cash resources. These transactions, and an increase of some £100,000 in stocks of raw materials and finished goods, largely account for the reduced cash balances.

I would sum up as follows. Our home market seems now to be settling down at a postwar level which may be regarded as highly satisfactory. Our efforts are being concentrated on maintaining this position, expanding an already substantial export market, and consolidating our recent Aspro/Ivers-Lee enterprises at home and abroad. We feel (subject always to the general reservations necessary in these uncertain times) that there are good grounds for confidence in the future.

The report and accounts were unanimously adopted.

CANADIAN BANK OF COMMERCE

IMPROVED CONDITIONS IN CANADA

The annual meeting of The Canadian Bank of Commerce was held, on the 14th instant, in Toronto.

Mr Allan E. Arscott, C.B.E., the president, stressed the improved conditions in Canada this year, good crops, industry working close to capacity, forestry active in most major areas and few interruptions in labour field. The improved crop situation was indicated by the fact that grain yields were about 200 million bushels above 1947, which should mean larger food supplies for domestic and export trade. A number of new factories and mills had been brought into operation and projects started many of which would be completed or well on the way to completion during the coming year.

Total Canadian exports were valued above those of preceding year but there were important changes in direction, and those to British group declined by more than $100 million from 1947 as the result of smaller shipments to Britain and substantial reduction in other markets of this group, particularly Australasia. There was also a marked falling off in exports to Continental Europe, however, European countries now obtaining goods from Canada through allocation on the European recovery programme. It had been indicated that the balance remaining of Canada's credit to Britain, $235 million, was likely to be unfrozen.

INCREASED EXPORTS TO U.S.A.

Exports to the U.S.A. had increased considerably, exceeding $1,200 million. Defence measures were being undertaken under different circumstances. Today, with high employment, such preparation came as a competitor to the productive machine. Canada was endeavouring to travel along the paths of peace, reconstruction and defence preparation simultaneously. This country was so dependent upon international trade that almost every phase of world affairs affected it and incidents in the international sphere were of considerable concern. It was hoped that deliberations and patient efforts of those charged with working out a peaceful solution would be successful in convincing potential belligerents of the wisdom of foregoing actions which might lead to actual war.

The general manager, Mr James Stewart, C.B.E., reviewed the bank's annual statement which showed assets in excess of $1,500 million, an increase for the year of over $100 million. The increase in current loans in Canada, $30 million, was indicative of the bank's active part in business of the country. The figures signified a combination of two factors, increased tempo of business compared with war and postwar periods and higher prices. There had been evidence in recent months of price increases slowing down and in these confused times one could not predict in anything but general terms what the future held. However, with the resources with which this country was blessed it could look to the future with confidence.

The report was adopted.

SCOTTISH AUSTRALIAN COMPANY, LIMITED

RECORD TRADING RESULTS

The annual general meeting of The Scottish Australian Company, Limited, was held, on the 9th instant, in London.

Mr J. Norman Eggar (chairman and managing director) in the course of his speech said: Perhaps the most satisfactory feature of last year's working is that every single station has shown a profit, a somewhat rare occurrence of recent years. Of course, the high prices realised for wool are the greatest contributory factor to the record profit made in Australia, but excellent sales of cattle and larger crops of wheat and oats and better prices for cereals have also helped to swell the revenue.

The policy of shipping our wool for sale at the London auctions has amply justified itself, for prices realised here have been comparatively better than in Australia. In April-May it looked very much as if the peak had been reached, and after consulting with the manager we decided to sell some portion of our Queensland clips in Brisbane; at that time there was not much shipping freight available. Good prices were realised, but since then the market has again completely recovered, and I am happy to tell you that the prices realised in London a few weeks ago for the balance of those clips were a good deal higher than the Brisbane prices.

As regards cattle, I am pleased to report that Austral Downs in Northern Territory, and Clonagh and Kynuna in North-West Queensland, have all had successful seasons. Turning to crops, on all our Riverina Stations both wheat and oats did well.

We have been constantly on the look-out for suitable properties to replace those which we only hold on occupation lease. We have practically concluded negotiations for a property on the Barkly Table land in the Northern Territory, about twice the size of Austral Downs. We are also closely negotiating for a sheep and cattle property in South-West Queensland on which we shall hope to maintain a flock of some 40,000 sheep.

FUTURE PROSPECTS

The prospects for the immediate future are good to this extent that wool, livestock and grain values remain high, and as far as one can judge, are likely to continue remunerative. The supply of wool has by no means overtaken demand. The United Kingdom is likely to become a more and more willing buyer of Australian meat, whilst the prices of cereals are still quite remunerative to the farmer. The guaranteed wheat price to growers is to be 6s. 8d. per bushel. The harvest in the Riverina is now proceeding, and we anticipate good average crops, though not so heavy as last year's. There will in my view always be a ready market in the United Kingdom, India and elsewhere for Australian wheat.

I must, however, sound the warning note that, except in the South, Queensland and the Territory have been suffering from drought for several months past, and on some of our stations the situation is quite serious, and cattle and sheep are deteriorating. In Southern Queensland and New South Wales conditions are reasonably satisfactory.

It is a real pleasure to be able to present to you so good a balance sheet. With regard to the profit and loss account, station working expenses were lower, due to decrease in drought expenses. The balance of £162,978 is, of course, an improvement on anything we have had for the last 23 years, and is reached after providing no less a sum than £220,000 for United Kingdom and Australian taxation. A sum of £6,328 has been allocated to staff bonus, and we are paying stockholders a bonus of 2½ per cent. in addition to the 7½ per cent. dividend.

The report was adopted.

TUBE INVESTMENTS LIMITED

NEW RECORDS IN OUTPUT AND EXPORTS

PLANS TO MEET CHANGING MARKET CONDITIONS

The annual general meeting of Tube Investments Limited, was held at Birmingham on the 15th instant.

Mr I. A. R. Stedeford (chairman) said that the group's output had exceeded that of the best war years, when many more men were working for many more hours. This had been due to the extended application of the new scientific principles of production management, in which the workers had co-operated enthusiastically, and to re-equipment and modernisation, upon which a further £1,250,000 had been spent.

Turnover, although not precisely comparable with last year's, showed an increase of nearly £9,000,000, and this in spite of the important reductions in prices which had been voluntarily made. This additional turnover was reflected in the profits for the year, but not to the extent which would ordinarily be expected from so substantial an increase in output. Manufacturing and raw material costs had continued to rise, and there was the serious increase in replacement cost of plant and buildings for which provision had to be made. An independent valuation of the group's fixed assets had been made. This very conservative valuation amounted to £17 million, an increase of nearly £11 million over book value. If these assets had to be replaced today, it was estimated that a sum of £25 million would be barely adequate.

OVERSEAS SALES EXCEED £10,000,000

Direct exports, worth over £10 million, were seven times greater than prewar totals, and nearly £3,000,000 up on last year's record. Including manufactures which found their way overseas as components in other companies' products, TI had earned £1 out of every £100 of the country's visible exports. Some 34 per cent. had been dispatched to countries designated as "desirable markets." A new selling company, TI New Zealand Limited, had been formed; and a substantial minority interest in the firm of Mauricio Silbert S.A., of Buenos Aires, long-established manufacturers of welded steel tubes, had been secured.

In the present trading year, it seemed likely that the volume of exports would depend largely on factors beyond TI's control—upon steel allocations, export quotas, import restrictions, and bilateral trading agreements, etc. If this country were to hold its own, it was vital that the rise in production costs, which had persisted since the end of the war, should be stopped. He believed that Britain would be heading for a painful disillusionment if she relied too much on sheer mass output of established products. Much of our national income might have to be provided that way, but Britain built up her national power on craftsmanship and quality. Her traditional ability to produce new products for old purposes was an asset we dared not squander. TI had, for example, recently developed a new technique in 'bus body construction from pre-fabricated parts, which were being produced in considerable quantities, and were already creating an important overseas demand.

The Commonwealth and Empire markets had always been the best customers overseas, and by their steady demands had encouraged TI—as he believed they had others—to bid competitively and successfully in other markets of the world. While he appreciated the need of a freer exchange of goods and services, he felt that Britain could not afford any sacrifice in Imperial preferences unless it were in return for a concession fully equal in promise, yield and spirit.

The TI Cycle Division, with expert orders alone of £10 million to hand, continued to prosper, but, given more supplies, much more business could have been done. There was a shortage of certain components which TI did not make and which affected not only TI's production but the output of companies depending upon TI for the components the group did make. Britain held the lead in the world's cycle markets, but it needed official encouragement, particularly in the matter of steel supplies, if this position were to be maintained in the coming critical years. The steel tube and general divisions showed good progress in home sales and increased overseas demand.

The aluminium division was pressing forward with its plans, a new company TI Aluminium Limited, having been formed to co-ordinate the technical and marketing resources of the companies. The £2,750,000 aluminium sheet and strip mill in South Wales should be completed by 1951-52. An important factor concerned raw material which largely came from dollar areas. He did not believe that this promising industry in times of dollar stringency would be allowed to suffer seriously for want of raw materials of which there were abundant world supplies, and, in the absence of official advice to the contrary, TI had laid plans accordingly.

The acute shortage of electricity supplies, and purchase tax, had confronted the electrical division with many problems. For example, one of the largest factories, geared for the mass production of a product for which there was still a high demand, quite suddenly had its output curtailed by 60 per cent. This resulted in the displacement of workers not long before specially trained, and the unbalancing of production plans at the works.

NATIONALISATION OF STEEL

They were, he was told, the largest private buyers of finished steel in the country, and received no special trading concessions from the steel makers. With experience in most foreign steels, they acknowledged that British-made steel compared with the best. If record outputs, cheaper prices, high quality, and great development plans, were still measures of efficiency and enterprise, then the British steel industry was well in advance of most others.

There had been conjecture as to the effect the nationalisation of steel would have on TI, particularly in view of the liaison shares exchanged free of cost 20 years ago with Stewarts & Lloyds Limited. The purpose for which the liaison shares were created remained equally important, whether Stewarts & Lloyds operated under private or state ownership, and it would, in his submission, be opposed to the best interests of the industrial community for them to be abandoned. While he did not believe that the nationalisation of steel would yield to TI, or to anyone, any advantage, there was no ground whatever for supposing that TI would suffer disadvantages compared with others, because of some non-marketable liaison shares.

Concluding, Mr Stedeford said that his confidence in the country's ultimate recovery was unshaken. Nevertheless, he believed we were approaching the stage when Britain's industrial planning would be put to its severest test; and at such a time it served nobody well to blink future problems in a pleasant appreciation of past achievement. Today what had been done was of little importance; what could yet be done was the crucial question.

The report and accounts were adopted and the dividend approved.

MALAYAN TIN DREDGING, LIMITED

WAR DAMAGE COMPENSATION

The thirty-seventh annual general meeting of Malayan Tin Dredging, Limited, was held, on the 15th instant, in London.

Mr H. Ashworth Hope, chairman of the company, in the course of his speech, said:—

It is common knowledge that a majority of the Cabinet were not in favour of the Steel Bill, but appear to have been overborne by a small but powerful minority. The nationalisation of the steel industry is a matter that much concerns the tin industry in general and your company in particular. Fabricated articles, due to the steep rise in labour costs, have increased 150 per cent., whereas the cost of raw material such as steel plates, girders, etc., has increased by approximately 60 per cent. to 70 per cent.

On November 10th last an important debate on Malaya took place in the House of Lords. Nearly all the members of the House who spoke during the debate charged the British Government with an attempt to subject Malaya to a very raw deal in the matter of war damage compensation and urged the Government to reconsider the matter and avoid making another major mistake in relation to that country.

POINTS FOR SELECT COMMITTEE

In view to the cynical attitude of the British Government towards a country we have failed in our undertaking to protect, I would remind you of the remarks contained in the interim statement of the Tronoh-Malayan group, which, I may say, have not passed unnoticed in Malaya. I should mention that a Select Committee of the Legislative Council in Kuala Lumpur is now examining the Colonial Office and Treasury proposals, and its reports will be submitted to the Legislative Council some time in the New Year.

I suggest that there are three main points for the Select Committee to consider. Firstly, to decide what sum (in lieu of the arbitrary figure fixed by the British and Malayan Governments) would, approximately, genuinely represent the total Malayan war losses.

Secondly, what sum between that proposed by the Colonial Office and the estimated genuine total losses would be acceptable to Malaya.

Thirdly, what amount could Malaya afford to contribute—as a voluntary offer and not as a duty—to the sum suggested by way of compromise for which Great Britain, as the defaulting Power, is responsible.

It is, however, important to remember that both the Select Committee and the Federal Legislative Council owe a duty to the Sultans, people and industries in Malaya and not to the British Government who have shown themselves only too willing to be relieved of their financial obligations to Malaya, whether legal or moral.

It must be a cardinal point in the deliberations of the Select Committee that all surplus revenue that Malay can produce is needed for social purposes and the restoration of the private trader and individual, who plays such an important part in the economic life of Malaya, more so than in Britain.

Lord Milverton, who spoke in the House of Lords debate, spent many years in Malaya and was known throughout Malaya as a wise and far-seeing administrator, stated, *inter alia*, "Those of us who sit on these benches believe in facing the future, but in connection with Malaya I would urge that if we do not face the facts of the present there will be no future to face."

The report was adopted.

SOUTHERN MALAYAN TIN DREDGING, LIMITED

MR H. ASHWORTH HOPE'S SPEECH

The twenty-second annual general meeting of Southern Malayan Tin Dredging, Limited, was held, on the 15th instant, in London.

Mr H. Ashworth Hope, chairman of the company, in the course of his speech, said: Out of the year's total profit of £405,128, provision for U.K. taxation amounts to £247,600, or 61 per cent. In addition we paid £88,763 duty on tin ore, so that the total profit before deducting the duty was £493,891, and the total of duty and taxes was £336,363, bringing the proportion of taxes up to 68 per cent.

We have made every effort to afford protection to the members of our staff by sending out arms and ammunition, after encountering considerable frustration and delay caused by controls and the usual muddle in their administration. Finally on August 3rd, we were forced to the conclusion that they could only go by sea route. Ultimately, weapons were supplied from America and Manila. It was not until August 6 that one of our managers was able to report that he had received sufficient weapons to arm all his European staff.

SITUATION IN MALAYA

Before the war, the safeguarding of life and property throughout the whole of Malaya was the responsibility of the police force alone and the fact that Malaya was the most peaceful and contented country in the world is the finest tribute that can be paid to this fine force and its organisation. Surely the first duty of the Colonial Office was to have given the most urgent priority to rehabilitating the police force.

An ample supply of arms and ammunition was available to the terrorists as a result of the Japanese surrender in 1945, coupled with the fact that the British military authorities had not secured the surrender of all arms before handing over the country to the civil administration in April, 1946. The police force, on the contrary, in the early months of the year were comparatively without arms of any sort and had a depleted rank and file whose morale had been undermined and whom it was not possible to equip adequately, even with uniforms.

If the British Government imagine that Malaya will accept the financial burden of the present military force, I would draw their attention to the strong objections that have already been raised in the Legislative Council to any such suggestion.

DIVIDEND LIMITATION

Dividend limitation was introduced by Government as part of their anti-inflation policy at the time when they proceeded to stabilise wages and prices. In complying with the somewhat sinister "invitation" of the Chancellor to limit dividends to the rate paid in the previous year, the majority of the boards of directors of companies registered in England apparently assumed that their shareholders would approve this course in the national interests.

It it now, however, abundantly clear, that the Government have strained the loyalty of both directors and shareholders in that they have adopted the principle of dividend limitation as a convenient technique to depress the Stock Exchange prices of stocks and shares in those companies marked down for nationalisation.

As long as I and my colleagues are in control of your company our policy will be to pay dividends on the basis that you are entitled to a just and equitable return on your investment consistent with efficient and sound management.

The report was adopted.

KRAMAT PULAI, LIMITED

MR H. ASHWORTH HOPE'S VIEWS

The fortieth annual general meeting of Kramat Pulai, Limited, was held, on the 15th instant, in London.

Mr H. Ashworth Hope, the chairman, in the course of his speech, said: On November 9th we received notification that our application for a prospecting licence over 10,000 acres in the Ulu Paka area of Trengganu has been approved by Government for a period of six months.

At the meeting of the Legislative Council on November 19th, Mr J. D. Mead stated that all prospecting in new areas is practically at a standstill owing to the activities of the terrorists, and that "every time an engineer is murdered the position becomes more difficult and new construction will suffer."

The British Government's proposals are that the total claims should be arbitrarily reduced to a maximum of £55,000,000, and that this amount should be provided as to £35,000,000 by Malaya, £10,000,000 by the United Kingdom Government and £10,000,000 reparations from Japan. The Legislative Council has made it quite clear that a larger contribution is expected from the British Government. The Singapore Association however, after a full discussion at a public meeting held in Singapore, rejected the whole scheme in its present form as being entirely unsatisfactory.

The board have given much time and thought to the question of possible hidden scheelite deposits. We have consulted Mr O. Weiss, one of the leading geophysicists, on the practicability of carrying out a geophysical survey. He has advised us that if there are any further deposits in this area, it should be possible to locate them by modern scientific methods, and we have accordingly decided to have a geophysical survey carried out.

The report was adopted.

THE STRAND HOTEL, LIMITED

CATERING WAGES ACT

The forty-first annual general meeting of the Strand Hotel, Limited, was held, on 16th instant, in London.

Major M. Gluckstein (the chairman) presided, and said: It has now become almost an established practice for the chairman of an hotel business to make some reference to the Catering Wages Act.

This company—if I may say so with due modesty—has the reputation of being fairly resourceful in adapting itself to new conditions. We have had plenty of practice, and a certain amount of success, in softening the effect on the public of all kinds of restrictions and even of actual calamities. If we, then, with our organisation and on our scale of activities, are finding that we must reduce our services, we can well imagine that equal or even greater difficulties are being encountered by our fellow-hoteliers. These difficulties fall alike on the more expensive hotels whose clientele is more exacting and possibly less sympathetic towards any form of austerity; and on the small hotels in all parts of Great Britain, because of their small number of staff and, in many cases, their dependence on a short season.

It seems indeed pitiable that a valuable dollar-earning industry such as ours, where the utmost goodwill between the employer and his staff existed before the Catering Wages Act was thought of, should have to lower its standards in this way.

I cannot believe that those who framed the Act intended the public to suffer to this extent or that the Minister who introduced it was anything but sincere in saying: "I believe the Bill will be a blessing to the industry."

The report and accounts were adopted

Statistical Summary

GOVERNMENT RETURNS

For the week ended December 11, 1948, total ordinary revenue was £47,269,000, against ordinary expenditure of £41,915,000 and issues to sinking funds £750,000. Thus, including sinking fund allocations of £11,583,000, the surplus accrued since April 1st is £273,448,093 against £208,499,123 for the corresponding period a year ago.

CIVIL SERVICE COMMISSION. An Open Competition will be held in 1949 for recruitment under Normal Regulations to the Special Departmental Classes (i.e. H.M. Inspector of Taxes; Departmental Class (Cadet Grade) Ministry of Labour and National Service; Probationary Assistant Postal Controllers; Research Assistants, Ministry of Defence). There will be two Methods of recruitment, Method I comprehensive written examination plus an interview, Method II written qualifying examination followed by personal tests and interview; for Method II candidates will be required to have obtained (or to obtain in 1949) a university degree, but this will be waived for certain candidates who have had regular service in H.M. Forces. Age limits 20½-21 on August 1, 1949, with extension for regular service in H.M. Forces, and, up to two years for voluntary Service in H.M. Forces otherwise than on a regular engagement or for compulsory national service under the National Service Acts. Candidates at least 24 and under 30 on August 1, 1949, may at the Commissioners' discretion be admitted to compete under Method II if they have experience in employment in industry or social work particularly fitting them for posts in the Ministry of Labour and National Service.

Regulations and particulars are obtainable on application (preferably by post-card) to the Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 2326. The latest date for the receipt of completed Application Forms is December 31, 1948 (for Method II) or January 31, 1949 (for Method I).

CIVIL SERVICE COMMISSION. An Open Competition will be held in 1949 for recruitment to the Executive Class and Corresponding Departmental Classes of the Home Civil Service and to Executive Posts in Branch B of the Foreign Service. Candidates will be required to have obtained (or to obtain in 1949) a university degree. Age limits 20½-24 on August 1, 1949, with extension up to two years for voluntary service in H.M. Forces or for compulsory national service under the National Service Acts.

Regulations and particulars are obtainable on application (preferably by post-card) to the Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1, quoting No. 2341. The latest date for the receipt of completed Application Forms is January 31, 1949.

MARKET RESEARCH ORGANISATION requires Statistician. Applicants must have first-class British degree in Statistics, but experience in commercial work is not so necessary as a real liking for figure work and adaptability. This is a sound position for person prepared to be trained in all aspects of Market Research. Write giving full details of education, age and previous experience to Box 916.

FOR SALE: Volumes of Economist, 1935-39 (bound); 1939, 1942, 1943, 1944, 1945 (unbound) 1931-35, 1940-41 (unbound and incomplete). Apply, Library, 39, Cadogan Gardens, S.W.3.

At Full Stretch

BY the accident of the calendar this Christmas issue is also the last of the year and therefore provides the appropriate moment for pausing and taking stock of ground travelled and of the milestones still to be reached. And, as if to assist in the process, the Government have released the full text of the Four-Year Plan submitted to the Organisation for European Economic Co-operation as token and proof of Britain's ability to put its economic affairs in order by the end of 1952. To call this document a Four-Year Plan is, indeed, a misnomer. The figures it contains are not promises but illustrations, and the detailed tables are to be regarded as no more than exercises in "spelling out," as the Americans say, the results that might be expected to flow in the next four years from the policies that the Government propose to follow.

But statistics can be doubly misleading if they are not only taken to be more accurate than they are but also distract attention to the details, which are infinitely variable, and away from the major outlines of policy, which are vital. The great virtue of the document is that it is a signpost, and the question it arouses is not whether the distances given on it are accurate but whether it points in the right direction.

There can be no doubt that, on the major issues of economic policy, the nation has been travelling during 1948 on the right road. Indeed, the best way of realising what a distance has been travelled is to look back to Christmas 1947, and to observe the almost magical change that has occurred in that sensitive barometer of national standing, the prestige and position of the pound sterling. A year ago the pound was shunned and suspect; now it is among the world's hard currencies. Then the world's criticism was that the British economy was incapable of paying its way; now it is that British policy is aiming at making the pound too scarce. This change is not entirely one of psychology and atmosphere; it has been produced by the restraint that has been shown in British spending abroad and the energy that has been shown in the export drive. When the figures of the current balance of payments come to be published, it is expected that they will show an overall balancing of payments and receipts, without the aid of Marshall dollars—that is to say, they will show a surplus in all other currencies approximately equal to the continuing deficit in dollars. This is a great achievement by any test, and though the ultimate credit belongs to the British people's capacity for self-control, by far the greatest individual share of praise attaches to Sir Stafford Cripps and the small circle of his intimate advisers. Not only has he shaped the policies and tenaciously defended them, he has also provided the essential moral foundation. A people that is being asked to exercise such severe self-discipline must be convinced that what is asked of it is asked for the good of the community, not to flatter the vanity or foster the ambition of a politician. This confidence Sir Stafford has created in full measure.

The achievements of 1948 justify some satisfaction, but no complacency. The British national economy is still strained to the utmost. There are no margins for relaxation anywhere. It is only, so to speak, by standing on tiptoe that the nation contrives to measure up to its economic commitments. This cannot go on for ever. It is suggested in the article

on page 1071 that the proof, contained in the Four-Year Plan, of Britain's ability to pay its way by 1953 is based on a number of assumptions which, without being in any way impossible, have a distinctly sanguine tinge. Perhaps the most important of these unspoken optimistic hypotheses is the assumption that the economy can go on standing on tiptoe for four more years—indeed, for an indefinite period.

★

This assumption, and the practical consequences that flow from it, deserve much more serious attention than they usually receive. The policy has been generally christened that of austerity. But it is a silly misnomer, for a large part of it consists of a determination not to abate anything of the social ambitions conceived and of the political commitments entered into in the starry-eyed days of the war; Sir Stafford Cripps is not one of those Ministers who are reported to be willing to forgo any item of the Labour Party's programme; all must be carried out to the letter, nationalisation, social welfare schemes, full employment, enhanced real wages and the rest. It is only in the carrying out of this grandiose programme that the austerity enters in. By keeping up the maximum pressure for output, by insisting on starving the home market in favour of exports, by cutting imports to the bone, by maintaining an apparatus of rationing and control more severe than any other democratic nation's, by persisting in a crushing burden of taxes, by seeking and accepting foreign subsidies—by doing all these things the nation can just, but only just, afford the extras it voted to itself when it thought it was going to be rich. That it can be done, at least for a year, has been demonstrated. But can it go on much longer? Can Sir Stafford preserve his precarious equilibrium in the middle of all the stresses and strains for even one more year, with his own party showing so clearly that it does not like the price of what it has ordered?

The answer, we must all hope, is Yes. For if it were No, if the inspired gambles that make up the Four-Year Plan do not come off, if the targets are not reached, if the run of luck is bad, if the dollar deficit is not removed by the continuance of present policies, then the alternative prospects that will face the country will be unpleasant for everybody alike. If the country finds that it cannot for ever go on standing on tiptoe to reach the jam it thinks it deserves, and if its kind American friend will not for ever provide a stool, then it has only two alternatives—either it must grow up very quickly or it must go without the jam. The former choice is, of course, to be preferred; but it is also likely to be much the more difficult to achieve. It has been apparent for a year past that no further great increase in output can be achieved by the present combination of exhortation and controls, of egalitarian taxation and welfare legislation. The great myth that the nationalisation of an industry could quickly improve either its efficiency or its psychology has been exploded. If more needs to be done, it must be done by wholly new methods—and, what is more, by wholly new methods that require no more imports and reduce none of the pressure behind the export drive. It may not be wholly impossible to find some such new methods; but it might be safer to assume that they will not, in fact, be found. If that is so, the only practical alternative to the general lines of policy that Sir Stafford Cripps is following is a reduction either in the standard of living of the people, or in the social welfare legislation that all parties have joined to put on the statute book, or in the capital programme that is the best long-term hope of escape from austerity. It is far better to hope that the Four-Year Plan works out as Sir Stafford expects it to.

Indonesian Debacle

IN the latest unfolding of the Indonesian crisis Dutch troops have crossed the truce line dividing them from the Republican forces of Indonesia—a line established, after earlier fighting, by the United Nations Good Offices Commission—have captured the Republican capital and have taken into custody the chief officials of the Republican regime.

The immediate reaction among the Western Powers to this reversion to force has naturally been grave concern and uneasiness. The United States, with Australian backing, has brought the issue before the Security Council and the Americans support the demand that the Dutch should return to the truce line and reopen negotiations. The Dutch, who claim to have lost faith in the ability of the Republicans to abide by any agreement—two major ones have already been signed and disregarded—will refuse further outside mediation. At this point the Western instinct will be to denounce the Dutch for violating the United Nations charter and for acting in a spirit contrary to the whole tradition of Western colonial policy. Such a reaction is not unreasonable but, unhappily for the peace of mind of the Western Powers, the situation in Java cannot be considered in either a moral or a political vacuum. All round Indonesia, the South East Asian world is in turmoil and disintegration. Everywhere the Western position is challenged. The question that the Western Powers must sooner or later face, whether they do so now in the Security Council or later under still greater pressure of events, is whether their cherished principles of colonial rule—in which the achievement of national equality either by independence or assimilation held pride of political place—can in fact be hurriedly realised in the kind of world native nationalism and Communist penetration are creating in South East Asia. This question could not be asked in 1945 and even 1946 since the dilemma had hardly arisen. Since 1946, however, it has become more and more clear that many of the South East Asian communities are not ready for self-government, that the forms of Western rule when practised by Eastern men quickly break down and that anarchy takes their place. This anarchy is in turn a forcing ground for Communism which thrives on a combination of Utopian propaganda and terrorism. Far from passing to independence, the communities threaten to become derelict, incapable of supporting their population economically, or else drift into new colonial dependence within the Russian sphere. What, in such circumstances, should the Western Powers attempt? Should they follow their liberal instincts at the risk of abandoning their territories to nationalist anarchy and later to Communism? Or should they strengthen their rule at the cost of driving nationalist opinion still more rapidly towards extremism? In fact, both ways have been tried. In Burma, the British withdrawal has reduced the kingdom to Communist-threatened anarchy in less than two years. In Indo-China, the French decision to stay has had the same result.

★

The evidence of the West's divided mind has been above all obvious in the handling of the Indonesian crisis. The Americans and the Australians have pressed for the "liberal" solution. They overlooked the Indonesian Republicans' origin as a Japanese-sponsored nationalist movement; they gave the Republican regime a sort of *de facto* recognition by allowing the dispute between the Netherlands and the Indonesian Republic to appear before the Security Council; and it was above all American pressure that led the Dutch under protest to accept a "cease fire" a year ago. British policy has been more hesitant. At first, largely out of expediency, the British occupying forces dealt with the Republican regime. On the other hand, the British allowed the Dutch to replace them as the occupying force and thus gave the Netherlands the springboard for restoring its rule in part of Java and Sumatra and in all the other islands of the Netherlands Indies. The British supported the "cease fire" and have consistently urged the Dutch to negotiate. But as the Communist upheavals in South East Asia increased during 1948, Britain's need to suppress terrorists in Malaya clearly weakened the restraining influence it could bring to bear on the Dutch.

In the policy pursued by the Netherlands Government itself, the West's divided mind has been clearly demonstrated. On the one hand, there is no doubt that Dutch colonial thought has been liberalised both by the experience of becoming a "colony" of Germany and by enforced exposure to British colonial beliefs. The attempt to make Indonesia an equal partner with Holland in a Netherlands Union has been genuine. Step by step, as order has been restored, the non-republican areas of the Netherlands Indies have been drawn into a federation which is to become, in time, a sovereign constituent of the Netherlands kingdom. In its dealings with the Republicans, the Dutch Government has also gone much farther on the road to concession than has pleased diehard Conservative opinion in Holland itself.

On the other hand, the Dutch have always set strict limits to the external sovereignty to be enjoyed by the federation or its constituent parts. By Western liberal standards, what was offered to the Republicans was less than the full national sovereignty they were in fact enjoying in parts of Java and Sumatra, and negotiations, however often renewed, always broke down on this or that aspect of the Indonesian claim to full independence. The final break occurred only ten days ago on the Dutch demand that a Netherlands Commander-in-Chief should command the Republican forces. The Dutch justify their hard bargaining by the state of Republican territory, which is a prey to economic stagnation and to a political disorganisation which culminated this autumn in a Communist rising against the Republican Government. The immediate excuse for breaking the truce was the alleged inability of the Republicans to control their own terrorists. In effect, therefore, Holland now claims that the risks inherent in leaving the Republicans to bring about still further economic and political disintegration outweigh the advantages to be gained by further negotiation in a liberal spirit. Liberalism has been overtaken by the realism of events.

★

The American decision to bring Indonesia before the Security Council has compelled the Western Powers to face at very short notice the problem of their response. All have interests in South East Asia. Some are bound to Holland by a close alliance. Others may soon join that alliance. What ought they to do? Given their divided minds, should they remember their liberalism, condemn the Dutch, demand further negotiation and threaten to apply sanctions, which the Netherlands, unlike Britain or France, cannot ward off with a veto? Or should they attempt to see the Indonesian problem against its wider background—of Asiatic disorder, of Western divisions and uncertainties, of Communism's rising power?

