The sources of revenue available to the five concerns for payment of final dividends were laid down under the *Railways Control Agreement* and Section (20) of the Transport Act. The only room for surprises lay in the measure of flexibility allowed under Section 20(b) of the Transport Act, which entitled companies to transport, outside the scope of the *Railway Control Agreement*. These transfers have evidently been open-handed, but the last dividends of the "controlled undertakings," even so, are not greatly different from general expectations.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports appear in the Supplement: Imperial Tobacco; Harrods; Bolsover Colliery.

Redemption yields on stocks optionally or finally redeemable within the next five years															

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 24 per cent free of income tax. Yield worked on 15 per cent basis. (g) Fifteen months to March 31, 1947 (yield basis 7.6 per cent.). (h) To latest redemption date. (i) Free of tax.

Imperial Tobacco and Leaf Stocks

It is evident from a careful reading of the Imperial Tobacco report that the position about tobacco leaf stocks must be giving the directors much cause for concern. Doubtless this is a major theme which is likely to be included in the president's speech at the annual meeting next month. But it emerges that stocks of tobacco leaf in bond and of manufactured tobacco are smaller in quantity than at the end of October, 1946, though this fall is masked by the substantial increase in values which has arisen from the increased duty which Mr Dalton imposed last April. The prospect of future raw tobacco supplies in fact dominates the situation of the group. Despite the easy notion that supplies of Empire tobacco can be increased to replace dollar tobacco, it has long been clear that the limitations to the expansion of Rhodesian production which are imposed by labour and other difficulties rule out any prospects of the enormous increase which would be needed if dollar imports were forgone. The prospect for Imperial Tobacco this year is dominated, like so many other sectors of the British economy, by the varying prospect of Marshall aid—the only difference, perhaps, being that American comments on the Marshall programme do not conceal the importance which tobacco exports will play in it.

The Imperial Tobacco report (which is analysed and discussed in some detail in the *Records and Statistics Supplement* this week) will not be regarded as an encouraging document by stockholders, at any rate so far as the current year's prospects are concerned, for the results of the past year were considerably influenced by the relatively high volume of trade during the first half of the financial year until the Budget. The current basis of production, which appears to restrict supplies below the effective level of demand, is likely to prevail—subject to what Sir Stafford Cripps may have in mind for his April Budget—for the whole of the current financial year. And this, moreover, will bear a full year's Profits Tax, a not unimportant point of view of the relatively heavy burden which it involved for 1947. Meanwhile the company's permanent capital remains quite out of line with the effective capital which is being used in the business, and the Bonus Issues Tax has put out of court an official capital of the lines which the directors were contemplating a year or more ago because it would involve the Group in the fantastic charge of £9,000,000. The uncertainties of the current year are reflected clearly enough in the present yield of £6 9s. per cent on the ordinary stock which is a full £1 10s. per cent more than the average yield on industrials. Clearly the current year, on the best assumptions, is bound to show lower profits than for the past financial year, but that does not mean—unless Britain is forced to become a nation of non-smokers—that the long-term investment merits of Imperial Tobacco will ultimately be less favourable to ordinary stockholders than they have been in the past.

COMPANY MEETINGS

GENERAL MORTGAGE
BANK OF PALESTINE,
LIMITED

PROGRESS DURING PAST YEAR

The twenty-sixth annual general meeting of the General Mortgage Bank of Palestine, Limited, was held on the 8th instant, at the bank's offices in Tel-Aviv.

In the absence of Mr. S. Hoofien, Dr. A. Barth was in the chair. He reported on the progress made by the bank during the year under review. The item "Loans on Mortgage" had increased by 21 per cent., or £P.602,000, after repayments in an amount of £P.263,000, including £P.103,000 repaid in advance of maturity. There was a strong demand for mortgage loans and, although the bank now concentrated its activities exclusively to financing new housing, it could not always meet all applications. There was every reason to expect that this demand would continue during the forthcoming year. Although housing activity had made considerable headway, the scarcity of housing accommodation remained acute, as a consequence of continuous immigration.

The debenture circulation had increased by £P.550,000, or about 25 per cent., this being the highest increase during the last 12 years. The greater part of these debentures was placed locally. Their registration with the Securities and Exchange Commission in the U.S.A. and the placing of the debentures abroad had been retarded by the foreign exchange regulations.

THE FUTURE

The chairman concluded by pointing out that after the establishment of an independent Jewish State the bank's tasks would most likely take on appreciably larger dimensions. Increased immigration and consequently greatly enhanced housing requirements would undoubtedly widen the scope of the bank's activities. Statistical data of savings and potential investment possibilities led to the presumption that the necessary financial means would be largely available locally. The participation of foreign capital would also be sought and, it was hoped, not without success.

The report and accounts were unanimously adopted.

A dividend of 6 per cent. on both the ordinary and preference shares was proposed and approved.

NOTICES

CANBERRA UNIVERSITY COLLEGE

The Canberra University College invites applications for appointment to full-time lectureship as follows:
Lecturer in Economics (2 positions).
Lecturer in Political Science.
SALARY: The salary range of the positions is £600-£800 p.a. Salaries are subject to cost-of-living adjustments (at present an additional £70 p.a.), and the commencing rate within the range will be in accordance with qualifications and experience. (All amounts are stated in Australian currency.)
Further particulars may be obtained from the Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1. Closing date for the receipt of applications is April 16, 1948.

PERSONNEL AND WELFARE MANAGER required by well-known and old-established manufacturers in Birmingham employing approximately 1,000 people. Duties of the post are in the main those recommended by Industrial Welfare Society. Write, giving age, salary required and full particulars of previous experience.—Box 677.

EXPERIENCED lady secretary seeks contacts for work at home. Typewriting, duplicating; also available for shorthand. High standard.—Wordsworth 2615.

WANTED, copies of *The Economist* from June 1, 1947, to date. State price.—Walker, Fonthill Abbey, Rathfarnham, Co. Dublin.

UNITED SERDANG (SUMATRA)
RUBBER PLANTATIONS,
LIMITED

MR. ERIC MILLER'S REVIEW

The fortieth annual general meeting of this company was held in London, on the 25th instant.

Mr. H. Eric Miller, the chairman, who presided, said in the course of his address that the majority of the company's rubber estates in Sumatra had been re-occupied and that losses so far ascertained seemed to be less severe than those of some other companies operating in the same territory.

Continuing, Mr. Miller said:
The political problem is still far from solved and in economic questions we have to rely on contact with the Dutch authorities in Indonesia, who have so far given no sign that they appreciate the necessity to create an atmosphere of encouragement instead of frustration if the economic recovery of the territories is to proceed at a pace which will stave off disaster. When the question of sending out new capital equipment or funds for rehabilitation arises we naturally have to observe the rulings of our own exchange control. This country and we ourselves cannot afford to embark on one-way traffic, and unless there is the certainty of recovering any new sterling remittances within a reasonable measure of time stalemate must continue.

The N.I. are retaining the whole of the foreign exchange brought in by sales of produce and we have no assurance as to when we may be allowed to remit home any part of such profit as our efforts may earn.

Working under such a complete stranglehold is not conducive to generating enthusiasm for the task in hand.

EXAMPLE OF MALAYA

The speedy recovery made by British Malaya is an example of what can be done when individual initiative and improvisation are allowed reasonable play. Many of us feel that we are over-governed there numerically, but at least we have been encouraged to put our best foot foremost to good effect, and it is high time the N.I. authorities followed suit in all areas which are now under peaceful control.

Taking a realistic view, however, I am afraid that in the best event recovery can only be gradual in face of world-wide shortages of so many essential materials, not least of which are foodstuffs, and the risk of intermittent yet serious setbacks as a result of extremist political activities.

Having thus put the stark realities before you, I hope the Netherlands Indies Government may also appreciate that this is a fair presentation of the problems facing us. I would, however, like to assure you and them that given fair play and reasonable encouragement, we have the talent and the organising ability to parallel on the East Coast of

Sumatra the wonderful recovery made in a short space of time by British Malaya.

You are all aware of the outstanding value of natural rubber as a dollar earner, and how unfortunate it is from that point of view that the U.S.A. Government, for reasons of national security, feel compelled to maintain compulsory use of synthetic rubber at this time of our greatest need.

Their action is, however, clear evidence of the strong competitive position which natural rubber would hold in a free market and provided the strategic stockpile of natural rubber which the U.S. Government are gradually building up is rigorously maintained for national security purposes only, the outlook for natural rubber producers seems reasonably encouraging when one measures the great strides which are being taken all over the world in the wider application of this wonderful material.

The report was adopted.

STERLING TRUST, LIMITED
INCREASED REVENUE

The thirty-first ordinary general meeting of the Sterling Trust, Limited, was held, on the 24th instant, in London, MR. MAURICE HEY-HUTCHINSON, M.C. (the chairman), presiding.

The following is an extract from his circulated statement:—Your directors decided to transfer from the reserve account the sum of £235,978 representing the net premium on the share issue made in 1928, and to apply it in writing-down the cost of certain investments, principally European bonds expressed in foreign currencies. This appropriation leaves the reserve at £324,022, to which has been added a transfer of £25,978 from the revenue account, bringing it up to £350,000 against £560,000 last year.

The result of these adjustments is to reduce the balance-sheet value of the investments, which are now stated at £4,273,170. The valuation at December 31 was £5,446,223, showing an appreciation of £1,173,053, or 27.5 per cent.

On valuation figures, the geographical spread is Great Britain and Empire 85½ per cent., South America 9½ per cent., Europe 2½ per cent., Asia 1½ per cent., other countries 1 per cent. and the classification is British Government securities 4½ per cent., other bonds 16½ per cent., preference stocks 31½ per cent., ordinary stocks 47½ per cent.

Our total gross revenue at £238,406 shows an increase of £9,793. This is again a substantial improvement. In view, however, of the satisfactory results for the year, your directors consider that a moderate increase in the ordinary dividend is justified, and they accordingly recommend a final of 4½ per cent., making 6½ per cent. for the year, as against 6 per cent. for 1946.

We have made an estimate of income for the current year. It shows some decrease but it indicates a good margin over the dividend now recommended.

The report was adopted.

INCORPORATED ACCOUNTANTS

THE SOCIETY OF INCORPORATED ACCOUNTANTS AND AUDITORS' EXAMINATIONS.

The next Examinations will be held at London, Manchester, Leeds, Cardiff, Glasgow, Dublin and Belfast as follows:—

Final Examination: May 4, 5 and 6, 1948.
Intermediate Examination: May 5 and 6, 1948.
Preliminary Examination: May 4 and 5, 1948.

Candidates are requested to make their own arrangements for accommodation.

Applications on the appropriate forms must be lodged on or before Tuesday, March 16, 1948, with the undersigned.

Incorporated Accountants' Hall,
Victoria Embankment, London, W.C.2. A. A. GARRETT, Secretary.

EX-SUDAN Government (Short Contract) Official (31), married, well-educated, energetic, knowledge of M.E. countries and affairs, lit., math., musical, with COMM. ECON., STATISTICAL (incl. research), ADMIN. and TEACHING exp., excel. test., wants resp. and progr. post any sphere anywhere England. Tel.: Skipwith 68.—Box 664.

CAMBRIDGE Graduate with administrative and judicial experience East Africa, and trade association experience U.K., seeks post.—Write Box 672.

IRISHMAN (27), B.Comm. (2nd Class Honours), eight years' business experience, desires position in U.K. or Empire.—Box 651.

GOVERNMENT RETURNS

For the week ended February 21, 1948, total ordinary revenue was £111,891,000 against ordinary expenditure of £114,703,000 and issues to sinking fund allocations of £13,627,000 the surplus accrued since April 1st is £738,588,000 against a deficit of £337,946,000 for the corresponding period a year ago.

MARKETS for you in AUSTRALIA

Australia and New Zealand are rich markets to develop because of the relatively high purchasing power of their people. For trade, investment and travel information, ask your bankers to consult

BANK OF NEW SOUTH WALES

(Incorporated in New South Wales with limited liability)
FIRST AND LARGEST COMMERCIAL BANK IN THE SOUTH-WEST PACIFIC
London Offices: 29 Threadneedle Street, E.C.2., and 47 Berkeley Square, W.1.

Trade with Canada

We provide a complete and informed banking service for foreign traders through branches from coast to coast. Correspondents the world over.

London Offices—6 Lothbury, E.C.2. E.B. McInerney, Mgr.
2-4 Cockspur St., S.W.1. L. R. Newman, Mgr.

THE ROYAL BANK OF CANADA

Over 690 branches in Canada, Newfoundland, the West Indies, Central and South America.
Head Office: Montreal
Offices in New York and Paris
Incorporated in Canada in 1869 with Limited Liability.

UNIVERSITY OF OXFORD

The Delegacy for Social Training proposes shortly to appoint a Senior Tutor (Woman), the appointment to begin as soon as possible. The stipend will be £600-£700, according to age and experience, and will be subject to the conditions of the Federated Superannuation System for Universities. Children's allowances are payable under the system in force in the University.

Applications for this post (six copies), with the names of three referees and a short account of the applicant's qualifications, experience, and academic career, should be sent before March 15th, to the Registrar, University Registry, from whom further particulars can be obtained. Testimonials are not required.

The choice of the electors will not be limited to those who apply.

BALLIOL COLLEGE, OXFORD

The College proposes shortly to elect an Official Fellow in Modern History as from September 29, 1948, and invites applications, to be received not later than April 17, 1948.

Applicants should be prepared to teach mainly nineteenth and twentieth century European history, and also political theory. The choice of the College will not be confined to those who apply.

Applications should be sent to the College Secretary, Balliol College, Oxford, from whom further details may be obtained.

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Public Administration tenable at the London School of Economics and Political Science (salary £800-£1,000-£1,200). Applications must be received not later than April 27, 1948, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY OF LONDON

A course of five lectures on "The Transmogrification of Economics" will be given by Professor G. Stigler (Columbia University, New York) at the London School of Economics, Houghton Street, Aldwych, W.C.2, on March 8th, 10th, 12th, 15th and 17th, at 5 p.m. Admission free, without ticket.

JAMES HENDERSON, Academic Registrar.

THE ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

The half-yearly PRELIMINARY, INTERMEDIATE and FINAL EXAMINATIONS for candidates will be held on Tuesday, Wednesday and Thursday, June 8th, 9th and 10th next in Aberdeen, Belfast, Birmingham, Bournemouth, Bristol, Cardiff, Cork, Dublin, Edinburgh, Glasgow, Hull, Leeds, Liverpool, London, Manchester, Newcastle-on-Tyne, Nottingham, Plymouth and Sheffield, and at such other Centres, if any, as circumstances may warrant.

Entries must be received on or before April 1, 1948, at the offices of the Association, 22, Bedford Square, London, W.C.1.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hongkong)
CAPITAL ISSUED AND FULLY PAID UP £20,000,000
RESERVE FUNDS STERLING £6,000,000
RESERVE LIABILITIES OF MEMBERS £20,000,000

CIVIL SERVICE COMMISSION

THE CIVIL SERVICE COMMISSIONERS announce an Open Competition for about 10 vacancies in the Statistician Class of the Home Civil Service, to be held in 1948 concurrently with the competition under Method I for the Administrative Class of the Home Civil Service, and with an examination on the same lines as for that Method except for certain additional subjects. Age limits at least 20 and under 33 on August 1, 1948. Entry as Assistant Statistician on the salary scale, for men in London, of £360 x £25—£410 x £30—£720; higher starting pay for entrants with approved post-graduate experience. Salaries are somewhat lower for women and for officers serving outside London. There are prospects of promotion to higher grades. Superannuation under the Federated Superannuation System for Universities.

Further particulars and forms of application obtainable from the Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 2125; completed application forms must be received by him by March 15, 1948.

CONSUMER RESEARCH. A man is required to direct the Consumer Research Department of a food manufacturing Company in the Home Counties. The post is one of high responsibility, and a man of outstanding ability and experience in this field is sought. He will initiate and plan a continuous programme of sample surveys, direct the work of the Company's own staff of interviewers, analyse and interpret the results of their work, and make policy recommendations arising therefrom. He must not only be master of the techniques of Consumer Research in current use, but must be capable of adapting them to new uses and of improving upon them. The appointment carries an initial salary of at least £2,500, with superannuation rights. Apply, in confidence, with full particulars of career and salaries earned, to Box 676.

EXPORT DIVISION of large engineering combine in Westminster has vacancy for LADY EXPORT SALES ASSISTANT. Duties involve prosecution export promotion in Engineering products, typing own correspondence. Applicants must have degree standard educational background and one fluent foreign language, also practical experience in a post which involved independent commercial initiative. Previous experience dealing light engineering or technical products advantage. Contributory Pension Scheme. Salary offered, £420-£530 p.a., according experience.—Apply Box 673.

ASSISTANT EDITOR required by specialised economic journal of international standing. Applicant, preferably between 25 and 40, must be an able and experienced journalist, a keen, hard worker, of sound education and some economic training. Good salary, according to qualification. Excellent prospects.—Box 669.

A YOUNG GENERAL MANAGER and Company Director, until recently controlling large firm with export subsidiaries, altogether 600 employees and million turnover, seeks an appointment where hard work, initiative and proved administrative abilities will be encouraged and backed by progressive and determined Board of Directors. Excellent home and foreign commercial and governmental contacts. Although accustomed to income of £2,500 per annum, it is emphasised that remuneration is secondary to other considerations outlined. Prepared to reside anywhere in U.K., Canada, U.S.A., S. Africa, Australia or New Zealand.—Box 675.

A VACANCY exists on the non-residential staff of an old-established and successful Correspondence College for an experienced Tutor in Statistics; must hold appropriate Degree, preferably Honours.—Box 674.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees, payable by instalments, if desired.

Prospectus from Dept. P17, WOLSEY HALL, OXFORD

Action After Prague

CZECHOSLOVAKIA and Finland—the two countries upon which the Soviet vice is closing—are more than two small countries engulfed by the tyranny of a powerful neighbour. They are symbols and portents in the mind of Europe—symbols of a former betrayal by the west, portents of war and destruction which might be in store. The wave of grief and alarm that has swept over the free world draws some, at least, of its strength and bitterness from memories of 1939. So much bloodshed, so much sacrifice, so much suffering have been spent and borne to undo the injustices of that year. Now, barely a decade later, Europe is apparently back at that melancholy starting point.

Yet the western nations should not resort to mere foreboding in measuring the significance of the Communists' latest moves. What has happened in Prague resembles only in part the aggression of the Nazis nine years ago. Both acts of violation involved the destruction of free government by an internal minority allied to an outside Power, but the motives are not the same. Paradoxical though it may seem, Russia's action in Czechoslovakia is in one important respect a defensive act—a consolidation of a control already in being in order to ward off imagined dangers from without.

In truth, neither in Czechoslovakia nor in Finland could the Communists be certain of maintaining their position at the forthcoming elections in May and July. On the contrary, all the evidence suggested that they were likely to lose ground quite heavily. This set-back would have occurred at a time when political confidence and economic recovery in the west are likely to be strengthened by the first stage of the Marshall Plan. Indeed, the fall in Communist popularity may already have been partly caused by new hope of better times among the free peoples of the west. The Russians have been on the defensive ever since the chance of a recovery programme appeared on Europe's horizon, when the Cominform was hastily brought into being as the General Staff of the ideological war against the Marshall Plan. Czechoslovakia, the most democratic member in form and spirit of the east European bloc, whose Government first accepted the invitation to participate in the Paris Conference and then, on Russian instructions, withdrew, was the most exposed salient in the anti-Marshall line. Last week's coup hammered out the salient and closed the chief door by which pernicious influences from the west might have entered.

The policy practised at Prague, in its brutality, its open duplicity, clumsy fakes, disguises, and contradictions, bears, in spite of its careful secret preparation, many of the marks of an action dictated by fear. And, like most actions dictated by fear, some of its results will not accord with what its perpetrators intended. If Russia's aim in screwing down the nails in the Czechs' coffin was to lessen the chances of the Marshall Plan and to win a round in the struggle against European recovery, the coup at Prague has failed. The Communists have, in fact, vastly increased the chances that the Marshall Plan may succeed outside their sphere.

The reaction has been general and immediate. In Washington, Senator Vandenberg, in the masterly fashion he has made his own, has been

able to present his Bill for European Recovery to the Senate in an atmosphere which makes isolationism seem lunacy and support for Mr Wallace almost treason. In western Europe at large, the urgency of uniting the Sixteen Nations in a single bloc has gained fresh point. Inside each nation, all parties have received a last warning that no spoon is long enough for those who sup with the Communists. This realisation may, perhaps, even offer some hope that, in France, the bickerings between the non-Communist groups may cease. General de Gaulle may decide to join forces with the constitutional parties and the strength and influence of M. Léon Jouhaux and his *Force Ouvrière* may receive a new impetus. In Italy, the defection of Left-wing Nenni Socialists to the constitutional Saragat wing is reported to be considerable. All save the Communists and their fellow-travellers are now alive to the real meaning of the great variety of Communist "shadow organisations" which exist in every field and ominously recall Czechoslovakia's "action committees." Prudent Russian policy would have wooed America and Europe into a false sense of security. Instead, every red light, every burglar alarm, every whistle has been set blinking and blaring from one end of the Continent to the other.

★

To recognise the Communist danger for what it is, and to realise that the latest moves are primarily defensive is not, however, to say that there is no real threat to western Europe and that nothing needs to be done. The ruthlessness of the Czech coup is a measure not only of the Communists' fear, but also of their determination. The Cominform's field of activity covers France and Italy—in each of which roughly one-quarter of the voters have been ready in the past to vote the Communist ticket. In both these countries, a desperate effort will certainly be made to defeat the recovery plan before it starts, even, perhaps, at the risk of civil war.

While there is imminent risk to the safety of these two exposed members of the western community, a more remote but no less real danger hangs over that community as a whole. It is that the plan for western association and the drive for European recovery are still only in the preparatory stage. Lord Pakenham created fresh hopes on Wednesday when he said that "a start is being made to give living embodiment to the Western Union idea." But it is still permissible to wonder whether the western powers are not scared of it too—at least scared enough to hesitate to take the plunge from the crumbling bank of national sovereignty into the unknown waters of sharing, pooling, co-operation, integration and all the other unfamiliar responsibilities which western association demands.

The lesson is clear. The answer to the Czech coup is two-fold—first to maintain free government in Italy and France, where the next Communist offensive will be launched; at the same time to lay with all possible speed the foundations of western union. The chief responsibility in the first case must lie with the French and Italian Governments. They alone can decide on the steps to prevent a minority from overthrowing the republic by unconstitutional action. But the governments which form the core of any future western association—Britain, France and the Low Countries—can go a certain distance to increase the general strength and security of the western fringe. After Prague, can they afford to delay any longer in uniting themselves in a formal defensive alliance against all outside aggression, either against themselves or any other western European state? Have they given any thought to the legal and constitutional problem of defining "aggression" more closely so as to cover such modern methods of aggression as infiltration or the use of armed minorities within the country to overthrow lawfully elected governments? The pact would be open to all like-minded states, but the five founder members

would need to establish at once regular staff discussion to co-ordinate policy and standardise equipment.

There are two reasons why it is essential that the United States should be associated with any such pact. The first is obvious. If Russian policy is, after all, adventurous and aggressive, that pact is not simply the concern of western Europe. It is the concern of the world, and the United States, as the most powerful member of the world community, has an equal responsibility with western Europe to check aggression. If possible it should be checked peacefully by making it clear in advance that any attack delivered in any quarter will lead to a major war.

The second reason for American participation is inherent in the present economic weakness of western Europe. Since nearly all the nations likely to be concerned with a defence pact are on the razor edge between collapse and recovery, largely as a result of the war they have already fought, the addition of a rearmament programme to their over-strained industrial capacity might prejudice their whole chance of success under the Recovery Programme. For a year or two, at least, there is need for some arrangement—possibly under a modified form of lend-lease—whereby American and Canadian equipment can be made available to the armies of Europe. Nor is it simply a question of materials; manpower is just as short. Although a policy of reinforcements to the American armies of occupation in Germany, Austria and Trieste may be unpalatable to a country as profoundly pacific as the United States, the lesson of all the dreary years of appeasement is surely that failure to take reasonable precautions in time involves a nation later in infinitely greater suffering and expense.

This question of timing is particularly important when the Russian case is considered. It can be argued that there is no drive within the Communist system which irresistibly compels the Russians to war. Unlike Hitler, Stalin has repeatedly shown himself able to retreat and to reconsider his tactics. The one thing that might tempt the Russians to further adventures would be the belief that the western world as a whole was as unwilling and unable to resist as the non-Communist groups in Czechoslovakia. At times of uncertainty such as these the temptation to the waverers to climb on the Communist bandwagon is great. There is still time to pull them back with an American guarantee of western Europe's integrity.

★

The major objective remains, however, not military pacts and defensive alliances, but the building of a western union. No garrisons, no defences will save the western world in the long run if it cannot find the secret of revival within itself. On this front, the news, though confused, is a little better. The warning from Prague has jolted the western nations into activity. An immediate meeting between officials of France, Britain and the Low Countries opened on Thursday in Brussels. The agenda of association will be fully discussed and preparations made for a general meeting of the Sixteen in Paris on March 16th which Mr Bevin will attend. But it is vital that at this conference the nations should pass beyond formal resolutions and general speechmaking. By then the Senate Bill will have given them an idea of the amount of aid they will be able to rely on for the first nine months. On that basis, the making of concrete plans can begin, provided that the right agencies exist to undertake the work.

This, then, is the crucial first decision to be taken at Paris—the decision to set up a continuing organisation or a central planning agency, staffed with men whose energy and experience are adequate to the tremendous task of evolving the proper methods of western co-operation. If these plans and methods are adequate, unity will grow; if they are not, unity will founder and, with it, western Europe.

How Strong is the Eastern Bloc?

WITH the fall of Prague the last obstacle to complete Soviet control of all eastern Europe north of Greece was removed. The obstacle, as events have shown, was not formidable: in foreign policy Czechoslovakia was already the complete and faithful ally of the Soviet Union. If the Russians wanted nothing more than security against foreign threats, and a firm grip on a geographical position and economic resources of great strategic importance, they had every reason to be satisfied with things as they were before February 25th.

Over four years ago, before the war was over, Messrs Fierlinger and Molotov had signed in Moscow a treaty wider in scope and more precise in commitments than the pact of Dunkirk between France and Britain. Like all other east European pacts its main avowed object was to prevent German aggression; it assured mutual assistance if either party were "involved in mutual respect of independence and sovereignty, non-interference in each other's internal affairs, economic relations on the largest scale" and permanent friendship and collaboration. This treaty became the corner stone of Prague's foreign policy, and was proudly regarded by men of all parties. It was also the corner stone of the Soviet's east European fortress. That the Communists in Czechoslovakia should have thought it necessary, with the approval, if not on the advice, of Moscow, to break the National Front and seize complete power is a sign of the grandiose proportions that the structure was intended to have, and of the haste with which its builders are now working.

The intention is clearly to make of seven or eight countries (the fate of Finland is not yet decided for reasons discussed in an article on page 380) a solid bloc, held together by exactly similar political and economic regimes, directed by the greatest experts in power-politics modern Europe has seen—the Moscow-trained satraps. The bloc is to provide not only a bulwark against the west but also a firm base for action in whatever direction future Soviet policy in Europe may turn: towards the Aegean, the North Sea or the western Mediterranean; against Turkey, Greece, Sweden, Italy or the Rhine Valley. Since Mr Marshall took charge of American foreign policy a year ago, the process of completing the bloc has been speeded up. And since the Cominform got busy last autumn, each country has taken one or more steps forward along the pre-determined path followed by its associates; Bulgaria to the Yugoslav and Albanian stage of development, Rumania to the Bulgarian stage, Hungary and Poland to the Rumanian, and now Czechoslovakia to the Hungarian. The tempo steadily grows faster and soon the Communists will have completed that "monolithic unity" for which they crave. The finishing touches may well be given before even the vague outline of western union is visible.

The time has come therefore to examine carefully the strength and the weakness of this Soviet base. Is the bloc indeed an organisation of "kindred souls"—to use Mr Bevin's phrase? Have the age-old feuds of some of its members been buried for good? Can the social and political levelling be made complete? Is the monolith as solid and as smooth as it looks?

Before the end of this year, this east European base will probably consist of Finland, Poland, Czechoslovakia, Hungary, Rumania, Bulgaria, Yugoslavia, Albania and the Russian zones of Austria and Germany. About its economic resources more will be said in a subsequent article; it is sufficient now to mention Silesian coal, Rumanian oil, the mineral ores of Hungary and Yugoslavia, and the highly developed industries and skilled

workers of Saxony, Bohemia, Lower Austria and Budapest. Its population numbers over 110 million, with excellent military material. At present only Yugoslavia has an army of importance; and it will take time to equip and retrain mass armies in the other countries on Red Army lines. But the task has certainly been begun. Russian-trained generals and staff officers—in the case of Poland numerous senior officers of Soviet nationality—are in charge at the key points; "political departments" have been set up to indoctrinate all ranks through commissars corresponding to the Soviet *politruk*. When "politically reliable" cadres are sufficiently numerous, the armies of the ex-enemy states, now limited by the peace treaties, will be expanded. Armaments will be provided by the heavy industry of the Soviet Union, supplemented from the industrial regions of the bloc. Whatever their quality, the quantity of such arms will be impressive.

On the credit side then, the Russians have gained from their supremacy east of the Elbe a useful salient into central Europe, access to the Adriatic, a mighty increase of man-power and raw

materials, and many economic advantages useful to their war potential. But the very uniformity and strictness which give cohesion to the seven or eight governments are signs of the difficulties and weaknesses which must worry their master.

The first weakness on the debit side of the Russian investment in eastern Europe is the general hostility of the east European peoples to Communism. It takes several forms. In Catholic Poland, Czechoslovakia, Hungary, Croatia and Slovenia the Church, which has great influence over the peasants, is a centre of powerful discontent. These same peasants, and others who are not Catholics, fear forcible collectivisation. In fact no steps are being taken to collectivise the peasants; the policy of the Communists is almost identical with that of the Russian Bolsheviks during the New Economic Policy after 1921. But NEP gave way after a few years to Stalin's drive for collectivisation, and there is little reason to doubt that the example will be followed by the east European disciples when they think the time is ripe. In any case, even if the "kolkhoz bogey" is laid, the peasants are antagonised by laws compelling them to sell the bulk of their produce to the state at low fixed prices, by the disparity between industrial and agricultural prices, and by the extreme scarcity of manufactured goods.

Even more hostile are the professional classes, whose cultural background has been predominantly western; and the shortage of experts and technicians in all fields makes their attitude a source of serious embarrassment to the regimes. Finally, the working class is by no means uniformly enthusiastic about Communism. Stakhanovite methods of speeding up work may or may not suit Serbs and Bulgars; but among the Poles there were unofficial strikes in Lodz in the autumn, and in Czechoslovakia workers' resentment against Communist management in the factories was growing until quite recently. Open opposition to the Communists may be impossible; but hidden resentment is a factor to be reckoned with in a time of crisis.

A second source of weakness lies in the nationalist rivalries that exist between the states of the bloc. The nineteen pacts which have been woven since 1943 across the pattern of older enmities have not entirely concealed these rivalries. For example, there is still no pact between Czechoslovakia and Hungary. In Hungary even Communist leaders express indignation at a peace settlement which is severer than Trianon; and the Czechoslovak-Polish dispute over Teschen has been postponed, not solved. Finally, the master-planners in Moscow still face the impossible task of reconciling Germans with Poles and Czechs.

Perhaps more dangerous than inter-state rivalries is the deep and strong nationalism within each nation, which is directed above all against Russia, the foreign conqueror and oppressor. Hatred of Russia has long been intense in Poland and serious in Rumania and Hungary. Even in the south Slav countries it has grown since 1945, and may now extend to Czechoslovakia.

Operation Canute

THE President of the Board of Trade, declared Mr Lyttelton in last Tuesday's debate, has become a modern Canute who piously implores the tide of rising prices to retreat from his chair; but the President will get his feet wet—very wet. This puts so vividly the most obvious criticism of the Government's latest prescription for countering inflation that it is a pity to challenge the metaphor. But the truth is that, though the Government's methods are no better than Canute's, there is a world of difference between their problem and his. The tidal pressure against which they contend is one which they certainly could abate if they but went the right way to work.

Obviously, it was right to show that the so-called anti-inflation policy is more likely to increase inflationary pressure than to reduce it, and that the only real remedy lies in turning off the inflationary taps at the source, by reducing the excessive flow of incomes and the surplus volume of money. But the Government are unlikely to change the whole foundation of their policy: at the least, they are likely to stand by it until the results of their request to the Federation of British Industries to produce a plan for reducing prices and profits have been studied. In the meantime, they contend that, although their measures will not of themselves reduce the pressure against the dams of control, they are taking steps to strengthen the dams. Such an argument, were it allowed to go unchallenged, might even now have a specious appeal to many people.

Certainly, a full appraisal of the effects of price control is long overdue. In Parliament, it has been neglected in the past principally because of a lack of sufficiently clear and comprehensive information of how the system really works. But, since the Government intend to rely even more heavily upon price control in future, attention ought to be drawn without delay to certain leading questions. How is it that a system which in future is expected to restrain increases in prices has so patently failed to do so in the past? What effects does price control have upon industrial efficiency? To what extent does it distort the struc-

The foundation of this nationalism throughout history has been the peasantry. But even among the Left elements in the intelligentsia, who were at first inclined to welcome Russian leadership as a unifying and socially progressive force, bitter disillusionment has grown. To east Europeans national survival seems at stake. It is easy to talk of the retrograde character of nationalism, and the merits of great multi-national units. But these men, with their backs to the wall, fear that they will be degraded to the level of Udmurts or Yakuts.

These weaknesses must be weighed against the Soviet gains. It would, however, be foolish to overestimate them. All three existed under the wartime German yoke, yet Hitler had little difficulty in maintaining his grip, at least until the end of 1943. It seems probable, too, that the Communists have a better technique than the Germans. Hitler confined himself to exploiting existing rivalries, and relied on kings, generals, landowners and bureaucrats, who vaguely sympathised with Nazism, supported Germany when it was strong, but proved unreliable in adversity. The Kremlin prefers to rule through its devoted stooges, schooled by years of staff training in the Comintern in Moscow and of field experience in the world Communist underground. Communist propaganda is far more truly totalitarian than was that of the Nazis. Finally, it is probable that the Communists, by improving the material lot of a considerable minority of the population, will win some genuine enthusiastic support. They trust their stooges further than did the Nazis, and they will see that all the arms available go to them. For these reasons it would be wise to assume that the Soviet grip on eastern Europe will be stronger—even if more resented—than was the German.

ture of production? Will the latest extensions make the system work more, or less, efficiently?

To the uninitiated, it might seem that the big rise in prices in the past two years is in itself proof that the system of control has not been working according to plan. But this is not so. Although the biggest rises have, of course, occurred in uncontrolled goods (mainly luxuries) many of the increases in more essential goods have been lawful increases, often specifically sanctioned by the authorities. Except in the very short run, price controllers have never been able to devise any better test of the reasonableness of prices than their relationship to costs of production. This does not mean that all price controls work upon the crudest cost-plus basis; but, in general, the system has enabled manufacturers to pass on their cost increases to consumers. That, in itself, imposes a strain upon industrial efficiency because it encourages manufacturers to assume—sometimes wrongly—that they will never be penalised for inefficiency.

Unfortunately, the ill effects are often greatly exacerbated by particular techniques of price control. These are complicated, but a brief summary of their main features serves to illustrate the difficulties which are involved in "Operation Canute." Since 1941, the price controllers have progressively extended the range of goods which are controlled by means of a uniform maximum price for each article or grade of article. But, until the Orders made last week, many of the less essential consumers goods were still controlled only by that crude formula adopted at the outbreak of war. Under that system, the controllers did not fix any specific prices at all, but simply decreed that a firm must not raise its price above the prewar level by more than the amount of any increase in its cost per unit of producing or selling an article of the same type. The effect of this formula, to the extent that it worked, was to stabilise the cash profit per unit at the prewar level, but to leave costs

wholly uncontrolled. During the war, as more ambitious techniques of control were applied to essential goods and as production of many non-essential goods ceased altogether, the weaknesses of the 1939 system became of diminishing significance. But since 1945, as production has become more diversified, the evil effects of this old formula have become more apparent. Not only was it impossible to track down and punish more than a few of the presumed infringements, but any firm could escape quite legally by producing or marketing goods which, often in some minor particular, were different from those it sold in 1939.

Unfortunately, it is not only in these less essential categories of goods that the principle of cost-plus has been doing damage to industrial efficiency. Indeed, it is often in the more essential categories that the worst effects can arise. The Board of Trade has resorted increasingly to standard maximum prices wherever the types of goods could be precisely defined and their qualities specified. But this system of uniform maximum prices (as distinct from a different maximum price for each individual firm working under a cost-plus formula) had the result, always abhorrent to price controllers, that a price which gave no more than a reasonable profit to the average firm would leave the low-cost firm with a very high profit and might perhaps involve actual losses for firms with the highest costs. Yet the need to secure the maximum output of scarce goods made it necessary to ensure that even the marginal firm could secure a "fair" profit. Hence the authorities devised for some important industries a supplementary method of control, resorting once again to the cost-plus principle. Under this hybrid system the maximum price which could be charged by a manufacturer of, say, utility clothing was either the prescribed maximum price of, which operated for all manufacturers of the article in question, or the maximum based upon his own costs, if his individual maximum was less than the general maximum.

★

The anomalous results of this system are easy to see. Whenever widely different maximum prices, all equally lawful, exist cheek by jowl for identical goods, the effects upon efficiency and morale are bound to be bad—for the lowest maximum prices govern the firms with the lowest costs, while the highest price is available only for the firm whose costs are highest. But the evil of this Gilbertian situation is greatly aggravated by the percentage "mark-up" system of controlling profits. In these days of physical limitations upon output, that often means that a manufacturer cannot increase his profits unless he inflates his costs. Yet if he refrains from doing so, he actually gives his wholesaler or retailer customers (whose gross profits are likewise governed by a cost percentage) an incentive to take their business to a higher-cost manufacturer.

Probably not much diversion in fact takes place for this

reason; most goods are so scarce that they will be bought at any price—even a low one. But this case, though extreme, is in principle typical of the way in which price control not only strikes at the roots of efficiency and business morality, but provides a constant inducement to business men to do precisely the opposite of what the controllers intend. This tendency is not peculiar to the crude cost-plus system. Inevitably, it is the most essential goods (especially the standardised utility goods) which are most closely controlled, and the tighter the control there, the greater is the incentive to switch production to less essential goods where control of profits or costs is more lax and where quality may not be controllable at all.

Will the latest extension of control reduce these evils? On the contrary, it is more likely to aggravate them, for it follows the familiar and dreary technique of trying to block up loopholes. In particular it imposes upon the less essential categories of goods which still were subject to the old 1939 formula a system which Mr Harold Wilson describes as "more up-to-date and realistic." Yet this control is nothing more than a standstill at existing price levels, from which manufacturers may escape by the device of slightly modifying the specifications of their goods. True, they then face a different form of control, but this, in Mr Wilson's own words, is "rough-and-ready and need be no more" because it is "designed to prevent evasion." Such naivety is scarcely to be expected from a President of the Board after ten years of price control. This "rough" system proves to be the oddest version yet of the cost-plus method; the percentage "mark-up" is to be applied, not to total costs, or even to prime costs, but merely to the cost of materials, and the same mark-up applies whether a firm manufactures from its own raw materials or produces the same article by the assembly of purchased components. The scope here for "legal" abuses looks wide indeed. The other new instrument in the armoury of price control is in principle more effective, for it extends to all cost-plus systems the new rule that increases in rates of wages, salaries or commission will not be allowed as increased costs unless the Board of Trade agrees that the increases in rates were justified by the principles laid down in the Personal Incomes White Paper. When applications for adjudication on this knotty point begin to flow in, the Board of Trade will face a severe headache.

The truth is that such efforts to stop up the leaking dams will never keep pace with the damage that inflation wreaks upon them. The Government's policy seems to them inevitably to require more and more control, more snooping, more cost investigations, and more prosecutions. Yet it could never succeed—not, at least, with any level of control below that of the most far-reaching totalitarian dragooning of the whole economy. It is much simpler, and incomparably less costly—whether in terms of politics or economics or social objectives—merely to turn down the pressure of inflation.

Flying Blind

THE greatest handicap to British civil aviation at present is not lack of a policy so much as failure to carry out an agreed policy. The conditions under which the three state-owned air corporations should operate were approved by Parliament and laid down in the Civil Aviation Act of 1946. The limitations were realised and the cost was accepted "with eyes wide open," as the Minister of Civil Aviation has recently affirmed. In simple terms, British air lines had the choice of flying with modern American aircraft, which would give them better prospects of commercial success from the outset, or of "flying British" at a heavy and unavoidable loss for several years, with the ultimate intention of encouraging British manufacturers to produce aircraft capable of competing effectively with American types.

There are few who would deny the good sense of the decision to take the second course. But the bill has already been heavy, and the next instalment is likely to be heavier. On their first year's operations the three Corporations exceeded their authorised deficit of £10 million by £214,274. This loss would undoubtedly have been smaller if the Corporations could have suspended several uneconomic routes or have avoided heavy initial expenditure. But that would have been to abandon the whole justification for the nationalisation of air services. On grounds of imperial policy, services, say, to Australia could not be stopped by reason of their expense: the Middle Eastern services, again, which are also essential in the national interest, cost another £600,000. Such losses cannot be charged directly to nationalisation; they represent the cost of services which would have to be provided under any regime. And the loss of British Overseas Airways Corporation, to that extent, is of the same character as the subsidy which would have to be paid to privately-owned airlines to maintain similar services.

But, even so, the loss would probably not have been so heavy. Private companies would have been less tolerant of departmental interference and indecision, which have cost the Air Corporations dear. Because there is, as yet, no single co-ordinating authority to supervise all aspects of civil aviation policy, avoidable expenses and disappointments have resulted. As Mr Lennox-Boyd pointed out, when opening the useful, if inconclusive, debate on civil aviation last week, "In a field where the Government could provide a lead, and where a lead is necessary, they have never provided that lead." The charge is reflected only too clearly in the report of the Courtney Committee on the development of the Tudor aircraft. The success of the original policy of 1946 depended entirely on the speediest development of satisfactory interim types of large British civil aircraft, and it was on the Tudor that the highest hopes were placed. Everyone now knows that its development has been unduly slow and that none of the parties involved is free from blame.

Two main weaknesses are emphasised in the Courtney Report. The first is the lack of any central responsibility for the efficient execution of civil aviation policy. The Committee concluded that "defective co-operation between user and producer" was the root cause of the trouble with the Tudor:

There was such an effective division of constitutional responsibility among the organisations concerned that each could find unimpeachable reasons for keeping its constructive activity within moderate limits; and on none of the parties was there such a clear financial responsibility as would have impelled action. None the less, effective leadership could have come from either of the two departments (the Ministries of Supply and Civil Aviation) but, for reasons which doubtless seemed good at the time, it did not.

It was not that this was a failure in a sudden crisis. The process of inaction was lengthy and its nature was common knowledge.

It is, therefore, hard to absolve the Government from lack of drive or from unjustified preoccupation with problems which were secondary to the prime purpose of getting satisfactory machines into the air. There is something to be said for the respect which the departments have sometimes shown to the autonomous character of the Corporations and for their hesitation to interfere in the development of a new type of public body. But even so there has been an excessive regard for susceptibilities and form. A Cabinet sub-committee could have knocked together the heads of the organisations concerned without diminishing their status.

The second weakness is the costly and cumbersome procedure for bringing a new aircraft into service. Something has been done to improve it since the period covered by the Courtney Report and an experienced and impartial committee is now investigating the problem. But the assurance of the Minister of Supply in the recent debate that "the future programming of planes for the Corporations is under constant review" hardly sounds very direct or forceful. It would need a much more inspiring report of vigilance and alertness to allay public anxieties about civil aircraft. More important, it raises yet again the question whether the Ministry of Supply has any rightful place at all in the acquisition of new machines by the Corporations. The research and development functions of the Ministry are important: their value has been noted by American manufacturers whose works are now operating at only about 3 per cent of their capacity and whose losses last year were estimated at some \$70 million. The recent suggestion—endorsed in the debate by several Members—that the Ministry of Supply should withdraw, once the Corporations have placed their orders, seems sound. Its adoption would save time, money and friction. It would improve relations between manufacturers of aircraft and the Corporations which operate them. It would certainly please the Corporations. What they think of the present arrangements which, incidentally, are reliably estimated to add between 2 and 3 per cent to the direct cost of an aircraft, in addition to the indirect cost of any delay in bringing it into operation, is stated in forthright terms in the report of British South American Airways.

The present system of ordering aircraft through the Ministry of Supply is entirely contrary to the interests of the Corporation. It imposes a third party between the user and the manufacturer, causing delays and misunderstandings. It takes control from the Corporation but leaves it with responsibility; it adds to the cost of aircraft, as the manufacturers' price is loaded with departmental overheads. One of the prerequisites of successful airline operation is that the right aircraft should be available at the right time at the right price. Under the present system, the Corporation has no control over price, it is in the hands of the Ministry of Supply as to priority, and is subject to very considerable interferences as to design.

It is hard to believe that a central body for civil aviation, whether temporary or permanent, could have failed to correct such a situation before it became a matter of open comment.

Nevertheless, it would be unwise to set up such a central authority now. The urgent need is now to give the machinery of the Civil Aviation Act a chance to run, though its aims could profitably be reviewed and adjustments could be made to it. There is plenty of "play" in the machine and not all its parts are properly synchronised. The "fly British" policy is implicitly intended to save dollars, as well as to support the British aircraft industry. Nevertheless, some American aircraft have been bought and six more are on order. These are for the North Atlantic route, yet the present Constellations, although they are most efficiently operated, have insufficient

capacity to secure for Britain its fair share of traffic, and the Boeing Stratocruisers will not be available for some time. But in the meantime, the Tudor will probably prove inadequate to the traffic tasks of the Transatlantic service. When this first became apparent an ingenious compromise aircraft was proposed—a Constellation airframe with Bristol engines. It was rejected. It could now have been starting to pay for itself, for the Tudors are still not ready and in any case they could better serve the less exacting Empire routes. In recent weeks it has been suggested that BOAC should acquire the Canadair IV—a Skymaster airframe with Rolls-Royce engines—which is already in operation. A case might be made for the acquisition of a few of these aircraft on the ground that they are equivalent to raw materials with a high dollar earning capacity, and that engine maintenance and replacement, which is one of the costliest charges on an air line, would not cost dollars, since the engines are British. It is therefore curious to note that the Minister of Supply does not know whether the proposal "has gone so far as being put as a proposition to the Chancellor of the Exchequer." This is indeed a distant attitude to adopt on such crucial problems as the saving of dollars and the supply of aircraft. Similarly, it is surprising that the transfer of BOAC's Atlantic maintenance base from Montreal to Bristol could not have been effected earlier.

Dollars involve the Treasury. The exact part which this department plays in civil aviation policy is not clear. But on a lower level of book-keeping, as two debates in the House of Lords and the Commons have shown, it is surely desirable that some indication should be given in the Corporations' accounts of the cost of services which would not be run as a commercial venture. This is desirable to provide data for assessing the cost of national as distinct from commercial operations. When the expenses of state airfields or of the system of navigational aids are included, it is obvious that the total effective cost of assistance

NOTES OF THE WEEK

A Covey of Conferences

Events are conspiring to make people believe that Western defence pacts, talks about Germany, committees on customs of the union, united Europe movements and the next meeting of the governments interested in the European Recovery Plan are all somehow products of one mind and parts of one programme. In fact they are not, and it is important that the main ideas of ERP and Western Union should be held clear of the present diplomatic and Scandi-scrimmage. Otherwise the weight of the Swiss and the Scandinavians will be quickly withdrawn from the team of fifteen governments which Mr Bevin will address in Paris on or about March 16.

That conference's chief task will be to give to a working committee firm and clear instructions, which should lead to the creation within a month or less of a permanent body to administer ERP. All the 16 governments will take part in the committee's work and the leading role seems likely to fall—either within or outside the permanent body—to this country. Some difficult appointments have to be made; a place of work has to be chosen; a secretariat has to be formed; and the range of the body's activity has to be roughly defined. The chances are that all this will be done quickly and efficiently; the officials working on ERP have already developed a promising team spirit. Obviously forms and methods of co-operation useful to Western Union—when it comes—will emerge from the ERP conference. But they will represent the work of 16 governments; whereas what they will represent for economic co-operation come out of the Brussels conference of Ambassadors and experts, which began on Thursday, will represent the work of Britain, France and Benelux only.

Cooler Heads Needed

The rapidly increased tempo of diplomatic activity in the last week has rather flurried the more leisurely talks on Germany which have been going on in London. As a result, it is hardly likely that the British, French and American ideas about Germany's part in ERP and Western union will have been brought much closer than they were a fortnight ago. The French

to civil aviation is bigger than the Corporations' accounts show. These high costs for airfields and other facilities are the justification, so rightly stressed by the Parliamentary Under-Secretary for Civil Aviation in a generally disappointing speech, for charging the State air lines the same landing fees as other lines.

The same point underlines the vital difference between the regular services, which the state Air Corporations run, and the activities of charter operators. The Corporations fly their services, weather permitting, whether full or not. The charter operators by definition, fly only when they have a load: and their fares are not controlled. Comparisons, always odious, are here inaccurate as well. So are comparisons between various companies which operate with fundamentally different aims and under entirely different conditions. There is no true basis of comparison, so long as national policy is a paramount consideration for some companies, while others are governed by purely commercial aims. Geographical factors similarly play their part. The long stages of BSAA's routes—the Azores to Bermuda leg is the longest in the world and perhaps the most difficult—mean smaller groundstuffs at fewer bases; it follows that miles flown per person employed are high. The other Corporations are laying broad foundations for what is as yet a small superstructure. Hence in their case miles flown per person employed are much lower, and they give a quite inadequate picture of the operators' activity and future promise.

For their promise is great. Its realisation can be hastened by some of the measures discussed here—a tuning up of the machine in order to give it a proper trial rather than its scrapping or rebuilding. The general economic deterioration of the country of course makes the task more difficult. But British Civil Aviation can and should improve its supply of motive power—by acquiring its own aircraft. And it should mark its course more clearly, and having marked it, hold to it.

delegation must have wondered whether their journey was really necessary when they found that the first week was spent in stating cases which, in their main features, have been known for months.

The last ten days have shown once again that the mere mention of defence pacts is enough to set diplomats off in full cry along a well-worn trail, abandoning the fresher scents laid by Mr Bevin in his Western Union speech. The war scare which has followed the news from Prague is neither rational nor dignified; and it is to be hoped that heads will be cooler by the time the Paris meeting takes place. To discuss European recovery with the fear of imminent war in mind does not make sense. The strategic situation, as distinct from the political, is no different from what it was a year ago. What is new is the avowed determination of the Western governments not to be pushed around. To produce that determination has clearly been Mr Marshall's intention all along; and he is a man who, like Mr Stalin, calculates risks very carefully.

* * *

Defence Debate

The debate last Monday on the Government's statement relating to defence was a poor affair. Everyone was on edge owing to the week end's news from abroad. Members who have been thinking of defence as something to have ready in ten years' time were asking, rather unfairly, why it was not ready now, considering that it is to cost £692 million for the coming financial year. Mr Alexander's speech was disappointing: it gave little more than a paraphrase of the White Paper, and lacked the clarity of ideas and imaginative sweep that a good Minister of Defence should command. Mr Alexander in that position is too much like one of the battleships he has recently scrapped; solid, slow, old-fashioned, reliable but with too much weight above the water-line for the Bikini age. Indeed the most cogent charge against his exposition was that the new defence policy has too much of the old look.

Yet the Government case deserves more understanding and sympathy than it has received. It is too early to redraft the strategic scheme in the light of scientific developments: unless

a breathing space is given to the research workers and the staff officers they will certainly prepare for future war on the lines that they fought the last—and so justify the jibe that is always waiting for them on the lips of politicians. If, on the other hand, they are told to be ready for war now or in the very near future, they will certainly propose an outlay of money, men and productive resources which would make nonsense of the White Paper's basic principle—that "the first element in any coherent defence policy is the establishment of a healthy economy."

The touchstone here is really civil defence, which, for quite grotesque reasons, does not come under Mr Alexander's department; if the Government's advisers expect war soon, then the organisation and defence of workers and factories should begin now. If they do not, then they are quite right to ask for flexibility and caution in the disposal of men and the preparation of weapons over the whole field of national and Commonwealth defence. Their critics must make it clear in the coming debates on the Estimates whether they want fully efficient defence before 1950 or by 1960; it is quite clear they cannot have both.

If 1960 is to be the date, then the amount of money and men (in and out of uniform) for which the Service Ministries are budgeting is excessive, even if allowance is made for the difficulties of absorbing and training the National Servicemen. Mr Alexander should hold firmly to his first principle that the source of military strength lies in a healthy economy, and should cut down the financial and industrial burden still further. The condition of doing so is for Mr Bevin to say quite candidly now to the Americans and the Dominions, and later to the possible members of a Western Union, that Britain is contributing far more than its fair share to their defence. Mr Crossman was quite right to argue in the debate that British military commitments are excessive; but he is wrong to ask that more of them should be abandoned without a vigorous effort to share them with others, whether in Europe, the Middle East, India or Africa.

The Opposition grumbled a good deal about the Government's secrecy. There is an easy way round this difficulty; Opposition leaders could and should be taken into the confidence of Mr Alexander. Mr Attlee should try to be magnanimous enough to consult Mr Churchill. Otherwise politics and security will get mixed up, to the detriment of both.

* * *

Labour and the Marshall Plan

The Labour Party's memorandum on the Marshall Plan is in many respects an interesting document; chiefly perhaps because the occasional flashes of real insight are so suddenly obscured by the distorting fog of party doctrines. It seems, for example, to recognise clearly enough that the degree of integration envisaged in the Report of the Committee on European Economic Co-operation is not enough, and that something much more fundamental will be necessary to turn the European queue into a team; but when it comes to translating this into practice the joint planning advocated resolves itself into an extension of existing schemes for international allotment of commodities and the international socialisation of the steel and chemical industries—hardly a very attractive programme for any but the minority Socialist opinion in the sixteen countries. Co-operative development of African resources by the colony-owning powers is also recommended, in order to diminish European dependence on the western hemisphere. This in principle would meet with general approval, but it would be exceedingly rash to build upon it any exaggerated hopes.

So again the economic integration of Europe is put forward as a revolutionary aim which must be "recognised and exploited" as a dynamic new ideal, progress "by the unconscious broadening from precedent to precedent" being "quite inadequate to withstand the strains and stresses to which the recovery programme will certainly be subjected in the coming years." But the momentous reaction suggested to this challenge is merely a public declaration of faith in European unity. Is this really what the special meaning for Socialists of the idea of unity in Western Europe amounts to? Apparently not, for it is also revealed between the lines that the real significance of Western European unity is that it alone can make the world safe for Socialism, and Socialists everywhere are warned to guard against the prostitution of this constructive ideal into the vulgar instrument of anti-Soviet propaganda by discredited (non-Socialist?) politicians who hope to rebuild their shattered fortunes. Finally, Socialists must take the lead in promoting European unity, for the success of the European Recovery Programme is declared to "depend to a large degree on the spread of ideas and practices for which Socialists have always fought," though it is graciously admitted

that it would be incorrect to say that "Socialists alone are capable of a disinterested passion for European unity."

There is something so disagreeable in this type of party self-esteem that it may easily blind the reader to much that is admirable in the memorandum, which in other respects sets out very fairly the aims of the Marshall Plan, its progress to date and its difficulties. The more the pity, therefore, that the Labour Party continues to display the same petty-mindedness which boycotted the Hague Conference. It is all very well to summon a conference of trade union delegates from the sixteen countries, but it is far more important to mobilise public opinion of every political complexion to co-operate in the cause of European unity.

* * *

Which Method for Italy?

Those who believe the Russians are prepared to push to any lengths their resistance to the Marshall Plan look anxiously at Italy. Is a *coup d'état* in Rome and Milan next in the Cominform's calculations? One thing is certain. The Communist Party in Italy is in no position to repeat the exploits of Mr Gottwald in Czechoslovakia. The Communists, and with them the Socialists, were edged out of the Italian Government in May, 1947; they have since been in no position to lay their hands on the Ministry of the Interior. This is the key position of political power in any state, but especially so in Italy, where twenty years of Mussolini did not entirely efface the memory of Giolitti and his methods of fixing elections in pre-Fascist Italy.

Any fixing that is accomplished before the first elections under the new constitution—in April—will have been the work of the strongest single party, the Christian Democrats. Control of the Ministry of the Interior has also given Signor de Gasperi's non-Communist Government control of the police—which played a crucial part in Prague. When, last autumn, the Communists and Nenni Socialists attempted to force their way back into the coalition by strikes and demonstrations, the police—armed, motorised and reported to be 150,000 strong—were used with impressive effect, particularly in Rome, where the general strike petered out on its second morning.

But the Left claims to be overwhelmingly strong in other fields. It has attempted to organise in every sphere a species of shadow state beneath the real republic—with Communist committees in factories, Communist land movements, Communist municipalities and Communist partisans. Yet their strength is an uncertain quantity. It should be strongest in the factories; but the Communist leader of the trade unions, de Vittorio, has been criticised for his "weakness" in dealing with the vocally anti-Communist minority. If he were to decree strike action for blatantly political purposes, he might find his numbers dwindling, as did the French Communists in the November strikes.

Although a Gottwald coup is out of the question, there are two other ways of winning power open to Signor Togliatti and his men—a victory at the elections and a successful civil war. Victory at the polls is almost certainly ruled out. At the last elections the Christian Democrats and the Right polled more than the Communists and the Socialists combined. Today the Saragat section of the Socialists—probably a growing section—has parted company with the Communists and is represented in the Government. If voting reflects this development, the Centre-Right poll will increase.

There remains the most dangerous possibility—civil war. The Communists could not win outright, but they might reproduce the wasting sickness of Greece. Their chances are made the brighter by the inefficiency of the present Government and by the economic dislocation caused by its deflationary policies. If opposition to the Communists led the Christian Democrats into unholy alliance with the neo-Fascists, other moderate Italians might take to the hills.

* * *

Spring Prospects in France

When M. Bidault made his moving appeal for unity in France between all those who value "the freedom of the Fatherland and the freedom of all fatherlands," the whole Chamber with the exception of the Communists rose to their feet to applaud. Their action is perhaps a symbol of the impact of the Czech crisis on French opinion; and there is at least a little evidence of a genuine effort behind the scenes to resolve party differences and create a stable majority in parliament.

But if the Communists should decide to renew the offensive, it is not in the Chamber but in the fields and factories that the struggle would develop. Their newspapers have spoken of the development of "action committees" in industry and agriculture,

and it is to some such state within the state that they might look for their main reinforcements. Yet if this is the plan, it is possible that they struck too soon last November. The independent *Force Ouvrière* has been busily organising itself since then, working out its relations with other autonomous unions. It hopes, when its first convention is held in April, to have a million workers behind it, which compares not unfavourably with the million and a-half in the Communist-dominated *Confédération Générale du Travail*. These figures are not, however, certain and many workers are doubtless deferring choice between the two bodies until they see which way prices go.

This is the crucial point. Can the French Government keep a measure of support among the working class in the three critical months before the harvest? The long-range prospects are not discouraging. Production in coal, electricity and heavy industry is back to, and even above, the record level of October, 1947; the general index is slightly above the level of 1938. The prospects for the harvest are good, with over 4,000,000 more acres under grain than last year and the likelihood of big yields. The franc is holding its own on the free market, and is actually stronger than it was in December, 1946. And M. Mayer has received an unconvicted mercy in the shape of 5 billion francs of unclaimed 5,000 franc notes, the result of the recent blocking operation. There is also a chance that the arrears of unpaid taxes will be paid up as a result of that measure.

The danger signal is the price level. January saw a sharp advance in industrial prices, since the subsidies of coal and steel had just been removed. Heating and lighting costs rose by one-third, and the overall advance was 4.5 per cent above December. The price of food rose only 3 per cent. If M. Schuman and M. Mayer can hold food prices steady there is hope for them, for the *Force Ouvrière*, and indeed for France.

Trade Unions in the Czech Coup

The leading part played in the Czechoslovak revolution by the trade unions and works councils is an ominous example of the very precise aims and methods pursued by the Communists in these bodies.

As in all countries in the Russian sphere—including the Eastern Zone of Germany—the Czech trade union organisation was re-formed after the war on the Russian model, from the top downwards, instead of from the bottom up. A central executive was established, led by the Communist Zapotocky and the fake Socialist, Evzen Erban. It was placed in absolute control of the unions, which were organised on an industrial basis, grouped in a single Revolutionary Trade Union (URO). To refer to URO as the Czech TUC is, therefore, misleading. Its centralised control of dependent industrial unions makes this Russian type of organisation essentially different from the British.

Efforts were concentrated (as everywhere) on gaining the controlling posts in the key unions—engineering, mining and transport. The police, under the Communist Ministry of the Interior, were also formed into a union which was a sub-division of URO. By pressing a button in Prague, therefore, the country's life could be brought to a standstill.

For months past the Communists had been trying to bring URO into the National Front in order to weight the balance in favour of the Left, but were resisted by the other political parties. None the less, the organisation took the lead in demanding various measures, including the nationalisation of all businesses employing more than 50 people, and arrogated to itself the rights of a political party. In the months before the *putsch*, there had been a campaign of intimidation of Socialist workers, aimed at forcing them to join the Communist party. Control of the works councils was being secured. Characteristically, the leading representative of the trade union inside a plant tended also to lead the works council. Communist practice is, in fact, to make the trade union superior to the works council in order to ensure a single centralised direction of the entire labour world.

In the *putsch* itself, URO had the role of threatening President Benes with a general strike, if he refused to accept the new Government. The strike was never called because the President submitted. Previously, URO had been responsible for a token strike and a demonstration in Prague—in which, it may be noted, the overwhelming number of delegates came from the engineering and transport industries, and from the works councils of the big, Communist-run plants. Finally, factories were seized by the "action committees" and by the armed works militia, which had been entirely disbanded since the liberation.

The Best of Both Worlds?

The supply side debate on trade policy in the House of Commons on Tuesday hardly contributed very much to the enlightenment of the public. That was largely because the political attractions of the Russian Trade Agreement proved almost irresistible as a subject of discussion, and the quite exaggerated official secrecy about prices made informed criticism impossible. In the circumstances, therefore, it was scarcely to be expected that critics of the agreement would be able to make out a very strong case. But Mr Lyttelton's remark that the coarse grains bought from Russia would be paid for in the hardest of hard currencies, namely, vital items of machinery and equipment, was scarcely appropriate. If Britain can use these manufactures to buy food and feeding-stuffs, so much the better, provided that the terms of trade are reasonable—the essential point on which the Government persists in keeping the public in ignorance. In order to make his point against the agreement, Mr Lyttelton would have to prove that the particular machinery, rails, locomotives, etc., could be sold elsewhere (e.g., in the Western Hemisphere) on more profitable terms in exchange for equally essential imports. And this he was, of course, unable to do. Meanwhile, the public must be left to gather some comfort from the assurance of the President of the Board of Trade that the prices paid for Soviet barley, maize and oats were considerably below the highest world prices ruling today.

On the question of multilateralism and bilateralism the debate was even less informative. Mr Bottomley's contention that the present policy of bilateral agreements, being pursued by the Government as an interim policy until conditions are ripe for playing the multilateral game, was really making the best of both worlds can hardly be taken seriously. It is true that in some of these agreements it has been possible to avoid the restriction of trade to a minimum of bare necessities and to secure at any rate a half-opened door for British exports; but the fact remains that the restrictive effects of bilateralism are inescapable. What is more, the combination of large-scale Government buying of imports, against implied undertakings, however indefinite, to provide from a largely private economy a given quantity of exports—to say nothing of definite commitments about exports of that still very scarce commodity, coal—provides a singularly unsatisfactory foundation for the development of foreign trade, even though in the circumstances of today it can hardly be avoided. For bilateralism is the ill-omened offspring of two inauspicious parents, world scarcity and monetary disequilibrium between the Eastern and the Western Hemispheres. As long as these two factors persist, it is difficult to see how any stable system of multilateral world trade can be brought into being. The present phase of bilateral agreements is at best a *pis aller* for this country, and it is devoutly to be hoped that with Marshall aid a multilateral system can gradually be built up.

* * *

Parliament and Public Boards

One of the troubles of the new public boards is that they are too attractive game to leave unhunted. Hence the enthusiasm of Members of Parliament to join in the chase. So much was evident from the debate on the subject of parliamentary questions to Ministers about nationalised industries which took place in the House of Commons on Wednesday. Unfortunately neither side contributed any really instructive suggestions to the fundamental problem of how much control a democratic country ought to exercise over its nationalised and monopoly industries, and Mr Morrison was, therefore, easily able to evade his pursuers by the usual answer that public boards must not be caught up in the toils of Question Time; though his attribution of mere mischief as the motive for opposition questions was rather an unworthy jibe.

It was unfortunate that the debate was narrowed to the single issue of how far Ministers are liable to answer questions about public boards. Mr Speaker had already given a much more satisfactory elaboration of his first explanation about the procedure for sorting out parliamentary questions on public boards, and this aspect of control might well have been side-stepped. The real issue is whether some more formal method of investigation is required. Only Mr Molson and Mr Diamond tackled this question at all fundamentally.

At this stage in the development of the new-style nationalised industries it is extremely difficult to take an impartial and long-term view of the subject. The experiment of nationalisation is so recent, so controversial, and its success so fundamental to the economic health of the country that everyone is itching to know what is going on and ready to pounce on any mistakes which leak

out. Such an attitude is very natural, but it is also very hard on the Boards themselves, which are having to create themselves out of nothing at a period of maximum difficulty. If Mr Diamond's suggestion that each Board should have an "Efficiency Auditor-General" responsible to Parliament, on the lines of the Comptroller and Auditor-General, were accepted, this would involve an almost impossible degree of interference in the Board's work. Some quite different procedure is required and time should be allowed to evolve it. Meanwhile it would be a mistake to foist an elaborate machine on these corporations which may be found to be quite unnecessary. That does not mean that things should simply be left as they are, and it is a pity that Mr Morrison did not accept Captain Crookshank's suggestion of a select committee to report on the best way of dealing with the problem.

* * *

Transport Wages* and the White Paper

Both the railwaymen's and the London busmen's wage settlements, which will bring considerable increases in weekly earnings, can be justified theoretically on the ground that they had been under negotiation long before the White Paper on Personal Incomes was published. In the case of the railwaymen, the agreement on a new wages structure follows the recommendation of the Guillebaud Court of Inquiry which had granted an interim increase of 7s. 6d. Full details of the new structure, which sets out new scales and grades, are not yet available, nor is it certain how many of the 800,000 railwaymen involved in the negotiations will benefit, nor how much the adjustments and removals of present anomalies will add to the wages bill. The railway unions can also argue that they have been rapidly becoming one of the "undermanned industries" and that without these wage improvements the labour force on the railways would become dangerously low.

It is less easy to apply this reasoning to the busmen, who have been awarded increases averaging 7s. 6d. in their weekly wages, together with increased overtime payment for Sunday duties. These increases, it is estimated, will cost London Transport about £1,500,000 a year. It is true that in return the men have agreed to the principle of working increased overtime and are proposing a relaxation of their self-imposed limit of five standing passengers. This is perhaps the only way in which the busmen could show their willingness to increase production. It is likely that, had this wage concession not been made, widespread trouble would have arisen in the passenger transport section. At the same time, the London busmen are already among the highest-paid sections of the working population and in the last two years they have secured both increased wages and shorter hours.

Whatever may be said by union spokesmen, it is difficult to reconcile the two wage agreements with the letter or the spirit of the White Paper. They will undoubtedly be used as a precedent for other trades where wage claims are pending. The difficulties of drawing the line are only too clear, and in the meantime every increase will accentuate the mounting inflationary pressure. Moreover, the public will want to know whether the Transport Executive intends to adopt the principle of the White Paper and refrain from passing on to the consumer the increased cost of wages in the form of higher fares and higher freight rates.

* * *

Sermon for the Stern Gang

The statement addressed to the Jewish Agency and community on Monday by the Palestine Government is of the same order as the protest addressed by Britain to Albania after the mining of the Corfu Channel. Aggrieved, yet dignified, it talks a language which is still understood in the West, but which is mere words to the kind of European who has emerged from Hitler's Europe. The Stern Gang will merely note with satisfaction that their mining of a British troop train on Sunday, with the loss of 27 lives, seems to have struck home. And tens of thousands of young Palestine Jews will agree with them. The sermon, too, will be wasted on the Jewish Agency, whose present leaders are now concerned only with keeping their heads above water.

The Stern Gang gave their allegiance to Russia only last December, but they are showing themselves loyal agents. In the past fortnight they have kidnapped and murdered two Poles, both well known in Palestine, where their connections were predominantly Jewish. The two victims certainly did not, like some other Polish exiles, give help to the Arabs; but one of them distinguished himself by anti-Soviet activities; the other by having many British friends.

The pro-Russian bloc in Palestine Jewry now ranges from the Stern Gang, through the new merger of the Left-wing settlers—Hashomer Hatzair—with the Labour Unity group, to the Communists. Of the last there are two sections, the (Jewish) Palestine Communist Party, which found no difficulty in changing overnight from a violent anti-partition platform to enthusiastic acceptance of partition, and the Association of Hebrew Communists, a "National-Bolshevik" group. Among young Jews all these groups can count on sentiment in favour of Russia and the new Poland, to which they give vent in a number of fellow-travelling associations, "For Soviet-Palestine Friendship," "Friendship for Democratic Poland," the "V-League," and even a section of the "Slav Union." The "Lepac" publishing house and bookshop in Tel Aviv has a massive output of Soviet literature supplemented by well-attended lectures and meetings.

* * *

A Communist Jewish State?

Over all these strange bedfellows, differing in their internal policies but united by a common hatred of Britain and America and hysterical adoration of Russia, presides the strident figure of Dr Moshe Sneh, who resigned from the General Zionist (Centre) Party and from the Jewish Agency Executive soon after the United Nations decision. In a visit to his native Poland last year, Dr Sneh is said to have made some violent anti-British and pro-Soviet speeches; no doubt he also made some useful contacts. In Palestine it is believed that he can rely particularly on the support of the larger terrorist organisation, the Irgun Zvai Leumi.

Before a Jewish state has even come into being, the "polarisation" of its politics is far advanced. The pro-Soviet bloc has been clamouring for new elections, and already provides the semblance of a "National democratic front" of the familiar East European type. Its counterpart in the USA is the mass of Jewish voters who elected Henry Wallace's candidate in the Bronx, and who are now calling Warren Austin—or President Truman—a "new Neville Chamberlain." The friends of the Agency, on the other hand, are using the existence of the bloc as a threat of what may happen if America does not forestall the Russians by itself giving effective help to the Jews against the Arabs.

* * *

Lull in the Health Service Fight

Since the results of the British Medical Association's plebiscite became known there appears to have been a lull in the fight between the doctors and the Minister of Health. Mr Bevan's department is presumably going ahead with its plans for introducing the health service on July 5th—an estimate of £149 million for it appears in the civil estimates for the coming financial year—but what steps are being taken to bring the two sides together is not known. The special representative meeting of the BMA, to be held on March 17th, will be asked to consider a resolution put forward by the council which, while not closing the door to the resumption of negotiations, insists on amending legislation, designed to "maintain the integrity of medicine and to prevent doctors being turned into state servants," before the profession can be advised to enter the new service.

Mr Bevan's speech in the recent debate on the health service would appear to rule out any amending legislation—at least as long as he is Minister of Health. Is he therefore gambling on the opposition to him from the rank and file of the profession melting away before July 5th? He is very optimistic if he counts on enough doctors giving way, on financial grounds, to make his health service a success; for even if 17,000 had voted for him instead of against him, the service would still have been stretched to the limit of its resources. It has been suggested that Mr Attlee should change his Minister of Health, but it is unlikely that Mr Attlee would take a step which would be read as giving way to a political demonstration against his Government.

Another possibility is that negotiators should be nominated by both sides, not the Minister of Health and not any representative of the BMA, who would try to see if a compromise solution could be reached and then put it to their respective parties. When deadlock first appeared to have been reached, in January, 1947, the presidents of the three Royal Colleges paved the way to the reopening of negotiations. It may, therefore, be significant that the Royal College of Physicians is holding its hand and taking no decision on the dispute until after the BMA meeting, when it will consider what action it could most usefully take in the

interests of the profession and the public. Is Lord Moran, its president, medical adviser to the leader of the Opposition, to be an envoy of peace?

* * *

Fewer Brick Houses

There are few official statistics more exasperating than those published each month in the Housing Returns. It appears that the health departments for England and Scotland cannot agree on any form of joint return, but must each persist in their frustrating idiosyncrasies which effectively prevent any but the most determined statisticians from making sensible deductions. Unless Ministers have an interest in this practice, they ought to bang their officials' heads together and force them into combination.

The figures for January,* published this week, show clearly enough a disappointing fall in the numbers of permanent houses completed during the month from 17,796 in December to 15,401 in January. It is, however, virtually impossible to make national comparisons for another set of equally important figures which would reveal future trends. Only for England and Wales is it possible to foresee at all clearly the effects of the future building programme in the demand for building labour and materials. Yet this is likely to be an inflammatory subject as soon as building labour becomes redundant in a big way.

When Mr Bevan was successfully defending his current housing programme from the Chancellor's capital cuts, he warned the country that imports of timber were the chief threat to the future programme. It now appears that he is attempting to reduce this threat by substituting factory-built for brick-built houses, because they use less timber. During January the number of tenders approved for traditional, or brick-built, houses was 2,262, while 3,176 tenders were approved for permanent non-traditional type houses; for the first nine months of 1947 the average monthly figures were 4,782 and 2,980 respectively, and this change in emphasis is likely to increase.

The consequences on the building industry will be startling. The *Economist* has always maintained that the country could not afford a building labour force of over a million, of which 600,000 were employed on housebuilding. If less than 3,000 brick-built houses are going to be started a month large cuts will soon have to be made in the country's building force and the industries which feed it on the site. The process may free labour for more essential purposes, but the adjustments will be painful.

* * *

Habeas Corpus Militis

Last week the High Court released, on an application for a writ of *habeas corpus*, an officer who had been sentenced by a court martial after his period of active duty had come to an end. The facts were straightforward enough. The officer concerned was commissioned in 1940 with an emergency commission. He was released in 1945, after which he received no pay, no longer wore uniform and took up employment as a civilian—in this, of course, he resembled the vast majority of officers who held emergency commissions during the war. In December, 1946, without the formality of a recall, he was arrested by Army authorities,

*Cmd. 7333 and 7334.

taken to Germany, court martialled on charges of fraudulent conversion and sentenced to two years imprisonment (subsequently reduced to 18 months). The application for the writ of *habeas corpus* was based on the ground that the officer was no longer subject to the Army Act, 1881, and so no longer subject to trial by court martial, unless the proceedings were started within three months of the date when he ceased to be so subject. It was successful.

The case is remarkable for the curious myopia of the War Office. During the case the Lord Chief Justice traced the circumstances that render an officer liable to trial by court martial. The obvious requisite is that he must be subject to military law. To be subject to military law he must be on the active list, and the test of being on the active list is simply whether or not the individual officer receives army pay. In the case of this officer, as with all officers on emergency commissions, pay ceased at the end of the period of release leave. All these facts are not so obscure or unusual that the War Office can be excused for its action. Apparently, someone thought it was perfectly proper to send the military police to arrest a man who had been a civilian for nearly a year, then to take him to Germany and, five months later, sentence him to two years of imprisonment, some of which probably were spent in a German gaol.

There is one further, and more general, point to make. Is it essential, or even desirable, to use the machinery of the court martial to try a fundamentally civilian offence such as fraudulent conversion? To the popular mind, the court martial is a part of the military machine intended to preserve discipline in the field and to try those cases where the crime is solely one against military law. A civilian court, with a civilian jury, would seem to be a better tribunal for the investigation of a charge which must in the main involve matters of accountancy and responsibility for custody. Perhaps the shock—and the financial consequences—of this decision will make the War Office think again over its future attitude to this kind of case.

* * *

Party Line at the Bank

The King's new prerogative in approving reappointments and elections to the Court of Directors to the Bank of England was duly exercised at the beginning of this month. Two directors whose terms of office expired on February 29th were re-appointed for the customary period of four years. They are Mr D. G. M. Bernard, a full time executive director, and Mr J. C. Hanbury-Williams. Two other directors whose terms of office also expired, Mr B. G. Catterns and Mr E. Holland-Martin, did not seek re-nomination. Their place has been taken by Lord Braintree and Mr G. L. F. Bolton, the latter replacing Mr Holland-Martin as a full-time executive director. Mr Bolton's appointment is an event which every argument of reason and circumstance contrives to make inevitable. He will bring a solid and energising contribution to the deliberations of the Court. His technical knowledge of foreign exchange and his qualities as a negotiator should also enable him to take some weight off the shoulders of the Deputy-Governor who has been all too hard pressed in recent turbulent months.

Of Lord Braintree's appointment the feature that springs most readily to mind is that it further promotes the tradition, studiously followed since the nationalisation of the Bank, of electing as new part-time directors men who have had affiliations of one kind or another with the Labour Party. These new appointments may indeed be justified by individual merit, but when six out of the seven new part-time directors, elected since nationalisation, are found to be friends of the party in office, the notion that their political colour had a part in their appointment in addition to their other qualifications becomes rather difficult to resist. The part-time directors of the Bank may have only a limited impact on policy making, but this fact does little to mitigate the distaste which this regular political preferment in the Central Bank is beginning to create.

* * *

Hongkong and China

Figures of the trade of Hongkong quoted on page 384 of *The Economist* this week indicate a remarkable economic recovery. That such a merchants' haven should exist in the Far East today is a benefit to the world at large, and there is no case for surrendering any part of Hongkong territory, whether ceded or leased, to which this country has a proper legal title.

It is the more regrettable that *The Economist's* comments on the Kowloon City dispute in the issue of January 24th appear

to have been interpreted in the British Hongkong press as a suggestion for a "surrender of responsibility" following the recent renunciation of old treaty rights in China. What was in fact pointed out was that China had never recognised the validity of the Order in Council of 1899 which abrogated the reservation of Kowloon City to Chinese jurisdiction in the treaty of 1898, and that a legal dispute existed between Britain and China. The existence of such a dispute has since been fully borne out by the Chinese Government's Note of February 4th, which asserts the Chinese view with considerable acerbity. For the *Hongkong Telegraph*, however, there is really no dispute; it is merely stated in refutation of *The Economist's* "ignorance" that "there can be no argument about the legality of British jurisdiction"—an attitude curiously similar to that of Argentina and Chile when they refuse to submit their claims to the Falklands Dependencies to the International Court on the plea that they are "indisputable."

As its own solution the *Hongkong Telegraph* declares that "a more practical and realistic attitude would be for Nanking to show approval of the proposed scheme to convert the disputed area into a public park, the amenities of which would be enjoyed by the colony's Chinese." Undoubtedly it would be practical and realistic; unfortunately these are the qualities least to be expected from a nationalist movement with an ancient grievance at a time when it is politically expedient to revive it. Chinese memories are almost as long as Irish, and the events of fifty years ago are the equivalent of the Battle of the Boyne. What has caused the Kuomintang—or at any rate its Youth Corps—to give the support it did to the anti-British rioting in Canton was most probably the need to compete with the intense anti-British and anti-American propaganda carried on by the Chinese Communists—a propaganda which makes a powerful appeal to sentiments of popular xenophobia. The Kuomintang is naturally afraid of being left high and dry as the party of the puppets of foreign imperialism; it can talk about Port Arthur and Dairen, but in Canton Manchuria is a long way off; the only effective turn is to have a crack at Hongkong. These political motives for the disturbances which have occurred are painfully obvious, but they do not affect the wisdom of offering some procedure for judicial settlement of the legal dispute which they have taken as a pretext.

Future of the Sudan

The announcement from Cairo this week that Egypt had rejected the British proposal for a conference on the Sudan is disappointing news. The future of the Sudan cannot be satisfactorily settled until the two condominium powers stop their haggling. The Egyptians now complain that, under the Treaty of 1899, the Sudan Government should never have dealt with constitutional policy which is specifically reserved for the condominium. As the Sudan Government have made it clear that the ordinance for increasing the Sudanese share in the government of their own country is essentially a draft ordinance and subject to the approval of the condominium, the Egyptian complaint is groundless. Egypt has put itself severely in the wrong by refusing to discuss the Sudanese proposals with Britain and it has once more laid itself open to the charge that its only desire is to make the Sudan an Egyptian colony.

The change of heart of the Egyptian Government seems to have been caused by the vociferous opposition press. The position of the Prime Minister, Nokrashy Pasha, is awkward. His public statements that he cannot negotiate until British troops are withdrawn make it difficult for him to behave in a manner befitting a statesman, while the increasing power of the Wafdist opposition has made him appease the hotheaded and irresponsible Cairo crowds.

In one sense Egypt's rejection of the British proposal may be a blessing in disguise for the Sudan. Britain has every justification now for taking unilateral action in spite of the Treaty. If Egypt will not work with Britain in carrying out the duties of the condominium, then Britain can and should continue the work alone. The draft ordinance of the Sudan Government for the new reforms was published last week and it should not take the British Government long to approve in detail what they have already approved in principle. The reforms, which were originally worked out by the Sudanese themselves, show an enlightened approach to the problem of developing self-government in a country unaccustomed to such responsibilities.

Constitution for India

The drafting committee of the Indian Constituent Assembly has submitted its report and the Constituent Assembly itself is

expected to meet to consider it sometime in April. The draft shows the results of careful study of modern written constitutions, especially that of the United States of America, and also of the British political system with which educated Indians have long been familiar. The draft aims at reconciling the actual diversity of India with an ideal of national unity by means of a federal structure. It includes the American device of a central legislature with two chambers, of which one represents the constituent units of the federation, and a Supreme Court to be the custodian of constitutional rights.

The constituent units will all be called States, thus putting on an equal footing the present Provinces and Indian States; the latter will be distinguished only by having as their constitutional heads hereditary princes instead of appointed governors. The lower house of the central legislature, to be called the House of the People, will be directly elected by universal adult franchise (with certain seats reserved for Moslem and other minorities), while the upper house, to be called the Council of States, will consist of 235 representatives of the States and 15 to be nominated by the President for distinction in literature, science or the arts. An electoral college of both Houses of Parliament and elected members of State Legislatures will elect the President, who will hold office for five years and be eligible for re-election only once.

The President is to have considerable powers, but his Cabinet, headed by a Prime Minister, will be collectively responsible to the House of the People; in this respect the Constitution will follow the British rather than the American model. The Drafting Committee have evidently tried to steer a middle course between reducing the President to a mere figurehead and giving him powers similar to those of the American President, which, with India's lack of democratic experience, would be an invitation to dictatorship. To obtain strong central rule without despotism is indeed India's problem and, as far as a written Constitution can achieve such an aim, the planners seem to have done their work well.

A Small Pop

Rumours notwithstanding, there is not to be found at the Treasury a room from which strange noises emerge, whose door bears the legend *Hellzapoppin*, and which is inhabited by those officials whose business it is to sort out the dollar-expenditure aspect of transatlantic theatre-traffic. What with Mickey Rooney, Danny Kaye, Mae West, Johnny Weissmuller, Joe Louis and *Oklahoma*, London has absorbed of late a formidable volume of what may be called audible imports, at a considerable price per performer. True, Britain has sent in exchange the Old Vic Company and a number of successful recruits to Hollywood; but it has no exportable torsos to vie with that of Johnny Weissmuller, her human armaments industry produces no Brown Bombers, nor have any of her theatrical companies hit the Broadway jackpot in the *Oklahoma* manner. Moreover, British artists in America, particularly in Hollywood, spend where the spending is good; most of their American counterparts here, on the same principle, take the bulk of their earnings home with them.

In the second half of last year the remittances of American entertainers amounted, according to Sir Stafford Cripps, to £174,000. There is no comparable figure for the remittances of British entertainers in America, but official quarters have no doubt that the net balance is heavily adverse to Britain—and likely to be more so this year. But compared with expenditure on films, let alone petrol and tobacco, the net dollar price of Messrs. Olsen and Johnson, Kaye, Rooney, *et al.*, is, as they themselves would probably say, chickenfeed. In the balance of payments, Joe Louis and Mae West are featherweights. Whether even that price is worth paying in the present state of that balance is another matter. It is also arguable that in no circumstances whatever are X, Y and Z worth paying anything for at all; that a *cordon sanitaire* against the spreading blight of Tin Pan Alley would be a by-product of crisis as salutary as the self-denying ordinance of Hollywood; that while it would be very sad if America were to retaliate by banning the Old Vic, her loss would be Britain's gain; and that while cultural exchanges are an excellent thing, the exchange of culture for X, Y and Z is much too one-sided. A selective *cordon sanitaire* is, unfortunately, hard to operate. Perhaps in one case at least the difficulty might be got over by retaining the entire cast of *Hellzapoppin*, not as entertainers, but as technical advisers on the conduct of economic policy.

The NEED for SPEED in present-day accounting routine

The Underwood Sundstrand Class 'D' Accounting Machine illustrated is an all-purpose, fully automatic Machine, equipped with two cross-computing Registers, eight accumulating Registers and Front Feed Carriage, designed for comprehensive Accounting requirements demanding the simultaneous posting of a number of related records with the cross-computation of any series of New Balances and the automatic accumulation of a large number of inter-related totals.

Ideally suited to Comprehensive Pay Roll, Costing, Sales, Purchase, and Stores Ledger Accounting, these machines are the effective answer to the vital need for speed and accuracy to-day. Demonstration arranged without obligation.

It takes 250 tons of paint to preserve and decorate a battleship of the Vanguard class.

The enduring preservative qualities in paint are due, largely, to the chemical preservatives used in its manufacture. Today P.C.M.C. (parachlorometacresol) is one of the most efficient

preservatives used for this purpose. Monsanto are the only manufacturers of P.C.M.C. in Great Britain.

SERVING INDUSTRY WHICH SERVES MANKIND

Letters to the Editor

On the Rocks

SIR,—Mr D. Davidson states in a letter to you of February 21st that while motor vehicle production is equal to prewar, there are now 550,000 persons employed in the industry against 387,000 prewar.

I should be interested to know from whence he obtains his figures as I have not seen them in any official publication. If they come from the *Monthly Digest of Statistics*, then the figures there for motor vehicles, cycles and aircraft are grouped together and there is no separate differentiation for the motor industry.

The number employed in the works of motor vehicle manufacturers before the war was estimated to be about 150,000 and that has now risen, as far as can be ascertained, to 158,000. There is also a number engaged on accessory manufacture but this includes so many varying industries that it is difficult to assess. There is, however, no reason to suppose that the increase is in any larger proportion.

The rise from 150,000 to 158,000 for motor vehicle manufacture would be accounted for by the 5-day week and by the fact that the emphasis in production in the motor industry has been changed since prewar from car to commercial vehicles.—Yours faithfully,

R. GRESHAM COOKE, Director
The Society of Motor Manufacturers and Traders Limited,
148 Piccadilly, London, W. 1

Third Party or No Party?

SIR,—Your correspondent's analysis of middle class politics based in part on exceedingly dubious hypotheses as to the characters of the Conservative and Socialist Parties, has called forth two odd letters in your issue of February 28th. Both deal with a situation in which the Liberals could hold the balance in the House of Commons. One contemplates this with equanimity and the other with such enthusiasm that machinery for its achievement is suggested.

I am at a loss to understand all this. It is, of course, a fact that if seats in the House of Commons were held in strict proportion to the percentage of the electorate voting for the various parties at the last election, the Liberals would hold some such balance at this moment. But whether such a situation came about through the application of a mathematician's notion of justice or in some other way, why should it be envisaged with anything save the gravest misgivings? What special attributes of political purity fit for this position a political party which in its day had certainly no fewer faults than the others and which the electorate has not thought worthy of its confidence for a quarter of a century? And what more dangerous negation of a democracy could there be than that the representatives of a minority view should possess virtual power of life and death over a Government formed by the majority party?—Yours faithfully,

PETER GOLDMAN

to Ridge Hill, London, N.W. 11

Salaries of Public Boards

SIR,—I expect that other readers beside myself were astonished at the salaries and expenses allowances to be paid to the gentlemen appointed to be chairmen and high officials of our nationalised industries. The Government expresses its belief in nationalisation as a means towards a share-and-share-alike equality. Surely such salaries and expenses (which are free of income tax) make a mockery of such a belief.

You say that "the expenses allowances, though lavish by the standard of the Civil Service, are perhaps reasonable compared to business practice." But "business practice" is the very thing the Government condemn, so they should show some other reason for this apparently unnecessary expenditure of public money. How can Mr Attlee and Sir Stafford Cripps reconcile this expenditure with their appeal to everyone to accept lower incomes, to refrain from seeking higher wages or salaries, and to reduce prices and profits?—Yours faithfully,

Rowenhurst, Oxted, Surrey

R. ARNOLD PRICE

Raw Material for Rayon

SIR,—I am very grateful to you for the notice which you gave in *The Economist* of February 21st of my lecture in Manchester. There is, however, one error which I regret. I did not advise importing straw pulping plant but making it here. There is, in fact, plant being exported to India which we could, with great advantage, erect in this country and thus quickly diminish part of our dependence on imported pulp.—Yours faithfully,

HERBERT LEVINSTEIN

Sand Hill, Claydon, Nr. Bletchley

Official English

SIR,—The substance of the Economic Survey for 1948 has probably now been settled. Is it too late to suggest to His Majesty's Government that they should carefully consider its language and avoid some current absurdities?

1. A deterrent should not be called a "disincentive."
2. Deflation should not be called "disinflation."
3. "Backlog" should not be used to convey a meaning that is not to be found in any dictionary.
4. The adjective "overall" should never be used, where its omission would make no difference to the sense.
5. "Scarce" is better than "in short supply."
6. If the words "substitute" and "substitution" are used, they should be used correctly. Mr Herbert Morrison recently announced the setting up of a Committee on Industrial Productivity with a panel to deal with "Import Substitution." In a subsequent speech he showed that the Government's object was far more sensible than these words indicated. The Government were not proposing to substitute imports for something else, but on the contrary to replace them by home production. When they said "Import Substitution," what they meant was "Substitutes for Imports."
7. "Breakdown" should not be used, where "analysis" or "classification" is intended. When an official speaks of "the breakdown of the European services of the B.B.C.," most people conclude that these services have broken down. In fact he is probably referring to the relative numbers of B.B.C. broadcasts to different European countries.

It is better to use the King's English.—Yours faithfully,
House of Commons

HENRY STRAUSS

From *The Economist* of 1848

March 4, 1848

We are not among those who can congratulate either the Government or the country upon the change announced on Monday night in the financial proposals for the year. . . . Before Lord John Russell propounded the plan of the Government to Parliament, the public mind was perfectly reconciled to an increase of taxation. An obvious necessity was a sufficient justification. Nay more, the public were reconciled to the fact that the income tax was not only to be made permanent, but increased. But what they did expect was that a fair distribution of this burthen should be made over various kinds of income—but fluctuating and uncertain incomes should not be taxed at the same rate as those of a steady and permanent character. It was admitted on all hands that to make this tax perfectly equal was impossible; but that was no reason why every effort should not be made to obtain as near an approximation to that object as possible. The absence of such an attempt was the real sting of the financial scheme. The impossibility of perfectly accomplishing such an object is no good ground why it should not be obtained as nearly as possible. Absolute perfection belongs to no human effort; but the closest approximation is the first duty of a Government. No tax that was ever imposed, or that can ever be imposed, was, or will be, free from the charge of some inequality. As it is, therefore, the Government has made concessions to the public demonstrations, which, while they place the finances in a condition of danger, and impose upon Parliament new proposals, which cannot, consistently with its duty and its dignity, be accepted, does not remove any part of the more serious objections entertained by the public.

Books and Publications

Japan under Occupation

"The Phoenix Cup." By John Morris. Cresset Press. 12s. 6d.

THE author grimly warns his readers that they are in for "a series of traveller's notes." Fortunately he is an uncommon traveller, who shows in the selection of items from his notebook a subtle and sensitive discernment that well matches his penetrating observation. The brief, brisk, introductory "Outward Journey" conjures up so authentic a picture that one lives again the hot trickling sweat of one's own interminable waits at blistering Indian airstrips, the frozen-bottomed agony of long dull flights in service aircraft, and the whirling, bumping, terminal jeep-rides. There is an unforgettable vignette of General Homma before the War Crimes Tribunal in Manila, a depressing glimpse of Okinawa, and then Japan.

The long second part of the book, "The Machine in Ruins," is a "portrait of Japan in 1946." Though it betrays a touch of nostalgia not unbecoming in one who has seen Japan's better days, this tale of the death of a regime rings true. The portrait is faithful, forthrightly outlined, and given third-dimensional life through a number of vivid, enlightening incidents and interviews. Like Ruth Benedict (whose brilliant sociological analysis, "The Chrysanthemum and the Sword," dovetails neatly into this traveller's tale), John Morris endorses both the American decision to retain the Emperor as a constitutional monarch, and their "Occupation without Humiliation." His study covers a wide social field, the position of the Emperor, the militarists, the politicians, the new constitution, the allies' policies, the family system, the arts and post-war entertainment, romanisation of the Japanese script, and education for democracy. Personalities abound—the Emperor and his powerful nobles; the caged generals in Sugamo prison; Hedizo, son of Black Dragon Toyama; priests, peasants, and bewildered prisoners returning to an unguessable reception. Each character study sheds a different light on the Japanese enigma, the poignant story of Private Tanaka alone being worth the price of the book.

The short concluding chapters give a brief survey of conditions in the Philippines, Siam and Burma, important less for themselves than for the perspective they give of the *malaise* in Japan, and John Morris's own views on what should be done about it.

Altogether, this is a worthwhile and very readable book.

Wake Up and Dream?

"The Awakening." By L. S. Amery. Macdonald. 269 pages. 8s. 6d.

THE "Awakening" of Mr Amery's title is an awakening from "the whole mentality of the last hundred years"—in particular from any outdated dreams of One World and of free trade therein. (Mr Amery generally refers to uncontrolled international trade by the well-chosen epithet "promiscuous.") The whole nineteenth-century trend towards free trade, the abandonment of subsidy, discrimination, protective tariffs and planning generally, was a hideous mistake, which Mr Amery underlines with a thunderous quotation from Disraeli. The prosperity and expansion

which followed, chronologically speaking, on the adoption of Free Trade, were in fact not due to that disastrous error but to the good effects of the previous policy, dating back to Edward III—a Listian policy, as Mr Amery sees it, of wisely fostering infant industries, protecting skills in the process of evolution, and laying up stores of capital and of technical know-how for the future. The majority of economic historians take a less flattering view of the consistency, let alone the success of these policies, but it is, of course, perfectly true that free trade offers much more immediately alluring rewards to a nation in a strong technological position than to one for whom its adoption means a radical rearrangement of its resources.

Had Mr Amery been content to underline this point, to stress—as he does—that the nation as an economic unit is not an imagination of jingoes or bureaucrats but a solid and undissolvable fact; had he sought to estimate the precise extent to which the organisation on a national basis of currency, social services, and employment policy invalidates theories built up on the assumption of internal *laissez-faire* and the self-adjustment of economic atoms; had he framed his criticisms of Bretton Woods, the Washington Loan Agreements, and the Geneva Report in the light of his conclusions; had he done these things, he would have produced a work of solid value instead of a piece of merely entertaining polemics.

He has some excellent things to say—nothing could be better, both for point and fairness, than his comments on Lend-Lease and its ending—and his vision of Commonwealth economics as a kind of deliberate ecological process is in the tradition of the best kind of Empire-building. But he has perversely elected to rest his whole argument on a condemnation of free trade between nations which could equally well be applied—and in his admired mediæval days was in fact applied over most of Europe—to free trade between provinces, cities, and even adjoining villages. He never really answers the Free-trader's obstinate inquiry why, since Yorkshire, London and Bournemouth thrive on "economic promiscuity," Britain, America and Italy—say—should not do likewise. One can think of a good many possible, though not unassailable, reasons; but they are not to be found in the pages of "The Awakening."

Shorter Notices

"Is This the Way? A Call to Jews." By Walter Zander. Victor Gollancz, Limited. 1s. net.

THIS pamphlet is addressed to the Jewish community by a courageous, clear-sighted and religious Jew. He tells the leaders of Jewry in Palestine that they misled their people about the Balfour Declaration; that they decided they could ride roughshod over the Arabs, and made no attempt to conciliate them, and that they boasted of the material prosperity they had brought the Arabs, as though a self-respecting people would sell its place in its own homeland for cash. They then pretended that no Arab problem existed, and when they discovered their mistake, could not conceive that they could themselves be in the wrong and throw all the blame on the British. "Gandhi warned you and you would not listen. In all this you were transgressing the principles of your own religion and the only hope for Palestine is that you re-learn them."

It is a remarkable manifesto and very difficult to answer.

This world-famed Sherry (formerly called Findlater's Fino) could not be registered under that name and thereby protected from imitators. For the safeguarding therefore of our world-wide clientele we have renamed it—Findlater's Dry Fly Sherry.

AMERICAN SURVEY

Whirlwind Harvest

(From Our US Editorial Staff)

"THIS," the United States can say at last with truth about any decision reached on Palestine, "will hurt me as much as it hurts you." Until now it has been possible to appease the American Zionists at the expense of friends and allies, but in future the cost will have to be paid in the currency of American interests as well. The realisation of this gloomy fact—long understood in the State and Defence Departments—finally seeped up to the White House, and there were recent rumours of belated attempts to get bipartisan support for an American policy which considered national interests first. Since Republicans, as well as Democrats, have always tried to squeeze the last drop of party advantage out of appeasing the Zionists, there was never much chance that they would accept the suggestion. Senator Taft's statement three days before the Security Council met—in which he raised the President's bid with counterfeit chips—destroyed any lingering hope.

Mr Truman, in his predicament, got as little respite from the left as from the right. The Bronx election—in a district where 55 per cent of the voters are Jewish—proved that vague promises, alternating with bitter reproaches, to Zionist leaders who visited the White House, could not stand up against the offers of a third party, in no danger of being called on to make them good. The American Labour Party's victorious candidate admitted that "Due to the emphasis we placed on the Palestine issue, I would say it played a great part in deciding the election." And Mr Wallace has since shown—in his evidence on ERP and his comments on Mr Austin's statement at Lake Success—that he is chasing the Zionist vote for all he is worth.

It has always been possible for minority pressure groups to secure sectional advantages at the expense of the public good because the damage to American interests did not become apparent at once.

In the past, also, even when no domestic issues were raised, minorities who voted, or threatened to vote, as a group, were allowed to advocate, foment and raise money to assist the overthrow of governments by force, often encouraged by pious resolutions in Congress. In the House of Representatives, in particular, urgent legislation has waited while speeches in favour of Indian independence were made, and as recently as last month two Irish societies appeared before the Committees considering the Marshall Plan and asked that no ERP money should go to Britain until it abandoned the military occupation of Ulster.

It is unfortunate for the Zionists that the results of their efforts are likely to be direct and immediately apparent rather than indirect and attributable to other countries. Since the end of the war their case has been stated at great length and with great heat, but it cannot be said to have been debated, newspapers in search of advertising having shown little more backbone than candidates in search of votes. Still less has the morality of their tactics been questioned. Yet they have used

every method of political blackmail to get commitments from candidates. And, as Mr Carroll Binder, one of the few editors with the courage to speak the truth, told the American Council for Judaism last month,

the commitments, made so blithely by candidates who never reckoned with the possibility that our government, rather than the British, would be called on to implement them, are beginning to turn up for implementation.

These commitments—Mr Truman's repetitive insistence that 100,000 Jews should be allowed into Palestine, for instance—inconvenienced only the British until the problem moved to the United Nations in the autumn. Still appeasing, but apparently unaware that the moment had come when the United States might get involved, the President passed the Zionist pressure on to the small nations. Mr Kermit Roosevelt has described what happened in the January number of the *Middle East Journal*:

So the Zionists took the fight into their own hands. Rallying a group of influential Americans and selecting their targets with care, they exerted all possible influence—personal suasion, floods of telegrams and letters and political and economic pressure. Six countries which had indicated their intention of voting against partition were the chosen targets—Haiti, Liberia, the Philippines, China, Ethiopia and Greece. . . . Many of the telegrams were from Congressmen, and others invoked the name and prestige of the United States Government. An ex-Governor, a prominent Democrat with White House connections, personally telephoned Haiti. . . . He spoke firmly and might be presumed to speak with authority. A well-known economist also close to the White House exerted his powers . . . upon the Liberian delegate. . . .

Mr Binder might well ask

What right had the United States to use its economic and political power to compel weaker, but none the less sovereign, states to act contrary to what they believed to be their national and the world's interests for the furtherance of the presumed domestic political interests of the Truman administration?

With the Partition resolution passed, the Zionists became the anxious defenders of the reputation of the United Nations. The question, they announced primly, is no longer whether a Jewish state should be set up. Can the United Nations, they asked, survive if it fails to carry out the recommendation of the General Assembly? What of its prestige if it allows its decisions to be flouted by a few feudal Arab states? (The words "feudal" and "Arab" are now, like Tristan and Isolde, never used singly.) This question is one which genuinely troubles others who, though uncomfortable last November when small nations were bullied and threatened, now feel that, having allowed the Zionists to make its bed, the United Nations must go on lying. But there was no anxiety in Zionist circles at what Professor Wright of Princeton University called two weeks ago "the exploitation of the United Nations by a great power—our own government." Professor Wright thinks that "to prostitute the United Nations for a few thousand votes is the surest way to discredit it."

By coincidence the Great Cold this winter came to underline the case of those whose fears of partition are based on strategic reasons. The warnings of men like Mr Harold Ickes that American reserves of oil were disappearing at an alarming rate had been largely disregarded. The Lord, it was felt, would not fail to provide and ensure the discovery of vast new oilfields.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

long before the passage of fifteen years, which was the minimum time even the most pessimistic thought proved reserves would last. But, during the last two months, city after city has been put on an emergency rationing basis and in 1948 the United States will be, for the first time, a net importer of oil. The American people have felt the effects of being thirsty for oil and have been told firmly the only place where they will get more in the future. Zionists persistently preach that the oil issue is not a real one. In any war, they say, Russia will seize the oilfields at once and no Middle Eastern oil will be available for American forces. The truth is that the oil is needed now, partly to offset existing shortages, partly for ERP and, perhaps most of all to preserve some strategic reserves in this country.

★

The American statement before the Security Council may have been legally unimpeachable, but it neither guaranteed the Jewish State nor did it promise that America would not ultimately be involved. It therefore pleased nobody. Some thought it chose the worst points from both the possible extremes—American troops, as part of a UN army, might find themselves in a war without even establishing the Zionist objective. “We assumed,” Mr Austin said, “that there would be Charter observance,” an assumption for which there had never been any firm grounds. “The life of this union,” he also said, “depends upon obedience to the law. If any member should violate its obligations to refrain . . . from the threat or use of force the Security Council itself must act.” But there are more kinds of force than physical force. There is economic force and there is political force, both of which the Arabs had seen used at Lake Success in November to obtain a recommendation which could have got the necessary majority by no other means. It may have been reprehensible, but it was not surprising, that they used the only kind of force available to them. They have now seen, in the American resolution, the sign of weakness they were waiting for. Partition, they and many others are saying, is dead, “as dead as the Great Auk,” thinks the *Washington Post*.

There are three tragedies here. There is the tragedy of the United Nations which, however legally immaculate its position may be, will be thought to have failed—before a demonstration of physical force—to carry out its own decisions. The American statement certainly drew attention to a flaw in the UN structure—there is no machinery for carrying out Assembly recommendations. But the structural weakness was aggravated by the nature of the decision itself and the methods by which it was reached. The second tragedy is that of Palestine, which is no nearer a solution than it was on April 2nd last year when the United Nations first considered it, though many months nearer to catastrophe. The third is that of American Jewry—both Zionist and anti-Zionist. Mr Wallace Deuel reported in the *Chicago Daily News* two months ago that the American Government was wondering whether “American Zionist leaders should be required to register as agents of foreign powers when there is an independent Jewish state in Palestine whose interests they seek to promote.” Those agents who have so far been the agents of a non-existent foreign power may find their position increasingly difficult now that they have largely cut their ties with those among whom they were born and lost their sympathy. The anti-Zionist Jews, whose organisation is the American Council for Judaism, and who are probably in a numerical and certainly in a vocal minority, have been desperately watching their hopes of integration fade before the insistent Jewish nationalism of the Zionists.

American Notes

Is the Marshall Plan Enough?

There was a new note of urgency in Senator Vandenberg's eloquence as he launched the European Recovery plan into the full Senate debate. The Communist coup in Czechoslovakia and the squeeze on Finland, he said, made it more than ever necessary to speed the Marshall Plan to stave off World War III and to prevent “the iron curtain from coming to the rims of the Atlantic.” It is now hoped that the Senate will have passed the Bill by March 15th, and the House is under pressure to have

completed its work before April 1st. But it is no longer merely a case of the Russians coming once more to the aid of the Marshall Plan. The State Department, as its apologists insist, may have written off Czechoslovakia long ago, but the coup has come as a profound shock to public and to Congressional opinion. A month ago the question was: is the Marshall Plan asking too much? Overnight it has become: is it enough?

Senator Vandenberg, after his great fight to preserve the Marshall Plan, now finds that his chief problem is the anxiety of some Senators to expand it to cover military commitments. Senator Ball is pressing an amendment to the Recovery Bill which would set up a rival Security Council. Senator Lodge, speaking for the Bill early this week, said

In the past few days Czechoslovakia has gone entirely behind the iron curtain. We see Finland about to go down. Italy may fall a victim. If that happens, dollars will not be enough to meet the situation.

Senator Knowland, one of the 20 Revisionist Senators, said ERP did not go far enough and called for the adoption of universal military training and the creation of a strong air force. There are reports that President Truman is flying back from his holiday to discuss the situation with the US chiefs of Staff.

As yet, although opinion is moving very fast, it has not crystallised. But Czechoslovakia has created new allies for what one columnist calls the “long-range worriers in the State Department,” men who have never been convinced that political stability and military security would automatically flower from economic aid, and who have wondered whether political federation and outside military guarantees were not essential to the success of economic reconstruction. Even Mr Hoover, alarmed lest weakness should lead Europe to proclaim its neutrality in another war and thus deprive America of allies, has urged the Western European nations to form a defence union within the framework of the United Nations which “would avoid the United States being involved in military alliances.” The *Herald Tribune* welcomes the joint note of protest against the seizure of Czechoslovakia as the announcement of a Triple Entente in defence of Europe against the Communist threat. The lesson of events is being learned so rapidly in the United States that the watch-word to Europe may be hurry, hurry, hurry, rather than the cautious, over-the-shoulder-glance-at-Congress restraints imposed a month ago.

★ ★ ★

Expanding the Truman Doctrine

The debate does not stop there. The question being asked is whether the United States should take the revolutionary step, at odds with all the nation's past, of extending military support, and, either directly or by implication, military guarantees to what remains of Europe. Mr Byrnes's proposal of a 40-year pact guaranteeing German demilitarisation has at last been formally abandoned. Should the United States substitute a regional security pact with Britain, France and Benelux of the type permitted by the United Nations Charter and already applied to the Americas? Should the United States extend the Truman Doctrine, already in effect in Greece and Turkey, to the whole of Western Europe at a time when it may be seriously challenged in a way the Monroe Doctrine never was? It is urged that if action is to be taken the Italian elections in April set a strategic deadline.

The alternative was very clearly put by Mr Henry Wallace when, testifying against ERP, this avowed internationalist and idealist suggested that the United States and Russia might conclude a deal, similar, though covering a wider area, to that between Russia and Britain in 1907, which divided Persia into spheres of influence. Such a cynical advocacy of old-fashioned power politics took the committee by surprise; no one pointed out that in 1907 appeasement no more led to stability than it did in 1938.

The strategic consequences to American security flowing from the fall of Czechoslovakia and the threat to Italy and Austria have not been lost upon an Administration in which the Service view is so strongly represented. Will that view lead the President to ask Congress in an election year to underwrite the defence of Europe? A formal military pledge would require the consent of

the Senate. The President, by virtue of his control over foreign policy and the armed forces has, of course, considerable freedom of action and the power so to arrange events as to make it difficult for Congress to repudiate his policies—a power of which both Franklin Roosevelt and Theodore Roosevelt took full advantage. But Mr Truman is no Roosevelt; he has always shown every desire to observe meticulously the Senate's right to give advice and consent in matters of foreign policy. At the moment, indeed, the initiative is being taken on the floor of the Senate. Congressmen of both parties who listened without enthusiasm to Mr Bernard Baruch in January are now remembering his prophetic warning:

The European nations must compact together against aggression. . . . Otherwise they invite being broken one by one. Any economic aid will be inadequate without this common readiness of Europeans to stand up and fight for their independence and freedoms. Given such a determination, the United States should pledge itself to come to the defence of these uniting nations in case of aggression. . . . Our world, this country, have come to the point where there can be no assurance of peace unless the American people make clear where they stand.

★ ★ ★

Half-out of the Democrat's Bag

“The Southern states are aroused and the present leadership of the Democratic Party will soon realise that the South is no longer ‘in the bag,’” declared the Southern Governors Committee after their meeting with Senator McGrath, chairman of the Democratic National Committee. They had come to Washington as emissaries of the Southern Governors' Conference, to protest against the President's civil rights programme. The Senator had been as conciliatory as he could be without offering any compromise on the programme, but neither the Governors nor the Southern representatives in Congress appear to share his hope of “a happy reunion in the not too distant future.” Nor, indeed, have they at present much desire for such a reunion, since they have at last found a method by which they can “bolt” the party without ending up in the wilderness; they propose, in fact, to initiate a well-controlled “half-bolt,” by which they can threaten to ensure the defeat of President Truman if he is nominated, without actually leaving the party.

Governor Tuck, of Virginia, has asked his State Assembly to pass a Bill removing the names of Presidential candidates from ballot papers in the State, so that the voter would choose representatives in the electoral college who were pledged only to a particular party, not to a particular candidate. There seems no doubt that the Bill will pass and that it is constitutional; similar Bills are expected in other Southern States. If, as a result, the Southern representatives next November were to vote for someone other than the national Democratic candidate, there might not be a clear majority for any Presidential candidate in the electoral college. The election would then go to the House of Representatives, where the Southern States could probably prevent the election of any candidate they did not favour.

Although the Confederate flag is already waving from the top of the Virginia Capitol, Southern defiance will probably not go to the limits of ensuring a Republican victory. But the defiance is not only accompanied by a more realistic threat than in the past, but is also expressed at a time when the party is even more dependent than usual upon the South. The real basis of the South's discontent is the Democratic Party's habit of taking its support for granted: its constitutional ingenuity may be as effective a means of breaking this as would be the restoration of the two-thirds majority vote in party decisions which enabled the South to dominate Democratic conventions until 1936. Mr Truman may find that the attack from the South can only be bought off by making irreparable breaches in his defences against the even more dangerous attack from the North. It is perhaps not surprising that Washington is beginning to discuss the possibility that the Democratic candidate next November might be someone other than Mr Truman, who two months ago, according to Dr Gallup, could have beaten any Republican candidate in the field.

★ ★ ★

Oil for the Lamps of China

Two more aid programmes, for China, and for Greece and Turkey, now lie beside the European Recovery plan for Congressional action. They may be wrapped up into one parcel in the House, which has grown impatient at the way Bills for foreign expenditure keep straggling in. The Administration has requested \$275 million for arms for Greek and Turkish defence, noting that civilian needs for Greece will be met under ERP. The China Bill is an interesting example of pressure politics.

It is the first Republican-sponsored aid Bill, and at \$570 million to run till June 30, 1949, nearly twice what Mr Marshall thought would be adequate last November, a reflection both of China's inexhaustible need and the equally inexhaustible zeal of her friends like Representative Judd, Mr Bullitt, and Senator Bridges. Of the total, \$510 million is for essential imports (cotton, \$150 million, cereals \$130 million, petroleum and petroleum products \$110 million) and \$60 million for a miniature Marshall Plan of reconstruction well behind the fighting lines. Before the House Foreign Affairs Committee Mr Marshall insisted that other imports and military supplies must be paid for out of Chinese resources, and that in the Chinese quagmire there is no firm foundation for any substantial parallel to ERP. The Administration view is that the programme should be directed by the administrator of the European Recovery Programme as soon as he is established in office, a concession which appeals to those members of Congress who would go even farther and transfer from the State Department to the new administrator control over all foreign aid programmes, including Germany, Japan and Trieste.

The programme satisfies no one. Though the amount is barely enough to keep the lamps of China from going out entirely, it will drain away supplies needed in Europe. Mr Judd, his appetite whetted rather than sated, is now calling for \$1.5 billion. The influential support of Senator Taft and Mr Martin, Speaker of the House, has been secured for a policy of regarding China as the Greece of the East, bringing it under the Truman Doctrine and providing it with arms and a military mission. Senator Taft chose the week in which the fall of Czechoslovakia shocked the world to declare his strong belief that the “Far East is ultimately even more important to our future peace than is Europe.” A year ago Senator Taft supported the Truman Doctrine only because he felt that the President had mortgaged American prestige. The doctrine that the duty of an opposition is to oppose makes for political agility, at least.

On the issue of arms and military advice for China, Mr Marshall's authority—by virtue of his military experience, and his year in China—is invincible, and he employed it with crushing effect at the hearings. “There has not been a lack of advice,” Mr Marshall said. “It has been continuous and emphatic—and ignored.” And a year of involvement in Greek politics lay behind his insistence that the United States should shun responsibility for the conduct of the economic, political or military affairs of China.

Injunction Against the Typographers

Last week in Indianapolis labour lost the first round in the fight, and possibly the most important, of the series of court tests which the Taft-Hartley Act is about to undergo. The International Typographers' Union (American Federation of Labour), charged with “unfair labour practices” under the Act, is accused of twenty-three different kinds of illegal activities, many of them attempts to maintain the closed shop, directed against newspaper publishers in various parts of the country. The National Labour Relations Board cannot be expected to come to a quick decision on such a complicated case, and in the meantime the objectionable activities continue; in Chicago they have led to a newspaper strike which has already lasted for over three months. Therefore, Mr Robert Denham, general counsel of the NLRB, is seeking a temporary injunction, under Section 10j of the Taft-Hartley Act, that would force the union to refrain from “illegal acts” or from action in furtherance of them, until the NLRB has issued its decision.

The union contested his right to seek such an injunction, on the grounds that this section of the Act was unconstitutional, and that in any case only the whole Board and not Mr Denham alone could take this step. However, in the Indianapolis Federal Circuit Court Judge Swygert denied the union's motion that the injunction suit be dismissed, and thus gave the first specific ruling on the constitutional position of the injunctive process set up by the Taft-Hartley Act, which to labour is one of the most disagreeable sections of that Act. The injunction suit itself is being heard this week, but, even if it is granted, the Chicago strike may not be called off immediately, since the union maintains that it is striking for higher wages, not, as the newspaper publishers contend, in furtherance of the allegedly unfair labour practices.

the Paris conference. Since then Switzerland has been present not only at Paris but also at all the subsequent meetings of the "participating countries" at Brussels, at Rome and elsewhere.

The policy adopted by the Swiss Government seems to enjoy the general support of the nation. The support is neither very articulate, nor is it at all enthusiastic, but it is well-nigh unanimous. The only consistent opposition has come from the Communists, to whose approved slogans of "national sovereignty" and "American imperialism," has been added an occasional critical reference to the sacrifice of Swiss neutrality on the altar of Wall Street. This has brought a touch of humour to an otherwise dull campaign and one too obviously inspired to be inspiring. The sudden solicitude about the traditional foreign policy of Switzerland has struck Swiss opinion as rather odd. It was being displayed for the first time by the only party which had hitherto condemned that policy and urged adhesion to the San Francisco Charter.

Applause for Marshall Plan

Why the Government, with the overwhelming support of parliament, has adopted a policy of co-operation, is to be explained by two reasons, one negative and the other positive.

Ever since the war and the birth of the United Nations, Berne seems to have been affected by a certain dread of international loneliness. Fearing their absence from Lake Success might be misinterpreted, Swiss official circles have left no stone unturned to display their interest in and their sympathy for all forms of international co-operation which are not incompatible with their religion of political neutrality. That is why Switzerland is taking an almost ostentatiously active part in the International Labour Organisation, Unesco, the Food and Agricultural Organisation and most of the other "special agencies." That is why the Swiss authorities have granted the United Nations and their officials terms of residence in Geneva appreciably more generous than those which they enjoy in New York. That is why they also accepted the Paris invitation even before it had been addressed directly to them.

The more positive consideration which led Switzerland to applaud the American offer is not dissimilar from that which had prompted it. If that offer be defined as an American investment in European peace and freedom, it is but natural that Switzerland should be most grateful for it. It may not be able itself to take any appreciable share in the investment and it will certainly claim no exclusive dividends therefrom, but no state in the world is more interested in European peace and freedom than Switzerland which, from its Alpine retreat, has witnessed twice in the course of one generation the ravages of war on all its borders. Without peace in Europe it can enjoy neither security nor prosperity. As for political freedom in Europe, it is the very life blood of the Swiss, not only because it is the condition of peace, but because their seven hundred years old history is nothing but a continuous struggle against external and internal oppression.

Switzerland has therefore become one of the "Sixteen" both because it welcomes every form of non-political international co-operation and because it fully shares the hope that peace and freedom may be preserved in at least a part of Europe, which will be economically rehabilitated and socially consolidated thanks to American aid.

What does Switzerland expect to receive from the Marshall plan? Immediately, nothing at all, and even ultimately, nothing exclusive. Indirectly, however, Switzerland hopes to profit not only politically, but also economically from the anticipated recovery of its European neighbours.

*Official rate: 17.30 francs=£1. Free market rate: approx. 10 francs=£1.

A few figures will show why and how Switzerland's prosperity depends on that of the outside world and particularly on that of the other "participating countries." In the last year prior to the Second World War, Switzerland's foreign trade amounted to 2,923 million Swiss francs, that is 697 francs per head of the population. The corresponding figures for 1947 were 8,088 million and 1,877 francs.

A perusal of the first table will suffice to explain why Switzerland could hardly afford to remain aloof from the Marshall Plan conferences. Initiated by the country which, as a result of the war, has become by far Switzerland's most important supplier and customer, they are being carried on between sixteen European countries, of which nine are among its fifteen most important suppliers and eight among its fifteen best customers.

Compared with this, the following figures illustrate the minor importance of Swiss trade with the principal countries of eastern Europe:

(Millions of Swiss Francs)

Imports			Exports		
	1947	1938		1947	1938
Czechoslovakia	261.4	57.2	Czechoslovakia	159.4	44.0
Poland	79.0	25.8	Hungary	32.2	15.2
Hungary	35.6	25.6	Poland	29.0	22.5
Yugoslavia	23.1	11.1	Romania	21.7	14.0
U.S.S.R.	8.6	29.0	Yugoslavia	14.6	10.9
Bulgaria	4.5	5.1	U.S.S.R.	4.9	10.1
Rumania	4.3	25.0	Bulgaria	3.1	4.1

The potential resources of eastern Europe are, of course, enormous, and its total population is more than equal to that of western Europe. It is therefore likely that its commercial relations with Switzerland will appreciably increase in the future—if that future be one of peace. For the present, however, Switzerland, like all other countries of western Europe which have lost in Germany both their most important supplier and their best customer, is looking westwards rather than eastwards for the promotion of its foreign trade.

As Switzerland has been, is, and hopes to remain able to pay for her imports without American aid, it is, with Portugal, the only participating country which asks for none. On the other hand it is not easy to imagine what new and constructive contribution Switzerland could make to the efforts of European economic co-operation. Its production, with the assistance of over 100,000 recent Italian immigrants, is today already strained to the limit and its exports could hardly be increased. It has opened its markets, wider than most, to foreign exports. Its customs tariff is probably the lowest in Europe. The import quotas, with which the Swiss unfortunately feel obliged to protect their agriculture, are often waived. Alone in Europe Switzerland practises no form of exchange control. Moreover, since the war, Switzerland has given and lent nearly 1,000 million Swiss francs to its war-ravaged neighbours for their economic reconstruction.

Cult of Neutrality

Switzerland and European Union is a topic about which much has been written. The most penetrating authors present the subject as a study in contrasts. On the one hand, the multilingual federal state in the heart of Europe is often heralded from without, and is sometimes even tempted to look upon itself, as the micro-cosmic model of a future rejuvenated Old World. On the other hand, traditionally neutral, Switzerland is in some ways the least co-operative member of the European family.

A small state, for centuries surrounded by great powers and inhabited by a people whose various tongues and faiths have ever attracted them towards different and often warring neighbours, Switzerland has long deemed it wise to remain aloof from the quarrels of others. The cult of neutrality has thus become the essence of Helvetic patriotism. Ever since the Thirty Years' War in the seventeenth century, the fear of internal disunity, no less than that of foreign invasion, has made of that principle the corner stone of Swiss foreign policy.

For nearly five centuries Switzerland has practised that policy and, except for the Napoleonic wars, has thereby escaped invasion. Is it surprising that, attributing as they do their astonishing immunity at least in part to their political tradition, the Swiss will not discard neutrality? Would it not be expecting too much of their idealism and decidedly too little of their common

sense, to believe that the generation of Swiss, which has survived two world wars unscathed, would be prepared to reverse it?

In favour of what could they be tempted to do so? The United Nations, whose main characteristic is their fundamental disunion and whose Charter does not even pretend to shield the weak against the strong? A European Union, that is either a western *bloc*, formed to protect one-half of Europe against the other, or, for the tragic present at least, the idlest of day dreams?

No. Switzerland's traditions, its sentiment and its self-interest will prompt it to do everything in its power to promote the economic reconstruction of Europe, of western and of eastern Europe alike. But these traditions, sentiments and self-interests will, with equal force, deter Switzerland from joining any political union, unless and until it can be truly continental or, better still, universal in scope.

Switzerland's national experience and internal structure lead it to believe that there will be no secure peace and freedom in the world before all national sovereignties are merged in a supra-national federation. But foreign history has convinced the Swiss people that, pending that dispensation and especially in the present mad state of the world, they can best save themselves by avoiding all political and military commitments, save a general undertaking of armed neutrality and hostility to every aggressor.

They are the less ashamed of their traditional policy in this matter, because past and recent history seems to show that, properly understood and humanely practised, that policy may well serve the interests of others hardly less than their own.

British Honduras

SENDING the Royal Navy to the support of the Crown Colony of British Honduras in the century-old quarrel with Guatemala, which was revived last week, was both a successful and apt gesture. For it was a naval officer, Admiral Sir William Burnaby, who, in 1765, first gave British Honduras an improvised code of laws and who implemented its first constitution, granted by George III in the same year. The colony originally grew up in the buccaneering days of the 17th century when English pirates found its complicated system of reefs and cays an ideal haven from their Spanish pursuers. Its later development was gradual, but by the beginning of the last century "new and more respectable sources of wealth had been discovered."

The two chief sources of wealth in British Honduras are mahogany and chicle, a substance from the chicle tree used as the basis of chewing gum. In the last few years efforts have been made to expand its products, and grape-fruit, coconuts, and the nuts of the cohune palm have been added to the colony's exports. But timber remains its most important asset; of an area of 8,600 square miles, 93.9 per cent is forest land, and the majority of the population of 60,000 are employed in timber-cutting and hauling. Roads are few and bad, but development schemes now in progress should do much to remedy this defect. Airfields have been built at the capital, Belize, and at the largest town in the hinterland, Cayo.

The position of Belize is a serious drawback to the development of the colony. It was originally chosen as a settlement because of its harbour, but a vast mangrove swamp separates it from the hinterland. To lay roads across this swamp is difficult, while the mosquitoes, sandflies and land crabs which infest it make the journey singularly unpleasant. "If there is anything that bites," say the Belizeans, "we have it."

Economically, British Honduras is a flourishing little country, well worth the funds allocated to it by Britain. Its export trade in 1946, the latest year for which figures are available, amounted to \$5,222,028, of which half was obtained from mahogany and chicle sales and half from other products such as grape-fruit juice and coconuts. Its principal imports are rice, flour, textiles, cars, lorries and tractors. Income tax is on a sliding scale from 5 per cent on an income of \$1,000 rising to 40 per cent on \$35,000 and above. The people are a diverse mixture of "creoles"—English-speaking West Indian negroes—Indians, Caribs, East Indians, and a few hundred Europeans.

Guatemala's Claims and Threats

The dispute with Guatemala arises out of the treaty signed in 1859 by which Guatemala agreed to recognise the British title to the colony in exchange for a road to be built from Guatemala City to the Atlantic coast. It was then found that to build this road would be impracticable, and Britain offered to pay Guatemala an indemnity of £50,000 instead. Guatemala retaliated by threatening to withdraw its recognition of British Honduras as a Crown Colony. In 1936 the dispute was revived and Guatemala then claimed that as Britain had not built the road, the original treaty was invalid and that British Honduras belonged to Guatemala. At the beginning of the war, President Ubico postponed the dispute as a recognition of Britain's engagements elsewhere, but in 1944 President Ubico was deposed, and the new President, Juan José Arévalo, began to press Guatemala's claims once more. Britain's suggestion that the matter should be referred to the International Court of Justice was rejected and last week threats of armed invasion were made. These threats subsided as a result of the prompt dispatch of British forces to the colony.

There the matter now rests, but more will probably be heard from Guatemala at the forthcoming pan-American conference at Bogota, when Guatemala will probably join Argentina, Chile and Venezuela in their protests against the "violation" of South American territory by Britain.

Revival of Hongkong

LOCAL political squabbles are not reflected in the figures just published of Hongkong's foreign trade last year. Their most significant item is the swift rise of Japanese imports from virtually nothing in 1946 to a value of nearly \$37 million in 1947. In the same period the value of piece-goods and textiles imported rose from \$101 million to \$215 million, which latter figure is exceeded only by oils and fats at \$246 million and food at \$240 million—although sundries amount to \$259 million. The largest rise in the main groups of merchandise is in dyeing and tanning materials, from \$12 million to \$66 million, metals from \$40 million to \$103 million, and minerals and ores from \$1,500,000 to \$9,000,000. The total value of imports was \$1,550 million compared with \$933 million in 1946. "Treasure" worth \$50 million—more than twice the 1946 sum—was also imported. The United States with goods worth \$299 million ousted South China with \$281 million as the largest importer. The United Kingdom's share increased from \$44 million to \$164 million and is now third largest. British Malaya, Australia and Canada also imported considerably more.

Hongkong's exports in 1947 totalled \$1,217 million, exclusive of "treasure" worth \$99 million. In 1946 they amounted to \$767 million. The main items were oils and fats, \$271 million; "sundries," \$245 million, piece-goods and textiles, \$194 million; food, \$159 million; and metals, \$74 million. Most went to British Malaya, which took goods worth \$214 million compared with \$162 million the previous year. Exports to South China amounted to \$167 million; to the United States, \$152 million; and to the United Kingdom, no more than \$38 million. These trade figures, which are given in greater detail in this week's *Records and Statistics Supplement*, underline the good prospects for Far Eastern trade—if political conditions allow.

THE BUSINESS WORLD

Shipbuilding Problems Now

BRITISH shipbuilders have increased the preponderance in world shipbuilding which they held before the war. This is clear from the final summary of world output of shipping in 1947 issued by Lloyd's Register. It is permissible, now that the wartime peak is past and the fantastic American mass-production effort has disappeared from the scene, to look for the outlines of a post-war pattern in the world shipbuilding industry. Last year 2,111,886 tons gross of merchant shipping were launched in the world (excluding Russia, Germany, and Japan); this is about the level of 1936, and is indeed less than in any of the intervening years except 1940. It is only slightly less, by 25,000 tons, than in 1946. British yards launched 1,202,024 tons—56.9 per cent of the world total, 69,000 tons more than in 1946 and, if the British wartime peak of 1942 is left out, more than in any year since 1930. United States output dropped from 501,294 tons to 164,848; Swedish launchings rose from 146,875 tons to 222,598 and displaced the United States for second place in the world table. Canada retained fourth place with 103,987 tons (an increase of 32,000). Next came France (91,911) and the Netherlands (87,801), each achieving its first substantial production since the interruption of the war years.

Among the British launchings were the *Caronia*, *Orcades*, *Edinburgh Castle*, and *Pretoria Castle* (28,500 tons and over), seven liners of 13,000 to 16,000 tons each (two for export to Portugal), a whaling factory ship of 17,000 tons for Norway, and a tanker of 12,200 tons. Of the sixteen ships of 12,000 tons and over launched in the world during 1947, thirteen came from British yards. Sixteen of the 35 tankers built were British. An unusually high proportion (380,000 tons or 31.6 per cent) of the British output was built for foreign owners—compared with 10.2 per cent in 1946, 19.8 per cent in 1938, 10.9 per cent in 1936, 44.0 per cent in 1930, and 17.1 per cent in 1929. The biggest overseas customers were France (79,000 tons), Norway (74,000 tons), and Portugal (52,000).

In 1913 British launchings were 58 per cent of world launchings; last year they were not a great deal less. What other major industry can show the same record? In the intervening years the share has, at times, fallen a good deal lower—it was 25.8 per cent in 1932 and 34 per cent in 1938. The shipbuilders would seem to have a good deal of reason to congratulate themselves. But in fact their utterances have lately been perplexed and dissatisfied. The shipbuilders are not fitting comfortably, it seems, into the new world of planning; the planners, they clearly feel, do not use them well. They themselves are doing much, but if Government departments did not interfere they could do so much more. Their main complaint is, naturally, about steel.

Steel is a sore subject in most industries now; accusations of parsimonious steel allocations come from all the main users, and are themselves the Government's best defence against the charge of unfairness. Steel production has increased, but there is not enough to go round. And the prospects for a continued and steady increase (depending, as they do, on such doubtful quantities as the supply of German scrap) are not firm enough to encourage bold allocation. That the shipbuilders, like others, should blame the allocation system for injuries for which short-

age is really to blame, is not surprising. Last year the industry got a good deal more steel than was allocated to it; it has now been allocated substantially less, and at the same time a new system has been introduced to ensure that deliveries approximate more nearly to allocations than they have done in the past. Left to themselves, the shipbuilders may reasonably feel, they would have done better.

The truth is that ill-feeling between the shipbuilders and the planners is aggravated by a singular cause; the shipbuilders are good planners themselves. They learned the hard lessons of the early thirties, and have come to leave as little as possible to chance. But they have now to adjust themselves to planning from above which is outside their control, and which, therefore, confronts them with a new factor of uncertainty. And here the Government planners might well study what can be done to improve matters. The shipbuilders may or may not be right in believing their allocations of steel for the first months of 1948 to be unreasonably low. Nobody can say; the allocations are not published, and the conflicting claims of the various industries have never been impartially presented to the public. Objective discussion of the merits of the various cases has not been possible, because the data are missing. Naturally, if the Ministry of Supply takes refuge in silence and obscurity, industrialists take refuge in special pleading. But in the uncertainty of steel allocation plans the shipbuilders have a clear and reasonable complaint. They complain, too, of failure to consult them, and that they learnt of the January cut in steel supplies from the press. This should not happen. They must know in advance, and with reasonable certainty, what they can do. Uncertain and uneven supplies reduce them from a well-organised and well-planned industry to one peculiarly liable to spasmodic interference, peculiarly at the mercy of the winds of trade.

What, after all, do the shipbuilders want? Are their requirements in conflict with the needs of the national economy? The two interests are—if quarrels over the immediate supply of steel can be suspended for a moment—substantially the same. The primary purpose of any plan for shipbuilding, in the face of the immediate economic crisis, must be simply to ensure that the best use of the industry's potential is made in the national interest, economic and strategic. The longer-term and for the moment secondary purpose must be to take any possible steps to prevent a future shipbuilding slump, with its consequent dislocation and unemployment which would not be confined within the limits of the industry. This calls for the levelling out of the worst fluctuations in demand to ensure a more steady flow of work, merchant and naval, over the years. These two main objectives are not likely to be contested. Any divergence of views is likely to be on the method rather than on the purpose.

It is pertinent to consider what are, for the time being, the chief demands on the shipbuilding potential of the country. In the first place there is the need to restore the deficiencies in tonnage caused by the war. This is as important to all the European maritime nations as it is to Great Britain, for until they have the ships they are deprived of the means to save dollar expenditure on freights, and to earn dollars for

shipping services rendered. Next comes the need to increase the total supply of world tanker tonnage, of which (though world tanker capacity is already some 50 per cent greater than it was at the outbreak of war) there is a general shortage. Thirdly, there is the need to improve the quality of the merchant fleets, to replace the heavy losses of specialised tonnage, such as refrigerated ships, fruit and timber carriers, short-sea traders, coasters and the like, whose duties can never be economically performed in peacetime by the makeshift standard tonnage which was built on such a scale in North America to meet the needs of war. The export value of the shipbuilding industry is a fourth factor which cannot be forgotten.

British shipyards have made a creditable effort to meet these demands. They have been delivering new ships at the rate of about a million tons gross a year for the past two years. But despite their efforts, despite the absorption of a good deal of ex-enemy tonnage into the register and the purchase of well over a million tons gross of war-built ships from America, United Kingdom merchant tonnage is still some 2,000,000 tons gross below the 1939 level. In quality and age, it is immeasurably inferior, and rough use in the war has accelerated its obsolescence. Other Marshall Plan nations, notably Norway, Denmark, the Netherlands and France, are in the same difficulty; all rely to a large extent on British shipyards to make good their deficiencies. The deficiency of tanker tonnage is world-wide, and the proportion of tankers under construction and on order at the moment bears witness to the demand and to the effort to meet it. At the end of December there were 50 tankers totalling 447,945 tons gross under construction in Great Britain, most of them still on the stocks. But shipbuilders had orders on their books for a further 118 tankers, totalling more than 1,100,000 tons, which account for a good 50 per cent of the total tonnage awaiting berths. Owing to their greater subdivision, tanker hulls ton for ton need more steel than passenger or cargo hulls. Current changes in the kind of demand for shipping mean, therefore, that requirements of shipbuilding steel will increase as the new orders reach the building stage.

*

In direct exports, the industry is doing well. For some time the proportion of export work in hand has been increasing; it is now about one-third, and if ships in hand and on order are taken together it may well amount to £100 million. If this could be completed within, say, three years, its contribution to the export programme would be substantial and timely.

"It is at present," said the White Paper on capital expenditure, "quite as advantageous to build ships for British owners as for export, even where the exports are to hard-currency

countries." This may be an over-simplified statement. The benefit, it must be added, is lost unless the ships are used to the best trading advantage, and the unsatisfactory figures given in the White Paper on the Balance of Payments leave room for doubt whether this is being achieved. At any rate the net foreign earnings of United Kingdom shipping increased from £9 million in 1946 to £17 million in 1947. It is fair to argue that another one or two million tons of merchant shipping would have brought a more than proportionate increase in foreign earnings. Neither the dry cargo fleet nor the tanker fleet is big enough yet to exclude the necessity of spending heavily in hard currency for the charter of American and Canadian ships; and, given more ships, earnings from the cross-trades could be a good deal higher than they are. The limited improvement which was achieved may be largely attributed to the output of high-quality liner tonnage for British owners from the shipyards during those two years. The output would have been much higher if it had not been for the serious deficiencies in raw materials and components and for congestion in the fitting-out stages caused by the large amount of reconversion work still being undertaken. But the back of the job has now been broken. Net shipping income should show a substantial increase in 1948; many more passenger liners will be back in service and four new liners of over 28,000 tons gross each are approaching completion.

What are the shipbuilding prospects for 1948? Shortages of various kinds may be expected to continue sporadically, but the prospects of a more regular flow of materials and components—except steel—are better than they have been. Shipbuilders have no general shortage of labour to contend with. They are equipped with more modern plant than ever before. They have, for the time being, plenty of orders to keep work flowing regularly through their yards. Their capacity is not stretched to its limit. Left to themselves, but given enough steel and fittings and components, they might be able by 1949 to produce finished ships at the rate of nearly 2,000,000 tons a year.

If such ideal conditions existed, it would be necessary to consider what would be the international economic repercussions of producing ships at a rate approaching the present world production. But they do not exist, and are not likely to be attained so quickly. The shipbuilders, as they themselves are aware, depend on a multitude of supplying trades for the components which go into the fitting and furnishing of their ships. They are as worried as any industrialists by the ever-rising trend of their costs. They are, in fact, exposed directly to the economic problems of the country at large. It is this point which sets the limit to their immediate case, sound though it may be, for some additional steel supplies.

The New Companies Act—I

Re-shaping the Balance Sheet

ON July 1st next, the accounting provisions of the new Companies Act will come into force. Many companies have already anticipated the changes which the new Act demands, but there are still a greater number whose directors and accountants have yet to address themselves to the new requirements. There are two fundamental statutory principles from which all the detailed stipulations about accounts can be said to flow. The first is that the balance sheet shall give a true and fair view of the state of affairs of the company at the end of its financial year, and also that the profit and loss account shall give a true and fair view of the profit or loss of the company for the financial year. The second principle is that companies with holdings in subsidiary companies will in future be obliged (with a few exceptions) to issue "group accounts."

The general effect of both of these principles will be to bring the laggards into line with the best practice, rather than to make any great advance on what is already being done by many enlightened boards of directors. The Act will have the advantage, however, of encouraging some degree of standardisation of practice and consistency in the use of technical accounting terms—though even here it builds on a foundation which the Institute of Chartered Accountants, by its extremely valuable recommendations on accounting practice, has already done much to consolidate. For example, the Institute's recommendations on "reserves" and "provisions" have been closely followed. "Reserves" are surpluses; that is, they are accretions to the proprietors of the business, either as undistributed profits or other revenue reserves (which can be distri-

buted as dividend if thought fit) or as capital surpluses, like profits on the sale of fixed assets and receipts from share premiums (which are "capital reserves" and whose distribution is therefore subject to certain limitations or outright prohibition).

In this, the first of two articles on the future shape of Company Accounts, it is proposed to deal with the balance sheet, and to leave the profit and loss account for later discussion. In the past, the left-hand side of a balance sheet has often presented an unsorted mixture of proprietorship balances (including capital, reserves, and undistributed profits) and of liabilities (with which free reserves are sometimes lumped together). The right-hand side might include such national "assets" as a debit balance on profit and loss or discounts on shares issued. The new obligation to classify the items in a balance sheet under the headings of capital, reserves, liabilities, and provisions (the latter are liabilities "of which the amount cannot be ascertained with substantial accuracy"), and fixed and current assets, will result in an improvement in the structure of the average balance sheet. It will, therefore, be easier to see the relationship between the funds contributed directly by shareholders, those provided indirectly from accumulated profits, and those borrowed, or financed by normal trade credit. The new form will distinguish resources sunk in fixed assets (which are not defined, but in general cover durable property and equipment, long-term claims, and other assets not convertible into cash within twelve months) from current or floating assets, which are turned over more or less rapidly in the course of trade, or represent the temporary investment of surplus funds. The general balance sheet form will therefore be as follows:—

Share Capital	Fixed Assets
Undistributed Profits and Reserves	Current Assets
Share Premium Account	Discount on Shares
Capital Reserves	Preliminary Expenses
Revenue Reserves	Profit and Loss Account
Profit and Loss Account	(debit balance)
Long-term Liabilities	
Current Liabilities and Provisions	

This is a clearer form than many balance sheets, but it is not revolutionary in any of its conceptions.

The detailed requirements of the new Act on the construction of accounts are extremely technical, and they have increased, rather than reduced, the scope for professional argument. But accounts in future will undoubtedly mean more to the layman than in the past. Most significantly, "secret reserves" will no longer be permissible, except for banking, discount and assurance companies. It is hard to imagine how a profit and loss account can ever have been worth the name if it failed to show a figure of profit or loss which reflected as closely as possible the results of manufacture and trading.

But public companies have often developed a practice of "tucking away" profits in good years, and the practice has long reposed on the legal sanction in *Newton v. Birmingham Small Arms Company*, 1906.

Accounting does not lend itself to detailed statutory regulation, and, unless a proper sense of judgment is preserved, niggling attention to detail can easily frustrate the fundamental ideas which accounts should satisfy. The accounting provisions of the Act are very largely what accountants have asked for through their professional bodies, and it is interesting that some of them are now wondering whether the Act will not involve them in more onerous responsibilities than they were inclined to anticipate. This, no doubt, is in part a reaction which is due to the technical argument and discussion on many provisions of the Act. As an example of the accountant's problems in the application of the new Act, the following extract from the 1st Schedule, Part IV 1 (2), is worth consideration:—

Where—(a) any amount written off or retained by way of providing for depreciation . . . not being an amount written off in relation to fixed assets before the coming into force of this Schedule or (b) any amount retained by way of providing for any known liability is in excess of that which in the opinion of the directors is reasonably necessary for the purpose, the excess shall be treated for the purposes of this Schedule as a reserve and not as a provision.

This extremely important passage removes the existing sanction given to "secret reserves." Companies should not in future understate their position—that is clearly the principle. But the accountant must look to the detailed wording of the Act, not to the principle which it purports to enshrine. It is therefore important that the first line of (a) refers to an "amount written off or retained by way of providing," whilst the exclusion after "not being" refers only to "an amount written off." The effect may be that excessive past depreciation must now appear as a free reserve if it happens that it was maintained as a separate balance, but not if it was actually applied in the books as a deduction from the original value of the assets. The distinction is clear, though it seems to have little intrinsic significance. Even if this is accepted without further argument, another problem arises. If depreciation written off in the past was excessive, should there be a relief from future provisions until the over-provisions of the past are absorbed? Questions of this kind will add to the already considerable burden carried by accountants and auditors for some time to come; and only by keeping in mind the principles underlying the new Act will accountants avoid losing themselves in technicalities.

A certain amount of room for judgment has quite rightly been left by the introduction of the words "if material" in many of the stipulations. No doubt what is material in one case may not be so in another. The significance of possible margins of

with the sudden draining away of accruing tax monies into the newly-issued and very attractive Tax Reserve Certificates. This very rapid net cancellation of bank credit has occurred, moreover, in a month in which there have been unprecedented demands upon the banks for new lending to the public. Bank advances have risen by no less than £51 million—a far larger movement than in any previous month—and now stand at £1,273 million, almost £270 million above their level at the corresponding date last year.

Those who are now busily propagating the view that the size of the prospective Budget surplus offers large scope for tax reliefs will no doubt seize upon these facts and present them as evidence that inflation is, mysteriously, generating its own correctives. But before any hats are thrown into the air, it would be well to reflect that Mr Dalton, casting around twelve months ago for a means of defending his cheap money policy, pounced upon precisely analogous evidence. In February, 1947, as he was quick to point out, net bank deposits dropped by £90 million. But they rose by fully £330 million in the ensuing ten months. Unless the Government rashly dissipates its prospective surplus, they are perhaps unlikely to follow a parallel course this year; but it must always be remembered that these February returns reflect the biggest tax-gathering weeks in the calendar, and the collections this year have broken all records. In the four weeks to February 21st (roughly the period covered by the banks' return) there was an ordinary surplus of more than £240 million—although by the last week of this period the succession of weekly surpluses had already given place to a small deficit. Moreover, the Treasury's sterling receipts from sales of dollars (obtained by drafts on the credits and sales of gold) far exceeded its "below-line" outgoings. If it were not evident that the Treasury has had to make certain "invisible" outlays (for example, for purchases of 3 per cent Conversion Loan in advance of maturity), an even larger fall in bank deposits might have been expected than has in fact occurred. This is indeed well demonstrated by a new index which has just been compiled by Lloyds Bank with the object of showing, by eliminating seasonal fluctuations, the underlying trend of bank deposits; figures have been calculated, on a 1938 base, for each month since 1936. Significantly, the index for last month shows a fractional rise.

It will be surprising if February's movement in published deposits is not sharply reversed by the March return. To enable Argentina to finance the rail pay-out, the British Treasury is having to raise the money from the banking system, partly to repay loans previously received from Argentina (by way of investment of its accumulated sterling) and partly to provide for the advance payments under the Ministry of Food contracts. This week, too, some £100 million has had to be found to redeem the publicly-held residue of the Conversion Loan. Both these operations will increase the volume of money in the hands of the public, and although the bulk is likely to be reinvested by the immediate recipients, it certainly cannot be taken for granted that most of it will be quickly withdrawn from circulation—by repayments of bank advances or purchases of securities from the banks or the "departments."

On a somewhat longer view, the greater the success of the drive to achieve equilibrium in the balance of payments, the greater will be the pressure on the domestic banking system. If in 1948 the total deficit were to be reduced to, say, £250 million, the Government would need fully £400 million more domestic finance than it required in 1947—unless there are countervailing savings in its net domestic outlays. That is simply another way of saying that the coming Budget ought to provide for the mopping-up not only of the inflationary pressure which already exists, but for the additional pressure which will arise from any narrowing of the external gap.

Control of Bank Advances

It is only rarely that any light is shed officially or authoritatively upon the relationships between the monetary authorities and the joint stock banks. As even tiny straws may show the direction of the wind, a reference in the latest *Midland Bank Review* to the method of controlling bank advances ought not to be allowed to pass without comment. In the matter of domestic monetary policy, in contrast with exchange control, the influence of the authorities upon the banking system and money market has long been exerted in a most informal manner, relying upon moral suasion exercised verbally and personally rather than officially, and depending hardly at all upon any legal or other sanc-

tions which the authorities might be able to bring to bear. This characteristically British tradition has not been altered by the powers conferred upon the Bank of England at the time of its nationalisation, but in one respect the wartime system of control has involved a slightly greater measure of formalisation. At the outbreak of war, and again in 1945 and late in 1947, the Chancellor's public request to the banks to ensure that their policy in making advances was in accordance with the spirit of the guidance given officially to the Capital Issues Committee, was privately put into more formal shape. On each occasion letters from the Chancellor to the Governor of the Bank of England inspired letters of guidance from the latter to the chairman of the British Bankers' Association.

The *Midland Bank Review* now reveals the substance of those behind-the-scenes requests and shows (as, indeed, close observers were already aware) that the latest one, both in scope and precision, goes rather beyond any of its predecessors:—

As in 1945, so in 1947, there was a specific request to avoid providing bank advances for customers' speculative operations, and to these were added injunctions against enlarged financial facilities for dealing in property or increasing hire-purchase credit, more especially for consumers' goods.

The *Midland Bank Review*, unlike many other bank reviews, still consists entirely of anonymous articles which may therefore be presumed to reflect the views of the bank. Given the tradition in such matters, the fact that this particular issue has been raised confirms the impression that it is one which lately has caused a certain concern to some at least of the banks. As soon as informal methods of control proceed from general to specific requests they are bound to cause difficulties in practice. Since there is, necessarily, no codified body of detailed principle by which any particular transaction may be judged, different banks are bound to have different views about which transactions are permissible and which not. Naturally, the authorities themselves are always ready to give guidance whenever their advice is sought. But even the smoothest co-operation between the banks and the authorities may not ensure uniformity or prevent any unfairness in the operation of the system as between bank and bank. For example, a bank might submit a borderline case to the authorities and be advised that the customer's project was not within the spirit of the regulations. But the customer might then take his business elsewhere and find that another bank, interpreting slightly differently the official "request," would be prepared to sanction the advance without feeling any need to seek official confirmation of its own interpretation.

Plainly, there is no ready solution for such difficulties as these, for any attempt to work a highly organised system with detailed rules would certainly create many more problems than it solved, and would undoubtedly be a source of intolerable friction in day-to-day working. But the fact that these problems exist makes it the more desirable that the relevant facts should be available for public discussion. It is time that the actual text of the "request" was made public.

Uruguayan Rail Purchase

This week has brought disillusionment to speculators in the stocks of South American railway companies whose probable purchase has been regarded as a corollary to the recent payments of the Argentine rail purchase money. As the accompanying table of recent price changes in these stocks shows, hopes of capital gains based on optimistic estimates of possible take-over prices have run high during the past few weeks. The first cold douche for stockholders has come from Montevideo. Mindful perhaps of the not unsatisfactory terms for the acquisition of Montevideo Tramways some months ago, the market had been talking freely of a global sum of between £8 and £10 million as the likely price to be agreed by Uruguay in payment for the six railway companies whose purchase has been under negotiation for some months.

The actual amount has been announced this week as only £7,150,000. Of that sum, Central Uruguay will receive £5,591,000, Midland Uruguay £802,000, North Western £318,000, Uruguay Northern £259,000, Midland Uruguay Extension £130,000 and Quarahim £50,000. No division of these totals among the various classes of stockholders has so far been arranged, but assuming that debenture and preference stockholders receive the lion's share according to their precedence, little will remain for the junior stocks. Yet as the total issued capital of the companies is nearly double the agreed take-over sum, the expectation that they would receive more than these amounts may have seemed reasonably founded. But the facts of the

British bargaining position decreed otherwise. The agreement was signed in Montevideo this week, and operation of the companies' properties by the Uruguayan Government will take effect retrospectively from July 1, 1947.

The lessons of this market flutter have been quickly perceived by the bulls of other South American utilities and railway stocks. Here, as might have been expected, the main reaction has been in Brazilian railway stocks, in which much activity has lately been witnessed. The departure of the members of the board of Leopoldina for Brazil has been followed with interest since the Uruguayan purchase price was announced. Although the setback in these and companion issues has not been as sharp, the whole market has been put on edge pending the receipt of progress reports from Rio de Janeiro, where, it is understood, negotiations between company officials and the Brazilian Government have been opened. But the mood of Brazil, as of other Central and South American Republics, appears to be none too

conciliatory at the moment. An order has gone out this week from the Federal Government cancelling the concession granted in 1911 for 76 years to the Ceara Tramways, Light and Power Company and ordering the transfer of the "assets of the concession" to the municipality of Fortaleza. Compensation is to be assessed by the Federal Department of Agriculture and the municipality; no provision appears to have been made for hearing representations from the company, nor has the likely amount of compensation or the time of payment been mentioned; presumably these are to be arranged in Brazil's own good time, but it is a matter which should be taken up without delay by the present British Government mission in Brazil. The protracted process of ratification of the San Paulo sterling payment, not yet agreed by the Congress of Brazil, is another reminder—if that were needed after the year's delay in completing the Argentine rail scheme—that over-optimistic speculators in the South American rail and utility stocks can no longer be regarded with much sympathy.

The Paris Free Market

The free exchange and gold market in Paris has now been functioning for over a month and has shown no signs of those pyrotechnic displays that had been widely expected of it. The

dollar, which was first quoted at about 307 francs, has gradually depreciated to about 305 francs, where the market has been reasonably stable for a few days. The turnover is reputed to be small, the largest daily figure being around \$1,000,000. There is strong evidence that the market is controlled and that some of the buying is on account of the Exchange Stabilisation Fund, whose orders are handled by the ordinary commercial banks. As yet there has been very little evidence of genuine commercial buying of dollars and escudos. This is not because of any lack of potential buyers but because no licences are being issued for the inessential imports eligible for exchange acquired in the free market. Most of the selling comes from tourists and American concerns which have remittances to make to France. There has been very little evidence yet that French exporters are selling the proceeds of their shipments in the free market.

As contrasted with the slight depreciation of the free dollar and escudo, the price of gold coins has been rising steadily since the free market began to operate. From a price of 8,300 francs the ten-dollar coin has risen to 10,500 francs. The rise in the price of gold coins has been particularly marked this week, for the events in Czechoslovakia have encouraged hoarding. It will be seen from these prices that the gold dollar is at a high premium over the paper dollar. At the current free market price of 305 francs for the paper dollar, the pre-1933 dollar would have a value of 516 francs. Yet the gold dollar is priced at 1,050 francs, showing a premium of over 100 per cent. It is not only sterling that has unflattering aspersions cast on it by the differential rates quoted in the Paris market.

The French Government have been compelled to make further concessions on the withdrawal of 5,000-franc notes. Immediate reimbursement was made on the first two 5,000-franc notes handed in by any one holder. Last week the Government decided that all holders who deposited notes amounting to less than 70,000 francs would be reimbursed by March 1, provided all taxes due by them had been paid. The Government is also expected to announce the conditions under which the rest of the 5,000-franc notes will be reimbursed. It is already committed, however, to make full eventual repayment of these notes—provided, of course, the holders can show a legal title to them and that they are free from the suspicion of tax evasion. In other words, the possibility that this operation might be made the basis of a substantial contraction of the currency appears to have weakened considerably in the last few days.

Expanding Trade under Bilateralism

In the debate last Tuesday the Secretary for Overseas Trade sought to prove that the Government was attempting "to make the best of both worlds"—to secure the advantages of multilateral trade by means of bilateral negotiations. It is wrong to argue, as Mr Bottomley sought to prove, that bilateral negotiations necessarily expand the volume of trade. They can do so in the initial stages, as indeed is apparent from the new agreements, but expansion under bilateralism is by its very nature restricted in the long run. But months of arduous work embodied in these negotiations are in fact at last bearing fruit, and the new trade pacts with Finland, the Netherlands and Poland, following on the Argentine and Danish agreements, go some way to substantiate the Government's claim. In each case an expanding volume of trade has been assured and Britain has been able to secure supplies of food-

stuffs and raw materials in return for coal, steel, chemicals and manufactures. Coal is now playing a vital part in all these negotiations, and if production continues to lag behind schedule—which it has been doing since the beginning of the year—the shortage will have to be carried by the home rather than the export market, particularly since the quantities of steel which can be offered to other countries are much lower than their requirements.

No official text of the Argentine agreement is yet available, although the protocol was signed some 14 days ago and the definitive text was despatched by airmail. After the Government's statements about prices in the debate on Monday of last week, the text is awaited with some eagerness. The official communiqué on the Danish pact is unique because contract prices were published. The details prove to be substantially similar to those published ten days ago in Copenhagen to which reference was made on page 340 of last week's issue. Denmark has agreed to send to the United Kingdom not less than 62½ per cent of its exportable surplus of butter, with a guaranteed minimum quantity of 40,000 tons; this differs slightly from last week's information. The bacon clause stands, but in addition Britain has undertaken to buy not less than 90 per cent of the exportable surplus between October, 1948, and September, 1949, at a price not less than 225s. a cwt. Britain is also to purchase small quantities of cheese, condensed milk, meat and fish.

Under the Finnish trade agreement, the United Kingdom is to import 190,000 tons of chemical wood pulp, 30,000-40,000 tons of mechanical wood pulp and 150,000 cubic fathoms of pitprops, in addition to sawn softwood, plywood and other timber products. The quantities of wood pulp are similar to British imports from Finland in 1947, but this year's quantity of pitprops is some 100,000 cubic fathoms less than last year's imports from Finland. Prices have not yet been agreed, but they are understood to be at "the existing world level." Britain will send Finland 500,000 tons of coal and coke and 40,000 tons of steel in addition to machinery and electrical equipment. Finland has also agreed to resume the issue of import licences for British goods. It is confidently expected on both sides that trade between the two countries will develop on a wider plane than hitherto since the war, and in the next nine months might total £30 million, or the equivalent of the whole volume of trade in 1947. But the achievement of such results rests largely on political factors.

As a result of the Anglo-Dutch agreement, announced on Monday, trade turnover between the two countries is expected to reach £72 million this year compared with £59 million in 1947. Britain will import condensed and powdered milk, eggs, bacon, fresh fruit and vegetables (including potatoes and onions) and small quantities of other foods such as canned meat and pulses. The value of these items this year will be £24 million out of the total import of £33½ million. In addition, Britain has agreed to purchase flax and strawboard. The Netherlands, on the other hand, will get 300,000 tons of coal, over 30,600 tons of steel, other essential raw materials, such as cotton yarn and chemicals, and motor-cars. Total British exports to the Netherlands will amount to £38½ million. The Dutch Government has also agreed to relax import restriction on a wide range of British goods. Both countries are also to make reciprocal arrangements for the resumption of tourist travel.

The Polish agreement is an elaboration of the trade pact signed last June, under which it was intended that Polish exports to this country should amount to £6,500,000 in 1948. The new programme has been expanded to a total of £11 million, of which £7,000,000 will comprise bacon, eggs and other essential food-stuffs. It is further hoped that supplies of timber will also be made available. Negotiations for long-term food contracts will take place later in the year. Britain has undertaken to facilitate the purchase of wool, rubber and other raw materials up to a value of £10 million during the current year, and both countries have agreed to exchange miscellaneous manufactures amounting to £2,000,000.

Restrictions on Oil Bunkering?

The effect on shipping costs of the rising price of oil is already considerable. Hardly less serious is the danger to the smooth operation of shipping which has arisen in the past few weeks through the growing shortage of oil at bunkering stations. More than two-thirds of the merchant tonnage launched in Britain in 1947 was fitted for burning oil fuel. In 1948, however, a further increase in February has already added another

an increase of about 50 per cent in 12 months. These price increases will add to the cost of food and raw materials imported to this country, and they have coincided with a severe shortage of oil for bunkering in British ports and throughout Europe.

No end to this general shortage can be seen at present. The suggestions to alleviate the scarcity of oil bunkers in British ports, made by a working party which reported to the Minister of Transport last month, fall under two heads. To supplement the tanker shortage, oil might be carried in the double bottoms of dry cargo ships instead of the usual water ballast. To avoid unnecessary carriage it was recommended that ships expecting to call at, or even to pass near, ports where oil was plentiful should take on as little as possible from home depots.

One aspect of the matter is that the extra oil required to supply British depots is very costly in dollars; Britain is still hiring an expensive tanker fleet—more than a million tons—from the USA. If oil which costs dollars is resold for dollars the sellers make a dollar profit. When it is resold to sterling ships the dollar expenditure (unless it includes the cost of a needless double carriage of the oil) is inevitable, for the ships must in any case be refuelled somewhere at the cost of dollars. If, however, oil bunkers are resold against soft currency, Britain is subsidising another country's need for dollars out of her own disappearing store. Problems of this kind, which are reflected throughout the British oil trade, must be under consideration by the Ministry of Transport. It is not yet known what restrictions on oil bunkering are likely to be imposed, but a decision cannot be delayed long.

Timber Supplies

The British timber position looks much more encouraging than it did a year ago. Much heavier quantities have been imported during the past twelve months and stocks are the largest since 1940—a fact which has occasioned much adverse comment in the building industry. Yet consumption in 1948 is unlikely to be any higher than in 1947 and for certain uses it may even be reduced. The supply of softwood from overseas has been particularly tight owing to the lack of felling and transport equipment, and in many cases timber had to be used as a fuel in place of coal. Some recovery in European timber output, however, has taken place, but expansion is slow despite the sharp rise in prices.

In 1947 the Timber Control signed a contract with Canada to take nearly 40 per cent of the total softwood production of British Columbia and increased quantities from the Eastern States. These supplies were to be spread over a period of sixteen months and the agreed prices were generally below the existing world level. Contracts were also placed with the United States and European countries. In August, Britain's critical dollar position made a revision of the timber import programme imperative. Existing contracts were allowed to stand, but new buying was virtually suspended. Nevertheless, imports of softwood in 1947 totalled 1.3 million standards, or nearly double the quantity of the previous year. But the chief sources of supply were Canada, Germany, Finland, the United States and Sweden—all of which are now hard currency countries, in fact or effect, except for Finland.

Future timber supplies will be governed by the availability of foreign exchange. Imports from Sweden and Finland may be maintained by virtue of the recent bilateral negotiations, but supplies from dollar sources can only continue if Britain can get more dollars. Now that any trade deficit with Germany has to be met in American currency, Britain will have to balance imports of timber, steel scrap and other goods against exports to Germany. With Canada and the United States the maintenance of timber imports, even on the same scale as in 1947, is also directly dependent—in the absence of Marshall Aid—on the amount of British exports which can be sold in these markets. The supply prospects for 1948 are, therefore, not very optimistic.

Softwood stocks in the United Kingdom at the end of December amounted to 615,000 standards, consisting almost entirely of imported timber. This very high level compares with 214,000 standards at the end of 1946 and 698,000 standards at the end of 1940. The present stock represents 7½ months' supply on the basis of last year's consumption—982,000 standards, or 10 per cent less than in 1946. Since future supplies are so problematical it would be an imprudent policy to allow consumption to expand until a new supply of dollars is assured.

A similar tightness exists in hardwood supplies. Imports during the past year expanded to 28.7 million cubic feet compared with 12.7 million cubic feet in 1946, but consumption declined from 5.1 million cubic feet in 1946 to 4.7 million cubic feet. End-of-year stocks, however, were the highest recorded, amounting to 23.3 million cubic feet against 20.1 million cubic feet in 1940.

Com. Reg. Cairo No. 47926

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (n) Net yields are calculated after allowing for tax at 5s. in the £. (h) Flat yield. * Assumed average life 17 years 6 months. (g) Buying Price.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (g) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7·6 per cent). (l) To latest redemption date. † Free of tax.

silver withdrawn was to be melted into bullion for eventual shipment to the United States in repayment of the silver received during the war under Lend-Lease. Smelting difficulties, however, delayed these operations, so that in consequence coin began to accumulate in the banks. As it happened this was a fortunate accident, since the "withdrawn" silver coin was available to relieve the stringency which later developed.

These statistics, indeed, merely make the recent pressure appear the more remarkable. The banks' holdings of silver coin now are understood to be around £12 million—only about one-half their mid-1947 level. In addition, since last June the Royal Mint has issued about £5,000,000 of new cupro-nickel coin, so that in the past eight months the amount of silver coin in the hands of the public must have been increased by about £17 million. The Mint originally expected to withdraw £4,000,000 of silver coin from circulation during the current financial year, but its actual withdrawals will probably be only about £1,300,000. Unless the public appetite for coin is sharply abated the Mint will obviously find great difficulty in making good the errors in its programme.

Report on China Clay

A Working Party Report published this week claims that china clay is at present Britain's most valuable raw material export. The 1947 trade figures put china clay behind coal, raw wool and rabbit-skins in annual export value, but the boast may well have been justified when the report was written last summer. China clay is that rare thing, a raw material of which Britain was

the world's largest producer before the war; in 1937, 830,946 tons were produced, and two-thirds of the output was normally exported. The United States is the largest foreign consumer; two other hard-currency countries Canada and Sweden come next. United States production outstripped British during the war; British output recovered to 624,397 tons in 1947, but is still limited by shortage of labour and coal. But why were exports so low at 248,862 tons, less than 40 per cent of production? One factor, as the accompanying chart shows, was the unprecedented home demand chiefly for paper-making and the production of cement and sanitary ware for the housing programme.

THE "COMING HOME" POLICY

is specially designed to meet the present urgent need for a flexible contract.

Please ask for the fully descriptive leaflet.

NATIONAL PROVIDENT INSTITUTION
FOR MUTUAL LIFE ASSURANCE

—ESTABLISHED 1835—

48 Gracechurch Street, London, E.C.3

China clay is derived from the decomposition of felspar, one of the minerals constituting granite. The deposits around St. Austell and in south-west Dartmoor are deep and workable. No properly sited pit, says the report, has yet been bottomed, and of the 66 pits not in use, few were abandoned because their deposits were exhausted, and most because it did not pay to work them in the prevailing conditions. All are open pits. An average of eight tons of waste has to be disposed of to every ton of clay gained; it is taken out of the pits in trucks to form the great barrows of sand which disfigure the moors. As a result the unit cost tends to rise as the pit goes deeper, unless the pit can expand laterally too. This, together with increasing mechanisation, makes the gaining and drying of china clay an industry subject to marked economies of large scale. One company, English Clays Lovering Pochin & Company, Ltd., has come to operate three quarters of the capacity and—not less important—to control 62 of the 66 pits which are out of operation. Vesting of mineral rights in the Crown under the Town and Country Development Act this year will tend to reinforce this monopoly, for it is unlikely with so many pits available for development that any newcomer would be permitted to start a new one. The Working Party pays lip-service to the principle of free entry but does not seriously tackle the problem of securing it. It recommends that a research organisation be set up for the industry as a whole, though the company, which has by no means abused its monopoly position, already possesses excellent research facilities. Why duplicate them?

LMS Ordinary Dividend

A note in last week's issue under the heading "Last Railway Dividends" included a gross inaccuracy about the dividend on LMS ordinary stock, by suggesting that no dividend had been paid on the stock since 1936. This error, on the last occasion for comment on railway dividends, is particularly regretted, and the following table is offered by way of correction:

LMS ORDINARY STOCK DIVIDEND			
	Per cent		Per cent
1936	1½	1942	2½
1937	1½	1943	2½
1938	Nil	1944	2½
1939	1½	1945	4
1940	1½	1946	2½
1941	2	1947	£4 17s. 10.95d.

Shorter Note

For the third time this year, the fiduciary limit on the Bank of England note issue has been reduced by £50 million. It now stands at £1,300 million. The abnormal reflux of currency which made these reductions possible—after eight years of uninterrupted expansion—now seems to be abating. Last week the active note circulation rose seasonally by £4,900,000—only £900,000 less than the corresponding increase last year. Despite the cancellation of the further £50 million of notes formerly held in reserve, the reserve still stands at the comfortable level of £63 million, which should amply provide for the seasonal demand for currency between now and the summer peak. In the corresponding period of 1947 the total demand for notes was £40 million.

Issued by The National Savings Committee

COMPANY MEETINGS

BIRMINGHAM AND DISTRICT INVESTMENT TRUST, LIMITED

DIVIDEND INCREASED TO 12 PER CENT.

The sixty-fourth ordinary general meeting of this company was held, on the 2nd instant, at 88, Kingsway, London, W.C., Mr. H. C. Drayton, chairman and managing director, presiding.

The chairman said: Gentlemen, investment income and interest total £462,000 as against £352,000 last year, an increase of £110,000, and our traffic receipts are £77,000 against £111,000, a decrease of £34,000 on the year, leaving us with a net increase of £76,000 subject to income tax and expenses. After providing for Debenture interest, taxation and expenses we have a balance available for distribution of £275,400. From this falls to be deducted the preference dividend and an ordinary dividend recommended by the board of 12 per cent., as against 8½ per cent. last year, the resulting balance of £173,900 to be added to undivided profits account, making that account £872,000.

There is one point to which I must draw your attention in our revenue, and that is that in the year under review we have had a windfall of approximately £30,000. It may be held that the directors are conservative in their distribution of dividend, but I must point out to you, as I have so often done in the past, that our revenue from traffic receipts ceases on December 31, 1949.

Our general investments stand in the books at £3,288,000 and a valuation which the directors have caused to be made show they are worth £4,769,000, and you may take it that our holding in the Birmingham Midland Motor Omnibus Company is worth more than the figure shown in the balance sheet.

Last year when I met you I was apprehensive of the financial outlook and the difficulty of investing money. As you are aware, the price of investments on the Stock Exchange has fallen considerably but we still have a large sum of money uninvested, and in addition we are due to receive in the near future a substantial sum from the sale of the Argentine Railways. These moneys are available for investment and, while I do not think we shall buy at the bottom, at least we are in a position to invest when we think the outlook is more propitious.

CONTROLS AND RESTRICTIONS

It is difficult to see what the current year holds for us. For the last eighteen months leaders of industry have been warning the Government that we had to produce more at the right price to be able to keep up our standard of living, but until recently their advice has not been heeded and they have been called Jeremiahs. Now, however, the Government themselves have realised the position and are telling both employers and employees they have to work harder if we wish to maintain our present standard of living.

The favourite plan to achieve this end appears to be more controls, directions and restrictions, whereas I feel convinced that if controls upon the employer were loosened and if the employee was allowed to work as he wished, this country could produce the requisite goods at the right price. There is no unwillingness to produce, but a feeling of frustration and lack of incentive. How the new plans and restrictions will affect our revenue in the current year it is impossible to say but I shall be happy if when the board meet you next year we are able to lay before you such a good result as we have today.

The report and accounts were unanimously adopted and the proposed dividend was approved.

SUN LIFE ASSURANCE SOCIETY

MR. W. M. PRYOR'S STATEMENT

The annual general meeting of the Sun Life Assurance Society will be held at 63, Threadneedle Street, London, E.C.2, on Tuesday, the 23rd instant.

Mr W. M. Pryor, D.S.O., D.L., chairman of the society, has issued a statement to shareholders, which in outline is as follows:—

DIRECTORATE

It is with great regret that I refer to the loss which the society has sustained by the death of Mr Frank Chaplin on October 27th last. He had been a director for over forty years, and was deputy-chairman from June 4, 1918. His personal qualities endeared him not only to his colleagues on the board, but also to the staff, among whom he had promoted the greatest good feeling. His successor as deputy-chairman is Mr C. G. Randolph. I am confident that the knowledge and experience which he brings to his appointment will be of the greatest value to the society.

FUNDS, INCOME AND OUTGO

In the life assurance account the fund increased from £56,405,000 to £58,936,000. In this account the premium income, inclusive of single premiums of £238,000, was £7,398,000.

The gross interest income of the life account was £2,143,000, representing a gross rate of interest of £3 15s. 9d. per cent. per annum.

Claims by death at £1,673,000 were practically the same as those for the previous year.

Claims by maturity amounted to £2,843,000 and were about £135,000 greater than they were in 1946. Surrenders were £443,000 and were only slightly larger than those for the previous year, but bonuses in cash at £35,000 showed a marked increase; the increase was, however, very much less than that which might have been expected after a general distribution of surplus.

Commission at £420,000 was about £89,000 above the 1946 figure, and expenses of management were £729,000, as compared with £584,000 in the previous year. The increase under each of these headings was, of course, closely associated with the much larger amount of new business which was transacted during the year under review.

The profits tax charged to the account represents that proportion of the total figure of £56,232 which arises from the taxable profits of that particular account.

ANNUITY AND SINKING FUND ACCOUNTS

The amount of the annuity fund at the beginning of the year was £2,373,000. The consideration for annuities granted was £341,000, and the gross interest income of the fund was £93,000. Annuities paid (less income tax) were £73,000, and annuities surrendered amounted to £20,600.

In the sinking fund and annuity-certain account the fund at the beginning of the year was £3,526,000. The premiums for sinking fund assurances were £82,900, the consideration for annuities-certain was £368,000 and the gross interest income was £136,000. Claims under sinking fund assurances matured were £83,000, and annuities-certain payments (less income tax) were £107,000.

NEW LIFE BUSINESS

The total amount of new life assurance business granted by the society during the year consisted of over 39,000 policies and sums assured of £35,965,000, the whole of which was obtained from our connections in Great Britain. These figures represent an increase of over 8,000 policies and nearly £6½ million in sums assured beyond those of

the previous year, and constitute a record in the history of the society.

INVESTMENTS

The year 1947 witnessed an increase in the yield on long-term Government securities from 2½ per cent. to 3 per cent. per annum, and, as a result, the society was enabled to invest its large surplus income to greater advantage.

For the first time since the outbreak of the war, the total of the society's holdings of British Government securities showed no increase over that of the previous year.

Practically all of our investments are due to be redeemed at fixed dates, and a geographical analysis shows that 95 per cent. of the total is invested in Great Britain with a further 3 per cent. in the Dominions: the market value exceeded the aggregate balance-sheet value by a substantial margin.

In conclusion, I would like to avail myself of this opportunity to offer on behalf of the directors my warmest congratulations to the staff upon the very satisfactory results of their year's work.

THE SCOTTISH PROVIDENT INSTITUTION

MUTUAL LIFE ASSURANCE

At the one hundred and tenth annual general meeting held in Edinburgh, on the 2nd instant, the chairman, Professor Sir Alexander Gray, C.B.E., stated that the report and accounts for the year 1947 were highly satisfactory. The net new sums assured, £3,950,000, were again a record and in addition under group life and pension schemes new sums assured were £406,000 with associated pensions of £114,000 per annum.

The consideration for annuities, £726,000, showed a substantial increase which may be taken as evidence that more and more people are being forced by current financial conditions to maintain income at the expense of capital. Claims by death showed a slight reduction and were again well within the amount expected.

Interest Income, £1,130,000 gross or £850,000 net exceeded that for 1946 and gave an average yield of £4 9s. 9d. per cent. gross or £3 7s. 9d. per cent. net calculated on the total funds. The nationalisation of industries had substituted the low return of a Government security for the larger income formerly enjoyed from securities of excellent standing, but the position was constantly under review and efforts were being made to maintain the investment income at the highest level compatible with the primary consideration of security.

FUNDS EXCEED £26,000,000

The funds increased during the year by nearly £850,000 and for the first time exceeded £26,000,000. The investments showed a substantial margin over the values entered in the balance sheet even though there had been a fall in prices generally during the year. The reduction in security values combined as it was with higher rates of interest tended in many respects to a more satisfactory position so far as life assurance funds were concerned.

The effecting of a new policy was not expenditure on a commodity in short supply but a form of saving and the need today of life assurance as a means of protecting dependants was greater than ever before. The Institution with its distinctive system of with-profit whole-life assurance offered maximum cover at minimum rates. It had also designed the "Adequate Income" policy to provide dependants with income as well as capital. Under this scheme a very moderate additional premium secured, as a supplement to each £1,000 of sum assured under an ordinary whole-life or endowment assurance, payment of £150 a year commencing at death if within 20 years and continuing to the end of that term.

The report was adopted.

SECOND BRITISH ASSETS TRUST, LIMITED

STRONG FINANCIAL POSITION

INCREASED DIVIDEND

The sixty-ninth annual general meeting of this Company was held at Edinburgh, on Thursday, the 4th instant, Mr W. H. Fraser, chairman of the company, presiding.

In moving the adoption of the report and accounts, the chairman said:

Before proceeding with more formal matters I should like to welcome the many new holders of our ordinary stock whose names have appeared for the first time on our register subsequent to our last annual meeting. At that time 96 per cent. of our ordinary stock was held by British Assets Trust, the remainder being distributed among some 70 stockholders. During the year under review British Assets Trust disposed of the major part of its holding, which was acquired by its own ordinary stockholders to whom it was offered proportionately to their existing holdings at £2 per £1 of stock. As a result we have now some 1,900 ordinary stockholders, the majority of whom have hitherto had only an indirect interest in this company through their ordinary stockholdings in British Assets Trust.

THE DIVIDEND

Some of you may wonder how this comes to be the sixty-ninth annual general meeting of this company while British Assets Trust has only completed 50 years of existence. The explanation is that this company was registered under the name of the Edinburgh American Land Mortgage Company in 1878 to undertake, as its name implied, mortgage business in the U.S.A. In 1920 practically the whole of the company's ordinary capital was acquired by British Assets Trust, and in 1925, following on the disposal of nearly all its mortgages, it became an ordinary investment trust and the name was changed to Second British Assets Trust. After 1931, in common with other trust companies, it went through a difficult period, but, as the result of gradually improving conditions and the exercise by the directors of a very conservative dividend policy, the company is now in a stronger financial position than it has ever been. In these circumstances the directors feel that the time has come to bring our dividend payments more into line with our earnings. We accordingly recommend a final dividend of 12½ per cent. for the past year making, with the interim dividend, a total of 15 per cent. for the year, compared with 10 per cent. for the previous year.

Turning to the accounts and balance sheet you will find that this year various minor alterations have been made to bring them into line with the requirements of the companies act which will shortly become obligatory. The changes mainly concern the setting out of the gross income and taxation figures, net income is not affected. In the balance sheet you will see that the item "Tax Reserve and Contingent Fund" is now shown separately in place of being deducted from the book cost of investments. Figures for the previous year have been adjusted for comparison.

YEAR'S INCOME

Our gross income for the past year amounted to £178,426 as against the previous year's figure of £153,525. After providing for taxation, management expenses, interest, and preference stock dividend the amount available for ordinary stockholders was £52,694 equal to 27.4 per cent. gross on the ordinary stock compared with £39,126 or 20.4 per cent. a year ago.

A valuation of the Investments at the close of the year shows an appreciation of 37.84 per cent. on the balance-sheet figure compared with 40.91 per cent. a year ago.

In the absence of unforeseen circumstances the directors propose in order to reduce the disparity between the interim and final dividends to increase the former from 2½ per

cent. to 5 per cent., but there is no present intention to increase the total distribution.

Satisfactory as the directors regard the results of the past year to be they consider a further strengthening of the company in these uncertain times advisable and they have therefore added £30,000 to the income reserve fund. At the same time we do not look for any material change on our revenue figures for the current year, and hope at our next meeting to be able to produce a satisfactory report.

The report and accounts were unanimously adopted.

KING LINE LIMITED

A SOUND POSITION

SIR VERNON THOMSON'S SPEECH

The fifty-ninth annual general meeting of King Line Limited, was held, on the 25th ultimo, in London.

Sir Vernon Thomson, Bt., G.B.E., the Chairman, said: Gentlemen.—The accounts show the results for the fifty-ninth year of the company's trading. They set out clearly the position of the company, which plainly is sound and financially strong.

Taxation on the current year's profits absorbs the large sum of £254,000, and after applying £35,099 towards writing down the book value of the fleet, there remains a balance of £291,853, which includes the sum of £78,311 excess profits taxation provision no longer required; to this has to be added the amount brought forward from 1946. The company's reserve account has been augmented by £250,000, making it now £500,000, and the directors recommend a total distribution of 15 per cent. for the year 1947, less income tax (the same as for the previous year), carrying forward the balance of £179,457. This dividend represents 4.4 per cent. upon the real capital of the company, that is, upon its issued capital, plus reserves.

The investments are worth substantially more than the £803,439 at which they appear in the company's books. The bank balances speak for themselves. The company owns six motor vessels and one steamship, of a total deadweight carrying capacity of 64,320 tons. The vessels are of an average age of 11 years and stand in the company's books at the moderate figure of £6 2s. 4d. per ton deadweight.

THE OUTLOOK

The immediate prospects for British Tramp Shipping for the next few months continue good; beyond that the prospect is still uncertain. It is prudent ship management policy, however, to strengthen the company's reserves as much as possible while current remunerative freights permit. Thus far the company has only replaced four out of the eleven vessels lost during the war.

Shipbuilding costs are, as is now well known, still abnormally high, and repairs and running costs, including oil and coal fuel, are likewise far in excess of prewar costs. Efficient tonnage is of first importance to a shipping company in world trade competition, and an adequate and efficient mercantile marine is indispensable to Britain's well-being.

SERVICES OF SHIPPING

In these grave times of inflation and economic stringency, the importance of shipping in the national economy is outstanding, in bringing to Britain the vital supplies of food and of raw materials essential to maintain full employment and the present standard of living in the U.K., and in carrying our exports. British shipping services overseas rank as U.K. invisible exports; they are higher than any other single industry exports from the U.K. British tonnage now building will add to these services. The export drive depends upon shipping. British shipping is our greatest earner of foreign exchange.

The report and accounts were adopted and the dividend as recommended was approved.

MANCHESTER SHIP CANAL COMPANY

SIR F. J. WEST'S SURVEY

The ordinary general meeting of this company was held, on the 27th ultimo, in Manchester, Sir Frederick J. West, G.B.E. (chairman of the company), presiding.

In the course of his address the Chairman said: The net revenue for the year was £896,896, which compares with £391,037 in 1946—an increase of £415,859. After adding £2,803 brought forward from the previous year, setting aside £135,000 for income tax and deducting £344,312 for loan and debenture interest there remained £330,387 for dividends and reserves. It is proposed that there should be appropriated £35,000 to the reserve for contingencies and repairs and that out of the balance of £295,387 the following dividends, amounting to £272,175, should be paid:—

Three and a-half per cent. on the Manchester Ship Canal Corporation Three and a-half per cent. on Preference shares.

Four per cent. on Preference shares.

Two per cent. on Ordinary shares.

Carrying forward £23,212 to next year's account.

INCREASED TONNAGE

Receipts from tolls and ship dues showed an increase of £332,831—most of which is attributable to the increase of 1,260,000 tons in the volume of traffic. Traffic rentals and sundry receipts were also more by £53,659. The actual expenditure on the working of the Ship Canal showed a decrease of £39,450.

INDUSTRIAL DEVELOPMENT

Industrial development within the Ship Canal zone is ever uppermost in our minds. No one here needs to be reminded that the Ship Canal was promoted to attract trade and industry and to bring prosperity to what was very much a depressed area in the last quarter of last century. Around about us there is ample evidence that the faith and enterprise of its promoters were justified, but I am beginning to fear that, in the generous measure of their success, there may lie the germ of our undoing.

The peculiar advantages which have ensured the success here of a particular kind of enterprise continue to attract the industrialist, but other forces are at work as industrial planning is subject to much direction. There are two Government measures particularly affecting the situation.

First: The Distribution of Industry Act, 1945—designed to encourage the settlement of industry in certain scheduled areas where a better balanced industrial set-up and greater opportunities for employment were considered to be desirable in the national interest.

Secondly: The Town and Country Planning Act, 1947, which provides that virtually no development can be carried out anywhere unless the Board of Trade certifies that such development is consistent with the proper distribution of industry. If there are any gaps in Government control in the first Act this closes them.

An industrialist may be offered very material inducements to abandon the site of his choice for another in a scheduled area. There is little criticism of this pressing of alternative proposals so long as it is a long-term policy in the national interest. But you will agree from what I have said that it is almost impossible to set a limit to the considerations upon which an industry may be refused the permits and priorities necessary before a start can be made. I fear that industry is being lost to us—not by the long-term policy of rehabilitating depressed areas—but on a short-term policy of dealing with local pockets of unemployment and temporary housing difficulties.

In conclusion I would say that the fortunes of your undertaking are too closely identified with those of the country at large to be considered apart.

The report and accounts were unanimously adopted.

GOVERNMENT RETURNS

For the week ended February 28, 1948, total ordinary revenue was £102,459,000 against ordinary expenditure of £75,025,000 and issues to sinking fund allocations of £13,737,000 the surplus accrued since April 1st is £765,911,000 against a deficit of £365,509,000 for the corresponding period a year ago.

Sink or Swim?

WHEN the Economic Survey for 1947 appeared twelve months ago, the country was gripped in ice and *The Economist* had been silenced by the Shinwell veto. Spirits were low; the outlook was dark; and the Government's collection of targets and estimates was frustrated at the very moment of its appearance. The Economic Survey for 1948 appears at a moment even more critical for British destiny. The British economy is denuded; it is now using up its last reserves; and the Government have brought themselves frankly to the devastating admission that "without further substantial external aid" there is no hope of economic stability and a reasonable standard of life within the next few years. Unless aid comes, wholesale unemployment, distress and the dislocation of production will delay "for years" the prospect of a decent standard of living for the British people. There is only one thing wrong with this assessment. The delay would not be for years; it would be for all time.

The stark realism of the White Paper says little that is fundamentally new to those who have followed with proper concern the gathering economic storm. The damaging reduction of Britain's gold and dollar reserves to a precarious level—enough, perhaps, to last for another six months without further aid—has continued ever since the suspension of sterling convertibility last August. It is that fact more than any other which conditions the economic prospect for the present year. Indeed, it comes near to defeating any attempt at planning at all in 1948, for planning in any real sense will be possible only if American aid is forthcoming. The Survey acknowledges this fact at several points, but nowhere more openly than by limiting its planning for imports to the first six months of the year, of which nearly half has already expired. Imports from the Western Hemisphere are to be cut to a level "no more than sufficient to maintain the nation in health and working efficiency." There is no allowance for the long overdue rebuilding of stocks of primary raw materials, for the lack of which production is being interrupted and kept in check. The country has reached such a level of financial exhaustion that it cannot afford a heavy investment in additional supplies of materials, though they would bring "a rich return."

This is a prospect alarming enough, though not exactly newly discovered. It suggests that, for all the brave talk of democratic planning in the Survey, the conditions for the progressive ordering of economic affairs in Britain do not exist. Planning implies control over the economic environment; the ability to use resources in a variety of ways and to choose freely between the different ways; a real degree of independence of charity, good luck, or economic exhaustion. These conditions no longer exist. Britain is dependent on what the United States, in its wisdom and generosity, sees fit to provide. Every target, every programme, every statement of economic intention this year, whether at home or abroad, is dependent on what America does to help, and when that help arrives. It is a euphemism to say that, without aid from the United States, Britain would be compelled to cut consumption and employment, and to abandon many of its development plans. The truth is that, on the showing of the Economic Survey itself, Britain cannot dispense with such

answer to a threatened overthrow of the balance of power are no longer adequate today.

If optimism is out of place in considering Europe's political crisis, it is hardly less unwelcome when the extent of its economic difficulties is discussed. The authoritative Paris Report takes a decidedly hopeful view of Europe's capacity for recovery. It will be recalled that the targets set for increased production equal the tremendous expansion achieved by the American economy between 1940 and 1944—three significant figures may be given: an increase of 34 per cent in coal production, 31 per cent in steel and 61 per cent in electric power. At the same time the Report made some markedly optimistic estimates of the possible fall in world prices, forecasting a fall of 7½ per cent in 1949, 10 per cent in 1950 and 12½ per cent in 1951. It also assumed a substantial increase of European exports, especially to hard currency areas. Yet, with all this expansion of output and exports and this improvement in the international terms of trade, the Paris Report had to admit that in 1951 the unfavourable balance of the Sixteen Nations' foreign trade would still be over one billion dollars for the year.

When the American experts came to study these figures, they reached more pessimistic conclusions. They doubted whether the targets for production could be reached and forecast a higher price level; even though they made higher estimates for possible exports, they reached the conclusion that the dollar deficit in 1951 would be in the neighbourhood of 3 billion dollars. In face of these calculations, it is difficult to believe in a quick self-regulating European recovery. On the contrary, only one honest conclusion can be drawn: the measures of European co-operation proposed in the Marshall Plan, far from being sufficient, must be supplemented by much more drastic measures. If this deficit of one to three billion dollars is to be removed before the ending of dollar aid, the Sixteen Nations will have to integrate their economic plans far more thoroughly, to cut out all unessential dollar imports, to boost in a concerted fashion their exports to the New World

and to expand production in every field where local output can replace dollar expenditure. It cannot be proved conclusively from these facts that a Western Union is the only solution, but it is certain that merely temporary co-operation against a background of economic isolationism offers no hope at all. And if a policy of closer integration is in any case necessary, it would be difficult to find greater possibilities than those offered by whole-hearted co-operation in a Western Association.

It is vital that the British Government should be certain which of the two possible approaches—temporary association or complete co-operation—it is going to make its own. If the policy is one of limited and temporary association, then any encouragement of Western Union is out of place. If the policy is based on the recognition that an entirely new situation demands new and revolutionary measures, then Western Union is the best available scheme. But there is one policy which would be utterly disastrous—to pay lip service to the ideal of full co-operation while in fact pursuing a separate and basically isolationist line. No Western Union can come into being without British support. More, no Western Union can defend itself, sustain itself, or grow and develop organically, if the British attitude is hesitant and uncertain. Britain's European neighbours will be watching suspiciously for every sign that the British are not really in earnest but are once again, as so often in the past, using a European alliance as a temporary measure to be abandoned when the need for it is past. Unless, therefore, the British Government throws itself into Western Union as a permanent commitment, as the new pattern of its national and international life, the Union that will come into being in Paris will be weak, vacillating, incoherent and finally it will fail—in which case the last state of Western Europe will be infinitely worse than the first.

This is the real issue behind Mr Bevin's speech in Paris next week. If he is not fully committed to the idea of Western Union, then let him not talk as though he were. And if he is, let the commitment be accepted in full and clear understanding of all its revolutionary implications.

How Rich is the Eastern Bloc?

FROM the present pattern of Russia's offensive behaviour and defensive mentality, it can be assumed that the political objective before the governments of eastern Europe is to provide a base and bulwark for the Kremlin's foreign policy in a divided Europe. The network of military and political pacts between them reveals the intention quite clearly. But it is not yet clear, from the information available about their economic agreements and national economic plans, whether they are aiming at a closely organised economic bloc, working with the West as well as with Russia; or whether their ultimate intention is to fit the integrated economy of eastern Europe into that of the Soviet Union, making both so far as possible independent of the West in all vital respects. For the moment the six governments are concentrating on their national plans, and it is possible to make only a rough estimate of the economic strength of a bloc whose political strength and weakness was examined in last week's issue of *The Economist*.

The outstanding economic fact about this group of six countries is that all are planning their economic life. If planning is a source of strength, this east European giant of the future is already well-muscled. There is indeed plenty for the planners to do; the whole region was ravaged by the Second World War even worse than by the first. The whole economic system was distorted as well as devastated by the Germans; then, with liberation, came the demands of the Russians. The occupation costs of the Red Army were enormous; Hungary and Rumania are paying huge reparations from production each year; even

the allies, Poland, Czechoslovakia and Yugoslavia have felt the pressure of the Russians' desperate effort to repair as quickly as possible the incomparable devastation in the Soviet Union.

On top of the task of repairing war damage comes the more long-range, fundamental problem of curing the basic prewar weaknesses of the east European economies: lack of domestic capital and skilled labour in industry, excessive population on the land and primitive methods of agriculture. Their soil and mineral resources are rich on the whole. The area will certainly be able to feed itself—bounteously; Poland is now a giant among coal producers; before the war the south-eastern countries had export surpluses of lead, zinc, chrome, manganese and bauxite; oil and timber production could be increased. All these are big assets; but the fact remains that, at prewar levels of production, eastern Europe generally was seriously over-populated. On an acre of cultivable land in Poland or a Balkan country, twice as many people produced a half or a third of what was being produced in Denmark or Switzerland.

The text-book solution of these problems, as even prewar governments grasped, is to modernise farming and develop industry. These—with the recovery of normal living standards—are declared aims of the national plans published since the war: Yugoslavia has a five-year plan, Poland and Hungary three-year plans, Bulgaria and Czechoslovakia two-year plans, and Rumania so far none. Of these the Polish, Yugoslav, Hungarian and Bulgarian plans aim at both reconstruction and development; the Czechoslovak plans are essentially reconstruction

plans, made necessary as much by the expulsion of eight million skilled Germans as by war damage. Czechoslovakia will shortly adopt a new five-year development plan designed to link its economy to that of Russia.

Mechanisation is of course the planners' chief prescription for the peasants. In all five countries "machine and tractor stations" owned by co-operatives are being set up, on the Russian model. In return for the peasants' payment in cash or kind the station teams work the land as required. As these machines displace men and animals, so the peasants' dependence on the State increases. Until machines are available in large quantities forced collectivisation of the peasants will be held back. So far there is little sign of it, although in Yugoslavia and Bulgaria the peasants are encouraged to work with and for voluntary "labour co-operatives." Which lead towards acceptance of collective farming.

Away from the land the prescription is industrialisation. Czechoslovakia and Poland already have large heavy industries. Both pay much more attention in their planning to capital goods production than to the needs of consumers. The next Czech plan will reorganise Bohemian industry from top to bottom, allowing luxury and craft industries—known on world markets for generations—to decline, and developing instead heavy industries to supply customers in the East. Hungary aims at bringing production in its iron, metal, and engineering industries to 154 per cent of the 1938 level. The Bulgarian plan lays the emphasis on mining, power generation and fertilisers. The Yugoslav plan is the most grandiose of all. At the end of it industrial production is to be 323 per cent of the 1939 level, and Yugoslav negotiators of trade agreements give the impression abroad that they are prepared, if necessary, to import the industrial revolution bit by bit. The Czechs plan to be the main suppliers of chemicals to their neighbours, and fertilisers will be available from Russia, from former German plants now in Poland, and from the Russian zone of Germany—a region of decisive importance if it should end up sooner or later in the eastern bloc.

How are these targets to be achieved? The Yugoslav plan assumes a yearly investment of over a billion dollars; in the fifth year of the plan the proportion of the national income to be devoted to savings is put as high as 27 per cent. The Polish figure is almost the same, and the percentage to go into savings is 20. For impoverished countries these figures seem fantastically high and are in fact open to suspicion, as are many official statistics from eastern Europe. They can only be realised by an intensive use of raw materials, equipment and labour. Are these readily available?

Some important raw materials are available within the bloc. There is plenty of coal, notably in Poland; but it is unevenly spread and much of it is of low quality. Some of the countries planning big metallurgical industries have no coking coal at all. Much will depend on what the Russians can send, and on the

use made of water communications to reduce transport costs. At the moment the Russians are importing coal from Poland. Then there is oil to be had in Rumania, Hungary and from the synthetic plants of Czechoslovakia—but not enough. Production in Rumania was running during the first nine months of last year at the rate of only 3,800,000 tons yearly, against 8,700,000 tons in 1936. On the other hand Hungarian oil production has risen from 2,000 tons a year in 1937 to over 800,000 tons last year.

★

There is high grade iron ore in Yugoslavia, but the present production plans require imports from Russia and Sweden. The surplus of metal ores has already been mentioned; there will be enough to go round and some to spare for Russia, which during the war was largely dependent on lease-lend supplies of these ores. Copper and tin will be seriously short throughout the bloc; even now Rumania and Bulgaria pay dollars for it. Of bauxite there would be a surplus; with it a great aluminium industry might be built up, if south-east Europe could develop the necessary water-power.

Raw materials for textiles are seriously lacking. All six countries have important textile industries, based on heavy imports of raw cotton and wool before the war; unless great strides are made in cultivation and irrigation, both within the bloc and in Russia, cotton and wool will remain on the import lists for a long time to come. The same is true of rubber; in 1937 the bloc's deficit was over 60,000 tons.

As for industrial equipment, the outlook is still obscure. The needs are urgent and large. In the long run Czechoslovakia can meet some of them, and Poland and Hungary will have more to offer as their recovery proceeds. But it is clear that the re-equipment and modernisation of existing plant, to say nothing of such vast new projects as the electrification of Bulgaria and Yugoslavia, can only be achieved with equipment and machinery imported from the West, most of it on credit. There is no sign that Russia can make a serious contribution on these lines in the predictable future.

It is unfortunate for these planning and Communist-controlled governments that all the facts point in the same direction—the need to draw on the skill and production of the United States, Britain and, above all, Germany. Their propaganda deplores the recovery of western Germany, and attacks the Marshall Plan. But it is quite clear that the same recovery, under Russian auspices, would be warmly welcomed. Until Germany comes into the field again, they have to turn to north-western Europe, where Sweden and Switzerland, at least, have so far not allowed their trading policies to be unduly influenced by political preferences. Switzerland is Czechoslovakia's most important trade-link with the West, and over 22 per cent of Poland's foreign trade in the first nine months of 1947 was done with Sweden

£1,000 if you live for twenty-five years.

On earlier death, in addition to this £1,000, up to £5,000 payable to your dependants by instalments of £200 per annum (not subject to tax) for the remainder of the twenty-five years.

All this may be secured under the **FAMILY PROVISION SCHEME** for a monthly premium, at age thirty-five, of £5.1.1 reducing after seventeen years to £3.4.0.

and Denmark. But there, too, they are finding the difficulties that they find in Britain—two genuine economic impediments to trade: the things which eastern Europe wants to buy in the west are the things that the west can sell in dollar markets; and the goods which eastern Europe offers are so far not those which the west most urgently needs.

Obviously, in its way, eastern Europe needs a Marshall plan as much as western Europe. But where is the generous patron to be found? Will Russian policy use the eastern bloc as a complementary area to meet Russian needs? Or is it Moscow's intention that its members should become prosperous and efficient in their own ways? It might be expected that Russia would assume Germany's prewar role. There are already certain similarities: Russians own all German assets in the three enemy countries of the east; officials of Russian banks and trusts sit in offices in Budapest and Bucharest from which they can control vital economic sectors (for example, shipping and bauxite and oil) as effectively as did the representatives of western capital in the past; appeals to ideological loyalty and military supremacy can be and are used when necessary to secure the inclusion of unfavourable terms in trade agreements. Like Germany, Russia has an almost unlimited demand for what eastern Europe might produce; like Germany it uses its influence to shape its plans and economies in required directions. But, unlike Germany, Russia has not readily available the means to re-equip and develop these backward countries. This explains the element of uncertainty—even of fantasy—which marks some parts of their national plans.

If foreign trade does not prosper, if national plans begin to clash and overlap, if scarce materials are not pooled, if political considerations interfere with efficiency, and if Russia does not

later play the role of lavish and far-sighted capitalist with capital and raw materials—what happens? The answer appears to be, on present evidence, that the industrial revolution goes on as it did a hundred years ago in the west, with the exploitation of a mass of cheap labour. There are millions in the excess rural population who will fill the armies, the police forces and factories—unskilled but easily manageable human material. For special tasks there will be political prisoners—whose numbers are likely to increase as eastern Europe moves further towards "popular democracy." What cannot be done by machines will be done by bare hands, painfully and slowly, but done none the less.

No clear and definite answer can be given to the question whether the eastern bloc is likely to achieve economic strength and independence. It can only be suggested in the series of "ifs" and queries given above. The peoples of eastern Europe are patient and hard-working; the land has its riches, and the paper plans, if less original than their authors like to think, are at least on sound capitalist lines. There is a genuine effort towards higher standards of living. Progress towards them may well be made if satisfactory solutions are found to the main problems raised in this article. But one thing is quite clear: if too large a proportion of the man-power and national income of these countries is swallowed by armies and armaments, by police and officials, and by the requirements of Russian policy and strategy, their standard of living will remain for years to come below the level which Government statements lead the populations to expect. If that should happen, the eastern bloc will not have the popular support by which claim to have established "people's democracy" in these countries could, in the long run, be justified.

Top Secret

OF the output of facts, there is no end. It would be ungrateful in a week which has seen the issue of the Economic Survey for 1948 and the Digest of Statistics for February (which this month includes a new index of production) to cavil at lack of information. For the expenditure of a few shillings and a little effort, the inquiring citizen can inform himself about the facts of the dollar drain, study the imports of oranges, stocks of goatskins, the output of fountain pens or the production and supplies of push chairs for the home civilian market—a careful definition which suggests that foreign powers may be buying them for warlike purposes, though the Digest is silent on the point.

There are facts galore. Yet mere richness does not necessarily mean a balanced statistical diet, and this feast of figures certainly lacks some important items. To take one example, it is important to know that the steel target is 14 million tons of ingots and castings this year. This is a single figure which relates to a single stage in the productive process, half way between the assembling of the raw materials for steel making and the use of the final product. Whether it can be achieved depends on the flow of iron ore supplies, the production of pig iron and the provision of sufficient steel scrap. The Digest gives figures for production of iron ore, but not of imported ore which, in terms of iron content, is more important than home ore; it shows pig iron production, but not stocks, so that there is no indication whether steel output is being increased at the expense of stocks of pig iron; the same comment can be made about scrap stocks, though the Economic Survey discloses that these were reduced from 616,000 tons to 375,000 tons during the course of last year.

Of the final application of the year's steel output there is no indication whatever. The Digest shows the course of monthly output of different types of finished steel, but that is

purely historical, and moreover it is in the form of a technical classification, not an analysis by consuming industries. On the demand for steel, the Economic Survey talks in the most general terms, emphasising yet again the point that steel is the most critical factor on the home economic front this year. So it is. But that is surely an additional reason for being quite explicit about its end-use. At the moment, every steel-using industry is using pressure of every kind to get more steel. The shipbuilders and the motor industry have developed into a fine art the technique of timely cries of anguish, and in the past this technique has often been good for a useful extra allocation. To any objective observer, the clamour over steel supplies shows many of the worst predatory instincts of the bargain-hunting crowd; and it creates the suspicion that steel allocations are determined not solely by the merits of the individual case, but also in part by the output of noise on the part of the using industry in putting its point of view. Can it be denied that the publication of the steel allocations to individual industries for 1948 would remove much of the present clamour and serve as the basis for planning by those industries and their suppliers? In this respect, the Economic Survey is disappointing, for it maintains the Government's obdurate refusal to publish the allocations of steel to individual industries.

It is difficult to find a rational explanation for this attitude. It obviously has no basis in economic logic, for figures for the industrial consumption of other key materials—in particular for coal—are forecast in some detail. The only conclusion is that the forecasts of steel consumption are not given on the ground—almost certainly mistaken—that publication would be a source of embarrassment to the Government, rather than a source of enlightenment to industry. This lapse into morbid introversion by a Government which can fairly claim to have done more to

provide economic facts than any of its predecessors is difficult to explain on any other ground.

Another blind spot, which has recently attracted much attention, in these columns and elsewhere, relates to the prices which are being paid by the British Government under bulk purchase agreements. The Anglo-Argentine agreement, belatedly published at the end of last week, gives no information of any kind about the prices which the Government is paying for meat and maize. Similar secrecy about contract prices was shown in the Anglo-Russian trade agreement. Indeed, both agreements involve extraneous payments or reliefs (£10 million to Argentina, and a revision of the terms of repayment of the credit granted to Russia in 1941) which would throw some doubt on the contract prices, even if they were published. The arguments for secrecy which are officially put forward are beginning to wear distinctly thin. According to the Minister of Food, prices are not disclosed at the express wish of the "businessmen" (as they are invariably described) who conduct the negotiations in their capacity as officers of the Ministry. It seems more probable, however, that secrecy about contract prices is something of a legacy from the wartime controls, which necessarily operated under wartime security conditions. If so, the doctrine of secrecy in peacetime can only be described as dangerous and undemocratic. It is argued that secrecy facilitates state trading; but if state trading can only be carried out successfully by the use of methods which are obnoxious in a democratic society, the whole policy must surely be open to the most serious doubt.

To what extent is secrecy in state trading operations a necessary condition of bulk purchase or long-term contracts? Sometimes it is argued that the countries which supply Britain more cheaply must not be told how much Britain has to pay for dearer supplies from other countries. But is anyone so naïve as to believe that, when the British negotiators are dealing with, say, New Zealand, the prices paid to Denmark for dairy produce are not known in detail on the New Zealand side? Do the British teams whisper behind their hand to the Danes, "Don't tell the New Zealanders about this deal"? The argument is based on a fatuous assumption. It is perfectly obvious from a study of the Dominion press that information about prices for bulk food contracts is freely available in the Dominions. Indeed, it has always been possible, with a little effort, to discover what prices Britain pays to Australia for meat, to Canada for wheat,

and to New Zealand for butter, from normal trade sources or from Dominion Government announcements.

The results of this policy are confusing and inconsistent. The Canadian food contract signed last December was published in full in Ottawa, but the Ministry of Food, labouring under its self-imposed vow of secrecy, could not bring itself to mention more than the barest outline of the agreement. Yet the recent contract with the Danes has been published in full, not only by the Danish authorities, but also by the British Treasury. But Denmark is a dearer supplier. Is it then fair to the Dominions to refuse to make known officially to the British public what help they are giving in supplying Britain with increasing quantities of food at prices much lower than those which are being paid for foreign supplies? It is understandable that, in the case of the Argentine contract, there are pressures making for concealment on both sides. The Argentine Government, which has reasons of its own for concealing from its graziers and farmers the prices it receives for exports of meat and grain, is a ready accomplice in secrecy.

Concealment is not limited to food prices. Both the Ministry of Supply in its purchase of non-ferrous metals and the Board of Trade, in contracts for fibres and other raw materials, maintain the same secrecy about prices. These negotiations are generally with producer organisations rather than overseas Governments, and consequently information about prices emerges rather slowly through trade channels and company reports. Here again, policy about disclosure is not consistent. The Government declines to publish its contract prices for copper, lead and zinc, yet it announced quite freely the prices to be paid for tin from Malaya, Nigeria and Bolivia. If tin prices can be safely published, why not copper prices? There is no obvious answer, either in terms of bargaining strategy or in any past success in keeping prices down. The inevitable result is that concealment breeds the suspicion that there is something damaging to hide, and that those responsible for bulk purchases are cultivating a vested interest in concealment. That may be an extreme, and even an unfair, inference to draw; but drawn it will be until fuller and franker information about the prices paid for Britain's food and primary raw materials is regularly provided. "Top Secret" is a slogan of wartime security. It should not be, even to a relatively small extent, a feature of an active, well-informed social democracy.

NOTES OF THE WEEK

A Man of Honour

Different ages have held different views on the moral rightness of suicide for a defeated statesman. The Romans considered it an honourable death for the leader of a lost cause to end his life by falling on his sword. The Christian ethic has disapproved of self-slaughter in any circumstances. The abstract ethical issue must be left to the philosophers and the theologians; but the observer of political affairs must recognise that, under a modern totalitarian regime, suicide is the only effective form of public protest which remains open to a holder of high office unwilling to endorse the acts of the dictator. In a totalitarian system a Minister must not resign; he can only be dismissed. To resign is treason, because it implies dissent; and if the dissenter does resign, he must expect the vengeance of the tyrant he has defied—a vengeance of arbitrary and ruthless power against which no legal rights avail and no appeal can receive publicity.

The leaders of the Communist *Putsch* in Czechoslovakia needed Jan Masaryk because of his name, because of his world-wide reputation and popularity. He was to remain as Foreign Minister, talking the language of democracy and supporting the new Government with his prestige, while Action Committees arbitrarily "purged" his friends from public life and the professions and dismissed his most trusted officials within his own office. As a man of honour, he could not do it. Yet what was the alternative? He probably could not have escaped abroad, for one of the first acts of the *Putsch* was the sealing of the frontiers; there have

already been too many successful plunges to safety through the iron curtain and Masaryk was no doubt watched by the very efficient agents of Nosek, Minister of the Interior.

Had he insisted on resignation, he would have lost all right of public speech and would probably not have retained his freedom; he might well have been imprisoned on charges similar to those hurled at other proscribed Czechs and "softened up" for trial with months of third degree interrogation. And he was not even a single-minded opponent of the new order; he believed in the policy of alliance with Russia against a German resurgence, and he was unwilling to divide the Czech nation by "resistance" to fanatics who claim a cosmological right to govern. The course he took was logical; he, for whom there was no place compatible with his conscience in Stalin's new world, ended his life by a single act, a monument to his own moral integrity, the ideals for which he stood and his inner conflict and agony of mind. He refused to swallow what may be called the "Quisling fallacy"—the argument that a man is right to betray his principles if he believes he can thereby exercise a moderating influence on a tyrant or a conqueror.

* * *

Full Speed Ahead in Prague

The conversion of Czechoslovakia into a modern "popular democracy" has gone quicker than might have been expected. Instead of passing through the various stages experienced in

Hungary during 1947, Czechoslovakia has passed straight to the stage in which Hungary is today; by now it has probably less political freedom than Poland.

The National Front, once a coalition of free parties, is now a "monolithic" organisation of the Balkan type. The old parties nominally still exist, but their leaders are utterly unrepresentative, and it is the Communist-controlled Central Action Committee which appoints them. Though the Social Democrats did not join the other three parties during the crisis, they too have had a purge. One of their ministers, Majer, and their able general-secretary, Vilim, have been expelled. Their leader is once more the pliable fellow-traveller Fierlinger.

The Ministry of Justice, long held by the National Socialist Drtina, President Benes's private secretary in exile and a man obstinately devoted to "bourgeois justice," is now being reorganised by the Communists with their customary energy. Judges are dismissed wholesale, past court decisions are annulled, and new trials are being prepared for "agents of the western powers" and for men acquitted after 1945 of charges of collaboration. Czechs will doubtless remember the principle under which justice was administered when Heydrich ruled Prague—*Recht ist was dem Volke nützt*.

At the Ministry of Education the ridiculous Professor Nejedly, who held this post in 1945, is back again. This spiteful old music-historian, is best known for his long-proclaimed theory that Smetana is a good composer because his music is "Slav," and Dvorak a bad one because he was influenced by western music. He began his new term at the ministry by sacking the music professors of Prague University. The purge was then extended to other faculties, and is going merrily ahead. Despised and hated with special fervour by the students, the Professor will prove a fine puppet for his Moscow masters. Unless Gottwald keeps a careful watch on him, Nejedly, always much more a stooge of the Russians than a genuine Czech Communist, will introduce the full flower of the Zhdanov literature and philosophy programme.

* * *

Unbalanced Forces

The confidence that Field Marshal Montgomery is said to feel in Mr Shinwell as Secretary for War was perhaps reflected in the latter's speech on Tuesday. The word "balanced" figured prominently in the description of the force to be provided by the Army Estimates of £395 million. Yet it is difficult to see where the balance in the new National Army will be visible, at any rate for four or five years to come. Twelve months hence there will be a Regular striking force of 200,000 men ready to go overseas at short notice; there will be a smaller National Service force which by 1950 will be sending trained men into the Territorial Army; and there will be a Territorial Army of reservists and volunteers. During the period between now and 1950 Mr Shinwell's statements seem to point to the existence of an unbalanced force of 527,000 men after April 1st of this year, falling to about 450,000 in 1949.

Such a prospect raises precisely the same question as did the White Paper on Defence and the Air Estimates last week. (The Navy has been cleared of all suspicion of weakness—not by a Government spokesman, but by Mr Churchill.) Is it possible, in the present state of knowledge and in the present economic situation of the country, to plan adequate defence for 1950 as well as for 1960? The amount of money that is being spent on research suggests that more questions about new weapons are being asked than answered—which is in fact the case. And the amount of time that is to be given to the training of the National Serviceman is clearly inadequate to produce the sufficient and efficient technical soldiers for 1950. After ten weeks' basic training he is to join a unit of the active army at home and abroad; and after 42 weeks in that role he will, according to Mr. Shinwell, "be fitted to take his place as a trained soldier in the TA." Unless training resources and methods are being improvised now as rapidly as they were in 1941-2 that can hardly be true.

This one year of training may produce an adequate driver or AA gunner; but the roles allotted to the Territorial Army demand more than that. It is to furnish the land and AA defence of this country, defend ports and airfields overseas, and provide a "properly balanced" field force. To impose all these tasks on the stripling Territorial organisation is asking for trouble, unless Mr Shinwell is in fact thinking of the army of 1960. If he is not, then the three-tier scheme does not make sense. If he is thinking of an effective army by 1950 then there is an overwhelming case for increasing the National Serviceman's training time.

It would perhaps lead to clearer thinking and more resolute action if Mr Alexander and his Service Ministers put the dilemma

to their Cabinet colleagues roughly in this form: either we tell the Americans—and of course the Dominions and western allies—that we can afford only small forces and will concentrate for ten years on economic recovery; or we tell them that Britain will provide the greater part of the sailors, soldiers, airmen and weapons needed to defend Western Europe and the Middle East, provided that America pays a large proportion of the security bill and that the Western allies are ready to draw up and execute within five years a fair and efficient joint defence plan. The second course has this in its favour: that it would attach fair conditions to what is in part happening, and would set a time limit to British obligations during which war is unlikely. Some will say that this makes the British a nation of mercenaries; but that is a perfectly honourable role in the present situation, where defenders of freedom, willing to "save the sum of things for pay," are so few.

* * *

Trade Unions and ERP

The international trade union conference on Marshall aid has gone according to plan. No trade unionists from any non-Marshall countries were represented, nor any from the Communist-controlled unions within the Marshall countries. In spite of that, the muster was considerable, and in all 26 organisations from 15 countries (including the United States) were represented. Perhaps the most significant feature from the point of view of representation was the presence of delegations from the American Federation of Labour and the Congress of Industrial Organisations, meeting on the same international trade union platform for the first time in history.

The conference went smoothly, and a unanimous declaration pledging full trade union support for the European Recovery Programme was adopted. In order to ensure active trade union co-operation in the administration of the programme, a special committee has been appointed to continue the work of the conference and to keep in close touch with the Governments and with any international agencies concerned. While the declaration stressed that there was no intention of "aligning the West against the East," and expressed the hope that the nonco-operating countries might yet be included in the scheme, it is difficult to see how a further rift within the ranks of the World Federation of Trade Unions can be avoided. The next meeting of the WFTU's Executive in Rome at the end of April may be decisive, for the question of Marshall aid and the London conference cannot very well be avoided. Mr James Carey's mission to Moscow does not seem to have resulted in any appreciable lessening of the tension, but there is no doubt that both the CIO and the British TUC are anxious to avoid a final breakdown of the World Federation and are at any rate reluctant to lay themselves open to the accusation of having hastened a breakdown.

It remains to be seen whether any practical results will emerge from the London conference or whether trade union participation in the European Recovery Programme will be of any more practical value than the participation of the WFTU in the work of the Economic and Social Council. It is significant that in the declaration the conference expressed its satisfaction that there were no "strings" or unacceptable conditions attached to the Marshall offer. Certainly the fact that the meeting was held and agreed on full co-operation in the Plan should provide a powerful counterweight to agitation against American aid from the Communist elements.

* * *

International Wheat Agreement

Britain, after holding out against an international wheat agreement since 1933, has at last given way and last week-end the protocol was signed in Washington by 36 countries. As the world's largest wheat importer, Britain has always been interested in procuring cheap supplies, and in the past no satisfactory compromise was possible about the level of prices to be fixed. Even last April the United Kingdom delegation maintained that the maximum limit then suggested of \$1.80 a bushel was too high. During the past twelve months the export price of wheat rose well above \$3, and although Britain did not buy at this fantastically high figure, owing to the existence of the Canadian contract other importing countries represented on the International Wheat Council did. To them the new limit of \$2 a bushel seemed a generous offer on the part of the exporters, and Britain has fought a lonely battle during the past weeks in Washington.

The new agreement is, in fact, a multilateral long-term contract for five years beginning on August 1st. It must, however, first be ratified by each of the 36 signatories. It is flexible and contains no restrictive measures. There are to be no limitation of acreage and no formal export and import quotas. An upper price limit of \$2.00 (10s.) a bushel has been fixed and a lower one of \$1.50 (7s. 6d.) which will be reduced by 10 cents a year, so that in 1952-53 it will be \$1.10 (5s. 6d.). The agreement covers three exporting countries—the United States, Canada and Australia—which have undertaken to market annually a total quantity of 500 million bushels. The remaining 33 countries are importers. Argentina and Russia are not participants. Neither side assumes any obligation until the price exceeds the upper limit or falls below the lower. At all other times exporters can sell to any country outside the agreement and importers can buy from other sources. When the price of wheat is above the \$2.00 limit, as it is at present, the exporting countries guarantee to sell 500 million bushels of wheat to other signatories. When the price falls below the lower limit the importing countries guarantee to purchase a total of 500 million bushels, which represents about three-quarters of their annual import requirements, from the three exporters at the minimum price.

A detailed discussion of the agreement must await the publication of the full text. But Britain is virtually unaffected by the agreement as its obligations are already covered for the first three years by its long-term contracts with Canada and Australia. Thereafter, at worst, Britain may have to pay a higher price for wheat than would otherwise have been necessary. The main criticism lies in the relatively high floor price. On the other hand, the advantages are twofold—apart from the immediate gain under the Australian contract, which fixed the price at \$2.70 a bushel and after August will have to be reduced to at least \$2.00. First the security offered to wheat growers is likely to encourage production, so that physical shortage should be overcome by 1952. Secondly, the agreement should help those other importing countries which are not favoured by Dominion contracts or by the Marshall Plan.

* * *

Defence of the West

It seems that the countries of Benelux have been making the pace at Brussels. The British and French delegations arrived with a modified version of the Dunkirk Treaty—which restricts the possible aggressor to Germany and whose economic clauses have remained a dead letter—and appeared to believe that a network of bilateral pacts on this model would meet the situation. But the thinking of the Benelux countries, with M. Spaak as their chief interpreter, had already advanced to bolder schemes, and the Communist *Putsch* in Prague only confirmed their courage. M. Spaak denounced "appeasement" in round terms in the Belgian Chamber, and the Benelux delegates have put forward schemes for a multilateral pact covering all possible forward schemes for a guarantee of automatic defence. At cases of aggression with a guarantee of automatic defence. At the same time, they have left their colleagues in no doubt of their intention to implement whatever clauses on economic and social co-operation are included in the treaty.

It is not certain whether this determination on the part of the Benelux countries has been altogether welcome in London. The British ruefully reflect that when it comes to "automatic defence," the main burden falls upon the major Powers. But there can be no doubt that M. Spaak's approach is correct. For one thing, a vigorous affirmation of self-defence will encourage the outposts of the West—in Italy and Denmark and Sweden. But by far the most important reason is the reaction in the United States. If the Americans are convinced that the western fringe is determined to unite in its own defence, they will be far more ready to give it the guarantee which alone can make that defence effective. The analogy with the European Recovery Programme is exact and illuminating—before American aid was possible on a reasonable scale, Europe had to concert its own economic programme. Similarly in the field of defence, western readiness to act is the pre-condition of an American commitment.

* * *

"Short of War"

Future historians, recalling Seeley's quip about the British Empire having been created in fits of absence of mind, may be tempted to say that western union was created in fits of fright. For it has to be admitted, whether with shame or satisfaction, that the Gottwald coup in Prague gave the western governments what Americans call a kick in the pants. The alarm and indignation

that it caused had the usual effect of making people want to "do something about it"; and action has taken the form of spectacular haste towards agreement on defence of the West.

This sailing before the east wind is all very well, provided that the politicians can allay war talk as quickly as it is aroused. Obviously they cannot sign defence pacts one week and declare that peace is secure the next; that was the technique of the Axis. But they can say, as Mr Marshall said on Wednesday, "The situation is very serious," but "it is regrettable that passions should have been aroused to the degree which has occurred." And they could perhaps point out one or two remarkable things about the recent past.

It is exactly a year since Mr Marshall took effective charge of American foreign policy. During that year he has captured the diplomatic initiative from Russia, found an answer to Communism which really worries Mr Stalin, got the western powers consulting together as never before, and gently helped Mr Bevin off the fence on which he had been sitting so long. In addition, he has played a rapid and intricate game of chess with Mr Molotov without losing any pieces. He has deliberately and coolly built up his counter-attack, and Mr Molotov has been equally deliberate if not quite so cool. Yet, in spite of the strain of the game, it cannot be said that there has been a single occasion during these twelve months when there was dangerous tension between the two contestants—the sort of tension that leads to blows. Both the American and the Russian showed self-control as well as caution. In the hot spots of Europe—Trieste, Berlin, Vienna, Turkey, even Greece—the tactics on each side have been "short of war," whatever the spectators and supporters might write and say.

It would be unwise to attempt prophecy about the future on the basis of these facts alone. It is sufficient to record them, to think twice about present alarms—even Mr Churchill's—and to ask whether the strategic situation in Europe at this moment is not, in essentials, very much what it was two years ago.

* * *

On the Way to Moscow

Most Finns do not consider a military alliance with Russia necessary or desirable. Such is the verdict of the Parliamentary groups of the various political parties on Mr Stalin's offer. The Democratic League favours a binding treaty. The Social Democrats have agreed to open preliminary negotiations. These two groups have just over half the 200 seats in the Diet. By a majority decision, therefore, negotiations are to proceed, the minority being against both negotiations and alliance. A delegation has been appointed and is expected to go to Moscow about March 20th. It will have seven members, led by the Socialist Unity Prime Minister, Mr Mauno Pekkala. Delegates of parties favouring negotiation preponderate. But fears that they will hurriedly barter away Finland's position are dispelled both by the attitude of the Social Democrats and the constitutional obligation that the treaty must subsequently be accepted by the Diet.

The general pattern of negotiations is clear—although the verdicts of the political parties must make it difficult to draft the Finnish delegates' instructions. The Finns will do everything possible to preserve certain fundamentals of freedom and their national institutions. They well know they are in a cage; but they will not readily be chained down as well. The Russians will press for certain minimum requirements. They will obtain them. Their exact nature is an open question. But it is clear that their choice will be determined by events outside Finland. Most probably their main aim will be to strengthen their comparatively light hold on Lapland, where strategic roads and railways have attracted increasing attention. A recent rumour that Russia intended to take over a large part of Lapland in exchange for restoring some of Karelia to Finland adds emphasis to this view.

The other Scandinavian countries however are wide awake to the threat, which the Oslo meeting of their leading Communists brought home. In Norway, which in recent weeks has led the move westward, the Prime Minister has made a forceful attack on Communists "with their hearts full of violence and terror." In the foreign affairs debate in the Danish Parliament this week speakers were not lacking to urge the fuller co-operation of the northern states to defend their integrity: the recent landings by sea of arms for the Communists reinforces this plea. The Swedish Premier too has declared political war on the Communists. And the Swedish General Staff has always been acutely aware of the strategic importance of the north of the country. For it lies across the road to Narvik. It also lies halfway on the great circle air route between American bases in Greenland and Russia industrial centres in the Urals.

New Targets for Cotton

Cotton has been in the limelight this week. The Economic Survey has set a very large increase in the industry's export target for this year—74 per cent in volume by the end of 1948 over the second half of 1947—and Mr Ness Edwards, Parliamentary Secretary to the Ministry of Labour, on a visit to Lancashire, announced the industry's new manpower targets, although his statement on recruitment was somewhat obscured by his premature revelation that the clothing ration might be cut this autumn.

The Government and the industry will have to strain every nerve if the ambitious new manpower target is to be reached this year. The objective is to raise the present labour force in cotton spinning and weaving by 70,000 to 325,000 by the end of the year, and to bring in 40,000 during the next six months. Of these new entrants, 20,000 will be foreign workers, and a delegation has already left for Germany to arrange for the recruitment of more displaced persons and of German women. In order to attract 10,000 married women the programme for day nurseries, which had virtually been allowed to lapse, is to be speeded up, and a further 10,000 women will, it is hoped, become available from other industries. It may be that the Ministry of Labour's powers of direction, which have hitherto barely been used, will be applied more vigorously. Overtime proposals are now being discussed with some hopes of success, and various schemes for output competitions are being introduced.

The biggest and most hopeful factor for future output, however, undoubtedly lies in the recommendations of the Moelwyn Hughes committee on weavers' wages. This report does for the weaving section what the Evershed report did for the spinners, but it goes a good deal further. The committee's proposals are revolutionary—they involve the complete rationalisation and simplification of the antiquated and complex wage structure, with the abolition of the 56-year-old uniform list. The origins of this schedule date back to the days of the hand-loom weaver, and for many years it has admittedly been quite unsuited to the technique of modern factory production. The biggest change proposed is that the new wage lists would be related to output, and thus provide greater incentives to efficiency both for operatives and managements. With the new system and a re-deployment of labour the operatives might in some instances double their earnings, while the manufacturers would have an incentive to improve working methods and introduce new machinery. The need for speed in adopting the commission's proposals is obvious. There are formidable obstacles, however, in the difficulties of re-equipment and in the limited manpower in the spinning section, which is now threatened with a major strike—hardly a very auspicious beginning for the year's effort.

Coal Board Resignations

The resignation of Mr John Hunter, announced this week, from his position as production director of the North-Eastern Division of the Coal Board is much more serious than it would appear to be if it were merely an isolated instance. This is the fifth resignation from the divisional production directorates since the Coal Board came into being fifteen months ago, and it is impossible to attribute such a large efflux merely to personal idiosyncrasies. Men in such positions, who are expert mining engineers and have so large an influence in the present formative period of the Board's life, do not resign easily.

The resignations are serious for two reasons: first, because first-class mining engineers are lamentably rare and these losses of key men could almost be measured in terms of lowered output and higher costs; moreover, their departure will be very depressing to the less competent managers who relied upon them. Secondly, the resignations are evidence of serious conflicts within the Board. These conflicts are of two kinds, reflecting a tug-of-war between headquarters and divisions and tension in the divisions themselves.

The vertical pull is exerted mainly over the question of delegation of power. There is still too much interference in the sanctioning of new schemes and a dangerous tendency to intervene in small questions such as the closing of pits—Waleswood Colliery is a case in point, where the local people felt they should have been allowed full responsibility for settling the matter on the spot. On the horizontal plane the difficulty arises from the dichotomy of labour and production. The organisation of the Board is stamped all over with the political conceptions of a Labour Government. In a concern run by private enterprise the manager is responsible for both production and labour on the assumption that no one can control production without having

complete responsibility for labour and raw materials. In the Divisions of the Coal Board the production manager and the labour manager are equals under a chairman and deputy-chairman, neither of whom may have any previous knowledge of the industry. Directions stream out from the labour and production departments in London to their regional counterparts with little joint consultation. Under such circumstances it is not surprising that the production managers in the Divisions feel they are no longer able to control their own costs or organisation and that their functions have become disintegrated to satisfy political theorists.

Communists on the Gold Coast?

It is deplorable that Mr Rees-Williams should have been so quick to blame Communists for the deaths, woundings and rioting in Accra on February 28th, when 22 people were killed and over 200 wounded. Both his statement in the House of Commons and the news that troops were being held in readiness at Gibraltar suggested that the Parliamentary Secretary wanted to bring a whiff of Czechoslovakia into the primitive but important politics of the Gold Coast. Presumably his attribution of blame was based on advice from the Governor; but it is very important that British officials in the colonies should be strongly discouraged from regarding the present excited interest in the workings of Communism as something to be played on in their handling of local problems.

A provisional and independent report from Accra (given on p. 422), suggests that the explosion of native indignation and excitement was due to the unorganised meeting of two crowds with different grievances. Whether the orgy of looting and destruction which followed was in any way organised beforehand is not known; but the procession of ex-servicemen with which the day's troubles began was organised with, it seems, the Governor's permission. It has to be explained why the police had to use force against the procession, why an angry and bewildered crowd was allowed to return to Accra from the Governor's official drive, and why there had been a native boycott of certain shops in the town. There should be a thorough and impartial inquiry into the whole incident to establish, among other things, whether contact between British officials and natives is sufficiently close to allow the former to distinguish between Communist agitators and Africans with a genuine grievance.

A Minor Mein Kampf

With no Versailles Treaty to set up as a target for post-defeat nationalist propaganda, certain Germans have chosen a substitute. The German case against their victors has appeared in the form of a volume with twelve annexes, the work of a team headed by Senator Harmssen of Bremen. The document has an official character, since it was produced at the request of the Ministers-President of the States in the British and American Zones, and is intended by its authors to form the basis of a negotiated peace settlement. The document must be taken seriously, not because it is moral, objective, accurate or realistic—it has none of those qualities—but because it may become the *Mein Kampf* of the new German nationalism. Henceforth, "Harmssen says" will be sufficient evidence for Germans to support their growing and universal sense of injustice.

The book shows an utter lack of appreciation of Germany's moral responsibility for the war, or of the incalculable human and material wreckage it left behind. It not only carefully avoids mention of Hitler, but implicitly whitewashes him. Going back to Versailles, it complains: "the results of the German people's labour have been reduced by 50 per cent within little more than one generation"—by other malicious, envious Powers, be it understood—not by Germany's wars of aggression. Nor is there any suggestion of, or reference to, the fact that Britain and America—not Germany—have made up the food deficit which arose from the cession of its eastern areas to Poland.

Senator Harmssen bases his opening arguments on the alleged illegality of taking reparations which have not been agreed to by the Germans after adjudication by an impartial judge. Such an attitude is almost incredible in view of Germany's past. The economic folly of reparations has been pointed out again and again by *The Economist*, but to make a moral or legal issue of the question shows how far some Germans still are from understanding the basis on which they can command the respect or

sympathy of the victims of their war. Nevertheless, indignation is not enough. The Harmssen brief might even have been welcomed, if it had provided a reliable German estimate of the economy of the Western Zones. But as a practical basis for planning it is useless, since it purports to deal with the economy of the whole country—a conception which does not exist in reality.

What the document does provide is a challenge to the British, Americans and French, not to answer it point by point—a procedure which would lead to senseless apologies for Potsdam and Russian actions—but to produce a clear, positive economic policy for the future. Such a statement should reassess, honestly and frankly, the extent to which the German economy has been affected by the taking of reparations in every form. If their value should in fact amount to Senator Harmssen's total of \$71 billion (including territorial losses), this should be acknowledged. If British and American interests have benefited at the expense of German industries, this should be stated without undue shame.

The essential point of any such statement of policy would be that it would have as its framework, not the Potsdam idea of Germany, but the economy of all Western Europe. The losses suffered by Western Germany, if they have benefited future partners in Western Union, would appear in this framework not as one-sided victimisation of an enemy, but as re-distribution of assets within a common industrial potential. Without a statement of the principles which will guide the integration of the West German economy with that of Western Europe, the British, American and French bids for German co-operation may prove too little and too late. Senator Harmssen's *Reparationen, Sozialprodukt, Lebensstandard* is a portent worth studying.

New Tasks for Health Committees

The National Assistance Bill, which had its third reading in the House of Commons at the end of last week, had one of the smoothest passages through committee that can ever have been given to a measure of similar importance. Divisions were extremely rare; on several occasions amendments were supported by both Labour and Opposition members; and the Ministers sponsoring the Bill showed themselves anxious to meet the committee's wishes to the utmost possible extent.

But the harmony which has so far accompanied the Bill's passage through Parliament does not guarantee it a smooth administration once it becomes law. The public assistance committees of local authorities, for instance, are worried lest, however they are transformed and in spite of the intention finally to break up the poor law, they will still be in the position of residuary legatees of the other social services, responsible for dealing with all the awkward, difficult cases which do not fit into the scope of the health service or the education service or the unemployment service and so on. During the committee stage of the Bill, the Government spokesman referred more than once to the residual case and frankly defended the all-embracing wording of some of the clauses, such as "persons who by reason of age, infirmity or any other circumstances," by saying that it must be wide enough to cover all the miscellaneous group of people, the simple-minded and neurotics, at present covered by the poor law.

It is just as well that this difficulty has been recognised. If those responsible for the Bill had pretended that the poor law could be finally broken up and all the beneficiaries under it neatly disposed of among the other social services, it would have resulted in the most unfortunate cases of all slipping through the net and eventually having to be legislated for separately. But the local authorities still have to face the problem of how they can deal with this sort of case and yet shed the stigma of the poor law. Kent County Council has decided to transfer all its obligations under the Bill to its health committee, on the ground that a special welfare committee, if set up, would merely inherit the old stigma. Of all the existing committees of local authorities, other than the present public assistance committees which are to disappear under the Bill, the health committee is probably the most appropriate for discharging the various welfare functions imposed by the Bill. But is it an appropriate body to deal with casuals, cases of eviction and the like for whom the local authority may have to provide accommodation?

Level of Subsistence

Another difficulty which will arise when the National Assistance Bill becomes law will be the determination of the new level of subsistence. The Assistance Board's scale rates are to be revised—obviously in an upward direction in view of the

rise in the cost of living. But what is to be the relation between its rates and the basic rate of insurance benefits under the national insurance scheme? At present the Board's scale rate for supplementary pensioners, who form by far the largest number of its beneficiaries, is 20s. a week for a single person living alone plus a rent allowance which on an average worked out at 9s. in 1946. For a man and wife who are supplementary pensioners the scale rate is 35s. a week plus a rent allowance, for which the average was 10s. in 1946. The basic rate of insurance benefit under the national insurance scheme is 26s. a week for a single person—for retirement pension, sickness benefit and unemployment benefit—and 42s. for a married couple.

Any marked rise in the National Assistance Board's scale rates will, therefore, if the rent allowance it pays is taken into consideration, widen the gap between the basic rate of insurance benefit and the subsistence level. If, to an old person who has not qualified for retirement pension under the national insurance scheme, the Board pays, say, 22s. 6d. a week plus his actual rent of, say, 7s. 6d., it is tantamount to admitting that the level of subsistence in his case is 30s. a week, 4s. more than the pensioner draws as of right under national insurance. Is there to be agitation in favour of higher basic old-age pensions before the national insurance scheme comes into full force?

Further anomalies arise if the disregard of resources, when the Board determines a person's need for assistance, is considered. Under the new Bill, as at present, no account is to be taken of an applicant's war savings up to £375 (£750 for a couple) or of house property owned and occupied by the applicant, or of other capital below £50. War pensions and industrial disability pensions are to be disregarded up to £1 a week; and sick pay from friendly societies or trade unions, private superannuation payments and charitable payments up to 10s. 6d. a week in each case, subject to a total disregard of £1 a week. The avowed purpose in making these disregards, especially of capital resources is to encourage the thrifty and deserving. But it should not be forgotten that the main purpose of national assistance is to provide, at the taxpayer's expense, a minimum level of subsistence below which no one should fall. The more a person's private resources are disregarded, the less the amount available for those who, as likely as not through no fault of their own, have to rely entirely on national assistance for their living.

Next Steps in Nationalisation

The second of the Labour Party's discussion pamphlets, that on public ownership, is a singularly ineffective document. Though it sets out to provide a background for the discussion of such questions as, is nationalisation effective?, should it be speeded up?, and if so in which industries?, it never anywhere gets down to examine the concrete points on which alone such questions could be answered. Reference is made to the resolutions, put forward at the Margate Conference last year, calling for the nationalisation of chemicals, motors, cotton, shipbuilding, milk distribution, betting, breweries, water supply and the land. But none of these proposals are discussed, and the pamphlet is content to lay down in the abstract five tests which should be applied to any proposal for nationalisation, namely, does it increase the people's power over their own economic destinies?; does it lead to a higher standard of life, by enabling industry to perform a better and more economic service to the nation?; a more equal standard of life? or a more stable standard of life?; does it open the way to extended industrial democracy? It also puts forward certain "yardsticks" by which aptitude for nationalisation can be measured. To be a suitable candidate an industry should satisfy one or more of the following conditions: it should be basic—as a supplier of vital raw material to other industries, or to human life, health or defence; monopolised by large trusts, inefficient because unable to find finance for capital development; split up into too small units for economic operation, or burdened with a particularly low standard of management, or suffering from very bad industrial relations.

The inadequacy of these criteria, which for the most part are largely irrelevant to the real issue, is only too clear. Beyond a purely dogmatic assertion of the benefits to be derived from nationalisation, such as cheaper finance, better management, more efficient research, the benefits of large scale organisation, and the promise that profits will "be distributed among the public in the form of lower prices" the pamphlet hardly attempts to go; and it is significant that foreign trade and the problem of finding and keeping foreign markets is not even mentioned.

Of the problems besetting nationalised industries there is not a word; nor is there even a hint that the superior

Alone on a Speedbird
—with thirty-five fellow passengers
for company and a stewardess who is friend and
looker-after in one? Quite a few children have travelled
the Speedbird routes 'alone' to that extent; and we can't
believe that their cheerfulness—or their appetites—were
assumed to spare our feelings. So they liked flying? We
doubt if they gave it a thought. They were comfortable,
rather frequently sleepy, very well fed and soon at their
destination. Which is probably just how the world of
their elders and betters will come to regard air travel as
time goes on.

IT'S A SMALL WORLD BY SPEEDBIRD **B.O.A.C.**

BRITISH OVERSEAS AIRWAYS CORPORATION

TRADE MUST FLOW TWO WAYS says CANADA

And, in fact, Canadian trade does flow two ways. Total exports and total imports are closely balanced in value.

To sellers abroad, Canada affords a large and varied market for imported goods.

To buyers abroad, Canada offers a broad range of both primary and manufactured products.

If you wish to buy or sell in Canada, consult your nearest Canadian Trade Representative.

LONDON: R. P. Bower, Commercial Secretary, Office of the High Commissioner for Canada, Canada House, Trafalgar Square, S.W.1.

LIVERPOOL: M. J. Vechter, Canadian Government Trade Commissioner, Martins Bank Building, Water Street.

GLASGOW: G. F. G. Hughes, Acting Canadian Government Trade Commissioner, 200, St. Vincent Street.

BELFAST: H. L. E. Priestman, Canadian Government Trade Commissioner, 36 Victoria Square.

THE FOREIGN TRADE SERVICE
DEPARTMENT OF
TRADE & COMMERCE

OTTAWA CANADA

ATTEND THE
CANADIAN
INTERNATIONAL
TRADE FAIR
TORONTO, CANADA
May 31 — June 12, 1948

See and examine the trade offerings of the world—on display in Canada in 1948. Compare the finest goods of many nations—of many industries. Plan now to attend the Canadian International Trade Fair, or to send a representative. Get full details, including information on travel and accommodation, from your nearest Canadian Trade Representative.

efficiency of nationalised management has still to be proved in practice or that the centralised control, e.g., of the coal industry, so far from leading to industrial democracy, whatever that may mean, may in fact merely imply the substitution of bureaucracy for an admittedly imperfect management. However strong the case that can be made out for the nationalisation of the coal industry—and it was admittedly a very strong one—it should not be forgotten that since nationalisation the price of coal, the basic raw material of the nation's industry, has risen, while weekly output, though it has shown some improvement, was last year still about 900,000 tons below the average of 1937. That does not mean that the nationalisation of comparatively simple industries like gas or electricity is wrong; but the more complex and varied the series of its products and the more they depend upon foreign trade for their market, the less suitable an industry is for this type of experiment, and the greater is the danger of attempting it. Today, when the balance of payments is the problem of overwhelming importance, further experiments in socialism are little short of lunacy. The next step now, is not to socialise more industries, but to see to it that those that have been socialised attain an adequate standard of efficiency.

New Index of Industrial Production

Every student of the Digest of Statistics, with its wide range of diffused information about particular industries, has long been painfully conscious of the need for a means of keeping track of the course of industry as a whole. Now, at last, the Central Statistical Office has produced an official Index of Industrial Production, opportunely launched to coincide with the new Economic Survey. It is a welcome innovation—but the welcome would have been even warmer if the compilers of the Index had not been beaten by a short head by the economists of the London and Cambridge Economic Service, who introduced their own index only a few weeks ago. Both indices are compiled on a 1946 base, both will be published monthly, and both have been calculated for each of the months since the beginning of 1946. The official index, however, differs from the unofficial in that it embraces supplies and equipment for the armed forces; in the other respects the coverage seems to be similar, except that the official index is divided into fewer sub-groups and apparently adopts a somewhat different system of weighting. But, despite these dissimilarities, each index is likely to be regarded as a rough cross-check upon the other. Indeed, a comparison of the two main series, as distinct from the sub-groups, over the last two years shows a quite striking parallelism. On the eve of the fuel crisis, for example, the official index stood at 106 (i.e., 6 per cent above the average for 1946), while the unofficial index stood at 107; both fell to 85 in February, 1947, and both had recovered to 116 four months later. The best month's production since the war was achieved last November when the official index reached 122 (with the unofficial index at 121). In December—the latest month for which figures are available—there was a fairly sharp setback to 117; but this seasonal movement was rather less marked than the comparable reduction at the end of 1946, despite the much steeper fall in building and mining at end-1947.

* * *

Save the Children

Few schemes are more deserving of support than the International Children's Emergency Fund set up by Uno in December, 1946. The fund is administered by a United Nations Agency and provides food, clothing and medical care for distressed children and mothers in countries which have been devastated by the war. It is one of the very few organisations in which all countries have co-operated with goodwill, regardless of race, religion or political beliefs, yet the British Government, apart from stimulating voluntary support, have given a meagre £100,000. The United States has made an outright grant of \$15 million, but has also agreed to match the contributions of other countries in the ratio of \$53 for every \$43 given. This does not mean that the contributions of other nations have to be made in dollars—the organisers of the fund stress that for the moment they want £1,000,000 from Britain to be spent only in the sterling area—but it does mean that unless the governments themselves make contributions, the additional grant from the United States will not be forthcoming.

Most European countries have already contributed in cash or in kind to the fund, which, together with the residual assets from Unrra and private donations, now amounts to \$38,930,250. But this is hardly sufficient for the needs of the 3,700,000 children and pregnant and nursing mothers to be provided for in Europe alone. It is intended to use a sterling credit—if one is granted—for payment of freight rates in British ships, for research into child welfare, for medical supplies and for medical equipment. The United Nations agency in charge of the fund controls the distribution of goods and services in the various countries which are themselves asked to match contributions of food to provide a daily supplementary meal of 600 calories per child.

There is thus every reason for the British Government actively to support the fund. The Lord Mayor's appeal will no doubt be successful, but voluntary contributions from a charitable public are not enough in what is a world-wide effort to save the children who have suffered the most from the terrible strife between their elders. The attitude of the British Government will make Britain look niggardly in the eyes of the world. It may, moreover, have an adverse effect on interests which any British Government must have closely at heart. The children of the world are not the only ones in need of help. Washington has been made fully aware in the last six months of the urgency of aid to Europe in general and to Britain in particular. Does the British Government believe that its own lack of generosity will be entirely overlooked when its present reliance upon American generosity comes up for discussion?

* * *

The Highland Islands

Scottish affairs are unsatisfactory subjects for a House of Lords debate, since, however expert and constructive the opposition may be, the Government spokesman is merely *vox humana* of a departmental memorandum. However, if the recent debate upon the Scottish islands elicited no very satisfactory reply from the Government, it drew attention to questions which are none the less grave because the news from elsewhere is graver. The curse of the islands—as of the Highlands generally—has been a declining and increasingly unbalanced population, coupled with chronically expensive communications with their markets and suppliers. Except for Orkney, for the most part a community of independent farmers, the island economies are based on crofting, which is a highly complex system of co-operative smallholding. Its defect is to produce a surplus of young men who tend to gravitate first to the Merchant Navy and then to the towns. This, together with the necessity of finding a secondary occupation to crofting, has created a long-standing policy of encouraging both croft industries and small local industries. Although much has been accomplished, and although the agricultural subsidies, the price of livestock and the sellers' market for tweed and wool have temporarily offset the high cost of transport, development has not yet reached a point at which the islands could weather an agricultural depression, nor in normal times prevent a steady recession of population. Although the outer skerries, such as St. Kilda, are untenable, it would be a grave reflection upon the British sense of community if the Western Isles were to decay, quite apart from the fact that a derelict island fringe would complicate the defence of Great Britain and impoverish our slender supply of livestock.

But equally nothing could be more unrealistic than to demand, at this moment, increased Governmental expenditure upon Highland and Island development. Public finance is being applied in increasing quantities both through special channels, such as the Hydro-Electric Commission, and through increased grants to county councils. However, a Highland Development Commissioner, whose appointment was recommended by the Hilleary Committee of 1938, might do much to integrate the development schemes of the various interested bodies, and to overcome the fact that the Western Isles are administered by three different Scottish counties, each inclined to be forgetful of its less wealthy island appendages. The Government has created a Highland Advisory Panel, which is not at all the same thing. The Government is directly involved in the question of Hebridean transport, since through the Transport Commission it now owns half of the shipping company which has a virtual monopoly of steamer communications in the Islands. Finally, the record of British European Airways in Scotland has not been good, and it is very doubtful whether air communications should, in an area that demands so much local initiative and knowledge, be left to the sole charge of a corporation designed for a completely different purpose.

Letters to the Editor

Third Party or No Party?

SIR,—Your correspondent Mr P. Goldman, who views with the gravest misgivings the idea that Liberals should have fair representation in the House of Commons in case they force their policies on the major parties, should wake up.

The Liberal Party, though a minority party for a quarter of a century, has been advising and criticising governments on every political subject such as industrial relationships, full employment, pensions, family allowances and, more recently, capital expenditure. The time it has taken the other parties to catch up with the Liberals varies from four months to twenty-two years, but, with fairer representation, the Liberal point of view would be given more emphasis and perhaps will result in getting a Liberal policy without the usual delay.

But if the vote does not entitle us to fair representation, why bother to have elections? It would be far less costly to elect members by drawing names out of a hat, and it would not be less democratic.—Yours faithfully, DAVID WOOLF

24 Poland Street, New Cross, Manchester

SIR,—May I support Mr Goldman's view that the existence of a minority Parliamentary group sufficiently large to have, in effect, power of veto would be the negation of democratic government, making it ineffective or unstable. But the "third party" suggested by your correspondent could do two vital things without Parliamentary representation.

First, it could combat the infection of this country by the one-party, totalitarian belief that the best government is the strongest possible. This battle will be fought, not by debate in Parliament, but by infiltration into local and national organisations of all kinds; this can only be met from within, by liberally-minded "anti-bodies." To be effective these must be united, they must "know what they fight for and love what they know," they must know how and when to fight and believe they can win.

The "third party" could act as rallying-point for these; it could clarify liberal thought and put it into a form capable of beating totalitarianism on its own pseudo-intellectual ground; and it could teach its members how to recognise and meet the totalitarian danger whenever and however it comes.

Secondly, it could help to create a politically educated democracy by teaching people *how* to think in politics, not *what* to think—how to weigh evidence, to trace the argument (if any) behind fine words, to recognise emotional bias and allow for it. Existing parties are too busy to do this; besides, they would be blunting their best weapon.

For these two ends the "third party" need not influence the electoral votes of its members directly, nor would its support for specific policies be so uncritical as to suggest "fellow travelling." Eventually it would, one hopes, be in a position to return its own members to Parliament; but by then it would probably realise that exercising the indirect influence of enlightened public opinion on a Government and Opposition chosen as at present would be more truly democratic than electing a minority Parliamentary group with wrecking powers, but no policy clearly distinguishable from both Conservatism and Socialism.

As for the existing Liberal Party, surely its associations and present policy make it a poor substitute for a new party.—Yours faithfully, FRANCIS HEAD

Farnborough Grange Hostel, Farnborough, Hants

Operation Canute

SIR,—The danger is not merely that Mr Harold Wilson may get his feet wet in the salty tide, but that over a large section of industry the fresh-water springs of enterprise may dry up. The system of price control is accompanied in many cases by consumer rationing and allocations of raw materials based on some basic year, generally 1939. The result is to prevent the expansion of the individual business, which is the normal incentive to efficiency and lower prices.

Your remedy of deflation would scale down effective demand and re-introduce the desirable element of competition amongst manufacturers, but it would not increase supplies. The Govern-

ment shows no strong sign of following your advice; it is evidently concerned to secure the equitable distribution of goods by means of the coupon, and it may well be that rationing of many consumer goods will continue for a long time. Even if that is so, it is still vitally necessary that competition should be introduced amongst manufacturers. Competition within a rationing scheme presents difficult problems, but unless the industries affected are to be stabilised indefinitely on 1939 levels, a solution must be found. The principle should be to render the system of allocations more flexible, so that they respond to proved consumer demand.—Yours faithfully, ARTHUR WHITTAKER

58 Bunbury Road, Northfield, Birmingham 31

Action After Prague

SIR,—If your correspondent had cast his mind back to the history of Ancient Greece he would have recognised that "the use of armed minorities within the country to overthrow lawfully elected governments" is by no means a purely modern method of aggression.

From the end of the sixth century B.C., when Isagoras invited the assistance of Sparta in an unsuccessful attempt to overthrow Cleisthenes and his party of moderate reform, the existence of factions ready to seize any opportunity of securing outside assistance for their revolutionary projects was a frequent feature of Greek political life. Commenting on the massacre (in 427 B.C.) of the Corcyrean oligarchs by the democratic party assisted by the Athenian forces, Thucydides remarks, "opportunities were readily presented to the revolutionary factions on each side for bringing in foreign allies to the detriment of their opponents and their own corresponding gain." The Fifth Column was thus prevalent in the fifth century B.C.

Referring again to Greek history, your correspondent might have illustrated his general thesis by adverting to the Persian subjugation of the Greek cities in Asia Minor after their refusal to act on the advice, attributed by Herodotus to the Milesian philosopher Thales, that they should sink their individual sovereignties in a Panionic Union to resist the invader from the East.—Yours faithfully, D. P. BREARLEY

21 Rodney Gardens, Eastcote, Pinner

From *The Economist* of 1848

March 11, 1848

THE outbreak in France was hastened by the reform in Italy, and by the troubles in Switzerland. In its turn it is spreading its influences, as was to be expected, over the neighbouring states. Belgium was, perhaps, the first to acknowledge it; but the Belgians have had a wiser monarch than Louis Philippe, and they almost at once declined to follow the example of their neighbours. They enjoy a tolerably well-regulated freedom, and King Leopold has not attempted to establish a great system of combined corruption and coercion; he has successively deferred to the wishes of his people, and they are content to keep him on his throne.

It is in Germany, therefore, where the revolutionary spirit has been most developed. Germany has made for several years past a rapid progress in material prosperity, and that is unfailingly accompanied by moral progress. With the English boats that navigate the Rhine, English ideas obtained circulation. The prosperity and freedom of our country excites all the people of Europe to imitation, and none more than the Germans. Ever since 1815 they have been struggling with their princes, particularly those on the Rhine, for freedom of representation and freedom of the press. Now they will attain both; they will not suffer themselves to be deceived again as they were deceived in 1815, but will, we have no doubt, take measures to secure those advantages they have gained. For them the preservation of peace is essential to their progress in political improvement, and it is satisfactory to know that France respects all their rights, and that at present there is no disposition to make revolution the pretext for war.

Books and Publications

Hopeless Sergeant-Majors

"To the Bitter End." By Hans Bernard Gisevius. Jonathan Cape. 595 pages. 18s.

"The Von Hassel Diaries, 1938-44." By Ulrich von Hassel. Hamish Hamilton. 365 pages. 15s.

THE German military caste and the upper classes who were the link between Hitler's and William's Reich are probably now almost extinct. It remains to be seen in the next few years how much of the middle class has survived inflation, National Socialism and whatever the allies can achieve in the way of currency reform. Whatever may be their economic prospects, it would be well to reckon on their showing intellectual and moral exhaustion for a generation or more; and that fact may be of decisive importance when the time comes to leave German politicians to their own devices to cope as best they can with the Communism of Berlin and its Russian-sponsored leaders.

The moral of these two books is quite clear: that resistance to the mass movements of the century of the common man needs conviction, strength and skill in conspiracy of a type that is only rarely in that bourgeoisie which is the main target of attack. The too rare in that bourgeoisie which is the main target of attack. The too rare in that bourgeoisie which is the main target of attack. The too rare in that bourgeoisie which is the main target of attack.

It is being said about these books that there is much fuss about nothing; that far finer and more determined resistance was being offered to Hitler throughout his time of power by humbler men and women. That is true, but it does not alter the fact that the German generals, civil servants, ambassadors, politicians and intellectuals who appear in these books had effective power to ruin Hitler and end the war. So much cannot be claimed for the less exalted heroes of resistance. What German trade unionists, Communists and Democrats found impossible, these men nearly achieved: effective organisation of conspiracy under the very noses of the Gestapo and its Security Service. The fascination of the Hassel and Gisevius narratives is therefore to watch conspiracy at work and to learn what human failings frustrated it and held courage back from the sticking point.

The story told by Gisevius is the more dramatic, even though the author has not the stature of von Hassel. It stretches from the Reichstag fire to the bomb attack on Hitler of July 20, 1944. The narrative of events up to 1939 is first-class reading. Hassel's diary stops short of that event, and in fact covers the year 1944 only very thinly. But both books are about the same set of people, and both authors have the same reasons for loathing the regime of Hitler. Their fellow-conspirators had in common a certain gentlemanliness, which, of course, does not exclude strong nationalist feeling; some of them—like General Beck—were respected for that combination of soldierly and Christian virtues nourished by the best Prussian tradition. What infuriated them about the Third Reich was its vulgarity, its corruption and hypocrisy, its riotous cruelty and its nihilism. What attracted them about it, in the days when they could have struck at the Nazis without risk, was its swift and spectacular success in making

Germany strong. Ostensibly, what dissuaded the Brauchitsches and Halders and Keitels from checking the drift towards war was their curious allegiance to their oath of loyalty to Hitler an oath obtained under false pretences. But it seems probable in several cases that this loyalty was a rationalisation of the feeling that they must see their army in action—just once.

It is useless to speculate about what they might have achieved had Mr Roosevelt and Mr Churchill not demanded unconditional surrender. It is more profitable to recommend that the British and the Americans should seek out and give hope to what remains of the tradition which produced men like Beck and von Moltke. Hitler and Goebbels did their best to destroy it because they feared it, as indeed do still the Communists and all the Marxist Social Democrats of Central Europe. There are stories in these two books which could keep it alive.

The Downgrade

"Decadence." By C. M. Joad. Gollancz. 12s. 6d.

DOCTOR JOAD has his own definition of decadence, and the stiffish first part of this important and stimulating book establishes and justifies that definition. Its manifestations in ethics, art, politics and economic life occupy more easily and to the vast entertainment of the reader, the pages of Part II. Decadence, in brief, is that state into which a society falls through abandoning the Platonic (and Christian) belief in eternal values of a higher order of reality than that of spatio-temporal events. To discard values is, in the end, to discard objective reality itself; to enthrone experience for its own sake (since experience is the only thing certainly existing) regardless of the object to which it relates. This "dropping of the object," in every field of human activity and appreciation, provides Doctor Joad with his criterion.

The argument (condensed from his "Return to Philosophy") is convincingly watertight; "Decadence" is a book not to be ignored. Such a book is never a very comfortable phenomenon, and in the closing chapters of Part II—after thoroughly enjoying himself over architecture, *New Writing*, power politics, cookery, and lowbrow psychology—Doctor Joad sets out to make economists in particular very uncomfortable indeed. A major cause of that "dropping of the object" which is the root of decadence is over-specialisation. The less complete and integrated a man, the less likely he is to conceive the universe as a whole and to be aware of "the object"—the eternal values. "Versatility in living," says Doctor Joad, "goes with affirmation in believing"—and *vice versa*. Here, of course, he collides head-on with the first principle of economic wisdom, which is, precisely, the division of labour for the full exploitation of relative advantage. The small community of necessarily versatile citizens is the essential nursery of healthy souls; the large community of specialists is essential to a high standard of living. One might add that, given the modern sensitiveness to social injustice, it is only on a high basic standard that the essential amenities of civilisation can be superimposed.

The dilemma seems insoluble; even more so for the intellectual specialist than for the slave of the machine. In that four-hours-a-day Utopia which may not, after all, be permanently unattain-

THE WORLD OVERSEAS

Key to China's Backdoor

(By a Special Correspondent)

IN June, 1947, the Chinese Government accused the Mongolian Government of having violated Sinkiang by an armed attack on Peitashan in which aircraft and tanks were used. During the last few years other reports of similar incidents in Sinkiang have found their way into the press. They are the ripples which reach the outside world of a long and bitter struggle for power in Central Asia between the Russians and the Chinese, a struggle which has also affected India, to the south. Sinkiang is the key to the back door of China—the Kansu corridor—down which in the past have come so many barbarian invaders. Sinkiang is also the natural political and economic extension to Russia's Asiatic Republics. Any other Great Power controlling air bases in Sinkiang would be able to strike at the inaccessible industrial areas of Soviet Asia. For India, Sinkiang acts as a buffer state impeding Soviet political penetration of Tibet and Kashmir.

The Chinese, although numbering under 10 per cent of Sinkiang's 5,000,000 people, are today the rulers of the province. Nearly eighty per cent of the population are Moslem Turks of Central Asian stock. Of these the most numerous are the Uighur Turks, generally known as Turkis, who are a settled people living in the towns and oases. They are mostly peasants, small land owners, petty merchants, and artisans. The second largest groups are the nomadic Kazaks and Kirghiz tribes who wander over the bare steppes of Northern Sinkiang and along the wooded slopes of the Altai and Tien Shan mountains. They live off their great herds of sheep, camels and horses. The settled and the nomadic peoples of Sinkiang are closely connected by language, race, religion, common tradition and often blood, to the Turks who form the bulk of the population of the Soviet Asiatic Republics.

There are large mineral resources, including oil, at Wusu, and gold, iron and tin in the Altai. None of them has been exploited on a commercial scale. The main exports are livestock, woollen felts, raw wool and silk, skins, gold and a small quantity of hashish. The main imports are cotton piece goods, dyes, sugar, tea and all forms of cheap manufactured products.

Russia, owing to her favourable geographical position, is able to supply Sinkiang's market at prices considerably lower than those of either Indian or Chinese products. After the 1917 revolution, the chaos in Russia allowed India to capture the whole of the Sinkiang trade, but by 1927, the Soviets had reorganised their export trade and there followed five years of lively economic rivalry between the two countries. The anti-Soviet governor, Yang, who had ruled Sinkiang as an autocrat since 1912, refused to allow Soviet economic influence to develop into Soviet political domination; his attitude displeased the Soviets and he was assassinated in 1928. Five confused and bloody years of civil war followed. Chinese, Turks, Tungans, the nomadic Kazaks and Kirghiz fought each other and laid waste to the province.

Secret Russian Treaty

At this time Russia feared that the Japanese, who had already occupied Manchuria and Jehol, would encourage the rebellions in Sinkiang to spread into Soviet central Asia, where there was already widespread discontent and armed resistance against the Soviet rule. The Soviets therefore signed a secret treaty of mutual aid and co-operation with the local Chinese commander, Sheng Shih-tsai, who, with Soviet help, defeated the rebels and gained control of practically the whole province. Although he was not a member of the Communist Party, he co-operated with the Soviets in order to strengthen his personal rule.

After the Japanese attack on China and an abortive rising of Tungans and Turkis in southern Sinkiang in 1937, the Russians increased their hold on the political and economic life of the province. They eliminated all Chinese nationalist, Islamic and tribal leaders, while at the same time British subjects of Indian nationality were persecuted and trade with India was brought to a standstill. Between 1939 and 1941 the Russian attitude

towards Japan softened, but Russia still held on to Sinkiang. Violent anti-British propaganda continued, so that by 1942 British prestige had been almost completely destroyed. The Russians now tried to undermine Sheng Shih-tsai's position with the intention of replacing him by one of their own Moscow-trained Turkis or Uzbeks, but in 1942 when the Germans were at the gates of Stalingrad, Sheng Shih-tsai was persuaded by a senior Chinese general, and later by Madame Chiang Kai-shek to turn against his Soviet masters and transfer his allegiance to the Chinese central government. Russia was then in no position to take strong action, with the result that between 1942 and 1944 the Red Army regiment stationed at Hami in north-east Sinkiang was withdrawn, the Soviet Trade Agencies were closed, and Soviet political and military advisers disappeared. Pro-Soviet natives and Communists were imprisoned and Soviet influence was eliminated or driven underground. The Chinese Central Government moved up reinforcements, and by the summer of 1944 felt strong enough to remove Sheng Shih-tsai and replace him by their own nominee. The British and American Governments opened consulates in Urumchi (Tihwa), the capital of the province and it seemed as though Sinkiang had again become, in fact as well as in name, an integral part of the Chinese Republic.

By 1944, however, the tide of war in the west had turned in favour of Russia, and Russian policy towards Japan and China correspondingly stiffened. In February 1944 an anti-Chinese, pro-Soviet revolt broke out among the Kazaks of the Altai. Protests and counter-protests were made by Chungking and Moscow. The causes of the revolt are obscure, but it seems that attempts by the Chinese government to settle Hunanese refugees on the nomads' pastures had angered the Kazaks, who are in any case always ready to revolt if there is a prospect of easy loot. The revolt in the Altai region was followed by another in the basin of the Ili round Kulja. It is not clear whether the Russians actually organised the revolts, but they took immediate steps to support and exploit them in their own interest. The pattern of the revolt in Sinkiang between 1944 and 1948 corresponds in many ways to the course of events in Persia's Azerbaijan. It seems, however, that the results have been more definite. China can do little at present to assert its authority in this remote territory and it is easy for Russia to make use of the desire of the non-Chinese population for local autonomy in order to keep the provincial Government weak and subservient. So far, on the other hand, Russia has not caused any part of Sinkiang to break away formally from China and join the Soviet Union.

Oil War in Rumania

(By a Correspondent)

THE "forcible dissolution" last Tuesday of *Astra Romana SA*, the largest oil company operating in Rumania, is the climax of a fierce struggle between the foreign oil companies in Rumania and the Communist Rumanian Government. In declaring the dissolution, the Royal Dutch Shell group, majority shareholders in *Astra Romana*, have taken the only step open to them. The company had been driven into bankruptcy by the unscrupulous methods of the Rumanian Government, and little doubt remains that the next move by the Rumanians would have been to nationalise the company while at the same time refusing compensation because of its bankrupt condition. The British Government have upheld the company's declaration of their "forcible dissolution" by the Rumanian Government, and in a diplomatic Note last Wednesday to Rumania, Britain accepted the powers and rights formerly belonging to *Astra Romana*. The events leading up to this act provide evidence for British oil interests which Rumania will find hard to refute.

Oil companies in which the controlling interest is British produce slightly more than half the total output of oil in Rumania. Before the war this amounted to some 8,700,000 tons, but owing to the deterioration of equipment it has been gradually falling, until, in 1946, only 4,800,000 tons were produced. By March, 1947, the oil companies reported that their equipment was more suitable for the scrap heap than for economic operation. The state of drilling machinery was so bad that only 135,000 metres were drilled in 1946 as against 340,000 metres annually during the war. To meet reparations claims and other Russian demands, 57 per cent of the total production was sent to the USSR, 40 per cent was reserved for home use, leaving a bare 3 per cent for sale in the free market. This did not provide anything like the amount of foreign exchange needed to buy new equipment. Moreover, the Rumanian Government fixed the selling price of oil at 85 times the prewar rate, whereas the price of equipment had increased 330 times. It was calculated then (March, 1947) that \$50 million would be required to modernise the refineries alone.

Up to that time no political pressure had been applied, apart from the Russian demand for reparations. But in June, 1947, the Communist Government passed a law giving the Minister of National Economy power to control any industry in every detail of its operations. Industrial corporations were formed to take over the industries that had been earmarked, and by December last year 750 private companies had been seized. The oil companies were not included in this process, which was the equivalent of nationalisation; instead, Government supervisory administrators were appointed to selected companies, including *Astra Romana* and the British *Unieca*, with full powers to interfere, even in the technical administration of their work.

In July, 1947, the United States and British Governments warned Rumania that adequate compensation would be demanded if the oil companies were nationalised. It was at this point, apparently, that the Rumanian Government decided upon the series of cleverly worked out moves which followed, with the deliberate intention of wrecking foreign oil companies and thus avoiding any question of compensation.

Political Tests for Technicians

Using the plausible excuse that foreign exchange was short, they forbade the foreign oil companies to import any new equipment which, before the war, had amounted to about 40,000 tons of material a year. The unfavourable selling price of oil led to an urgent need to borrow capital and the Rumanians insisted that the money should be borrowed from the State banks. New exploration or exploitation was made illegal for companies which were less than 75 per cent Rumanian-owned; the Russian organisation *Sovrompetrol*—although only 50 per cent Rumanian—was exempted from the order and given "most-favoured nation" treatment in defiance of the terms of the peace treaty. Skilled technicians were removed because of their "political unsuitability." The economic plan drawn up in the second half of 1947 set targets for the oil industry which could not possibly be carried out with the existing equipment. Finally, supervisory administrators were appointed by the Government.

The powers of these administrators were all-embracing, and they set to work to interfere in every branch of the industry.

If technical advisers, for instance, recommended drilling in one particular area, the administrator would insist on some other spot of his own choosing. Employees were brought under his close scrutiny, and dismissals or appointments were made regardless of technical efficiency. The administrator could and did withdraw the powers of signature of executives, and often vetoed the decisions of the board of directors.

The result of these measures has been a catastrophic decline in oil production. The total for last year was 3,800,000 tons, and this year it is not expected to exceed 3,500,000 tons, in spite of the official target of 4,500,000 tons. The hold which the Rumanian banks now have over the foreign oil companies enables them to foreclose the mortgages at any time, while the deterioration of refineries, wells, and drilling machinery is now so great that oil experts consider the industry to be beyond repair. The Communist policy has obviously harmed Rumania as much as the foreign oil interests, but this seems to carry little weight with Rumania's present rulers.

The Rumanian Government has thus been in a position during the past few weeks, where they could have seized the foreign—particularly the British—oil industries without the formality of nationalisation, and without even the legal obligation to pay for the damage they have wilfully done. It was because this situation had been reached that the majority shareholders in *Astra Romana* have declared their company to have been "forcibly dissolved." Whether admitted or not by the Rumanian Government, it establishes a fact and a date on which future negotiations can be based—if the political atmosphere should ever change.

Apathy Among Workers

Besides the political and economic struggles, the lot of the employees of foreign oil companies has been intolerable. With the removal of the last non-Marxist group, Tatarescu's "Liberals," the destruction of all opposition parties, and finally the forced abdication of King Michael, Communist control over Rumania has been made complete. With few exceptions, every worker has felt the urgent necessity to join the Communist Party or, at the very least, to become a member of the *Arlus*—the association for strengthening Rumanian relations with Russia. Works Committees have been "elected" to watch and spy on fellow workers who, should they run foul of the Communists, may lose their employment and their houses. They have even been threatened recently with punishment in forced labour camps. Whenever demonstrations are organised, a roll is called to ensure that no one is missing from the procession, which often continues for several hours. Care is also taken to see that workers attend the many meetings and "study" courses where they are "instructed" in the usual propaganda against the Marshall Plan, Anglo-American imperialists, warmongers and saboteurs.

The result has been to bring about a state of apathy and despair among the workers which, apart from the time wasted on processions and meetings, has hastened the decline in production. There are few left now who do not live in permanent anxiety and fear.

Holland's Economic Plight

[FROM OUR CORRESPONDENT AT THE HAGUE]

HOLLAND, too, is on the rocks—or rather smelling the seaweed on the rocks. The Dutch Minister of Finance, Professor Liefstuck, recently stated that without American assistance Holland's balance of payments would show a deficit of 1,500 million guilders (£150 million). Even before the war Holland's exports exceeded its imports by 500 million guilders, but then the balance was made up fairly easily by transport earnings and dividends from the United States, Britain and the Netherlands East Indies. Dutch foreign investments then amounted to about 5,000 million guilders (£500 million).

The whole economic position has now changed. According to provisional estimates for last year, Holland's exports amounted to

about 1,300 million guilders, and its imports totalled about 4,250 million guilders. There has also been additional expenditure of approximately 600 million guilders in Indonesia, but income from freight charges and from foreign investments, which now bring in only about 180 million guilders per year, have slightly narrowed the gap. The adverse balance is therefore more likely to be about 2,000 million guilders.

The Dutch Government have so far refused to give more accurate figures. At the beginning of 1947 Holland had about 500 million guilders left in existing balances abroad, and another 500 million guilders in foreign investments which could still be used—about half of the latter has probably been sold. Gold reserves also amounted to about 500 million guilders, of which the Treasury planned to sell 50 millions during the year, and foreign loans were expected to total about 900 million guilders—both the World Bank and the New York Stock Exchange were successfully approached. But whatever part of these reserves was used last year, it is clear that, if no help is made available under the Marshall Plan, the “gap” will be enormous. The estimate of approximately 1,500 million guilders made at the Paris Conference in July, 1947, has already been exceeded.

Battle for Exports

Other methods can, of course, be used to narrow the gap. Curtailing imports and increasing exports are familiar devices of the time, but both methods have limits. Holland's paucity of foreign exchange is not only caused by dwindling foreign investments, but, as in Britain, also by the adverse “terms of trade.” Import prices have been trebled since 1939, and the Government have, at the same time, had to support a programme of reconstruction and industrial re-equipment at home.

As in Britain, a continual struggle is going on in Holland between the Government's financial experts, who want to use as large a part as possible of the foreign loans and investments in an anti-inflationary, budget-balancing policy, and the industrial specialists, who emphasise with some justification that such measures can only be used once whereas investment in the expansion and re-equipment of Dutch industries promises better exports and less financial strain in the years to come. Until a few months ago, exports rose steadily, but it looks now as though they will remain at the same level unless large-scale industrialisation takes place. Towards the end of 1947 the volume of production passed the level for 1938, but with very different figures for different industries: chemicals reached 160 per cent of their 1938 level, but textiles attained only 72 per cent and the production of bricks was even less at 70 per cent.

Export targets are always a matter of guess-work, but competent economists say that the metallurgical, chemical and textile industries, which, between them, will have to bear the brunt of the “battle for exports,” will have to produce from 175-200 per cent of their prewar volume if the battle is to be won. It will be, to put it mildly, exceedingly difficult to find the 2,000 million guilders necessary for further industrialisation and the trained labour force necessary to achieve this target. Something drastic will have to be done if Holland—even with American help—is ever to balance its imports and exports again.

The Riots in Accra

[FROM A CORRESPONDENT]

THE sequence of events on Saturday, February 28th, which led to the outbreak of violent rioting in Accra, began with a procession of African ex-servicemen which was organised to present a petition to the Governor of the Gold Coast. They sought the Governor's help in resettling ex-servicemen in civilian life. Most of them had received some sort of clerical training during their military service, and they were dismayed by the lack of “white-collar” work available for them in peacetime. Permission to present the petition had been previously granted. Accordingly, on February 28th, they formed a procession to march from Accra to the Governor's residence in Christiansborg Castle, which is outside the town, and can only be approached by one route. The road up to the castle passes through two ceremonial arches; when the procession reached these arches they were met by a detachment of African police under the command of a European superintendent.

The police had presumably been stationed in the normal manner to control the procession, but instead of allowing the ex-servicemen

to continue—they were so far quite orderly and calm—they stopped the procession and questioned their right to present a petition. During the argument which followed, it is alleged, someone suddenly lost his temper and fired his rifle, killing one of the ex-servicemen. The African ex-servicemen, who were unarmed, were for a moment dumbfounded and stood aghast at what had happened. Then they raised their voices and complained loudly and bitterly against the police. The police thereupon took fright and threw tear-gas bombs into the procession. Still howling and shouting, the ex-servicemen dispersed and made their way back to Accra.

On the same day the boycott of the shops of the AWAM (Association of West African Merchants) was lifted. For some time the African natives of Accra had refused to buy any goods from these shops because of the high prices charged and because it was alleged that there had been favouritism towards Europeans. A few weeks ago, however, some of the African chieftains negotiated with AWAM, and claimed that they had been promised a reduction in prices of 33½ per cent, to come into effect on February 28th.

On that day, therefore, crowds assembled in Accra to enjoy their first day's shopping at the lower prices after a considerable period of scarcity. They seem to have expected to be able to buy anything and everything. But, on going into the shops, they discovered that only a few of the prices had been reduced, while others had actually been increased. Moreover, many of the goods they had hoped for were simply not available. In true African fashion, the crowds gathered in the streets and began to howl.

Frenzy of Looting

Into this melee came the ex-servicemen with their story of the police shooting, and of how they had been prevented from seeing the Governor. Indignation mounted, and in a short space of time the Africans worked themselves up into a frenzy, culminating in violent rioting. Shop-windows were smashed and wholesale looting started. Twenty-two people were killed and more than 200 were injured. The police eventually quelled the riots and order was restored. A curfew was imposed; the Post Office, banks and Government offices were put under guard, and the African chieftains were called in to calm their people.

What is believed to be the injustice meted out to the ex-servicemen and the statement by Mr Rees-Williams in the House of Commons that Communists were behind the riots have led to widespread hostility against Europeans. The number of “fellow-travellers” in the Gold Coast is said to be very small; to make charges of Communist incitement leads directly to counter-charges of a deliberate attempt by the Government to cover up the real grounds for discontent which exist. Although co-operation between Africans and Europeans in other parts of the Gold Coast is excellent, the officials in Accra appear to be out of touch with native feeling and opinion. Little effort seems to have been made to explain to the Africans the existence of world shortages and the reason for high prices, or to allay their suspicion that the Government is closely connected with AWAM.

The case of the members of AWAM has still to be heard, and it remains to be seen what acceptable evidence there is, if any, that the later disorders in Accra and simultaneous outbreaks in other towns were deliberately organised. To at least one impartial observer on the spot it appears that this tragic affair has been badly handled and that the Accra natives had grievances worthy of serious attention.

THE BUSINESS WORLD

Economic Survey for 1948

THE balance of payments inevitably dominates the Government's Economic Survey for 1948. This is the problem in terms of which all other aspects of the economic situation, production, consumption and investment must be viewed. The current payments with overseas countries, the pressure on gold and dollar reserves, and the availability of extraneous assistance must in 1948 determine what can be consumed and invested at home, and the Survey for 1948, in contrast to that of 1947, is therefore largely concerned with the problem of external payments. Part of what it has to say on this subject has already been divulged in the White Paper on the balance of payments for 1947 (which was discussed in detail in *The Economist* of February 14th). The projection of the figures through 1948 is, however, entirely new.

Last September the target for exports of British produce and manufactures had been set provisionally to reach by the end of the current year a volume greater by 60 per cent than that of 1938. That figure has now been revised to 50 per cent, owing to the saturation of certain overseas markets, import restrictions due to dollar shortage, and an insufficiency of steel to meet all our export needs, particularly in certain types of machinery and vehicles. Some offset to these reductions has been provided by increasing the targets for textile exports. Increased exports of these would be particularly valuable in as much as they are almost exclusively directed to dollar markets, or, if shipped to sterling countries, can save dollars by reducing the demand for American textiles. The principal export targets for 1948 are shown below:—

REVISED EXPORT TARGETS
(Monthly Rates at End of 1948)

	£ million at Forecast end-1948 Prices	Per Cent of 1938 Volume
Machinery	23	203
Vehicles	25	272
Electrical goods and apparatus	7	215
Textiles and clothing	39	131
Chemicals	8	181
Pottery, glass, abrasives, etc.	5	223
Coal	4	39
All other exports	48	127
Total	157	151

On the import side, programmes are published covering only the first half of this year. What happens after June depends on the fate of the European Recovery Programme. The import estimates for the first half of 1948 are shown in the following table:—

IMPORT PROGRAMMES, 1946-48
(£ Million at Current Prices fob)

	1946	1947	First Half-Year, 1948			
			Western Hemisphere	Sterling Area	Other Countries	Total
Food and feeding stuffs	546	750	123	179	88	390
Raw materials	347	544	91	113	76	280
Petroleum (civil)	50	75	27	12	8	47
Manufactures & other imports	139	205	26	9	40	75
Total	1,092	1,574	267	313	212	792

* Including tobacco, of which purchases in the first half-year are negligible.

This table reveals that programmes have been cut to a definite austerity pattern. Food purchases from the United States have been almost wholly eliminated. The Survey states that "the greatest practical economy of dollars has been achieved in imports from Canada and the Argentine"—a claim which looks a little doubtful in the light of the latest commercial agreements negotiated with those two countries. Imports of raw materials are to be maintained at about the minimum required to ensure a high level of employment, although the Survey points out that the import programme makes no provision for the expansion of stocks which is required to ensure a smooth and rising rate of production. Stocks of many key materials are at a minimum level and will remain there throughout 1948. The Survey points out that the rebuilding of these stocks must remain an important object of import policy.

The "invisible" deficit should be reduced to about £80 million in 1948 compared with £226 million in 1947. Cuts in overseas Government commitments and in film and travel expenditure, together with the rebuilding of the merchant shipping fleet, are the main contributors to this improvement. For the first half of the year "invisibles" as a whole are estimated to produce a net deficit of £49 million. On the basis of these estimates of visible and invisible payments, the Survey makes the following projection of the British balance of payments for the first half of 1948:—

U.K. BALANCE OF PAYMENTS ON CURRENT ACCOUNT
(£ Million at Current Prices)

	1938	1946	1947 Provisional	1948 First Half (Forecast)			
				Western Hemisphere	Sterling Area	Other Countries	Total
Total payments for imports (fob)	835	1,092	1,574	267	313	212	792
Receipts from exports & re-exports	533	888	1,125	105	355	245	705
Surplus (+) or deficit (-) on visible trade	- 302	- 304	- 449	- 162	+ 42	+ 33	- 87
Invisible (net)	+ 232	- 176	- 226	- 21	+ 28	- 56	- 49
Total surplus (+) or deficit (-)	- 70	- 380	- 675	- 153	+ 70	- 23	- 136

No detailed estimates have been made for the year as a whole because of the uncertainty of Marshall aid. But it is estimated that if imports continue at the same general level as for the first half of 1948, making due allowance for seasonal factors, they would amount to about £1,670 million for the full year. Total exports have been estimated at £1,500 million and the net deficit on invisible account is put at £80 million, giving an overall deficit of £250 million, compared with the £675 million incurred last year. The deficit with the Western Hemisphere, however, would be considerably greater than the total figure, for the estimated surplus with the sterling area is expected to be substantially larger than the deficit with the rest of the world. The Western Hemisphere deficit itself, however, is expected to be largely reduced—from £680 million for the whole of 1947 to £183 million for the first half of this year. Whereas in 1946 Britain drew 49 per cent of its imports from the Western Hemisphere and in 1947 44 per cent, the import programme for the first half of 1948 brings the figure down to 34 per cent. It is hoped to export to the Western Hemisphere 14 per cent more by

volume in 1948 than in 1938. The gold and dollar reserves will thus have to meet continued pressure, at least in the first part of 1948, and in all probability thereafter. Such pressure will derive not merely from the United Kingdom's direct expenditure but from that of the rest of the sterling area. The expected changes in gold and dollar reserves for the first half of 1948, with comparable figures for 1946 and 1947, are shown in the following table:—

CHANGE IN THE GOLD AND DOLLAR RESERVES, 1946-48
(Including United States and Canadian Credits)
(£ Million)

	1946	1947 (Provisional)	1st Half 1948 (Forecast)
1. United Kingdom net expenditure in Dollar area (a)	340	626	151
2. Rest of Sterling area net expenditure in Dollar area	38	266	45 (b)
3. Sterling area net gold and U.S. Dollar expenditure in other countries	- 80	157	31
4. Sterling area subscriptions to International Bank and Fund in gold and United States Dollars	10	58	...
Net outflow of gold and dollars	308	1,107	227
5. Gold receipts from South Africa	- 71	- 70	...
6. Other gold receipts (net)	- 11	- 14	- 5
Net drain on reserves	226	1,023	222
7. Drawings on International Monetary Fund	...	60	...
Net reduction in reserves	226	963	222

(a) U.S.A., Canada and Newfoundland, American account countries. (b) Excluding South Africa. (c) No allowance has been made for drawings on I.M.F. by the United Kingdom or any sterling area country in the first half of 1948. Any such drawings will diminish the figures for net reductions by an equal amount.

The Survey points out that at the beginning of 1948 the reserves were about £680 million, including the South African gold loan and the residue of the American credit, but excluding the balance of the Canadian loan over and above the agreed drawing of \$45 million to the end of March. The estimates above suggest that the reserves are likely to be reduced to at least £450 million by the middle of the year and at the same rate of drain would be down to £225 million by the end of the year. In other words, they would then have fallen below the minimum figure for practical working. The estimated drain on the gold reserves for the first half of 1948 may appear modest in the light of the gold losses already suffered in the first two months of the year. These, in so far as they can be gauged from the gold sales and drawings from the American and Canadian credits, would appear to be in the neighbourhood of £110 million for the two months. These losses were, however, exceptional in size and appear to have included some £25 million of hasty withdrawals of hard currency quotas given to certain overseas countries to cover their needs for the first half of 1948—a sad commentary on their confidence in sterling.

Whether the reserves fall below the operable minimum depends upon Marshall aid. Without this aid, the Survey declares, Britain will have to make further heavy cuts in Western Hemisphere imports, especially in those of raw materials. Cuts in these would bring in their train severe unemployment and further drastic revision of the capital programme. The Survey builds up a powerful brief for Marshall aid, not only from the point of view of the direct interests of Britain but in its relation to the recovery of Europe. It therefore concludes that the cuts in raw material imports which would have to be made if no aid were forthcoming should be postponed until they are shown to be absolutely inescapable.

The Government's broad strategy of external recovery is first to make the best progress towards a balance of total payments, and secondly to establish some approach to equilibrium of payments with the Western Hemisphere. The following practical steps in achieving this balance are specified: (1) to fix an export target to reach 150 per cent of the 1938 volume by the end of this year; (2) to save dollars by increasing supplies from home

sources, particularly by the development of home agriculture; (3) to divert exports to the United States, Canada and Argentina; (4) to create new sources of supply of British imports in non-dollar countries and more particularly the British Commonwealth; (5) to invite other sterling area countries to exercise similar measures of dollar economy; and (6) to restore, in concert with other countries, a system of multilateral trade and convertible currencies.

This declaration of policy raises the issue of "unrequited exports." If Britain tries to arrive at a total balance while it is still running a large deficit with the Western Hemisphere, a correspondingly large surplus must be accumulated in the form of unrequited exports; but "it is intended to limit them to an amount commensurate with the present resources of the United Kingdom." In the first half of 1948 a total deficit of £136 million is expected—with a surplus of about £70 million with the rest of the sterling area. This surplus will not necessarily be wasted, for the alternative to exports to the sterling countries may be a higher dollar outlay by them. Some unrequited exports to countries like Belgium, which already hold substantial sterling balances and have the right to convert part of them into gold, are also beyond criticism. The Survey also endeavours to justify "unrequited" exports representing investments that will create new supplies of food and raw materials which ultimately will replace imports from dollar countries. Finally, it points out that to try to reach an exact balance of trade with every country would be to turn the back on the policy of multilateral trade which Britain has so far pursued and would remove a powerful motive for other countries to use and hold sterling.

To achieve the required equilibrium in Britain's external payments, greater production is the first prerequisite. The Survey sets the following targets for 1948:—

PRODUCTION TARGETS FOR 1948

Industry	Unit	1947 Actual	1948 Target
Coal:—			
Deep-mined output (52 weeks)	million tons	186.3	200.0
Open-cast output (52 weeks)	"	10.2	11.0
Manpower on colliery books (c)	number	718,000	750,000
Mining Machinery:—			
Coal cutters	"	1,172	1,400
Power loaders	"	109	250
Conveyors	"	2,666	4,700
Tubs and cars (capacity)	tons	56,390	70,000
Iron and Steel:—			
Steel output (ingot)	tons	12,724,000	14,000,000
Iron castings	"	2,781,000	3,000,000
Shipbuilding:—			
Tankers completed	gross regis. tons	120,000	175,000
Repairs: (target reductions)—			
Railway wagons under repair (at end-September)	number	203,000	170,000
Electricity generating plant out of commission (c)	kW.	1,450,000	1,300,000
Textiles:—			
Cotton yarn (a)	million lb.	740	900
End-year annual rate	"	828	1,000
Worsted yarn	"	154	190
End-year annual rate	"	170	204
Woolen and worsted cloth	million yards	233	290
End-year annual rate	"	260	300
Rayon: continuous filament	million lb.	119	150
End-year annual rate	"	135	165
Rayon: staple fibre	"	82	105
End-year annual rate	"	85	120
Manpower in cotton (c)	number	267,000	325,000
Manpower in woolen and worsted (c)	"	179,000	200,000
Manpower in other textiles (c)	"	212,000	235,000
Agriculture:—			
Bread grains	'000 acres	2,207	2,595
Other grains	"	5,888	6,050

Sugar beet	"	396	400
Linseed	"	40	150
Manpower in agriculture (b)	number	1,055,000	1,110,000

(a) Cotton yarn, including cotton waste yarn, but excluding spun rayon and mixture yarns.
(b) The figure for 1947 is at end-year; the target for 1948 is required by mid-year.
(c) End-year.

Steel, despite the record output of 14 million tons promised for this year—a figure "within the physical capacity of the industry . . . if there is freedom from serious fuel, raw material

and transport difficulties"—will be the principal limiting factor throughout a large part of British industry during 1948. The textile targets are perhaps the most ambitious. Their attainment depends not only upon an advance in efficiency towards that achieved by the best firms but also upon increased hours and a large increase in manpower. It is in the textile industry that the need for redistribution of the industrial population is greatest. From 652,000 textile workers employed at the end of 1947, the total is expected to reach 760,000 by the end of this year. Even this figure will be 38,000 below that for the middle of 1939. The estimated redistribution of the industrial population is shown in the following table:—

DISTRIBUTION OF MANPOWER, 1947-48
(Thousands)

	Mid 1939 Actual	End 1947 Actual	Mid 1947 Actual	End 1947 Actual	End 1948 Distribution
Coal (total manpower)	77.5	7.9	7.5	7.4	7.9

Total Employed	18,000	18,276	18,650	18,887	18,870
Unemployed	1,270	393	269	300	450
Total Industrial Population	19,270	18,674	18,910	19,187	19,320

* Including industrial staffs of Government departments not classified to a particular industry and Police, N.E.S. and Civil Defence.

The increased shifting of labour is reflected in the higher estimates of unemployed workpeople for the end of 1948.

Higher output will, however, have to be canalised almost exclusively to export trade, and with a much smaller volume of goods imported on credit or by other forms of external disinvestment, the physical volume of resources available to cover domestic consumption, investment and Government expenditure will be smaller—but only by an amount estimated at 3 to 5 per cent. The reduction of consumption in terms of food is estimated as follows:

CONSUMPTION PER HEAD PER ANNUM
(lb.)

	Pre-war Annual Average	1947	First Half, 1948		Pre-war Annual Average	1947	First Half, 1948
Dairy products (milk solid)	38.3	48.9	45.7	Potatoes	176.0	297.0	176.4
Meat	103.6	82.2	67.2	Pulses and nuts	9.6	7.8	5.8

* Shell egg equivalent. † Fresh equivalent. ‡ Edible weight.

At current prices the resources available for use at home are estimated at £9,250 million for 1948. This assumes a net national income of £9,000 million and £250 million of net borrowing from abroad. In 1947 the corresponding figures were £8,600 million and £675 million respectively. The capital budget which emerges from these targets and estimates—and the extent of the danger of further inflation unless the Chancellor budgets for a large surplus—are discussed on page 427.

Business Notes

A "Tough" Budget?

From the point of view of the City, quite the most significant aspect of the "Economic Survey" lies in the light it sheds upon the attitude of the Government—or at least of the Chancellor—to the forthcoming Budget. In this year's Survey the authorities have not been content, as they were last year, simply to set out the targets for production, capital outlay and the balance of payments, and then to leave the public to make its own guesses about the chances of pursuing such a programme without creating inflationary strain. This time the Survey presents a *pro forma* balance sheet for the national economy as a whole, complete with estimates of 1948 national income and of the structure of the Budget on the current basis of taxation.

On the assumption that supplies of imported materials suffice to maintain employment at only a little below its current level, the net domestic output of goods and services is estimated at £9,000 million at the current price-level, compared with £8,600 million in 1947 (at the prices then ruling). This expansion in the money volume of domestic output is approximately equal to the amount by which the authorities hope to reduce the deficit on the overall balance of payments, which is put at roughly £250 million for the full year compared with £675 million in 1947. Hence, as the table opposite shows, the total resources available for use at home are put at £9,250 million compared with £9,275 million in 1947.

Of these resources, £2,050 million is expected to be absorbed by public authorities (excluding purely "transfer" payments, such as social security payments, war pensions and national debt interest to the total of £1,140 million). The amount required for net capital formation, i.e., for housing and re-equipment of the industry and the utilities, is put at £1,100 million, so that the physical resources residually available for personal consumption would be, at current market prices, £7,675 million.

What are the chances that the demands of consumers could in fact be kept down to this figure without any further increase in prices will continue, and will attract real resources away from exports and essential capital outlays. The Government expenditure of £3,590 million (including subsidies and transfer payments) will be self-financing, for, on the existing basis of taxation, public authorities are expected to have a surplus of £275 million before allowing for £150 million expected to be disbursed in 1948 in war damage payments and EPT refunds, both of which items are treated as capital. Of the £1,100 million of net capital outlay, therefore, £275 million will be financed from the savings of public authorities and a further £250 million by net borrowings overseas, leaving £575 million as the requisite amount of private savings.

* * *

Savings and Inflation

The crucial question is whether it is reasonable to expect such a volume of savings to be provided by non-inflationary means, that is, by genuine and spontaneous savings, as distinct from the mere accumulation of temporary savings in the hands of those who are able to use the inflationary situation as a means of exacting higher money incomes. The Government itself plainly has grave doubts, for it now frankly points out that the relatively large savings of 1946 and 1947 are "no guide to what savings we may expect individuals to be prepared to make in 1948," because these savings "were in part the outcome of the inflationary process . . . and in particular were accompanied by a heavy strain on the economic controls." After Mr Dalton's repeated arguments to the contrary, the Government is to be congratulated on this candour. Indeed, its frankness does not stop there, for it points out that the requisite personal saving of £450 million (a net £125 million is expected to be provided from undistributed business profits) is equivalent to 5½ per cent of the total of personal incomes after direct taxes have been paid, a proportion which is half as great again as that for 1938. Hence it is concluded that "without a radical change in the willingness of individuals to save," it is unlikely that the requisite net savings would be generated by non-inflationary processes.

It should be noted that this sombre conclusion, which is surprising only in its frankness, is based upon the assumption that all the other official targets will be attained. Obviously, there are great uncertainties at almost every point in the complex computa-

tion; but, in particular, there is reason to question the estimates of investment outlays and savings by industry. Gross domestic investment is put at £1,800 million compared with the £1,420 million already estimated (in the White Paper of last December) for outlays on fixed capital. The difference of £380 million represents the expected increase in industrial work in progress and in export goods "in the pipe-line" and also an allowance for "some small rise" in costs. But the amount needed to maintain existing capital equipment intact is estimated at only the £700 million which is allowed for depreciation at Inland Revenue rates, although the White Paper itself admits that at current costs the bill would be some £200 million larger than this. Most industrialists would put it higher still; but, even on the basis of £900 million, it is clear that unless industrialists can be prevented from undertaking

NATIONAL RESOURCES AND EXPENDITURE, 1946-48
(£ Million at Current Prices)

RESOURCES	Provisional		1948 Esti- mated	EXPENDITURE	Provisional		1948 Esti- mated
	1946	1947			1946	1947	
National income of the United Kingdom	8,200	8,600	9,000	Domestic expenditure on goods and services, at market prices			
Borrowing from abroad, etc.	380	675	250	Personal	6,750	7,300	7,675
				Government	2,330	2,150	2,050
				Net capital formation	750	1,250	1,100
				Total	9,830	10,700	10,825
				Subsidies	360	430	400
				Less indirect taxes	-1,610	-1,855	-1,975
Total resources available for use at home	8,580	9,275	9,250	Total resources available for use at home	8,580	9,275	9,250

necessary maintenance, the official estimates will be falsified in one of two ways: either the gross capital outlay will, in fact, be larger than £1,800 million, or the net new capital formation will be less than the £1,100 million which the estimates assume. In the former case, the inflationary pressure and the need for saving would be even greater than the White Paper implies; in the latter case, inflation would be held down only at the cost of drastic impairment of the productive efficiency of British industry. For all these reasons there is plainly need for the Chancellor next month to budget for a really large surplus—and the frank admissions in this White Paper suggest that he, at least, is fully alive to the need.