It is difficult in international law to assail the Dutch claim that the Indonesian Republic had at no time any right to sovereignty and that in re-establishing Dutch rule, the Netherlands Government is simply regaining its lawful jurisdiction. But the case will not turn on legal points. The Western Powers must ask themselves on what concrete grounds they can attack the Dutch action. Can they do so because it is wrong to reconquer colonial territory taken over by the Japanese, or because it is wrong to defend colonial territory against nationalists whose nationalism does not coincide with one's own ideas? On these charges, it is difficult for either France or Britain to speak, since both are engaged in suppressing nationalism and Communism in some of their own territories. Should the charge be based upon the flouting of the United Nations Good Offices Commission and the securing by force of what was only to be given by negotiation? The United States can hardly press home such a charge after its support of the Zionists who in the Middle East have flouted the United Nations in an identical way.

Even the most damaging charge of all—which is simply that the Dutch have violated the peace—is not really as straightforward as it may appear. To the Dutch, the Republican Government, nurtured by the Japanese, were usurpers, no more, no less. Other governments, believing this, would have fought and not negotiated. The Dutch, inclining to the liberal counsels of Britain and America, have spent over two years in negotiation, even though for at least eighteen months they have had grounds for believing that they could settle the issue by force. Their claim that the Indonesians neither respected the truce nor wished for a final settlement cannot be entirely dismissed—unless it is also part of the Western gospel that a Dutchman may never be believed in preference to an Indonesian. All in all, the case which the Western Powers can place before the Security Council is equivocal and they are not especially well equipped to urge it. And quite apart from modesty over their own record, respect for Holland as a trusted ally should encourage them to restraint.

This, surely, is the decisive point. The Netherlands is a vital point in the system of Western defence—a system which has had to be built to stabilise the uncertain position in Europe. Since the alliance was begun, the situation in South East Asia has grown suddenly and much more alarmingly unstable, but far from the Western Powers evolving a joint strategy to counter

the new threat, they have not even given the faintest sign of engaging in joint consultation. Part of the essential character of this threat is that it swallows up peoples from whom Western support has been withdrawn (as in Burma) or to whom insufficiently effective support has been given (as in China). After long delays, after genuine efforts at conciliation, the Dutch have applied the logic of this situation to the Indonesian problem. Are their Western allies now to turn on them, and brand them as aggressors for a policy which each has practised or would have to practise in face of the same threat? The liberals are not to be blamed because their favourite road of independence leads in some cases not to independence, but to chaos and disintegration. Since, however, they are daily faced with the evidence of the fact, they are merely blind if they cannot adapt their policy to fit the new conditions.

Yet even if the conclusion must be reached that the Americans and Australians are unwise in arraigning Holland before the Security Council, even if it is admitted that the need among the Western Powers is not recrimination but a joint response to the Communist challenge in South East Asia, does it follow that the whole of their liberal thinking must be abandoned and that from henceforth a group of grim *Realpolitiker* must plot the course of the Western Powers? Such a conclusion only follows if the conferring of immediate independence on any nationalist leadership available at the time constitutes the sum of liberal wisdom—which it clearly does not. On the contrary, if the Western Powers decide to stay and meet the challenge of Communism in lands where so many forces work against them, there will be needed from them a much more difficult and constructive liberalism than that which satisfies itself by simply cutting the painter. The liberalism of today demands in Western colonial practice a progressiveness and a social advance which put their former more political liberalism into the shadow. If the Western nations will only make the effort to work out together a co-operative policy for South East Asia and to put behind it the full measure of their experience and their resources, it will be found that in the long run the defence of the liberal tradition, the defence of national freedom itself, will be better preserved by contributions in thought and wealth and manpower—which demand sacrifices—than by speeches in the Security Council—which do not.

Leaks in the French Economy

THE French people must by now be hardened to being told that they stand at the crossroads between the path of economic stability and prosperity and the path that leads to economic chaos and political weakness. Save for the briefest intervals, the economic history of France for many centuries past has been one of chronic monetary instability, deteriorating at intervals into sheer insolvency. So recurrent have been the crises that the average Frenchman has difficulty in any longer taking his national finances seriously. Perhaps, over the centuries, monetary instability has done less ultimate harm to France than might be supposed. What could be called the ordinary crises come and go without leaving much permanent trace. But every now and then there is an extraordinary crisis that threatens to bring down, for a time, the structure of the French state. By all the signs and portents, this is one of those occasions. For what is happening at present is not merely that the French Government is living beyond its means—that is almost a normal state of affairs—but that France itself is consuming wealth at a considerably faster rate than it is being created. The French people are living on their own capital and on other nations' bounty. Neither process can go on very long. But if they stop before French efforts have put something in their place, the result can only be a sharp deterioration in the national standard of life.

The facts that are needed to document this diagnosis are set out, with his customary lucidity and force, by M. Jean Monnet in the third interim report on the progress of the plan with which his name is associated, which was issued in Paris last week. The report purports to cover the plan of investment during the first six months of 1948; but in fact it is a cogent argument on the crisis in which France now finds itself, and a summons to make the effort of political courage necessary to emerge from it.

Whatever else may be responsible for the steady deterioration of French finances, it is not any inadequacy of physical production. The level of output, it is true, was very low at the time of liberation, and even in 1946 the general index of industrial production was still more than 20 per cent below the 1938 level. But the last two years have shown an impressive recovery and in the first half of this year the index stood at 114. The average for the second half of the year will have been depressed by the coal strike, but the present level of production is again considerably above the prewar figure. The most spectacular gains of the last two years have been in steel, where output has nearly reached the 1937 peak, in coal, where the 1939 peak has been well surpassed, and in the production of electricity and cement. Shipbuilding has increased fourfold since 1946 and in the middle of this year the tonnage of merchant shipping under construction in France was second in the world only to that of the United Kingdom. The darkest corner of the production picture is in agriculture; the 1947 harvest was disastrous and that of 1948 is probably still some 15 per cent below the prewar level.

M. Monnet's more immediate concern is with the creation of new fixed industrial capital, particularly in the half-dozen key industries that were singled out in his original report for special attention. Here, too, the report can tell of reasonably satisfactory progress. The value of new equipment installed in 1947 was 29 milliards of francs of 1938 value and was at the annual rate of 30 milliards of 1938 francs in the first half of 1948, compared with a mere 8 milliard in 1938 itself. The increase in industrial equipment is not, in fact, as great as these figures would suggest, since buildings of all kinds absorbed 13 billion in 1947 and 11 billion (annual rate) in the first half of 1948, against almost nothing in 1938. Nevertheless, it is clear that some investment in fixed capital is going on. Indeed, figures in the report indicate that total gross capital creation in 1948 has been running at the rate of 24 per cent of the gross national output, which is a high proportion by any standards. Indeed, the outside observer will be tempted to conclude that these figures are far too good to be true. In a state of hyper-inflation there is a great deal of conscious and unconscious consumption of capital that never gets into estimates of national income, which tend therefore to include all of the pluses and none of the minuses. The combined effect of the Monnet plan and of monetary inflation is probably to increase France's fixed capital and to drain its working capital. It is significant that over half of the privately financed capital investment of the last two years has been paid for with bank credit; nor can the Government's contribution be regarded as wholly derived from non-inflationary sources. Moreover, many of the basic industries are now publicly owned and running at constantly mounting deficits. It is politically difficult either to raise their charges or to cut their expenditure and their appropriations for maintenance of capital have proved to be far too tempting targets for the politicians. It is doubtful how far the existing capital of these industries is being maintained, and it is certainly not being maintained out of revenue. French national savings are certainly not enough to pay for the new capital creation that is going on; a complete reckoning of things seen and unseen might even show that there is, on balance, no net saving at all.

The defects in the French economy in fact, are those of finance, not of physical production. The two running sores are the balance of payments and the budget. In 1947, French imports and other overseas payments amounted to $2,815 million. Of this total, French exports sufficed to meet only 37 per cent; a further 18½ per cent came from reserves and private assets; and as much as 44½ per cent came from external aid. At the beginning of 1948, in an effort to correct this disparity, the franc was sharply devalued. Nevertheless, in the first half of 1948, the position got worse. Imports and other charges amounted (on an annual basis) to $2,658 million; but exports covered only 33 per cent of the total and foreign aid had to rise to 49 per cent. Examination of the export figures shows a most peculiar state of affairs. In the first half of 1948, exports were 15 per cent lower than in the previous year by dollar value, but 36 per cent higher by weight. Though there are some other partial explanations of this paradox, the main explanation is that French exports are under-invoiced. In other words, there is a large flight of capital, which unofficial estimates put at $500 million, a sum equal to half the American aid extended to France this year.

The second running sore is the budget. Under happier circumstances, France's budget would be nobody else's business. Today, however, the welfare of the eighteen other European nations joined together in the European Recovery Programme is linked to the French economy. What happens in Paris may well affect the standard of living in Perth and Palermo.

What is happening in Paris at present is the familiar December spectacle of budget-making. The Government has produced proposals which do not, indeed, balance the budget but which reduce the gap between income and expenditure to a figure which the optimists can argue is non-inflationary. Unfortunately, its means of closing the gap are politically circumscribed. Any attempt seriously to reduce expenditure would inevitably mean throwing voters out of work, and any attempt seriously to increase direct taxation, or any form of taxation on the agricultural population, would run up against the well-known obstacles that generations of finance ministers have learned to respect. All that can, therefore, be done, in effect, is to increase indirect taxes still further—which will infallibly lead to demands for higher wages, which will increase expenditure, which will prevent even the optimists from pretending that inflation will now stop. The Government's initial proposals, as usual, look like being too much for large sections of the Chamber.

Expenditure in 1949 is estimated at Frs. 1,250 milliard on the ordinary budget and at Frs. 615 milliards on the extraordinary budget of capital expenditures. The total of Frs. 1,865 milliard is equivalent to £1,760 million at the current official rate of exchange, which certainly does not under-value the franc. Taxation is estimated to produce Frs. 1,385 milliard, including the fruits of the Government's new measure of fiscal reform. The gap of Frs. 480 milliard, or about a quarter of the total, is to be closed, in the main, by two major operations, first, the inclusion of Frs. 280 milliards representing the "counterpart" of American aid—that is, the francs earned by the French Government by selling the goods it gets free from the United States—and, second, Frs. 100 milliards to be raised by a loan, whose contributors are promised an amnesty from investigation into the source of the funds they subscribe. The theory of a current budget covered by revenue and of a capital budget covered by savings and capital receipts is unexceptionable. But in practice everything depends on whether the revenue comes in to cover the first budget and the savings to cover the other. Many French observers believe that there is more than a little optimism in the balancing of the ordinary budget; as for the capital budget, the Marshall counterpart, though it is a real source of finance, is also a temporary one, and the conditions attaching to the loan do not sound as if it is even hoped to attract many genuine new savings. The test, in the end, will be severely practical: will the Government get through the year without recourse to the banks? And since, even in the budget estimates, genuine recurring revenue covers only three-quarters of the expenditure, the answer is almost certainly in the negative.

It seems, therefore, that the two leaks will continue. France, as a country, will continue to pay for only a third of its imports; and the French Government will continue to raise in revenue only, at most, three-quarters of what it spends.

*

Yet the problems of the French economy, as national economic problems go these days, are simple. A few rough statistical comparisons will serve to put them into proportion. If the comparison is with the United Kingdom, the object is not to vaunt what has been achieved in one country or to denigrate what has been done in the other, but simply because comparison between such close neighbours is natural.

The French gross national product, according to the Monnet report, was running in the first half of 1948 at the annual rate of 376 milliard prewar francs and is probably still at about the same level in that elusive historical currency. The indices of franc prices are now reaching 2,000 per cent of prewar, so that the gross national product in today's even more elusive francs can be put at about Frs. 7,500 milliard. It would therefore appear that the total expenditure of both French budgets is about 25 per cent, and estimated revenue rather less than 20 per cent, of gross national product. The corresponding British figures are something like 35 per cent for revenue and 32 per cent for expenditure. The level of British taxation, as everybody knows only too well, is monstrously too high. But any postwar Chancellor of the Exchequer would consider himself lucky beyond his wildest dreams if he had to raise in taxation only 25 per cent of the gross national product; he could reduce taxation by an amount equal to three-quarters of the whole yield from income tax, or two-thirds of the whole Customs and Excise revenue. Judged in non-political terms, the problem of stopping inflation in France is easy: it requires simply that the French Government should levy taxes at about three-quarters of the rate that other countries have found possible. The possibility can be illumined by another comparison: the consumption of the people takes 76½ per cent of the gross national product in France, but only 68 per cent in Britain.

The other leak—that of the balance of payments—would be harder to stop. But again the problem looks simple alongside that of other countries. France is much more nearly a self-supporting country than Britain; foreign trade is much more marginal. At present the average Frenchman is importing about $62 worth a year of visible goods and invisible services and paying for them with $22 worth of his own exports. Relatively, the gap is enormous; but the imports are only some 8 or 9 per cent and the exports 3 per cent of the gross output. The British figures are 15 to 16 per cent and 13 to 14 per cent, respectively. Clearly, the effort and the readjustment that would be involved for the Frenchman either in cutting down his consumption of foreign goods and services or in expanding the proportion of his own output that is sold abroad would need to be far smaller proportionately than the sacrifices and the exertions that are already being made on this side of the channel.

That the French have serious problems to face nobody would wish to deny. But those problems are not economic; they are political. They are the problems of asserting self-control and collective authority. There is nothing wrong with the French economy that a short period of firm, honest and courageous government could not easily set right. The problem before the French people is how to give themselves such government without falling prey to dictatorship.

Paying for Sickness

RUMOURS have been rife about the cost of the national health service almost from the day it was introduced, but very little hard information has been available on the extent to which the estimates were being exceeded—that they were being exceeded was accepted as a matter of course. Last week, however, in a parliamentary answer, the Minister of Health gave the actual amounts that had been spent from public funds, excluding the amount spent by local health authorities on their services, on the five main branches of the health service in its first five months, and the figures are reproduced below, together with the original estimates for the nine months, July 5, 1948, to March 31, 1949.

£'000

	Estimate 1948–49*	Spent July 5 to Nov. 30*
Hospitals	107,196	58,000
General medical services	27,500	7,983
Pharmaceutical services	11,450	5,439
Dental services	7,150	5,542
Ophthalmic services	2,080	4,048

* England and Wales only.

It should be pointed out that the amounts actually spent do not represent the total liabilities incurred in this period. Even so, the figures bear out the general impression of the working of the health service: that the general practitioners have some cause for their complaints that they are underpaid; that the cost of prescribing accords roughly with the estimate; and that the dentists and opticians are doing extremely well.

General practitioners are paid a capitation fee for each patient on their list and a mileage payment for visiting; there is also a special inducement fund for doctors in under-doctored or sparsely populated areas, and a basic salary of £300 a year, for which any practitioner can apply, in the first instance to the local executive council and, if rejected, on appeal to the Minister. This basic salary has to be paid out of the pool allotted to each executive council for payment of the capitation fees to the doctors in their area. Doctors who receive it are given a capitation fee one-seventh less than the normal rate. Nevertheless, its effect is to subsidise the less successful doctors at the expense of their colleagues. This charge on the pool, together with the fact that the first instalment of the sum allocated to the executive councils was less than it should have been, the Ministry preferring to settle up any deficiency at the end of the year rather than to overpay to begin with, has been the cause of much discontent. The £8,000,000 shown as spent in the first five months really represents the payment of the first three months, as general practitioners are paid quarterly. In the nine months to March 31, 1949, on the same basis, doctors would be paid £24 million, £3,500,000 less than the estimate, which was calculated on the assumption that fewer doctors would join the service than has in fact been the case. There does, therefore, seem to be some substance for the doctors' complaints—at present being investigated by a sample survey of their earnings—although it has repeatedly been said that underpayments will be made up in the final settlement.

The amount spent on the pharmaceutical service should not be regarded too favourably. If the same rate were maintained throughout the nine months, the total would be £9,790,000 compared with an estimate of £11,450,000. But dispensing is largely a seasonal occupation, and the peak period has still to come.

The actual liability for the dental and supplementary ophthalmic services is likely to be much bigger than the amount spent in the first five months indicates, for the rate has increased from month to month. Indeed, it was estimated in the *British Dental Journal* of November 19 that the cost of the dental service was then running at the rate of £28 million in a full year, which would be a rate of £21 million for nine months. Mr Bevan's decision to cut the top off dentists' earnings should reduce the cost to a certain extent, but it is difficult to see how payments that are based on items of treatment performed can be anything but heavy. One need not suggest cynically that digging holes and filling them up again is the classic method of making employment. The fact is that there is a heavy, unsatisfied demand for treatment, which dentists are naturally trying to meet. If the fees for each item of treatment are greatly reduced, it will only lead to the danger that dentists will work excessively long hours to earn more money.

The truth is that the ideal method of paying the practitioners in a free health service has yet to be found. Payment by salary is hard on the patient, for it denies him free choice of doctor or dentist—doctors paid the same amount will tend to do the same amount of work; the lack of incentive in a salaried service also discourages the best people from entering it. Payment by items of service is hard on the taxpayer. Payment by capitation fee is hard on the practitioner; it means that, no matter how great the demand for his services from his patients, he gets no additional reward. Nevertheless, it does seem the best of the three methods. It enables the cost of the service to be estimated fairly closely; it ensures free choice for the patient; and it provides some incentive for the practitioner. Is there any reason why it should not be tried out in the dental service?

*

There remains the hospital service, which accounts for well over half the total cost of the health service. The figure given by Mr Bevan for the cost of the hospitals in the first five months does not seem unduly high. It would give a total of £104,400,000 in the nine months, which is actually just below the estimate. But the budgets of the regional hospital boards for the year 1949-50 give a less favourable picture. They estimate a total gross expenditure, including capital expenditure, of £157,680,000. This compares with the Ministry of Health's estimate for the regional boards' expenditure only—that is, excluding the teaching hospitals' expenditure—in the present year of £129,414,000 when calculated on an annual basis.

In fact, it is not so much the cost of the hospital service at present that causes anxiety as the mounting cost from year to year as plans for expansion are framed and put into operation. At the moment, the maintenance cost of a hospital bed shows big variations from hospital to hospital, both in London and in the country as a whole. All, however, have this in common—the cost is increasing from year to year. In London, the average cost of a bed in the former voluntary general hospitals was £11 7s. 6d. a week in 1947. In the whole of England and Wales, 388,000 hospital beds were taken over on July 5. If the eventual cost of each is put at £10 a week, it gives an expenditure of £194 million a year on in-patient treatment alone, let alone out-patient treatment, the cost of other services and the cost of teaching and research. Even if, by the economies of large-scale management, it is possible to maintain a hospital bed efficiently at a cost of, say, £7 a week, the total cost is still likely to rise because of the planned increase in the number of beds.

It is true that Mr Bevan has not yet approved the regional boards' budgets. He may decide that they will have to be cut, and so may any future Minister of Health in subsequent years. But it would be difficult for him to square a drastic cut with the duty imposed on him by the first clause of the National Health Service Act:

> to promote the establishment in England and Wales of a comprehensive health service designed to secure improvement in the physical and mental health of the people of England and Wales, and the prevention, diagnosis and treatment of illness . . .

As the secretary of a regional board points out in a letter on page 1061 this week, no one in close touch with the hospital service and aware of the great needs to be met can be expected to impose a check. Only the Minister can place a limit on the hospitals' expenditure, and there will be constant pressure on him to raise it.

Of all the costly social services of the modern state, a health service is likely to prove the costliest. Far more than education, more even than old age pensions, the treatment of sickness has a popular appeal that is very difficult to resist. It is certainly arguable that fewer man-hours are lost to industry by sickness treated than by sickness untreated, and that a nation made healthier through the resources of a health service will have a greater productive capacity. But this has yet to be proved. All the evidence seems to show that, in spite of the great advances in medicine, the burden of treating sickness increases from year to year. When one illness disappears, there is always another to take its place—science is overcoming many diseases, but it has yet to conquer Disease. Until it has done so, the nation will have to face, so long as the principle of a free health service is maintained, a mounting bill for its maintenance.

NOTES OF THE WEEK

"Honourable Peace" in China?

After three weeks of negotiation with political leaders in Nanking Dr Sun Fo has at last succeeded in forming a Cabinet and has told correspondents that his policy will be to fight on until he can get an "honourable peace." He refused to state his terms for peace, and indeed the basis of negotiation will be determined by the development of the military situation, which changes from day to day. The new Cabinet includes representatives of the Kuomintang "Old Guard," so it appears that the latter are now prepared to bring the civil war to an end by a partition of China or a coalition at the centre or a combination of both. They have to recognise that Manchuria and North China are lost—there are signs that General Fu Tso-yi, who still holds Peiping and Tientsin in isolation from Nanking, is independently making his peace with the Communists—and the only question for them is whether they can hold on to Nanking and South China. As long as they can keep back the Communists from Nanking they have a chance of survival, but if the armies now fighting in defence of the capital are destroyed, it is unlikely that a firm stand could be made anywhere else in China, except in the island of Formosa, where the Government would be already virtually in exile even though still on Chinese soil. The battle for Nanking, therefore, appears to be the decisive action; the Government forces have so far been the losers, but not yet so definitely as to place the capital in Communist hands, and the Government's bargaining hand seems slightly stronger than it was a week ago, even though this may be only a momentary respite.

If the Government can hold Nanking, and if, as is not impossible, the Communists also are feeling the strain of prolonged warfare and are in need of a breathing-space, a peace might be arranged which would leave the Communists in control of the Manchurian and North China provinces, with some representation in the central Government, but not a preponderance. If, on the other hand, Nanking falls and the Kuomintang breaks up into die-hard and compromise factions, as it would then almost certainly do, the Communists would have preponderance in any coalition Government which could be formed and would in particular decide its foreign policy. The Communists would, however, do their best to conceal their overruling power by the temporary appointment of decorative liberals to as many portfolios as possible, in order to obtain American diplomatic recognition. Whether to extend recognition to such a Government would be the crucial question to be decided by President Truman.

* * *

Deadlock in Western Germany

The German constitution-makers at Bonn continue to make heavy weather, but it is arguable how much of the responsibility can be pinned on them. It is true that the division between centralisers and federalists is strong and is crystallised in the party division between Socialists and Christian Democrats. Although on the key question of the financial powers of the future central government, the finance committee has reached agreement and plumped for the vesting of rights of direct taxation in the central authorities, uncertainty hangs over the Commission's powers. Its financial decisions may be overruled later and, for the time being, it is paralysed by a split between those who believe the constitution cannot be formed until the Allies have handed in their Occupation Statute (the Socialists are of this group) and those who argue—surely with more reason—that while the Statute is ephemeral, the constitution is likely to be lasting, and that the important thing is to clarify German views on the more fundamental document.

It is at this point that German efforts have become bedevilled by the Allies' own failure to agree. The split between the "wait and see" school of thought and those who urge the completion of the constitution would certainly be of little importance if the Occupation Statute were about to appear. Unfortunately, there now seems little hope of this, for the deadlock between the three Military Governors is now absolute, the matters at issue have been referred back to the various governments and only a genuine retreat on the side either of the "Anglo-Americans" or the French will make compromise possible.

Significantly, the split between the Allies takes a form similar to the division between the Germans. Under cover of the question of occupation costs, the old issue of centralisation versus federalism has been raised in a new form. The Anglo-American Governors, with an eye on the taxpayer at home, argue that some economic centralisation is necessary, otherwise Germany will never be efficient enough to pay its way. The French have no desire for an efficient Germany and regard a loose federation as a guarantee of weakness. But how can the question of what authority should pay occupation costs be decided until financial powers are vested either in central or regional bodies? A centralised government will pay costs from the centre. In a loose federation, each state will be responsible. In their inability to agree on one or the other, the Military Governors have now adjourned their discussions *sine die*.

If fear of a speedy birth of a western German state caused the Russians to blockade Berlin, that fear appears misplaced. All their policy has done is to provide an excuse for the concentration of large Allied forces in Europe while the German state's travail is indefinitely prolonged. If logic ruled the Russians' policy, they might now reconsider the tactics of blockade.

* * *

Russia Backs Poland

It is perhaps fortunate for the western Powers that Russian policy is calculated to ensure the enmity of Germans, even though it by no means turns them into friends of the West. For the Germans, one question overrides all others—which side will be most likely to return the lost territories east of the Oder-Neisse line? The millions of refugees eating their resentful fellow-countrymen out of house and home constitute by far the most important political factor in Germany today and in the days to come.

For this reason, it is of the utmost importance that the Polish Premier, Cyrankiewicz, speaking at the "merger" congress of the Polish Workers (Communist) Party and the Socialist Party on December 16th, affirmed that the SED, the German Socialist Unity (Communist) Party, was pledged to uphold the Oder-Neisse frontier:

> German partition is becoming a fact. The SED, after ridding itself of its Social-Democrat heritage, has been transformed into a party of the new type. Its object must be to waken the class-consciousness of the German working-class, which was blunted by Nazism. The touchstone of Germany's democratisation must be its attitude to its eastern boundaries. The SED leadership recently put this question very clearly before its members. A campaign has been launched to have this fact recognised and to popularise among the masses the achievements and successes of the Polish people.

The leaders of the SED were present at the Congress and echoed the Polish Premier's statement. One of them, Franz Dahlem, added that "the stronger Poland grows, the more rapid will be the building of a new system in Eastern Germany, and the sooner will the working-class in western Germany be able to profit by the SED's example."

It is evident that Russia has been forced for the time being to sacrifice its chances of winning the Germans in order to secure Polish agreement to collaboration with the Soviet Zone. Russia hopes to weld Poles and Germans into one Communist bloc, just as it once hoped to fuse Jews and Arabs under the banner of allegiance to Moscow. Polish economic aid for the Soviet Zone is even more important than political collaboration, particularly since western German supplies were cut by the counter-blockade imposed by the Anglo-Americans as reprisals for the blockade of Berlin. Poland is now, after the Soviet Union, the eastern Zone's largest trading partner, and is said to be selling the Soviet Germans as much as it did to the whole of Germany before the war.

The political price for this aid is, nevertheless, extremely heavy. If the statements made at the Warsaw Congress are sufficiently publicised in the West, the mistakes and deadlocks in Bonn and Frankfurt will lose much of their danger.

* * *

Cost of Living Debate

Mr Maurice Webb, the chairman of the Parliamentary Labour Party, remains quite impenitent. Raising the cost of living question in the Adjournment Debate, he repeated the arguments with which for the last few weeks he has been bombarding the Government. The high cost of living "threatens the success of the whole Government programme." It is all very well to agree that the national situation demands a certain amount of going without; the essential thing is that this going without shall not be determined by prices, for this the workers will not stand. They will come forward with "an inevitable upsurge of fresh wage demands." This would be inflationary; whereas the grant, to these same groups, of greater purchasing power, whether by giving "more cash to spend" (the distinction between "more cash" and higher wages seems tenuous) or by cutting prices, would, apparently, carry no inflationary danger. On the other hand, they will cheerfully "go without" so long as their abstinence is imposed by ration and quota; so long, that is, as no possibility exists for anyone to go out and by earning a little extra money qualify for a little extra wellbeing. Or so one must infer from certain passages of Mr Webb's speech; though it is hard to believe that anyone could be quite so blind to the lessons of the last three years.

There is a grain, just a grain, of justification for the plea that an inflation dammed up and diverted by controls is better than one which runs its course through higher prices, higher wages and higher prices again. It is easier to deflate when what is deflated is a mass of floating purchasing power, hovering as it were outside the price structure, than when the notoriously rigid and resistant price structure itself has incorporated that purchasing power into its framework. It is easier, when the time comes, to cut a subsidy to match a falling world price than to enforce a corresponding reduction on money wages which have risen to match the unsubsidised cost of living. If controls cost nothing in themselves, if the question of incentives could be neglected, and if, above all, the distorting effect of dammed-up inflation on the distribution of resources could be avoided, Mr Webb's plea for the exclusive use of ration and quota to limit consumption would have some merit. Unfortunately none of these conditions is fulfilled—as Mr Spearman pointed out for the Conservatives, and as Mr Douglas Jay confirmed, though naturally in different terms, from the Treasury bench. Mr Webb admits that mass consumption must be reduced. Reduction is undeniably unpleasant. There is all the more reason for making it as brief and as slight as the national circumstances permit; an aim to which his proposals would probably prove an insuperable obstacle.

* * *

Rent Act Amendments

The Government's Landlord and Tenant (Rent Control) Bill, now published, is something of an omnibus. It groups together a number of miscellaneous provisions affecting houses that are let and it endeavours, a little late in the day, to remedy several of the abuses that have grown up in the last three years. Belated attempts may be praiseworthy, as was the arrival of the man in the vineyard at the eleventh hour, but they are not always rewarded with the full measure of success.

Clauses 1 to 6 of the Bill deal with cases of property let for the first time since the war. Under the existing Rent Acts, the rent at which the property is first let becomes, *ipso facto*, the standard rent and, therefore, the rent that can always be demanded. The Bill provides machinery for setting up tribunals to investigate these rents, to fix new ones, if it considers fit, and to have the judicially determined rent recorded as the standard rent thereafter. It also gives the tribunal power to allow the tenant to set off against future payments of rent some part of any premium he has paid if the tribunal thinks that the rent alone, without premium, provides a fair return to the landlord. Clauses 7 and 8 are intended to reverse an earlier House of Lords decision that where part of a house is let with the use of one room (commonly the kitchen or bathroom) in common with other tenants in the building the Rent Acts do not cover the letting and the tenants are without their protection. Clause 10 gives the tribunals set up under the Furnished Houses (Rent Control) Act, 1946, power to extend the security of tenure they can give a tenant under that Act for periods beyond the three months limit laid down by that Act.

The first set of Clauses is, no doubt, a laudable attempt to secure rough justice for those unfortunate people who have been driven into paying premiums for houses and flats simply because of the present scarcity of houses and flats. It will be anathema to the principles, although not to the pockets, of lawyers, for it overrides existing bargains, tears up existing agreements and so disregards the sanctity of contracts. It may also cause considerable hardship to many landlords, innocent as well as greedy, who have entered into commitments in the belief that contracts for letting houses were legal and therefore sacred. But it may alleviate more hard cases than it creates. The remaining provisions in the Bill are to be commended. They are sensible attempts to deal with real abuses and it is very difficult to see how any of them could cause any injustice to the innocent.

But a point on which the Opposition ought to seize is the fact that the Bill is completely silent on the readjustment of prewar rents to meet postwar conditions. The unfurnished house is about the one form of property left on which no increase on the prewar return is possible. Further, since the sale of the British-owned railways in Argentina, it is about the one form of property left where the law compels the owner to spend money on his property by way of maintenance while denying him any hope of return on the money he lays out. The Government will doubtless say that if the basis of controlled rents were to be increased an inflationary wave of demands for wage increases would immediately follow. Even if that were true (and local authorities may increase their rents, have increased their rents, and still are not dubbed inflationists), where is the justice in expecting the owner of small property to subsidise wages out of his own pocket?