* * *

Chancellor on Sterling

The intervals between the recurrent rumours of sterling devaluation are growing shorter. Perhaps for that reason the official denials are becoming increasingly explicit and emphatic. Asked last week whether he considered sterling devaluation to be inevitable during the course of this year, Sir Stafford Cripps replied bluntly: "No, I certainly do not." The occasion for this latest exchange was provided by an odd report from Brussels that the British Ambassador had mooted the possibility of a simultaneous devaluation of the pound, Belgian franc and Dutch florin as part of the economic side of the plan for Western Union. The story was, in fact, promptly denied by an Embassy spokesman, and was finally scotched by the Chancellor's terse comment—"complete nonsense." The trouble about these denials is that while they are accepted at face value by almost everyone in this country, on the Continent they seem merely to add fuel to the flames of speculation, for people there cannot forget the experiences with their own currencies in the 'thirties. Then the obstinacy of the so-called gold bloc in clinging to over-valued parities led Continental monetary authorities to issue flat denials in monotonous sequence up to the very eve of the eventual devaluations.

But, in fact, there is no analogy between the position of sterling now and the position of the gold bloc currencies in the 'thirties. Then those currencies were demonstrably far out of step with those of almost the whole of the rest of the trading world, and

Prosperity is not without many
fears and distastes: and ad-
versity is not without comforts
and hopes.

BACON

BANKING business is daily concerned with its customers' problems of attaining and sustaining prosperity; and of enduring and overcoming temporary adversity. The wise use of the various departmental expert services of Martins Bank can do much to counteract the effects of temporary adversity or to enhance the enjoyment of those compensations of which the great English philosopher gives at once consolation and warning.

MARTINS BANK

LIMITED

LIVERPOOL LONDON & BRANCHES

The giant cotton tree which bears the name of Tom Cringle stands on the road from Kingston to Spanish Town and is named after the hero of 'Tom Cringle's Log', an early nineteenth century adventure story set in the West Indies. Tom, a young naval officer in the tradition of Mr. Midshipman Easy, deals with slavers and privateers in the summary and effective manner expected of such heroes and the book also contains entertaining and informative descriptions of the way of life of the West Indian people in those days. Much has changed since the book was written but the great tree remains as a link with the Jamaica that Cringle knew. The capital of the island was transferred from Spanish Town to Kingston in 1870 and the port of Kingston now handles a volume of trade which would have staggered the merchants of a century ago. Full and up-to-date information from our branches in Jamaica on industrial conditions and commercial trends in the island is readily obtainable on request.

gold bloc exports were languishing. But now, although it is the dollar which sets the pace, hardly any currencies are demonstrably in step either with it or with one another, and it is impossible to know—given the uncertainties about dollar prices—what pace it will be setting in a few months time. This is no moment at which to start trimming the line. Though some Continental countries may be forced into action by pressures similar to those which compelled the recent move by France, the sheer uncertainties provide strong arguments against making any avoidable changes in the near future. For sterling, the crucial question is simply this: would early devaluation ease the crippling difficulties of the hard currency deficit of the sterling area? Despite the increasing resistance which British goods are encountering in export markets, there is no evidence at all that a cheapening of sterling would reduce the deficit.

* * *

Devaluation No Solution

Some of the confused thinking on this subject evidently springs from misconceptions of the Chancellor's own reiterations of the need to reduce British costs. Of course, if the production costs of goods which are now meeting price-competition can be reduced, export sales would benefit. But discriminating price reductions achieved by such means would have very different results from the all-round reduction which a devaluation would in effect involve. Before a case can be made on these lines for devaluation, it has to be shown that the effects of the stimulus it might give to some exports would more than outweigh the losses involved from a cheapening of the great mass of exports which can be sold readily at present prices. At present, almost every competent observer in this country believes that there would actually be a substantial net loss from a devaluation—that it would increase, and not reduce, the deficit. The increased difficulty of selling luxury or inessential goods springs much more from the general exchange shortage in the importing countries than from price-competition; the effects of devaluation in stimulating such sales would be unlikely, therefore, to be large. On the other hand, the export demand for the more essential goods still far exceeds the amount which Britain can produce or release from domestic consumption.

On the import side, the case against early devaluation is even more apparent. It is often thoughtlessly contended that a country which urgently needs a large volume of imports dare not depreciate its currency because that would increase its import bill. Put in this way, the argument is fallacious; the imports have to be paid for in foreign currency, and their true cost does not depend upon the amount of sterling which has to be given for that currency. In the absence, however, of a policy of domestic subsidisation, devaluation would increase the sterling prices which had to be paid by the domestic consumer. Under a system of free importation, therefore, the increase in prices would tend to reduce the volume of imports. But under the present system, when imports are subject to strict control and only essential goods are being imported (except for certain goods imported under bilateral pacts), this part of the normal mechanism of automatic adjustment is entirely out of commission. On the import side, the only effects of devaluation would be to dislocate the subsidies policy and destroy the Government's hopes of achieving price stabilisation. As Sir Stafford himself very pointedly remarked, "Where you are at the limit of export, and already control rigidly your imports, you do not get any better control by monkeying about with your currency." The obvious sincerity of that comment ought to convince the doubters that the Government is satisfied that British interests are best served by the present rate for sterling.

* * *

The Film Agreement

The deadlock over the earnings of American films in this country has been settled by a realistic compromise. The full details are not known as this issue goes to press, but Mr Harold Wilson's announcement in Parliament on Thursday gave the main points of a four-year agreement which can be reviewed at the end of the first two years. As a beginning, the British Government agrees to withdraw the tax on foreign films; the point on which Mr Eric Johnston had staked his honour is conceded, and since there is no sign of any quantitative restriction on film imports the British exhibitors should be pleased, too.

For the first two years (beginning in June when the agreement is to come into force) the remittance of net earnings for American films—not only new films, but those already in this country as well—is fixed at 17 million dollars a year. This means a substantial

saving in dollars; it can be compared with the net payments for imported films of £7 million in 1938, £17 million in 1946 and £13 million in 1947, shown in the Economic Survey. The Survey's forecast of £4 million for the first half of this year seems to be wide of the mark, since Mr Wilson said on Thursday that Britain is now remitting at the rate of 50 million dollars a year on re-issues—an admission that the import duty has saved only a small amount of dollars so far. The Americans can increase their dollar remittances further to the extent that British films earn dollars in the United States. This jettisons any idea that British films shown in the United States might help to improve our dollar position, and accepts a position of commercial inferiority for the British film industry; but that is realistic, too. It does give the American producers a motive for encouraging the distribution of British films in the United States. What they can do in that direction is, however, entirely doubtful, and it seems inadvisable to build any great hopes on it.

In compensation for its immediate loss of dollar revenue the American motion picture industry gains a clear prospect of being able to re-invest the inconvertible part of its British earnings in "permitted sterling uses," and—a remarkable provision—will form a joint committee with British Government representatives to decide what the permitted uses are to be. They will presumably go outside mere re-investment in motion picture activities here. The sums involved will clearly be substantial; but most people will hope that they can be reasonably expended in commerce before the point is reached at which the final residue of film earnings goes into the vaguely described "charitable or public uses" with which Mr Wilson concluded his summary.

* * *

Steel Prospects

Mr Strauss mentioned in the Commons on Monday that a contract had been signed in the last few days for 100,000 tons of German commercial scrap. But a contract for that quantity was signed in December and never carried out. It has had to be negotiated again, and the contract just signed appears to relate to the same steel, which has still not moved. It is, first of all, to the problem of getting commercial scrap from Germany that the new Committee which the Minister of Supply has appointed will address itself; and the committee is to begin by visiting Bizonia. There is a chance that in this matter a special inquiry may achieve results which the routine negotiators cannot. For it is clear that the ordinary methods of trade negotiations are defeated by the political confusion of Frankfurt as well as by the intractable German currency problem. If the committee does no more than discover, and explain to the Minister of Supply, the real prospects of getting scrap from Bizonia in the next few months, it will have achieved something. Mr Strauss on Monday was non-committal: "The uncertainties of the situation make it impossible to think in terms of a target . . . I doubt whether we shall get as much as that (1,000,000 tons), but we want to get as much as we can during the coming year."

The Economic Survey for 1948, by putting steel first among the shortages limiting industrial production, and scrap first among the shortages limiting steel production, underlines the seriousness of the scrap problem. Its authors, with obviously very little to go on, have fallen back on 850,000 tons as their forecast for scrap imports this year. (The Government forecast has hitherto been 1,000,000 tons.) "If more than this could be obtained," they add, "it could be used by the industry and relieve pressure on pig-iron supplies." They mention coke and transport as other potential bottlenecks; supplies of limestone and refractories, too, "will have to be watched carefully."

These uncertainties have to be borne in mind in assessing the steel industry's considerable achievement in the first two months of this year, and the favourable survey of the steel prospects for 1948 given in the Iron and Steel Federation's statistical bulletin for February. Ingot production in January was at the rate of more than 14.5 million tons a year; in February it reached the rate of 15 million tons, the highest ever attained in the history of the industry. But the holidays are still to come. If all goes well, the target of 14 million tons should be reached, but it is not a certainty; and industrial demands are, at the moment, virtually insatiable. There may be enough steel to permit, on paper, the steel-using industries to reach their export targets; but home consumption and the demands of re-equipment are competing for the same steel, often in the same factories. And, as the bulletin suggests, shortages of components (themselves frequently due to lack of steel) cause large quantities of steel to be immobilised in an unfinished state of assembly.

What Price Argentine Maize?

The enigma of the Argentine meat and maize prices remains unsolved despite the publication of the full text of the Andes Agreement. Some three weeks ago, the Minister of Food, when challenged about the price to be paid for maize, stated in Parliament that it was "considerably below £30 a ton." But no corroboration of this statement is to be found in the agreement. Indeed no information at all is given which would permit even the vaguest estimate of prices. Moreover, the full text adds little to what is already known about the trade agreement, which was discussed in an article in *The Economist* on February 21st. A detailed list of both the British purchases and the Argentine requirements is appended in two schedules, together with the exchange of notes between Dr Bramuglia, the Argentine Minister of Foreign Affairs, and Sir R. A. Leeper, the British Ambassador in Buenos Aires.

Britain has contracted for 1,272,000 metric tons of maize of which 300,000 tons can be replaced by barley at the Ministry of Food's option. Frozen meat amounts to 400,000 long tons carcase weight with 20,000 tons of corned beef. In addition, Britain will receive 45,000 metric tons of animal fats, 85,000 tons of wheat offals, 100,000 tons of oilcakes and oilmeals and 20,000 tons of linseed oil. British exports to Argentina include 2,600,000 cubic metres of petroleum products, consisting mainly of fuel oil, crude petroleum and petrol, 1,000,000 tons of coal, 77,300 tons of steel, 34,000 tons of tin plate (mainly for the British food pack) and 45,000 tons of chemicals of which 20,000 tons will be soda ash and 16,500 tons caustic soda. There are also 10,000 tons of agricultural equipment and small quantities of lead, zinc sheet, asbestos and cutlery. The British Government has undertaken—as in the Russian agreement—to ensure, "within the limits of its powers," that contracts are fulfilled on time.

Neither the British nor the Argentine list is necessarily exhaustive, but any supplementary purchases will in all probability be determined by the development of the balance of trade between the two countries. At least this allows for possible purchases of the wheat, hides and skins by Britain at some future time during the year. Argentina has also agreed to give preference to British goods in making further purchases, provided that quality, price and time of delivery are equal to other competitors—a provision which will still leave the Argentine Government with ample room for manoeuvre.

One interesting feature is contained in the exchange of notes, whereby the Argentine Government asks for an undertaking from Britain that the meat sold is "exclusively for consumption in the United Kingdom and its dependent areas." Presumably maize and the other goods could be re-sold by Britain to other countries. Even in its official dress, the agreement gives little cause for jubilation, but it has secured really vital supplies for this country and it does at least open up the possibility of expansion of trade with an important prewar market.

* * *

Break in Wool Prices—

For the first time since wool auctions were resumed in September, 1946, wool prices have fallen sharply in both Australia and London. The fall was not entirely unexpected. The sharp rise in prices during the London sales in January caused apprehension in trade circles and it was generally felt that the peak had been reached. But prices continued to rise in the first three weeks of February and it was only towards the end of last month that the first signs of a break were discernible—first in New Zealand, then in Australia and finally at the London sales. The Zealand, then in Australia and finally at the London sales. The falls have been both general and sharp. Greasy merinos dropped by 10 to 15 per cent, fine crossbreds by 15 to 20 per cent and medium and coarse crossbreds by 20 to 25 per cent. The bigger fall in the lower qualities is not surprising, as much of the buying of these types has been in substitution for finer wools. Manufacturers bought medium crossbreds because fine crossbreds and merinos were too dear, and as soon as the better qualities became cheaper, demand swung away from the inferior wools. Prices are now back to the level ruling in December for combing merino, while crossbreds are even lower. For the coarser grades it is reported that the market price was only 1d. a lb. above the Joint Organisation's reserve price.

The causes of the decline are naturally complex, but they are unlikely to be directly connected with the "break" in grain and cotton prices experienced in the United States early in February. More probably it was due to the absence of the factors which caused the sharp rise in January. During these latter sales, Russia, Poland and Czechoslovakia bought strongly and without limit, concentrating on combing merinos and good crossbreds. Bradford had to replenish its stocks and was forced to compete

with this strong European demand. The Lazard credit to France for wool purchases was renewed and expanded. In addition, the general feeling of instability of currencies and fears of further inflationary pressure helped to boost the demand. The publication of the Joint Organisation's wool stocks showing a dearth of the finer types and the announcement from Australia that the wool clip was showing a steady deterioration no doubt contributed to the "bull" position.

In the past week Poland and Czechoslovakia have shown much less interest in the sales and even Russian buying has been more moderate. Bradford was probably deterred by the more positive stand taken by the Government to peg prices and the growing belief that devaluation of sterling was no longer imminent, while the political uneasiness over recent events in Czechoslovakia undoubtedly undermined the optimistic tone in the market. Nevertheless, despite the sharp fall in prices, the basis of the wool market is strong. Consumption is still being maintained at a high level in all the major manufacturing countries and stocks in commercial hands are generally not excessive. Reports from Bradford in particular indicate that stocks are by no means high, and the same is probably true in France, the Netherlands and to a less extent Belgium. The undertone of the market for merinos and fine crossbreds is firm and the decline in these prices is unlikely to be protracted.

* * *

—But Rise in Cotton

The first two months of the Raw Cotton Commission have been far from happy, and any goodwill it may have had must be dwindling rapidly. After abruptly raising the price of Egyptian cotton by 7½d. a lb. to home spinners barely three weeks ago, the Commission has just announced a further rise of between 4d. and 7d. a lb. for Egyptian growth (Giza 7 is now 37.6d. a lb.) and 4d. to 1½d. a lb. for American type cottons, with middling American now quoted at 23.30d. a lb. This increase is the more unfortunate because it occurred at a time when the American cotton market was experiencing its second sharp fall in a little over a month. Cotton futures last Wednesday stood at 33.68 cents a lb. (19.9d.), compared with 34.71 cents (20.6d.) on February 2nd. On the other hand, Egyptian cotton prices in Alexandria are continuing to rise quite sharply but the present level of prices there can hardly be considered a true reflection of the market position.

In the absence of any official explanation by the Raw Cotton Commission, it is natural to conclude that British supplies of American cotton were bought at the peak of the market, while in Egypt, British buyers have been at the mercy of growers and brokers. Or was the increase in Egyptian prices so great that its effect had to be averaged over the American types—which are quantitatively much larger—in order to prevent too great a margin between the prices of the different types? Again, to what extent is the Commission a free agent in the matter of prices? Or is general policy still dictated by the Board of Trade?

These points undoubtedly warrant some explanation, for clearly under present arrangements spinners may be confronted with abrupt price changes which cannot possibly be foreseen. Moreover, in the world export market, they are being placed at a price disadvantage compared with their competitors. Admittedly spinners had hitherto been able to buy Egyptian cotton below the world price, but the quantities available were insufficient to allow an accumulation of stocks, while the low output of the mills due to lack of labour prevented full advantage being taken of this position.

Efforts are now being made to expand production and the volume of exports. Where the sellers' market for textiles still obtains overseas, the higher price British spinners have to pay for their raw material can be passed on to the consumers, but where competitive conditions are returning, the increase in raw cotton costs, against the American trend, puts them at a disadvantage.

Final Railway Meetings

The final meetings of the four railway companies last week were rightly occasions for valedictory sentiment and eulogies of the faithful service of railwaymen of all grades. Perhaps the spirit of service was most manifest at the meeting of the Great Western Railway, whose directors, alone among the four companies, did not have to submit to the will of the stockholders on a proposal to pay so-called remuneration for loss of office. The company has always been generous to its shareholders, and the chairman underlined a point which was not conceded elsewhere by saying that the stockholders deserved every penny of the final revenue available for distribution, for they had suffered severe cuts in their income from the conversion of their holdings into British Transport stock. The board of LNER were less fortunate than their fellow-directors of the LMS and Southern, for the resolution moved from the floor to grant them £63,000 compensation for loss of office was defeated on a show of hands, while amounts proposed in the other two cases were approved.

A universal desire was apparent at the meetings to see that the old companies were wound up in a manner befitting their great record. At some of them the opportunity was taken to review the state of the railway facilities as they were handed over to the State on January 1st. It was generally conceded that if the properties were in indifferent shape, damaged by the heavy demands of wartime and post-war traffic, there were good reasons in explanation, and that plans for making good wear and tear and for new development, which had been seriously retarded by shortages of materials and labour, had been passed on to the British Transport Commission. Sir Ronald Matthew at the LNER meeting hardly envied the lot of the Commission in their task of making the railway services pay in the light of a probable deficit of £43,500,000 on the operations of the railways in 1947, even allowing for the increase in charges made in the final quarter. But Sir Robert Burrows of the LMS pointed out that the Transport Commission would be free from the damaging competition of road transport, and that the doubts about the administrative forms under which transport now operates would best be resolved by hard experience. At the Southern meeting, Colonel E. Gore-Brown insisted right up to the end that the terms of compensation based on Stock Exchange values were unfair. Thus the companies dissolve, but they will leave behind assets and experience of the highest value to State-owned transport. Their passing has certainly been dignified by the tone of last week's final proceedings.

Canada's Gold Reserve

The annual report of the Bank of Canada for the year 1947 deals in broad outlines with the Canadian exchange situation. The Governor, Mr Graham Towers, points out that during 1947 some \$560 million of Canada's sales to other countries were financed out of drawings on Canadian credits and roughly \$40 million out of relief appropriations. At the same time Canada had to pay cash for all its purchases from other countries. Since the overall balance of payments showed a surplus of only \$70 million there was a cash deficiency on current transactions of some \$530 million and a corresponding drain on Canada's foreign exchange reserves. This drain, together with the payment of \$74 million on Canada's subscription to the International Monetary Fund, redemptions of Canadian bonds held abroad and other net capital transactions, accounted for the overall reduction of \$743 million in Canada's gold and dollar exchange reserves during 1947. Mr Graham Towers stresses the urgent need to increase Canada's gold reserve. In this context he refers with approbation to the European Recovery Programme, pointing out that it would facilitate the continuance of Canadian shipments to Western European countries where they are badly needed. But, he adds, Canada has an even greater interest in the long run implications of ERP, since Canadian exports and employment will be influenced to an important degree by the extent of recovery in Europe when the present unusually heavy demand for Canadian goods has declined.

Belgium's Dilemma

The financial negotiations between Belgium and Britain are proving extremely laborious and something near deadlock appears to have been reached. The basic difficulty is that which has dogged Anglo-Belgian monetary relations for some time past, namely the chronic capacity of Belgium to accumulate sterling. That is, of course, a reflection of Belgium's export potential and

of its current surplus of payments with countries that wish to pay for that surplus in sterling. Last year that difficulty was temporarily resolved by inducing Belgium to increase the ceiling of its sterling holdings from £5,000,000 to £27 million, giving Belgium a bilateral exchange guarantee and retaining the right of convertibility in respect of any sterling held in excess of the new ceiling. In fact Belgium has increased its sterling holding beyond that ceiling and is likely to increase it further as a result of sterling payments for exports to countries such as Egypt, exports which had been arranged before the suspension of convertibility of sterling and before Egypt ceased to be a member of the sterling area. The Belgian Government is naturally pressing for convertibility rights and its attitude is strengthened by its continuing dollar deficit in meeting which Belgium has recently had to sell gold and buy dollars from the International Monetary Fund. But Britain can plead poverty in refusing to grant convertibility rights for sterling acquired from third parties, and has countered by asking Belgium to agree to a further increase in the ceiling of its sterling balances, sweetening the request by the offer of a more effective exchange guarantee than the strictly bilateral protection against a change in the Belgian franc-sterling rate which Belgium enjoys today.

The choice before Belgium is a particularly difficult one. The monetary relations with the sterling monetary area are by no means unique. The same characteristics are to be found in Belgium's balance of payments with a number of other European countries, including the Netherlands, France and Italy. With all of these, Belgium has a current surplus and is being asked to finance it by holding what are virtually blocked, and certainly inconvertible, currencies. To understand Belgium's aversion to further increases in these holdings it is necessary to realise that the surpluses are needed to cover a deficit with the dollar area. It should also be appreciated that Belgium is at present trying to put into operation a severe deflationary policy intended to bring down prices and costs to a point at which Belgian exports can become really competitive in hard currency markets. To that end Belgium is using the orthodox mechanism of bank rate and credit restriction. But exports to European countries financed by the accumulation of inconvertible currencies work in a diametrically opposite direction. The exporters have to be paid and currency and credit is created against the acquisition of non-convertible foreign assets by the national bank. At the same time, goods are exported and thus subtracted from the volume of those available for domestic consumption. The inflationary impact is thus two-fold.

The escape from this dilemma is to cut exports to other European countries. That is in fact being done, and a perceptible contraction not merely of Belgian but of all inter-European trade is now under way, prompted by this gradual freezing of the whole mechanism of payments in Europe.

The European compensation scheme which is now operated by the Bank for International Settlements in Basle offers little hope of relief from this situation until the clearing can be backed by an infusion of dollars providing a reserve out of which accumulated sterling balances can be converted. When the European balance of current payments is as distorted as it is today, with a few countries like Belgium, Portugal, and Switzerland occupying a dominant creditor position *vis à vis* the rest, the scope for compensation is inevitably small. That explains the urgency with which Belgium is pleading for some allocation of Marshall aid dollars to underpin the European monetary compensation scheme.

Currency Confusion in China

British enterprises trading in China have in these days an unenviable task, for there is no sign yet that the country is emerging from the confusion into which prolonged war and civil disturbances have thrown its finances and trade. A striking account of some of the many problems was given by Mr A. A. Morse at the recent meeting of the Hongkong and Shanghai Banking Corporation, in a comprehensive speech which deserves to be read by all who have trade or financial interests in the East. Inflation in China continues unabated, nor will there be any hope of checking it until some approach towards political tranquility makes it possible for military expenditures to be drastically reduced. Inflation in China is, indeed, of the crudest type, for during the Japanese war the loss of the ports and therefore of the all-important customs revenue left the Government with virtually no alternative but to use the printing press as a means of financing its own expenditure. Now, at last, overseas trade has again been brought under control, but the issue of notes to finance military outlays goes on. Since 1946 the official

index of wholesale prices in Shanghai has been multiplied fifteenfold, and even the official rate for the US dollar has risen from CN\$3,350 to CN\$89,000. In the black market quotations have generally been between 25 and 50 per cent above this. The cost of living, by comparison with 1946, has been multiplied ten to twelve times.

In the circumstances, it is perhaps surprising that the authorities have had any success in their efforts to encourage exports and to check the menacing flood of imports which was causing concern in 1946. By the end of last year, however, imports were declining and exports rising, but the volume of smuggling was probably still large. The recovery of exports has, of course, been assisted by the abandonment of the policy of deliberately keeping the official exchange rate at an artificial level; but the authorities plainly find it hard to keep pace with the impetus which inflation imparts to outside rates; recently the margin between them has widened, and there have been complaints of an undue rigidity. The effort to control imports has involved an increasing range of restrictions upon business: there has been a "jungle growth of controls and monopolies." Meanwhile, no real headway has been made in the effort to ensure a more reasonable attitude on the part of the Chinese authorities to foreign capital in China. Last July the Chinese Premier reiterated that foreign capital coming to China would be free from inequitable and restrictive legislation, and would be permitted to remit overseas a reasonable profit return. But in fact no practical steps have yet been taken, and at present even properly chargeable foreign currency expenses cannot be remitted.

Railway Wages

Final details of the revised wage structure for the railways, which has been agreed on by the Railway Executive and the three railway trade unions, have yet to be announced. From the information so far available, however, it seems certain to add substantially to the wages bill. Practically all sections of the industry will benefit. Drivers will receive an extra 6s. a week, firemen another 4s., and ticket collectors of various grades increases of 6s. Supervisory staffs, such as shed masters, will receive annual increases ranging from £17 10s. to £32 16s. and a maximum increase of £7 10s. a year will be given to super-

BRITAIN'S BACKBONE. Steel is so vital to enable British industry to re-establish itself, that every technical device must be employed to increase output. The English Electric Company's part in this effort is the manufacture of plant for the complete electrical equipment of steelworks, including generating, transforming and converting plant, drives for all classes of rolling mills and auxiliaries, switchgear and control gear. All these, and other industrial electrical equipment made by the Company, have won a high and world-wide reputation.

THE ENGLISH ELECTRIC COMPANY

annuated employees. These increases are retrospective to February 1st.

The exclusion of lower-grade workers makes the agreement hard to reconcile with the TUC's interpretation of the wages White Paper, or with the Government's general policy on wage increases. Some of the lower grades who have been relatively underpaid—in many cases the minimum is only £4 8s. a week—might have expected to benefit by a general raising of the standard. What the agreement in fact does is to increase the differentials between the higher grades, in order to provide incentives for promotion and the acceptance of responsibility. This fits in with the findings of the Ministry of Labour's court of enquiry.

The decision to increase the wages of electricity supply workers is also difficult to reconcile with the White Paper. As a result of this week's decision of the Joint Industrial Council, some 80,000 workers will benefit by increases of about 5s. 6d. a week. It will be hard to persuade individual unions to exercise restraint in their wage claims, when they see these awards reached after the White Paper was published, even though the negotiations began at an earlier date. It is significant, too, that the three major increases conceded since the White Paper was published have been in railway transport, London passenger transport and electricity supply—all industries which have been, or are about to be, nationalised. The next test will come when the engineering wage claim, which has now been taken up on behalf of the women in the industry, comes up for a hearing.

Imperial Tobacco Prospects

At the annual meeting of Imperial Tobacco this week, Sir Robert Sinclair must have dispelled any outstanding doubts that the maintenance of the present level of consumption of tobacco in this country depends on the receipt of Marshall aid. In his unequivocal words, "If what we have seen reported as the proposals for inclusion of tobacco in Marshall aid materialise, then the quantity available—together with the maximum increase that we can foresee in supplies from the sterling area—might just make it possible to maintain supplies to the British public at the present restricted level." But Sir Robert gave little information on the present level of leaf stocks except to indicate that since June last

It looks well . . . true. It gives protection . . . truer still. But for Paint

most of the iron and steel we forge would rust away to nothing.

Paint is a mixture of a powder pigment with a liquid medium.

The medium is valuable,

but the pigment is the armour of the painted surface

year the rate of consumption of dollar tobacco in manufacture has been less than 75 per cent of that prior to the budget and that the group was able to spend two-thirds of its allocation of dollars for 1947 before purchases were stopped in the autumn. He also indicated that sterling area tobacco had contributed a greater amount. But although the supply position may not yet be acute, it is evident then that stocks must be considerably lower than last year.

Imperial Tobacco is obviously banking on Marshall aid—just as the Government itself is doing on the broader economic front—and the maintenance of tobacco supplies to the home trade depends on that assumption. Sir Robert suggested that it would be a mistake to overlook the importance of tobacco as an incentive good, and suggested that the increase in duty last April put tobacco beyond the reach of many people and is now perilously near the level at which the law of diminishing returns may begin to operate. Yet even these considerations may be secondary compared with the present need to economise on dollar expenditure. In defending the apparently high percentage rate of dividend, Sir Robert disclosed that the trading profit of the group before taxation was equivalent to only 10 per cent on the true capital employed. The capital at present required by Imperial Tobacco has been greatly expanded as a result of the increased tobacco duty, but even in more normal times it would remain at a high level, partly owing to the higher quantities of leaf stocks that could then be carried. The conclusion from Sir Robert's informative speech is that Imperial Tobacco profits for the current year are likely to show some decline, even on the assumption that tobacco supplies are forthcoming under Marshall aid.

* * *

Electricity "Takeover" Arrangements

Although the basis for valuing electricity securities was written into the Electricity Act (as explained in a Note in *The Economist* of February 21st) the list of "takeover" prices for 129 securities issued this week is the first official intimation which has been made of the actual prices. With only three weeks to go before the issue of British Electricity Stock, the Ministry of Fuel and Power has cut its timing very fine and, indeed, there remains a large number of "unvalued" securities for which no firm date of valuation is given. In the case of securities already guaranteed by the Treasury—the two debenture stocks of North Wales Power and the 5 per cent debenture of North Metropolitan Power—Electricity Stock will be issued to the same nominal amount as the old security.

The Stock Exchange Council has also announced the procedure to be adopted for dealings in, and transfers of, securities in electricity undertakings, and of British Electricity Stock. It is broadly similar to that for the take over of Home Rail Stocks on January 1st, but certain improvements in technique based on that experience have been incorporated. On March 10th all old electricity stocks were quoted ex any half yearly or final payment of interest or dividend due to March 31st; this, in effect, has reduced all these stocks to the status of the new Electricity Stock. The last day for dealings in the stocks in this form will be March 31st, the day following the end of the account, and all dealings up to the close of business that day will be for settlement on April 6th. After April 1st, the vesting day, on which the Treasury will fix the terms of the new Electricity Stock, transfers of Electricity Stock must be accompanied by the appropriate certificate either of the new Stock itself, or of one of the authorities recognised by the Council for the purpose. The list of authorities has now been extended to include the registrar of the old security in addition to the Bank of England, the Share and Loan Department and Associated Stock Exchanges.

Thus the penultimate phase in the takeover of electricity stocks has now been reached. As in the case of the home railway issues, the stocks stand at a considerable discount—at the time of writing up to 2½ per cent on "valued" prices. If there is greater assurance that the Treasury will issue the new stock in accordance with the strict instructions of the Electricity Act, these discounts should narrow. In any case there is not likely to be the same volume of purchases before the takeover that was witnessed in home rail issues after December 10th. But the Treasury would do well to accept the real level of the market in fixing the terms of the new stock. British Transport Stock, which purported to be worth par when it was issued has never been higher than 1½ discount, and is at present around 2½ discount. Indeed, the 3 per cent Savings Bonds 1965-75 now standing at 100 "clean" appear to match the requirements of the Electricity issue, although the Treasury may be reluctant to concede 12 years on the life of the stock to the earliest date, compared with the terms of Transport Stock.

Lessons from German Oil Technique

The first of the BIOS Overall Reports on German industry provides a valuable survey of the development of the German petroleum and synthetic oil industries in recent years. The groundwork of fact is available in the reports of the various British and American investigating teams; the new report attempts to collate and, up to a point, to evaluate their findings. An authoritative evaluation was needed so that the implications for British research and industrial development in oil could be assessed. But on the commercial application of the work which was done by the Germans, in a very different trading and political context, the report is bound to leave many questions unanswered.

The problem which the German oil chemists had to solve was not purely economic. Their work was directed to the special end of securing from indigenous resources the fuels and lubricants for German industry and the German war effort. Lack of natural petroleum forced them to concentrate on the production of oil by synthetic processes based on coal. British problems are different, as the British petroleum industry is quick to point out. But it is inevitable that interest in the German oil industry should be primarily in the synthetic processes. The various German methods are competently described. The extent to which recent German work has tended to replace expensive bituminous coal by cheap brown coal (lignite) as the basic raw material is illuminating; so is the other line of development which replaces solid fuel by hydrocarbon gases such as methane. The German achievement demonstrated that in large-scale plants there is no technical difficulty in converting complex organic material to oil in liquid phase at high pressure. But costs are high, and the application (so far as fuel production alone is concerned) most likely to arouse immediate interest in this country is not in the coal-based processes which the Germans were forced to use, but in the hydrogenation of vaporisable middle oils to petrol.

What of the Fischer-Tropsch process, the importance of which has still to be fully assessed in Britain? This was used by the Germans as a complement to the hydrogenation industry. Hydrogenation provided, above all, the high-grade aviation and motor spirit. The Fischer-Tropsch process provided only low-quality motor spirit, some diesel oil, and a large proportion of solid wax. From the wax came synthetic fatty acids and in the end-product soap, edible fats, detergents, and alcohols. Its importance is not primarily as a source of fuels, and the report (reflecting, naturally enough, the customary attitude of the British petroleum industry) regards it as unlikely to be economic for this purpose. The report does, however, concede that the process is "particularly suitable" for the production of high-priced chemicals—and here, it hints, the prospects are better. And the possibility that further research may reduce costs in both fields "cannot be ruled out."

* * *

Electric Power Peaks

The new committee set up by the Minister of Fuel and Power presents a formidable appearance. Besides technicians it includes economists and representative consumers of electric power under the chairmanship of Sir Andrew Clow. It is to report within three months on possible ways of reducing peak demand. The attempt is overdue. For too long the idea has been cherished that the country could afford to go on building enough generators to keep capacity permanently ahead of peak demand; it is now exploded. Demand for electricity almost doubled in volume during the war years. If the trend is continued, not even the completion in 1950 of the 5½ million kilowatt programme, which was left unscathed in the capital expenditure cuts last October, will be enough to prevent shedding at peak periods. Unless something can be done to even out the demand, a large part of this expensive new capacity will lie idle for most of the year and for most of the 24 hours of each day. The inquiry to be undertaken by the new committee can, therefore, have a long-term usefulness; it would be disappointing if it proved to be mere cover for the preparation of yet another stop-gap rationing scheme.

What is required is a mechanical means of separating classes of electricity consumption by types and times of use; this might mean installing a second meter, or a second register on the existing meter, in houses and shops. It is not likely to be attained without an expenditure of labour and material which could be justified only for a long-term scheme. Once the technical problem was solved, differential charges for peak hours ought to do the rest. It would become possible to spread loads efficiently, and the incentive would exist for the adoption of devices like the thermal storage system in Switzerland, where water heating is

done in the off-peak hours. Shedding might still be necessary at peak hours in a cold winter, but it should be possible, by an extension of the "central control" method by which heavy load appliances can be cut off automatically by a signal from the power station, to make cuts where they would do least damage. The committee will have to compare the cost of installing devices of this sort with their probable benefits. Anything that can be done to spread loads more evenly should reduce the amount of wasted generating capacity, and should therefore tend to keep costs down. But this will not evade the necessity (discussed in *The Economist* on November 1st) of bringing the general price of current to the domestic consumer more into line with real costs than it is at present.

Cable and Wireless Questions

There has been much disappointment at the disclosure by the directors of Cable and Wireless (Holding) in the annual report of the company that there has so far been no meeting of the Tribunal set up in accordance with the Cable and Wireless Act to fix the amount of compensation to be paid for the 27,400,000 ordinary shares of Cable and Wireless, Ltd., taken over by the Government on January 1, 1947. When the Tribunal was appointed last summer it was fully expected that the sum would be fixed before the end of the year. No reasons have been given for the delay. In the meantime the group has received no income in respect of its former cable and wireless assets, although it will receive interest on the compensation payment retrospectively from January 1, 1947. But the parent company has been able to pay the preference and ordinary dividends at the same rates as for 1946, by calling on the reserves of subsidiaries to supplement its other income. And it may be an interesting coincidence that the amount drawn from these reserves—£863,000—is, to the nearest £100, the equivalent of one year's interest at 3 per cent on the 27,400,000 ordinary stock of Cable and Wireless, Ltd., valued at 21s. a share. From this it might be assumed that the board of Cable and Wireless (Holding) is expecting the terms of compensation to be of that order, for it has long been held that the price to be paid will be something over par.

The group has been actively developing its interests along investment trust lines during the year. Investments in quoted securities valued at cost have increased from £9,974,125 to £13,351,096, yielding an income of £181,275 compared with £79,967 in 1946. Funds for this expansion have been provided mainly from previously uninvested sums amounting to £1,400,000, receipts from the sale of shareholdings in Marconi's Wireless Telegraph and from a bank loan of £1,200,000 which has since been repaid. Whereas the special dividend of £4,990,000 received from Eastern Telegraph has swollen the investments of the parent company, in the consolidated accounts it is offset by a corresponding decrease in other investment holdings within the group. In fact the full amount of the dividend has been utilised to reduce the book value of the holding of Eastern Tele-

graph stock. Until the High Court has decided whether its payment represented a permissible application of the general reserve of Eastern Telegraph, the eventual fate of this sum must remain in some doubt.

Building Societies' Record Year

Figures published by the *Building Societies Gazette* for the operations of 195 building societies in 1947 show that the expansionist trends of the previous year have been accelerated. These preliminary figures are subject to completion by the inclusion of those of some 679 other societies whose reports have yet to appear, but they relate to societies which, in 1946, accounted for 90.4 per cent of the total assets of the movement; past experience shows that they are entirely dependable as a guide to the year's operations for the movement as a whole. The outstanding feature of 1947 was the continued increase in mortgage advances. The 195 societies made advances of £219.0 million compared with £168.9 million in 1946, which suggests that the movement as a whole may have advanced no less than £240 million last year against £187 million in 1946—its far above the sum of £140 million advanced in 1936, the previous record year. This startling increase can be largely attributed to the further increase in transactions in existing houses—many of them purchased by tenants; new building for sale has, of course, been negligible.

The rise in the mortgage assets of the 195 societies from £571.7 million to £656.4 million is distinctly small compared with the sharp increase in advances. It suggests, as the *Gazette* points out, that repayments of mortgages have continued on a heavy scale. Moreover, it is implicit in these figures that the repayment of mortgages has been the chief medium from which new advances have been financed. Although the *Gazette* does not furnish an aggregate figure for share and deposit funds, the experience of the Halifax Building Society, whose share and deposit funds have been increased from £128.7 million to £134.2 million compared with a rise of only £1,000,000 in 1946 suggests that this source of finance contributed substantially more in 1947.

The continued upward trend of mortgage assets indicates that the societies have been able to employ their funds more remuneratively since the war, for the interest paid on advances is given as 4.014 per cent—considerably more than was available on gilt-edged investments. In fact, the average rate of interest has been calculated conservatively by the *Gazette* which has expressed the total interest as a percentage of the year-end total of mortgage assets over the year—this was, of course, much higher than the average of mortgage assets over the year. If the rate were calculated on the average mortgage assets over the whole year, it would be 4.292 per cent. This expansion in mortgage assets has been accompanied by a net fall of £15.7 million in liquid funds—reducing the percentage of total liquid funds to 23 per cent.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports appear in the Supplement: Cable and Wireless; Woolcombers; Westinghouse Brake.

Redemption yields on stocks optionally or finally redeemable within the next five years are shown in italics. All yields are guaranteed at the earliest date. Redemption

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked "e"), and those paying 3 per cent or less will be repaid at the latest date (marked "l"). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months. (g) Buying Price.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent of income tax. (g) Yield worked out on 15 per cent basis. (h) Fifteen months to March 31 1947 (yield basis 7-6 per cent). (i) To latest redemption date. † Free of tax.

THE IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND), LIMITED

RELATION OF CAPITAL TO TURNOVER

TOBACCO AIDS PRODUCTION

UNCERTAINTY OF LEAF SUPPLIES

SIR ROBERT J. SINCLAIR'S REVIEW

The forty-sixth annual ordinary general meeting of The Imperial Tobacco Company (of Great Britain and Ireland), Limited, was held, on the 9th instant, in Belfast, Sir Robert J. Sinclair, K.C.B., K.B.E. (the chairman), presiding.

The chairman, in moving the adoption of the report and accounts, said:—

Ladies and gentlemen, with your consent we will take the notice convening the meeting, and the report and accounts, as read, and I will ask the secretary to read the auditors' report.

CHANGES ON THE BOARD

Before proceeding to comment on the accounts, I would like to refer for a moment to those paragraphs of the directors' report which mention the changes in the board since the last meeting. In paragraph 12 reference is made to the death of three greatly esteemed colleagues.

Sir William Churchman joined the family business of H. C. Churchman & Company over 60 years ago. He was a member of our board for no less than 42 years, and for a large part of that time was manager of the branch which bears his name. His great knowledge of every phase of the business, his shrewd judgment and keen business sense, were of the greatest benefit to the company. He retired from active work with the company in 1927.

Mr C. S. Clarke's connection with the industry lasted 54 years. He joined the firm of William Clarke & Son in 1893, and ten years later he came to head office as Leaf Manager. His contribution to the development of our leaf buying policy will long be remembered, not only here but also in the United States where he was greatly beloved and respected, and in Nyasaland and Rhodesia, where his foresight was largely instrumental in the establishment of our leaf buying and handling plants. He was appointed a director in 1912. When failing eye-sight necessitated his retirement from active work he continued to maintain a keen interest in all the company's affairs, and right up to the time of his death his exceptionally retentive memory, allied to his wide experience and his other qualities, made him one of the most valued members of our board. His quiet and almost gentle manner concealed a firmness of judgment and purpose, which served the company well.

Mr William Milligan joined this company after the first world war. He served for 17 years with our organisation in Virginia, and in 1941 he joined the management of

the John Player & Sons branch and was elected a director of the company. From 1944 to the time of his death he was in charge of the branch. He possessed ability of a very high order, an exceptionally strong sense of duty, and an infinite capacity for work. I believe it to be true that he literally wore himself out in the company's service.

Each of these three in their several ways rendered outstanding service to the company, and it is fitting that we should by this tribute do honour to their memory.

NEW APPOINTMENTS

Of the new directors whose names are given in paragraph 13, Mr Gascoigne as one of the management of our W. D. & H. O. Wills Branch, Mr Roberts as our chief accountant, and Mr Ritchie as joint manager with Mr H. C. Williams of our John Player & Sons Branch, are actively engaged in the company's business and each has rendered long and valuable service to the company. Mr H. S. Gunn, son of the late Mr H. W. Gunn whom you will remember as the first secretary of the company and for nine years our deputy chairman, was for many years one of our senior departmental managers. Sir James Grigg is perhaps best known for the great service he rendered to the country as Secretary of State for War during three of the most critical years in our history. In the course of a distinguished career in the Civil Service, he was in turn chairman of the Board of Customs, chairman of the Board of Inland Revenue, and finance member of the Viceroy's council in India. After the war he was for a year the British representative on the International Bank in Washington. He brings to our deliberations a wide experience of men and affairs and an expert knowledge of finance. I am sure you will cordially welcome all these new appointments.

It will be observed from paragraph 14 that Mr L. H. Reed, due to retire under Article 93, does not offer himself for re-election and that the directors propose to appoint Mr J. R. Hutson in his place. Mr Reed was actively engaged with the company for 44 years and for 25 years has been a member of the board during which period he has been the head of our leaf buying and handling organisation in the United States. His unrivalled knowledge of leaf, coupled with a character and personality that won universal respect and affection, were such that it is difficult to find words adequate to express the company's indebtedness to him. It is a truism that the success of our business depends primarily upon the quality of our

brands, and undoubtedly the foundation of that quality lies in the selection and initial treatment of the tobacco we buy. Mr Reed built up an extremely efficient team, and when he handed over the day-to-day control of our organisation in Richmond rather less than two years ago to Mr J. R. Hutson, he did so in the confident expectation that he would have a worthy successor. Subsequent events have fully confirmed that judgment, and it is with very great pleasure that the board have decided to appoint Mr Hutson a director in Mr Reed's place.

COMMENTS ON THE ACCOUNTS

The main features of the accounts are commented upon in some detail in the directors' report and I propose therefore to confine my remarks to those points that appear to me to merit elaboration.

TRADING PROFIT

In the second paragraph of the report reference is made to a point which may, I think, well be emphasised: namely that the true rate of return on capital employed in the business is very much smaller than is represented by the rate of dividend on the ordinary stock of the company. The precise basis on which capital employed ought to be calculated is a fruitful subject for argument among experts, but I am satisfied that it must closely represent the facts on any reasonable basis of calculation to say that the figure of trading profit shown at the head of the profit and loss account is in the region of 10 per cent. on capital employed before charging the income tax and profits tax payable on these profits. Profits tax alone reduces that percentage to about 8.

Although under present conditions duty is a large factor in capital employed, in normal times we would be carrying a much larger stock of leaf in bond, so that the relative importance of duty would be much less; and it cannot be too strongly stressed that the large amount of capital we require in our business should be looked at in relation to our very considerable turnover on which a relatively small rate of profit is earned.

That last statement can best be illustrated by two simple but striking facts—namely that averaged over all the cigarettes we sell (large and small) the duty cost represents nearly 90 per cent. of our price to the distributive trade, and the remainder, which averages less than 2d. per 10 cigarettes, has to cover the cost of the tobacco, its freight, insurance and storage, all manufacturing, selling and administrative expenses, taxation, and net profit. At a time when somewhat sweeping and occasionally ill-informed criticism is directed against the level of industrial profits it is right to mention these facts since they serve to show that in spite of the restrictions under which we are for the time being forced to work our trading operations have been maintained on a strictly competitive basis.

DUTY INCREASE AND LESSER AVAILABILITY OF LEAF AS AFFECTING THE LEVEL OF TRADE

Paragraph 5 contains a reference to reduced rate of withdrawals from Bond in the second half of the year, and paragraph 9 refers to the lower level of sales in the same

period as due to a combination of two factors—the heavy duty increase and lesser availability of leaf. I think you would wish me to dwell on this aspect of the situation for a moment.

The rate of duty stands at the astronomical figure of 54s. 10d. per lb., an increase of nearly 500 per cent. over the figure in the last fiscal year before the war. At the time of the imposition of the last duty increase—19s. 4d. per lb.—the then Chancellor explained that his primary object was to effect a reduction in consumption, and particularly in the consumption of dollar tobacco. A reduction was made in the amount of dollars allocated for the purchase of tobacco from the 1947 crop in the U.S.A., and later, as the dollar situation grew still more acute, purchases in America were stopped altogether at a time when just over two-thirds of the reduced allocation of dollars had been spent.

Immediately after the Budget, purchases by the public fell very sharply, but the distributive trade were able at that time to replenish their stocks of our brands. The result was that in May and June our sales were at a somewhat higher level than that of public consumption. That position, however, soon adjusted itself, and bearing in mind the acute dollar situation we have since June kept our usings of dollar tobacco below the pre-Budget level by rather more than 25 per cent. Fortunately, we have been able, although to a relatively slight extent, to increase our using of tobacco grown in the sterling area.

New there can be no doubt that tobacco has a high place in the range of incentive goods—a point of special significance when most consumer goods are in short supply—and it would, I suggest, be a mistake to overlook its value as an aid to production and to social well-being. Moreover, in the circumstances of today it is a more important contributor to the national revenue than ever before. But it will be obvious that the revenue depends not only upon the rate of duty per lb. but also upon the number of lbs. consumed.

The last increase in duty has undoubtedly deprived some people of the pleasure of smoking and has reduced the consumption of others; and there is every indication that if the present very high rate of duty is maintained the law of diminishing returns must sooner, rather than later, begin to operate—a revenue consideration to which, I trust, due weight will be accorded.

THE COMPANY'S PENSION FUND

I would now like to say a word about the company's pension fund.

A year ago Lord Dulverton told you that a review of the position of the fund had been instituted. This has been undertaken by a special committee in consultation with the actuaries to the fund. The main factors necessitating the review are the decline in recent years in the yield from the fund's investments owing to the general lowering of interest rates; the additional liability accruing from the increases in pensionable remuneration that have been made in the last few years; and the increases in state insurance contributions and benefits.

Consideration of these factors has pointed to the necessity, firstly, of an increase in the capital of the fund, which could be effected by company payments spread over a period of years; secondly, of an increase in contributions from the members of the fund and from the company, who contribute equally with the members; and thirdly, of some revisions in the scales on which future pensions would be calculated, involving reductions in certain cases (though in general it might well be that the level of company pension plus state pension would be somewhat higher than the combined level on the old basis).

Before any such measures are put into operation the details will be fully discussed

with the members of the fund, but present circumstances make it difficult to decide when these changes should be made, and we shall not take a decision nor embark on these discussions until we can see the future more clearly than we can now.

NET PROFIT

You will have observed from the profit and loss account that the net profit for the year is down by approximately £2,230,000. There was a reduction of £1,397,000 in the trading profit and an increase of £1,335,000 in taxation which together amount to £2,732,000. After deducting the increase in dividends and interest on investments the decrease in net profit after taxation stands at the figure I have mentioned.

The exceptional profit arising from duty increase is explained in the report. Such profits arose on more than one occasion during the war but of course never to such a large extent because there has never been so large an increase in duty as was imposed in the United Kingdom Budget of April 1947. During the war such profits simply went to increase the excess profits tax and were reflected in our accounts under the heading of taxation. Now, however, while approximately half goes in income tax and profits tax the balance appears in the accounts as exceptional profit arising from the duty increase. The report states the circumstances in which the profit arose. If and when the duty is reduced—and it is impossible to contemplate its indefinite continuance at a level which makes duty-paid unmanufactured leaf tobacco more costly than silver—we shall certainly want to reduce prices to the public as soon as possible and the transfer of this sum to contingencies reserve should help us to do that. In the meantime the sum is employed in the business and helps to finance the increased capital required by the duty increase. There is no doubt in the minds of your directors that this is the wise and prudent way in which to deal with this item.

If I may venture a general comment on the result of the year's working, I would say that having regard to the difficulties with which we had to contend and which arose from circumstances entirely outside our control the result is appreciably better than might under these conditions have been expected. I believe that would be a fair assessment.

GIFT TO STAFF AND WORKPEOPLE

For many years past we have thought it well to mark our appreciation of the loyal and willing service of our employees both at home and abroad by a gift over and above the ordinary salary or wage and as stated in the report the board have decided this year to make a gift to the staff and workpeople on the same lines as last year. They have authorised the payment of a sum equivalent to 16 per cent. of the total salary or wage received from the company during the twelve months ended October 31, 1947. The general conditions of the gift are the same as in previous years, and the directors, as usual, reserve to themselves a discretion to grant or withhold a share in the gift in any case that may appear to them to require exceptional treatment.

Now, in this connection, may I remind you that the questions whether or not a gift should be paid, and if so the amount, are not decided by the board until the results of the year are known. There is, therefore, no specific commitment for the future; but such a practice cannot continue unbroken for many years without giving some grounds for expectation of continuance unless a note of warning is struck. The rate of the gift has remained unchanged for the last ten years, although of course the amount distributed has risen with increases in wages and salaries. During the same period the amount distributed by way of ordinary dividend has shown very little change. But although the gift has never borne a direct relation to dividend it

is obvious that its continuance must depend to some degree upon the company's prosperity. Therefore, when the immediate future is as uncertain as it is to-day—through causes, of course, that as I have said are entirely outside our control—I would be failing in my duty if I did not point out that our employees should not count upon the percentage being maintained next year. Having thus sounded a note of warning, may I add that the appreciation of loyal and willing service, to which I have referred, is in our case no mere figure of speech. It is indeed my conviction that the relationships which have been built up over the years with our employees are based upon the only secure foundation—good understanding—and anything that my colleagues and I can do to cement and strengthen that foundation will be done.

FUTURE PROSPECTS

My predecessors in this chair have consistently—and wisely—refused to be drawn into anything in the nature of a precise estimation of the financial results of the current year. And the uncertainties of the future have certainly never been greater than they are to-day, so that I might readily be excused from any venture into the realms of prophecy. There must, however, be in the very nature of things many doubts in the minds of stockholders, and while, unfortunately, it is not in my power completely to resolve those doubts, I think I ought to put before you as frankly as I can the major considerations affecting our immediate future.

The first—and this overshadows all the others—is the uncertainty about future supplies of leaf tobacco. About two-thirds of the tobacco consumed in this country comes from dollar countries. That proportion is considerably less than it was ten years ago, and (although we do not grow tobacco ourselves—except to a very small extent and experimentally) we, in common with other United Kingdom manufacturers, are doing all we can to encourage production within the sterling area. But experience has shown that tobacco is not an easy crop to grow successfully even under conditions that look reasonably favourable. It is essentially a small man's crop; and it requires a combination of soil and climate that exists in few parts of the world. A great deal of research and experiment has been devoted to the development of its production and to overcoming natural disadvantages; and even when the pressure for increased production of foodstuffs was much less than it is to-day many of these experiments proved dismal failures. But Rhodesia, Nyasaland, and India, are in greater or less degree exceptions. Rhodesia makes a substantial contribution and, as you know, the Rhodesian growers who recently sent a deputation to this country have received all the encouragement from United Kingdom manufacturers that they could ask for. (Incidentally, I might mention that two of our directors are at this moment in Africa.) In India the need to increase her production of foodstuffs and her very large requirements of tobacco for her own consumption combine to discount the prospect of any very substantial or immediate increase in the export of tobacco from that source. In Turkey and the Near East a considerable quantity of tobacco is grown and, although it is not of a type favoured by the majority of smokers of this country, we are using, and in present circumstances will continue to use, what we can.

TOBACCO AND MARSHALL AID

The fact remains that the Southern States of North America and part of Ontario is the area where at the present time a very large quantity of tobacco can be grown efficiently and economically. And if tobacco does not come from there in large quantities, the world will be short of tobacco.

The position then is that if, despite the recognition that tobacco comes within the

range of incentive goods, this country's financial position is such that dollars cannot be found in the next few years for the purchase of tobacco, the sale of our operations in the near future is in large measure dependent upon Marshall Aid. If what we have seen reported is the proposal for inclusion of tobacco in Marshall Aid materialise, then the quantity available together with the maximum increase that we can foresee in supplies from the sterling area might just make it possible to maintain supplies to the British public at the present restricted level.

I am no pessimist about the economic future of this country and the British Commonwealth of Nations. There are indeed already some encouraging signs of greater productivity if raw materials can be available in sufficient quantity. But it is increasingly and painfully clear that the present financial position of this country is desperately serious. When the British people fully—and I emphasise the word "fully"—appreciate the position, the restoration of our economy will be only a matter of time—but time in which as a nation we have to endure hardship and display a national resolution as great as ever we did in the war. And it is in that matter of time that the great and generous conception of Marshall Aid is of vital importance to the restoration of a world economy distorted by the unequal incidence of the mass destruction of property caused by the war.

I hope you will forgive me for touching upon these wider considerations. I do so only, of course, because of their very direct bearing upon our business. For the tasks ahead of the people of this country the comfort and the incentive of tobacco are not negligible. Although no one would contend that it is a commodity essential to life, further restriction of its supply would be an irritant and a deterrent in national effort at a time when so few incentives are available.

CURRENT YEAR'S TRADING

Even, however, if circumstances make it possible to maintain supplies at their existing level with little or no dollar expenditure until we can as a nation increase our dollar earnings, we cannot expect that the trading profit of our company will be fully maintained on the level of last year. I say this because, although we have kept our operations on a fully competitive basis and should be able at least to maintain our proportion of the trade that can be done, it is clear that we cannot count on, however much we may desire, such an increase in the availability of leaf as would make possible any raising of the existing level of supplies to the public in the current year. Figures are published from time to time of stocks of leaf tobacco, but they rarely if ever distinguish between stocks for export and home trade. The facts are that our stock position does not justify, so far as we can at present see, any increase in the level of supplies even if the full quantity proposed by way of Marshall Aid comes forward and if the hopes for the maximum supplies from the sterling area are realised. Therefore, it cannot be expected that our trading in the current year will exceed the level since the Budget of April last year, and that was a level somewhat lower than the average for the whole of our last financial year.

These, ladies and gentlemen, are the considerations I feel it my duty to put before you. There are clearly many difficulties and uncertainties ahead. So far as lies within our power we will cope with them and we have a loyal and efficient organisation backed by generations of experience, and kept up-to-date by continuous research and development. I can assure you that the whole effort of that organisation will continue to be directed to maintaining our efficiency at the highest possible level and so making the best possible contribution to the national effort in these critical times.

The report and accounts were unanimously

adopted and the dividends as recommended were approved.

The retiring directors were re-elected and the auditors, Messrs Deloitte Plender Griffiths and Company, were reappointed.

VOTE OF THANKS TO THE CHAIRMAN

Mr R. S. W. Clarke, in proposing a resolution of thanks to the chairman, said: Throughout its history the company has been extremely fortunate in its chairman, and when a year ago Lord Duivenrode retired from their office after occupying the chair for 22 years we were fortunate indeed in having available so worthy a successor as Sir Robert Sinclair. Some of us were greatly relieved that Sir Robert was available because during the course of his Government service throughout the war years Sir Robert's outstanding ability and tireless energy had become so well known in the highest circles in London and Washington that requests for his services came from many quarters. Fortunately for us Sir Robert's devotion to the interests of this company enabled him to resist the temptations and withstand the pressures which were brought to bear, and we are most grateful that he did so.

Mr A. G. Thomsen, who seconded the resolution, said that as one who was working in the employ of the company he could say that they felt they had the right man in the right place at the right time.

The vote of thanks was carried with acclamation.

The chairman, acknowledging the vote of thanks, said the company was fortunate in its personnel and he paid a tribute to the help received from the staff, and in particular Mr Partridge, the secretary, and his colleagues on the board of directors. They had all contributed to the efficient running of the organisation.

The proceedings then terminated.

ACHILLE SERRE LIMITED

INCREASED EFFICIENCY

The annual general meeting of Achille Serre Limited (Cleaners and Dyers) was held, on the 5th instant, in London.

Mr F. M. L. Fitzwilliams, F.C.A. (the chairman and managing director), said:—

The February fuel crisis caused to us a loss of over £17,000 and an ensuing dislocation which postponed complete recoupment of that loss for several further months of the year 1947. This winter, as a result of the installation of our own generating plant, disruption of production through lack of electric power has been avoided.

In the last six months of 1947 we were able to effect great advances in production.

Volume of sales expanded by 17 per cent. Average weekly earnings of all employees increased by 16 per cent., while working hours decreased by 13 per cent. But output per productive man-hour increased by no less than 33½ per cent. and the average price per order paid by members of the public was reduced by a full 3 per cent.

The accounts for the year to December, 1947, show a trading profit of £79,382 and a net profit amounting to £23,837. Adding to this amount the brought-forward of £6,284, there is a total to be dealt with of £30,121. After transferring £12,000 to reserve and providing for a dividend of 15 per cent., less income tax (same), there is a credit on profit and loss account of £6,571.

Considerable assistance has been obtained from the American and Canadian industry, and supplies of new types of plant are already being received from enterprising British manufacturers.

The report and accounts were adopted.

THE SCOTTISH WIDOWS' FUND AND LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The hundred-and-thirty-fourth stated annual meeting of the Scottish Widows' Fund and Life Assurance Society, was held in the society's head office, Edinburgh, on Tuesday, the 9th instant, Mr Douglas Mure Wood, C.A. (chairman of the ordinary court of directors), presiding.

In moving the adoption of the report and accounts, the chairman said: The year under review was one in which the country was beset by growing economic difficulties but the need for life assurance was as great as ever and the demand continued at a high level. We are able to record an increase to over £9,000,000 in the gross amount of new assurance business completed—£7,500,000 of ordinary business and £1,500,000 of group life assurances under pension schemes. The net total, after deducting sums reassured with other offices was over £8,800,000 and the figures both gross and net represent the highest amount of new business ever transacted by the society in a single year.

The interest income is higher than the figure for the preceding year by about £180,000 and represents an average rate of interest on the whole of the assurance and annuity funds of £5 1s. 6d. per cent. before deducting income tax. This is 3s. 9d. more than in the year 1946 and it will, I am sure, be gratifying to the members. The net rate of interest, after deduction of income tax, £3 16s. 3d., has risen by 5s. 5d.

Once again you will notice our customary statement that the stock exchange securities stand at or under their lowest market value at the date of the balance-sheet. This is an understatement of the position because of the margin between the market values of our securities and the values at which they stand in the balance-sheet. Notwithstanding the general fall in prices of stock exchange securities since the end of 1946, the margin today is still a large one and provides a useful buffer against fluctuating values in these uncertain times.

At December 31, 1947, our holdings of British government securities and securities guaranteed by the British Government under the Trade Facilities Acts appear at a combined total of just under £5,000,000—a reduction of £5,000,000 from the figure at the end of 1946, accounted for by sales during the year under review. The major part of the proceeds of these sales was applied to increase our holdings of home railway stocks and this has proved to be a satisfactory exchange. These stocks were automatically converted into British transport stock on the nationalisation of the railways on January 1st, of this year, and it may interest you to know that, if our balance-sheet had been drawn up at that date instead of at December 31st, our holdings of British government securities and stocks guaranteed by the British Government would have appeared at practically the same total as at December 31, 1946.

In conclusion, I would draw your attention to the fact that we have now entered what is known as "Bonus Year" at the end of which our quinquennial valuation and distribution of surplus fall to be made. I shall not be so rash as to attempt to forecast the results but I can say that we look forward to being able to present to you next year another satisfactory report not only for the year but also for the quinquennial period.

The directors' report and the accounts, as audited, were adopted unanimously.

HONGKONG AND SHANGHAI BANKING CORPORATION

CONTINUED EXPANSION

THE HON. A. MORSE ON CONDITIONS IN CHINA

The ordinary general meeting of the Hongkong and Shanghai Banking Corporation was held in Hongkong on the 5th instant.

The Hon. A. Morse, C.B.E., the chairman, in the course of his speech, said: Our business continues to expand and there has been an increase in the total of the accounts during the year of about £23 millions. Our note issue has increased by over £12 millions and current and deposit accounts by over £10 millions. On the assets side cash in hand is up by £1½ millions, certificates of indebtedness by £12 millions, bills receivable by £1½ millions, investments by £2½ millions and advances by £5½ millions, while money at call is down by £2 millions.

The increase in our note issue is as you are probably aware due to a great extent to the uncertainties at present unfortunately attached to the currency of China and not to any inflationary tendency in the Colony during the year under review. The amount of H.K.\$2 millions written off bank premises brings the figure appearing in the balance sheet slightly below that shown last year, after taking into account additions during the year under review.

INCREASED PROFIT

Turning to the profit and loss account you will observe the profit arising from current transactions during the year, after making certain transfers to provisions for contingencies, amounts to H.K.\$16,595,079 which exceeds our profit for the previous year by approximately H.K.\$7 millions.

In the various countries in which we operate an unparalleled number of constitutional changes have taken place in the past year or are at the moment being fashioned. When one considers the upheavals in the East it is surprising that we have been able to produce such a good balance sheet and I hope you will agree with me that the results of the past year are very satisfactory. It is with great pleasure that your directors are today able to recommend the payment of a final dividend of £3, making a total of £5 for the year, similar to that paid for the year 1940. Much credit is due to the staff for the hard work they have done since they resumed their duties. Their keenness, and I may say their enthusiasm, will help us to face the future with confidence in spite of the difficulties with which banking is confronted in many of the countries where we operate.

I am glad to say that the Trustee companies which we established here and in Singapore a little over a year ago are both proving their worth and are actively extending their usefulness.

SITUATION IN CHINA

In China the situation at the end of hostilities with Japan was different from that in Europe. Being predominantly an agricultural country she was in a better position to recover rapidly, but the longer period of turmoil which had existed could not fail seriously to affect the economy of the country and its morale. There were, however, fair chances that trade and industry would be restarted on a peace time basis without any excessive complications, and such might have been the case had it not been for the differences between the Kuomintang and the Communists which spread steadily throughout 1946 and 1947, and developed into an open split in spite of the efforts of General Marshall and other mediators. So far the main areas of disturbance remain north of the Yangtze River and from Shensi Province eastwards to the coast, but the situation has deteriorated since our meeting last year. Of the wealthy north-eastern provinces there remains in

Nanking's control little more than a tenuous hold on Moukden; the Lung Hai Railway is badly disrupted and crossings of the Yangtze River have been threatened.

In South and West China and in Taiwan conditions are generally quiet, but in many parts there is a feeling of unrest due to fears of disturbances inspired by Communists or other disaffected parties. The disgraceful Shamen episode in January was one such case which developed without warning.

INFLATION INCREASING

China's financial situation is also not a happy subject to discuss, nor are the details clear. But Chinese Government spokesmen have frequently noted the fact that the inflation of currency to meet the budgetary deficit, which it was hoped would be checked at the end of hostilities with Japan, has in the postwar years increased at a dangerously enhanced pace, almost solely because of the needs of the military in their operations against the Communists.

The outstanding fact is, as emphasised by the Minister of Finance in an interview reported in the Press on December 23, that there is little hope of stabilising financial conditions so long as the enormous military expenditure continues. Currency reforms will of course be necessary, but while the basic causes of inflation are not eliminated, the Minister added, the issue of a new currency would complicate and not lessen the problems.

Meantime the Central Bank and the Central Authorities have made vigorous and sometimes successful efforts to lessen the diseases of inflation and prevent the situation getting out of hand. Their task has been exceedingly complicated and, under the circumstances, it is surprising that they have been able to hold the fort in spite of military demands, smuggling, black markets, speculative operations and all the evils which are legacies of war.

ENCOURAGEMENT OF EXPORTS

As regards foreign trade, by means of regulations governing the import and export trade and by frequent adjustments of the official rate of exchange, it appears that reasonable success has been obtained in encouraging exports and in checking the enormous surplus of imports which the Customs returns showed in 1946 and early 1947. At the end of the year 1947 imports were reduced and exports were making a better showing, but obscurity veils our information about smuggling.

In recent months the Chinese Government has reiterated that foreign capital coming to China will be free from inequitable and restrictive legislation, and will be permitted to remit overseas a reasonable return. In July, Premier Chang Chun replied in this sense to a questionnaire by the United States Ambassador and again in August he said that a procedure was being worked out whereby an appropriate portion of foreign capital invested in industries might be remitted abroad. Unfortunately, no practical steps have yet been taken to permit reasonable profits, nor even properly chargeable foreign currency expenses, to be remitted. In the circumstances it has not been possible for our offices in China to contribute towards our dividend.

As for your bank I feel that notwithstanding the uncertainties of the future we have a strong organisation supported by a reliable staff capable of dealing with any problems it may have to face with as much skill and vigour as in the past.

The report was adopted.

CO-OPERATIVE PERMANENT BUILDING SOCIETY

ANOTHER YEAR OF PROGRESS

MR. H. L. SCORE'S ADDRESS

The annual general meeting of the Co-operative Permanent Building Society was held, on the 28th ultimo, at the Conway Hall, London.

The President, Mr H. L. Score, in the course of his address, said: This is a fitting occasion to refer to the loss we have sustained in the passing of our colleague, Mr C. P. Derbyshire, who died this year. Mr Derbyshire commenced duty with the society as far back as 1907. We shall deeply miss his friendly presence.

You will recollect that your directors asked me to succeed to the office of president in succession to Dr Mansbridge, who continues as a director. I would like to say to him that we know of our great debt to him. We are proud of him and his work.

So far as the society is concerned the balance-sheet and accounts once again speak for themselves. We have gone forward in the year, rising to new heights, and our total assets are reaching out towards the £50,000,000 mark.

INCREASED ADVANCES

The details of our progress this year are shown in the report and statement of accounts. I will only mention the increase in mortgage advance by nearly £4,000,000 to £14,000,000, and in share receipts by approximately £1,600,000 to £4,700,000.

I am very glad to tell you of the continued strengthening of our associations with co-operative societies in all areas. Our links with the Co-operative Insurance Society have brought increasing business to our mutual benefit.

In these troublous days there are special duties and responsibilities placed on building societies. Building societies, in their mortgage service, must take every possible step to restrain inflation in house values. Singly and in isolation there is very little they can do beyond strengthening the usual sound arrangements to ensure competent valuations, joined with prudent assessments of the sums to be lent on each property in relation to value. Most societies habitually take these precautions, for their methods and procedure are based on long experience. They have had to deal, in past years, with problems of a similar nature, arising out of the first world war, the general strike, and the financial crisis in the nineteen-thirties. This individual action of each society is largely unco-ordinated and has practically no effect in restraining inflation.

CO-OPERATION AGAINST INFLATION

I venture to ask the Chancellor of the Exchequer whether he could not re-examine this very important problem of inflation as it affects the homes of the people. An approach by him to leading building societies, or the Building Societies Association, would, I feel sure, bring about a co-operative action from the societies. It is in their interests and the interests of the country as a whole that a limit be placed on the extension of this serious form of inflation. Action should be taken in time, not only to prevent further increase in the values of existing houses, but to avoid the possibility that most of the new houses shall become affected by the contagion.

At the same time there is much to be said for discussion and the desirability and possibility of settling building society interest rates at a common level. Building societies are the largest voluntary housing service in this country. The magnitude of their operations requires that their resources and influence should be harnessed to the nation's effort to retard inflation. The report and balance-sheet were adopted.

INTERNATIONAL COMBUSTION, LIMITED

ORDERS REACH NEW PEAK

The fourteenth ordinary general meeting of International Combustion, Limited, was held, on the 10th instant, in London, Mr G. R. T. Taylor (chairman) presiding.

The following are extracts from the chairman's circulated statement:

The preference dividend and an interim dividend of 10 per cent. on the ordinary stock having been paid, your directors recommend that a final dividend of 27½ per cent. be paid on the ordinary stock for the year ended September 30, 1947. This leaves a balance of £124,958 to be carried forward, against the sum of £112,789 brought in from last year.

As shown by the consolidated balance-sheet, the capital employed in the business, which includes the reserves, is more than double the actual share capital issued. Consequently the rate of dividend for the year on the actual capital employed in the business is really less than half of the rates indicated above. It should also be borne in mind that our trading profit represents a small percentage on our turnover.

Our order book, which includes a useful amount of export work, continued to expand, reaching a new high peak at the end of the year. Notwithstanding the capital expenditure cuts which the Government has seen fit to make, we are still extremely well placed so far as orders for future execution are concerned.

While the fuel crisis naturally affected us to some extent, we have by unremitting effort been able to maintain our output for the past year and we hope that no further serious difficulties will now occur to prevent us from increasing our production so as to keep pace with the greater volume of orders on hand. The report was adopted.

BRITISH HOME STORES

IMPROVED NET PROFIT

The annual general meeting of this company will be held, on the 17th instant, at Winchester House, London, E.C.

The following is an extract from the circulated statement of the chairman (Mr Horace Moore):—

The improved net profit of £441,893, against £292,331 last year, can be attributed to three main reasons. The first, and most important, is the very substantial increase both in volume and units of sale which has followed our continuous efforts to give our

customers ever-improving quality and value. Secondly, the two smaller businesses acquired in recent years are showing excellent results. Thirdly, since the termination of hostilities, the return of so many of our personnel.

Our gross profit margin on goods sold was smaller than in the previous year, and costs of operation, particularly wages and salaries, increased considerably. It has always been our policy to keep selling prices as low as possible while maintaining quality.

The issue of ordinary shares to our stockholders a year ago was an immediate success, and we had applications from stockholders for fifty times the shares available. The premium on the issue of the ordinary shares, after deduction of expenses of both issues, left a balance of £151,842, which has been applied in reduction of investment in subsidiary companies. To bring the general reserve to £250,000, your directors have appropriated £71,850 this year.

A final dividend of 8d. per stock unit (less tax) is proposed, which will allow an increased carry-forward of £40,593. It is interesting to note that we have been able, this year, to plough back into the business more than three times the amount retained last year.

I am pleased to be able to report that so far in the current year business is satisfactory.

UNIVERSITY COLLEGE, NOTTINGHAM

SCHOOL OF AGRICULTURE

The Council invites applications for the following appointments in the Department of Agricultural Economics:—

(a) *Agricultural Economist*
Salary scale: Men £170-£710. Women £100-£620, plus cost-of-living bonus. Men £90. Women £72, per annum. Candidates must be graduates in Agriculture or Economics and should have had experience in the field of Agricultural Economics. Preference will be given to candidates with suitable research training and experience.

(b) *Assistant Agricultural Economist*
Salary scale for candidates with 1st or 2nd Class Honours and at least two years' postgraduate experience: Men £295-£470. Women £285-£400, plus cost-of-living bonus. Men £78. Women £63, per annum.

The conditions of appointment and form of application may be obtained from the Registrar, University College, Nottingham.

A **STATISTICIAN** is required by an expanding manufacturing company in the Home Counties to take charge of its statistical department. The successful applicant will have taken an Economics Degree combined with Statistics as a special subject and it is desirable that he should have attained the standard set in the Certificate Examination of the Royal Statistical Society. The work includes forward planning and forecasting and provides an opportunity for development of statistical method in relation to business problems, especially those of marketing and production, and experience in these fields will be of advantage. Age preferred 25-32. The commencing salary will be at least £1,250 per annum. Send for full particulars including education, qualifications, experience, age, etc., to Box 680.

An **ASSISTANT MANAGER** required for Export Department of development and other foreign languages desirable but not essential. Good prospects. Remuneration according to qualifications. London office.—Please write Box 687.

THE **BRITISH INSTITUTE OF MANAGEMENT** wishes to appoint a senior member of its Information and Research Staff, with experience in a majority of the following subjects: Company Accounting, Budgetary Control, Cost Accounting, Production Control, Stores, Control. Applicant must be interested in the application of these techniques to general management problems, be capable of supervising enquiries in fields related to those in which he has direct experience, and be able to express himself in clear English. Salary £1,250 per annum or over, according to experience. Apply in writing to: The Director, British Institute of Management, 17, Hill Street, London, W.1.

A **BUSINESS** man, 31, Cambridge M.A., formerly staff Lieut.-Colonel, crisis, seeks responsible post demanding application, organising ability and drive. At present advertising and sales executive, well known abroad, provided young family can accompany.—Box 685.

A **SALES** Manager required by progressive Scottish Manufacturing Firm to organise and supervise home and overseas sales. Technical knowledge, shipping experience, or previous knowledge of Sales Management an advantage. Good prospects for enterprising young man, age under 35 years.—Address "0236," Wm. Porteous & Co., Glasgow.

EUROPEAN HAGUE CONGRESS. Speakers: M. FRENAY (Ex-Minister, France, Soc.), ROBERT BOOTHBY, M.P. (Cons.), DR. H. BRUGMANS (Benelux, Soc.), R. W. G. MACKAY, M.P. (Lab.), Chairman: F. L. JOSEPHY (Lib.). CENTRAL HALL, WESTMINSTER (Lecture Hall). THURSDAY, 18th MARCH, 7.15 p.m. ADMISSION FREE. RESERVED SEATS AT 2/6d. and 1/- from FEDERAL UNION, 20, Buckingham Street, Strand, W.C.2.

BELGIUM.—Economic and marketing counsel, market research, merchandising, advertising. Englishman with wide and successful experience would like position in Belgium.—Box 644.

EASTER HOUSE PARTY: A few more professional and university people are invited to join informal Sussex House Party, also other Easter, Weekend and Summer arrangements Gt. Britain and abroad.—Box 682.

PROFESSIONAL CONSULTANT seeks modest, comfortable office with telephone, for secretary and self. Westminster or City preferred.—Box 678.

GOVERNMENT RETURNS

For the week ended March 6, 1948, total ordinary revenue was £94,614,000 against ordinary expenditure of £107,864,000 and issues to sinking funds £2,885,000. Thus, including sinking fund allocations of £16,622,000 the surplus accrued since April 1st is £749,776,000 against a deficit of £397,446,000 for the corresponding period a year ago.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

Revenue	Estimate, 1947-48	April 1 to Mar. 1947	April 1 to Mar. 1948	Week ended Mar. 6, 1947	Week ended Mar. 6, 1948

UNIVERSITY OF LEEDS
DEPARTMENT OF EXTRA-MURAL STUDIES

Applications are invited for posts of Staff Tutor for Adult Education work from candidates qualified to take University Tutorial Classes in one or more of the following:—English Literature, Psychology, Music, History, International Relations, Industrial Relations, Economics, Political Science, Biology. Appointments will be made either on the salary scale for probationary Staff Tutors (£400-£25-£500) or on the scale £550-£25-£900, together with child allowance and membership of the Federated Superannuation System for Universities. Applications should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained), not later than the 30th April.

Can It Happen Here ?

IN four weeks since the fall of Prague, the outlook of the Western world towards the East has been transformed. After a wave of alarm, the reaction in Western Europe has been prompt and determined. Western association has rapidly developed from a vague concept, capable of gradual attainment, into a pressing political necessity. Prague has given Brussels and Paris an urgent meaning which they would otherwise have lacked. In the United States, the Senate has approved the European Recovery Bill more quickly and more decisively than seemed possible a month ago. President Truman has urged the necessity for conscription in the United States, now at the height of its prosperity and power. In Western Europe, the dangers from the Communist Trojan Horse have been demonstrated by the horrifying object lesson from Czechoslovakia. Such a cynical and indecent *ruse de guerre* invited, and is most properly receiving, retaliation with the gloves off.

Such is the background against which the Prime Minister's statement about the employment of Communists and fellow travellers in Government service must be assessed. Inevitably, it has produced howls of denunciation from the Communists, who represent the removal from temptation of those with doubtful loyalties to the state as the introduction of the police state in Britain, and "another indication of complete subservience to American monopoly capitalism." In Czechoslovakia today, there is no police state and, of course, no subservience to Russia. This insolent perversion of the very reasons for which the *Putsch* in Czechoslovakia has been universally condemned by all true democracies has a staggering but characteristic effrontery.

But it is, nevertheless, a disturbing thing when liberties have to be qualified in order to preserve the larger freedoms. A healthy democracy does well to think long before it resorts even to the gentlest of the means employed by its enemies to deny freedom of opinion to any of its citizens or to limit their choice of occupation. But a careful reading of Mr Attlee's statement shows that the Government in its precautionary measures has stopped well short of the point at which liberty and conscience are imperilled or economic sanctions raised against particular political creeds. The state has the undoubted right to exclude from the performance of secret duties anyone whose reliability is in doubt. Experience has shown that "membership of, and other forms of continuing association with, the Communist Party may involve the acceptance by the individual of a loyalty which in certain circumstances can be inimical to the state." Not all Communists would necessarily be disloyal, if opportunity offered, but since there is no way of distinguishing the loyal from the potentially disloyal, party members and fellow travellers must be excluded from work which is vital to the security of the state, though alternative non-secret work will be found for them as far as possible. The same rule will apply to those who are known to be actively associated with Fascist organisations.

Action is being taken, then, solely on security grounds, and not because of the political views of particular employees in the Government service. To all except the purblind, and professional "viewers with alarm," the

Prime Minister's simple logic must be convincing. Western democracy works by toleration and governs by consent. Eastern Communism has no use for mutual trust; it exacts unquestioning loyalty; it seeks to overrun the frontiers of sincere democratic patriotism and to spread its poisonous religion at every opportunity. Attempts will be made to institute some form of judicial process or tribunal to hear cases and weigh evidence. But while this shows a proper regard for the prevention of any arbitrary excesses on the part of the Executive, it misses the point of the procedure which the Prime Minister outlined. There is no case for judgment; no offence is alleged—otherwise the Official Secrets Act would quickly be invoked. It is merely that the state must satisfy itself, on good *prima facie* grounds in each case, that one of its servants, by membership of, or allegiance to, the Communist Party, might be capable of accepting an outside loyalty which in certain circumstances could be inimical to the state.

No one who surveys the plight of freedom in the Communist satellite countries would regard this test as being in any way extreme. Of the possible conflict of loyalties, equally, there can be no doubt. In Czechoslovakia it was obedience to Russia which impelled a Communist minority to impose its will on the majority—insurrection under the covert form of a change of Government. In Canada, as the Report of the Royal Commission showed, it enabled the Soviet Embassy at Ottawa to build up an espionage organisation, served by Communists, scientists, and Government officials, whose overriding loyalty to their Russian masters and fellow-conspirators can be measured by their refusal to answer questions about their activities and contacts in their espionage network. The British Constitution makes no provision for such a division of loyalties. Nearly three hundred years have passed since the state felt itself to be endangered by rival authority, and hurriedly put the Test Acts on the Statute Book. They were no adornment on the banner of British liberty.

★

If remedies against the tyranny of a minority exist, either in the Common Law or on the Statute Book, they should obviously be invoked. But a brief survey of both branches of the law shows that neither offers any effective safeguard against the undercover work of Communism, in its latter-day form. There is indeed authority for the view that an intention to incite feelings of ill-will and hostility between different classes of His Majesty's subjects may be seditious—but it is for the jury to decide, and moreover it rests on the commission of an overt act. Sedition, as defined in the law books, is a phrase too wide in its meaning to attract the measure of public support on which the foundations of good law must rest. Put quite shortly, many people today would accept the existence of class antagonism but would reject out of hand the Communist thesis of how to deal with it.

A century ago, the threat came from the burning but misguided passion of the Chartists; today it comes from the insidious boring from within, the conspiring of invisible partners, the undeclared ideological war. It is not civil strife, but the breach of security, the betrayal of duty, the furtive suggestion of economic sabotage which are the peril now. All of these are offences which are difficult to prove until it is too late—if indeed they can be proved at all. But that is not an argument for violent steps like the banning of the Party, or some emergency counterpart of the wartime Regulation 18b. For one thing, it would be an imperfect instrument, a net at once too large and too wide in its mesh. For another, the Communist Party is no longer a conspiratorial party; it has open and avowed aims, and if it could convince a majority of the electorate, genuinely but mistakenly, that the changes in the social and political structure which it advocates were desirable, its activities would

not deserve the label of sedition, no matter how wrong-headed they might be. But if the object is to overthrow democratic rule of the majority, or to further the interests of another state, then the state against whom they are working is entitled beyond question to put them out of harm's way.

There are two principal reasons for arguing that this stage has not been reached, and that no further extension of Executive action against the danger from within is at present justified. The first is the abiding faith in the democratic principle which has always inspired the activities of the major political parties. That is why Sir Stafford Cripps's recent references to the danger of totalitarianism have failed to make a convincing ring through the country. People may be convinced that the outlook is grave, yet they refuse to believe that it could become so grave as that. But it is still true that faith in the democratic principle is frequently unaccompanied by a determination to make democratic forms work. The successes of the Communists in the Trade Unions have so often been due to indifference to union elections and failure to attend and support union activities. The crude successes of Communist propaganda would not survive a little clear thinking and a little counter-campaigning on the merits and achievements of social democracy. The extremes of class antagonism which the Communists work so hard to foster, and which some Socialists are unduly anxious to encourage themselves, have no meaning in modern Britain.

★

The second reason is more technical. Experience in Hungary and Czechoslovakia has shown that states within the Russian sphere could still survive as Parliamentary democracies so long as Communists were kept out of the Ministries of the Interior, or Justice or Defence. But the moment that Communist Ministers are entrusted with these portfolios, the die is cast; Governments can be divided and very soon torn asunder by Ministers representing a minority of the people, but wielding a degree of power beyond that of Prime Ministers and Presidents. This moral has not been lost on Italy and France, where it might still be relevant. But in Britain, it is not relevant at all.

The merciful conclusion, then, must be that it cannot happen here. But there is not the slightest justification for its smug acceptance—as if Britain is destined, by some immutable law of Providence, to remain a social democracy for all time. There are Ministers whose notion of the dividing line between individual liberty and responsibility to the state might well be refurbished. There is an urgent need for an effective counter-attack on Communist activities and propaganda in all walks of life—in public affairs, in the professions, in science particularly, in the arts, and above all in the factories. The measure of the problem is not the 40,000 members which the Communist Party claims, but its half-convinced adherents who have been persuaded by better organisation, tireless proselytising, and dishonest propaganda to move away from the dull established forms of the trade union movement towards the crude religious beliefs of Communism. They are not converts—yet. But they will become converts unless there is a more active evangelist in the Trade Union movement.

This act of legitimate self-defence by the state, so far from being a "purge," is an example to all who are revolted by the manifestations of Communism to strengthen their own defence against its erosive forces. There is no justification for any witch-hunting. Action against professing Communists in the Government service has long seemed desirable, but it must not be allowed to develop into the kind of excesses which have lately been witnessed in Washington. There may be something laughable in the spectacle of Hollywood reduced to a jelly of fear of "radicalism"; but there is something tragic in it too. In the last resort, democracies must work out their own means of self-protection, by their own democratic method. That is the only final assurance that it cannot happen here.

Western Workshop

MR BEVIN struck exactly the right note when, in opening the second conference of the Sixteen Nations with a speech of admirable brevity, he urged two things on his colleagues—work and speed. Speed they have certainly shown. At a meeting attended by fourteen Foreign Ministers, many of them with separate axes to grind—as was expected, the Portuguese Minister suggested that Spain should be invited to join the Sixteen—the unity of purpose which had brought them together was not once lost to sight. The Conference lasted less than two days, fewer than a dozen speeches were made and when the delegates departed, they left behind them three agreed resolutions. If all international conferences could be conducted with such praiseworthy despatch, international institutions would hardly be in their present disrepute.

Those who expected feats of oratory and clarion calls to new crusades from Mr Bevin are no doubt disappointed, but the Foreign Secretary has shown himself shrewder than they. There has been quite enough talk about co-operation for the time being. If the realisation of closer association in the West depended only upon the public utterances of distinguished men, it would have come into being months ago. The real test of Western Europe's capacity for co-operation is the practical test of how much sovereignty the nations are prepared to sacrifice and how much effort they will throw into the common cause. Mr Bevin has given his pledge for the British to "make whatever contribution we can." But this contribution and that of all the others can only be judged by experience. The need now is not to talk but to get to work, and the first step towards working together is to establish the machinery of co-operation.

The decision to set up a working party to draw up an agreed constitution for this machinery—the continuing organisation as it is called for the time being—is clearly the most urgent of the three resolutions with which the conference closed. Of the other two, the first though important is a matter of routine—to report to the United States the amount of progress achieved by the Sixteen so far. The second—the decision to ask Military Government to designate German experts from the Western Zones to work with the Sixteen—will have long-term consequences of the utmost importance. But the immediate task is to create the continuing organisation.

To judge by past experience, there are two different ways of establishing a functioning piece of international machinery. One is to make the central secretariat an efficient but not very influential international body, and attach to it national delegations with considerable powers in which real authority resides. These delegations in effect negotiate with each other on such questions as allocation, production, inter-European trade or the Sixteen's dollar strategy, and the international secretariat provides them with material and registers their decisions. This pattern was largely adopted in setting up the Combined Boards on which British and American delegates sat in their national capacity and the role of the secretaries was entirely subordinate. In part as a result of this wartime experience, the British are believed to have favoured this approach so far. Another reason for their supposed preference may be that, since such a structure would represent a fairly loose type of organisation in which there would be no loss of national identity, it should be easier to protect Britain's special position as a member of another association—that of the Commonwealth.

This approach, however, seems insufficiently radical to some of the continental governments, and particularly to France. They want a strong international secretariat, under a chairman or director of commanding influence and personality. This body would carry out all the functions allotted to the central

authority, not as a group of separate national officials, but as a single international team with loyalty to Western Europe as a whole; it would negotiate directly with member governments to secure their consent for the policies it proposed and—so at least the French hope—it could provide the nucleus round which a genuinely international civil service would gradually grow up to serve an eventual Western European Government.

It may be that some compromise will be found between these two views, but the weight of argument seems to lie with the French case. The difficulty in working out policies for Western Europe will not lie in the safeguarding of national interests. Sixteen jealous governments will see to that. The difficulty will lie in establishing clearly the wider international interest and in relating national policies to that interest, often at the sacrifice of local aims and ambitions. If, at the very centre of the Western association, there is a series of negotiating delegations and not a genuine international body, then each problem will be discussed from the national angle and the result may be, not the emergence of the common good, but of the lowest common denominator of governmental bargaining. In that case, Mr Bevin's hope that the continuing organisation will be "not a conference but a workshop" will be largely frustrated. The advantage of setting up an international continuing organisation with loyalty to the western association as a whole, and without overriding loyalties to any particular partner, is simply that European policies will have a chance to emerge at the centre, however much they have to be modified later to meet the views of the member governments.

These considerations are borne out by two others. The first is that the setting up of national delegations would probably lead to great duplication of activity and effort. Not even the strongest delegation could exercise governmental powers. The decisions taken by the delegations in Brussels (or Paris) would have to be referred back to their Governments. There would thus be three stages in every negotiation—the preparation of material by the small secretariat, the discussion and decision of the delegations and the referring back of these decisions to the various national capitals. If, on the other hand, the secretariat itself were a strong international body, one time-consuming stage would be cut out, since the inevitable bargaining could be carried out directly with the only authorities competent to take final decisions—namely the governments themselves. And this consideration is enforced by yet another: perhaps the most difficult task at Paris will be to find the right men to staff the new organisation. The quality and effectiveness of the machinery established will depend entirely on the character of the men appointed to work it. There is already a dangerous shortage of officials competent to carry large administrative responsibilities, but nowhere is the shortage so apparent as among those capable of acting effectively in the international field. The proposal to duplicate the secretariat by separate national delegations would involve impossible demands on the manpower available; men of sufficient calibre simply cannot be found for both tasks. One central secretariat with the most competent and effective men available would be infinitely better than sixteen delegations of very uneven quality tripping over each other at the centre.

The need for a strong secretariat is underlined by the nature of the work which the continuing organisation will be expected to do. Mr Bevin outlined its two chief functions when he mentioned its responsibility to secure the successful allocation of the scarce supplies available under the Marshall Plan, and "to establish an equilibrium with the Western hemisphere and to reduce the dollar deficit." The former responsibility is

reasonably straightforward, although it involves exceedingly difficult political decisions. For instance, it is now apparent that the amount of crude steel available to Western Europe under the American programme may be 4,000,000 tons short of the desired total in 1949 and 2,000,000 tons short in 1950. When the overriding need for crude steel and scrap in each industrial community in Western Europe is remembered, it is clear that the process of deciding where, in the best interests of all, the cuts should come and of persuading the unlucky nations to accept the decision will tax to the utmost the organisation's authority and power of persuasion.

The heaviest responsibilities may, however, be incurred in carrying out the second function—the establishment of equilibrium between the Old and the New World. On present calculations, anything from one to three billion dollars has to be cut from West Europe's spending by 1951. This formidable reduction can be made only if production is developed with the utmost vigour in Europe and in non-American areas of supply, if inter-European trade (of essentials as well as the frills) is fostered by every measure, if the Sixteen will organise some sort of pool for their dollar earnings and agree to the spending of those dollars only on the most essential imports from the dollar area. A "dollar strategy" involves co-operation of the highest order and the sacrifice of sovereignty at some of the most delicate points in the national economic systems of the Sixteen.

At this point, some critics may ask whether such tremendous responsibilities can be exercised by an international secretariat. Can a body of international officials undertake the responsibility for determining the most vital interests of individual states? Can they be left to decide how much industrial development is to be permitted in individual countries by allocating such vital materials as steel or coal? Can they determine how hard-earned dollars are to be spent—sometimes by countries which have not made satisfactory dollar earnings themselves? Can the development of the whole pattern of Western European trade be left to such a body? Many would argue that no Government could accept sacrifices of sovereignty of this character, and that although the meeting of delegations to bargain may not be a perfect arrangement, it would at least be practicable.

Probe for Monopolies

THE Government has announced its intention of dealing with monopolies—as promised in *Let Us Face the Future*. This is good news. Any measure which reduces the power of combine, cartel or association either to exploit the public or to clog and frustrate technical and commercial progress is much more to the point than the pursuit of party logic through a series of half-digested Nationalisation Bills; here is a genuine national interest, and one which, if near-Syndicalists on the left and near-Corporationists on the right be excluded, should command a genuine national backing.

This is not to say that the Government's line of attack will inevitably, or even probably, be the best. There are, indeed, suggestions that the Anti-Cartel bill will be a mere enabling measure, whose effectiveness will depend entirely on the energy which the overburdened Board of Trade can bring to its application in individual cases. Again, few Socialists are capable of envisaging Trade Unions as what they in fact are—highly aggressive monopolies whose wares happen to be manpower. Hardly more are willing to apply to the enormous, powerful and introverted public corporations of triumphant Socialism the same criteria of economic conduct as those by which they judge Big Business when in private hands. But almost any move in this field will at least have an educational effect; a monopoly-conscious public, roused by disclosures (if such are to come) of private iniquity, may not be quite incapable of applying what

To these objections, there are two answers. The first is that, for the time being at least, ultimate responsibility will continue to rest with the member Governments. As the years pass and the habits of co-operation grow they may be ready to give power to some central body—a Prime Ministers' Conference perhaps—but for the time being, the continuing organisation will depend for its effectiveness on the extent to which it can persuade, cajole or bully the member governments into accepting its recommendations. But the second answer lies in the extent to which international bodies in the past have successfully carried out such functions. During the war such bodies as the Middle East Supply Centre and the United Nations Relief and Rehabilitation Administration, were both examples of effective international bodies dealing with such questions as allocation, supply and production programmes and the negotiating of these programmes with governments. And since the war, two bodies have exercised vital functions in the sphere of allocation. Both were international bodies. Both had to negotiate with national governments. Both handled the most vital of all commodities. Both were successful. One, the International Emergency Food Committee, has allocated the whole world's scarce grain supplies for the last two years. The other, the European Coal Organisation (now a Committee of the United Nations Economic Commission for Europe) allocated Europe's desperately needed coal supplies. There is thus no reason to deduce from the history of the last six years, that a strong international secretariat cannot plan and allocate or secure the support of governments. The lesson is, in fact, the exact opposite.

With these models in mind the working party should go to work to prepare its proposals for the next conference of the Sixteen which will be convened again as soon as the working party's report is ready. Its work may seem unsensational and severely practical compared with the great events—the policies and treaties and acts of union—which ordinarily occupy the centre of history's stage. But in reality its concern will be to create the sinews of western association. Mr Bevin hardly exaggerated when he said that its work "will determine the future peace and prosperity of the world."

it has learned in judging the behaviour of Trade Unions or of nationalised industries.

It is most likely to be roused by evidence of positive misdoing, in the easily recognisable shape of exploitation—the reaping of exorbitant profits from artificially induced scarcity. It is, in fact, likely to look on these, and on these alone, as calling for condemnation; and under the guidance of the Left it may not be particularly reasonable in its interpretations. There may well be heard some British counterpart of Mr Reuther's recent indictment of the American steel industry (when it was operating at some 120 per cent of its nominal rated capacity) for engaging in a nation-wide conspiracy to promote shortage and penetrating, in its accuser's peculiar phrase, "a creeping Pearl Harbour." Exploitation is, of course, perfectly possible, and it would be rash to deny that it plays an appreciable part in maintaining the perilously high British price structure. But successful exploitation depends on a combination of circumstances—inelastic demand, concentrated monopoly power, and an absence of economic penalty for the under-use of equipment—which is less frequently found than is often supposed. Much more frequent, and much more insidious, is a state of affairs where profits are far from exorbitant, simply because high prices are matched by high costs; where monopoly produces its effects indirectly, through the withdrawal of the competitive spur of efficiency, through actual penalties on enterprise, and through

the barring of entry to the promising newcomer with a good idea. It is on a dynamic view of economic affairs that monopoly and near-monopoly stand condemned; and this condemnation should not rest (as in the public mind it generally does) merely on the monopolists' supposed propensity for buying up and suppressing inconvenient competitive inventions such as perpetual matches.

The case for monopolistic organisation must, of course, be honestly recognised. Technique alone may demand it. Only a few enthusiastic supporters of competition would like to chop up the London transport system into competing atoms. The very process of dynamic specialisation which has made so important a contribution to economic advance tends to create a number of concerns holding a monopoly position in a field too small to admit a competitor. Stability is a genuine economic asset; the benefits of uninhibited competition may be too dearly bought if the relation between an industry's capital structure and its operating costs is such that the slightest shrinkage of the market unleashes cut-throat warfare. And any deliberate public planning, whether national or—a highly relevant point at the moment—international, must *ipso facto* interfere with the free play of competition; it must work towards an agreed allocation of markets and supplies; and thus it must imitate in its policy, even if it does not actually use as its instrument, that suspect economic organism the cartel.

The problem confronting any government, whether Socialist or not, is thus more complicated even than that presented by a sweeping frontal attack on all monopoly practices. Such an attack would be faced with almost overwhelming difficulties; to make monopolistic agreements a statutory offence, for instance, would be comparatively easy if such agreements were invariably embodied in written documents, or easily open to proof. But when monopolistic policies are carried on by a single highly respectable firm which has no need to make agreements with rivals because none exists; or where agreement merely consists in a reciprocal verbal agreement not to tread on the other party's toes; or where no agreement whatever exists, but one dominant concern exercises a tacitly recognised price leadership—what is authority to do?

But a frontal attack does not appear to be in question. The Government's plan, though not yet disclosed in detail, may be to set up a special division of the Board of Trade to collect, sift and publicise complaints of monopolistic practices, and to promote specific action when the facts as disclosed seem to call for it. This would be a useful, if not stupendous, beginning. But the practical steps for action remain obscure; so does the nature of the restrictive practices which the Government might consider to require action. Will complaints against Trade Union restrictionism and aggressiveness in wage policy be considered? They should be; no monopolists pursue more single-minded policies of exclusion, restriction and extortion

than some of the craft unions. Where it can be shown, after fair investigation, that production is being impeded by unnecessary rules and union delimitation, will remedial action be taken by the Government? Will the price policy of the nationalised industries, whether as buyers or as sellers, be subject to publicity? There is no logical reason whatever why they should be exempt; but the omens are not good. Socialist economic theory has constructed beautiful models of a planned society whose various economic organs function behind glass walls, "playing at competition" in the light of a mass of information about costs, techniques, and policy which should bring their activities nearer to the theoretical perfections of the free market system of the text books than those of any *laissez-faire* economy in real life. But they have yet to be seen in practice.

Above all, will feather bedding for the inefficient get as much attention as the profit margins of the efficient? It would be encouraging to think so. There is a relation, though often depressingly indirect and inadequate, between the profit motive and the public interest. But there is no harmony whatever between the public interest and the motives liable to operate in non-competitive enterprise; the prestige-of-size motive, the departmental-jealousy motive, the for-heaven's-sake-let-me-sleep-in-peace motive. In Labour nostrils, however, the profit motive has a brimstone smell. The scientific analysis of costs which is supposed to replace it has the properties of ether—it may be clinical in small doses but too much of it becomes overwhelmingly soporific.

More positive action, judging by a recent statement of the Prime Minister's, might be expected in the matter of inventions and patents. For obvious reasons, no reliable estimate can be made of the extent to which monopoly power is in practice buttressed by the buying up and suppression of patents. It is less widely known than it should be that a patent unused after a reasonable lapse of time after its acquisition is legally open to use, on a royalty basis, by anyone who cares to apply for a licence. But the practical difficulties of this procedure are at present enormous. Many patents depend for their applicability on the prior possession of a master-patent, which may itself be in use and so not available to the applicant; and legal battles over patent rights are notoriously so costly, and therefore likely to go by default in favour of the big financial battalions, that this access to undeveloped technique is usually inoperative. This situation could and should be remedied.

There does thus emerge a line of action which the Government could follow with general approval from all except those who slumber on feather-beds. That line is to establish organs of publicity, investigation, and audit. It is not so sensational as the method of mass attack, complete with dramatic legal actions, on the American model; but in this field there is good reason to believe that the probe is likely to be more powerful, and more discriminating, than the bludgeon.

£1,000 if you live for twenty-five years.

On earlier death, in addition to this £1,000, up to £5,000 payable to your dependants by instalments of £200 per annum (not subject to tax) for the remainder of the twenty-five years.

All this may be secured under the **FAMILY PROVISION SCHEME** for a monthly premium, at age thirty-five, of £5.1.1 reducing after seventeen years to £3.4.0.

Far Eastern Fronts

THE rape of Czechoslovakia has stirred up American politics into a fresh blaze of anti-Communist resolution and activity which is by no means confined to Europe. In combination with recent news from the Far East, militant Communism in Europe has brought a large section of American opinion round to the idea of giving military aid to the Chinese Government in its civil war. A few weeks ago the auspices for such proposals were not favourable and the Administration's programme called for an appropriation for China of only \$570 million for relief and recovery. But on March 2nd, ex-Ambassador Bullitt, addressing the House Foreign Affairs Committee, denounced the State Department for "blindness and apathy" towards China and demanded \$100 million for military supplies. "We cannot successfully oppose Communist conquest of the world," he said, "by opposing it in Europe only." On the next day even heavier guns were brought to bear; a cable from General MacArthur's castle in Japan was read to the legislators. In it the General told them that "a free, independent, peaceful and friendly China" was essential to "the peace of the world and the position of the United States," and that mere economic aid could not bring it rehabilitation as long as the military problem remained unsolved. The Committee has now tacked aid for China on to ERP in its Bill for the House of Representatives.

Since the period immediately after the war, when American transport was used to enable the Chinese Government troops to move up to North China and forestall the Communists in taking over from the Japanese, there has been a natural reluctance in the United States to intervene in the Chinese civil war. Intervention in a foreign country must be for someone as well as against someone, and few Americans have recently been able to see in China any authority to which the support of American power could be given with a clear conscience. The correct moral position for Americans, in their emergence from isolationism, is to sustain a democracy against domestic dictatorship or foreign aggression. But in China no real political democracy exists to be endangered; the struggle has been hitherto between two brands of revolutionary "tutelage," and the elections recently held in Kuomintang China to establish the democratic legitimacy of the present regime were not, even on the most generous interpretation, very convincing.

In the absence of any fair means of measuring relative popular support for the rival parties in China, General Chiang Kai-shek's Government might still have gained—or rather retained—general moral support in the United States, if it had shown itself, since the defeat of Japan, an active promoter of social and administrative reform. But shocking manifestations of inefficiency and corruption, particularly the postwar reign of carpet-baggers in Shanghai and Formosa and the malversations of Unrra goods by high officials, have alienated many American observers who cannot be suspected of inclination towards Communism. Indeed, they have been disposed to think well of any deluge which might cleanse the Augean stables. The Communists by contrast have won good reports for the honesty of their administration and the personal austerity of their leaders—for the Chinese Communists, who need to bid for the genuine support of the masses, are still in the stage of apostolic poverty. Moreover, their short-term programme of agrarian reform and toleration for private enterprise in industry has seemed harmless enough to foreign business men and liberal politicians, who have even been converted in some cases to the belief that Chinese Communists are a distinct species, distinguished from Communists of other lands by the difference between a grass snake and an adder.

Were it not for the question of China's foreign policy, there can be no doubt that American tactics would be to let events in China take their course and recognise whatever power emerged from the struggle. In Mexico, where a series of revolutionary civil wars took place, with redistribution of land as the main underlying issue, the United States never seriously intervened against the disorder on its very frontier. But the Mexican revolution was independent of international alignments, and did not aim at bringing Mexico into a bloc of nations hostile to the United States. Chinese Communism, on the other hand, shows fundamentally the same gravitation towards the Soviet Union as Communism elsewhere.

It is not true, as is sometimes asserted, that the Chinese Communists were anxious to co-operate with the United States and were only driven to take up an anti-American attitude because of American help for the Kuomintang. They were indeed eager to share in the supply of American lend-lease to China, and were quick to encourage wishful thinking among American

officers and journalists who visited them. But the full orthodoxy of their party line was demonstrated between 1939 and 1941, when they faithfully reproduced Soviet propaganda of the Molotov-Ribbentrop honeymoon and denounced the Anglo-French "imperialist war" and American support for it. There cannot be any reasonable doubt that Communist victory in China would mean its alignment in the Soviet bloc, with the same campaign against all Western influences, political, cultural or economic, that has been going on in the countries of the Russian zone in Europe. From recognition of this probability, American official circles have been slowly and reluctantly drawing the inference that active measures must be taken to prevent the overthrow of what remains internationally the legal Government of China.

To apply the Truman Doctrine in China will be an infinitely more difficult task than applying it in Greece, where the Americans have already met trouble in plenty. It will certainly be necessary not to limit aid to military supplies, but to supplement them with an agency similar to AMAG in Greece, with a

wide range of supervision over the national economy as well as over the finance, training and administration of the Government's military forces. It will not be easy to staff such a mission, for the United States possesses few individuals with the special qualities required for persuading Chinese to do what they would not otherwise be doing. But, even if good working relations could be established, and even if it proved possible to strengthen the Chinese Government's rule in part of China, the suppression of so vast a revolt as has occurred in other parts would be an immensely long and costly undertaking. China is about seventy times the size of Greece, and its division may persist for years or decades. Washington may have to choose—it may indeed already be thinking in such terms—between more and less important or defensible areas.

At present there is no clear-cut front in China; Nanking still has forces in southern Manchuria, while Communist formations are scattered over North China down to the Yangtze. Unless Nanking can show better success than it has met so far in its Manchurian campaign, American advice may be strongly in favour of cutting the Manchurian commitment and concentrating on suppression of the Communists in North China. Such a partition was implied in the deal over Manchuria which President Roosevelt made at Yalta; its significance was to place Manchuria, like Poland, within the Soviet sphere. Even if Nanking were to gain complete military victory in Manchuria, the consequences of Yalta could not be undone, for Russia has now a treaty right to Port Arthur and the trunk railways. Moreover, it is hard to imagine that Russia would watch an American-directed military campaign up to the Amur without a reaction which might bring the world very close to a major war. Manchuria is Chinese and cannot be permanently separated from China, but a Communist "Manchukuo" may be a temporary *pis aller* to be accepted in this two-world period. If the political

NOTES OF THE WEEK

Five Power Pact

The Brussels Treaty is an excellent document: clear, simple in its key clauses, open to the adherence of many other governments, and enlightened in its statement of common social and economic objectives. To compare it with the Dunkirk Treaty of last March between Britain and France is to measure the great distance travelled by the statesmen of western Europe in twelve months.

It is not a regional pact on the lines suggested in the United Nations Charter, because the five Powers can "by agreement" invite "any other state to accede." Yet it leaves obligations under the Charter untouched, and simply ensures that defensive action against an aggressor will be taken jointly and quickly while the Security Council is playing its usually hesitant role. It is a simpler and more swiftly usable instrument than the Rio pact of reciprocal assistance between the American States. In fact, it is just the kind of pact needed to persuade small Powers that it is worth while giving up precarious neutrality in a divided Europe.

So much having been said in its praise, it is legitimate to point out things that the Brussels pact does not do. It does not define aggression by fifth-column or "tourist" methods. Some such definition must be found sooner or later for the ideal treaty; but this one is content to make the signatories promise "all the military and other aid and assistance in their power" if one of them is "the object of an armed attack in Europe." Then there is no specific mention of the colonial territories of four of the five Powers; but Article VII says they can be called together for consultation about "a threat to peace in whatever area this threat should arise." These and other apparent omissions can all be made good if the statesmen who signed the treaty on Wednesday are determined to put stuffing into it.

Three points have to be borne in mind in deciding the exact degree of optimism which the Brussels Treaty should inspire. Firstly, it probably commits our grandchildren to compulsory military service. From the individual and social point of view that is bad; but it is only one of the sacrifices that Western Union may in the long run demand. Secondly, to use the language of

health of mankind is restored such schisms can be remedied; if it deteriorates further, China, with American naval supremacy in the Pacific, would still be better off strategically than in 1937.

But this strategic position would depend on the continued exclusion of Russia or of Communist satellite ascendancy from the present American occupation zone of Korea, as well as from Japan itself. In Korea there is an absolute barrier along the notorious thirty-eighth parallel of latitude. In the north the Russians have enabled the Communists to take power in coalition with several well-purged parties of fellow-travellers and forcibly to eliminate all opposition; in the south the Americans have tried to introduce political democracy, and are about to hold a general election. The Korean Communists have built up a strong army in the north, with Russian training and equipment, and the withdrawal of the occupation forces from Korea would inevitably be followed by an armed struggle, in which the south would probably be defeated. As the Russians will not agree to any unification of Korea prior to withdrawal of the occupation forces, except on terms which would assure Communist ascendancy, there is no prospect of an end to the present deadlock.

The Americans will have to make up their minds whether to surrender Korea entirely to the Russian orbit, or to remain indefinitely in their occupation zone to protect their moiety of the Korean people. The new pattern of American diplomacy suggests that they are unlikely to withdraw; but if they stay, it will be no use merely to keep an isolated beachhead on the Asiatic mainland without any strategic support. In Europe a Western Union would be weak without American military backing, but it would mean something in terms of power. But in the Far East, with a disarmed Japan and a disintegrated China, there is no first line of defence and no buffer; an equilibrium of power can only be maintained if America stands in the breach alone and keeps watch on the Great Wall.

Rugby football, the five countries do not make up a team of international standard. Britain is a useful full-back and France, Belgium and Holland will make quite good three-quarters if they are joined by Italy. Luxemburg will presumably be the traditionally small but plucky scrum-half. But there is a lack of weight and speed, so long as the United States has no representatives in the team. Thirdly, there is nothing in the treaty to show that the signatories intend to pool their military and industrial resources for defence. Much is said about economic, social and cultural co-operation; nothing about standardised equipment, weapons and training. Perhaps ideas like these are to come later; but it is well to realise that what is taken for granted in the pacts of eastern Europe is not yet publicly mentioned in the west.

Burden on Britain

Clearly, much of the value of the treaty will arise from the working of the Consultative Council. This will have a permanent secretariat and should meet in the first place in London. For until 1952, at the earliest, the defensive strength of the Brussels bloc will depend on the power of this country. French forces, particularly the air force, are in a parlous state; the strength of the Dutch army is largely tied up in Indonesia; the Belgians are in the throes of reorganisation.

The Consultative Council will, of course, have economic tasks which will not clash with those of the continuing organisation of the 16 Marshall countries, but its real tests will be political. If, for example, Italy is invited to join the Brussels group—as it should be—there might well be within the next three months a threat to peace in that country which would bring the Council together. But unless the purpose and procedure of this body are carefully thought out beforehand, there is a risk of the threat being dealt with hesitantly and simultaneously by a hierarchy of bodies—the Security Council, the "little assembly" and what will doubtless come to be known as the Western Council. It may be that the time is coming to reconsider the functions of the United Nations organisation,

Truman Doctrine—Stage Two

The Treaty of Brussels does in the sphere of defence what the Sixteen Nations Conference hopes to do in the sphere of economics. It establishes beyond all question the determination of the Western European democracies to help themselves and it lays the foundations upon which the defence and reconstruction of the West can be built. But both at Brussels and Paris it is realised that in present circumstances the efforts of the European nations alone are insufficient to achieve their ends. They must be reinforced and completed by the United States. President Truman's speech before both Houses of Congress, represents the American Government's recognition of its double responsibility. His plea that the Recovery Programme should be speedily passed and that, by adopting military service, America should demonstrate its readiness to support its allies—if necessary by force—places squarely before Congress and before the American people the sacrifices for which they must be ready in order to check aggression and underwrite the risks of defending peace.

The first purpose both of the Brussels Treaty and of the President's Message is to leave the Russians in no doubt of the consequences of further violence and expansion. In 1914 and 1939, lack of certainty about the future policy not only of America but even of Britain gave the aggressors the pretext for believing that they could attack with impunity. To-day, that pretext must be removed. That is the immediate aim of the moves in Brussels and Washington. But the President was right to emphasise the fact that the fundamental purposes of the Western democracies are profoundly pacific:

We shall remain ready and anxious to join with all nations . . . in every possible effort to reach international understanding and agreement. The door has never been closed, nor will it ever be closed, to the Soviet Union or any other nation which will genuinely co-operate in preserving the peace.

The hope of Western Europe and of the United States is that their clear determination to rebuild their community and to defend it against all attack will quieten the adventurous spirits in the Kremlin. They are certain that, provided Russia can be restrained now, time itself will prove their own profoundly pacific intent.

* * *

Miracle in the Commons

One of the oldest traditions in British parliamentary practice is a certain continuity in foreign policy and the readiness of Government and Opposition to take broadly the same line in international affairs. This unity has not, of course, been absolute. Liberals and Conservatives were bitterly at odds on the question of Ireland and there were divided minds in the 1880s over British imperial expansion. But the first occasion on which foreign policy became the chief bone of contention between the parties was during the years of appeasement, when such issues as Spain dominated all others and violent ideological passions were aroused on both sides.

There was at least a chance after the war that a similar division might have arisen, and that once again differences in ideology would have added a sharp edge to the discussion of foreign policy. But Stalin has succeeded after all in making strange bed-fellows. Who would have thought two years ago that the names of Sir Cuthbert Headlam and Mr Ian Mikardo could appear together in the list of signatories supporting any motion, let alone a motion advocating new and startling innovations in the conduct of British foreign policy? Yet the miracle has happened. The unity of British foreign policy has been for the time being restored. Crusted Conservatives and members of the Keep Left group together have signed an all party motion advocating the creation of a political and economic union in Western Europe and the establishment immediately of a Council of Western Europe. This would have powers to create the machinery of integration and to prepare for an eventual federation.

The movement is encouraging and right. It will strengthen Mr Bevin's hand. It will encourage timid spirits in the Foreign Office. It will assure the Government of the widest parliamentary support even for its boldest experiments. Two reservations should, however, be made. Those members who have held back because they wish to move forward in Western Europe only "in agreement" with the Dominions, are showing a wise restraint. "Consultation" is hardly enough to safeguard the feelings and interests of peoples who are closer to Britain in sentiment and tradition than any of its potential European partners. The second reservation concerns the project of federation. As an ultimate aim it is legitimate, but nothing could be more confusing than the injection of constitution-making into West European negotiations for some years to come.

A Whale of a Victory

After Paisley and Wigan, the result of the by-election at North Croydon must have come as something of a shock to the Government. The Conservatives not only managed to retain the seat but increased their majority by just short of 11,000 votes. This result has naturally been hailed by Lord Woolton as a conspicuous triumph for his party, and it is certainly significant that of the enlarged electorate three-quarters voted—a very high percentage for a by-election. As in the general election, there were three candidates: Mr Harris, the Conservative had the advantage of being a well-known local figure; the Labour candidate was Mr Harold Nicolson, whose original method of campaigning was not perhaps calculated to captivate a suburban electorate; while the Liberal candidature of Air Vice-Marshal Bennett—who like so many Liberal candidates in recent by-elections, forfeited his deposit—must have struck the public as something of a stunt. Moreover, the seat was traditionally Conservative; since the Conservatives managed to retain it in the general election, though only by a very small majority, the result was hardly surprising—except for the size of the majority, which was no doubt assisted by the opportune participation of Mr Churchill in the critical last phase of the campaign.

But even when all due allowance has been made for these factors, it would be a mistake to underrate the significance of this symptom of a turn in the tide of public opinion. The Conservatives indeed have claimed for their industrial charter a large share in the merit of the victory, but it may perhaps be doubted whether this really played the determining part. It would appear more probable that the Communist coup in Czechoslovakia and the suicide of Mr Masaryk were decisive in turning votes; and it seems fairly plain that on this occasion the Liberal votes which did not go to the Liberal candidate, who polled less than two-thirds of his predecessor's total in the general election, went to the Conservatives and not to Labour. Nor can the shock administered to the public by the Economic Survey be entirely ruled out. Though few of the electorate would have had the opportunity of digesting it before polling day, its main features had been given publicity in the press, and there must have been not a few electors who drew their own conclusions from so candid a comment on the success of Government planning. Though it would be easy enough to exaggerate the importance of a single poll, North Croydon is certainly, as Sir Richard Acland candidly described it, a whale of a victory, which gives a much more palpable indication than any previous by-election of the potentialities of the floating vote.

* * *

Electoral Reform

This week's debate in the House of Commons on the Committee stage of the Representation of the People Bill dealt only with the University seats and the City of London. It was hardly to be expected that any novel arguments would emerge, but the case against the University representation was obliquely given away on the Labour side by Mr Chamberlain, who maintained that they should be represented in the Lords rather than in the Commons. And the most convincing defence of it on general grounds was provided from the Labour side of the House by Mr Skeffington-Lodge, who with great courage voted with the Opposition for the retention of the University franchise. On purely abstract grounds the defence of the City of London seats, which is bound up with the existence of the business vote, is more difficult to sustain, and Mr Assheton's suggestion that all who worked in the City should be given the alternative of registering there hardly seems very practicable.

As was only to be expected, the charge against the Government of a breach of faith in failing to confine themselves to the agreements reached in the Speaker's Conference of 1944 again figured prominently. After it had been refuted somewhat perfunctorily by Mr Morrison, it was pressed with great vigour by Sir Arthur Salter, and formed as it were the *basso continuo* to the whole debate. And even if in this matter the Government is given the benefit of the doubt, the fact remains that it cannot be acquitted of sinning against the important unwritten convention that constitutional changes should be made wherever possible by agreement, and the offence would still be rank, even if on the merits of the case the abolition of these constituencies were justified. Despite the strong emphasis which Government spokesmen have laid on the abstract principle of "one man, one vote," they have been unable to refute the suggestions of class bias in their handling of the University vote. Even in the case of the City of London it might have been wiser to display a little magnanimity—to say nothing of a respect for history—by pre-

serving some form of representation for it. As things are, with an Opposition unreconciled to these dubious changes, the only result can be a lamentable prospect of constitutional tinkering.

* * *

Four Minds on Libya

The four-Power commission on the future of the ex-Italian colonies has moved into Libya in a state of mind that is, to say the least, unpromising. In Eritrea and Somalia, where it has finished its inspection, its members have found agreement difficult even on matters of fact. Their Eritrean report, though finished, is said to be peppered with blank paragraphs and dissenting footnotes. Their Somalia report is not yet drafted; they propose to complete it during their Libyan afternoons. To crown all, each delegate approaches Libya with a preconceived, and different, notion in his head. The French member wants an Italian trusteeship because France wants an "old colonial" type of administration in a territory that adjoins four French dependencies—Tunisia, Algeria, French West Africa and Chad. The French Government, which is already in charge of the Fezzan province of southern Libya, wishes, if humanly possible, to retain this area as a shock-absorber.

The Russians also support Italy as sole trustee, because they hope thereby to help Signor Togliatti and his Communists in the Italian elections. The Americans, wanting to influence the Italian elections in the opposite direction, also favour an Italian share in Libya's management. The Italian vote in America and this year's Presidential election are probably also in their mind. The British, remembering their own strategic interests as well as a promise they have several times given to the Cyrenaican Senussi, intend to see that Cyrenaica shall not come under Italian domination. In a situation so bedevilled by power politics, what hope have the Libyans of being "consulted"? And what hope is there of a united Libya? The answer to both questions is: None.

The Libyans' chances of a proper hearing would be greater if they were agreed upon a workable plan for their future. As it is, they agree upon two points only: that they want independence and that no one wants the Italians back. In both they are, of course, vigorously supported by the Arab League. All brush aside the awkward fact that a Libyan state is, by the economic standards it now knows, not economically viable. And, failing independence, all are at sixes and sevens about making a second choice. Some favour a collective trusteeship. Some, particularly in Tripoli, would welcome the Americans. Most Cyrenaicans would prefer the devil they know and to keep the British.

Though divided on domestic details the Cyrenaicans and Tripolitarians have made some effort to speak with one voice to the commission, but outside factors keep pulling them apart. The Senussi Emir, for instance, having measured the pressure to restore Italy in Tripolitania, wonders whether he would not do best to discard the United Libya idea and to shelter under the umbrella of the British promise in a smaller area. In Cyrenaica, he has mustered all parties into a National Congress. In Tripolitania, where there is more political dissension and less leadership, a similar operation is being attempted by a recently returned emigré called Beshir Bey Saadawi.

All told, the Commissioners must expect a babel of opinion, swelled by the voices of Egypt (speaking for the Arab League but at the same time wanting the oasis of Jarabub and the Sollum escarpment); of the local Italians, a few of whom are even flirting with Arab independence groups; of the Italian majority and the Italian exiles, who are of quite another mind; of Russia, which is asking what the American air force is doing on the aerodrome at Mehaha, and of several states which ask whether it is in order for the British to use Cyrenaica as a park for forces leaving Palestine.

The omens are set for yet another major Great Power disagreement. The alternatives ahead are, on the one hand, a ruthless bargain on a basis of power politics; on the other, recourse to the sequel already planned: reference of the problem to the next UN Assembly. Here is an even gloomier prospect. For the Italians should be able to muster in that body at least as many votes as the Zionists. If so, will 1948 see a second vote for a fight to instal an immigrant people?

* * *

Transjordan Treaty

Transjordan's new Treaty of Alliance with Britain is a neatly tailored job—diplomats are calling it the "New Look Treaty." Some of them add a hope that it does not, like the New Look, cover more than it reveals. It has some features in common with the ill-fated Treaty with Iraq—notably the Anglo-Transjordan Joint

Defence Board, an advisory body of equal numbers of British and Transjordan military representatives to co-ordinate defence policy. But it discards those features of the older Anglo-Transjordan Treaty which were considered incompatible with full sovereignty. An Annex provides that, until it is agreed "that the state of world security renders such measures unnecessary," King Abdullah will invite Britain to maintain RAF units at Amman and Mafrak. There are, however, no extra-territorial privileges at such airfields, which remain under Transjordan command. There is no provision for stationing British land forces in Transjordan in time of peace, but they are to have full transit facilities, and British "operational units" are to engage in joint training operations with the Transjordan armed forces "for a sufficient period in each year."

Accompanying letters assure British financial assistance for Transjordan and help in carrying out "extensive plans in economic and social development," and draw attention to Transjordan's regard for its obligations under the Arab League Covenant. Indeed, despite 20 years of good government and steady progress, Transjordan is not yet an economically self-supporting entity. King Abdullah is as financially dependent on Britain as his rival King Ibn Saud is on the American oil companies. But nationalism is habitually more suspicious of foreign governments than of foreign companies, and the fact may as well be faced that this new Treaty will be criticised by many nationalists in the Arab world.

They will not be the only ones. The absorption of the Arab remnant of Palestine after partition in Transjordan has often seemed desirable to the Zionists, who fear Abdullah less than the Mufti. But Mr Ben Gurion was bitterly criticised for such a view the other day by *Al Hamishmar*, organ of the influential Jewish pro-Soviet bloc, on the ground that if "British bases" were to be set up in Arab Palestine, they would be "a permanent threat" to Jewish "neutrality and security."

Quick Returns from the Colonies?

Reports from committees on colonial development are showering on an expectant public. Two have appeared during the past week, and more are due shortly. The first two—interim reports from the Colonial Primary Products Committee and the Development Co-ordinating Commission for Southern Rhodesia—concentrate on dispelling the prevalent dreams of a Colonial Empire, flowing with milk and honey, which has only to be tapped to fill British bellies overnight.

The Primary Products Committee have so far surveyed the general question of how soon, and by how much, food production in the Colonies can be increased. They point out that the lack of adequate communications, of transport, of skilled labour and of capital equipment of all kinds, and the presence of such obstacles as soil erosion, primitive husbandry and political eruptions mean that colonial development must almost everywhere be looked upon as a long-term investment. In particular, the shortage of agricultural equipment is world-wide, and, moreover, the introduction of a high degree of mechanisation in areas where husbandry is still primitive will bring with it a social revolution. In a section dealing in detail with the principal agricultural commodities, the committee present a formidable account of the difficulties to be overcome. The possibilities of development are shown to be great, but it is obvious that it will be several years before the fruits of any schemes started now are likely to mature.

The report of Sir Miles Thomas on Southern Rhodesia is no less revealing. The lack of adequate transport is shown to be the greatest single drawback to the colony's development. The grandiose ideas represented by the Sabi Basin project and the expansion of the coal mines at Wankie—which hope to export 3,000,000 tons of coal—are directly dependent upon improved railways. Shortages of other items such as cement, bricks and water-piping also govern the speed of the colony's development. In an interesting graph, based on reasonable expectations of capital equipment, Sir Miles Thomas shows that Southern Rhodesia may achieve a 50 per cent increase in production by January, 1950. During 1948 production will increase by only 5 per cent.

Both reports show that the British Government must draw up immediately a list of priorities for the export of capital equipment. The need for dollars now must be weighed against the possible return from the colonies in the future. And the potential production of the colonies themselves must be carefully analysed. It is becoming more and more obvious, for instance, that a quicker return can be expected from expanding the food and

mineral products of the West Indies or Malaya, where the groundwork has already been done, than from starting from scratch in virgin Africa.

* * *

FBI and Prices

The reply of the Federation of British Industries (with which the Association of British Chambers of Commerce and the National Union of Manufacturers are associated) to Sir Stafford Cripps's request to make proposals for a reduction in prices goes quite as far as could be expected. It meets the Chancellor of the Exchequer rather more than half-way in his attempt to obtain a voluntary stabilisation of wages and prices and has been welcomed by him as a good basis for action. Though it hints very pertinently that the stabilisation of wages at the present level, combined with a reduction in prices, would merely involve a continuation of inflationary pressure, it accepts for the period of one year the limitation of dividends, which is discussed in a note on page 466, and recommends reductions in prices of goods and services wherever possible. But the view taken of this possibility is naturally far from optimistic, since selling prices have not yet been adjusted to sharp increases which have recently taken place in manufacturing costs, and some formidable recent increases in the cost of various raw materials are quoted, such as wool, cotton, leather, wood pulp and coal.

After emphasising that the real key to a reduction of costs and prices is increased productivity, some hope is held out for a reduction of prices—in some (unspecified) industries—even though this will entail reduced profits. But this hope is qualified by the statement that it is not immediately possible in many industries for price reductions to be made. Finally, the Government is reminded that in the matter of fuel and transport what is sauce for the goose is also sauce for the gander, and is urged to create a substantial budgetary surplus, not by increasing taxation but by reducing expenditure.

The replies of the National Joint Standing Committee on Wholesale Distribution, and the Retail Distributive Trades Conference display a similar co-operative spirit, but their real import can be summed up as *Tirez les premiers, Messieurs du Gouvernement*. Voluntary deflation by mutual agreement is not as easy as it sounds, as the recent experience has shown. Nor would it seem that the prospects of its success are rated very highly in the Economic Survey. The principal measures necessary to cure inflation are well known, but the medicine is certainly a bitter one which the public has too long been encouraged to regard as a poison. It is therefore natural enough in the circumstances that the Government's attempt to cope with the economic crisis should assume the aspect of a political deal, the only bait by which trade union opinion could be persuaded to swallow a policy of wage stabilisation. But that is just what makes the present situation so desperately serious. For until the man in the street can be made to look at the facts in all their nakedness, it will hardly be practicable for a Labour Government to take the drastic measures that are known, at any rate by its more instructed members, to be vitally necessary. Some advance in this direction has been made in the Economic Survey, the popular version of which, though far from perfect, is at any rate an improvement on its predecessor. Meanwhile the country will await Sir Stafford Cripps's first Budget with heightened expectation. Is it still too much to hope that it will contain some really sound deflationary measures?

* * *

The Cost of Mr Strachey

The civil estimate of the Ministry of Food for 1948-49 which was presented to Parliament last week caused a little surprise and much unjustified jubilation. The total cost was given as £320 million against £476 million in 1947-48—an apparent reduction of over £150 million. Is this the first fruits of lower world food prices? Clearly not, because the cost in 1947-48 was made up of an original estimate of over £333 million and a supplementary one of over £142 million, of which £100 million was the pre-payment to Argentina for food supplies which will arrive in this country during the coming financial year. Hence the cost for the twelve months beginning next April should be £420 million compared with £376 million in the present year—a net increase of £44 million. And if past experience is any reliable guide, even this figure may prove to be too low by March 31, 1949.

So, too, with the deficit on the trading services—the sum budgeted for in 1948-49 is £302 million, but this figure should, in fact, be nearer £400 million if account is taken of the payment already made to Argentina. The deficit for 1947-48 was £364

million—a clear indication of the rising trend in the cost of subsidies. But the civil estimate represents a request to Parliament for money to carry on the Ministry of Food's work over the ensuing twelve months. It does not show the cost of subsidies which the country has to bear and which can only be revealed by the Ministry's trading accounts. Mr Strachey has promised publication of these accounts for 1946-47 at an early date, and when they are available it should be possible to recalculate the subsidy for that particular year. But it will be at least twelve months out of date and thus mainly of academic interest.

The only possibility of calculating the current cost of subsidies from the new civil estimates is by making certain assumptions regarding trading and stock policy, which necessitates a calculation of the level of food stocks in this country. Even without this, it is obvious from the increased food prices Britain has agreed to pay under various contracts that next year's subsidies will cost more than the current ones, unless retail prices are allowed to rise. And the fundamental question which has to be answered is whether this increased cost is genuinely forced on Britain by extraneous circumstances or the result of the Government's purchasing policy. Parliamentary debates on this topic—and indeed any discussion at all—must necessarily be unsatisfactory until the relevant details on the Ministry's trading operations are published. Mr Strachey last week again defended secrecy of the Argentine meat and maize prices as the usual practice of private trading. But he forgot to add that private traders do not use public money. However, if those who desire to know what price Britain has paid to Argentina—or even Russia—will exercise a little patience, these details can be obtained from the appropriate monthly trade returns published by the Customs and Excise.

Labour Lessons from Queensland

The great transport strike in Queensland, which is now in its seventh week, is threatening to spread throughout Australia. The strong measures taken by Mr Hanlon, the Prime Minister of Queensland, have not succeeded in bringing the strikers to heel; they have instead given the Communists an opportunity to make political capital out of what was originally little more than a petty annoyance. There are now more than 31,000 transport workers on strike, including the powerful Seamen's and Waterside Workers' unions. Trade is being brought to a standstill—22 ships are blocked in the ports, 200,000 tons of butter for Britain are waiting to be loaded, the delivery of £3,000,000 worth of wool is being held up, and inland towns in the State are suffering a severe shortage of food.

The strike began by the refusal of the Queensland Industrial Court to hear out of turn a claim by the railway metal workers. There were some 349 other claims to be heard, and the Court would not allow itself to be stamped into breaking the queue. The 600 metal workers then struck, preventing the servicing of locomotives, which in turn caused 18,000 engine-drivers and station hands to be stood down. Mr Hanlon thereupon declared the strike to be illegal and tried to force the strikers back to work. Communist agitators were suppressed, but they were nevertheless able to seize the lead, and called out the waterside workers', seamen's and miners' unions in sympathy.

The Australian Labour Party has always put its faith in the arbitration and industrial courts to settle disputes, and Mr Chifley has backed Mr Hanlon in all his efforts to subdue the strikers. The Federal and State Governments are also doing their best to confine the struggle to Queensland; but well-known Communist leaders from other States, particularly from New South Wales, have gone to the strike centre. It is probable that they will try to spread the strike throughout Australia. The unions in New South Wales have already banned rail freight between the two States.

There is no doubt that most Australians are opposed to the Communists and that the Labour Party will win the struggle. But the lesson of the Queensland strikes is clear: action against Communists, unless taken with skill and patience, plays into their hands by inflaming the workers' fear of suppression. Mr Hanlon, provoked though he was, acted rashly and aroused precisely those fears which the Labour Party was put in power to remove.

* * *

How Much Room in Australia?

At a time when it is proving so expensive to bring food to the British people from abroad, it is natural that Sir Stafford

Cripps and others should be thinking of how the people might be brought to the food. And there have been reports recently, arising out of hints dropped in Australia by Mr Calwell, the Minister for Immigration, that some big new scheme is hatching. Whether this might be a straightforward emigration scheme, or a development of the idea that there should be planned dispersal of skilled labour in the Commonwealth for defence purposes, is not clear. In either case the long-range immigration prospects in Australia are uncertain.

There is no question of admitting immediately 250,000 British emigrants, as has been suggested. The annual "absorption quota" is about 2 per cent of the population, namely, 140,000 people, of which half are provided by natural increase in Australia itself. This year the Australian Government is expecting 70,000 immigrants: between 30,000 and 35,000 from Britain, half the remainder from Europe (including 10,000 displaced persons) and the other half from the United States. Private, unassisted emigration from Britain is already larger than the shipping companies can cope with: it will take two and a-half years to work off the waiting list of 35,000. Australia House is still receiving some 3,000 applications weekly for immigration permits.

Anything like planned emigration to Australia—or any other Dominion—is impossible until it has been decided in London what "planning" implies, and whether dispersal of skill is more beneficial to defence than harmful to production. There is the further difficulty that the Australian Government has not worked out its absorption curve for future years, and cannot forecast with any accuracy the immigration possibilities that lie ahead.

* * *

The Doctors Declare War

After the storm created by the results of the doctors' plebiscite there has been a lull; during it the public has been left to speculate about the point at which the thunder would break out again. On Wednesday the storm broke afresh. A BMA meeting of nearly 400 doctors from all over the Kingdom unanimously decided not to enter the National Health Service on July 5th unless substantial changes are made in the Act. And a Scottish amendment declaring willingness to reopen negotiations with the Government was overwhelmingly defeated. Moreover an independence fund was established, to which it was announced that £400,000 had been voted by the National Insurance Defence Trust as an initial contribution. There are thus no signs that the *impasse* which threatens to wreck the new service will be avoided.

The doctors have certainly missed a valuable opportunity of contributing some constructive proposals. It is on the constructive side that they are most vulnerable to criticism. Bit by bit they have retreated from the proposals put forward by their own Planning Commission in 1942, and now that they have enormously strengthened their position by the plebiscite, they can afford to be generous. But they are still obviously unwilling to make the first move.

The position on the Minister's side is psychologically more complicated. Temperament and politics combine to make concession difficult. It is to be hoped, however, that in private Mr Bevan has at last brought himself to believe that he is his own worst enemy. At the conference, Dr Guy Dain's words that the Minister's powers were far too absolute and Lord Horder's claim that it was for liberty that the doctors were fighting both evoked roars of applause. The Minister must now realise that, the doctors' fears of dictatorship are very real, even if unfounded, and that it is his own handling of the situation rather than the terms of the Act which have made them so. The solid barrier of difference between the two parties is in fact small, but it is of great importance, and it is concerned almost entirely with the issue of freedom from control. A little unbending by Mr Bevan could even now bring about agreement.

* * *

Tourist Travel Restored

Sir Stafford Cripps's long-expected announcement in the House of Commons on Tuesday, giving a list of eight countries to which foreign travel for pleasure is to be permitted, will certainly be welcomed—if only as a first instalment of the restoration of freedom in international movement. As from May 1st tourists will be permitted to travel to Austria, Denmark, France, Italy, the Netherlands, Norway, Portugal and Switzerland, with a foreign currency allowance of £35 for adults and £25 for children—hardly an extravagant sum, yet in the circumstances perhaps as large as could be expected. With the exception of Switzerland, to which travel is to be limited by quota, none of

the hardest currency countries is included and two omissions are particularly notable—Belgium and Sweden. But as the Chancellor of the Exchequer pointed out, the eight countries do not necessarily constitute a final list and it may be possible to add one or two more within a few weeks.

In the light of Britain's foreign exchange difficulties, the public must be content to be thankful for small mercies. But it is a sad commentary on the postwar world that freedom of travel, one of the more important spiritual freedoms of mankind, should be enchained in the meshes of bilateralism. Nevertheless, after six months staying at home the prospect of even partial relief is stimulating, and to-day, when the issue of the union of Western Europe is so pressing, the restoration of travel facilities is particularly welcome. And on the material side it must be remembered that tourism need not be a unilateral business, even though as far as Europe is concerned the balance of flow is from rather than to this country. The renewal of British tourism abroad should help to stimulate a mutual exchange of intercourse, and the tourist industry in this country, difficult as the circumstances are today, has an opportunity of developing an important contribution to the nation's balance of payments.

* * *

Communists and the BBC

Last week's brief debate on the BBC would have had little significance had it not raised the question of Communism in broadcasting. Two members accused the Corporation of harbouring Communists, particularly in its overseas services, and allowing distortions to creep into its broadcasting as a result. A couple of days later the Prime Minister was challenged, after his statement that Communists would be removed from positions involving the nation's security, to say whether similar steps would be taken in the BBC.

It is clearly important for public opinion not to lose its head on this matter of Communism and to end in such ridiculous witch-hunts as those conducted by Congressman Thomas in the United States. Nothing in the Prime Minister's statement warrants a general attack upon the Communists' right to hold their views, to express them and to be employed in work for which they are competent and which has no bearing on national security. The number of jobs vitally concerned with security within the BBC cannot normally be very large. For the rest, an official who does his or her work conscientiously and does not violate the fundamental requirements of the BBC cannot be chased out for political opinions which do not affect the quality of the work.

But it has to be remembered that the "fundamental requirements" are rigid and exacting. Their basis is strict impartiality and the Corporation's duty to give an unbiased and accurate reflection of public opinion and public thought. If any BBC official is found tampering with the news, or pressing Communist or Marxist views in a manner out of keeping with their strength in the community at large, then the case for dismissal is obvious. The BBC will presumably exercise especial vigilance now that events in Prague have shown the Communists' methods of undercover activity in every branch of society. But the case for dismissal must depend, not on views, but on dereliction of duty.

* * *

Sweden and the Risks of War

It is neither cheap nor comfortable to be Minister of Defence of a small power in Europe today, even if its policy is directed towards neutrality. The Swedish Defence Minister, Mr Vougt, who several months ago supported the defence committee in their desire to cut the High Command's budget estimates from 1,050 million kronor to 810 million, has been made so uncomfortable by the trend of events that he now considers "the basis of defence calculations has altered" and supports the higher figure. The Chief of his General Staff, General Jung, had earlier criticised the reduced estimates in a manner reminiscent of the days when he led the "Jung Turks." Russia's actions in Czechoslovakia and Finland has underlined his warnings; for Russian bases in Finland are only under 200 miles from Stockholm.

Since Sweden's forces, which are very modern and well-equipped, are organised for defence, the emphasis is on fighter aircraft—mainly de Havilland "Vampires"—and light naval craft, although the new *Tre Kronor* and *Göta Lejon* are two of the most modern cruisers afloat anywhere. If no cuts are made in the defence estimates, it is likely that the extra money will be spent mainly on day fighter aircraft and partly on night fighters. The defence committee's proposals regarding the size

of the forces and the length of service will probably stand, particularly since a new system of "time and motion study" training is proving very successful. If so, conscripts will serve for nine months. This is considered the minimum time in which men can acquire at least the rudiments of winter fighting.

For a knowledge of winter fighting is necessary in the north of the country, and if Sweden fights, it expects to fight there. Recent manoeuvres of the Finnish Army in Lapland and the prevalent Scandinavian view, that Russia's main purpose in forcing an alliance on Finland is to put the Red Army in an advantageous position to control the north, do nothing to weaken this opinion. Lying half-way between American bases in Greenland and Russian industrial centres in the Urals, northern Scandinavia is likely to be watched carefully by both World Powers. Here could be established airfields, controlled weapon sites and radar stations, both for offence and defence. Secondly, through the north of Sweden goes the only adequate land route to Narvik—through an area which valuable iron deposits make an attractive prize in itself. And Narvik is important both as controlling a large part of the iron-ore trade and for its potential value to the defence of the north Russian ports.

Recent scientific developments have opened up such vast potentialities to the designers of weapons that no country dares commit itself to a large expenditure on present types of equipment. Recent policy has been to compromise all round. Long a producer of excellent guns, Sweden has recently acquired licences for the manufacture of items like jet engines. Much specialised equipment—radar, for example—has also been bought; and its development goes on in Sweden. Such production at home is less economic than the purchase of arms abroad, but it is safer. These patents and this equipment have come from the West—inevitably, for the East will not sell. Hence the tendency sometimes to consider Sweden as more committed to the West than in fact it is. There is influential support for real co-operation with the West, but self-reliance and self-defence are the basis of Sweden's continued neutrality.

* * *

New Leader for China?

The new American interest in the affairs of China arising out of demands for an extension of the Truman Doctrine to the Far East, gives a special significance to a struggle for power now reported to be going on in Nanking. The Government's military defeats, the incessant currency inflation and the absence of any clear or effective economic policy are said to have at last seriously undermined the personal prestige of President Chiang Kai-shek himself. There is a widespread demand within his own camp for a leader younger, more dynamic and less bound up with the "Old Guard" of the Kuomintang. Respect for Chiang is still expected to be sufficient to ensure his re-election to the Presidency when the National Assembly meets in April, but it is recognised that, if a man of strong character with powerful political backing were to be elected to the vice-presidency, the latter might in practice wield an even greater authority in present circumstances.

The party machine's favourite for the post is the elderly Yu Yuen, a respectable but ineffective figure, who would be unlikely to cause any embarrassment to President Chiang or his entourage. But a numerous faction, gathered together from military, business and literary circles, has been canvassing for General Li Tsung-jen,

at present director of the Government's military headquarters in Peking. Aged 57, Li was the principal organiser of the administration which made Kwangsi one of the best governed of Chinese provinces, and his military record has been outstanding; the reluctance of the Government to give him one of the highest military posts has perhaps been due to jealousy of his popularity. His participation at a high level in the central government might well give it the reinvigoration which it so badly needs. In China at present it seems that only a military man can provide real political leadership, for influence over the army—or rather armies—is essential as a foundation for power.

* * *

France and Vietnam

At a time when the trend of French internal politics appears to be towards Gaullism, France's unfinished war in Indo-China is one of the principal factors posing to Frenchmen the question of national power and prestige. Two and a half years after French troops landed at Saigon to take, with British assistance, the surrender of the local Japanese forces, there is still no solution in sight for the political problem of Indo-China. The military campaign in recent months has been far from satisfactory for the French. They hold the principal towns, but they are faced with an extremely well-organised and stubborn guerilla warfare; their convoys are frequently ambushed, with serious loss of life, and even the use of air power avails little against a mobile enemy who disappears into the jungle whenever closely threatened. The protracted struggle is costly for France and it destroys the productivity and trade of Indo-China, so that there are virtually no export surpluses of commodities to offset the drain on French resources.

Politically, all negotiation with the Vietnam Government headed by Ho Chi Minh has been abandoned; the final rupture was marked by the arrest in Paris at the end of January of Tran Ngoc Danh, the head of the Vietnam delegation to France, on a charge of "inciting acts to endanger French territory and publication of false news." As their alternative to coming to terms with Ho Chi Minh and the Vietnamese nationalist party, the Viet Minh, the French have been negotiating with the ex-emperor Bao Dai, who abdicated under Viet Minh pressure in 1945 and was living in retirement in Hongkong until invited by the French Government to enter into talks for setting up a new regime in Vietnam. The old royal dynasty was almost completely deprived of actual power by the French; but its heir would probably have rather more standing in Vietnam than the undistinguished personalities who have so far shown willingness to work with the French, and have to go about in armoured cars for fear of assassination. Bao Dai, however, has claimed a substantial autonomy for Vietnam and wants to see clear evidence of military victory before finally committing itself.

France is now faced with a dilemma; either it must cut its losses, withdraw its forces and come to the best terms it can with Ho Chi Minh as the only possessor of real power in Vietnam; or else it must treat the military campaign as a serious war and make a much bigger effort than has been made so far to crush the Viet Minh resistance. The French cannot now achieve a friendly parting in the manner of the British quitting of India and Burma. Sooner than merely accept military defeat, they will probably intensify their attempt at reconquest. Impatience at a mismanaged colonial war is already an important factor aiding the cause of General de Gaulle.

Letters to the Editor

Basic Petrol

SIR,—The Government has promised a statement this month on the question of the basic petrol ration. I suggest that further consideration of some factors to which too little attention has so far been paid is first desirable.

The question is usually discussed as if it depended upon whether the direct saving, estimated by the Government at about £9 million worth of dollars a year, made the personal hardship involved worth while. If this were indeed the issue I should myself not doubt that, though £9 million is only about 1½ per cent of last year's dollar deficit, the ban ought certainly to be continued. The real question is, however, what loss of dollar earning is to be set against the direct dollar saving, and whether indeed there is likely to be any *net* dollar gain at all. This seems to me doubtful for two reasons.

1. There is a loss to the revenue, through petrol duty and licences alone, of £19 million—that is an addition to the inflationary excess of that amount. The contrast with the increase in the tobacco duty is striking. In that case the direct dollar-saving was estimated at £7½ million, and the *gain* to the revenue (i.e., the decrease of the inflationary excess) at ten times as much, £75 million. It was this second advantage that made the increase of duty well worth while. £19 millions added to the inflationary excess is a formidable matter. I need not here argue either that the measures at present proposed will not eliminate the general inflationary excess, which makes all economic inducements the enemy, instead of the ally, of national policy, diverting enterprise, manpower and materials to the least essential or desirable purposes, with adverse effects on the production of essentials, including dollar-earnings exports. Let me be more particular. Is it not obvious that some of the £19 million more left in the consumers' pockets will (in spite of all controls) increase the purchase of dollar imports? Is it not also certain that *some* of the excess money, additional to the £19 million, would have been spent on e.g. hotel accommodation in country hotels which will now be left wasted, and will now be available for expenditure on articles involving current effort—in other words the inflationary excess will be increased not only by an addition to spendable money but by a reduction of purchasable services?

2. Tourist expenditure here is an important invisible export. Hotels are now being closed down, with the consequence, of which Sir Alexander Maxwell has sharply reminded us, that accommodation for American tourists will be seriously affected. Quality as well as quantity will suffer; and the severe restrictions on tourist petrol allowances will discourage one type of remunerative tourist—the one who brings his car. It is surely likely that the general reduction of tourist amenities (more serious than in other countries attractive to dollar-tourists) will cause a loss of dollar-earning which will be a formidable offset against the direct saving.

If we could calculate exactly the ultimate results of these two kinds of dollar losses, as of course we cannot, would there be any *net* dollar gain at all as the reward of the personal hardship? I suggest that it is at least doubtful and that there may even be a final net loss. It is the temptation of the planner to reckon only the first results, and not the secondary consequences, of a particular action; it is the temptation of the statistician to ignore a factor which he cannot exactly evaluate, even though on a broad view it is the most important. As secondary consequences are normally more difficult to calculate than the direct ones, the planner, advised by his statisticians, is constantly in danger of doing more harm than good. And the petrol ban is a striking example of this general truth.