* * *

Frontiers of Legal Aid

The Legal Aid and Advice Bill received a welcome from all parties during its second reading on December 15th, but nevertheless the debate showed up weaknesses in its construction which will be attacked when it comes up in Committee. The chief difficulty of Ministers in defending the details of the Bill is the arbitrary—necessarily arbitrary—line at which the various frontiers to legal aid are drawn. There is no absolute standard of justice which fixes the income limits beyond which assistance may not be given. There is no logical reason why legal aid and advice should be available for cases heard before the courts, but not before tribunals. The frontiers have been drawn where they are considered to be reasonable and practicable in the light of the legal resources available. There are about 2,000 practising barristers and 11,000 practising solicitors. It is no good saddling them with a volume of work with which they will be quite unable to deal. No one has any real idea how much litigation will be encouraged by the new Bill. Until the present scheme is seen in practice it would be unwise to attempt much more. As Sir Hartley Shawcross said, there are something like 100 different kinds of tribunal of a judicial or quasi-judicial nature outside the ordinary legal hierarchy. Members of the legal profession rarely appear at most of them, and the atmosphere is informal. At present it seems wiser to let sleeping dogs lie.

This does not mean that the Bill is perfect in all its parts. Several speakers spoke against the rigidity of incorporating the proposed income limits for assistance in the Bill, and asked for such rules to be made by regulation, subject to affirmative resolution by the House. Although government by regulation has to be guarded against, the delay and difficulty of introducing amending legislation is well instanced by the old arrangements for legal aid. The present income limit for legal aid of £2 a week (extendable in certain circumstances to £4) was fixed in 1914, and has never been changed since, in spite of changes in the cost of living. The new income schedules in the Bill are drafted much more flexibly and with a better relation to family circumstances. Even so, they may easily get out of date, and it would be better to have a less cumbersome method of revision than the necessity of introducing a new Act.

* * *

Back to the Austrian Treaty

The Four Great Powers have virtually agreed to reopen negotiations on a Treaty for Austria, and there is even an atmosphere of subdued optimism in the west over the prospects of securing a settlement for the much-tried and long divided country. The hopefulness springs from a single fact. When talks last broke down—in May this year—one of the principal stumbling blocks appeared to be the question of Jugoslav claims on Austrian territory. Marshal Tito has insisted since the end of the war that parts of Carinthia and Styria shall be transferred to Jugoslav sovereignty, and in all previous negotiations the Russians have supported him. Western observers now believe that the breach between Russia and Jugoslavia will put an end to Russian backing for Marshal Tito's claims, and that as a result a settlement will be reached on the basis of Austria's frontiers in 1939.

There have, however, been so many disappointments and setbacks in Austrian treaty-making in the last three years that it is only reasonable for the time being to be guarded on the hopes of a final agreement. It is not as though the Jugoslav claims were the only outstanding points of difference. In fact, a number of vital economic clauses still had to be agreed when talks were suspended eight months ago. The centre of controversy was naturally Russia's claim to German assets in Austria. The Russians had agreed in earlier talks to accept a lump sum in lieu of the various properties, but in May the figure had still to be settled. The Russians reduced their claim from $200 million to $150 million payable over six years in hard currency. The western Powers proposed instead a figure of $100 million to be paid, partly in cash, partly in goods and partly in Austrian assets abroad over a period of seven years. The gap between the two proposals was not bridged.

Agreement was also still to seek in May on the particular question of Soviet ownership in Austrian oil. On Western reckoning, oil production is the key to Austria's future viability as an independent state. The western Powers have consistently sought to reduce Russia's claim to two-thirds of Austria's present productive capacity in oil. In April, the contending parties moved closer together, Russia moderating its demands on several points and agreeing to a smaller percentage of oil capacity—58 to 60 per cent—and reducing the periods for which its oil leases should run. But specific agreement on the particular plants to be allocated to Russia had not been reached when the talks adjourned.

The gap between the western Powers' concern to see Austria—in large measure a Marshall country—set on its feet and Russia's desire to extract the fullest compensation from the Austrian economy—had narrowed in the spring to a point at which it seemed relatively small. Unfortunately, in some cases the difference of a few per cent appeared to the west to represent the exact balance between viability and insolvency. The issues still outstanding may thus prove more difficult to settle than their apparent magnitude suggests. On the other hand, the western Powers may feel inclined to concede the balance, arguing that ultimately nothing so damages the Austrian economy as endless fourfold occupation.

* * *

Arab Comings and Goings

The Arab League's fate hangs on its forthcoming meeting—for there is no way of escape from one of two perplexing decisions. Shall it go on refusing to admit that, if its members do not forthwith annex what is left of Palestine, the rump will be swallowed by Israel? Or shall it expel its one member who is ready for compromise—King Abdullah of Transjordan? Unimportant though Transjordan is in terms of population, economics and strategy, to do this is to carve a vital organ out of the League's anatomy. Wishfully thinking Arabs are pointing out that Abdullah's defection need not be fatal because, by the terms of the League's charter, "decisions by majority vote shall be obligatory on those who accept them." But this, surely, is a quibble. A League without Transjordan ceases to be a solid object.

The problem is Abdullah's as well as the League's, for his own bargaining power is obviously greater if he speaks as one of seven than if he becomes an outcast. Can he think up terms in which to convey to six head-in-sand colleagues a realisation that unless they accept a line, Israel will continue to spill over into Arab territory? The method that he seems to be planning is to say to them that if they do not compromise, they must fight, and to ask who still wants to do so. Doubtless all will drown this direct question with a rattle of sabres, but none has the capacity to do more than this. The Syrians, driven back over their own frontiers by the Israelis, have had difficulty in persuading anyone to take over their Ministry of Defence; the Egyptians are still in no position to rescue their beleaguered garrisons in the Negeb, and the Iraqis, whose national finances are in a disturbed state, have not even financial inducements to restore morale to their rank and file. Yet, in spite of these stark military facts, it is doubtful whether Abdullah can find the means to compel the League's Council to face reality.

Unfortunately, his moves during the past week have reduced his chances of a reasonable hearing. He has incensed the Egyptians by telegraphing his greetings to the Sudanese Independence Party on the opening day of the Sudan's Legislative Assembly. He has put himself in the wrong by making an appointment which is not in his gift—that of Mufti of Jerusalem. He has "appointed" Sheikh Hussan Meddin Jarallah, formerly Chief Justice of the Palestine Religious Courts, to this office. Few people still hold a brief for the old Mufti, Haj Amin al-Husseini. His one-time political and mediatory gifts seem to have left him, and he has proved, during the last year or so, to be no organiser, no spell-binder and no more than a grey-bearded back number with scarcely the substance to serve the Egyptians and Syrians as a figurehead for their "Gaza Government." Abdullah, by unfrocking him with no conceivable right to do so, will scarcely win him supporters. But he will supply a new handle to everyone who has a grievance against Transjordan. Lastly, Abdullah has vexed his Iraqi cousins by refusing to agree to the proposal of their emissary, Nuri Pasha es-Said, that he should refrain from declaring a bigger kingdom. He has, however, told Nuri that he will do nothing immediately. He has, in fact, made no new moves. So far, therefore, such mistakes as he has made are merely psychological. They are damaging, none the less.

* * *

The Birth of Zoë

"Zoë" is the name which has been given to France's new atomic pile in Fort de Chatillon to the south of Paris, which began to function on December 15th. It is supposed to be devoted entirely to research on the peacetime uses of atomic energy and not to be directed towards the production of atomic weapons. Its birth has nevertheless been a political event, especially as the French High Commissioner for Atomic Energy, Dr Joliot-Curie, is politically a Communist. The French Communist press has hailed the making of the pile as a great victory for France, a kind of declaration of independence from the atomic monopoly of the Anglo-Saxons. It is natural, indeed, that a nation with so great a scientific tradition as the French should wish to pursue atomic research in its own right, and there could not be any reasonable opposition to this from London or Washington, but there is some alarm in the United States at the prospect of a French development in this field with key scientific positions held by Communists. The *New York Herald Tribune* remarks that "it remains a mystery what France will do when it begins to collect information that might be of value to a less peaceful nation" and that "France will soon have at its disposal a good many results that are top secret in the United States and Great Britain."

Russia no doubt is finding out many of these by its own researches, but availability of French results through the French Communist party would probably provide a valuable supplement. Atomic research in France with Communist participation is hardly compatible in the long run with French military commitments in Western or Atlantic Union, and sooner or later it seems that France will have to face the problem of purging Communists from posts affecting national security, as Britain and the United States have already done. That it has not been done already for the experiments with Zoë is probably due in part to the reluctance of the French Government to provoke the Communists by purges more than is absolutely necessary, and partly to the fiction that the pile is only to be used for non-military researches. But it is not a situation which can continue indefinitely without jeopardising the understanding on defence which has been reached by the western democracies.

Retort from the Colonial Office

The first report from the Select Committee on Estimates for the session 1948-49 contains a spirited and effective reply from the Colonial Office to the Select Committee's criticisms last session of its development and welfare policy. It is easy to find faults in that policy; many of the Select Committee's criticisms, discussed in *The Economist* of July 17th (page 98), had been made before it reported. The difficulty is that the right method of planning economic policy—if indeed, the right method has been decided—is quite inapplicable to colonial development. Planning in this country stumbles against the intractable human factor. How much more intractable is this factor in the colonies, with all their suspicion of Britain's good faith, their fear of being exploited and their growing nationalism.

But if the Colonial Office had an effective reply to the Select Committee's preference for a master economic plan drawn up in Whitehall and sent to colonial governments for them to carry out, it does not follow that colonial development can be undertaken regardless of economic planning in this country. In the allocations of supplies—of exports and of steel and capital equipment—there is now far more co-ordination between the colonies and the planning authorities in Whitehall. But this, as the Colonial Office points out, is a matter of tactics rather than strategy. What is missing from its reply to the Select Committee, for the very good reason that it was missing from the committee's report, is any reference to colonial development in relation to the four-year plan drawn up under Marshall Aid. The expansion of colonial resources is taken into account in this plan, but exactly how this expansion fits in with the colonial development already planned and to be planned is not clear. What has also to be revealed is whether there is to be any co-ordination in the planning of colonial resources between the western colonial powers. And can there be any co-ordination that would not offend the susceptibilities of the colonial peoples?

* * *

Musicians and the BBC

The Ministry of Labour's Committee appointed to deal with the dispute between the BBC and the Musicians' Union—a dispute which threatened a musical strike in the course of the summer—has now published its recommendations. Two wage issues were before it—a union claim to increase minimum fees for casual studio broadcasts and another claim to full studio rates for all relays of outside performances. The BBC wished to maintain studio broadcasts at the rates demanded by musicians from outside concert promoters and while refusing to pay full rates for relays offered to increase the musicians' fee from 12s. 6d. to 25s. But the BBC also sought to widen the scope of the Committee's hearings and submitted evidence on the musicians' restrictive practices both in limiting the number of repeated performances and in drastically cutting down the amount of gramophone music to be broadcast in any week.

The Committee's findings must on the whole appear satisfactory to the BBC. It is true that only one award is compulsory and this gives the union the increase in minimum studio rates for which they pressed. A ten shilling rise has been awarded. But on all other points, the Committee's views coincided with those of the BBC. It gives its opinion that 25s. is a reasonable rate for relays and that the interests of the listening public will be better served if the Musicians' Union allows a more liberal use of repeats and increases the number of permitted hours for broadcasting gramophone records from the present 26 hours a week (falling later to 22) to an average of 28 to 35 hours a week together with facilities for regional broadcasting. These are important recommendations and would allow important progress to be made, particularly in the broadcasting of opera, which the ban on relays and the restriction on records at present virtually prevents.

There is, however, a cloud on the brighter musical horizon. Only the wage award is compulsory. All the rest depends upon the good will of the Musicians' Union—and good will or consideration for the public interest has not been conspicuous in the Union in the past. If all save the Committee's compulsory wage award were finally to be disregarded by the musicians, the public would need to find some other way of giving its legitimate demands effective backing.

* * *

A Sky-light for the Civil Service

A rigid pension scheme has been both a curse and a blessing to the civil service. It has prevented the glitter of the outside world from luring many civil servants into more lucrative fields: it has also manacled the misfit to his Whitehall chair and protected the incompetent from being slung out. A change, though a modest one, is going to be made in a new bill which is expected to come up during this session. This will alter the existing pension arrangements and will, amongst other things, permit a civil servant to retire voluntarily at 50 without sacrificing his accrued pension rights, and allow a department to dismiss a man "in the interests of efficiency" and to give him his proportionate pension forthwith. In the case of voluntary retirement he will not be able to draw his pension until the age of 60, except on special compassionate grounds.

This change in policy is important for it will help to rid the civil service of many who are either of no great value to the machine, restless and unsatisfied with their work, or anxious to retire or to try their hand at something else. The pity is that the scheme has not been extended much further down, say to people between 40 and 50, who may be doing just as much harm and feeling just as much frustrated. In such cases there seems no reason why they should not at least be able to withdraw a block sum corresponding to what their own contribution might be, an arrangement which obtains widely elsewhere in industry and commerce.

Two objections exist to such a commonsense proposal. On the one hand the Treasury is desperately anxious lest it lose its best men to other walks of life—a coward's reaction, which could be countered at least in part by paying senior civil servants more in accordance with their responsibilities. The second snag is that civil servants do not openly contribute to their pensions; they are merely paid less because of them. To calculate a block "repayment" of contributions might open up all sorts of horrible questions about pay and contributory pension schemes. Perhaps this is what is now really required? Meanwhile instead of a window to the outside world the civil servants have been given a sky-light, provided at the age of fifty they still have the agility to climb out of it.

* * *

South Africa Faces Austerity

South Africa's steady progress towards insolvency will not be stopped as easily as Mr Havenga, the Minister of Finance, and Dr de Kock, the Governor of the Reserve Bank, hope. Dr de Kock's recent statement on South Africa's economic health is more fully discussed on p. 1075. His economic arguments, however, are based on the assumption that the Government will in fact carry out his very necessary programme of disinflation and austerity. Few assumptions could be less certain. The political balance in South Africa is so fine that it needs only four members to cross over to the Opposition benches to upset the government. The party in power is, therefore, hardly likely to risk introducing an economic policy which few of their supporters will understand and which—if it is firmly applied—many will resent.

Political considerations have nearly always dominated economic policy in South Africa. General Smuts's government, for example, though probably aware of the adverse trend in South Africa's overseas trade, were obviously unwilling to bring in "austerity" measures in an election year. Dr Malan, anxious to allay the suspicions of a largely English-speaking business population, has also put off drastic measures for as long as he could without apparently realising that by so doing he must now make these measures severer still.

But so long as each of the two chief political parties remain so determinedly partisan, there is very little likelihood that any really effective attempt will be made to cure South Africa's economic ills. The prewar abundance of gold and cheap labour has bred an easy-going belief in prosperity which, it seems, only the hard fact of crisis will shake. Nevertheless, the signs of a possible rapprochement between General Smuts and Mr Havenga provide some slight hope for the future. Only a coalition of English-speaking and Afrikaans-speaking parties will have sufficient support from the electorate to carry through the economic reforms which are needed.

"Pollitt, Pollitt, Pollitt"

A prophet is not without honour except in his own country, and we should not grudge our Communists and fellow-travellers the rapturous welcome which awaits them whenever they go to Eastern Europe and which must help to console them for the general failure of their own fellow-countrymen to appreciate their merits. With so little success to record for the British Communist party in years which should have given so many opportunities for revolutionary leadership, Mr Harry Pollitt's heart must have warmed to the organised chanting of "Pollitt, Pollitt, Pollitt" by the delegates assembled in the Bulgarian Communist Congress after he had told them how in Britain under the Labour Government the profits of the capitalists were rising and the living standards of the workers were falling. In his turn Mr Pollitt listened to and applauded the speech of the Bulgarian Prime Minister, Mr Dimitrov, of Reichstag Fire, Comintern and Petkov-killing fame, who contemptuously described Britain as a second-rate power which had only been saved from Fascist conquest by the might of the Soviet Union. What memories indeed must the words of Bulgaria's despot have evoked in the breast of his would-be imitator in the art of dictatorship—memories of the summer and autumn days of 1940 when German bombers over England were driven off by Russian air power gallantly coming to the aid of the anti-Fascist cause and when the defeated and dispirited British people was rallied to resistance against Hitler by the undaunted resolution of the Communists. The British are indeed often forgetful of how the Soviet Union saved them from Fascism eight years ago, but that is due to their being by nature ungrateful and to their not reading the *Daily Worker* as much as they should. It is the task of the Communists to put matters right in the recording of history, and no doubt Mr Pollitt, when he returns from the Communist hate-feast in Sofia filled with fresh malevolence against his own country, will see to it that the Dimitrov version of Britain's war against Nazi Germany is duly propagated.

* * *

London Pride

The loss on active service of London's familiar iron railings did more than anything else—except the blitz—to convert the once orderly metropolis into a vast labyrinth of shabby squares and desecrated parks.

The iron railings will not return. Instead they are being replaced by hedges, but by what kind of hedges? London's hedges are not needed to fence cattle or to break the wind. Their use is mainly aesthetic, to provide a pleasant sense of order and formality without excluding the passer-by. The Ministry of Works have been experimenting with many possible plants including rockspray, rosemary, forsythia, Chinese honeysuckle and seven varieties of berberis. These plants are as delightful as their names, but some of them have already proved to be insufficiently

From *The Economist* of 1848

December 23, 1848

NOTWITHSTANDING the praiseworthy exertions of the peace party, nations have not yet adopted the plan of settling their disputes by an appeal to a congress. . . . We are great believers in progress: we are full of hope for the future, which our successors will enjoy; but the time is not yet come when all mankind may lay down their arms, and when all nations prefer the delights of peace to the savageness of war. . . . After all, too, say what men may about the beauties of moral force, it derives all its effect ultimately from the physical force it can call into operation. . . .

The advocates of the militia contemplate, however, merely training all the people to arms, calling them out to exercise for a month or two every year, placing the firelock in their hands for a few days, and then, piling all the arms in a storehouse, dismiss the people to their customary labour. Of what use could such men be against well-disciplined troops, with their parks of artillery, their well-trained cavalry and habitual, combined action, every man being formed to tread, and work, and fire with another. These gentlemen seem to forget that war is an art, and like other arts, becomes difficult and complicated in the progress of society, so that in the army, as in society, there is a very extensive division of labour. . . . To take the peasant from the plough, the smith from his anvil, and the carpenter from his bench, for a month or six weeks every year, may spoil a tradesman, but will never make a soldier. . . .

We hear a great deal about the expense of a standing army, and we are quite ready to state, that not one sixpence should be expended on it which is not required to make it efficient. . . . Precisely because the military force is an instrument intended for a specific and well-defined purpose, we would have it organised and paid, so as most completely to answer that purpose, and that alone. But all the necessary expense of a standing army must be trifling compared to the loss of skill, the waste of ability, the interruption of peaceful labour and peaceful habits, which must be caused by taking the people from their ordinary pursuits to make soldiers of them.

robust for London conditions. But the Minister is "glad to say that it looks as if yew and holly will stand up to the wear and tear of London park conditions." It is difficult to share his gladness. At this time of the year there is already too much blackened privet and laurel to make one welcome more evergreens. True, the yew is said to be the queen of hedges and gives ample scope for the whimsies of topiary, while holly provides a glossily efficient barrier of prickles. But surely the Minister was not referring to wear and tear by mankind. Londoners do not usually molest flowers, and if there is a tendency for people to burrow through hedges for short cuts, the authorities can easily arrange for enough gaps for those in a hurry, and stiles for the romantic. Wear and tear by London's sulphurous winter is another matter. This might well rule out some of the more delicate plants, but still there should be no need for us to be condemned to miles and miles of uniform privet, holly and yew.

If we cannot have berberis or forsythia or mock orange, perhaps we could take comfort in deciduous plants. Beech makes a good hedge, it changes with each season and in each it is beautiful. *Prunus spinosa* or the common thorn responds cheerfully to the warm days of spring. *Symphoricarpus Racemosus*, or snowberry, carries the pleasures of summer well into the autumn. Where there is room for them to breathe, flowering trees—almond, cherry or laburnum—could be planted to break the monotony of long hedges. But this is known by every gardener, and very much more is known by the experts at Kew. The public's anxiety is not lest the authorities are ignorant, but that they may lack imagination. It would be sad to have to watch millions of dull evergreens maturing slowly over the years through lack of initiative in experimenting now with the scores of varieties of attractive shrubs that flourish in this country.

Dreaming of a Red Christmas?

The following extract is from a broadcast by *Radio Romania* on December 14th:

The Bucharest Police informs those whom it may concern in connection with carol singing at Christmas and the New Year that children under 12 can sing carols without authorisation. Choirs and all other associations which sing carols must obtain authorisation from the Bucharest Police Administrative Department. Applications must state, on the responsibility of the association's head, the name, age and occupation of each member and the part he takes in the choir. All members must carry identity cards. The carrying of firearms is prohibited even if members possess licences to carry arms. It is forbidden to knock at or force closed and locked doors and gates.

Shorter Notes

The three Commandants of the western sectors of Berlin have set up the Kommandatura again. In future the three sectors will be the joint responsibility of the three Powers, and they have underlined their hope that the Russians may join them at some future time. The first act of the new body has been to promise extra electricity for the Christmas season.

*

The death of Sir Aubrey Smith in Hollywood makes one reflect upon the difference between the official and the unofficial projection of a nation upon the minds of the world. Frenchmen are for their neighbours across the channel little men with pointed beards called Alphonse, and the idea of an American cherished in the hearts of Englishmen bears a closer resemblance to Mr Tom Mix or Mr Edward G. Robinson than to Professor Conant or Mr Herbert Agar. Similarly, despite the best efforts of the COI and the British Council, of Professor Laski and Dr Dalton, of innumerable pamphlets on social services or the British Way and Purpose, the name of Sir Aubrey Smith remains and will long remain for American bobby soxers, Malayan natives or Italian peasants the synonym for an Englishman. Foreigners are perhaps more fortunate in the illusion they cherish than the English in the reality they know of themselves.

Letters to the Editor

Economics in Moscow

SIR,—May I draw attention to the treatment that has been meted out by the USSR Academy of Sciences to its leading economist on world economics, Professor E. S. Varga? Sir Robert Robinson, President of the Royal Society, Sir Henry Dale and other scholars and scientists in this country and in the United States have recently called attention to the treatment of certain of Russia's most distinguished geneticists, and the case which I cite is of much interest to economists.

Last year Professor Varga published a book entitled "Changes in the Economy of Capitalism as a Result of the Second World War." This aroused much controversy in the USSR, notably among the academicians, led by Professor K. V. Ostrovityanov, then head of the section of Political Economy of the Institut Ekonomiki. The discussion of academicians was spread over three days. The book has been recalled. The Institute of which Professor Varga was Director has been merged into a new Institute of Economics under Professor Ostrovityanov. Professor Varga's journal, "World Economics and World Politics," has gone and a new journal, "Voprosy Ekonomiki" (Problems of Economics), of which Professor Ostrovityanov is editor-in-chief, is to be the official organ of the Institute of Economics. Professor Varga has been demoted to membership of the editorial board of six.

Professor Varga stated in his book that although it may not be possible to avert an economic crisis in the United States, it is unlikely to occur within the first ten postwar years. In the eyes of the Soviet Government this is an un-Marxist approach, as it does not foreshadow an impending crisis in western capitalist countries, a view dictated not by real economic facts, but by Soviet internal needs. Truly, when politics comes in at the door, economics flies out of the window.—Yours faithfully,

G. FINDLAY SHIRRAS

Electoral Reform

SIR,—Every Englishman considers it absurd that the party having a majority even of only one vote should win all the 47 electoral college seats in the State of New York. But is it really so much less absurd that in Worcester (England) a majority of only four votes out of 31,501 should have given one party the whole of that borough's representation in Parliament? That this representation is one Member and not 47 is a difference of degree but not of kind—the smaller parties are in either case disfranchised.

In America, one person in 20 changing his mind between the Gallup Poll and the actual election completely upset all expectations. In Britain, one person in 20 turning against Labour could reverse the 1945 result. In 1923, each of our three main parties polled, within 1 per cent, the same as in 1922—yet the Conservative Government lost 90 seats and made way for a Labour Government.

The Americans are beginning to see the need for a proportional system "before the day when a President takes office with a minority of the popular vote" (incidentally, this has already occurred once). Let us also be warned in time. If our experience in this island is not sufficiently convincing, let us look at South Africa, where (in spite of electoral pacts which prevented any candidate being elected on a "split vote") a five-to-four vote for Smuts put Malan in power.—Yours faithfully, ENID LAKEMAN

The Proportional Representation Society,
82 Victoria Street, London, S.W.1

Palestine and the Arabs

SIR,—May I, as a Christian Lebanese, disagree with the sweeping statement in *The Economist* of December 11th concerning Lebanese Christian opinion towards the establishment of a Jewish state in Palestine.

I do not deny that certain Christian elements whose political reactions are still conditioned by the sectarian feelings of the past entertain the thoughts that you ascribe to them, but it is entirely untrue and unjust to ascribe this attitude to the whole Christian half of the country, as you do. Many of the Christian leaders, both in the political and the intellectual fields, are as deeply and sincerely imbued with the determination to fight Zionism and prevent the establishment of a Jewish state in Palestine as any Moslem Arab. Let me give you two examples. Mr Camille Chamoun (at one time Lebanese Minister in London), one of the foremost and most influential Maronite leaders in the Lebanon, has, in office and out of office, been one of the staunchest advocates in the whole Arab world of uncompromising resistance to the Zionist menace. While the clearest exposition of the deadly nature of that menace to the Arab world and the most cogent exhortation for an unrelenting prosecution of the struggle against it that has ever been addressed to the Arab world has come recently from the pen of Dr Costi Zurayk, a Greek Orthodox Christian. He is now vice-president of the American University of Beirut, and enjoys a position of great eminence as a leader of thought among Lebanese intellectuals, both Christian and Moslem. The body of Christian Lebanese opinion that follows such leaders is considerable.—Yours faithfully,

EDWARD ATTIYAH

The Arab Office, 92 Eaton Place, London, S.W.1

SIR,—Your contributor, the "Gentile recently in Palestine," has clearly had intimate contact with the "Mind of Israel" at its very centre. I also have enjoyed that privilege, less recently perhaps and less intensively but probably for longer.

The judgments slowly formed during twenty-five years, of which twenty-three were spent in Palestine, give me some solid reason to believe that the Zionists will *not* accord the Arabs "genuinely equal status." Any such equality must be enforced and continued indefinitely by the armed vigour and integrity of the United Nations exhibited more conspicuously than hitherto.

There is, further, no ground upon which to suppose that the Zionists could, even if they would, give the Arabs "better education." The Arab public school system a year ago was superior in quality and good order to the Zionist, though less advertised and though more restricted in extent relatively to population. Palestine is naturally a poor country and the Arabs enjoy no foreign revenues to balance the influx of Zionist money from abroad, none of which will readily be given to restore and extend the Arab school system which the Zionists have recently destroyed.—I am, Sir, yours faithfully,

JEROME FARRELL,
Formerly Director of Education in the Government of Palestine

The Burden of Hospital Treatment

SIR,—I have before me the Note which appeared in *The Economist* dated November 20th concerning "The Burden of Hospital Treatment." I am not an economist, and therefore cannot dispute the question as to whether the country can afford the increasing cost of hospital services. I am, however, in daily contact with the human side of this problem of medical treatment, and since July 5th the endeavour of my Board has been to use the resources available to them in the number of beds and in the available nurses to serve the beds in the most economic manner. In nearly all branches of medicine there are large waiting lists of patients in urgent need of treatment. By judicious re-arrangement of the existing hospitals, and by the close link which we are trying to establish between the former municipal and voluntary hospitals, we are hoping to reduce these waiting lists considerably, but no real solution will be reached until we can again build new hospitals and replace many which are out of date and obsolete.

Whilst I am aware of the justifiable concern of many responsible people at the rise in cost of services such as the hospital service, I feel that your negative answer to the last question in the paragraph would have carried more weight if you had been able to proffer some practical alternative whereby the urgent medical need which undoubtedly exists and is evidenced by our waiting lists could be met without increasing the financial expenditure necessary in providing this treatment. You may find someone brave enough to impose a check amongst those who have no direct connection with illness or the problems of meeting the demand for proper medical attention, but not, I think, from any who have the slightest knowledge of this problem.—Yours faithfully,

E. G. BRAITHWAITE,
Secretary

South West Metropolitan Regional Hospital Board,
11A Portland Place, London, W.1

Central American Explosions

SIR,—Permit me to make two minor corrections to your Note of December 18th. In "Central American Explosions" you state that Calderón Guardia was forcibly removed from office in the revolution of the spring this year. He was President of Costa Rica from 1940-44 but not at the time of the revolution. The President then was Teodoro Picardo Michalstoy and he was the President who was forcibly removed from office. In 1948 Calderón Guardia was a candidate for the elections.

Also the revolution of Tuesday 14th occurred not in Panama but in El Salvador where General Castañeda Castro was overthrown and succeeded by a military junta.—Yours faithfully,

45, *Endeavour Road,*
Cheshunt, Herts.
R. G. HARRIS

Books and Publications

The Fall of the Morgenthau Plan

"On Active Service in Peace and War." By Henry L. Stimson and McG. Bundy. Harper and Brothers. New York. 689 pages. $5.

MR HENRY L. STIMSON, a liberal Republican from New York, served Taft as Secretary of War, Coolidge as Governor-General of the Philippines, and Mr Hoover as Secretary of State. In 1940 he accepted President Roosevelt's appointment as Secretary of War, though his party denounced him. He helped to organise the stupendous military effort of the United States and participated in some of the war's most critical strategic decisions, occasionally clashing with Mr Churchill.

His outstanding contribution to policy was his defeat of Mr Morgenthau. The President had appointed a committee to study the German problem, in which Morgenthau unfolded his Ruhr and Saar plan:

> All industrial plants and equipment not destroyed by military action, shall either be completely dismantled or removed from the area or completely destroyed; all equipment shall be removed from the mines, and the mines shall be completely wrecked.

Stimson's and Hull's opposition made Roosevelt postpone his decision until the Quebec Conference. Mr Morgenthau then managed to persuade the President: he also overcame Mr Churchill's resistance by working, according to Mr Hull, on Lord Cherwell and by suggesting a big loan to Great Britain. Mr Churchill himself drafted the agreement:

> This programme for eliminating the war-making industries in the Ruhr and in the Saar is looking forward to converting Germany into a country primarily agricultural and pastoral in its character.

Mr Morgenthau had already published this document in 1946 and Mr Stimson reproduces it. At the time Mr Stimson insisted that the plan was unworkable, was a breach of the Atlantic Charter and conflicted with American principles. A few days later, Roosevelt telephoned to Stimson, "that he didn't really intend to try to make Germany a purely agricultural country, but said that his underlying motive was the very confidential one, that England was broke." He evidently hoped, that by something like the Morgenthau plan, Britain might inherit Germany's Ruhr business. He clearly did not fear the military substance of Germany's war potential, as much as the shadow of a great depression. When Stimson read out to him (October 3rd) the Quebec memorandum, "he was frankly staggered by this and said he had no idea how he could have initialled this."

This was the end of the Morgenthau plan. Unfortunately the influence of the Morgenthau clique survived in the instructions to the American military government in 1945. Nearly all the difficulties which confront Great Britain and the United States today stem from the plan. One is horrified by the levity with which great problems were handled at Washington, when one hears of the President arguing for the plan and saying "that Germany could live happily and peacefully on soup from soup kitchens." The partial attempt to bring this about has already

cost Great Britain and the United States of America 1,200 million dollars. Robert E. Sherwood's "The White House Papers of Henry Hopkins" is more fascinatingly written; Cordell Hull's Memoirs give one a more detailed view of the activities of the State Department. But Stimson's record, modestly taken down for him by his friend Mr Bundy, has a quality of its own. Only a very honest, very courageous and exceptionally clearsighted man could review the great events, in which he played no inconspicuous part, with such superb detachment.