Are we sure that the personal hardship caused by the ban has any dollar saving to reward it? Are we sure even that it will not result in an actual net loss of dollars?—Yours faithfully,

ARTHUR SALTER

West House, Glebe Place, Chelsea, S.W.3

Reshaping the Balance Sheet

SIR,—The article on the new Companies Act contained in *The Economist* of March 6th concludes with the suggestion that there is, as yet, but little stirring of thought among accountants on the problem of making adequate provision in the form of depreciation for the replacement of fixed assets. Although the interest of British accountants in this problem may be of relatively recent date, and the results of that interest little apparent, it is perhaps hardly fair to suggest that they have not yet begun to think about it. The apparent reluctance of professional accountants to recognise that the orthodox methods may involve an insidious erosion of capital and an overstatement of current earnings derives, I think, from their ingrained conviction that a

pound is still a pound, and that in dealing with fixed assets regard must be had to ascertained "facts"—viz., historical cost—rather than to computations based on hypothetical circumstances and unknown quantities.

In order, therefore, to overcome accounting prejudices the solution seems to be to call for a restatement of fixed assets and depreciation accounts and, consequentially, the capital account, in the terms of present-day monetary values, depreciation being computed on the basis of the "revalorized" asset instead of on a hypothetical replacement cost. The application of this method, of course, requires the use of an index or co-efficient for the conversion of pounds of varying values expended over a period of years into pounds of present-day value, and opinions would be welcomed from your readers as to what would be the most appropriate basis for the drawing up of a list of indices for this purpose. This technique has been widely adopted in countries where currency depreciation has been more marked than in our own, and it is now in use even in the United States. Nothing like "accuracy" is, of course, claimed for this method, but the abandonment of the fetish of historical cost should lead to a more realistic appreciation of the long-term prospects of industrial undertakings and would do something to facilitate the maintenance of their real capital.—Yours faithfully,

E. L. WRIGHT

1, Emberton House, Shakespeare Road, Bedford

Disturbances on the Gold Coast

SIR,—The Accra riots are to be the subject of an official inquiry, as has been stated in the House of Commons. It would be improper to anticipate their findings as to the causes of the disorder.

Two statements in the article of your issue of March 13th are, however, likely to cause grave misunderstanding in this country; and, as they are contrary to fact, I feel sure you will permit me to correct them.

The procession of ex-Servicemen had not been organised to present a petition to the Governor, nor had any application to

From *The Economist* of 1848

March 18, 1848.

THREE times within sixty years the Government of France has been destroyed by a revolution. Improving by practice, each revolution has been accomplished more rapidly and completely than its predecessor. The last, more like a flash of lightning than an ordinary series of human actions, has instantly destroyed the throne, and covered the land with the ruins. Each successive government, either ignorant of the volcano on which it rested, or ignorant of the means to disperse it, has allowed the danger to accumulate till it has tumbled down the government and all the interests that depend on it. We cannot imagine that the ruin was unavoidable . . .

A peurile ambition, and a false creed were the basis of the mighty mischief. France, Europe, and the world at large, believe that nature has done nothing for the order of society, and has left the whole human family a prey to anarchy . . . With the natural system such a government as that of Louis Philippe is perpetually at war. To a certain point it succeeds, then nature can be constrained no further, and the false system is shattered into ruin . . . The whiffing away of the government of Louis Philippe is the most impressive injunction against the centralising and meddling system that has yet been issued from the high court of nature's chancery . . .

To the Editor of the *Economist*.

SIR,—Having been in the House last night during the debate on Mr Ewart's motion for the total repeal of the punishment of death, I feel called upon, as a matter of duty, to offer a few remarks on the subject.

Like Mr Muntz, I have been tried for a criminal offence by a judge and jury, but was less fortunate than him, though equally innocent, and found guilty, but afterwards received a *free pardon*.

Judges and juries, it has been too amply proved, have been, and will continue to be, deceived by false evidence and appearances and *misrepresentation*. On this ground alone, therefore, I contend that man should *not* by law be allowed to take that away which he cannot bestow. . . .

I am, Sir, yours, etc.,

A late Pardoned Convict and Chemist, C.B.

see the Governor been made either on that afternoon or at any previous time. The procession moved along a previously agreed route to the office of the Colonial Secretary, and the petition had in fact been duly presented to and received by him before any disorder occurred. The delegation of six persons which presented it had been assured that it would be forwarded to the Governor.

It was only after this had taken place that the organisers, in breach of arrangements previously agreed to, attempted to lead their followers to the Governor's residence, which is in a different part of the town.—Yours faithfully,

Lessons from German Oil Technique

SIR,—The statement in *The Economist* of March 13th is of particular interest to me because I used to live in Nigeria, in which there are large deposits of lignite, which are considered suitable for manufacture into petroleum. The Imperial Institute conducted experiments on the suitability of Nigerian lignite for this purpose and published the results, before the war, in their quarterly publication, the reference to which I have not at hand. It was stated therein that Nigerian lignite was more suitable than the lignite used in Germany. The decision to make petroleum in South Africa from soft coal inspires the question, could the same not be done in Nigeria? Could machinery used by the Germans for the purpose not be acquired and used in Nigeria?—Yours faithfully,

C. W. GREENIDGE

Denison House, Vauxhall Bridge Road, London, S.W.1

Switzerland and Western Union

SIR,—Your Swiss correspondent in his article published this week remarks that the constitution of Switzerland is often regarded as a model for "a future rejuvenated Old World." It is, indeed, high time that Europe learned from the Swiss what the Swiss learned from the American pioneers of 1789, namely:—

1. The members of the supra-state legislature must be empowered by their electors to make laws which do not require ratification.

2. The laws must act directly on the citizens, not through the intermediary of the constituent governments (the only way to enforce laws upon states as such is by war).

3. The representatives must be appointed not by the state governments, but by the citizens, thus minimising national block voting.

4. The central authority must have full governmental power in its own sphere, but this sphere should be restricted to, e.g., defence, foreign policy and power to finance its own activities.

Your correspondent poses Switzerland's dilemma as a choice between support for "a western bloc formed to protect one-half of Europe against the other," and support for "the United Nations, whose main characteristic is their fundamental disunion and whose Charter does not even pretend to shield the weak against the strong."

It seems obvious to me that a Western bloc could not defend itself unless it had but one Foreign Office, one War Office, one Army, one Navy and one Air Force, and until it possessed a common treasury, and a common parliament and government for common affairs (defence, foreign policy and power to finance itself). All other affairs could, of course, be left where they now rest—with the separate national parliaments. Anything short of this means that Western Europe is inviting an attack which it cannot parry. Full constitutional union means, on the other hand, that the new entity is so well protected that no aggressor dare attack it.

The article goes on to say that "Switzerland's national experience and internal structure lead it to believe that there will be no secure peace and freedom in the world before all national sovereignties are merged in a supra-national federation." This, of course, is true; but your correspondent concludes that until this goal is achieved the Swiss are justified in making no move towards it!

If Switzerland were to be afforded an opportunity to join a constitutional union which showed promise of being the embryo of a future world federation, they would be false to their traditions if (subject to approval of the constitutional details) they did not join in at the outset. If and when such an opportunity occurs, I do not doubt that the Swiss would rise to the occasion. To help create that opportunity lies within the power of us all.—Yours faithfully,

HAROLD S. BIDMEAD

Walsingham House, Seething Lane, London, E.C.3

AMERICAN SURVEY

Arms and the Plan

(From Our US Editorial Staff)

March 13th

IF Joseph Stalin had put a finger on the names of certain members of Congress and ordered that they be made as miserable as possible he could have produced no torture more subtle than that caused by his one-two play in Czechoslovakia and Finland. The Washington air is filled with the groans of men whose noses he thus forced back to the grindstone of international affairs at a moment when they were set to gambol in election pastures nearer home. To face demands for an appropriation of more than five billion dollars for any purpose is not a light matter at any time. To face such demands in an election year, to have them underlined by foreign aggression that comes ever closer, to have them presented in such terms as to rule out party advantage and to make it quite clear that no penny is for use in a place which will return one single vote to the men who support the project—this makes the politician ache. Ordinary

components of legislative generosity he can handle, but the European recovery plan drives him to strange inventions.

Neither aching nor incomprehension prevent his trying to make the most of it. He may grow cross-eyed and confused, set off at once in all directions, get so tangled that he ends by achieving the major result he was aiming to avoid—defeat at the polls in November. But try he will, for of such is the political kingdom. And there are signs in Washington today that Stalin is not the only politician who knows how to sow confusion for his own ends.

The debate on the Marshall Plan goes on in an arena open to the world, and the world makes its presence felt. In the process, certain clear distinctions have given way. Far has become near, foreign become domestic, policy entangled with politics. In 1938 Washington pulled neutrality tighter and agreed with London that Prague was the capital of a far country which could be disregarded. In 1948 it is so close to these shores that the violent death of its Foreign Minister called forth banner headlines on afternoon papers, and provided a favourable background for the President's request that Congress appropriate another \$55 million so that the pipe lines carrying relief to Europe might develop no air pockets between the end of interim aid and the start of funds under the Economic Co-operation Act. Two months ago informed Americans were telling each other that if the Marshall Plan were to accomplish

its purpose it must carry with it a degree of European co-operation more comprehensive than that displayed in Bizonia or Benelux, but that it would be hard to convince Europe and Congress of that logic. Today Western Union means not only a telegraph company, but also a draft agreement ready for the signatures of the European statesmen. Congressmen in Washington who then disregarded the idea are now talking of American support for the reality.

What is perhaps most serious in the situation is the ease with which emphasis in the past month, and particularly since the death of Jan Masaryk, has shifted from economic measures meant to save the peace toward economic measures meant to stave off war. Military measures toward the same end lie still ahead, but not so very far. People begin to forget that the Marshall Plan was conceived as a way of "restoring the confidence of the European people in the economic future of their own countries and of Europe as a whole." Even last June the bogey of Communist domination of the continent was visible, but as a skeleton to be decently hidden behind humane talk of easing suffering, or business talk of promoting trade. With the seizure of power in Prague the Communist bogey rent the veils, and, for Washington at least, is now dominating the scene. The question now is what supplementary measures are necessary to make the plan fit new needs.

The Washington state of mind is mirrored in three recent utterances which indicate the gravity of the situation as the capital sees it. On two successive days the Secretary of State said first that the world situation was "very, very serious," and then that "at no time has it been so important for cool judgment, for an appeal to oneself for a sense of justice, for a realisation of conditions material, political and spiritual, in other parts of the world." A conservative Republican columnist explained the same day that Americans must now "turn from a Republican primary in New Hampshire to a general election in Italy," for if the Communists win on April 18th we shall be faced with the "stark alternative" of permitting Communist totalitarianism to "dominate the world, including us," or of drawing a line and telling Russia "no farther." Later, two junior Republican Representatives introduced into the House a joint resolution asking Congress to "give solemn warning to the conspiracy in asking Congress to 'give further act of aggression, internal or external, will be actively resisted by every means at our disposal.'"

*

To take this alarm at its face value and conclude that the United States is preparing to declare a "preventive" war on Russia is to go much too fast. To try to dismiss it as a whipped-up manoeuvre designed to get through Congress a measure for which gentler arguments might not be enough is to underrate which the keen Congressional nose for administration pressures. If the politics makes strange bedfellows it also induces strange night-mares. At the same time it must be remembered that Secretary Marshall is by education an officer trained to assume that war will come and to plan for it before it arrives. His move from Chief of Staff to Secretary of State marked a change in the terms of the conflict, but it can hardly have blunted his alertness to possible danger.

This time Washington is ahead of the country. Except in quarters known to have a low boiling point, editorial writers and commentators have been very slow to talk of war as a means of stopping the Communist march westward. War is not popular with the people, but neither is Communism. Henry Wallace is the only one trying to test the degree of relative unpopularity as between the two. On the very day that Secretary Marshall was warning the country of peril the New York State Chamber of Commerce was declining to back the Marshall Plan, and applauding a retired industrialist who objected to voting that much money for a Democratic administration to spend, more especially because too much of it would go to England where a Labour government is applying principles "indistinguishable from those that have finally reduced the Russian people to virtual slavery."

Whatever domestic factors may play a part in the present alarm—growing maturity in international affairs, political sensitivity in an election year, attempts to measure the future in

terms of the past before it is too late, experience on the part of many Americans with many Russians—Moscow has regularly called the tune. The picking off of Poland and Hungary a year ago accompanied the Truman doctrine and the spring aid appropriations; the building of the eastern bloc last summer underlined Mr Marshall's June speech; the creation of the Cominform in October preceded Mr Truman's calling of Congress to special session; the Vishinsky campaign of vituperation and the French strikes, which seemed aimed at making America so angry and so scared that it would not help, spurred Congress to provide interim aid and prepared it for the Marshall Plan. The recent coup in Prague came at the moment when Senator Vandenberg needed fresh eloquence with which to open the Senate debate.

There are those who now claim that the Russian attitude is softening, if not going into reverse; that the new Ambassador to Washington knows how to smile; that Stalin said he would go as far as Moscow to meet Truman; that Gromyko has become America's best friend in the Palestine matter. This will have to be demonstrated with more conviction if it is to convince.

Editorial writers are now saying that the year-old policy of containment by economic aid alone has failed to contain. Experts have said repeatedly that the Soviets do not want war and cannot afford it. Events have convinced an increasing number of Americans that neither do the Soviets want peace, and the suspicion grows that perhaps they cannot afford that either. The Marshall Plan was designed as an aid to peace. Senator Vandenberg says it must now be held a counter offensive to the westward Communist march, and an attempt to stop World War III before it starts. Russia found the Plan unacceptable in its first guise. It remains to be seen how she will regard it when Congress passes it in this more martial dress.

American Notes

New Truman Doctrine

Not even Mr Roosevelt in the days of the Hitler menace felt able to deliver so outspoken a warning to an aggressor as that which was contained in Mr Truman's address to the joint session of the Congress. Its terms and its tone are the truest measure of the continuing revolution in American thought about international affairs. Mr Marshall's Harvard speech marked the first stage of this revolution. Mr Truman's speech, indicating the new frontiers of American security, recognises that economic measures alone are not enough to meet the challenge. His central theme is the need for the United States to make its position unmistakably clear and to take steps to support the democracies of western Europe:—

I am sure that the determination of the free countries of Europe to protect themselves will be matched by an equal determination on our part to help them to do so.

This theme was repeated by Mr Marshall when he told the Senate Armed Services Committee:—

We desire a state of affairs which would make repetition of the fate of Hungary and Czechoslovakia, the intimidation of Finland, subversive operations in Italy and France, and cold-blooded efforts to destroy the Greek Government unlikely because they would definitely be fraught with real danger to those who attempted such action.

In language there is not much more than a hair's breadth between these words and the specific military pledge to Europe which has been demanded by some Americans and hoped for by the European democracies. Such a specific commitment could only be made with the consent of the senate. That Mr Truman, in an election year, felt that he could take so uncompromising a stand as he did is a measure of the bipartisan support which the Administration feels it will secure on this issue. Yet a guarantee would be an empty and ineffective gesture without proof of the power and, even more important, the will to enforce it. The

Readers of *The Economist* in the United States and Canada can receive their copies within a day or two of publication for an annual subscription of \$24. They should apply to The Publisher, *The Economist*, 22, Ryder Street, St. James's, London, S.W.1.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

President's request, the last of many, for the speedy enactment of universal military training, and even more, his request for a temporary revival of conscription, are tests of public and Congressional opinion. Is America ready "to earn the peace," to pay the price in preparedness, and to face the possible consequences of saying: "so far and no farther"?

The President's actual proposals may seem mild to Europe, but they may be more than large sections of America will approve or than Congress will pass in an election year. It must not be forgotten that the bottling-up of the Universal Military Training Bill in the House Rules Committee has been due to a profound conviction that to bring it to a vote would be political suicide for many a Congressman. The revival of conscription in times, nominally at least, of peace is an even more important and more severe test. The response of Congress will show how deep and how widespread is the revolution of opinion caused by the forward thrust of Communist power in Europe.

* * *

The Strength for Peace

Even before the President recommended measures "calculated to give support to the free and democratic nations of Europe," there were signs that the United States was doubtful whether its preparations for defence were adequate to guarantee its own security under present conditions. The first peacetime civilian defence director in United States history, has been appointed. General Eisenhower has talked of the need for legislation on industrial mobilisation. The joint Chiefs of Staff met in Florida last week and, under the combined pressure of events and Mr Forrestal, agreed upon a division of responsibilities among the three services. It had been frequently suggested that their failure to do this had rendered ineffectual last year's Act for the unification of the armed services and had prevented the preparation of an over-all defence plan.

It is presumed that such a plan will soon be presented and that it will call for a great increase in air power. Congress will not be unfavourable to such a call: Senator Taft, Mr Martin, the Speaker of the House, and the Joint Congressional Aviation Policy Board have all recently demanded "air power that is supreme." The Board's suggestions for achieving this closely resemble those put forward earlier by the President's Air Policy Committee: it proposes a combined strength of 35,000 modern aircraft by 1954 at a total cost of nearly \$17 billion. Only about \$10 billion were provided for all the services during the current fiscal year, divided between the three in roughly equal shares, but existing estimates for the fiscal years 1948 and 1949 forecast a gradual increase, especially in expenditure on the air forces.

The need for some means of bringing the armed services up to strength had been recognised before the President asked for conscription, although the actual words "selective service" had hardly been mentioned in public. The latest estimates show that, with voluntary enlistment only, the services are nearly 400,000 men below their authorised strength of 2,000,000, which includes the 226,000 members of the National Guard. Universal military training has never been intended to provide men for the Army, but only to prepare men to serve as part of the Reserve. If the President is at last successful in inducing Congress to act on UMT, it is hoped to have by 1953 a trained reserve of 900,000 Army and Air Force officers and men ready for mobilisation. At present the official Reserves (including the Navy) total over 700,000 officers and men, but this is largely a paper force.

* * *

Aid Before the House

There could be no more impressive proof of the growing responsiveness to international affairs than the crowning of a brief eleven days' debate on the Senate floor by a vote approving the Marshall Plan by 69-17. These were eleven days to shake the Kremlin; the time when floor debates on foreign measures dragged on interminably seem to belong to a now prehistoric era. Thirteen Republicans and four Democrats alone remained unconvinced by Senator Vandenberg's eloquence and the even more pressing argument of the Czech *fait accompli*. Senator Taft's amendment to cut the funds to \$4 billion, the last shot in the opposition locker, was defeated by 56-31, and Mr Taft himself, still sceptical of the Bill's economic justification, voted for it as a part of the fight against Communism.

Two interesting additional changes were made in the Senate draft. One adds \$44 million of additional money to buy surplus American farm goods for Europe; the other eliminated the clause

permitting the chartering of 300 ships to the Marshall countries. This concession to the shipping companies, the maritime unions, and their Senators will, it is estimated, raise the costs of shipping aid by about \$200 million.

On all calendars, even those of the House, there is a red circle around April 18th, the date of the Italian elections. The House has alarmed the State Department by its insistence upon the need for an omnibus foreign aid bill, including Administration-sponsored plans for arms for Greece and Turkey, and military help for China. This would mean compromise in conference, revision of the Senate Bill, and further delay.

Mr Truman's speech, however, seems to have hastened action, and House discipline has some advantages on easy-going Senate procedure. The Foreign Affairs Committee this week rejected further efforts to cut the \$5.3 billion total, but voted for a \$1 billion Export Bank loan, leaving \$4.3 billion only for Congressional appropriation.

The Committee also deferred action on aid for Greece, Turkey and China. On the floor, discussion will now be speeded-up. The debate will begin next Tuesday, and a final vote is now expected in the following week, in contrast with an earlier deadline of April 10th. Allowing for conferences, where Senate authority will be very great, the Bill may be ready for Presidential signature early in April.

* * *

Defence—And Trade Prospects

No action seems likely to follow from the batch of reports received by President Truman concerning the recent advance in semi-finished steel prices. Mr Harriman's Department of Commerce gave a pleasant contrast between a decline in steel profits (measured by the rate of return on investments in 1929 and 1947) and a general rise in the rate for other manufacturing industries. The Department of Justice gravely reported that "further investigation would be needed" to determine whether steel price policy conflicts with the Sherman Act, while the Council of Economic Advisers, in a sharply critical document, declared that Congress had been imprudent in rejecting Presidential pleas for price control, and that the steel price would reinforce wage pressure and would probably prove to be "self-defeating." Its chairman, Mr Nourse, however, declared that "no immediate action is called for."

For the time being, therefore, Mr Truman, individual Congressmen, and the Federal Trade Commission, will presumably continue to rely upon the public pressure arising from direct charges against particular industries. But the longer-term price and profit prospect now depends overwhelmingly upon the pace of the military and industrial response to the challenge of Soviet power in Europe. There is some accumulating evidence of caution, with retail trade reports less than brilliant, and footwear and apparel sales less buoyant. Moreover, an increasing labour force is being absorbed less automatically than in 1947. Unemployment in February at 2,600,000, was 600,000 higher than in January, though employment was also 1,600,000 above 1947. These items are not decisive, though they may be important at a time when the Administration still judges the inflationary potential to be more important than deflationary signals, and when the Treasury still has in its hands the power to exert a modest brake on new expansionist moves.

A dynamic defence policy can, of course, bring a fundamental change to this picture, and Mr Truman's proposals to Congress would mean a formidable addition to present budgetary costs, while his speech certainly ensures that the European Recovery Programme will bring a solid floor for exports, though it will be some way below the peak of last year.

If the political tension continues, there will, ultimately, be no alternative to an all-out armament effort, and already, Mr Walter Lippmann is well in advance both of the President and Congress, in his appeal for the restoration of Lend-Lease and wartime executive powers, and the declaration of national emergency. Wall Street has shown clearly that it will find little consolation in such a programme, even though it would signal the end of any fears of a major depression, and might mark a possible path to later security. It would bring quite certainly the reimposition of rigid material and profit controls, and the assurance of penal taxation.

* * *

Who is Un-American?

Who is un-American? And who is to decide in the case of Federal employees? Is it to be the Administration, through

its own loyalty checks, or Congress? The House Committee on Un-American Activities is locked in a bitter contest with the Department of Commerce over the right to determine the "loyalty" of Dr Condon, head of the National Bureau of Standards; and Mr Harriman, the Secretary of Commerce, has dared to pin an "Un-American" label on the committee itself. This group, which, as the Dies Committee during the war, was accused of a scarcely suppressed preference for investigating Reds rather than Fascists, now swims happily with the anti-Russian tide. It has just been voted \$200,000, twice the appropriation it received last year.

Dr Condon, who worked in Manhattan District during the war, and who is still concerned with research into atomic energy, was appointed to his present post by Mr Wallace. He has already been given a clean bill of political health by the loyalty board of the Department of Commerce, but the Committee stands by its statement—made in advance of a hearing—that he is "one of the weakest links in our security chain" and insists he has not been cleared of the crimes of indiscreet utterances and indiscreet associations with Russian scientists and members of the Russian or satellite embassies.

The Committee's critics denounce the doctrine of "guilt by association" and Dr Condon, himself, has appealed to the Congressional Committee on Atomic Energy for an investigation which would "restore conditions in which men of intelligence will be willing to work for the Government and will not be constantly harried and harassed by irresponsible attacks on their character." The difficulty of reconciling scientific freedom with the requirements, real or fancied, of security, has been notorious since the end of the war, when atomic scientists revolted against the iron curtain imposed by General Groves. But, until relations with Russia improve, or deteriorate completely, this difficulty is likely to grow. The shock of the Canadian spy trials still outweighs Mr Lillenthal's insistence that secrecy, injudiciously applied, is the enemy of security, for by restricting the cross-fertilisation of scientific brains, it impairs the flow of new ideas.

The present case is likely to become more of a trial of strength between the Administration and Congress than an objective test of loyalties. The Committee threatens to subpoena Administration loyalty files; the Administration is said to be preparing a directive forbidding the opening of such files to Congress. The effect of the Committee's charges and methods has been to under-

line heavily the political risks run by the universities and private companies, which, through sub-contracts, perform the bulk of research into the problems of atomic energy.

* * *

Opening the Third Round

Mr John L. Lewis's coal strike is as sure a sign of spring as the ground-hog and the first crocus. In the soft-coal fields, nearly 300,000 miners of a total of 400,000 are out on strike, following Mr Lewis's letter last week accusing the coal owners of "dishonouring" their contract. In Chicago the Packinghouse Workers of the Congress of Industrial Organisations have called out 100,000 members, after the major packers refused to arbitrate their demand for a 20 cent increase beyond the 9 cent rise already agreed upon. The strike was called despite Mr Truman's appointment of a fact-finding board and his appeal for delay.

The coal dispute has been on the horizon for many months. The crucial point at issue is not the simple granting of pensions, from the fund created by coal royalties, to miners over 60 with 20 years' service. It is the size of the pension and the problem of whether pensions should be granted to miners who have already left the industry. Operators fear that the inclusion of these men would increase the cost substantially.

Only the events of the next few days can answer the main question: Is this an Easter holiday in the mines, or is it Mr Lewis's considered challenge to the Taft-Hartley Act? Both coal and meat-packing are essential industries; the government has not been out of the coal business for very long, and it took over the meat-packing plants following a strike two years ago. If the strikes go on, imperilling coal supplies for industry and for Europe, threatening a semi-vegetarian diet, there will be no choice but to invoke the procedure laid down in the Taft-Hartley Act for just such contingencies: that is to seek an injunction for 80 days' labour peace while the facts are ferreted out by a government body and a vote is taken by the National Labour Relations Board. The industry has given Mr Lewis three days to call off the strike and accept arbitration of the dispute; after that it will resort to the courts. If Mr Lewis persists, there will then be a trial of the famous clause he had inserted in the coal contract last year to by-pass the Taft-Hartley Act, that the miners would work only as long as they were "willing and able."

The fable of the foolish young man

A certain Young Man, dismayed by his country's plight, denounced Discovery, forswore Science and arraigned Industry. 'We are the victims of our own ingenuity,' he declared. 'Henceforth I intend to live simply, unhampered by machines of any kind.'

'An admirable plan' said another. 'First, you must cut off your hands . . .'

For better or for worse we are a people with an industrial genius — and TI sees Britain's recovery in terms of Britain's natural gifts. TI itself stands for the highly-developed skill of thousands of men and women, organised by experience and expressed in a multitude of forms, from steel tubes and wrought light-alloys to bicycles, electrical equipment, pressure vessels and paint.

Mild Spell in Russia

(By a Correspondent)

IN the last few weeks local and regional conferences of the Communist Party have been taking place all over Russia. The purpose of these conferences has not been made quite clear. Normally, they should foreshadow a national congress of the party at which the leadership reviews past policies and fixes the party line for the future. The last congress, the 18th, took place in March, 1939. According to the new statutes then adopted—their author was Mr Zhdanov—ordinary congresses of the party should be convened “at least once in three years,” and in the intervals less representative and less authoritative national conferences of the party should be convened “at least once in a year.” These provisions of the statutes, adopted with much solemnity, have so far been ignored. For nine years the ruling party has held no congress, and for seven years its delegates have not come together for a conference either.

It is understandable why Mr Stalin and the other members of the Politbureau did not bother to address national assemblies of their party in the years of the war. But nearly three years have elapsed since the armistice with Germany, and the absence of any party convention during this time has been less accountable. It emphasises a certain provisional character that has marked the conduct of party policy since the war. The membership undoubtedly expects the Politbureau to answer many of the questions and doubts that must have been occupying its mind. But the Politbureau has so far apparently preferred to evade hard and fast commitments and to leave some loose ends of the party line untied. Even in the present provincial and local conferences there has been no sign of preparation for the expected congress or conference.

So far as can be gathered from reports in the Soviet press, matters of high policy, problems of war and peace, have not loomed large in the regional and provincial Communist assemblies. Officially, there is no need to thrash out those matters. The propagandists keep on repeating the assurances about the Soviet Government's peace-loving policy, and they dwell on the growth of aggressive tendencies on the part of the Western Powers, though they do so in terms calculated to avoid undue alarm and war panic. It seems that the official line of propaganda meets with popular response. A war weary nation is inclined to take it for granted that its Government is not going to involve it in adventures of aggression, and this belief has been enhanced by Mr Molotov's “peace offensives” at the United Nations by Soviet proposals for disarmament—which have for weeks on end filled the pages of the press—and quite lately by the completion of demobilisation. It has just been announced that only two age groups, the 1926 and 1927 classes, are now with the colours. This would indicate that the army has been reduced to what is a more or less normal peace-time establishment in a country which has always had conscription. The Russian public can obtain from its press only a very faint idea of the international tension created, say, by the events in Czechoslovakia. Those events were presented to it not as a *coup d'état*, but as a wholly legitimate shift to the Left in the internal social balance of Czechoslovakia, a shift which should not normally affect the relations between the Great Powers. There are, it is true, clouds in the sky, but there is no reason to fear the thunder and the lightning of war—this is how the international horizon probably looks to the mass of the Russian people.

Battle of the Secretaries

The fact that international affairs did not loom large in the local party conventions does not mean, however, that the conventions were devoid of interest. Their whole attention was devoted to those domestic developments that may, for the sake of brevity, be described as the semi-liberal spell in Russia. The special feature of every convention has been the election of new party officials, especially of the secretaries of local, district and regional organisations. In the past such elections were, as a rule, empty formalities. Usually the secretaries were appointed

from above, and the members of the organisations could only endorse the appointment by an open vote in favour of the nominee. Even abstention from the vote bordered on treason. Thus the inner life of the party was regulated by the method of military command. The new feature in the present elections is the real and open struggle that has developed over the appointment of party officials in the lower and middle grades. The secretaries are now elected in a secret ballot. In some cases the higher grades have put forward their candidates for the offices, with the result that the provincial assemblies rejected their candidates by majorities, which, if the Soviet press is to be believed, amounted at times to three-quarters of the total vote. A characteristic case is reported in *Pravda*. The regional party bosses come down to sponsor their candidate at a local conference. They are defeated. The local organisation elects a secretary whom it knows and trusts. The regional bosses insist on a new vote. The conference rejects their demand and confirms its previous decision. The bosses threaten to instal in office their own candidate, regardless of the result of the vote. The leaders of the local organisation denounce the arbitrariness of their superiors in the columns of *Pravda*. The same motif in milder versions runs through many reports from the provinces.

Another issue which preoccupied the conferences has been the relationship between the party and the economic administration. Since the war, the party has been systematically boosted, and urged to intervene in every field of public activity. This has apparently led to much overlapping between party men and economic administrators. The party bosses, it may be guessed, were as a rule stronger in the tug-of-war. Their meddlesomeness must have apparently led to much confusion; and so now the party committees are being put back into their places. They are told that their job is to look after the political morale of the people, not to sign or endorse economic plans, to set production targets or to issue administrative orders. Business managers must have a free hand in dealing with their own affairs. The party committees are further castigated for attempts to suppress criticism coming from the rank and file. The inner life of the party, it is said, must be governed by democratic principles.

Revival of Free Discussion

It would probably be wrong to dismiss such signs of a milder spell in Russia's political weather as completely unreal. The freedom to elect party officials, the relative freedom of the administrators from the tutelage of the party bosses mean a lot to people who have not enjoyed those limited freedoms for a very long time. There has, in addition, been a revival of relatively free discussion, such as Russia has not witnessed for more than twenty years. The limits of that freedom are narrow by truly democratic standards; but they are surprisingly wide by Russian standards. From a political viewpoint the most interesting of the recent public debates has been the discussion on Professor Varga's book “The Changes in the Capitalist Economy After the Second World War.” A verbatim report of the discussion, which took place at the Moscow University, has now been published in Russian. It shows a surprising variety of views, some of them undoubtedly “heretical,” expressed with great freedom and thrashed out without any hint of heresy hunting, even though the discussion often touched on the most delicate issues of high policy. Professor Varga has so far made no apologies for his alleged deviation (in which he was backed by a number of other well-known personalities) and he is still the editor of the most serious Russian economic and political journal. The revival of relatively free discussion has been noticeable in many fields, from biological theory to literary criticism. Every now and then Mr Zhdanov, or somebody else, makes a somewhat ridiculous denunciation of this or that “heresy” in philosophy or music such as might be expected from an unqualified and opinionated patron of the arts. But it is not true that those denunciations are followed by purges, especially if the word is given the ominous meaning

it had in the thirties. Some of the men criticised, by no means all or most of them, indulge in mild forms of specifically Stalinist “self-criticism.” But all continue in their professions, and the most eminent continue to be honoured and rewarded by the state.

This semi-liberal spell may be explained by the *malaise* of Russian postwar society and its indubitable longing for a degree of freedom. It may also be explained as a result of some softening in the very texture of the regime. Mr Stalin is surely not the first dictator to grow somewhat milder in his old age long after all his opponents and rivals at home had been defeated. Inevitably the question arises: how long is this semi-liberal spell going to last? The massive framework of the dictatorship is intact. Some screws have been loosened. How far can the loosening go? It is easy for *Pravda* to castigate local party

Portugal's Estado Novo—I

Salazar Loosens the Reins

(From a Special Correspondent)

THE long statement on the European Recovery Programme issued by the British Labour Party on February 27th explicitly bars Franco Spain, but, apparently, sees in Salazar's Portugal no obstacle to the “spiritual and intellectual community” which is postulated. It was not therefore, presumably, just as a backstopper aimed at General Franco that Mr Bevin, in his House of Commons speech of January 22nd, made specific mention of Portugal as one of the prospective members of “Western Union.” He did so in the particular context of the projected co-operation of European colonial Powers in the exploitation of the riches of Africa. It is not for nothing that Portugal today ranks fifth among the Powers administering overseas territories, while the mainland and the colonies of Portugal in Africa are so placed geographically that they must at all time be a matter of vital concern to British strategy.

The *Estado Novo* certainly makes no claim to be “democratic” in the Western meaning of the term. It is a semi-corporate State and the archetype of political paternalism: what it is not, however, is a variant of Fascism. It should be noted that Oliveira Salazar, though manifestly the head and front of the regime, is not himself, strictly speaking, the dictator. He holds his position as nominee and coadjutor of the military leaders who were responsible for sending the parliamentarians packing in May, 1926; and, under the Constitution, ratified in March, 1933, by a national plebiscite, it is the President of the Republic who, as Chief of State, appoints the Prime Minister, and can at any time dismiss him (Article 81). The National Assembly, elected every four years on a restricted franchise, is not a fully-fledged legislative power, but there are in the Portuguese regime, based on the sovereignty of the nation, certain checks and balances justifying comparison with the presidential type of constitution which is the rule in the American continent. Moreover, apart from sharing with that of Eire the distinction of embodying Christian-democratic precepts as laid down in the Papal Encyclicals—and this with a Church whose separation from the state, effected by the Republic, has been wisely maintained in the present regime—the Portuguese Constitution contains in Part I (Articles 1-70) “fundamental guarantees” such as should satisfy the most exacting apostle of liberalism: equality before the law, freedom of religious worship, unimpaired liberty of expression and freedom of association. The only trouble is that in another clause just below this the exercise of these freedoms and prerogatives of the citizen is made contingent on special laws designed to “prevent or repress any perversion of public opinion in its function as a social force.” In practice, as is well known, active political non-conformists are liable to be gaoled by order of the International Police* (whose powers certainly have no warrant in the Constitution) with no means of redress.

While not a terrorist dictatorship, contemporary Portugal comes then into the category of a police state. Yet, compared with other present-day forms of tyranny, Salazar's autocracy is benevolent indeed, and has a good record of clemency. There has been no

* This is the curious appellation of the State Security Police, PIDE (*Policia Internacional da Defesa do Estado*). Its extra-legal powers assumed during the war were nominally abolished by a decree of October 17, 1945.

committees for suppressing the freedom of criticism. But is it not the Politbureau that sets the example of suppression? And if criticism is allowed, which grades of the party hierarchy should be immune from it and which not? If the rank and file are free to reject a candidate of a provincial party boss, may they not one day desire to reject a candidate of the Central Committee, too?

These are the usual dilemmas with which any dictatorship is confronted when it attempts some relaxation of controls. Russia experienced a similar spell of reform and constitutional illusions in the early thirties, one which was followed by the bloody purge trials. It is not very likely that the present relaxation of the rigours of the regime should have a similarly ugly ending, if only because Mr Stalin has now no actual or potential rivals. But any cold political wind may, of course, nip the feeble shoots of toleration that have made their appearance.

shooting of political opponents: indeed, capital punishment is expressly excluded by the Constitution, which also forbids a life-sentence. There is no preaching of intolerance, except in regard to Communism, and little or no denunciation. The press censorship, though humiliating, is no great hardship; it does not extend—in theory, at any rate—to foreign correspondents. And the obligation (Article 6) upon the state to take especial heed for improvement of conditions for the under-privileged is, on the whole, faithfully fulfilled.

Although Salazar can afford to ignore the mutterings of the monarchist or liberal-democratic opposition, and although Communism makes precious little headway, the incidence of three abortive military revolts during the past two years, sponsored by the Military Committee of Liberation, has been a reminder that the all-powerful “dictator” is manoeuvring against a background of military power. Last year the original head of the military triumvirate that made the “revolution” of 1926, Admiral Jose Mendes Cabeçadas, was clapped into prison by the police on a charge of sedition, after he had, apparently, secured the ear of his old colleague, President Carmona, for his complaint that the Constitution, with its blue-print guarantees, has in practice been frequently violated. For their presumed complicity in a projected military *coup* on April 10, 1947, Admiral Cabeçadas and a number of brother-officers were dismissed the service last June. A score of university teachers were likewise suspended from their chairs under a “special law” which grants the Government powers to dismiss any military or civil officials “who reveal a spirit of opposition to the fundamental principles of the Constitution or who do not show a guarantee of co-operating with the State. . .”

Creating an Opposition

On July 21st the ex-officers were summoned to report to the police for interrogation and thereafter detained pending trial—at first in a wing of the Julio de Matos lunatic asylum outside Lisbon, then in an ordinary prison at Santarem. In October, Admiral Cabeçadas filed a petition claiming on behalf of himself and his friends the benefits of *habeas corpus* granted in theory to every Portuguese citizen by a decree of October 20, 1945. Three weeks later the Government announced that this petition had been disallowed by the Supreme Court, a statement of the reasons being given out to the press a few days later. The line taken was that the *habeas corpus* decree in question did not apply to persons who came under military law and who had been detained at the instance of the Ministry of War, and that the police had duly passed on the relevant documents, within the prescribed period, to the military. These rebels are thus still awaiting trial by a military court.

This episode took on unusual significance because seventy-eight year-old President Carmona was involved. But Dr. Salazar put an end to the idle chatter about a serious rift between himself and the President when, in November, he declared with characteristic self-sufficiency “the dignity of the Government is sufficient guarantee of the unrestricted freedom of the Chief of State. . .” Incidentally, President Carmona's term of office expires in the spring of 1949; he has already been twice re-elected, and it is unlikely that at his age he would stand again.

Meanwhile the attempt to fill the political vacuum, which failed

in October, 1945, is being taken up again. The democratic opposition which joined forces in the MUD (*Movimento de Unidade Democrática*) is regarded as having forfeited all claim to consideration by their non-co-operation tactics on that occasion—e.g., their boycott of the elections for the National Assembly. The search now is for new men and new parties. Dr Salazar has indicated the direction in which his mind is working. In a speech to the Executive Committee of the *União Nacional* a year ago, he once more rebutted the charge that the regime is a single-party dictatorship and admitted the need for political development, at the same time excluding any return to a multiplicity of feckless warring and sectionalist parties such as had brought Portugal low in the years before 1926. It was necessary, he said, to secure the collaboration of public opinion without endangering the achievements of the regime. This is, in Dr Salazar's view, the task of the "National Union" in which, he imagines, Right, Left and Centre tendencies may emerge. So far the only concrete development, however, has been the creation of a new grouping of supporters of the regime called *Accão Popular*—presumably with a view to the presidential elections—while renewed efforts are being made to "sell" the idea of the "National Union" as being not merely an assemblage of yes-men, not, indeed, a political party, but a reservoir of "men of good will," without distinction of political creed or religious beliefs, from which new political groups may be drawn.

Unpopular but Stable Regime

The first meeting of this year's Council for the Lisbon area of the "National Union" on February 19th was chosen for a long exposition of the Union's purpose by its President, Dr Marcelo Caetano. What is postulated is general acceptance of the spirit and doctrinal tendency of the Constitution of 1933, and "civic collaboration but not political participation except in the measure required of them": in fact, to organise the non-party mass of the nation into a political force which may sound a contradiction in terms but which has a certain meaning in a country deprived of all political expression for a generation. This introduction of politics from above will be no easy matter. Unprecedented skill will be needed to extricate Portugal from the normal fate of a dictatorship which is to lead into a blind alley. The experiment will be worth watching. The regime is certainly not popular, as Dr Salazar discovered to his chagrin when he opened the safety-valve of criticism two and a half years ago. But it still enjoys the support, with varying degrees of enthusiasm, of a broad and substantial middle sector of the nation; and, at any rate, Dr Salazar has solid economic foundations upon which to build.

(To be continued)

Economic Union for France and Italy

THE French-Italian Customs Union Commission was constituted on September 13th last year. Its task was to examine the possibility of a customs union between the two countries and report by the end of the year. During this short period of three and a half months the Commission worked with energy. Its final report, the full contents of which have now become generally known, was completed on December 22nd.

In this report the Commission reaches conclusions of great potential importance to France and Italy. It is highly favourable not only to a customs union but to an economic union, in which the two states would "establish together a new kind of sovereignty." Two reasons for going beyond a mere customs union stand out from the Commission's report. First, much general legislation nowadays affects the economic structure of a modern state. On the one hand, there are measures which bear directly on international trade such as quotas, import and export licences, and restrictions on capital transfers; on the other, many internal regulations themselves shape economic life, so that the simple abolition of tariffs does not remove the problems which a customs union is meant to solve.

Secondly, in the case of France and Italy, only a relatively small volume of their external trade passes from one country to the other. If, therefore, the object is, as it should be, to improve the standard of living in each by making better use of available resources, then positive steps must be taken to share their raw materials, improve their combined potentialities as a market and exchange their surpluses. In its report the Commission accordingly goes on to examine alternately each aspect of the French and

Italian economies; Algeria is included throughout with metropolitan France.

In the chapter on agriculture, France and Italy are shown to be in very similar circumstances; 40.5 per cent of France is arable land (but only 15.5 per cent of Algeria) against 53 per cent of Italy. France has 25 per cent under pasture, Italy 20; 21.5 per cent of France is forest, 20 per cent of Italy. Both countries provide for their own needs in plough animals, pork, butter, animal fats and sugar. Both have a deficit in oats, maize, dried vegetables, oil cake, vegetable oils (olive or ground nuts), seed potatoes, and, until, 1952, some kinds of agricultural machinery. Both have surpluses of fresh fruit and vegetables, dried fruit, cheeses (according to type), wine and certain species of flour paste; an exchange of hard Italian wheat, for instance, could be made for the more tender French variety. Italy could supply France with rice, hemp, sulphur and, by 1952, with nitrogen fertilisers. France could supply Italy with oxen, perhaps by 1950 with just a little wheat if all goes well, with barley, rye, and potatoes. That is the view of the commission. In conclusion, the report considers, that, in part, French and Italian agricultural products are complementary. For the rest, the two countries have similar types of output; there, it is a question of a joint productive effort to lower the cost of living.

The objective of lower costs is again held out in the chapter on industry. The conclusion drawn from a survey of the chief industrial products of the two countries is that there is great scope for rationalisation and specialisation between them. To execute such a scheme, of course, presents difficulties. The report holds quite rightly that, as a result of wartime dislocations and their continuing effects, it would be impossible to attempt any sudden general reorganisation between the two economies. Instead there would need to be gradual adaptation in each industrial system independently, with the ultimate double objective of developing both not only those French and Italian industries which are complementary to one another, but also those which work in parallel lines.

Lack of Industrial Power

The report examines and compares French and Italian industrial output with particular reference to existing future plans. In dealing with raw materials it assesses France as an exporter to Italy of steel, scrap iron, potash, phosphates and various metallurgical products; Italy would send to France zinc and silk. Both countries are notably short of lead, copper, manganese, cotton and wool. And both lack sufficient industrial power for their projected needs. Thus the French envisage raising their present annual output of 47 million tons of coal by a third before 1952, while the Italians expect to need eighty per cent more than their present consumption of 13 million tons a year. Of the French electric output of 24.5 milliard kilowatt-hours, 12.9 are from water power: the Italian equivalents are 20.8 and 19.6. France hopes to raise its figure to 37 and Italy to 31.26, both mostly by hydro-electric development. Economic union would, it is stated, immediately involve building lines for complete inter-connection.

Such economic union would also mean improving transport facilities between the two countries, particularly by sea. No special difficulty is seen in this, though it would, for instance, probably mean lowering French harbour dues to something nearer the Italian level. This kind of problem is dealt with in the chapter on finance. Here the report concludes that, as the French and Italian budgetary structures are fairly similar, as much in the nature of their receipts as of their expenditures, adjustments to bring them into line in certain respects should be quite possible. A common currency is held out as a still remote but probably desirable ideal. Meanwhile transfers of capital between the two countries would be necessary. This would mean establishing a stable exchange rate between lira and franc, which in turn depends, for one thing, on balancing both budgets and stopping inflation.

The problems ahead are recognised to be great. But the report is optimistic about solving enough of them to make it practicable to begin a union which could become closer with time. The three stages which Benelux has gone through provide an analogy, though the French and Italians would hope to get much further at the first leap. In general, the report sees a French surplus of capital as complementary to excessive Italian manpower. Provided that free movement of both could take place from the start, the report recommends that the two governments should work out ways and means of forming an economic union as soon as possible. This proposal has now been accepted in principle both in Paris and Rome. Their Foreign Ministers, M. Bidault and Count Sforza, are signing an agreement to this effect in Turin today.

THE BUSINESS WORLD

Exporting British Cars

THE British motor-car industry has had a good deal of success in the past twelve months in selling its cars abroad. It exported 143,000 cars in 1947—57,000 more than in 1946, and 75,000 more than in 1938. This excluded commercial vehicles and motor parts, both of them substantial exports, too. The monthly rate of export (11,900 on an average over 1947) rose through the year, and in January, 1948, it was 16,129—nearly three times in number, and more than seven times in sterling value, the average monthly export in 1938. Some cheerful assessments of the motor industry's prospects and of its contribution to the country's effort to balance its payments have been based on such figures. But among the motor manufacturers themselves, few would read into last year's trade any assurance that the industry is established beyond question as a large-scale exporter.

If the trade figures are examined closely, three main points emerge. The 16,129 British cars exported in January (assembled cars, unassembled cars, and chassis) brought in £4,282,000, an average price per unit of £265 10s. fob. Ten years ago 5,684 cars (the average monthly export in 1938) brought in £605,991, or £106 12s. each f.o.b. Average export prices look modest, but they have still to be augmented by freight charges, duties, and distributors' margins. The actual retail prices at which a number of British and foreign cars are sold in some overseas markets are shown in the table on page 463. What matters is that today's fob price is in general two and a half times higher than in 1938, and has not finished rising; last year it was 12 per cent higher than the year before. Certainly world prices have gone up, and the prices of materials and labour at home have gone up too. But the complaint that British cars are too dear for what they are is an old and serious complaint. Has any progress been made towards meeting it? Are the cars, perhaps, bigger and better than they were before the war?

There is nothing to suggest that they are. In design, it is generally agreed that, with a few exceptions, British cars produced since the war do not show any important innovations. In materials and finish, motor manufacturers have to meet the same difficulties as all industrial producers in this country. As to size, *Engineering* pointed out recently that 77 per cent of British cars produced in 1935, and 80 per cent in 1947, were cars of 12 hp or below. British cars (or, at any rate, their engines) have thus been getting smaller, not bigger.

This general fact is even more marked in the export figures for January, which show that, of the 16,129 cars and car chassis exported, no less than 13,561 (or 84 per cent) were cars of less than 1,600 cc—that is, by the old taxation rating, cars of 12 hp or less. It is worth noting that in production for the home market the preponderance of light cars, though still considerable, is less (5,641 out of 8,392: most of the remaining 2,751 were 14 or 16 hp). Since this is unlikely to be due to tenderness for the comfort of the British motorist, it is presumably caused by foreign unwillingness to pay the high prices for the larger British cars. For the British motor industry has yet to build a car with a large engine at a moderate price, or a car with a medium-sized engine at a low price; the horse-power tax was effective in stifling any ambitions of that sort. The new Standard two-litre "Vanguard" is probably the first British car of medium power to be designed for large-scale production. It should gain a further cost advantage from the linking of its engine design with that of the Ferguson tractor.

To assess the importance of the motor industry's part in redressing the British payments deficit, the next step is to consider where British cars are sold. Do they earn dollars? Analysis of British car exports by destinations reveals some curious facts. Export destinations include the Channel Islands, which took 2,411 British cars in 1947—more than twice as many as the 1,127 cars sold in the United States. But exports to the United States were outnumbered also by Malta (1,140) and Hongkong (1,517), and closely rivalled by Trinidad and Tobago (1,018) and Nigeria (1,072). The British Commonwealth, in fact, took 87,000 of the 143,000 British cars exported in 1947. Canada (only 1,956) and South Africa (9,522) can be subtracted as being hard-currency countries, but still more than half the exports of British cars earn, not dollars, but sterling. Australia (19,176) and New Zealand (14,327) are the two biggest customers in the list.

What of the foreign destinations? Belgium (12,215) comes first, with Switzerland (6,000) next; they are both two useful currency-earners. Then come Sweden, Portugal, the Netherlands, Argentina (3,510), Norway and Denmark. Some of these countries, it should be mentioned, imported considerable numbers of British commercial vehicles in addition to private cars. A list of all products of the motor industry would show

a somewhat different order. It would remain true, however, that the preponderance of sales (about 75 per cent) is to sterling and soft-currency countries. British cars sell, but they sell most easily where dollars are scarce.

Indeed, the motor-car industry is dependent on the shortage of dollars in many overseas countries to maintain its sales. The Society of Motor Manufacturers and Traders made the point in its report to the Minister of Supply last September:

Many countries will presumably not be able to buy as many American cars as previously. In contrast sterling should be freely available, particularly following the recent suspension of free convertibility of current sterling. Such conditions should confer an advantage next year on British over USA car exporters and perhaps in some cases neutralise the price differential.

The report went on to say that "the industry could not be content with such an artificial and insecure advantage." Not only is the advantage insecure; it has the further drawback of being useless in the markets which Britain most urgently needs to capture—the dollar markets. If British cars are to earn dollars, they must be bought for choice, not from necessity, by people who are free to buy American cars instead if they wish. Is there any sign of British cars achieving that kind of success?

★

There is, unfortunately, only one answer to this question at the moment. No doubt there is a demand for the light car even in dollar countries. It is a limited demand, but it exists. But the light car is expected to be a great deal cheaper than the British car is at present, and unless it is very cheap indeed, a great deal is expected of it. An American publicity expert, Mr Edward R. Grace, who organised interviews with 1,600 American motorists last December on the question "Do Americans want a small, light car?", told the Society of Automotive Engineers in Detroit a few weeks ago that 60 per cent of the persons interviewed answered "Yes." Their answers to the detailed question make it perfectly clear, however, that the first consideration which caused them to answer "Yes" was that they wanted a car which was cheap to buy. The great majority (78.5 per cent) wanted to pay between 750 and 1,000 dollars, or even less; and the technical developments which would enable a British car to sell overseas at less than 1,000 dollars have yet to be recorded. But what did these American motorists want for their 1,000 dollars? The majority wanted a six-cylinder, five-seater car with a wheelbase between 100 and 120 inches.

Mr Grace's investigation has indubitable lessons for the British motor industry—and, indeed, for the American industry too, for the American producers themselves are heavily committed to their particular types of car, and might be outflanked by a competitor with quick wits and great material and technical resources. The lesson is not that people can be persuaded to pay dollars for bijou cars; in general, they cannot. They can, however, be persuaded to pay dollars for a car lighter and more manoeuvrable than the present Cadillacs and Chevrolets and Buicks, if it is also cheaper—and if it has adequate power, comfort, durability, and space. There is an opportunity here. The fleeting advantages which the British industry derives from the sellers' market, the maladjustment of international currency relationships, and the American steel shortage (which limits American production to no more than ten times the present British production) give the British industry the weapons which it could use to force its way into the world markets—if it had the strength to handle them.

Critics of the industry have exhorted it for many years to set out along a new path of technical development: to design its cars for the world market rather than for the specialised home market which was sheltered and fostered by the old horse-power tax. The average motorist, they maintained, using the average roads in the average overseas country, judged his car by

standards of price, size and performance—not by the ingenuity which put a quart of brake horse-power into a pint of engine or crowded the English family over a wheelbase small enough to fit in the English suburban garage. The British car was a hothouse product—"an exercise in tax evasion rather than in power transmission." It was too lightly powered; it was too dear; it was the wrong size and shape. It could flourish in the British and Empire markets, but it was not what the world at large wanted, and in fact, the world at large did not buy it. The British industry in 1938 exported 68,000 cars, but 56,000 of them went to Empire countries. Only two foreign countries, Denmark and Sweden, bought more than a thousand British cars in 1938. For many years the industry accepted the situation complacently enough, ignored foreign demand for larger, more powerful, more strongly built cars at low prices,

and cultivated its domestic garden. Overseas sales were an extra, carried on the back of the home market.

The industry's transformation from a protected home producer to a great export industry has been abrupt. It is now required to export 75 per cent of its car production. No doubt that is too high a percentage to be healthy; but even when (and if) the present dollar crisis is surmounted, the industry cannot go back to the old life. In the foreseeable future, there is no prospect that the national resources of steel, labour, and power can be spared to provide, on the old scale, motor-cars for Englishmen. This fact was given fiscal recognition last June when the horse-power tax was finally replaced by a standard tax falling equally on all sizes of engine. The change was made as a stimulus to technological reform to meet the necessities now admitted: fewer models, mass-produced at lower prices; direction of the designer's endeavours away from British taxable capacity, towards the production of a generally saleable car. But it was not made until the national resources were so dangerously stretched that neither time nor resources could be spared for revolutionary enterprises. And what the industry needs to fit it for untrammelled competition in the world is a revolution in methods and design.

Here is the present dilemma. The industry knows at last that it must face the future as an exporting industry—or those of its members who do not know now, never will. It knows that new designs and new processes alone can save it—or those who do not know, are learning now from their overseas agencies. But the industry is told that it cannot relax immediate production for the sake of better models in a year or two; it cannot have the steel for retooling; it cannot, indeed, have all the steel it wants for actual production. Its immediate task is simply to divert its product from home to foreign markets. It must be exporting 20,500 cars a month by June, and 26,300 cars a month by the end of this year. Those firms which cannot adapt themselves to these requirements have been told by the Minister of Supply that they risk being put out of production altogether. How many will evade the threat?

A Modern Profit and Loss Account

A FIRST article in this series dealt with the reshaping of company balance sheets to conform with the provisions of the new Companies Act when they come into force on July 1st*. The next stage is to assess the importance of the changes which the 1947 Act demands in the content and presentation of company profit and loss accounts. This is, oddly enough, the first Act which lays down any statutory requirements about the content of profit and loss accounts. The overriding principle is that the profit and loss account, like the balance sheet, must show a "true and fair view." But the principle is strengthened by a number of detailed provisions. The first Schedule of the Act demands specific information on several important points—the method of depreciation; the basis of the United Kingdom tax charge; the manner of showing dividends (gross or net); provision of comparative figures; and the effect of exceptional transactions or changes in the basis of accounting. Moreover, directors' aggregate emoluments must be shown in the accounts. Excess provisions or reserves, or transfers from amounts set aside in the past, must be disclosed "if material." Income from investments must be shown separately.

In other words, the profit and loss account of the future will be designed to show true profit. It will open with a credit item for trading profit, without any deduction for inner reserves (save when such a deduction is specifically sanctioned by the Board of Trade) or for depreciation. A warning is necessary lest excessive weight should be given to the figure for trading profit. The shareholder should continue to look to the trend of net profits, not to trading profit, for the measure of his company's earning power. It would be a pity if the full disclosure of items which have to be charged against trading profit should lead to erroneous ideas about the significance of the latter. The new figures of trading profit will be most valuable to the economist; but the wise shareholder will keep his eyes fastened on net earning power.

The obligation on companies to show amounts allocated to provisions may be waived by the Board of Trade if it is satisfied that disclosure "is not required in the public interest and would prejudice the company"—though the fact of non-disclosure must be indicated in the accounts. The Board of Trade is given fairly extensive licence to vary the requirements in particular cases, and may find itself with a considerable load of work as a result.

The disclosure of directors' remuneration is a matter of considerable interest, arising partly from natural curiosity about a field of which too little was known in the past, but mainly from the principle that shareholders should know how much the directors (whom they appoint) actually receive, and whether they are worth the money. The provisions of the 1929 Act on directors' fees were fatuous and indeed positively mischievous. Only "fees" were required to be shown, and even so the fees and salaries of managing directors were exempted from disclosure. Hence the principal part of the emoluments of directors—namely the salaries which they receive for the performance of executive office—was hidden from sight. Since "fees" are generally a small fraction of total emoluments, it is likely that shareholders of some companies will receive something of a shock when they are in a position to compare their dividends with the total emolu-

*An Order has since been made by the Board of Trade which appoints July 1st as the date on which the remaining provisions of the new Act (including those relating to prospectuses and audit) will come into force. The promised Consolidation Bill has been introduced in the House of Lords.

ments of their directors. But it would be regrettable if disclosure were followed by indiscriminate criticism and led to reluctance to spend money on efficient management, which is always a profitable investment. It is right that shareholders should have such information, but this again is a point on which they would be wise to keep a proper sense of proportion.

Perhaps the most important forward step in the new Act is the statutory obligation on holding companies to provide group accounts. Instead of the vague comments which are enough to satisfy Section 126 of the 1929 Act about the treatment of subsidiaries' profits or losses, holding companies must now produce audited group accounts in addition to the ordinary accounts. There is considerable latitude for variation in the precise form of group accounts ; but although supplementary statements of other kinds may sometimes be used, the usual method will obviously be the consolidated balance sheet and consolidated profit and loss account, in which the accounts of all companies in a group are integrated to give a picture of the whole group as an economic unit. One considerable difficulty is presented when the companies forming the group have different accounting dates. This difficulty does not always prevent consolidation, but it does involve the possibility that the grouped figures may be distorted. Under Section 17, directors of holding companies are required to "secure that, except where in their opinion there are good reasons against it, the financial year of each of its subsidiaries shall coincide with the company's own financial year." Unfortunately, tax procedure and other considerations often make it positively unprofitable to alter the date at which accounts are made up. Where, for some good and stated reason, the results of any subsidiaries are not brought into the group accounts, particulars of their current earnings and accumulated profits must be given in a note to the parent company's accounts.

Latitude about the form of group accounts extends so far as permitting them to be "wholly or partly incorporated in the company's own balance sheet and profit and loss account." No doubt the practical result would then be a single profit and loss account showing the group's results—beginning with group trading profits, from which depreciation and other provisions would be deducted, leaving a figure for the group's net profits. From this net profit figure, the share attributable to any outside interests would then be deducted, leaving a figure which would be available for distribution to the parent company if the subsidiaries' net profits were divided "up to the hilt." The next stage would be to deduct any net profits retained by subsidiaries (that is the excess of their profits over dividends paid to the parent company), leaving finally the profit in the parent company's accounts. This form has been employed to advantage by several companies, among them Lever Brothers and Unilever. It has so many advantages of clarity and comprehensiveness that it may be hoped that it will be adopted as general practice. *The Economist* is not unaffected by the decision. For 40 years it has regularly compiled records of company profits, and every argument of convenience and comprehensiveness shows that the extension of these records to include—as they should—the totality of profits and not merely those brought into reckoning by the parent companies favours the method of group accounting which has been described.

In the past, there has been too little uniformity in consolidated accounts. A greater measure of standardisation could be achieved without any difficulty if the form of group

profit and loss account, described above and illustrated in the accompanying tabular form, were widely adopted. The

There is only one doubt about this form of account. The new Act—it would seem—offers to any holding company which uses this form of profit and loss account an exemption from showing directors' remuneration. Such remuneration is formally required only in the "ordinary" profit and loss account; the Act does not call for a total item for the emoluments of the directors both of the holding company and its subsidiaries. Presumably, the intention was that shareholders had a right to know the total benefits received by the directors appointed by them, but not the amounts received by individuals who are directors only of subsidiaries and not of the parent company. This curious loophole could be exploited only where the combined form of account is used, but in view of the obvious intention of the Act, and of the manifest advantages of the combined form, it is inconceivable that a technicality which can so easily be rectified should be allowed to prevent the general adoption of a convenient form of group profit and loss account.

The accountants and the lawyers now receive from Parliament the task of improving and democratising the relationship between company administration and ownership. Any one who has attended a typical annual general meeting will testify that the high standards of integrity in the administration of British companies, and even the past standards of information in company accounts are out of proportion to the indifference displayed by the "proprietors" in the working of their companies. The average shareholder can hardly be said to deserve more information by virtue of his own efforts or interest; without a great change in this past attitude, the new Act will not serve its most fruitful purpose, for in the end the work and watchfulness of the financial press and the Stock Exchange is not a substitute for an alert and well-informed

general body of investors. In the new Companies Act, they have a sound measure which in its accounting provisions will give them most, if not all, of the information they require for forming sound judgments. It is up to shareholders to make effective use of it.

Business Notes

Surplus or Deficit ?

Since the issue of the Economic Survey, efforts to align some of the estimates given there with the figures shown by the Exchequer Return have involved many headaches for the statisticians. But at the close of this particular financial year the oddities of Exchequer accounting threaten to have much more unfortunate consequences than the discomfiture of seekers after truth. The display of a very large apparent surplus on the Budget accounts for the current year seems to the uninitiated to be providing a solid justification for the diverse interests in the swelling chorus which is now crying for tax-reduction as a supposed prescription for combating inflation. The current year's surplus, as the Exchequer computes it, is certainly remarkable. A cautious estimate in these columns a few weeks ago, which allowed for the possibility of particularly heavy expenditure in the closing weeks, suggested that the "above-line" surplus for the full year might reach £600 million. But it is now clear that it will be a good deal larger than that.

Up to last Saturday, with only two and a half weeks to go, it stood at £812 million—contrasting with a deficit of £417 million in the similar period of 1946-47. Apparently, the recent special advance payment by the Ministry of Food has still to be brought to account above the line; but, even after allowing for that and for less predictable last-minute charges (expenditure in the final week of 1946-47 was no less than £230 million), it appears certain that the total ordinary expenditure will fall far short of the official revised estimate of some £3,420 million. The year's revenue, recently estimated here at between £3,850 million and £3,950 million, now promises to be closer to the upper than the lower of these figures. Its performance in the ten weeks or so since the end of 1947 has broken all records. In the taxation categories, all but two items (excise and stamps) already exceed the year's estimates. Income tax, which Mr Dalton expected to produce £70 million less than in 1946-47, has yielded nearly £50 million more, and EPT and Profits Tax, which were expected to fall very steeply, by £150 million, have dropped by only about £70 million. In the ten weeks total ordinary revenue has produced £1,267 million—more than the total of a prewar budget for a full year—and only a little over £100 million of this came from the abnormal items (Miscellaneous receipts, sales of surplus stores, and trading receipts). Almost half came from income-tax.

It is perhaps not surprising that figures such as these, which promise a year-end surplus of, say, £700 million, should have gone to some people's heads. But in fact this striking result of official book-keeping disappears fast under detailed analysis. The "true" figure could be put at anything ranging from about £500 million (assuming an "official" figure of £700 million) down to an actual deficit of some £500 million or so—according to the particular definition adopted by different interpreters. If purely nominal revenues are excluded, the official surplus would be reduced, in round figures, by £300 million, allowing £200 million for the results of Mr Dalton's clawing-back and £100 million for net surrenders of tax reserve certificates. If, in addition, war damage payments, postwar credits and EPT refunds were included in the expenditure, a further £350 million of "surplus" would disappear. If, moreover, the £300 million of income from sales of surplus stores and Government trading was excluded on the ground that these are temporary and fast-disappearing sources of revenue, the balance would become a "negative surplus" (a phrase now dear to the Government statisticians) of some £250 million. If, finally, the year's Exchequer outlays on coal, local loans and temporary housing were brought to account, the deficit on these extreme hypotheses would become £550 million.

No Budget Leak

A spread of a cool £1,000 million between the limits set by these various definitions, each of which is defensible, certainly leaves ample play to those who choose their facts to suit their argument, and is a positive inducement to specious pleas of the kind now being publicised. Amid these shifting sands, the only firm ground is the basis provided in the National Income White Papers and now, apparently, extended into the Economic Survey. The analyses there are made on sound economic principles, and set the national accounts in the only context in which their significance can be seen—the context of the national economy as a whole.

Unfortunately, not only are these merely annual publications, but it is almost as difficult to translate the Economic Survey's analysis into terms of Exchequer accounting as it is to sort out the Exchequer Return on rational economic principles.

In particular—though many are now attempting the task—it seems to be impossible to discover the equivalent, in terms of ordinary Budget accounting, of the £275 million surplus which the Survey estimates (on existing tax bases) for public authorities in the current calendar year. This figure, of course, relates not only to the position of the central Exchequer, but includes local authorities as well as the various extra-budgetary and social insurance funds. It excludes from the expenditure, however, Governmental payments which are assumed to be treated as capital by those to whom they are made: in this category are postwar EPT refunds and war damage payments, estimated at £150 million for the current year, compared with £280 million in 1947. These are good definitions in principle, but outside investigators have no firm basis for estimating the size of the non-Governmental items which they include. For these reasons, the estimated revenues shown as direct and indirect taxes respectively afford hardly any clue to the Treasury's expectations of its own "ordinary" receipts. "Direct taxes" as shown for 1948 in the Survey would appear to include not only the expected return to the Exchequer on the existing tax basis, but also employees' and voluntary contributions to social insurance funds. "Indirect taxes" apparently include Exchequer receipts, local rates, employers' social insurance contributions, and the Post Office surplus (if any).

In short, despite the frankness of the Economic Survey on the issue of inflation, the Chancellor's Budget remains inscrutable. From the discussion in the Survey about the inadequacy of personal savings, there is a strong presumption that the Chancellor intends to frame his Budget in such a way as to provide an appreciably larger surplus than the £275 million which is at present in sight on the basis indicated above. But it would require much labour and ingenuity in analysis to formulate any worthwhile guess of what this means in the conventional notation in which the Budget will be presented.

Voluntary Dividend Limitation

While the principle of voluntary dividend limitation is on trial, the Stock Exchange has rightly assumed that, whether it succeeds in obviating more direct action against profits in the Budget, some form of dividend limitation is likely to be the overriding market factor for some time to come. In the memorandum submitted to the Chancellor of the Exchequer by the employers' organisations last week, it was suggested that, subject to "exceptional" cases, "the gross amount distributed by a business by way of dividends in the current year should not exceed the gross amount distributed on the same capital in its last financial year." This principle would not apply to new companies or to companies which had suffered from concentration, war damage or enemy occupation.

It would be difficult to evolve an equitable basis for freezing dividends, since any scheme will produce anomalies. All things considered, the proposals of the Federation of British Industries are probably as effective and simple in practice as any rigid and complicated scheme. But there is, obviously, plenty of room for argument about the companies which should qualify for exceptional treatment, particularly since the voluntary principle would enable companies in the first instance to be judges of their own eligibility, whatever pressure might be brought to bear later by fellow industrialists. And it will not be easy to apply restriction to the distributions of new companies, many of which have naturally been concerned to bring at least their initial payments up to prospectus forecasts. But difficulties will undoubtedly arise among companies which are emerging from a series of unprofitable years.

In fact, the general significance of this formula is to reduce ordinary shares virtually to the status of non-cumulative preference shares. Once this effect is recognised, the application of the formula is seen to produce a large number of anomalies and injustices. Obviously, those companies which have been ploughing back a large proportion of their profits—according to sound financial

practice and also at the Government's own behest—will now have to withhold the distribution of the higher profits which would usually follow from such a policy in conditions of expanding earnings. By contrast, companies which have been distributing up to the hilt, would be given a further brief

to continue to do so. Thus, the formula tends to favour high-yielding equities, although their high yields must still be weighed against their other investment qualifications. Conversely, the shares with modest yields, based on the expectation of higher dividends to come, fall in favour since the fulfilment of those expectations will now be delayed. Under dividend limitation an ample dividend cover may no longer be regarded as an automatic blessing.

Inviting Trouble

The range of dividend increases announced this week is disturbing, to say the least of it. It would be unfair, however, to conclude forthwith that these declarations, of which a sample is given in the accompanying table, represent an attempt by industry to disregard the counsels of the Federation of British Industries and the wishes of the Government. There is inevitably an interval between decisions to recommend dividend payments and their announcement; and a mere handful of companies can hardly be regarded as representative of the behaviour to be expected from industry in general.

That this is so is shown by the response of most of the 580 larger industrial companies (representing a market capitalisation of over £2,100 million), to whom Sir Frederick Bain wrote. Some 97.8 per cent of these companies were prepared to follow the recommendations of the FBI. And it would be wrong to

RECENT ORDINARY DIVIDEND INCREASES

say that the good impression made by this response, which has been duly welcomed by the Chancellor, has been erased by the independent decisions of a few of the smaller companies. This conviction is strengthened by consideration of the decisions of British Aluminium and Bradford Dyers—which have expressly refrained in their recent announcements from making dividend increases that might reasonably have been expected in view of the improvement in their earnings—and of others such as John Summers and British Celanese, who have anticipated the usual date of their dividend declarations in order to say that there will be no increase in their payments this year.

It must not be forgotten that Sir Stafford has shown a genuine desire to gain the co-operation of industry in his assault on inflation and that he is at present watching "with the keenest and most hopeful anticipation the actual results which can be achieved

in the stabilisation and reduction of prices and in the reduction of profits and stabilisation of dividends." Obviously the actions of industry are being watched—and not only by Sir Stafford. Less conciliatory Labour members would prefer dictation to compromise, and if a section of industry prefers in its turn to act without regard to its responsibilities, Sir Stafford might well be pressed to adopt a sterner approach. Nor could the TUC be expected to remain passive. Industry may not like the equity or be convinced about the effectiveness, as a counter-inflationary policy, of the campaign against profits. But if it fails to do its part, it cannot complain if the TUC loses even its present tenuous hold on individual trade unions who are ready to press for higher wages at the first opportunity.

Problems of Revival in Cotton

It has needed the threat of bankruptcy and the sheer lack of steel for other exports to bring home the urgency of regenerating the Lancashire cotton industry. The chosen spokesmen of the Government were not the Cotton Board nor the mysterious committee of under-secretaries, both of whom are primarily concerned, but the authors of the Economic Survey. They are explicit. Between the second half of 1947 and the end of 1948 an increase of 74 per cent in the volume of cotton goods exports is to be attempted. A target of 20 million tons of cotton yarn a week by the end of the year replaces the target of 18½ million tons which had itself only just been announced by the under-secretaries. About methods, the Survey says: "The most immediate need is to increase and re-deploy the labour force. In general, the cotton and wool industries have more than sufficient machinery for their present labour, and raw material stocks are high." They ask for 58,000 more cotton workers this year; but it took nineteen months from May, 1946, to December, 1947, to raise the depleted labour force of the industry from 225,000 to 267,000.

General sufficiency of machinery is no substitute for particular shortages. But it is true that there is here a possibility of expanding output without consuming much more steel. Trained and suitable labour is actually to be found in Lancashire homes. It ought to be possible to induce it to return to the mills for two or three years' work while the re-equipment problem is tackled. Not only more, but more efficient, labour is required. Much can be done by redeployment methods. Studies made by the Shirley Institute show that output per man-hour in different spinning mills using similar plant varies by over 30 per cent. In one weaving shed where non-automatic looms were used, redeployment increased production per man-hour by 11 per cent and reduced labour needs by 30 per cent. The labour problem is a difficult nut to crack, but far harder ones were broken during the war.

Yet there is still no sign of the sense of urgency which will be necessary if the campaign is to succeed. As the three ministers departed from Lancashire after the weekend manoeuvres, a new strike broke out in the Bolton area over comparative rates of payment under the new Aronson agreement; it threatens to spread to more than 45,000 workers. Is Mr Attlee's intercession with the heads of the industry next Monday likely to be more effective? It must indeed be questioned whether the existing weapons are strong enough. Direction can only be cautiously used and in any case it does not reach the majority of the potential workers. Discouragement of other new industries in the cotton area is merely negative, and may have dubious results in the long run. An agent capable of initiating and directing a campaign is needed inside the cotton trade, and the obvious choice is the Cotton Board itself, which under the Order approved by the Commons on Monday is to be reconstituted as a Development Council. But the Board's powers are little more than advisory. The task of regenerating the Lancashire trade is especially urgent, and the ingrained pessimism left in the trade itself by the long decline of the past thirty years makes it peculiarly difficult. Certainly the Cotton Board will need all its strength for the task.

Textile Machinery Problems

Mr Harold Wilson, in expounding the new drive in the cotton industry to a Manchester meeting last weekend, did not confine himself to the problem of finding and utilising labour. He went on to talk of increasing the production of textile machinery and of those "small but vital accessories" the lack of which is slowing up production in so many mills and factories. This is

common sense, but it smacks of heresy in more ways than one. The President of the Board of Trade is responsible for the textile industries, but the production of textile machinery with (or, as often happens nowadays, without) the vital accessories lies within the province of the Minister of Supply. Any buildings which the machinery makers may wish to build, or to alter, so that their production may increase, have to be sanctioned by the Minister of Works. And that consent (as some manufacturers of knitting machines, desiring to furnish their machines with the necessary needles, found not long ago) can by no means be taken for granted. Mr Wilson's first problem, then, is to get co-ordination within the Government machine, so that the textile industries may be revived in an efficient manner.

His attempt to relate textile production to textile equipment contains another heresy: it challenges the tradition in Lancashire that the makers of cloth and the makers of machinery are enemies. The deep roots of this tradition grew during the years when the cotton trade was declining and the machinery trade was selling steadily to Lancashire's foreign competitors. The industries making textile machinery and equipment are firmly established export industries, and the bulk of their production has for many years gone abroad. The chief makers of spinning machinery have several years' work on their order-books, but it is chiefly for export. And the slow response of the spinners to the Re-equipment Bill is unlikely to urge the machinery makers to make any great change in the emphasis of their trade. No doubt, however, they will be able to meet some home orders if the Lancashire spinners can summon up enough confidence to place them. On the weaving side, the Cotton Working Party estimated that 120,000 automatic looms would be needed in five years to bring the industry's proportion of automatic looms up to 45 per cent. The output of looms is so far from meeting such vast requirements that the Evershed Committee suggested "the application of some similar scheme of manufacture as was applied in the war to the production of war munitions, for instance, the Lancaster bomber."

It is clear that the main problems of re-equipment will not be quickly solved. More immediately, a good deal can be done to improve productivity by smaller devices—ring-spinning, larger packages, rewinding, shuttle-changers, and so on—if a number of minor shortages can be overcome. The Ministry of Supply is addressing itself to this problem as well as to the need for restoring to their prewar level the supplies of shuttles, bobbins, card clothing and other ordinary mill stores.

* * *

Agreement with Belgium

None of the financial agreements made by Britain over the past year has had to be revised so often as that with Belgium. The reasons are not far to seek. First among them is Belgium's astonishing export potential which, allied to Britain's equally astonishing import potential—not only *vis à vis* Belgium but many other countries with which Belgium runs surpluses—has contrived to canalise a substantial volume of sterling into Belgian hands. This movement of sterling has been further swollen by considerable amounts of sterling held by Belgian nationals which have been sold to the National Bank of Belgium as confidence in sterling has waned. As a result, Belgium, despite a considerable lifting of the ceiling of its non-convertible holdings of sterling, has been in a position to offer sterling and demand gold from Britain.

It was to meet this situation and to stop an outflow of gold from Britain, which amounted to some £11 million in the first two months of this year, that the financial agreement came up for further revision. The new agreement announced this week maintains at £27 million the maximum of sterling which Belgium is prepared to hold before demanding conversion rights. An attempt is to be made, by influencing the volume of trade between the sterling and Belgian franc currency areas, to keep this balance at £27 million and prevent further gold movements from Britain to Belgium. It is unlikely that the desired equilibrium can be established immediately, and the agreement clearly envisages further sales of gold in the coming weeks.

It is, however, provided that as and when payments turn in favour of the sterling area, Britain will be able to use this surplus in order to buy back from Belgium any gold sold after March 1, 1948. In other words, Belgium agrees to hold its sterling balances at £27 million until such time as it has resold to Britain any gold acquired from Britain after that date. After the completion of these resales, any subsequent current surplus in favour of the sterling area will of course be met by dipping into Belgium's accumulated sterling balances, bringing these below the ceiling of £27 million.

The control of the volume of trade between the two monetary areas which will be required in order to bring about the desired equilibrium is to become the general responsibility of a new Anglo-Belgian joint committee which has been set up and will meet regularly to supervise the new arrangements. The new agreement will operate for a period of eighteen months, beginning January 1, 1948. During this period Belgium has undertaken drastically to restrict its acceptance of sterling from countries outside the sterling area. It will be the task of the Anglo-Belgian joint committee to decide from time to time whether the circle of non-sterling countries from which Belgium may accept sterling for current purposes can be increased.

Although the general intention of the two parties to the agreement is to maximise trade between them it should be fairly evident that in prevailing circumstances the desired bilateral equilibrium can be reached only by cutting down the larger side, namely, the exports from the Belgian to the sterling monetary area. Any suggestion to the contrary in the official statements published here is specious and suspect in the extreme. This is definitely a case in which bilateralism is working in a restrictive sense. Unfortunately, that at present appears inevitable; the agreement provides the least unsatisfactory alternative open to the two countries. If sterling exports to Belgium could be appreciably expanded, the new agreement might yet be cleansed of this restrictionist taint, but nothing in the official announcement lends much support to this particular hope.

* * *

Capital to South Africa

The South African banks have this week been instructed by the authorities in the Union to sell South African currency against sterling only for approved purposes. The intention of this move is to discourage the transfer of idle money from Great Britain to South Africa. It is in step with the financial agreement of last October, which pointed out that it was in the joint interest of the two countries to control or prevent movements of capital from the United Kingdom which are not required for any useful economic purpose in South Africa. The Union Government undertook at the time to give such assistance as might be necessary to make controlling measures effective. The first step taken to achieve the objective is this order by the Reserve Bank of South Africa. Its intention is to prevent unauthorised movements of funds from British to South African banking accounts. There is no evidence that the freedom of the market for gold shares, for example, is in any way impeded, and so long as it is free, this market provides only a very slight detour for the transfer of funds which is now to be discouraged, or even prevented, if it takes the direct route. The move by the South African authorities is, however, one more piece of evidence indicating the drift of South Africa away from the sterling area and into a unique midway position between that area and the hard currency countries.

Effects of the Film Agreement

Some of the dismay which has been aroused by the details of the American film agreement is a little difficult to account for. It appears that the American motion picture producers have secured for themselves a fair prospect of being able to put the British earnings of their films to profitable uses. This is not surprising. The British Government had set itself the object of restricting the net dollar drain of the film trade to a quarter of what the drain was in 1946. It succeeded, though narrowly, in holding on to that point; in return, it had to give something away.

What the Government gave way was not negligible. Hollywood's balances in Britain will (among other uses) be expendable without restriction—except, one supposes, the restrictions to which all industrial activities are subject as to the material resources they use—on film production in this country and on such associated activity as the purchase of copyrights. It is necessary to be clear that the consequent productive activities will not necessarily, in the ordinary meaning of words, benefit the British film industry. A film made in the United Kingdom may be a British film, or it may be a Hollywood film made on location in Britain; before the war such films as "A Yank at Oxford," though made in this country, were marketed abroad as American films. The Americans will be entitled to make in Britain films which are virtually American films; and, whatever

March

This year Easter falls in March, and Spring brings many inquiries of a happy and eventful nature. "I am delighted to tell you that I am to be married at Easter"—so begins a letter to one of our branch managers. It continues "My solicitors are preparing a marriage settlement and they tell me that I shall need to make a new will, as marriage revokes the existing one. I wonder whether your Trustee Company will act?" Of course the Company will act, as executor or trustee or both. Its officers, while giving the benefits of a specialized service, preserve friendly relations with all those for whom they act.

Roger Bacon showed the world, for the first time, the importance of scientific observation and experiment. This remarkable man was born at Ilchester in Somerset in 1214. After studying at the University of Oxford and in Paris and Italy, he eventually returned to Oxford, and became a Franciscan monk in 1251. In an age when "science" was largely synonymous with the alchemists' search for the philosopher's stone and attempts to transmute base metals into gold, Bacon displayed a scientific vision far in advance of his era. He foresaw the possibility of mechanical flight, the use of explosives, the improvement of sight by lenses and the propulsion of ships by engines.

In all his teaching he insisted on the importance of experiment rather than discussion, and on the necessity for first-hand practical experience, particularly of such chemical operations as distillation and calcination. He saw clearly that, without this practical foundation, natural science was little more than a collection of words. One result of his insistence on experiment was to enable him to show that air is necessary to sustain combustion. He has also been credited, but without adequate evidence, with the discovery of gunpowder. Some explosive mixture was undoubtedly known in Western Europe in his time for Bacon complained of the annoyance caused by boys letting off fireworks outside his study. He died on the 11th June, 1292, leaving as his contribution to science a way of thought which still persists all over the world. Roger Bacon, Englishman, may justly be described as the first modern scientist.

sort of films they make, any dollars the films earn will go to America.

In effect, that will also be true of any dollars to be earned in the United States by British films proper. And here is the most curious effect of the agreement. It gives the American film producers a certain interest in fostering the distribution of British films in the United States, since they will be able to increase their basic remittance of 17 million dollars a year by the amount of British film earnings there. Mr Eric Johnston, president of the MPAA, gave some interesting figures on this subject which do not appear to have been confirmed or denied. He said that British films earned about 4,000,000 dollars in the United States last year, after distribution costs had been met; but that only 1,000,000 of these were actually sent to the UK. He hoped that the earnings might be increased by two or three times as British films became better known. Twelve million dollars is still a modest figure for a big market. And, indeed, the American film industry is not likely to go to any extravagant lengths in pushing the sales of even a small competitor.

But the Americans may be said to have a certain interest in the matter. By contrast, the British Government has now—so far as the balance-of-payments problem is concerned in the next four years—virtually none. During the period of the agreement, the earnings of British films in the United States will have no effect whatever on the British balance of payments. In some ways this may prove a dangerous situation for the British film industry, which will be unable to support with the hope of dollar returns any claims it may make upon scarce material resources. The Board of Trade, it must be hoped, will take the long view and give reasonable help. If it does not, the British film industry at the end of another four years will be no more capable of stepping into Hollywood's shoes, even in its own home market, than it has shown itself in the last few months.

Slump in Bricks

The White Paper on Capital Investment made it clear that severe cuts in the industries which provide building materials could not be avoided. The brick industry is now experiencing the consequences, which are surprising only by their suddenness; they came at the end of a year in which the Government had persistently exhorted the brick companies to increase their output. Building (and in particular new building) has now slowed down, the demand for bricks has fallen off, and the works are stacking vast quantities. By this time of year they are accustomed to know with reasonable certainty what the demand is going to be; but now, since builders' and architects' plans are contingent on the granting of licences, they have no way of telling. They only know that it will be less than they can meet. A number of brickworks have already closed down.

Night shifts are being stopped at the London Brick Company's works in the Peterborough area and at some works in Bedfordshire and Buckinghamshire. Labour is being redistributed as far as possible to avoid throwing men out of work, and it happens that the prisoners of war who have worked in the brickyards are due to return home; the London Brick Company has still found it necessary to dismiss about 600 of its foreign workers as well. Sir Malcolm Stewart, the chairman, has addressed a message to all workers in the company's employment to explain the situation to them. He admits the impossibility of predicting how long the present restriction of demand will last; it depends on Government decisions, and "efforts to find out what is going to happen have so far been unsuccessful." His own guess is: "Building will continue for the present at a reduced rate which will be insufficient to absorb more than a part of our present production; thus our power to compete and to distribute widely our products on a national basis will be affected." It was only last June that Sir Malcolm Stewart was describing to the company's annual meeting the efforts that had been made to reach full day-and-night working, and the expenditure in building materials and engineering skill which was being made to get the installations working at full capacity. The London Brick Company represents a quarter of the UK brick industry.

It is to be hoped that this situation will at least provide an opportunity for revision of the curious wartime structure of fixed prices which still survives in the brick industry. Minimum as well as maximum prices are fixed, and they are so arranged as to leave room for producers who consume fuel and manpower extravagantly as well as for those who consume economically. The variations in this industry are remarkably wide. Since capacity is now in excess of demand, a free price system would be worth considering.

Trends in Bank Advances

The tightening of control over bank advances which (as a Note in these columns a fortnight ago pointed out) accompanied last December's revised directive from the authorities to the Capital Issues Committee, has so far had no discernible effect upon the volume of demands upon the banks. Even now some bankers still expect that the shifting emphasis in advances policy, and the general effects of the enforced curtailment of industrial development, may involve some reduction in their lending operations. In the past three months, however, as the latest quarterly classification shows, the total of advances in Great Britain (made by all members of the British Bankers' Association) has risen from £1,219 million to £1,307 million. This increase of £88 million is almost twice the expansion achieved in the preceding quarter and compares with £66 million in the three months to February 1947. This experience is not, however, any very reliable guide to the future trend, principally because the latest quarterly return embraces the period of maximum inflow of taxes to the Exchequer. It was certainly no accident that February's record expansion of clearing bank advances—they rose in that month by £50 million—synchronised with record surpluses at the Exchequer. There can be little doubt that a substantial part of the additional accommodation granted recently represents funds required, directly or indirectly, to finance these abnormally heavy seasonal tax payments.

For this reason, the changes shown this quarter in the detailed analysis of advances by industrial categories are a particularly unreliable guide to the underlying experience and financial needs of the industries in question. It is perhaps significant, however, that the proportion of the total additional accommodation absorbed by the large Personal and Professional group has declined still further. Although this category still accounts for 27.2 per cent of the outstanding total of advances (compared with 28.7 per cent twelve months ago) its net demands in the past three months amounted to only £14 million or 16 per cent of the quarter's net new business. The largest expansion during the quarter occurred in the Retail Trade group which absorbed £17 million; advances to this group now stand at £131 million, or more than double their level of two years ago. The only other large expansion during the three months is that in the Engineering group, the total of which has risen by £10 million to £105.5 million, compared with £72.7 million in February 1947. Rather unexpectedly, in view of the restraint which the banks have been asked to exercise when dealing with requests for the finance of hire-purchase or operations in property, there has been a perceptible recovery in accommodation to the "Other Financial" group.

* * *

Canadian Credit Drawings

The latest exchequer return shows that a further £2,200,000 was raised by external borrowing last week. The whole of this came from the Canadian credit and exhausts the quota of \$45 million which it was arranged could be drawn from this credit over the first quarter of 1948. Any further net payments due to Canada between now and the end of the month will, in accordance with that agreement, have to be made in US dollars. Between now and the end of the month, decisions will have to be reached regarding the payments arrangements that will operate from April 1st onward. About \$242 million remains in the Canadian credit, but cannot be touched without a new agreement with the Canadian Government. For that reason this balance was quite properly excluded from the UK gold and dollar reserves of £680 million which the Economic Survey for 1948 calculated to be available at the end of 1947.

High-level discussions of the problem of Anglo-Canadian payments have been proceeding for some time past in Ottawa and London. In these discussions the Canadians have tended to adopt the usual opening bargaining position and have suggested that the deficit Britain will have to meet in Canada be met by a larger proportionate payment in US dollars than was provided for in the arrangements made for the first quarter of this year when the payment of about US \$100 million accompanied drafts of \$45 million on the Canadian credit. These initial Canadian demands may have been intended to stimulate British exports to Canada—the most satisfactory way of closing the gap. The ultimate solution of the problem of meeting the British-Canadian deficit for the next two or three years will probably be provided by Marshall aid. In view of the delicate stage which the Marshall plan project has reached in the United States, it is probable that the new arrangements to be made between Great Britain and Canada will be of very short-term character.

Titles of the lectures include, *London on the Move*, *The Story of the Underground*, *The Story of the London Bus*, *How London's Tube Railways are Built*, *A Night with London Transport*. For details, write to the Publicity Officer, London Transport, 55 Broadway, S.W.1.

"I feel like an angel, up here, winging on my way to be with you. . . ." It's the sense of riding on a big friendly cloud that makes her feel like that. Quietness, a tranquil atmosphere—she writes her letter easily, naturally, and in perfect comfort in the lounge cabin of the Short flying boat.

In the evening, after an excellent dinner, it is a pleasure to sit in the quiet, roomy cabins. The steward will bring the drinks—and through the wide window is a dreamlike view of the passing world below. And then, to bed in cloud-pillow comfort, to dream of breakfast in Augusta.

The romance of flying, to all parts of the world, is catered for in a big way by Shorts. Flying boats leave the U.K. regularly for India and China, South Africa, Australia, and New Zealand. Short flying boats operate also in South America and Scandinavia, and between Baltimore and Bermuda. Your travel agent has details.

It's fun to fly by flying boat!

THE SPIRIT OF ENQUIRY

The Black Crust!

... a mystery of 1888

In 1888, the late Dr. Ludwig Mond noticed the formation of a puzzling black crust on the nickel valves of a plant for recovering ammonium chloride in the ammonia soda process.

The black deposit proved to be carbon formed by the unexpected presence of carbon monoxide. Further experiment on a laboratory scale led to the discovery that nickel unites with carbon monoxide to form nickel carbonyl, which in turn breaks down readily again into nickel and carbon monoxide.

Mond immediately appreciated the possibility of using this reaction as a means of refining nickel ores commercially even though other metals were present.

This black crust led to a revolutionary step in metallurgy, for nickel serves us all at every turn to-day thanks to the background of research and enquiry which has always characterized the Nickel Industry.

Apart from a secured Bank overdraft of one subsidiary company not exceeding £10,000 neither the Company nor any of its Subsidiaries has any Debentures, Mortgages, or Loan Capital.

The Subscription List will open and close on Tuesday, 23rd March, for an

ISSUE OF 1,000,000 4 per cent. Redeemable Cumulative Preference Shares of £1 each at 20s. 6d. per Share.

The Prospectus shows (inter alia) that:—

- The Company's principal customer is and has always been the British Post Office, but since the end of the war it has greatly increased its export business and it is anticipated that, in 1948, 60% of its productive effort will be sold overseas.
- The proceeds of the issue will be applied to reduction of the Bank overdraft (amounting at 1st March, 1948, to £1,053,012), to pay for extensions to the Company's Buildings, Plant and Equipment (£160,000), to finance the further development of the Company's interests overseas (£100,000), and to provide additional working capital required for the increased volume of work in hand.
- Total net assets at 31st December, 1946, plus the proceeds of the present issue, amounted to £3,446,016, which sum covers the aggregate of the nominal amounts of the 7% Cumulative Preference Stock and the 4% Redeemable Cumulative Preference Shares now being issued two-and-three-quarter times.
- The gross amount required to pay the dividends on the 7% Cumulative Preference Stock and on the 4% Redeemable Cumulative Preference Shares now being issued plus additional Profits Tax at the present rate is £62,100. This amount was covered over six times by the profits of the financial year ended 31st December, 1946, which amounted to £384,589.
- Final accounts for 1947 will not be available until early in June, 1948, but the Directors are satisfied that the results of the group in that year will approximate to those of 1946, and they consider that provided no factors beyond the Company's control intervene the trading prospects of 1948 should be no less satisfactory than those of 1947.

Copies of the full Prospectus, on the terms of which alone applications will be considered, and Forms of Application are obtainable from:—

discouraging, but they will tax the resources of the industry to the full. At the moment, exports of domestic pottery are about 50 per cent above 1938 in volume, and four times the 1938 value. About 40 per cent of the exports go to Western Hemisphere countries, and there is still a considerable unsatisfied demand in Canada and the Latin-American countries. To stimulate production, manufacturers have been urged to effect improvements in their methods, and each operative is to receive a special leaflet drafted by the trade unions, suggesting ways of increasing output. Absenteeism is a considerable problem in this industry which employs a large proportion of married women and where so many of the processes depend on team-work. The effective labour force is about the same as before the war, allowing for prewar unemployment, but there are some vacancies and there is sharp competition for female labour from other trades in the area. The chief incentive is the effective one of a straight piecework system, which applies to 98 per cent of the operatives.

The industry's fundamental problem, however, is to increase its efficiency by more mechanisation, especially in its handling methods, and by the replacement of old-fashioned intermittent ovens by continuous kilns. In the past two years, 65 new kilns have been installed, but further progress is delayed by lack of materials. There are suggestions, too, that it is delayed by aversion to change. Until there is a root-and-branch reorganisation, the industry's long-term future must be uncertain. It has already to reckon with the revival of competition from Germany, Czechoslovakia and Japan.

Bowaters' Position

The increase announced early this month in the permitted basis of operation for newsprint manufacture from 20 to 24 per cent of capacity compared with a level of 35 per cent twelve months ago only mitigates to a very small extent the plight of the newsprint industry in Britain. In explaining the process by which the price of newsprint is determined, Sir Eric Bowater, at the annual meeting of the Bowater Organisation last week, referred to the grip of controls in which the industry is held. The Government allocates raw materials, fixes their prices and determines the final selling price. And to assist in establishing selling prices the newsprint companies from time to time voluntarily furnish the Government with cost schedules. This has not been sufficient to prevent at least the United Kingdom subsidiaries of Bowater working at a loss—although, of course, by means of expanding from its big overseas interests, particularly in Newfoundland, Sweden and Norway, the group had a record income in the year to September 30, 1947, earning 76.3 per cent on the reorganised ordinary capital compared with 50.3 per cent in 1945-46. Increases in the price of newsprint, which at present averages around £43 a ton depending on the quality, have apparently

afforded no extra profit to the industry since they have been offset by equivalent rises in the price of raw materials.

With permitted operating capacity at a level which is little higher than in the worst years of the war, the spread of overhead costs over the reduced output greatly increases costs of production per ton of output. But the country itself is in the grip of the dollar shortage, and though it is universally desired to enlarge the size of newspapers and increase the availability of paper in general, the prospects of an early relaxation of the present tight control on operating capacity are not promising. Yet only thus can the weight of overhead charges be eased.

Poland and Sterling

The widening use of sterling for international transactions is to be further encouraged by the new financial agreement between Britain and Poland. This agreement extends the principle of administrative transferability to Poland. The previous account of the National Bank of Poland at the Bank of England has been redesignated the Number One account and becomes a transferable account. Transferable account status will also be given to other Polish sterling accounts that may be agreed between the Bank of England and the Polish authorities. Sterling in these accounts will be available to make payments to residents of Poland for payments to residents in the sterling area and for effective current payments to such non-sterling countries as may be agreed between the Bank of England and the National Bank of Poland. This infiltration of transferable sterling facilities East of the Curtain is one of the more reassuring developments in a tense political situation.

Shorter Notes

The assets of Prudential Assurance at December 31, 1947, were £502,003,240, compared with £471,716,725 a year earlier, and have exceeded £500 million for the first time in the company's history. Although assets amounting to £275 million, against £270 million, were held in gilt-edged securities—British Government stocks amounted to £244 million and Dominion and Colonial Government securities to £15½ million—the major part of the increase in assets in 1947 was spread over higher yielding securities. Holdings of real property increased by £3½ million to £25 million, ordinary shares by some £6½ million to £51½ million, preference shares by £6½ million to £42 million, and debenture stocks were increased by £3 million to £47 million. Cash holdings have risen by nearly £3 million £8,200,000.

The gross operating revenue of the Canadian Pacific Railway for 1947 was \$318.5 million compared with \$292.5 million in 1946. Working expenses were also higher but other income rose on the year, leaving net income of \$31.8 million against \$25.1 million.

SECURITY PRICES AND YIELDS

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be repaid at the earliest date (these are marked 'e'), and those paying 3 per cent or less for tax at the latest date (marked 'l'). (n) Net yields are calculated after allowing for tax at 8s. in the £. (f) Flat yield. * Assumed average life 15 years 6 months. (g) Buying Price.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (A) Fifteen months to March 31, 1947 (yield basis 7-6 per cent). (B) To latest redemption date. † Free of tax.

EQUITY & LAW LIFE ASSURANCE SOCIETY

VERY SATISFACTORY RESULTS

SUBSTANTIAL NEW BUSINESS

SIR GEOFFREY ELLIS'S REVIEW

The annual general meeting of the Equity & Law Life Assurance Society was held, on the 18th instant, at The Auctioneers' and Estate Agents' Institute, 29, Lincoln's Inn Fields, London, W.C.

Sir Geoffrey Ellis, Bt. (Chairman of the Society), presided.

The Chairman said:—Gentlemen, I rise to move: "That the report and accounts for the year ending December 31, 1947, be received and adopted and entered on the minutes." These have been in your hands for some days and I assume may be taken as read.

My first very sad duty is to refer to the death during the year under review of our friend, Thomas Francis Tallents. He was a most loyal and able colleague and a lovable friend; his early death was a great loss to all who knew him, and I would like to take this opportunity of expressing the Society's thanks for all that he did for us, and our sympathy with his family.

CHANGES ON THE BOARD

The next three matters which I wish to mention also concern directors of the Society. First, the appointment of Sir Arthur florde to be headmaster of Rugby School. This appointment means that Sir Arthur is relinquishing his directorship of the Society—we shall miss him greatly. May I pay tribute to the outstanding ability which he has brought to the conduct of our affairs. We wish him well, and I can only echo warmly a phrase used by the Chairman of the Board of Governors of Rugby School in announcing the appointment—"we believe Sir Arthur florde to possess in an altogether exceptional degree the personal and intellectual qualities which make a great headmaster."

Next, I refer to the change in the title of Mr Lewis G. Whyte—who was appointed to the board on April 9, 1947—from "Investment Manager" to "Investment Adviser"; this change in title gives effect to the change in his duties in our internal administration which I forecast to you in my speech last year.

Lastly, we welcome our new director, Mr Geoffrey Eley, who joined the Board of the Society on February 1st to fill the vacancy left by the death of Mr Tallents.

THE YEAR'S RESULTS

Now I turn to the report and accounts before you. May I begin by reminding you that the year under review is the first of a new triennium and that no formal published valuation falls to be made until December 31, 1949. We have, of course, made a valuation for our own internal purposes, and the results for the year were very satisfactory indeed; the surplus earned is amply sufficient to provide bonuses on our policies at the rates we are now paying.

The three main sources of profit or loss—mortality, expense and interest—call for comment. Mortality I can dismiss quite briefly by saying that it was so favourable to the Society that we can only regard the contribution provided from this source as exceptional.

EXPENSES OF MANAGEMENT

As regards expenses of management, you will see from the revenue accounts before

you that there has been a substantial increase in this item as compared with the previous year. This increase is approximately £68,000 excluding stamps on policies and annuity bonds, which we now show as a separate item.

The increase has been due in part to special non-recurring items—such as the bonus which we paid to our staff to mark the occasion of the Society's Centenary; in part to the building up of our organisation after the war; and in part to increased salaries. This matter is being watched both from the point of view of the provision made in our rates of premium, and from the point of view of the valuation bases which we employ in assessing our liabilities.

INTEREST RATES

And now as to interest; in my speech to you last year I indicated that we expected to earn a rate of interest of slightly more than 4 per cent. gross after making full allowances for the loss of income likely to be suffered on all securities then the subject of legislation; the figure shown in the report before you is £4 10s. 10d. per cent. gross. The very substantial difference between these two figures is due to a number of causes; to dividends from Home Railway stocks, which are now replaced by 3 per cent. Transport stock; to the collection of arrears of interest in respect of mortgages; and to our investment policy resulting in the securing of a rather higher yield than expected on certain classes of securities. At the end of each year we investigate the future interest earning capacity of our assets, and on the basis of the investigation made as at December 31st last we expect to earn a rate of interest of 4½ per cent. gross on their balance sheet value. This figure is truly comparable with the figure which I mentioned to you twelve months ago and shows an increase of about ½ per cent.; this increase is a measure of the effect of the investment policy followed by the Society during the year.

Last year, in comparing the rate of interest assumed in the actuarial valuation with the rate the Society's funds were expected to earn, I said that there was a very valuable margin of ½ per cent. gross which should prove in the years to come both a source of strength and a source of profit to the Society. After allowing for the increase in expenses to which I have referred, the increase in the rate of interest which we expect to earn is such that this margin has now increased to about 1½ per cent. The other margin which I mentioned to you last year, namely the difference between the value at which our assets appear in the balance sheet and their market value, has decreased, but remains satisfactory; the increase in the margin of interest as a source of profit to the Society is, of course, of the greatest possible importance.

And now four points to which I think I should draw your attention in the accounts before you—one in the revenue accounts, the other three in the balance sheet. The revenue account figure is that for "premiums," which shows an increase of over £340,000 as compared with the same item for the year 1946. This increase is almost entirely due to the group life and pensions business which we have placed on our books and to which I shall refer later.

The first point on the balance sheet concerns Home Railway and Canal securities; we felt that it would be misleading to include these securities with our investments in debentures, preference and ordinary shares since they would be immediately replaced by British Transport stock, and we accordingly show them in the balance sheet as a separate item of just over £5,700,000. The large figure appearing in respect of "securities purchased for subsequent settlement" is due to the fact that a number of the securities in question were bought in December for settlement in January; this liability is offset on the assets side of the balance sheet by short dated and readily realisable securities earmarked for the purpose.

Second, you will notice that the item "Deposit with the High Court" has disappeared from the assets side of our balance sheet—this is a technical point arising from the passing of the Assurance Companies Act, 1946.

Last, I would draw your attention to the reduction during the year of just over £190,000 in the item "Other Subsidiary Companies." This reduction arises from the sale of our interest in "Reserves Securities Trust"—an investment trust company; the sale was effected at prices which resulted in a substantial profit for the society.

Next, I wish to mention our new business figures. When I spoke to you last year I referred to the efficient service which could be given by our pensions department in connection with group life and group pension schemes; I hardly thought, however, that within twelve months we should be reporting to you the very substantial amount of new business which is shown in the report. The figures reflect the greatest credit on all concerned. Another point that will, I think, interest you, is that after consultation with our principal medical officer, Dr A. E. Gow, we have decided to underwrite—on special terms—lives suffering from diabetes. As you probably know, the treatment of this disease has made great strides in recent years and we feel that assurance facilities should now be extended to these lives more widely than hitherto.

IMPORTANCE OF WITH-PROFIT POLICIES

Finally, I would like to emphasise the great importance which we attach to the securing of new With-Profit Whole Life and Endowment Assurances. Experience has shown that a Life Assurance Society thrives best when it is in a position to transact a large volume of business on terms which provide not only excellent value to new policyholders, but contribute as well to the general well-being of the society as a whole. I have no hesitation in saying that in the case of the society the medium by which this dual purpose can now be achieved best is by the issue of With-Profit Whole Life and Endowment Assurances. When a With-Profit policy is under consideration and when estimates are made as to its ultimate value, it is not infrequent that comparisons are made with an office's bonus record stretching over many years into the past. While relevant, this method contains some obvious fallacies. The ultimate value of a With-Profit policy will be determined partly by unknown events unfolding in the future and partly by an office's present financial position. We make no claim for any exceptional foresight as to the former, though it will be our constant endeavour to follow the paths of prudence, efficiency and enterprise; but the latter—an office's present financial position—is a matter of fact. The most careful and critical examination of the society's present financial position entitles me to state with the firmest conviction that the society's With-Profit policies provide outstanding value in life assurance contracts. We shall go forth to seek such business holding our heads high in the face of the keenest competition we may meet.

To our staff I would again say "thank you"; we hear with great pleasure of the promise shown by a number of the younger men who returned from the Forces—they are settling down well, and it is with particular pleasure that from time to time we are able to accord promotion to some of these men.

May I take this opportunity of saying how thoroughly their colleagues on the board appreciate the year's work of Mr Kirton, our General Manager and Actuary, and Mr Whyte, our Investment Adviser.

The success of Mr Kirton's rebuilding to meet a year of exceptional inhibitions is evident in the strength of our position. Moreover, he has paid a most successful visit to North America in order to equate with our own insurance problems those on the other side of the Atlantic. That visit has been fruitful as well as interesting. As an assurance society we also appreciate what he is giving up out of a scanty leisure to carry on as joint honorary secretary in the preparatory work for the centenary gathering of the Institute of Actuaries.

Mr Whyte's work has been done in a year which every City man will agree has no parallel in recent world financial history. His intimate sense of market atmosphere, his knowledge of industrial conditions and his foresight into our economic future have proved of exceptional value in the arrangement of our investments.

The report and accounts were unanimously adopted.

The retiring directors, Mr Allan E. Messer, C.B.E., and Mr Owen J. Humbert, were re-elected. The third director who retired by rotation, Sir Arthur F. B. florde, did not offer himself for re-election. The auditors, Messrs. Price, Waterhouse and Company, having been reappointed, the proceedings terminated.

JEREMIAH ROTHERHAM AND COMPANY, LIMITED

VERY SATISFACTORY RESULTS

The fiftieth annual general meeting of Jeremiah Rotherham & Company, Limited, was held, on the 17th instant, in London, Mr Joseph Hockley, chairman and managing director, presiding.

The following is an extract from his circulated statement:—

Notwithstanding the shortage of supplies in some sections, we are able to report an increase in our turnover in those departments which have obtained certain consumer goods that were available for home consumption. The result of the year's trading, despite the many regulations and conditions under which we are working, may be considered to be very satisfactory.

The trading profit, after allowing for all expenses, but before providing for final payment of Excess Profits Tax and Profits Tax (estimated at £30,204), amounts to £140,335, against £113,752 last year. The net amount, viz., £58,945, is after crediting interest on investments and providing for Profits Tax to January 15, 1948. Adding to that amount £52,121 brought forward from last year gives a disposable balance of £111,066. The increase in profit this year enables us to recommend a dividend on the ordinary stock of 6 per cent., and a special bonus of 6½ per cent., making 12½ per cent. for the year.

With regard to the future, the existing conditions and the Government's White Paper for freezing prices and limited profits, make it difficult even to attempt a forecast on what the trading conditions are likely to be in the present year. Nevertheless, I can assure you that we will do our part to meet whatever difficulties that may confront us, with the hope that we will overcome them and be able again to present a satisfactory report at the end of the current year.

The report was adopted.

CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

RECORD FIGURES

The 94th ordinary general meeting of this Bank will be held, on the 24th instant, in London.

The following is an extract from the statement by the chairman, Mr Vincent Alpe Grantham, circulated with the report and accounts.

During the last year, further progress has been made in re-opening agencies which were closed during the Japanese occupation, and there now only remain Kobe and Yokohama, for which we are unable to include up-to-date figures. We have, as you will see, opened an agency at Tokyo, from which centre our representatives are supervising all Japanese business, pending re-opening at Kobe and Yokohama. Whilst we have not yet re-opened for business in Canton, we have been able to obtain details of our commitments at that port.

THE BALANCE SHEET

Once again I am able to report record figures in our balance sheet, the total of £126,413,799 showing an increase of £8,238,929 over the 1946 figures. On the liabilities side, this increase is almost wholly due to the increases in current and other accounts and fixed deposits of £3,926,842 and £2,442,215 respectively. Smaller increases occur in the totals of notes in circulation of £1,070,957 and loans payable of £667,500. Movements on the assets side show wider divergencies, but cash in hand and at bankers at £23,110,595, shows an increase of £3,387,352, representing 22.4 per cent. of our call liabilities. Government and other securities, apart from those lodged against our note issue, have been reduced by £4,134,355, and this reduction is reflected in the increased cash position.

In accordance with our Charter, our increased note issue has required the deposit of further securities with the authorities to the extent of £848,197. Bills of Exchange, including Foreign Treasury Bills at £4,754,675, show an increase of £1,618,340, and advances to customers at £36,997,025, an increase of £7,490,264, both of which are eloquent testimony of the increased participation of the Bank in financing world trade and the greater requirements of our customers, due, largely, to higher prices of commodities. The only other major change is a decrease of £843,104 in the balance of remittances, drafts, etc., in transit between head office, branches and agencies, which is regarded as a satisfactory feature.

PROFIT AND LOSS ACCOUNT

The profits for the year, after providing for bad and doubtful debts, contingencies and taxation upon the current year's profits, are £448,058 3s. 11d., an increase of £69,426 over those of last year. Our working costs everywhere have again risen, but the increase in our business has more than offset these increased costs.

In October last we paid an interim dividend of 5 per cent., absorbing £82,500, and we propose that, out of the balance available for distribution this year, a final dividend of 7 per cent., less income tax, be paid, costing £115,500. In view of the further progress that we have been able to make in the re-opening of branches that were closed, and the clearer vision we now have regarding war-time liabilities, for which we had already made provision, but for which the necessary legislation to enable us to finalise the position has not yet been passed, and the opening of new branches, we feel that we are justified in raising the basis of our annual distribution to 12 per cent.

We therefore propose that, out of the balance available, after providing for the

dividend, £100,000 be added to the Officers' Pension Fund, £10,000 to the Widows' and Orphans' Fund, and £125,000 be written off bank premises, leaving £402,326 9s. 3d. to be carried forward to the current year.

CONDITIONS OVERSEAS

The year 1947 has been a momentous one in the history of many of the countries in which the Bank operates, and in considering as a whole the position in the various countries in which the Bank is established, and which came under Japanese domination, the most striking feature common to the majority is the shortage of food grains and mainly of rice. With the exception of the three rice-growing countries of Burma, Siam and Indo-China, all are affected by lack of food supplies, and this factor, more than any other, perhaps, is holding up the speed of recovery, certainly in some areas. It is a notable fact that, although considerable progress has been made in Burma and Siam in re-establishing themselves as exporters of rice, their exportable surpluses this year, although greatly in excess of the amounts available last year, are not expected in either case to be more than about 50 per cent. of pre-war, in spite of the encouragement offered by the high prices which the commodity now commands. There are few other parallels to be drawn, but it may be said that, of the countries which were occupied by the Japanese, the Philippine Republic, aided by generous aid from the United States, Hongkong, Singapore, the Federation of Malaya, Siam and Burma, are now making steady progress, while Indo-China and Indonesia still lag behind. It is hoped, however, now that agreement has been reached between the Dutch and the Indonesians, that progress in Indonesia might soon parallel that being made in Malaya.

BRITAIN'S MONETARY STABILITY

I refrain from comment upon affairs in Great Britain, which are constantly under review, except to say that, from experience gained through wide contact with the outside world exchange markets, it is impossible to stress too strongly the importance of re-creating confidence in Britain's monetary stability. Britain's position as banker to more than half the world has been endangered through the threat to monetary stability of the very large adverse balances of trade and payments which are proving so difficult to reduce and bring within control. It is not that the world can afford to dispense with Britain's services as a banker, but that it can and does refrain from buying sterling until the last possible moment while selling it at the first opportunity whenever monetary stability is thought to be in danger, and there are many other devices, quite legitimate, but outside the power of the Exchange Control to check, which can have the effect of increasing imports and holding up exports.

All this adds up to saying that, if full confidence in our monetary stability can be restored, there is likely to be a substantial return of sterling into this country with a consequent easing of the position, and, provided the country stands together and works all out to increase production for export, while conserving internal expenditure and consumption, we can hope that, aided by the Dominions and Colonies, British sterling will regain its stability even if the country cannot aspire to be the world's greatest creditor nation.

It will be clear to the stockholders that we, as a bank, have not been without our own problems, but the strength of the balance sheet is sufficient evidence of the fact that our staff has proved more than equal to the many difficulties which they have had to face.

THE STANDARD LIFE ASSURANCE COMPANY

LARGE INCREASE IN NEW BUSINESS

Mr J. H. RICHARDSON'S REVIEW

The one hundred and twenty-second annual general meeting of The Standard Life Assurance Company was held in Edinburgh on 16th instant with Mr J. H. Richardson in the chair.

The manager and actuary having read the auditor's report, the chairman said:—

My Lord and Gentlemen,—May I take it to be your wish that the directors' report which is in your hands be held as read?

ALTERATIONS ON THE BOARD

In the first place, it gives me much pleasure to welcome two new members to the board, Mr T. G. Waterlow and Mr Ian R. Pitman. Mr Waterlow, who has important commercial interests, joined the board on May 27, 1947, and Mr Pitman, whose family has had a long connection with the Standard and who is a member of the firm of Messrs J. and F. Anderson, W.S., joined the board on August 5, 1947. Since they joined the board, both have been of great assistance to us and we count ourselves fortunate in having secured their services. Their names will be submitted to you at a later stage of this meeting for re-election in the usual way.

There have also been changes in our West Indies board during the year. Major G. H. Simpson has retired from active business in Trinidad to settle down in this country so that his services in the West Indies are no longer available and the Hon. Gerald Wight found that the increasing responsibilities of political work rendered it necessary for him to resign his seat on the board. To fill the vacancies caused by these resignations the Board has appointed as directors, Mr Charles Pereira and Mr S. H. Banning. We extend our gratitude to the retiring directors for their services to the company and a warm welcome to those who have just taken up office. It was in 1847 that the Standard first commenced operations in the West Indies and the company held appropriate celebrations in the Islands last year to mark the occasion of the centenary. It showed great vision to introduce the benefits of life assurance into the West Indies one hundred years ago when the Islands were relatively undeveloped and conditions of life were so utterly different from what they are today; but the present flourishing condition of our business there affords yet another example of the success which has rewarded the courage and unfettered enterprise of the early administrators of our company.

It is with regret that I have to report that Mr T. H. Ritchie, our accountant at head office, retired yesterday on pension, after having served the company for the long span of 48 years. During the difficult war period and the time of rapid expansion which came afterwards, he was in charge of our accounts and carried out his duties with the utmost acceptance to the directors. We shall miss him, and I should like on behalf of us all to wish him every happiness and contentment in his retirement.

INCREASE IN PREMIUM INCOME

Turning to the report and the accounts, I think we may say that they present an encouraging picture. The figure representing our new life assurance business for the year, namely £16,445,000, including £6,818,000 of group life assurance, is unprecedented for the Standard. Our pension business also increased and we are proud of the work done by our outside staff during the past year and very satisfied indeed with its results. Our premium income is shown in the revenue account at £5,907,000, and this shows the

substantial increase over last year of £1,493,000; the expense ratio of 11.2 per cent. is only fractionally greater than last year's figure of 11.1 per cent. This small increase is less than might have been expected when we bear in mind the heavy initial expense of putting the very large amount of new business on to the books. The net rate of interest at £3 16s. 1d. per cent. shows a reduction on the figure of last year. This is an inevitable result of the large increase in our funds which has necessitated investment at the current comparatively low rates of interest. Members should not, however, regard these new investments or the great accession to our funds with anything other than satisfaction, because the terms upon which we carry out our new business are naturally fixed in accordance with the terms upon which we can now invest our money. The balance sheet assets during the past year have increased by £6,239,000 and now stand at the total of £54,603,000.

ENCOURAGEMENT OF SAVING

As regards the large increase in our funds we can feel, I think, that we are doing much for the nation in the present emergency by assisting, and in fact encouraging, the public to save through the medium of life assurance policies, pension and similar schemes, which offer a practical method of responding to the repeated national appeals for increased savings. I am not sure that the life companies of this country have received all the credit that is due to them for the work they have done in this respect. The large accessions to our funds, of course, place upon us the responsibility of adding substantially to our investment portfolio, and this requires a high degree of selection at the present time, when the outlook is so uncertain. It is our duty to do our best with the money entrusted to us by members, and in this connection I may say that the assets exceeded the value shown in the balance sheet by a large margin. The field of investment is narrowing, however, on account of continual changes in the structure of the nation's finances brought about by the nationalisation schemes upon which the present Government seems to set such store. Nationalisation naturally creates many problems for us. These arise both from the investment point of view and from the point of view of our business generally; but up to date it is in the field of investment that nationalisation has chiefly hampered us. In making an investment we must continually consider the possibility of nationalisation and the effect which it might have upon the security we are purchasing. This may be considered to be only a minor problem, but it is, I think, symptomatic of what must be a very real handicap to the nation as a whole at this time of crisis. Quite apart from the inherent merits or demerits of the ideological moves being made, the present does not seem the time to make them; they cannot but upset and distract the nation generally from the main task which is before us all—the task of trying to bring back prosperity to our country.

HOUSE PURCHASE

There is one item in the balance sheet to which I should like to draw particular attention, namely loans to the Heritable Securities & Mortgage Investment Association, Limited. It will be seen that this figure now stands at £1,254,000—as compared with only £524,000 a year ago. The increase represents money

which we have advanced to our associated company to enable it to expand and develop the service which it renders to the community in making loans on property. By far the greater part of the advances which it has made during the past year has been to private individuals in order to assist them to purchase houses for their own occupation and I should like to remind members of this service which is available to them. In most cases where a loan is advanced by the Heritable Securities Association a policy is effected with this company. In this way arrangements can be made for the automatic repayment of the loan at the end of a certain period of years and at the same time the proceeds of the policy are available to extinguish the loan should death occur whilst it is outstanding; the element of security for dependents thus afforded is proving increasingly popular in these days of uncertainty.

TRIBUTE TO STAFF

The great increase in our business during the past year has meant that the pressure of work on our staff has been very heavy. Your directors have been struck by the cheerful manner in which this extra work has been accepted—an instance of what is essential if this country is once more to take its proper place in world affairs. So far as our business is concerned there is no question of cutting down hours of work—indeed the normal office hours are at present in excess of what they were before the war and there is no immediate prospect of a reduction—and our thanks are due to the members of our staff for the loyal and energetic manner in which they are responding to the extra calls made upon them.

Perhaps I may be permitted to close on a personal note. After this meeting, my time as chairman comes to an end. The three years during which I have had the honour and privilege of occupying the chair have covered great changes in our country's affairs and in those of the Standard. In 1945 we were still at war and we had before us all the problems of readjustment which were bound to follow years of war. The first and most important was the return of our staff, each case involving its own problem. I can say without hesitation that this was accomplished without any friction. For that our thanks are due not only to the men and women who readjusted themselves so admirably, but also to our manager and the other members of the staff, without whose care and thoughtfulness this would have been infinitely more difficult. Apart from this, we have been faced—and are still faced—with serious economic difficulties as a nation. It has been a period during which particularly anxious thought had to be given to every action. We have, too, been seriously handicapped through lack of space owing to our not being allowed to proceed with our new building at head office. In spite of all these things, our new life business figures have steadily improved—£4,000,000 in 1945, £8,700,000 in 1946, and now over £16,400,000.

I would like you to know how much we all owe to our manager, our secretary and the other principal officers of the Standard. Their leadership and example have been beyond all praise. For a chairman it is essential to have a complete and happy understanding with the manager, and I would like to thank Mr Davidson for the great help and consideration which he has given me during my years of office. The Standard has always had the reputation of being a happy family, and I can assure you that that spirit is as strong as ever. While it lasts, we shall continue to flourish.

I now move the formal adoption of the report, revenue accounts and balance sheet submitted.

Mr A. D. B. Pearson in seconding this motion said:—

"I have listened with great interest to the chairman's remarks and I must congratulate him and the company on the excellent results which are shown by the accounts. During

the past year the Standard wrote a record amount of business and, whilst this is most gratifying to us as members it is even more a source of quiet satisfaction that, as our chairman remarked, it is making a real contribution to the strength of the nation in connection with the Savings Campaign. Of all forms of saving surely Life Assurance must rank very high, for it involves the careful provision of a definite sum each year and may require a considerable measure of unselfishness if a man is to face his responsibilities.

"I think the Standard and, if I may say so, the other Life Offices, are greatly to be congratulated on the work which they are doing to cultivate and encourage this most admirable practice.

"From the accounts, I am convinced that our company, although it has grown tremendously in the last decade, still retains its inherent strength and soundness and I am sure that we can say today, as our chairmen were able to say before the war, that, as far as we know, there is no Life Assurance Company in a stronger position than the Standard.

"The chairman introduced a personal note towards the close of his speech and I feel sure that his tribute to the manager and the whole staff will be most sincerely echoed by all members of this great company, but he had nothing to say about himself. So much we would have expected, but perhaps I too may be permitted to close on a personal note. I have known Mr Richardson for some years now as a man of careful speech but I think that to have described the New Life business of the last three years as steady improvement is slightly to understate the position. In fact, during his chairmanship, these figures have quadrupled.

"We are very grateful to you, Sir, and to all who have contributed to such a magnificent record.

"I have pleasure in seconding the adoption of the report and accounts for the past year."

CONSOLIDATED MINES SELECTION COMPANY, LIMITED

INCREASED REVENUE

The fifty-second ordinary general meeting of The Consolidated Mines Selection Company, Limited, will be held on 23rd instant in London.

The following is an extract from the statement by Mr S. S. Taylor, C.M.G., D.S.O., circulated with the report and accounts:—

The balance-sheet shows that at December 31, 1947, there was a surplus of current assets over current liabilities and provisions of £17,202. The quoted investments stand at cost, less amounts written off, but in no case above market value at the balance-sheet date. On this basis, their book value is £1,178,173, compared with a market value of £2,981,028.

In the profit and loss account the revenue from dividends and interest shows a gratifying increase from £66,821 in 1946 to £92,790 for the year under review.

The company's substantial holding of ordinary shares in the Anglo American Corporation of South Africa, Limited, was increased during the year. On March 5, 1948, the corporation declared a dividend of 3s. and a bonus of 2s. making a total of 5s. per share in respect of the year 1947, which are the same as for the preceding year.

The Consolidated Mines Selection Company, has important holdings in Orange Free State Investment Trust, Limited, and South African Mines Selection, Limited.

Orange Free State Investment Trust and South African Mines Selection have recently acquired an interest in the mineral rights of the Farm Harmony 222, in the Sand River area, on which encouraging borehole results have been obtained.

Your company retains its holding of stock in Rhodesian Anglo American, Limited.

THE SCOTTISH LIFE ASSURANCE COMPANY, LIMITED

ANOTHER EXCELLENT YEAR

The annual meeting of The Scottish Life Assurance Company, Limited, was held in Edinburgh on the 17th instant. Sir Iain Colquhoun, Bart. of Luss, K.T., D.S.O., chairman of the board of directors, presided. In moving the adoption of the annual report and accounts he said:—

Today we hold our third annual meeting since hostilities came to an end. With the commencement of peace our hopes were naturally high, and the economic difficulties which have since beset the United Kingdom and the rest of Europe were anticipated by few. The present position of this country is one of extreme gravity and there is general agreement that the utmost exertions of the whole nation are necessary if we are to pull through without having to accept a standard of life lower by far than anything we have yet known.

The Chancellor of the Exchequer has laid great stress on the vital need for saving at this time. May I point out the value of the Life Offices' contribution to this all-important aim? Once a life policy is taken out, the renewal premiums fall due year by year and have to be paid like any other account, thus becoming an almost automatic method of saving, and we can justly claim credit for our contribution to the savings campaign. The net new sums assured during 1947 again show a considerable increase, to £3,885,000 as compared with £3,027,000 in 1946, which is a new record for the company. This reflects the greatest credit on our outside staff and agents. It is not always realised by the general public that life assurance is a commodity which has to be sold in competition with consumer goods. Very seldom indeed does the initiative come from the proposer, and new life assurance business depends almost entirely on the skill and energy of the outside staffs of the Life Offices.

RECORD RENEWALS

We have had another excellent year. The premium income has shown an even greater increase than last year and net renewal premiums have actually gone up by 17 per cent., which is easily a record for the company. Interest has been well maintained, the gross earned rate being the same as the previous year at £4 10s. 10d. per cent. and the net rate after income tax having increased by 2s. 10d. per cent. to £3 13s. per cent. Claims by death were very light during 1947, the actual death strain representing 66 per cent. of that anticipated according to the table of mortality; this is, however, exceptional and we cannot expect so low a figure to recur. The increase in commissions and expenses of management will be noted. This feature is in large degree due to the rapid increase in new business; the expense of writing new business falls almost entirely on the first year's premium and as within two years the company's new business has increased from £800,000 to nearly £4,000,000 a sharp rise in the ratio of total costs to total premiums must be expected. When proper adjustment has been made, the true ratios of expense to new and renewal premiums show only a very moderate increase. During 1947, and even more so since the end of that year, there has been a general fall in market values, but even so, the market values of our Assets are still substantially in excess of the values at which they stand in our books.

The Company's Memorandum and Articles of Association are now somewhat out of date and the directors have been considering the position in view of the passing of the Companies Act, 1947. They have decided to delay action until the Consolidation Bill, which has just been introduced into Parliament, be-

comes law. As soon as this has happened, the matter will be taken up with a view to submitting to the shareholders in due course proposals for the revision of the Memorandum and Articles. As last year, the directors recommend a final dividend of 3s. per share, less income tax, making 6s. for 1947, and an interim dividend on account of 1948 of 3s. per share, less tax, payable on September 1, 1948.

The motion having been seconded by Mr J. H. Gu'd, W.S., the report and accounts were adopted.

FOY MORGAN AND COMPANY, LIMITED

SUBSTANTIAL INCREASE IN BUSINESS

SIR GERALD LENANTON ON THE OUTLOOK

The thirteenth annual general meeting of Foy Morgan and Company, Limited, was held, on the 16th instant, at the company's offices, 16, Eastcheap, London, E.C., Sir Gerald Lenanton (chairman of the company) presiding.

The Secretary (Mr E. A. Cremer, F.C.I.S.) read the notice convening the meeting and the report of the auditors.

The following is the Chairman's statement which had been circulated to the shareholders with the report and accounts for the year ended December 31, 1947:—

The total quantity of timber of all kinds imported into the U.K. during 1947 was a little over half that of prewar years. The import during 1948 depends greatly upon the operation of E.R.P. On the assumption that no arrangement is made before the autumn for the purchase of all or part of the quantities set out in the technical report of the Committee of European Economic Co-operation (July-September, 1947) the total quantity to be imported during 1948 is unlikely to exceed two-thirds of that imported during 1947.

The profit and loss account for the year 1947 reflects the substantial increase of your company's business foreshadowed in my remarks last year; but conditions of trading are so unsettled that it would be unwise to base an estimate of future long-term earning capacity on these results.

REVENUE EARNED IN HARD CURRENCY COUNTRIES

It should be remembered that a great proportion of your company's income is derived from commissions earned abroad, largely in hard currency countries. There has been a substantial increase in commission earned on contracts made between timber-producing countries and importing countries other than the U.K. All of these amounts have been returned to this country and converted to sterling.

Certain trading contingencies have, in the opinion of your directors, been adequately covered in the accounts.

The capital of your company and its subsidiaries and of their customers has been the subject of careful consideration in the light of prospective turnover. Until, however, future prices and import quantities can be more closely estimated and the credit risks thereon more nearly assessed it is premature to make suggestions for altering the capital structure of your company. Accordingly your directors recommend that £63,393 shall be carried forward to next year's accounts, without special allocation.

Dividends for the year to December 31, 1947, on the three classes of shares, as set out in the accounts, have already been paid.

The report and accounts were unanimously adopted.

The auditors, Messrs Hope Agar and Co., having been reappointed, the proceedings terminated with a vote of thanks to the chairman.

HARRODS, LIMITED

SATISFACTORY RESULTS—INCREASED PROFIT

SIR RICHARD BURBIDGE'S STATEMENT

The fifty-eighth annual general meeting of Harrods, Limited, will be held at the Assembly Room on the company's premises, Brompton Road, London, S.W.1, on the 24th instant.

The following is the statement by the chairman (Sir Richard Burbidge, Bart., C.B.E.) which has been circulated with the report and accounts:—

I am again circulating my review of the year's working, as I am sure this method meets with your approval.

The net profit for the year amounted to £1,175,260, an increase of £45,132. This profit has been arrived at after making further additions to the provision for contingencies, including repairs and renewals and possible stock losses. This provision now amounts to nearly £800,000 and should be sufficient for such purposes.

The directors recommend that a final dividend of 10 per cent. and a bonus dividend of 5 per cent. be paid on the ordinary stock, making a total of 20 per cent. for the year, the same as for the previous year.

Provision for taxation requires £705,000, an increase of £59,000, due to the increased profits tax. An amount of £50,000 has been provided as an addition to freehold buildings reserve, and the carry forward is increased by £11,588 to £280,500. You will notice that taxation now absorbs 60 per cent. of the total profits.

TRADE

During the year the turnover of Harrods, in London and Manchester, and of all the subsidiaries, has exceeded all previous figures. This is partly due to rising prices, including increased purchase tax, but also to larger supplies of some types of merchandise, particularly household goods and toys.

GROSS PROFIT

The rate of gross profit is falling rapidly and especially in our fashion departments is approaching a dangerously low level at which we can only trade profitably if turnover continues to increase quite considerably.

EXPENSES

Expenses have risen, and will continue to rise. This is a problem that causes us great concern, as there are few directions in which we can make any saving. More than half of the total expenses is in respect of salaries, wages and pensions, a total of £1,313,350, and there is not much likelihood of any saving in this direction.

Rates, etc., amount to £253,169, against £220,282. This heading, in addition to rates, which have increased during the year owing to the withdrawal of certain reliefs that were allowed during the war, also includes the cost of heating and lighting, which, owing to the fuel restrictions, are at an absolute minimum.

Printing, etc., and departmental expenses reflect increased costs plus the purchase tax on stationery and packing materials.

The increase in transport expenses is due to increased wages and extra vans owing to the reopening of more rounds, although we are even now making do with only half the number of vans operating in 1938-9.

Provision for repairs and renewals and depreciations are both items that are not likely to fall when we are able to replace fixtures or make alterations.

The above items account for most of our expenses, and you will appreciate it would be

difficult to save on any of them without adversely affecting the essential distribution of merchandise to so many homes in London, its suburbs and the provinces.

KENDAL MILNE AND COMPANY

Both the trade and profit of Kendal Milne and Company last year were a record.

The new building is now being used in its entirety, although not quite complete so far as lighting and modern shopfittings on the third and fourth floors are concerned, and with these reservations I think it is the most up-to-date store in the country, designed for the merchandise and service which Kendal Milne's customers expect.

The transfer of departments from the old building to the new, commenced in 1946, has been completed this year. Women's fashions, drapery, men's and boys' departments and the restaurant are now established in their new surroundings, and the furnishing sections, carpets and everything for the home are now housed in the old building. It has been proved this year that the public appreciate the new conditions and the extra facilities provided, and I feel we may well look forward to increasing results from this business.

TRADE INVESTMENTS

Dickins and Jones, Limited. We now hold all the ordinary stock of this business, as we have made a further purchase since the end of the year. Dickins and Jones have replaced from their own resources their issue of £850,000 4½ per cent. debenture stock by an issue of £500,000 3½ per cent. stock. This will result in a net annual saving of £10,260, and will help towards the resumption of dividends on the ordinary stock. I consider their prospects very bright.

D. H. Evans have had another satisfactory year and we are very pleased with the continued progress of this subsidiary.

John Walsh, Limited, Sheffield, experienced a most successful year's trading and have again declared a dividend on the preference stock in respect of the year under review. We are conserving their resources in view of the considerable expenditure with which this business will be faced some day for re-building. Negotiations have practically been concluded with the Sheffield Corporation regarding the bombed site, and we shall soon be in a position to apply for licences to start building the basement and ground floor.

Wm. Holt and Sons, Limited. We purchased this business to obtain the stock of good quality pre-utility towels, etc., that they held.

Stock-in-trade stands at £2,229,087 and shows an increase of £629,515. We are happy to have this stock, but the figure, of course, reflects increased prices, including purchase tax. The volume of stock is actually less than our prewar stock, which totalled £776,000, and this is an indication of the extra working capital we need to employ in the business.

Debtors at £1,741,594 show an increase of £362,105. This is partly due to the increased trade at Christmas, but also to delay in rendering our accounts, due to shortage of experienced staff. The increase in stock and debtors and the purchase of Wm. Holt and Sons is reflected in a drop in Government securities and cash of £585,890.

Fixtures, etc., at £190,958 represents fixtures and plant in the new building at Manchester, as all fixtures, plant and rolling stock employed in the London business and all rolling stock at Manchester have now been written off.

That completes my review of the year's trading, which I am sure you will agree has been very satisfactory.

STAFF

These results could not have been obtained without the loyal and whole-hearted co-operation of our staff. I know that a very large proportion of our stockholders are also customers of our stores, and I feel sure that they will agree with me that we have a courteous and willing staff who do their utmost to make shopping at Harrods a real pleasure, and that we are making good progress in bringing our service back to its pre-war standard.

Our trade needs good staff—anything less than the best available is uneconomic. But I must point out that in building up a staff of the excellence we need and our customers expect, we have received a set-back by reason of the Control of Engagement Order recently introduced. I appreciate the need to man the export and the basic industries, but the most practical method of conserving manpower in the retail trade is to recognise that skilled staff are always the most economical.

We have always believed in the personal touch between management and staff; we like to know our staff individually and we like them to feel free to express their opinions and point of view. We have two excellent institutions which have existed for very many years—the buyers council and the staff council—both of which contribute to the smooth running of the business by their constructive criticism of the current affairs of the store.

MARGINS

I am of necessity preparing this statement while discussions concerning prices and profits are taking place. I do not know what the result of these discussions will be, but I do know that all stockholders, and in particular ordinary stockholders are fully prepared to bear their full share of any further sacrifices that must be made in the present emergency. At the same time, as there is a great deal of misconception as to the profits that are made by businesses such as this, I should like to emphasise one or two points.

EFFECT OF PURCHASE TAX

In the first place the price of, and profit on, practically all the goods we sell is already subject to control. The increase in the rate of the Purchase Tax has been chiefly responsible for recent rises in prices, and on this Purchase Tax we do not make any profit. In fact it is a source of expense to us as we finance the tax, paying it when goods come in but not recouping ourselves until the goods are sold, and as our purchases during the year involved us in the payment of £1,750,000 in respect of Purchase Tax you will appreciate that the expense is quite considerable.

Secondly the dividend of 20 per cent. paid to the ordinary stockholders would represent less than five per cent. if related to the present day value of their proportion of the net assets employed in the business. To consider this matter in another way—the reward of the employee, the state and the stockholder—here is the division in your businesses:—

	1947/48.	1938/39.
Wages (excluding factories), pensions, etc.	1,942,816	1,338,808
Taxations on Profits	912,102	234,414
Stockholders (net) ...	422,833	493,131

It is to be noted that the number of staff in 1947-48 is considerably less than in 1938-39.

When considering margins and price levels the interdependence of the home trade and the export trade must be borne in mind. If price levels are fixed too low there is a grave

danger that quality will suffer, and that the production of new types of goods will not be undertaken. It is essential that the quality of goods for export should be maintained, that their price should be right and that they should be up to date with or ahead of any fashion trend. These things do not "just happen," they are the result of experience and experiment on the home market, and no trader, be he manufacturer, wholesaler or retailer, can be right every time. Mistakes and losses will be made and margins must be sufficient to take care of them. This problem is becoming more and more acute, as until recently all goods were in short supply, types of merchandise were stable and there were no "bad stocks," either for home or export trade. Now, as more merchandise is available, as more types and qualities of an article come on the market, a certain amount of old stock becomes unsaleable at the original price. In particular this applies to merchandise subject to the dictates of fashion. You all have heard of the "New Look," well this is just a typical example of what is happening. The introduction of a new style means a necessary reduction in the price of and consequent loss on quantities of merchandise that are already in stock.

TWO UNFAIR RESTRICTIONS

There is no doubt that in the long run these three factors, price, quality and fashion are best controlled by customer resistance and by competition: in fact these influences are already beginning to be felt at home and abroad. But as long as controls are necessary they must be such as will enable a trader to merchant his stock in a proper and orderly fashion. At present, in addition to price control, he is hampered by two unfair restrictions. In the first place he is not allowed to reduce the number of coupons he is compelled to collect for any article unless the goods are practically given away or at any rate sold at a price that does not even represent the Purchase Tax paid to the Government. Secondly the method of charging the Purchase Tax on the cost of goods from the manufacturer or wholesaler does not allow a retailer any redress in cases where any subsequent reduction of tax is made or when goods have to be sold by a retailer at reduced prices. The Government must make an allowance for such reductions, otherwise businesses for carrying large stocks will be heavily hit, as they will certainly not be able to provide against such losses out of the present profit margin.

PROSPECTS

It is impossible for me to forecast with any degree of accuracy the result of the trading for the year ahead. This depends primarily on our total trade which of course is controlled by the volume of goods that the Government allow to be produced for home consumption and the prospect here in many directions is not too bright. The other major factor that controls our profit is the gross margin which I have discussed at some length. Expenses we shall continue to control in detail to the utmost, but the total is bound to increase. On the face of it all this can be summed up in one word "difficult."

But there is another side to the picture. Notwithstanding the general problems confronting the country and our own special problems, I have every confidence in our future. I have seen most of the big stores in America during the year. I learned a lot; I saw a lot of merchandise I should like to be able to sell here, but apart from this I was satisfied that in the circumstances we compared very favourably with similar organisations in the States. In fact I returned here more convinced than ever that "There is only one Harrods." We are sound financially, the internal strength of all our businesses has increased considerably during the last few years, and I am sure we can face our difficulties with confidence.

THE EASTERN BANK, LIMITED

IMPROVED TRADE

The thirty-eighth annual general meeting of The Eastern Bank, Limited, will be held in London on the 31st instant.

The following is an extract from the statement by the chairman (Sir Thomas J. Strangman, K.C.), circulated with the accounts:—

The accounts show a net profit for the year of £119,357, being an increase of more than £8,000 over the profit of the previous year. Our investments in Government and other securities are down by nearly £2,000,000, whilst our cash and bills receivable are up by about £1,500,000 and £550,000 respectively. Advances are greater by about £650,000 and acceptances show an increase of over £130,000. The figures for bills receivable and advances are indicative of improved trade with the East and the normal functions of the Bank in financing that trade. The profit enables us to provide for an appropriation of £50,000 to the published reserve, making £900,000 in all and to increase the carry forward by over £9,000.

The total dividend for the year which we recommend is the same as that in the previous year.

CONDITIONS IN INDIA, PAKISTAN, ETC.

India and Pakistan.—The establishment of the two Dominions of India and Pakistan has caused less dislocation of trade than might have been expected, having regard to the administrative difficulties with which the new Governments were faced. Whilst Karachi, the capital of Pakistan, has suffered serious inconvenience from the migration to the other Dominion of many of the Hindus, who were prominent in the grain and cotton trades and who staffed the banking and commercial houses, and the loss of experienced men has for the time being increased the responsibility of our European staff, our working, both in Pakistan and India, has otherwise been quite normal. I have every hope that such matters as require adjustment between the Dominions will be settled before very long.

Ceylon.—We join in wishing all good fortune to this new Dominion which starts its career in happy auspices. Although for the year 1947 there was an unfavourable trade balance of between £5,000,000 and £6,000,000, there remains an accumulated favourable balance of sterling exchange said to amount to £53 million. The public debt is not excessive, being about £40 million, payment of some £7,000,000 of which is guaranteed to the Ceylon Government by the British Government, and there is a budget surplus. The new taxation is not for the purpose of balancing the present budget—there is sufficient revenue from existing taxation for that purpose—but to provide funds which might be necessary to balance budgets in years to come. This new taxation will involve the Bank in an extra charge for which no relief can be claimed from the tax authorities here.

Iraq.—With other countries, Iraq is in need of capital goods and of consumer goods also. We should not be unduly discouraged by the anti-British feeling evinced after the signing of the Portsmouth Treaty. The demonstrations took place at a time when there were hardships of a local character, amongst them a shortage of bread and of housing accommodation.

Bahrain.—Oil resources continue to be developed rapidly on the mainland.

Far East.—Business continues to expand, and the results of the year's working have been gratifying. New branches have been opened, in Penang on December 1st, and in Kuala Lumpur on January 12th of this year.

THE NATIONAL MUTUAL LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The one hundredth and eighteenth annual meeting of the National Mutual Life Assurance Society was held, on the 17th instant, in London.

Mr Kenneth A. E. Moore, F.C.A., presided and referred to the abnormal problems of investment faced by the board during 1947. He said: The rise in the so-called "risk free" rate of interest from 2½ per cent. to 3 per cent. caused a decline of nearly 20 per cent. in the market value of 2½ per cent. Consols and 2½ per cent. Treasury Stock, and to a lesser degree, a decline in debentures and preference shares. Moreover, ordinary shares fluctuated violently. Largely as a result of judicious switching from long- to short-term Government securities and by a major reduction in ordinary shares the depreciation in the Society's investments amounted to no more than 5 per cent. of the total assets.

It has always been the Society's practice to carry Stock Exchange securities in the balance sheet at their middle market values and the depreciation in 1947 of some £500,000 has been written off the reserve fund—a fund which represents the accumulated net profit and appreciation on investments over many years.

Generally speaking, the policy of the board in relation to investment matters has been to seek to maintain capital values at the cost of some temporary loss of income representing, in effect, the insurance premium against possible heavy depreciation. Members can regard, with satisfaction, the maintenance of a substantially unaltered net rate of interest earned.

DEMAND FOR ANNUITIES

The Society has once again transacted a record amount of new life assurance business. There has been also a great increase in the demand for those annuities whereby the risk of premature death of the annuitant is covered and the maximum measure of taxation relief is attained. The Society is handling an increasing amount of staff pension fund business of various kinds and a special department has been formed to handle this type of business.

A good augury for the valuation and distribution of surplus which it is intended to make at the end of 1948 was shown by an internal actuarial valuation—the trading profits for 1947 comfortably exceeded, in terms of the rate of bonus earned, those of the previous valuation period.

Now that the Government Economic Survey for 1948 has been published it is, in a way, a relief to know that the worst, which has been well recognised in informed circles for a long time past, is being brought home to every man and woman throughout the country. Not until then will the disagreeable steps which are necessary to rectify the country's economic plight be understood and supported by the general public. As to the nature of these disagreeable steps, there is, of course, a divergence of opinion and some of those recently taken, particularly those referred to by *The Economist* and others as "Operation Canute," are open to objection in that they appear to be an attempt to legislate against the natural laws of supply and demand in their broadest interpretation.

Fortunately the Society's functions as a life assurance office are entirely in harmony with the needs of the moment because additional savings are essential to recovery and life assurance is one of the most important and desirable ways to achieve real personal savings.

The report was adopted.

CABLE AND WIRELESS (HOLDING), LIMITED

ARBITRATION AWAITED

The nineteenth ordinary general meeting of Cable and Wireless (Holding), Limited, was held, on the 12th instant, in London.

Sir Edward Wilshaw, K.C.M.G., (the Governor) said that following unsuccessful attempts to reach agreement regarding the price to be paid by the Government for the shares in Cable and Wireless, Limited (the Operating company) it had been agreed that the matter should be referred to an arbitration tribunal in accordance with the Cable and Wireless Act. He hoped that the tribunal would sit before the long vacation which commenced on August 1st. In those circumstances the directors felt that the presentation of the accounts to December 31, 1947, and the payment of dividends should not be withheld owing to that delay and had, therefore, convened the meeting as soon as possible after the termination of 1947, leaving consideration of any matters which might arise from the findings of the arbitration tribunal to a later meeting of stockholders.

When the tribunal had fixed the sum to be paid they would then also receive interest retrospective as from January 1st, 1947, but as neither the award nor the interest was assessable until after the arbitration and the income therefore not yet available for dividend purposes, the directors had decided that the normal dividends should be paid now. For that purpose they were transferring from the principal underlying companies appropriate amounts from the reserves of previously undistributed profits.

THE YEAR'S REVENUE

The main source of income was dividends from subsidiary companies amounting to £1,107,239. Those dividends had been maintained at the 1946 level by passing up sums equivalent to £863,000 gross (net £475,000) from undistributed profits of earlier years held in the reserves of those subsidiary companies. In addition they had received a dividend of £50,000 from Cables Investment Trust and interest on other investments of £181,000. Other receipts, which amounted to £15,000, made a total of £1,353,000.

The valuation of shareholdings in the three subsidiary companies, the Eastern, the Eastern Extension and the Western Telegraph Companies, was subject to the compensation to be received by those companies from H.M. Treasury in respect of their former holdings in Cable and Wireless, Limited. Investments in securities, stocks and shares stood at £10,286,081 against £2,185,544 last year, an increase of £8,100,537.

In the consolidated balance-sheet the book value of the securities at £13,351,096 showed an increase of £3,377,000 over the previous year. The market value of the securities of the group showed an appreciation of £927,019 over book cost.

A SUCCESSFUL RESULT

In spite of the uncertain conditions which had prevailed during 1947, he thought they might congratulate themselves upon the successful results of the year's working which had resulted in further profits on realisations of £249,352; increased book value of investments of £3,377,000 and increased value of those investments over book value of £927,019.