A Melancholy Betrayal

"The Pattern of Soviet Domination." By Stanislaw Mikolajczyk. Sampson Low. 344 pages. 15s.

Mr Mikolajczyk was premier of Poland's exiled government in the years when his country's fate was the principal cause of dissension between the western allies and the Soviet Union. He then returned home to take part in a government dominated by Soviet-imposed Polish Communists, only to escape again after two years' hopeless struggle to a new exile. As the result of these experiences he possesses a wealth of knowledge of the workings of Soviet policy in eastern Europe. Some of it is in this book.

The section dealing with the war years is disappointing. It can hardly be doubted that regular officers, trained in an army dominated by Pilsudski and his successors, "the colonels' clique," or regular diplomatists appointed by Colonel Beck, held different views on many important points from those of Mikolajczyk. It was commonly believed that most of the real power was held by these men, while the cabinet ministers from the Peasant and Socialist Party were mere figureheads. No light is thrown on this question. Moreover the problem of the eastern frontier is not fairly presented. Mr Mikolajczyk shows that this was the central issue in the Polish-Soviet dispute, and that the two western Powers steadily pressed Poland to accept the Curzon line. He bitterly resented this pressure, but omits to inform his readers that the majority of the population east of the Curzon line was not Polish. Nor does he show any reluctance to accept the western territories, which both ethnically and "historically" were undeniably German.

The second half, describing the situation in Poland in 1945-47, is more useful. Mikolajczyk gives a melancholy catalogue, backed by names, dates and places, of the lies, tricks, provocations and outrages committed by the Communists against his supporters and the people of Poland. A hideous picture emerges of Wanda Wasilewska, Bierut and the rest of the servile Communist gang who in August, 1944, denied that fighting was going on in Warsaw, who decided to abandon inquiries into the Katyn massacre when it looked as if evidence embarrassing to the Soviets would be produced, and who cheerfully accepted the exploitation prices for Polish coal proposed by the Soviet "liberators." The remarkable recovery of Poland's economy has been achieved, he believes, not by but in spite of these people. The reader's curiosity is left unsatisfied on many points. What are the functions of the "secret government" which, he alleges, directs the nominal cabinet? And who is the mysterious Soviet general, Malinov, who is supposed to give the real orders? It is also a pity that there is not more about the inner workings of the Polish Socialist party and the personality of its leader Cyrankiewicz.

In spite of these defects this book is the work not of an academic analyst but of a politician burning with a sense of the injustice done to his country. It is exasperating, but it is also deeply moving. British democrats should read it, and face up to the issues which it raises.

Commonwealth Reflections

"The British Commonwealth of Nations." Sir Ivor Jennings. Hutchinson's University Library. viii and 227 pages. 8s. 6d.

"The Commonwealth and the Nations." Professor Nicholas Mansergh. Royal Institute of International Affairs. 176 pages. 7s. 6d.

The British Commonwealth is only superficially a legal entity and because it is made up of a series of constantly altering political relationships, it can never be the subject of a definitive study. The assessment of its current shape, size and immediate future is a task that must be carried on from decade to decade, or—at present—from year to year. Sir Ivor Jennings and Professor Mansergh approach this task for two different reasons. The former, whose work as a constitutional lawyer and historian has been coupled with the virtual creation of the modern University of Ceylon, is concerned to lay bare for university students the central framework of the Commonwealth, and to explain briefly how its various special phenomena, responsible government, free association, imperial preference and so on, have originated. Professor Mansergh is not concerned in this book with a systematic treatment of the subject since he is at present preparing a successor to Professor Hancock's magnificent *Survey of British Commonwealth Affairs 1918-1936* dealing with the decade from 1939. His present book is rather a series of reflections and subjective impressions which would be inappropriate in a larger work but are nevertheless too valuable to be pigeon-holed. However, both books examine certain common subjects, in particular the retreat from the conception of a Commonwealth foreign policy, and the effect of nationalism upon the future of the Commonwealth in the East. Both books avoid the besetting sin of most literature on the Commonwealth—a complacency which believes that the Statute of Westminster patented an ideal state of bliss and which looks back to the easy days of the past rather than the difficult days of the future.

On the whole Professor Mansergh probes deeper than Sir Ivor Jennings for he is not concerned so much with exposition as with analysis. He is particularly interesting on the question of Eire, its development of the doctrine of External Association with the Commonwealth and the undoubted connection between the views of Eire and India of their possible relationship to the Commonwealth. His sketch of a solution to this problem suffers from being a little over-subtle, for in the last analysis the relation of one country to another must be sufficiently simple for the rest of the world to understand and recognise. Sir Ivor Jennings's book suffers on the other hand by having been written in the first half of 1947, while Professor Mansergh brings events up to the summer of 1948. It is a measure of the unprecedented swiftness of events that the former is already in urgent need of revision, for the rise of the Eastern Dominions, the passing of the British Nationality Act and the repeal of the Irish External Relations Act, have profoundly altered the structure of the Commonwealth.

Shorter Notice

"Estonia." By J. Hampden Jackson. Allen and Unwin. 272 pages with maps and diagrams. 12s. 6d.

"There is nothing left to destroy. Not a cock crows." This report to Peter the Great from the commander of the Russian forces in Estonia over 200 years ago inevitably haunts one's memory when considering the plight of Estonia today and in the past few years. It is the postscript on those years which chiefly distinguishes this second edition of the standard English work on Estonia from the first edition. Estonia is once again in eclipse. It would be plausible to attribute the brilliance of Estonian achievement during the brief period of independence to the contrast between it and the continuation of partial or total eclipse. But it would be untrue. The progress of the new Republic will stand comparison with that of any of its neighbours: Mr Jackson presents an exciting picture of eager social and political emancipation. Later, in the thirties, economic difficulties, it is true, bred an authoritarian regime which the growing seriousness of the international position perpetuated. Yet cultural life still flourished. The standard of living rose steadily. There was every prospect that the antagonisms of political life would be mellowed in the forties. But in 1940, as so often before, Estonia was doomed by its geographical position. Once more it lies under Russian domination. But Estonians, wherever they may be, will not forget the achievements of their short independence. The re-issue of this book should help the world also to remember them.

AMERICAN SURVEY

Escape from Malthus?

(From a Correspondent in California)

THE pessimists who prophesy permanent large-scale starvation in the world, the American neo-Malthusians whose arguments were outlined in *The Economist* of December 18th, in an article called "Malthus Goes West," can find a ray of hope if they go still farther west to the atomic research laboratories in California. Here and elsewhere in the United States, scientists are carrying out experiments which may enable mankind to produce sufficient food for all the peoples of the world for the foreseeable future. In these experiments they are attempting to control photosynthesis, the chemical sleight-of-hand by which nature maintains life on earth. The control of photosynthesis, or its duplication in the laboratory, is perhaps as close to reality as was the release of atomic energy after the discovery of uranium fission in 1939. In that year the atomic bomb was possible in theory, although it was not certain that it was possible in practice. To make the control of photosynthesis a reality will require the same sort of scientific development project, perhaps not on so grandiose a scale, as that required to make an atomic bomb. Ironically, this potential shot-in-the-arm for the human race is the result of knowledge obtained through one of the by-products of making the atomic bomb, radio-active carbon.

Photosynthesis is the process by which nature stores the energy of the sun, in the form of sugars, carbohydrates, proteins and other energy-bearing substances. In photosynthesis, green plants breathe in carbon dioxide from the air, and take in water through the roots. When the sun shines upon a plant, chemical reactions take place, largely through the connecting link of the green plant pigment, chlorophyll. In these reactions the raw materials—carbon dioxide and water and the sun's energy—are transformed into food and fuel. To insure against waste, nature has arranged that when man and animals, furnaces and automobile motors, burn these materials to obtain the stored energy, the carbon dioxide and water are released once again to the atmosphere, replenishing the supplies needed for further photosynthesis. This cycle is the hub of life on earth.

The duplication of this cycle in the laboratory or its control in natural environments has been a scientific Golden Fleece. Such knowledge could be applied in several directions: the production of foods and fuels artificially in the laboratory; the farming of the seas which cover 70 per cent of the world's surface; and the improvement of the photosynthetic process itself, which is only one per cent efficient. The implications of these applications are obvious; for example, a small improvement in the efficiency of photosynthesis would greatly increase the world's food supply. All of these things have been dreamed of by scientists who have despaired of their realisation, because knowledge of the intimate details of photosynthesis seemed to be beyond reach, in spite of a hundred years of research. Its simple raw materials were known and its complex end products, but scientists could only guess at the intermediate processes of conversion.

Radio-active carbon provided the first means of detecting them. Carbon is the most critical element of the raw materials that go into photosynthesis. A radio-active form of this element cannot be distinguished chemically from ordinary carbon and a plant reacts similarly to both. But the course of radio-active carbon can be detected by Geiger counters. The first carbon, which enabled scientists to glimpse the inner secrets of photosynthesis, had a useful radio-active life of only 20 minutes, so that scientists had literally to run from laboratory to laboratory during an experiment. Then carbon 14, which has a radio-active life of 5,000 years, was discovered. It was an ideal tool, but even using the cyclotron, at that time—1939—the most prolific source of neutrons in the world, it was possible to make it only in minute amounts, too small to be of general use in laboratories. When it seemed that nature had frustrated man again, the first atomic pile went into operation in 1942. The pile, much more prolific as a source of neutrons than the cyclotron, produced carbon 14, in quantity. With the end of the war, the United States Atomic Energy Commission began shipments of carbon 14, as well as of other radio-isotopes, to eager scientists all over the United States and photosynthetic projects were started at several universities and technical institutes.

Two scientists, Dr Melvin Calvin and Dr Andrew Benson, are working on photosynthesis in the Radiation Laboratory at the University of California under the auspices of the Atomic Energy Commission. They are using single-celled marine plants, such as algæ, because they are simple to handle in laboratory experiments and can be cultivated easily and quickly, in nutrient solutions in glass flasks. Carbon dioxide is pumped into the flasks, which are mechanically agitated so that there is a maximum exposure to the strong light trained on them. The plants are harvested when needed, then whirled in a centrifuge to obtain a high concentration of plants. Radio-active carbon dioxide is admitted to this concentration and, depending upon the experiment, photosynthesis is allowed to go on either in the dark or under a strong light, for varied lengths of time. After exposure, the plants are killed, the different fractions of organic materials are separated by chemical means, and each fraction is tested for the presence of radio-activity. When this has been done a number of times, the pieces of a jig-saw puzzle become available. For example, if a certain quantity of radio-activity is in a certain position in a certain molecule of a simple sugar after one minute of photosynthesis, this, together with other information available, helps the researchers to trace the course of photosynthetic processes from one step to the next.

Out of such experiments Dr Calvin and his colleagues established a theory to explain the intermediate steps in photosynthesis, which had previously been unknown. Dr Calvin's theory, while it is controversial, is holding up well. The theory is extremely complex but in a general way the routes taken by the raw materials to their destination as energy compounds are now known. Details have still to be filled in and the role of sunlight in photosynthesis has not yet been elucidated. How sunlight is captured, moves the process along from step to step and is finally stored, is now being studied.

*

What is the use of this information? Eventually, when all of the details of the chemical reactions are known, it should be possible to set up industrial factories not unlike many modern chemical plants, to produce by artificial photosynthesis the carbohydrates, sugars, proteins and fuels the world so badly needs. Secondly, it may be possible to tell the farmer how to alter his methods of cultivation in order to double his crops. There is a third possibility which offers almost immediate oppor-

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

tunities. A number of scientists, including Dr Calvin, think that, if a large-scale applied chemical project were undertaken, almost unlimited quantities of foods and fuels could be produced in and near large bodies of either marine or fresh water.

This latter possibility first came up for serious consideration as a result of experiments by Dr Herman A. Spoehr, in the Carnegie Institution's Division of Plant Biology at Stanford University, which have shown that by altering the environment of plants it is possible to order the product of photosynthesis. This work was empirical, that is, it was a trial-by-error technique and did not provide the fundamental information upon which scientists could systematically direct plants to produce compounds to order. But the work with radio-actiye carbon is doing this and it is now theoretically possible to channel the photosynthetic process in a desired direction. Imagine an algæ which produces 50 per cent protein, 20 per cent fat, 15 per cent carbohydrates, and 15 per cent cellulose. On the basis of what radio-active carbon has helped scientists to find out, and after some detailed research on the applied level, it will be possible to direct the raw materials to form whichever end product is wanted.

Several possible methods of making food in this way have been suggested. The Gulf of California offers an environment with plenty of sunshine and protected water: part of it might conceivably be walled off, a few common minerals added to the water as needed and harvesting plants built along the shores. Or water, seeded with algæ, might perhaps be pumped through miles of huge plastic tubes, in which the conditions of atmosphere and mineral content could be easily regulated; there would be harvesting plants for the separation of the food products at various points along the tube.

While these conceptions are both dramatic and fanciful, they may be no more fantastic than the atomic bomb. The atomic bomb was successfully developed, first, because the basic principles were known; and second, because governments were ready to devote the necessary funds and the scientific personnel to the task. It is not likely that the atomic bomb project would have been undertaken had there not been a crisis in human affairs, a threat of defeat and ruin for the western democracies. There may be approaching another crisis in human affairs: permanent large-scale food shortages. Starvation and malnutrition are slow processes, and their threat seems less urgent than sudden death from bombs and bullets. At what point in this crisis the social, economic and political barriers will be breached cannot now be predicted. But scientists are ready with the knowledge needed to enable the waters of the world to come to the rescue of the overburdened land.

American Notes

CIO's Christmas Carol

Twenty inches of snow in Wall Street and record company profits provide a suitable background for the businessman's Christmas celebrations. But a Christmas feast for industry is always liable to interruption from those who stand outside the board rooms, who suspect that Christmas boxes are unfairly distributed, and who insist also that the season of goodwill should not extend to the goodwill in company balance sheets. The Christmas carol is sung by the delegates of organised labour, and more especially, the representatives of the Congress of Industrial Organisations. They believe, with more conviction than their brothers of the American Federation of Labour, that Santa Claus now resides in Washington. This year, as their customary carol reaches its crescendo of Yuletide fervour, with its appropriate blessings for those who feed the poor, the CIO delegates can rest assured that a majority of Congressmen will join their choral insistence on a prosperous New Year.

The 1948 carols are perhaps more impressive than in 1946 and 1947 simply because they are being sung more forcefully, by more voting participants, and because the policemen (in the shape of Congress and the Executive branch) who might be expected to exert a gentle pressure against boisterous behaviour, now tend to regard a Christmas bonus less as a reflection of generosity than as a form of social service.

But that is not quite the whole story of the Christmas carol. The tune may be something less than harmonious, and the clamour may be unduly loud. But the content of the message is clear, and has been composed with care, and with the help and counsel of the most respectable advisers. And the burden of the song is simply this: profits are high, and are increasing, and ought to be diminished. Did not the Council of Economic Advisers declare recently that company profits had reached a gross annual rate of $35 billion, by contrast with an average of less than $5 billion for 1935-39? Did not President Truman himself lead a campaign charge against the "racketeers" of Wall Street? Did not Mr John Snyder, Secretary to the Treasury, in high summer give his blessing to a return of the Excess Profits Tax? Did not at least one influential spokesman for the Federal Reserve Board declare in January that undistributed profits could finance expansion, and that available capital was "too much rather than too little."? There is no lack of material for the composers of Christmas carols with their insistent demand for higher wages, lower profits, and price stability.

Accountants and Minstrels

For their early rounds the CIO minstrels believe, appropriately enough, that the committee rooms of Congress provide the best amplifier. Here—until the new Congress, to which he was not elected, convenes—may be found Mr Harold Knutson, for two years Republican chairman of the House Ways and Means Committee, and now the grudging exponent of a "profits investigation," in striking contrast to his pre-election zeal for tax relief. Here also is the able and influential Senator Flanders, Republican advocate of Government controls. Here may be found a number of economic advisers to join the songs of praise from Democratic Congressmen, who know that the call of the carollers does no more than echo the cry of the voters who brought them home.

Against this background, a special investigating committee under the chairmanship of Senator Flanders is at present preparing a report for the new Congress intended to cover all aspects of the debate on wage rates and profits. The strength of labour's charges is not in dispute. Profits are high by any comparative standard. But may they not be as misleading as they are (superficially) impressive? That is the burden of industry's answer. And to reinforce this argument, industry notes the admission by spokesmen of the Federal Government that company profits are no more substantial today, in relation to national income, than they were in earlier periods of prosperity. Furthermore, as a residual item in national income statistics, do they not exclude the very substantial charges which must be made over and above normal depreciation allowances, if industry is to maintain its real capital intact, in a time of rampant price inflation? And should not these allowances cover stocks, equally with fixed capital?

The economic argument that "replacement reserves" are needed to maintain real capital intact is denied by the Treasury and by the Securities and Exchange Commission in relation to company finance. It has not yet secured the full agreement of the professional accountants. Perhaps industry does not always realise that it is an argument which may prove double-edged if conditions change. But industry, too, has a solid case for submission to Congress. High profits are the consequence, and not the cause, of inflationary movements, although their secondary and cumulative impact may be adverse as the boom is fed by heavy capital expenditure on private account. So far as price reduction is concerned, account must surely be taken of the unprecedentedly high level of business activity, and the strong presumptive evidence that profit margins, as distinct from profit rates on equity capital, are by no means excessive in relation to business risks. And finally, when labour income is running at an annual rate of $137 billion, there is clearly no more than very modest scope for wage advances, with stability of prices, at the present level of company profits.

*

In times of peace, and with a Budget surplus, the unions will make the most of certain other arguments. EPT, for example, is not the automatic feeder of inflation that it was so generally assumed to be during the "deficit financed" era of the war years. And if industry and government are to clash violently—as 1949 may conceivably show—over the distribution of steel and metal products now in such desperately short supply, there is a case for reducing the internal funds on which industry has drawn so heavily for postwar expansion. But an Excess Profits Tax would probably be one of the most capricious and inequitable ways of raising revenues. And, if the postwar boom is now past its peak, the taxation of company profits should be related to the longer-term ambitions of Mr Truman's Administration. Does it wish to stimulate an unprecedentedly high level of private capital expenditure, as the President has suggested before now? Does it seek the redistribution of national income and the "underwriting" of consumer demand, or the stimulation of Federal investment? These are questions not for the minstrel boys of the pressure groups, but for such a responsible body as the Council of Economic Advisers. But the echoes of the CIO chorus will take a long time to die down in Washington.

* * *

Slaughter in the Lobby

There is some force in Mr Roger Slaughter's contention that political reasons explain his recent indictment for failure to register under the Lobbying Act of 1946, since he has a long-standing political feud with Mr Truman, and since much was heard during the election campaign of the matters on which he is alleged to have tried to influence Congress—the International Wheat Agreement, speculation in the commodity markets and the operations of the Commodity Credit Corporation. On the other hand, any resentment which Mr Truman may have felt against Mr Slaughter, when the investigation was opened some months ago, must now have been allayed by the fact that the votes which the Democrats drew so unexpectedly from the rural areas were largely the outcome of the farmers' disquiet at the willingness of the Republican Congress to follow the line supposedly advocated by Mr Slaughter on behalf of certain grain traders. Those grain associations are said to have paid him nearly $55,000 to forward their interests in Washington during the past year.

The first indictment under the 1946 Act, which was brought last March against a building and loan association for failing to register as a group in connection with lobbying activities, was taken as a sign that the Department of Justice intended to interpret strictly the provisions of the Act which require organisations as well as individuals engaged in lobbying to register and file financial statements. It was quickly followed by a rush of registrations from such varied groups as the Association of American Railroads and the Congress of Industrial Organisations, which had been delaying registration until the Act was clarified. They maintained, and still maintain, that lobbying is only a minor part of their work, and that under the Act details of expenditure only need to be filed if lobbying is the principal purpose of an organisation's existence.

The accredited representatives of these groups have, however, been registering details of their work, salaries and expense accounts in increasing numbers ever since the passage of the Act. The lobbyists for about 500 business, labour, religious, veteran and other organisations, together with the "free-lance" lobbyists, number well over a thousand. Some of them draw salaries of $25,000 a year, and are prepared to draft legislation and organise nation-wide "Write your Congressman" campaigns. Others hire themselves out at piecework rates of $10 to $25 a day. The increasing scope of government and the complexity of modern legislation offer them constant new opportunities, and many of the lobbyists give valuable advice and assistance to overworked Congressmen. The Lobbying Act is not intended to curtail their activities, but to ensure that the public knows what those activities are. Mr Slaughter, however, may have found one of the ways in which the Act can be side-stepped: his defence is that he represents the grain associations as a lawyer, not as a lobbyist, and is therefore not required to register. It is not always the full-time professional lobbyist who has the greatest influence on pending legislation; the most effective lobbying is often done behind the scenes by those who have been called the "invisible government." If they are to be forced into the open, the Act will probably have to be strengthened. One of Mr Truman's campaign charges against the Eightieth Congress was that it had been unduly influenced by the pressures of oil, real estate and other special interests, and he has now endorsed the suggestion that the new Congress should undertake a thorough investigation of lobbying.

* * *

Twentieth-Century Defence

In its task of paring, pruning, and simplifying to devise a governmental machine adequate to twentieth-century responsibilities, the Hoover Commission is likely to find its greatest single challenge in the administration of defence. The Services absorb 30 per cent of the national income today, $100 from every citizen compared with $8 in 1938. A defence establishment on a scale hitherto unknown in the United States is responsible, not only for security, but for occupying enemy countries, and operating the airlift, and has a part—perhaps too large a part—to play in foreign policy. The committee whose recommendations to the Commission have just been made public (partly to forestall gossip and leaks) recognises that the present defence establishment, dating only from last year's Unification Act, is tender and comparatively untried. It also appreciates that some of the problems raised—those of the relation between civilian and military authority, of economy *versus* adequate preparedness—admit of no perfect solution. And though extravagance is charged against the Services, it is pointed out that, as over half the cost is incurred for feeding, paying, clothing, and transporting the soldiers, no major economies are possible without reducing the size of the military establishment, a question outside the group's authority.

The committee has no fault to find with the structure laid down by the Unification Act, which is not surprising, as it is headed by Mr Ferdinand Eberstadt, who was one of the chief architects of unification. Nor, in view of Service rivalries, is its prescription of more unity unexpected. More team-work is urged, not only between the Services, but between the military and other planning bodies; better intelligence and more acute evaluation of it are also required. The Committee cites the alarmist reports last spring of one department which might have led to total mobilisation had not the Central Intelligence Agency correctly evalued it in this instance (the sub-acid note is the committee's). (It might also have mentioned another error of intelligence, the "gold-plated" aircraft believed to have been built to Mr Symington's design by the Air Force for Mr Dewey's Presidential flights.)

While rejecting the plea of Mr McCloy (a former Assistant Secretary of War) for a single all-powerful Chief of Staff for all three Services, and that of Mr Patterson, formerly Secretary of War, for an outright merger of the three, the committee proposes to increase the authority of the Secretary of Defence over policy and the military budget at the expense of his three warlords, the Secretaries of the Navy, Army, and Air. Mr Forrestal would have the right to appoint a chairman of the Joint Chiefs of Staff, and a military adviser, while the posts of Assistant Secretaries would be abolished. Merger of the naval air arm with the Air Force was rejected, on the ground that the military future was too uncertain to close down any promising avenue of experiment.

* * *

The Defence Dollar

The committee's sharpest criticism was reserved for Service waste, and accounting procedures characterised, with almost British understatement, as below the standards of an ordinary business firm. The fault is American, rather than exclusively military, "a reflection of America, a great sprawling wasteful land." But with the growth of military commitments and the squandering of resources, it must be replaced by a "consciousness of cost." Service dreams of $30 billion a year must be abandoned; the Army must never again mislay 9,000 tanks at one fell swoop. The "awful cost of reasonable security" demands economy. The fiscal procedures of all three Services are obsolete; no comparison or analysis of costs is possible because of differing budgetary practices.

More urgency is demanded in planning for mobilization, in view of the fact that time to prepare—America's privilege in the last two great wars—may not exist in a third. In particular, the Committee feels that a remedy must be found for the "deplorable" state of the stock-pile, which has suffered from divided authority, limited appropriations, and restrictions on interference with civilian demand. Stock-pile policy should be co-ordinated more effectively with the Economic Co-operation Administration. The need is urged of finding a full-time head for the Munitions Board and of laying down basic policies for the National Security Resources Board. (Mr Steelman, a prominent adviser of the President, recently was appointed to the latter, but this was due, it is thought, as much to the difficulty of finding any alternative as to his own capacity.)

The $600,000 allotted to scientific research also is felt to show few returns. There is no master plan into which the present 18,000 projects are fitted. And finally, it is urged that more attention should be devoted to civil defence, internal security, and psychological warfare.

Voluntary reform has conspicuously accompanied the attack from outside. Mr Forrestal recently announced the creation of a weapons evaluation board, half military, half civilian (but with a military head), which was the subject of an urgent recommendation by the committee; he has also released plans for unifying recruitment procedure and placing the Navy in full charge of military sea transport.

The view of the committee is that the changes should be made

quickly, if at all, and the patient then allowed a long breathing-spell for convalescence. The second operation is necessary, but most important is time to allow the Services to grow together naturally.

* * *

Government by the People

"In Los Angeles," it is said in San Francisco, "they'll sign anything." That is perhaps why it is apparently easier in California than elsewhere for the professional organisers of "popular initiatives" to collect the signatures required before that system can be used to submit constitutional amendments or new laws directly to the voters of a State at a general election. Last month popular initiative was responsible for eight, including all the most important, of the nineteen propositions on which the voters of California had to give their opinion; the others were constitutional amendments already approved by the State legislature. The propositions dealt with liquor control, tax exemption, pensions, regulation of chiropractors, of railroad brakemen and of fishing, housing and the machinery of government. In addition, voters had to make up their minds about bond issues and charter amendments, in connection with their city or county, and had to choose a President and Vice-President, representatives in the national and State legislatures, several judges and possibly candidates for other local offices.

Legislation by popular initiative may be more necessary in California than elsewhere, because the strong body of progressive opinion in the State is reflected only dimly in the State legislature. Under the State's cross-filing system, those seeking election can offer themselves to, and are often selected by, both major parties in the primary elections at which the party candidates are chosen (Governor Warren is the classic example). It is difficult to organise effective opposition to Assemblymen and Senators who have the support of both party machines; they are fairly certain of re-election, and thus the temptation to do nothing and offend no one is very great. Then, too, party discipline in the legislature itself is undermined, and the influence of the lobbyists increased, when so many of the members have no strong political allegiance.

An unsuccessful attempt was made to get a proposition against cross-filing on the ballot in 1946, and this year a constitutional amendment to reapportion the seats in the State Senate was proposed, in the hope that it would improve the representation in the Upper House, more reactionary than the Lower. At present each county, whether city or backwoods, has only one Senator and 12 per cent of the State's population elects a majority of the Senators. The "cow counties" have not been very enlightened in their choice of Senators, and the proposed reallocation would have given more adequate representation to the cities. The trade unions worked hard for this proposition, but the voters, perhaps influenced by its place—13—on the ballot, turned it down.

* * *

The general attitude of the voters on these propositions was negative. Those dealing with technical matters such as the qualifications of voters and the succession to the Governorship were approved, but proposals for increasing the pay of the lawmakers and exempting hide and brand inspectors of the State Department of Agriculture from the civil service system were rejected. This was perhaps due in part to distrust of the legislature, while the rejection of other propositions may have been caused by the natural inclination to say "No" to something that is not understood. Several of the propositions were very complicated; impracticability and lack of clarity are weaknesses which it is hard to avoid in legislation drafted by special interests, however public-spirited, rather than by those who will have the ultimate responsibility for it.

The proposal for a State Housing Agency was the most obvious example of this, and it was rejected in spite of the shortage of low-cost housing in California. An amendment to the State labour code dealing with the number of brakemen on trains was approved, although, or more probably because, it was a declared attack on "feather-bedding" and was opposed by labour for this reason. In fact, the only proposition on which the voters acted liberally—and in this case it was in both senses of the word—was the one which increased the maximum State assistance to old persons from $65 to $75 and for the blind from $80 to $85 a month, and eased the conditions under which such aid is given. The people of California who, contrary to all expectations, gave Mr Truman a mandate to carry out his liberal programme in Washington were surprisingly reluctant to undertake a similar programme when the responsibility rested on their own shoulders.

Shorter Notes

"Now we will have one of the greatest transit unions in America," said Mr Michael Quill, newly re-elected president of the Tranport Workers' Union, after he had used the same masterful tactics which have so often won higher wages for New York's transit workers (and higher fares for New York's travellers) to eliminate Communists and fellow-travellers from a union which had been controlled by its left-wing elements for 14 years. This was the first convention of the union since Mr Quill, formerly known as "Red Mike," realised last March that the Communist taint was becoming increasingly unhealthy. At it he used his left-wing experience to organise a purge, which any Communist might envy, of the majority of the union's officers, many of them his close associates of former days. Mr Quill has not modified his economic views to match his political ones: his 1949 goal for his transport workers is a flat wage of $2 an hour for a 40-hour week.

*

The Supreme Court has ruled, by a majority vote, that the Fair Labour Standards Act, passed in 1938 to cover the United States, its territories and possessions, is applicable to the Bermuda military base, which was not leased from Britain until 1940. Since other laws have been specifically amended by Congress to include leased bases, the Court is being accused of having usurped the authority of Congress by this ruling. More serious is the fact that the decision, which has been protested by all the government agencies concerned, brings the leased bases into the category of possessions of the United States, for the purposes of this Act at least, a move which, as the State Department has pointed out, is not "calculated to improve" American relations with Britain.

*

The total dollar allotments made by the Economic Co-operation Administration to European countries now amount to $4,900,200,000 which, with administrative and other incidental expenses, exhausts the initial appropriation of $5,000,000,000. Loans to the participating countries in the first year amounted to $984,000,000 and the total loan programme will run well above $1,000,000,000, since loan funds also cover guarantees to American investors abroad.

*

New York hotel owners have been ordered by the City Rent Commission to refund at once $600,000 which they collected from permanent residents during October and November to cover rent increases which were tentatively allowed because of recent wage rises. The tentative increases led to an investigation by the Mayor and the resignation of two of the three Commissioners. Their successors have refused to confirm the increases.

*

Far-reaching improvements are made in courts-martial procedure, for the first time in twenty years, under new regulations which come into effect on February 1st as a result of the Selective Service Act of 1948. The most important change is that enlisted men as well as officers will now be able to sit as members of courts-martial boards. A uniform code of justice for all three Services, which will incorporate these and other provisions, is being drafted and will be submitted to the new Congress soon after it convenes. It is hoped that this code will include the more fundamental reforms in the courts-martial system that legal experts find desirable.

*

Mr Lester Cole, one of the ten Hollywood employees who defied the Un-American Activities Committee a year ago and was afterwards suspended, when the film companies announced their policy of not employing Communists, has won his suit against Metro-Goldwyn-Mayer Studios for reinstatement in his job as a screen-writer. The jury refused to accept the studio's view that Mr Cole's conduct in Washington had jeopardised its public relations sufficiently to violate his contract. The studio had made his reinstatement dependent upon public disavowal of membership in the Communist party. This is the first of five similar cases, involving several million dollars in salary claims; the studio is expected to appeal against the decision.