In conclusion, he did not think he could do better than repeat substantially what he had said at the last general meeting, that so soon as the amount of compensation they were to receive was known, they would be able to consider the best course to suggest in the stockholders' interests and to repeat the assurance that he then gave that the stockholders would be consulted before any decisive step was taken.

The report was adopted.

THE NORTHMET POWER COMPANY

LORD ASHFIELD'S SPEECH AT FINAL MEETING

At the annual general meeting of The Northmet Power Company held in London on Wednesday, 17th instant, the Rt. Hon. Lord Ashfield, P.C., chairman and managing director said: Fourteen days from now this company will cease to exist and therefore I have today, no doubt in common with you all, a feeling of sadness mingling with the pride we all so rightly have in the achievements of the company when for the last time I address you as its chairman. It will be my purpose in the course of my remarks to review in retrospect what has been achieved by the company over a long life, not in any narrow parochial sense but from the stand-point of service to the community.

THE ELECTRICITY ACT

On April 1, 1948, your directors will go out of office; as your company will, by virtue of the Electricity Act, 1947, be automatically dissolved and its undertaking vested in the Eastern Electricity Board of the British Electricity Authority. The Act provides for the appointment of a stockholders' representative whose principal duties will be to represent the interests of all holders of securities in connection with the determination of the amount of compensation to be met by the issue of British Electricity Stock and ascertaining the net revenue for the three months ending March 31, 1948, out of which interest and dividends up to the permitted maximum may be paid.

The terms and conditions on which the British Electricity Stock will be issued are not yet known because in estimating the value of that stock regard is to be had to the market value of government securities on April 1, 1948.

Interest and dividends on the existing debenture and preference stocks at the fixed rates may be paid in respect of the period from January 1 to March 31, 1948, but the dividend on the ordinary stock for that period may only be met out of the net revenue for the period or out of funds which may be so applied in accordance with normal practice in past years for maintaining interest payments and equalising rates of dividend but at a rate not higher than that of the dividend paid for the year 1946.

I am sure we are all very grateful to Sir Reginald Blair for accepting appointment as stockholders' representative following upon the unanimous vote of the stockholders at their special meeting held on December 3rd last. It is indeed a matter of congratulation that Sir Reginald, whose services as a Director have been so valuable, will continue to watch over the interests of the stockholders.

FINANCIAL RESULTS

Notwithstanding, the number of units sold has increased by three per cent. to over 1,250 million with a consequential increase in the revenue of the company of roundly £97,000 and that there has been an increase of some £150,000 in the revenue derived from the wiring of consumers premises and the sale of fittings, the balance from working fell by some £318,000. This decrease is, of course, due to increased working expenses. Coal, the raw material of electrical generation, has increased in price from 26s. 7d. per ton in 1938 to 56s. 4d. per ton in 1947, an increase of over 100 per cent. In addition, the quality of the coal has deteriorated and this factor still further increases the cost of generation. Similarly salaries, wages and materials all show very substantial increases.

To the balance from working, there is to be added the interest and dividends received during the year and the profit on the sale of investments giving a total of roundly £512,000 to meet the payment of mortgage,

debenture stock and other interest and the provisions for redemption funds and Depreciation.

After providing for these items there remains a small balance of £1,916. Fortunately there are certain sums to be added. Firstly there is the balance brought forward from 1946 of roundly £125,000. Then owing to the reduction of taxable profits and to the deduction by the company of income tax from the payment of mortgage and debenture interest there remains a credit balance from the income tax provision of approximately £142,000. The aggregate of these balances is just over £269,000. Your directors recommend the payment of dividends less tax on the 6 per cent. and 4 per cent. cumulative preference stocks and a dividend of 9 per cent. less tax on the ordinary stock of which 3 per cent. has already been paid. These dividends require a total of £232,976, leaving a balance of £36,758 to be carried forward.

In reviewing the year's working it is clear that the small balance of some £1,900 which remains after meeting all interest charges and making proper provision for depreciation and redemption must be regarded as very disappointing. In these circumstances the question of some adjustment to the scale of charges will require very careful consideration. Our consumers will not, I am sure, expect to continue to be supplied with electricity on an uneconomic basis.

GENERATING STATIONS

The work of constructing the buildings of the new generating station at Rye House is in hand but in view of the present shortage of labour and materials progress must necessarily be rather slow.

Directions have been received from the Central Electricity Board for extensions of plant at this station and also at Brimsdown "B" generating station.

ACHIEVEMENTS OF NORTHMET COMPANY

Over the years the company has achieved and maintained a reputation for affording a dependable supply of electricity at a low cost to the consumer. The reputation we enjoy today has not been lightly achieved nor would we have gained it but for the keenness and efficiency of our officers and staff.

That we merit the reputation we have achieved can be briefly illustrated by my reminding you that starting in our early years the number of units sold was in the region of 50,000 and from this small beginning we have expanded until today we are supplying annually some 1,250 million units.

I would leave it to an outside voice from an unprejudiced source to sum up in one short sentence what has been achieved by your company. I refer to a tribute made by Mr. Mellings, the chairman of the Eastern Electricity Board, at a recent meeting when he said—"In its operation and consumer service the Northmet has been one of the most successful company undertakings in the whole country."

Finally, may I be allowed to say how greatly I have enjoyed my association with our companies. It has been in every way a very agreeable experience. Much as I regret this severance I am comforted with the thought that the initiative and efficiency which our staff have shown over the years will assist the new authority to make that contribution which is more than ever today so vital to the national need.

The necessary resolutions were unanimously adopted and the meeting terminated with a vote of thanks to Lord Ashfield.

LEWIS'S, LIMITED

FINANCIAL STRENGTH OF THE ORGANISATION

The thirty-ninth annual ordinary general meeting of Lewis's, Limited, was held, on the 16th instant, at Liverpool, L.

The Rt. Hon. Lord Woolton, P.C., C.H., D.L., LL.D. (chairman and senior managing director), in the course of his speech said:—

The year we are now reviewing has been one of the most puzzling in my experience. To begin with we anticipated a serious shortage of supplies. Those shortages did not in fact materialise to the extent officially prophesied, or at any rate the efforts of our buyers ensured that they were at no time seriously reflected in our stocks. Over large areas of our stock, profit margins were at first reduced and subsequently restored to their original level. With few exceptions all items of trading expenses increased and in the case of salaries and wages this increase was substantial. As a result the tendency in recent years for the gap between realised gross profit and expenses to narrow was still further accentuated.

The rates of purchase tax on much of the merchandise we sell fluctuated during the year in the most erratic fashion, and this in turn had its effect not only on our gross profit, but also in other directions, to which I will refer later. The dates when releases of clothing coupons were made to the public were altered so that they did not conform to the clothing trade's natural rhythm of seasonal production and distribution. Finally, turnover, although in the end it registered a substantial increase over the previous year, was abnormally erratic in its peaks and valleys during the year.

It was unusually difficult to forecast to what extent increase in turnover was going to be translated into net profit. In the event the increased turnover slightly more than counter-balanced the reduction in percentage gross profit realised and you will see if you look at the first item in the profit and loss account that our trading profit before depreciation and taxation amounted to £1,664,933 or £91,461 more than our peak last year.

SOME MISCONCEPTIONS

There is much misconception, both about profits and dividends. The making of profit is a sign of efficiency, and the intelligent use and pursuit of profit is one of the factors in the reduction of cost. Those of us who, over a period approaching a century, have been responsible for building up this business have worked on the old-fashioned basis of small profits and quick returns. We sell for cash; we lend money to nobody, and when we were allowed the free use of our skill we balanced losses against profits by a very active system of merchandising of goods. Always we sought to give the public the best obtainable value for their money. We have made large profits, and year by year we have distributed but a modest portion of those profits to the shareholders. We have been indeed fortunate in having the bulk of the shareholding in the hands of people who were able and willing to "plough back" the profits into the business for its greater strength and stability.

This brings me to the misconception that arises on the question of dividends. These are calculated on the nominal share capital of the business, but they are earned on the whole of the capital, including the profits that have been ploughed back into the business. Any calculation of dividends on the basis of the percentage of dividend to subscribed capital is likely to be misleading, for the more skilful the management of the finances of the business, the lower will be the percentage of subscribed capital to turnover. The correct estimate of profit is profit on turnover.

If you will refer now to the profit and loss account you will see that our total revenue

of £1,914,274 is not more than £73,169 over last year and the reduction as compared with the increase in the trading profit is largely accounted for, as explained in the directors' report, by the smaller dividend we have received from Lewis's Bank.

INEQUITABLE PROFITS TAX

From our total revenue of £1,914,274 we have to make various deductions, which amount in all to £1,340,591. Of this total by far the largest proportion is accounted for by the provision for taxation of £1,216,147, and in this connection I want to draw your attention to the inequitable operation of profits tax at the increased rate of 25 per cent. on distributed profits, in the case of those companies which have a capital structure similar to our own. You will observe that of our total issued capital of £3,311,500 no less than £3,174,000 is accounted for by preference capital. The payment of the preferential dividends on that class of capital, assuming that the profits have been earned, is a matter which is quite outside the control or choice of the directors, and yet those dividends are mulcted to profits tax at the higher rate of 25 per cent. applicable to distributed profits. The intention of raising the rate of this tax was understood to have been to prevent the inflationary pressure which any increase in ordinary dividends might have created. But as the dividends on our preference capital would have been paid in any case no increase or decrease in the inflationary pressure can arise, and it seems obviously unjust that such dividends should continue to pay profits tax at the 25 per cent. rate. Our taxation provision this year is in excess of our strict legal liability, in that we have now succeeded in setting aside a sum which when added to the provisions we have made in previous years will cover our Schedule D income tax liability not merely on the profits of the previous year, but on those of the year ended February 1, 1948, as well.

BALANCE SHEET STRENGTH

If you will turn now to the balance sheet you will note the features that add considerably to the financial strength of our group. For the first time our reserves and surplus exceed £2,500,000, and included in this figure is an amount of £100,717 which we have received by way of E.P.T. refund and which now appears in the capital reserve of £310,849.

A feature of the balance sheet which is worthy of note is the reduction of our total current liabilities to £2,169,512. This compares with the total of our current assets of £3,321,991. The excess of our current assets over liabilities is, therefore, now £1,152,479, which compares with the corresponding figure of £758,691 last year and only £365,207 two years ago. In other words, there has been a steady and marked improvement in our liquid position.

I am satisfied that manufacturers and retailers are ready and more than willing to play their part in reducing prices and the evidence of their joint enterprise in the past is the high standard of living enjoyed by this country before the war. But what incentive is there now for the manufacturer to reduce his cost price by harder work, better management and more skilful organisation when in many cases the Government take in purchase tax and uplift more than the manufacturers' cost of production and profit combined? And what inducement is there to the big distributor to reduce prices by buying in bulk direct from the manufacturer when his enterprise is nullified by the iniquitous system of purchase tax uplift which reduces competition and discourages efficiency?

The report was adopted.

BRITISH ASSETS TRUST, LIMITED

STRONG POSITION

MR W. H. FRASER'S SPEECH

The fiftieth annual general meeting of British Assets Trust, Limited, was held at Edinburgh on the 18th instant, Mr W. H. Fraser, chairman of the company, presiding.

In moving the adoption of the report and accounts, the chairman said: On January 15th last this company attained its jubilee, and in the circumstances a few figures showing the company's growth during the past fifty years may be of interest.

GROWTH OF THE COMPANY DURING FIFTY YEARS

The company was formed in 1898, with a capital of £15,000, by the late Mr James Ivory, who guided its fortunes until his death in 1939. He is now represented by his two sons, one of whom is a director and the other manager and secretary. Before the issue of the first annual report the capital had increased to £50,000, at which figure it remained until 1906. By the issue from time to time of debenture, preference and ordinary stocks the capital had increased to £1,000,000 by 1915 and to £2,000,000 by 1926. From then onwards, as further issues of capital were made, substantial growth was shown, and the balance sheet before you shows that at January 15th last the total terminable debentures and deposits and debenture, preference and ordinary stocks amounted to £5,456,522, of which the ordinary stock represented only £468,562. Based on these figures, the ordinary stock would appear to be very highly geared, but it is actually not so highly geared as would appear. It will be observed from the balance sheet that the actual value of our investments at January 15th last amounted to £10,412,425 as compared with a book value of £6,732,171, and, after deducting all prior charges, the amount available for the ordinary stock was £5,213,826, which gave the stock a break-up value of 1112.7 per cent. But for the restrictions and penalties imposed on the issue of so-called bonus shares steps would have been taken before now to bring the ordinary share capital of the company more closely into line with the assets representing it.

During the fifty years of its existence the company has experienced in turn good and bad times but only once—in 1935—has it failed to pay some dividend on its ordinary stock. Since then the directors have taken advantage of improving conditions to strengthen the company by distributing its available profits on a conservative basis. The result is that the company is now in a very strong position, stronger indeed than it has ever been.

Various minor alterations have been made in the accounts and balance sheet to bring them into line with the requirements of the new Companies Act which will shortly become obligatory. The changes mainly concern the setting out of the gross income and taxation figures; net income is not affected. In the balance sheet you will see that the item "Tax reserve and contingent fund" is now shown separately in place of being deducted from the book cost of investments. Figures for the previous year have been adjusted for comparison.

PROFIT AND DIVIDEND

The accounts show that the income for the past year amounted to £507,161 compared with the previous year's figure of £456,394. After providing for taxation, management expenses, interest and preference stock dividends, the amount available for the ordinary stockholders was £133,837, or 51.9 per cent. gross on the ordinary stock, compared with £108,062, or 41.8 per cent. a year ago. The

directors have added £25,000 to general reserve fund and £25,000 to income reserve fund, and now recommend a final dividend of 17½ per cent., which, with the interim dividend of 7½ per cent., will make the total 25 per cent., the same as last year. To mark the company's jubilee they also recommend a special jubilee dividend amounting to 10 per cent., less tax. These appropriations will reduce the carry-forward from £56,163 to £49,802. While I do not look for any substantial change in income in the current year, there may be some moderate fall in income if for no other reason because during the year under review the company received a final dividend on the holding of ordinary shares of Second British Assets Trust which it disposed of later in the year, while at the same time it has in some cases received a full year's dividend from the invested proceeds of sale. The shares, as the stockholders know, were offered to the holders at the time of this company's ordinary stock in proportion to their holdings at £2 a share, and as the directors of Second British Assets Trust have recently recommended a dividend of 15 per cent. for the past year those stockholders who took up the shares have made a very satisfactory purchase.

In the absence of any material adverse circumstances it is the intention of the directors to reduce the present disparity between the interim and final dividends and to pay in due course in respect of the current year an interim dividend of 10 per cent.

FUTURE PROSPECTS

In these uncertain times it would be unwise to attempt to prophesy the future course of events. I have already indicated that it does not appear likely that our income for the current year will show any substantial change on that of the year under review, and I am hopeful that we shall be able when we next meet to submit a satisfactory report.

The report and accounts were unanimously adopted.

GENERAL INVESTORS AND TRUSTEES, LIMITED

STRONG POSITION

The forty-first annual general meeting of General Investors and Trustees, Limited, was held, on the 17th instant, in London, Mr. SIDNEY S. LAMERT (the chairman) presiding.

The following is an extract from his circulated statement:—

Revenue again shows an increase (£135,637 compared with £122,298 a year ago) and our closing valuation an excess of £744,571 over the net cost of our investments, that is to say a further appreciation of £13,368 over the 1947 figure. We recommend that the same dividend and bonus be paid as last year, and that £12,056 be added to general reserve, bringing this account to a round figure of £350,000.

Here, to all outward seeming, is a cheerful picture of prosperity and progress. But is the picture really as cheerful as it appears? Any feeling of satisfaction which a stockholder may feel with the results achieved by an individual company must surely be tempered by reflection on the grave peril which presently threatens the country and may ultimately engulf our whole industrial activity. Let us face the facts. To-day our national economy is on the very brink of disaster.

The inflationary menace, which not so many months ago Mr. Dalton assured us had been laid, is once again the urgent problem of the hour. It would I think be prudent to budget for some normal contraction of our revenue in the next year or two. We shall definitely obtain a smaller yield from the "compensation" we shall receive from stocks in nationalised industries.

We are in a strong position to meet setback, if setback comes, owing to our prudent and conservative policy in the past.

The report was adopted.

COUNTY OF LONDON ELECTRIC SUPPLY COMPANY, LIMITED

PASSING OF A GREAT UNDERTAKING

SIR ROBERT RENWICK'S FAREWELL ADDRESS

The fifty-fourth ordinary general meeting of this company, was held, on the 16th instant in London.

Sir Robert Renwick, Bt., K.B.E., the chairman, in the course of his speech, said: On April 1st next this company will cease to exist, and this will be, therefore, the last occasion on which I shall have the honour of addressing you.

The whole of our great industry passes over, and is to be apportioned between the new British Electricity Authority and its fourteen Area Boards. While we learn from the public Press that many of the undertakings of our local authority friends are not in too healthy a state—in fact, a number of them are reported to be insolvent—I am proud to say we are passing over an undertaking virile and strong and with a potential ready to materialise as soon as the existing restrictions are lifted.

THE COMPANY'S POTENTIAL

Let me explain what I mean by the company's potential. We estimate that if all restrictions were removed the output of the company would, within twelve months, go up by some 200 million units, thereafter reverting to an increase of 100 to 150 million units per annum, an estimate which is on the conservative side.

In addition, we are passing over some £5 million of liquid assets, money which was awaiting the greater expansion of our business when we became freed from the present controls and restrictions.

It has been said in official quarters that prices charged for electricity throughout the country must soon be raised. No doubt there are undertakings where this may be necessary, but in our undertaking, with its inherent strength, potential and performance, it is premature to talk of raising charges to our domestic consumers. I think that it should be known that this company, and indeed the whole of our organisation, including our associated companies, have been and will be directed and managed till the last moment on sound business lines.

BARKING POWER STATION

One of the great milestones in the history was in the year 1913 when the company obtained the Romford order giving us a new area of supply over a large part of Essex. But, more important still, this order gave us authority to erect our Barking generating station. Many obstacles, legal and otherwise, had to be overcome, and it was ten years before we were able to commence erecting the station which turned out to be, and still is, the cornerstone of the great edifice which has since been built up.

In 1925 the future looked secure; capital expenditure by the end of that year had risen to over £7 million, of which nearly £4 million had been spent on Barking and the necessary feeders out of the station. From then onwards until the outbreak of the second World War it was a story of great development and the justification of Barking. Indeed, since the passing of the 1926 Act, by owning this station, instead of having to purchase the bulk of requirements from the Central Electricity Board, we have been able to obtain these supplies at the cost of production of this major power station, so effecting a saving of hundreds of thousands of pounds per annum, and also enabling us to make reductions in the rates for supply to consumers.

THE NEW STOCK

The vesting date has been fixed for April 1st of this year. The last payment

to ordinary stockholders will be made tomorrow for the year ending December 31, 1947, and, therefore, a further three months' dividend will be due to them. The holders of the two preference stocks will also be entitled to three months' accrued dividends, and the debenture stockholders will be entitled to four months' accrued interest, the last payment having been made to them on December 1st last. Your representative will make these payments to you as soon after April 1st as is possible. The terms of issue and the rate of interest of the British Electricity stock which you will receive in exchange for your holdings in this company will be announced after Stock Exchange closing hours on April 1st.

At our last annual general meeting I said that the new stock will probably yield 2½ per cent. It must now be of the order of 3 per cent., owing to the fall in gilt-edged securities which has taken place since that date. Even so, I am afraid the ordinary stockholders will still have to face a reduction in income of some 26 per cent.

Last year I told you that I did not consider it prudent to publish our idea of the value of our undertaking. I assess the value of our assets in the group at round about £50 million, for which you are receiving just over £37 million. You can well understand that my views on this expropriation of our business remain unchanged and why I have lost no opportunity in denouncing in the strongest terms possible this unjust measure.

PRUDENT POLICY PENALISED

The policy of your board of directors has been over a long period of years to endeavour to maintain a fair balance between the interests of the shareholders and those of the consumers. With that end always in view, your directors have from time to time prudently set aside adequate reserves, and have either made progressive reductions in rates for supply to consumers or made available to them additional facilities.

It is obvious that in taking the basis of Stock Exchange values of the parent company's stocks for purposes of compensation, these substantial free reserves, involving as they do the realisable value of your holdings in the subsidiary companies, have to all intents and purposes been ignored. In my opinion, if a policy had been adopted of distributing to the ordinary stockholders of the County Company large blocks of the holdings in the subsidiary companies, the County Company's strength would still have permitted the maintenance of a 10 per cent. dividend. Still, I think you will agree that the policy adopted by your directors of building up the inherent strength of our group organisation was the right one—the honest one. Where we erred was that we could not anticipate that any British Government, renowned throughout the centuries for honesty and fair-play, should have penalised prudence by introducing such a confiscatory measure.

Referring to the Bill to nationalise the gas industry, he said: It is not proposed to transfer to the Gas Council any gas assets or give it any responsibilities of producing or transmitting gas analogous to the responsibilities of the British Electricity Authority. I do most earnestly hope for the sake of the country that the powers of the Minister and the British Electricity Authority will so be exercised as to prevent over-centralisation happening in the electricity industry.

The report was adopted.

BRITISH POWER AND LIGHT CORPORATION, LIMITED

INCREASED REVENUE

AIR COMMODORE C. E. BENSON'S SPEECH

THE LAST ANNUAL MEETING

The 19th ordinary general meeting of the British Power and Light Corporation, Ltd., was held on the 18th instant at Winchester House, Old Broad Street, London, E.C., Air-Commodore C. E. Benson, C.B.E., D.S.O. (chairman of the company), presiding.

The secretary (Mr James Rankin, F.C.I.S.), having read the notice convening the meeting and the report of the auditors,

The chairman said: The consolidated profit and loss account and balance sheet show a complete picture of the operations of the Corporation and its subsidiary companies during the past year and the position as at 31st December. In spite of the restrictions imposed on the consumption of electricity during the early part of the year and of certain reductions which we have made in our tariffs, to which I shall refer later, revenue from sale of energy increased by approximately £78,700 and for the first time exceeded £2,500,000. Due mainly, however, to the continued upward trend in the cost of coal and to the reduction in tariffs, our cost of energy increased to an even greater extent with the result the gross profit was less than that for the previous year by about £76,000.

INCREASED OPERATING EXPENSES

Operating and management expenses are higher by just over £55,000, due almost entirely to increases in the cost of repairs and maintenance, local rates and salaries and wages. Interest and other receipts and reserves for depreciation are both slightly up and our trading profit is down by about £133,000 at £386,309.

Debenture and other interest shows a small decrease due to the normal annual debenture redemption, and the reserve for taxation is down from £254,884 to £146,206, due partly to the reduction in trading profit and partly to the repeal of excess profits tax. The result is that after providing for preference dividends there remains a balance of £160,313 compared with £181,275 for the previous year.

CONSOLIDATED BALANCE SHEET

The Consolidated Balance-sheet shows the Capital Expenditure during the year amounted to approximately £165,000. In addition, stock and work-in-progress are higher by about £266,000. These figures reflect the somewhat more plentiful supplies of certain materials which were available during the year. Sundry debtors and payments in advance and sundry creditors are down by approximately £72,000 and £88,000 respectively. In spite of the reduction in trading profit, provision for future taxation is higher by nearly £33,000. This owing to the fact that, excess profits tax having been repealed, income tax has been provided on the whole of the profit for the year and has been shown as provision for future taxation.

With regard to the Corporation's own

accounts, interest, dividends and sundry receipts are less than in the previous year by £12,637 and the profit for the year is £338,276 compared with £349,611. After providing for taxation, preference dividends, and the interim ordinary dividend paid on October 1st, 1947, there remains a balance of £104,931. It is proposed to pay a final dividend on the ordinary stock of 5 per cent, maintaining the total dividend at 8 per cent, leaving £49,106 to be added to the amount carried forward.

REVISION OF TARIFFS

Ever since the inception of your company your board has consistently endeavoured to reduce the cost of electricity and from time to time substantial reductions have been made. During the war period such reductions had to be held in abeyance, but during the year under review we have completed our postwar revision of tariffs on our subsidiary companies and have been able in some cases to make material reductions. Further, we have discontinued the charging of meter-rentals in all our areas. It is to be hoped that this policy of continually attempting to bring down the cost of electricity to the public will be continued under the new nationalisation policy and that the record of your company, which has never once put up its prices, will not be broken.

Stockholders will remember that at a meeting on November 27th last, Mr R. Ashton Hamlyn, of Messrs. Binder, Hamlyn and Co., the Corporation's auditors, was appointed stockholders' representative for the purposes of Section 21 of the Electricity Act, 1947. An order has now been made by the Ministry of Fuel and Power prescribing April 1st as the vesting date under the Act, with the result that as from that date Mr Hamlyn will take the place of the directors as representative of the interests of stockholders.

THANKS TO EXECUTIVE AND EMPLOYEES

This is the last time that we shall hold an annual general meeting and I know that shareholders will not want me to finish without thanking all the executive staff and employees from top to bottom, who have throughout the history of the Corporation worked so loyally and efficiently. We have indeed been lucky in having such a good team, and I know that you would like me to wish them the very best of luck, prosperity and happiness under their new regime.

I now move:—"That the report and accounts, as audited by the Corporation's auditors, now before the meeting showing the position of the Corporation's affairs as at December 31, 1947, be approved and adopted."

Mr. G. Wansbrough, Comp.I.E.E., seconded the resolution and it was carried unanimously.

The dividends as recommended were approved; the retiring directors, Mr R. Nelson, M.I.M.E., M.I.E.E., and Mr G. Wansbrough, Comp.I.E.E., were re-elected, and the auditors, Messrs. Binder, Hamlyn and Co., having been reappointed, the proceedings terminated with a vote of thanks to the chairman, directors, executives and staff.

SCOTTISH EQUITABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The one hundred and seventeenth meeting was held, in Edinburgh, on the 18th instant, and in the absence of the president, the Right Honourable the Earl of Stair, K.T., D.S.O., the chair was taken by Mr Ranald K. Cuthbertson, W.S., chairman of the board of directors.

Mr Cuthbertson said: Today I have a two-fold duty, because in addition to the year's accounts we have before us the report on the quinquennial investigation as at December 31st last.

NEW BUSINESS

Dealing first with the year 1947, life assurance policies were issued for a net total of more than £3,000,000, being nearly 50 per cent. in excess of our previous record. Annuity business (mainly under the Society's scheme of guaranteed annuities) was maintained about the same level as 1946. £644,033 was received in purchase money in respect of annual payments of £50,385. On the subject of new business, I think you will be interested to know that we have made arrangements to commence at an early date the transaction of group insurance.

REVENUE ACCOUNT

The net rate of interest calculated on the life assurance fund, excluding the reserve fund and carry forward, is £3 15s. 3d. per cent. Claims by death were £324,134, while claims by survivorship under endowment assurances amounted to £549,530. Our large new business is reflected in the substantial sum paid in commission to agents. The item expenses of management has increased, but the figure is believed to be a reasonable one in relation to the size and scope of our operations. There was an increase in the funds amounting to £716,000, to which annuities again contributed substantially.

BALANCE SHEET

Turning to the balance sheet, British Government securities are reduced by £1,280,000, loans to the Standard Property Investment Company Limited, are increased by £400,000 and mortgages by £114,000, while debentures, preference stocks and equities show increases of £220,000, £532,000 and £771,000 respectively.

As a result of the general fall in Stock Exchange values since the last report the favourable margin between the balance sheet values and the market values of our Stock Exchange securities has diminished. The reduced margin is still, however, a very substantial one.

BONUS DECLARATION

I have been brief in my references to the year's accounts, because the operations and figures of the year are, of course, included with those of the four previous years in the actuarial investigation, and to this subject I shall now address myself.

The actuary's valuation of the life assurance contracts was made at the previous investigation at the end of 1942 at a net rate of interest of 2½ per cent. This valuation basis was strengthened by an additional reserve of £150,000. On this occasion the rate of 2½ per cent. has been used again, but the £150,000 has been increased to £230,000, which sum is sufficient to reduce the rate of interest by ¼ per cent. The valuation interest basis for assurances at December 31, 1947, is thus the equivalent of 2½ per cent. The rate used in valuing the annuities is 2½ per cent.

Deducting the resulting total of the liabilities from the amount of the fund at Decem-

ber 31st last, there emerges a surplus of £1,056,770. The directors have decided to declare bonuses on ordinary participating policies at the rate of 36s. per cent. per annum (or £9 per cent. for the quinquennium), calculated on sums assured and existing bonuses, and corresponding rates on the new very small "immediate bonus" and "minimum rates" classes. These allocations cost in all £893,413, leaving £163,357 to be carried forward.

INTERMEDIATE BONUS

We enter the new quinquennium in a position of considerable financial strength, which is the starting point for consideration of the intermediate bonus which falls to be approved by this meeting. Intermediate bonus is bonus to be allowed meantime in respect of premiums payable after December 31, 1947, on policies becoming claims in the new quinquennium.

The board devoted most careful attention to this question of intermediate bonus, and decided to recommend a rate of 30s. per cent. per annum compound on ordinary participating policies becoming claims by death or survivorship, and 26s. per cent. for those in the small "minimum rates" class becoming claims by survivorship. These rates of bonus may be reviewed at any annual general meeting during the quinquennium, and it will be even more necessary than in the past to watch to what extent changing circumstances and conditions may indicate the desirability of reconsidering them.

I am sure it will be agreed that these results show not only a very strong position as regards reserves, but indicates substantial earning power in spite of the handicaps of high taxation and increasing costs and in spite of the well-known investment difficulties of the present time.

The report and accounts were adopted unanimously.

TEMPERANCE PERMANENT BUILDING SOCIETY

MR CYRIL W. BLACK ON SOCIETY'S PROGRESS

The ninety-fourth annual meeting of the Temperance Permanent Building Society was held, on the 11th instant, at the Caxton Hall, London.

Mr Cyril W. Black, J.P., F.R.I.C.S., F.A.I., chairman of the society, in the course of his speech, said: The year which has recently ended has been one of steady progress in all departments of the society's business.

INCREASE IN BUSINESS

The total assets have risen during the year by £3,190,935 to a record figure of

£20,748,243. On the other side of the balance sheet the amounts due to shareholders and depositors have increased by £2,984,881 to £19,108,124.

Mortgage advances made during the year total £6,694,030, a figure which marks a further record in the history of the society. It should be emphasised that the large volume of mortgage business transacted has not been secured at the cost of the relaxation in the slightest degree of those rigid standards of prudence which it has ever been our custom to observe.

I have made reference in former years to the importance attached by the board, particularly at a period such as this, of having our mortgage securities widely distributed so that any depression affecting part of the country or any widespread removal of industry and population from one district to another would have only a minimum effect upon our business. The extent to which we have been successful in securing a wide dispersal of our mortgage securities is demonstrated by the following table:—

Area	Money advanced on Mortgage during 1947	Total Mortgage Asset on the 31/12/47
Greater London Area	£2,371,690	£8,428,845
Remainder of England and Wales	£3,194,890	£6,282,477
Scotland and Nthn. Ireland	£1,127,450	£2,089,943

The reserve and contingency funds and balance of profit carried forward amount to £1,342,242, a figure higher than ever before, representing over 7 per cent. of the aggregate share and deposit capital. A satisfactory degree of liquidity has also been maintained.

CRIPPLING TAXATION

Turning now to the profit and loss account, there are two matters only on which I think it is necessary for me to comment. Our ratio of management expenses to mortgage asset shows a considerable reduction compared with the previous year. In these days of rapidly rising costs, your Board has considered it more than usually important to concentrate upon maintaining the expenses of the society at the lowest possible level consistent with efficiency. The second matter to which I would direct your attention relates to the crippling taxation to which the society is subject, and, in particular, the increase in the amount payable in profits tax (£39,427) compared with the amount previously payable in National Defence Contribution (£6,965). The reasons advanced by Government spokesmen in favour of the special con-

cession to co-operative societies would all appear to me to apply with at least equal force in the case of building societies. The Government, however, was not inclined, for reasons which have never been made clear, to extend the same concession to building societies, and one is left with the impression that the concession to co-operative societies was made rather for political considerations than on the merits of the case.

I am pleased to be able to assume you that our borrowing members continue to honour their obligations in a satisfactory manner.

I cannot pass from my review of the work of the past year without voicing our sense of gratitude to those who, in a very difficult period, have made possible the satisfactory results now under review. The outstanding services of our managing director, Mr Ronald Bell, have played a large part in raising the society to the position it at present enjoys; to him, to his executive colleagues and to all members of the staff, I wish to express our appreciation and sincere thanks.

THE OUTLOOK FOR BUILDING SOCIETIES

As far as the future is concerned, it is more than usually difficult to speak with any sense of assurance. As far as our society is concerned we foresee the immediate future as a period of consolidation.

The total volume of mortgage business throughout the country in the near future will probably be less than during the past few years. The building of houses for sale will not be on a sufficiently large scale to add to the volume of mortgage securities available, and, while during the past two or three years there have been great transfers of population throughout the country as a result of the resettlement of families after the war, this process is now probably drawing to a close.

Today the proposition that it is socially and politically beneficial for as many citizens as possible to become the owners of their own homes is being challenged and assailed as never before, but in spite of every onslaught its truth remains. The creation of a property-owning democracy has ever been the ideal and objective of the building society movement, and the principles of thrift and personal endeavour on which the success of the movement has been built up will assuredly come into their own again. Without them the rebuilding of the prosperity of our country is impossible. We accordingly face the future conscious of the difficulties which impend, but confident of our ability to continue to make our contribution to the welfare and prosperity of the community.

The report and statement of accounts were adopted.

AIR MINISTRY

Vacancies exist in the Air Ministry for the following Statistical posts.

1. *Statistician* (Order No. A92/48/A). Salary £800 rising by annual increments of £25 to a maximum of £965 a year. The duties involve responsibility for the collection and presentation of various statistical data connected with the organisation of the Royal Air Force. It is essential that candidates should have an Honours degree, or equivalent qualification, in mathematical statistics. They must be highly skilled statisticians with considerable experience and possess good personality with a talent for administration.
2. *Statistical Officer* (Order No. A461/47/A). Salary £650, rising by annual increments of £25 to a maximum of £750 a year. The duties involve the provision, collection, analysis and interpretation of all statistical information concerning the serviceability, repairs and defects of aircraft, mechanical transport, marine craft and ground equipment in the Royal Air Force. Candidates must have a degree, or equivalent qualification, in mathematical statistics and a knowledge of engineering with, if possible, some administrative experience.

Write, quoting relevant order number, to Ministry of Labour and National Service, Technical and Scientific Register, Room 669, York House, Kingsway, W.C.2, for application form, which must be returned completed by 31 March, 1948.

HOLIDAY PLANS? If you want good suggestions for a holiday "off the beaten track," independently or with a party of professional people, contact Erna Low, 9, Reece Mews, S.W.7. KEN. 0911.

WANTED.—Runs of *Economist* before 1936.—Box 691.

Statistical Summary

GOVERNMENT RETURNS

For the week ended March 13, 1948, total ordinary revenue was £105,776,000 against ordinary expenditure of £60,131,000 and issues to sinking funds £120,000. Thus, including sinking fund allocations of £16,742,000 the surplus accrued since April 1st is £795,302,000 against a deficit of £433,662,000 for the corresponding period a year ago.

Closing date for the receipt of applications is 16th April, 1948.

*The New Approach to Politics!***THE DOMAIN OF IDEOLOGIES**

By HAROLD WALSBY

This is a book of equal importance to Left, Right, and the mass of free thinking people in the Centre, for it analyses for the first time in a scientific way just how and why different political ideas arise, their inter-relationships, and the profound effects they exert on social behaviour.

THE ALEXANDRIA WATER COMPANY, LIMITED
ALEXANDRIA, EGYPT

NOTICE IS HEREBY GIVEN that the seventieth ORDINARY GENERAL MEETING of the Shareholders will be held at the Company's offices, 61, Avenue Fouad Ier, Alexandria, on Thursday the 8th April, 1948, at half past four in the afternoon for the transaction of the ordinary business of the Company, pursuant to Act of Parliament. Holders of share warrants to bearer desiring to attend or to be represented at the Meeting must deposit their share warrants in London before the 25th March, 1948, or in Alexandria before the 5th April, 1948, until after the Meeting, at the National Bank of Egypt, 6, King William Street, London, E.C.4, or at the National Bank of Egypt, Alexandria, or at some other approved bank in London or Alexandria.

DATED, Alexandria, Egypt, the 12th February, 1948.

By Order of the Board,

ROBERT WALTON, Manager.

NATIONAL BANK OF INDIA, LIMITED

NOTICE IS HEREBY GIVEN that the Ordinary General Meeting of the Shareholders will be held in the Bank's Premises at 21, Bishopsgate, London, E.C.2, on Tuesday, 30th March at Twelve o'clock noon precisely, to receive the Accounts to 31st December last, with the relative report by the Directors, to declare a Dividend, to elect Directors, to appoint Auditors, and for general purposes.

An Extraordinary General Meeting, notice of which was sent to the Shareholders on 5th instant, will be held immediately following the Ordinary General Meeting in connection with a Special Resolution for the alteration of the Bank's Memorandum of Association.

By Order of the Board,

N. W. CHISHOLM, London Manager.

26, Bishopsgate, London, E.C.2. 9th March, 1948.

WOMAN graduate with varied experience in commerce and public service, including statistics, buying, office organisation, secretarial and personnel work, seeks interesting position requiring energy and initiative. Willing to travel.—Box 665.

MANAGEMENT enthusiast with fine record of sales and advertising administration in first-class firms, lately Assistant Director of Artillery (Lt.-Col.), Ministry of Supply, public school man, highest references, available shortly.—Box 679.

MECH. ENG. (29), experienced both technically and administratively. 5 years' apprenticeship, automotive industry. Ex-Captain, R.E.M.E., studied scientific management. Seeks position as Technical/Personal Assistant.—Box 681.

ASSISTANT to the Managing Director of a well known group of companies with a considerable home and export trade, seeks a responsible administrative appointment with substantial prospects. The post which is sought would offer scope for a well qualified young man (34), with enthusiasm, initiative and a keen interest in good management, to develop into a top ranking executive within the next five years. The initial salary offered is secondary to the scope and prospects attached to the post.—Box 688.

COTTON Cloth, Import, Export and Home Trade. For the management of our Cloth Department, we require first class gentleman with full experience in all lines connected with Import, Export and Home Trade. The department would be under the sole responsibility with high salary and if progressive, with profit participation. Knowledge of foreign markets and languages an advantage. Offers in strict confidence to Box 689.

MARKET RESEARCH Assistant (Woman) required in London, capable of handling consumer research at all stages. Flair for fieldwork essential. State age, name of present employer, experience, other qualifications and salary.—Box 690.

LARGE group of Engineering Companies in the Midlands requires the services of a Director of Costing to take control of costing methods and systems in the Group. Only those having full practical knowledge of Cost Accounting and the installation of Costing Systems and who are now holding high executive positions in this work need apply.—Box 692.

EXPERIENCED lady secretary seeks contacts for work at home. Typewriting, duplicating; also available for shorthand. High standard.—Wordsworth 2615.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees, payable by instalments, if desired.

Realities in Palestine

SLOWLY but inexorably the facts about Palestine are exerting their pressure in Washington. The fact that partition can be imposed only by force has been fought against for many wasted months, but it is now accepted. So, at last, is the fact that Britain will not obligingly supply the force. If, therefore, partition is to go through, either the United States must itself provide the troops, or else it must face all the problems of creating an international army, which might have a Russian component and would certainly contain many Communists. Neither alternative is acceptable. The United States has therefore abandoned partition and proposes instead that the United Nations should undertake a trusteeship for Palestine when Britain lays down the existing mandate, and maintain it until such time as the Arabs and Jews find a solution upon which they can agree.

The abandonment of partition represents an American concession to reality. The same can hardly be said of the proposal that the United Nations should take over the mandatory's task. The imposition of Trusteeship is now as unacceptable to Arab and Jew as the imposition of partition. The Jews have prepared their plans for announcing the creation of a Jewish state on May 16th—the day after Britain formally abandons the mandate—and the Arabs will continue to attack the state, whether or not a perplexed and helpless United Nations Commissioner sits in some heavily defended corner of the King David Hotel. The only condition in which a trusteeship could now be maintained would be a readiness of the British Government to keep their troops in Palestine and maintain internal security after May 15th. There is no time to do anything else—so that new Trusteeship is merely old Mandate writ large. But Mr Creech Jones has left the world in no doubt about Britain's determination to abandon sole responsibility for Palestine in May, whatever plan—partition, continued mandate, federation—is proposed to fill the vacuum.

It is time surely to look at the situation in Palestine squarely, without reference to settlements by agreement, the extension of United Nations authority, the maintenance of the mandate or any other form of words designed to mask the ugly reality. There can now be no settlement in Palestine of any kind except by force. When the British withdraw, the Arabs and Jews will fight it out. The only way of preventing a murderous war is to use external force to hold the combatants from each other's throats. That is the reality of Palestine—there is no other. And at the moment the likelihood of external force coming in to prevent the struggle is so remote that a fight to a standstill between Arabs and Jews in the Holy Land is the tragic prospect of 1948.

Some observers are not too perturbed at this. They argue that the only way in which Arab and Jew can ever approach a settlement is for each side to be compelled, by the irrefutable evidence of war, to abandon its extremer claims. They believe that prolonged fighting will leave the Jews with a small area along the coast where their sovereignty will be unchallenged, while the Arabs will be in control everywhere else. This situation will compel the Jews to abandon their claim to control all

Palestine (and even more), while the Arabs may be persuaded to accept a partition they know they cannot overthrow by force. At that point, therefore, a settlement might be reached.

Anglo-American opinion is not likely to accept easily the cold-blooded realism of this approach. What has already happened in Palestine is proof enough of how pitiless and horrible the war between Arab and Jew would be, and anyone with a spark of humanity left in him will recoil horrified from the possibility that the Jewish people, already decimated by the Nazis and loaded with the persecution of centuries, should now, in the land they hoped to make their own, be exposed to new violence in a war they cannot win. This purely disinterested and humane reaction is reinforced in the case of Britain and America by the realisation that Palestine lies dangerously near the front line between Russian and Western interests in the Middle East and that nothing renders intervention so inviting or so possible as the existence of a bitter civil war. If there were any feasible alternative to accepting the arbitrament of war in Palestine, the Americans and the British would have the most compelling reasons for adopting it and carrying it out.

Is there such an alternative? In the past the difficulty has lain not only in the division of opinion between Arab and Jew, but in the inability of the British and American Governments to agree even in principle. President Truman's retreat from partition suggests that he has now abandoned the attempt to conduct American policy as though Palestine were a Zionist ward attached to New York State. But it gives no hint whether he has also abandoned the adjunct of partition—unlimited immigration for the Jews. Insistence upon immigration and, in particular, upon the immediate admission of 100,000 Jews into Palestine, has proved a permanent obstacle to Anglo-American agreement even in principle. It may still remain. If, however, the President is ready to accept the reality of Arab opposition not only to partition but to mass Jewish immigration as well, it is possible to believe that the British and American Governments together in an earnest effort to reach agreement could evolve a joint policy, at least on paper. It might take the form of creating a separate Jewish canton or state in a federal Palestine, in an area smaller than that proposed by the United Nations Commission, but larger than the area the Jews would be likely to retain after an Arab-Jewish

war. It might also be possible to lessen the opposition of both sides by offering the Jews alternative possibilities of immigration for their unhappy displaced persons in Europe (the passage of the Stratton Bill would be a helpful American contribution) and by assuring the Arabs of economic assistance in developing the Middle East. Some such scheme is conceivable, now that the Americans are no longer committed to the full Zionist case. The difficulty lies in its implementation.

Any scheme must be initiated before the British leave Palestine. Otherwise the situation will be out of hand before the alternative to Arab-Jewish war has fairly been launched. But the British will not carry through any scheme single-handed. Nine months ago they still might have done so, but the murder of the two young sergeants brought about one of those rare shifts in British public opinion which, once they have occurred, are irrevocable and which no statesman will challenge. There is only one conceivable condition under which the British could be persuaded to stay in Palestine and to help carry through an agreed Anglo-American policy, and that is if the Americans were prepared to carry at least half the direct military burden and the lion's share of the economic cost. If the British Government knew that British forces in Palestine would be reinforced by American troops, that the heavy financial burden of restoring internal security in Palestine would pass in the main to America's broader shoulders, and that America's full participation would be maintained for as long as was necessary to reconcile Jew and Arab to a solution they both dislike, it is conceivable that the present British policy of withdrawal and *après nous, le déluge* might be reversed.

To say so much is simply to underline the extreme improbability of such a solution. In abstract terms, it may be a better solution than any other. It may more fully meet the realities of Anglo-American strategic needs in the Middle East. It may give more hope in the long run to the tragic remnants of European Jewry. It may offer the Arabs a better chance of improving their economic and social conditions and of avoiding internal collapse and revolution. But all these possibilities splinter on the single fact that America will not send troops to Palestine and the British are no longer prepared to do so. No phrase-making about the United Nations or mandates or trusteeships or sacred trusts to humanity will cover up the stark reality. And since neither Britain nor America will enforce a settlement, the Arabs and Jews will, by bloody war, enforce their own.

Civil Defence

THE state of a nation's precautions against attack by aircraft or projectiles is in these days the measure of its expectation of war. Nothing can make convincing the suggestion that the Great Powers intend aggressive or preventive war with the latest weapons so long as civil defence in America, Russia and Britain is virtually non-existent. So vast and complex is the reorganisation of home and industrial life, the location and protection of national resources demanded by any efficient scheme of defence, that no Government will seriously attempt it unless its military advisers offer unanimous advice or incontestable intelligence that war is probable. Yet that is no reason why the basic ideas, the framework of direction and the nature of the training that civil defence demands should not be thought about and planned as carefully as the future of armies and air forces. What was said on behalf of the Government in last Monday's debate in the House of Commons was in this respect far from satisfactory.

For practical purposes civil defence is almost back where it was in 1937. The Civil Defence Department of the Home Office is exiled from Whitehall to the museum district of

Kensington; its staff is reduced to a faithful few with whom reposes the military, administrative and human experience collected during the air attacks of four years; the Home Office officials who dismantled the wartime organisation with such exemplary speed are examining plans for a new structure with no less exemplary caution. Yet, if White Papers mean what they say, "the security of the United Kingdom" is "our first long-term defence commitment." And the Home Secretary said as long ago as November 5, 1945, that the Government regarded as essential its duty

to make adequate arrangements for the protection and rescue of the population, for the mitigation of the effects of air attack and for the restoration of industries and services after attack.

The two years that have passed since that statement have been used by the faithful few to think out a new doctrine of civil defence. Except for some progress in research, little else has happened.

Part of the new doctrine—the tactical part—is set out in the "Memorandum on the Reorganisation of Civil Defence Services" which was circulated in December among the repre-

sentative associations of local authorities. Its main features are four: a new and decisive role for the Army; mobility of large portions of all the necessary services; division of the country into target areas each covering several local authorities; concentration of commands. All these fall into the class of remedial measures. Preventive measures, so far as they are not covered by active military defence, fall under the main heading of "dispersal"—of which more will be said later.

There can be no quibbling with the proposal to draw from the Army the main force and reserves of mobile columns for rescue and restoration duties. By the beginning of next year training in civil defence will be universal in the Army. There will grow gradually out of the ranks of conscripts and Territorials a cadre of specialists that can be quickly mobilised to cover the slower deployment of civilian services. In case of heavy air attacks, the transport and communications of the Army would be normally better defended and more quickly reinforced than those of local authorities and civilian columns. The present intention is that military columns would work under the direction of civil defence area commanders; there is apparently to be no GHQ Home Forces.

Next in the hierarchy come "local mobile services," possibly based in peace-time on the police and the fire services; civilian volunteers would give part-time service in peace and provide a large whole-time element in war. Recruitment and administration in peace would be local, and training would be provided in rescue work, first-aid, direction of the homeless, emergency repairs, and measures against gas and biological warfare. Behind these local forces come the "static forces," organised and administered by the police. Whether they will emerge as a combination of the old wardens' and fireguard services, or whether they will consist of able-bodied civilians organised for self-help is not yet decided. For them too voluntary peace-time training is prescribed. In line with this national wide force come an emergency medical service, civil defence units in factories, transport and business premises, and a special full-time force for the work of restoration after attacks.

*

So far so good. Civil defence has a sensible tactical doctrine which local authorities are now examining. They will doubtless accept it and concentrate their comments on the question of who pays the bill. They will probably begin a tug-of-war with Whitehall—like that of 1937-38—which will delay by months the most tentative advance towards organisation and training. But the delay in this quarter is likely to be far less serious than that which can be foreseen in the top levels of the civil defence hierarchy. Mr Younger, when stating the case for the Home Office in the debate on civil defence, glided swiftly over this very slippery ground.

The present intention is that the Ministry of Defence should have nothing to do with civil defence. No one knows why. To make matters worse, the Minister in charge of civil defence—

the Home Secretary—is not a member of the defence committee of the Cabinet, in spite of the fact that there is scarcely a subject discussed by that body which has not some bearing on his task. The new Civil Defence Committee of all departments, on which one would expect Ministers to sit, in fact consists of Permanent Under-Secretaries. Beneath this body, responsible to nothing more exalted than a department of the Home Office, is the newly formed Civil Defence Joint Planning Staff, which has yet to meet. With such a chain of command it will be surprising if either speedy or authoritative action is taken; it is clearly the creation of minds more interested in maintaining the authority of the Home Office than in relating civil defence to the plans and work of the Fighting Services.

This confusion is, of course, only one result of the proliferation of committees which has occurred in Whitehall since the wartime defence organisation under the Cabinet was transformed into a system in which military experts are carefully subordinated to civil servants and "channels" are more important than ideas. Only such an environment could nourish the idea that the Home Secretary should be responsible for matters which lie at the very root of national defence—matters which in the United States are to be entrusted to the Department of Defence. It would perhaps be reasonable to rely on time to prove the weakness of the organisation, if it were not quite clear that its persistence will delay still further the working out of the strategy of civil defence.

Without such a strategy no amount of sensible thinking and administrative changes will answer the puzzled, indignant questions that will be heard when the demands for action filter through layer after layer of county, town hall and parish representatives to the full-time and part-time volunteers of the local "mobile" and "static forces." What is the good—they say—of trying to do anything against atomic bombs? How can a single soul work or move or live in an area where radiation is still active (as it still is at Bikini months after the explosion of the atomic bomb under water)? How can any force, however well trained and equipped, cope with the destruction that would face it after a raid on a great industrial area? Or with a determined attempt to neutralise key areas of the country by chemical or bacteriological warfare?

These questions are already being asked, and Sir John Anderson made on Monday a sensible and well-informed attempt to show that they can be answered. He realised that it is not enough to answer them with the reminder that people must be rescued and tended after attack, that transport and communication must be restored, that civilised life collapses if certain public services cease for more than a few days. Something more has to be done and said to overcome the feeling of complete helplessness that is bred by the intelligence and imagination of people who think aloud about the prospects of atomic warfare. That something positive can be done has been proved by the small team of lecturers and demonstrators sent by the Home Office's

Head Office:
ROYAL EXCHANGE,

Civil Defence Department to audiences all over the country. They have discussed and shown official reports and pictures of what happened at Hiroshima and Bikini, in the Hamburg "fire-storm raid," and the Tokyo incendiary attack. They have passed on what expert views there are about the lessons for the future. They have discussed candidly with their audiences the problem presented by a Portsmouth or a Liverpool sprayed with radio-active water by the explosion of an atomic bomb in the port. The response has been a readiness to volunteer for peace-time training which can be measured not in thousands but in hundreds of thousands; apathy gives way to interest as soon as men and women in the old civil defence clubs up and down the country are convinced that the appalling gravity of the problem is understood by the men from Whitehall.

At the present rate of progress, the planners' constructive and practical suggestions will not be offered for a long time to come. How—to start with an elementary problem—are the trainers and leaders of the public to be trained? Is there to be a civil defence staff college? Will the appropriate Ministers insist on the more careful siting of new power stations, or the more solid construction of new factories? Is a new gas mask being designed for mass production? Are the lessons of Hiroshima and Bikini to be available in simple, sober form for public discussion?

It can of course be argued that to take and discuss such measures publicly is to take war for granted. Several slightly hysterical voices said so during last Monday's debate; they might have said the same with equal cogency in the debates on the Services Estimates a fortnight before. And the idea has to be overcome that measures for civil defence are in some way more immoral, more irrevocable, more fatalistic than the maintenance of a Navy or an Air Force. For they need longer and more careful preparation than fleets or squadrons, and failure to take them in time is likely to offer more temptation to future aggressors than any other weakness in the British defence system. To make this long preparation possible there should be a set of clear ideas about what measures are scientifically, industrially and medically possible. When these are achieved they should be disseminated and carried out by an organisation which is an integral part of the machinery which would come into action in wartime.

For the first time in history, the means exist to destroy in a day or two the chief productive centres of a great Power—if they are unprotected and unorganised. Great harbours can

be denied to fleets; large stretches of town and country can be rendered uninhabitable; the whole industrial system which pumped power into the British and American forces from this island in 1943 and 1944 could be quickly wrecked and dislocated. The problem of meeting the menace cannot just be handed over to the regular sailors, soldiers and airmen. It is their task to engage the enemy, not to look after the civilians. It is for them to stop missiles or microbes arriving, not to restrict the damage they may do. But they have a much more urgent and direct interest in that damage than they used to have: some of them learnt this when the V2s were falling on Antwerp in 1945, threatening to deprive the docks of their Belgian labour and the Army of the Rhine of its food and ammunition. So one would have expected from the Services a demand that civil defence should be taken seriously, that Ministers should prepare answers to the question whether the British Isles, with their present concentration of population and industry, can be held and defended as a base against the forms of warfare that might be directed against them.

The question was being asked before the end of the last war, when it was thought that the Germans might get the atomic bomb first. Some experts are prepared to answer Yes—provided the defence of Britain is regarded as only one aspect of the defence of the Commonwealth. They argue that Britain would be neither so tempting, nor so vulnerable as a target, if there were distributed in the Dominions and Colonies six or seven alternative centres of British industrial strength and striking power. They ask for planned dispersal of population within the Commonwealth; for a gradual sharing out of skilled workmen and key machinery; for deliberate encouragement of heavy and light industries in the Dominions; for dispersal of fuel, raw material and munition stocks.

Such proposals—first presented in full-dress papers at the meetings of Commonwealth Prime Ministers in London nearly two years ago—open up a vast debate. They are mentioned here, not to have judgment passed upon them, but to show the kind of thinking which has to be done before civil defence can be said to have anything more than a tactical doctrine—the doctrine of the memorandum to local authorities. Without that kind of thinking there can be no civil defence strategy; and such thinking will not be stimulated and pursued into action until civil defence has its own planning staff, its staff college, its parity with the fighting Services, and its full and qualified representation in Whitehall.

Warning from Italy

THE impending Italian general elections have taken on the air of a by-election in a far greater contest, the contest which will help to determine the balance of power between the gigantic coalitions of the world powers. The local politicians, Alcide de Gasperi, Palmiro Togliatti, Pietro Nenni, Giuseppe Saragat and the rest, are doing the rounds of North, Central and Southern Italy. But even in the remote villages and country towns, other and larger figures loom as the protagonists of the struggle in its world aspect. Truman, Marshall, Bevin, Stalin, the Pope, are watching Italy for a "straw vote" to show which way the world is going. And like good party managers helping their local Tammany, they throw out tidbits from the platters of international politics, or issue dire warnings on the results of local victory.

Before the new Western policy for Trieste was launched at Turin by M. Bidault, the Western Powers had already done some fairly sustained wooing. Without any repetition of the tale of American economic support from 1943 onwards, whereby

over \$2 billion have been pumped into Italy, a long enough story could be told of the encouragements of a more political nature tendered by the Western Powers to Italy in the last six months—the invitation to the Conference of the Sixteen Nations, the holding of the first meetings on Manpower in Rome, the British and American renunciation of Italian ships due under the Peace Treaty—reparations had already been abandoned—the readmission of Italy to the international administration of Tangier. It is true that, from the joint view of Italian diplomacy and "bourgeois" public opinion, these caresses left the major grievances unhealed. The Italian colonies remain under British Administration and the Adriatic frontier is still fixed by the *Diktat* of 1946—a description of the Peace Treaty now unblushingly adopted by the Press of the Extreme Right. The fact that France and America have proposed the return of the colonies to Italian trusteeship and the excellent record of Allied Military Government in Trieste have not mollified Italian opinion on these points.

Even so, the balance of aid has been heavily on the Allied side, since the approaches of the East towards Italy have been much less concrete and cordial. Something, however, appeared to be brewing in this period immediately preceding the elections. Negotiations for a trade treaty between Italy and the Soviet Union have reached an advanced stage. Their conclusion has been held up only by the Soviet demand that reparations from Italy should be speeded up. The treaty lays down a payment of \$100 million over six years, to start two years after its coming into force. There is room here for bargaining and it has been widely expected that the Soviets would come out with an offer, in time to produce an effect in the elections, which would combine the promise of supplies with some new arrangements for the payment of reparations.

But above all, it has been expected that a new offer would be forthcoming from the Soviet-Jugoslav side on the future of Trieste. At one point—in 1946—conversations between Marshal Tito and Signor Togliatti produced the suggestion that the City of Trieste should pass back into Italian hands in exchange for the cession to Yugoslavia of the city of Gorizia—a proposal at once rejected on the Italian side for both strategic and sentimental reasons. But there was reason to suppose the offer would be repeated. It therefore seems that the new Western proposal that Trieste should revert unconditionally to the Italians has, by very nice timing, anticipated an offer which would have come from the East.

Given this contrast between the scale and effectiveness of Eastern and Western support, one might expect the result—as far as the local elections are concerned—to be a foregone conclusion. The party which can point to its world backers and say, "There is the source of your bread and your livelihood. There are the sponsors of your diplomatic resurgence. There are your friends" ought, surely, to be able to pull off a comfortable majority in the Italian "by-election." The paradox which the Western Allies would do well to consider carefully is that the Italian Government and its supporters expect to do no more than squeeze home and that the Popular Front of Opposition has not been simply whistling in the dark in its assertions that it will emerge as the largest party. In spite of Russian coldness, in spite of Soviet backing for Yugoslavia, in spite of Russia's insistence upon reparations, the Communists and the Nenni Socialists still have grounds for hoping that they will get over 40 per cent of the votes. In spite of having, practically speaking, fed and clothed the Italian people for the last two years, the Western Allies have to admit that the Christian Democrats and their supporters are hard pressed. Something has gone badly wrong, and since the diplomatic duel between East and West is likely to dominate Europe for some time to come, the Western Powers could do worse than make a stock-take now, before they play their trump card—the European Recovery Programme. Italy has, after all, received over \$2 billion all told in the last two years. Not much more will be forthcoming during the four years of ERP. If no greater political results are to be achieved than those which are apparent on the eve of the elections, will there really be stability and revival by 1951? The Western Powers are about to play their highest stakes. But are they certain of the game?

One reason for the unpopularity of both the Western Allies and of the Italian Government is quite simply that both have had a hand in the direct administration of Italy. Memories of the Allied occupation are fading now, but they leave a backwash of bitterness. The Prime Minister, Signor de Gasperi, is inevitably the target for every criticism and discontent by the mere fact of having managed to last for two years and of having shouldered sole responsibility for the last difficult nine months. But this is not a sufficient explanation. The Allies are unpopular not only because they were for a time

actively responsible for Italy, but because there has proved to be so great a gap between their wartime promises of liberation and the dreary performance of co-belligerency. Nor is the Italian Government simply guilty of having governed. It has governed badly. Two examples of this will suffice. The voting strength which may just possibly tip the election scales in favour of the Popular Front lies with the peasants, and one factor which, more than any other, has upset the traditional pattern of voting has been the gains secured by the Communists among the share-croppers in Southern Italy and Sicily. The landless peasant is always radical until he receives his land, and land reform is written into the programme of the Christian Democrats. A few radical moves to end the intolerable feudal organisation of the South would have given them the peasant vote. But they have done nothing, and thus it is their own timidity and conservatism that has handed the advantage to the Communists.

The other issue is that of economic and financial policy. Admitted, Italy had not and has not the machinery to plan a whole economy. Nothing is in more need of radical overhaul than the entire civil service. But it is hard to believe that the degree of incompetence achieved was in fact inevitable. The deflationary policy initiated last year was carried much too far and applied far too rigidly. After forcing prices to fall briefly, it is now reaping the whirlwind in growing unemployment, the collapse and disappearance of many small businesses, the near-bankruptcy of some big firms and the re-emergence of inflation and rising prices, thanks to the Government's expenditure on the unemployed. The resulting sense of confusion and hopelessness is leading even business men to talk of voting for the Popular Front, since "at least it might provide a competent administration."

These economic failures are reinforced by the unfortunate political background of the regime. There are few cities in Europe where the contrast between irresponsible wealth and utter destitution is as marked as in Rome. Anti-clericalism, which the great part played by the Catholics in the Resistance damped down, has reappeared in part at least as a result of Christian Democrat ineptitude and intervention in the field of education. Above all, any genuine Democrat must be worried by the ease with which a genuine Fascist movement, the *Movimento Sociale Italiano*, has been allowed to grow up in the last year and might become, in the event of a large Popular Front vote, an essential part of a Christian Democrat majority in the Chamber.

All these factors not only explain the strength of the Communist opposition in Italy—in spite of all Russia has done to make Signor Togliatti's task impossible. They are also a sharp reminder that dollars alone will not carry through a European Recovery Programme. There has been much talk—rightly—of the necessity of avoiding political and economic conditions and of abandoning any attempt to link American aid with concessions from the receiving nations. But some conditions must be imposed by the nations themselves and must be overseen by the Continuing Organisation and by the Americans, if ERP is to succeed at all. Equitable distribution of supplies, the full use of all local production, the reform of taxation and the creation of financial stability, social measures designed to bring all classes within the benefits of the scheme, honesty of administration and, if possible, higher standards of efficiency—all these are as vital to the success of ERP as the actual voting of dollars in Congress. The Italian situation is a warning and a portent. A whole country may be placed in jeopardy, in spite of the outlay of vast sums of money and the offering of every diplomatic support, simply because internal conditions are chaotic and anti-social. Even with an ERP of treble the size, the fight for Western Europe might still be lost if internal reconstruction did not march external aid.

Scottish Home Rule

THERE is a good deal of disappointment in both Scotland and Wales that the Labour Government has not done more to give those countries direct local control over their own affairs—very little more than the Conservative Governments of the past. Despite the rather rash promises made at the General Election by the Labour candidates on the spot, who flirted freely with Gaelic and Celtic nationalism, only minor concessions have been made; and the recent White Paper on Scottish Affairs [Cmd. 7308] asserts in effect that the question of Scottish self-government is so controversial, and arouses such fierce passions, that an official inquiry into it would be unprofitable and unproductive. What holds of Scotland holds *a fortiori* of Wales. This attempt to close an issue before it has been properly ventilated will do the Government nothing but harm. To many Scotsmen and Welshmen it signifies just another betrayal, and even to the English it denotes a defeatist attitude towards the very real problem of over-centralisation, which this Government has done its level best to exacerbate.

Owing in large part to the extension of socialism, there are in fact two issues involved. The first concerns the general case for decentralisation and devolution, which is applicable to the whole realm, to Cornwall or Yorkshire as much as to Wales or Scotland. As state control over economic affairs extends and widens, the executive becomes more irresponsible and Parliamentary supervision gets harder and less effective. Provincial affairs are increasingly coming under the control of regional officers of Government departments and the regional boards of nationalised industries, whose accountability to the citizens in their own area, being a matter of remote control *via* Whitehall and Westminster, is virtually non-existent. Moreover, all the controls of the expanding administrative machine are wielded from London; and Parliament has its work cut out to keep track of the operations of this machine at its centre, let alone at its periphery.

There is, therefore, a strong case for establishing new representative institutions at a provincial level, for democratising the regional organs of state control, and for relieving Westminster of part of its load and Whitehall of part of its power. But this general case applies with special force to Wales and Scotland, particularly to the latter, where it becomes mixed up with the much older issue of political separatism and of racial and cultural self-determination. Extreme nationalism—the sort which demands Dominion status, or even complete severance from “English domination”—is not a serious force in either Wales or Scotland. At the last General Election, the Welsh Nationalists mustered only 14,750 votes, and the Scottish Nationalists only 30,600. Nevertheless, these movements should not be dismissed as mere moonshine. The fact that at election time the Scots and Welsh have sense enough to be more interested in fighting Socialism or Conservatism (as the case may be), rather than in pursuing a traditional feud with the English, does not mean that they are satisfied with the present position. They are not. The liveliness of Scottish and Welsh patriotism is shown by the promises which have been exacted, albeit to little effect, from the main political parties. The Liberals have always stood for granting home rule to both Scotland and Wales, and have polled much better in those places than elsewhere in consequence; at the last election, Labour candidates on the spot played the old trick of catching the Whigs bathing; while even the Conservatives in Edinburgh, traditionally anti-separatist, are now toying cautiously with schemes of Scottish independence, partly—it must be said—in the hope of confining schemes of industrial nationalisation to the southern side of the Border.

Claims of racial self-determination, as applied to Britain,

are difficult to take very seriously if pushed at all far. Any examination into them, supposing there to be an inquirer unemotional and thick-skinned enough for the task, must founder on the more or less unanswerable question of what constitutes a race for the purposes of self-government. What must be conceded to both Scotland and Wales, however, is a historical and a cultural tradition that is undeniably unique and distinctive from that of England. Cultural assimilation may have proceeded a long way, but it is not—nor will it be or should it be—anything like complete. The insufficient recognition of this fact, as applied to wireless broadcasting for instance, is a source of irritation in both countries. It is in the main a whole series of irritations over examples of what is regarded as London misrule—over Prestwick and the Forth Bridge in Scotland, over broadcasting and the Welsh ports in Wales—that has given much of the impetus to separatist schemes. Exactly what it is they want neither the Scots nor the Welsh really know—nor probably do they want the same thing. But in both cases a majority is probably agreed in wanting a greater say in its country's affairs coupled with less control from London.

Some administrative concessions have of course already been made. The renewed capacity of the United Kingdom for constitutional improvisation is shown within its own borders by the differing status possessed by Wales, Scotland, and Northern Ireland, which enjoy in ascending order a number of the attributes of domestic autonomy. Wales, at the bottom of the scale, has no more than a co-ordinating committee of senior civil servants plus an annual progress report in the form of a White Paper, and a special division at the Ministry of Education. The former is a recent concession. It is not much, but at least it is more recognition than is given for instance to Yorkshire, which has a much bigger population and no mean local patriotism. The Government also does its best, despite inconveniences in doing so, to keep Wales intact for purposes of regional administration.

Scotland has far more than Wales. Edinburgh houses four autonomous departments of State—those of Health, Education, Agriculture, and Home Affairs—which are responsible direct to the Secretary of State for Scotland in London, a Minister of Cabinet rank. Northern Ireland has more or less complete home rule. Its Parliament—a Commons of 52 members and a Senate of 26 members—can legislate on all domestic affairs except a few reserved matters such as the Post Office. Foreign relations, defence and all associated matters are explicitly reserved to the United Kingdom Parliament, to which Northern Ireland sends thirteen members. The main taxes—income tax and surtax, customs and excise—are also levied from London at the same rate as elsewhere, an agreed portion of the proceeds being retained as contribution to imperial services and the remainder being handed over to the Northern Ireland Government to use as it sees fit.

Taken together, these three countries have only the population of Greater London. Northern Ireland has little more than 1,250,000 residents, Wales 2,500,000, Scotland 5,000,000. It is historical circumstances that account for their special and varying treatment. Ulster was given autonomy in domestic matters as part of the general scheme for the pacification of Ireland, and for dealing with a deep internal cleavage in religion and politics. It is thus a special case. Again, Scotland has a better claim than Wales, both historically and pragmatically, to a measure of independence. England never absorbed Scotland by force of conquest, and the relations

between the two countries are still theoretically governed by the Act of Union of 1707. Scotland has its own system of law and of local government, necessitating separate legislation on many matters, which causes considerable choking of Parliamentary business. The Government's recent innovation, which permits all stages of a Scottish Bill up to the report stage to be handled by the Scottish Grand Committee, still cannot prevent an appreciable slice of Parliamentary time being spent on sketchy and ill-attended debates on Scottish Bills and Estimates. Again, Scotland is a compact and convenient unit of administration, which Wales emphatically is not. Finally, much of

Electoral Reform

Though Opposition charges of gerrymandering need not in this case be taken too seriously, it is certainly unfortunate that the Government should have chosen this particular moment to bring forward amendments to the Representation of the People Bill which depart from the recommendations laid down by the Boundary Commission. For whatever their merits, it will be difficult, after the obvious party bias shown in the abolition of the University seats and the representation of the City of London, to convince the public that they have been inspired by purely disinterested considerations. The effect of the amendments is to divide the eight constituencies with electorates exceeding 80,000 and to increase the representation of the large urban centres, Liverpool, Birmingham, Manchester, Sheffield, Leeds, Bradford and Bristol, thus enlarging the membership of the House originally proposed in the Bill by seventeen. The object of these changes, which were asked for by Mr Dalton in his speech on the second reading, is to close the gap between the size of the large and small constituencies and to give greater weight to the large industrial areas, which tend to have larger constituencies than the more sparsely populated rural districts.

It is difficult to quarrel seriously with the substance of these amendments—80,000 is quite as large as a constituency ought to be—it is the method and the timing of their introduction which is objectionable. If the findings of the Boundary Commission are to be amended arbitrarily by unilateral one-party action, and at a stage too late for any reference back to the Commission, the traditional method of arriving at constitutional changes where possible by agreement, which was so grossly violated by the abolition of the University seats, is once more seriously compromised. That fact does not make it easier to believe that it is a mere casual coincidence that the boroughs to be divided are today nearly all represented by Labour members, and that in all the large cities whose representation is to be enlarged by the amendments, Labour members are in a big majority.

Distribution by Persuasion

The more strident notes of party controversy were happily absent from the debate on manpower in the House of Commons last week, though it can scarcely be said to have contributed very greatly to the enlightenment of the public. The distribution of labour formed the main topic, the inspiration for which came from the Economic Survey, which compares actual manpower changes in 1947 with the estimates made in last year's survey and provides its own targets for 1948. The difference between production and accomplishment provided a natural talking point for the Opposition, which was pressed to its full value by Sir David Maxwell Fyfe, and the reply of the Minister of Labour was not very illuminating, though he made out as good a case as he could for the technique of persuasion, as opposed to direction, which he has abstemiously followed up till now.

The actual manpower changes during last year deserve some attention. Owing to the diminution of the numbers absorbed by the Services, the increase in civilian employment amounted to 611,000 as compared with an estimate of 278,000, but unfortunately the essential industries suffering the most conspicuous labour shortages did not profit by this increase. Agriculture, coal and textiles fell badly short of their targets by over 50,000, while other manufactures, distribution and consumers' services showed a large surplus on last year's estimates amounting to 123,000. Transport and shipping instead of being 3,000 lower were 54,000

Scotland is very remote from England, and the country's economy and communications focus naturally on Edinburgh and Glasgow. This is not true of Wales, which has not even a handy centre to act as capital.

Scotland, some way along the road to self-government already, occupies a key place in the general progress of political and administrative devolution in Great Britain. A further article will consider the Scottish problem in more detail. The answer to this problem, if there be one, may contain some lesson for Wales—and even for Yorkshire.

(To be concluded)

NOTES OF THE WEEK

higher, and employment in civilian government services, national and local, which was expected to show a decline of 80,000, actually showed an increase of 14,000. With these figures in mind, it is difficult to regard the manpower targets set for 1948 without a certain degree of scepticism, especially with regard to textiles, for which an increase of 108,000 is budgeted, and coal, which is put down for an increase of 32,000. Nor will the decrease of over 160,000 in building and civil engineering and 31,000 in distribution be altogether easy to accomplish. It is easy to understand why the Government are reluctant to use their powers of direction—and to applaud their reluctance. But the fact remains that unless much more vigorous steps are taken to reduce inflation, the time will come when it will be forced to choose between vigorous and unpopular direction and the abandonment of its manpower targets.

Co-operative Price-cutting

Nothing could be more symptomatic of the strange state of mind into which British business has fallen, over the last twenty years or so, with regard to prices, than the cries of dismayed accusation with which the retail trade has greeted the Co-operative movement's decision to put in force an all-round price reduction. This decision, according to the critics, is part of a deep-laid plot to impose on the country a state monopoly of retail trade (the minor differences between state and co-operative trading do not count). Alternatively, it is an attempt to bilk co-op members out of their dividend, and as such ranks virtually as fraud. (Touching solicitude!) Finally, it is a barefaced exploitation of the unfair advantage held by the Co-ops in virtue of their privileged tax status. On this last point, rational dissent is indeed possible. To its members the Co-op is no more a profit-producing institution than is the sharing of a taxi by two travellers or the joint purchase of a garden-roller by several neighbours; it is merely a means of sharing in the advantages of wholesale purchase. But to its competitors it is, quite genuinely and obviously, a trading firm like any other trading firm; and if the definition of profits, for tax purposes, is so drawn as to give the Co-ops, not merely in its membership but in its commercial activities, a differential advantage, then their sense of grievance is understandable.

The first two counts of the indictment, however, only make one wonder what are, after all, supposed to be the advantages of private enterprise. If it is more efficient, it should be able to cut prices with less discomfort than its lumbering and amateurish competitor. How loud would have been the sounds of triumph had private traders cut their prices, and the Co-ops declared themselves unable to do so. Its ability to give better value for money than any other system is, indeed, its one unanswerable justification and *raison d'être*. If the despised Co-op can not only give a dividend on purchases, but actually undersell the private shop as well, then private retailing is certainly in a bad way. Actually, there seems no particular reason to suppose that, where the Co-op leads, private trade cannot follow without catastrophe; the retailers' indignation is rather akin to that of the good unionist against the pacemaker, or of the properly and traditionally insubordinate classroom against the notorious teacher's pet—natural, but not to be taken very seriously as an indication of injuries received.

Which Capital for Germany?

Somewhere in the Russian Foreign Office there must be a department of choreography. In it are planned and rehearsed the gestures with which Sokolovsky, Gromyko and Vishinsky enter-

tain a diplomatic audience ranging from the ripe and unruffled Sir Alexander Cadogan to the younger and tougher General Clay. Last Saturday the Allied Control Council in Berlin were treated to a special performance of Marshal Sokolovsky's angry soldier act, his first set piece since the diatribe which preceded the meeting of the Foreign Ministers in December—a performance of which at the time he looked honourably ashamed.

The Marshal complained firstly of recent happenings in western Germany, on behalf of the Foreign Ministers of Poland, Czechoslovakia and Jugoslavia; and then he accused Britain, America and France of keeping secret the "decisions" taken at the "conference" which was held in London recently at ambassadorial level. The suitable retort was obvious: that there had been no conference, but only talks intended to produce recommendations and that many things had also been done unilaterally in the Russian zone about which the Control Council should have been told. At this point the Marshal in the chair declared the meeting adjourned, walked out of the room and left his western colleagues to look vainly for the vodka and caviare which it was his turn to provide.

The incident may or may not be significant. The Control Council is already moribund; it does everything but govern Germany; it is part of the fantastic circus which now represents the life of Berlin. Yet the Russians have again and again betrayed anxiety to keep it in being. Had they wished the opposite it would long ago have been easy for them, with their control of all the communications and approaches to Berlin, to make life there intolerable for their Allies.

As the western and eastern zones develop on the divergent lines which are now quite clearly marked, the British, Americans and French will have to decide how important it is for them to stay in Berlin. The question is not as easily answered as, for example, General Clay and Lord Pakenham seem to think. Both have said their troops will stay. But, in fact, without food, electricity, mails and means of movement to their own zones, neither troops nor office staffs would find it easy to stay. At what point then are the western representatives to defy the Russians to turn them out?

Already any movement of Germans out of the city is checked with the help of a "people's police." Traffic by lorry and cart is a fifth of what it was. Black market food, according to the correspondent of the *Manchester Guardian*, has never before been so scarce. The Berliners already believe that the Russian sector of the city will be absorbed into the Russian zone. It may become impossible for the three western sectors to work and live.

The reasons usually given for British and American determination to stay are three: prestige, the need to protect the free and flourishing political life of the western sectors, and the importance of keeping direct contact with the Russians. Yet there is something paradoxical in their determination to maintain the prestige of eastern Berlin while a new capital is being established in western Frankfurt. So long as the Control Council functions there, the eyes of all Germans are turned at regular intervals towards the Prussian capital. Is it the intention of Mr Bevin that this should continue indefinitely? One would like to think that he intended to guard a small island of freedom in Eastern Germany, while making every effort to create in the West the nucleus of a United Germany.

* * *

Good News from Frankfurt

Against the uncertainties of Berlin have to be set three recent pieces of good news. Firstly, British expenditure in Bizonia will fall this year by £54 million. As a result of the financial agreement reached in December with the Americans, the British share in the cost of importing food and goods drops from nearly £65 million to only £20½ million. Secondly, the weighted average of the ration for adults in the Ruhr and Hamburg is to be raised in April to 1,560 calories, or 1,460 for the normal consumer. Increased supplies are being imported and it should be possible to distribute the ration, which has been only about 1,300 calories for the normal consumer in industrial areas. Thirdly, there has been the decision to include German expert advisers—but no representatives—in the work of the Committee of European Economic Co-operation and its continuing organisation. This step forward in western neighbourliness is most welcome, because it will bring Germans into contact with the outside world, of which they are so ignorant, and relieve their growing sense of frustration and resentment.

But there is still urgent and fundamental work to be done on the problem of keeping Germany fed, if the roots of any plan for increasing industrial production are not to be choked. The black side of the German food picture is that improve-

ments have been at the expense of the "normal consumer." There has been some thinning of the unhappy ranks in this category, which consists of about one-third of the total rationed population, excluding the farmers. Those that remain—about 12 million souls—are even nearer starvation level than before, particularly in the industrial areas. Gross inequality in the standards of eating has been apparent in Germany at all times since the end of the war; it is now worse. The increased ration for April is a timely move towards redressing the balance, and will bring a little variety into German food. At present, with practically no fats, meat or fish, the wretched housewife has to try to cook a meal out of almost nothing but flour, potatoes and sugar.

This cause of grievance is largely due to the system whereby food imports are placed in a separate category from imports of goods for priming industry; eighty per cent of food imports, mostly high-calorie flour, is bought in America—in the Americans' own currency—with the proceeds of grants from Congress made "to prevent disease and unrest." Britain pays only for the imports from the sterling area. The proceeds of German exports are devoted to payment for imports of industry's raw materials, and no amount of arguing has yet induced the occupation authorities to allow any part of these earnings to be used for securing small quantities of butter which could be picked up in the Netherlands, Denmark or Sweden. The resentment of Germans is largely based on conviction that their food imports are in any case piling up a debt which they will have to pay, and that the Americans are trying to find a market for their own farmers' surpluses. There are, in fact, sound reasons for the Anglo-American policy—which is now chiefly the responsibility of the Americans—and a change would not do much to help the general food supply; but it is shortsighted to disregard the psychological fillip which the Germans would get from being allowed to shop abroad for themselves.

Alarums in the Baltic

In a few days there should be evidence of Russia's purpose in forcing on Finland a defence treaty which the military position of Finland does not require. Last Monday the Finnish delegation arrived in Moscow. On Russian insistence it has now been joined by the sick Premier, its original leader. Negotiations have started, and they should show whether the Russians are content to formalise their present relationship with appropriate ceremony, or whether they are bent on exacting such terms that all vestiges of Finland's limited independence must eventually disappear.

There is already striking evidence of the effect on Finland's neighbours, and further afield, of Mr Stalin's invitation to the Finns to become his allies. In his speech proposing conscription, Mr Truman referred specifically to Finland. This has been interpreted as a warning to the Russians that the limits beyond which they would not be permitted to step had been reached. But when military and geographical factors are considered, it seems likely to have been no more than a graphic illustration of the kind of event against which Americans must prepare.

The most remarkable hardening of opinion has occurred among Finland's closest neighbours. In Sweden the Foreign Minister has become less cautious and less ambiguous. His Premier, Mr Erlander, has declared war on the Communists at home. Every effort is to be made to oust them from their public offices and positions of authority: already they have lost control of the trade unions in the Lulea region, which has long been their stronghold. The Defence Minister is revising his estimates upwards—as are the Norwegians, who last week voted an extra 100 million kroner for defence.

The Norwegians, too, are intensifying the attack on their own Communists, whose leadership is splitting and whose membership is falling. But even so their power for harm should not be underestimated. Strikes and agitation are likely to increase here and throughout Scandinavia as a result of the Communist Party meeting in Oslo at the end of February.

Meanwhile, rumours of Russian pressure and Communist threats persist. One of the most damaging and mischievous—that Russia had demanded a military alliance with Norway—not only originated in London, but is being given authority by irresponsible repetition. The net result of all this is to be seen in the firm front and bold words of the Premiers of Denmark, Norway and Sweden when they met in Stockholm last week. It is difficult to believe that Russia could not foresee that the result of its actions would be to stiffen the Scandinavian states and to turn them westward.

The Cost of Sickness

While the doctors mark time belligerently on the roof of their citadel, and rumours abound about how Mr Bevan is wrestling with the problem of luring them out without signalling surrender, the civil estimates of expenditure for the coming financial year are based on the assumption that the National Health Service will come into operation promptly and on the full scale. There is cause for grave concern over the very sharp increase in the estimated cost of the service above the estimates originally given in the Financial Memorandum attached to the National Health Service Bill in March, 1946.

At that time it was reckoned that the total annual cost of the scheme falling on the Exchequer and the local authorities together for England and Wales would be £152 million, of which the two main items were £87 million for the hospital and specialist services and £45 million for the general practitioner services, including dentists and opticians. The new estimates, which are based on more realistic figures, are calculated only for the nine months from July, 1948, to March, 1949. Recalculated on a twelve-months' basis, they reveal that the cost of hospital and specialist services has now increased by 54 per cent from £87 million to £134 million, and that the cost of the general practitioner services has increased by 25 per cent from £45 million to £60 million, the total for the whole service being now about £218 million as against the earlier calculation of £154 million. These variations conceal some minor differences of calculation; for example, the cost of the local authority services was calculated at £12 million in the original 1946 estimate and appear at £4,000,000 now, but they give the rough order of magnitude of the change in costs which has taken place, and it is very large.

Until Mr Bevan comes to terms with the doctors, the actual salary bill will not be known, and the details of the agreement may well make the final sum even larger than the estimate. It is no use having a discontented service for the benefit of saving an extra hundred a year per doctor. But the very size of the bill may perhaps be an argument for moderation.

The Stokers' Minimum

An interesting and possibly portentous aspect of the now happily suspended strike of Ministry of Works boilermen is the choice of reasons to justify their claim to an extra 22s. a week. Partly, that claim rests on the familiar foundation of rising prices; £4 17s. a week is not regarded as a living wage. Whether the national economy can really support a national minimum—as this claim implies—of over £5 a week and at the same time provide over and above that minimum, the necessary incentive-producing differentials, is extremely questionable. In no other country in the world has the effective equalisation of earnings been pushed so far, and while it may still be possible to balance additions to some anomalously small incomes by subtractions from some anomalously large ones, this latter source is running dry far too soon for a general—or for that matter piecemeal—hoisting of minimum standards to be practicable.

But the rise in the cost of living is not the whole story. The really sinister item in the strikers' case was the impending burden to be laid on their incomes by the coming into force of the National Health Act. So far are they from regarding that service as "something for nothing"—or even as ninepence for fourpence—that the weekly contributions are simply looked upon as a net deduction from earnings, unmatched by any gain whatever, and calling therefore for a countervailing increase in wage rates. There could be no clearer illustration of the argument that high taxation has an essentially inflationary tendency. Given firmness on the part of the Ministry of Works, one may hope for an equally clear demonstration that tendencies are one thing and accomplished facts quite another.

There should be found in this affair, too, a moral for Mr Bevan. He has signally failed to sell one of his Acts to the doctors; it looks—if the boilermen's attitude is anything to go by—as if the general public, the supposed beneficiaries of another Act, also had the gravest doubts about the value offered. On the whole, however, it is less likely to be those specific values than the whole principle of payment for mutual benefits which is causing trouble. Security, it seems, is all very well; it is something to be voted for every time; but its price in hard cash is something else again. It is precisely on such points as this that the gulf yawns between the responsible and knowledgeable trade union leader—at least in his private thoughts—and the rank and file, who may be neither. There is evidently scope here for a good deal of rather painful popular education.

Contradictions for the Police

Just how does the Home Secretary propose to implement his own objective of increasing the size of the police force? Apparently only by waiting passively until the committee he has promised to set up ultimately reaches its conclusions. It is true that he has now promised to set up this committee as soon as possible, instead of, as originally intended, at the beginning of next year, but this was the limit of any positive action to which he would subscribe in his reply to a debate initiated by Lord Winterton in the House of Commons on Monday. Yet on the Minister's own showing the total police force is at only four-fifths of its required strength, and the deficit is at its worst in the large towns where crime is most prevalent and the profits of crime the most rewarding. And while Mr Ede sits and waits, how many holiday makers will find their empty houses burgled this Easter? The risks are quite great enough to act as a strong deterrent to going away. Can Mr Barnes and Mr Ede be acting in collusion?

Lord Winterton's attack must warm the hearts of all who are not devotees of promotion by seniority. He roundly attacked "the egregious report"* which gave no preference "to youth, brains and personality . . . over proved police ability," and advocated reasonable incentives to help all those who are now struggling to make up the deficiencies of men in police forces all over the country. In answer to this challenge Mr Ede replied that he too needed men with a sense of adventure, young and ambitious; but what young men of any vitality are going to come into a profession which is now comparatively badly paid and then wait years for promotion, because all his seniors must go up first?

The facts speak for themselves. The total establishment for all police forces in the country is 67,000; the present strength is 54,000 and the deficit 13,000. Of this deficit 5,000 is in London alone. These figures are an improvement on 1945, but there can be no doubt that in the Government's own definition the police are "undermanned." There is an obvious reluctance to raise wage rates now even when the present case is so good. But what possible objection can there be to holding the promised inquiry immediately? Mr Ede produced no justification for delay.

Success at Havana?

Last Wednesday, 57 nations signed the charter for an International Trade Organisation at Havana. Only Argentina, who had objected to 30 of its 100 articles, abstained. The rest, with appropriate speech-making and large gestures of goodwill, heralded the charter as a momentous step towards a saner and healthier world. It may well be such a step, but, until the paper schemes are put to a practical working test, it would be rash to forecast the success or failure of the charter. If it is successful, then it will bring order into the jungle of international trade—and that would indeed be a momentous achievement.

Three years of patient and protracted negotiations have gone into the making of what is in effect a Trade Treaty between 57 different countries with 57 different interests. The last stages during the past four months at Havana often seemed to be near the breaking point, but the will to agree carried the negotiators through. At one stage it was said that the charter contained five articles and fifty-five escape clauses. This is no longer true, and, behind the extraordinary jargon of the charter, the solid and worthy intentions of its framers can be dimly discerned.

The charter has suffered many changes during its gestation, but some articles have survived the endless discussions in more or less their original shape. The general objective of the signatories—to bring order into world trade—has not been altered. Nor have the articles on employment, state trading, cartels, commodities and the technique of working the organisation suffered. But where the nations did disagree—notably on the questions of export subsidies, voting procedure in the Executive Council, non-discrimination, preferential tariffs and protective import quotas—they disagreed violently. Inevitably some peculiar compromises resulted, but the escape clauses which had to be devised were all given definite limits and the aim of ordered, multilateral trade was kept in view.

The charter now goes to each of the governments to be ratified, and the organisation will not be properly constituted until at least half the governments have sent in their "acceptances." Much depends on the United States which, in order to ratify its part, will have to pass new legislation, which, owing to the presidential elections, is unlikely to be completed before June next year. As

* Cmd. 7156. Report of the Commissioner of Police for the Metropolis, 1946. Is. 6d.

many countries will wait for the United States' acceptance, the organisation will probably not begin working until 1949. Meanwhile, an Interim Commission has already been set up and they are to begin work immediately, choosing their staff and a home in which to work. Their first meetings have been in Havana, but they are shortly moving to Geneva where the organisation may eventually be housed.

* * *

British Losses and Gains

From Britain's point of view it is difficult to say yet what has been lost or gained. The Government maintain that they have not had to make any important concessions, and, obviously, as the country with the largest foreign trade in the world, Britain must benefit in the long run from a system which enforces multi-lateral trade. But the prospects for the immediate future are far from clear.

There were five questions in the charter negotiations which directly affected Britain—imperial preference, the voting procedure of the Executive Council, non-discrimination, preferential tariffs in other countries and protective import quotas. Each of these five questions has been covered by complicated and almost unintelligible compromise clauses.

Imperial preferences seem to have been left untouched, but Britain has agreed to reduce their range by negotiation later. On the question of voting procedure, Britain originally sought—as was right—to weigh each country's vote according to the economic importance of that country. Now, Britain has agreed to the principle of one state, one vote, gaining only a decision to have eight permanent members, of whom Britain will almost certainly be one, out of an Executive Council of 18. Non-discrimination has also been accepted, but there, indeed, the escape clauses are so numerous that Britain should not suffer.

On the question of new preferences by other countries, the negotiators compromised by allowing what are called "underdeveloped" countries—notably the Arab states and Latin America—to set up new preferences where this was necessary for internal development. The prior approval of the organisation was required, but, subject to certain rules, this approval was guaranteed. Britain might have suffered considerably under this article, but an "interpretative note" was inserted which said that the definition of an underdeveloped economic region did not mean that the areas concerned had to be contiguous, if there was a sufficient degree of economic integration. This can mean, in effect, that Britain and its West African colonies could be regarded as an "underdeveloped economic region." Similar safeguards and compromises were devised for protective import quotas which, on the whole, show no great disadvantage to Britain.

Generally, then, signing the charter should not harm—may even benefit—Britain during the first few years. But schemes or treaties are useless unless the individuals concerned are willing to make them work. A charter as complex as the International Trade Organisation could easily be wrecked by evasion. It remains to be seen whether this one will go the way of other charters, or whether it will be, in the words of the American delegate, Mr Clayton: "the greatest step in history . . . towards a great expansion in the production, distribution and consumption of goods in the world."

* * *

Right and Wrong About Czechoslovakia

Mr Trygve Lie must often regret the zeal and irresponsibility of some of his minor masters. Chile's decision to ask for an inquiry into Russia's part in the Czech *coup d'état* is a notable example of the misuse of international machinery. To judge by evidence given so far, such an inquiry will establish nothing, and it will make the major Powers look silly. Moreover, it will encourage the already widespread tendency to miss the whole point of the fifth-column technique, which is that the part played in it by a great Power can be and is covert. So long as it remains covert, this form of attack can be challenged and met by other Powers only with the greatest difficulty. The answer to it is to trick or force the offender into the open, where he can be dealt with by the new or the traditional diplomatic methods. But this is outside the rules and scope of Uno.

A month after the Gottwald revolution it is encouraging to see with what unanimity the western nations have formed their estimate of how and why it was achieved. And now is perhaps the right moment to say a word in defence of the correspondents who covered the events in Prague. During the first few days of the crisis, and for a time after it was over, there was some disposition to question their accuracy and their judgment. Minds which should have recognised evil when they saw it wobbled sadly; the

old plea was heard that in a revolutionary situation much must be forgiven. In other words, there were some who wanted to disbelieve what the correspondents of the French, Swiss, Scandinavian, American and British press agreed to be the accurate general picture of the Gottwald revolution. Visits have since been made to check this picture; impressions formed in a few days have been compared with those formed over months and years by journalists who reported the Spanish civil war, the Nazi revolution, the world war, and the events of the last two years in eastern Europe. There are few things more humiliating to the resident correspondent than the hasty check-up by visitors who "look in"; and it is time that some of these visitors specifically said or wrote that the judgment of experienced resident correspondents had been confirmed and vindicated.

* * *

Soviet Socialist Rumania

Since last autumn Rumania has in fact been ruled by a Communist dictatorship, but it is only in this month that the regime has passed formally to what the Communists call the "monolithic" stage. The government coalition has now been renamed "People's Democratic Front," and is a single monopoly organisation, with a single programme and a centralised well-disciplined hierarchy. Within it three groups nominally still exist—Workers' Unity Party, Ploughmen's Front and National Popular Party. The first is by far the most important. Like the party with a similar name in the Soviet zone of Germany, it is a Communist party which has taken over the local organisations of the Socialist Party, and given a few "reliable" Socialist leaders some purely decorative positions in its central committee. The Ploughmen's Front and the National Popular Front have long been no more than rural and urban camouflage organisations for "mobilising the peasant and progressive petty bourgeois masses" behind the leadership of the "revolutionary vanguard."

The Front is firmly controlled by the Communists, and within the Communist Party control by Moscow-trained personnel has lately been tightened up. Patrascanu, who represented the Communist Party in the first postwar cabinets, and has for three years held the Ministry of Justice, has recently had to resign, as he has been found guilty of "bourgeois deviations." The truth is that he is a man of intellectual integrity who has never lived in the Soviet Union, has thoroughly studied Rumania's past and present social problems, and fought and suffered all his life for Communism because it meant to him the social rebirth of his own country, not the geographical extension of Russian imperialism. There is no room for such people in the "People's Republic" of Anna Pauker and Emil Bodmarash.

Russian domination is well illustrated by the draft Constitution published last week in Bucharest, which is a close copy of the Soviet Constitution. As Rumania is not a "federal" state there is not, as in the USSR, a second chamber representing the nationalities. Otherwise the institutions—Assembly, Presidium, pyramid of "Councils" (Soviets), Public Prosecutor, etc.—are a mechanical imitation of those of Russia. When the time comes to move one stage further, and to give satisfaction to the spontaneous desire of the broad popular masses for incorporation in the fatherland of Socialism, the task of modifying Rumania's institutions will not be heavy.

* * *

Socinform at Last?

International Socialism took two decisive steps at the conferences last weekend in London and Surrey. The first was to recognise the reality of divided Europe by expelling the Czech Socialists from the Socialist fold and by placing the Polish and Italian Nenni-Socialists "on probation."

For some time past the Socialist parties in Western Europe, especially in Holland and France, have been urging the Labour Party to take a clear stand against Mr Zhdanov's Cominform and openly to declare the impossibility of Socialist-Communist co-operation. The British Socialists held back until the Communist coup in Prague, for they continued to hope that some sort of working arrangement between East and West might still be maintained. Now, however, they have overcome their hesitation and last weekend they went along with the other Western Socialists in virtually excommunicating any Socialist Party that seeks to work with the Communists. The Nenni-Socialists responded to this sentence by marching out of the meeting. The Poles and the Czechs would no doubt have responded in the same way, had they been present to do so. Unfortunately for Britain's good name, owing to the unwillingness of British security officials to grant them visas in time, they could not attend to hear their case decided.

The other decision follows logically from the first. If East and West are divided, it is all the more necessary to consolidate what is left of free Europe. The Socialist parties have therefore decided to place themselves in the vanguard of the movement for Union in the West and the French Socialists have agreed to call a conference in Paris on April 25th to discuss the contribution European Socialism can make to European unity. Individual Socialists are free to attend other conferences on the same subject—for instance, Mr Churchill's conference at the Hague—but officially, European Socialism will not be represented.

* * *

Farm Prices—No Change

The Ministry of Agriculture and the National Farmers' Union have played a drawn game in the annual review of agricultural prices which has just been completed. The Government has confirmed the increased scale of guaranteed prices for crops from this year's and next year's harvest, and for livestock products for the period up to March 31, 1949, which it introduced in August of last year. No prices are to be raised and none lowered. A further review of suspected anomalies in milk and potato prices is to take place, but it is not to result in increased payments for these commodities.

This result is hardly surprising. After raising prices of guaranteed commodities by an average of about 15 per cent last year, and after urging strongly this year that the general price level should be stabilised and where possible reduced, the Government would put itself in an absurd position if it now proceeded to pay the farmers any more. As it is, there is the nasty problem of making the consumer pay a further £75 million a year for home-produced food without thereby adding to inflationary trends.

Equally, however, it would be very difficult, and would lay the Government open to charges of bad faith, to reduce the prices this year. Voluntarily and of set purpose, the Government permitted a large price increase last August with the intention of imparting confidence and stimulating output. It may now be regretting that it instituted, in the case of agriculture, a policy which appears to run counter to its more recent, and much better, concept of economic planning. But it is useless to repine. Having expressly linked the new price schedule with the four-year agricultural expansion programme, the Government could not drop the one without ruining the other.

The test of Government policy will come in subsequent years. It is only gradually, in the case of agriculture, that the Cripps era can rectify the mistakes of the Dalton era.

* * *

Government and Party

In some ways it is a pity that East Lewisham has decided to withdraw its resolution for the Labour Party conference, urging that party decisions should be binding on the Government. It would certainly have provided a good topic for debate and would have helped to clear the air, although if it were carried, it would naturally cause considerable embarrassment to the party leaders, especially to Mr Herbert Morrison, as Member for the division. The question of the relations between Government and party, however, will certainly come up at the conference. Some local parties are indignant that the conference decisions taken last year on equal pay and the abolition of the tied cottage have not been implemented, and both these subjects are again raised in resolutions.

The issue, however much the party organisations may wish to disguise it, is quite simple. Clearly the Government has got to govern, and while it can work along the lines and towards the aims laid down by the party conference, it would obviously be out of the question for it to be bound by a time-table or a detailed programme of action. The nationalisation of iron and steel is a case in point. While this is one of the major planks in Labour's election programme, the Government, in spite of considerable pressure from the Left, has not allowed itself to be rushed.

Even without the Lewisham resolution, however, there should be plenty of controversy at the Whitsun conference. Unlike former years, criticisms are directed against the Government's economic policy rather than its foreign policy and Mr Bevin, who is supported in a resolution by the miners, should have a comparatively smooth passage. The longest and most detailed criticism of foreign policy emanates, naturally enough, from Gateshead, Mr Zilliacus's constituency. But to judge by the preliminary agenda the opposition to the White Paper on personal incomes will be strong and the demand for stricter control over profits and prices before any wage limitation is sought will be

very insistent. Indeed, if the Budget fails to satisfy Labour opinion that burdens are falling on employers as well as on workers, Sir Stafford Cripps will be faced with combined opposition from constituency parties and from many trade unions. The general line of criticism advanced by parties is that the Government is not moving far enough or fast enough towards Socialism. But with North Croydon in their minds and with the fear of alienating middle-class voters in marginal constituencies, the Labour leaders are hardly likely to alter their course.

* * *

What to Publicise?

It may have been eminently sensible, from the point of view of the Cabinet's internal arrangements, for the Under-Secretary of State for Commonwealth Relations to reply to an adjournment debate on the Government's home publicity, but to the outsider it looks rank crazy. The criss-cross organisation of the Government's publicity organs is already complicated enough: Mr Gordon Walker's admission, however, that Mr Morrison had asked him some months ago to "look into" the Central Office of Information only makes the pattern still more involved. This is no reflection on Mr Gordon Walker nor on the need to look into things. It only serves to accentuate the curiousness of what is happening now.

As things stand, each major department has its own Information or Public Relations Division, which deals directly with the public, the press and the BBC. The Central Office of Information acts as the agent for any of these departments, when it comes to more technical matters involving the production of films, exhibitions, books and posters; it is one of the galaxy of small departments attached to the Lord President's coat-tails, and in this way he may be assumed to have a considerable direct influence on the machinery of publicity. On policy his influence is exercised elsewhere. The Government's public relations are co-ordinated by four committees, two ministerial and two official for home and foreign affairs respectively. The official committees consist entirely of the heads of information departments in the Ministries, with the Director-General of the COI in the chair. Mr Morrison is chairman of the Ministerial Committee for domestic matters; Mr Mayhew regularly deputises for Mr Bevin on the overseas Ministerial Committee. To add to these involutions Mr S. C. Leslie is at the head of the Economic Information Unit and is responsible to Sir Stafford Cripps.

In considering the Government's public relations policy it is useful to have this background, for against it can be set the large increase in expenditure included in the Civil Estimates for 1948-49 for the COI. Next year the COI will be spending £4,500,000 which is some £870,000 more than the estimate for 1947-48 and many times as much as was spent on Government publicity before the war. To the current figure should be added expenditure by individual departments amounting (according to Mr Boyd-Carpenter) to nearly £3,000,000.

Such an obvious target is fair game for the Opposition, and Mr Boyd-Carpenter made much of it in moving the adjournment. There is unfortunately no hard and fast rule about what is information and what is propaganda. On the one hand the Government has been exhorted to tell the public the facts about the economic situation, and this it has recently set about doing in a much more realistic and successful fashion. On the other hand, the Opposition will always criticise the Government for any publication like the technically excellent production of "Something Done," which is an admirable example of "Talk Success" but evades all the awkward questions. Criticism of Government publicity can never be avoided, but it might be a good maxim to leave to Transport House or the Central Offices matters on which more than half the facts have to be suppressed.

The New Indonesia

On March 9th an "Interim Government" of an Indonesian federation was set up in Batavia with Dr Van Mook as President; of its sixteen members nine are Dutch and the rest Indonesians. Nine *negaras* or autonomous states have been formed with Dutch encouragement in the parts of Indonesia now under Dutch military control. This Government is charged with the task of bringing into existence the United States of Indonesia (USI), which it is hoped to have ready by the beginning of 1949. Outside the federation so far is the Indonesian Republic itself and the parts of Java and Sumatra which its forces still control. The Dutch have invited it to participate in the Interim Government as one of the *negaras* constituting the federation and have reserved four ministries for its representatives, but the Republic has not yet agreed to come in.

The formation of the Interim Government followed the conclusion in January of a new Dutch-Republican military truce under the auspices of the good offices committee of Uno—a body of representatives of the United States, Belgium and of Australia, charged by the Security Council with putting a stop to the fighting in Java. By this truce the Republic agreed to withdraw its forces operating behind the Dutch lines, while the Dutch undertook not to encroach further on Republican-held territory without authorisation from the Security Council. Although the agreement certainly gives the Republic a measure of international protection for the territory which is left to it, it is much more to the advantage of the Dutch, who now have undisputed control of the areas captured in their "police action" last year and can proceed to their economic rehabilitation without interference. The general situation in Indonesia has now indeed turned definitely in favour of the Dutch, who hold in combination with more or less willing local Indonesian political leaders, enough of the archipelago to sustain a large-scale political and economic structure without dependence on the territory remaining under the rule of Jogjakarta.

Encouraging the Tourist

In spite of the difficulty of the times, the President of the Board of Trade is making a valiant effort to dispose, once and for all, of the charge of inhospitality once brought by the poet Horace against the inhabitants of this island. Clothing vouchers and petrol are among the inducements to be offered to the foreign visitor, and the citizen deprived of his basic ration may very well envy the comparative abundance offered to his guests, though in fact the allowance may seem rather a mean affair to the visitor from the western hemisphere. Nor is the Olympic victor (or vanquished) to be confined to the classical wreath of olive leaves, for he, too, is to be given an allowance of clothing coupons.

This policy of relaxing the domestic standards of austerity in favour of the foreign tourist is undoubtedly wise, and the government may be congratulated on their foresight in discounting in advance any grumbles on the part of indignant members of the public which may be evoked by the sight of foreigners enjoying facilities of which they are deprived. After the immense reduction in the nation's income from overseas investment brought about by the war, it is more than ever necessary to build up any item which

will figure as an asset on the invisible section of the balance sheet. Tourism, which in this country has hitherto been rather a neglected industry, affords the readiest opportunity, and it is to be hoped that the facilities just granted to British tourists for visiting Europe will find their counterpart in a welcome stream of visitors to these shores.

The Cosmetics Case

On Monday the Court of Criminal Appeal delivered its judgment in the prosecution that has come to be known as the Cosmetics Case. It allowed the appeal of the remaining defendants (the decision to allow the appeal of Mr Weitzman, M.P., was announced earlier), with the result that the original convictions against all the defendants have now been quashed.

The original case was involved. In substance the prosecution alleged that the defendants, as the men responsible for running a business making toilet preparations, had during the war obtained raw materials and manufacturing licences in excess of their proper quotas by supplying false information to the Board of Trade. The importance of the Appeal Court's decision, in its wider application, is that it is likely to check a practice which had been growing up of late, by which a prosecution in complex criminal cases charges all the defendants with a "criminal conspiracy," as a kind of blanket charge additional to and in support of all the detailed individual offences that are alleged.

It is easy to allege a "criminal conspiracy," and difficult to disprove it for the simple reason that it is difficult to define it. It has always been a principle of English criminal law that a man charged shall be told exactly with what offence he is charged. It may be theft, forgery or obtaining money by false pretences. In each of those offences, it is for the prosecution to say, and prove, what was stolen or forged and when, in detail and with precision. A general charge of criminal conspiracy does not lend itself to precision. It may be a convenient weapon for the prosecution. It can also make it very difficult for an innocent man to defend himself, because he may not be able to tell in advance what evidence he must produce to rebut the allegations made against him. No one can fence with a fog. This principle has wider application than to cases involving toilet preparations. The time for its re-affirmation for the Court of Criminal Appeal could not have been more opportune.

Letters to the Editor

For the Peace of Jerusalem

SIR,—I have just received *The Economist* of February 14th. Having been in Palestine for most of twelve eventful months, and as a subscriber who pays tribute to your high standards of accuracy and realism, it came as a surprise to observe the extent to which the fundamental realities of the situation in Palestine, particularly as it affects Jerusalem, are obscured in this article.

I do not suppose there is any Briton now in Palestine from the High Commissioner downwards, whether a "good Christian" or not, whose greatest concern over the political situation is not a fear lest the Holy City become even more a scene of violence than it has been of recent weeks. I can assure you that amongst British in Palestine the solution advocated—namely, retention of a force of British police after May 15th—has not gone unchallenged. But the question is would this help? The purpose must be one of two alternatives—either to keep peace and order on behalf of the majority of citizens (who undoubtedly desire it), or else to institute a defensive crusade, as it were, on behalf of Christendom.

To take the first of these alternative premises. We must ask ourselves whether an unsupported force of "alien" police could possibly succeed where a combined force, supported by well-equipped armed units of the British Army, has already failed in spite of constant vigilance and the measures taken by the Arab and Jewish communities themselves for their own protection? The answer to this must be self-evident; they could not. If, alternatively, something in the nature of a "crusade" is desired, it must be clear that this would defeat its own purpose by its implied challenge to those of the Moslem and Jewish faiths. Such a concept could lead only to conflict, as much to be avoided as it would be deplored, between representatives of the Christian faith, on the one hand, and Moslems and Jews on the other.

The position is simply, that if Moslems and Jews were able, under the stress of present conditions, to subordinate deep convictions or strong political opinions to their acknowledged zeal for Jerusalem, then there would be no need for a force to keep the peace. This is, indeed, the crux of the whole matter; without Arab and Jewish political agreement to regard Jerusalem as an open city the efforts of others are doomed to failure. All will agree it is a thousand pities that this small measure of agreement can evidently not be obtained.

In conclusion please allow me to draw attention to two inaccuracies in the article in question which are by no means unimportant. In a later part of the article reference is made to a move by the British Mayor of Jerusalem—in reality "Chairman of the Municipal Commission," the Mayoralty having been in abeyance for some years. This gentleman is indeed doing all that a man in his position can to further the cause of peace in Jerusalem, but it is commonly known that organisation of a Municipal Police Force for each community in Jerusalem is but part of a wider scheme which has been set on foot by the Government and fostered in all municipal areas, to be used to the fullest extent that the people themselves are willing and able.

Secondly, credit is given to the Zionists for deciding that the capital of the projected Jewish state should not be in Jerusalem. It should be known as a not unimportant factor in the depth of political feeling on both sides, that at least one responsible Jewish leader has publicly declared (since the UN Assembly decision) that no Jewish state would be worthy of the name unless the capital were in Jerusalem.

Further, in the light of the suggestion that Britain had made a "poor showing" in not taking the lead, let us not forget that we did lay down the mandate for the whole of the Holy Land and that the United Nations General Assembly did, by their Resolution at the end of last year, accept responsibility. That so little progress has been made "for the peace of Jerusalem" is indeed a matter for concern, but scarcely Britain's fault.—Yours faithfully, SISYPHUS

The Doctors Declare War

SIR,—I would be grateful if you would allow me to refute a misrepresentation which appears in your Note of March 20th.

You assert that the doctors have bit by bit "retreated from the proposals put forward by their own Planning Commission in

1942." May I point out that the Medical Planning Commission was established by the British Medical Association with the co-operation of various other bodies, and that the members of the Commission took part in its work as individuals. It issued a Draft Interim Report only for consideration, and it declared in this Draft Report that the bodies appointing to the Commission were in no way committed by this Report.

The recommendations in the Report are governed by a paragraph on page 5 which I quote:—

The suggestions contained in the present report should not, therefore, be regarded as expressing the Commission's conclusions but as recommendations made to it which the Commission as a whole has not yet considered and will not consider until the profession has made known its views through the usual channels.

—Yours faithfully, J. ARTHUR GORSKY,

Representative, Westminster and Holborn Division, BMA
60 Palace Gardens Terrace, London, W.8

Limited Dividends and Nationalisation

SIR,—The Chancellor of the Exchequer on February 12th wrote to the Federation of British Industries, asking them to study ways and means of "obtaining a reduction of prices and to face the consequence of this on the level of profits."

The natural consequences of such measures obviously is to reduce in terms of Stock Exchange values the capitalisation of those companies who accept the exhortation of the Chancellor, since reduction in dividends would affect the equity value of the companies. This week, the ex-Chancellor of the Exchequer, Mr Dalton, said: "The iron and steel industry is too important to national life to leave it in private hands . . . the Government has pledged that nationalisation would be accomplished in the lifetime of this Parliament."

So at a time when the Chancellor of the Exchequer is deliberately depressing market values as a whole, and at the same time asking the nation for unity of effort in face of current difficulties, the ex-Chancellor is reiterating the Government's intention to nationalise an all-important section of industry. As the basis for compensation will presumably be Stock Exchange values, it would seem that the investing public will be placed at a disadvantage as a result of the "patriotic" response the directors of companies have made to Sir Stafford Cripps's appeal. Of course, if there is a gentleman's agreement that the self-denial of shareholders shall be matched by a self-denial of further nationalisation projects by the Government, this situation would not arise, and indeed the appeals for unity would have reality.

On the other hand, shareholders would have very reasonable grounds for resenting any such arrangement without an assurance that an agreement does in fact exist.—Yours faithfully,

32 Davies Street, London, W.1

BERNARD DOCKER

"Can It Happen Here?"

SIR,—Your very sane editorial, "Can it Happen Here?" underlines the fact that the chief enemies of democracy today are not those who attack democracy, but those who take democracy for granted. The spread of Communism cannot be stalled—at any rate for long—by purely defensive measures; it can only be forestalled, by measures that might be called offensive and an infringement of freedom of thought, were it not that freedom of thought and democracy were really inseparable.

One such measure that is long overdue is the introduction, into the curriculum of all our secondary schools, of an elementary course in political theory. "The crude successes of Communist propaganda," as you say, "would not survive a little clear thinking." As a former schoolmaster, I can testify to the fact that clear thinking on political theory is not beyond the capacity of most boys and girls: yet they are seldom stimulated to any; and to the best of my knowledge there does not exist a single textbook on the subject suitable for use with fifteen- and sixteen-year-olds.

It is surely time this gap was filled. Initiation into the "idea" of parliamentary democracy ought, as Rousseau contended, to form the climax of the educational syllabus.—Yours faithfully,

3 Blackstock Road, London, N.4

No clothes are too old

So desperate is the plight of war-victims in Western Europe that even the oldest footwear and clothing is welcome (moth-free and clean, of course, but not necessarily mended as D.P.'s sadly need work). Also needed are soap; uniforms (which will be dyed), blackouts, bedding, mending materials and scraps of leather, wool, cloth; and sheeting, towelling, etc., for baby napkins (instead of newspapers used in British Zone). Each parcel to "EconRelief," 17 Broad Street, Oxford (stating sender's address) will be acknowledged by Lady Franks.

OXFORD COMMITTEE FOR FAMINE RELIEF

(Registered War Charities, 1940.)

By sound enterprise (D.V.) we make your £10 produce £100 in food (not reducing rations or dollars), medical supplies or clothing, etc. (entrusted mainly to Quakers). £65,000 produced in 2 years. Cheques to "EconRelief," Barclays, 92 High Street, Oxford. Sir Alan Pim acknowledges.

Supporters include Lords Halifax, Beveridge, Lindsay and Pakenham, Professor Gilbert Murray, O.M., Misses Margery Fry, Barbara Ward, and Sir Arthur Salter, M.P.

Books and Publications

Indictment of Slavery

"Forced Labour in Soviet Russia." By David J. Dallin and Boris I. Nicolaevsky. London, Hollis and Carter. 331 pages. 25s. net.

THE authors of this book, two Russian Menshevik writers, present a well-documented indictment of Stalin's Government on the ground of the vast use which it has been making of forced labour. The book abounds in hair-raising descriptions of Soviet labour camps, drawn from many sources. Private information derived from ex-inmates of these camps suggests that some of the descriptions, which are quoted by the Menshevik authors and emanate from Poles and Balts, are not free from propagandist exaggerations. But if the exaggerations are discounted, the authentic truth about forced labour in Russia and the murderous practices of the GPU is so horrible that it is surpassed only by the sadistic insanity of the Nazi terror. The difference between the Hitlerite and the Stalinist concentration camps is that, whereas in the former, millions of men, women and children were deliberately and scientifically exterminated, in the latter millions of "enemies of the people" have been subject to ruthless economic exploitation under conditions of extreme misery and degradation, which result in a horrifying waste of human life. The authors of the book hold that slave labour has become so important an element in Soviet economy that its abolition can be achieved only by a radical change of the whole political system.

The most interesting chapter of the book is the one in which the authors give a very scholarly and well-written account of the evolution of Soviet legal ideas and practices, from the most humanitarian reforms of the early years of the Soviets to the mammoth concentration camps of the present.

This conflict [say Messrs Dallin and Nicolaevsky] between the lofty ideals and the reality of the post-revolutionary decade marks the ideological evolution of Russian Communism. There is no other domain of political activity in which a retrogressive development—from the highest peak of humanitarian idealism to the lowest methods of coercion—is as clearly discernible as in the field of Russian justice and law, crime and forced labour.

The explanation of this "retrogressive development," which the authors offer, is perhaps not quite satisfactory. As Russian patriots, they are somewhat indignant about the suggestion that the early humanitarian strivings of the old Bolsheviks were defeated by natively Russian custom and tradition. What the authors seem to forget is that forced labour, in the form of serfdom, persisted in Russia, as the basic and common mode of production, until late in the nineteenth century.

In Defence of Laval

"The Unpublished Diary of Pierre Laval." The Falcon Press, 12s. 6d. 217 pages, 1948. "Pourquoi je n'ai pas défendu Pierre Laval." Albert Naud. Librairie Arthème Fayard, 1948. 180 Frs.

THESE two books should be read together: the first is a statement by Laval of his own case, boiling with self-righteousness; the second is an account by the distinguished lawyer instructed to defend him of why the case could never be pleaded.

Laval's book leaves the reader astounded by the curious combination of earthy cunning and ingenuous self-confidence. There is no reason to doubt that Laval sincerely believed that a defeated France could negotiate with a victorious Germany and that he was the man for the job. If one accepts the assumption that negotiations were possible, and recalls Laval's profound pacifism, which he shared with an impressive proportion of his generation of Frenchmen, then the whole course of his career, including his violent death, follows with the logic of a Greek tragedy.

Unlike most of his lamentable predecessors before the High Court of Justice, he makes no pretence of a "double game" or secret understandings with the allies. He recognises no loyalties to Britain and dismisses pleas of revulsion at negotiating with Hitler as irrelevant "ideology." He cannot understand why he has provoked such indignation by what he calls "serving my country by day-to-day negotiations."

Maitre Naud's book is the most formidable indictment yet penned against the French High Court and the travesty of justice by an undisguisedly political tribunal. Maitre Naud shows how every step—the abrupt suspension of the preliminary investigations; the hustled trial; the gruesome execution of the half-dead Laval after Herculean efforts to pump the poison out of him—was

dictated by electoral considerations with their date-line of October 21, 1945.

The story of the Laval trial is certainly among the blackest pages of French judicial history. It would have been too much to expect a jury of politicians, who had fought in the resistance movement and were now vying with each other for the reputation of being "*pur et dur*," to display even an appearance of objectivity. Two incidents stand out in this book, which is both passionate and compelling, but makes no attempt to cover the despicable character of its central figure. The first is the statement made at the opening session by the presiding judge informing the court, that, however long the sessions might be, the trial must end before election day. The second is a remark made by a jurymen to the accused, also on the first day: "In fifteen days from now you'll be less cocky." Twelve days later Laval was dead. The tricotouse tradition lives on.

Dominions and Democracy

"Democracy in the Dominions." By Alexander Brady. Oxford University Press. 439 pages. 21s.

THIS thorough, yet lively, account of the planting and growth of the British type of government in four regions of the earth—Canada, Australia, New Zealand and South Africa—is an important contribution to our knowledge of these Dominions and of the British type of democratic government. Not only do we have outlined for us the history of these Dominions' parliamentary institutions, but also the essential features of the geographical, economic and social framework within which the institutions function. The result is a picture of new countries adopting as the basis of their government the systems which an old mother country has evolved for herself over centuries, and using those systems to answer the problems raised in communities where the dominant influences are those of the frontier, of racial differences, and of social equality.

It is not surprising that there are strong resemblances in the forms of government adopted by each Dominion, since they spring from a common source; and it is no more surprising that there are some important differences in the political philosophies underlying government, for these are strongly swayed by circumstances peculiar to each Dominion. Professor Brady shows this clearly. In Canada the French population influenced the development of federalism in contrast with its development in Australia, where no racial problem existed; but more potent influences on the political philosophies of these two Dominions were the existence of small farms in Canada and large holdings in Australia, and the fact that Canada shares a continent with an extremely important neighbour, while Australia occupies a whole continent in relative isolation. New Zealand democracy closely resembles that of Australia, with its tradition of direct State participation in many spheres which in other countries

From The Economist of 1848

March 25, 1848.

It is plain, then, that capital is necessary; that where capital is to be created and maintained, it must receive a share of the produce of industry; and, further, that its possessors may dispense with physical toil, if they are satisfied with their respective shares, which their possession of it produces. This is not less true with respect to the communist scheme. Let the capital be the property of the community; it must be maintained, nay, increased, if the community increases. The motive for maintaining it, operating on individual members of the community, must be the return they expect from it. To suppose that this motive will operate equally on all, is to suppose, against all experience, that all men are equally disposed, and able, to exercise thrift and forethought. If those, who do exercise these qualities, only share the return of capital equally with those who do not, there will soon be an *uniformity of improvidence*. If, on the other hand, those, who maintain and add to the capital of the community, alone are to share in that portion of the general produce of industry, allotted to capital, there will then be, as now, members of the community who can dispense with physical toil; and, moreover, the most perfect artificial rule of distribution among them, which can now be planned, will only approach to that, which now actually takes effect.

are the province of private enterprise or semi-public corporations. South African democracy appears in sharp contrast with that of the other three Dominions, for among the white population the conflicts of nationality have not yet disappeared, and there is ever present the enormous fact of the social, economic and political differences between the white and coloured races.

One cannot but reflect, after reading this book, that a severe testing time lies ahead, not only for South African democracy, but for British democracy as a whole; and that the question which, Professor Brady suggests, will be easier to answer in twenty-five years' time—whether the Dominions have successfully reconciled parliamentary democracy and modern collectivism—may by then have been overshadowed by more urgent and momentous external questions posed by the inexorable trend of events in the rest of the world.

Ethiopian Survey

"The Government of Ethiopia." By Margery Perham. Faber and Faber. 481 pages. 30s.

THIS is a survey of the history, politics, religion, economics, past and present administration, and future prospects of the country which, until the Emperor decreed official use of the name Ethiopia, was often known as Abyssinia. Early in the war Miss Perham helped to prepare a private report on Ethiopia for Chatham House. Fired by the experience, she claims only that she wrote the present book on the basis of links with her subject for twenty years and the assistance of several distinguished collaborators, notably Mr Frank de Halpert, who was appointed official adviser to the Ethiopian Ministry of the Interior in 1930.

Miss Perham has, however, brought all her own big guns to bear on this work. It carries the vivid and unmistakable mark of the inspired expert. As she writes, a mass of cold fact seems to warm up under the sun of Africa. Reading it is at times like making a journey in childhood to King Solomon's Mines or Buchan's almost mythical realm of Prester John. The Ethiopian monarchy—a "continuous shaft of unity" for 2,000 years—does indeed trace its legendary origins back through the priesthood of the Prester John—Emperor in the Middle Ages—to the line of Solomon and Christ.

Miss Perham is reader in Colonial Administration at Oxford, and, as an outstanding authority on all affairs African, has laid out for inspection the present structure of this still little known country. And while she finds much of it good, some is bad. British political officers stationed there after the liberation, she says, were shocked by the rough and ready methods of local governors. Nor does she create surprise with the information that when the Italians overran Ethiopia they found between 300,000 and 500,000 people still in slavery. Her book ends with some useful documentary appendices, three excellent maps, and a bibliography. In so ably assembling all this material Miss Perham has done a service to all who are concerned with the future of Africa.

British Trade Relations

"Great Britain in the World Economy." By Alfred E. Kahn. Pitman. 299 pages. 15s.

DR KAHN's book does not entirely escape the primal curse laid on all Ph.D. theses; that they shall be (a) out of date, (b) un-

readable. Anyone turning to his pages for an up-to-the-minute, near-journalistic account of the current Battle of the Gap, or for a popular explanation of Britain's role in world trade, will be sorely disappointed. The world economy of his title is that of the period 1914-39, and only a postscript (written before the end of hostilities) glances at the problems of today; and the level of discussion is that of an economic seminar, uncompromising and rarefied.

Those, however, who come to this volume armed with the requisite familiarity with economic concepts, and without misleading expectations, will find it stimulating, illuminating and altogether well worth reading, either from the historical or the analytical point of view. Primal curse or no, this is not the usual academic disinterment of old bones. The particular problems of Great Britain are treated as "a case study of an organic theory"—a theory which minimises the importance of the traditionally emphasised gold standard mechanism and stresses both the mutual adjustment of trade and purchasing power flows and the impediments which may prevent its completion. It lacks the beautiful symmetry and simplicity of older constructions, but certainly gains in realism. The summing up of British economic history between the wars would in itself earn for *Great Britain in the World Economy* a high place in the literature of twentieth century economic problems. Some of the predictions in the final postscript induce wry smiles; but they err only quantitatively, and confirm the impression that Dr Kahn is the possessor of a shrewd judgment as well as of a keen academic mind.

Shorter Notices

"An Economic Policy for a Free Society." By H. Simons.

A review of this book appeared on January 17th. At the time it had only been published in America. We are now informed that stocks are being sent to this country and will be issued by the Cambridge University Press, price probably 21s.

"Petroleum Facts and Figures." 8th Edition, 1947. Price 2 dollars.

HERE in statistics of black and white the roots of the world petroleum shortage are neatly displayed. Charts of scarlet and sky-blue illustrate the 35 per cent rise between 1940 and 1946 in US petroleum consumption, which takes 75 per cent of the total. Crude oil production did not quite succeed in keeping pace, while imports doubled and the number of producing oil wells advanced by a mere 9 per cent. Some information might well have been more up to date: for instance, world prices and consumption figures are not shown for any year later than 1941 and nothing at all relates to 1947. But the American Petroleum Institute is to be congratulated on publishing a handbook which is not too heavy to handle or to read.

"Colonial Annual Reports." Jamaica, 3s. net. Gold Coast, 5s. 6d. net. Turks and Caicos Islands, 1s. net. The Gambia, 2s. net. Aden, 2s. net. British Guiana, 2s. 6d. net. HMSO.

THE Colonial Office has taken the opportunity offered by the resumption of the publication of the colonies' annual reports to make them far more attractive in appearance. They are now illustrated, and both text and tabular matter, which in the reports enumerated above refer to 1946, are clearly set out. They are not likely, even now, to be best sellers, but people who use them for reference will commend the improvement.

This world-famed Sherry (formerly called Findlater's Fino) could not be registered under that name and thereby protected from imitators. For the safeguarding therefore of our world-wide clientele we have renamed it—Findlater's Dry Fly Sherry.

AMERICAN SURVEY

Defence of the West

(From Our US Editorial Staff)

WHEN President Truman delivered his St. Patrick's Day message to the suddenly summoned joint session of Congress, the doorkeepers pushed closed the doors in a masterpiece of human compression. The House looked unusually theatrical. The yellow light poured on the rostrum and its surrounding semi-circle of seats by the floodlights of the television operators was strong enough to make the photographers' photoflashes appear incidental. And Irish patriotism, supplemented by willing florists, had placed green carnations in the buttonholes of President, Cabinet members, and a fair proportion of legislators; as the solemn-faced Cabinet, two by two, went down the centre aisle in the stagey light, the impression alternated between wedding and wake. The spotlight on the supporting cast was symbolic, because Mr Truman was so clearly acting as the transmitter of the combined wisdom of his advisers, military and civilian. The recommendations he made were proposals of the executive branch of government rather than those of the Chief Executive.

The legislative branch had assembled with no great intention of being enthusiastic. Particularly in an election year, the opposition majority normally keeps its hands quietly folded, and the dissensions among the Democrats have created opposition minorities of some size. Further, the President's decision to call the joint session had not been cleared with Congressional leaders in advance. Such is the background against which to measure the applause—there were only three rounds for the entire message—that followed the paragraph:

I am confident that the United States will, by appropriate means, extend to the free nations the support which the situation requires. I am sure that the determination of the free countries of Europe to protect themselves will be matched by an equal determination on our part to help them to do so.

The President's words clearly meant military commitments in Europe, the very antithesis, that is, of America's historic policy. Yet the clapping was spontaneous, diverse in origin, and came from both sides of the aisle.

The speedy conclusion to the debate on the Marshall plan requested by the President had been almost assured before he spoke by a forestalling move of Mr Halleck, the Republican floor-leader in the House, who announced the hope of completing the House Bill by April 1st and thereby allowing time to reconcile the House and Senate versions and present the result to the White House well in advance of the Italian election date. There was a similar responsiveness in respect of the military measures he proposed.

That was Wednesday. Thursday was the morning after. Spring was seductively present. Around the tidal basin the Japanese cherry blossoms were preparing for the Easter parade. At the Mellon Gallery, the Department of the Army was showing masterpieces of European painting that had been found

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

cached in a salt mine; they will be returned to Germany next month. On such a day, wasn't it possible that the crisis was synthetic? At any rate, Congressmen had questions to ask the Administration before voting bills out, particularly on the military side. The morning-after response to the President's speech, however, made some observers wonder whether bipartisan support of foreign policy may not be more difficult to maintain as the season progresses. They point to the Senate vote on the Taft amendment which would have cut funds for Europe from \$5.3 billion to \$4 billion; in this maximum show of opposition strength the Republican division was 24 to 23 as against 32 to 8 among the Democrats.

Certainly the situation with regard to Universal Military Training (UMT) is complex in the House, where the Armed Services Committee's favourable report has been effectively held up since last July by Mr Allen, the Chairman of the Rules Committee; he is said to have found nothing in the speech to alter the situation. Even in the Senate Armed Services Committee where Secretary Marshall's testimony was followed by that of Secretary Forrestal and the service chiefs, Senator Gurney, the Chairman, and a number of his colleagues have indicated that recommendations requiring appropriations would be forthcoming only if convincing answers are given to a number of questions: To what extent is the unification of the armed services, begun last year, an effective reality? Is UMT, with its training of the entire male population as it reaches a certain age, preferable to more intensive training of a smaller group specialising in technical skills? Why, with a current appropriation of \$11 billion, is the US military establishment described by Secretary Marshall as a "hollow shell"? How many men are currently needed, and what administrative structure do the services suggest for obtaining them in case selective service is really necessary? Support for UMT seems to be considerably more widespread than support for conscription.

*

Mr Forrestal's presentation of the services' case is based on the failure of voluntary enlistment to keep military manpower up to the strength authorised by Congress at the close of the war. Present enlistments are about 350,000 below the then authorised number of 1,732,000 for all the services, and the Secretary indicated that the present permissive total of 669,000 for the Army should be raised to 900,000. He called reliance on atomic and other new weapons handled by a small corps of technicians a "seductive appeal," insisting that a "large army of specialists" is required, and that the indiscriminate character of modern war in respect to targets makes essential the integration of civilian defence and the army, through a trained manpower pool. The aim, he said, should be a mobile general reserve, together with some increase in the overseas base system. On the division of responsibilities between the three services, he said that differences between the Joint Chiefs of Staff had been substantially resolved at the recent meeting at Key West.

Beyond their questions on these technical matters, Senators and Representatives are clearly going to press for further definition of exactly what foreign policy is to be backed by this increased military potential. Senator Russell held that the United States should name the countries whose integrity would be supported against Communist advance. Moreover, support for a country, as a year's experience with the Greek-Turkish

programme has begun to make clear, actually means partnership with certain elements in that country. Legislators, uncomfortably aware, this election year, of the protest vote which Mr Wallace may roll up in their constituencies, are unhappy about some of the foreign governments and groups which American policy is being forced to support. The land reforms promised by the Communists in Italy and in other countries now become satellites, are typical of progressive measures never encouraged by some of the elements, temporal and spiritual, on which the United States now leans. In the jittery week that preceded the President's speech the projected inclusion of Franco among the Western freedom-lovers, and the suggested acceptability, in case of war with Russia, of German and Japanese volunteers in a sort of EERP—ex-enemy recovery programme—caused some to swallow hard. Even among those who see no fault at all in a position a little right of right in the industrialised countries, concern is felt for possible damage to the American reputation for forward-looking disinterestedness built up through the last generation and a half in the Orient.

Yet the realism with which Congress is viewing events is perhaps the most significant of all facts pertaining to the present situation. Within the last year, at least every other man in both Houses has had a look for himself overseas. During the last weeks, Congress, in its concern over international events, has been ahead of the country, and at least abreast of the executive. Its current attitude offers a striking contrast with the record in 1914-17 and 1939-41.

American Notes

Latin America and the Marshall Plan

"The success of the European Recovery Programme depends in part," says the Herter Committee of Congress, "upon successful mobilisation of Latin America's capacity to produce and export increased quantities of foodstuffs and raw materials." It is possible that \$1.5 billion of ERP funds will be spent in Latin America during the first fifteen months of the programme. The Committee proposes that purchases for ERP should be co-ordinated, in order to lessen their inflationary effect on the Latin American economy, and it also proposes that the United States should assure foreign exchange for Latin America's essential imports and should make supplies of these available, as was done during the war.

But this is hardly enough to allay the disquiet in Latin America about the effect of the Marshall plan upon the long-deferred schemes for industrial development, which have become the chief objective of national policy in all these countries. They claim that their needs are as urgent, if not as striking, as those of Europe: the already distorted pattern of their economies, dislocated by unbalanced wartime expansion and by the loss of European markets, is now further distorted by severe inflation. ERP will mean a renewed demand for increased output of raw materials and foodstuffs and will give Europe priority in the allocation of supplies of United States coal, steel and machinery: it will thus mean additional delay in industrialisation. Economic strength and stability are the essential basis of the plans for hemisphere defence which were drawn up at Rio last year. This argument gains force as the European situation deteriorates, and so does the final one—the opportunity offered to Communist elements in the Western hemisphere by present economic difficulties.

The Herter Committee believes that the recovery of Europe is a first essential for the recovery of Latin America. ERP will not only revive markets for Latin American goods and provide Latin America with much-needed dollars, but it will enable Latin America to buy the capital goods which it wants from Europe. It has also been pointed out that, without European

recovery, Latin America will become entirely dependent economically on the United States. However, very little attempt appears to have been made to explain this point of view to the Latin American countries or to enlist their co-operation in the Marshall plan, although it is hoped that they will make concrete offers of help in carrying out the programme, offers which have not yet materialised.

* * *

The United States at Bogotá

The ninth International Conference of American States, which opens at Bogotá on March 30th, will give the United States an opportunity of explaining its position, but it will also give the Latin Americans an opportunity to express the dissatisfaction which they have already shown at Havana—and possibly to express it in more than words. At a height of 7,500 feet, the atmosphere will already be rather chilly, and it will not be warmed by the inevitable discussion of the Antarctic and Honduras disputes. Other matters which are due to come up are the formation of a permanent inter-American military defence council and the reorganisation of the inter-American system into a kind of "regional United Nations." But the main purpose of the conference is to consider the draft agreement, drawn up by the Pan American Union, which is to govern long-term economic relations between the American Republics.

The United States has entered a number of reservations to this draft agreement, particularly with respect to assurances and safeguards for private American enterprises in Latin America. The Government believes that Latin American development is properly a field for private capital, but realises that past expropriations and present discrimination against foreign capital in many Latin American countries do not provide a favourable climate for such investment. Mr Norman Armour, Assistant Secretary of State, has suggested that an Inter-American Corporation might be established, with \$50-\$100 million of mixed United States-Latin American funds, to make loans or guarantees for the realisation of specially desirable projects for which other financing is unobtainable. It seems possible that this Corporation may be the reward which the United States is prepared to pay for satisfactory assurances with regard to Latin American treatment of private capital. Congress is also to be asked to increase by \$500 million the authority of the Export-Import Bank to lend to Latin America. It is doubtful if this will be enough to satisfy the Latin American countries, whose most specific proposal is for a Latin American Development Council, accompanied by a Development Corporation, with a capital of possibly \$5 billion, most of which would inevitably have to come from the United States. Mr Marshall's diplomatic ability will be tested to the utmost at Bogotá if he is to restore a firm outline to the somewhat faded picture of Uncle Sam as a good neighbour, which was so carefully drawn by Mr Roosevelt and Mr Sumner Welles.

* * *

The Wallace Peace Party

A roar of applause greeted Mr Truman in New York when he made his fighting digression against Mr Wallace:

If joining Henry Wallace and his Communists or permitting them to join me is the price of victory, I recommend defeat. These are days of high prices for everything, but any price for Wallace and his Communists is too much for me to pay.

From an audience so largely Catholic, enthusiasm was inevitable. But Mr Truman's final break with Mr Wallace will be cheered even by many former admirers of the hero of the common man, who have watched with amazement Mr Wallace not so much following as writing the "party line" on Czechoslovakia. His accusations that the Czech Communists acted to forestall a "rightist coup" by the American Ambassador, and that the Administration, by fanning war hysteria, is attempting to block the peoples of the world "now on the march" in China, Czechoslovakia, Greece and Italy, have torn away the last shreds of camouflage. Mr Wallace, intoxicated by opposition, is now plainly the prisoner of the Communists and his own egotism.

Mr Truman gauged very neatly the moment when it became possible to turn the Wallace opposition into something of an asset. But this is only making the best of an ill-wind; the Administration has no illusions about the wrecking possibilities of the third party. Mr Farley, for public consumption, estimated the Wallace popular vote at 5 million, that is, about what Senator La Follette rolled up in 1924, and more than Theodore Roosevelt

THE ECONOMIST BY AIR

Express Service to U.S.A. and Canada

Readers of *The Economist* in the United States and Canada can receive their copies within a day or two of publication for an annual subscription of \$24. They should apply to The Publisher, *The Economist*, 22, Ryder Street, St. James's, London, S.W.1.

polled in 1912. The total electorate in those years was, of course, much smaller. The Wallace forces are now organised in 26 states. In California, where 200,000 signatures are necessary to get on the ballot, they have collected nearly 300,000.

Peace is the programme; and peace, in the Wallace book, means opposition to Greek-Turkish aid, the Marshall Plan (unless rewritten to include Russia), military training and the draft. Domestic liberalism comes a poor second; progressives of the staunchest kind will find themselves opposed in their home districts in November by "peace candidates" if they voted wrong on Greek aid and the Marshall Plan. Past polls have showed that of 100 Wallace supporters, only six voted Republican in 1944, 62 voted for Roosevelt and 30 did not vote, in many cases because they were too young. Mr Wallace's chief threat remains to the Democrats. But if American mothers and isolationists come to believe that only a vote for Wallace is a vote for peace, these figures may somewhat underestimate the inroads he may make on Republican votes in the Middle West.

Mr Wallace is now the Messiah of what in America is unkindly known as the lunatic fringe. A march past of his supporters would include pacifists, Jews, negroes, isolationists, Irish, Italians, Communists and near Communists. His meetings have the air of religious revivals, and "Gideon's Army" is marshalled with all the techniques of Billy Sunday. But a protest vote of such diversity is far less stable than the major third party revolts of the past which were fired by a deep sense of common injury.

* * *

Defence and Taxes

Pressure for tax reduction in Congress has grown steadily in recent weeks. Apart from the obvious attractions of such a programme in an election year, there are many Congressmen who believe, quite sincerely, that the Treasury's estimates for 1948-49 seriously under-estimate the probable revenue over that period. Many more believe that taxation is steadily undermining the foundations of the US economy, and many cling to the simple faith that tax reduction is, *per se*, deflationary.

The path has been well prepared. Budget committees have cut \$2.5 billion from the President's expenditure total of \$39.7 billion. The Senate has adopted an ingenious procedure whereby \$3 billion of the cost of the European Recovery Programme, though spent in 1948-49, will be debited to 1947-48. By this device, which would not affect actual cash transactions, but would reduce a heavy 1947-48 Budget surplus to the benefit of next year's accounting, Republican tax crusaders overcame the objections of many Democratic Party rebels, who were persuaded last year, only with great difficulty, to support the Presidential vetoes on tax relief.

As Congress now considers the fiscal prospect for 1948-49, a Budget surplus of something like \$10 billion is in prospect, the expenditure reduction already noted being coupled with a revision of the revenue estimate, from \$44.5 billion to rather more than \$47 billion.

Wall Street, and commodity markets have made a striking response to these moves, coupled with the suggestion that rearmament expenditures will shortly become the dominant feature in the economy. In a few days, the Dow Jones Industrial stock average regained more than half of the setback from the 1948 "high" of 181, and there has been a sharp rally in selected commodities, such as grain and cotton. The assumption seems to be that with a probable Republican Administration in 1949, and a steadily-swelling defence programme, industry will enjoy a further sustained period of prosperity, and a Federal government so far removed from "New Deal excesses," that taxation will, in fact, be reduced rather than raised.

Defence expenditures seem bound to rise, in any event, and Wall Street prices are now so low, relative to earnings, that some sort of a rally, which could well be sharp, may seem to be wholly justifiable. But from this distance, it seems as though Wall Street would be taking a great deal for granted, if it assumes for long that a really impressive pace of rearmament can go hand in hand with lower taxes. It has been suggested that arms expenditures might rise by \$6 billion or \$7 billion in 1948-49, to about \$17 billion or \$18 billion, and this would certainly mean solid support in aircraft stocks, for example, and a "floor" for non-ferrous metals and other war supplies. But in relation to the recent pace of private capital expenditures, and consumer purchases these amounts are still relatively modest. For the moment, however, Congress cannot see beyond lower taxes. The Senate vote this week, of 78 to 11, for tax cuts of \$4.8 billion, shows that a Presidential veto could now be overthrown in both Houses.

Direct Election of the President

The political tug-of-war from which the Democratic Party is suffering this year may provide the motive power for eventual revision of the Electoral College, that device which the Founding Fathers fondly hoped would stand as a barrier between the Presidency and the passions of the mob. Representative Gossett (Texas) has sponsored, and the House Judiciary Committee has approved, a constitutional amendment which, while preserving the present electoral votes of the states, would divide each state's vote between the parties according to the popular vote. The present system gives all the electoral votes of each state to whatever party wins a majority or a plurality of the popular vote in that state. Just over a thousand votes in New York made Cleveland, rather than Blaine, President in 1884; a few thousand votes in California gave Wilson his second term.

Originally it was intended that the members of the Electoral College should use their own judgment, and not be bound by the popular vote; in practice they have become so. But the Virginia plan for putting the state's electoral votes, not automatically behind the official candidate nominated nationally by the party, but at the disposal of the state machine, has shown how undemocratic a rigid revival of the plain meaning of the Constitution would be. At the same time, the exaggerated weight which the present system gives to certain strategically placed minorities has been underlined by the competition between Mr Wallace and Mr Truman for the negro vote and the ineptitude of Mr Truman's Palestine policy in the past.

* * *

The Dilemma of the South

The South is desperately trying through the Virginia Bill to find a substitute for the veto over Democratic policy it enjoyed prior to 1936 through the two-thirds rule. But it is extremely unlikely that, faced in the Electoral College with a choice between, say, Mr Truman and Senator Taft, even the desire to punish Mr Truman could make the South swallow the deliberate engineering of a Republican President. The South would also do well to remember that when it possessed a veto over the party's choice, the effect was too often a succession of weak compromise candidates; and that the Democratic candidate has never won the Presidency in the twentieth century except on a national and liberal programme.

But the South has a real grievance, which it shares with "safe" Republican states: they can both be largely ignored by their respective parties in the formation of policy and the choice of candidates, for they have nowhere else to go. A constitutional amendment providing for the direct election of the President would make both parties take more account of their safe seats. Mr Truman's espousal of civil rights for the Negro may conceivably repeat the feat of Al Smith in 1928 and smash the Solid South, or at least alienate certain border states. But until a real two-party system develops below the Mason-Dixon line, no constitutional tinkering can make the South anything but safe—and therefore negligible—for the Democrats in a normal election year.

Mr Gossett's proposal will not affect the election results this year. But its chances are good in the long run. Certainly it deserves more support than the anti-third term amendment which the Republicans have tried to make Mr Roosevelt's constitutional monument.

Shorter Notes

The House has responded to the President's call for speed on economic aid to Europe by voting an additional interim aid appropriation of \$55 millions for France, Italy and Austria. General debate on the \$6.2 billion Foreign Aid Bill begins on Monday next. This includes \$5.3 billion already approved by the Senate, \$275 million for Greece and Turkey, and \$570 million for China.

*

Mr John L. Lewis has turned down the suggestion of the government conciliation service that he induce the miners to return to work while negotiations on the pension scheme are carried on. This greatly increases the likelihood that the Government will be forced to find a way of applying the provisions of the Taft-Hartley Act for dealing with a strike which menaces the national safety or welfare. The legal difficulty is that the strike has never been officially called.

THE WORLD OVERSEAS

Bulgaria—Kingdom of Dimitrov

(By a Special Correspondent)

THE fusion of the five government parties into "one united political organisation," which took place on February 2nd, has now made Bulgaria a totalitarian state in appearance as well as in reality. For a long time the non-Communist parties had served merely as camouflage for the Communist dictatorship. But for reasons of foreign policy Premier Dimitrov felt obliged to keep a semblance of democracy: the parties had their own leadership and their own political programmes. Now they are to exist only in name, as parts of a "central organisation"—the Fatherland Front, whose leaders are all Communists.

This change, which the Bulgarian Communist press calls "democratisation," was accelerated some eight months ago after the arrest of Nikola Petkov, leader of the Parliamentary opposition. Petkov was sentenced to death on August 16th, his Agrarian party was disbanded three weeks later, and he was hanged on September 23rd. Dimitrov signed a military alliance with Yugoslavia in August, with Albania in October, and with Rumania in January. A new Bulgarian constitution on the Soviet model was adopted on December 4th, and two nationalisation laws, voted in December, 1947, and February, 1948, completely transformed the economic and social structure of the country.

In the political field these changes have been marked by two main characteristics: intensified Communist terror and the replacement of local Communist leaders by Communists from Russia, who, though Bulgarian born, had been Soviet citizens and Soviet officials for the best part of their lives. (They are known in Sofia Communist circles as "the people from up above.")

By the end of 1947 the Opposition, with the exception of a small group of nine Socialists in the Assembly, had been driven out of existence. One month after Petkov's hanging all prominent leaders of his party were arrested. Those who did not sign a "voluntary" statement denouncing Petkov and their own political past were sent to concentration camps or interned in remote villages. Others, among them former Agrarian ministers, were tried and sentenced to long terms of imprisonment for "obstructing the two-year economic plan." Petkov's deputy, Dimitar Gichev, is to be tried for "espionage." Gichev's popularity among the peasants was second only to Petkov's, and his elimination is clearly intended to head off the Agrarian movement as a living political force. Even the pro-Communist Agrarian, Alexander Obbov, who was deputy Prime Minister in Dimitrov's cabinet up to December, 1947, has been expelled from all government organisations and is now under house arrest.

Anti-Communist "Criminals"

Savage measures of repression have overtaken all other prominent democrats. Professor Venelin Ganev, who as chairman of the Regency Council, was head of the Bulgarian State for two years, was arrested last October. He was suspended from the university and deprived of his pension as an "enemy of the people." His crime seems to have been his readiness to appear as a defence witness during Petkov's trial. The leaders of the Democratic party, including the eighty-seven year old former Prime Minister, Nikola Mushanov, and the energetic pro-British Stoicho Moshanov; the leader of the Conservative party, Atanas Burav; the former Regent, Zvetko Boboshevsky; the former minister and leader of the Radicals, Professor Petko Stoyanov; most of the well known Socialists, and many other politicians, professors and journalists have all been arrested and interned in the last four months.

In January, 1948, the Communist Politbureau, which had fourteen members, ten of whom were local Communists and only four "people from up above," was disbanded. A new Politbureau of seven men was formed, five of whom are Soviet citizens and only two are local Communists. The Bureau's Secretary-General is George Dimitrov. His first assistant is his brother-in-law, Valko Chervenkov, a Soviet citizen since 1923, with long experience of political work in Moscow. As chairman of the "Committee for Science, Art and Culture," with the rank of deputy Prime Minister, Chervenkov directs all propaganda activities in the country. He is also Secretary-General of the Fatherland Front Executive

Committee. Next in the Politbureau comes General George Damyanov, a Soviet officer and former professor in the Moscow Military Academy. He arrived in Bulgaria only in 1946. The Police Minister, Anton Yugov, is a local Communist, but his department is subordinated to the notorious "R.O." (Investigations Branch) of the War Ministry headed by yet another man from "up above"—General Ivan Vranchev.

The new nationalisation laws, easily the most drastic of their kind in Communist Europe, put under state ownership all trade, business, banking and industrial enterprises, including workshops employing as little as three workers and the only night club in Sofia. In reality this nationalisation was the naked confiscation of all property and spelt the liquidation of the middle classes. For compensation is to be paid, according to Article 17 of the law, only to those owners who have not "served and helped" the German Army, the Bulgarian Police or the Bulgarian Army. Since Bulgaria was an Axis state up to September, 1944, there is hardly a Bulgarian industrial business, trade or banking firm which has not, in one way or other, "served" the Bulgarian army. Furthermore, compensation is to be denied to anyone who has "served or helped foreign agents, spies or persons incriminated for activities aiming at the overthrow of the people's government and the restoration of the fascist dictatorship." This, of course, denies compensation to anyone suspected of anti-Communist views. There is no appeal.

Workers Under Martial Law

Articles 15 and 16 of this nationalisation law need no comment: "Whosoever, in whatever form, commits acts of a nature to frustrate, obstruct or delay nationalisation under this law is liable to be punished for sabotage." (The penalty for sabotage is death.) And: "Civil servants who do not carry out or who delay the carrying out of any measure under this law are liable to be punished for sabotage." Finally, according to Article 20, all "owners, governors, directors, accountants, executives and the whole technical staff of the nationalised enterprises are to be mobilised in their industries, businesses, factories, offices, workshops, etc." A Communist "Commandant" is appointed to each nationalised enterprise and the mobilised men are to work under military discipline and martial law. But the final blow came with the second nationalisation law last February, which took over all "land, houses, villas, flats, rooms, etc." with the exception of the "living accommodation of working class families."

The annual budget, voted in January, 1948, gives some more revealing facts on Bulgaria's financial and economic situation. Out of a total expenditure of 70,000 million leva, some 10,000 million are for the War Ministry. (There is still no official rate of exchange between the leva and the pound sterling, but on the free market in Sofia £1 is worth about 3,000 levass.) The Ministry of the Interior and the Police take 4,200 million levass; the Committee for "Science, Art and Culture" and the Ministry of Education—7,300 million levass; Agriculture and Reconstruction—3,000 million levass each. The Social Services are allowed 2,000 million levass, less than half the credits for the Ministry of the Interior and the Police. On the revenue side 27,000 million levass are expected to come from a "turnover tax," introduced for the first time in Bulgaria and modelled on the similar Soviet tax. 4,000 million levass are to come from the "sale of rationed goods on the free market" (known in Bulgaria as the "official Black market.") Income Tax amounts to 7,000 million levass, only ten per cent of the total estimated revenue.

The lonely nine Opposition Socialists in Parliament attempted to criticise this budget as "unrealistic and insincere." Dimitrov, however, openly threatened them with "the fate of Petkov" and they abstained from voting. Thus, while the new nationalisation laws, in eliminating the middle class, have laid the economic foundation of the Communist dictatorship, the reign of terror that followed Petkov's hanging has assured Dimitrov of absolute power, which no "reactionary monarch" or "Fascist dictator" ever enjoyed in Bulgaria before.

Portugal's Estado Novo—II

New Deal in Lisbon

(From a Special Correspondent)

ONE of the sixteen nations pledged to economic co-operation in the European Recovery Plan, Portugal is in the happy position of needing to ask for nothing from the rich American uncle. It still has substantial gold and foreign exchange resources, acquired from its gains as a neutral during the war, amounting at the beginning of 1948 to £155 million. Thanks to a ruler who knows his economic business, the escudo is a "hard" currency, quoted alongside the dollar in the French "free" market.

Portugal's participation in ERP has to be assessed, therefore, rather in terms of political prestige. Where it stands to gain at a later stage, is in the consolidation of the economic development of its African colonies. This has already been put in train by the Salazar regime. The Lisbon Government sponsored a development loan of £10 million for Mozambique on July 31st last, and the prosperity of Angola has in recent years made remarkable strides. The Anglo-Portuguese Trade and Payments Agreement, the outlines of which were announced on January 12th, has settled monetary difficulties affecting Portugal's chief source of supply, and, by means of the Superior Commission for External Trade set up in November and a comprehensive but elastic system of import controls, the Government is well placed to meet all essential trading needs. Portugal is a poor country dependent for raw materials and for wheat on foreign markets, but the relatively low standard of living affords a considerable degree of self-sufficiency.

Portugal after the war, like the other countries starved of goods, was exposed to the perils of inflation. The monetary increase of the war period—in 1947 the fiduciary circulation amounted to about four times that of 1939—was not accompanied by any appreciable increase of consumption. When the navicert controls were lifted, it had to meet the full force of world competition for goods in short supply. Internal prices consequently rose steadily. Dr Salazar insisted that there must be no comparable rise of wages and internal costs such as might imperil the stability of the escudo—the most that he would concede was a temporary cost-of-living bonus for the shockingly-paid Government servants in October, 1946. He was banking on the assumption that the inflated world prices were an immediate result of the war and that they would not persist.

Discontented Professional Classes

By the end of 1946, however, there was a rising tide of discontent among the long-suffering working and professional classes, who resented particularly the luxury goods from the United States at prices only payable by the wealthy few. (In 1946, for example, the US accounted for almost 25 per cent of total imports, twice as much as in 1942.) There was the familiar phenomenon of the country people hoarding food, combined with excessive middlemen's charges and an alarming increase of black market speculation.

Today there is a very different picture: stocks have been replenished, prices of all necessities have been brought down to a reasonable level (and rationed goods are regularly forthcoming) while black market operations have been largely eliminated. The credit for this transformation belongs to the dynamic personality of the new Minister of Economy, Daniel Vieira Barbosa, appointed in the Cabinet re-shuffle of February, 1947, and his able secretary, Dr Correia de Barros (who studied for a time at the London School of Economics). Senhor Vieira Barbosa was an almost unknown figure. In the execution of his task, for which Salazar gave him a free hand, he has shown notable skill, not to say guile and courage. He is the first of Salazar's Ministers to appreciate the value of publicity, and recently he made a series of important speeches vindicating, with a liberal use of statistics, the Government's policy.

A year ago the new Minister, having satisfied himself by personal investigation that the "shortage" of foodstuffs was to a very large extent artificial, set himself to create a "falling prices psychology." In the early summer a Commission of Enquiry was set up to determine a "just price" for a variety of articles in relation to increased costs since 1938. Police action was taken against a number of leading industrialists and the

Ministry's investigation squads have been working overtime ever since. Senhor Barbosa issued warnings that, if farmers and producers failed to surrender their stocks, he would use the reserves of the *gremios* (employers' and producers' associations) to flood the market with imported food. He did in fact, in the spring and early summer, make good use in this way of Argentine meat, Brazilian and American grain, imported sugar, potatoes and fats—with the desired effect of bringing prices down. Maximum prices were fixed for other products, and the Government at one stage set up its own booths in the markets for selling fruit and vegetables at cheaper prices than those being charged. For bread a special arrangement was necessary owing to the very bad wheat harvest, and Portugal's bread ration, of between 150-200 grammes per day, is one of the lowest in Europe. But rations in Portugal are simply the basic allocation at the controlled price: all staple products can be bought in larger quantities at the differential price.

Balance of Payments Difficulties

To critics who complained that he had been playing fast and loose with the country's foreign exchange assets simply in order to salvage the Government's popularity, he quoted some eloquent facts and figures:

- (1) Imports in 1947 were some 37,000 tons less than in the previous year, and there was a diminution of 65,000 tons in the amount of foodstuffs;
- (2) If that import programme was more expensive—an average of 3,100 escudos per ton as against 2,750—than that of 1946, and the deficit of the balance of payments had increased, the reason was the jump in the world prices for which the Portuguese Government could not be held responsible;
- (3) The actual deficit of 1,370,575 contos* was only 17 per cent more than the average of the years 1928-37, and steps had been taken—e.g., the Control of Imports Order of October 9th affecting 150 products—to put a stop to unwise spending; as for Portugal's foreign exchange reserves, the figures showed that on January 1st the amount held was 18,450 thousand contos, and at the end of the year 15,625 thousand contos, a curtailment of 2,825 contos, which was surely justified in a good cause, i.e., to check the prices ramp.

For the benefit of other critics who professed to be worried about the effect on the Government's industrialisation schemes, Senhor Barbosa pointed out that imports of machinery, tools, lorries, ships, etc., in 1947, were only 73 per cent of the previous year's figures. On the other hand, the amount of raw materials imported was 45,000 tons greater than in 1946—and more than in any of the war years. Exports of animal oils, timber, cork, resin, wines and tinned goods had necessarily fallen off because of foreign exchange difficulties. Hence the unsatisfactory balance of payments. The Minister made no bones about taking the blame for allowing too many non-essential goods to be imported, but he said this had now been rectified.

The Government passed its Act for the development and reorganisation of industry in 1944. The first phase of the eight-year plan was scheduled to cost £13 million. Conscious that at present any substantial increase in industrialisation is hampered by the lack of fuel or alternative sources of power, the Government has put as a first priority the construction of hydro-electric works, making good use of equipment and technical aid from Britain. A respectable merchant fleet is being established, many of the new vessels having been built in Britain. There are ambitious plans for the improvement of railway yards, dockyards and ports, specifically the expansion of Lisbon's harbour, and other projects which are likely to cost some £20 million. Total expenditure is estimated at £65 million, but, in view of the expanding population—an increase from 5,500,000 to 7,000,000 in the last 20 years—it will be money well spent. There should be no danger of an unbalanced budget. All in all, provided that Dr Salazar and his lieutenants, chiefly Marcelo Caetano and Vieira Barbosa, can hold the political position, there is a good chance that Portugal will reap a precious harvest from a generation of financial and economic stability.

Self-Government for the Sudan

(By a Correspondent)

THE predominant feeling in the Sudan today is one of suspicion of and dislike for the way in which the Sudan is being used as a pawn in the Anglo-Egyptian dispute. For the past few years the Sudanese have sought the goal of self-government with single-minded determination. But, just as they were enthusiastically working out the details of the next critical stage in their development, they found themselves the centre of an acrimonious dispute between their joint rulers, Britain and Egypt.

To begin with, some Sudanese thought that they would profit by the dispute. If their rulers fell out, they argued, there would be nothing to stop the Sudanese from winning independence. It soon became clear, however, that although the two condominium Powers could not agree, neither would relax its hold on the Sudan. Indeed the dispute, which had begun over reframing the Treaty of 1936, quickly developed into the question of the future of the Sudan itself. Egypt, suspicious of British intentions and anxious about the security of its vital water supplies, claimed the Sudan as a colony. Britain resisted the claim, and within a few months the Sudanese found their affairs exposed to the limelight of the Security Council. No settlement was reached, but from that time on the Sudanese realised that what had originally seemed a simple matter of moving step by step towards self-government had become a complicated tangle of power politics.

Under such trying circumstances, the Sudanese remained admirably cool. The *Ashigga*, or pro-Egyptian party, led by Sayed Sir Ali el Mirghani Pasha, supported Egypt, and the *Umma*, or Independence party, led by Sayed Sir Abdel Rahman el Mahdi Pasha, resisted it. The *Umma* probably spoke for the majority of the Sudanese, few of whom have any liking for Egyptians, but members of both parties worked amicably enough together when they assembled for the Sudan Administration Conference last year to frame the proposals for their next step towards self-government. Helped by exceptionally able British administrators, the Conference worked quickly and smoothly. It completed its work last March, and produced detailed suggestions for amending the internal constitution of the Sudan.

Egypt's New Interest

It was at this stage that the dispute between the condominium Powers again made itself felt. Under Lord Cromer's Condominium Agreement of 1899, any constitutional changes in the Sudan must have the approval of both Britain and Egypt. In fact, ever since the murder in 1924 of Sir Lee Stack, then Governor-General of the Sudan, Britain had shouldered the main responsibility for the Sudan, and Egyptian interference, up to the time of the dispute last year, had been slight. Now, however, Egypt decided to make its presence felt, and insisted on its right to approve any constitutional changes. Britain approved the proposals of the Administration Conference in principle, but Egypt, fearing that its influence might be undermined, went further. In a list of detailed amendments it offered the Sudanese an even greater measure of self-government—but on conditions which would give Egypt more direct control of the Sudan.

The Administration Conference had proposed that an Executive Council, of whom at least half should be Sudanese, should replace the present Governor-General's Council, and that a Legislative Assembly, elected from the whole of the Sudan, should replace the Northern Advisory Council, which, constituted in 1943, is at present the only representative body of Sudanese. The Executive Council was to be responsible for framing and initiating legislation, while the powers of the Legislative Assembly were to be limited for the first three trial years to debating on Government Bills and to some control over the Budget. The Governor-General was to retain his present wide powers, and, in particular, was to be responsible for resolving differences between the Executive Council and the Legislative Assembly. Egypt's criticisms were that Egypt ought to be represented on the Executive Council; that full electoral rights should be given to all Sudanese instead of the limited franchise suggested; that the powers of the Legislative Assembly should be extended; and that all legislation should be referred back to the condominium.

The contradictions in the Egyptian amendments were self-evident—if all legislation had to be referred back to the Con-

dominium, it would mean less, not more, independence for the Sudan—but the chief result was to turn what had been a fairly open dispute between Britain and Egypt into a haggling match over constitutional details. It was clearly Egypt's intention either to force into the new proposals clauses which would give it control over the Sudan, or so to confuse the issue as to make progress impossible and to prevent Britain from taking up the role of guide, philosopher and friend to the Sudanese.

Friction with Cairo

The Sudan Government, however, accepted most of the suggestions of the Administration Conference and began to work out a draft ordinance for putting them into effect. Sir Robert Howe, the Governor-General, saw the Egyptian Premier, Nokrashy Pasha, in Cairo at the beginning of this year and told him that some of the Egyptian amendments would be included. Later in January, the British Government invited the Egyptian Government to a conference on the Sudan. Egypt refused. In a Note to the British Government, dated March 11th, Nokrashy Pasha explained Egypt's refusal by claiming that none of the Egyptian amendments had been accepted and that therefore there was no basis for discussion between Britain and Egypt. The previous criticisms of the proposals were repeated, but the Note added that, after a trial period, "the Sudanese shall take over . . . all government posts under the common Crown and within the unity of the Nile Valley." Few Sudanese would accept the domination by Egypt implied in that statement.

Meanwhile, the Sudan Government has published its draft ordinance embodying the constitutional proposals. There are a few changes to the original suggestions, but the substance is the same. The Northern Advisory Council of Sudanese debated the ordinance in the first fortnight of this month and approved it in principle unanimously. Two other unanimous resolutions were passed: the first asked the Sudan Government to consider carefully the recommendations which had been made during the debate, and the second was: "The Council recommends that the Government should put this legislation into effect as soon as possible."

Promising Parliamentarians

The recommendations of the Northern Advisory Council were, in the main, intelligent and reasonable. The standard of the debate was exceptionally high and gave convincing proof of the ability of the Sudanese to adopt now a form of parliamentary government. The Council proposed that some or the "under-secretaries," equivalent roughly to a British parliamentary secretary, should be made full Ministers from the start, and that more than half of the Executive Council should be Sudanese, as originally suggested. There is no reason why the Sudan Government should not accept these recommendations. There are Sudanese who are eminently capable of taking over the departments of health and education, although it might be as well for the more technical departments, such as agriculture and economics, to remain for the time being in the hands of their British administrators.

But, now that the details of the constitutional changes have been settled, will the Sudan Government be able to carry them out? The present impasse between Britain and Egypt seems likely to continue for some months, and Britain's approval alone is, technically, not enough. There has been some talk of forming a Supervisory Council on which Egypt would have an equal say with Britain over Sudanese affairs; but such a concession, besides being unwelcome in the Sudan, would almost certainly lead to further demands from Egypt and would, by its nature, retard the progress of the Sudanese.

There is one way out. Under the Agreement of 1899, the Governor-General of the Sudan is empowered to do all he can for the peace and welfare of the Sudanese. As the Sudanese will almost certainly take the law into their own hands if their development is delayed much longer, and as obviously their welfare is at stake, the Sudan Government has every reason for disregarding the Anglo-Egyptian dispute and carrying out its plans. Britain, at least, could not reasonably object.

were demanding. Moreover, production costs of wheat have undoubtedly risen sharply since the war, though it is doubtful whether they are now as high as \$1.50 a bushel. The minimum price in the first year is not merely of academic interest, for although the current price of wheat in Chicago is \$2.40 a bushel the prospects of a harvest in the United States of perhaps 1.2 billion bushels this year, following good crops in the Southern Hemisphere and the likelihood of a greatly improved harvest in Western Europe, suggest that even if the wheat market does not fall abruptly, prices may in due course be well under rather than over \$2 a bushel. Experience during the past year has underlined the need for caution in forecasting the trend of grain prices, which can be sharply affected by supplies of coarse grains and rice. Admittedly, the guaranteed prices offered to domestic growers both by importing and exporting countries are usually well above \$1.50 a bushel—in Britain the price is over \$2. The only certain factor in the situation is simply this: if the minimum price of wheat during the next five years proves to have been fixed too high under the agreement the prospect of its renewal in 1953 will be so much the poorer.

From Britain's point of view, perhaps, there is not much to lose from the agreement in the first two or three years. Under the Anglo-Canadian wheat contract, prices in 1948-49 had already been fixed at \$2 a bushel, and the minimum price in 1949-50 was originally agreed at \$1. Under the new agreement the price for 1949-50 will be revised to \$1.40. Britain is now buying wheat from Australia at \$2.70 a bushel, and if the agreement comes into force next August the maximum price for these supplies will be reduced to \$2. But the advantages in later years after these long-term contracts have expired are perhaps more questionable. It may be difficult at this moment to believe that grain prices will slump to their prewar level in any foreseeable period of time, but world markets have a way of defying prophecy.

One of the doubts arising from the agreement is the narrow scope which will now remain for a free world market in wheat. Again, the stabilisation of the price of wheat is likely to distort the normal price relations between wheat and other grains. So long as the three exporting countries pursue a domestic agricultural policy designed to maintain a high wheat output, no serious repercussions on the supply side need be

expected. But suppose that the world price for maize remained above the maximum export price fixed in the wheat agreement—which is a distinct possibility. Would not producers in the exporting countries be tempted to sow a greater acreage of animal feeding grains and to reduce their acreage of wheat? Such a possibility is even more likely in those countries like Argentina which are outside the agreement. An increased supply of feeding grains would be beneficial. But in these circumstances might it not be obtained at the cost of an unduly high price for wheat?

From an economic standpoint the new agreement is not without its shortcomings. Lack of precision in detail may be desirable in order to administer the agreement with proper flexibility, but that very fact will put a heavy responsibility upon the new Wheat Council for carrying out its provisions equitably. From the particular point of the consumer, the wheat agreement will be judged by two results: first, if it encourages an expansion in world wheat production commensurate with the increase of between 5 and 10 per cent in the world population since 1939, and secondly, if relatively stable wheat prices succeed in inducing a greater measure of stability in the world economy as a whole. There are, of course, political considerations which are bound to be important in an agreement of this kind. For a period of four years out of the five during which the agreement will run, it is conceivable that American aid will be forthcoming to a number of the importing countries, and a maximum limit for wheat would prevent a repetition of the rapid using up of the American loan which occurred after price controls in the United States were rescinded. A more important consideration, perhaps, is Britain's responsibility to other European importers. Clearly, no wheat agreement would have been feasible without British participation, and it would be shortsighted for Britain to refuse to ratify the agreement on the ground that in the last two years of its duration wheat might cost more than would otherwise have been the case. At present, that is not a matter which is now open to proof. Not until the later years of this agreement—assuming that it is ratified—will it be possible to decide whether Britain threw away an opportunity of buying food in the cheapest market or whether, instead, it reached a satisfactory compromise between its interests as an importer and the broader interest of stable farm incomes.

The New Companies Act—III

Safeguards for Private Companies

PRIVATE companies outnumber public companies by fifteen to one. Yet to date the position of private companies under the new Companies Act has received relatively little attention. The main provisions of the new Act do indeed refer largely to public companies, but many are of equal application to private companies, and some are exclusively concerned with private companies. There are two main reasons for examining the changes in the law governing private companies. The first is that private companies are frequently members—and sometimes important members—of industrial groups in which the investing public is interested. The second is that abuses on the part of private companies have in the past involved painful losses to trading creditors, as distinct from the investing public.

The new Act does something to limit these losses in future. One of the earliest forms of abuse of the advantage of limited liability to the private company was the floating charge. By taking debentures, secured by a floating charge, as part-consideration for assets sold to the company either on its formation or subsequently, the principal shareholder could obtain a preference over the unsecured creditors of the private company when it was liquidated. Frauds have taken place by the purchase of goods on credit, followed by a liquidation in which the promoter secured the goods through the operation of a floating charge. The Act of 1907 made void any floating charge, evidenced by debentures issued other than for cash, if it had been created within three months before the winding up of an insolvent company. This period of three months was extended to six in the 1929 Companies Act; it is now increased to twelve months in the new Act.

Before the war, the trail of debts left by dubious private limited companies tended to be marked in particular trades; fraudulent promoters were never numerous, but a small number of them were very active and were responsible for the registration of chains of companies. In future under Section 101 of the new Act it will be harder to form a last link in such chains, since the Court has been given greater powers to restrain people found guilty of fraudulent trading from engaging in the management of companies. In addition, enquiries will be facilitated by the new Section 102 which gives power to the police, the Board of Trade or the Public Prosecutor to apply for a Court Order to inspect a company's books and papers if reasonable cause can be shown that an offence has been committed.

Another type of fraud which has been made more difficult involves the purchase of goods on credit by a private company which are then sold to an associate at a fictitiously low price. When the purchasing company liquidates, its creditors recover only what is left of the money paid to the company by the associates; the goods are ultimately disposed of at their true market value and the difference is divided between the two venturers. In frauds of this type the Public Prosecutor will now have a wider discretion. Many prosecutions were not made in the past either because they involved only small sums or because of difficulties arising from the rule requiring action in a police court to be taken within six months of the offence. This period has been extended to three years, with the limitation that not more than one year must elapse after the date when the Public Prosecutor or the Board of Trade first learns of evidence which in their opinion would justify legal proceedings.

Apart from these cases, which involve punishable dishonesty, there have been others which were not fraudulent, but where the creditor has nevertheless been hampered in his transactions with companies of doubtful honesty. A most frequent instance arose when a director made the declaration of

solvency, required, under the Act of 1929, for a voluntary liquidation, either recklessly in order to keep a winding-up out of the creditors' hands or alternatively so long in advance that the declaration no longer held good at the time of the liquidation. Under Section 94 of the new Act, such a declaration must be made within five weeks of the resolution to wind up and it must also be supported by a statement of assets and liabilities; if the company then proves insolvent the onus will be upon the directors to show that when they made the declaration they had good reason for thinking that the company would be able to pay its debts within twelve months. Another section now gives any receiver the right to apply to the Court for directions, whereas at present receivers who are not appointed by the Court have no recognised authority to turn to for instructions if they are dissatisfied with the company's conduct.

On questions of broader principle, however, few changes have been made. Most private companies will still be exempt from the duty of filing a balance sheet and profit and loss account. The commercial world has long recognised the right of a private company to keep its financial affairs to itself and despite the strong evidence which was submitted to the Cohen Committee, urging an improvement of the standard of disclosure of financial information by private companies and suggesting that private companies should be liable to publish annual profit and loss statements and balance sheets, nothing on these lines has been incorporated in the new Act.

It has often been held that creditors of private companies, more particularly larger creditors, have not pressed for a change in the law mainly on the ground that before they supply goods on credit to a private company they make it their business to obtain such information as they require. Representatives of trade protection organisations, however, expressed the view to the Cohen Committee that they would be assisted in their work by being able to refer to filed accounts, and it is certainly true that credit reports on private companies tend to be in rather vague terms in many cases where nothing disadvantageous is known. It is questionable whether the valuable privilege of limitation of liability should be granted without a corresponding responsibility for filing accounts. One argument to the contrary is that many private companies have been incorporated which would not have been formed if such publicity had been demanded at the time, and that it would be unjust to demand disclosure, so to say, retrospectively. Many individuals have formed private companies for reasons originally connected with tax evasion; but great inroads on the possibility of such manoeuvres have been made in recent years through successive Finance Acts. It would undoubtedly embarrass many people to have their private fortunes disclosed but, for trading companies, at any rate, the protection afforded to private companies still seems an anomalous exemption. There is another aspect of this matter. In their discussion of the relation between wages and profits, trade unions have emphasised the disadvantage from which they suffer owing to the secrecy surrounding the financial affairs of private companies. They have suggested more forcibly that some private companies, whose objections to the disclosure of profits or assets are based on the ground that such publication might help competitors, have been more anxious to conceal their position from employees.

Although the new Act has left the privacy of private company business unchallenged, it has introduced the concept of the "exempt private company." It is only this type of private company which is not required to file accounts at Bush House. It is defined in Section 54 of the Third Schedule to the new Act as a company that (with certain exceptions) does not have a

public or a non-exempt private company or a nominee as an owner of shares or debentures, either directly or at several removes; nor must it be controlled by any except its own members and directors or have a body corporate as a director. In addition holders of its debentures and of shares in the group of which the company forms a part, must not exceed fifty in number in each case. Thus a typical private company representing a family business will be exempt.

Another object of the new legislation has been to make it easier for shareholders generally to take a more active part in the running of a company by receiving notices of meetings longer in advance. Minority members of private companies, who have hitherto been completely ignored in company legislation, will also receive these benefits and enjoy the right to receive copies of the profit and loss account and balance sheet in advance of the annual meeting. Like other shareholders, they may in future give their proxies to persons other than members, although it is only at the meetings of private companies that such proxy holders will be entitled to speak. Where it is complained that a company is being run in a manner oppressive to some members and where winding up would be prejudicial—although grounds for liquidation exist—the new Act gives a right to shareholders to apply to the Court for an order to regulate the affairs of the company or for a purchase of the shares of a member. Although the new Section 9 does not specifically mention private companies, the conclusions drawn by the Cohen Committee make it clear that this and related clauses were put in to deal as broadly as possible with oppressed minorities of companies generally, and the position of minorities is particularly vulnerable in the case of private companies. When a partnership is turned into a limited company, it is common for the former partners to take high salaries (if only because of earned income relief) rather than draw their income in the form of dividends. Should

one die, his beneficiaries are in an extremely weak position in relation to the surviving active members, and they had only limited remedies under the old Act. Under the new provisions (Section 9), the Court, on application, may make such order as it thinks fit for the regulation of the conduct of the company's affairs or for the compulsory purchase of any member's shares. In such a case, directors' remuneration may therefore be limited by Court order for the protection of the minority shareholders' interests.

On the question of the appointment of auditors for private companies, the Act has not fully met the recommendations of the Cohen Committee, which held that no one should be eligible for appointment who was not qualified by membership of an approved body or who was not otherwise authorised to act by the Board of Trade. The Act includes provisions giving partial effect to this recommendation but "exempt" private companies are not affected by it. The Cohen Report, in discussing cases where an auditor joined the board of a private company and his partner was appointed as auditor, held that "such an appointment was wrong in principle" and "the exemption of private companies . . . should be abolished." The new Act specifically disavows this recommendation by providing Section 23 (2) that the preclusion of partners and employees of the company's officers from appointment as auditors shall not apply to an "exempt" private company.

The new Act has tried to strike a balance between the legitimate interests of creditors and shareholders for information about private companies and the convenience of the trading community. It may perhaps have given slightly more emphasis to the latter than to the former, but the new safeguards upon the activities of private companies which come into force in July will certainly remedy the worst practices which a very small minority of private companies and their promoters have exploited in the past to their own advantage.

York Saturday Market

ALTHOUGH BIG DEALS involving thousands of pounds take place daily in the markets of England, a large proportion of their turnover consists of small sales "for cash." Similarly throughout the country, for every sizeable firm there are many "small men" who make a less impressive but still significant contribution to the output of their industry. Both large and small business men appreciate the unique Barclays system of Local Head Offices, covering England and Wales. They know it means that their problems will be given friendly consideration by men on the spot who understand local conditions.

Business Notes

Quantity and Quality in Coal

Lord Hyndley explained last week what the coal industry is doing to meet the requirements set out in the Economic Survey. The average weekly output of the mines (excluding, that is, open-cast coal) was 3,948,590 tons in the first ten weeks of this year. Sustained over 52 weeks, this would yield more than the 200 million tons which has been set as the target for the coal industry, "though still, of course, not as much as we should like and the nation needs." But since the miners have their week's paid holiday and their six statutory (also paid) holidays to come, there are for practical purposes not 52 productive weeks in the year but 50; and on this basis, as Lord Hyndley pointed out, deep-mined coal output will need to average 4 million tons a week. A further improvement, therefore, is still needed. Output so far is 8 per cent higher than in the corresponding period of last year. Lord Hyndley attributed 2.6 per cent out of the improvement to the milder weather, leaving to the Coal Board and other human agencies the credit for an improvement of 5.4 per cent; the improvement required over the year if the minimum target is to be reached is 7.3 per cent. Last week's output figures show the requisite improvement—to 4,036,000 tons.

Recruiting on a scale necessary to bring mining manpower up to 750,000 by the end of 1948 will, in the chairman's words, "take some doing in view of the general shortage of labour and the urgent needs of the textile industry, agriculture and the Forces." This is so. A further statement by the Coal Board speaks of the success of special campaigns conducted by mobile cinema van in the Liverpool and Manchester area. But many of the new workers for the textile industry are being sought in South Lancashire, too. To what extent are the various officially-directed recruiting efforts competing against each other for the same workers?

Two points in Lord Hyndley's remarks may reasonably increase the consumer's concern about the rising cost of coal. The efforts being made to reduce dust in the mines are proper and necessary; the question remains whether these methods will eventually promote increased efficiency in the mines. Can the Coal Board make efficiency pay for itself? On the problem of dirty coal—"exaggerated" or not, it is still a problem—Lord Hyndley was less than reassuring. Mechanisation makes coal dirtier unless it is corrected by screening and washing plant; and while more than 75 per cent of the coal is now cut and conveyed mechanically, the existing screens and washeries can deal with only 48 per cent of the output. The export programme requires good clean coal, since foreign customers have enough American and Polish coal to enable them to discriminate—another example of a fading seller's market. It is disheartening for the industrial consumer—who also, often enough, has to export his goods—to be told that the exigencies of the coal export programme will require him to put up with inferior coal. For him, a fall in quality is the same as an increase in price.

Price Control Dilemma

The postponement until April 26th of the operation of the Board of Trade's new price-freezing orders provides a breathing space in which some of the problems involved may be examined a little more closely than was possible before the hasty issue of the orders themselves. It may be surmised that this interval is no less welcome to the officials who will have to operate the scheme than to those industrial and trade interests at whose request it was granted. But even the most intensive efforts in the next few weeks will hardly succeed in removing the fundamental difficulty with which the price controllers are now confronted. The object of freezing orders, as Mr Wilson explained, was to impose a supposedly "closer and more up-to-date" control over categories of goods the prices of which have hitherto been only loosely controlled. These categories, as an article in *The Economist* of March 6th showed, were those which, because of their inessential and/or unstandardised character, had never been brought within the range of the specific and highly detailed systems of control such as are operated, for example, for most utility goods. These "fringe" categories, which in the past two years have become increasingly important, were therefore controlled only by the principle laid down by the Prices of Goods Act, passed at the outbreak of war. Under this principle, the maximum price for each seller was the prewar price plus the ascertained increase in his cost per unit since that date.

Without doubt this system was honoured more in the breach than in the observance. Indeed, it appears that some small concerns whose operations were suspended during the war have only now discovered, since the new order was published, that their goods had been subject to any price control at all. The new orders, in their efforts to end this situation, go to the other extreme and simply freeze the price of each commodity at the lowest level at which it was in fact being sold by the particular manufacturer during January and February last. Plainly, the Board of Trade was faced with the alternative either of imposing a rigid rule of this kind, which at least had the merit of simplicity, or of trying to do for these fringe products what has been done for the most essential and standardised goods, namely, to introduce specific and detailed schemes for particular varieties of goods or even for particular manufacturers. It is well understood that it would be far beyond the range of administrative possibilities to apply this system to the great variety of miscellaneous goods which the new orders are intended to control.

Attempting the Impossible

Mere price freezing by itself, however, would have been hopelessly inadequate, because any manufacturer or trader could at once have put himself beyond the scope of control by altering the specification of his goods just sufficiently to enable him to claim that he was not making or selling any goods of the type made or sold in the base period. The price controllers had to do something to block this loophole; but, once again, they were confronted with the impracticability of legislating for particular cases in any reasonably flexible way. Where a manufacturer, importer or distributor is now selling goods of a character which he did not sell in January-February last, his maximum price is defined under the order as the cost of his raw materials, landed cost or purchase price (as the case may be) plus the appropriate percentage prescribed in the order for the category of goods in question. But some manufacturers work up their goods from the raw material stage, whereas others produce the same finished article merely by assembling components. If the price-control authorities had tried to legislate for the infinite varieties which occur between these two extremes, they would, once again, have been overwhelmed by the size and complexity of the task. Here too, therefore, they have sought a solution in harsh rigidity, and in general appear to have based the prescribed percentages upon margins which would be reasonable only for firms working high up the production chain, such as the assemblers.

It seems that this really is the *reductio ad absurdum* of price control. The authorities have had to eschew flexible or complicating techniques because they would be unworkable from their own point of view; but this has driven them to a system which is bound to be unworkable from the business point of view. The discussions of the next few weeks may perhaps remove some of the minor oddities (such as the provision under the order which appears to compel firms to grant cash discounts, and at an invariable rate of 2½ per cent, even in cases in which no discounts have been customary in the past), but they can hardly be expected to find a way of avoiding this fundamental dilemma. It is useless, in fact, to waste further time and effort upon this Operation Canute. The only sane approach is by way of an appropriate budgetary and monetary policy which will relieve the pressure upon prices at the source.

Further Rise in Cotton Prices

For the third time within a month the price of Egyptian cotton to British spinners has been raised. Egyptian standard type and Sudan Sakel were increased last Monday by 11d.-12d. a lb. to approximately 50d. a lb., East African by 7½d. a lb. and West Indian Sea Island by 7d. a lb. The price of American type cotton was also raised by 0.90-1.50d. a lb. This latest rise brings the Raw Cotton Commission's selling prices into line with those ruling in the principal producing countries and it is announced that adjustments will be made from time to time to keep home prices approximately related to those in foreign markets.

The point of interest lies more in this statement of policy than in the sharp rise in prices, unpleasant though that may be to the cotton trade. Domestic prices have for some time past

million, in contrast with \$1,435 million for the record output of 1945.

Fortunately, a large part of the aggregate decline in production over the seven years has occurred in non-British output, which declined from 16,753,000 ounces in 1945 to 6,820,000 ounces last year. British Empire production reached its peak in 1941, with a total of 24,145,000 ounces. Last year's total, at 16,830,000 ounces, was some 30 per cent below this figure and was also appreciably less than in 1946; it was the smallest, in fact, since 1934. Last year's decline was, of course, mainly due to the reduction caused in South African output by the labour difficulties of the early part of the year. The dollar value of Empire output last year was about \$590 million compared with about \$845 million at the 1941 peak. The decline in purchasing power which this gold output represents has, of course, been much steeper than the fall in output would alone suggest. As the Economic Survey pointed out, the price of gold has remained fixed but all other prices have risen, so that the purchasing power of the Sterling Area's newly mined gold is now only about one-third of what it was in 1938. In making this estimate, the authors of the Survey naturally included the output of the South African mines as gold available to the Sterling Area. But, in view of the changing relationship of South Africa to that area, it is perhaps questionable whether more than a part of its output ought to be so regarded in future. At the current Bank of England price, South Africa's output was worth about £96 million in 1947 and roughly £103 million in 1946.

Rising Costs of Shipbuilding

The upward curve of shipbuilding prices is not yet spent. Two years after the first World War a rapid fall of about 50 per cent left shipowners who had built at peak prices to compete with newer and cheaper vessels. It is not surprising that the shipowners should be watching shipyard costs with a wary eye. Their caution is reflected in the order books of British shipbuilders, which are still well filled for two or three years ahead, but with an unusual and not altogether healthy preponderance of tanker tonnage, for which there is an exceptional demand. An owner who built a cargo vessel of 9,000 tons deadweight before the war for about £170,000 was fortunate in acquiring a wartime standard ship for about £250,000 in 1945; he is now asked about £400,000 for a similar ship to be delivered no earlier than 1950 at best.

Individual ships differ so much in design that there is no easy method of comparing prices, but in general it can be said that today's prices range between 2½ and 3½ times those of 1938 for comparable ships and are from 10 to 20 per cent higher than a year ago. Four passenger liners of over 28,500 tons gross at present fitting-out are estimated to be costing about £110 per ton; they would have cost less than £50 a ton before the war. A fully refrigerated cargo liner of 10,000 tons gross delivered in 1947 cost about £1,000,000, compared with just over £400,000 in 1938. A normal cargo vessel of about 8,000 tons gross ordered in 1939 and delivered 14 months later cost £369,000; a similar ship ordered in 1945 and delivered 17 months later cost £638,000. Today the cost would be in the region of £725,000 and delivery date would be uncertain. A short-sea trader of about 3,000 tons gross, according to the Liverpool Steam Ship Owners' Association, cost £104,000 in 1939 and £201,000 in 1946, while the latest quotation is £360,000. It has to be conceded that the modern ship is on the average faster than the ship of ten years ago, and an increase in speed means a more than proportionate increase in cost. Standards of crew accommodation are improved; there are more navigational aids and lifesaving appliances, more efficient cargo-handling and preserving gear, and often an increase in insulated hold capacity. Unfortunately, the benefits of more economical running which the new ships might offer are lost to shipowners when port delays all over the world are causing ships to spend 40 or 50 fewer days at sea in the year than they spent before the war.

The cost of a ship is largely governed by the cost of the raw materials and components that go into it. But there is little doubt that the deterioration of output per man-hour in the shipyards themselves has had a marked effect. Shipyard wages have not, on the face of it, increased unduly since 1939; the advance averages about 75 per cent. But the Confederation of Shipbuilding and Engineering Unions is pressing further claims, and hours have already been reduced from 47 to 44 per week, which has not improved output. The uneven flow of material and components has helped to prolong the time it takes to build a ship, and therefore to inflate labour costs and overheads. It is becoming necessary for the shipbuilding industry to observe the

performance of its Continental competitors closely. Working hours on the Continent are not decreasing; output is certainly improving; and even 18 months ago Swedish building costs were some 25 per cent lower than in Britain. This would mean to the shipowner a saving in interest and depreciation charges ranging from about £10,000 per annum for an ocean-going cargo vessel to as much as £75,000 for a passenger liner.

German Potash Bonds

Negotiations which have been proceeding for over a year for the release of funds accumulated during and before the war from the sale of German potash show signs of being successfully concluded. This is the gist of an official statement issued last week by the Trustees of the Potash Syndicate of Germany 25-year Sinking Fund Gold Loans. The statement followed rumours that had been circulating in London to the contrary; it had been believed that the authorities were claiming part of the proceeds to offset against other outstanding German liabilities, but it is now categorically denied that any such suggestion has arisen in the negotiations.

Although various estimates have been made of the funds which have been accumulated, mainly in Holland, to service these bonds, no figure has been given by the Trustees, and none is likely to be forthcoming for the time being. Even at this stage it is possible that the negotiations may be compromised by the difficulty of transferring these funds from Holland, for from the Dutch point of view their transfer would be in the nature of an unrequited export. Nevertheless the latest pronouncement from the trustees has raised hopes to a higher pitch. Yet until a definite statement of agreement is forthcoming, the prices of the bonds in the London market may still be liable to wide fluctuations such as have been witnessed this week. The 7 per cent issue stands at 57 and the 6½ per cent bonds at 52; as recently as March 18th the prices were 48 and 47 respectively, and they have been as high as 58½ and 55 this week. No indication has, in fact, been given by the trustees of the likely method of distributing the funds should they become available in London. The suggestion has been made that the arrears of interest dating back to 1940 and amounting to over £3,250,000 might be paid off, but it is possible that since such a large part of the payment of arrears of interest would go in taxation, some scheme of capital repayment may be under consideration.

Research on Fires

Recent research on the causes and effects of fires was outlined in a paper lately read to the Royal Statistical Society by Mr J. Wallace which described the work of the Joint Fire Research Organisation. The Organisation is a hopeful effort at co-operation between the Government (Department of Scientific and Industrial Research) and private enterprise (the Fire Offices' Committee). The Research Organisation maintains a "fire census" based on full reports from the National Fire Service on every fire which it attends. A library of more than a quarter of a million reports has been accumulated since the beginning of 1944. A sample analysis of a quarter of the reports for 1946 showed the most important cause of fires in buildings to be the spread of fire from grates; ignition of furniture, clothing or similar material from this source accounted for 10.1 per cent of the total of fires and ignition of structural timber under hearths produced a further 7.1 per cent of the total. "Children playing with matches" started 7.7 per cent of fires in buildings; the other main causes were "electric wires and cables" (6.1 per cent) and the spread of fire from chimney fires (4.2 per cent). The census may prove a useful source of fire prevention propaganda.

Mr Wallace gave a comparison between the fire risk in post-war temporary houses and pre-war dwellings. For all types of temporary houses taken together, the average rate was nine damaged houses per 10,000 houses at risk per year, compared with 13 per 10,000 pre-war dwellings. But in the temporary houses 23 per cent of fires, and in the others only 11 per cent, spread beyond the room of origin. Study of figures such as these may lead to conclusions on the effect of post-war materials and types of construction on fire risks. The NFS reports to the Fire Research Organisation do not deal with the financial effects of fires. But here, surely, is a wide field for useful statistical analysis, complementary to work done by the Fire Offices' Committee, which would be of considerable value to insurance companies. The application of statistical theory, especially in probabilities, to the problem of fire premium rating has received some attention; it awaits reinforcement by information of the kind which the Research Organisation could collect.

A WONDERLAND OF BOOKS

"You're laughing" said the Duchess. "I'm not," said Alice, turning her face the other way, "but I can't help thinking how funny you look." The Duchess frowned fiercely. "Sensible people should find something better to laugh at" she said.

"Sensible people often do," replied Alice, "if they read the right books." "But WHERE" roared the Duchess "would they find the right books?" Alice thought that was a very silly question, because everybody knows where to find the right books...

W. H. SMITH & SON, LTD.

Britain's Biggest Booksellers

1500 BOOKSHOPS AND BOOKSTALLS THROUGHOUT ENGLAND AND WALES

With acknowledgments to Messrs. Macmillan & Co., Ltd.

"Glad you like this sherry —it's South African"

It's extremely good. I got some South African wine the other day . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too."

EXTREMELY LIQUID POSITION

Cash on hand, at call and at bankers amounting to £20,455,000 is £4,344,000 higher than last year, and with Treasury bills held represents about 30 per cent. of the total of our demand liabilities, a position which you will agree is extremely liquid. Sterling securities increased during the year by £2,463,000, the new purchases being almost entirely composed of securities maturing within the next five years. Rupee securities are down by £5,347,000, as branches have had to dispose of securities in order to meet the much larger demand for accommodation—advances being up by £6,147,000—occasioned by enhanced prices for commodities and larger turnover. Apart from the sales of securities made in order to finance the demand for advances, it has been considered politic, in these days of exchange control, that non-Indian branches should invest surplus funds in their own territories. This policy has necessitated sales in adjustment of the position and cash is held pending reinvestment. Bills of exchange are up by £238,000 and acceptances to customers by £393,000.

STRONGER DEMAND FOR BANKING FACILITIES

We have under review a year in which, generally speaking, prices continued to rise, and this naturally resulted in a stronger demand for banking facilities and accommodation, which has been spread over the whole field of our activities. On the other hand, conditions in India have been far from easy and the division of the sub-continent into two Dominions brought in its train much dislocation of business and many problems for some of our branch managers. In certain branches, Indian staff practically disappeared, and this has put a great strain on our officers and on the skeleton local staffs who were left. In such circumstances some trading losses were inevitable, but despite these it is again my good fortune to be able to present to you results which we regard as satisfactory. After all necessary reservations and provisions for taxation, possible bad debts, etc., net profits at £475,597 exceed those for the previous year by £23,467. As you will appreciate, the taxation item is swollen very considerably by the increased United Kingdom profits tax of 25 per cent. on distributed and 10 per cent. on undistributed profits and also by the increases in Indian and Ceylon taxation.

THE TWO DOMINIONS

On August 15, 1947, India, as we knew it, became two nations, the Dominions of India and Pakistan. Then, on January 4th last, Burma became a sovereign independent state, and on February 4th Ceylon achieved Dominion status under a new Constitution. To all four countries we wish the best of fortune.

These are big changes and necessitate many adjustments in banking as well as in other directions. I have in mind particularly the need already referred to for fitting our investments and investment policy to the altered situation, and this is one of the problems that have our unremitting attention.

We are also conscious of the need for expanding our banking service to meet the needs these changes create as well as to cope with normal developments. Naturally the Pakistan ports of Karachi and Chittagong are already handling a larger volume of trade and will undoubtedly continue to develop.

We are also not forgetting the expansion of trade in our East African territories, and in 1947 we opened a branch at Mbale in Uganda. In the near future we shall also open at Kericho in Kenya, where we consider we should be able to offer local facilities to our clients. As you know, we are bankers to the Governments of Kenya Colony and the Uganda and Zanzibar Protectorates, and the developments already in train in East Africa under Government aegis may well require further expansion by us.

SCOTTISH POWER COMPANY, LIMITED

THIRTY-EIGHT YEARS' PROGRESS

MR. WILLIAM SHEARER'S ADDRESS

The thirty-eighth ordinary general meeting of the Scottish Power Company, Limited, was held, on the 19th instant, in Edinburgh.

Mr William Shearer, the chairman, in the course of his speech, said: "This is the thirty-eighth annual general meeting of our company, and is the last occasion upon which I shall have the privilege of addressing you as your chairman. On April 1st, that is in less than two weeks' time, all the properties, rights, liabilities and obligations of this company and its subsidiaries will vest in the state."

You may have observed from press reports that the Minister of Fuel and Power has made an Order determining the values of securities of the Electricity Undertakings enumerated in the Order for the purpose of statutory compensation.

The securities of this company are included in the Order and the official values are as follows:—

Six per cent. preference stock, 31s. 4d. per £1 stock.

Four per cent. preference stock, 22s. 4d. per £1 stock.

Ordinary stock, 46s. 2d. per £1 stock.

The statutory compensation payable is in the form of British Electricity Stock, which will be issued direct to stockholders by the Central Electricity Authority.

NEW ELECTRICITY STOCK

On the basis of a 3 per cent. stock at par the stockholders would suffer a percentage reduction in income as follows:—

Six per cent. preference stockholders, 21.7 per cent.

Four per cent. preference stockholders, 16.25 per cent.

Ordinary stockholders, 23 per cent.

PROSPECTS UNDER NATIONALISATION

My views on the nationalisation of the electricity industry have been expressed on numerous occasions, and are familiar to you. It was, and is, my sincere conviction that the creation of a huge state monopoly will result neither in increased efficiency nor economy, which, on the other hand, could have been attained by legislation enabling integration under appropriate Government control, without any dislocation or disunity. We have criticised the underlying principles of nationalisation on the grounds of public policy, but as the Electricity Act is now in force, and in the interests of our country now beset by so many dangers, we must wish this new vast organisation all success, and express the hope that in its operations it will justify the expectations of its sponsors.

HOLDING COMPANY ORGANISATION JUSTIFIED

I am sure you will agree it is appropriate that at this, our last meeting, I should again pay tribute to the memory of the man through whose vision and imagination the foundations of our great business were so well and truly laid. I refer to my predecessor in this chair, the late Mr George Balfour.

You are aware, I think, of the immense benefit which has resulted from the services rendered by this company in providing for our operating subsidiaries the technical and financial assistance which has resulted in such a great measure of development throughout our widespread areas, comprising some 13,000 square miles.

I have referred on different occasions to the attacks made upon holding companies by opponents of private enterprise, as if they were a cloak for hidden and reprehensible practices. At the close of their activities in electricity supply, holding companies may take some little satisfaction from these words of the present Minister of Fuel and Power during the debate on the Electricity Bill: "They" (Holding Companies) "perform important executive and managerial functions; indeed, I think those who would speak in favour of the company form of organisation in the past would particularly point to the good work done by the holding companies." A little later the Minister said: "We wish to take advantage of their expert organisation in this matter."

THIRTY-EIGHT YEARS' PROGRESS UNDER FREE ENTERPRISE

In 1910 the installed capacity of the Bonnybridge generating station was only 1,800 kw. and the aggregate power connected approximately 1,400 kw. The units taken by consumers are given as approximately two millions per annum. There were then 18½ miles of underground cables and overhead lines.

On December 31, 1947, the total installed capacity of our generating plant was 181,756 kw., the connected load was 457,500 kw., and the units sold during 1947 were 473 million units at the low average price of 1.15d. per unit. Our underground cables and overhead lines extended to 5,185 miles.

The capital of this company in 1910 was only £93,174; the capital employed in our undertakings now totals approximately £15,000,000, which, of course, is very considerably less than the present-day value of the physical assets owned.

The density of population in the Grampian areas is 42 only per square mile, and a study of the history of the company refutes any suggestion that there has been neglect of our rural areas, but on the contrary will furnish a testimonial to our imaginative, energetic and rapid development of supplies in these sparsely populated districts. It will also establish that, under peculiarly difficult conditions, there has been long-term development planning. I use the word "planning" in its good old sense, and not to indicate the debased conception implied in its use in these topsy-turvy days.

ELECTRICAL AND FINANCIAL BENEFITS TO HIGHLANDS

I sometimes wonder if it is realised that in the North of Scotland districts we have already expended over £8,000,000, and that we have 51,000 consumers connected to transmission and distribution systems extending to 3,000 miles.

Our contribution to the finances of local authorities in the Highlands in the form of rates was designated in one county as "a mere bagatelle." Actually out of an aggregate of £177,787 local rates payable by our group of companies during the current year of assessment the burden imposed on the Grampian Company totals no less than £102,000, of which the County of Perth receive £46,500 and the County of Inverness £16,400.

The chairman then dealt with the accounts, and paid tribute to the management, staff and employees.

The report and accounts were unanimously adopted.

ABBEY NATIONAL BUILDING SOCIETY

STOCKTAKING AS NATION'S HOUSING POLICY

BURDEN OF TAXATION

SIR HAROLD BELLMAN'S REVIEW

The annual meeting of the Abbey National Building Society was held on the 19th instant at the Wigmore Hall, Wigmore Street, London, W.1. Sir Harold Bellman, D.L., J.P., LL.D., chairman of the Society, in the course of moving the adoption of the report and accounts, said:

Our total assets at December 31, 1947, increased to £84,787,000, as compared with £83,981,000 at the end of the preceding year. The mortgage asset has increased more than proportionately, having risen to £67,967,000, in contrast with £60,221,000 at the end of 1946. Notwithstanding this absorption of surplus funds in mortgage securities, the Society's financial position remains very liquid. Thus, investments other than mortgages amount to £12,637,000, plus cash at bank and in hand amounting to £2,507,000.

Turning to the other side of the balance sheet, the total of share holdings stands at £65,237,000, against £66,378,000 a year ago, with amounts on deposit at £12,402,000, as compared with £10,749,000. Sums not exceeding a total of £5,000 can still be accepted on deposit, the return on which remains at 1½ per cent. with income tax borne by the society—the figure at which it has stood throughout 1947. The rate paid to shareholders throughout the year remained at 2½ per cent., with income tax borne by the Society. Reserve funds stand at £5,978,000, against £5,856,000 a year ago. You will doubtless feel that this represents a valuable element of strength in the Society's financial position.

BURDEN OF TAXATION

It will be seen from the profit and loss account that taxation has again been responsible for a heavy drain upon our surplus revenue. Our liabilities in this respect total £768,005 in 1947, as compared with £680,717 in 1946. The increase has been principally due to a sharp rise in the profits tax—from £35,912 in 1946 to £152,748 in 1947. Since we last met this tax has been increased fourfold, the last revision in the Autumn Budget having had retrospective effect from January 1, 1947. Retrospective legislation can rarely be justified, and as a specific profits tax, with an avowed anti-inflationary objective, it was, in its application to building societies, quite inappropriate.

LARGE INCREASE IN MORTGAGE BUSINESS

No doubt, however, members will regard the amount advanced on mortgage during the past year as the most significant figure revealed by the accounts. This stands at £20,697,000, in contrast with £14,042,000 in 1946.

As a national institution, we draw our mortgage business from all classes of the community and from all parts of the country. Our securities are not concentrated in any region or in dependence on any narrow social or industrial range, but are broadly based upon the economic and family life of the country as a whole. That is a fact of great significance.

OBJECTIVE TO MAXIMISE SERVICE AND MINIMISE PROFIT

You will doubtless appreciate that the building society in its structure is essentially of this age. Based on everyman's savings—since the movement draws its funds from nearly three million people—these are utilised to enable everyman's neighbours to buy their

homes. The thrifty receive no more by way of interest than is necessary to encourage the required volume of savings, which, in turn, means that the borrower is enabled to obtain his loan on distinctly economical terms. For a building society, the linking of the two—the saver and the borrower—provides an opportunity for service rather than profit. Its whole objective, in fact, is to maximise service and minimise profit. All that a building society derives by virtue of its office as intermediary is substantially a narrow margin to cover management expenses. Such is its tradition in this matter that whenever opportunity occurs, borrowers who have in earlier years taken out loans at higher rates of interest than those now prevailing receive rebates of interest, thus giving them the advantage of the lower rates obtained by the newest borrower. Here, then, is an institution with an ideal of public service and a broadly based democratic structure which is entirely in keeping with the spirit of the times. Devised by the man in the street for the man in the street, it has grown with his social progress and looks forward to yet wider horizons.

HOUSING RESULTS SINCE THE WAR

Since the war local authorities in England and Wales have provided to the end of 1947 102,477 permanent houses for letting, together with 113,868 units affording temporary accommodation. In addition, there has been extensive restoration of war damaged property and adaptation of existing premises, and during the same period private enterprise has been permitted to erect 57,646 houses for sale. As a result, it is officially claimed that 531,387 families have been provided with housing accommodation since the end of the war. The official aim is now to concentrate upon the completion of the houses already begun rather than to initiate extensive new building programmes. This will undoubtedly provide the industry with much to do in the immediate future, since 169,000 permanent houses are already in course of erection by local authorities but not completed.

By the time these are completed, however, it is evident that the local authorities, including the contribution of private enterprise, will have provided 700,000 additional units of accommodation since the end of the war. This will clearly go some way towards meeting the more urgent needs for new housing accommodation apparent at the end of the war. It may well be, therefore, that this will provide an opportunity for a comprehensive and constructive stocktaking in regard to national housing policy; a stock-taking carried out with due consideration to the needs of all sections of the community. The present policy was framed to meet an admitted emergency, and was widely supported on that ground.

Once the more urgent needs of the housing shortage have been met, there can be no justification for excluding those who desire to purchase houses for their own occupation from the right to have a reasonable share of building manpower and material allocated to their requirements. This is a matter of elementary justice.

MR STANLEY C. RAMSEY'S ADDRESS

Mr Stanley C. Ramsey, F.R.I.B.A., deputy-chairman of the Society, in the course of seconding the adoption of the report and accounts said:

If the conditions which obtained after the 1914-1918 war can be taken as any guide for action today, the greater number of houses built for sale (always bearing in mind the social side of the problem), the quicker will be the reduction in cost.

Mr Walker, the Director of Housing to the London County Council, the largest local authority with the greatest housing programme in the country, at a conference held by the Building Industries National Council at Folkestone in the Spring of last year, stated that the present cost of housing was then one hundred and seventy per cent. above prewar prices. This is an abnormally high figure, even when compared with the present high cost of living. I think one of the most potent causes of these high figures is the uncertainty which the contractors have had to provide against; uncertainty and delay are the two most expensive risks which accompany the hazards of building. It might have been wiser, and more economical in the long run, if the Government and the local authorities had shared these risks to a greater degree, in place of putting the main burden on the shoulders of the contractors. If the ratio of one house for sale to four for letting—which was the recognised quota until the "dollar crisis" threw the whole building programme out of gear—could be stepped up to parity, the effect in the realm of economics would be immense.

TRIBUTE TO SIR HAROLD BELLMAN

Sir Harold Bellman's many friends will, I am sure, be sorry to hear that he has felt it necessary, after some thirty years arduous work for the Society, to ask the board to relieve him of his executive duties. Your board felt there was no alternative but to accede to Sir Harold's request, and he will be retiring from the position of Joint Managing Director at the end of this year.

In arriving at this decision the board expressed the wish that Sir Harold would continue as chairman for many years to come. I very much doubt myself whether the release from the duties of the joint managing directorship will in any way lessen Sir Harold's work for the Society. Knowing him as well as we all do, I am quite sure that the giving up of these more detailed duties will afford him still greater facilities as chairman to deal with those larger matters of policy which must inevitably accompany the operations of a society of the size of the Abbey National. In proffering his resignation, Sir Harold said he did so with the knowledge that the duties of managing director would be adequately carried on by Mr Bruce Wycherley, with whom he had been working most harmoniously for the last five years; a view in which the board fully concurred.

You will, I am sure, wish to join with me and my colleagues on the board in expressing our grateful appreciation of the great service which Sir Harold Bellman has contributed during his years of management.

The report and accounts were adopted.

MR R. BRUCE WYCHERLEY'S SPEECH

Mr R. Bruce Wycherley, M.C., F.C.I.S., joint managing director of the Society, referred to Sir Harold Bellman's retirement at the end of the present year, and as his colleague who had shared the office of joint managing director since union, he expressed the great pleasure which he had derived from his close business association with Sir Harold and his deep personal regret that the association was to terminate when the present year had run its course. They all recognised year had run its course. They all recognised the unique place which Sir Harold held in the Society and, indeed, in the building society world. That placed a correspondingly heavy burden upon him when he became sole managing director, but, with the co-operation of all concerned, he hoped to discharge the duties of his office to the general satisfaction.

TRADE OPPORTUNITIES

Australia and New Zealand

Australia, New Zealand and Fiji are rapidly developing overseas trade connections.

Both exporters and importers value the specialized foreign banking services of the Bank of New South Wales. Ask your bankers to consult and use

SUDAN GOVERNMENT

The Finance Department requires men, aged 23 to 40, to fill posts on the Financial Secretary's General List for executive duties in the Finance Department or in the Statistical Section of the Department of Economics and Trade. Candidates should possess a University Degree (preferably honours) in Economics or Mathematics.

Appointment will be on the following alternative terms: (i) Long Term Contract in Scale D.1 under which salary scale applicable to present appointment is ££600-660-720-780-852-936, all increases being biennial except the last, which is available after three years at ££852. Cost-of-living allowance payable at rates quoted below. Subject to satisfactory completion of two years' probation, contractual period envisaged ranges between 10 and 15 years, on completion of which candidate qualifies for gratuity ranging between ££3,000 and ££5,500. This gratuity is also payable on suppression of post or replacement by Sudanese before completion of contractual period. Special gratuities in the event of discharge on medical grounds before completion of contractual period. (ii) Provident Fund Contract with salary scale of ££700-770-840-920-1,000-1,100, all increases being biennial except the last, which is available after three years at ££1,000. Cost-of-living allowance payable. Subject to satisfactory completion of two years' probation, period of service not less than seven years or such longer period as will bring selected candidate to age of 38. Candidate contributes to Provident Fund at 7½ per cent. of salary and receives on completion of period a Government contribution equivalent to his own contribution plus interest. In all the above cases, starting rate would be determined according to age, qualifications and experience of selected candidate, credit being allowed for war service. There are prospects of promotion to posts carrying scales with higher maxima. Cost-of-living allowance at rate of ££225 per annum is at present payable in addition to salary. Outfit allowance of ££60 is payable when contract is signed, provided salary under (i) does not exceed ££600 or under (ii) ££700 (££1=£1 0s. 6d.). There is at present no Income Tax in the Sudan. Free passage on appointment. Strict medical examination. Application form and "General Information for Candidates" are obtainable from Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Finance (Statistical)."

SUDAN GOVERNMENT

The Finance Department requires Qualified Accountants, aged 30 to 45, to fill posts on the Financial Secretary's General List for executive duties in the Finance Department or supervision of accounts of another department or audit work. Candidates should be either another department or audit work. Candidates should be either another department or audit work. Candidates should be either another department or audit work. Candidates should be either another department or audit work.

Appointment will be in one or other of the following contracts: (i) Short Term Contract with a salary range of ££900 to ££1,200 (££1=£1 0s. 6d.), plus cost-of-living allowance at rate in force. Starting rate fixed according to age, qualifications and experience. Contract provides for an initial probationary period of two years, on satisfactory completion of which a further period up to four years may be agreed. (ii) Long Term Contract in Scale D.1, under which salary scale applicable to present appointment is ££660-720-780-852-936, all increases being biennial except the last, which is available after three years at ££852, plus cost-of-living allowance. Subject to satisfactory completion of two years' probation, contractual period envisaged ranges between 10 and 15 years, on completion of which candidate qualifies for gratuity ranging between ££3,000 and ££5,500. This gratuity is also payable on suppression of post or replacement by Sudanese before completion of contractual period. Special gratuities in the event of discharge on medical grounds before completion of contractual period. (iii) Provident Fund Contract with salary scale of ££770-840-920-1,000-1,100, all increases being biennial except the last, which is available after three years at ££1,000. Cost-of-living allowance payable. Subject to satisfactory completion of two years' probation, period of service not less than seven years or such longer period as will bring selected candidate to age of 38. Candidate contributes to Provident Fund at 7½ per cent. of salary and receives on completion of period a Government contribution equivalent to his own contribution plus interest. In all the above cases, starting rate would be determined according to age, qualifications and experience of selected candidate, credit being allowed for war service. There are prospects of promotion to posts carrying higher scales of pay. Cost-of-living allowance at rate of ££225 per annum is at present payable in addition to salary. There is at present no Income Tax in the Sudan. Free passage on appointment. Strict medical examination. Application form and further particulars obtainable from Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Accountants—F.S."

SUDAN GOVERNMENT

The Irrigation Department requires a Qualified Accountant, aged 30 to 45, for service in the Sudan, to supervise the accounts of the Department of Irrigation over a period in which a considerable amount of development work is to be undertaken. Candidates should be qualified Accountants with costing experience. Experience in Civil Engineering accounting (with particular reference to construction) would be an added qualification. Appointment on Short Term Contract with a salary range of ££900 to ££1,200 (££1=£1 0s. 6d.), plus cost-of-living allowance at rate in force; at present the rate is ££225 per annum. Contract provides for an initial period of 24 months during which notice cannot be given by either party, and may be renewable by mutual consent for further periods. Starting rate would be determined according to age, qualifications and experience of selected candidate, credit being allowed for war service. There is at present no Income Tax in the Sudan. Free passage on appointment. Strict medical examination. Application form and general information for candidates are obtainable from the Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Accountant, S.I.D."

SUDAN GOVERNMENT

The Mechanical Transport Department requires a Qualified Accountant, aged 30 to 45, for service in the Sudan, to install and supervise an accounting system for the newly created Mechanical Transport Department, comprising a large major repairs workshop and a number of small workshops and service stations. Candidates should be Qualified Accountants with costing experience, preferably in connection with mechanical transport accounting. Appointment on Short Term Contract with a salary range of ££900 to ££1,200 (££1=£1 0s. 6d.), plus cost-of-living allowance at rate in force; at present the rate is ££225 per annum. Contract provides for an initial period of 24 months during which notice cannot be given by either party, and may be renewable by mutual consent for further periods. Starting rate would be determined according to age, qualifications and experience of selected candidate, credit being allowed for war service. There is at present no Income Tax in the Sudan. Free passage on appointment. Strict medical examination. Application form and general information for candidates are obtainable from the Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Accountant, M.T.D."

UNIVERSITY COLLEGE, LONDON

DEPARTMENT OF ANTHROPOLOGY

The College will shortly proceed to the appointment of a Lecturer in Social Anthropology. Salary £550-£850. In the event of applications being received from persons with appropriate qualifications and experience, consideration will be given to the appointment being made in the grade of Senior Lecturer. Salary £800-£1,000.

Duties will commence 1st October, 1948. Applications, to be received by 1st May, 1948, should be addressed to the Secretary, University College, London, Gower Street, W.C.1, from whom further particulars may be obtained.

EDUCATIONAL FOUNDATION FOR VISUAL AIDS

The Governing Body of the Educational Foundation for Visual Aids invite applications for the post of Director of the Foundation, which is to market educational films and other visual material.

Candidates should normally be at least 35 and under 50 years of age on the 1st April, 1948, but applications for exceptionally well-qualified candidates outside these age limits may also be considered. They must have had administrative and organising experience, not necessarily of a specialised kind, and a knowledge and experience of public educational administration and of the organisation of documentary and educational film production would be an advantage.

The successful candidate will enter the salary scale of £1,500 x £100—£2,000 at a point on the range £1,500-£1,800 appropriate to his/her qualifications and experience.

Further particulars regarding the appointment, together with a form of application, may be obtained from the Acting Secretary, The Educational Foundation for Visual Aids, Hamilton House, Mabledon Place, London, W.C.1, to whom applications should be sent not later than 10th April, 1948.

Unsordid Act

MEN lose their capacity for astonishment very easily. Let a thing be mentioned often enough and they begin to accept it as a normal unsensational fact. Few things have been mentioned more persistently in the last ten months than the chances and the hopes and the possibilities offered by the Marshall Plan. Insensibly, people have grown used to it. Its fabulous quality has been stripped away. But this week, since the Plan is no longer just a hope or a chance but a concrete reality—an Act approved by Congress and signed by the President, provisional funds already granted, ships already sailing with supplies from American harbours—this week, it is fitting that the peoples of Western Europe should attempt to renew their capacity for wonder, so that they can return to the United States a gratitude in some way commensurate with the aid they are about to receive. For a day or two, the Marshall Plan must be retrieved from the realm of normal day-to-day developments in international affairs and be seen for what it is—an act without peer in history.

In time of peace, in order to aid nations geographically remote and politically separate from the Americas, at a time of great internal shortages, the United States is ready to give away over \$5 billion worth of commodities as the first instalment of a wider programme, to give them for peaceful economic reconstruction and, save for minor exceptions, to give them without political conditions of any sort. A year ago, the project would have been inconceivable—Congress was then making desperately heavy weather over only \$400 million for aid to Greece and Turkey. Ten years ago, such an initiative would have driven the nation *en masse* into the arms of the America Firsters. And search back as one may through the annals of the United States or of any other Power, there is no record of a comparable act of inspired and generous diplomacy.

So, with their sense of astonishment restored, the peoples of Western Europe must offer their thanks to the American nation who, through their Congress, have now spoken for the Bill. It will be difficult, after this demonstration of international solidarity, to go on repeating the old gibes about American isolationism, the old complacent references to American political immaturity. In recent months, the American public, in its eagerness for information, its sustained interest in foreign affairs, and in its acceptance of positive and onerous international responsibility, is rapidly qualifying for the title of the least isolationist and self-absorbed of peoples. And this development in turn is due, above all, to the work of a small group of leaders, on whose vision and devoted labours the successful development of the Plan has depended, on Mr Marshall and Mr Acheson for the sweep and courage of the initial project, on Mr Vandenberg and Mr Lewis Douglas, among many others, for the skill and patience—and speed—with which it was piloted through both Houses of Congress. This last point of speed is clearly vital. How often in the last twenty years has the reaction of democracy come too little and too late; but this time, the initiative has been captured and held by the party of freedom. It is true that the Russians carry a

large measure of responsibility for the breakneck speed (by American standards) of the debates on the Plan in the House of Representatives, all of which took place after the Communist coup in Prague. But there is no reason to suppose that, without the lesson of Czechoslovakia, the House of Representatives would have given a decision different from the Senate's, for which the ground-work had been fully laid before the seizure of Czechoslovakia, even though the debate might have been larger and more discordant. Nor has the Bill been loaded with military and strategic commitments or diverted in any way from its original fundamentally constructive and pacific purpose. It emerges from its Congressional ordeal as it went into it—as a Bill for the peaceful economic reconstruction of Europe.

*

Nevertheless, there is a warning to Europe in the extent to which Russian action has speeded up the final phases of the Marshall debate. For the sake of peace in Europe, it must be hoped that, as the Plan develops, its pacific character will become more and more obvious, Russian opposition will decline and the effectiveness of Communist opposition be hamstrung by growing economic prosperity. When in a year's time, and two years' time and three years' time, the further appropriations come to be voted by Congress, it should be assumed that the spur of the Communist menace may be less sharp than it is today. Under such conditions, will Congress find the Plan a sufficiently worthwhile end in itself? Will the prospect of continuing a pacific effort of international reconstruction be compelling enough to call forth further dollars?

The answer lies in one thing only—the way in which the European nations themselves go about their work of recovery. Nothing could be more misguided at this moment than to throw one's cap in the air and believe that the "battle for the Marshall Plan" has been fought and won. The Americans are moving up the heavy guns and the mechanised units, but the use the European general staff will make of them cannot yet even be hazarded. The operation that lies

ahead is one that calls for the last reserves of energy and skill in the Sixteen Nations. Energy they must exhibit because the bulk of the productive effort falls on them. Even if all Marshall aid for all four years is added together, it amounts to only some 5 per cent of the total output necessary to meet the targets laid down in the Paris Report. And skill is no less essential, since the use of that 5 per cent may make all the difference between Europe's present halting, jamming economy and the reactivation of the whole machine.

As the latest report of the Economic Commission for Europe points out, the actual recovery of production in Europe is substantial. What is lacking is the free circulation and exchange of wealth made possible by active and balanced trade. The European economy is like a machine with three or four essential cogs missing. These the American 5 per cent is designed to supply. But their restoration is not automatic. In the last two years Europe has already received some \$9 billion and will not receive a larger figure in the next two. If the results in 1949 are to be different from those of 1947, the Sixteen must fulfil their side of the bargain by solving together in the closest collaboration the problems which eluded them as long as they acted separately in sixteen jealous and independent sovereignties. If they so act, there is a chance of the Plan succeeding in Europe. If they do not, their failure will spell the end of Congressional interest and with it, in all probability, the loss of the later appropriations.

It is too early to judge the likely scale of Europe's performance. The final form of the Continuing Organisation is still undecided. No appointments have been made, no names mentioned. So far there is not the material to decide on either the probable scale of effort or the seriousness with which the Governments are facing their new responsibility. But it is not too early to say, with categorical certainty, that the success or failure of the Plan now lies fairly and squarely with the Sixteen Nations. They have been given the tools. It is now for them to finish the job.

Courage Within Limits

WHAT Sir Stafford Cripps ought to have done in his Budget, if he had been a free agent, was to cut the total of expenditure by at least £400 million—finding the economies chiefly in the food subsidies—and then to reduce the burden of taxation by roughly one-eighth or one-ninth while keeping his surplus intact. He came as close as it was reasonable to expect to saying that he would like to do this—"in theory the food subsidies might be inflationary"—but that the trade unions would not let him—"in practice they had in the particular circumstances of today precisely the opposite effect, since they restrained the demands which would otherwise inevitably arise for increased personal incomes." So the average family has to go on being taxed 12s. to 14s. a week more than it need be, in order to get the same sum back in subsidies.

Within the limits set by this major absurdity, the Budget was, in the main, a sound and competent, even a courageous, performance. A particular word of appreciation needs to be said for the form in which it was cast. Not only was the speech a model of lucidity and fairness, it also went much further than ever before in setting the fiscal arrangements of the year in the framework of economic policy as a whole. There can be no question that this new practice is right, and one must hope that, like the amalgamation of the functions of chief financial and chief economic minister, it will never again be abandoned, as it was, inexplicably, by Mr Dalton, the professional economist. The same welcome can be given to Sir Stafford Cripps's innovation of distinguishing between the formal surplus shown in the

orthodox Exchequer returns and the "true" surplus of receipts over expenditure.

The chief risk to be faced in connection with this year's Budget was that the pressure on the Chancellor to give away his surplus would be too great for him to resist—especially since the prospective surplus for 1948-49 turns out, on the official estimates, to be larger than any outside commentators had expected. In the conventional form of accounting and on the existing basis of taxation, it would amount to £778 million. Even in the Chancellor's new and more rigorous notation, the prospective real surplus would be £319 million. By any form of calculation, these are enormous figures, and it took a politician of courage to refuse to allow them to be nibbled at. In point of fact, the various changes that Sir Stafford proposes have the net effect of slightly increasing his surplus, to £790 million by the one method of calculation and £330 million by the other. For this basic element in his Budget-making Sir Stafford deserves the fullest praise. It is, of course, impossible to determine by any absolute test how large the real surplus ought to be in present circumstances. But it is hard to see how it can be put at less than £300 million if even the reduced capital programme is to be carried through without further inflation.

The changes in taxation that the Chancellor proposes, within a revenue total which is to be substantial, also, with one large exception, soundly and certainly right to increase the load on indirect taxes, a few disincentive effects, in order to relieve d

has many. The relief has been given where it is most needed and where it will do most good—that is, in the absence of the long overdue complete reform of the income-tax system (which Sir Stafford did not mention). An increase in the slice of income subject to tax at a reduced rate and an increase in the income-tax concessions that the Chancellor could give and he deserves a grateful word for extending the benefits to the middle class. It is clearly right to put a stop to the open evasion of tax by way of expense allowances. The changes in Purchase Tax are less logical, since on balance they are inflationary; but the balance is a small one.

*

There is, in fact, only one part of the Budget which does not call for more or less unqualified commendation. This is the Special Contribution that is to be levied on the investment income of the richer individuals, on top of their income tax and surtax, as a specific alternative to a capital levy. The effect will be that, for a single year, the combined rate of income tax, surtax and Special Contribution on the top slice of the largest incomes will be 29s. 6d. in the £, or 147½ per cent. A single man who had an investment income of £50,000 in 1947-48 will be liable to pay taxes of £69,243. Different people will have different views about the justice of mulcting rich men; there is no absolute standard of judgment. But the economic effects are another matter. There is a genuine economic argument in favour of dissuading individuals from living on their capital. Consumption expenditures in excess of their income have a definitely inflationary effect; and though the volume of spending by rich people out of capital is probably not large in the aggregate, it is very conspicuous. The ideal way of stopping it, of course, would be by a special tax on expenditure in excess of net income—if anybody could think of a practical way of assessing such a tax. In its absence, it may be argued that to compel the rich to dip into their capital for the tax collector will act as a severe deterrent to making further inroads on it for consumption expenditures and will thus induce some economies. This, presumably, is the economic argument for the Special Contribution. There is some substance in it, but the connection is both indirect and uncertain. But the new tax will have other economic effects as well. It is one more blow at voluntary private savings. The large private investor must have a very stout heart if he does not now abandon the struggle, put all his money in a safe bank and draw on it for his needs. The disappearance of the rich private investor may or may not be an edifying spectacle. But it will certainly be bad for the tax collector, who will have to find his revenue from slenderer purses. And unless some substitute is provided to perform the functions that the large investor has hitherto discharged, it will be very bad for the national economy.

*

If the capital requirements of the country can no longer be financed out of private savings, they will have to be financed out of Budget surpluses. Is it generally realised in the Labour Party that "soaking the rich" leads inevitably, and by a double route, to a higher level of taxes on smaller incomes, firstly because more revenue will be needed to finance the capital programme, and secondly because there will be fewer large incomes to get it from?

These reflections apply to any form of capital levy. But the particular form proposed by Sir Stafford Cripps is open to still another objection. It is a levy which will admittedly have to be largely paid out of capital. But it is assessed upon, and its burden is proportional to, the income received. This means that if capital was invested in enterprise and earned a higher yield, not only does it get no reward for so doing, but it is actually penalised. This can be seen by imagining three men, each with a capital of £1,000,000, the first of whom invested it in enterprise and secured, last year, a return of 5 per cent, while the second invested in gilt-edged securities and got 3 per cent and the third was content to leave his money on current account at the bank. It can further be supposed that each man spent £10,000 on consumption last year. The net effect of Sir Stafford Cripps's new proposal, taken together with income tax and surtax, is that the first man has to draw on his capital to the extent of £29,243, the second of £19,743, and the third of £10,000. In short, the first man is very heavily punished for doing what is surely his duty to the community. There has been too much of this fiscal lunacy in recent years. The iniquitous profits tax is bad enough; but this new proposal beats the band. If there must be a capital levy, let it at least be levied on capital. And if that is administratively impossible, then the conclusion should be to have no capital levy, rather than to do something that runs directly counter to common-sense. In a country whose chief economic problem is a shortage of capital, any form of capital levy must be a very dubious expedient, and this particular levy is about as bad an example of the species as could be desired.

In short, no sort of case can be made for the Special Contribution unless it can be believed to be, as Sir Stafford declared it, a once-for-all expedient. In that case there is no occasion for those who are subject to it to act as they would do in the case of an annual tax. But surely it is childish to suppose that it will be non-recurring. Any tax which is administratively easy and brings in revenue without costing many votes will always be repeated. Investors have been put upon notice that they should so arrange their affairs as to avoid having any income, and the whole national economy will inevitably be the sufferer.

Perhaps it would be wrong to be too harsh on Sir Stafford

If you live

... for twenty-five years—£1,000.

On earlier death, in addition to this £1,000, up to £5,000 payable to your dependants by instalments of £200 per annum (not subject to tax) for the remainder of the twenty-five years.

All this may be secured under the FAMILY PROVISION SCHEME for a monthly premium, at age thirty-five, of £5.1.1 reducing after seventeen years to £3.4.0.

For further particulars, please write to:—

for this new proposal. The trade unions had made it clear that one of their conditions for reluctant agreement to the policy of wage stabilisation was that something should be done to capital, and this was probably the only thing that could be done that would be sufficiently spectacular without breaking the back of the Inland Revenue. But when a veto on any interference with the subsidies is followed by insistence on a capital levy of a harmful type, the combination makes a most distasteful picture. So long as the trade unions refuse to do their plain duty to the community until they have forced the Chancellor of the Exchequer not only to refrain from doing what he ought to do but also to do what he ought not to do, it will be impossible to claim for Labour Socialism that it is a system of scientific, or even of rational, control of economic affairs.

It is a pity that this blot had to be made on what is otherwise a sound Budget. Its excellences can be seen by reflecting on how Mr Dalton would have played politics in the same position, obfuscating and envenoming the issues as he did so—he gave a good example of his style in the second day's debate. But it is only within the context of a single year that this is a good Budget. It does the right thing for the moment; but it makes little contribution to the long-term problem of Government finance. Sir Stafford said that Government expenditures—"all those national activities which we have decided to undertake in

common because we regard them as of importance"—will absorb in 1948 "only" about 22 per cent of the national income compared with 16 per cent in 1938. But the additional 6 per cent must be subtracted either from capital expenditure—which would be disastrous—or from consumption—which will hardly be popular. Moreover, the proportion will all too probably rise as the inflationary element disappears from the national income.

It should be realised by the whole nation that there is no hope of any large reduction in taxation until the scale of Government expenditure is reduced. This year's surplus is fully accounted for by non-recurring items of revenue. Moreover, tax revenue will fall much faster than expenditure when the inflation ends. The public will not always be willing to pay over enormous sums in duties on tobacco and alcohol and it may well be necessary in a few years' time to increase the rates of other taxes if the present level of government expenditure is to be maintained. Sooner or later this question will have to be faced. Which would the British people rather do—accept a permanent continuance of the present, or an even higher, level of taxation, or revise its opinion of the importance of some of "those national activities which we have decided to undertake in common"? Nobody but the people will have the final answer; but it would be a poor service to them to mislead them into believing that they can dodge the question.

Atomic Bombs for Two?

THE effort to find an agreed international method of controlling the use of atomic energy has failed, after two years of debate. If the world were not so harassed with other cares it would be pausing in its work and politics to ponder what this means. For the moment it means simply this: that the United States will probably continue to make atomic bombs, and to pursue the research into the application of atomic power in which it holds such a formidable lead; and that Russia—if it is already in the race—will try very hard to reduce this lead by every means in its power. To make matters worse, it will probably be impossible for either Power to tell how the race is going. That uncertainty, rather than the certainty that atomic bombs exist and can be used, is likely to influence profoundly the international politics of the next decade—if it is allowed to continue. It is a prospect that must deeply disturb the bystanders, among whom are likely to be Britain and its allies of Western Europe. The prospect is in fact intolerable.

It is important to realise just what Uno has failed to do—through no fault of organisation or goodwill. It has failed to find a method of international control to which the Russians and the eastern bloc will agree; but it has certainly not failed to find a method which looks like being workable and fair. In other words, it would almost certainly be possible to provide a large measure of security against the misuse of atomic power for warlike purposes if the Russians would change their present attitude, or if the distrust between them and the Americans could be allayed. For what is the root of the disagreement which made Uno's Atomic Energy Commission last week and its working committee this week throw in their hands at Lake Success? It is simply this: that the Russians will consider and accept no system of international control until the Americans have destroyed their stocks of atomic bombs and subscribed to a pledge never to use atomic weapons; while the Americans refuse to submit their bomb stocks, their production plant and "relevant scientific information" to international inspection and control until a fully adequate system of control has been established.

Put in this way, the diplomatic deadlock looks not unfamiliar;

there appears to be little to choose between the disputants. But when it is remembered that the Americans solemnly offered over two years ago to surrender not only what they believed to be their monopoly of a decisive weapon, but also their superior resources for bringing about the expected revolution in industrial technique through atomic power—matters look somewhat different. And when it is realised that, after months of discussion, the Russians were unable to secure a single independent vote in the Uno working committee in favour of their alternative proposals, matters look entirely different. There must, in any atomic control scheme, be an element of good faith. But the great strength of the American proposals is that they reduce to a minimum the extent to which nations are asked to repose their safety merely in the unsupported promises of other nations. The Russian proposals provide no other safeguard, which would turn the present American advantage into a severe disadvantage, for while any promises given by the United States Government—or by any other Western government—will be policed by the full force of uncensored public opinion, nobody can have any idea of whether a Russian promise is being kept or not. Indeed, it looks as if the Russians are either without the technical knowledge to grasp the significance of the American proposals for international control, or that they really prefer the prospect of an atomic war to any surrender of their national sovereignty. Mr. Gromyko has given the impression that the second explanation is the right one; but, to be quite fair to him, it is difficult to imagine international inspectors having the run of plants and mines in the Soviet Union for a long time to come. Likewise it is difficult to imagine a satisfactory scheme of international control and inspection being established within five, or even more, years, during which time the United States would retain all its present advantages, including a dominant voice in the framing of the scheme. In fact both Americans and Russians are trying to sell one another a pig in a poke; the difference between them being that the Russian pig is probably dead.

It is important to understand what is Mr Gromyko's case, for he may be offering clues to some of the riddles of Soviet

policy. He does not say that the American proposals are technically faulty, or that they would offer no security, or that they could not be enforced; what he says is that the Americans arrogantly insist on their plan and nothing but their plan, that they refuse to outlaw atomic weapons, and that their proposal of an international control agency shows a desire to interfere in the affairs of other states—the same objection as was made to the Marshall Plan.

This summary is no tendentious simplification of what Mr Gromyko said; it is taken from the Tass report of his speech a fortnight ago before the working committee of the Atomic Energy Commission. As if to rub in the negative character of his approach he insisted that "the problem of international atomic energy control is first and foremost a political problem." That may well be true in present circumstances; but it is the Russian attitude that makes it a political, and prevents it from being a technical problem. And Mr Gromyko deepened the despair of his colleagues by saying that his government could not agree in advance to any technical proposals for control that might be made, even if its demand for the outlawry of atomic weapons and the destruction of existing bomb stocks were met by the Americans.

*

If Mr Gromyko is now primarily interested in politics, it is fair to say that the Americans started by being primarily interested in technics. The excellent work done for Mr Byrnes two years ago by the Lilienthal Committee made them confident that they really had a practicable scheme, a scheme so good that they were prepared—with British and Canadian approval—to surrender most of their advantages in the atomic field if the other Powers could be brought to accept and work it. They wanted to take the matter right out of politics by setting up a control agency outside the Security Council, able to decide and act without any interference from the veto of its members.*

The Lilienthal Committee foresaw and rejected in advance as inadequate almost every proposal subsequently made by the Russians. They rejected outlawry of atomic bombs because the development of atomic energy for peaceful purposes and for the production of bombs is interchangeable and interdependent; also because the outlawry of gas warfare did not prevent nations building up large stocks of poison gas. They rejected mere pledges by governments, because existing governments do not trust one another sufficiently to take any comfort from the pledges. They rejected the inspection of all production of fissionable materials, because they found such supervision would demand huge and expert staffs of inspectors employed on pure police work—the kind of work no self-respecting scientist would willingly accept. (The Lilienthal Committee estimated that control of one diffusion plant alone would need 300 inspectors.)

So, by elimination, they came to the following criteria for a scheme of control: it must reduce the problem of enforcement to manageable proportions; it must provide reliable and unmistakable "danger signals" of any misuse of atomic materials; its work must be not merely "negative and police-like," but must also "look to the promise of man's future well-being." Finally, and most important of all, the Lilienthal Committee argued that the organisation of security and the beneficial development of atomic energy be entrusted to the same hands. In other words scientists of all nations must be challenged to do their best in an international effort to prevent the worst uses being made of their work.

The train of reasoning leads directly to the main feature of the American case: an international agency must be formed "conducting all intrinsically dangerous operations in the nuclear

* A useful summary of the various proposals, together with much illuminating discussion of the whole problem, will be found in a pamphlet entitled "Atomic Energy," published by the Royal Institute of International Affairs (128 pp., 4s. net).

field." These operations include the mining and surveying of raw materials, the production of fissionable materials, such as plutonium and U 235, and the use of these to make atomic weapons. The agency would have to control the world's supplies of uranium and thorium; it would itself conduct research both for warlike and peaceful ends; it would have a monopoly of the primary processes of producing fissionable material—that is, of those primary processes which, being common to bomb manufacture and to peaceful uses, are dangerous to leave in national hands; but it would make possible the widest development of peaceful projects by providing all nations with supplies of "denatured" fissionable material—that is, material potent enough to generate power but not to make bombs. The task of inspection would then be reduced to the detection of primary plants and of plants to remove the "denaturing" element—both of which would necessarily be very large plants, easily detectable from the air.

Such a scheme, by reducing inspection to the minimum, reduces infringement of national sovereignty to the minimum. It is the technician's attempt to seduce the politician into a surrender of sovereignty; but it is not seductive enough for Mr Gromyko. The ingenuity of the American proposals is largely due to the fact that the Lilienthal Committee was able to consult the experts who have gone furthest in studying the industrial and military possibilities of fissionable materials. These men had had a memorable experience of wartime comradeship between the leaders of their profession in different Allied countries which has influenced their whole approach to future problems. And it is this conception of an international scientific service which puts the Lilienthal report far ahead of other proposals which have been made. Yet it is only fair to recall that the report pays the most careful attention to the needs of American security; that the international agency it suggests is meant to leave nothing to chance; and that the thought is always with its writers that the American advantage in atomic weapon research is unlikely to be held for more than a few years. Indeed, it is probably this thoroughness which gives the American proposals the authority and air of dogma to which Mr Gromyko objects so strongly.

*

So long as the Russians wish to regard the question as political rather than technological, so long will it remain so—at any rate between them and the Americans. But is there any reason why it should remain so at this stage with other members of Uno? Is there no way out of the present deadlock to be found by members of the Assembly? Apart from Russia, there cannot be more than a handful of nations likely or able to undertake extensive research in the nuclear field; and those nations are likely to remain on terms of friendship and trust—if not of alliance—with the United States. Why then should not the American scheme be adapted to fit the needs of those nations? They can offer important contributions—scientists, engineers, sources of power, space, indispensable deposits of raw materials (for example, in Canada and Africa) and above all common political and professional traditions. Little though members of this group may need protection one from the other, the fundamental security ideas of the Lilienthal report could be tested among them. Moreover, such co-operation and such expansion of the American enterprise in the atomic field would surely make quicker the progress towards applying atomic power to "man's well-being."

To set up such an agency in North America and Western Europe would have obvious disadvantages: it would be denounced as a further move in the division of Europe, as a piece of American imperialism, as a direct threat to Russia. But these charges are brought automatically against any act of international organisation which escapes the Russian veto; and the tackling of technical and administrative problems of international collaboration cannot wait indefinitely on the mood of

Moscow. Moreover, it may well become obvious to the Russians, as time goes on, that the association with the United States of such countries as Britain, France and Holland, will prove a restraining and pacifying factor in American policy; that atomic power controlled by a Western agency is for them less dangerous than atomic power controlled by the President of the United States.

The cue now is surely for the Americans to invite those who accept their control plan in principle to consult further on its execution, making it clear to the Russians that its practicability is to be demonstrated in circumstances where grave political difficulties do not arise. If Mr Gromyko continued to find the

political obstacles insuperable, he would have the consolation of knowing that atomic weapons had become available to several governments instead of to one. For it is this which must worry him and his countrymen—as it worries millions in Europe: the thought that months and years of uncertainty must pass before it is generally known whether there are atomic bombs for two or for one. If there cannot be full international control, and so long as the Soviet Union goes on defending national sovereignty in its curiously reactionary way, let the Americans go on making bombs. But let “kindred souls” share the cost and the know-how—and such security against sudden attack as they provide. For there would be great comfort in numbers.

Offensive Against Monopoly

IT would be pleasant to be able to offer an unqualified welcome to the Monopoly (Inquiry and Control) Bill, which was published last week, and on which some brief comment appeared in last week's issue of *The Economist*. That there should be such a Bill at all is certainly something to cheer about; the attitude of authority towards monopolistic practices, ever since the first World War if not earlier, has been compounded of fatalistic defeatism, condonation, active encouragement and outright prescription. Restriction-mindedness in industry, bred out of successive depressions, lost little ground in the intervening good times; and on several occasions between the wars, Governmental action encouraged or actually enforced monopolistic combination—as when the steel industry was ordered to organise itself into a tighter association as the condition of getting an import tariff, or when the coal mines were forced into a cartel by the Act of 1930, or when the various Marketing Boards were imposed on agricultural distribution. And, of course, wartime concentration and controls generated numbers of organisations with almost unlimited capacities for restrictive mischief. If the present Bill marks a real turn in the tide and the beginning of a reversal of the policy of fostering monopoly and discouraging or eliminating competition, it is a portent that should not be disregarded. The sceptic may be forgiven for saying that he will wait and see whether there is any real change in the Labour Party's—or in the Opposition's—attitude towards restrictionism, and that meantime he will prefer to regard the Bill as no more than a politician's attempt to provide an alibi against the charge of restrictionism. But even if this more cynical view is correct, it is something that the vice of restriction finds it necessary to pay some tribute to the virtue of competition. That, in itself, would be some advance on the position of the 1930s.

It is pleasant, too, to find this Bill emerging as the product of a Socialist Government. Though private monopoly is a universal target of theoretical Socialist criticism, one school of Socialist thought certainly dislikes it much less in practice than in theory. For one thing, it is—according to this school—an inevitable step in the foredoomed decline and fall of capitalism, and any effort to forbid or prevent it is a vain attempt to salvage the unsalvageable (and in any case not worth salvaging) wreck of the competitive system. Moreover, a tightly knit industry, integrated under monopolistic or near-monopolistic control, is a much handier subject for socialisation than one composed of multitudes of small competing enterprises, inconvenient and elusive elements in a programme of *Gleichschaltung*. At the very least, they are more convenient bricks for a planners' edifice. Let capitalism do its own concentrating and the task of its controllers or expropriators will be all the easier. Moreover, the trade unions find some attractions in monopoly. It

is easier to negotiate with a tightly knit employers' association; the closed shop and the cartel are obvious partners. But it is another school of thought in the Labour Party, a more liberal school, whose hand can be discerned in this attempt to make private enterprise fit to live with instead of fit for suppression; and the ascendancy of that school can be welcomed without reservations, even if its products can not.

*

Reservations, indeed, there certainly must be about the Bill. The machinery of investigation, for one thing, is weakened at the start by the provision that the Monopoly Commission may only investigate at the specific direction of the Board of Trade—a restriction for which it is hard to think of any good excuse, and which might well prevent the investigators from following trails which lead across the arbitrarily defined frontiers of industry. More important is the glaring and specific exemption, from the unwelcome publicity which is the chief result to be expected from the Commission's enquiries, of trade union activities and also of monopoly practices “expressly authorised by or under any enactment”—a provision which presumably places outside the Commission's terms of reference not only the whole body of nationalised industry but also the appalling jumble of restrictionist regulation dating back to the inter-war period and the founding of the Marketing Boards. As it is precisely in these fields that some of the most myopic and idiotic examples are to be found, the Commission's usefulness is grossly diminished by their exemption. The reasons why the trade unions have been ruled out, either directly as subjects of investigation or indirectly as affecting wage contracts in firms being investigated, are obvious enough, but none the better for that. It would be easy for some future Government, less firmly under the trade union thumb, to amend the Act so as to do away with this unsavoury piece of political favouritism, were it not that the Conservative Party's proposals, published on the day before the Bill, for some inexplicable reason make the same exemption. But a Conservative Government would presumably not feel the same hesitation in turning the Commission loose to report anything “contrary to the public interest” about the conduct of the British Transport Commission, the National Coal Board, or the British Electricity Authority.

But the Bill has a less easily remedied weakness, a weakness constitutional in every sense of the word. The Commission are required to investigate and to report on practices contrary to the public interest; the relevant Minister is given power to act on the receipt of their report; but no principles whatever are laid down about what does and what does not constitute an injury to that interest. Such and such a practice, say,

visibly and undeniably raises prices. Is it against the public interest? But it ensures stability; and regular employment; and the survival in good trim of key firms in a key industry, which ought not to be irresponsibly imperilled by competition. Indeed, is competition itself in the public interest? It has come to be regarded by wide sections of the public as so dangerously anti-social that the word “competition” is rarely allowed nowadays to appear in public without being safely handcuffed to one of its recognised guardian epithets—“ruinous,” “wasteful,” or “cut-throat.” Surely, it will always be argued, the public interest, though superficially impaired by a price-fixing (and price-raising) agreement, is, in fact, well served? This is an argument likely to appeal to Commissioners appointed by a Government most of whose members reject with shudders of intellectual horror the notion that the public interest can possibly be indicated, still less served, by movements in prices. A Commission doomed to grapple, industry by industry and firm by firm, with special pleading of this sort, unassisted by any standard of reference or precedent whatever, will have to be extremely able and pertinacious and extremely lucky to accomplish anything at all in the way of coherent judgment—let alone recommendation to action—except in the most glaring cases of public exploitation.

But if the Commission lacks the moral support and practical guidance of an agreed body of principle, the Administration is, on the other hand, given powers of disquieting breadth and vagueness. Clause 10 of the Bill provides that the relevant Minister (who may be the President of the Board of Trade, the Minister of Supply or Food, or any one of half a dozen others) may take any action that he sees fit—with explicit exemption from having to follow in any way the recommendations, if any, of the Commission—in respect of matters concerning which the latter has reported the possible danger to the public interest. He can discriminate between different firms and industries precisely as he pleases. He can permit the continuance of dubious practices on such conditions as he chooses to impose—and one can imagine the sort of shady horse-trading which might follow—a closed-shop agreement bartered against a conditional sales agreement, a monopoly grant as the reward for moving to a politically desirable area, and so forth. Like the Commission itself, the Minister is given no guiding principles whatever. His Orders must, it is true, be approved by affirmative vote of each House of Parliament before they have the force of law; but given the present congestion of Parliamentary business and the present rigour of Parliamentary discipline, everyone knows how much that safeguard is worth. Two of the basic principles of justice used to be a certain law and an impartial tribunal; Clause 10 substitutes for this and arbitrary powers of economic life and death, to be wielded by a political Minister according to no known principle. There are all too many precedents for this sort of thing, but they do not make it any the more justifiable; on the contrary. There is too much scope already for pressure groups; in any other country but this the outcrop of downright graft would already be great; and even here there is such a thing as putting too great a strain on the integrity of men in public life.

*

The Bill, in short, does at once too much and too little. The main public service that can be rendered at present is in establishing and broadcasting the facts about monopoly and restriction and their effects. In this respect the Bill is far too timid. It is difficult to see why any limits whatever should be placed upon the ascertainment of the truth. The Commission should neither be limited to the instructions it receives from the Board of Trade nor debarred from entering any field. Nor should there be any restrictions upon the publication of its findings, save such as are genuinely necessary to protect trade

secrets or national security. Who exactly is it who is afraid of the truth?

But when it comes to the matter of action to be taken on the facts, the Bill is rushing at its fences. Before anything effective can be done by way of legal action against monopoly and restriction, two preconditions are necessary. The first is that there should be an aroused and articulate public opinion, conscious of the dangers of restrictionism and ready to support prohibitive action. So long as the majority of the public believes, as it does now, that restrictionism (called by politer names, of course) is good rather than bad, no Commission and no Government will be able to do more than nibble at the problem. The second condition is that some principles of economic justice should be drawn up, so that business men may have an idea, as precise as may be, of what they may do and what not, and so that the enforcing authorities may have something other than their own prejudices to guide them.

*

Neither of these two conditions exists today. The first step in any campaign against restrictionism should therefore be to create them; and the way to do that is to provide the factual raw material for an educational campaign. After the Commission has provided enough facts, it, or some other body, should be given the task of sifting them and of distinguishing and defining those kinds of restrictive practices—for example, the barring of entry to newcomers or the organised destruction of productive capacity—which can be definitely labelled as *prima facie* harmful to the public interest. The next step would be to pass an Act declaring these practices, as defined in the Act, to be illegal and empowering either the Public Prosecutor or any aggrieved party to proceed in the courts against any business firm indulging in them, but also empowering the Monopoly Commission to issue a licence of exemption, where a case for doing so is proved to its satisfaction. By this means, the impartiality of the law could be invoked, while room could still be left for special cases; but the onus of proof would be put where it belongs, on those who wish to practise restriction. This programme of action would be slower than the Government's Bill. But it would be surer and it would be juster. Under the present Bill, the most probable contingency is that nothing effective will be done at all; but if any Orders are issued, they will be at best arbitrary *ad hoc* expedients, and at worst they will sink to downright political jobbery.

The best of Bills cannot, in any case, solve the problem of anti-social monopoly power overnight or next year. The experience of the United States, where opinion and law alike have always been solidly opposed to monopoly, is enough to show that when strong incentives to restrictionism exist there will always be under-the-counter deals, ingenious wriggings through legal loopholes, and tacit understandings on which no injured party can lay a finger. But the striking thing about the United States is not the extent to which competition is inhibited, but the extent to which it is vigorously and flourishingly carried on. How far this difference is due to the legal provision, how far to sheer temperamental difference, remains to be seen. The two naturally interact, but there are few symptoms in America of that acquiescence in restriction, that fear of dynamic change, that conviction that competition is a Bad Thing, which in England characterises not only monopolistic big business but practically every class of society. Any delay imposed on the offensive against monopoly by the need for prior investigation will be time well spent if it gives opportunity for public opinion to form itself along more rational and less defeatist lines. An informed and determined public opinion is an essential constituent of the campaign. For business firms cannot be made efficient, any more than men can be made honest, by Act of Parliament alone.

NOTES OF THE WEEK

Tragedy at Gatow

The tragedy at Gatow, where an irresponsible Soviet pilot, "frolicking" an incoming British plane, cannoned both himself and the other aircraft to destruction, is a bitter and urgent warning to those who paddle in the shallows of violence that they may find themselves sucked out into the main torrent. The Russians do not want a war over Berlin, but they are going exactly the right way about creating such tension that the relaxation of it by peaceful means becomes almost impossible. They are fortunate that the victims of their irresponsibility belonged to a nation of strong nerves and steady temper. British officials on the spot and the British Government have handled the affair with exemplary firmness and discretion. As it is, the likelihood is that some agreement over traffic in and out of Berlin may actually be accelerated by the Gatow disaster, but the incident might easily have ended in an ugly international brawl.

The folly of Russian conduct is rendered even more inexplicable by the fact that the only aim it can presumably be designed to achieve—the removal of the Western Allies from Berlin—must be directly frustrated by the events of the week. No Western Power can now afford to be "frightened" out of Berlin, and yet hope to maintain any prestige in the eyes of the German people. Nor is it simply a question of prestige. The Germans in the Western sectors of Berlin are in a special sense the West's responsibility. They have been encouraged to stand up against Russian threats and Communist encroachment. A special plebiscite, arranged by the Allies for the Socialists among them, was held in 1946 to enable them to express their determination not to accept fusion with the Communists in the Socialist Unity Party. If they are now abandoned, it will be impossible to persuade the Germans at Frankfurt to take risks, to accept responsibility, to identify themselves with Western Europe. Berlin has become a test of the Western Allies' staying power and of the extent to which the peoples of Western Germany can rely on them. Thus the Russians have succeeded in creating the one situation in which at any price the Western Allies will remain in Berlin. Was this the aim of their diplomacy?

Robertson at Dusseldorf

An Allied stand in Berlin is made all the more essential by the revolutionary character of the speech made by Sir Brian Robertson at Dusseldorf on Wednesday. His engagement to speak to the state assembly (*Landtag*) of Rhine-Westphalia had been arranged many weeks in advance, but Sir Brian and his advisers clearly felt that the events in Berlin had made the time ripe to speak in more radical terms of the Western Allies' response to Soviet pressure. And the response was radical indeed.

The Western Powers have now burned their boats. The Commander-in-Chief told the Germans in blunt terms that while there was probably no risk of war, the division in Germany was absolute for the time being, and that the Germans must now choose whether to work fully with Western Europe for their own regeneration or hang back and play into the hands of the totalitarians, the mock-democrats of the East. The advantages the West had to offer were twofold—the Marshall Plan, in which Western Germany was called upon to play a decisive part, and the Western Defence Pact, which registered the Western Powers' determination to resist Eastern encroachments. These were the prospects—of security and reconstruction—offered the German people. Hitherto they had proved unwilling to accept the responsibility the Allies were ready to transfer to them. Now the time for hesitation had passed. "Make up your minds to stand together . . . then you need have no fear. The prospects are good. Go forward and seize them."

It is clear that this radically new departure in Western policy is about to be given concrete shape. The Germans will presumably be given a greater share in the workings of the Marshall Plan and something more closely resembling a government will be established at Frankfurt. But the effectiveness of all such moves will depend for the time being on one thing only—the Germans' confidence in the seriousness of the Allied stand. In this context, Berlin is vital. A retreat there would shatter the prospects at Dusseldorf, Frankfurt or anywhere else in the Western Zones.

Chartist Centenary

A hundred years ago today the monster demonstration of the Chartists, announced as a gathering of half a million people who were to assemble on Kennington Common and march on the House of Commons, proved a miserable failure. In view of the revolutions which had broken out all over Europe, the authorities had expected and were prepared for serious trouble. The Duke of Wellington was in charge of a large body of troops and practically the whole of the gentry had been enrolled as special constables—Prince Louis Napoleon among them. But when the day arrived only fifty thousand persons assembled at Kennington; the march on Westminster was hastily called off, and the Charter with its numerous bogus signatures was taken to the House of Commons in a cab.

That was the end of Chartism, but it was only the beginning of the age of Liberalism, which during the century which followed adopted one after another of the institutions demanded in that prophetic document. Four of the six points have become incorporated in the constitution—the ballot, adult suffrage, payment of members, and the removal of all property qualifications. A fifth point, the creation of equal electoral districts, has not proved practicable in the strictest sense, but it has been generally recognised as the norm towards which the distribution of electoral seats should approximate. Indeed, it is the main principle underlying the changes in the distribution of seats contained in the Representation of the People Bill, at present before the House of Commons. Only one point, that of annual parliaments, has failed to become a living issue.

Chartism, though it was essentially a working-class not a middle-class movement, and though it contained a lunatic fringe of quasi-revolutionary elements, was radical rather than socialist. What the Charter demanded was merely an extension to the masses of the political status which the middle-classes had achieved in the Reform Bill of 1832. It thus formed a strange contrast to that other political manifesto which first made its appearance in the year of revolution, the opening words of which—"A spectre is haunting Europe—the spectre of Communism"—have a strangely appropriate ring today, when, after the lapse of a century, the principles embodied in these two documents stand incarnate as Democracy and Communism, confronting each other in Western and Eastern Europe.

Mr Bevan Ends the Deadlock

Mr Bevan's move to end the deadlock over the health services will certainly be welcomed as a reasonable, if belated, act. The personal antagonism between him and the British Medical Association had reached such a pitch that it was difficult to see how negotiations could be reopened. Fortunately the intervention of the Royal College of Physicians gave him the opportunity and he has taken it handsomely without any camouflaged attempt at face-saving. Indeed, for the first time during these long drawn out negotiations he has shown a proper appreciation of the fact that the doctors' opposition has been inspired, not by mere factionalism, but by genuine concern for the interest of the public.

On two fundamental issues Mr Bevan has gone the full way to meet the doctors' objections. The first concerns the opposition to a full-time medical service. The Royal College in its first resolution had suggested that the co-operation of the medical profession in running the National Health Service might be secured if the Minister of Health made it clear in an amending Act that a whole-time service would not be brought in by regulation. Mr Bevan has accepted this suggestion. He has also given way on the question of the basic salary in a proposal which is more than an uneasy compromise. The basic salary is to be applied to new entrants into practice for a period of three years, after that each doctor will decide for himself whether he will give it up and pass to a system of plain capitation fees or stay as he is with the basic salary plus a lower capitation rate. Mr Bevan has also promised to set up an expert legal committee to advise him on the disputed effect of the Act on partnership agreements, the results of whose findings will probably need embodiment in a short clarifying Bill.

Mr Bevan's proposals, which were announced simultaneously in the House of Lords, were wholeheartedly welcomed by Lord

Moran, who stated that the Minister had boldly met the doctors' main fears and expressed the hope that he would be rewarded by the loyal support of all reasonable members of the profession. It is now up to the BMA to take advantage of the offer of a new deal. It has become clear since the doctors' plebiscite that the BMA is not certain what to do with the weapon given to it by the large vote against the health service. Beyond asking for a further fund from the profession, it appears to have been reluctant to act. Now any hesitation that it may have felt should be ended. The way to full and final agreement has been opened by Mr Bevan and the BMA can no longer, if it wishes to retain any sympathy from the public, continue to be implacable.

The Building Slump

At any ordinary time the swing from boom to slump in the house-building industry, which is now taking place, would be a matter for alarm. That it is not is yet another measure of the abnormal condition of the country's economy. This subject is blazoned by Labour Ministers, and references to reductions in the housing programme are made obliquely or in careful under-emphasis. Even in the *Economic Survey for 1948*, which is to be discussed in this week's Budget Debate, the savings in capital investment and in manpower which will follow the reductions are only lightly touched upon. Yet if the Chancellor of the Exchequer had cared this week to give the Government credit for trimming the nation's coat at a point where savings were great but the Government's reputation most vulnerable, he could have scored a bull point.

Ever since the cuts in the country's capital programme were decided last autumn it was anticipated that the building programme for houses would result in changes in the distribution of manpower and resources. But the Government camouflaged their policy in so much talk about finishing the 350,000 houses under construction or tender, and laid so much emphasis on the necessity for reductions being due solely to the impossibility of importing timber, that the effects of their pronouncements were imported to the public—and one might almost suspect to themselves. It is only the publication of the monthly housing reports, of which those for February have just appeared, which reveals the true position.

The change is very marked. After two years, during which the plus signs crept falteringly up after one another and the curve of those houses under construction climbed rapidly and the curve of those completed less rapidly, the trends are now reversed. There have been so many misleading deviations in the housing figures that until now it has been unsafe to make any firm judgment on the altered trends, but the most recent returns make the movement unmistakable. With the exceptions of the number of houses completed, for which the figure is slightly above that for January, minus signs have now succeeded the plus signs without any doubt. The number of houses under construction has now fallen steadily from its peak in November, and those being started each month is falling also. For example, during the first nine months of 1947 an average of 11,000 permanent houses was started each month, but the figure for February is only 6,570. So far as the building

* Cmd. 7365, 7366.

of traditional brick houses is concerned, the change is even greater, for the fact that the subsidy for non-traditional houses ceased to be payable after December, 1947, resulted in a scramble to get the non-traditional schemes approved before the end of the year. Consequently, it is the brick-built houses which have taken the brunt of the fall, and there are very real fears that an even flow of building even on the reduced programme of 15,000 houses a month, will not be maintained unless there is a quick increase in the number of traditional houses started in the next few months.

The Finns Pull It Off

It is not only in Finland that the moderate terms of the Russo-Finnish treaty of mutual assistance will be received with surprise and relief. The Finns have gained both the points they considered vital. Russian forces may give military assistance to Finland only "subject to mutual agreement between the contracting parties." Finnish forces may be used only for the protection of Finland. In these respects the treaty belies the fears raised by Mr Stalin's reference to a treaty "analogous to the Russo-Hungarian or Russo-Rumanian agreements." It is also unlike these instruments in being operative in the first place for a period of ten years, while the alliances between the countries of the eastern bloc are to last for at least 20 years. The contracting parties pledge themselves "to observe the principle of the mutual respect of sovereignty and integrity and that of non-interference in the internal affairs of the other state." It is true that this clause appears in Soviet Russia's other defence treaties—with results already demonstrated—but the Finns clearly stand a better chance of turning pledge into reality.

There is in fact a good chance that the general elections in July will be fair and free. If so, there is no doubt that the Communists will lose heavily. There is equally no doubt that this must be plain to the Soviet Government, which seems to have acquiesced in a probable weakening of its supporters. This is not the least puzzling aspect of the whole interlude in the course of which the Russians appear to have gained practically nothing by their initiative in demanding a defence treaty. The motives behind Russian policy and the counter-actions of the Finns can only be guessed at, but the clue to the treaty may perhaps be found in the preamble to the pact in which it is stated that the agreement has been reached in consideration of "Finland's desire to remain out of the conflicting interests of the Great Powers." Finland lies off the great strategic routes of Europe. As a springboard against Russia for any Atlantic Power, it is remote and isolated. The Russians may therefore be content to ensure its neutrality. And if they did in fact ask for more during the recent negotiations, it may be that the Finnish delegation made clear their country's readiness to fight in order to maintain its internal integrity. With Europe like a tinder box and the Americans growing increasingly impatient, a war of self-defence in Finland could easily be the signal for a general struggle. This the Russians may not

munists, and the war has been gradually changing its character. Formerly, the Communists confined themselves to guerilla operations, raiding and destroying communications and getting control of the countryside, but avoiding pitched battles and attacks on well-garrisoned large towns. But during the last few months they have combined the mobility of their guerilla days with a new hitting power which endangers strongly held positions. In Manchuria they have captured important towns, and even in North China they have been resorting more and more to direct attack after receiving reinforcements from their more heavily armed Manchurian comrades. In Manchuria the Communists have now plenty of arms; in addition to the Japanese arms dumps which the Russians allowed them to take over in 1945, they have made large hauls by capture from the Nanking armies and hold several industrial centres where they are able to produce arms themselves on a considerable scale.

The main military cause of the Government troops' lack of success appears to have been their lack of mobility as compared with their opponents. They are not short of manpower and not seriously short of equipment, but they seem to be incapable of rapid movement and concentration at vital points. This is no doubt partly a heritage of the war against Japan, which for the Chinese regular army was essentially a war of "resistance"; there was never really a question of building up an offensive striking force. The Japanese then had superior mobility, but could never use it decisively in China, partly because they had other fish to fry elsewhere, but even more because of the hostility of the population towards them. The Communists with their zealous local supporters are able to take much more advantage of their capacity for swift manoeuvre, and in this respect the problem of Nanking is as much political as military; better organisation and training with the aid of American military advisers and transport may soon provide the Government with a "new-model" army of improved quality, but it will still be at a disadvantage as long as the Communists retain as much peasant support as they have had up to now. Perception of this fact has led the Foreign Affairs Committee of the American House of Representatives to advocate an expenditure of funds for "rural rehabilitation" in China, to be administered, not by the Chinese Government, but by a mixed Commission of unofficial Chinese and Americans. Such an invasion of Chinese domestic administration will be little to the liking of Chinese nationalists of whatever political camp, but the Nanking Government after its recent reverses is not in a strong position to refuse, and the Americans have undoubtedly discovered the most effective and least costly method of fighting Communism in China.

* * *

Co-operation in East Africa

The first meeting in Nairobi last Tuesday of the Central Assembly for East Africa begins a new phase in economic co-operation between colonies which may have far-reaching results throughout the Empire. The formation of the Assembly marks the last of a number of measures which were put into operation at the beginning of this year to lessen the cost and to improve the efficiency of various services in Kenya, Uganda and Tanganyika. The services, chief of which are transport, pests and telegraphs, production and supply, and scientific research, were formerly administered by each colony independently. The waste of manpower and money was great. The new measures set up an East African High Commission, composed of the Governors of the three colonies, to administer these common services jointly, an executive organisation to carry out the orders of the Commission, and a Central Assembly to act as watch-dog over the Commission.

The economic measures are all obviously necessary, but when these measures were originally proposed by the Ormsby-Gore Commission in 1924 the different races in East Africa—Europeans, Africans, Arabs and Indians—each feared that economic co-operation would mean political subordination. This fear persisted and proved the biggest stumbling block in the way of economic efficiency. It has now been overcome by strictly defining the powers of the administrative authority and by giving the people of each colony an equal voice in their joint affairs. No one colony has a superiority over any other in the Central Assembly, and any extension or alteration of the Assembly's powers—and of the powers of the High Commission—must be referred back to each local legislature for approval.

All in all, the present compromise solution of the different problems has every chance of success. The powers of the Central Assembly are limited, but it constitutes a real start in the effort to make East Africans territorially rather than racially conscious.

There is no question of political fusion and the economic advantages should benefit all. As an additional safeguard the whole constitution is to be reviewed in four years' time, by when this imaginative experiment should have proved its worth.

* * *

"These Avaricious Hordes . . ."

Middle-class parents whose pockets or whose principles would willingly persuade them to send their children to state schools will applaud Mr W. J. Rodda's condemnation, at the conference of the National Union of Teachers at Easter, of the Regulations which lay down the target of classes of 30 for secondary schools, but 40 for primary schools. Those parents, who would be ready in the interests of social equality and in the face of crippling income tax, to support their local schools may well give up the attempt, when they find a classroom filled to capacity by 40 youngsters. Neither happiness nor education are founded by this means, and as a result the non-state schools have waiting lists, and the gulf between state and non-state schools is widened.

The official view, which is surely wrong, appears to be that small children can be taught in hordes, but that older children need more individual attention. The experience of private schools, where expense matters less, is all the other way: the bottom forms are almost always small. Only when teaching becomes more complicated and the claims of examinations and of real scholarship demand it, is there again an acute need for smaller classes. If, because of its cost, or because of the shortage of teachers, some classes must have over 30 pupils, surely the bulge should be at the gregarious period of a child's development, leaving the first stages and the last to be dealt with in smaller groups?

It must, nevertheless, be admitted that however mistaken the aim of classes of 40 may be, in practice local authorities are labouring under severe difficulties in staffing the youngest classes. There is a shortage of women teachers, which is acute as far as the infant classes are concerned, owing partly to the rise in the birth-rate which is just beginning to swell the school population at the bottom, partly to the relatively small number of women who offered themselves for training under the Emergency Training Scheme, and partly to the preference of the women teachers themselves for teaching older age groups. So severe is the shortage that the Ministry of Education has recently produced a scheme for rationing women teachers among local education authorities, and some authorities are experimenting with using men even in the lowest classes. This state of affairs gives an added piquancy to the views expressed at the conference of the National Association of Schoolmasters last week-end:—

These avaricious hordes of women have already staked their claim on our field, and the sooner they are smoked out of that field the better it will be for the boys of the country.

This sentence rings with the phraseology of a bloodcurdling schoolboy thriller. No penny dreadful could have summed up the sentiments of the "closed-shops" more succinctly.

Shorter Notes

It is welcome news that the recent successful application for a writ of *habeas corpus* by an ex-Army officer who was court-martialled in Germany a year after his demobilisation has resulted in an amendment to the Army Act of 1871. An amendment was to be moved by the Secretary of State for War on Friday by which offences which are punishable by the law of England when committed in England may be tried in the civil courts. It is astonishing to find that the belated and illegal arrest of this Army officer was not an isolated case: the result of the successful application for the writ was that several other proposed courts-martial were dropped.

*

Two inaccuracies occurred in a Note entitled "What to Publicise?" in the issue of March 27th. First, it was stated that "next year the Central Office of Information will be spending £4,500,000 which is £870,000 more than the estimate for 1947-48." The figure of £4,500,000 should have referred to 1947-48; the increase of £870,000 is in comparison with the estimate for 1946-47. The estimate for 1948-49 shows a fall of some £365,000. Secondly, it was stated that "to the current figure should be added expenditure by individual departments amounting (according to Mr Boyd-Carpenter) to nearly £3,000,000." Mr Boyd-Carpenter did not make it clear that, of the £3,000,000, nearly £1,700,000 was included in the COI figures.

AMERICAN SURVEY

The Beacon is Lighted

(From Our US Editorial Staff)

THE Congressional Steeplechase course, like that of the Grand National, must be covered twice. On the first circuit a piece of legislation is authorised; on the second, the funds to make it effective are appropriated. The European Recovery Programme has only been round once and its passage through the House of Representatives only gets it over the water jump for the first time. It must now go out into the country again and through all the wearisome procedure of hearings before the Appropriations Committees of Senate and House, ending with votes on the Appropriations Bills, conference to iron out differences between the two Bills and final adoption by both houses of an agreed version.

But, also as in the Grand National, there are times when the first round is the most important, and all dangerous opposition has been eliminated before starting on the second circuit. This has happened in the case of ERP. The overwhelming majorities it was given in Senate and House (over four to one in both cases) have made it impossible for the Appropriations Committees to do more than minor damage. There are, as far as can be seen, no riderless horses or doubtful jumpers who might bring the favourite down, though it can still slip up while rounding the Canal Turn of the portly Mr Taber, Chairman of the House Appropriations Committee.

There was little surprise when ERP passed the Senate in a form to which nobody could take exception. During the hearings in the Foreign Relations Committee it had been evident that Senator Vandenberg would have the support of most of his Committee in resisting all attempts to include harmful amendments. When the Bill was debated on the floor he did not have to do all the work himself; others—Senator Lodge in particular—helping him to carry the burden day after day. But nobody knew what would happen to it during debate in the House. The Foreign Affairs Committee had never worked the floor.

The debate in the House was, therefore, a pleasant surprise and a personal triumph for Representative John Vorys of Ohio, majority leader on the Foreign Affairs Committee. He enjoyed, of course, every assistance from Russian policy in Czechoslovakia and Berlin. The veteran Chairman of the Committee, Representative Charles Eaton of New Jersey, was there to help in critical moments, but he left the tiring job to Mr Vorys, who never let the situation of floor leadership to Mr Vorys, who never let the situation get seriously out of hand. Only the unfortunate decision to include Spain, by name, among those which could join the participating countries in the future—which Mr Vorys accepted and for which he voted—can be counted against him. And that was the first amendment removed when the Committees of the two houses met in conference.

There are amendments left in the Bill which would have been better omitted, such as the Mundt amendment on trade with Russia. But there is nothing which orders the Administrator to make mistakes. At the worst, the amendments only permit him to do so. His job is made more difficult because Congressmen are given the chance to complain that he has failed to make them. But the effect of these amendments will probably be more than offset by the decision in conference to drop the idea of a special "watchdog" Committee—passed by the Senate as a sop to Representative Herter, but shouted down in the House—and the decision to substitute for it a joint Committee of the four Committees—Foreign Relations and Appropriations from the Senate and Foreign Affairs and

Appropriations from the House—who will have the responsibility over the next four years for continuing and financing the programme. The Administrator will be able to work closely with the Joint Committee and, by consulting it regularly and keeping it fully aware of all he does, make his annual task of getting new funds much easier.

As it would be unwise to count on Russia giving assistance at the beginning of every year on the same scale as she has done during the birth of the programme, its fate in future will depend on the Administrator's ability to prove that it is doing what Congress intended it to do. The responsibility now moves from Mr Marshall and Senator Vandenberg, from the State Department and Congress, to the newly-appointed Administrator, Mr Hoffman and his staff. A great deal depends on him, because the Act, as finally adopted, restricts him very little and gives him a wide field in which his own decisions of policy will be of the greatest importance. His first problem will be to decide what he wants from the European organisation and Mr Hoffman has made it clear to the Senate Foreign Relations Committee that he expects a great deal. He believes in the potential strength of an integrated Western Europe and will no doubt use his powers to further its realisation. Since his appointment he has repeated that his great hope lies in what the Sixteen Nations can do for each other.

*

His also will be the decision whether the programme will be primarily one of relief or whether greater emphasis is placed on capital goods. In spite of the Administration's insistence on the recovery aspect of its plans, the relief side has been more prominent during the debates in Congress. This was inevitable, because the demand for capital goods in the United States is likely to exceed the supply for some time to come, while surpluses in some agricultural products already exist and were beginning to worry some Congressmen. An amendment approved by the House referred specifically to "domestically produced fishery products" as being included under the term "surplus agricultural commodity." These words were deleted in conference, but the intention of the amendment was plain. The Administrator was expected to include in his programme any product which failed to find a domestic market. (Iceland would, no doubt, have been delighted to receive a consignment of frozen cod.) Mr Hoffman will have many pressures of this kind to resist, but he has already repeated an earlier statement that his aim will be an increase of one-third in the national income of the participating countries.

His task is, while keeping Europe going during the four years which the programme has to run, to ensure that it is self-supporting at the end of that time. He cannot do this with a relief programme only, but neither can he do it with a programme which depends on nothing but Government purchasing and financing. There would be little left when

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

his programme finished. He intends to encourage the resumption of long-term investment in European industry by American private capital, but not the control of European industries by the American Government. Under the Bill he has been given \$1 billion for the first year to provide loans and guarantees to American business willing to invest in projects which he certifies as contributing to European recovery. By his handling of these funds he can show the sincerity of the American desire for that recovery or prove the truth of Communist allegations that ERP is nothing but "Wall Street Imperialism" in not very fancy dress.

The extent of Latin-American participation, on which much depends, will be decided by Mr Marshall's success or failure at Bogotá before the Administrator can begin his negotiations. The Secretary of State began well. In his first big speech he refused to compromise and explained firmly to the South American countries the stakes involved in Europe, saying "This is a matter of as much concern to your countries as it is to

mine." When he comes back to Washington he may have made the European Recovery Programme considerably easier to manage successfully. He has certainly left no doubts in any minds as to what the United States is trying to do. The more irresponsible speeches in Congress—they were few, though no debate can be without them—should be forgotten and these words of his remembered:

"The United States today, with its tremendous responsibilities, which involve us all over the world, has to proceed with great wisdom in all it does and what it feels it must do in future. I ask you to have in mind, to realise what tremendous burdens the people of my country have undertaken, and that you profit by it as much as we do."

That is the spirit in which Mr Marshall, himself, proposed the European Recovery Programme and the spirit in which the great majority of Congress accepted it. On Mr Hoffman depends whether it is the spirit in which it is carried through its four-year life. Everything he has said on the subject suggests that it will be.

Taxation of Co-operatives

(From a Correspondent in Colorado)

CO-OPERATIVES are often thought of as rather idealistic ventures by which consumers traditionally try to save themselves money. Hence the occasional spectacle of a government charge of illegal action to hold up prices, levelled at some large farmers' co-operative marketing associations, seems to require explanation. And when the co-operatives in question plead no contest to the charge, it seems to require more explanation still. What requires less explanation, under the circumstances, is the general absence of public indignation now that Congress threatens to impose taxation on co-operative corporations to diminish the competitive advantage they enjoy over "profit" business. At the National Institute of Co-operation at Fort Collins, Colorado, last fall, a speaker said: "I paid 25 cents for a glass of canned orange juice, within sight of the trees. Is that any kind of platform on which to go to the public?"

In the United States, the co-operative scene has always been dominated by co-operatives organised to aid farmers as producers—both in buying their supplies and in settling their products. In 1946-47 such co-operatives are estimated to have done a gross business of more than 7 billions, though that figure includes some duplication since several organisations may handle the same goods at different stages.

Consumers' co-operatives, by contrast, have only a fraction of the membership, and do only a fraction of the business, of the producers' groups, despite the recent growth stimulated by the interest of labour unions under pressure of the high cost of living. And generally speaking there has been little common cause made by producers' and consumers' organisations—some officials of farmers' co-operatives rather ostentatiously differentiate between their own organisations and "communist" or "socialistic" consumers' co-operatives.

One reason for this is not far to seek: farmer co-operators when they came to purchase supplies, quickly found that they could not only escape strangulation by "profit" business, but achieve the largest saving if they controlled their sources of supply all the way back to the oil well or the lumber camp. If urban consumers made the same discovery, they might swell the trend toward corporation-owned farms, with the farmer reduced to the status of hired man. There are exceptions to the hostility: in numerous instances farm and urban co-opera-

tives have shared savings. But it is the predominant attitude.

This lack of solidarity in the co-operative movement is related to the argument, advanced rather plaintively by officials of farm co-operatives when urging "profit" business to let them alone, to the effect that they have not "upset the market." They have not cut prices; they have sold at the going rate and later paid themselves back their savings. But they have operated at certain distinct advantages as compared with "profit" business, and sooner or later—since this is an election year, doubtless later—Congress is likely to attempt to lessen the advantageous tax differential which the co-operatives admittedly enjoy.

This advantage has two aspects. Special legislation, in the grim 1930's, exempted farmer-organised co-operatives that met certain requirements from all payment of federal income tax on their income. Actually, only about half of today's farmer co-operatives follow these regulations and claim the exemption; the amount at stake is only a few million dollars a year. But when asked why they do not voluntarily surrender the exemption, co-operative officials respond that those who are urging Congress to require it are "not going after taxes, but after co-operatives."

Far more important are the savings made possible to co-operatives by the Treasury rulings and court decisions that the federal corporate income tax cannot be collected on rebates to customers. These rulings and decisions are applicable to all business, not to co-operatives alone, but they cover the patronage dividends paid to patron-members by both farmer and urban co-operatives.

The courts have also ruled uniformly that a co-operative is only an agent, so that income does not accrue to it, but to its member-patrons, and taxes on such income can be collected only from them. (Urban members have an edge on members of farmer co-operatives in this connection. By saving money on supplies and marketing co-operatively, farmers are presumed to enhance their business income; and hence are supposed to include their savings through co-operation in their income for tax purposes. Consumers, since their savings merely affect their cost of living, are not liable to such taxation.)

The effect of the courts' rulings is thus to free co-operatives, except in special instances affecting a relatively small part of their "savings," from paying the federal corporate income tax on those "savings." The corporations of "profit" business, by contrast, must pay 38 per cent on net income. (In addition to this advantage, farmers' co-operatives are able to borrow federal funds at very low interest rates.)

Business leaders raised little objections to these differentials when co-operatives were poor and scattered, and the volume of their activities was small. But the co-operative leaders have utilised their advantages shrewdly to build some formidable competition. One practice in particular has contributed to the result. Tax exemption applies whether patron-members are paid

in cash or given, instead, evidences of debt. It has become practically universal for farmers' co-operatives to give their members such evidences, redeemable only after some years, and to use the funds thus accumulated for both vertical and horizontal expansion. The size of such funds can be gauged by the "savings" of a farmers' wholesale co-operative, inconspicuously named Consumers' Co-operative Association: in 1947 they amounted to \$3,700,000 on \$37 million worth of business. By this technique, over the past decade, farmers' co-operatives have built up a fairly complete distributive system paralleling that of "profit business" and competing with it. In North Dakota, the co-operatives taken together are the largest single distributors of petroleum products. The Farmers' Union Grain Terminal Association of St. Paul, Minn., is one of the largest wheat handlers in the United States.

These are the reasons for the organisation of the National Tax Equality Association, to work toward the removal of the special tax exemptions enjoyed by farmers' associations and to find some way to tax patronage refunds, especially those held in the co-operatives' treasuries and used for expansion. The association campaigned vigorously in 1947; its relaxation of effort in 1948 doubtless arises from a realistic acceptance of the fact that it is futile to ask a Republican Congress to shoot Santa Claus by alienating a large—and mainly Republican—group of citizens, the farmers, just before a national election.

Aside from the political difficulties, when pressure is resumed, there will be legal and economic problems. The exemptions which the co-operatives enjoy apply to an enormous range of business—including at-cost wholesalers set up, for their own benefit, by some of the very "profit" businesses which complain of co-operative competition.

Another incongruity is that, while the taxes complained of as unjustly burdening "profit" business are corporation income taxes, the hottest anti-co-operative campaigning has come in general from small country merchants selling goods and services to farmers, who almost invariably do business as individuals

or partners, and who therefore are in the same tax status as the co-operatives.

Then, too, the farmers' co-operatives have an obvious way of retaliating against the proposed legislation. By giving member-patrons the benefit of their savings in the form of price cuts at the time of sale, they could eliminate the disputed year-end patronage refunds, and with them all question as to whether these are taxable. The move would precipitate a price-cutting war in many lines, petroleum products among them.

American Notes

Waterloo in Wisconsin

The Wisconsin primary, which four years ago retired Wendell Willkie from the Republican race, this week administered a heavy setback to Governor Dewey and appears to have pricked the MacArthur boom decisively. From the latest reports available, Mr Stassen has swept the State, probably securing 20 of its 27 delegates to the Republican convention. General MacArthur won probably only 7 delegates despite the almost unanimous reports from Wisconsin that he might sweep the field. It is a particularly heavy blow to the MacArthur supporters, for as a "native son" he was conceded a head start in Wisconsin which he lacks elsewhere. Governor Dewey, struggling against the tradition that the Republicans never renominate a candidate who has once been defeated, has made an unpromising start apparently without a single delegate from the State he swept in 1940 and 1944.

In Wisconsin there were only three stars running, and the Nebraska primary, which will exhibit the paces, in addition, of Mr Martin, Senator Taft, Governor Warren and Senator Vandenberg, will provide a much surer test of Republican opinion. But Mr Stassen's overwhelming victory in Wisconsin plainly indicates an important and unexpected change in the relative strength of at least two contenders; Governor Dewey may not now prove strong enough even to deadlock the convention. Calculating politicians awaiting the Wisconsin result before deciding whether to board the MacArthur or the Dewey bandwagon, have seen the Stassen chariot flash by instead.

ELECTRICITY ACT, 1947

NOTICE TO HOLDERS OF SECURITIES OF ELECTRICITY UNDERTAKINGS

The British Electricity Authority give notice that announcements providing information on the points set out below have been published. Copies of the announcements will be available for inspection at offices of Banks on and after the 7th April, 1948.

1. The titles of those Securities of Electricity Undertakings the values of which have been declared by the Minister of Fuel and Power and the rates at which the calculation of the amounts of British Electricity Stock attributable to holdings of those Securities is to be made.
2. The procedure to be followed by holders of British Electricity Stock who may wish to dispose of their holdings.
3. The use of certificates of the old Securities as representing the appropriate amount of British Electricity Stock until such time as new certificates for that Stock have been issued.
4. Instructions to holders not to send certificates of the old Securities for exchange until requested by the Undertakings to do so.
5. The extension of dividend mandates registered in respect of the old Securities to the British Electricity Stock attributable thereto.
6. The titles of those Securities the values of which have not yet been declared by the Minister of Fuel and Power and the procedure to be followed by holders desiring to dispose of their holdings.

British Electricity Authority,
London.

2nd April, 1948.

ABRIDGED REPORT

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)
SIXTY-SEVENTH ANNUAL REPORT OF THE DIRECTORS
FOR THE YEAR ENDED DECEMBER 31, 1947

TO THE SHAREHOLDERS:

The volume of traffic on the railway in 1947 greatly exceeded expectations and established a peacetime record. Among the factors contributing to this were the condition of almost full employment in Canada, the backlog of need for construction materials and durable consumption goods, special efforts to move grain and flour to ocean ports for export, heavy imports in many categories from the United States, and record exports of wood pulp and newsprint paper to that country. Passenger traffic continued to decrease but was still much above the prewar level.

The application of the Railways for a 30% increase in freight rates filed in October, 1946, was the subject of public hearings throughout Canada before the Board of Transport Commissioners, commencing in February and ending in December. A decision had not been rendered at the end of the year. The Interstate Commerce Commission of the United States meanwhile authorised two increases in freight rates, additional to that authorised in 1946, and the Board of Transport in each instance authorised the application of these increases to international, overhead and certain import and export traffic in Canada. Notwithstanding these increases the average revenue received for hauling one ton one mile in 1947 was 95/100 of a cent only, compared with 93/100 in 1946 and with an average exceeding 45% more than prior to the war and costs of materials and supplies were far above pre-war levels.

Working expenses continued to increase. The general wage increase of ten cents an hour made effective June 1, 1946, was applied for the full year 1947 compared with the seven months of 1946. Wage rates averaged 45% more than prior to the war and costs of materials and supplies were far above pre-war levels.

Net earnings from railway operations were again markedly inadequate. A substantial improvement might have been expected from the upward revision of freight rates on the international traffic referred to, as well as from the larger traffic volume. Instead, the increase in gross earnings was almost wholly offset by rising costs, and the ratio of net to gross earnings remained practically the same as in 1946 when an all-time low was reached.

The accounts of your Company show the following results for the year ended December 31, 1947:

INCOME ACCOUNT	
Gross Earnings	\$318,585,919
Working Expenses (including taxes)	295,693,730
Net Earnings	\$22,892,189
Other Income	24,788,927
Fixed Charges	\$47,681,116
Net Income	\$15,787,174
Dividends	\$31,893,942

Preference Stock 2% paid August 1, 1947	\$ 2,278,841
2% payable February 2, 1948	2,278,841
Ordinary Stock 2% paid November 1, 1947	\$4,557,682
	6,700,000
	11,257,682
Balance transferred to Profit and Loss Account	\$70,636,260

(The final dividend of 3 per cent, on the Ordinary Stock which was declared in gross earnings was almost wholly offset by rising costs; and the ratio of net to gross earnings remained practically the same as in 1946 when an all-time low was reached.)

PROFIT AND LOSS ACCOUNT	
Profit and Loss Balance December 31, 1946	\$269,126,972
Final dividend of 3 per cent, on the Ordinary Stock, declared from the earnings of the year 1946, paid March 31, 1947	10,050,000
	\$259,076,972

Balance of Income Account for the year ended December 31, 1947	\$20,636,260
Portion of steamship insurance recoveries representing compensation for increased cost of tonnage replacement	636,825
Miscellaneous—Net Credit	304,583
	\$21,577,668

Deduct:	
Adjustment to prevailing official rates for sterling in respect of capital expenditures for steamships in years 1943-1946	1,530,679
	20,046,989
Profit and Loss Balance December 31, 1947, as per Balance Sheet	\$279,123,961

RAILWAY OPERATIONS

Gross Earnings in 1947 increased \$26,090,091, or 8.9%, over those of 1946, and were but \$285,115 below those of 1944, the year of highest earnings.

Working Expenses increased \$24,040,952, or 8.8%. The ratio of working expenses to gross earnings was 92.81%, a reduction of a bare .06 from last year's ratio, which was the highest on record.

Net Earnings from railway operations were \$22,892,189, an increase of \$2,049,139. Out of each dollar of gross earnings, only seven cents of net was realised.

GENERAL BALANCE SHEET, DECEMBER 31, 1947	
Property Investment:	ASSETS
Railway, Rolling Stock and Inland Steamships	\$880,747,256
Improvements on Leased Property	107,956,776
Stocks and Bonds—Leased Railway Companies	134,169,779
Ocean and Coastal Steamships	54,545,167

Land Surplus	6,722,460
Profit and Loss Balance	279,123,961
	\$1,648,453,823

ERIC A. LESLIE,
Vice President and Comptroller.

Mr Stassen's triumph is due in part to the fact that, if not a nativeson, he is at least a stepson from across the border in Minnesota; he has strength with the Scandinavian vote, and he has spent years cultivating personal contacts with the voters. Governor Dewey's last-minute decision to make a personal appearance himself—intended, ironically, to stem a supposed MacArthur tide—came too late.

But more was at stake than personalities. The "generalissimo jitters," the yearning for any strong man, untainted by political experience, is evidently weaker than was feared. An almost legendary figure, which could be all things to all men—and the MacArthur following was so ill-assorted as to justify calling him the Wallace of the Right—has been defeated by an avowedly ambitious politician who has made almost a fetish of frankness. Whether or not General MacArthur could be called an isolationist, or a China Firmer, many of his followers were. Mr Stassen, despite certain vagaries, has always been an internationalist. He belongs to the more forward-looking section of a party which also cherishes its Martins and its Tafts. One primary does not make a nomination; but if the Nebraska result resembles that in Wisconsin, it will be hard to persuade Mr Stassen that he should be grateful for second place on the ticket.

Industrial Mobilisation for Peace?

President Truman's declaration that "the United States will, by appropriate means, extend to the free nations the support which the situation requires" is regarded by well-informed observers in Washington as the forerunner of a request for military lend-lease. They believe that the only reasons why the President did not openly demand this were that in Europe the time is not yet ripe and that at home Congress might welcome it as an alternative, rather than as an addition, to selective service and universal training. These observers expected that in due course the free nations would be provided with at least enough military help to protect them against a Communist coup and that this would involve joint consultations on political and strategic questions. Congress in its present mood seems ready to give such help—in theory at least.

But in practice, if an effective programme of military lend-lease were added to the present rearmament plans, it would be hard to avoid a mobilisation of industry of the kind, though hardly on the scale, of the last war. Indeed, this would have been equally unavoidable if rearmament had been undertaken to the extent which was being discussed after the President's speech and which the Services are believed to want. Mr Truman's request for additional appropriations of only \$3 billion for the military establishment came as a real and no doubt intentional anti-climax to talk of raw material shortages, price pressures and renewed controls. The President's programme is one for establishing peace, not for making war, but there are many, including probably Mr Truman himself, who doubt if it will be adequate even for this limited purpose. It is evidently, however, the maximum which he felt the economy could bear without the reimposition of wartime restrictions, a consideration which may damp Congressional enthusiasm for an Air Force bigger than that at present proposed by the Administration.

Even this moderate expenditure may require some compulsory allocations, and Congress may be a little more sympathetic to these when they are asked for as aids to mobilisation than it was when they were asked for last year as preventives of inflation. There is little hope that the present system of voluntary allocations will prove adequate: steel is already in short supply, and shortages of aluminium (owing to insufficient electric power), of other non-ferrous metals and of petroleum are among those predicted. The public was well aware, even before Mr Baruch's reminder, that the national resources were being fully utilised, and that this time there was no slack to take up in the economy. For this reason, Mr Baruch advocates not only that the impact of the present partial mobilisation on the economy should be carefully watched, but that the Government should be equipped with full mobilisation powers, which could be brought into effect immediately on the outbreak of war by Presidential proclamation, with the concurrence of Congress. His "ready-to-go" plan covers a system of priorities and rationing, inflation controls, accumulation of strategic materials, a work-or-fight draft, and industrial readiness. This is not by any means the first time he has advocated such a plan, but today memories of past unpreparedness are still vivid, and his reputation as a successful prophet is unrivalled.

Congress Cuts Taxes

By 311 votes to 88 in the House of Representatives, and by 77 votes to 10 in the Senate, President Truman last week lost the final round of a tax battle which began with the Republican electoral victory of 1946. Mr Truman's vetoes—two in 1947 and that last week—were given against Republican majorities and therefore created no such sensation as that of 1944 when Mr Roosevelt "attempted to defeat his own party in election year," and attempted also the first major challenge by the executive branch to Congressional control of tax-gathering. But whereas in 1947 the Democrats in Congress voted to uphold their President's veto, they have refused to do so in an election year. Mr Truman's case against relief, at the expense of some easy popularity, is still exceedingly difficult to confound, and Republican leaders, while naturally jubilant at a success which enables them to keep election pledges, have no great faith in its permanence. They declare that Congress will maintain budget stability, reduce public debt, and rearm to any necessary extent. They may be lucky; to achieve all this they will need to be.

The new tax law is a relatively mild version of the exuberant plans formulated by eager Congressmen in 1946, and modest again by comparison with 1947 plans, when tax cut proposals ranged from 30 per cent to 10½ per cent, with comparatively small reliefs for lower income groups. The Act increases the personal exemptions for each taxpayer, and for each dependant, from \$500 to \$600, repeals the 5 per cent "allowable charge" against assessable income, and applies a reduction of 17 per cent on the initial \$400, 12 per cent from that point to \$100,000 and almost 10 per cent on higher figures. There is no direct change in normal income or surtax rates, but the maximum effective rate is cut from 85 to 77 per cent.

Mr Truman maintains, despite Republican denials, that 40 per cent of the relief will accrue to incomes beyond \$5,000 yearly, and that the substantial reliefs of estate and gift taxes can bring no benefits to most taxpayers. Republican figures may be based on the widespread refusal to concede that the adoption of "community property" assessments for married couples represent tax relief so much as "tax reform." But under it very substantial benefits accrue to higher incomes, for the adoption of the "community property" standard will mean that taxpayers in all States can now enjoy the right to divide their joint income equally between husband and wife, without regard to source. In the past this privilege has been confined to the twelve "community property" States. Since present surtax rates touch 50 per cent on incomes from \$16,000 to \$18,000 and range to 91 per cent on individual incomes exceeding \$200,000, it is clear that the process of halving assessable income can be very profitable indeed—to those on the higher brackets.

This is perhaps the most interesting feature of the new tax law, since it rings down the curtain on the attempts made by the Bureau of Internal Revenue to confine the benefits of "community property" assessments to eight States which were fortunate enough to apply these provisions before the introduction of the first Federal income tax in 1913. Nine years ago, Oklahoma and Oregon attempted to extend "community property" schedules, but were over-ruled on technical grounds. When the Supreme Court finally accepted a revised plea by Oklahoma, the way was clear to correct anomalies which conferred indiscriminate benefits on only a fraction of the States.

A Federal Minimum for Education

The Taft Bill to equalise educational opportunities by distributing \$300 million of Federal aid to the States has been passed by a Senate majority of 58-22, drawn from both parties. The Bill would set a minimum of \$50 on educational expenditure for every child. If the House follows suit, it will become the first major welfare act of the 80th Congress. Compared with the national expenditure of \$3 billion on education, \$300 million is not very much; it is an even smaller drop in the \$6 billion bucket which the National Education Association believes is needed. But it is the opening wedge of equalisation. The bulk of the payments will go to the South, which with its high birth rate and meagre funds for schools exports illiteracy throughout the nation. With 30 per cent of the nation's children, the South has only 17 per cent of the national income. Mississippi, which like the old woman who lived in a shoe has so many children she doesn't know what to do, spent 3.4 per cent of her income to provide \$25 of education for each pupil last year. New York, which spent 2.6 per cent of a much larger income, was able to allot \$234 per child.

If the prospects for enactment of the Bill look good, it is partly because of the growing crisis in education, and partly because of the skill with which the Bill has been drafted to avoid the rocks which have wrecked previous Bills. Every effort has been made to lay the spectre of Federal control following Federal funds. The question of whether any Federal funds can be used to support non-public (chiefly Catholic parochial) schools, has been rigorously left to the States; but the Supreme Court decision in the *Champaign* case suggests that the use even of State funds, beyond the provision of text-books and transport, is probably unconstitutional. The South's separate and inferior school system for negro children has, in the past, proved an even greater obstacle. The present Bill leaves the solution of this problem to the States, with the sole proviso that Federal funds must be "justly and equitably apportioned." If this is defined as it has been in the past, as meaning a share of Federal funds proportionate to the number of negroes in the population of the State, there will be a revolution in negro education. Mississippi, whose population is 49 per cent coloured, spends at present \$52 a year for each white pupil, \$7 a year for each negro child. The Bill also provides a complex system of allocation, devised to meet objections that with Federal aid some States will relax their own efforts.