*

Ocean traffic may be declining, but traffic on the Mississippi River is reaching new peaks, and it is possible that the river may regain the importance it had in the days before the railroads. The first ocean-going freighter has just arrived at St Louis from Cuba; it is hoped that this will inaugurate a regular service of ocean-river ships, but there is some doubt whether sufficient cargoes are available in the area, in spite of the industrial expansion which is going on in the Middle West.

THE WORLD OVERSEAS

Obituary of Polish Socialism

(By a Special Correspondent)

AT the joint congress which opened in Warsaw on December 15th, the Socialist (PPS) and Communist (PPR) parties of Poland were formally merged in the "United Workers' Party." With the spontaneous popular enthusiasm customary in sovietised eastern Europe, an assembly of well-selected and long-prepared puppets voted out of existence one of the great historic socialist parties of Europe.

From its foundation by exiles in Paris in 1892 until the restoration of Polish independence in 1918, the Polish Socialists suffered from many different internal quarrels. They were divided by the division of Poland itself between the Russian, Austrian and German empires. Their main strength, however, was in Russian Poland among the big industrial centres (Lodz, Warsaw and Sosnowiec). In these areas socialism remained largely conspiratorial, but in Austrian Galicia, where the political liberties customary in western Europe had spread, the Galician Socialist leaders acquired a taste for parliamentary democracy and, after 1906, were strongly represented in the Reichsrat in Vienna. The socialist organisation in German Poland was nominally separate from, but in fact kept close contact with, their colleagues in the Russian-controlled areas. Polish Socialism in Russia was divided after 1906 into three groups—PPS Revolutionary Fraction, the PPS Left and Social Democracy (SDKPL), led by Rosa Luxemburg. The Revolutionary Fraction demanded complete independence for Poland, and viewed all Russians with suspicion; the PPS Left stood for Polish autonomy within a democratic Russia and close liaison with the Russian workers; SDKPL believed in a completely centralised Russian republic, and also recognised as permanent the annexation of Western and Southern Poland by Germany and Austria. In spite of all these differences, the majority of Polish Socialists desired independence, although they did not believe it could be achieved quickly.

With the collapse of the three empires in 1917-18 and the restoration of Polish independence, these various currents were brought within one state. The Social Democrats had lost their best leaders—Rosa Luxemburg to German Communism and Radek and Dzerzhinski to Russian—but it was still a force. In December, 1918, they and the PPS Left combined to form the Communist Party of Poland. In the workers' councils which were set up during the winter of 1918-19, the Communists were strongly represented. They had a majority in the Dombrowa basin and between a third and a half in Warsaw and Lublin. In the following years they lost ground, partly through government persecution and partly because their association with Russia made them suspect to most Poles, but they still enjoyed support in the industrial centres until the Russian purges of 1937. Then their leaders, living in exile in the Soviet Union, were "unmasked" and "liquidated," and the Polish Communist Party was officially dissolved by the Comintern. It did not reappear until 1942, when it took the title "Polish Workers' Party" (PPR).

All other groups of pre-1914 Polish Socialism were united in a joint congress in Cracow in March, 1919, in a single Polish Socialist Party (PPS), which during the twenty years of Poland's independence was supported by the overwhelming majority of the rapidly increasing industrial working class. In the depression years the workers' movement became very radical, as shown by the wave of strikes, some of the "sitdown" type, in 1935-37. The outlook of most Polish Socialists was probably a good deal more to the Left than that of the PPS official leaders, but leaders and followers alike were determined to defend Poland's independence against any threat from either of its traditional enemies—Germany or Russia.

Poland After Hitler

When Hitler occupied Poland, the Polish Socialist Party (PPS) went underground, and in order for at least a short period to give some protection to its members it changed its name to WRN (the Polish initials of Liberty, Equality and Independence). The WRN was very active in the Resistance, which grew into the Home Army. In its ranks socialist workers fought side by side with Peasant Party men, right wing National Democrats and even former Pilsudskist regular officers. No other socialist organisation existed. Only some months after Hitler invaded Russia did a group appear called the Workers' Polish Socialist Party (RPPS), which did little but print a leaflet or two. About the same time the Communist Party was reconstituted as the PPR and had its own small resistance force, the "People's Army." In the last days of 1943 a body called the National Council of the Homeland (KRN) was created by the RPPS and the PPR, whose respective leaders were then Osobka-Morawski and Bierut. From KRN was formed the "Lublin Committee" which the Red Army set up as a quasi-government when the Germans had retreated beyond the Curzon Line.

When all Poland was clear of Germans, it was to be expected that the Polish Socialist Party would reappear as one of Poland's strongest parties. The Soviet authorities permitted this, but limited their consent by a "black list" of former Socialist leaders who must be excluded from politics. These included not only the exiled Socialists in London, who had enraged Moscow by refusing to accept the Curzon Line, but Puzak, president of the underground parliament of the Resistance, arrested by the Russians with 15 other Resistance leaders as a "diversionist," and other local Socialist leaders who had proved themselves capable organisers of the socialist movement. Cyrankiewicz, little known before 1939, returned from the concentration camp of Oswiecim to become General Secretary of the revived Polish Socialist Party, in which RPPS had already been merged. Though he made occasional tactical retreats, Cyrankiewicz has worked consistently for fusion with the Communist Party.

Fusion by Force

The fusion is the result of three years of pressure, purges and political pacts, which have methodically removed all power and will of the Polish Socialists to resist. The Communists from the beginning controlled the police and the ministries of Industry and Regained Territories (eastern Germany). The first enabled them to arrest anti-Communist Socialists, the second and third to put pressure on workers in the factories and to offer attractive jobs to converts. Purges continued throughout the period: it is worth mentioning those of November, 1946, June, 1947, and March, 1948, the latter including the removal of the entire Socialist executive committee in Poland's largest industrial city, Lodz. During the summer, purges and arrests further increased, and in September even such formerly pro-Communist figures as Szwalbe, Rusinek and Osobka-Morawski resigned from the central committee. It is worth recalling that during the summer a parallel purge took place in the Polish Communists (PPR) of followers of the too nationalistic Gomulka. There were three main stages towards fusion. In November, 1946, a political alliance was made, with special reference to the general elections of January, 1947, but with an undertaking by both parties to respect the independence of each other's organisations. In December, 1947, the Polish Socialist congress at Wroclaw (Breslau) accepted fusion as the goal, but Cyrankiewicz stressed that the time had not yet come. In March, 1948, after the Communist *coup d'etat* in Czechoslovakia and the purge of Socialists in Hungary, Cyrankiewicz suddenly informed the Warsaw committee of the Polish Socialist Party that fusion had been decided, and the party's executive committee was then summoned to ratify the decision.

This brief account should have made clear that there have always been trends in the Polish Socialist movement—and at certain periods very strong trends—in favour of an extreme Left policy and in favour of close co-operation with the Russian workers' movement. It is also true that Polish workers, like those of other countries, have always desired unity of their class. Since 1945, moreover, a social revolution has taken place in Poland—

imposed from above yet no less radical for that—and the workers are now privileged at least in relation to other classes. All these facts are stressed by the Communists to justify fusion and to win workers' support for the new regime.

Against them must be set the Polish workers' experience of the methods used—police terror far more ruthless than those of the Tsars or of Pilsudski and more dangerously efficient than that of Hitler; a totalitarian propaganda machine that constantly repeats the same Moscow-made slogans oversimplifying or perverting the teaching of the masters of Socialism; the system of "socialist competition" and the Pstrowski (Polish Stahanov) movement which exploit labour as prewar capitalists would not have dared; ruthless suppression of strikes (as in Lodz in 1947). Above all, they are convinced, and rightly, that Poland's independence is gone and that its rulers are once more puppets of Russia.

Soviet spokesmen denounce the Russian centralist views of Rosa Luxemburg of forty years ago, and claim that the USSR stands for equality of all nations. But the Soviets destroy national independence in the name of independence, just as they destroy democracy in the name of democracy. This is not a fusion of two Polish parties for the sake of workers' unity, but the conquest of a great Polish party by a power clique of Russian puppets. And the failure of Polish Socialism to resist the process is due far less to the divisions within its own ranks than to the overwhelming force exerted on it from outside. The Polish worker, with his sixty-year tradition of struggle for both social justice and independence, knows this. If the present regime has a generation of peace, its totalitarian police and school system may perhaps destroy the old beliefs. But for many years yet they will survive in the minds of the great majority of members of the new united party, be they former Socialists or Communists. There are also circumstances—a war, a Russian agreement with Germany, the threat of a new partition—in which this fact might be of more than academic importance. This also the Polish worker knows, and the Polish Communist leaders know it too.

Russia's Economic Revival—III

[BY A SPECIAL CORRESPONDENT]

EVER since the beginning of its planned economy Russia has had to struggle against the limitations imposed on its industrialisation by the inadequate development of its agriculture. This may sound surprising in view of the fact that Russia has been the major agricultural power in the world. It is nevertheless true. Old Russia could well be one of the great exporters of agricultural produce, because there was no need for its farms to support a vast urban population and because the peasantry consumed little. But within the last decade before the second world war Russia's urban population increased by 25 to 30 million people. An ever growing section of the rural population, hitherto self-supporting but now engaged in the exclusive production of industrial plants, added to the expanded domestic demand for food. The mass of the food-producing peasantry was undoubtedly consuming more than it had done before. And so this cumulatively growing demand tended to outstrip agricultural yields. This situation has continued after the war and, because of the losses sustained in agriculture, it has become aggravated.

In his last speech on the anniversary of the revolution Mr Molotov stated, with that studious lack of precision that belongs to the style of official pronouncements on economic matters, that "this year the gross grain harvest has already reached the level of the prewar year of 1940." Almost in the same breath he added that "the grain yield this year exceeded that of the prewar year 1940." The grain crop for 1940 was 118 million tons. This was the record harvest in the whole of Russia's agricultural history. Even if allowance is made for propagandist exaggeration in Mr Molotov's anniversary statement and if it is assumed that this year's crop has only approached the prewar peak, this would still mark an astonishing recovery especially since, as Mr Molotov said, "the crop area has not yet attained the prewar level, and the heavy loss of tractors and agricultural machines sustained in the period of enemy occupation has not yet been repaired."

The grain harvest in the years of the war was as low as 50-70 million tons, and it was only in 1944, when most of the western provinces had been recaptured from the Germans, that it actually reached 70 million tons. In 1946, the year of the disastrous drought, the grain crop for the whole of the country was between 60-70 million tons. In 1947 it was about 100 million tons. (These are not official figures, but estimates based on indications in Russian economic periodicals.)

This year's bumper harvest may be explained by a combination of causes. The great droughts in the steppes are usually followed by compensatory spells of high soil-fertility. This is the normal pattern of the climatic cycle. The re-equipment of agriculture with new machinery and fertilisers has made considerable progress. Furthermore, the new system of incentive wages in farming, which was introduced in the beginning of 1947 and under which wages were fixed in proportion not only to the work performed but also to the yield achieved, has apparently resulted in higher productivity.

Yet, in spite of all this, the agricultural output is still inadequate in relation to needs. For one thing the recovery in grain output has apparently not been matched by anything similar in cattle and dairy farming or in the cultivation of industrial crops except sugar beet. The unsatisfactory condition of cattle farming is strikingly illustrated by the following table:—

(In Millions)

	Horses	Horned Cattle	Sheep and Goats	Pigs
1929	34·6	67·1	147·0	20·4
1938	17·5	63·2	102·5	30·6
1943	8·8	31·0	61·0	7·6
1945	10·5	47·0	69·4	10·4
1950 (targets)	15·3	65·3	121·5	31·2

This decline in livestock—the result of two great slaughters, the first provoked by collectivisation and the other caused by the war—has made farming almost completely dependent for its traction power on the state-owned Machine Tractor Stations. Before collectivisation, mechanical traction amounted to only 4 per cent of the total traction power in Russian agriculture, but it increased to 70 per cent just before the last war. Animal traction power declined from 96 to 30 per cent.

But more important than the decline in livestock has been the fact that even the record grain harvest of 1940 (or of 1948) was only 50 per cent or so above Russia's crops before the revolution. Thus the rate of expansion in Russian farming has actually been inadequate even in relation to the growth of the population at large, regardless of urbanisation and industrialisation. It was only in the middle and late thirties that collectivisation was consolidated and that the basic technical improvements in farming were actually carried out. It was also in those years that the grain yield increased by 50 per cent. This was in the nature of an advanced dividend that the nation received from its heavy investments in agriculture. The main dividends were expected to come in the forties. But the second half of the forties has been taken up by an effort designed to make good the devastation suffered in the first half; the great expectations of a radical advance have been deferred until the fifties.

Here, as in some other fields, recently published information indicates by what narrow margin Russia escaped defeat in the last war. Without the relatively modest advance of the late thirties, its agricultural resources would probably not have been enough to carry it through the war. It was mainly from the increased harvests of the prewar years that the emergency food stocks were built up. About one third of the 1940 crop (that is, nearly 40 million tons of grain) was collected by the Government either by way of taxation or through purchases. This compares with government stocks for feeding the towns of 10-15 million tons before collectivisation. In the years of the war, an average of only 17 million tons was annually transferred from the farms into government channels. The total amount of grain collected by government agencies from the farmers throughout the war was 68 million tons which—as Mr Voznesensky points out—is more than three times as much as the Tsarist government had collected in the first world war. But since the non-food producing population had also increased at least three times, the actual achievement of the Soviet government was, in relation to its increased needs, not over-impressive.

One of the reasons of the collapse of Tsardom in the first world war was that it had not been able to guarantee food supplies for the urban population. The food resources which Stalin's government had at its disposal were not larger proportionately, but they were more efficiently distributed, and the much higher discipline of the totalitarian state did not allow starvation in the towns to become politically dangerous. The housewife did not this time leave the bread queue to join in revolutionary demonstrations.

Development of the Steppes

The experience of the war alone would have been enough to prompt the Soviet government to make a determined effort now to stimulate the development of agriculture as rapidly as possible. The disastrous drought of 1946 was an additional warning. And even this year's large harvest could have been larger still had it not been for the new drought on the Volga. About one third of all collective farms has been situated in the steppe area where they are affected by periodical droughts and soil erosion. This explains the great importance which the Soviet government attaches to the recently launched long-term scheme for the irrigation and afforestation of the steppes, where they intend to plant some 15 million acres of forest between 1950 and 1960-65.

The steady shift of the centres of Russian industry to the Urals and beyond has, of course, created the gravest problem of all. For it is not enough that the overall food production should increase; it is equally important that it should increase near the new industrial centres. But here agricultural policy must wrestle with nature itself. How far to the north and to the east, how far into the frosty and snowy wastes of Siberia can the cultivation of wheat and other grain be carried? Up to a point the whole future of Russia's internal colonisation depends on this. It is a political as well as an economic issue of the greatest moment. The colonising experience of no other nation offers any satisfactory parallel to the present Russian experiment, for no other nation has attempted colonisation under comparable climatic handicaps.

It is in this context that the practical, political and economic, as distinct from scientific, significance of the present Russian dispute over biological doctrines should be viewed. The spectacle of the Politbureau excommunicating a biological doctrine and dismissing its expounders from academic posts and possibly persecuting them in other ways is, of course, as bizarre and repulsive as any such revival of the practices of the Holy Inquisition can possibly be. But it would be a mistake to assume that Stalin and his associates have been indulging in ideological scholasticism and heresy hunting for its own sake. A practical national interest of the first magnitude has been at stake.

Isle of Refuge?

[BY A SPECIAL CORRESPONDENT]

FOR some time there has been talk of President Chiang Kai-shek and his Government withdrawing to the island of Formosa if they are unable to continue resistance to the Communists in continental China. Steps indeed appear to have been taken to prepare Formosa as a base, and high government officials are reported to have been sending their families there. There is precedent in Chinese history for a last stand in Formosa, for, when the Manchus overran China in the seventeenth century, the supporters of the defeated Ming dynasty held out in Formosa for two decades after the mainland had fallen to the conquerors from the north. The precedent is not altogether a reassuring one, for the Manchus got Formosa in the end, but then the defenders had to rely entirely on their own local resources and could not expect aid from across the ocean.

The hope of preserving an anti-Communist regime in Formosa, even after a military collapse on the mainland, is, of course, based on the fact that Formosa is an island, and cannot be invaded without shipping and naval cover. It is assumed that either the Chinese navy, such as it is, will remain loyal to the Government, or else that the American navy, on account of the strategic importance of Formosa to the United States, would provide protection and bar a Communist invasion; if neither of these conditions were to be fulfilled, Formosa would be no easier to defend than any other part of China. That Formosa is of great interest to the United States Navy Department is apparent from its geographical position in the island chain fringing Asia, from Japan to the Philippines; moreover, it is already well provided with airfields which were constructed for its defence by the Japanese and the neighbouring harbour of Makung in the Pescadores islands was formerly one of the most important Japanese naval bases, their farthest south outpost towards the Philippines. If the United States were to continue to recognize a Chinese government in Formosa as legal in spite of a Communist occupation of Nanking, it would be in order to support it with naval assistance and thus keep the island from falling into the hands of an anti-American power. If, on the other hand, Washington were to decide to recognise a Communist-dominated coalition government in Nanking any separate regime in Formosa would be, in international law, a rebel authority and the Americans would be precluded from supporting it; the Communists then might get hold of Formosa and if China were to make an alliance with Russia, it would be available as an advance base for Soviet air power in time of war.

Apart from the question of naval protection, there would be the problem of economic viability for a refugee government in Formosa. In this respect the situation would be more promising, even without American aid or the bullion and American dollar reserves which the Government woud presumably be able to bring with it from the evacuation of Nanking and Shanghai. In spite of initial neglect and mismanagement after its restoration to China in 1945, it is today one of China's principal assets for foreign trade. It is not particularly well endowed with natural resources, but both its industrial and its agricultural potentialities had been efficiently exploited by the Japanese. The value of its exports to foreign countries is today approximately

one tenth of the value of all China's exports, and their volume is exceeded only by the exports being shipped out of Shanghai. The value varies from month to month, depending chiefly on the amount of sugar exported; but the total figure for this year is expected to exceed US$21 million. The island's usefulness to China may be gauged by comparing this last figure with Formosa's allocations of foreign exchange, which for the first two quarters of this year amounted to US$2,177,800 and US$1,957,800 respectively. Trade with the mainland for the first six months of this year showed an excess of exports over imports of Taiwan $13.5 million.

In terms of value, more than three-quarters of Formosa's exports to foreign countries consists of sugar, the next most important exports being tea, cement, pineapples and alcohol (a by-product of sugar). Under the Japanese there were 42 sugar mills producing, at their peak, 1,400,000 tons of sugar a year. Only eight mills were discovered intact at the end of the war, the rest having been damaged in bombing raids or allowed to fall into disrepair through neglect. Moreover, the production of sugarcane had dropped sharply, chiefly through lack of fertilisers. Only 30,000 tons of sugar were produced in 1946 and 100,000 tons in 1947. The target for this year is 268,000 tons and for 1950 800,000 tons.

Prospects for Rice

Although it does not figure in the current list of exports the next most important crop in Formosa is rice. The Japanese developed rice cultivation intensively, through irrigation and the use of fertilisers, as part of their campaign to make the Japanese empire self-sufficient in food. In the peak year before the war (1938) Formosa produced 48,711,452 bushels of rice, of which nearly half was exported to Japan. Nearly all cultivable land was under cultivation but the Japanese hoped to be able to increase production still further by more scientific methods. Although much higher than in most parts of China the Formosan crop yields were well below those in Japan. Production for 1946 and 1947 totalled 30,977,814 bushels and 38,930,032 bushels respectively, and the estimate for this year is 42,878,000 bushels. Little has been exported legitimately but there has been a considerable amount of smuggling across to the mainland.

In raising the production of sugar-cane and rice the chief limiting factor in both cases is the shortage of fertiliser. In 1938 Formosa used 650,675 tons of commercial fertiliser, including 217,300 tons of soya-bean cake. Last year the authorities were able to obtain only 80,000 tons of imported chemical fertiliser, 40,000 tons of bean cake and 20,000 tons of locally manufactured fertiliser. Up to the end of August this year only 44,000 tons of chemical fertiliser had been imported. Formosa's economy was thoroughly integrated with Japan's. Although backward economically compared with prewar Japan, Formosa is advanced both agriculturally and industrially compared with China. This shortage of fertiliser illustrates clearly the inevitable dislocation which occurs when an area is torn from one economic system, of which it forms an integral part, and attached to another. It is reliably reported that Formosa's fertiliser requirements are henceforth going to be covered by the American aid programme.

Most of the big Japanese industrial installations are now owned jointly by the Provincial Government and the National Resources Commission of the central government, being operated by the latter. The managements are being assisted by some American advisers and, especially in the sugar field, by some Japanese experts. (The only other Japanese left on the island, apart from some Japanese wives of Formosan men, are about 30 Japanese professors and lecturers at the university in Taipeh.) Three enterprises are owned and operated by the National Resources Commission alone:—the oil refineries at Kaohsiung which fuelled the Japanese navy during the war and were badly damaged by American bombers, the gold and copper mines near Keelung (currently producing only 1,500 ozs. of gold and 100 tons of copper monthly), and the aluminium works at Kaohsiung. This aluminium plant, the most elaborate single industrial installation on the island, was planned to produce 20,000 tons of unfinished aluminium ingots a year, but under the Japanese it never got beyond the stage of producing 12,000 tons. It was severely damaged by American bombing raids. Rehabilitation is still in progress and it is currently producing about 3,000 tons a year. One of the main limiting factors is shortage of electric power. The Japanese estimated that they required 42,000 Kws. to produce 12,000 tons and 60,000 Kws. to produce 20,000 tons. At present only 16,000 Kws. are available.

The Plan Examined

FOR more than a month past, the main outlines of Britain's four-year plan have been familiar. They were discussed in two articles in *The Economist* of November 27th. This week the British plan submitted to the Organisation for European Economic Co-operation on October 1st has been officially published. (Cmd 7572). It is a document which lays bare the economic anatomy of Britain for the next four years. The patient puts a good—indeed an optimistic—face on his condition, and looks forward to getting about unassisted by 1952-53. Many of the doctors are less certain of his vitality, and there are one or two surgeons who would like to make cuts to prevent him from trying to do too much. If the plan is optimistic, it is not because it exaggerates what Britain needs to do; it is rather because even the achievement of the tentative degree of independence postulated in it depends upon the fulfilment of so many favourable assumptions that it remains a mere hope, and cannot at this stage begin to enter the realm of probability. The critical margin between undue despair and over-optimism arises from the very nature of economic planning in Britain—"an economy" (as the preamble to the document emphasises) "heavily dependent upon international trade . . . a democratic nation with a high degree of individual liberty" whose economic rulers are aware of no more than the very general trends of future developments.

Thus the plan is contingent, provisional, open to quite radical adjustment, and plausibly illustrated by the best guesses that can be made at the figures as the planners would like to see them four years hence. If the plan is regarded as a piece of necessarily speculative supporting evidence about the broad character of economic policy in Britain during the next four years, rather than a rigid programme which must be persistently adhered to, no great harm need be done. But among the many limitations to this notion of planning—or half planning—one of the biggest is that the basic economic intentions behind the plan, and indeed many of the particular statements and figures, have become a matter of acute controversy within OEEC. The primary task in 1949 will be to reconcile the differences between the nineteen plans, and to weld them into some sort of integrated shape, so that co-operation and recovery in Western Europe stand some chance of becoming realities.

It is for this reason that a sober assessment of the assumptions made in the plan, and of the statements of aims and possibilities contained in its pages is needed. Broadly, the programme seeks to expand the output of industry, mining and agriculture by about one-third, compared with the prewar level and, despite a static or slightly reduced labour force, to increase the output of manufacturing industries by one-quarter compared with 1947 and by two-fifths compared with 1938. Expanding output should enable exports to be increased by nearly two-fifths above the 1947 level, while the supply of capital equipment to home industry should increase by about 15 per cent compared with 1947. If these assumptions turn out to be right, the deficit on the dollar account should be reduced to manageable dimensions and a total surplus of £100 million will be earned in 1952-53. The programme also suggests a fairly cheerful conclusion about standards of consumption, which the Chancellor of the Exchequer has lately been at some pains to discount:

> A growth of output and trade of this magnitude . . . will permit a distinct increase in home consumption per head not only beyond the somewhat meagre standards of 1947 but, in many respects, beyond prewar levels. The supply of manufactured goods for the consumer should rise 15-20 per cent above the 1947 level, with clothing and household goods somewhat above the prewar level. There should be sufficient supplies of the chief energy-producing foods and notable increases in the 1947 level of consumption per head of meat, eggs, oils and fats. The consumption of food as a whole would approach the prewar volume and the more equal distribution of the national income which has been secured in recent years would imply that the standard of food consumption of a large part of the population should be markedly better than before the war.

Sir Stafford Cripps this week has pointed out that the standard of living in 1952-53 is not something which can be determined four years in advance. Obviously, an improvement of the order of 15 to 20 per cent—whatever that may mean—is out of the question during the next four years. But the observations quoted above carry the implication that, on the best assumptions, the improvement might exceed the 5 per cent which official sources were suggesting a month ago.

This question of consumption standards is material to the whole conception of the plan. The gap between Britain's payments and receipts will in any case have to be closed without external assistance by 1953. The standard of living at which the balance is struck is for the British people and their leaders to choose for themselves, within the limits set by the economic circumstances of the country and the world outside. The limits assumed in the plan are not necessarily those which will govern the outcome of this decision. In the first place, OEEC instructed each of the nineteen countries to assume in its planning that the terms of trade—that is, the relation between import and export prices—would continue as at mid-1948. Some assumption was necessary for consistent forecasting, and against the background of history—apart from the years of world agricultural depression in the thirties—the assumption made is not unreasonable; it is at least better to proceed on the basis that there will be no gratuitous relief in the relative cost of British imports than to assume a large relative fall, which would incidentally affect the attainment of the ambitions for British exports. Secondly, each country was instructed to aim at balancing its overseas payments with its total receipts, and not to count on earning dollars from any of the other participants. Beyond these instructions, the plan is founded on the continuation of certain general policies of the Government—economic education and joint discussion between Government, management and labour; a fiscal policy designed to stem inflation and to finance the investment programme; stabilising of personal incomes; measures for the redeployment of labour; the encouragement of increased productivity; and the use of controls for "fair shares" and assistance to the export drive.

Targets for Industry

So much for the broader background. The next stage is to examine the major components of the plan in some detail. *Agriculture*, more carefully cossetted by this Government than by any of its predecessors, is once again exhorted to fulfil the

plan laid down in 1947, and to produce by 1952 the highest output ever known. The hopeful character of this expansion is obvious from the following table:—

'000 Metric Tons

	1934-38 Average	1947-48 Actual	1948-49 Programme	1952-53 Programme
Bread grains	1,751	1,716	2,284	2,764
Coarse grains	2,876	4,585	5,277	5,644
Meat and bacon	1,485	885	958	1,454
Milk and milk products†	7,305*	7,794	8,039	8,974
Potatoes	4,051*	7,893	10,100	7,750
Sugar beet (roots)	2,785*	2,932	3,650	3,650

* 1936-39. † In terms of liquid milk.

It assumes an increase in the acreage under corn from 6,052,000 acres in 1948-49 to 6,700,000 acres in 1952-53, and in linseed (that bane of all growers this year) from a mere 11,000 acres in 1946-47 to no less than 400,000 acres in 1952-53. To set the acreage of wheat in four years' time at 2,750,000 acres is, as the plan admits, "the highest that can be maintained as a permanent feature of British farming without an acute distortion of the general farming pattern and a loss of soil fertility." The revolution in farming practice which such figures imply—it is to be coupled with a considerable and welcome increase in livestock and dairy production—is likely to require something more than the provision of a favourable economic and technical environment for British farming. And even if the programme is satisfied, Britain will still draw half its food from abroad.

For *coal*, the Government has based its plans on the achievement of an annual increase of 5 per cent in productivity per man-year "a rate substantially higher than has ever been sustained for a long period by any large section of industry." It may not be impossible; but it will certainly require a tremendous effort. The aim is to meet the requirements of this country for coal and coke "at the lowest possible cost" and to ensure also that Europe's needs for solid fuel are fully met from European (largely British) supplies. But by 1952-53, it might well be that the ambition in the plan to supply 40 million metric tons of coal exports and bunkers from this country will be challenged by other suppliers. Although the National Coal Board puts its capital investment programme for the next four years as high as £150 million, it is obvious that this will cover only the preliminary stages of a longer-term programme to improve underground haulage and surface cleaning plant. Its contribution towards reduced costs and improved quality ought not to be negligible, but clearly the success of the coal mining target depends on increased physical effort, a great reduction in absenteeism, and the end of the Grimethorpe spirit.

Much is expected of the *oil* industry. It is to play a major part in converting the "invisible" account into a big earner. Seven new refineries at home and a doubling of crude oil output compared with the 1947 total of 54 million tons (including the Royal Dutch-Shell group as a British company under this heading), together with heavy capital investment in pipelines and tankers—these are familiar objectives. But in the four years 1949 to 1952, these programmes will require 3,500,000 tons of steel. The plan drops the plainest of hints that "the carrying out of the full programme in good time and the meeting of this large demand for steel will require the co-operation of other participating countries, who will so largely benefit from it." This is a good example of planning in a vacuum, for it happens that some of the other participating countries themselves have ambitious programmes for oil development and refining.

"The *steel* industry is now operating at full stretch." Output at the rate of 15¼ million ingot tons a year, which has recently been maintained, is not enough. And a review of the probable demand for steel in the 'fifties (it would be interesting to know on what assumption about prices and other factors this review was based) "indicates a total requirement for home and export in the region of 18¼ million ingot tons a year." The steel industry's plan (now estimated to cost £250 million) aims at 17 million ingot tons by 1952-53. The Government's plan assumes, without proof, that the shortage of imported semi-finished steel will prove persistent. The point is illustrated in the table below:

ACTUAL WEIGHT
'000 Metric Tons

	1935-38 Average	1947 Actual	1948-49 Programme	1952-53 Programme
Production of crude steel	11,437	12,684	14,987	17,929
Imports—crude and semi-finished steel	487	295	373	333
" finished steel	435	105	544	317
Exports—crude and semi-finished steel	22	4	6	...
" finished steel	1,411	996	1,185	1,580
Consumption of finished steel	7,444	9,630	11,032	11,860

In steel, perhaps more than in any other industry, there is an opportunity for effective European co-operation—in harmonising development programmes, in the provision of raw materials, and in the supply of steel for processing and finishing. It was not to be expected that the British plan, which was submitted with the need for such co-operation in mind, should have explored these possibilities. But it does well to recognise that British policy for the expansion of the steel industry will be reconsidered in the light of the long-term programmes submitted by other countries.

The *engineering* industries were set the task of exporting by the end of 1948 230 per cent of the volume of their exports in 1938. By 1952, production in mechanical and electrical engineering is expected to rise to about 170 per cent of the 1938 level, in vehicles to 135 per cent, and in tools and implements to 160 per cent. The aim is to export "not less than" 230 per cent of the 1938 volume in 1952, which seems, indirectly, to imply that no major expansion in exports is looked for. At any rate, the supply of machinery for home investment in 1952 is expected to increase to 40 per cent above the 1938 level (in 1947, it was 20 per cent above) and the main stress so far as exports are concerned is put on agricultural tractors, for which home demand will presently become stabilised for replacement, leaving most of the rapid increase in production for export.

The programme for *chemicals* combines two objects. One is to replace supplies of organic chemicals now drawn from dollar sources at a cost of $60 million a year, and to yield an export surplus. Another is to increase the output of basic chemicals like soda ash, caustic soda and fertilisers, mainly to enable the sterling area to supply South America and the Far East, rather than to supply Europe, which is already largely self-sufficient. This programme is estimated to cost £200 million by 1952. The export contribution from the *textile* industries is more direct in character, and on recent experience, the figures in the following table seem optimistic:—

'000 Metric Tons

	1935-38 Average	1947	1948-49	1952-53
Cotton consumption	619	368	457	473
Wool consumption	190	191	223	232
Synthetic fibres production	61·2	92·1	122	200
Exports of textile materials and products	(1938) 490	818	1,212	$ mns.* 1,452

* 1938 and 1947 at f.o.b. prices of those years; 1948-49 and 1952-53 at 1948-49 prices.

By 1952, output of cotton and rayon cloth, it is hoped, will increase by 35 to 40 per cent, compared with 1947. Production of synthetic fibres is to be doubled in the same period. Exports of cotton goods in 1952 should be "at least" 80 per cent greater than in 1947, and wool exports 60 to 80 per cent greater, while exports of staple fibre should be "at least" doubled.

The need for new and faster *ships*, specially designed for the particular trades which they serve, is acknowledged in the plan. Dry cargo tonnage is expected to reach 12.9 million tons gross by the end of 1952, compared with 12.1 million tons at the beginning of this year, and with 13.9 million tons in 1939. And this programme assumes an abnormally low rate of obsolescence, so that much of the shipping in use in 1952 will be too old to give efficient service. Yet it is expected that the better-balanced fleet will then provide a net income of about £90 million, provided that shipping is free to compete in world trade without flag discrimination. Tanker tonnage will, of course, be far higher than in 1939, but the development of the Middle Eastern oilfields will require all the tonnage that can be built in the next four years. The shipping programme as a whole will require an investment of £50-£62½ million a year, and will continue to be limited by steel supplies.

The Scale of Investment

This summary of the industrial targets will have given a Capital investment picture of the scale of investment which the Government proposes for the next four years and is, in fact, one of the constants in its economic equation. The annual programme, at current prices, is to cost £2,125 million—in other words, something very close to the present figure, and to the present proportion (about 20 per cent) which investment absorbs from the national income. The hope is that Britain, unaided in 1952, will be able to finance such a programme from its own financial resources, without drawing, as it is now drawing, on external assistance in order to make investment on this scale possible at all. The plan professes the intention to increase the rate of investment, if the national income itself expands. But it would be more realistic to demonstrate that an investment programme of this order will be achieved without inflation and without running any risk of curtailment through political pressure exerted by consumers.

As it is, the programme implies much less than is commonly supposed about the rate of net new investment in manufacturing industry. It is a gross programme, which includes provision for maintenance and repair of existing assets; the major constituents of the programme are under direct Governmental control, for they include fuel and power, transport, housing, social services and defence. Together these account for 61 per cent of the gross investment expenditure which is projected for the four years. Industry accounts for one-third of the total, but the iron and steel and shipbuilding programmes are absorbing a large share of the resources available for industrial investment. The plan contents itself with the observation that "should any additional resources become available for investment, they will be concentrated on industrial investment." Since industry's share must also contain some provision for stocks of working capital, as well as fixed assets, and since it is common ground that the majority of industrial concerns have been unable to maintain their real capital intact during a decade of rising prices and high taxation, the allocation to industry of one-third of the resources to be committed to investment is almost certainly inadequate. It may represent the most that can be done when the other claimants have been satisfied, but there is no justification in the White Paper for the proportions (including 16 per cent for housing) in which the Government has attempted to divide the total. The plan has been laid down, the shares fixed after departmental bargaining and political pressure have done their work; and these decisions are fortified by the "wide range of controls in force to ensure that investment resources are canalised in the desired direction." Between what is desirable and what is justifiable by strict economic calculation, however, there may be a wide gulf. That is particularly true of the more ambitious plans for Colonial development.

The problem of financing this volume of investment during the four years is made no clearer in the plan itself. There are, indeed, general passages describing the role which fiscal policy is playing in financing public expenditure and capital investment. The approach is rigid: public finance must aim at maintaining full employment, but must counter any inflationary pressure which will arise if voluntary savings are insufficient to cover the projected level of investment. The tentative success of this policy during the present year, however, provides no assurance that, during the next four years, it will be possible to strengthen, or indeed, to sustain it. The inherent contradictions between a policy designed to increase total output of manufacturing industry by a quarter, to throw off dependence upon external aid, to raise by taxation what will not be saved voluntarily—these contradictions can only be resolved by the use of a fiscal strait-jacket which only the boldest of chancellors dare impose, and to which only the most pliant electorate would submit. The importance of the function of saving has only been discovered now that the means of saving have largely been destroyed.

Balance in 1952?

The Government's hopes about the balance of payments in 1952 have been known in some detail for a month past, and were outlined in these pages on November 27th. To the account then given, the White Paper adds some further details. The Government believes, on "a realistic assessment of the prospects" that in the early 'fifties Britain should be able to maintain "year in, year out" exports at 150 per cent of the volume exported in 1938. The earlier ambitions of raising the percentage to 160 or 170 have been abandoned. The new target is based on a recovery in exports of solid fuel, and on a continuing expansion in exports of equipment and textiles. The detailed planning for these industries, which has already been summarised above, includes, however, several cautious references about the expansion of output and of overseas sales. To bring the external account as a whole into balance by 1952 depends upon a prodigious expansion in invisible earnings, of which the net earnings of British oil companies are destined to contribute a major part. The import programme, as a whole, is to be

limited to 85 per cent of the prewar volume but, within this total imports of food and feeding stuffs are to be limited to 80 to 85 per cent of the prewar volume (an increase of 10 per cent compared with 1947) and raw materials will be raised to 100 to 105 per cent of the prewar volume—a decision which is clearly necessary to maintain rising production.

The balance of payments estimates are offered, in the Chancellor's words, "more by way of a possible outcome than a forecast of what will actually happen." They assume a high level of economic activity throughout the world, and particularly in the western hemisphere; a "reasonable flow" of trade between eastern and western Europe; substantial progress in European co-operation; continued aid from the United States until 1952; and no substantial increase in the need for rearmament—a point which has gained added force since the British memorandum was submitted last October. All these conditions may be satisfied, but it will be providential if they are. And even so, the balance will be precarious, not only (as the White Paper emphasises) on the dollar account, but on the total account too. It is based on the explicit assumption that the countries participating in OEEC will be short of sterling as a whole—an assumption of which much more will be heard in the next few weeks. It is based, too, on a much more purposeful approach to the multilateral use of sterling ("the United Kingdom would deprecate attempts to work towards complete bilateral balance even between broad geographical groups"). This is a meritorious ambition. But the process of offsetting surpluses against deficits throughout the non-dollar world is bound to be slow and painful. For it implies radical adjustments of the economies of western Europe so that their deficiencies of sterling are matched by their earnings from other countries with which the sterling area itself is in deficit. And several of the European participants will have different views from those of Britain about the necessity and practicability of such alterations in the pattern of their economies.

Some Broad Conclusions

This exposition and commentary on the plan cannot pretend to be exhaustive, but it suggests some broad conclusions. First, perhaps, is the reliance which it places on rising productivity—without indicating, save in the most general way, how the increase is to be won. The expansion of output as a whole by one-third assumes that productivity can be raised by 2½ per cent per annum during the next four years. The figure is realistic, in the sense that its attainment is well within the bounds of technical possibility. But by what combination of persuasion, inducement, or compulsion can its achievement be guaranteed, at a time when "a real and grave crisis in economic affairs seems remote and unreal" to the British public? By what strengthening of policy can the declining labour force of Britain be re-distributed for the most urgent tasks?

Secondly, the plan contains a number of inconsistencies. Controls are being simplified "wherever possible" and "will be abolished as soon as their advantages appear to be outweighed by their disadvantages." Yet there is no possibility, on the Government's own showing, of abandoning controls at the most critical points of the economy. The level of imports seems destined to be controlled in perpetuity; food rationing may be here to stay; the division of output between home use and exports depends largely on the effectiveness of controls on investment and home consumption. The cost is acknowledged, both in money and manpower. But it is only from the manpower unproductively employed in controls that some increase in the industrial labour force can be secured.

Thirdly, there remains the abiding dilemma between the level of consumption and the volume of new investment. The former is to increase, and perhaps appreciably if the plan works. The latter is to be kept more or less constant, and even so, only

at the expense of a large budget surplus which in turn implies the disincentives of high taxation, and predatory fingers ever ready to grasp part of the surplus to increase the scale of current consumption.

Fourthly, the plan exposes the weakness of unilateral planning which assumes without grounds for certainty that exports can be sold in the required volume in a world where almost every country is a debtor, and only one a major creditor; where all the debtors will aim their exports at Western Hemisphere markets; and where the supplies of essential foodstuffs and raw materials available from the non-dollar countries will have to show a prodigious increase if independence from dollar sources of supply is to be even thinkable.

To draw attention to these difficulties is not to decry the plan as a whole. This, or something very much like it, will be necessary if Britain is to reach a state of economic independence with a tolerable standard of living in four years' time. The country has a free choice, not between success and failure—for success cannot be taken as a matter of certainty—but between making the effort to deserve success and courting certain disaster.

Business Notes

Administrative Law and the Steel Bill

The committee stage of the Iron and Steel Bill is to be dealt with, as the business of the Standing Committee is now arranged, in 36 sittings. The Bill contains 58 clauses. By the end of the seventh sitting, when it adjourned until next month, the Committee had finished dealing with Clause 1, in which it had corrected a few crude errors of drafting but made no substantial changes. The Minister of Supply resisted a number of attempts to fix the composition of the Corporation and the conditions of service of its members. The example of the National Coal Board (which has had to go to Parliament for authority to appoint some part-time members) supported him in insisting on the need for flexibility on these matters. Faced with an amendment to limit the number of full-time members to six, Mr Strauss explained that when the Corporation is first established it is to consist mainly of full-time members; work in the early stages will be heavy. Later the proportion may be changed as the members' work changes. He refused to be tied down to a three years' tenure of office for the Corporation members, or to accept a fixed system of retirement in rotation; but he indicated that the intention was to make appointments for not more than five years. His insistence on freedom of action provoked Mr Lyttelton to ask "Why have Bills at all?" and Lord Hinchingbrooke to protest that Parliament should not leave important matters to subsequent administrative action:

> We might just as well have a sheet of paper before us saying that the iron and steel industry shall be nationalised and leave it to the *dieit administratif* of the Minister afterwards to write in what he wants.

But there is still a suspicion that flexibility may really be essential if the Bill is not to be even more unworkable than it need be; variable factors, such as the market price of a board member or the length of tenure necessary to induce him to take the job, can be left to administrative decision.

An article in the *Statistical Bulletin* for November of the British Iron and Steel Federation discusses some points that go deeper. One of these is the extent to which the proposed Corporation is to take over the common services now rendered to the industry by the Iron and Steel Federation. The *Bulletin* points out that in nearly every branch of its productive activities beyond the ingot stage the Corporation will be in competition with some private firms, and in some of the more highly finished branches the non-nationalised sector will be a good deal larger than the nationalised sector. Beyond the stage of ingots and hot rolled steel the nationalised sector will vary from 97 per cent for wheels and axles to 16.5 per cent for drop forgings. "How in such circumstances the Corporation could possibly claim to be a suitable body for providing common services for itself and for the private companies which are its competitors it is impossible to see." An analogous point is raised with reference to the proposed price-fixing functions of the Corporation. Prices of iron and steel products are at present fixed by the Government on the advice of the Iron and Steel Board. But the Corporation, in fixing the prices of scheduled products, will be under no statutory obligation to publish price lists or consult independent authority: "There is nothing in the Bill to prevent the Corporation from undercutting its privately-owned competitors in wire, forgings and constructional engineering, or in many other products, making a loss on these sections of its business and recouping itself by exploiting its monopoly of crude steel production." These speculations may seem highly coloured now, but they arise from the Bill directly and without perversion. There seems no point in creating, unnecessarily, situations in which the Iron and Steel Corporation will be both judge and interested party.

Achievement in Exports

At least one target is nearing achievement, for in November the volume of exports reached 148 per cent of the 1938 level compared with the end-of-year target of 150 per cent. This has been assisted by a notable expansion in textile exports, particularly cotton goods. Exports in October were 142 per cent of their prewar volume and in July, which had an extra working day, 149 per cent. In value, total exports in November at £147 million were the highest ever recorded. The daily rate of exports during the month which had 26 working days was 5 per cent higher than in either October, also with 26 working days, or July the previous peak month, which had 27 working days. Exports for the past nine months adjusted to a notional month of 26 working days are as follows:

British Exports

(based on 26 working days a month)

	£ mn.		£ mn.		£ mn.
March	126	June	139	September	131
April	126½	July	140	October	140
May	135	August	135½	November	147

These figures give an encouraging picture. The upward trend in the value of exports is also reflected in the relatively steady increase in their volume over the same period.

Exports of food and raw materials in November were not very much larger than in October. Shipments of coal declined by 10 per cent in value, while exports of seed and nuts for oil were halved. These declines, however, were offset by increased exports of miscellaneous raw materials, and in particular of coal tar pitch to France. The export of manufactured goods rose by £5,400,000 and most of this was due to a sharp increase in cotton exports, which at nearly £13½ million not only exceeded their target set for the end of the year but were also the highest recorded since 1929. Shipments of cotton piece-goods amounted to £8,700,000 or £1,200,000 more than in October and exports to Canada in particular were 25 per cent higher. Woollen and worsted exports reached £9,400,000 and were the highest value attained since 1920. Machinery maintained its position as premier export group but shipments during the month increased by only £1,000,000 to £23½ million. The value of vehicle exports totalled almost £22 million and was also only slightly higher than in October.

The value of imports during November reached £181 million, a figure which has been exceeded only twice since the war—in April and July of this year. Imports of food, drink and tobacco rose to a new record of nearly £83½ million, owing to heavier arrivals of butter and meat from New Zealand, and also of cocoa, tea and wines. Raw material imports were also higher than in October and totalled £60 million. Most of this increase was due to heavier arrivals of wool. The adverse visible trade balance fell slightly during the month to £28,700,000, taking imports at their c.i.f. value. This was the lowest figure since January, 1947. The total adverse balance for the first eleven months of the year (allowing 10 per cent for insurance and freight in import values) amounted to £216 million, compared with £390 million for the same period of 1947. Details of November's trade are included in this week's issue of the *Records and Statistics* Supplement.

Disinflation for South Africa?

Last week, for the second time in recent months, Dr de Kock warned the people of South Africa of the need for restraint, declaring that the tempo of "development" must be slowed down and that consumption demands must be limited so as to provide resources for essential capital outlay. This time he gave first

teeth to the warning by announcing financial measures to reinforce the rather half-hearted efforts of the Government. In the absence of any stern budgetary policy, it is, indeed, only by financial restrictions that any genuine disinflationary pressure can be exerted. Even so, the monetary authorities apparently prefer to rely upon directives to the banks rather than upon the orthodox method of deliberately raising interest rates: the aim will be to stabilise rates at or near the higher levels recently established. Meanwhile, the banks have been asked "as a matter of positive public policy" to contract credit facilities for non-productive purposes generally and also to restrict advances for less essential and over-developed industries "with due regard to the obvious need of exercising discretion." Owing to the massive inflow of overseas capital in 1947 and early 1948, the yawning gap in the current balance of payments, so far from causing a contraction in the volume of credit internally, actually coincided with a large expansion—as, indeed, happened in Britain in the Daltonian phase. The volume of money in the Union expanded from £349 million at the end of 1945 to £412 million by October, 1947, and by a further £21 million—to £433 million—in the ensuing twelve months. Bank advances and discounts, which stood at £114 million in 1947, rose to £131 million by June last and to £152 million by October.

Despite its forthrightness at certain points, the general tone of Dr de Kock's speech was less austere than might have been expected. He does not think that South Africa ought to be expected to work out its own salvation: "it would be presumptuous to expect the Union to achieve equilibrium in its balance of payments without substantial amounts of overseas capital during the next five years." His own informal inquiries suggest that "a certain amount" could be obtained from the United States if "attractive terms" were offered; and, if necessary, it appears that he would seek dollars indirectly by borrowing in Switzerland. "We must," he said, "exert ourselves" to borrow hard currency capital, to avoid "unnecessary dislocation." If Government and people had really made an honest effort to put their own house in order, this might be a reasonable—perhaps, then, even an inevitable—attitude. But at this early stage, before most South Africans have even discovered the meaning of their crisis, it is surely an irresponsible line for a central banker to take. For the present, he would have done better to have left that to the politicians, who now may be prone to take his opinion as an excuse for inaction.

Except in the matter of overseas borrowing, the authorities apparently intend to sit back and await the results of the measures so far adopted. Dr de Kock believes that the drain of gold will stop when the import restrictions exert their full effect; in the meantime he is prepared to see the reserve ratio drop below its recently reduced (and also relaxed) minimum. He sees no solution in unilateral devaluation, because "there is little likelihood of our gold-mining industry deriving any net benefit" from such a "desperate" step.

* * *

Anglo-Swedish Trade and Payments

The unexpectedly protracted London discussions on commercial and financial questions which have occupied representatives of the British and Swedish Governments since early November yielded an agreement at the end of last week. The main issue that had to be faced by the negotiators was the disequilibrium in Anglo-Swedish payments which had occurred since the previous agreement was signed in November, 1947. It was then assumed that payments between the two parties would be kept in approximate equilibrium. That assumption has gone sadly astray. Swedish exports have been unquestionably hampered by the over-valuation of the kronor, while Swedish purchases from the sterling area have been considerably swollen by the switching of imports from dollar countries. Sweden's dollar shortage preceded its shortage of sterling and was a direct cause of the disequilibrium in payments with the sterling area. The measure of that disequilibrium was gauged in the recent intra-European payments discussions in Paris when it was discovered that in order to meet its prospective deficit with the sterling area in the twelve months to June 30, 1949, Sweden would have to draw down immobilised sterling balances by £17 million. The London negotiations were intended to devise the means by which a more satisfactory equilibrium in these payments could be restored.

In order to provide the greatest measure of room for manoeuvre the two parties undertook at the outset to waive the gold payments clause and thus leave no specific limit to the mutual overdraft facilities they might grant to each other. In the second place, Britain undertook to step up considerably its 1949 import programme with Sweden and in particular to take more iron ore, timber, pulp and newsprint. These prospective increases in Swedish sterling receipts were not, however, deemed sufficient to maintain Swedish imports from sterling countries at the level held in 1948. It was therefore decided that some of these imports should be considerably reduced. It was mainly in the selection of the classes of sterling imports to be cut that difficulties between the two parties emerged. In the end the onus of selection had to be left to the Swedish authorities and they decided to make the main cuts in textiles and machinery. During the coming year, therefore, licences for the import of such goods from the sterling countries will be appreciably reduced. The new agreement leaves Sweden in the transferable account group of countries and increases the advantages to be derived from that membership by removing the gold convertibility clauses which have in the past tended to shackle trade and payments between the two countries.

* * *

Expanding Trade Under Bilateralism

There was evidently a last-minute rush to conclude the various trade talks before Christmas. Norway has agreed to buy more British goods in 1949, even though its sterling expenditure is likely to exceed its sterling earnings. Britain is also to import more goods from Norway, including larger quantities of timber and wood pulp. Both countries have further agreed to waive the gold payments clause. Danish imports from Britain next year will be increased to about £62½ million compared with £46¼ million this year. A large part of the additional imports will be textile piece-goods. The conclusion of the Swedish trade talks, also announced last week-end, is discussed in a separate note above.

The success of these negotiations is undoubtedly connected with the success of the British export drive. If Britain can produce the type of goods which other countries want, trade is likely to expand even within the limits of bilateral agreements. For certain countries, sterling may be becoming a hard currency, but Britain's unique position as a large potential importer of many different types of goods—from raw materials and foodstuffs to manufactures—precludes any possibility of sterling becoming as scarce as dollars. A relative scarcity of sterling may even encourage Europe (as before the war) to expand production for the British market.

A new five-year trade agreement is expected to be signed with Poland this week. Total trade between the two countries will amount to £300 million during the period. Britain is to get foodstuffs, mainly bacon and eggs, in return for wool, tin, rubber, copper, cotton and certain manufactured goods. The pact had been held up over the rate of compensation to be paid for British property in Poland which has been nationalised. The agreed figure is £30 million. But according to reports from Warsaw, this will not be entirely repaid during the life of the new agreement, as the balance of trade in Poland's favour will not be sufficiently large. If these reports are correct it means that Britain has given way to the Polish demands—a move which is not easy to understand.

There are also reports that the negotiations with Jugoslavia may be concluded shortly. Here, again, the stumbling block has been the rate of compensation for British property sequestrated by the Jugoslav Government. If Britain has really waived this point with one country it can hardly maintain it against another.

Opencast Coal

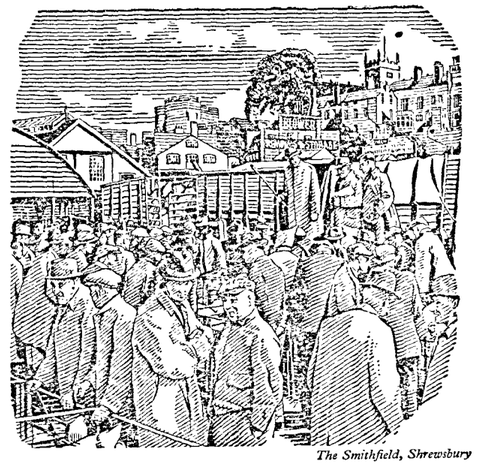
No new target has been set for opencast coal production. The programme of 13 million tons in 1949 which has been mentioned this week formed part of the British coal production programme put before the Paris Conference sixteen months ago. Since this year's opencast output will not be far short of 12 million tons, the programme for next year does not represent a large productive increase. It does, however, mean an intensification of activity, for as the present workings become exhausted new fields have constantly to be found, and the search becomes gradually more difficult in spite of the more powerful equipment and bolder techniques employed in stripping off the soil. And with each year of opencast working the area of damage spreads. Clearly the sooner it is brought to an end the better.

From this point of view the four-year plan is more disquieting than the 1949 programme itself. The plan speaks of an increase by 1952-53 of some 40 million metric tons of deep-mined coal to bring about "a total production (including opencast production) of between 250-260 million metric tons." The figures are very rough, but this means that out of a total production of between 246 and 256 million long tons, less than 240 million is to come from the mines. Opencast output will be called upon to fill this gap and to make up any unforeseen deficiencies as well. It is true that the Ministry of Fuel and Power sees opencast as playing by 1952 or 1953 a declining part in British coal production. But it is not easy to see how the present dependence on opencast is to be removed. To reach the rate of deepmined output intended by 1952-53 will take a great effort—an annual increase of 5 per cent, as the four-year plan points out, in output per man-year. Whether this programme will be fulfilled is speculative; it is most unlikely to be exceeded. Home and foreign demand may prove, however, to have been overestimated, and the four-year plan, which points out the uncertainties surrounding the attempt to assess the probable course of demand, appears to have this possibility in mind. In that case the first concern must be to keep mining output up and cut down the opencast programmes. Coal users who have to endure coal of poor quality, farmers, and the local communities whose amenities are damaged, would all be glad to see it go.

* * *

Russian Coarse Grain

Although there is little likelihood of a new trade agreement with Russia in the immediate future, Britain is trying to buy further substantial quantities of coarse grains from the Soviet Union. In 1948 a total of 764,000 metric tons were received under the trade agreement signed twelve months ago; of this quantity 476,000 tons consisted of barley, 190,000 tons of maize, and 104,000 tons of oats. The quantity suggested for 1949 is 1,500,000 metric tons, or double this year's amount, and if it is forthcoming it would place Britain in a much stronger bargaining position in the prospective negotiations with Argentina. An import of this size from Russia, with additional quantities of maize from Jugoslavia and the United States, would enable Britain to maintain the current allocation of feeding-stuffs without having to buy any grain from Argentina. Supplies of grain retained by British farmers during the new season are expected to increase from 3,300,000 tons to 4,200,000 tons, but even given the increased supply of milling offals, the total available supply of feeding-stuffs to British farmers will still be only 60 per cent of its prewar level.



Most of the sterling which Russia earned from this year's sale of grain has been spent on buying raw materials, particularly wool and rubber. Such purchases are likely to be continued during the coming twelve months, and in addition Russia will need sterling to meet deliveries of capital equipment contracted for earlier this year.

Prices will present a difficult problem. Last year's prices were never officially divulged, but were supposed to be based on world prices. They were declared in Parliament to be "fair and reasonable." Yet, from the evidence of the Trade and Navigation Accounts, the average cif import prices of Russian grain seems to have been well above the corresponding prices in Chicago; moreover, they increased from quarter to quarter although during the same period the Chicago price fell sharply. Details of these prices were published on page 762 of *The Economist* of November 6th. The Russian selling authorities will no doubt try to exact equally favourable terms this time. Britain obviously does not want to pay too high a price, but the search for new sources of supply often succeeds only because higher prices are paid. Nevertheless there is a limit to the premium which it is worth paying in order to get coarse grain for sterling instead of for dollars.

The Three Banks

The Royal Bank of Scotland, Glyn, Mills & Co., and Williams Deacon's Bank Limited, constitute a banking group whose resources rank them sixth among the banks of Great Britain. Their resources are large enough to meet the requirements of any customer. These three banks, each with a famous banking tradition, each still retaining its individuality, can give to every customer the advantages of their pooled facilities and diverse financial experience.

ROYAL BANK OF SCOTLAND
Founded 1727 Edinburgh, London & Branches
GLYN, MILLS & CO.
Founded 1753 London
WILLIAMS DEACON'S BANK LIMITED
Founded 1771 Manchester, London and Branches

The Smithfield, Shrewsbury

THE ENGLISH COUNTRY market grew up with the land and those who work on it. Produce is sold and needs are supplied through its agency and even in this age of centralisation the farmer still finds much that he values in his own market town.
It is in market towns that the Local Head Offices of Barclays Bank have been established in many cases. This has enabled the Local Directors—themselves men who know the district well—to keep in constant touch with the problems and needs of the farming community. It is through this long tradition of service to farmers that the Bank is known in many parts of the country as the "Farmer's Bank".

Multiple Rates for the Peseta

Spanish pride which apparently refused to tolerate a straightforward devaluation of the peseta is being safeguarded by the introduction of a differential exchange rate system the like of which has been matched by no other country, save perhaps Bizonia in the short period before the currency reform. The new system follows directly on the commercial and financial discussions with representatives of the British Government which were held in Madrid recently. The negotiations for enlarging the volume of trade between the two countries stumbled time and again on the wholly artificial valuation of the peseta at the official rate of 44 to the £. This made the prices of Spanish exports prohibitive and offered too great an inducement to imports into Spain. Instead of meeting the difficulty with a devaluation—a suggestion which apparently was held by the Spanish authorities as an affront to the régime—the Spanish exchange system has been transformed into what seems at first sight a Schachtian nightmare of unbelievable complexity. Eight foreign currencies, including sterling and the dollar, are affected by the new exchange system, which provides different exchange rates for 47 kinds of goods classified for this purpose in 13 groups. In the case of sterling the rates vary from 50.737 pesetas to the £ for imports of salt to 88.26 pesetas for books and films. The complexity of this system can only have been exceeded in exchange history by the Bizone's Joint Export-Import Agency system which, until the recent currency reform, involved a separate exchange rate for every foreign trading transaction.

* * *

Trend in Bank Advances

The tendencies shown in the latest quarterly analysis of bank advances afford a convincing answer to any suggestion that the recent large expansion of bank deposits may have been due to excessive or incautious lending by the banks to the private sector of industry. For the three months to November last, for the first time since the war, the quarterly figures show a net fall in total advances. True, it is only a fractional decline, from £1,381 million to £1,379¼ million. But, to be seen in perspective, this change needs to be contrasted with the increase of £45 million in the corresponding quarter of 1947 and with no less than £132 million in the six months to last May, since when the further expansion has amounted to only £29 million. The stability of the total in the past three months has, of course, been partly due to certain special repayments. The figures reflect the first of the repayments which the British Electricity Authority has been making out of the proceeds of its recent issue of 3 per cent stock, with the result that the Public Utilities group of bank advances declined from £33¾ million to £18½ million (to a level which is, however, still nearly £7,000,000 above that for the similar date in 1947). Similarly, the redemptions, under the National Health scheme, of indebtedness to hospitals is reflected in a further fall, by £3,000,000, in "Churches, Charities, Hospitals, etc." But, apart from these special influences, there have been net reductions in the borrowings of a number of industrial groups, the most noteworthy being those in Chemicals (down by £3,100,000 to £18.6 million), Shipping and Shipbuilding, Leather and Rubber, and each of the three textile categories. Building materials declined fractionally, while advances to builders and contractors were virtually unchanged.

The only large increase in the industrial categories occurred in Food, Drink and Tobacco, but this movement (£12.4 million) may be partly seasonal and was rather less than the corresponding increase last year. Retail Trade advances expanded further, by £2,500,000, compared with nearly £5,000,000 twelve months earlier. During the quarter, the Transport group absorbed an additional £3,000,000, Engineering, etc., £2,000,000. Iron and Steel £1,000,000; and there was also a slight expansion in Coal and Quarrying. It will be seen that, except for the possibility that the growth in the engineering category might conceivably be concentrated upon the lighter sections, these figures leave no room for the suggestion that any significant volume of funds may be flowing into inessential industry. In this connection, it is noteworthy that the large "unclassifiable" group contracted fractionally; entertainment rose fractionally (by £580,000), and the very big personal and professional group increased by a mere £3,000,000—easily its smallest quarterly movement since classified figures became available after the war. The "Other Financial" group, which includes advances to the hire purchase finance companies, property finance companies, etc., declined by £2,200,000.

* * *

Lead and Zinc Prices

American consumers are apparently no longer so willing to pay high premiums above the official prices for immediate deliveries of lead and zinc. As yet, there is little to suggest a definite decline in consumption of base metals, but it is generally expected that President Truman will introduce some system of price control. Base metals are no longer cheap, and even in Britain consumption has tended to fall slightly in recent months. At the end of November the Ministry of Supply raised the price of zinc by £14 a ton to £106, and explained that the rise "follows recent increases in market prices which affect the cost of imported zinc." This is the third increase this year. The official British selling price was raised at the end of January from £70 to £75 a ton and on October 1st to £92 a ton. Each increase followed fairly closely similar increases in the American market price. In the middle of November the American price of zinc rose from 15½ cents a lb to 17½ cents a lb—a rise equivalent to £11 a ton, from £86 to £97. Although it was realised that the British price would conform to this trend, it was generally expected that no change would be made until the end of the year.

During November the price of lead was also raised in the United States by 2 cents to 21½ cents per lb (equivalent to a rise of £11 to £119 10s. per ton), but the British price has remained at £112 a ton. In the first eleven months of this year 131,000 tons out of a total import of 147,000 tons of lead came from Commonwealth sources, largely Australia and Canada. In the same period imports of zinc amounted to 159,000 tons, of which 58,000 tons—or more than a third—came from the United States. If, as it seems, short-term contracts (three or six monthly) are made only with Commonwealth producers, while purchases in the United States are made spot, this would explain the more or less immediate rise in the British price of zinc and the postponement of the rise in the price of lead—presumably until the turn of the year or whenever the new contracts are concluded.