The deterioration in the nation's schools since 1939 has long been pressed by the educational lobby. It is reinforced each year by rising enrolments of children and the exodus of teachers to better-paid work. Congress, which is constantly reminded that the American way of life is on trial, may well feel it can no longer postpone a reform which recognises that, although children are educated by the States, they all become American citizens.

* * *

Testing the Labour Injunctions

In a message to the 400,000 soft coal miners who have left the pits, Mr Lewis denied that he had ever ordered them to cease work and told them to make up their own minds whether they should go back. So far not only have they shown no sign of doing so, but they have been joined by the anthracite miners, who are protesting against the way in which Mr Lewis is being "pushed around." Mr Lewis's message may have been a characteristically indirect way of suggesting to the miners that they return to work, but it was more probably an attempt to build up his case against the temporary injunction which was issued on Saturday to restrain the Mineworkers' Union from continuing the strike. Mr Lewis has petitioned for the injunction to be set aside and the Government has replied by summoning him to explain why the Union should not be cited for contempt of court, since the miners remain idle. He has, however, complied, after his usual delay, with the other part of the injunction, which requires him to negotiate with the coal-owners on the pension disagreement which is the cause of the stoppage. The summons is to be heard on Monday, when hearings are also due to open on whether the temporary injunction shall be extended to the full 80 days provided by the Taft-Hartley Act. Meanwhile, as the strike nears the end of its fourth week, and as vital tons of steel are lost daily, Mr Lewis is demonstrating very successfully that the Taft-Hartley Act provides inadequate protection against strikes inimical to the national welfare. As in the past, he may be equally successful in inducing Congress to pass new legislation which is even less acceptable to labour than the old.

If the railway engineers strike at the end of the month, they will presumably provide another opportunity for testing the injunctive process, but few will argue nowadays that the strike of Stock Exchange employees affects the national welfare, even though its violence certainly affected the welfare of a few of the nation's citizens. As long as negotiations continue, the National Labour Relations Board is unlikely in this case to seek an injunction of the kind which it obtained last week against the International Typographers' Union. The exact implications of this injunction are uncertain, but the ITU, in what is apparently a satisfactory attempt to comply with it, has recommended to its striking local branches that they bargain in good faith, negotiate contracts for a definite term and abandon any effort to perpetuate the "closed shop." Negotiations on this basis have been opened in the most famous of the current printing strikes, that against the Chicago newspapers, and seem likely to lead to a speedy settlement in New York, where there has been no strike, although the printers' contract with the newspapers expired at the end of March. A truce has now been called in the strike against the New York commercial printing firms, which was over wages, not over the terms of union security.

Letters to the Editor

"Short of War"

SIR,—I have almost invariably agreed with your leading articles on foreign policy, but I feel that your last was most misleading. Of course, I agree with you that any Munich-like action at this stage would be fatal. I agree that some of the 15 Labour MPs who have suggested an Attlee-Stalin conference have in the past advocated a policy which could in my view be fairly denounced as a policy of appeasement. But that is no reason at all for concluding that any high-level conference with Stalin would be a mistake. On the contrary, the fact that Mr Churchill, among others, has in effect advocated this course of action, should make it clear that a conference with Stalin could be devised in circumstances which would indicate strength and not weakness.

You suggest that the international situation is not really worse than it was eighteen months ago. I should in any event disagree with this view, because I believe the Soviet Union's recent actions to have been even more brutal and antagonistic than ever before. But the real point is that another eighteen months have elapsed, during which the totalitarian powers have been able to proceed with their development of weapons of mass destruction, including the atomic bomb. There is the real danger.

For that reason it seems to me that your leading article is dangerously complacent, and indeed seems to suggest that the freedom-loving powers should wait until the police states themselves develop weapons of mass destruction. If that really were your policy, it would surely be almost as unrealistic as that of those who ask us to be neutral in any struggle between the Soviet Union and the United States of America.

Surely now is the time to confront Stalin personally with the fateful choice which he has to make. I believe that Mr Attlee, Mr Bevin and Mr Churchill, for Britain, Mr Truman, Mr Marshall and Mr Vandenberg for the United States of America, might have a tremendous effect upon Stalin. They could say things in private which could not usefully be said in public at

From *The Economist* of 1848

April 8, 1848.

It is plain that if some new plan be not fallen on to introduce order, government, and something approximating to a common unity of feeling into France, that country must long be the prey of great disorder. Perfectly secure, as she now appears, from all foreign invasion, she is quite free to work out her own progressive improvement in her own way; and it will be alike a great scandal to her civilised people, to her men of letters, her philosophers, and her statesmen, if they do not educe some kind of order from the present confusion. Susceptible as her people are to ridicule, to eloquence, and to music—the enthusiasm excited in them by a speech or a song being far beyond the cold conception of our people—the press must be the great instrument for promoting amongst them that knowledge which alone is the basis of all improvement. . . . Our observation leads us . . . to believe that many of the Paris papers are beginning to take a very reasonable view of the most important questions now at issue, and that they will in no long time . . . effect a quiet but a great reformation in the opinion and conduct of their countrymen.

For example: *The Times* . . . tells us that the *Corsaire* and *Charivari* are courageously throwing raillery on the ridiculous practice of having great public processions to plant trees of liberty, and that the threatening cries of "*à bas les riches*," "*à bas les aristocrates*," are no longer heard. The vigorous opposition of *La Presse* to many of the nostrums of the day is notorious; and if that has gained for *La Presse* a fierce attack by the enemies, it has rallied around that journal all the defenders of the freedom of the press . . . The *Journal des Débats*, rejoined by M. Michel Chevalier, who left it some months ago on account of a difference of political opinion, is devoting a succession of leaders by him to the great question of labour, and will, no doubt, with the help of other journals, convince the people that their safety depends on discarding the nostrums of Louis Blanc. It finds a powerful coadjutor in *Le Bon Sens du Peuple*, which mocks unmercifully at Louis Blanc's denunciation of competition. We scarcely need add that *Le Libre Echange* takes the same side, with all the vigour and biting logic of M. Bastiat. . . . That journal informs us, too, that a club for freedom of industry . . . has been established at Paris, and there the question of the organisation of labour has been patiently discussed.

this stage. If they were to succeed, they would earn the gratitude of our generation. But even if they were to fail, as I agree to be very likely, they would still have performed an invaluable service. Such a mission would do an enormous amount to unite the British and the American peoples behind their Governments. (It is often forgotten that even Mr Chamberlain's ill-fated mission at Munich did succeed in uniting the British Commonwealth and Empire behind his delayed call to resistance against Fascist aggression.)

The more one considers the advisability of such a conference, the more one is convinced that if the principal actors concerned are willing to act together, and prepare in advance a carefully devised line of action, they might perhaps even change the mind of the Polit-Bureau, and would in any event solidify public opinion in their countries. This time such a move could be the reverse of Munich and could be the most effective culmination of the diplomatic offensive which has now been assumed.—Yours faithfully,

RAYMOND BLACKBURN

House of Commons

"Two Million Without a Party"

SIR,—It is now over six weeks since the last of your four admirable articles on this subject appeared, and like, I imagine, many others I have been waiting for somebody to raise the standard and call those who find themselves politically homeless to organise and make their influence felt. But now surely the time has come and to stop saying "Why doesn't somebody do something?" and for those of us who broadly agree with these articles to get together and do it ourselves.

Books and Publications

Historical Portraiture

"Personality in Politics." By Sir Arthur Salter. Faber and Faber. 250 pages. 12s. 6d.

FEW people living today can have come into close personal contact with such a varied group of personalities in so many spheres of the public life as Sir Arthur Salter. This fact combined with the penetrating lucidity and balance of his judgments make these essays an unusual contribution to contemporary biography. The sketches include besides five British Prime Ministers from Lord Balfour to Winston Churchill—all, in fact, except Lord Baldwin—President Roosevelt, Woodrow Wilson, Mussolini, Clemenceau, the Poincaré and Briand, Chiang Kai Shek and members of the Soong dynasty. They are prefaced by an interesting discussion on the place of personality in history and a critical evaluation of the not unimportant element which anecdote can contribute to the historical judgment as "the humblest of the servants of Clio but not the least attractive and, it may be, not the least valuable."

The two essays on Lloyd George and Ramsay MacDonald show an interesting contrast. Both these political leaders rose from obscure conditions to the highest office; but the dynamic imagina-

For what your final article, "Third Party or No Party," proposes can certainly be done. I have, in fact, helped to do it. In 1934 the farmers of Dorset and Wiltshire, seeing themselves faced with ruin, organised for political action and told their Members of Parliament that they would vote against them if a particularly objectionable Bill which the Government had introduced was passed. Success was immediate and complete. Although normally an ignored and impotent minority even in the rural constituencies, the farmers could influence enough votes to turn the scale between the parties, and thus as if by magic the minority acquired the powers of a majority.

The reason why "Movements" usually fail is that they do not know how to move. Mass Meetings at the Albert Hall seldom worry a Government, for they threaten no seat. But if those who represented the floating vote of Kensington were to hold a meeting there, it would be a different matter; and if similar meetings were held in two or three hundred constituencies, even the strongest Government would be ready to listen. For the majority of Members are at the mercy of the floating vote; and even more vulnerable than the Member is the candidate. Anybody who has stood for Parliament knows what it costs to say "no" to the offer of even a dozen votes; after all, they might mean the difference between winning and losing.

There is, in fact, no insuperable difficulty to prevent us from organising the great mass of informed and independent opinion which feels at home neither with the Left nor the Right; and until it is done, "something," as you say, "will be badly wrong with British politics." Will those who agree that we must end the waste of what is perhaps our most valuable asset please get in touch with me?—Yours faithfully,

D. ALLHUSEN

of dictatorship has made the subversion of free government a comparatively easy matter, but the recovery of freedom almost insuperably difficult.

Two of the essays are devoted to persons who could not normally be described as politicians—H. G. Wells and Maynard Keynes. The former is described in a most illuminating study as "the greatest public teacher of our time," which traces in his life the successive alternatives of enthusiasm and disillusion which ended so tragically in *Mind at the end of its Tether*. The study of Keynes, the artist-economist, is also a brilliant appreciation, but the judgment that *The Economic Consequences of the Peace* did more harm than good may come as something of a surprise.

The Last Contribution

"The Age of Peel and Cobden." A History of the English People, 1841-1852. By E. Halévy. Translated from the French by E. I. Watkin. Benn. 25s.

At the time of his death in 1937 M. Halévy had completed more than half of his *Histoire du Peuple Anglais au XIXe Siècle*. This work began with an introductory volume which will remain a classic; two volumes then brought the narrative and analysis down to 1841. M. Halévy had also published an *Epilogue* in two volumes on the years 1895-1915. He had planned three volumes to cover the period between 1841 and 1915, and had written the greater part of the first of them. This unfinished volume has now been revised and arranged for publication by Professor Vaucher, a great friend and former pupil of M. Halévy. Professor Vaucher, with characteristic modesty, keeps himself wholly in the background, but his editorial work is of the highest order. The labour which he has expended is amply repaid in the production of a book well able to stand with the other volumes of this great History. The translation is also very good.

M. Halévy died in the fullness of his intellectual powers and maturity; his last completed chapters show no falling off in scholarship or judgment, and his writing, as always, is quiet, careful, and restrained. He does not often attempt large-scale characterisation; his leading figures take on the colour of their environment and are built up out of it. They are indeed for

this reason fully alive and fully differentiated. Palmerston is seen perhaps a little too much as he appeared to exasperated foreign statesmen, but Peel could not be better described, and somewhat grim justice is done to Lord John Russell.

M. Halévy is at his best in the spheres where politics and economics meet. The years 1841-1852 are especially rich in this conjuncture and give ample scope for M. Halévy's acute and original treatment. There could be no better short summary of Chartism than these two sentences:

"In a country of artisans and peasant proprietors Chartism would probably have succeeded, the Anti-Corn-Law failed. But in consequence of the distinctive social structure of Britain the contrary happened."

Or again, Peel's Budgets:

"According to Disraeli, Peel lacked imagination. True, if you mean the imagination of a man of letters, of Disraeli himself. His Budgets, nevertheless, were in their fashion works of imagination and spoke to the imagination of a nation of economists and business men."

Or the landed aristocracy and the repeal of the Corn Laws:

"In 1832 the nobility had sacrificed much of its political to save its economic privileges. Now it sacrificed the most valuable of the latter to save what the Reform Act had left of the former."

It is impossible to review this last volume of M. Halévy's work without great sadness, not only for the loss of so charming a man and so fine a scholar. The circumstances of our time make it very difficult for the younger scholars of one country to acquire that deep knowledge of their European neighbours which M. Halévy possessed, and yet, without such capacity for mutual understanding, political plans for closer European Union can lead at best only to "watery friendships." It is a matter for congratulation beyond the world of scholarship that M. Vaucher is now in Paris and is encouraging his pupils in those studies which he learned from his own master.

Correction

In the issue of March 13th Dr C. E. M. Joad's book "Decadence" was inaccurately attributed to Messrs. Gollancz as publishers. The publishers should have been given as Messrs Faber and Faber.

THE WORLD OVERSEAS

France Leaves the Doldrums

(From Our Paris Correspondent)

IN so far as economic facts dominate political factors, the prospects of the present Schuman coalition government are reasonably rosy. The double dose of interim aid, followed by the unexpectedly swift passage of ERP, means that American supplies, on which French subsistence today directly and immediately depends, will not be interrupted. A major economic catastrophe, which has been threatening the country for months, is now decisively averted. Within the next few months France will be receiving materials and machinery of which imports had been totally suspended since dollar supplies gave out last summer, and of which stocks were almost exhausted.

Out of the first year of aid the French hope to obtain 20 per cent of Europe's dollar allocations. Three-fifths of this will cover the food and raw materials, taking the form of a free grant. The French authorities hope that the precedent established under the interim aid agreements will again be followed, and that the bulk of the franc-value of the grant will be allocated to the French Government for reconstruction purposes. This means that reconstruction will no longer have to be financed by the inflationary methods which have destroyed the various attempts at monetary stability since the Liberation.

The other two-fifths of American aid will cover the re-equipment and modernisation of French industry and agriculture, presumably in the form of a loan, and it is hoped will help towards the targets, now far in arrears, of the Monnet Five Year Plan.

Two other factors, outside the reach of the Government but essential to its success, have combined to make this year potentially the turning point from poverty to plenty. First, are the good harvest prospects for the world in general and France in particular—a fortunate contrast with 1947. A mild winter and satisfactory spring rainfall have already assured record grass supplies, and hold out promises of a bumper cereal crop. There is thus no encouragement to the peasants to hoard in expectation of scarcity, which occurred this time last year and constituted the first and most fatal blow to Leon Blum's price reducing experiment. So far (although this week, for the first time since Christmas, adults have received their monthly 100 gr. butter ration) the improvement is barely visible in food prices, but at this time of the year it is significant that these are not rising. Butcher shops are bulging with meat, but prices still confine supplies to the upper income groups, where excess is creating new national health problems. There is still an unsolved bread deficit, but the authorities are hoping that external aid may enable the existing ration to hold out until the next harvest.

The other hopeful factor is the revival of French coke and coal imports, lack of which, ever since the war, has strangled industrial production. Whereas the Lorraine industrial basin, by far the most important steel-producing area in France, has hitherto barely produced 60 per cent of its capacity, the decision to double the coke allocation from the Ruhr to France will now not only be able to meet its own serious steel deficiencies, but will also be able to export machinery to Eastern Europe and to contribute its steel export quota, fixed under the 16-nation agreements.

For these three reasons—American aid, good weather and higher fuel imports—the French Government have fought their battle with inflation on relatively favourable terms. The world tendency for prices to drop has influenced the French market, and American aid has enabled the French authorities to provide and importers of approved goods with 50 per cent of their dollars at the controlled rates (210 instead of 310 francs), thereby reducing the effect of devaluation on the home market. By expanding production the Government has also obtained agreement—production the Government has also obtained agreement—even co-operation—with manufacturers to lower some prices, among which certain textiles, leather goods and agricultural machinery are the most important. At the risk of having to re-

impose abolished subsidies, the Government have also made a sacrifice to the cause of reducing prices by cutting the cost of domestic coal by 10 per cent and electricity by 7 per cent.

But so far *le climat de la baisse* (the climate of falling prices) heralded in the columns of the pro-Government newspapers, provides Parisians with a subject rather for irony and doubtful jokes than for real enthusiasm. Housewives returning from market remain vociferously sceptical. Until the new harvest is in, until the bread ration rises, until fresh vegetables and fruit glut the market, until projected imports of agricultural machinery reach French farms, until the double quota of Ruhr coal makes itself felt, the political impact of the present economic recovery will remain barely discernible.

In well-informed official and business quarters there is general agreement that *la conjoncture économique* is more promising than at any time since the Liberation, but their optimism has not yet filtered through to the people either in town or country.

Socialism Abandoned

For the time being, Parliament is on vacation until April 20th, and the discouraging spectacle of the successive diminutions of the Government's majority has been interrupted. But even allowing for the present economic blessings, it is by no means certain that when the deputies return from "sounding" their constituents the coalition will not be subject to new strains.

Trouble may come from either wing: the Socialists or the *rassemblement des gauches* (Radical and near-Radical groups). The Socialists have basically a sound reason for discontent, since the Government's present policy, whatever its merits, is the antithesis of Socialism. It has systematically withdrawn price controls while continuing to peg wages; it has permitted rapid, in some cases spectacular, increases in industrial profits; it has given up any attempt to ration the large majority of basic foods; it has failed to alter the system of tax collection so that salary earners still pay the lion's share. Like his predecessor under Louis Philippe, M. René Mayer has said "*Enrichissez-vous*," while the Socialist party's clientèle is composed precisely of people unable to do so. The Socialists are also critical of a 40 per cent budgetary expenditure on armaments and particularly of the costly Viet Nam war. Any disturbances elsewhere in the French Union, notably in inflammable North Africa, would also almost certainly bring Socialist autonomous conceptions into conflict with the belief in authoritarian handling of the natives which distinguishes imperial thinking on the right.

At the same time, any concessions to Socialist views, or any delay in liberalising and decontrolling French economy, would bring the Government's doubtful supporters from the Right into Opposition, where they would meet the Gaullists, now more than ever intent on bringing the General back into office, so that he can profit from the promising economic outlook. Their impatience may incline General de Gaulle to compromise on the constitutional and parliamentary issues, so as to permit a coalition with the centre, advocated publicly by the Gaullist ex-Minister of Finance, M. René Pleven, just before the Easter parliamentary recess.

How long the Government will survive, and who will replace it, will largely depend on international factors and particularly on the result of the Italian elections. For the time being, the French Communists are playing for low stakes, contenting themselves with inciting local strikes and demonstrations, whose cumulative effects may retard recovery, but which barely influence the political equilibrium. A kick from the Kremlin, or encouragement from Italy might alter their tactics. Certainly any signs of a more vigorous Communist offensive at home or on the French frontier would provoke a Gaullist reaction and support for a strong government to handle real or imagined insurrection. if the present calm continues and if the Italian results suggest no immediate menace to France, the Socialists may begin to wonder why they are rowing a Conservative boat. Fear of the alternatives, rather than political affinities, have induced them to support Schuman and Mayer, and their loyalties will almost certainly subside with their fears.

Nevertheless, it would be a mistake to underestimate the tenacity and tactical talents of the present leaders. Even if M. Schuman has never commanded any personal popularity, he has handled successive crises with a flexible opportunism which has saved many apparently hopeless situations. His Government is indeed a political anomaly created in a panic, with no positive programme and no common object, yet his whole team has a strong incentive to stay in office in the now reasonable expectation of better times to come.

Denmark's Foreign Policy

[FROM OUR COPENHAGEN CORRESPONDENT]

IN the hundred years that Denmark has been a democratic country, the *Riksdag* has never had a debate on foreign policy. It was a subject which only concerned the Minister of Foreign Affairs and his carefully selected and most exclusive staff. During the Second World War, however, the then Foreign Minister, Mr Erik Scavenius, found out, much to his bewilderment, that the people had taken foreign policy into their own hands. But once the interregnum of the resistance movement had ended, there was a tendency again to withdraw the delicate subject of foreign affairs from the public eye.

Up to the beginning of this year, the *Riksdag* and most of the press seemed to have been hypnotised into silence by the Soviet shadow. Public declarations cautiously reflected the differences between east and west, and abstruse compliments were paid to both sides. At the same time they stressed that Denmark would stay neutral and never, never, join any bloc.

The conception of Western Union and events in Czechoslovakia and Finland caused a great change in public opinion. The press began calling a spade a spade, and, on public demand, permission was graciously given for the Lower House to hold its first debate on foreign affairs for a hundred years. In a sense the debate was disappointing, for it developed merely into an internal fight between the Communists and the other parties. This fight, however, revealed a bitterness which left no doubt that the overwhelming majority favoured the West. Social Democrats openly called the Communists a fifth column which was ready, they said, to enslave the Danes as their comrades had done in Czechoslovakia. (But this would not be easy: the Danish Communists hold only 9 seats, or 6 per cent of the Lower House, as against the 38 per cent held by the Czechoslovak Communists.) Moreover, the Prime Minister, Mr Hans Hedtoft, publicly encouraged Danish workers to isolate Communist leaders everywhere on the grounds that Communist policy was dictated by a foreign Power.

Co-operation with the West

Two main themes emerged during the foreign policy debate—co-operation with the Scandinavian countries, linked with the Marshall countries, and Danish defence policy. There is no doubt that before the last war, Danish foreign policy was a function of its "great neighbour in the South." Quite logically it might be expected that today it would be a function of its "great neighbour in the East." But the Foreign Minister, Mr Gustav Rasmussen, commenting on the latest developments in Eastern Europe, said: "We Danes are against any form of compulsion or unification in thought, speech, creed, or living conditions. We cannot imagine a bearable existence without freedom of speech and democratic institutions as developed in this country during the last century." The former Prime Minister, Mr Knud Kristensen, declared that Denmark must co-operate closely with Scandinavia and all democratic countries, "so that they are not overrun, one after another." The Conservative spokesman, the former Minister of Defence, Mr Ole Bjørn Kraft, also spoke for full co-operation with the Western democracies.

Co-operation between the Northern countries has long been close and intimate on all economic questions. The Prime Ministers and the Foreign Secretaries of Norway, Sweden, Iceland and Denmark meet frequently. At the last Marshall conference in Paris, for example, the Danish Foreign Minister spoke for all three Scandinavian countries in the opening debate. From the very first Denmark has been the most eager of the three countries to take the risks—and the benefits—of the Marshall Plan. Now

there seems to be no difference between them. There is good progress also in building up a Northern Customs Union, but the idea of a Nordic defence union is still barred by Russia's hostile attitude. The idea of a Northern Customs Union is very much related to the Benelux system and to the whole suggestion of closer economic co-operation in Europe. As one of the foreign correspondents in Denmark remarked, using the familiar terms from the cable companies: "Western Union via Great Northern."

There is still a long way to go from Marshall Plan to Western Union. Mr Bevin seems not even to have indicated that his suggestion for a Western bloc included the Northern countries and the invitation may never come. Danes have not forgotten that both Sir Edward Grey, before the First World War, and Mr Winston Churchill, after the outbreak of the Second World War, said that Denmark was "written off." Geographically its situation was such that Great Britain could not come to its help. The strategic position may still be the same, so that a Western Union may not want to include a Denmark it cannot afford to protect.

Demand for Stronger Defences

During the debate in the *Folketing* the Foreign Minister stressed the importance of Danish defence. He did not believe that any country wanted war. On the other hand, he would not guarantee that there would be no war, and it might start in quite unexpected places. It was necessary, he said, to strengthen their defences, and, should Denmark be attacked, it would defend its independence with all its might.

These words—which are more positive than have ever been heard in the Danish Parliament—were not contradicted from any side during the debate. Having mishandled the reconstruction of Danish defences ever since the end of the war—and spent 800 million kroner (£40 million) during the last two years—the Minister of Defence has now ordered the service chiefs to produce a combined defence plan amounting to 242 million kroner a year. This is a big increase compared with the years before the war (62 million kroner)—it may even be too much, as Denmark does not now possess sufficient hard currency to buy the necessary arms. The money ought probably to be spent on a sliding scale, or the Government should call in, not the military leaders, but a small group of industrial leaders who, advised by the technical experts, could plan a rearming programme in a minimum of time and also see to it that it could be carried out by the country's own industry. That was the way Sweden rearmed during the war, with amazing results. Strategy, too, appears to be out of date. In proposing an army of up to 400,000 men, insufficient attention has been paid to the Air Force. Denmark's outstanding aviator, Colonel Birksted, who served with great honour in the Norwegian Air Force in England during the war, has proposed that Denmark should concentrate on building up a transferable defensive air force which could join those allied forces which in other countries would be fighting for freedom.

Without such an alliance Denmark would fight in vain.

South African Politics

[FROM OUR JOHANNESBURG CORRESPONDENT]

THE first postwar General Election in South Africa is expected to be held towards the end of May. Even the Opposition expects the Government to win, and General Smuts' United Party hopes for a substantial majority. Apart from the divided Labour Party and the almost extinct Dominion Party, the Opposition groups consist of the Nationalist Party, the Afrikaner Party, the New Order and the *Ossewa Brandwag*. The last two will not put up candidates because they do not believe in Parliament.

The Nationalists, led by Dr D. F. Malan, have rediscovered the virtues of democracy since Germany's defeat, and they will not make the establishment of a republic an issue at this election. The chief plank in their platform is native policy. The majority stand for *apartheid*—the natives to be kept in reserves without citizenship rights when not working on farms or in towns, and the abolition of natives' representation in Parliament. But the Nationalists are themselves in doubt about the practicability of this and have appointed a commission to work out its implications. The Afrikaner Party, under Mr N. C. Havenga, broke away from the Nationalists in 1940 and was believed to be more liberal than the Nationalists until it suddenly became friendly towards the *Ossewa Brandwag*, an anti-democratic organisation. However, Malan and Havenga have made an election pact, as a result of which the Nationalists will probably get the support of

members of the *Ossewa Brandwag*. Mr Oswald Pirow's "New Order" stands for National Socialism on the German model.

Though the Afrikaner Opposition is thus divided, all groups are linked by the *Broederbond*, a society whose members hold key posts in all walks of life, including the public service. The aim of the *Broederbond* is the establishment of a republic in which the English-speaking section of the whites (40 per cent of the total European population) would play second fiddle. Both Dr Malan and Dr J. F. J. van Rensburg, the leader of the *Ossewa Brandwag*, are members of the *Broederbond*.

Weak Labour Party

The Labour Party is so volatile and unstable that even though an election agreement has now been reached with the United Party, heartsearching is likely to continue. The agreement's "sole purpose is to ensure that the Nationalists and their allies will not be in a position to win seats on a minority vote through three-cornered contests." Even if Labour had split the vote, the United Party did not expect the Nationalists to win more than 16 additional seats, giving them a total of 64, and the United Party between 80 and 85 compared with its present 90. The United Party would thus still have had a good majority in a House of 153 members, of whom three are natives' representatives who usually vote with the United Party. Presumably the United Party now calculates that the anti-Nationalist majority will be still larger but that Labour will have a small quota without having to fight too hard. The Labour Party is to fight six seats in the Transvaal and two in Natal, under the agreement; and will get one Cape and one Transvaal Senator.

The Dominion Party is an extreme royalist group which disapproves of the Statute of Westminster. At the same time its native policy is indistinguishable from that of the Nationalists. Its influence is negligible.

The country is experiencing a wave of prosperity from which the Government automatically benefits. South Africans like the idea of so much overseas capital flowing into their country and doubt if it would continue to the same extent under a Nationalist Government. The Opposition played its "black peril" card too soon and familiarity has bred contempt.

The United Party claims to stand for co-operation between the two white sections, retention of South Africa within the Commonwealth, and raising the status of the natives. The last is to be accomplished by gradually extending political rights to non-Europeans who "become capable of carrying out corresponding duties," but with, as a background, awareness that "democratic government is a 'white man's' invention" for which other races have to prove their fitness. The Nationalists' *apartheid* policy is regarded by the United Party as both impracticable and retrogressive.

The Labour Party has no clear-cut policy: it wavers between maintenance of "civilised standards" by retention of the rigid colour bar in industry, and vague uplift of the natives—this to be achieved, however, without any reduction of the gap between "skilled" (i.e., white) and "unskilled" (i.e., black) wages, the proportion being about eight to one.

The Budget has been postponed; so have many important measures, including a Bill for the official recognition of native trade unions under numerous safeguards. General Smuts has recently drawn gloomy attention to the international situation in a manner suggesting he may yet base the election on it. But internally, what the country most of all needs is a coherent native policy which will recognise that the 1936 legislation is now out of date. No party has yet produced such a policy, as strong supporters of the Smuts Government never tire of pointing out.

Chaos in China

[FROM A CORRESPONDENT]

INFLATION, corruption, speculation, a sapping horde of middlemen—that is the economic picture of China as seen through the eyes of the United Kingdom Trade Mission. Headed by Sir Leslie Boyce, the mission covered some 8,000 miles of Chinese territory and interviewed well over a hundred Chinese officials and business men, including Chiang Kai-Shek and his cabinet at Nanking, during their three months visit from October to December, 1946. Although one year out of date, their report,* published recently, reveals a state of economic chaos which still

* H.M.S.O., 5s.

persists and which makes nonsense of any light-hearted hopes of a speedy recovery.

The principal cause of the chaos is civil war. "China's first economic need is peace," say the mission, and in each of the detailed reports on trade, transport, shipping, agriculture, industrial development, mining, banking and communications, their contention is borne out again and again. The Nanking Government calculated that 80 per cent of their expenditure was directly connected with the war while the catastrophic fall in export production caused by the war has brought galloping inflation in its train. The value of the Chinese dollar fell from CN\$80 to £1 during the war to CN\$48,000 to £1 in February, 1947, and has now reached the astronomical level of CN\$585,000 to £1. The desperate shortage of foreign exchange has speeded up the decline in production, for, without foreign exchange, the Chinese cannot buy the machinery and equipment necessary to increase their output.

Inflation has also brought into being a vast crowd of speculators who, gambling on the rate at which the Chinese dollar will fall, quote prices for goods based on the future value of money and hence themselves help to send prices higher. Goods change hands several times a day, wasting energy that might have been better employed in production. The profits made by speculation are so high and the risks of genuine trade so great that few are willing to undertake regular business with the interior which is so badly needed. An instance quoted is of a motor car, sold originally at a fair profit for US\$4,000, which was sold for the third time within a week of the original deal for US\$16,000. Unrra, in an attempt to ensure that their supplies would escape the hands of speculators, issued special ration cards to those in real need. The cards were promptly sold to middlemen, and in a short time one individual obtained a thousand cards. He made a corner in the Unrra goods and shipped them back to Shanghai where he sold them for a handsome profit in the open market. Like all other prices, the cost of rice, the staple food of the Chinese, rose from CN\$10.5 per hectolitre in 1937 to CN\$24,000 in Chungking and CN\$122,000 in Tsingtao by December, 1946.

End of Cheap Labour

The rise in real wages, brought about by terrorism and strikes, is the only improvement noted in Chinese standards, but this in itself has militated against China's trade recovery. The cost of living was, in December, 1946, 6,470 times the 1936 level, but during the same period unskilled wages had multiplied by 14,270 times. Real wages have thus been doubled, and in Shanghai, at least, the coolie is much better off. But the result has been to make normal industrial costs prohibitive. Coal, for example, is £65 per ton. Moreover, it seems unlikely that China will ever again be a country of very cheap labour.

Of all the spheres of economic activity which the British Trade Mission investigated, transport had suffered most. The enormous distances between the interior and the coast make good and cheap transport a vital factor in China's trade. There is a large network of rivers and canals which in prewar days made the movement of goods comparatively inexpensive. Now, partly because of the war and partly because of Chinese nationalism, which has prevented foreigners—chiefly the British—from operating, the inland shipping situation has become so bad that goods are more than doubled in cost because of the freight charges. It costs more, in fact, to move a car across the river at Shanghai than to ship that same car across the Pacific from America. The actual quantity of inland shipping fell from a prewar total of 1,300,000 tons to 60,000 tons by the end of the war. By recovering shipping from the Japanese and by making additional purchases, the total had, by November, 1946, been made up to 660,000 tons, but this is still quite inadequate for China's needs. Railways and roads are also in a poor state, made worse by the roving bands of Communists which prevent repairs and interrupt traffic.

Under such conditions it is not surprising to find that China had, in 1946, an import surplus of £118,400,000—the largest in its history. Exports amounted to £37,900,000 against £156,300,000 for imports. But in spite of the chaotic condition of Chinese trade, the British Mission were not wholly despondent. They were impressed by the indigenous wealth of China, by the industry of the people and by the extent and diversity of their agriculture. Although they conclude that existing conditions are decidedly unfavourable for British trade, they point out that boundless opportunities would arise if the civil war could be brought to an end—opportunities so great that there would be no question of competition between Britain and the United States.

The Budget Analysed

SIR STAFFORD CRIPPS'S first budget has set a new standard and a new pattern in the history of British budgeting. In the past seven years each of his three predecessors had done something to expound the modern principle, never conceded by Chancellors before the war, that the budget, instead of being merely a means of enabling the Exchequer to finance its own outgoings, should be carefully tailored to fit the needs of the national economy as a whole. Mr Dalton paid lip service to this principle last year but flagrantly ignored it in practice. Sir Stafford, by contrast, this week set forth the principle more clearly and forthrightly than ever before, and then shaped his budget accordingly. The manner in which he has done so, by fitting this budget into the wider structure of the national economy, is described and discussed in other articles in this issue. This article is concerned rather with the structure of the budget itself.

In the sphere of budget accounting, as in the wider sphere of policy, Sir Stafford has made an honest attempt to meet almost every one of the criticisms which the economists and financial experts have levelled against budget technique in the past. Mr Dalton twelve months ago, after virtuously declaiming that 1947-48 was "a good year for a good surplus" at once made a mockery of this sound principle by budgeting for a surplus which was spurious even by the conventions of Treasury accounting in the past. Sir Stafford scorns all such pretences. The new Financial Statement indeed takes the first step towards reform of the outmoded Exchequer Return. It shows that if the "line" between revenue and capital items had been fairly drawn last year, the nominal budget surplus of £636 million would have been converted into a "revenue" surplus of £338 million, while capital items accounted below-the-line would have required a net expenditure of £352 million—a revised basis of accounting which reveals that, on the Exchequer transactions as a whole, there was last year a deficit of £14 million instead of the vast nominal surplus which has given Mr Dalton so much satisfaction.

The new budget has been cast on the same realistic basis of accounting as this novel analysis implies. The Chancellor estimated that, if inflation was to be avoided, the accounts of the Central Government as a whole would need to show a true surplus of at least £300 million instead of the small deficit which, on a true reckoning, they showed in 1947-48). That was in fact approximately the surplus which seemed in sight on the existing basis of taxation. After reducing the fixed debt charge from £525 million to £500 million, Sir Stafford was confronted by prospective ordinary expenditure totalling, on the conventional basis of accounting, a little under £3,000 million. His estimate of ordinary revenue, on the same basis, was £3,754 million, promising an "ordinary" surplus of £778 million. This was a much larger sum than unofficial estimators had envisaged, for most of them had made insufficient allowance for the effects (which Mr Dalton always strenuously denied but Sir Stafford now frankly admits) of past inflation upon the levels of personal incomes. In consequence of this inflation of last year's incomes, the yield of income-tax this year was put as much as £205 million higher than in 1947-48—despite the loss of tax through the operation, for the first full year, of the

reliefs granted last April and of the increases in profits tax. The influence of inflation is, indeed, apparent right through the structure of revenue. After allowing for the effect of tax changes made in earlier budgets, the only items from which any significantly smaller yield had to be expected in 1948-49 were those fed by abnormal receipts arising from the war—Miscellaneous receipts (which will decline by £174½ million), sales of Surplus War Stores (a decline of £95 million) and receipts from Trading Services (a decline of £44½ million).

More than half of the unexpectedly large "ordinary" surplus was, however, absorbed by expenditure which, on the customary accounting basis, is charged below-the-line. Such expenditure is this year expected to amount to £473 million, compared with £711 million gross or £692 million net in 1947-48, as the following table shows:

BELOW-LINE EXPENDITURE

	1947/48 (Actual net)	1948/49 (Estimated)
	£m	£m
War Damage Payments	280	140
Postwar Credits	56	20
EPT Refunds	28	20
Advances for New Capital Development ...	103*	59
Local Loans Fund	225	234
	692	473

* Principally for coal, housing, cotton, and overseas development.

Allowing for these outgoings, and after making certain other adjustments, the conventional surplus of £778 million above-the-line was reduced to £319 million for Exchequer receipts and payments as a whole. On the new alternative basis of classification set out in the Financial Statement, whereby capital items are more strictly segregated from revenue items, the prospective "revenue" surplus would be £598 million, compared with £338 million in 1947-48.

Despite the prospective buoyancy of the revenue, therefore, the surplus which confronted the Chancellor was only just sufficient to comply with his formula for non-inflationary finance. The scope for giving tax reliefs to reduce the disincentive effects of the current high level of taxation was therefore strictly circumscribed, for the cost of any concessions in one direction had to be made good by additional imposts in another. But within the narrow limits which anti-inflationary budgeting dictated, the Chancellor has exploited the opportunities to the full.

His first concern has rightly been to ease the pressure of PAYE upon incentive and effort, and he has done so by the only practicable means—suggested, indeed, in these columns last week—of raising the income limit at which tax first becomes payable at the full standard rate. The first £50 of income will still bear tax at the minimum rate of 3s. in the £; but the 6s. rate, which in the past applied to only the next £75 of income will in future apply to the next £200—a change which, in conjunction with other concessions, will have the effect of putting most wage earners outside the range of the full standard rate. This concession will cost the Chancellor £44 million in the current year, and £50 million in a full year. It is coupled, at a cost of a further £40 million (£46½ million in the full year),

by a raising of the earned income relief from one-sixth to one-fifth, thus restoring the prewar proportion. In giving this second "incentive" relief, the Chancellor has shown real statesmanship, for he frankly admitted the need to offer some succour to administrative, professional and scientific workers, and has unexpectedly raised the maximum allowance of earned income relief from £250 to £400, or £100 above the prewar limit. Thirdly, as a more specific inducement to married women to respond to the appeal to them to re-enter industry, the employed wife, as well as her husband, will in future receive the benefit of the reduced rates of taxation which operate for the first £250 of taxable income.

These three important sources of relief will cost a little under £85 million this year, or £103½ million in a full year. To finance them, the Chancellor looked first to those sturdy pillars of postwar budgeting, beer and tobacco. The beer duty is raised by 8½d. per barrel for each degree of strength, equivalent to an increase of 1d. per pint on beer of average strength. This is estimated to produce £30½ million this year. In view of the swinging increase in the tobacco duty twelve months ago, the additional demands upon the smoker are designed, as the Chancellor said, merely to bring home to him again the need to reduce his consumption. The increase in the duty on leaf tobacco is therefore the relatively modest one of 3s. 4d. a pound, equivalent to 2d. on the price of a packet of 20 cigarettes of standard size; but it should produce the not inconsiderable sum of £19½ million this year. Of this additional revenue, £2 million will accrue from a special excise duty levied on stocks held by manufacturers on Budget day. The principle of this charge is undoubtedly sound, for it is not right that manufacturers should make an adventitious profit out of the needs of the Exchequer and the misfortunes of the smoker. It ought to be emphasised, however, that if manufacturers are to be denied a profit when the duty is increased, they should equally be protected against loss when, eventually, the duties are reduced—after allowing for their existing cushion of past profit.

Increases in the duties on potable spirits and wines follow naturally from the additional burden upon the beer drinker. The duty on spirits is raised by £1 per proof gallon (equivalent to an additional 2s. 4d. on a standard bottle of whisky) while the duty on heavy wines is raised by the equivalent of 1s. per bottle and that on light wines by 6d. The increase on heavy wines, however, applies only to those of foreign origin, since it was agreed at Geneva recently that heavy wines of Empire origin were entitled to a wider margin of preference; after allowing for this concession, they will bear the same duty

as before. This is no doubt a reasonable and necessary concession, but it may have the odd effect of increasing British expenditure in the now extremely "hard" South African currency. The increased duties on spirits and wines will produce £10½ million this year and a little more than that in a full year.

Mr Dalton's experiment in taxation of football and similar pools having proved even more productive than was envisaged twelve months ago, Sir Stafford found here an "easy and profitable" source of additional revenue. The duty is accordingly doubled, at 20 per cent, to yield £5½ million this year. In addition, an entirely new duty is to be imposed, indirectly, on cash betting on dog racing courses—betting which has, of course, escaped the taxation imposed on tote betting. This is to be achieved by a new and graduated licence duty imposed upon bookmakers operating ring betting, the duty to be collected by the occupier of the racecourse at each meeting. This new tax is expected to produce £3,000,000 this year and £5,000,000 next.

These four measures of additional taxation—on beer, spirits and wines, tobacco and betting—which spread the burden where it can be borne with minimum hardship and without undesirable repercussions, together provide all but £17 million of the sum needed this year to finance the reliefs in income tax. The difference could readily have been provided by the increases which have been effected in purchase tax, for these should yield £26 million in a full year or, say, £21-22 million this year, thus leaving a margin of about £4 million which would have neatly financed the aesthetically desirable, but scarcely necessary, relief given to "live" entertainment (at a cost of £3,750,000 this year).

But the increases in purchase tax were not designed for this objective. They are part of the promised comprehensive plan for rationalisation of the purchase tax, which had been made even more chaotic by the measures that Mr Dalton had to devise so hastily last autumn. The 125 per cent category has been withdrawn (on the ground that so high a rate was simply provoking evasion) and so have the 50 and 75 per cent categories, leaving only four categories—exempt, 33½ per cent, 66½ per cent and 100 per cent. As part of this plan, certain items are shifted from the 50 per cent to the 66½ per cent category—notably non-utility cloth and non-utility furniture; clocks, watches and radio sets; photographic gear; smokers' requisites, and musical instruments (except church organs). But these increases serve another purpose besides simplification. They tend to mask the effects of the concessions which Sir Stafford has felt obliged to make—giving thereby just one sign

	REVENUE (£'000's)		Estimates for 1948-49

of a weakening in the sound austerity of his policy—to the noisy pleadings for tax abatement which he himself had aroused by launching the drive for voluntary restraints against inflation. He declared himself to be "most anxious to make some contribution to a lowering of prices" by reducing purchase tax on the goods which most concern the "hard-pressed housewife," and therefore moved a miscellaneous range of articles from the 50 to the 33½ per cent category. The reductions include gloves and haberdashery, carpets, washing and sewing-machines, cutlery, stationery, tooth brushes and paste, razors and blades, lighting fittings, and most domestic hardware and kitchenware. The list of concessions presents some odd anomalies and certainly does not suggest any coherent underlying principle; but it will cost £50 million in a full year and, according to Sir Stafford, may involve roughly a 10 per cent price reduction in the £500 million worth of goods over which it is spread.

These paradoxical concessions, which will increase public spending power and can hardly be regarded as necessary for the purpose of buttressing the drive for voluntary deflation (which is in any case of much lower priority than the need for direct action against inflation), perhaps help to explain the one remaining main feature of this complex Budget—the special levy on investment income where it exceeds £250 in 1947-48 of a total income of at least £2,000. The levy is 2s. on the first slice of investment income (£250 to £500); 4s. on the next slice (£500 to £1,000); 6s. on £1,000 to £2,000; 8s. on £2,000 to £5,000; and 10s. over £5,000. The unpleasant implications

of this measure are discussed in a separate Note, on page 598. This article is concerned only with its strictly budgetary effects. Without this source of additional revenue, the Chancellor, after making the purchase tax concessions, would have found his prospective surplus whittled down by nearly £39 million, to well under the minimum objective of £300 million. But the levy is expected to provide a total of £105 million eventually, and £50 million this year. On balance, therefore, the tax changes actually raise the original surplus from £778 million to £789 million on the conventional reckoning, or from £319 million to £330 million on a true reckoning, including all Governmental outlays, thereby achieving Sir Stafford's anti-inflationary target. Here, then, is an apparent financial justification for seeking additional revenue in a direction which otherwise seems to serve only a narrow political end. But it is not a real justification, for the £40 million or so of purchase tax concessions to be financed this year will clearly generate additional inflationary pressure, while the £50 million which comes from the special levy will impose no equivalent counter-inflationary pressure, for these funds will be produced mainly or wholly by drafts upon the inadequate stream of private savings. It is a pity that so courageous and realistic a budget should be marred by this unworthy reversion to the very techniques of spurious accounting which Sir Stafford himself has so successfully unmasked. But perhaps even the most eloquent and objective Chancellor must make some gesture to those of his colleagues who are less objective.

The National Income

THE annual White Paper on the National Income*, with its profusion of statistics and estimates of what the nation earns and how it spends, is never easy statistical going. If the figures were mere figures, there would be every excuse for the informed layman to leave this document to the specialists. But the White Paper is nowadays far more than a mere record of facts and guesses. Complex it most certainly is—in some respects unnecessarily so—but simple it can never be. Its complexities arise mainly because the White Paper also presents a relatively new technique of economic thinking. And its importance, even for the layman, arises because that technique is rapidly becoming the determining factor in the terms of reference of the Government's broader economic policy—on capital programmes, import cuts, and this week, at the very pinnacle of policy, in the Budget itself.

No one can assess the full significance—and the full merit—of Sir Stafford Cripps's first Budget without at least some general idea of the main categories of the structure of the National Income in the back of his mind. It is essential, therefore, that a wider public should, in the course of time, be able to understand the broad drift of the White Paper, despite its technical complexities. The main purpose of this article is to expound what is in the document, and its secondary purpose, left to the end, to comment on some of its technical difficulties and weaknesses.

The first table in the White Paper, reproduced in the next column, is fundamental. Its concepts are relatively simple. It shows the money value of what the community produced (Gross National Product), what it earned after providing for the maintenance of its capital assets (National Income) and the total resources which it could use at home—that is, its output plus the proceeds of borrowing from abroad or selling assets to

foreigners. The other side of the account shows the use to which these resources were put—the shares which the three claimants, personal consumption, Government spending, and capital investment, respectively absorbed.

GROSS NATIONAL PRODUCT AND BORROWING FROM ABROAD (£ Mn.)

	1938	1946	1947		1938	1946	1947
National income of the United Kingdom....	4,707	8,100	8,770	National cost of:			
Provision for depreciation and maintenance	450	725	775	Personal consumption	3,713	5,573	6,161
Gross national product	5,157	8,825	9,545	Government	767	2,411	2,115
Borrowing from abroad and sale of assets to foreigners	70	380	675	Gross capital formation at home	747	1,221	1,944
Total resources available for use at home	5,227	9,205	10,220	Total resources used at home	5,227	9,205	10,220

Last year, total resources available for use at home increased by over £1,000 million to £10,220 million, an apparent increase of 11 per cent. But over 6½ per cent of these resources were provided, not from output at home, but from borrowing abroad to the extent of £675 million. The money value of national output increased by a little over 8 per cent to £9,545 million, but this does not imply a corresponding increase in the volume of real output. The White Paper does not attempt to estimate how far national output increased last year in real terms, but it does disclose that the average cost of that part of national output which entered into personal consumption—which is by far the largest of the three shares—rose last year by 7 per cent, and the average prices of the physical output used for capital investment may have increased still more steeply. It would be surprising if the real national output last year, as distinct from its money value, increased by more than one per cent, though that indeed represents a considerable improvement on what seemed possible twelve months ago.

* National Income and Expenditure of the United Kingdom, 1947. Cmd. 7371. 1s.

In 1938, personal income absorbed 72 per cent of national output, Government spending 15 per cent and capital investment 14 per cent; there was thus overspending to the extent of one per cent, which was made up by a draft on overseas assets. Last year, personal consumption absorbed 65 per cent of total output (against 63 per cent in 1946), Government spending 22 per cent (against 27 per cent), and total capital investment 20 per cent (against 14 per cent). Very roughly, this is the kind of distribution which had been suggested in the Economic Survey for 1947, and it had to be supplemented to the extent of 7 per cent by overseas borrowing. That is the extent to which Britain exceeded its income last year. It is the simple demonstration of what happens when too much is attempted too quickly—and when overseas countries are prepared to come to the rescue. It also exposes what must happen if Britain cannot obtain assistance on the same scale this year—the prospect with Marshall Aid. The three claimants cannot be satisfied, this year, by the same shares that they received last year. If the volume of capital investment is to be maintained, personal and Government consumption must fall. But if nothing is done to reduce the money demand of the public and the Government for real resources, their prices will rise, and the volume of investment work carried out must therefore be reduced. Those are the simple logistics of inflation. That they should have conditioned the shape of the Chancellor's Budget so directly is a great step forward in the campaign against its evils.

If the first table is fundamental, there are others which are scarcely less interesting. Much has been made in recent months of the respective shares of the various factors of production in the national income. The figures are given below, before and after direct taxation:—

TOTAL PRIVATE INCOME BEFORE AND AFTER TAX (£ Mn.)					
	1938	1941	1945	1946	1947
<i>Income from work and property:—</i>					
Wages	1,735	2,840	2,780	3,095	3,530
Salaries	1,110	1,465	1,530	1,630	1,729
Pay and allowances of the Armed Forces	78	1,175	1,221	512	535
Rents	380	385	394	398	400
Profits and interest*	1,570	2,787	2,851	2,942	3,242
Total private income	4,873	8,652	8,776	8,577	9,227
Social security benefits, &c.	270	344	490	878	684
Total private income before tax	5,143	8,996	9,266	9,455	9,911
less Direct taxes	531	2,175	2,119	1,739	1,725
Private income after tax	4,612	6,821	7,147	7,716	8,186
less Undistributed profits	170	210	230	260	320
Personal disposable income	4,442	6,611	6,917	7,456	7,866

* Including farmers' profits, professional earnings and national debt interest.

This table shows the effect of the redistribution of private incomes since before the war. Wages, which absorbed 36 per cent of gross civilian income in 1938, absorbed 40 per cent last year; after meeting income tax, their proportion increased from 39 per cent to 44 per cent of net civilian income. But on the same construction, salary incomes fell proportionately from 24 per cent to 20 per cent, and the *omnium gatherum* item "Profits, interest, rent, farmers' profits, professional earnings and national debt interest" from 37 per cent to 36 per cent after tax. It is regrettable that the White Paper still makes no distinction between interest, profit and professional incomes; in the popular view, the 36 per cent consists of "profits" and nothing else. Why is the Board of Inland Revenue still unable, or unwilling, to provide adequate details? The composition of the national wage bill is known with considerable accuracy—indeed, it is one of the most important items of raw material in the entire computation of the national income. It is possible to say that total wages rose by 14 per cent last year, of which nearly half was due to increases in average earnings. But it is quite impossible to say, with any precision, what happened to rentier and entrepreneurial incomes.

The next stage is to examine how far the total disposable

income shown in Table II was spent, and how far saved. The figures are given below:—

PERSONAL EXPENDITURE AND SAVING					
	1938	1944	1945	1946	1947
	£mn.	£mn.	£mn.	£mn.	£mn.
Personal expenditure at market value	4,288	5,544	5,996	6,739	7,421
Personal saving	154	1,057	921	717	445
Personal disposable income	4,442	6,611	6,917	7,456	7,866
	%	%	%	%	%
Personal expenditure at market value	90.5	83.9	86.7	90.4	91.3
Personal saving	3.5	16.1	13.3	9.6	5.7
Personal disposable income	100.0	100.0	100.0	100.0	100.0

Personal expenditure at market prices jumped by £682 million, though incomes rose by only £410 million; personal saving fell by £272 million to £445 million, which represented 5.7 per cent of total income after direct taxation. Personal savings have in fact shown a rapid tendency to return towards the prewar proportion—a point which has great significance for capital investment. The public spent almost exactly 10 per cent more on consumption than in 1947, but that is a figure which has no significance until it is adjusted for changes in prices. The following table shows the total of personal expenditure at current market prices in each year, then revalued at 1938 prices, and the index number of prices of the goods and services which have been bought:—

EXPENDITURE ON CONSUMPTION					
	1938	1944	1945	1946	1947
	£mn.	£mn.	£mn.	£mn.	£mn.
Personal expenditure on consumers' goods at market prices	4,288	5,544	5,996	6,739	7,421
Personal expenditure on consumers' goods at 1938 prices	4,288	3,706	3,921	4,292	4,424
	%	%	%	%	%
Index of expenditure	100	120.3	140	157	173
Index of "consumption"	100	86.3	91.4	100	103
Index of prices	100	150	153	157	168

For want of a better shorthand term, the index for consumers' expenditure revalued at 1938 prices has been labelled an index of "consumption." But it is necessary to be very careful in using this index for comparative purposes. It might be interpreted as showing that real personal consumption is now 3 per cent higher than in 1938. Even if that were so, it would still be necessary to allow for the increase of about 4 per cent in the population since 1938. Nor does it allow for changes in the composition of personal "consumption"—the reductions in quality which are impossible to measure, and the limited selection of foods and other goods and services which is now available. It makes no allowance for the fact that some people, because they cannot buy steaks now buy imported fruit, or smoke more because they eat fewer sweets. The standard of living of vast numbers of the population has undeniably improved, compared with 1938, but to infer from this index that the standard of living of the country as a whole is now higher than it was in 1938 assumes that consumers are to-day equally satisfied by the collection of goods and services which is allotted to them under rationing or is made available by controlled production as they were by the collection which they bought of their own choice in 1938. That is manifestly not so.

Indeed, the figures must be regarded as a measure of the attempt by consumers to substitute less desirable satisfactions for those which are now denied them. This point is illustrated in the next table, which shows the movement of actual expenditure on different classes of consumers goods and services, between 1946 and 1947 and the same expenditures recalculated at 1938 prices—a much more accurate comparison, incidentally, since the character of the items entering into personal consumption is unlikely to have shown any radical change during the two years:—

PERSONAL EXPENDITURE ON CONSUMERS' GOODS AND SERVICES
(1938=100)

	At current market prices		Revalued at 1938 prices	
	1946	1947	1946	1947
Food	137	155	96	102
Alcoholic beverages	238	238	96	95
Tobacco	341	390	133	117
Rent, rates and water charges	109	115	104	106
Fuel and light	148	157	111	117
Durable household goods	129	168	65	81
Other household goods	111	122	74	84
Clothing	137	158	139	155
Books, newspapers and magazines	164	186	56	59
Private motoring	95	106	56	59
Travel	166	182	143	145
Communication services	186	193	145	145
Entertainment	286	273	163	155
Other services	134	148	94	99
Other goods	175	212	86	95
Total personal expenditure	157	173	98	102

There may be ground for doubt whether food consumption increased by 2 per cent compared with 1938, but it is much more plausible to suppose that it did increase by over 6 per cent last year. The table shows the pressure of purchasing power seeking an escape into every channel that presents itself. It is no accident that those goods and services which have increased less in price compared with 1938 (disregarding changes in quality) have enjoyed the greatest patronage from consumers. The price of coal has increased by 66 per cent and its consumption has been reduced by 30 per cent largely as the result of rationing. But electricity has fallen 13 per cent and its consumption has increased by 132 per cent. The same interplay of price and demand is shown by books and publications, and travel. This table, indeed, provides much evidence to support the assertion that inflationary demand has diverted resources of raw materials and manpower from uses where they were urgently needed into many less essential ends of personal consumption.

There are many other descriptive features of the national economy which could be brought out from the White Paper. But space must be left to turn to a few of its more technical aspects. This year there are omissions which, it will be hoped, may be made good later—continuous series of figures since 1938, and the enterprising statement, given in Appendix V of last year's White Paper, on the social accounts of the United Kingdom. Again, some explanation might then be given of several disconcerting changes in the figures of earlier years which appear in the latest issue, particularly as they affect capital investment. There is room, too, for greater standardisation of the concepts employed in the White Paper. When it talks of gross capital formation at home, it should mean the same

thing on different pages, and show the same figure. Moreover, since the national income technique runs through other discussions of Government economic policy (such, for example, as the White Paper on capital cuts, and the Economic Survey for 1948) the public has a right to expect a common method of treatment in all the documents. This point applies particularly to the equation of capital investment and savings. It should be possible to carry forward the discussion in the Economic Survey on this crucial determinant of inflation with the aid of the latest figures in the White Paper. But unfortunately the treatment is in several respects quite different—and for no obvious reason. Again, while the national income estimates in the Economic Survey were necessarily tentative—for it appeared several weeks ago—it is disconcerting to find so great a margin of difference between the figures then published for depreciation allowances, private savings and undistributed profits (to cite three examples only) that some doubt is inevitably thrown on the margin of error which may be inherent in the projected capital account for 1948.

A full discussion of this question must be postponed. But it is so important that it deserves serious emphasis now. If the national income technique is to be successfully used as a guide to inflationary (or deflationary) potentialities in the economic system, a radical improvement will have to be made in the estimates about savings and the cost of investment. The White Paper frankly admits that these are undoubtedly the most vulnerable estimates in the whole paper. Indeed, that must be so because they are derived from differences in much larger figures of personal and Government expenditure compared with the national income. One of the results of this process is to add a sum of £100 million to home investment which more properly belongs to overseas investment (and would therefore increase last year's investment in the sterling area, already put at the high figure of £181 million in the White Paper on the Balance of Payments, to no less than £281 million).

But although this is extremely hazardous statistical territory, an attempt must sooner or later be made to survey it, if the framework of information about capital investment is to be made sufficiently strong to bear the superstructure of financial policy which is now—quite rightly—built upon it. This is in no sense a criticism of the labours which have gone into recent economic documents issued by the Government, though at some points these appear to have lacked the fullest support and information which might have been expected from certain public departments. But if planning is to have any meaning, it must repose upon far more reliable information about capital investment than is now the case.

Business Notes

Budget Reactions

The City's reaction to the Budget was a compound of respect for its firm handling of the problem of inflation, and of sharp criticism of the "Special Contribution." Some days before the Budget speech, fears had gradually subsided about a stiff increase in profits tax or statutory limitation of dividends, and the confirmation of these hopes was marked by some relieved buying of ordinary shares—with particular emphasis on the higher-yield groups—rather than by any outburst of excitement. Tobacco shares inevitably reacted to the increase in duty, but not very much, and brewery shares seemed wholly unaffected by the extra 1d. on the pint—a plausible calculation, since direct tax reliefs will enable many consumers to pay the new duties without any noticeable tightening of belts. The outlook for ordinary shares cannot have been changed so radically by the Budget, however, as some commentators appear to assume. Economic and industrial problems have not lifted. Dividend limitation is an accomplished fact over a large range of industry, and who can say when it will end? Yet the range in average yields between gilt-edged and

ordinary shares is little more than one per cent on the blue chips and 1½ per cent on a mixed industrial portfolio. The only remaining scope for equity investment, while these circumstances last, is to find ordinary shares with a greater than average yield whose dividends are not vulnerable—an arduous and not very rewarding task.

But if equities showed a measure of relief over the Budget, gilt-edged were distinctly depressed. The market argued that the levy would fall on capital in the case of large incomes and that the necessary sales of securities would comprise more gilt-edged than equities. The argument has some force, but it could easily be exaggerated. The revenue from the levy during this financial year is no greater than £50 million, and the total yield £105 million. Some large investors may see some advantage in settling the greater part of their liability before next January (at a discount of 2 per cent net per annum). But even if the whole contribution were provided out of capital (which will not be the case) and that only gilt-edged stocks were affected (equally not the case) it is difficult, on the basis of a "once for all" contribution, to

14th, it should be possible to take a clearer view of what Marshall dollars may be available to Britain to make offshore purchases from Canada, and in the light of that information longer term arrangements may again be possible. The matter is now under discussion not merely between London and Washington but between Washington and Ottawa. Meanwhile the very short term arrangements provide for further drawings on the Canadian credit. The maximum of these drawings for the first three months of this year was \$45 million. If that rate were maintained it would be open to Britain to draw nearly \$8,000,000 during the fourteen days of the interim agreement. It is thought that the permissible releases are somewhat in excess of this figure. For the rest Britain continues to fill the Canadian deficit in US dollars but can do so with less anxiety now that Marshall assistance is assured.

The position regarding offshore purchases, as this issue goes to press, is that the United States authorities have asked the British to state their Western Hemisphere requirements under Marshall aid. These particulars have been furnished, together with details of British contracts for supplies from Canada—all of which are at prices which are favourable compared with American prices for the same commodities. It is therefore expected that these contracts will be taken over by the United States as offshore purchases, but the final decision rests with the American administrator of ERP. As for other supplies, like wheat from Argentina or South American cotton, there is distinct doubt whether these will qualify for inclusion, at least at present.

* * *

American Plans and British Studios

American film producers, as was to be expected in view of the film agreement, have begun to show a renewed interest in British studio space. Various signs of this have appeared, and one definite arrangement: Mr J. Arthur Rank, in New York, has made an agreement under which Universal are to make two films in the studios and using the technical resources of the Rank Organisation. These productions will be financed ("to the extent permitted by the tax settlement," of which the terms have still to be published) from the American company's non-remittable British earnings.

Of the major American film-producing companies, Warner Brothers and Metro-Goldwyn-Mayer already command studio space in this country. For Universal (since they distribute in the United States a part of the Rank output) the Rank Organisation is the obvious channel. Mr Rank has been at pains to point out that this is the only commitment of the kind into which he has entered. It remains to be seen where the remaining American producers will look for British studio space in which to spend their sterling. Some of them have already announced programmes of production.

The amount of empty British studio space has lately been increasing; so has unemployment in the film industry. The prospects that American producers will be able to get the space and the personnel which they will require (for they will want to employ some British staff) seem to be good; and this very fact is aggravating the hesitations and difficulties of British producers. The Association of Cinematograph and Allied Technicians, which was already suffering from unusually heavy unemployment among its specialist members, has suffered two new blows with the closing of the British National Studios at Elstree and the cutting of staff at Sir Alexander Korda's studios at Shepperton. The reduction of staff at Shepperton may not mean a fall in production, since extra personnel had been employed there on expansion and improvements. But the Association now has 500 or 600 members out of work; unemployment among the technicians means a much larger volume of unemployment among less skilled workers as well; and it seems unlikely that British producers in their present despondent mood will be able to find them work. Only the Americans, it seems, have the capital in sight to expand film production in the near future. Their superior resources, together with the larger markets they can command, are enough to frighten away the backers on whom so much British production depends. But there must be a limit to the extent to which the Americans wish to enter film production in Britain, and the present wave of pessimism about the future of British film production may yet prove to be overdone.

* * *

A Bottleneck Answers Back

The British Iron and Steel Federation, understandably nettled by the description of steel as "the worst bottleneck" in the popular edition of the Economic Survey, defends itself with some

vigour in the March number of its *Statistical Bulletin*. Both editions of the Survey (the *Bulletin* points out) create the impression that shortage of steel is limiting British recovery and compels special efforts elsewhere:

An example of this occurs in comments on the export targets for 1948, where it is suggested that shortage of steel has made it necessary to reduce export targets for certain types of machinery and vehicles. Why this is so is not clear, since these targets were fixed after the fixing of the 14 million ton target for steel production. Either, therefore, there was some miscalculation in fixing the original targets, or the closing of overseas markets, which is also referred to, is, in fact an over-riding factor in their adjustment.

As to its own target, the *Bulletin* points out that the steel industry is doing well; production was at the rate of 14.5 million tons in January and at the rate of 15 million tons in February. It naturally admits the need to make more steel if possible, but adds:

There is, however, a great difference between stressing the importance of expanding production at a time when the crucial problem facing the country is how to increase production generally, and branding some particular expanding industry as a bottleneck holding back the rest of the economy.

Its defence (or, rather, counter-attack) is that the steel industry is supplying more steel than it has ever supplied before, and that if this is not enough, it is because of extraordinary demands, caused by deficiencies in other products. To the suggestion that textiles are to be called upon to make good the deficiencies of steel in the export trade, the steel industry replies that even the new target for textile and clothing exports is only 99 per cent of prewar exports, while the new "reduced" export target for machinery and vehicles is 199 per cent.

So far from other industries having to carry increased loads because of shortages of steel, the position is that claims on steel are so high because supplies of many products, some produced at home and some imported—for example, coal, timber, and textiles—are still below the prewar level.

The *Bulletin* draws attention to the particular shortages of components (ball-bearings, precision chains, electric motors) which are mentioned in the Economic Survey. Here, it suggests, the real bottlenecks are to be found—not in the general supply of steel. In the ball-bearing industry, for example, "there is no question of output being hampered by shortage of steel." But there is an abnormally heavy demand, aggravated by the requirements of conveyor-belts for colliery re-equipment, and there is a shortage of labour for additional ball-bearing production. The *Bulletin* doubts whether such things were remembered when steel was described as "the worst bottleneck." It adds a discreet but not ineffective thrust at the Government system of allocating steel: "It may be that difficulties here, which certainly characterised 1947, have not yet been overcome." It is a lively polemic, which certainly succeeds in proving that there is more than one aspect from which inflation of demand and its consequences can be regarded.

* * *

Can Germany Spare Scrap?

In the same publication the German scrap position is discussed. The main contract which Britain has been seeking for a million tons of German commercial scrap has never been put into final form, and the current contract for 100,000 tons (to be delivered by July) to which the *Bulletin* refers is hardly even a stop-gap. Two difficulties remain to be overcome. First, on prices; the contract price is £6 10s. a ton f.o.b., but this goes to the Joint Export-Import Agency; what the German dealer gets, according to the *Bulletin*, is fifty marks. Attempts to express the value of fifty marks are a waste of time; the *Bulletin* hazards "anything from £1 5s. to £3 15s. a ton"; the German dealer would probably say "ten cigarettes." The high price paid to JEIA has obviously not solved this difficulty. The second difficulty that has been raised is Germany's own need for scrap; against this the *Bulletin* states the British case in some detail.

Bizonia's maximum permitted output of steel under the revised level of industry plan is 10.7 million ingot tons a year. But this cannot be attained at once; according to the Marshall Plan forecasts it should reach 4,075,000 tons this year and 10 million tons in 1951. About half is to be made by the Basic Bessemer or Thomas process, and half by open-hearth and electric furnaces; the division is determined by such factors as the existing structure of the German industry, the raw materials expected to be available, and the important German demand for Thomas slag, a by-product of the Thomas process, as fertiliser. While 72 per cent of scrap—obtained within the industry itself and from its associated engineering and fabricating shops—is to be

● Money is required for the export programme—to keep men and machines working and so ensure the ceaseless flow of British goods to markets overseas. All this vital activity is sustained by the facilities which a Bank alone can provide.

used in the open-hearth furnaces, the Thomas steel is to be made mainly from pig iron in accordance with ordinary German practice. The following table, reproduced from the *Bulletin*, shows the steel production programme for Western Germany under the Marshall Plan, the requirements of scrap for steel production, and the estimated tonnages of scrap arising from within the industry.

ESTIMATED GERMAN STEEL PRODUCTION AND SCRAP REQUIREMENT
(Thousands of Metric Tons)

	Year			
	1948	1949	1950	1951
Steel production.....	4,675	5,500	7,500	10,000
Thomas.....	2,057	2,750	3,750	5,000
Open hearth, &c.....	2,618	2,750	3,750	5,000
Scrap required :—				
Thomas.....	30	40	55	75
Open hearth.....	1,590	2,145	2,925	3,900
Total.....	1,620	2,185	2,980	3,975
Scrap arising :—				
Steel works.....	856	1,430	1,950	2,600
Engineering and fabricating.....	407	770	1,050	1,400
Total.....	1,263	2,200	3,000	4,000
Surplus or deficit.....	— 357	+ 15	+ 20	+ 25

Only in 1948, according to this programme, will extra scrap be needed to bridge the initial time-lag. The scrap requirements for pig-iron production are separate, but they are limited. In blast furnaces making Thomas iron only about 5 per cent scrap can be used if basic slag for fertiliser is to be maintained at the necessary quality. In other furnaces up to 22.5 per cent scrap is expected to be used during 1948-49, 20 per cent in 1950, and 18 per cent hereafter. On these assumptions, scrap requirements for blast furnaces are 416,000 tons, 540,000 tons, 686,000 tons and 851,000 tons in the four years 1948-51. These figures result in the following total requirements of scrap for German iron and steel production from sources external to the iron and steel industry itself:—

	Metric tons.			
1948	1949	1950	1951	
773,000	525,000	666,000	826,000	

These needs, the *Bulletin* maintains, can be comfortably met by the existing stocks of 880,000 tons in the hands of steelworks and the scrap merchants, together with the quantities, estimated at 550,000 rising to 1,000,000 tons, which should become available from industry year by year through normal wear and tear. And German steel production will have no need of the vast quantity of scrap (estimated at 5 or 6 million metric tons) in the British Zone not yet collected by the scrap merchants.

Overtime in the Mines

The decision reached at last week's special delegate conference of the National Union of Mineworkers to continue working overtime for another twelve months was expected, but is none the less welcome. It is estimated that some 4,000,000 tons have been added to production since the overtime agreement was originally reached last November, and if this year's agreement can be accompanied by a concerted drive against absenteeism, the

Agencies in New York, Bradford, Manchester

addition to output should be even greater. This, however, is a rather large assumption. In recent months, absenteeism at weekends has been rising. The experience of Northumberland and Durham which chose to work an extra half hour rather than the Saturday shift suggests that this method is more economical and effective, as the Government originally held, and districts where Saturday absenteeism has been exceptionally high may well consider switching over to the half hour a day practice.

Coal output has recently been running at about the rate required to fulfil the 1948 target, and deep-mined output had in certain weeks exceeded the 4,000,000 ton mark. Last week, however, 1,000,000 tons were lost through the Easter holiday, and deep-mined output fell to 2,816,600 tons. A spurt will be needed to recapture lost ground. Opencast working had been steadily improving until the holidays, and with the warm weather should improve further.

The chief danger-point in the industry still lies in the number of unofficial strikes. In January and February, more than half the number of strikes and a third of the working days lost were in the mines. A stoppage is now threatened by the Yorkshire winding enginemmen which would upset production in this important coalfield. The negotiations over craftsmen's wages are still dragging on, and even though the Board has given an assurance that any increases will be retrospective from January 1st, there is a growing sense of frustration and impatience at the slow procedure. Miners' hopes that the negotiating and conciliation machinery established under nationalisation would lead to speedier settlement of disputes and thus avert the danger of unofficial stoppages have so far not been realised.

Capital Movements to South Africa

Two important notices dealing with the movement of capital to South Africa and exchange arrangements with that country emphasise the increasing momentum of the drift which, in certain technical respects, is taking the Union outside the sterling area system. The new capital arrangements apply to sales of securities on behalf of non-residents and reinvestment of the proceeds in South African securities. The Bank of England has announced that such switching requires the prior approval of the Bank. For the purpose of this notice, non-residents are persons residing outside the sterling area, and it is understood that the tightening of the regulations is aimed at controlling the switching of investments by Continental and American holders of securities who have recently found their confidence in sterling sufficiently shaken to transfer capital to South Africa. Such switching has throughout been subject to permission of the Bank of England, but this permission has in the past been given so automatically that some stockbrokers had been inclined to take the matter as a pure formality and on many occasions sought permission from the authorities after the business had been transacted. The presumption is that, in future, permission will be given only in very exceptional cases.

It should be added that the tightening of the regulations does not affect switching by residents in the sterling area. It is from these quarters that the main movement of capital from Britain to South Africa has been initiated, but presumably the authorities on this side feel that the discouragement of that movement is being effectively achieved by the initiative recently taken by the South African Reserve Bank.

The main British objection to this shift of capital is that it is placing in South African hands sterling resources which can be

used to finance current imports from the sterling area and which to that extent make it unnecessary for the Union of South Africa to replenish its sterling holdings by sales of newly-mined gold to the British Government. Over the past year the sterling holdings of the South African Reserve Bank have risen from about £10 million to nearly £70 million. This accumulation of sterling, which is largely the product of capital transactions, is a measure of the gold that would otherwise have accrued to the sterling area central reserve.

The second notice affecting payments arrangements with South Africa is an amendment to the arrangements by which facilities have in the past been granted under Foreign Exchange Notice No. 257 for selling dollars or other foreign exchange to South African importers. Under the former system a resident in South Africa could open a credit in London for an import to be paid for in non-sterling currencies, including dollars. He was not allowed to cover his commitment by a forward purchase, but in effect his bank was entitled to buy the dollars spot and hold them for him until such time as his commitments fell due. It is this procedure that is now no longer allowed. Any sale of dollars for other currencies by London banks to finance imports into South Africa must now receive prior sanction by the South African Reserve Bank. This change merely formalises recent developments under which South Africa has ceased to have access to the sterling area dollar pool and has become directly responsible for its own dollar and other hard currency deficits.

Industrial Production

The index of industrial production, now in its second month of publication in the *Monthly Digest of Statistics*, is given for January (the latest month covered) as 122 (1946=100). The latest calculation is, however, given only provisionally, and the reservation is real: the index for December, assessed provisionally at 117 in last month's *Digest*, is now corrected to 115. Of the main industrial groups which the index covers, manufacturing industries for December are corrected from 117 to 114, and gas, electricity and water from 126 to 119. The corrected picture for December, 1947, is given below.

INTERIM INDEX OF INDUSTRIAL PRODUCTION
December, 1947 (1946=100)

	December, 1947	December, 1947	January, 1948
		Revised	Provisional
Total	115	115	122
Mining and quarrying	104	104	115
Manufacturing industries (total)	114	114	123
Chemicals	104	104	...
Metals, engineering and vehicles	120	120	...
Textiles and clothing	105	105	...
Food, drink and tobacco	105	105	...
Other manufacturing industries	117	117	...
Building and contracting	128	128	120
Gas, electricity and water	119	119	121

Last November (the index for which is now corrected to 123) still stands as the best month since the war.

In its statistics relating to iron and steel production the *Digest* includes for the first time stocks of pig iron and scrap—a useful addition (urged in *The Economist* on March 13th) which tends to show how far the success of steel production has been achieved at the expense of stocks. Pig iron stocks in February stood at 388,000 tons compared with 814,000 a year before and 997,000 in February, 1946. Scrap stocks were 352,000 tons, compared with 534,000 in February, 1947, and 492,000 in February, 1946. The Economic Survey referred to “continuous and ominous falls” in these stock levels; the figures now published show the position more precisely, if not less ominously.

The Volume of Bills

Amid the mass of information contained in the latest report of the Commissioners of Inland Revenue, that for the year ended March 31, 1947, an item of particular interest to the money market is the revenue from duties on bills of exchange. These figures make it possible to frame an approximate estimate of the amount of bills outstanding in the fiscal year 1946-7 and to compare them with those for the preceding year. Receipts are shown separately for inland and foreign bills. The estimates of the amounts outstanding are based on the assumption that on the average the bills drawn are for periods of three months, and that they are all in excess of £75 and therefore bear stamp duties at the rate of 1s. per £100. The resultant estimates of inland

and foreign bills outstanding in the last pre-war year and in each of the three latest fiscal years are as follows:—

			£ 000's	
		1938-39	1944-45	1945-46
Inland	...	135,339	32,787	40,432
Foreign	...	123,626	9,454	11,085
				30,912

The revival of the inland bill in the year 1946-7 was striking, and market experience suggests that the growth in this type of paper has continued since March, 1947, and that the volume outstanding must now challenge comparison with what it was before the war. The comparative revival in foreign bills was even more marked, but the amount outstanding in 1946-47 was still less than one quarter of what it was before the outbreak of the war. The above figures of bills outstanding should not be regarded as a measure of the volume of commercial bills circulating in the London market. A considerable proportion of the bills drawn go straight into the holdings banks and commercial houses and do not appear in the market. The volume of inland bills, for example, has been appreciably swollen by hire purchase paper.

How to Streamline

It may be urgently necessary to reduce imports and to expand exports, but it is often easier to obtain a licence to import than to export. Last November, the President of the Board of Trade set up a "working party" to consider whether the forms required for export trade could be simplified or even eliminated. It was a committee of the talents, including representatives of the Association of British Chambers of Commerce, the Federation of British Industries, the Institute of Export, the Institute of Shipping and Forwarding Agents, the banks, the National General Export Merchants' Group and the National Union of Manufacturers. In addition, the Bank of England, the Treasury, Customs and Excise, the Board of Trade and the Ministry of Transport were represented.

If radical improvements could be made, such a committee was certainly well qualified to discover them. But it has completed the first stage of its inquiry—the examination of forms required by the Government—and is unable to recommend any major changes, given the existing export and exchange controls. Export licensing, originally devised to prevent the starving of the home market by excessive exports of necessities in short supply, at present covers only about 30 per cent by value of Britain's total export trade, and the "working party" could offer no improvement in the system already in operation. Similarly, it endorsed the use of form "C.D.3" for the purpose of exchange control which covers over 50 per cent by value of the total export trade. A suggestion to amalgamate the two failed, because only 20 per cent of total exports calls for the completion of both forms, and the increased complexity would be a nuisance to other exporters. On Customs forms, it had to accept the contention of the authorities that the present forms—unchanged since 1939—are essential to safeguard the revenue.

Thus, the "working party" has laboured without producing even a mouse to lighten the exporter's burden. And indeed it was doomed to failure because it had to take for granted the existing background of controls. Forms may indeed be a nuisance. But absence of forms would not automatically sell more British exports.

Cunard Steam-Ship Capital

At the annual general meeting at the end of this month the Cunard Steam-Ship Company is to seek approval to increase the authorised ordinary share capital of the company from £5,570,241 to £12 million. This is as far as the chairman, Mr Frederic A. Bates, is at present prepared to go in elaborating the board's plans to issue more capital. The decision has been dictated largely to fund the group's short-term finance, represented in the consolidated balance sheet at December 31, 1947, by a liability of £4,881,300 for unsecured loans to bankers (and since reduced to £4,581,300).

This liability arose from last year's purchase by Cunard Steamship of the outstanding 38 per cent of the ordinary shares of Cunard White Star from O.S.N. Realisation Company at 40s. a share—a transaction described by Mr Bates in his statement as one which enables the Cunard Company to retain "all that might be called the built-in strength which a prudent company requires to meet its varying fortunes in the future." Although the liquid position of the group was not known at the time of the purchase, it was evident that the parent company (judging

by its resources at the end of 1946) could not have financed the deal without external assistance. The accounts for 1947, which have now been issued in consolidated form for the first time, show that the group enjoys a position of great strength, with reserves of £18,069,422 and a written down book value for the fleet of £25 16s. per gross ton. In this situation the low level of net liquid assets is a striking anomaly. If short-term loans in the consolidated balance sheet are offset against liquid assets, there remains a surplus of only £113,162. Quite apart from its expressed desire to repay the outstanding indebtedness to the banks, Cunard is clearly in need of some replenishment of resources. These have been heavily depleted since the war; it is now revealed that up to the completion of the "Caronia," building contracts and purchase of tonnage have cost the group more than £14½ million.

Another reason for the proposed increase of capital is to "pave the way for any future expansion or development of the company's business." Does this imply a further expansion of building plans? Presumably not, for Mr Bates' views on the inadequacy of depreciation allowances, the exorbitant cost of building, the weight of taxation and the uncertain trading conditions which lie ahead, especially on the Atlantic route, in which the group has such a commanding interest, are well known. But Cunard is unlikely to be wholly deterred by these factors. Cautiousness has always been the keynote of Cunard pronouncements, but the group has been most enterprising in its postwar efforts to re-establish British shipping on a peacetime basis, especially on the important dollar-earning routes, and no doubt it does not regard its work as wholly finished. In 1947 profits of the group totalled £9,474,785, and provided earnings of 85.3 per cent to cover the 10 per cent dividend which has been paid for each of the last three years.

* * *

Relief from Rice

Prospects for the world rice crop this season are encouraging, and if large grain harvests are secured in both Europe and North America, much of the physical distress caused by the shortage of staple foods will be alleviated. Abundance, however, is still not yet in sight. The US Department of Agriculture has estimated world production of rough rice in 1947-48 at 7,086 million bushels; this represents 96 per cent of the average prewar output, but there are many more mouths to feed. The current crop is nearly 150 million bushels larger than in 1946-47 and the greatest gain occurred in Asia, where production is gradually recovering from wartime destruction. Both India and Japan, however, are expected to have smaller crops than last season.

Before the war the major exporting countries, in order of importance, were Burma, Siam, Indo-China and Korea. Output is expanding in each of these countries, but it is well below the

this season from Burma, Siam and Indo-China—some 100 million bushels more than in 1946-47—will reduce Asia's demand for grain substitutes, but total supplies from these sources will still be 250 million bushels lower than before the war. Production in other areas of the world is also increasing and only in Europe is output below the 1935-39 average. The great expansion which has taken place in North and South America and Africa will help to swell world rice supplies, but they will still be insufficient to offset the smaller crops in the Far East. Asia alone still accounts for 93 per cent of world production, although before the war the proportion was 96 per cent.

Full recovery of rice production in the Far East depends to a large extent on political stability. Acreage is only 98 per cent of the prewar level, and in the major exporting countries it is nearer 70 per cent. Lack of internal security, lack of confidence in currency, and lack of consumer goods still play their part in restricting output; but at least the general prospect is not so bleak as it was nine months ago. More adequate rice supplies in Asia would do much to improve political conditions there and help indirectly to relieve the world's food shortage.

* * *

Base Metals from Dollar Sources

American demand for base metals has continued strongly since the turn of the year despite recurring apprehensions of a business recession. Lead advanced early this week by 2½ cents to 17.30 cents a lb. (equivalent to £96 a ton compared with the British price of £90)—a new record level for common grades. A rise had been anticipated for many weeks and last week foreign lead was offered in the United States at 16½ cents a lb. The strike in the Mexican mines may have been a contributory cause to the recent rise, although Mexico's annual production is not a major factor. World supplies, however, are still well below requirements. In the last week the world export price of electrolytic copper in New York has declined from 22.00 cents a lb. to 21.75 cents (or £121 a ton, against the British price of £132), but fundamentally the market is still firm. American tin has remained unchanged despite the new premium on Straits metal. The Ministry of Supply has agreed after nearly three months' negotiations with Malayan tin representatives to raise its buying price from £500 to £504 a ton ex-smelter (Penang or Singapore), while its ex-smelter selling price is increased from £504 to £505 10s. a ton. This new price pays little more than lip service to the Malayan claim for a premium over Bolivian tin, but it was probably the best concession which could be obtained without altering the whole structure of world tin prices.

Britain is still very dependent on dollar sources for copper, zinc and lead. This month the first supplies of electrolytic copper refined in the United States from Rhodesian blister should arrive in this country. Although this copper will provide a welcome contribution to British supplies, it will cover barely a tenth of Britain's electrolytic requirements. The British demand for high-grade zinc rose sharply last year, and consumption totalled 110,000 tons out of a total virgin zinc consumption of 223,000 tons for the year. Most of this high-grade metal has to be imported from the United States, which with Canada supplied over two-thirds of British imports of slab zinc in 1947. Moreover, dollar countries also supply this country with between 25 and 30 per cent of its lead imports.

Europe, of course, is equally dependent on Western Hemisphere non-ferrous metal supplies, even though demand has been restricted to essential uses by the scarcity of foreign exchange. Marshall aid will not be so lavish that an uncontrollable boom in base metal prices is likely to result. And it still remains to be seen whether, with Marshall aid, it will be possible to avoid some curtailment of the British and European demand for copper, lead and zinc, even at some threat to industrial activity.

Shorter Note

The selling price of platinum in London was recently raised from £19 to £22 10s. per troy ounce. This increase is in conformity with price advances announced by a leading American smelting company. The present price level compares with £15 a year ago and the increase of £7 is due to the cessation of exports from Russia since the first half of 1947. The new London price applies to sales for manufacturing purposes which are conducted in very small lots. There is also a free market price in London of about £26; this premium results from speculative holdings owing to the cessation of imports

REPORT OF THE AUDITORS TO THE MEMBERS

We have examined the Consolidated Balance Sheet set out above with the Balance Sheets of The Cunard Steam-Ship Company Ltd., and of its Subsidiary Companies which have been duly audited. In our opinion the Consolidated Balance Sheet is properly drawn up so as to exhibit a true and fair view of the state of the affairs of the group as a whole as shown by the audited accounts so far as concerns the members of The Cunard Steam-Ship Company Limited.

FAMILY MEN UNDER AGE 45

Your responsibilities are great. A considerable Fund would be required to provide your widow with **£250 A YEAR FREE OF TAX** until the time you would have reached the age of 65, followed by a substantial annuity, for the remainder of her life.

THE STANDARD FAMILY INCOME POLICY

solves this problem for less than £60 a year at age 24, rising to £93 a year at age 44. Other amounts may be obtained at a proportionate cost.

This type of policy can be granted only to male lives in good health whose ages do not exceed 45.

Write for full particulars to:—

Safe as the Bank

SAVINGS CERTIFICATES are a safe and profitable investment, and your Bank is ready to make it easy for you to buy them. Your Bank Manager will ask only for your signature on a Banker's Order form authorising either a single purchase of a block of National Savings Certificates, or a regular automatic monthly purchase of Certificates for as long as you wish.

You can now hold 1,000 10/- units of the new Certificates, and in 10 years this £500 will have grown to £650 free of tax. Secure for yourself this highly profitable gilt-edged investment by calling on your Bank Manager to-day.

SAVE—The Bank Way

Issued by the National Savings Committee.

THE SPIRIT OF ENQUIRY

To-day . . . another meteor flashes through the sky

Five thousand years ago heaven-sent meteorites brought man his first knowledge of nickel-bearing ore. Mysterious and recalcitrant, it was for centuries impossible to separate from other metallic constituents.

To-day, the spirit of enquiry and the impetus of the research work which has always characterized the Mond organization has introduced nickel into our everyday lives. Cars, machine tools, radio, the cinema—all depend on nickel, and in the manufacture of food and clothing nickel plays its part behind the scenes.

New nickel alloys with extraordinarily high properties have been evolved quietly during the war years. One such withstands the terrific stresses and high temperatures associated with the gas turbine.

Thus, after fifty centuries, another meteor flashes across the heavens, this time bearing nickel the servant, tamed and controlled by research for the benefit of mankind.

THE CUNARD STEAM-SHIP COMPANY, LIMITED

STATEMENT OF THE CHAIRMAN

ACQUISITION OF CUNARD WHITE STAR SHARES

GROUP CONSOLIDATED ACCOUNTS FOR FIRST TIME

Mr F. A. Bates, chairman of the company, in a statement issued to stockholders for submission at the seventy-first annual general meeting to be held on the 28th instant, says:—

The report and accounts submitted to you on this occasion are, I think, of unusual interest to the stockholders and indeed noteworthy in the Cunard Company's long history. For the first time, we are enabled to present consolidated accounts for the whole of the group of companies whose capital is owned by the company in addition to the customary annual accounts of the Cunard Company. This has only been possible by the remarkable spirit of co-operation which has inspired the directors and staffs of all our companies to give you accounts in this form.

CHANGES ON THE BOARD

The directors of the Cunard Company presenting the report are the same as last year, with two exceptions. Sir Thomas Brocklebank, acting under medical advice, is curtailing for the present some of his business activities and has resigned his seat on the board, much to the regret of his colleagues. In Sir Richard Hopkins we welcome a new director already well-known to us for his valuable services on the board of Cunard White Star. There will be also present with us at the annual meeting some of the directors of the associated companies responsible for our combined trading results, now for the first time consolidated in one set of accounts by the skill of our grouped accountants.

Many of those most actively engaged in the direction of our affairs are men who have grown grey in the service of the shipping industry, and it is with great regret that I tell you that Mr Herbert Corry, who has been a director of the Port Line for over thirty years and chairman all through the war has decided to retire during May from the Cunard board of which he has been a director for nearly 22 years. He will then also be retiring from the board of Cunard White Star, but the Port Line will, I hope, prevail on him to retain his directorship of that line and to continue to give them the benefit of his long experience in that trade. Sir Arthur Cauty and Mr W. R. Roberts are also retiring in May from the board of Cunard White Star. I cannot speak too highly of their services to the Cunard White Star Co. from its formation until now, nor indeed of their personalities and organising abilities, which have been devoted to the service of British shipping all their lives. They have earned retirement by merit as well as seniority and we wish them well. While referring to age, I would like to say that it is abundantly evident that the value to a company like ours, of maturity and ex-

perience in matters of policy and direction, knows no limit solely by the years of a man. The advice of the older directors is of inestimable value in the work of our board and as chairman I can ill afford to lose their contribution.

ACQUISITION OF CUNARD WHITE STAR SHARES

Before commenting in detail on the accounts, I will refer first to a matter which last summer created a good deal of public interest, namely, the arrangements which resulted in the Cunard Company acquiring the whole of the share capital in Cunard White Star, Limited, of which previously we had owned only 62 per cent. For 13 years in the North Atlantic trade there has been a fruitful and smooth-working partnership within Cunard White Star, Limited, between the Cunard Company and The O.S.N. Realisation Company, Limited, together with certain interests of H.M. Treasury and the Government of Northern Ireland. This partnership, which was cemented by the early and difficult years through which we have passed, has ended, not because the Cunard Company asked for a change, but because the Realisation Company sought the fulfilment of its destiny—a right which could not be denied to it. When the approach to us was made, the circumstances pressing on the Realisation Company to seek retirement brought a grave responsibility to the Cunard Company to offer fair terms, so that the retirement might take place in concord and continuing friendship. The Cunard Company did not wish to gain an advantage at the expense of their partners, nor did the latter wish to lay an over-heavy burden on the shoulders of the partner that would be left to carry on the company in the future.

It will be remembered that the shares in Cunard White Star, Limited, were held as to 62 per cent. by the Cunard Company and 38 per cent. by our partners—and so, after considering all the bearings of the matter the Cunard directors laid down the principle that we would pay for this 38 per cent. of the shares at a price worked out on the book value of the assets in the Cunard White Star balance sheet at December 31, 1946. Thus was a round price of 40s. per share decided as the fair figure to complete the deal. In addition, we paid to our retiring friends the dividends in respect of the 1946 operations. In fact, the retiring partners received full value for the built-up strength, as exhibited in the balance sheet without inflation, while the Cunard Company retained all that might be called the built-in strength which a prudent company requires to meet its varying fortunes in the future.

The most enduring form of credit of a company is that quality of confidence engendered by the men who have made its

history and in this respect the Cunard Company is fortunate in finding itself well endowed, so when we desired to consummate the deal, our several bankers jointly gave us the necessary facilities. Our unsecured overdraft at December 31st last, as you see in the accounts, amounted to £4,881,300 after reduction by payments from our current resources, and by transfer to Cunard White Star, Limited, of real estate assets originally acquired by the Cunard Company primarily for the housing and conduct of its business on both sides of the Atlantic. At the time of the formation of Cunard White Star, Limited, in 1934, these large assets, here and in America, would have been transferred to that company together with the ships, but for the fact that their inclusion in the deal at that time would have disturbed the agreed percentages of capital as between the respective parties. The continued use by Cunard White Star, Limited, of these premises was secured by tenancy agreements, but from many points of view it is desirable that such properties should be in the ownership of the operating company. The Cunard Company's purchase of the minority shareholding of the operating company provided the occasion to effect this change.

Since the end of the year, the overdraft has been further reduced out of our current funds, to £4,581,300, at which figure it now stands.

CUNARD BALANCE SHEET

Turning to the Cunard balance sheet, you will observe the important and beneficial changes which have been brought into effect, firstly on the assets side by the purchase of the additional Cunard White Star, Limited, shares and secondly, on the liability side, by the financial co-operation of our associated companies in arrangements to cancel certain internal indebtedness as explained later.

On the assets side, our additional investment in 3,800,000 Cunard White Star shares has increased the book value of our holdings in subsidiary and other companies; and on the same side our real estate interests at home and abroad set up for the operation of the Atlantic business, have been transferred to Cunard White Star, Limited, as already explained. Independent and expert valuations were obtained in order to fix a sound and reasonable basis for the transaction. The difference between the book values and the transfer valuations has been used to write down our investments in subsidiary companies which now stand at £18,581,625 in the balance sheet.

On the liability side of the balance sheet at December 31, 1946, there was an amount of £3,700,000 representing loans from Port Line, Limited, and Thos. and Jno. Brocklebank Limited. It may be recalled that the Cunard Company borrowed this money in order to redeem the 5 per cent. mortgage debenture stock in 1942. These loans have now been cancelled for the purpose of simplifying the accounts and of reducing indebtedness within the group as circumstances make possible. As the book value of the subsidiary investments has always been on a conservative basis, the cancellation of the debts has been dealt with in the Cunard Company's balance sheet by transfer of the amount to reserve, the book value of these investments remaining unaltered.

CUNARD PROFIT AND LOSS ACCOUNT

In the profit and loss account the figures run on similar lines to those of the previous year. The item £17,005 on the right-hand side is a non-recurring profit in the books resulting from the sale of some overseas assets which we no longer required to hold for our business. The balance of profit for the year is £769,908 against £699,064 in 1946. It is proposed to transfer £100,000 to the reserve and £100,000 to contingency reserve.

**THE TELEPHONE AND GENERAL TRUST,
LIMITED**

THE ECONOMIC CRISIS

SIR ALEXANDER ROGER ON A VITAL TASK

The twenty-second ordinary general meeting of this company will be held, on the 12th instant, at Derwent House, 2, Arundel Street, London, W.C.2.

The following is an extract from the statement by the Chairman, Sir Alexander Roger, K.C.I.E., which has been circulated with the report and accounts for the year ended December 31, 1947:—

The profit amounts to £137,705, being an increase of £11,360. Dividends and interest received amount to £200,996, an increase of £19,947. After providing £6,000 for profits tax, as against £325 last year for National Defence Contribution, £62,000 for income-tax and £53,163 net for the preference and ordinary dividends of 7 per cent. and 8 per cent. respectively, £118,794 is carried forward as against £96,252 brought in—an increase of £22,542.

VALUATION OF INVESTMENTS

The valuation shows an appreciation of 33.76 per cent. on the figure of £2,139,987. Quoted investments as usual are valued at middle prices at December 31, 1947, and the unquoted investments, amounting to £738,268, mainly in the British West Indies, Portugal and Venezuela, are in the aggregate valued on what the directors consider to be a fair and reasonable basis.

TELEPHONE OPERATING COMPANIES

Portugal—The Trust became associated with the Anglo-Portuguese Telephone Company in 1927 when telephone stations numbered about 20,500. Today there are over 80,000 stations, and the demand steadily grows.

Venezuela—British telephone equipment is being despatched to Venezuela as rapidly as it can be manufactured, and the Trust and its connections are doing everything possible to assist the Nacional Company to meet demands, which show no sign of falling off. Stations in 1928 numbered about 11,200, and have increased to date to over 46,000.

West Indies—I am pleased to be able to record a year of steady progress in the telephone companies in Jamaica, Trinidad and Barbados and Tobago, in which we are so largely interested. In Jamaica, the company's application for increased telephone rates was approved by the Telephone Rates Board, and these were introduced at October 1, 1947. As a consequence, it has been possible to plan the development of the Jamaica company over the next five years. The Trinidad company has made excellent progress during 1947, and is a healthy and developing concern. In Barbados, the capital expenditure programme designed to relieve traffic congestion and to provide telephones for those on the waiting list is proceeding as rapidly as possible.

It is the constant endeavour of your directors to develop telecommunications in the West Indies; both within and between the islands and also internationally. We are ready to investigate the possibility of expanding our telephone business in other parts of the world, either on a concessionary or managerial basis, in both of which we have large accumulated experience.

The Economic Survey for 1948—the Black Paper—is truly a grim document. It admits that whatever we do in 1948 we cannot pay

SERVICE AND INVISIBLE EXPORTS

The facts relating to the development of our various services, which are briefly set out in the report of the directors, tell their own tale. The year has been one of great activity in all the trades in which we are engaged. There have been many difficulties to overcome as the ships have been introduced gradually into commercial service, but the reputation of our companies, I am glad to say, stands high with both passengers and freight shippers in all parts of the world. The staffs, both ashore and afloat—seasoned and skilled teams as they are—have given every evidence of their old skill and efficiency in meeting and satisfying the wants of our patrons and developing the interests of the group in the face of increasing competition. In this connection I am sure it must afford the stockholders no little gratification to realise that the operations of the group contribute very materially to the export drive and in national goodwill. The hard currencies and invisible exports which our ships earn are of inestimable value to the country's economy.

OPERATING COSTS

Among the problems we have to face in every trade are the heavy increases in expenses in all directions. Notably oil fuel has greatly increased in price and this factor alone will have considerable effect on voyage results during 1948. The continued delays in handling ships in port are another depressing feature with which we have to contend. To illustrate the consequence of these delays in our Indian trade the comparable picture is that in 1947 twenty ships made 33 round Indian voyages as against 60 similar voyages in 1938, notwithstanding that the sea speed of our modern ships has considerably increased. It is a serious fact that the major part of the delay occurs in our home U.K. ports.

PROSPECTS

Finally, you may wish me to say something about our prospects. A year ago I expressed the perplexity of the times by the question "and who would be a prophet?" Perhaps it is easier to practise foresight this April, because there is less fog when seas are stormy and there is no need to-day of prophetic gifts to enjoin a cautious outlook. It is a serious thing at any time to draw attention to the risks of one's trade, but particularly so when we may shortly be offering new shares to our stockholders. Nevertheless, I would be uneasy in mind if I failed to warn you of growing risks and dangers ahead, most of which are quite outside the company's control.

During 1947 there was a "low ebb" in passenger accommodation in relation to the peak demand for it and in all our cargo trades there was satisfactory employment. These factors have produced exceptional figures in our consolidated accounts, which would be unwise to take as a standard. 1948 is still likely to be exceptional, but in different ways, and its changing factors bear small resemblance to those of 1947. So different in fact are the circumstances that I do not feel able to attempt a prophetic comparison.

We have a big stake in the Atlantic passenger and cargo business. How big will be

Provision for pension funds at £310,000 is made up of allocations for different schemes by several companies in the group. The payment of £95,578 by the Cunard Company to which I referred earlier, is not included in this figure, because it was debited to that company's contingency fund.

With regard to the consolidated balance-sheet, the items are in form compiled from all the companies as though the group were a single company, and are largely self-explanatory.

The investments, £5,905,781, are almost all Government stocks. The tax reserve certificates, £2,914,000 are our preparation for paying the liability for taxes shown in the profit and loss account.

On the left-hand side, the mortgage loans, £970,639, are mainly on Cunard House in London and on the New York building at 25, Broadway. The small item £2,737 attributable to minority stockholders (with a counterpart item of £356 in the profit and loss account) represents small outside shareholdings in sub-subsidiary companies. They are insignificant figures and the fact that they have special lines of their own is evidence of our accountants' care in presenting these consolidated accounts.

UNITY OF OPERATION

When reporting on these matters, it is well to remind you that though this is the first year of union of the figures we have four years enjoyed consolidation of operations. The Brocklebank ships operate freely with those of Cunard White Star on the home-ward Atlantic berths and the Cunard White Star cargo ships are to be found in the ports of Australia and New Zealand, while Port Line ships are operated on the Cunard White Star berths in the Atlantic. The sum of this is that the co-operation between the associated companies is as excellent on the seas as in accounting, to the great benefit of all concerned.

TAXATION AND BUILDING COSTS

The figures in our consolidated accounts reflect the present financial strength of the company due to long continued and careful husbanding of our finances. But not so obvious is the danger inherent in the position when both constructional and taxation costs are alike swollen to their present degree. Ships are wasting assets and adequate provision out of the profits for replacement is as essential to a continuing shipping company as any other expense. But burdensome indeed is this essential provision when post-war replacement costs are more than doubled and the dues to the collector of taxes are as large as £4,160,418 shown in the consolidated profit and loss account. The handling of the tax liability is now a major problem. It must be remembered that the current depreciation allowed on our prewar ships against profits is less than half what is required for replacement at current building levels and on top of this factor, the renewal monies set aside and invested in earlier years have lost a great part of their buying value expressed in tonnage. Reserves are good, but if the reserve to buy a ton of shipping will only buy half a ton when expended, the reserve has lost its savour and twice as much reserve is needed.

When anyone assures me that the difficulties to the shipping industry arising from the 9s. in the £ income tax, plus profits tax, plus ever-expanding replacement costs, will be a figment of the imagination, my inclination is to consider the translation of "Expert's Creed" and to say to myself "You have been warned."

our way or avoid a further fall in our reserves.

The Prime Minister himself stated at least a year ago that the Government alone could not achieve success and that the job must be mainly one for industry itself, yet the ponderous growth of controls, licences, inspections, directions and red tape goes on relentlessly, and there are still today men in the Government who used to speak gleefully of the disappearance of our foreign investments and to sneer at the concern of experienced men about our export trade. The Economic Survey tells us much about our difficulties while being strangely silent concerning the Socialist failures and unredeemed extravagant promises. The continued upward trend in coal prices, the warnings of further rises in railway charges, and forecasts of rises in electricity prices, surely call for explanation.

The Survey also refers to the great changes which have been and must continue to be made in the pattern of our trade and in our lives, and it calls these changes "signs of progress." I should think that more than half the country would say they were signs of retrogression. There is very little reason why many steps now recommended by the Survey should not have been taken a year or more ago, especially while we still had our sheet anchor, the Washington credit. The results of Government policy can no longer be hidden from the nation, and no artifice can now cover the bankruptcy of their planning.

INFLATION DANGER

It is more than ever necessary to stop the inflationary rise in prices and wages which, while bringing no benefit to the worker consumer, greatly damages our prospects of selling at competitive prices in overseas markets. Every control or restriction which can be dispensed with should be boldly abandoned and, at the same time, every assistance which the Government can give by international agreements, currency pacts, tariff adjustments, etc., should be made available. Such a policy would help to free the industrial machine from much of the clogging deadweight of unproductive administration which has been set up in a vain endeavour to make the Socialist schemes workable.

The Socialists are perfectly right in advocating savings, but steps should also be taken to stop the Socialist campaign against the rentier, who largely consists and will in the future consist of men and women who save for a rainy day at much personal sacrifice. Savings should not be used by the Government for nationalisation experiments.

CO-OPERATION ESSENTIAL

This is not a time for more party politics, or for ideological partisan experiments, which divide the electorate into two camps; the necessity is for co-operation by men of all parties and all walks of life to save the country from an economic disaster which even war was not able to bring about. By all means let us have a plan—a plan free of party ideologies, but giving a clear lead to industrialists, manufacturers, directors, managements and workers which will enable them to work out themselves how they best may make use of their knowledge and experience so as to increase and accelerate the flow of goods to overseas markets and eventually to meet the needs of the home market so sadly starved of goods during the last ten years.

BRITANNIC ASSURANCE COMPANY, LIMITED

RECORD NEW BUSINESS, PREMIUM INCOME AND FUNDS

LARGER ALLOCATIONS TO POLICYHOLDERS

FUNDS NOW OVER £57,000,000

Mr J. A. Jefferson, F.I.A., presiding at the eighty-second ordinary general meeting, said:

The year 1947 was the most successful in the company's history from the point of view that new business, increase in premium income and increase in funds all reached their highest levels. The total income was £10,838,000—an increase of £711,000—while the funds at £57,597,000 showed an increase of £3,846,000. The sums assured in force at the 1947 valuation were approximately £150,000,000. The total claims paid to date amount to £79,213,000.

The valuation was greatly strengthened, and the sum allocated to policyholders was the largest in the company's history. After the 1940 valuation, I was proud to report that we had valued both life branches at 2½ per cent. interest, which was a big forward step. This year, we have gone further along the road of financial strength by valuing both life branches at 2 per cent. interest.

ORDINARY BRANCH

During 1947 over 20,000 policies were issued in the ordinary branch, assuring £8,011,000. The premium income increased by £271,000 to £2,726,000, and the fund by £1,694,000 to £20,642,000. In all three respects—new business, increase in premium income, and increase in funds—1947 was a record year and the £20 million funds form a notable milestone.

The net rate of interest was £3 4s. 5d. per cent., while the expense ratio of 13.29 per cent. was moderate, and only slightly above the prewar rate despite the much larger amount of new business.

The average sum assured of new policies continues to increase, and last year was £390. The new business shows a marked increase in policies of £1,000 and over; in fact in 1947 no less than £2,800,000 of the new business was in this group.

INDUSTRIAL BRANCH

The premium income in the industrial branch amounted to £5,968,000, the increase over the previous year being the record one of £408,000. The fund at the end of the year was £31,642,000, having increased by £2,110,000.

The net rate of interest was £3 15s. 3d. per cent., while the expense ratio at 27.42 per cent. was .27 per cent. below that for the previous year. We regard this as very satisfactory in a year when a record increase in premium income was achieved.

The Industrial Assurance and Friendly Societies Bill has been made necessary by the inclusion of a death grant in the National Insurance Scheme. Under the Assurance Companies Act, 1909, and the Industrial Assurance Act, 1923, powers were granted to the Industrial Assurance Offices to issue policies to persons desirous of insuring near-relatives for the purpose of covering funeral expenses. The amount for which the policies might be issued had to be reasonable, and now that a sum of £20 is being provided under the National Insurance Scheme, it is logical that some restriction should be placed

on the issue of these policies. The Bill limits the issue of such policies to the children, step-children, or grandchildren of the life to be assured, and limits the total sum for which such a life may be assured by any one proposer to £20. The proportion of funeral expenses business has been gradually declining for many years past. Last year our new premiums in the industrial branch consisted of 80 per cent. endowment assurances, and 20 per cent. whole life assurances. None of the endowment assurances, and only about a half of the whole life assurances were effected for funeral expenses. This means that only a tenth of our total new premiums was in this class. Frankly, if we did not transact any funeral expenses business, I do not think it would have any adverse effect on the company.

MORTGAGES

Mortgages have increased by just over £1,000,000 to £4,500,000. This represents a net increase in our house purchase advances linked with life assurance protection. We have been operating this scheme for forty years, and have assisted over 20,000 people in buying their houses by advances totalling over £10,000,000.

Some people who spend their time planning how others should live, deprecate the desire of a thrifty man to own his own house. The global figures of monies advanced by offices like ours and the building societies show conclusively that these planners do not represent the general view.

BRITISH GOVERNMENT SECURITIES

An increase of £438,000 in British Government securities is the next item for comment. I would remind you that on January 5 last year 3 per cent. Local Loans were redeemed at par, and the Government offered in exchange 2½ per cent. Treasury stock. We held £700,000 of 3 per cent. Local Loans, and had we converted we should by now have suffered a capital depreciation of more than £140,000—not, I submit, a very gilt-edged transaction, or one that would have helped our millions of working-class policyholders. I do not claim any credit for the fact that we were not "caught out" by this piece of market "rigging," and towards the end of the year, when it appeared that the 2½ per cent. goal had definitely been abandoned, we invested some money in the gilt-edged market.

NATURAL RE-ADJUSTMENT OF ORDINARY SHARES PRICES

Last year I made the statement that many ordinary shares then appeared to stand at prices "unjustified by past records and future prospects." The truth of that can now be demonstrated by these figures from the Actuaries' Investment Index:—

Ordinary Shares	Price Indexes	
	Feb., 1947	Feb., 1948
Bank and Discount companies	128.6	109.4
Insurance companies	138.5	109.3
Commercial and Industrial companies	160.6	144.7

What you have been seeing is just what was expected, and is a natural re-adjustment towards more normal values from an artificially created peak. To select ordinary shares

under these conditions is no easy task. One must take a favourable view of the country's long-term prospects—if one doesn't one might as well "shut up shop"—and one must have a prospect of a reasonable yield in the immediate future that will carry us through any period of painful adjustment in our national economy. Bearing all these factors in mind, we did, during 1947, increase our holding of ordinary shares by £1,602,000, bringing up the ratio of our assets under this heading to 14.6 per cent.

Although a valuation of our securities by today's lower prices still shows a considerable margin over book values, you will not be surprised, in view of what I have just said, that we are again increasing our investment reserve funds by £275,000, bringing them up to £3,800,000.

EFFECT OF NATIONALISATION OF INTEREST EARNINGS

Next year our interest earnings will be affected by the conversion of our holdings of railway, electricity and gas stocks into Government securities. The drop in revenue will not be quite so severe as I anticipated last year, when 2½ per cent. appeared to be the rate the Government were aiming to give us, but it will nevertheless be quite substantial. One man's loss is usually another's gain, but I have as yet failed to discover who has gained by these transactions.

ORDINARY AND INDUSTRIAL BONUS ALLOCATIONS

Out of the ordinary branch surplus we have allocated £342,293 to declare a bonus addition to all with-profit policies in force at December 31, 1947, of £1 per £100 sum assured. The allocation to policyholders a year ago was £287,831.

Out of the industrial branch surplus we have allocated £400,000 to policyholders, and the present bonus scheme is continued for a further year. This year's allocation of £400,000 compares with £330,000 a year ago.

We continue to increase our business in the fire and accident branch, and the premium income of £435,000 was £47,000 greater than that of a year ago. There was a profit of £11,560 for the year, compared with £9,160 in 1946.

NATIONAL AMALGAMATED APPROVED SOCIETY

1947 was the last full year of operation of the National Amalgamated Approved Society, with which we have been associated for National Health Insurance since 1912. The work of the Society is to be absorbed gradually by the Ministry of National Insurance, and so we shall no longer be assisting to provide a home service to the 3,542,000 members of the National Amalgamated Approved Society.

As the existence of the National Amalgamated Approved Society draws to a close, we view with pride the grand work the Society has performed for the benefit of the insured person. Tribute has already been paid to the quality of this work by successive Ministers of Health and National Insurance, and we shall maintain that quality in the best traditions of the Society until the end. It is with much regret, coupled with serious doubts as to the wisdom of the change, that we face the termination of our 36 years' association with this great scheme of social insurance.

STAFF PENSION FUND

We have again transferred the sum of £175,000 to the staff pension fund. These transfers year by year express to the staff, in a very practical way, our appreciation of the excellence of their work and of the spirit in which it is invariably carried out. The results which we have been able to place before you would not have been possible, but for the continuance of that happy relationship between the board and all sections of the staff which is a tradition of this company.

THE PRUDENTIAL ASSURANCE COMPANY, LIMITED

SUCCESSFUL RESULTS

RECORD NEW BUSINESS

SIR GEORGE BARSTOW'S REVIEW

The ninety-ninth annual general meeting of this company was held, on the 1st instant, at 142, Holborn Bars, London, E.C.1. Sir George Lewis Barstow, K.C.B., chairman of the company, presiding.

The Chairman, in the course of his remarks, said:—

RETIREMENT OF A DEPUTY CHAIRMAN

I have first of all an announcement to make which I am sure you will all hear with great regret. Since the report was issued to shareholders, Mr Guy Harben, O.B.E., has found it necessary, in view of his continued ill-health, to resign his seat on the board.

Mr Harben has been a director since 1918 and a deputy chairman since 1936. He and his family have served the Prudential with great distinction since its foundation. He will be greatly missed here, where his many fine qualities have endeared him to all. We hope that he will be restored to better health during his retirement.

In the ordinary branch the number of policies issued during the year, including overseas and group life business but not group pension business, was 169,000, compared with 145,000 in 1946, assuring sums of £99,700,000 compared with £73,200,000. Of the total new sums assured in 1947 the home business produced £77,500,000 compared with £53,200,000 in 1946, and the overseas business produced £22,200,000 compared with £20,000,000. The average sum assured per policy for the home business further increased from £446 to £512.

In the industrial branch the number of policies issued during the year was 2,166,000 compared with 2,231,000 in 1946, assuring sums of £103,500,000 compared with £101,900,000. The average sum assured per policy further increased from £45 to £47.

LIFE ASSURANCE AND THE NATION'S PROBLEMS

Last year I commented in my speech on the fact that some of the excess of purchasing power over the amount of goods available was finding a healthy and non-inflationary outlet in life assurance. This factor continues to operate and I have no doubt accounts, at least in part, for the record new business in 1947.

The country is engaged in a stern economic struggle. Apart from the external difficulty of earning dollars, there are two primary internal problems: the physical problem of increasing production to satisfy the desire for consumption; and the financial problem of absorbing the excess of monetary purchasing power over the value of goods available. While life assurance may have little part to play in the first of these two, it has an important part to play in the second.

The significance of life assurance business in counteracting any inflationary trend is perhaps not immediately apparent. It is true that the premium income from a single year's new business may not be large when measured as a proportion of the national income, but it should not be forgotten that life assurance represents long-term saving. The cumulative result of successive years of new business soon becomes substantial and has an appreciable stabilising effect on the national economy.

INVESTMENTS

I expressed the opinion last year that the cheap money policy had been carried to

excess, and it now seems that the Government have been forced by events to take a similar view. The fall in prices consequent upon the change in interest rates has of course reduced the substantial margin by which the market value of our investments exceeded their ledger value at the end of 1946. It is, however, more important to the prosperity of an expanding life assurance company that its new money should be invested at a reasonable rate of interest than that there should be substantial appreciation on its existing investments.

The movement to a 3 per cent. long term basis was confirmed at the beginning of the present year when the Government issued the 3 per cent. British Transport Stock to holders of Home Railway securities. Such a rate of interest was not foreseen a year ago and, in consequence, the income from our holdings of these securities will not suffer as great a decrease as I then indicated. Nevertheless, the total reduction in our interest income as a result of the full implementation of the Government's nationalisation programme will be considerable.

During 1947 there were greater opportunities of obtaining investments on reasonable terms outside the gilt-edged class and as a result our purchases of British Government securities have not been so great as in recent years. These securities now stand in our balance sheet at £244 million, only £1,670,000 more than a year ago, and the percentage to total assets has declined from 51.5 per cent. to 48.7 per cent. On the other hand, our holdings of the nationalised railway and electricity stocks, amounting to some £25,000,000, still appear under their old headings in the balance sheet now before you, as they did not become vested in the Government during 1947. This nationalisation involves a compulsory transfer of investments of that amount into British Government securities.

EFFECTS OF NATIONAL INSURANCE LEGISLATION

Consequent upon the new scheme of National Insurance, several changes affecting our business are imminent. The Prudential Approved Societies, which since 1912 have administered National Health Insurance, will come to an end during this year, when their functions will be taken over by The Ministry of National Insurance. Although we hope that our members will continue to receive satisfactory service, I am confident that the Ministry will find it difficult to improve upon the standard we have always maintained.

The anticipated legislation affecting industrial assurance, consequent upon the incorporation of a death grant in National Insurance, has now been introduced. Under the Bill now before Parliament the powers to issue funeral expense assurances will be withdrawn, but the right is substituted to insure the lives of parents and grandparents to the extent of £20. The existing legislation regarding children's assurances is also being amended. Certain other provisions of the Bill will involve alterations in our administrative procedure, and their effects are being closely examined.

ORDINARY BRANCH

In the ordinary branch the premiums were over £25,000,000, an increase of £4,200,000. The total sums assured in force, including bonuses, exceeded £484,000,000; the actuarial liabilities exceeded £173,000,000. The

death claims amounted to £2,900,000 and claims by maturity of endowment were £8,200,000.

The expenses were 15.83 per cent. of the premiums as compared with 17.01 per cent. for the preceding year.

The surplus in the ordinary branch, including £482,687 brought forward from the previous year, is £3,587,517. The allocation of this amount is set out in the directors' report. The directors have declared a reversionary bonus of £1 per £100 sum assured on participating policies in force on December 31, 1947.

OVERSEAS LIFE BUSINESS

Included in the ordinary branch figures to which I have just referred are sums assured and bonuses in force of £123,000,000 in respect of overseas life business, that is to say, about one-quarter of our total ordinary branch business. Progress in the territories overseas in which we operate continues, in general, to be highly satisfactory.

INDUSTRIAL BRANCH

In the industrial branch the premiums were £35,600,000, an increase of £3,600,000. The total sums assured in force, including bonuses, exceeded £862,000,000; the actuarial liabilities exceeded £292,000,000. The death claims amounted to £9,600,000 and claims by maturity of endowment were £7,800,000.

The expenses were 24.84 per cent. of the premiums, as compared with 25.59 per cent. for the preceding year.

The surplus in the industrial branch, including £1,029,611 brought forward from the previous year, is £6,998,376. The allocation of this sum is set out in the directors' report.

The directors have declared a reversionary bonus at the rate of 16s. per £100 sum assured on participating policies issued by the Prudential which were premium-paying policies on December 31, 1947. This bonus is subject to completion of payment of one year's premiums.

GENERAL BRANCH

The exceptional growth in business to which I have referred in the life branches has been paralleled by a record increase in the general branch premium income from £4,448,000 to £5,487,000. The 1947 figure was more than double the 1938 figure of £2,692,000.

The surplus for the year before the inclusion of the sum brought forward is £177,000, compared with £217,000 for the year 1946.

The underwriting results in the separate accounts showed considerable variations from the previous year.

The fire account, which comprises nearly half of our general branch business, suffered abnormal losses in 1947. Included in these losses were heavy claims under insurances against flood risks included in certain fire policies.

The sickness and accident account and the marine account continue to show favourable results. The employers' liability account produced a small profit compared with a loss for the previous year. The profit in the miscellaneous account was considerably higher than in any of the three preceding years, but the motor account against disclosed a substantial loss.

The total underwriting profit for 1947 is £206,000, compared with £223,000 for 1946.

On turning now to the other items in the profit and loss account, it will be seen that interest has increased, that items of arrears of interest and accrued interest appearing in the 1946 accounts are non-recurrent, that profits tax has increased and that income tax has decreased. The decrease in income tax is due partly to the very heavy increase in profits tax, which falls to be treated as an expense for income tax purposes, partly to a non-recurrent tax relief of £25,000 and partly to reduced profits. The final result, after excluding non-recurrent items, is a decrease of about £15,000 in the true net profit.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 24 per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7.6 per cent.) (i) To latest redemption date. † Free of tax.

hour traffic by cutting fares? And if it is admitted that "postalisation," the disregard for particular purposes of the cost-price nexus, can thus be a convenience of genuine economic value, then the door is opened to just those vague considerations of "public benefit," "national interest," and so on, on which Professor Jewkes (and the ultra-liberal school in general) pour such scorn. There are areas, in fact, where the frontier needs to be drawn with reference to the relative costs of operating the price system in its full nicety of detail (say with an auction, at the platform gates, of tickets for the "Bournemouth Belle") and of working the cruder, but less time-wasting, device of arbitrary commonsense decision.

★

Enough has been said to show that the extremist case for laming all Government economic activity outright and pushing its frontiers back into the sea is, at least, unrealistic. But the exact drawing of any frontier is, as postwar statesmen have painfully found out, considerably less important than a proper relationship between the entities on both sides of the frontier. In the last resort, Professor Jewkes's quarrel, and the quarrel of other sensible people far less Right-minded than he, is not with the attribution of any particular region or function to the sphere of Government planning; it is with the claim of the planners to exercise detailed authority, at their own convenience, wherever they choose. Eighty per cent of economic

activity in Great Britain, as Mr Morrison has said, remains in the hands of private enterprise; but the degree of its independence is just about comparable to that of the satellite states east of the Iron Curtain. Business men outside the nationalised industries may retain their trade name on their notepaper, as Rumania or Bulgaria retain a national flag; but their activities are as subject to veto, their judgment as liable to supersession, their essential supplies and markets as dependent on the good will of the predominant Power, and their separate existences as precarious, as those of any Soviet ally. Under no definition can this be described as freedom.

That the state must have ultimate authority goes without saying. But the planning machine is a lesser thing than the state. Its business is to plan within its own limits, beginning with a monetary policy which does not frustrate both its own plans and those of the public; to have the courage of its own expertise, without respect of persons or of pressure groups; and to remember on the other hand, with due humility, that plans are made for men and not men for plans. Its expedient frontiers are not immutably fixed by supernatural wisdom. They may expand; they may quite possibly shrink. What is essential is that they should conform to present realities, and that beyond them liberty, under the rule of law, should be genuine and not a sham. Freedom and planning can co-exist; but the prime conditions of that harmony is that planners shall respect freedom—and know when to keep their hands off.

The Economy of Europe

WHEN the third session of the Economic Commission for Europe opens at Geneva on April 26th, it will have on its agenda the consideration of the Report on the European economic situation prepared by its Research and Planning Division. In one sense this lucid and exhaustive survey says little that is new, since the gravest economic problem facing Europe—the profound disequilibrium in its balance of payments—has been under the researcher's microscope for the last nine months, but in pursuing its analysis, the Report reaches clearer and better documented conclusions on the nature of the problem and suggests more apparently practicable methods of meeting it than any previous survey has been able to do. In particular, it brings out with alarming clarity the most disturbing feature of the disequilibrium—its potential permanence.

The pattern of multilateral trade that was created before the first World War and continued to be the basis of prosperity until the second was based primarily on three factors—the first was the large income derived by the European nations in general and by Great Britain in particular from overseas investments and from such invisible items as shipping. In this way, for the two years 1919 and 1920 taken together, Europe earned \$4 billion (at today's rates), Britain's share being about \$2½ billion. This cushion of investment enabled Europe to afford a surplus of imports over exports which in the two years after the first war was in the neighbourhood of \$12 billion—a figure about as great as the deficit for 1946 and 1947.

The second factor was the trading relationship of Europe with Germany and Britain. Germany's balance with the rest of Europe was almost invariably favourable, whereas Great Britain consistently imported more from the European nations than it exported to them. Their prosperity was therefore based in part on their ability to buy German goods—of which the bulk were the products of heavy industry—and to offset the deficit by their trade with Britain. The third factor was a similar relationship in world trade. Europe did not balance its trading account with the United States, but had a surplus with the rest of the world, while the rest of the world tended to export more to the United

States than it imported from there. In this way a species of triangular balance was maintained.

The most disconcerting fact about the aftermath of the second World War is, as the Report clearly brings out, the almost complete disappearance of these three essential features of the pre-war trading system. The period after the 1914-1918 war in many ways resembled the present troubled times. There was the same vast surplus of imports over exports. Then as now productivity fell. Then as now inflation distorted the nations' economies and aggravated the tendency to import more and export less. But the reason why the crisis is more serious and more apparently insoluble today is that the foundations of the old system have crumbled. Europe's income from overseas investments, shipping and other invisibles has dwindled away. In 1946 and 1947 it was a minus quantity, the deficit running at the level of \$1.4 billion. As shipping is restored, tourism begins again and emigrants' remittances start to flow, the income derived from invisible items will certainly rise a little, but Europe's overseas investments cannot be recreated—at least not quickly. There the change is almost certainly permanent.

This fact helps to explain the second fundamental change—the disappearance of the European balance between Germany and Britain. Britain can no longer afford large adverse trade balances. In 1946 it exported to Europe more than it imported. As for Germany, its elimination is the chief cause of lowered levels of production, of bottlenecks and disintegrated trade relationships in Europe. The fact that Eastern European nations have participated in the drafting of the Report has not led it to minimise the catastrophic consequences for Europe of Germany's collapse.

The last factor—the old triangular balance between Europe, other non-European areas and the United States—has also vanished. Not only has Europe a gigantic deficit with the United States. The non-European nations have an equal one and there can be no question for years to come of Europe earning dollars by selling to nations with a dollar surplus. All are equally indebted and equally in need. And the likelihood that this

represents a permanent trend is shown by the fact that the proportion of United States imports from any country to its own productive capacity has declined sharply since the first World War. Producing more and buying relatively less is an unmistakable trend in the American economy.

From this analysis certain conclusions follow which the Report underlines, either explicitly or by implication. Europe must achieve a balance in its trading accounts. So much is clear, but should it be achieved by cutting imports or by expanding exports or by increasing production or by what proportions of all three? The Report analyses the character of Europe's present imports and finds that in the categories of foodstuffs and industrial raw materials, a percentage (of which the bulk comes from the United States) belongs to the category of relief shipments and may be expected to decline as European production, which at present, largely because of Germany's ruin, is nearly 20 per cent below the prewar level, recovers its normal output. Another category—heavy equipment—may also decline when the exceptional period of postwar reconstruction comes to an end. But even when these favourable developments are allowed for, the loss of overseas investments, the destruction of capital in Europe and the growth of about 5 or 6 per cent in the population make a return to the prewar pattern of imports and exports improbable.

What then can be done? The Report examines the possibilities of expanding exports and believes that only in the category of heavy industry can a really large increase be secured. Any sufficient contraction of imports is still more difficult, since the food and raw materials habitually imported are the basis of the European economic system; but any expansion in European-grown food and in European production of coal, iron and steel and timber would ease the strain. And the category of imports of manufactured goods could be drastically cut, if the proposed expansion in European heavy industry took place. That German recovery is an essential part of this programme is not underlined, but is implicit in the Report.

This main thread of inquiry—the origins, nature and possible cure of Europe's disequilibrium—is naturally accompanied by a number of supporting studies, some of which break relatively new and interesting ground—for instance, the comparison of the "terms of trade" for Britain and for Europe respectively and the analysis of the impact of inflation upon the nations' internal economy and foreign trade. Altogether the Report is a sober, comprehensive and, within the limits imposed by the doubtful character of many Governments' statistics, a reliable piece of work. But many critics, while admitting its academic value, nevertheless regard it as a waste of time and energy. What is the use, they argue, of discussing Europe as a whole when Europe is irrevocably divided? Why keep a large Commission in being in Geneva when no Government will either listen to or act upon its recommendations? Inevitably, when

the Report comes up for detailed discussion at the end of this month, not only its substance will be called into question, but also its *raison d'être* and that of its parent body, the Economic Commission for Europe.

Admittedly, the Commission was not designed for a divided Europe in which one half would be undergoing reconstruction with dollars on a basis tending towards free enterprise and the other with roubles on the basis of total control. It is perfectly legitimate to question whether, in the conditions of 1948, the attempt to maintain the fiction of a single Europe is worth making and whether, if it is not, there is any useful role for the Commission to perform. The Commission's critics have two main arguments. On the one hand, there is the practical circumstance that the supply of competent technicians, economists and analysts capable of supplying the data for reconstruction in Western Europe is far too limited to permit any diversion of resources to Geneva. The experts at Geneva should, so the argument runs, be withdrawn and set to work in the domain where not only analysis but action will be possible.

The other argument is wider and consists simply in the belief that continued contacts, even trade contacts, with Eastern Europe weaken the West and should all be broken off. This second argument is clearly decisive one way or the other. Is or is not Eastern Europe to have any economic part to play in the West's Recovery Programme? A glance at the Paris Report gives the answer. Active trade with Eastern Europe was there assumed as one of the prerequisites of the Western plan. In one crucial sector—coal—Polish exports are the key to achieving Western targets of production. In another, timber, an expansion of Eastern output could revolutionise the construction programme of the West. And in the vital question of European food supplies, there is little hope of restoring prewar standards of diet to an increased population without a revival and expansion of the traditional food exports from the East. And these economic arguments are reinforced by the political argument—that the Western Powers are determined to maintain, especially within the framework of the United Nations, whatever peaceful contacts they can across the barriers in Europe. It is Russian, not Western, policy to impose isolation.

If this is the case, there is a strong case for maintaining the Commission at Geneva and making use of its undeniable competence. Rightly used, it can do much of the economic intelligence work for the Continuing Organisation, particularly where problems of Eastern European production are involved. Should its objectivity or its reliability at any time decline, a new policy would be necessary, but meanwhile there is everything to be said for establishing regular links between Geneva and the Continuing Organisation in Paris, using the Commission wherever practicable, maintaining its functioning machinery of allocation and ensuring that as far as possible the resources of both Eastern and Western Europe are drawn into the struggle for recovery.

If you live

... for twenty-five years—£1,000.

On earlier death, in addition to this £1,000, up to £5,000 payable to your dependants by instalments of £200 per annum (not subject to tax) for the remainder of the twenty-five years.

All this may be secured under the FAMILY PROVISION SCHEME for a monthly premium, at age thirty-five, of £5.1.1 reducing after seventeen years to £3.4.0.

Local Government Reform

THE second annual report of the Local Government Boundary Commission (HMSO, 1s.) contains a plan for the complete recasting of local government units in England. Wales is left for further consideration, and Scotland, having a distinctive system of its own, is not covered. Local government is the chosen instrument for administering the great bulk of the nation's social services and many of its public utilities. Upon its proper functioning depends not only their efficiency but also the maintenance of the vital democratic principle of local self-government. But at present it is under a great strain, with duties piled upon it by an impatient Parliament in excess of its ability to execute them. To some, the strain itself is an argument against initiating reform at present. But unless reform is undertaken promptly, the local authorities will find their functions taken right out of their hands—as has happened with health and public assistance—and entrusted to new centralised services whose local roots are shallow and whose democratic accountability is at best remote. If life and vigour can be restored to local government, it will be well worth while.

The Commission, one member dissenting, states quite frankly that, without a considerable extension of its powers and a fresh authorisation from Parliament, it is unable to perform its statutory function of creating "effective and convenient units of local government administration." It then proceeds to set out in some detail the plan of reorganisation which it would introduce if authorised to do so. This plan represents a fine achievement in the admixture of reforming zeal and political realism. Some drastic changes are involved, but these are framed in a way that should cause the minimum of discontent among the existing local authorities, and do the least possible harm to tradition and sentiment. The plan, therefore, has some chance of winning Parliamentary acceptance. But this strength is also its weakness. While the proposed new system is undoubtedly an improvement, it contains failings of its own which might become fatal with the passing of time.

The top authorities of English local government in the present system—those that have no authorities above their heads but the state itself—are the 80 county boroughs and the 49 administrative counties. The county boroughs are "all-purpose" authorities, administering all services within their boundaries and having no common administration with the counties surrounding them. The counties, on the other hand, are "two-tier" authorities, sharing their authority with the municipal boroughs, the urban districts and the rural districts beneath them. The chief defect in the system is the enormous variation in the size of these "major authorities," the county boroughs ranging from 1,085,000 to 25,000 and the administrative counties from 2,270,000 to 18,000. As a result, many of these major authorities are far too small for efficient administration.

*

The Commission's main object has been to reduce these extremes of population. To get an efficient operating unit for the major services, and the rateable value to pay for it, necessitates a certain minimum of population. As services become more specialised and more costly, the desirable minimum rises. The Commission have put it at 200,000—they could hardly have chosen a lower figure, and most administrative experts would have gone higher. Their proposal is that the whole of England should be redivided into 67 new counties, none of which should have a lower population than 200,000. Twenty of these would be "one-tier counties"—that is to say, large towns whose status would be precisely the same as that of a county borough today. The remaining 47 new

counties would be administered on the two-tier system, with lesser authorities beneath them.

This is a sound starting-point for reform. It enables the number of major authorities to be halved from a total of 129 counties and county boroughs to a total of 67 two-tier and one-tier counties, to the general benefit of administrative efficiency and financial solvency. It does this without destroying the map of England, for the only administrative counties which would disappear are Herefordshire (united with Worcestershire), Rutland (to Leicestershire) and the tiny units of the Isle of Ely, Soke of Peterborough, and Huntingdon (joined with Cambridge). In addition, the two present divisions of Suffolk would be re-united and the three "Parts" of Lincoln reduced to two administrative counties, and Westmorland would be joined to the northernmost part of Lancashire. At the same time, the plan enables the virtues of all-purpose government—that is, one authority running all services—to be preserved in some of the largest towns. But just as there is to be a minimum population for an all-purpose authority, the Commission also argues that an all-purpose authority is normally too large and remote from its citizens if it exceeds 500,000 population (Birmingham is allowed to be an exception to this rule). Its chief practical problem was how to treat the great provincial concentrations of population and industry, such as Merseyside and the Black Country, where joint administrative needs and closely related housing and planning requirements point to a two-tier form of government, with a single major authority for each conurbation. The difficulty facing the Commission was that while some large cities, such as Manchester or Liverpool are not unwilling to forgo their present all-purpose form of government in the interest of forming a centre for the surrounding region, others—such as Sheffield or Bradford—emphatically oppose the idea. Moreover, there is the practical difficulty of what constitutes a conurbation. For instance, the industrial grouping of the West Riding of Yorkshire is less closely concentrated than that of South Lancashire, while in the Commission's view—but contrary to the opinion of a prewar Royal Commission—the North and South banks of the Tyne do not require joint treatment.

The Commission has therefore treated the problem on an empirical basis. It suggests that Lancashire (except the northernmost part) and North Cheshire should be divided into four two-tier counties, two of them concentrated on Manchester and Merseyside and the other two consisting of the mainly industrial portions of central Lancashire. (These proposals are illustrated in the accompanying map.) The Black Country would also be turned into a new two-tier county of South Staffordshire. In Yorkshire and on Tyneside, on the other hand, the large towns of over 200,000 population would be left on their own as one-tier counties. Greater London is effectively outside the Commission's terms of reference.

Despite its respect for varying local conditions and local feelings, it may be doubted whether this treatment takes a sufficiently firm hold of the pressing problems of the provincial conurbations. For one thing, the Commission has too timorous a distaste for large units, arguing that even a two-tier county should not (outside London) exceed 1,000,000 population. On this basis, it prefers its own plan to the better scheme of dividing Lancashire into three counties, and it insists on dividing the West Riding of Yorkshire, bringing into existence a "South Riding." It also, on somewhat flimsy evidence, allows to Tees-side what it denies to Tyneside, and includes the whole of it inside Yorkshire, thus enlarging the resources of the North Riding.

The complete picture thus involves the elimination of seven counties, most of them indefensibly small units, and the insertion of five new two-tier counties. This is not a proposition to antagonise a majority of the existing counties—indeed it represents an extension of the two-tier system. The case is different, however, with existing county boroughs, three-quarters of which would, under the Commission's proposals, cease to be all-purpose authorities. The only ones left in full possession of their autonomy, and rechristened "one-tier counties," are the large towns of over 200,000 population (other than Liverpool and Manchester). Although the list of these has been drawn generously, to allow for desirable boundary extensions, it comprises only 17 members (outside three doubtful towns in Greater London), namely, Birmingham, Bradford, Bristol, Coventry, Derby, Hull, Leeds, Leicester, Newcastle-on-Tyne, Nottingham, Plymouth, Portsmouth, Sheffield, Southampton, Sunderland, with the Potteries (Stoke-on-Trent and district) and Central Sussex (Brighton and district).

These towns have every reason to feel satisfied. But if the plan was left at this, the other existing county boroughs would

strongly object and very likely secure its rejection. To meet the case of the medium-sized town, a new category of local authority is introduced by the Commission, occupying a privileged position within the framework of two-tier county administration, and called, cunningly but confusingly, by the old title of county borough. This new-style county borough is described as a "most-purpose authority"—that is to say, it would

be under the administration of the surrounding county for certain major services including police, fire brigades, and for certain aspects of town and country planning, but it would be a completely independent authority for education and health. The lower population limit for this new sort of "county borough" is put at 60,000, thus enabling all but seven of the existing smaller county boroughs to qualify (and all of these existing smaller county boroughs, would have their case further investigated) together with eleven other towns which do not at present enjoy the status of county boroughs. The total number of new county boroughs would initially be 63.

This ingenious idea, by making a bid to appease the medium-sized towns as well as the big cities and the existing counties, may make the decisive difference to the plan's acceptability. Nevertheless it will create serious weaknesses and dangers in two-tier county administration. It will reduce the minimum administrative unit for education and health to one of 60,000 population—quite contrary to the view of the experts. It will seriously weaken the counties' administration of these and other services in areas outside the county boroughs. Indeed it will mean that the area coming under the full control of the county will, in very many cases, be smaller and more awkward than at present. It will not, as the Commission hopes, put an end

to the struggle between different types of local authority, for the counties will have to resist the encroachments of both one-tier counties and new "county boroughs," actual or aspiring. Indeed many towns are already encouraged to hope that it will be easier to get county borough status of the new variety than of the old. Finally, the unevenness in power and prestige between the new-style county boroughs, who will have considerable independence, and the other authorities within the counties—municipal boroughs and county districts—who as now will have very little to do, will be cause for much jealousy and dissatisfaction. To take one instance, presumably under the plan the inhabitants of the county borough of Reading would elect a third of the members of the Berkshire County Council, even though their interest in the efficient administration of the county would be limited to the police, the fire brigades and part of town planning.

In brief, the chief weakness of the Boundary Commission's plan is that it tries to please too many existing authorities—with the result that, just like the 1888 Act, it may beget further unprofitable struggles among local authorities and become somewhat weak and anomalous within a short space of time. It is also a weakness—though it would be unfair to criticise the Commission for not going still further outside their terms of reference—that the report says virtually nothing about finance. The basic dilemma of local government to-day is that an increasingly large part of its activities has to be financed by grants from the central government, with a consequent divorce between administrative responsibility and ultimate authority. The Commission quotes the Minister of Health to the effect that it is nonsense to talk about boundaries without talking about functions, and it might have added that it is nonsense to talk about functions without talking about finance.

Nevertheless, even when these things are said, the Commission's plan for a new upper tier is vastly preferable to the existing position. It is in the plan for the new lower tier of authorities that the chief weakness emerges. If the new category of "most-purpose" county borough was to be introduced at all, it should surely have been confined to towns of over 100,000 or 150,000 population—otherwise the fabric of county government will again slowly be destroyed. But the real task in this direction—that of securing a more homogeneous lower tier of authorities with some worthwhile jobs to do—is not properly tackled, except in the vague suggestion that there should for each county be a scheme of delegation of functions to its constituent county districts.

To conclude, this is an important report. It is better that the Government should implement it completely rather than do nothing. But it is very much better that the Government should have the courage to turn the half-vision of the Commission into a fully effective scheme of reform.

The Foreign Assistance Act

(A Summary)

THE Foreign Assistance Act of 1948, passed by Congress and signed by President Truman on April 3rd, is primarily concerned with the financing of foreign aid. It lays down the totals which shall be made available for various purposes and establishes the procedures by which further funds shall be obtained later. It is much less specific on the vital field of actual supply and administration, for here, it is clear, the aim has been to leave as much responsibility as possible to the Administrator, Mr Paul Hoffman. The kinds of agreement he may reach with the participating nations are outlined and their general aims are laid down. But the actual content is left to his discretion. Another striking feature of the Act is the absence of political or economic conditions. If this is America's "imperialist plot," it must be admitted that the capitalists are content to roar "like any sucking dove."

Among its specific provisions, the Act authorises military aid to Greece and Turkey (\$275 million), a \$60 million contribution to the International Children's Fund, economic aid to China (\$338 million) and an additional untied grant of \$100 million to China to permit military purchases without involving the United States. But the bulk of the Act consists of Title I, the Economic Co-operation Act, better known as the Marshall Plan. Recognising that postwar disruption is not contained by national frontiers, and endangers not only peace, but the welfare of the United States and the attainment of the objectives of the United Nations, the preamble concludes that the situation in Europe calls for a plan of recovery to "achieve that economic co-operation in Europe which is essential for lasting peace and prosperity." The three chief aims of the Act are the promotion of production, the restoration of sound currencies, and the stimulation of international trade.

The Administrator, Mr Hoffman, is directed to review and appraise requirements for aid, to formulate and approve programmes of aid, including specific projects to increase production, and to terminate aid or take "remedial measures" if he is dissatisfied with the performance of any participating country or if changed conditions make further aid inconsistent with the foreign policy of the United States. For this section of the Act there is authorised (though not yet appropriated) \$4.3 billion, plus an increase of \$1 billion in the lending authority of the Export-Import Bank, making a total of \$5.3 billion for the twelve months following the enactment of the Act. The Administrator is also empowered to extend "convertibility guarantees" of up to \$15 million in the first year to encourage the investment of private American capital in approved European enterprises. These guarantees may not exceed \$300 million throughout the life of the programme, and to the extent that they are made—that is, to the extent that private funds are forthcoming—the lending power of the Export-Import Bank is reduced. Although references are made to a four-year programme, the present authorisation is only for a twelve-month period, and a fresh authorisation and appropriation will be necessary each year. No limitations are placed on the amount of "off-shore" purchases—that is, the use of US dollars to buy supplies from countries other than the United States. The proportion of loans to grants is left to the decision of the Administrator and the National Advisory Council, of which he becomes a member. The decision on whether repayment should be requested will be determined partly by the nature of the help extended, and partly on whether there is a reasonable assurance of repayment, considering the capacity of the country to make such payments without jeopardising the general purposes of the plan.

Although the shipment of interim relief supplies is permitted and is already under way, the first task will be the negotiation, by the Secretary of State with the advice of the Administrator, of agreements with the individual participating countries or with an organisation representing them. Matters

that might well be the subjects of these more precise undertakings are listed as:

1. Promotion of industrial and agricultural production, including the submission of specific projects for increasing the production of coal, steel, food, and transport facilities.
2. Measures to stabilise currencies and exchange rates, and to balance budgets.
3. Co-operation with other participating countries to stimulate the interchange of goods and reduce trade barriers.
4. The best use of resources of individual countries, including assets of their citizens in the United States, to further the common aims.
5. Facilitating the transfer to the United States, "by barter, sale, exchange, or otherwise, for stockpiling or other purposes, on reasonable terms and in reasonable quantities," of commodities deficient or likely to become so in the United States.
6. The placing in special accounts of local currencies equivalent to the sum contributed in grants by the United States, these funds to be used chiefly for internal stabilisation and the stimulation of production, as agreed by consultation between the country concerned, the Administrator, the National Advisory Council and the Public Advisory Council.
7. Publishing quarterly accounts and furnishing any information needed to guide the Administrator.
8. The protection of the access of American industry to an equitable share of commodities needed by the United States. Where practicable, the Administrator is to use funds at his disposal to promote the production in participating countries of commodities deficient in the United States. He is also directed to ask the Secretary of State to obtain the agreement of the countries concerned to halt the removal of capital equipment as reparations if the retention in Germany of the equipment will assist European recovery.

The specific protection of America's economic interests and security has been kept to a minimum. Beyond provisions for obtaining foreign supplies of scarce commodities, already mentioned, the Administrator is directed to carry out the procurement of supplies in such a way as to minimize the impact on the American economy; he is to obtain petroleum and its products abroad to the greatest extent possible and discourage the installation of oil-burning equipment where the use of alternative fuels is practicable. American ships are to transport at least 50 per cent of the supplies procured in the United States. Agricultural commodities declared "surplus" in the United States shall not be bought outside the United States, unless American surpluses are insufficient for European needs.

Three provisions are aimed at Russia. One is that no export shall be authorised to a non-participating country wholly or partly in Europe of a commodity the supplies of which are insufficient for the needs of the participating countries unless such export is considered essential to the national interests of the United States. Another directs the Administrator to refuse delivery, insofar as possible, to participating countries of commodities used in producing goods for sale to Russia and its satellites when the end-product would have been refused an export licence, had it been produced in the United States. Finally the Administrator may appeal to the President if he finds the granting of American export licences conflicts with the Recovery plan.

The Act recognises the close relation of the Administrator with the Secretary of State, urges on them the closest consultation, and provides that when conflicts arise, either between these two, or the diplomatic and economic co-operation missions in each of the participating countries, the disagreement shall be resolved by the President. Two additional bodies are created to aid the Administrator in the formation of policy. One is a Public Advisory Board of twelve citizens of "broad and varied experience," not officers of the Government. The other is a joint Congressional Committee of ten men drawn from the appropriations and foreign relations committees of the House and Senate which will exercise continuous supervision.

NOTES OF THE WEEK

The Sixteen Meet Again

The Foreign Secretaries of the Sixteen are meeting in Paris for the first time since the American Foreign Assistance Bill became law. The means of achieving their aim—the co-operative reconstruction of Western Europe—are assured. All attention must now be concentrated upon the machinery which will be used to deploy the resources to the best possible advantage, and the chief business of the new Conference will be to bring into being the continuing organisation upon which the main responsibility will fall.

Yet even at this late hour it is difficult to be certain either of the shape or of the prospects of the Sixteen's great venture. It is true that they are signing a multilateral act committing themselves to the utmost co-operation; that in this act they avoid a marked extent all safeguarding references to national sovereignty and put their emphasis on pooling, on consultation, on expanding production and trade, and on fulfilling every condition necessary to ensure the success of the Plan's joint operation. It is also true that, broadly speaking, the framework of the continuing organisation is also fixed. A council under Mr Bevin's chairmanship will be its formal and ceremonial head. The work will be done by an executive committee of seven nations which will represent the separate interests of the Sixteen in Paris. Of this vital committee, Sir Edmund Hall-Patch, a Deputy Under-Secretary of State in the Foreign Office and chief British delegate, will be chairman. The committee will in turn be served by a secretariat, of which the Secretary-General may be, in spite of Benelux opposition, a Frenchman.

So much is clear, but until the Sixteen Governments have concluded their separate agreements with the Americans, and until the continuing organisation has started its work, the actual shape and content and working methods of ERP will remain obscure. There are, moreover, two general factors making for uncertainty. The first is the attitude of the British Government. Belief that it prefers a national to an international approach has been revived by the strength of the team it is sending to Washington—which includes not only Sir Oliver Franks, but also two of the ablest officials in Whitehall, Mr Frank Lee and Mr Hoyer Miller. Only practical experience of British policy will dispel this fear.

The other factor is considerable uncertainty over American plans. Mr Hoffman's first statements have all been encouraging and on the right lines. It is perfectly true that Europe needs nothing so much as the philosophy and practice of economic expansion, and it is in this field of production and productivity that America has most to offer. But the fundamental difficulty has still to be faced that if the Sixteen Nations are to achieve independence of dollar aid by 1951—an aim which both they and the Americans devoutly support—they may be compelled to do a number of things which discriminate against America in the meantime—for example, by substituting non-dollar imports for American imports, by seeking other sources of supply and by building up exports to other countries, sometimes in competition with American goods.