Negotiations are in progress in Australia which may raise the price of zinc to Australian users. Hitherto both lead and zinc have been sold on the Australian market at the controlled price of £17 12s. a ton. This price is, of course, abnormally low by world standards, and may not even cover costs of production; it is subsidised by the higher prices obtained on the export market. But whereas certain mines export all their concentrates (the Zinc Corporation at Broken Hill and the Mount Isa Mines), others (Broken Hill South and North Broken Hill) sell their concentrates on the domestic market. An attempt is now being made to introduce a quota system for all producers, so that each shares part of the loss incurred by selling on the home market. Even if the Australian price is raised, it is likely to reflect the increase in costs of production rather than the rise in the world market. The low Australian price of zinc and lead has not only tended to retard development in the Australian mines, at a time when the world is in need of both these metals, but it has also encouraged uneconomic use in the Australian market.

Timber from Finland

Negotiations between representatives of the Finnish Sawmill Owners' Association and the British Timber Control about next year's contract have temporarily broken down. Finland, it is understood, has been seeking higher prices than this year whereas the Timber Control was not even willing to pay current prices. These are, of course, the usual moves in bilateral bargaining, but in this instance the problem is more deep-rooted. Meanwhile the Finnish delegation has returned home for discussions with producers and negotiations are expected to be resumed in London in the New Year.

A month ago the Finnish representative on the Pitwood Working Party of the Economic Commission for Europe explained that both Britain and Belgium wanted only long pitprops in 1949—that is pitprops varying between 7 and 10 feet—with only a minimum quantity of pitprops of 5, 5½ and 6 feet lengths. But Finland has to make a large amount of the shorter pitprops firstly because of the cutting technique at present in use and secondly because otherwise Finland could not use a large proportion of its timber output. The Finnish delegate registered a further complaint about the thickness of pitprops. Britain wanted pitprops starting from 3½ inch whereas Finland always made them starting from 2½ inch. If Britain and other purchasers insisted on these sizes, then about one quarter of Finland's natural pitwood production would result in waste wood.

According to the Finnish representative, in order to meet the buyers' requirements, Finland would have to utilise forests which were intended for timber production and this would necessarily reduce the supply of pitwood available and increase the cost. Although this year, prices reached a new high level, Finland still claimed to be producing at a loss. The problem, of course, resolves itself into one of timber equipment. Six European timber importing countries (Britain, Belgium, Denmark, France, Italy and the Netherlands) have agreed to grant credit facilities to five European timber exporting countries (Austria, Czechoslovakia, Finland, Poland and Jugoslavia) to purchase timber cutting equipment against additional exports of timber and pitwood. Details of the plan remain to be worked. But the International Bank for Reconstruction and Development would extend credits to the timber exporters up to $6-8,000,000 and simultaneously the timber importers would provide equipment to the value of $8,000,000. In return, the $120 million worth of additional timber exports would be made available in the next two years, making total timber exports from these five countries equal to $330 million.

These schemes will help the future, but what of Britain's pitwood supplies in 1949? Hardwood could be used as a temporary substitute and is at present being used as such in French mines. For most purposes it is just as safe as softwood pitprops and very much cheaper. But it may mean having to overcome prejudice and to alter traditional routine. Failing that, Britain may have to pay Finland at least this year's prices if it insists on pitwood to its own specifications.

* * *

New Passenger Liners

The last month of the year has seen three British passenger liners of over 27,000 tons gross entering service, and a fourth, the *Caronia*, follows in the first week of 1949. Three of these are new ships; the fourth, the Shaw Savill liner *Dominion Monarch*, was new in 1939 and has undergone extensive renovation and overhaul after arduous war service. These are signs that the passenger fleets are once more approaching prewar strength. The *Edinburgh Castle* (28,705 tons gross), now on her maiden voyage to South Africa, brings the Union-Castle fleet up to prewar strength, except for one liner still refitting. The *Caronia* (35,000 tons gross), which will join the Cunard White Star liners *Mauretania* and *Britannic* in spring cruises to the Caribbean from New York, is the last passenger liner ordered for the North Atlantic fleet, although Furness, Withy and Co. have a smaller liner on order for their New York-Bermuda service, which the reconditioned *Queen of Bermuda* will shortly be resuming.

The recent report of the Commonwealth Shipping Committee discussed the need for more passenger facilities between Britain and the Eastern Caribbean. Elders and Fyffes, Ltd., have since announced that their new twin-screw turbine steamer *Golfito* will take the route Barbados-Trinidad-Jamaica, picking up a banana cargo at Jamaica for the return run. The *Golfito*, of about 7,000 tons, will have accommodation for 100 passengers; she will make her maiden voyage in May.

In the Australian and New Zealand service the Shaw Savill Line, in addition to the *Dominion Monarch*, has recently received the refrigerated cargo liners *Ceramic* and *Gothic*, each carrying 85 passengers, and the last of four ordered since the war. The *Orcades* (28,00 tons) is on her maiden voyage, which will reduce the passage time to 28 days for 1,500 passengers, and the Orient Line has only one more sister ship on the stocks. The P. and O. liner *Himalaya* was launched in October, and there remains only the *Chusan* on the stocks for this company's passenger fleet. The Royal Mail Lines' passenger programme will be completed when the *Magdalena* enters service in February.

Large passenger liners are now disappearing from the shipyards, and from the order books. There still remains a fair amount of cargo liner tonnage, but tanker tonnage is becoming preponderant. Some two million tons gross of tankers are on order or under construction, and of these more than 300,000 tons were laid down in the first ten months of this year. These will keep the yards fully occupied for two or three years, but the demand for tankers is likely to fall off suddenly, and shipbuilders, at home and overseas, will be wondering when tramp owners will begin ordering replacements. For them, cost is a paramount consideration. For ship repairing firms the end of the boom is very much nearer now that the postwar reconversion programme is within sight of completion. Wartime and subsequent pressure of repair work inflated the labour force to more than twice its normal level and the process of disinflation is likely to prove painful

* * *

Briton Ferry Steel Compensation

Critics of the Stock Exchange valuation basis for compensation in the Iron and Steel Bill have usually cited the giant companies to illustrate the gross inequity of the method. But injustices in the case of the smaller companies can be no less flagrant. Such a case has found its champion this week in Col. J. M. Bevan, of Briton Ferry Steel. In a forthright document explaining to the shareholders the effect of nationalisation on the company, Col. Bevan has given figures showing the inadequacy of the estimated compensation sum for the company, judged from two familiar and valid approaches.

After deducting £1,025,096, representing the net current assets of the group attributable to the parent company, from the total compensation payable under the provisions of the Act, only £129,430 would be left as compensation for the group's fixed assets, At April 3, 1948, fixed assets of Briton Ferry Steel, taken at cost and after writing off substantial depreciation, had a book value of £748,755. These comprise two steel works with a combined output of over 250,000 tons of steel annually, six tinplate works which last year manufactured over a million boxes of tinplate, majority interests in Neath Steel Sheet and Galvanising Company (which owns five sheet mills), Baglan Engineering Company and a large real estate property. Goodwill has been entirely written off. It is little wonder that Col. Bevan stigmatises the terms as confiscatory.

Col. Bevan proceeds to show that, on the basis of the latest group profit figures of £425,656 (including £200,000 from London Works (Barlow), which has been acquired since the date of the accounts), the estimated compensation payable to Briton Ferry Steel represents less than three years' purchase of profits. It may be open to argument whether, as Col. Bevan suggests, the integration of London Works (Barlow) with Briton Ferry has escaped the notice of the Stock Exchange, and will "not be reflected in any way" in the market value of the shares. Conceivably, the full benefit of the merger may not have been adequately discounted in the price of Briton Ferry Steel shares. Yet even on the basis of the profits of the group before the acquisition of London Works (Barlow), compensation would clearly be inadequate.

* * *

Peruvian Corporation Moratorium

The petition to obtain Court sanction to the scheme of arrangement between Peruvian Corporation and its debenture holders for an extension of the present moratorium was opposed by Mr Horace B. Samuel in the Chancery Division this week. The scheme allows for an extension of the moratorium for a further year from the date of expiry of the existing scheme on December 31, 1948, and would give power to the debenture holders' committee to prolong the period until the end of 1953. Mr Justice Vaisey proved sympathetic to the objections raised in opposition to this loose arrangement, and ruled that the moratorium should continue until December 31, 1949, with no provision for any additional period. He also declared that the directors should give serious thought to the preparation of a more permanent scheme of settlement with the debenture holders, since the representation that such a scheme was in prospect had some influence with the Court in sanctioning the previous renewal of the moratorium in 1946. This ruling has upset the calculations of even the majority of the debenture holders, who agreed on December 6th by a substantial majority to approve the latest scheme submitted by the company. But a complicating factor here has been the dual holdings of debenture and ordinary capital by some of those voting for the scheme. This had some weight in the Court's decision to limit the extension. Arrears of interest and sinking funds on the outstanding £3,946,900 6 per cent first mortgage debenture stock amounted to £2,691,879 on December 1, 1948. Interest has now been paid on the debenture stock up to April 1, 1943.

* * *

Bulgarian Debt Gesture

The Bulgarian Government's decision, announced last week, to meet interest arrears since 1940 on the Bulgarian external debt and to service the Bulgarian foreign loans in 1949 has come as a complete surprise. The terms on which the arrears are to be paid off and current payments resumed for one year may not be generous, even when measured by the treatment usually accorded to foreign bondholders nowadays. But it is a matter for grateful surprise that Bulgaria is acknowledging its foreign debt obligations and treating its creditors, if not handsomely, at least without discrimination between them.

The Bulgarian Government has unconditionally guaranteed to remit arrears of interest in 3 instalments by 1951. Arrears on the pre-1914 Bulgarian external debt will be paid off at the uniform rate

of 3s. 6d. per cent per annum (calculated by reference to the current exchange value of the Swiss franc) while arrears on the two loans issued in 1926 and 1927 under the auspices of the League of Nations will amount to 16s. Interest to be paid in 1949 will be at the rate of 4s. per cent on the loans of 1892, 1896 and 1909, 5s. per cent on the loans of 1902, 1904 and 1907, and £1 2s. 6d. on the two League loans. It is hoped that before the end of 1949 discussions towards a permanent settlement will have been undertaken.

On a number of occasions in recent months there has been evidence of informed dealing before foreign bond settlements were announced. The market in foreign bonds is quiet on most days. Thus any buying or selling of foreign bonds before an announcement affecting their prospects is readily noticeable and can influence prices appreciably. The market has recently complained to the Stock Exchange Council about two leakages. Details of the first Italian debt agreement did not remain unknown. More recently, news that the Council of Foreign Bondholders was negotiating with the Burgomaster of Saarbrücken about interest and arrears on the City of Saarbrücken 6 per cent. sterling loan of 1928, leaked out before the announcement. It may be that the Council of Foreign Bondholders is almost too concerned that nothing should become known officially until negotiations have been completed. Perhaps these embarrassments would be fewer if the Council were more ready to make interim announcements.

* * *

Investigation Into Aluminium Scrap

The investigation into the British sale of aluminium scrap to the United States is proceeding but no further charges or denials have been made. The allegations made last week by Mr Howard Bruce the deputy administrator of ECA in Washington and which were discussed on page 1029 in *The Economist* last week, have been denied by Britain, Belgium and the Netherlands. The following tables show the problem to be investigated in terms of British export figures and American import figures. Table I shows the exports of aluminium and aluminium alloys from the United Kingdom during the first eleven months of 1948. There was no export of old aluminium or scrap during this period and there was no re-export of aluminium or aluminium alloys. There was, however, an export of some 40,000 tons of aluminium compounds consisting mainly of sulphate of alumina. These latter items, however, do not come within the scope of the controversy. The United States is not mentioned as a destination and if any aluminium was sent there it would be included in "Other Foreign Countries." And in this connection it is noteworthy that from July onwards, the exports to "Other Foreign Countries" increased quite appreciably. It would seem that the maximum export to the United States under this heading would be of the order of 10-12,000 tons during the first eleven months of the year. And the chances are that most of this would consist of sheets and plates.

Table II shows the import of aluminium scrap into the United States, during the first nine months of this year. Since June imports have increased sharply, and this increase has undoubtedly been the cause of the allegations. The first imports of scrap from the United Kingdom are recorded in June when 1,400 tons were received. In July the quantity increased to 3,000 tons, in August to 4,500 tons, but imports fell in September to 3,000 tons. In all some 12,000 tons were received from Britain in the four months June to September. The American charge was that up to the end of September, Britain had resold 12,812 tons of aluminium to American firms as scrap. In addition to the import of aluminium scrap, the American trade accounts show an import of aluminium manufactures from Britain totalling well under 1,000 tons for the nine months; in fact there was again no import before June and most of the quantity arrived in September.

To dovetail the two halves of the picture together requires some conjecture. In the first place, it is inconceivable that any large quantity of aluminium scrap could have been smuggled from Britain. The discrepancy is more likely to lie in the definition of "scrap." It would seem that aluminium sheets and plates, some probably recovered from British war equipment, has been exported from Britain to the United States under the quota export scheme and rightly classified by the Customs as manufactures. On the other hand, American firms although having bought the aluminium as manufactures, no doubt intended to use them as scrap and declared them as such to the American customs in order to get a lower import duty charge. The fact that this trade did not become important until after June—when ECA funds became available—is probably a coincidence, but clearly one which might well raise suspicion in American minds. Had the export of aluminium and aluminium alloys from Britain to the United States been on a large scale at the beginning of the year, the United States would have been listed as a destination in the British trade returns alongside Iran, Iraq and Argentina.

TABLE I—EXPORTS OF ALUMINIUM AND ALUMINIUM ALLOYS FROM THE UNITED KINGDOM, 1948
(Long Tons)

	Jan.–June	July	Aug.	Sept.	Oct.	Nov.
Commonwealth Countries	9,256	2,584	2,836	3,547	3,397	4,521
European Countries	4,795	1,942	2,024	607	961	1,339
Iraq	637	23	89	71	25	41
Iran	261	34	137	59	82	89
Argentina	410	29	65	38	92	404

Woolwich Equitable 101st Year

Although new mortgage business transacted by Woolwich Equitable Building Society in the year to September 30, 1948, did not quite maintain the level reached in 1947-48—its centenary year—the society has made a good start to its second century of activity. New mortgage advances in 1947-48 amounted to £12,050,550 a figure only £81,593 lower than the record of the previous year. The number of mortgages outstanding at September 30th last was 64,495 compared with 65,057 a year earlier. Within these global figures, a marked change has occurred both in the size of individual advances and in the proportions of the total new mortgages taken out during the year over and under £2,000. For instance, the number of new mortgages where the amount of the advance did not exceed £2,000 actually increased from 7,688 to 10,669 in 1947-48 and the total amount involved has been nearly doubled, whereas new mortgages exceeding £2,000 fell from 3,868 to 907, valued at £3,492,935, compared with £7,734,543. This is a remarkable change; it reflects the relatively greater decline in both the turnover and value of larger properties during the year, and may also possibly denote that the society has introduced some modification of lending policy.

Any fear of falling property values—and the Woolwich Equitable makes no secret of its expectations in this respect—has now to be balanced by the search for employment not only of surplus liquid funds accumulated during the war period but for those still being attracted to the movement. The flow of funds towards the building societies appears to have abated little in the past year and the Woolwich Equitable found it necessary to fix a limit of £250 to the amount by which the balance on any existing share account might be increased and also on the amount acceptable from any new share investor during the year. Even so, in 1947-48 there was an increase of nearly £1,000,000 in amounts due to shareholders at the end of the year. In addition, repayments of advances and interest amounted to £9,939,284 (some £579,697 lower than in the previous record year) so that total funds seeking employment were greatly augmented. Yet the preference for property over alternative avenues of investment has if anything been increased, since there has been a decline in the ratio of investments to total assets from 25 per cent to 20 per cent on the year. This has resulted from a heavy net realisation of gilt-edged investments which has reduced the balance of the investment account from £10,434,869 to £9,221,916.

Shorter Note

Output of deep-mined coal in the past two weeks has been at the highest level since the summer of 1940. In the week ended December 11th deep-mined output was 4,214,000 tons; this was achieved largely by a decrease in absenteeism (from all causes) by 0.53 per cent for face workers and 0.38 per cent for all workers). Overall output per man-shift remained constant at 1.15 tons. An opencast output of 192,000 tons brought total coal production for the week ended December 11th to 4,406,000 tons. Last week an increase of 213,400 tons brought the deep-mined output to 4,427,400 tons; opencast output declined by 34,100 tons to 157,900, and the total for the week was 4,585,300 tons. At the end of 49 weeks total deep-mined output for the year was 9,454,000 tons short of the year's target of 200 million tons; the opencast target (11 million tons) had been passed by 440,000 tons.

SECURITY PRICES AND YIELDS

A fuller list containing 371 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Turner and Newall; Mitchell and Butlers; Apex (Trinidad) Oilfields.

THE
STANDARD LIFE
ASSURANCE COMPANY
For Mutual Assurance

Established 1825 *Assets exceed £54,000,000*

SPECIAL ATTENTION IS DRAWN TO THE FOLLOWING CONTRACTS:—

1. **BUSINESS MAN'S POLICY** Inexpensive Life Assurance with options to convert at a later date to an endowment assurance either with or without profits.

2. **FAMILY INCOME POLICY** The ideal contract for a young married man: maximum life cover at minimum cost.

3. **POLICIES FOR CHILDREN** (*a*) "Public Schools" Policy. Provision for education by means of premiums spread over the early years of a child's life.

(*b*) "Early Thrift" Policy. Should be effected as soon after birth as possible to provide a splendid life or endowment assurance policy when the child attains the age of 21.

(*c*) "Family Protection" Policy. A policy on the life of a parent incorporating valuable options on the life of his child at age 21. Income tax rebate is allowed on the premiums.

An enquiry will bring full particulars.

COMPANY MEETINGS

ASSOCIATED TALKING PICTURES LIMITED

EALING STUDIOS' FULL YEAR

HIGH PRODUCTION COSTS

MALDISTRIBUTION OF FILM EARNINGS

MR STEPHEN L. COURTAULD ON THE POSITION

The nineteenth annual general meeting of Associated Talking Pictures Limited was held, on the 15th instant, at Ealing Studios, Ealing Green, London, W. 5, Mr Stephen L. Courtauld, M.C. (chairman of the company), presiding.

The secretary (Mr Leslie F. Baker, A.C.A.) having read the notice convening the meeting and the auditor's report,

The chairman said: Ladies and gentlemen,—The report and accounts have now been in your hands for some weeks and with your permission I will take them as read.

This year, as you will see in addition to the balance sheet of your company itself, your directors, in accordance with the provisions of the Companies Act of 1948, have placed before you a Consolidated Balance Sheet as at June 26, 1948, of your company and its subsidiary company, Ealing Studios Limited, together with a consolidated profit and loss account for the year ended on that date.

I do not propose, myself, to deal with these accounts in detail, as I am going to ask your managing director to do this when I have finished my address to you, and I will ask him at the same time to answer any questions you may have on these accounts. I will therefore confine my remarks to the general activities of your company and of its subsidiary, Ealing Studios Limited.

As you know, your company has not for some years engaged in active film production other than through its subsidiary, but has nevertheless continued to derive revenues from its past productions.

SUCCESSFUL FILMS

Dealing with current manufacturing activities, Ealing Studios Limited has again had a very full year of production. Although during the year under review only two films were actually delivered to the distributors, nevertheless, the year was a heavy one indeed as regards manufacture. The two films delivered were "It Always Rains on Sunday" and "Against the Wind," both of which were well received.

Since June 26th last, three further films have been delivered to General Film Distributors Limited, two of these, "Saraband for Dead Lovers" and "Scott of the Antarctic" being large-scale productions in Technicolor and the third a black and white film entitled "Another Shore."

Members will probably have seen from the press that an Ealing Studios Film, "Scott of the Antarctic" was selected for the Royal Command Film Performance this year. The film was very well received and the film critics were enthusiastic in their reviews. In addition, the shooting of two further films, "Passport to Pimlico" and "Whisky Galore," has been completed, and these films will be available for distribution and exhibition in the near future. A further film, "Kind Hearts and Coronets," is at present in course of production.

ACTIVITIES IN AUSTRALIA

Shareholders will doubtless remember that I advised them last year that it was proposed that Ealing Studios should continue with its production activities in Australia. During the year under review a further film, "Eureka Stockade," was produced in Australia and the final editing and completion of this film is now in progress, and it is hoped that it will be available for showing in the theatres at the beginning of the New Year.

It is proposed that further production shall be continued in Australia, where Ealing Studios have now arranged to take over a modest one-stage studio near Sydney. The first of the films at present planned for Australia will, it is hoped, go into production in the first half of the New Year.

THE NEW ACT

Regarding the general outlook for the future, I am sure shareholders will agree that it would be unwise for me to attempt to prophesy. Since we last met a new Films Act had come into operation, which provides, *inter alia*, for the showing, in cinemas of this country, of British first feature films in varying degrees. The Act, together with the Board of Trade Order which was subsequently made, provides for a proportion of the screen playing time, varying from 10 per cent. up to 45 per cent. being reserved for British first feature films. The object of the new Act is to give further stimulation and encouragement to the production of high quality British films, and the film production industry has expressed its opinion that good films in sufficient measure can be forthcoming to enable the cinemas to fulfil this quota.

It must not, however, be thought, and I stress this, that this Quota Act alone can solve many of the problems and difficulties inherent in film production. Production costs at present are far too high to enable an economic balance to be maintained in the production side of the industry by itself.

COSTS OF PRODUCTION

These high production costs have been built up over a period of years, producers relying to some extent on revenues from markets outside the domestic territory. As yet, however, we have not succeeded in making any appreciable impression on the American market, and it is unfortunately the case that several foreign territories find themselves in an uneconomic position similar to our own, which precludes anything in the nature of free importation of films; we are therefore placed in the position of having to rely mainly on our own domestic market and certain parts of the Commonwealth. Endeavours are being made to reduce production costs, but this is not the whole story, for we producers think—as pointed out in the House of Commons recently—there is a maldistribution of the moneys earned which acts against the interests of the primary producer.

The entertainment tax is far too high, and from the remaining balance we have thought for a long time that a fair proportion does not reach the producer.

GOVERNMENT'S ATTITUDE

You will have noticed that the Government are still alive to the importance of film production, this being apparent in the formation of the Film Finance Corporation and also in the fact that the President of the Board of Trade has set up a Commission of Inquiry in regard to production costs and in regard to the methods of distribution and exhibition.

You may be sure, however, that your directors will continue to use their utmost endeavours not only to maintain and, as conditions permit, improve the company's position, but also to play a full part in solving industrial problems. I will now ask the managing director to deal with the accounts and afterwards to deal with any questions which shareholders may wish to put to the directors.

MANAGING DIRECTOR'S SPEECH

The managing director (Major R. P. Baker) said: Ladies and gentlemen,—Members will no doubt remember that when I made some comments to them last year I did endeavour to give shareholders a verbal view of the consolidated position, and to recount the various steps through which it had been necessary for your directors to go to take the efforts of your company and its subsidiary up to the position which was then before us, and which today is, in a measure, revealed by the consolidated balance sheet.

I say "in a measure" advisedly, because it is my personal view, and I stress here that I speak personally—that the consolidated balance sheet, although no doubt absolutely correct academically, does not necessarily reflect the factual position of your company and its subsidiary. Point I think is given to what I say, if I mention that on the right-hand side of the consolidated balance sheet almost you will see at the bottom an item appears under the heading of "interest of minority shareholders in subsidiary company."

This interest is stated, in effect, as being an adverse balance on profit and loss account, and I would say, speaking as one of the minority shareholders; and the position is that Sir Michael Balcon and I are minority shareholders in that company; I hope that our minority interest does not represent merely a proportion of such adverse balance. This brings me to a point relating to the fixed assets which appear at the top of the balance sheet on the right-hand side, at a figure of approximately £195,000.

VALUATION OF ASSETS

In this connection I would remind shareholders that I did explain to them at last year's meeting that, after the end of the war and the bombing was finished, and these Studios had emerged with a more or less whole skin, your directors decided to have a complete inventory and valuation made with a view to ascertaining more precisely of what assets your subsidiary company was possessed, and in some detail to ascertain the current values which would reasonably attach to these assets. I did tell shareholders last year that the valuation which had been arrived at in relation to the fixed assets only, excluding any question of motor vehicles or mobile equipment, and excluding certain sound and camera equipment, was fully half a million pounds.

If, therefore, one substituted some £400,000 or £500,000 instead of the figure of some £195,000 appearing under the heading of fixed assets on the balance sheet, a somewhat different state of affairs would be revealed. I would like shareholders to know that I did discuss with your auditors the question of the adjustment in the company's books of the valuation of the fixed assets. Certain arguments for and against this course were developed, and I would here stress that whether a higher or a lower value were attached to these fixed assets, this does not in any shape or form alter the results or the prospects of the company's trading, except for one point, which is that the amount of depreciation to be provided on high values is, of course, more than that which is necessary on lower values.

I would advise shareholders, however, that it is the intention of the board to have further discussions with your auditors with a view to seeing whether or not, during the current year, some adjustment can be made to the Balance Sheet with a view possibly to reflecting, in the light of prevailing conditions, a little more accurately—if I may put it that way—the position of the assets of the company as against its liabilities.

UNSECURED LOAN

Regarding the item of £80,000 which appears under the heading of "unsecured loan," I think I ought to advise shareholders that this was purely a temporary inter-company transaction which happened to be effected during that year, but since the date of the balance sheet £60,000 of that loan has been repaid, and the remaining £20,000 will be repaid in the next few weeks.

The item appearing under the heading of "policies" relates to the endowment and sinking fund policies which were taken out when the studios were first built and covers £100,000 of endowment policies maturing in February, 1952, on which only three more premiums are payable, and a £50,000 sinking fund policy which matures in February, 1955, on which six more premiums are payable. I would also advise shareholders that, although the surrender value is stated as being approximately £107,000, we are advised that the cash value of these policies in the open market is, of course, materially higher than that. This is because the policies were taken out at a time when money rates were much higher, and the premiums were based upon those higher rates then prevailing.

FILM ASSETS

I think I should say a word about the current assets, that is the film assets, because, after all, this is really the axis upon which the whole of the company's trading turns. It has always been your company's policy, as we have pointed out before, to treat trading assets as conservatively as possible. We have not hesitated to write down current assets when the occasion, in our view, has demanded it, and we have not hesitated to carry forward what we think is right and proper at any time.

I might perhaps, in this respect, remind shareholders of what I told them last year, that substantially over £100,000 of net revenue had been received by your company from trading assets which had been completely written off by your directors. I mention this point specifically because you will doubtless have noticed that the report of your auditors calls attention to the amount which is carried forward in the balance sheet under the heading of "completed films." Your auditors were not able, at the date of the balance sheet, to confirm that this amount would be recoverable out of future revenues on those films.

I would like to add that your directors also were not able to confirm this. Indeed, if we wait to prepare the figures until we are able to confirm that certain revenues will, or will not, be received, then we shall have to defer the making up of our balance sheet for quite a number of years, because the life of a film, from the revenue earning point of view, is a very long one, and even now revenues are being received on films which are ten and twelve years old and more.

Turning to the liabilities side of the consolidated balance sheet, shareholders will note that the figures appearing do reflect the information which I endeavoured to give them last year. I did say that at its peak the borrowing of your company, and its subsidiary company, from its bankers and from the directors had exceeded the million pound mark. You will notice that the bank loans and overdrafts and loans shown on the consolidated balance sheet amounted to upwards of £790,000 as at June 26th last. Since that date this figure has increased somewhat.

PRIMARY PRODUCER'S INSUFFICIENT REWARD

On the general trading operations of your company and its subsidiary since the formation of your company in 1929, I would like to say just two or three words, if I may, because it is a subject on which I feel very keenly. Your chairman has already said that the board take the view that an insufficient proportion of the fruits of a successful picture come back to the primary producer. I think that what I am going to say does give reinforcement to the chairman's comment. Since the beginning, as I told shareholders last year, upwards of one hundred and twenty films had been made by your company or its subsidiary, or in association with them—at all events, made in these studios.

During that time I think it can be reasonably claimed that your company has had its fair measure of successful films: One has only to remember films like "Convoy," "Foreman Went to France," "San Demetrio," the seven films which were made with Gracie Fields, "Nine Men," the Will Hay comedies, the eleven films which were made with George Formby, "Frieda," "It Always Rains On Sunday," "Scott of the Antarctic," and many other films. The result of the trading operations of your company and its subsidiary are revealed in both the balance sheet of your company and the consolidated balance sheet, in the very heavy adverse balances on profit and loss account.

I, personally, am not at all satisfied that the amount which has been paid by the public to see the product of your company and its subsidiary over what is, approximately, the last 20 years, was not sufficient to pay a reasonable amount of entertainment tax to the Treasury to give a reasonable return to the retailer, that is the exhibitor, to give a reasonable return to the middleman, that is the distributor, and still enable the primary producer to stay at least on an even keel, if not to have a reasonable measure of profit.

The primary producer, however, does seem to be left to absorb all the severe shocks which are inherent in this industry, without having any of the compensating cushions which apply in the case of exhibitors and distributors; and, of course, the Treasury have a very substantial first mortgage on the takings of the films for entertainment tax, which at present absorbs more than 40 per cent. of those takings. It is to be hoped that the working party and committee of enquiry which have been set up by the Board of Trade will do something, in some measure, to adjust this situation.

BOARD'S ENDEAVOUR

I would just like to make one other point. As you will be aware, at these meetings we have, from time to time, stressed the fact that it has been the desire of your board to keep this company afloat if it were at all possible. Had we taken the advice of those who are alleged to be experts in such matters, we should, as it were, have written this company off many years ago. However, in addition to our normal obstinacy, we have a sort of sentimental attachment to this company.

If shareholders pause for a moment to reflect on the amount of money which has been obtained or subscribed by your directors —in the main, of course, by your chairman— over the long period of years, and compare this with the small amount of £34,000 which was the net amount of cash originally subscribed by shareholders they will, I am sure, realise that the directors have gone to fairly extreme lengths in their endeavours. In addition, your directors have acquired, from time to time, over a number of years, such shares as may have been put on offer and have not been taken up elsewhere.

Shareholders may think that this was an act of wisdom or an act of folly, but I mention this to show shareholders that, adverse as the position may be, and may have been for a long time, your directors have gone to some lengths to exemplify and sustain their confidence in the eventual outcome of the operations. The directors and their friends are now holding rather more than 50 per cent. of the issued share capital of the company.

DIFFICULT POSITION

I would not, however, like shareholders to attach undue optimism to what I have said in this respect. The position is acutely difficult. The rising costs of production have far outstripped the extension which it has been possible to make in the available markets of the world and it seems to your board, as your chairman has said, that in addition to reducing in production costs, it is only by the extension of markets and by the increase of revenues that the manufacture of quality pictures in this country can be sustained.

After the managing-director had replied to shareholders' questions the report and accounts were unanimously adopted. The retiring directors, Mr. R. P. Baker and Mr. G. W. G. Rayner, were re-elected.

BIRMID INDUSTRIES, LIMITED

ANOTHER SUCCESSFUL YEAR

The annual general meeting of Birmid Industries Limited was held on 17th instant, at Birmingham, Mr. Cyril C. Maudslay (the chairman) presiding.

The following is an extract from his circulated address:

Your directors are very pleased to report another year's successful working. In the consolidated balance-sheet the capital and revenue reserves amount to £2,874,612 or some 300 per cent. of the capital subscribed. In addition I would call attention to the special depreciation and obsolescence reserve, viz: £231,096, which is shown as a deduction from the fixed assets and represents some 13 per cent. of the gross value of such assets. Current assets at £3,757,461 are in excess of current liabilities (£1,081,368) by no less than £2,676,093, which I think you will agree shows a very healthy state of affairs. After charging £432,648 to cover taxation, i.e. some 41 per cent. of the total profits, the net profit for the year amounted to £301,621.

INCREASED PRODUCTION

Production has been substantially increased throughout the group factories. This circumstance reflects credit on managements, staff and workpeople alike, as industry has still many difficulties with which to contend which were absent in former days. You will be interested in the following figures, showing sales increases for 1947/48 as compared with 1946/47: Group iron foundries 41 per cent.; group aluminium foundries 18 per cent.; group magnesium foundries 70 per cent.; and light alloy wrought products 6 per cent.

Technical progress is in a way the lifeblood of our industry, and some report on this side of our work is called for. There is continual search for better alloys to suit new conditions, for more efficient methods and equipment and for new industrial designs and applications where our products can be used with advantage. Work of this kind is inevitably slow in producing results, and only a few of the many trails explored lead to a worthwhile goal. Notwithstanding, each year brings some useful successes.

Export is a subject of paramount importance to the nation in these times. The products of your factories, being semi-fabricated products, are in the main not suitable for direct export. As suppliers of important

components of finished products, however, we play a leading part in such major exporting industries as the motor trade—now in the lead of exports. In fact, the products of your foundries eventually go overseas to the extent of 75 per cent. to 80 per cent. of their total output.

Indirect exports of wrought light alloys is not so high, owing to the smaller proportion of sheet and sections taken by the motor and other exporting industries. In compensation however, a much higher percentage of Birmetals products is directly exported.

EXPANSION OF EXPORTS

Prior to 1946, Birmetals had virtually no export business. A long-term policy for examining export possibilities in different parts of the world was adopted. As a result, agencies and representatives were established as time went on in Belgium, Holland, Denmark, Sweden and Norway in Europe, Argentina in South America, New Zealand and French West Africa. Negotiations are progressing for agencies in other territories and to all those mentioned, regular and increasing supplies are sent. This export drive has been so successful that from practically nil at the beginning of 1946, Birmetals at the present time export direct over 20 per cent. of their total output.

An important factor in this success is our will and ability to give expert technical service in design particularly for marine applications—and tuition in fabrication methods. Experience shows that service of this kind is valued even more than a slight advantage in the price of material. Birmetals showed their range of products, with typical applications, at the recent Anglo-Danish Exhibition at Copenhagen. Their display was of outstanding merit and attraction and received exceptionally favourable notice from all commentators.

The report was adopted.

TANGANYIKA CONCESSIONS, LIMITED

INTERESTS REVIEWED

The annual general meeting of Tanganyika Concessions, Limited, was held on 16th instant, in London. The chairman Mr Maurice Hely-Hutchinson, M.C., presided.

The following is a résumé of his circulated statement:—

After crediting an amount of £522,339 received from the Union Miniere Company, in respect of dividends and royalties for 1947 and £200,830 in respect of amount received from the Benguela Railway Company, on account of redemption of 4 per cent. income debentures for 1947 and after providing £360,000 for taxation, the surplus on profit and loss account was £287,203, appropriated as to £126,818 for dividend on the preference stock at the rate of 10 per cent., less tax, and £138,146 for dividend on the ordinary stock at the rate of 8 per cent., less tax, the balance of £126,936 being carried forward.

Gross operating receipts of the Benguela Railway for 1947 amounted to £1,128,354 as against £653,175 in 1946, and after transferring £360,000 to renewal reserve account, the excess of income over expenditure, set aside towards redemption of debentures was £250,860, as compared with £86,800.

Gold production by the Geita Gold Mining Company, Limited, for the year ended June 30, 1948, was 17,440 ozs. Since the end of June, however, there has been a gradual improvement in operating results. Development on No. 7 Level at the Geita Mine reveals a considerable improvement in the grade of ore over the mine average, with greatly increased tonnage estimates. The estimated ore reserves at June 30, 1948, showed a total of 1,307,025 tons of an average grade of 3.94 dwts. per ton.

The report was adopted.

HORROCKSES, CREWDSON AND COMPANY, LIMITED

SATISFACTORY RESULTS

TAXATION AND RE-EQUIPMENT

The annual general meeting of Horrockses, Crewdson and Company, Limited, was held, on the 22nd instant, at the registered office, Yard Works, Stanley Street, Preston.

Lt.-Col. T. M. Brooks (chairman) presided.

Before commencing the business of the meeting, the chairman referred to the sudden death of one of the directors, Mr L. W. Brown, which occurred after the report and accounts had been issued. The chairman wished to record the deep regret of the members of the board at the loss of so young and valued a colleague.

The following is the directors' report which was circulated to shareholders with the report and accounts:—

The directors submit the audited accounts for the year ended August 31, 1948.

The combined net profit of the company and its subsidiary companies for the year, after deducting all working expenses, but before taking account of taxation, amounts to £511,909, compared with £298,829 for the previous year.

PROFIT AND DIVIDEND

The liability for profits tax and income tax on the profit for the year amounts to £273,042, against £197,563 last year. After this provision there remains a combined net profit of the company and its subsidiary companies of £238,867, compared with £101,266 last year.

After allowing for profits retained by the subsidiary companies, and additional provision for taxation by recently acquired subsidiaries, the net profit taken up by the company is £175,717 as against £60,473 last year.

Your directors recommend a dividend of 10 per cent. and a bonus of 5 per cent., requiring £41,030 after deduction of tax. Of the remaining balance they have transferred £50,000 to the re-equipment reserve, and £50,000 to the general reserve, leaving £34,687 to be added to the balance brought in, thereby increasing the amount to be carried forward to £134,718.

The Companies Act, 1948, was, to some extent, anticipated in the method of presenting the accounts last year, and the accounts this year are, therefore, in the most part capable of comparison with those of twelve months ago.

Stockholders will, however, observe that the fixed assets are given in greater detail—buildings, plant and machinery, etc., are shown under separate headings at values based on the 1935 reconstruction scheme, with subsequent additions and sales at cost. Cumulative depreciation, based on the written down value, is shown as a deduction and has been taken out of the provision for renewals, depreciation and modernisation. The balance of this provision now appears as a re-equipment reserve, the inadequacy of which is referred to later in this report.

SATISFACTORY RESULTS OF SUBSIDIARY COMPANIES

We are happy to report that all our subsidiary companies made profits during the year, and it is pleasing to record the progress made by Horrockses Fashions Limited. The demand for our fashions during the year, both at home and abroad, has fully confirmed the views expressed on previous occasions that cotton is still the most popular material for ready-to-wear garments tastefully designed and properly styled.

It is a matter of regret to your directors that the company has been unable to increase its productive capacity to any material extent during the year, nor to make any substantial recovery from the drastic concentration scheme to which it was subjected in 1941. The fact remains that the running plant at the moment is still considerably less than that in operation in 1939, a position which obviously has seriously retarded efforts to re-establish trade in markets which, of necessity, were neglected during the war.

ADVERSE RESULTS OF GOVERNMENT BUYING

We have, so far, found little or no difficulty in disposing of our products, particularly in the export markets, but the astronomical increases in the price of Egyptian cotton, and the frequent substantial falls in recent months, have made forward-selling difficult; so much for the Government claim that State buying of cotton would stabilise prices. On several occasions in the past we have referred to the dangers of discarding the services of the Liverpool Cotton Market. Events have proved, and are proving, that our fears were not unjustified.

It was hoped that our new factory in Northern Ireland would be ready to start by the end of 1948. Unfortunately, the forecast was too optimistic, but we hope to commence installing machinery in the spring of next year. The increased production will be of great benefit to the company, but it must be understood that it will be some time before our operatives can be trained and the factory put on a remunerative basis. It was to meet a contingency such as this that your directors have increased so far as possible the company's general reserve.

PROBLEM OF RE-EQUIPMENT RESERVES

With the question of reserves in mind, we wish to draw the attention of stockholders to one important feature which is causing your directors grave concern. In last year's report we published an analysis of the company's disbursements and it was shown that the balance remaining for reserves and the payment of dividend was only 8d. out of every £ received from our customers. This, however, is not the complete picture. The depreciation charged in the accounts, which is necessarily calculated upon the amount at which the fixed assets stand in the books, is approximately the same as the amount of the annual allowance which the company obtains for taxation purposes. As we have pointed out in our reports of recent years the cost of replacing our fixed assets as and when they fall to be renewed is far in excess of their book value. We, as a company, have done our best out of profits to prepare to meet the financial stringency with which we are bound to be faced when our re-equipment programme is able to take effect. It is for this reason that substantial amounts have been set aside to the re-equipment reserve, but no corresponding allowances have been obtained or are obtainable in respect of the excessive burden of taxation.

COST OF REPLACEMENTS

According to up-to-date figures, the replacement cost of our fixed assets at today's prices would be roughly ten times the amounts at which they stand in the books. It is true that we do not, and will not in the immediate future, need to replace the whole of our fixed assets, but if the company is to progress it is essential that we should be enabled to refit ourselves with the most modern equipment as soon as supplies become available. This means that we must face very considerable expenditure during the next few years in order to maintain our output capacity at a reasonable level and apart altogether from the development of new lines and activities.

BURDEN OF TAXATION

Your board is averse to raising new capital merely for the purpose of maintaining the capacity of the business, and considers that the provision of the funds necessary for this purpose should come out of the profits which are being earned. The burden of taxation on those profits under present conditions is, however, so severe that the ability of the company to set aside the necessary provisions is greatly restricted. According to the best estimates which can now be made, the company requires to set aside a sum approaching £150,000 per annum in order to make provision in the way indicated; the allowances for taxation purposes are approximately one-fifth of this amount, and the balance, if it is to be provided, must come out of profits which have been subjected not only to profits tax at the rate of 10 per cent., but also to income tax at the rate of 9s. in the £. In other words, in order to provide the additional sum of about £120,000 per annum for the purpose of maintaining its business, the company needs to earn profits for this purpose alone approximating to £250,000. This is apart altogether from providing a modest return to those who have invested their capital in the company.

In common with other boards of directors, your directors would urge the Government to recognise the facts of the existing situation and not to continue to levy what is, in effect, penal taxation, which can only in the long run discourage enterprise and deter the re-equipment of industry at the very time when maximum efficiency is essential.

The following analysis relative to the parent company only may help to make the position clear:—

	£
Current replacement value of the parent company's assets only	5,800,000
Annual depreciation required to write off replacement value over following periods: buildings 100 yrs., plant & machinery 40 yrs.	142,000
Annual depreciation based on 1935 valuation and subsequent cost actually provided in parent co's. accounts	28,500
Depreciation allowed for taxation purposes	30,000

BOARD CHANGES

During the year Mr R. M. Perry and Mr L. W. Brown, departmental directors of the company, were co-opted members of the board.

Mr Perry, who has been associated with the company for many years, will continue to be responsible for the sale of our products, particularly in the export markets, which he has visited on our behalf on many occasions.

Mr Brown is in control of our subsidiary company, Horrockses Fashions Limited, and its associated companies, the success of which this year is reflected in the consolidated accounts.

Your directors are confident that these gentlemen will be valuable acquisitions to the board.

We wish again to record our thanks to the management and employees who by their individual and collective efforts have contributed so much to the success of our operations during the past year. It is with their help and co-operation we can look forward with confidence to the future.

The report and accounts were adopted. The dividend of 10 per cent. plus bonus of 5 per cent. were sanctioned. The retiring directors Mr P. T. Stevenson, Mr R. R. Crewdson, and Mr R. M. Perry were re-elected and the auditors Messrs Price Waterhouse and Company, were re-appointed.

ANSELLS BREWERY, LIMITED

SATISFACTORY YEAR'S TRADING

The forty-eighth ordinary general meeting of Ansells Brewery, Limited, was held, on 17th instant, at Birmingham.

Mr A. E. Wiley (chairman and joint managing director) said that they felt the stockholders would be well satisfied with the year's trading. The trading profits of the group amounted to £1,871,566, an increase over the previous year of £112,811. After deducting items of expense, the resulting net profit for the year was £652,501, showing an increase over that of the previous year of £32,181.

INCREASED FINANCIAL STRENGTH

The consolidated balance sheet showed that the total fixed assets at £8,929,196 had increased during the year by £322,230, caused by the purchase of additional licensed properties and renewal of plant, machinery and vehicles. The current assets, amounting to £4,310,783, gave an excess over current liabilities of £1,928,936, an increase over last year of £234,746. From those figures it would be observed that the financial strength of the group continued to grow.

There had been two budgets during their financial year, both of which had severely affected trade by still further increasing the beer duty and consequently the selling price of their products. In addition to that, the Government since January had reduced the permitted barrelage of each brewery from 85 per cent. to 82 per cent. of the barrelage produced by them in the period 1945-46 and no regard was given to fluctuations in trade since. The result had been a falling off in demand due to the price being prohibitive to many people, so that in some cases brewers were now producing less beer than their permitted materials would allow. However, in industrial areas such as theirs, although the demand had fallen off, it still exceeded the amount they were allowed to brew, so that they were unable to keep many of their licensed houses supplied for the full permitted hours.

THE LICENSING BILL

Last month the brewing trade had received a severe shock when the Licensing Bill was introduced in the House of Commons. Its effect on their company could not yet be foreseen, but they were bound to view it with the gravest concern. It appeared to him that that was another step in the present Government's campaign of nationalisation, and a preparative towards the nationalisation of the brewing industry. The directors were convinced that in structure and management the licensed houses owned by the company were superior to those in the State managed districts. They felt that both the public and the trade itself had benefited from the healthy competition that existed between brewers.

Mr W. Scott, J.P. (deputy-chairman and joint managing director) said that the maximum price of malting barley had been fixed at 15s. per quarter above that of last year, which would materially raise their cost of production. The Catering Wages Act would also affect them in a similar direction. A member of the Government had commented on "the awful lot of profit" the brewers had made since 1939. In that connection it was interesting to note that their ordinary stockholders had gone through all the war years without any increase whatever in the rate of dividend. Since 1946 they had had a 5 per cent. increase but, in spite of that their net "pick-up" this year was £247,500, which was £6,250 less than they had received in 1939.

The report was adopted.

MONTAGUE L. MEYER, LIMITED

LARGER TURNOVER AND PROFIT

The annual general meeting of Montague L. Meyer, Limited, was held on 17th instant at Charing Cross Hotel, London, W.C., Mr Montague L. Meyer, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:

The trading profit of the parent company and its subsidiaries amounts to £355,753. This large increase is attributable to the considerable expansion of turnover, but the average rate of profit is lower than last year owing to the reduced remuneration on certain classes of goods in which we deal.

I am pleased to be able to report a continued development in our imported hardwood business, the purchase of which was announced in my address last year. Our well-equipped sawmills dealing with home-grown timber have, under energetic local management, again contributed to the results we are able to show.

EXTENSIVE BUSINESS ABROAD

Another satisfactory aspect of our trading is the extensive business which has been done abroad. This has not only proved of value to the company but has been the means of earning foreign currency for the country's needs.

A further point which should be mentioned is the question of control. Imported softwood, the largest section of the timber trade, is still strictly controlled. All purchases are made by the Government, and re-selling only permitted against licence. Centralised buying has been criticised in some quarters, but one must not lose sight of the fact that this continuation of control is principally caused by scarcity of certain currencies, and, until financial restrictions are removed, allowing purchases to be made in any market and at any time, Government buying, in my opinion, must remain. We are an anxious for our trade to be free from restrictions, but, until world conditions are such that we can buy where we like, and sell as we choose, we have to rest content with the present situation.

The cost of imported timber still remains at a high level, but the lessening demand from consuming countries will, it is hoped, gradually reduce prices to a stable basis, and, if this desirable situation coincides with the restoration of full freedom to trade, the Government can rest assured that the needs of the country will be fully catered for by the members of the timber trade.

ADDITIONS TO RESERVE

The directors propose to increase the general reserve by £50,000, bringing the group total under this heading to £175,000, and also to commence with the sum of £10,000 a reserve account for the redemption of the cumulative redeemable second preference shares. They further consider that the contingency reserve of £10,000 is no longer required, and propose that this be credited to profit and loss account. The final dividend recommended on the ordinary capital is 1s. per share, less tax, which, with the interim dividend paid on May 12, 1948, amounts to 1s. 6d. per share, less tax, the same as the previous year.

The financial strength of your group of companies is evident, as, after allowing for the recommended transfers and payment of all dividends for the year, the consolidated profit and loss account balance will be £227,888, which is £47,717 higher than last year. The addition of the group reserves (excluding that of £123,000 for future taxation) to this balance makes a total of £455,288, which is almost equal to the paid up capital of the company. While record profits are not always maintainable, I feel that you will have no reason to be disappointed with the next balance sheet.

The report was adopted.

RHOKANA CORPORATION, LIMITED

INCREASED PRODUCTION

The twenty-sixth annual general meeting of the Rhokana Corporation, Limited, was held, on the 21st instant, in London.

Mr S. S. Taylor, C.M.G., D.S.O. (the deputy chairman), having dealt with the changes which had been made in the accounts in order to comply with the Companies Act, 1948, said:

Quite apart from the fact that the methods we have adopted in framing the balance-sheet conform with the new law, they have the advantage of showing with greater clarity than before the amount of stockholders' money that has been expended on those assets which are still employed in the corporation's business. It will be all to the good if this has the effect of emphasising the fallacy to which I have often drawn attention before of considering the amount received by ordinary stockholders by way of dividends as having been earned by the employment of the nominal amount of the issued ordinary capital.

Our production for the year shows an increase of over 3,000 long tons compared with the previous year. This increase would have been greater had it not been for the shortage of coal deliveries which caused a total or partial shut-down of the plant on a number of occasions. We can, however, congratulate ourselves on the results for the year.

The revenue from the sale of metals, after making adjustment for opening and closing stocks, was £8,655,599, compared with £6,336,740 for the previous year, an increase of £2,318,859.

On the other side of the account operating costs have increased by £777,659. This sum has been absorbed in higher wages and supplies, increased cost of stores and other expenses. This leaves the operating profit, before providing for depreciation, at a figure approximately £1,540,000 higher than the previous year. Of this sum no less than £1,152,000 is absorbed by an increase over the amount set aside last year for taxation.

DIVIDEND AND RESERVES

The amounts set aside for depreciation and reserves have been increased by £236,000, leaving only about £141,000 available out of the additional operating profit to increase the net dividends to the ordinary stockholders. The net amount received by the corporation by way of dividends and interest was, however, approximately £65,000 more than in the previous year, so that £206,000 is available for increasing the ordinary dividend, equivalent to 15 per cent. net on the nominal value of the ordinary stock.

The total amount set aside for taxation on the profit for the year is £2,571,000 and there is a small adjustment of just over £2,000 in respect of earlier years. Your directors have decided to appropriate to general reserve the sum of £668,488, compared with £600,000 last year. The directors recommend that a final dividend of 75 per cent., equivalent to 15s. per unit of stock, be paid.

There is no indication at the present time of any impending fall in the world price of copper. When considering the prospects of the corporation you, of course, take into consideration our investments in Mufulira Copper Mines, Limited, and Nchanga Consolidated Copper Mines, Limited. Both these mines are potentially great profit-earners, although Nchanga has still to complete its expansion programmes. Arrangements have been made to sell to the Ministry of Supply the larger portion of the corporation's output for 1949.

The report was adopted

HARRISONS AND CROSFIELD

A SOUND POSITION

At the annual general meeting of Harrisons and Crosfield, Limited, held, on the 21st instant, in London, the Chairman, Mr H. Eric Miller, in reviewing the balance sheet and accounts, said: The available profit for the year amounts to £603,213 before U.K. taxation, and is the highest figure recorded in the company's 40 year existence. Provision for income-tax and profits-tax in the U.K. alone absorbs £344,730, and in addition, considerable sums for taxation have had to be provided by our overseas branches and subsidiary companies.

The balance sheet shows a strong and liquid position. Investments and current assets together exceed current liabilities by nearly two and a half millions sterling. The first item to catch the eye in the consolidated balance sheet is "Revenue Reserves and undistributed profits" standing at over £1,500,000. Sundry stocks £1,632,000 and sundry debtors and bills receivable, £3,396,000, give an indication of the wider trading activities of the organisation as a whole.

TRIBUTE TO STAFF

This seems to me the appropriate moment once again to pay a wholehearted tribute to the staff of the parent, subsidiary and associated companies, without whose talented and loyal co-operation we could not be presenting accounts which give so much cause for thankful satisfaction. We have, indeed, first-class teams representing us in many territories, and may well be proud of the manner in which they are upholding the best traditions of our race.

Mr Miller gave his usual review of conditions in the territories where the company is established overseas and of the position in the tea- and rubber-producing industries, in the course of which he said: Since our last meeting there has been no change in the method of purchasing tea for this country, the Ministry of Food continuing to enter into contracts with producers in India, Ceylon and East Africa, but there is evidence of a desire to get back to private trading.

The outstanding feature is, I think, the wonderful recuperative power shown by the plantation rubber industry which, despite disturbances in the principal producing territories, is now turning out natural rubber at about the same rate as in the peak year, 1941. World consumption of natural rubber and synthetics is now running at the rate of 1,850,000 tons per annum, virtually double the rate of consumption in 1938. Production of synthetic rubber, which in the peak year, 1944, amounted to 900,000 tons, is now running at the rate of 530,000 tons per annum, which is appreciably higher than the operative in the middle of 1947.

STEADY EXPANSION

With minor fluctuations the record of the rubber industry is one of steady, almost phenomenal, expansion, and I for one refuse to take a pessimistic view of its future progress in the service of mankind. Violent fluctuations in price are, however, thoroughly detrimental to producers, manufacturers and consumers. The International Rubber Regulation Agreement of 1934, which operated until the Japanese overran the Far East, showed how fluctuations can be kept within reasonable bounds, and it seems to me that the best interests of world trade would be served by the adoption of some such measure within the terms of the I.T.O. Charter.

The report was adopted and a final dividend of 20 per cent. (making 25 per cent. for the year) on the deferred ordinary stock was approved.

At the ensuing extra-ordinary general meeting, special resolutions were passed with reference to age limit and provision of pensions for directors.

KLINGER MANUFACTURING COMPANY, LIMITED

EXPANSION PROGRAMME

The 35th annual general meeting of the Klinger Manufacturing Company, Limited, was held, on the 17th instant, in London, Mr J. L. Callow, the chairman, presiding.

The following is an extract from the chairman's circulated statement:—

DIVIDEND MAINTAINED

On this occasion the report and accounts now before you cover a period of eleven months only. As this change will not result in any material alteration in the date on which the dividend will be paid, your board have thought it to be only fair to shareholders to recommend the maintenance of the dividend at 25 per cent., tax free, for the period, the same amount as paid for the previous year. As you will see from the comparative figures set out in the accounts, the net profit for the eleven months period is £80,320, against £73,490 for the previous twelve months.

The provision for taxation charged in the accounts consists of profits tax for eleven months, having regard to the dividend now proposed, together with income tax on the balance of profits adjusted for calculation for a complete year. The general reserve has been increased by a transfer from profit and loss appropriation account of a further £25,000, thus bringing its total to £125,000, and £3,529 has been placed to investment reserve. If you approve the proposed dividend there will remain £66,697 to be carried forward to next year, against £50,212 brought in.

The paid-up capital of the company remains unchanged at £141,224, but, as I reminded you last year, the effective capital actually employed in the business includes the reserves shown in the balance sheet, and these now amount to £347,085, making a total of £488,309.

MODERNISATION WORK

I referred last year to the programme of expansion and modernisation which was being pursued by your board. During the year we have spent £78,395 on new plant and machinery, of the latest types. The outstanding contracts for capital expenditure of £185,000 referred to on the balance sheet are for delivery over the next two to three years.

When embarking on this programme your board was conscious of the necessity for keeping in close touch with the latest developments in the design of machinery for the manufacture of hosiery, and with this object two of your directors have recently visited both the U.S.A. and Switzerland in order to investigate the latest types of knitting machines. We are satisfied that our new plant is well up to the highest standards, as regards productivity, technical efficiency and operatives' output per machine, and that our factory will continue to be equipped with the latest and most efficient machinery available.

WIDE RANGE OF PRODUCTS

Our present range of output covers all grades of fine gauge ladies' stockings. In addition to a large production of utility styles in pure silk, rayon and lisle, we have a steadily increasing output of Klingsil nylon stockings, both seam-free and fully-fashioned, which are finished by our own patented process. Our full-fashioned production is now getting well into its stride.

Our export trade has developed satisfactorily during the year with encouraging results in hard currency markets, though I am sorry to say that this has resulted in the diversion from the home market of the whole of our nylon production. We can only look forward to the day when we shall be able to supply our home trade customers with their full requirements.

The report and accounts were unanimously adopted.

Statistical Summary

GOVERNMENT RETURNS

For the week ended December 18, 1948, total ordinary revenue was £52,502,000, against ordinary expenditure of £90,673,000 and issues to sinking funds £110,000. Thus, including sinking fund allocations of £11,693,000, the surplus accrued since April 1st is £235,166,568 against £194,402,638 for the corresponding period a year ago.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

UNIVERSITY OF LONDON.—The Senate invite applications for the Readership in Demography tenable at the London School of Economics and Political Science (salary £800-£1,000-£1,200). Applications (10 copies) must be received not later than January 20, 1949, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY COLLEGE, IBADAN, NIGERIA

INSTITUTE OF SOCIAL AND ECONOMIC RESEARCH

Applications are invited for the post of Director of the above Institute. The appointment will be for a period of five years in the first instance and will carry a salary, depending on the qualifications and experience of the holder, of £1,500 per annum plus £250 per annum expatriation allowance with the status of professor or a salary in the range £1,000 to £1,350 per annum, plus £300 to £500 expatriation allowance with the status of Senior Lecturer, together with free passages to and from Nigeria, annual leave in the United Kingdom with passages paid, and payment of contributions to any approved superannuation scheme to which the holder belongs. The primary responsibilities of the holder will be to initiate and organise the Institute and to plan and conduct social and economic research in British West Africa, but he may be required later to undertake some teaching duties. Applications, giving particulars of age, academic qualifications and published writings, together with the names of three referees who can speak from personal knowledge of the character and ability of the candidate, should be sent not later than March 31, 1949, to the Under Secretary of State, Research Department, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1, from whom further particulars regarding the appointment can be obtained.

THE BRITISH BOOT, Shoe and Allied Trades Research Association require an Economist or Statistician for operational research on productivity in the shoe manufacturing industry. A man with a few years' research experience will be preferred. The post is expected to be a permanent one, and is eligible for superannuation under F.S.S.U. Applications to the Director, Satra House, Rockingham Road, Kettering.

STATISTICIAN required for expanding statistical department of large company. Applicants should have had at least 5 years' experience in the industrial applications of statistics. Age 30/40. A good salary will be paid to selected applicant which will be consistent with qualifications and experience. Write, in confidence, giving fullest details of career to date, to "Statistician," Fisons Ltd., Harvest House, Ipswich.

AN International Company distributing high quality foods, desires further to develop their Market Research Department. They offer an opportunity to a student graduating in July next, with a University degree in Statistics, to join them in enlarging this Department.—Box 919.

Postal Tuition for B.Sc. ECON.

The London University B.Sc. Econ. [illegible] qualification for posts in statistical, research and welfare work in commerce and industry, banking, administrative posts in the Civil Service, Education authorities, etc. The [illegible] open to all, whether University residents or not. You may prepare for the three examinations at home under the expert guidance of Wolsey Hall (est. 1894): moderate fees payable by instalments; if desired.

Prospectus from: [illegible], 117, WOLSEY HALL, OXFORD

DENBIGHSHIRE EDUCATION COMMITTEE

DENBIGHSHIRE TECHNICAL COLLEGE, WREXHAM

Principal: D. CECIL MORGAN, B.Sc., F.R.I.C.

Applications are invited for the post of Lecturer in Commerce, Law and Economics. Candidates should be graduates in Commerce or Economics and previous teaching and business experience will be a recommendation.

Applications (no forms issued), stating age, education, qualifications and experience, with dates, together with copies of two testimonials and the names of two referees, should reach the undersigned on or before Friday, December 24, 1948.

EDWARD REES, Director of Education

Education Offices, Ruthin. December 15, 1948.

THE Civil Service Commissioners invite applications for the following appointments in Government Departments to be filled during 1949, by competitive interview. Interviews will be held throughout 1949 beginning in January. Successful candidates may be appointed immediately.

(1) *Senior Scientific Officers.* Candidates must be at least 26 and under 31 years of age on August 1, 1949. They must have obtained a university degree in a Scientific subject (including Engineering) or in Mathematics with first or second class honours or an equivalent qualification, or possess high professional attainments, and must have had at least three years' appropriate post-graduate or other approved experience.

(2) *Scientific Officers.* Candidates must be at least 21 and under 25 years of age on August 1, 1949. They must have obtained a university degree in a Scientific subject (including Engineering) or in Mathematics with first or second class honours or an equivalent qualification, or possess high professional attainments. Candidates sitting for their degrees in 1949 may be admitted to the competition before the result of their degree examination is known.

The appointments announced in (1) and (2) cover a wide range of Scientific research and development in most of the major fields of fundamental and applied science. They will be held in various Government Departments (Ministry of Supply, Admiralty, Department of Scientific and Industrial Research, Air Ministry, Ministry of Agriculture and Fisheries, Ministry of Civil Aviation, Scottish Home Department, Home Office, Ministry of Works, War Office) and the places of work are spread throughout Great Britain. Each candidate is given the fullest opportunity to express his preference in the subject of work and the Government Department and particular establishment to which he wishes to be appointed.

Inclusive London salary scales for men are:—

Senior Scientific Officer £700 x 25—£900

Scientific Officer £400 x 25—£650

Rates for women are somewhat lower.

Further particulars and application forms from the Secretary, Scientific Branch, 27, Grosvenor Square, London, W.1, quoting No. 2351. Completed applications forms should be returned as soon as possible.

THE Civil Service Commissioners invite applications for about 120 vacancies for Professional Accountants in the permanent establishment of the Home Civil Service.

Candidates must be at least 25 and under 35 years of age on January 1, 1949; time served on a regular engagement in H.M. Forces may be deducted from actual age.

Candidates must have had wide professional experience and be members of one or more of the following bodies:—

Institute of Chartered Accountants in England and Wales.
Society of Incorporated Accountants and Auditors.
Society of Accountants in Edinburgh.
Institute of Accountants and Actuaries in Glasgow.
Society of Accountants in Aberdeen.
Institute of Chartered Accountants in Ireland.
Association of Certified and Corporate Accountants.

The salary scale for men in London is £475 x £25-£750. Starting pay according to age. Prospects of promotion. The rates for women and for posts in the Provinces will be somewhat lower.

Particulars and application forms from Secretary, Civil Service Commission, 6, Burlington Gardens London, W.1, quoting No. 2356; completed application forms must be received by him by January 13, 1949.

FRENCH-ITALIAN tuition, conversation.—Robert[illegible], T.C.[illegible] home; Gladstone 2892.

Printed in Great Britain by St. Clements Press, Ltd., [illegible] St., Kingsway, at 22 Ryder [illegible], St. James's, London, S.W.1. Published weekly by The Economist Newspaper Ltd., London, W.C.2. Representatives: S. S. Eadey, 111, Broadway, New York, 6.—Saturday, December 25, 1948.