In other words, the real drama of ERP lies all ahead. Paris will only ring up the curtain.

War in Palestine

In all but name, there is war in Palestine. The Special Assembly of the United Nations, convened to reconsider its decision on partition, will meet in the shadow of the week's fighting and massacre on the roads to Jerusalem where a desperate fight is being waged by the Arabs to cut off the com-munity of some 100,000 Jews who live in the Holy City and by the Jews to enable convoys of supplies to reach their beleaguered fellow countrymen. The fighting has been bitter but indecisive. One fact has, however, emerged clearly. The British are no longer in full control of the situation, and from now until May 15th the pressure towards full-scale war will steadily increase.

These are the facts before the Assembly, and no passing of resolutions or laying of blame upon the retiring British will alter the situation. To impose partition would require force. To re-impose trusteeship would require force—the Jews have all their plans laid to announce an independent Jewish state on May 15th.

Even to impose a truce would now require force, for both sides are fairly launched in warfare. It is therefore totally unrealistic to discuss a "solution" for Palestine except in terms of force, and the choice before the Assembly lies between imposing by military means its own solution (provided it can agree on one) or leaving the future of Palestine to be decided by the military supremacy of either Arab or Jew.

Since the British will in no circumstances stay to execute the Assembly's will, and the prospects of any other kind of force are virtually nil, it seems likely that, United Nations or no United Nations, the final decision in Palestine will be reached only by civil war. It is difficult to conceive of an uglier outlook or to remember a more shocking example of diplomatic bankruptcy on the part of two supposedly friendly powers—the Americans and the British—but the wretchedness of the prospect does not make it less real.

Berlin Parleys

The collapse on Tuesday of the Anglo-Russian inquiry into the Gatow air disaster makes clearer than ever the Russian determination to make mischief in Berlin. The British, with their belief in finding the facts before passing judgment, have behaved with a moderation which bordered on weakness. They climbed down from their original demand for a Four-Power inquiry and conceded the point that only British and Russian members should sit on the commission. Even the remarks of the Russian member, General Alexandrov, who blatantly prejudged the inquiry, were allowed to pass unrebuked. Such reasonableness could not go on indefinitely, and on Tuesday, when General Alexandrov repeated his refusal to hear American or German witnesses, the British member, Air Commodore Waite, rightly announced Britain's intention to continue the inquiry alone.

Whatever the rights or wrongs of this tragic disaster, the Russians' rejection of every moderate British proposal is but one more proof of their refusal to co-operate in Germany. The British Government must accept the fact that they are dealing with a semi-hostile Power—a Power which will not go to war, but will go as near war as it dares. The tactics of mischief-making will be carried to almost intolerable limits. The British must now decide in collaboration with their American and French allies how much they want to retain—what proportion of their administration and how big a garrison—and then make it clear, unaggressively but decisively, that they mean to take any measures, however forceful, to hold their zones in Berlin.

Budget Debate

Apart from Mr Dalton's egregious accusation of conspiracy against his cheap money policy "in the press and in other circles," the debate in the House of Commons on the Budget and the Economic Survey provided no headlines. Opposition criticism, as was only to be expected, was mainly directed against the special levy. Even if Sir Stafford Cripps's repeated assurance of its "once-for-all" imposition could be believed in, it would still be impossible to justify. In spite of the Chancellor's assurance that it will largely be paid out of income, there can be no doubt that, since it is so steeply progressive, it will in fact be paid in the higher ranges out of capital, and this at a time when the encouragement of private savings is of the first importance. The best that could be said of it, is that it must be excused politically as a sop to Left-wing opinion—a task which was certainly not made any easier by Mr Dalton's demand for a genuine capital levy.

The only other serious objection to the details of his proposals on their positive side was met by Sir Stafford Cripps with a concession restoring the exemption of children's non-utility clothing from purchase tax. This was wise—though it makes his purchase tax changes, still less in accordance with his general disinflationary purpose. For the rest, though there was some criticism of the increase of taxation on tobacco and beer, the income tax changes could hardly fail to be welcomed by the Conservatives as providing much-needed incentives by relief from direct taxation where these are most necessary. It is on the score of omission that the Budget is more vulnerable, and Sir John Anderson's criticism of the policy of stabilising food subsidies at £400 million was made all the more pertinent by Mr Dalton's qualification of the £500 million interest charge on

the national debt—a gross figure from which income tax receivable must be deducted—as an intolerable national burden. Mr Stanley rightly criticised the failure to reduce the enormous volume of expenditure, but his plea for an economy inquiry recalls the not altogether happy results achieved by the Geddes axe, the crude amputations of which would scarcely be appropriate today. Nevertheless, after the financial laxity inevitable in wartime, extravagant habits die hard, and an inquiry by a suitably selected body might very well help the Treasury in restoring a proper degree of control.

On the Government side of the House there was little evidence that back bench members have learned the lesson so clearly expounded in this year's White Papers—with one conspicuous exception. Mr Benson, with a clear-sighted independence all too rare among his colleagues, hit the nail square on the head when he pointed out that the inflationary pressure from which the national economy is suffering is due to a steady refusal to recognise the physical limits of the standard of living which the country can afford, and that the attempt to improve the standard of living by forcing up wages is the source from which the major problem of inflation arises. But this insight did not enable him to draw the obvious practical conclusion in respect of the food subsidies.

The Death Penalty

A hundred years ago, the abolition of capital punishment was being energetically and persistently pursued by a band of penal reformers, and *The Economist*, commenting in its issue of October 21, 1848, on the case of Smith O'Brien, an Irish rebel who was found guilty but recommended to mercy, stated that the abolition of the death penalty, for all crimes, was inevitable.

There are grand moral epochs in the history of mankind, when some great truth that had long been dormant in the minds of the community, is recognised as it were by common consent, and becomes at once established firmly and for ever. . . . The present seems such an epoch in relation to capital punishment.

Yet it was not for a hundred years that the youthful prophecy of *The Economist*, which looked forward to the early abolition of all "sanguinary laws and cruel punishments" as a mark of the "great progress of mankind," was fulfilled, and then the House of Commons carried an amendment to the Criminal Justice Bill, suspending the death penalty for an experimental period of five years, by a majority of only 23.

There is something ironical in the fact that the proposal was carried by such a small margin at a time when the party in power, with a large majority, is a party that in the past has consistently supported the abolition of capital punishment. If in this case the Labour Party had been true to its programme, the proposed abolition would have been carried without difficulty. But the Labour Government has changed its mind; or rather the Labour Home Secretary has changed his mind, and, in spite of the fact that the question was supposed to be settled by a free vote, Ministers were expected to support his view.

Mr Chuter Ede justified his change of mind by the violence of the times. It is not opportune, he argued, now that crimes of violence are on the increase, and the police force is undermanned, to remove the deterrent effect of the death penalty. He thus went straight to the heart of the matter. For, if the rights and wrongs of judicial killing and all humanitarian considerations are left out of account, the justification for capital punishment can only rest on its power as a deterrent. On this, the balance of evidence is that the power does not exist. The evidence is inconclusive; but the very increase in crimes of violence since the war, when the death penalty is still in force and is carried out for such crimes, is a fundamental weakness of Mr Ede's own case. The real deterrent is certainty of detection and conviction, and Mr Ede would have been in a stronger position if he had not previously shown himself so half-hearted in his measures to strengthen the police. Now that Parliament has decided to remove, in the words of 1848,

a punishment which revolts public feeling . . . and being in its own nature an evil . . . loses all justification the instant it becomes inefficacious,

the Home Secretary should do all in his power to strengthen the forces of law and order, without which any form of punishment is largely ineffectual.

The Bill in Committee

Like the debate on capital punishment, the debates in standing committee on the Criminal Justice Bill were a non-party affair.

In fact, there were so many lawyers on the committee that the proceedings often read like proceedings in the High Court of Justice, the honourable and learned members vying with one another to point out technical flaws in the Bill's clauses and to find legal points which would defeat their opponents.

But in spite of the large overlay of counsel's opinion, it is possible to discern along what lines the standing committee was usually divided. There were those members, exemplified by Mr Silverman, whose views were mainly prompted by sympathy, sometimes sneaking, sometimes open, for the wrongdoer; who felt that he is sinned against rather than a sinner, and that humane and sympathetic treatment is all that is necessary to reform him. Ranged up against them were those who felt that the protection of society must come first and that, in any case, the majority of criminals are quite simply wicked people whom it is impossible to reform. From reading the debates one has the impression, which may well be mistaken, that the Home Secretary falls into this group and that he is personally very half-hearted about the clauses in the Bill which enable the courts to call for reports on an offender's state of mind and to prescribe treatment for his mental condition, and about other clauses concerned with the rehabilitation of an offender by sending him to a special institution, instead of merely punishing him by sending him to prison.

In between these two sections of opinion comes, as always, a middle point of view typified by Mr Benson. A great many offenders, according to this view, can be restored as normal members of society. They may be, but not necessarily are, mentally and emotionally unstable. Mental treatment may, but often may not, do them any good. On the other hand, some offenders, including children, are quite incorrigible and have to be dealt with accordingly. This is the commonsense view which should commend itself to the general public. It also inspires the Bill which, in its provisions for employing psychiatry to help the penal code, for the most part only regulates what is in fact the present practice. But there is urgent need for research into the real causes of crime, and a new clause, allowing public money to be spent on this purpose, added to the Bill on Report may in the long run prove to be one of its most useful provisions.

Interregnum at Bogotá

After a violent interlude of several days of riot and bloodshed in the Colombian capital of Bogotá, the Inter-American Conference resumed its work there on Tuesday. The delegates are on their mettle. They have not only to regain lost time but to retrieve their countries' Pan-American reputation—Colombia, where these outrages occurred, has long been considered a model Republic. In order to meet the first objective, the agenda has been shortened by the transfer of economic items to a conference which is to be held at Buenos Aires later in the year. To meet the second, a scapegoat is being vigorously sought to explain Colombia's surprising misbehaviour and the rods are ready for the conveniently broad backs of the Communists.

Mr Marshall has likened the pattern of events in Bogotá to Communist disturbances in France and Italy. The Bogotá riots, he says, must be regarded as a world affair. Certainly the speed with which the Communists occupied the broadcasting station and exploited Dr Gaitan's assassination could be evidence of sinister preparation. Nor would one expect a mob to destroy the records of the Conference on its own initiative. At any rate, two "Soviet agents" have been arrested. The increasingly anti-Communist tone of the Conference—Mr Marshall had had the agenda modified to permit the discussion of "foreign-inspired subversive activities"—may have provoked a counterstroke and what better place for a demonstration than the town where were assembled the delegates of states which are taking ever stronger precautions against Communism? In Costa Rica, for example, a civil war has been going on since the middle of March against a Communist supported Government, which, for that reason, is not represented at Bogotá. Only last week a Communist plot was thwarted by the Paraguayan police. The previous week the garrison of Sao Paulo State had been put on the alert after the alleged appearance there of the Brazilian Communist leader, Prestes. And at present Chile is debating measures to outlaw Communists.

Given this explosive background, it is very likely both that there was a Communist element in the Bogotá rising but also that the Pan-American delegates will be likely to over-emphasise its importance. The danger is increased by the fact that the Bogotá Conference has decided to concentrate henceforth on political problems to the exclusion of Latin America's economic difficulties. Yet these in many ways present the most urgent issue. Mr

McCloy, the President of the World Bank, in perhaps the most important statement made at the Conference so far, pointed to the South American nations' lack of capital and affirmed that the Bank's policy in Latin America was to blaze the trail for private international investment. This is an implicit challenge to the Republics to reconcile their over-ambitious plans for exploiting their undeveloped resources out of their own totally inadequate savings with their need to admit foreign capital on reasonable terms. Until they meet this economic challenge, they will lack political stability and be vulnerable to Communist or anti-Communist manoeuvres.

Last Act in Prague

The announcement by Mr Fierlinger last Saturday that the Socialist Party was to be merged with the Communist Party ends any pretence there might still have been of democracy in Czechoslovakia. The arrest on the same day of seven journalists charged with producing an anti-Government newsletter and facsimiles of the former National Socialist newspaper *Svobodné Slovo* underlines the police-state methods of the new regime and marks the beginning of the last "monolithic" stage of their revolution. Single electoral lists are now to be prepared for this fact election due to take place on May 30th. In view of this disenfranchisement and since known opponents of the regime are being discredited, the Communists are certain to get a very high percentage of the votes, thus acquiring the familiar cover of popular support for their dictatorship. Those Czechs who remained silent during and after the Prague coup in order to record their protests legally at the elections later have now lost all hope of being able to do so. As some of them have said: "The Italian elections must now be our elections."

The precedents set by Communist leaders in Rumania and Bulgaria are being faithfully followed in Poland, Czechoslovakia and Hungary. It is the Socialists who must be eliminated before the countries is the same: first the Social Democrats or similar left-wing parties are forced to purge themselves of their more liberal members, then those extreme socialists who remain are absorbed into the Communist Party and effectively muzzled. It

The fable of the man-at-arms

There was once a Soldier home from the wars, with more fame than fortune. 'Fine words butter no parsnips,' observed his allies, 'but virtue brings its own reward . . . moreover, every flow must have an ebb, and charity begins at home. How will you live on your island, now all the fighting's done?' 'By force of arms,' answered the Soldier, as he unbuckled his sword.

Britain's outlook cannot be less adventurous or determined than it was four years ago . . . we are still under arms. TI is helping to forge the weapons for our prosperity — precision tubes, light-alloy extrusions, bicycles and parts by the million, electrical equipment, pressure chambers and traffic signs for the world's markets.

TUBE INVESTMENTS LTD • THE ADELPHI • LONDON • W.C.2

is never enough for the Communists to have the pledged support of Socialists; for them there are no Socialists except those who look only to Moscow for inspiration.

Apart from Moscow's strongly-felt need to line up the countries of eastern Europe in a solid, all-Communist front, the fusion of Socialists and Communists reveals a psychosis which is the real tragedy of eastern Europe. Men give up the fight before they have to. Exhausted and frustrated in their own efforts to achieve positive results, they seem unable to resist the prospect of peace which they see as the reward for joining the strong. The continual compromise between the conflicting interests of left, centre and right undermines their strength and saps their fortitude; then, when the Communists gain control, fear of what might happen if they stand aloof drives them like sheep to seek the safety of the herd. It is at this point that men of integrity, like Jan Masaryk, are driven to assert their final independence by suicide.

Developing Inventions

The Development of Inventions Bill which was given its first reading in the House of Lords on Tuesday should certainly be welcomed as a genuine effort to assist the exploitation of scientific discoveries. The Bill sets up a National Research Development Corporation under the general direction of the Board of Trade, which is empowered to provide it with working capital in the form of advances up to £5,000,000 in five years. The functions of this body will be to secure the development and exploitation of inventions resulting from Government research or any other invention which is not being adequately developed or exploited. The normal method envisaged is the licensing of a particular invention or process to an industrial undertaking, the Corporation fixing the royalty to be paid, but powers are to be given it to promote or conduct any business necessary for the exploitation of an invention in the public interest. The object of these rather widely drawn powers, is not intended to enable the Government to compete with private industry, but to enable the Corporation to establish pilot plants which will ensure the commercial possibilities of inventions being practically explored. The Bill also lays down that the Corporation should as soon as possible meet its expenditure out of income "in so far as this

MR. WINSTON CHURCHILL

writes:

"The Royal Cancer Hospital is doing work of which the Nation should be proud. It is fighting this fell disease—trying to establish its cause and discover a cure—providing beds for patients and keeping those who are inoperable free from pain. If those who have contemplated even for an instant, the possibility of being one day themselves in the clutch of cancer subscribe to the fund, the present difficulty of raising sufficient money to continue the work should be easily overcome."

Although the State will become responsible for hospital maintenance after July 5th, it will still be necessary to seek voluntary support for research on the scale required. Please mark your gift "RESEARCH FUND" and send addressed to the Secretary.

is consistent with the fulfilment of its purposes," but repayment of interest on advances made by the Board of Trade may be waived during the first five years.

With the general object of the Corporation few will feel inclined to quarrel. In the past many inventions and discoveries made by British scientists have been seized upon and patented abroad, such as the much quoted ultra-violet radiation of ergosterol to produce vitamin D, which was invented here but patented in the United States. Moreover, the inventor with no capital resources of his own has too often been notoriously unsuccessful in obtaining commercial backing. The National Corporation should give both him and his invention a much fairer chance of success. At a time when the Government has been doing so much to discourage the taking of risks by the private individual, it is certainly appropriate that it should assume such special risk-bearing functions on behalf of the public. The powers of erecting and running pilot plants at the public expense will, however, need careful scrutiny. Without in any way distrusting the genuineness of the present Government's intentions, it is impossible, in view of certain currents of left wing opinion as exemplified, for instance, in Mr Mikardo's programme for the next five years, to avoid the suspicion that these powers might some day be misused. That does not condemn the Bill, but it does mean that it may be advisable to introduce some amendments.

Wages and the Budget

If the special conference of trade union executives had been held after, and not before, April 6th the minority against the TUC General Council's acceptance of the White Paper on personal incomes might well have been very much larger. For although the Budget has had a fairly friendly reception in labour circles generally, certain aspects of it are causing trade unionists to think fast and furiously. One is that the increased price of tobacco and beer will bear most severely on lower-paid workers, who will be hardly touched by the income-tax concessions. The main complaint, however, is that the Chancellor has failed to take drastic action to "curb" profits, which action, the unions say, was implicit in their acceptance of the White Paper. Both these points will be taken up when the TUC Economic Committee meets Sir Stafford Cripps next week.

It is, of course, only logical that if the limitation of wages is to be on a voluntary basis, the voluntary principle should equally apply to the limitation of profits, and Sir Stafford's decision to give the FBI scheme a year's trial is only fair and reasonable. But the average trade union leader who has a rank and file straining at the leash is hardly likely to be swayed by logic. The truculence of the vehicle builders, whose talks at the Ministry of Labour have resulted in complete deadlock, is symptomatic of the temper of a certain section of the unions. Mr Isaacs's third, and it is to be hoped final, letter to Wages Councils, reminding them of the terms of the White Paper, is not likely to make very much difference to anybody, and is really more of a formality than an injunction.

In the meantime, the engineers' big claim for an increase of 13s.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

Enquiries should be addressed to:—

The Economist Intelligence Unit

(Telephone: WHItchall 1511, Ext. 13.)

a week has been laid before the engineering employers. Engineering wage negotiations are notoriously unhurried, and in this case the process of claim, counter-claim and final resort to arbitration is likely to run its full course. The engineers composed the bulk of the opposition at the TUC conference, so presumably they do not feel themselves bound by its decisions. Mr Tanner's case, as set out in the current *AEU Journal*, is that engineers have not had any wage increase for two years and that the cost of living has increased considerably. It is rather difficult, however, to fit this claim into any of the "exemption" categories suggested by the TUC. Engineering is not an undermanned industry; it is not badly paid in relation to other industries, and wages are certainly not "below a reasonable level of subsistence." Moreover, the claim for a flat-rate increase for all workers can scarcely be said to provide an additional incentive to output and higher productivity. The only practical argument in its favour, though it is not a very honourable one, is that if the engineers are not given an increase there will be widespread trouble in the workshops.

When Will the Brabazon Fly?

The Report of the Select Committee on Estimates on the Cost of Construction of Brabazon I and other Similar Types of Civil Aircraft* arouses melancholy reflections. The Report itself is straightforward and informative. But nearly all its information of current importance relates to further delays and increased costs. One can accept the technical reasons for this. It would have been remarkable in the present state of aeronautics if there had been no delays in the development of the enormous Brabazon I, with its highly specialised design for the London-New York route, or of the even bigger SR45 flying-boat. Some increase in their cost thus seems reasonable. No precise estimates are published for the three SR45s, which are expected to cost about £5,000,000. The cost of the two Brabazon I prototypes, however, has risen by 40 per cent to just over £11 million.

But are the technical reasons a full explanation? The impression that a part of the rise in costs is due to a lack of drive in the higher direction of civil aviation policy cannot be avoided. The Committee agrees—and few would disagree—that the importance of these projects makes it reasonable for the Exchequer to bear some of their cost: in the United States the Army Air Force has assumed responsibility for similar costly experiments. As early as 1943 construction of the Brabazon was "top priority." The Committee is justifiably surprised that neither it nor the SR45 was on the Prime Minister's priority list, and recommend that they should be. Their continued omission may further delay a development which is already retarded enough by unavoidable delays. One would have expected such important projects to be treated with a greater sense of urgency.

These delays are thrown into relief by the expectations raised by what the Bristol Aeroplane Co. calls the "hopelessly optimistic" estimate of the Ministry that the second Brabazon prototype would fly in autumn, 1949. The impression left by the Courtney Committee's Report returns. Over and above reasonable technical delays progress has been hindered and costs increased by unsatisfactory procedure. While time and money are spent there is no body responsible for modifying these procedures or ensuring that they work as efficiently as possible. There should be. They cause delays when time is vital. And the accumulation of delays threatens to wreck the whole postwar programme for civil aviation.

Communists in India and Burma

Since it has held power in India the Congress Party has suffered the embarrassment of any revolutionary party which suddenly discovers the virtues of order, discipline and obedience to constituted authority. It has to commend these virtues to masses of people whom it has previously led by subversive agitation and see the revolutionary initiative pass to other parties which remain unrestrained by governmental responsibility. In India, in spite of democratic forms, it has been evident since last August that the state authority has only a small margin of strength against the breakdown of public order, and that not only in the areas of high communal tension. For India's stability the Congress Party has relied on its "strong man," the Home Minister, Mr Patel, who shows a marked disposition to use police action against actual or potential disturbers of the public peace. Occasion for

* HMSO, 3s. 6d.

such measures first arose with the murder of Gandhi; drastic action was then taken against the Hindu communal organisation, the Mahasabha, and its "fascist" private army; to hold the balance even, the repression was extended to the para-military formations of the Moslems. More recently it has been the turn of the Communists, who have been promoting widespread strikes of Government employees; on the ground that these strikes have been fomented for political ends and are a danger to public order, mass arrests of Communists have been carried out and in West Bengal, the centre of the trouble, the party has been banned altogether.

The Indian Communists, with control of a group of trade unions, are strong in the main industrial centres, and have also a following among the peasants, notably in Madras. The Socialists, who were formerly affiliated to the Congress Party and have their own trade union organisation, have now also gone into opposition to Congress, but show no signs of co-operating with the Communists, with whom they are in sharp rivalry. In contrast with the Communists, the Socialists have joined the Government in appealing for increased production and industrial peace in order to raise India out of its present economic stagnation.

In Burma also, the Communists, who maintain close contacts with their Indian comrades, have been promoting strikes of a political character and the Government of Thakin Nu has been following the Patel line of wholesale arrests, though without prohibiting the party itself. Both in India and Burma the new Governments, raised to power on a broad coalition of parties in the nationalist cause, have become acutely aware of the threat from the extreme Left. Neither Government appears at the moment to be seriously threatened by an armed uprising, and the semi-violent strike tactics of the Communists have so far been a failure; unfortunately, however, as elsewhere, the police action required for checking Communist disorders can only too easily develop into a general persecution of healthy trade union organisations.

Pakistan and Kalat

The state of Kalat, an account of whose affairs was given in *The Economist* of February 21, has finally acceded to Pakistan on March 28th, after having first refused to surrender its claim to complete independence. There was considerable pressure from Karachi, which took the form both of a military demonstration and of a diplomacy designed to induce the lesser states of Kharan and Las Bela, vassals of Kalat, to renounce their feudal allegiance and join up directly with Pakistan. When Kharan and Las Bela yielded to these blandishments, the position of Kalat was fatally undermined and the Khan had virtually no choice but to come to terms with Mr Jinnah. He made his final decision to accede after the Delhi radio had broadcast a statement that Kalat had offered to accede to India, but that India had declined the proposal. The Khan has publicly denied the truth of this story, and it is probably untrue as it stands, but certain elements in India and on the North-west Frontier are believed to have been playing with the idea of an alliance between India, "Pathanistan" and Kalat, which would hold Pakistan in a nut-cracker grip.

The scheme is not likely to have appealed much to Kalat, partly because the Baluchi feels no sense of solidarity with the Pathan, and partly because the Khan of Kalat is unsympathetic to the Russian influences which support the "Pathanistan" agitation. His accession to Pakistan has certainly reduced the dangers of tribal chaos on Pakistan's western border; Mr Jinnah for his part will be well advised not to press his victory too hard and risk a Baluchi revolt by imposing too much bureaucratic centralisation on the tribes which still acknowledge the overlordship of Kalat.

Algerian Confusion

The Algerian elections are particularly confusing as the names of the political parties are even more misleading than in France itself—where *de gauche* is right of centre and *républicains* nearly always hate the Fourth Republic. Reliable reports from Algeria show that, in the First college, the majority of lists, which won their seats in the name of the Gaullists, were in fact composed of ex-Vichyites or ex-Giraudists who nurse personal grievances against de Gaulle. Canvassers for the Gaullists had, indeed, previously returned to France depressed by the total absence of enthusiasm for the RPF. But they had taken the initiative in amalgamating the parties of the right, who thereupon adopted

the RPF mask for their own principal aims—to keep Moslems out of posts held by Europeans and to safeguard "the French presence." The coalition lists had an overwhelming success and thus created the erroneous impression that Algeria had voted *en masse* for the General.

In the Second college party names were even more confusing. The common characteristic of the victorious "independents" seems to have been their dependence on the French authorities. Unofficially these candidates are more usually called *administratifs*, and it is a tribute to French organising ability that they were elected by such high polls with troubles in only one village.

The failure of the nationalists at the polls is no indication that Arab religious and national fanaticism is less marked in the west than in the east of North Africa. Indeed, the former moderate leader, Fehrat Abbas, has recently changed his tactics and is outbidding the extremist Messali Hadj, in preaching massacre. Local feeling is intensely racial and anti-European. There is little doubt that the elections as a whole revealed the absurdity of applying western standards of democratic procedure to a largely illiterate and primitive mass dominated by a minority of Europeans in constant terror of expropriation and murder. Neither side can nor will accept the electoral rules of metropolitan France. Nor would it be reasonable to expect the French to accept the will of the majority when this might easily be swayed into a will to kill all Frenchmen. The French have invested capital and effort in Algeria which they consider they have a right to protect. Whether that aim can best be served by pretending that Algeria is France and leaving the local administration to conceal the bare facts as decently as they can, is another problem. And when that problem is considered it will be found to be the whole liberal conception of the French Union, the successor of the French Empire, that is at stake.

Another Plebiscite

The British Medical Association is to hold another plebiscite of the medical profession, now that its council has considered Mr Bevan's replies to questions put to him on Monday, when negotiations between him and the Association were reopened. In the light of the changed situation, brought about by the intervention of the Royal College of Physicians and Mr Bevan's generous gesture, another plebiscite is necessary, for the floating voters, having previously registered their complete lack of confidence in the Minister, should now be given a chance to say whether he has reinstated himself or not. But it ought to be a really free vote. After Mr Bevan's climb down, the leaders of the BMA ought to content themselves with placing their questions and his replies before the profession and to refrain from placing a tendentious interpretation upon them.

It is also to be hoped that this plebiscite—the fourth to be held on the National Health Service since 1944—will be the last. In less than three months' time the health service is due to start. The Ministry of Health has been going ahead with the administrative arrangements, and a series of regulations has been issued; but it would be foolish to pretend that the service could have counted on a successful start even if the co-operation of the medical profession had been secured earlier. Has anyone, one wonders, estimated the extent of the new demands which will be placed on the country's health services as soon as they are available to everyone free of charge? The fact that they will only be

come into bi-polar competition. For the first time in American history the country must guard "live frontiers" which are not only three-directional (he doubts attack from the south) but also three-dimensional. Atomic fission, guided missiles, long-range air transport and new submarines make it possible to approach a landless country by sea and air.

"We face no immediate threat," says Mr Baldwin, and quickly sets forth the imperative demands of the new defence. This would include a "highly trained, completely ready mobile force," and "the most efficient airborne army in the world." This force is to be secured not by universal military service, a device which Mr Baldwin deplores, but by voluntary enlistment in a small regular army and in such civilian reserves as an efficient and co-ordinated national guard; these together would form the skeleton cadres for instant expansion to full strength. Distant bases at key points in the world are essential; another canal across the Isthmus of Panama is desirable. An efficient world-wide intelligence system is, after diplomacy, "the first line of defence."

Not only industry, but the entire economy must be mobilised in the event of another war. Cities must be decentralised, factories, laboratories and key offices put underground. Plans must be flexible and decentralised, providing "the greatest possible autonomy for industry, labour, agriculture, etc." They must be under civilian control. Because total war involves the whole economy and therefore the whole population, peace is to become a state of total and constant readiness for war. But all this is to be voluntary, in the spirit of the frontier Indian fighter, without regimentation, hysteria or witch-hunting. America is to be at once armed, relaxed and ready to spring.

Mr Baldwin obviously believes that this is possible. He thinks that the United States can and must live in a state of total preparedness for total war, and at the same time, avoiding both imperialism and the garrison state, hold to its cherished liberties. To the reader, however, the measures outlined and the conditions imposed would appear to demand a race of trained supermen who might or might not find the life involved worth living. The price of power here sketched is so repellent that one can only hope it will inspire both Russians and Americans to call the whole thing off and go fishing.

From The Economist of 1848

April 15, 1848

A FEW moments will not be ill spent in considering what are the especial lessons of wisdom which we, as Englishmen, may learn from these flagrant errors and these sad misdeeds [in France] . . .

That the true interests of freedom are even more endangered by the government falling into the hands of, or into the control of, the working classes, than by falling into the hands of even a military despot. In saying this, we mean no disrespect, and we feel no disrespect for those classes, especially in our own country. We acknowledge their general good dispositions, we honour their energy and industry. . . . We know that their temper is proof against irritations and oppressions which have driven wiser men frantic. . . . But from the inevitable defects of limited views and imperfect education, as well as from the excitability and mobility which distinguish large masses, it is not in their hands that the reins of power can be safely held, nor to them that the administration of freedom can be safely entrusted. It is not that we believe they are more selfish than other classes, but from their numbers, and from the habit of considering and calling themselves "the People," selfishness with them more easily disguises itself under the semblance of a regard for the public weal. . . . It is because they are less capable than others of postponing present and temporary, to future and permanent, advantage, and of perceiving how closely the welfare of their own body is bound up with that of every other part of the community. It is, in short, because the complicated and delicate construction of the social system is above the comprehension of all but the thoughtful and the instructed; . . . because the science of government, and more especially that most subtle and difficult portion of it, economic science, can only be mastered by the long and patient study of trained intellects; that we feel obliged to pronounce the working classes unfitted for the hard and hazardous task of governing the state, or of controlling and overruling their governors. Granting to them the best intentions and the most unselfish views, their haste, their impressibility, their openness to deception, and their inevitable ignorance, must ever make, and has ever made, the government of the lower classes fatal beyond all others to freedom, to prosperity, to peace.

Economic Research

"Productivity, Prices and Distribution in Selected British Industries." By L. Rostas. 199 pages. 16s. net.

"The Management of Colonial National Incomes." By Phyllis Deane. 173 pages. 12s. 6d. net.

Occasional Papers XI and XII. National Institute of Economic and Social Research. Published by Cambridge University Press.

THE publication list of the National Institute of Economic and Social Research is lengthening in impressive fashion, though it is apparent that the Institute is still handicapped by the delays in publishing its work that present conditions impose. The two latest "Occasional Papers" are among the most important of the series. Dr Rostas's monograph is a further instalment of his work on the distribution of the product of British industry. It is mainly concerned with the variations from firm to firm of such things as prices, costs and gross profit margins. The examples are largely drawn from the cement, tinplate, blast furnace, food processing and wallpaper trades.

Miss Deane's work is an examination of the extent to which the techniques of measurement of the national income that were developed in the Central Statistical Office during the war can be applied to colonial territories. The experiment was tried on Northern Rhodesia, Nyasaland and Jamaica, and the answer is that the method can be made to work, though naturally with wider margins of error than in a country like the United Kingdom, with its much more developed statistical equipment.

Both these pamphlets represent the best type of economic research work, not merely because of the important and practically useful subjects that they illumine but also because they both represent the fruit of collaboration between a private institution and Government Departments.

Malthus was Right

"The Phantom of Plenty." By George O'Brien. (Dublin) Clonnon and Reynolds. 75 pages. 4s. 6d.

MALTHUS was right, after all. That is the gist of this sober and stimulating little book, which places the vast economic progress of the past hundred years, so fatal in appearance to Malthus's argument, in perspective as a unique and non-recurring phenomenon; a process now slowing down through the exhaustion of the possibilities of robber agriculture and of extractive industry generally, and limited in any case by the impossibility of mechanising the "service" element in economic life. Mr O'Brien would not claim to carry guns of Malthus's calibre; beside that dreadnought the "Essay on Population," "The Phantom of Plenty" is only, at most, an MTB. He is, in almost any reckoning, over-pessimistic about the possibility of raising standards in backward countries; remembering what happened to Malthus's predictions, one cannot but feel that he over-discounts the potentialities of science. But in the most general terms his anti-perfectionist argument is unanswerable. "The Phantom of Plenty" deserves a wide circulation.

Keynes Simplified

"Conquest of Unemployment." By E. Victor Morgan. Sampson Low. 182 pp. 7s. 6d.

THIS is an admirable book, the first really satisfactory popular statement on employment theory and the practical policies based upon it. To those already familiar with Lord Keynes's "General Theory," with Lord Beveridge's "Full Employment in a Free Society," and with the controversies to which, at various levels, these have given rise, it presents nothing very new—though even the professional economist would find Mr Morgan's final chapter stimulating, and anyone faced with the appalling job of conveying Keynesian theory in digestible form to the novice will find his book an invaluable ally. But for the student, and above all for the puzzled man in the street, this clear, sound and felicitous statement is a real godsend. Criticism is possible. From the point of view of presentation, one could wish that Mr Morgan had applied his adequate gifts towards explaining, once for all, the context of the word "investment," and had then used that word throughout instead of his ingenious substitute phrase, "borrowing-and-spending"—which is not really a full equivalent. Also, his discussion of the foreign trade aspects of the problem is a little too simple, not to say, in present circumstances, too optimistic. But these defects weigh very lightly in the balance against the merits of this most necessary and opportune book. If succeeding volumes of the *Britain in the Future* series are as good as this, its editor (Mr Hugh Molson, MP) will have reason to congratulate both himself and his contributors.

AMERICAN SURVEY

Spring Strikes

(From Our US Editorial Staff)

CONSIDERABLY over a half a million workers were on strike in the first week in April, and a daily increasing number were unemployed owing to the resulting shortages. The range of occupations affected was exceptionally wide, from the stock market to the stockyards. While one set of pickets kept guard at the entrances to remote Allegheny coal pits, another circled the caverns of Wall Street. Of the strikers, about 400,000 were followers of Mr Lewis. Close to another 100,000 were meat packers. Ten thousand more were from the printing trades. The strike at the Stock and Curb Exchanges concerned directly only about a thousand employees. Their number, however, was augmented by local geography. The lower tip of Manhattan includes not only Wall Street but Battery Park, on whose benches, these warm spring mornings, sit members of the Seafarers Union, close to their Beaver Street headquarters; largely on a sporting basis, they have from time to time made common cause with the pickets in the financial area.

While these strikes take today's headlines, others seem possible-to-probable for tomorrow. The stoppages in part of the atomic energy installations at Oak Ridge, which threatened in March, have been temporarily averted by an 80-day injunction. On the railroads, the engineers', firemen's and enginemen's, and switchmen's unions, which set February 1st as a strike date, but held off after the appointment by the President of an emergency board, have rejected the board's report. If renewed negotiations are unsuccessful, some 140,000 workers may bring to a standstill trains whose schedules were recently cut by lack of coal. In a number of cities, local transportation is either halted or threatened with a halt. In steel, negotiations are in process under a clause in the contract which permits reopening for cost of living adjustments, although the contract prohibits any strike this year. The United Auto Workers' contracts with the General Motors, Ford and Chrysler companies expire within the next few weeks. The outcome of the steel negotiations will probably set the pattern for other industries. Mr Murray may bring up the question of pensions as well as wages, following on the ruling of the National Labour Relations Board that employers must bargain on pension funds if asked to do so.

*

The situation has raised issues which involve the constitutionality of the Taft-Hartley Act and larger issues affecting the economy as a whole. At its peak the coal strike unquestionably created a condition of national emergency warranting the use of the powers given the government in the Act to meet just such a situation. This section of the Act, moreover, was written with Mr Lewis in mind. But once more Mr Lewis has demonstrated his ability to side-step the law, this time with the eager aid of Mr Martin, the Speaker of the House and a candidate for the Republican nomination, and Senator Styles Bridges. Mr Martin's suggestion that Senator Bridges be appointed as the public member of the board of trustees for the miners' pension fund has produced a speedy agreement on the pension issue and the ironic command from Mr Lewis to his loyal miners that "your voluntary cessation of work should be terminated."

The agreement is that pensions of \$100 a month should be paid to miners aged 62 and over who have left the coal fields since May 28, 1946. Mr Lewis's original demand was that pensions of \$100 should be granted to miners of 60 and over without regard to when they left the mines. The owners' representative still maintains that the scheme, even as revised, is beyond the resources of the welfare fund. Mr

Lewis is still to be tried for contempt of court for failing to order the miners back earlier. But his technique of evading both the law and the consequences of defying it, which failed so miserably twelve months ago, has been perfected, and has triumphed in an election year when it is so much easier—even for Mr Lewis—to make friends and influence candidates. His shrewd sense of when the time had come to be conciliatory has postponed the long-awaited test of the constitutionality, and effectiveness, of the law's provisions for dealing with strikes affecting the national welfare.

A second major part of the Taft-Hartley Act is being tested in the courts in the International Typographical Union case. A temporary injunction has been issued to restrain the Union from instructing its locals to take action which, in effect, attempts to by-pass the Act's prohibition of the closed shop and which has led to newspaper strikes in Chicago and elsewhere. Wage issues are also at stake in these strikes. The political provisions of the Act are being tested as well. A month ago, a district court judge ruled that the prohibition of the spending of Union funds for political purposes was unconstitutional. This decision has been carried to the Supreme Court, which is also likely to review this week's ruling that it is constitutional to require Union officers to swear that they are not Communists.

*

But whatever sections of the Taft-Hartley Act stand or fall in these court tests, the greatest effect of the current strikes is to increase inflationary pressures. Some of them may peter out: when the meat strike started, the packers had in storage over a billion pounds of meat, bought at prices which made them view a period during which they could unload with something less than alarm. By the third week of the strike, moreover, both receipts at the stockyards and actual slaughter were at 60 per cent of their usual rate. (In this respect, this strike is like last year's strike in the telephone service where the availability of dial equipment, plus the use of supervisory personnel, minimised the outcry that the consuming public might otherwise have made.) The American Federation of Labour packers are not involved in the meat strike; they accepted the 9 cents increase agreed to by the companies while the Congress of Industrial Organisations Union first held out for its original 29 cents demand, then offered arbitration and was turned down.

In 1947, of the 3,693 work stoppages, resulting in 34.6 million man days of idleness, 36.6 per cent concerned wage increases; it seems probable that a similar purpose will stand out in this year's record. In recent negotiations and strikes for wage increases, the rise in the cost of living since the end of the war or since the last contract was signed has been increasingly stressed. The trend in regard to net spendable weekly earnings differs considerably from occupation to occupation, from the service trades through Government service to manufacturing and mining, in terms of the extent to which workers are better

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

off than in 1939. But they have all dropped back from their wartime peak.

Negotiations completed in recent weeks provide hourly increases averaging around 10 cents and ranging from 5 cents to 15 cents. They approximate the increase in consumers' prices since the last contract date. Production workers in manufacturing industries averaged \$51.52 a week in mid-February 1948 as compared with \$47.29 a year previously and \$29.58 in 1941; gross average hourly earnings were \$1.287 in February as compared with \$1.170 in February 1947 and \$0.729 in 1941. These facts may have contributed to the emphasis on the desirability of controls, including wage controls, contained in the report on the first quarter of the year submitted by the Economic Advisory Council, which, in a breach of ordinary practice, was released to the public by one of the Cabinet.

American Notes

Free-for-all in Nebraska

Mr Stassen has made as good a showing in this week's free-for-all fight in Nebraska as in last week's three-cornered contest in Wisconsin. The Republican primary in Nebraska was a straight popularity contest between the seven leading Presidential aspirants, none of whom were "favourite sons." According to the latest figures, which cover nearly 90 per cent of the votes, Mr Stassen has 72,000 to Mr Dewey's 57,000 votes, Mr Taft is a bad third with 18,000 and General MacArthur comes fifth with 6,000 votes. No campaign had been conducted for the other candidates, Senator Vandenberg, Governor Warren and Representative Martin; Mr Vandenberg had been entered against his will, yet he comes fourth with 8,000 votes.

Mr Stassen admittedly was fighting near home in a State where he had shown substantial strength in 1944 and where he had the very active help of his well-developed organisation in the Middle West, but even after his band-wagon began to roll last week, the contest remained very open. Senator Taft had behind him the Butler political machine, which had defeated Mr Stassen's candidate, ex-Governor Griswold, in the Nebraska Senatorial contest in 1946. That defeat was taken, both by the nation and the world, as a sign that isolationism was reasserting itself in the Middle West. Mr Stassen's, and indeed Mr Dewey's, victory over Mr Taft and Senator Vandenberg's over General MacArthur are a more reliable indication that today isolationism has little appeal for the American voter.

Mr Stassen is using the primaries to force his Party to debate the international issues which he regards as vital. This unorthodox challenge has not endeared him to the Party leaders, but his vote-getting ability has made it impossible to ignore him as they had hoped to do. If he makes a good showing on May 4th in Ohio—he does not expect to win—when he challenges Mr Taft on his home ground, and in Oregon on May 21st, when he and Mr Dewey meet, both far from base, he will have proved beyond question his brilliance as a giant-killer.

The Republicans, however, do not expect to be opposed by a giant next November and victories in the primaries lose much of their weight when balanced against the behind-the-scenes bargaining of a national convention. But defeats in the primaries always weigh heavily and Nebraska seems to prove that Senator Taft was wise in his original decision to enter only in Ohio. He changed his mind, it is believed, in order to show that the voters would be more favourable to him than the public-opinion polls, but not even with the able and colourful assistance of his wife could he beat the friendly and positive approach of Mr Stassen or even the last-minute campaign of Mr Dewey. Nor did Mr Dewey succeed in stemming the rout which began in Wisconsin. Many of the uninstructed convention delegates on whom he has been relying must already have at least one foot on the step of Mr Stassen's band-wagon.

* * *

Congress is Airborne

With European aid out of the way, Congress is concentrating on mending America's military fences. The clank and splutter of rusty preparedness machinery changing into gear can be heard on all sides: in the proposal to build fast passenger ships which might serve as troop transports; in the survey of industrial plants to be allocated to each Service; in the halting, for a 30-day survey, of the sale of surplus war plants to industry. The

Republican leaders have promised right-of-way to the preparedness Bills now in committees of both Houses.

But the programme which emerges will follow Mr Truman's recommendations only in part. Congress is spreading its wings and is about to be airborne. The testimony of Mr Symington, the Secretary for Air, that Russia is seeking a decision with America in the skies, and that even with 70 front-line air groups, American air power will be inferior to that of Russia, merely added urgency and confirmation to the vision of air supremacy which has long kindled Congressional imaginations.

Mr Symington's inability to restrain either his imagination, or his enthusiasm for the unilateral expansion of his service, has disillusioned those who hoped that Mr Forrestal had at last made unification of the Services a reality. Mr Forrestal's view, reflecting both those of the Chiefs of Staff and the President's civilian advisers, has been that the target for the Air Force in 1948-49 should be 55 groups, not 70. Funds already requested for the purchase of aircraft in the fiscal year 1948 total \$2,376 million, which will probably be "activated" at once so that orders need not be delayed until the beginning of the next fiscal year in July, Mr Forrestal has struggled, apparently in vain, to make Congress keep its feet on the ground. He has pointed out that 70 ill-equipped groups are less effective than 55 groups fully manned and equipped; that it would create a false sense of security to build up a large air force without providing for comparable increases in the Army and Navy on which the effective use of air power depends; that at its peak, such an enlarged, balanced defence force would add \$15-18 billion to defence costs, now estimated at \$14 billion for 1948-49; and that even the \$2.4 billion which it is estimated a 70-group air force alone would add to defence costs next year might pose a disagreeable choice between a revival of controls and an inflationary free-for-all scramble for materials.

There is a suspicion in Congress, however, that these arguments are prompted to some extent by the jealousy of the senior Services; and the Service Committees are awaiting a fresh report from the Chiefs of Staff and new estimates of the cost of a 70-group force before completing their work on the revival of conscription and Universal Military Training which Mr Truman recommended so strongly. The temporary return of conscription seems to be reluctantly accepted as unavoidable; but all the signs are that UMT may be blown out of sight by the back-draught of the Congressional air armada.

* * *

Building the Aircraft

The Council of Economic Advisers has reported that the additional \$3 billion of defence funds sought by the Administration can be absorbed by a \$200 billion economy without creating significant new inflationary pressures. If Congress insists on outdoing the President in generosity to the Forces, it may, of course, make inevitable the very controls it detests. But a 70-group air force for the United States is not fantastic. The peak for the Army Air Forces alone during the war was 230 groups; and both the Finletter Committee and the Congressional Air Power Committee recommended the creation of a 70-group force by 1952.

It is the timing which is at issue. An effective 70-group air force cannot be created overnight by Congressional fiat. A rich new flow of appropriations could hardly be digested by an air-plane industry accustomed to the lean diet of government orders available over the last two years. Aircraft, too, are larger, more costly, and more complicated than they were in 1940; it may take as long as seven years to bring a new design to the assembly lines. This time could be cut down in an emergency, but it is doubtful whether the automobile industry can ever again make the contribution it did in 1940-45. Military aircraft have become specialist's work. Another argument against premature expansion is the risk that present models may become obsolete before they are needed. Whether this is a greater risk than taking time, thought, and money to produce new models before fixing the assembly line depends on whether one belongs to what *Life* calls the "Act Now" or the "Go Slow" school of thought about Russia. These technical considerations may impose a brake upon the air-mindedness of Congress.

One requirement of air security which is second only to adequate funds, is the regularity of their flow. At present planning is made almost impossible by the financial axe which falls at the end of each fiscal year, and costs are increased by interruptions to production. The Bills now being introduced in Congress to establish a five-year procurement pattern for the Air Force similar to that of the Navy, are long overdue.

Spotlight on Communists

The House Committee on Un-American Activities has approved in principle, although not in detail, a legislative programme recommended by one of its sub-Committees and designed to take away from Communism in America "the cloak of secrecy and fraud and the assistance and direction of a foreign Communist dictatorship," so that it shall have no unfair advantages when the theories of Communism and democracy "clash in the open market-place of political ideas." The Committee rejected various draft Bills designed to "outlaw," that is, to forbid political activity by, the Communist Party. Mr Stassen is the most notable supporter of this policy, on the ground that the Party has been clearly shown to be a subversive arm of the foreign policy of the Soviet Union. Mr Dewey, however, shares the view of government officials that it is better "to keep Communists out in the open where we can beat them." The committee was probably induced to make what is for it an unusually liberal decision by the experts who consider that such repressive legislation would be unconstitutional.

Probably the most important of the Committee's proposals is that all "Communist-front" organisations should be required to register; this carries with it the danger that non-Communist members may be regarded as guilty by association, but they will no longer be able to plead ignorance of the true nature of organisations which have suffered from Communist infiltrations. There is to be a right of appeal from the Attorney-General's designation of organisations as belonging to the "Communist front"; the lack of such a right has been much criticised in the past. There is to be a right of appeal from the Attorney-General's case of similar designations which the Attorney-General has made for the guidance of the President's Loyalty Review Board. This latter list includes Fascist as well as Communist groups and even so contains only 91 names, while the Un-American Activities Committee believes that there are several hundred Communist-front organisations—a difference of opinion about which more will be heard.

Other proposals are for the annual registration of aliens, which the Attorney-General has recently requested, for the denial of passports to Communists and for the banning of Communists from Government employment, a ban which already operates in practice. The sub-committee also recommends that Provision be made for prosecuting as criminals Communist leaders

who conspire against the United States in the interests of the world Communist movement.

Congressmen, with a few obvious exceptions, will be favourably disposed towards the committee's proposals, since they are well aware of the ease with which their political opponents can make capital out of any failure to take action against the Communists. If the programme becomes law, it will certainly turn the spotlight on some aspects of Communism, but it is doubtful whether it will achieve its purpose of eliminating the Communist "menace" in the United States.

Shorter Notes

The official welcome for the Havana trade charter has met with a very grudging response in Congress, where the House Ways and Means Committee (also hostile to extension of the Reciprocal Trade Agreements Act) has declared that any action by the President or the State Department cannot "be construed as a commitment by the United States." The warning vote was on straight party lines, though it probably does not reflect the considered opinion of the Republican majority.

*

The grain export target for the year ending in June has been raised to 556 million bushels of all grains, following the Department of Agriculture's crop report, which forecasts a winter wheat crop of 8,605 million bushels. It is now practically certain that the 1948 harvest will be over a billion bushels, and it may prove second only to last year's record harvest. Exports of grains may even reach the 570 million bushels advocated by the Cabinet Food Committee last autumn and abandoned in favour of a 520 million goal when bad weather at planting time threatened this year's harvest.

*

After some conflict between the two Houses, Congress has approved the continuation, with some modifications, of existing rent control measures for another year. The House Bill would have granted local rent control boards complete autonomy in the imposition of general rent increases or the abolition of controls and, it was believed, would have meant the end of effective rent control. The compromise Bill provides that the Emergency Court of Appeals, made up of three Federal judges, shall review the evidence and make the final decision in cases where the Housing Expediter rejects the recommendations of local boards.

A decisive defeat of Communism can hardly be unaccompanied by a clipping of the claws of the Communist Trade Union organisation which has in the last year held the life of the country to ransom. Whether this process is compensated by the adoption of a vigorous social policy under pressure from the "Third Force" elements of the present Government, coalition is perhaps the deeper question at issue in these elections. It is from the same elements that a foreign policy can be expected which, while resisting Communism, would seek a working arrangement with the Yugoslavia of the future. When the period of American aid ceases, Italy's best hope of a satisfactory trade balance will lie, it seems, in recovering the position of a supplier of manufactures to the Balkans. It is the dogma of the Communists that both in internal and in external affairs the defeat of Communism means the revival of Fascist thoughts and methods. The new Socialists, the Republicans, some of the Liberals and some of the Christian Democrats themselves dispute this fantastic doctrine and make the defeat of Communism a step on the path of progress.

Cold War in Austria

[BY A SPECIAL CORRESPONDENT]

INEVITABLY it is the Russians who appear as the disturbers of the Austrian peace. By claiming, from the individual level of the soldier who steals a watch to the official level of the administrator who takes over 250 factories, an oilfield and a shipping company, that the impoverished Russian is entitled to recompense himself at the cost of the comparatively well-to-do Austrian, the Russians have provoked the natural reactions—hatred and fear. “Bourgeois!” the Red Army troops said when they first saw the comforts of the Viennese workers’ flats, and the Viennese workers have reacted as bourgeois would do, determined to resist a cantankerous liberator who, as they see it, sets out to rob them of their private possessions and to cut their standard of living.

Because the Russians, despite a great tightening-up of discipline, have never been able to overcome the initial shocking impression made by their troops’ wild behaviour, every step that they have taken has been judged by the standards which the Austrians have learnt to apply. It is almost impossible for the Russians to be in the right—“an unknown assailant” in a crime story is automatically read as “a Russian” by every newspaper reader—and so they have given up the attempt. The Russians now obviously feel that they are on hostile territory. Psychologically Austria has been won for the Western allies. Free from outside interference the country would be an anti-Soviet bastion, another Ostmark of western civilisation; whereas for the Western allies a withdrawal of all occupation would mean no loss of influence or interests, for the Russians these can only be maintained by continual interference, backed by the presence of the Red Army. Thus the Russians are in a position where, to maintain what they regard as legitimate claims, they must always put themselves in the wrong and appear as the enemies of Austrian independence. Austrian resistance increases, the Russian attitude hardens further, and a vicious process is started.

National Unity at Stake

It is too late for this to be stopped. The Austrians no longer believe that the Russians are even capable of behaving properly and honourably; the Russians have no faith in Austrian professions of neutrality. If this is a cold war, they feel, then Austria is the sharp end of the icicle. Thus a situation has developed which looks like ending either in a serious Russian diplomatic defeat or in a partition of the country. Because they do not realise that the Russians may quite well prefer the latter—to break off the point of this weapon that is fragile as well as sharp—the Austrians have allowed anti-Russian feeling to become a stronger emotion than their desire for unity; in other words, they are insisting that their existence be independent of the Russians when that existence itself is still in question. At the same time, with starvation still not far from the door, and foreign aid likely to be essential for some years to come, the dependence of the country on American goodwill is obvious to all. Where it is not obvious American propaganda hammers home the point, and no strings are necessary to make the Austrians move in most respects as the Western powers would like. In the cold war Austria is not merely a battlefield but a participant; a role for which the country’s weakness and uncertain future hardly fit it.

Both in the government and among individuals in the street this spirit prevails. Split into eastern plain and western mountains, into huge capital and minute country, into Socialist townspeople and conservative, Catholic peasants, the Austrians tend by their whole tradition of internal jealousies and local patriotism to be blind to any threat to their unity. Few feel this danger to be comparable with the threat which the Russian claims represent to their economic resources, and no one has devised a more constructive way of meeting it than by mere apprehensions. No Austrian leader has made any attempt to create a feeling for national unity, and hatred for the Russians is the only strong universal emotion. The political parties naturally reflect this. No one takes a neutral line. The People’s Party, representing the conservative forces and the peasants, plus a relatively small number of Catholic clerical and industrial workers, is understandably anti-Russian, and with its main strength in the provinces is disinclined to unify the country if that means limiting provincial independence. Loosely bound together, it is unlikely to take any firm political line which will accentuate internal party differences, and it limits its appeal to a vague, semi-religious patriotism. The Communists ask Austrians to be neutral, but it is evident that they would like this neutrality to precede a change of sides; their attempt to replace anti-Russian feeling by hatred of

the Americans and love of the Russians shows how partiality has affected their sense of reality and their sense of the ridiculous.

Only the Socialists might have overcome the temptation to enter the battle on one side or the other, but they have definitely chosen the Western path. For them, as the party’s *Arbeiterzeitung* continually makes plain, Russia and the Communists are the enemy. The People’s Party is merely a rival, and a left-wing resolution demanding that it be treated more roughly not only found little support at the party’s congress in October, but even led to the dismissal of Scharf, the junior party secretary who sponsored it. Thanks to the war and to the German repression—the Jewish intellectual element in the party, for example, has virtually gone—there are few new figures to challenge the elderly party leadership. The former revolutionary Socialist or Marxist wing has little power, and there is no likelihood of any change in the party’s orientation before the treaty question is settled. Even among individual Austrians it is rare to find anyone who feels that Russia has any right to make claims on them. The Russians, they feel, are an Asiatic people, and can stew in their own juice.

Thus, with the Communists in a weak position, the Russians must see any possible Austrian government as inevitably hostile. Originally, the Russians, who had sponsored the Moscow Declaration of 1943, were the champions of Austrian independence and of Renner’s Provisional Government against the Western allies with their huge military government apparatus. Now the situation is reversed. By the Control Agreement of June, 1946, the Allied Council abolished most of its powers and took up a mainly supervisory role. Military government, though much of the apparatus still exists, has been virtually abolished in the three Western zones; colonels, majors and captains sit invigilating over the activities of the Austrian provincial governments and occupying their office space, but they have no real function. Only the military courts still operate, judging all cases where the military are in some way involved. At the centre, the task of the Western elements of the Allied Commission has become one of giving a mixture of prods, advice and help to the Austrian government departments. All this could be withdrawn without difficulty as soon as general withdrawal takes place, nor would this result in any major changes in the Austrians’ conduct of their affairs.

But the Russians, although they brought no military government with them, find themselves interfering increasingly in Austrian administration. Movement of goods, persons and raw materials has to be restricted in an attempt to protect the interests of the Russian-controlled factories; political meetings are regulated because of the fear of anti-Russian agitation; there is a strict Russian censorship, and trial by military courts takes place *à la Russe*, with no publication of charges, no legal representation for the defendant and the minimum publicity for the results. While the Russians still fight for their claims there is no chance that this interference will diminish. It makes agreement daily more difficult, but the causes that produce it will remain until one is reached. The Austrians have taken sides, and there is no influence to prevent the situation from getting steadily worse.

Prosperity in Switzerland

[FROM A SPECIAL CORRESPONDENT IN BERNE]

SWITZERLAND is an oasis of prosperity in a ruined Continent, and the last twelve months have, on the whole, fortified its self-confidence. A year or so ago the Swiss were anxious about the dangers of being undercut in world markets unless the Swiss franc were devalued, but, after watching Sweden’s experiences in the meantime, the Swiss have decided that the value of their currency should on no account be altered. The country is producing as much as it can; there are no strikes, no currency restrictions, and rationing of only the cheaper fats and rice—the recent liberation of cream has smothered the tea-shops in meringues.

Switzerland is not, however, without its worries. The chemical and machine industries have orders which should keep them going for years, but this creates a serious shortage of skilled labour which reacts upon the less flourishing textile industry—textile workers are less well paid and it is difficult to keep them to the job when they can earn so much more in heavy industry. The flow of population from the countryside into the towns is causing grave anxiety. It is easy enough to engage foreign labour to work on the land, but the Swiss are peasant-farmers at heart and do not welcome this solution; meanwhile the builders cannot catch up with the housing demand in the towns.

Some 141,354 foreign workers—about two-thirds of them Italian—came into Switzerland in the first eleven months of

1947. They are the safety-valve. If the foreign markets for which Switzerland works, should for one reason or another suddenly shrink, they could be evicted without the provocation of internal labour troubles. One or two factories have recently dismissed employees on account of tariffs imposed by Brazil and Mexico, or simply because their directors fear foreign incapacity to pay. Moreover, a number of business people succumbed to panic as the result of Czechoslovak events and reduced staff in preparation for their own flight to South America, where they hoped to find shelter from the Communist hurricane which they feared would strip the Swiss countryside bare. Lastly, a serious, though only a small-scale, problem has been created by the winding-up of war-time economic apparatus. This has threatened a number of black-coated workers with destitution at a time when prices have increased quite as fast as in Britain.

The steep rise in prices is part of an inflationary situation which has been causing alarm for some time. The last monthly index showed a tiny drop in the cost of living, but nobody was impressed by it, the less because the basis of calculation is considered by many people to be quite as outdated as that which was recently discarded in Britain. The poorer townspeople are hard hit since there is no subsidising of essential foods; on the contrary, the farmers are a favoured, if dwindling, section of society, so that the Swiss return to liberalism is tempered by the protection, through high prices and duties on food imports, of agricultural and dairy producers.

Mainly owing to the war, the debt of the Federal Government has recently reached unprecedented levels. In order to fight inflation the actual revenue has been increased and is increasing—according to figures published last March—but it has been determined that it must yet be increased by much more in order to reduce the public debt. The Federal Ministry of Finance has been working out a scheme for financial reform which was made public on January 22nd of this year. At present Swiss finances rest upon emergency decrees whose validity expires at the end of 1949. The new proposals, which must be fully worked out by then, involve a constitutional issue, that is whether the Federal authorities shall in future be permitted to levy regular direct taxes. Strong objections to this have been raised in the *Ständerat* or Upper House; the alternative, which is being debated this week, appears to be that the Cantons should contribute lump sums which would allow of local variety of incidence.

Absence of Strikes

Another measure to check inflation is a wages standstill agreement between capital and labour reached towards the end of last year. It has worked satisfactorily on the whole, thanks to an extensive and efficient system of arbitration in Swiss industry. Federal employees like railwaymen and postmen may not strike and therefore depend entirely upon arbitration, and for years the watch-making industry, too, have dropped the strike weapon. In the watch-making industry, however, wages have lagged noticeably behind profits and there has been a certain amount of trouble. The Swiss watch-making industry suffers from constant crises. Its highly specialised character no doubt makes it particularly vulnerable, and for this reason it is the only industry in Switzerland in which Federal permits are now required before a new land in which Federal permits are now required before a new concern may be founded or even an old one extended. At the beginning of 1947 the watchmakers were in despair because American competition was about to cut them out or because it would not do to work for a European market which could not afford to pay for the luxury of new watches. The Federal economic authorities were nevertheless able to report in March, 1948, that it had been possible to sanction a larger expansion of the watch-making industry in 1947 than in 1946, the number of employees increasing by 1,502. So far the fears of the owners of the watch-making concerns have not been justified, but their employees have to some extent been sacrificed to them. Meanwhile the export of Swiss watches continues.

The buoyancy of the Federal revenue is partly due to the increase of imports, which has increased the proceeds from customs. The Government is deliberately laying in stocks in case of war, and imports are therefore likely to remain at a high level, though there was a drop in February after a record figure for imports in January. It has been normal for many years for Switzerland to import more than it exports, but it cannot allow the tendency to go too far, especially when the outlook for the tourist trade is overcast and its past European investments must be written off. In spite of something like anti-Communist panic at the time, Switzerland was glad enough to sign a commercial treaty with the Soviet Union on March 17th by which the export of machines and chemicals to Russia should be stimu-

lated; in return Switzerland will receive some of the raw materials upon which it depends. Coal is still a basic problem for the Swiss. At first Poland seemed to be the successor to Germany as their chief supplier, but a treaty with France on March 20th makes it possible for the bulk of Swiss coal supplies to be imported from that less alarmingly situated country. Apart from coal the expansion of Swiss industry since the war has been such that Switzerland’s production of electric power lags behind consumption, especially if the weather is dry. The construction of the Genissiat power station is but one of many efforts to meet the new demand; indeed, Switzerland’s main contribution to European recovery is expected to be the full exploitation (in conjunction with France) of the hydro-electric possibilities of the Alps. Since the importance of a development of this kind is appreciated by the Americans, it may provide the Swiss with their only direct gain from the Marshall Plan.

Gold Dealings at Macao

[FROM A SPECIAL CORRESPONDENT IN THE FAR EAST]

ONE of the biggest gold markets in the world today, certainly the biggest in Asia, is at Macao, the 400-year old Portuguese settlement at the mouth of the Canton river. It is the main channel for gold entering China and also serves as a distributing centre for the whole of the Far East. It is reliably reported to have absorbed more gold during the past six months than any other market in the world. Most of the gold is coming from Mexico and the United States, while the balance is from various European and Middle Eastern countries. During the week ending February 18th alone, the United States exported gold to the value of US\$900,000—about 26,000 oz.

Gold has always been a popular investment in China. Owing to the inflation and the uncertain political situation, the demand is greater than ever before. The capacity of the Chinese market to absorb large quantities of gold at prices which are 75 and 100 per cent above parity is a puzzling phenomenon. The weakness of the government’s control is illustrated by its inability to prevent a continuing expenditure of foreign exchange on a commodity which is of singularly little use to it in fighting the civil war or rehabilitating the country.

During Dr Soong’s premiership, the Chinese government sold large quantities of gold through the Central Bank of China—estimated at 2,000,000 oz. for the year ending February 17, 1947—as part of a campaign to bolster China’s currency. On February 17, 1947, however, official sales were suspended and unofficial dealings were declared illegal. Owing to the increasing demand, a good deal of smuggling and illicit trading continued. The main problem was how to get the gold into the country. The Hongkong government forbade gold imports, both because Britain is a member of the International Monetary Fund which discourages gold sales above parity prices, and because gold imports would have increased the unofficial exchange rate for US dollars and raised the price of commodities imported from America.

It was at this juncture that the dealers turned their attention to the little half-forgotten Portuguese settlement of Macao. Portugal, not being a member of the United Nations, does not subscribe to the IMF. There was no legal bar to the traffic and the Portuguese authorities were quick to appreciate its possibilities. Macao’s airfield was too small for transport aircraft, but very soon a specially chartered Catalina flying-boat was hauling gold on regular runs from Manila, Bangkok and Saigon. More than 1,100,000 oz. were imported last year and about 350,000 during the first seven weeks of 1948. At the beginning import licences were issued at the rate of one Macao dollar per oz. The rate has now been raised to M\$2 per oz. for direct imports and M\$3 per oz. for imports in transit. A deposit of 10 per cent of the value imported has to be made in Macao dollars with the *Banco Nacional Ultramarino*. This has led to a shortage of Macao dollars and has resulted in the Hongkong dollar, which runs normally at par, being quoted at a discount ranging from 10 to 21 per cent. The importer also has to surrender one per cent of the American exchange required to finance the traffic. Thus the market is proving highly lucrative to the local government, to the dealers and also to those individuals who have been manipulating the money exchanges and re-selling import licences.

Most of the gold is smuggled into China and Hongkong—the current smuggling quotation from Macao to Hongkong is about HK\$12 per tael—but there is also a considerable flow in the direction of Bangkok, Rangoon and other markets in the East. It is thought by some observers that imports into Macao this year may touch 3,000,000 oz.

dealers in gold pointed out that as there was no legislation to prevent their operations in gold at prices higher than the official parity, they would continue to engage in them and abide by the law of the land, even if they infringed the rulings of the IMF.

It was not until the following November that the US Treasury issued new regulations specifically prohibiting the export of gold at these higher prices. For more than four months, therefore, the New York market was picking up the international gold business which London was forbidden to touch. The new US Treasury regulations, however, left an interesting loophole which for a short while allowed the tables to be turned in favour of London and against New York. These regulations still permitted the re-export of processed gold at prices above the parity, and it did not take London dealers long to discover that profitable business could be done by exporting to the United States sheet gold for which more than the parity price could be obtained. This business suited the British authorities admirably, since it yielded dollars at a rate of around \$43 per ounce instead of the return of only \$35 per ounce obtained when gold was sold direct by the British to the US Government. During December, therefore, a considerable business in exports of sheet gold to the United States developed. The US authorities, however, were not slow to see through the thin disguise by which the "processed" gold was able to slip through their regulations. Though ostensibly intended for manufacturers, sheet gold is the perfect hoarding medium—especially as a sheet could be made to any desired thickness. After the US authorities had lodged objections in London, this traffic was stopped early in January, by the simple expedient of refusal by the Bank of England of export licences.

Since the cessation of this traffic, the export of manufactured gold from Britain has been kept down to very small proportions. The exports to non-dollar countries are now regulated by a rigid and minute quota. It may be asked why any gold at all should be made available for export to sterling area and other soft currency countries, merely for the sake of securing, in such currencies, the exceptionally high prices that can be obtained for exports of manufactured gold. The official answer would be that by a small expenditure in gold—and it can probably be reckoned in hundreds rather than thousands of ounces a month—it is possible to maintain valuable connections between the London market and the countries in question. Licences are of course granted more readily for exports to dollar countries,

but this business is neither large, nor, in terms of sterling, particularly profitable.

Although London and New York, the main bullion markets, are temporarily impeded in their international gold business by the restrictions placed on free dealings by their own controls and at the instigation of the IMF, this does not mean that no active international arbitrage business in gold can take place. On the contrary, the gold business in the Middle and Far East has seldom been more active. The basis for it is the exceptional hoarders' appetite, which has been whetted to a fine edge by paper currency inflation and political uncertainty. In satisfying this demand the Syrians, above all others, have come into their own as the champion black marketeers. They are the main agents for this traffic in gold. They buy largely from South America and Abyssinia, and their supplies are also fed indirectly by the coins provided through British and American initiative in Greece and other Middle Eastern countries. They sell largely to hoarders in the Middle and Far East. Most of this traffic involves smuggling and the evasion of every kind of regulation. But that is no deterrent or real handicap to the gentlemen from Damascus. The prizes are considerable. Though the competition is now sufficiently keen to give the semblance of genuine arbitrage the free prices do not approximate to a recognisable uniform parity. The price per ounce in Hong Kong has been as high as the equivalent of \$53 but is now about \$47. In the Middle East the price is now equivalent to about \$41. These are prices on the basis of which arbitrage is taking place and their disparity is a measure of the charges that have to be incurred in this gold traffic. The price paid by the ultimate buyers in China and elsewhere are considerably higher. It is interesting to note that in the free but essentially domestic market for gold in France, coins are now valued at the equivalent of over £20 per ounce. The market in gold therefore bears all the marks of disruption and disorganisation caused by exchange controls and national import and export licensing systems of widely varying degrees of intensity. The principal common thread that runs through the markets is the fact that all free prices are well above the official quotations. Another of their characteristics is that wherever the metal is quoted in terms both of dollars and of sterling, the quotations produce an equivalent of about \$3 to the pound. The significance of that ratio should not be pressed too far, but it cannot be altogether ignored.

Bottleneck in Bearings?

THE fashionable pastime of hunting the bottleneck has drawn attention to the ball and roller bearing industry. "Steel more than anything else," said the *Economic Survey*, "will be the limiting factor in 1948." But the steel industry has repudiated the distinction with some spirit, and suggests (in the *Statistical Bulletin* of the Iron and Steel Federation) that the real bottlenecks arise in particular components such as ball-bearings, precision chains, and electric motors. It is not to be expected that the makers of these things will be any more ready than are the steelmakers to accept the odious label; and the ball and roller bearing trade association, through its chairman, Mr F. J. Pascoe, has stated this week that reports of a hold-up of production through shortage of bearings "are rather exaggerated."

Clearly the bearing industry is, from its nature, particularly exposed to charges of being the limiting factor in a modern industrial economy. For, small though it is, it is a key industry to the key industries: few programmes of industrial expansion are not dependent on it. Cutter-loaders for the mines require

bearings; the conveyor programme requires vast quantities of bearings of a specific type; increased activity in the steel rolling mills puts an increased strain on the production of heavy roller bearings. Re-equipment in textile spinning and weaving is making urgent demands. All these are special demands, abruptly variable, to be met without slackening the supplies needed to maintain countless existing machines and for the current output of a multitude of commodities.

It is not surprising that some of the demands are hard to meet promptly, or that manufacturers who have to strive for flexibility and resource should resent being told that they are holding things up.

Some users (said Mr Pascoe in a speech in London this week) do not give us sufficient time to manufacture bearings. It is a little hard on us when a machine tool manufacturer is quite ready to quote some two years' delivery for a machine tool, but expects to get a bearing within two or three months of placing an order. The industry manufactures many thousands of sizes and to a very large extent uses separate and distinct sizes of raw material for different sizes of bearings.

We cannot be sure of obtaining any new size of raw material under at least six months. Again, economical manufacture depends on careful and detailed planning, and we are urged only to purchase that raw material which we know will be used. We cannot, therefore, manufacture any of our multitude of sizes in the hope that we will get orders for them."

He added that the majority of bearings made fell into the "standard" group of 300 sizes; it was not these, but the unusual sizes only, that were difficult to supply at short notice. This is one half of the defence; the industry's other retort is that abrupt changes in the national industrial plans are bound to create equally abrupt difficulties in the supply of components. The conveyor programme and the latest drive for higher textile production are obvious examples; these place on one section of a factory a sudden weight of demand which the whole factory cannot, without unreasonable dislocation, be mobilised to meet.

Good though the excuses may be, there is still a shortage of bearings. Demand has reached extraordinary levels, and has outstripped supply. It has always been found necessary to import some special bearings for which demand was too small to justify home production; but lately standard types have been imported as well, and imports from the United States have reached the rate of £2,000,000 a year. To dispense with these imports, production of bearings in this country would have to be expanded by about 20 per cent; and this, it seems clear, cannot be done without building more plant. The industry as it stands is new, energetic, and rudely efficient; there is little room here to achieve miracles by simple rationalisation or redeployment.

A purely twentieth-century growth, the industry enjoys also a special international background. Of the five firms which represent about 95 per cent of British capacity, four have foreign associations, or have had them in the recent past. One

is a subsidiary of the world-wide Swedish concern; two have American participations and arrangements for technological interchange with the United States; one of these two now controls the fourth, which severed its connection with Schweinfurt at the beginning of the war. It is a specialised industry using its own processes and for the most part specialised plant, either of American or of Swedish origin; the British supply of ball-bearing machinery is, relatively speaking, in its beginnings. Imports of American plant have, indeed, been heavy in recent years; they are expensive, but a great deal cheaper than importing the finished product. One unusual fact about this industry is that it has no complaints about the scale on which it has been permitted to import plant. (Hardly less astonishing, it has no complaints about its supplies of raw material—principally, chrome steel. And members have even said that they find Government supervision helpful and constructive.)

Its international affiliations, then, have had the clear consequence of keeping the industry thoroughly up to date. Its production record, as to quantity, is good; as to quality, perhaps even better. The following figures show employment and production before and since the war:

	1938	1946	1947
Number of employees	11,868	17,058	18,030
Number of bearings delivered to customers (thousands) ...	23,650	33,436	40,062

Expected production for 1948 is 50,000,000 bearings. The variety of product makes this a very rough method of assessing production; the industry claims that on a more accurate method it would make a still better showing. Not only production, but the productivity of labour, has gone up; and this is confirmed by the experience of individual factories. Progress in the simplification of processes has been substantial, and

WESTMINSTER BANK at the British Industries Fair

Exhibitors and visitors who require the services of a bank are invited to make full use of the facilities which the Westminster Bank is making available through special branches at Olympia and Castle Bromwich during the period of the Fair. These branches will be fully equipped to deal with all normal banking operations and the services of specialists in foreign business and linguists will be available for those who need them.

STAND NO. A22 LONDON • STAND NO. A201 BIRMINGHAM

A casual observer of the architecture of the Union of South Africa would probably place more emphasis on the sky-scrapers of the Rand than on the spacious old Early Dutch houses which form such a pleasant decoration to the countryside of Cape Province.

There are, however, numerous examples of this attractive form of architecture still remaining. Many of them, as in the case of Groot Constantia near Cape Town, were designed as chateaux for the vineyards which still surround them and have served as centres for the wine industry ever since the seventeenth century. The wine industry in turn has done much to contribute to the prosperity of the Union in general and of the port of Cape Town in particular, and continues to hold its own to-day in the busy and expanding commercial life of the Union.

Full and up-to-date information from our branches in South Africa on the state and trends of local markets is readily obtainable on request.

HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

cent; agricultural machinery has been reduced by more than a half, textile machinery by 10 per cent, while electrical and other machinery remains unchanged. In the vehicle group the projected end-1948 rate is now 260 per cent, instead of 272 per cent given in the Economic Survey and the original target of 319 per cent. The reduction mainly affects private and commercial cars, the exports of which will be almost 30 per cent smaller; aircraft exports will also be slightly reduced. In certain cases the revised export targets have taken account of the need for a larger supply of spare parts. The quantity of refined steel which Britain has agreed to export under bilateral trade agreements, however, remains unaltered.

The major expansion in exports is to be borne by textiles, whisky, carpets, linoleum, wires and cables, and scientific instruments. The cotton industry's target has been raised from 69 per cent of 1938's volume to 79 per cent, concentrated on larger piece-goods exports. The wool target has also been increased from 182 per cent to 202 per cent, but in this case the increase will consist of tops, yarns and carpets. Exports of cotton goods to Canada are scheduled to achieve a rate of 100 millions yards a year, compared with 8,000,000 yards in 1947, while shipments of wool textiles to Canada—again mainly tops and yarn—are to be increased by 75 per cent.

The non-steel using industries, which must make good a large part of the reduced exports of machinery and motor-cars, are also confronted with difficulties in their overseas markets. In some

REVISED EXPORT TARGETS, FOR END-1948
(Monthly Rates)

products, as Mr Wilson pointed out, exports are suffering because British prices are not competitive; in one or two cases the problem of quality has arisen. More important still are the import restrictions imposed by other countries on non-essential goods, which in fact account for a big proportion of British exports. Some relief has no doubt been achieved through bilateral trade agreements, but mere barter arrangements will not absolve industry from the necessity to make its prices competitive and its qualities acceptable.

Progress in Production

Sir Stafford Cripps's progress report on Wednesday presented the production background of the rising figures of foreign trade. In coal and steel, at least, the story is beginning to be heartening. The mines, with a target $7\frac{1}{2}$ per cent higher than last year's output, produced 8 per cent more than last year. Steel production, with a target of 14 million tons a year, was rising impressively and in March reached an annual rate of 15,117,000 tons—the highest month's production yet recorded. Output of cotton goods, on which so much of the export drive is to depend, is lagging; so far it has attained only about four-fifths of the target rate. Cotton spinning is doing rather better than weaving; with a target of 900 million lb., it has produced so far this year at the rate of 850 million; last year's output was 740 million lb.

Sir Stafford gave a number of examples of production figures for January which were substantially higher than in January last year. Output of railway wagons was 3,926 (compared with a monthly average of 3,176 in 1947); internal combustion engines, 21,581 (18,549); shell boilers, £496,000 (£419,000); industrial valves £947,000 (£795,000); pumps and pumping plant, £1,043,000 (£892,000); typewriters, 5,066 (3,814); industrial furnaces, £422,000 (£398,000); footwear, 11,800,000 pairs (10,300,000). Deliveries of coal cutters are below the set figures, the monthly required average being 117, but deliveries so far were 98 in January and 99 in February. Power loaders are being produced at the rate of 10 a month; 20 a month are needed. Clearly, the urgently needed production for the programme of mechanisation in the mines is going all too slowly.

France's Sterling

The rate at which France has recently been running through its accumulated sterling resources has now reached such a pitch that the French authorities have tabled formal demands for credit facilities from this country. This was one of the subjects of discussion of the Anglo-French Economic Committee which met in Paris last week. No credit agreement was reached, however, as it was thought that the plans for substantially increasing French exports to Britain this year and for postponing the originally projected increase in French imports from the sterling area will achieve the necessary balancing of current payments without calling for the formal opening of inter-Governmental credit facilities. The British, moreover, might argue that it should be open to France to cover part of its sterling deficit by means of such Marshall dollars as may be made available to it for "off-shore" purchases.

Meanwhile, private agencies in this country are helping to bridge the gap in the franc-sterling balance of payments. The latest evidence of this movement is the £1,000,000 credit arranged for the Société Métallurgique de Normandie by Hambros Bank and Lazard Bros. The credit is to be used to finance the purchase of plant from Great Britain for the reconstruction and re-equipment of the French company's works near Caen in Normandy. It is to be reimbursed from the proceeds of shipments to Britain of steel billets and pig iron. This financial operation, and the trade that will ensue from it, will re-establish a traditional channel of two-way Anglo-French trade. Before the war, the French steel works in Normandy derived part of their coal supplies from South Wales, and in turn exported part of their steel to South Wales firms for re-rolling. The restoration of this trade is a promising, though still very modest, harbinger of what may yet be achieved in the way of industrial integration in Europe. The Anglo-French Economic Committee approved the general plan by which French deliveries of semi-finished steel products to Britain are being resumed this year at an initial rate of 40,000 tons a year, rising to 200,000 tons a year by the end of 1949, by which time French output of steel is expected to reach the target figure of 10,000 tons a year.

The Finance of Films

Mr Harold Wilson was less than kind in describing criticism of the American film agreement as "singularly uninformed and misleading": when will the Board of Trade be able to publish the agreement? It may not be until the end of this month. Discussion is still going on with the Americans on a number of points, and a trade report suggests that these may include one of substantial importance—the possibility of registering American films produced in Britain in a separate category which would not count for quota.

Mr Wilson's important speech to the Association of Cinematograph and Allied Technicians at the week-end added something to the interpretation of the agreement, and made three other points. He gave a pledge that "on all those matters which are within Government concern everything will be done to ensure full maintenance of production and employment." It appeared, however, that he was by no means clear how this might be done. He stressed the necessity for getting production costs down to a reasonable basis. This is good sense and would, as the President of the Board of Trade suggested, provide the best possible guarantee of financial soundness; it is welcome news that the new National Film Production Council is collecting information about present costs. But here again a good deal will depend on the method employed. Emphasis at the moment seems to be on reducing the salaries of the highly-paid stars and producers. No

The propensity to barter and exchange one thing for another is common to all men.

ADAM SMITH

TWO great epoch-making inventions gave a world-wide release to this propensity; firstly, the invention of money as the means of exchange; and secondly, the invention of banking to take safer care and make better use of money.

Martins Bank for generations has been associated with the growth of British internal and external commerce. To-day its central and local management and its expert departmental services are called upon to give all possible support and facilities to sound enterprise.

British Industries Fair, Birmingham

ONCE A YEAR British Industry holds a great "At home" to all its customers and friends. This is the famous British Industries Fair to which come buyers from all parts of the world, seeking a vast variety of goods and services.

The Fair does much to stimulate that export trade by which Great Britain chiefly lives, and Barclays Bank, with their Associated Companies, are able to be of great assistance to those whose interests lie in overseas markets.

Business men entering the export trade for the first time are particularly invited to discuss any financial problems with the Manager of their local branch, or to write direct to the address given below:

BARCLAYS BANK LIMITED

Chief Foreign Branch: 168, Fenchurch Street, London, E.C.3

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London or Manchester.

one would waste any sentiment on inflated salaries. But they are to some extent competitive, and are paid because the producing company expects a financial return from them. The star can often go elsewhere, and the moment when American finance is entering the market may not be the best moment to offer the key people a great deal less money. The rate of pay, further, is not the decisive thing; what matters more is the number of weeks the salary bill has to run. If the British industry could find producers and directors (and, indeed, actors) who could make in six weeks a film which now takes eighteen, it would have gone most of the way to repairing its finances.

On the provision of money for film production, Mr Wilson talked common sense; his words were not encouraging because the situation is, in fact, not cheerful. Independent finance is being frightened away by, above all, the prospect of losing its money. Naturally the Government cannot be expected to lose the public's money instead. But it can be expected to attack first the heart of the problem—methods and cost of production—and then seek ways of making finance practicable.

US Dollars for Canada

The short-term payments agreement with Canada expired last Wednesday before alternative arrangements for further drawings on the Canadian credit could be negotiated. For the time being, therefore, the net payments due to Canada by Britain will have to be made wholly in US dollars. The balance remaining in the Canadian credit, namely about \$250 million, will be temporarily immobilised. The awkward hiatus which has arisen is due to the fact that the British request to the Economic Co-operation Administration in Washington to have the Canadian food contracts transferred to ERP has not yet been sanctioned. In the circumstances the Canadian Government have not felt themselves able to allow further use of the credit to Britain, and the British Government have agreed to pay the whole of the current deficit to Canada—about \$50 million a month—in US dollars in the hope of later recovering the expenditure under ERP.

Whether, in fact, these dollars will be recaptured will depend on the decisions of the EC Administrator—first, upon whether the Canadian food contracts will rank for off-shore ERP purchases; and, secondly, whether any expenditure incurred before the ERP Appropriation Act is passed by Congress will be eligible for ERP and can be recaptured. Uncertainties remain on both counts. The US administration has never been enamoured of Britain's long-term food contracts, which appear to offend against the State Department's theology on non-discrimination. This suspicion may communicate itself to the Administrator, Mr Paul Hoffman. On the second point, it still remains uncertain whether ERP dates from the moment the President signed the Financial Assistance Act, or whether it comes into being when the necessary funds are formally appropriated. Meanwhile, the food contracts signed with Canada towards the end of last year will run on undisturbed—and fingers will be kept crossed both in London and Ottawa.

* * *

The Tobacco Enigma

The elasticity of demand for tobacco has so far belied all estimates. On balance, the huge additional revenue which has been secured by the increases in the tobacco duty since 1939 has been provided without affecting consumption. Even last year, when Mr Dalton increased the Customs duty on leaf tobacco by 50 per cent (from 35s. 6d. to 54s. 10d. a lb.), consumption was reduced by only 10 to 20 per cent—the exact figure depending upon the basis of calculation selected. The further addition to the duty, of 3s. 4d. a lb., proposed by Sir Stafford last week was designed, as he said, "to bring to smokers' attention once again the need for economising in tobacco." Clearly, the purpose of the increase is not to try to reach Mr Dalton's target of a 25 per cent reduction in consumption. If that had been the object, a much larger increase would have been necessary. Tobacco consumption in the United Kingdom totalled 225 million lb. in 1947, or 10 per cent less than the 250 million lb. smoked in 1946. Personal expenditure in tobacco over the same period showed a reduction of nearly 12 per cent. But consumption for the twelve months beginning May 1, 1947, is likely to be only 206 million lb., compared with 259 million lb. in the previous twelve months—a reduction of almost 20 per cent.

Despite the cessation of purchases of American tobacco last August, the United States supplied almost two-thirds of British imports in 1947, when retained imports were equal to consump-

tion. Under Marshall aid, it is believed, Britain will receive about £28 million worth of tobacco annually, or, say, a quantity similar to that received last year, but substantially less than the annual rate of importation previously. Assuming imports from other sources to be also the same as those in 1947—allowing for an increase in Rhodesian supplies to balance a reduction in Canadian shipments—British consumption under Marshall aid is likely to be restricted to about 205 million lb. a year—or the same annual rate as that of the past eleven months.

If these calculations are correct, why increase the duty with the avowed object of promoting economy? The payment of a penny or twopenny more for 20 cigarettes is unlikely to reduce consumption by itself, and perhaps not even if taken in conjunction with the increased tax on beer, spirits and betting. The habit of smoking requires more than a 2d. rise to combat it. Perhaps, after all, this new impost served the usual "revenue" purpose. Or was the Treasury afraid that the extra purchasing power to be placed in the hands of the lower income groups through the income tax concessions would undermine the resistance of the new non-smokers and reluctant economisers? If so, the increase in price might be regarded simply as a psychological deterrent to an increase in consumption, but not as a means of reducing it. In any case, even on last year's consumption, the new tax ought to yield much more than the £20 million allowed for by Sir Stafford. Tobacco consumption over the next six months, however, should reveal an interesting trend, particularly if purchasing power is curbed and if, as the Economic Survey postulated, the number of unemployed increases to 450,000 by the year-end.

* * *

ICI Record Income

Despite the forebodings of Lord McGowan in the 1946 report of Imperial Chemical Industries, written in the gloomy circumstances prevailing soon after the fuel crisis, the group has emerged from its trials in 1947 with something like a triumphant record for the full year's trading. The net income of £7,646,933 for the year—announced in the preliminary profits statement last week—makes an even more striking comparison with the 1946 figure of £7,171,109 when it is considered that in the past year only £426,000 was credited from previous over-provision for taxation, whereas in 1946 a sum of £1,692,000 was brought in from the same source. It is clear, then, if these special credits are excluded, that the expansion in net income in 1947 was of the order of some £1,750,000. Thus, not only has it been possible to repeat the allocation of £3,000,000 to the central obsolescence and depreciation fund before striking net income, but also to raise the additional contribution from net income to obsolescence and depreciation, and to place £1,000,000 to general revenue reserves, which last received an allocation in 1939, when the figure was £375,000.

This continued careful husbanding of resources is fully in line with the established conservative policy of the board, who in the past have laid emphasis on the need for finding out of profits not only the substantial amounts required by the group for the replacement and expansion of fixed assets, but also for financing technological changes to which the industry is particularly liable. Yet a point of considerable significance in the preliminary profits statement is that the directors have chosen to pay the whole of the 10 per cent distributed for the past year as dividend, thus eliminating the bonus element of 2½ per cent first introduced in 1946, when the total annual payment was raised to its present level. In view of the expansion of earnings from 22.5 to 24.2 per cent on the £50,465,116 ordinary capital, the increase in the dividend *per se* naturally raises the question of what the total distribution would have been if the hands of the group had not been tied by voluntary dividend limitation. It is unlikely, however, that an increase would have been made in any case unless the directors were confident that the higher level of profit in 1947 would be maintained. At any rate, the market reacted favourably to the profit figures; the ordinary shares opened the week at 50s. 3d. bid after being 48s. 6d. before the announcement. The subsequent relapse to this level, at which the yield is 4½ per cent, can rightly be attributed to general market factors, for the price has fully recovered the amount by which it was adjusted when the shares went ex-dividend.

* * *

Ford Motor

The report of the Ford Motor Company for 1947 certainly justifies the enhanced investment status which the shares of the

company have achieved during the past year. The yield on the £1 ordinary shares at the current price of 50s. is no more than 4½ per cent, a rating bettered in this section of the market only by Leyland Motors. Indeed, the group's consolidated accounts are expected to show earnings well above the level of 37.3 per cent attained in 1947, in itself a handsome cover for the 10 per cent distribution—now paid entirely as dividend instead of 7½ per cent in dividend and 2½ per cent in bonus as in 1946. If voluntary dividend limitation had not been in vogue, the payment this year might well have been greater. After deducting taxation, it represents only 1.4 per cent of the company's gross trading and other disbursements of £35.6 million in 1947. This total is itemised in chart form in the report, showing that purchases of materials accounted for 65.4 per cent, wages and salaries 16.4 per cent, overhead expenses 5.7, taxation 5.7 and employees' benefits, excluding state schemes, 1.5 per cent; profit retained in the business represented 3.9 per cent. The company achieved a record output in 1947, and its production policy continues to be focused upon large-scale output of a limited range of vehicles. Import and currency restrictions alone have limited sales in overseas markets, where Ford products have generally more than held their own at competitive prices.

The satisfactory trading results for 1947 have enabled the company to show an even stronger liquid position, despite the absorption of over £2,000,000 of profits by taxation. Incidentally, the accounts disclose for the first time that the company paid almost £1,000,000 in EPT at the 60 per cent rate in 1946, compared with what would seem to be £661,443 for profits tax in 1947. Reserves were strengthened in the past year by additions of some £1,925,000, bringing the capital employed in the business up to £16.6 million, compared with the issued ordinary capital of £9,000,000. It has been decided to set up a new reserve of £750,000 to provide against a possible fall in commodity prices. This is a prudent measure in view of the big rise during the year in the value of stocks; this has risen by over £2,000,000, to some £5½ million.

Perplexities of the Cotton Talks

It is not easy to see in the conclusions of the Anglo-American cotton trade conference, which has just been held in Manchester and London, any reflection either of the critical British trading position or of the part which the British textile industry is expected to play. Perhaps some of the talk of increased textile exports to dollar markets has been a little unrealistic, and it would have been more salutary to look at the extraordinarily high level of textile imports by the sterling area from the United States. This has been one of the heaviest single items in the dollar drain on sterling. What used to be Japan's trade has been taken over not by Lancashire but by the United States, India, and the indigenous industries.

Here, it might be thought, would be the background of the talks. British exports of cotton and rayon piece goods in 1947 amounted to 630.6 million square yards; US exports, for the first nine months of the year only, were 1,326.5 million square yards. This complete reversal of the prewar relationship is attributable to a number of causes, not least of which is the utter failure of the Lancashire industry to revive quantity production. In the circumstances the lines on which the talks appear to have run are a little puzzling. The American intention, bluntly stated, of maintaining American textile exports in full had to be taken as a starting-point. There followed an examination of the Japanese problem, and weighty reasons were given for allowing Japan a reasonable textile production. Among these was the necessity of providing dollars to finance the operations of SCAP. The report states:

The United Kingdom delegation consider it would be proper in the British interests for Britain to aid in relieving the existing situation by facilitating the entry into the markets of the sterling area of textiles produced in Japan.

This trade might be conducted "without directly involving dollars" and be balanced by the supply of sterling area commodities "to be consumed as far as practicable in Japan, but otherwise in the United States." It would help to relieve the danger of there being no other place to sell Japanese textiles than in the United States itself, where they are neither needed nor wanted.

If the intention were merely to switch the Commonwealth textile purchases from the United States to Japan, such a plan might appear sensible. But the Americans have said that they intend fully to maintain their present trade. Indeed, the British undertook to recommend various relaxations of exchange control and "the most liberal policy possible in providing dollar exchange for United States textiles." Liberal policies are, of course, delightful

But it is hard to fit into this liberal prospect the plan which the two delegations agreed (and which looks foolish as well as unscrupulous) for limiting Japanese spinning capacity to 3,500,000 spindles. Can this plan be seriously intended? Has the British cotton trade swallowed it in a belief that it would benefit Lancashire? It would be more to the point to know what the plans of the British cotton trade are and who is going to support the British balance of payments.

Some figures given in *The Economist* of April 3rd under the heading "Competition from the East" need correction. The British output of cotton, rayon and mixture piece-goods in 1947 was 2,014.4 million yards; Japanese output was 739.2 million yards. British exports were 630.6 million yards; Japanese exports, shown as 360.5 million square yards for eleven months of 1947 in the supplement to Cotton Board Trade Letter on February 19th, totalled 394.1 million square yards for the whole year.

Rationing Emigrants' Capital

The dangerous state of Britain's gold reserves has called for a considerable—and rather overdue—curtailment in the facilities hitherto offered to emigrants to take their capital with them when leaving this country for countries outside the sterling area. The rule which has now been superseded allowed emigrants to take a maximum of £5,000 in equal instalments over a period of four years. Under the new ordinance the maximum has been cut down to £1,000, and that reduced figure also will be convertible into non-sterling currency only over a four-year period. After four years of residence in his country of adoption, the emigrant will be treated as a non-resident for purposes of exchange control regulations, and then will be allowed to convert into the currency of his adopted country the whole of the income on his capital remaining in Britain. The capital itself, however, will remain immobilised for the time being and will be subject to the general restrictions then applicable to capital held in this country by non-residents. The new regulations leave wholly unaffected the rights of emigrants to sterling countries to take their capital with them. At present the right of emigrants to move capital from Britain to other parts of the sterling area is unconditional, with the one exception of transfers to South Africa, which are limited, at the behest of the South African authorities, to individual amounts of £10,000, above which figure the special authorisation of the South African Reserve Bank has to be obtained. In view of the "hardness" of the South African pound from the British standpoint, it is perhaps surprising that the British currency regulations governing emigration to non-sterling territory—or at least a modified version of them—have not been extended to cover this case also.

* * *

Fur Trade Blunders

In its approach to the British fur trade since the end of the war, the Government has shown a singular lack of imagination. Before the war, the international importance of the London fur market helped to narrow Britain's trade deficit with such countries as the United States, France and Germany. In the autumn of 1945 the resumption of international trading in furs was permitted in this country; but it was obvious even then that it would be difficult to re-establish London as a leading international fur trade centre, particularly as during the war New York had established its own contacts with the primary sources of supply. In fact, in the two years to last September, the British fur trade showed an adverse balance of £10 million and became an important drain on dollars. Furs were purchased from hard currency sources and after dressing were exported to soft currency markets.

Last September, the Government made imports of fur conditional upon exports, and although these restrictions reduced London's international turnover, the fur trade showed a slight surplus of £300,000 between October, 1947, and February, 1948. But the increase in purchase tax now threatens to impose a new obstacle. To secure a proper export balance the fur trade cannot rely entirely upon imports and re-exports. It needs to develop domestic processing—dyeing and dressing—and the manufacture of fur skins into garments for the export market. And since the end of the war such a development has shown encouraging results. In 1938 British exports of manufactured furs totalled £163,608; by 1945 they had fallen to £125,267, but rose to £620,208 in 1946 and £970,173 in 1947. Exports in the first two months of this year were at an annual rate of nearly £1,200,000.

This development, however, was linked to the utility scheme. Manufacturers were permitted to produce the higher grades of utility fur only if they were—or became—exporters. Moreover,

BARCELONA TRACTION, LIGHT AND POWER COMPANY, LIMITED

BONDHOLDERS' COMMITTEE APPOINTED

At a well-supported meeting of holders of Consolidated Six and a-Half Per Cent. Prior Lien Bonds of Barcelona Traction, Light and Power Company, Limited, held recently in London, under the independent chairmanship of Mr Leslie Peppiatt, solicitor, resolutions were passed forming a committee to represent the interests of those holders and setting out the powers of this committee. Mr Peppiatt said that the meeting had been convened by the Trustee (National Trust Company, Limited) at the request of certain bondholders.

Mr C. A. Settle, Counsel proposing the resolutions on behalf of Helvetia Finance Company, Limited, said that the company's policy in the past had been favourable to the shareholders at the expense of the bondholders and the latter had received no interest for more than eleven years. Among his conclusions, Counsel submitted that he had proved that peseta funds equivalent to arrears of interest on the bonds had not been segregated; that Ebro's published accounts showed substantial losses and that the company was inaccurate in describing the problem as solely one of exchange. He also asserted that the company had forfeited the confidence of the Spanish Government; that the actions of his clients had benefited the small bondholders and that the company had not kept the bondholders advised of events and the changes of circumstances.

THE COMMITTEE

Counsel then proposed the adoption of resolutions setting out the powers of a suggested committee and nominating as its members: Mr J. L. Olivan, formerly Spanish Ambassador in London and formerly Registrar of the Permanent Court of International Justice at The Hague; Mr H. A. Benson, C.B.E., F.C.A., of Messrs Cooper Brothers and Company, chartered accountants; Capt. A. H. Hillgarth, C.M.G., O.B.E., R.N. (Rtd.), chairman of Helvetia Finance Company, Limited; Mr R. G. E. Jarvis, director of Messrs M. Samuel and Company, Limited, merchant bankers; Mr C. H. Kleinwort, director of Messrs Kleinwort Sons and Company, Limited, merchant bankers; Sir Arthur Page, K.C., and Mr Juan March Servera.

The resolution having been seconded, three amendments were duly proposed and seconded making additions and alterations to the above resolutions.

A discussion followed, the contributors being Mr J. G. Archibald, on behalf of the company, Mr G. Phillips, for the Trustee, Mr Donald Duncan, a director of Sofina and Barcelona Traction, and Mr C. E. Montaines, who said that he was one of the original bondholders of the company and a founder of Ebro, and who asserted that the situation was much more serious than was known before and that the committee should take immediate steps in the interests of bondholders.

The resolutions, as amended, were carried on a show of hands by 27 votes to 6, and on a later poll by £1,928,900 in favour to £197,000 against.

KEMSLEY NEWSPAPERS LIMITED

VISCOUNT KEMSLEY'S REVIEW

The twenty-fourth ordinary general meeting of Kemsley Newspapers Limited will be held, on the 20th instant, at Kemsley House, London.

The following are extracts from the statement of the Chairman, Viscount Kemsley, circulated with the report and accounts for the year ended December 31, 1947, to be submitted to the meeting.

I will refer, at first, to the accounts of the parent company.

The trading profit of £792,129 is an increase of £15,409 on last year's figure. There is a disposable balance of £1,086,159.

It is recommended that £350,000 be transferred to general reserve, and that a final dividend be paid on the ordinary stock of 7 per cent., less tax at 9s. in the £, which, together with the interim dividend of 5 per cent., makes 12 per cent., the same as last year. The amount carried forward of £272,892 compares with £264,055 brought in.

Stock in trade at £240,053 compares with £323,785 last year. This is due to the decrease in the stocks of newsprint held at the end of the year.

CONSOLIDATED ACCOUNTS

The trading profits and sundry income (including dividends and interest), amount to £2,516,605 in the consolidated profit and loss account. Out of this we have provided £1,346,406 for taxation on profits up to December 31, 1947. We have considered it prudent to strengthen the individual subsidiary companies by retaining in their accounts the sum of £160,004.

In the consolidated balance sheet, the revenue reserves and undistributed profits stand at the very substantial figure of £4,994,553.

The figure of £14,084,979 for copyrights and goodwill is considerable. This figure is fully justified by trading results and on current values it is certainly not too high.

THE TAX ON INVESTMENTS

The available profits would fully justify the recommendation of an increased ordinary dividend. The Chancellor of the Exchequer recently expressed the wish that dividends should not be increased. We have respected his wish, but I am bound to say that the vast body of the investing public, had it known that the Budget would include an unprecedented tax related to investment incomes received during the tax year 1947-48, might have felt that they should be able to draw on profits to which they are entitled to enable them to meet the new demand. The effect of the tax, I fear, will be to remove capital from the hands of those who for the most part are proved investors to be used as revenue by a Government not itself setting an example of economy.

Further, out of the group profits we have made provision for the Treasury to receive over 53 per cent., whereas the holders of the ordinary shares receive no more than 6½ per cent.

Difficulties, both expected and unexpected, have beset us during the year. Not only is there less newsprint, but it costs more. This places an immense burden of additional cost upon your company. In almost every other direction we have been faced with rising costs. We have sought to counter the rising tide of costs by increased efficiency.

NEWSPRINT FAMINE DANGER

The subject of newsprint cannot be regarded as purely a domestic concern for newspapers. It is, indeed, a matter of the gravest public importance. Never was there

a time when, by the limitation of space imposed upon them, the newspapers were so effectively prevented from discharging all their public responsibilities in the way that they would wish.

With the possible exception of Japan and Hungary, the supplies of newsprint available to us are, relative to pre-war usage, the lowest in the world.

There is no ground for any complaint of consequence against editors on the ground that serious topics are neglected.

Examination of the newspapers of this group reveals that no complaint whatsoever can be made on this score. The number of columns we devote to news of public importance is stretched to the limit.

News, which in normal times would be deemed to be of first-class importance, is crushed out.

It might be supposed that the small newspapers of to-day mean reduced editorial staffs and a considerable saving of costs in other directions. This is not so. Taking into account the substantial increases in wages and salaries which are common to all departments, the increase in terms of costs is very substantial indeed.

We are able to face these difficulties. There can be no doubt that the increased economies and improved contents which are the result of the association of newspapers in a coherent group, of which your company is an outstanding example, strengthen provincial papers in resisting the stern competition of the national papers which circulate in their areas.

Last year I was completing plans for a training scheme within the organisation. The editorial plan, embracing all members, is in operation and has achieved a success beyond our expectations. It has created a new sense of unity and of opportunity within the group for those ready to take it.

THE SUNDAY TIMES

Since last August every newspaper has been limited to a fixed circulation. I am glad to be able to say that as a result of the advantage taken during the period when circulations were free, the circulations of all your newspapers, morning, evening and Sunday, are now as high as or higher than at this time last year, with one exception—the *Sunday Times*.

At this time last year the net sale of the *Sunday Times* was 556,000. It is now 506,000. This is due to no fault of the *Sunday Times*, but to the latest cut in newsprint last summer and the decision to maintain the size at eight pages.

One serious consequence of the restriction in newsprint has been the limitation still further of the space available to advertisers. Throughout the year the demand for advertising space in the columns of your newspapers has substantially exceeded the space available.

A year ago I referred to the launching of the Kemsley Empire Journalists' Scheme under which promising young journalists in the Dominions were to visit Britain as our guests. These young men spend a year with us, and the cost is borne by the company. The other educational schemes which this company has promoted continue to produce valuable results.

The Trustees of the Kemsley Flying Trust have received over 30 requests for loans from flying and gliding clubs and so far many grants have been made.

After paying a tribute to the staff, Lord Kemsley's statement concludes: Our satisfaction with the figures I have presented to you is tempered by the sense of frustration we feel by reason of the restrictions upon us.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

PROGRESS IN ALL DEPARTMENTS

The one hundred and seventh annual general meeting of the Wesleyan and General Assurance Society was held, on the 6th instant.

Mr A. L. Hunt, F.S.S., F.C.I.L., the chairman and managing director, in the course of his speech said:—

In the ordinary department the total of new sums assured amounting to £3,339,000 constitutes a record. The average sum assured per policy is more than twice the prewar figure. In the industrial department the new sums assured amount to £3,766,030. These good new business figures have resulted in the substantial increase of £177,275 in the premium income of the two departments. In the fire and general departments the premium income has increased by £22,607 while the premium income of the Society as a whole has passed the £3,000,000 mark.

At the end of every year the liability under policy contracts is calculated and compared with the respective funds. The bases of calculation used by the actuary at this valuation were more stringent than formerly. He had in previous years built up extra reserves for the purpose of strengthening the valuation and this year a large proportion of those reserves has now been applied for this purpose. The rate of interest now assumed in both the ordinary and industrial departments is 2½ per cent.

ALLOCATION OF SURPLUSES

The excess of the funds over the calculated liabilities constitutes the surpluses. There is a surplus in each department and the surpluses total £589,000 (including £151,345 brought forward from the previous year). It must not be assumed, however, that this is true profit. Approximately £200,000 of this sum results from the difference between two items in the Revenue accounts, namely, "Profit on Realisation of Investments," less "Amount written off Investments"; this emerges as the result of the sales of investment assets, but, since the proceeds of sale must be re-invested again at current low yields, it is important that it should be retained as, say, investment reserve or general reserve in order to maintain the interest yield. It will be understood that in the years when interest rates were high, in the years when interest rates were high, the policyholders were given the benefit of those high rates of interest in lower premium rates, and many of those policies are still on the books. It should also be remembered that with profits policyholders pay higher premiums than without profits policyholders and the excess normally emerges as surplus.

In the ordinary department the surplus is £291,233. Of this sum, a total of £107,000 has been transferred to investments reserve and general reserve, and £17,610 to the staff pension fund. The directors declare the pension fund. The directors declare the pension fund. The directors declare the pension fund.

In the industrial department the surplus is £235,073. Of this sum, £33,000 has been transferred to investments reserve and £62,390 to the staff pension fund. The directors declare the divisible profits to be £65,000, representing £40,000 allocated for industrial department policyholders by way of additional non-contractual benefits under policies becoming claims, and £25,000 for the outdoor staff. It is of interest to record that, since 1927, no less than £940,000 has been allocated to industrial department policyholders.

The fire and general departments are making

substantial progress and the premium income has reached £109,583. The whole of the business is reinsured and a small profit to the Society results.

HOUSE PURCHASE

House purchase advances in 1947 far exceed the total of any previous year. This is remarkable, in view of the postwar restrictions on the building of houses for owner-occupiers, and the fact that the Society is not prepared to encourage the purchase of houses at greatly inflated prices.

Many tenants are now able to purchase their houses at prices not much in excess of 1939 values. The Society will advance a generous proportion of the purchase price of a house to a tenant able to purchase on reasonable terms.

It is very desirable that every householder purchasing his home by payments out of income, should protect his dependents by ensuring that the house is freed from the loan in the event of his untimely death before the purchase is completed. The Society's house purchase plan ensures this protection.

If the house purchaser desires to repay his mortgage for any reason, interest is calculated on the net sum outstanding, no redemption fees are required, and no interest is required in lieu of notice.

The assets stand in the balance sheet at £23,974,383, and represents in the main investments in British Government securities, debentures and preference shares in the United Kingdom and mortgages.

The investments reserve has been increased by £115,000 to £875,000 and represents just over 3½ per cent. of the assets. This reserve is necessary and certainly not too large. The general reserve has also been increased by £25,000 to £275,000.

Assets, which may appear to be of considerable magnitude, are necessary because they largely represent policyholders' money under endowment assurances which are constantly reaching maturity and have to be paid out. It is incorrect to judge the financial strength of a life office merely by the size of its assets and it is equally incorrect to regard the assets as the accumulation of profits earned in the past. I am happy to be able to say that the Society is in an unquestionably sound financial position.

NATIONAL INSURANCE

In July next we shall nearly all be called upon to commence paying National Insurance contributions greater than the National Health contributions now being paid and, with certain exceptions, our personal representatives will be entitled to a death grant of £20. I wish to make it quite clear that National Insurance will not affect in any way existing policies and they will be honoured by the Society in accordance with their terms.

A consequence of the death grant is that funeral expenses policies on the lives of various permitted relatives will no longer be issued in the industrial department, but, as a result of current legislation, a person will be able to insure for £20 maximum on the death of his or her parent or grandparent only. This new legislation does not alter or restrict the right of a husband to affect assurances for any amount on the life of his wife or vice-versa, nor does it restrict own life assurances. In 1947 approximately 81 per cent. of the new premium income of the industrial department was accounted for by own life assurances or assurances by a wife on her husband, or vice-versa; it follows that the new circumstances are unlikely to have a serious adverse financial effect.

The report and accounts were adopted.

GENERAL REFRACTORIES, LIMITED

RECORD TURNOVER

The forty-eighth annual general meeting of General Refractories, Limited, was held at Sheffield, on the 12th instant, Sir Ronald W. Matthews (the chairman) presiding.

The following is an extract from his circulated statement:—

The heavy demand for all types of your company's products, both in the home and overseas markets, continued throughout the year, and is still being maintained at a highly satisfactory level. The turnover for the year proved to be a record for the group. This continued expansion of our business will give great satisfaction to our stockholders, and is conclusive proof of the wisdom of the policy of modernisation and mechanisation which your directors are pursuing in the company's works and quarries, with a view to combining the maximum rate of production with the highest quality of product.

There is a constantly expanding demand for refractory products of all kinds for consumption both at home and in the export markets. That is amply proved by our own growing turnovers during the past few years, and it is clear that as the production of steel and other materials, which rely for their manufacture on high grade refractories, increases, so will the pressure on the refractories industry grow.

There is unhappily still among large sections of the population a complete inability to realise the gravity of the situation in which the country finds itself today. American aid is certainly not going to maintain our standard of living even at its present level indefinitely. Already in many markets the high prices of British goods are causing a distinct slackening of demand, and only hard and conscientious work and a determination by all concerned to get the maximum amount out of every unit of plant and machinery will provide that extra volume of output which will make it possible to keep down export prices to a competitive level.

FULLY EMPLOYED

Stockholders will be glad to learn that during 1947 all branches and subsidiaries were fully employed to the maximum of their available manpower and played their part in the satisfactory results achieved. The plant and machinery is in first-class condition and—so far as raw materials are concerned—we have vast resources of fireclay, ganister and sand in this country which assure our position for a long term of years.

The new Research and Technical laboratory which we are building at Workop will, we anticipate, be completed by the middle of 1948. The closer concentration of our research organisation in a building, furnished with the most modern equipment available, will facilitate the quest for new and improved products and will be of the greatest help to the works management in solving their day-to-day problems, as well as fostering even closer co-operation with the industries we serve. The plant erected by Henry Foster & Company, Limited, for production of carbon blocks for blast furnaces operated very satisfactorily during the whole of the year under review. In the Scottish Group we have completed the driving of the new clay mine at Castlecary, and also the pithead erections; these improvements will increase the tonnage from the mine and provide more economical handling methods.

The trading profit of the group for 1947 amounted to £330,681. Income from other sources, £995, aggregating £331,676 against a total last year of £285,985—an increase over the figure of the previous year of £45,691. The Group net profit attributable to General Refractories, Limited, amounted to £106,228 (£89,405). Your directors recommend the payment of a dividend of 10 per cent.

The report was adopted.

DAVIS AND TIMMINS, LIMITED

INCREASED PROFITS

The forty-ninth annual general meeting of Davis and Timmins, Limited, was held, on the 12th instant, in London.

Mr F. Le Neve Foster (chairman and joint managing director) said that when he had addressed shareholders last year it had been in the shadow of the serious interruption caused by the fuel crisis. He had referred to the fact they had had with their workpeople to make up the substantial amount of production lost during the stoppage. Their workpeople had well and truly carried out their bargain. By increased efforts and by overtime, the whole of the lost production had been made good well within schedule. There was evidence that the tempo set by that excellent achievement had carried on and inspired what he hoped was a permanent increase of efficiency throughout their works, which had resulted in the satisfactory report and accounts now presented.

THE YEAR'S RESULTS

The net profit for the year, after making provision for depreciation, taxation and other items, was £56,342, as against the corresponding figure of £42,388. Gross trading profit was £104,910 as against £68,004 last year. The combined profit and loss account gave a clearer picture of the results of the group as a whole. They showed trading profits, after providing for profits tax, etc., at £152,579, as against £89,454 for the previous year, while net profits, after provision for considerable increased allocations for depreciation and income tax, amounted to £59,742, as against £43,568.

The substantially increased trading profits could definitely be attributed to increased

production. During the year they had increased their total turnover by well over 20 per cent. in value. Part of the increase was attributable to increased cost of metal and wages but, when he told them that their weight of metal cut up during the year was up by over 20 per cent., shareholders would appreciate that the increase in production was a very real one.

After bringing in the net profits for the year and the profits brought forward from 1946 and deducting the net interim dividends already paid, there was a balance left to be dealt with of £127,789. The directors recommended a final dividend of 30 per cent., including 10 per cent. bonus, making with the interim of 10 per cent. already paid a total distribution of 40 per cent. for the year, which was the same as for 1945. Even so, their net dividends for the year were less than half the group profit available, after making full provision for income tax and profits tax. In those circumstances the directors felt that the distribution proposed was well within the spirit of the F.B.I.'s dividend limitation proposals and the White Paper.

HEAVY ORDER BOOK

They still had a heavy order book and their works were running smoothly. For the first three months of the current year production and sales were higher than the average of last year. There was, however, some slackening in the demand for larger diameters and business was tending to become more competitive. It must be expected that the tendency would develop through all sections. Looking into the future, he felt confident that, with the benefit of their unrivalled experience in the trade and the efficiency they could demonstrate, the company could and would continue to give an account of itself which would be worthy of its great record in the past.

The report was adopted.

JOHN BARKER AND COMPANY, LIMITED

LARGER TURNOVER

The fifty-fifth annual general meeting of John Barker and Company, Limited, was held, on the 8th instant, at Kensington.

Mr Trevor A. Bowen, D.L., J.P., the chairman, said that the year ended January 31, 1948, had presented many complexities and problems entailing anxious thought and concentrated effort on the part of the directors, managers and staff, and in his opinion the resulting net profit of £1,056,407 must be considered satisfactory, although not as good as their record of the previous year. The net profit was, of course, subject to the charge for taxation.

During the year under review conditions had remained difficult and the drive for exports had had a reflex action upon trade. In addition, there had been a continued issue of new Orders by the various Ministries, as well as cancellations of previous Orders, many of them resulting in confusion. There had also been changes in purchase tax and couponage. Ceiling prices and control had been enforced by the Ministries with a general contraction in margins. Those factors combined had made it a very difficult year and had brought about a reduction in gross profits. Nevertheless, he thought it would be agreed that the net profit was satisfactory. With the company's strong liquid assets position the directors were confident that their established trading policy could be maintained and good competitive value given to their many customers.

The report was adopted and the proposed final dividend of 17½ per cent., making 25 per cent., less tax, for the year, was approved.

GOVERNMENT RETURNS

For the 10 days ended April 10, 1948, total ordinary revenue was £99,831,000 against ordinary expenditure of £95,378,000 and issues to sinking funds £114,000. Thus, including sinking fund allocations of £114,000, the surplus accrued since April 1st is £4,339,000 against a deficit of £26,491,000 for the corresponding period a year ago.

Not By Bread Alone

LAST week the United Nations Conference on Freedom of Information adopted a resolution drawing the attention of governments "to the harm and dangers which inadequate production of newsprint, and unequal distribution thereof, have on the exercise of freedom of information." On Monday, Lord Rothermere appealed to a meeting of American newspaper publishers to use their influence in having newsprint included on the list of commodities to be provided under the Marshall Plan. On Tuesday, Mr Hoffman's "illustrative" allocation of his funds revealed that newsprint had indeed been included—though only for the United Kingdom and Eire.

Placed thus in their chronological order, these events sound like cause and effect. Actually, they cannot be so, for Mr Hoffman's list must have been in preparation for some time. It is still not certain whether the American purpose is merely to take over the financing of the supplies of Canadian newsprint that are already available to the British press or whether an increase in the supply is contemplated. The sum of \$22 million would suggest the latter conclusion, since it would be enough to pay for 200,000 tons and the present supply is limited to 100,000. But the explanations given in Washington—particularly of the reasons for omitting other countries—support the former and more disappointing view. But that newsprint should find a place on the list at all suggests that the American Government, at least, is waking up to the dangerous anaemia of democratic life that prevails in Europe.

What is, perhaps, more doubtful is whether the British Government has yet similarly awakened. The British Government made no request for additional newsprint under ERP; it appears to have been as much taken by surprise as anybody else by its inclusion on Mr Hoffman's list; and there is even some question whether more than the present supplies would be accepted if they were formally offered. It would be wrong to put this down to mere malice. Even with Marshall dollars, the British Government's task in making ends meet is still immensely difficult. (Mr Hoffman's tentative allocation to the United Kingdom is \$1,324 million for twelve months, whereas the actual dollar deficit in 1947 was over \$4,000 million and the forecast for 1948, at the rate of the first half of the year, is \$1,776 million). If the Government is unwilling to accept newsprint, the reason is that it thinks other things are more urgent.

Within the context of British national policy, it is difficult to challenge this decision. A beleaguered nation is compelled to put food and raw materials ahead of things of the spirit. A garrison threatened with starvation naturally wants bread before books. But the passage of the Economic Co-operation Act removes the problem from the context of British national policy. Over and over again the Americans made it clear that they were not interested in merely patching up the separate national economies of the Western European states. They were interested in breathing life into the practice of democracy in Europe. When the question is widened from "what is necessary to keep the British people alive" to "what will best make a working reality of democracy in Europe," then no man in his senses would exclude paper from the list.

Perhaps the argument will be more acceptable if we make it clear that it is not for ourselves, at least in the first place, that we plead. *The Economist* is indeed short of paper. We are cramped for space; we cannot meet all demands for the paper; we are compelled to use a sheet of barely tolerable flimsiness. But though we are constricted by the paper shortage we are not throttled, as other paper users are. One of the most deserving claimants, which can and does speak for itself, is the daily newspaper press. Another, even more deserving but less vocal, is the claim that can be made for paper for educational textbooks. All over Europe, education is languishing for lack of the necessary books; and what can democracy be without education? The greatest need, under both heads, is in Germany.

Interested parties always claim too much. To listen to some of the newspaper proprietors, one would suppose that they would devote any additional newsprint exclusively to the discussion of democratic principles. The book publishers argue as if all books were by definition educational. If one is to be candid, one must admit that a great deal of any additional newsprint that was provided would be used to report sport and crime, and that any larger general allocation of paper for books would lead to a greater output of trash. But this is merely an illustration of a general dilemma that the American people have faced, and wisely resolved, in their discussion of the Marshall Plan. The Western European democracies are imperfect; but time is too short to insist on reform as a pre-condition of assistance. Taking them as they are, should the Americans help them or not? And the answer has been a clear yes. A book which has been widely circulated in America in opposition to the whole notion of Marshall aid bears the title "Can Dollars Save the World?". The answer that Congress has rightly given is "No, but the world cannot be saved without dollars."

Triumph in Italy

SIGNOR DE GASPERI has done very well—almost too well. A free and orderly election at the edge of the iron curtain, with the strongest Communist Party in Europe competing, has been won hands down by the Right. The Christian Democrats alone will have an absolute majority in the Chamber of Deputies with 307 out of 574 seats. In the Senate they will command with the aid of friendly parties a smaller majority—of some 200 seats out of 339. The Communists will not only be outvoted in the Chamber and in the Senate, but may also lose their volatile and disappointed allies in the Popular Front, the Nenni Socialists. There may in fact be no effective parliamentary opposition from the Left save that of the Communists. For the Socialists who refused to work with the Communists in the Popular Front, the followers of Signor Saragat and Signor Lombardo who collaborated with the government, will presumably get rewards in a new Cabinet for the loyal help they gave before and during the elections. These Socialists, who did not get a telegram from Mr Platts-Mills, attracted away from the Popular Front over 1,800,000 votes, or seven per cent of the total cast.

The Christian Democrat victory is a very fine and welcome achievement. It means a decisive check to the first big challenge by the Communists west of the iron curtain. For it was a major effort that Signor Togliatti made, and his followers pledged themselves to total success. Even the most experienced observers took their claims seriously and forecasted for Signor de Gasperi nothing more than a win by a short head. His success in winning 48 per cent of the Italian people's votes against the 30 per cent of the Popular Front is an event of more than European significance.

It is true that Russia was not as helpful to the Italian

Similarly, to the question "Will larger newspapers and more books make democracy work in Western Europe?" the only possible answer is "Certainly not; but it will not work without them."

The facts about the present distribution of newsprint are sufficiently startling, in all conscience. The United States, which before the war consumed 44 per cent of the total world supply, consumed 61 per cent in 1947. American consumption last year was a million tons more than before the war, that of the rest of the world a million and a half tons less. Consumption per head of the population before the war was 6 lb. in Britain and 56 lb. in the United States; last year it was 15 lb. in Britain and over 70 lb. in the United States; and the gap is steadily widening. How much of their consumption of newsprint, would Americans say, is a necessary ingredient of their democracy? Half? A third? A quarter? It would still be larger than the ration on which British democracy is struggling to exist. Or conversely, if it be accepted that the British ration is enough, then over three-quarters of the American consumption is unnecessary.

The argument is not one for complete equality of consumption between America and Europe, any more than it is in wheat or oil or steel. The argument for Marshall paper, as for Marshall wheat or Marshall steel, is that it is an essential ingredient of democracy, which cannot sustain adequate health on the present ration. Every argument that induces the American people to send to Europe food and raw materials which they could use at home, applies with equal force to paper, which also they would like to use at home. Indeed, in the long run it applies with even more force. For democracy does not live by food and raw materials alone.

Left as it might have been. The trainload of paper that represented its final contribution to the election campaign compared unimpressively with the trainloads of food that Marshall aid will mean, and has already meant, to the Italian people. Moscow did not accept the western suggestion that Trieste should be returned to Italy; it suggested no modification in reparation payments—in fact it kept a very respectable distance from the whole affair. It took little risk of losing face. Britain and America and France on the other hand took the gloves off for the first time. It was made clear to the Italian public that a Communist success would mean short rations, unemployment, insecurity—because it would mean the end of Marshall aid; also that a Christian Democrat success would mean membership of the Brussels Pact, supplies of American wheat and British coal, raw materials, emigration possibilities, and perhaps the return of some colonies.

It is possible that some of the interventions of the last two months could have been dispensed with, but squeamishness by the West would have invited bullying from the East. The de Gasperi government had earned such western support by the way it had handled the Communists in parliament and their followers in the streets. To give this support still left the Italian people free to decide whether they liked the de Gasperi government or not. There is not the slightest doubt that American aid and advice, British and French friendship, properly used can do more to give prosperity and security to free Italians than anything the Communists can offer. And it is not the West's fault that the methods used by the Communists in Czechoslovakia probably killed Signor Togliatti's chances.

It is too soon after the event to assess the significance of these results for Italy's internal situation. There are possibly some

dangers, as well as advantages, in the fact that the government has an absolute majority over all other parties. Will it not encourage those very faults of omission in economic policy which have left Italy with great arrears in social and agrarian reform and the impression among many workers that Signor de Gasperi works chiefly with bankers, priests and industrialists? And it is not possible to say yet how far his triumph was due to members of splinter parties voting moderate instead of extreme Right, how far to conversions made from the Left. The Christian Democrats form now a party so heterogeneous, so much held together by simple anti-Communist feeling, that it may split too easily if its leader follows the radical internal policy that economic necessities and a 30 per cent Popular Front vote would seem to demand.

It is important to realise that this is not a victory of the Third Force or of moderate Socialists over Communism—it is a victory of the Right—certainly of the moderate Right, but one in which religion, family and other powerful interests that are regarded as sinister by the Left played a full part. Signor de Gasperi's party is Christian and Democratic in the way that the German CDU is. Its success will encourage the move towards non-Socialist policies that is taking place all over Europe. It demonstrates to Western Socialists—what events in Eastern Europe had already proved—the disastrous futility of the popular front policy, or even of fellow-traveller flirtations. Signor Nenni has blundered so badly that many of his followers may just abandon their alliance with the Communists. The lesson is useful at a moment when M. Thorez in France is suspected of trying to revive popular front ideas by conciliatory and patriotic gestures.

The check in Italy may be the signal for the Russians to

begin switching their diplomatic offensive away from the lesser powers of the West to remoter areas where the Great Powers can be more easily worried by mischiefmaking. The American counter-offensive, as planned, has reached its height in time for the spring; and it seems unlikely that the Russians, or the Cominform, will risk further losses of prestige by pushing Communist parties into ineffectual offensive actions.

It is of course possible that in Italy itself the Popular Front will continue the struggle by other means—by occupying factories, by guerrilla action, by sabotage and resistance. But so far there is no sign of the possibility materialising. The Communists seem still stunned at some of the things that have happened: Pescara, scene six months ago of a miniature Communist revolution, casting only 27,000 votes for and as many as 46,000 against the Popular Front; the peasants of the south failing to vote solidly Left; whole districts of industrial Milan, Genoa and Rome voting as never before. Such changes must make Signor Togliatti pause and ask what his effective appeal in Italy now is.

If, as seems likely, the next few weeks pass quietly, Italy should begin a new stage in parliamentary government in decent, serious fashion. The two Houses of Parliament have to meet on May 10 to elect a new President. To him Signor de Gasperi will offer his resignation and from him automatically receive the invitation to retain office and obtain a vote of confidence from Parliament. It would be a helpful and gracious act if, early in its career, the new Italian Government were to receive an invitation to join the Brussels Treaty of mutual co-operation which is intended to be the basic instrument of western unity. For the Italian people have made a memorable contribution to the principles on which that treaty is founded.

D-Day For Western Union?

ORGANS of European co-operation have been created in such numbers in the last few days that there is a real risk of public confusion. There is, first of all, the Continuing Organisation of the sixteen beneficiaries of the Marshall Plan, which has been set up on a permanent basis in Paris and bears the title of Organisation for European Economic Co-operation. Its chief body is called the Council and it is representative of all the sixteen participants, with M. Spaak as its President. Under the Council there is, first, an Executive Committee of seven members, designated annually by the Council, with Sir Edmund Hall-Patch as Chairman; secondly, a permanent Secretariat, with a Frenchman, M. Robert Marjolin, as Secretary-General; and thirdly, a number of technical committees, of which the most important is the European Customs Union Study Group. All these organs are probably to be situated in Paris, and it is perhaps by that geographical designation that they will be chiefly known.

Alongside these Paris organisations are what may be called the Brussels-London organisations, consisting (at present) of five-nations only, arising out of the Treaty of Brussels, but having their seat mainly in London. Of these the chief organ is the Permanent Consultative Council, consisting of the Foreign Ministers of the five participants and meeting, at least once a quarter, in each capital in turn. Beneath this there are two permanent five-member bodies, sitting in London, the Permanent Organ of the Consultative Council, which is to meet monthly, and the Permanent Military Committee.

To complete the picture, it should be recalled that there is also the Economic Commission for Europe in Geneva. This is an organ of the United Nations, and its eighteen members come from Eastern as well as from Western Europe, but exclude non-members of Uno. The Eighteen thus sit in Geneva, the Sixteen in Paris, the Five in London.

Here is enough constitution-making to please the most avid

amateur of political structures. It is all to the good that so many channels should have been created through which the nations of Europe can work out their mutual relations and their common problems. Unquestionably the work that has been done is good as far as it goes.

But how far does it go? That is a question which even the most acute observer will find it difficult to answer. Judged by documents signed, by pledges exchanged and by committees created, and compared with what existed twelve months ago, the progress made is impressive. But compared with the high hopes that have been raised in Europe and America and with the large phrases that have been on statesmen's lips, it is still not proven that any progress has been made at all. There is, after all, a fairly simple primary test. The object of all the turmoil is to achieve something that is familiarly, grandiloquently, and imprecisely referred to as the integration of Western Europe. A significant step will have been taken towards something that deserves the name of integration when, and only when, the nations of Western Europe have decided to pool some of their authority—that is, to transfer to some joint or central body the right to decide for them.

Has this yet occurred? In the Eighteen at Geneva, certainly not; the ECE is, and from its composition inevitably must be, purely advisory and consultative. Has it occurred at Paris? The new organisation has been set up under the sign of the pledge given by Mr Bevin and M. Bidault when the Paris Conference was summoned last summer:

In order to draw up a programme . . . a special organisation will be set up. . . . It will not interfere in the internal affairs of these States, and no action will be taken by it which could be regarded as a violation of their sovereignty.

A close examination of the text of the new agreement shows that this line has not been over-stepped. It has been approached, as in the phrase that the Organisation may "take decisions for

implementation by Members," but it is also clear that a member cannot be bound without his affirmative vote. None of the Paris organisations can decide a matter for a Government against its will. The Brussels-London organisations, being smaller and deliberately designed to serve as the core of Western Union, might be expected to include more of the vital principle of pooled sovereignty. It is true that the military committee can hardly be imagined to function at all without the principle of unified command and standardised equipment. But though some pooling of sovereignty may thus be implied, it is nowhere clearly stated or openly accepted. Of such specific objectives as a great free trade area, a common currency, common development of colonial sources of food and raw materials, the rationalisation of capital programmes—of all these, no one of which is attainable without some common instrument of government, some common executive authority, there is no mention.

It would seem, therefore, that the principle of unimpaired national sovereignty, of the right of governments to go their own ultimate way if they choose, has emerged from this orgy of constitution-building unscathed. Indeed, it is even possible to discern in Whitehall and Downing Street a certain air of self-congratulation over this fact, as over a victory won in a hard fight. Whether or not the preservation of national sovereignty is really a matter for congratulation is a question that different people will answer according to their different convictions. But what ought to be quite clear is that it is not even the first step towards Western Union. For Western Union, if it is to mean anything at all, must mean some pooling of sovereignty, some willingness to submit, in some defined questions, to the decision of a central authority. Without that, Western Union is merely a phrase of deception.

Indeed, there is some reason to fear that a situation may be growing up which is by no means unfamiliar in the history of British diplomacy—a situation in which British statesmen accustom themselves to using large phrases without really meaning them. Disarmament was one such, collective security was another; so was "steady and collective resistance to all acts of unprovoked aggression." There is no conscious hypocrisy in the process; it is merely the grandiloquence that comes naturally to politicians; but it feeds the legend of "perfidious Albion." Is it happening again? In every capital of Europe, the question is being asked: Does the British Government really mean what it says about Western Union? Is Mr Bevin really in earnest?

It would be wrong to conclude, on the evidence yet to hand, that he is not. There are plenty of sound arguments for the strategy of the gradual approach. It can very properly be urged that the immediate task is to smooth the path for Marshall aid, which, being both an urgent and a complicated matter, must inevitably rest between the American and the other Governments separately. It can truthfully be said that some of the Sixteen are already nervous about the lengths to which they have gone, and that to try to go further now might drive them out. This is certainly true of the Swedes, the Swiss and the Danes. It can be said that the best approach to Western Union is empirical, by trial and error, that the attack on the obstacles must not be frontal and concentrated; that there must first be reconnaissance and sorties.

All these arguments may be sound and sincere; nobody who is not in possession of all the facts can give them their appropriate weight. But if this is the real position—that the British Government (for its voice is the decisive one) is honestly anxious to go very much further and is moving towards its goal with all the speed that is prudently possible—then there is one acid test that can be quite easily applied. That is to observe how quickly, and on what scale, something further happens. The opportunities for speedy development are obviously much greater in the five-Power organs of the Brussels-London complex than in those at Paris. Those who want evidence of intent will therefore watch the five-Power organs very closely. It is there that

the first convincing signs will appear of whether the British Government is or is not prepared to surrender some of its national sovereignty as the price of a Western Union.

The Economist is one of the oldest advocates of a Western Union. But it would be foolish to underrate the gravity of the decision that is involved. It is no small thing for a Government to hand over any of its responsibilities to a foreign body. Mr Bevin should not be abused because he has not yet brought himself, or his colleagues, to face it. But the point is that he must face it now. If he goes on talking about Western Union, and setting up bodies that look as if they are designed to achieve it—and then when it comes to the point he has to confess that he is not in fact prepared to delegate to any joint body the power to decide anything of importance against his will, then he is running a very grave danger. Such a policy will not only lose for Britain all leadership among the nations of the Continent and drive them back to the anarchy of separatism, it will also produce most grievous disappointment and disillusion in America. Britain can no longer (if it ever could) afford to be deserted both by America and by Western Europe. If the British Government's real view is—as the trend of conversation in Whitehall would suggest it is—that, for good and weighty reasons, it cannot contemplate any real surrender of sovereignty now or in the foreseeable future, let it say so and make a reasoned case for so doing.

But if it really believes in Western Union, let it prepare to face the consequences and cease treating the whole subject as if it concerned the Foreign Office alone. And, above all, let it realise the need for haste. The threats and fears that created the present favourable atmosphere for projects of union may well diminish as time passes. Twelve months of conciliatory Russian diplomacy (if the two adjectives are not wholly contradictory) could cause infinite confusion in Western ranks, to say nothing of the British Labour Party. Moreover, it is only twelve months until the second appropriation for Marshall aid will be needed and if there is to be a continuous effort at recovery over the next four years, the Americans (who have a natural difficulty in seeing why a United States of Western Europe is not immediately practical) will need convincing that no time is being wasted. And thirdly, as was argued here last week, the only chance of solving the German problem (on which all else in Europe depends) is to win the race with time and have a functioning Western Union in existence before a liberated Germany makes the fateful choice between East and West. There is a need for haste, and there is also a possibility of hurrying. For even though Hitler's New Order (created in three years) and Stalin's east European bloc (built in the same space of time) are no precedents for a union of "nations which are free to take their own decisions," it is also true that the nations of Western Europe will move towards union just as fast as British leadership and American backing will take them.

It is urgently necessary that Mr Bevin should explain clearly what the next steps are and where they lead. No British Minister has yet made any statement from which anybody can deduce what Western Union is to be or when it can be expected to arrive. Strongly though Mr Bevin may object to the continental preference for defining ends before working out means, he must realise that leadership in Europe involves some concessions to European ways of thinking. To Frenchmen, Germans, Italians, Scandinavians, Western Union as so far defined means nothing. Mr Bevin took a great risk the other day in turning to his own use a phrase of Mr Churchill's: he said that the movement towards Western unity had come to the "end of the beginning." Mr Churchill's "end of the beginning" was the fall of Tunis, and the phrase was justified because he was resolved to go on, to take the great risk and to make the great sacrifices by which the prize was won. There is no evidence that Mr Bevin also has a final objective and a time-table. When is D-Day for Western Union?

The Fleming Report in Practice

THE Minister of Education was asked in the House of Commons last week whether he was aware that the London County Council had rejected 270 places offered by the independent boarding schools to London schoolchildren. This kind of question is typical of the misunderstandings which are current about the Scheme, commonly associated with the Fleming Report, but more correctly the outcome of the Education Act of 1944, to give children who would benefit from it the opportunity of an education at a boarding school. In the case of the LCC the facts are that about 280 places have been offered to the Council for next September; the applications from parents are now under review; a large number of places will be accepted, but probably not all, since the ages and sexes of the children considered suitable by the LCC do not necessarily fit the places open to them. Owing to the organisation of the independent schools it is inevitable that far more places should be available for boys than for girls, and that the majority of them should be available only for children who have reached the age of at least 13. There is nothing in the circumstances of London schoolchildren that automatically fits this very arbitrary ratio of boarding school places. Hence at least part of the difficulty, which applies as much to other authorities as to the LCC.

This is, however, only a small part of the picture which illustrates the progress made since 1944 in implementing the boarding school scheme. There have been many difficulties, not the least being the marked change in the political atmosphere that followed the postwar elections for Parliament and for the local councils. For all the reforming spirit of the Education Act of 1944 it was the child of a Government with strong conservative sympathies: it was therefore natural at that time that the independent Public Schools should be regarded with more tolerance than is now the case by many Labour Councils, with their passion for equality. To them equality means that every child should go to the council school, not that a more representative selection should go to the Public Schools.

The Fleming Committee was set up in 1942, "To consider means whereby the association between the Public Schools . . . and the general educational system of the country could be developed and extended. . . ." Two motives lay behind the committee's work. The first was a question of principle: how the reputation of the Public Schools for exclusiveness could be broken down, and their undeniable advantages be made available to a wider public, irrespective of wealth. The second was economic: it was thought at the time that the dwindling incomes of the middle classes, and the growing attractiveness of the state system, would bring the Public Schools into severe financial difficulties, and that some means should be found to secure their survival on more egalitarian lines.

Events have so far proved the second estimate wrong. The delays in school building, the shortage of teachers and the general upheaval in the state system of education have served to decrease its popularity—at least temporarily. For the Public Schools the waiting lists are longer than ever, in spite of large increases in fees, and the schools are reasonably prosperous. The middle classes are apparently prepared to spend even their capital, if they have any, on a first-class education for their children, reckoning that this is a safer and more remunerative investment than any other. How long they will be able to continue doing this is anyone's guess.

Progress in implementing the report has varied greatly. Some schools, such as Mill Hill, which started to operate a scheme of this kind before the Report was published, have already had the experience of three years' intake covering some 120 boys in all. Others have only had their first batch this

year, and others again are only starting next autumn. For the year 1947/48 some 700 places in all were offered by the schools out of a total of about 6,000 (excluding an unknown number of private arrangements between the schools and the local authorities, of which there is no record). For the year 1948/49 about 860 places have been offered, the ratio in both years being two to one in favour of boys, as against girls. The full number of places offered was not filled last year, nor will it be this year, but the offer is large and is likely to grow as new schemes get started. Methods of selection vary between school and school. The usual procedure is for the school to offer a number of places direct to one or more local authorities or to notify a central pooling committee at the Ministry of Education. The authority then selects a number of boys and girls on the basis of its own regulations for eligibility, and the school makes the final choice out of those proposed.

★

That so many offered places have remained unfilled arises from a fundamental difference of approach between the local education authorities and the school. The school is concerned to find children who will fit into the school life and make good on equal terms with those who enter by the normal means. They do not necessarily want the intellectual cream of the council schools, but still less do they want misfits. The education authorities, by contrast, are concerned with those children who will especially benefit by a boarding-school education. By definition this means boys and girls whose home background is unsuitable for a day-school life. The following regulations for selection are typical of many local authorities:

- (1) Children who are orphaned or neglected.
- (2) Children from homes where the parents are unable to look after them.
- (3) Children whose parents are abroad.
- (4) Only children.
- (5) Children from overcrowded homes, or where there is sickness, e.g. tuberculosis, in the family.
- (6) Children whose parents' business keeps them constantly on the move.

It is obvious that a rigid interpretation of these regulations would produce a very unrepresentative selection of children, and that the education authorities would be disburdening themselves of their problem children into the arms of the boarding schools. That this is only partly the case is due to the authorities' knowledge that the boarding schools will not accept more than a limited number of problem cases, and that they must leaven the lump with a scattering of really good candidates. How far this scattering becomes a fair proportion depends first upon the far-sightedness of the authority and secondly upon its wealth: not many authorities can afford to spend four times the cost of a day-school education on many normal children.

It must be admitted that the position of the education authorities is difficult. Boarding-school education is very costly. Fees vary between £60 and £300 per annum, the maintained and direct-grant schools being generally cheaper than the Public Schools, but the average is now round about £200 p.a. While it is possible to justify paying £200 of public money for poor Peter, whose father drinks or is tubercular, or for Paul, whose parents are in China, it is extremely difficult to give this preferential treatment to James and Jemina who are ordinary intelligent children, differing from the mass only in having parents who believe in boarding-school education. Parents may be prepared to spend this amount on the education of their own children, but as ratepayers they are generally not prepared to do so for other people's.

From the point of view of the local authorities, political principle, educational principle and wealth all influence policy.

that statements to press conferences, even public speeches, make little impression on the mass of continental people, who are still mostly nervous, irresolute and vulnerable to defeatist, even pacifist arguments. Much careful and solid work remains to be done before the war scare can be allayed, and before the full energy and confidence of the West are applied to the work of economic recovery.

Down to Work at The Hague

The Organisation for European Economic Co-operation (hitherto known as the "continuing organisation") has wasted little time in getting down to work. The Executive Committee, in which the main power and authority are vested, and of which the British representative, Sir Edmund Hall-Patch, is chairman, met for the first time last Saturday, the day after OEEC was set up. The first task of the committee is to revise and agree the programmes of imports from the Western Hemisphere and of aid required from the Economic Co-operation Administration. The situation has changed considerably since the first version of those programmes was drawn up in Paris last September. Certain needs have changed.

The pressure on the balance of payments of certain countries such as France has increased far more than was then foreseen. Availabilities in the United States have also changed. It seems more than ever unrealistic now to hope for substantial imports of American steel. On balance, dollar prices have risen, and this introduces another and important element in the revision of import programmes. Finally, there is now a definite framework within which the programmes must be made to fit, namely, the \$5,300 million appropriation to cover the whole of the Economic Co-operation programme for the next twelve months. In revising its programmes the Executive Committee of OEEC will have at its disposal the tentative but very detailed breakdown of aid which was submitted to the Appropriations Committee of the House of Representatives in Washington this week (and which is referred to in a Note on page 682).

No less important than the work of the OEEC will be that of the financial experts of the five signatories of the Treaty of Brussels, who are now at The Hague to prepare the way for their Finance Ministers, who will meet in Brussels towards the end of next week. Their main task will be to unravel the knots into which the trade and payments of the five countries have recently become tangled. The tangles are due mainly to the chronic tendency for Belgium to over-export to its European neighbours and the equally chronic tendency for France to do the reverse. The position can only be cured by more production and more exports from France and Britain. But the experts are expected to do some conjuring tricks which may allow trade to continue flowing while the more basic difficulties are being tackled. There is talk of a monetary fund for Europe, of a new intra-European compensation scheme assisted by some free dollars, of a joint guarantee fund by which the five will underwrite their mutual claims. Something will no doubt emerge from all this; but it will be well not to rate it too high, to appreciate that it will be no more than a conjuring trick, and to remember that the rabbit which will be brought out of the hat will have to be provided by somebody.

All Set for Scarborough

The revised agenda for the Labour Party conference at Scarborough has brought few significant changes in the provisional programme issued some weeks ago. The main amendments to the original resolutions concern Communist activities—this is natural, as the resolutions were framed long before the Czech crisis and the sharpening of the East-West conflict. Whatever the party Executive and the Parliamentary Labour Party may decide to do about the "fellow-travellers," it is clear that the delegates to the conference will be highly vocal, although the issue will never be in doubt. Some local parties, it is true, deplore the witch-hunt and express concern, mainly on liberal grounds, at the civil service "purge." Others, on the other hand, call for even more vigorous defence measures, particularly within the trade union movement.

An interesting debate can be expected to arise on the resolution from Eddisbury, calling on the Government to "act upon" conference decisions. This is substantially the same as an earlier resolution from East Lewisham, which was withdrawn at Mr Morrison's request. But while the minds of Mr Morrison and other Labour leaders may already be made up, the conference can easily be swung by a persuasive speaker, and pressure from the delegates might cause the Government temporary embarrassment. It will also be interesting to see how the left-wing

members, such as Mr Foot, Mr Mikardo and Mr Driberg fare in the elections for the National Executive. The conference will almost certainly place beyond the pale anybody who co-operates with Communists, but there is a large measure of support for the genuine "untainted" Left, to judge from the large number of resolutions calling for a more socialist approach to home and foreign politics. It will be revealing also to see the measure of support for Mr Dalton, who is being widely tipped in the lobbies as about to make his come-back.

The most important debate, from the national point of view, however, will be on the control of wages, prices and profits, which is the subject of an immense number of resolutions. These were framed before the Budget, but it is unlikely that Sir Stafford Cripps's statements on profits, which is widely regarded as showing undue sensibility for the FBI, will be favourably received. Much will depend on the outcome of this week's discussions between the Chancellor and the TUC. If the big unions are still not satisfied, and decide to throw their weight behind the constituency parties' protests, the White Paper on Personal Incomes may indeed become a dead letter.

Poll on Emigration

The grass is notoriously always greener on the other side of the fence; and few people have not, at one time or another, wished either positively to shift their ground to those greener pastures or, negatively, to Get Away From It All—whether "it" be a queue in the London drizzle, a starved farm in Southern Europe, or even (dare one suggest it?) Main Street, Hicksville, Hicks County. The wish may result from a solid and rational weighing of advantages; but it may equally spring from irrational exasperation and romantic ignorance. For this reason it is doubtful whether much importance should be attached to the decidedly sensational results of the public opinion poll survey, recently conducted in nine countries, which showed 42 per cent of the adult British public (58 per cent of those between 21 and 29) and an average of over 25 per cent of the adult public elsewhere, as wanting to emigrate. How many of these, one wonders, would in fact accept the offer of a magic carpet to South Africa, and of those, how many would want to stay? Even the statistics of inquiries at Dominion immigration offices mean, indeed, comparatively little. Plenty of people enjoy pipe-dreaming over a leaflet who would not think of selling up their home. More significance might be attached to the fact that the British proportion was higher than that of any other country; but this is at least as likely to result from the long British tradition of overseas settlement as from any greater sharpness of British discontent. Even the striking increase since the similar poll, which, taken immediately after the end of the war, gave a total of only 19 per cent of would-be emigrants, can easily be accounted for by simple psychological factors; in 1945 most people had had quite enough of being uprooted from their homes and asked nothing better than to settle down.

Altogether this inquiry, though entertaining enough, is not one of those in which the Gallup technique shines. That technique can extract significant and reliable information on topics concerning which people have genuinely thought and formed opinions, as is demonstrated by its record in electoral forecasting. It can also give a solid statistical content to generalisations such as that "the public is reading more." It fails when, as in this instance, the replies elicited are as likely to originate in momentary fantasy as in solid opinion.

The BMA Replies

Now that the forms for the new plebiscite of doctors have been sent out, the attitude of the British Medical Association's leaders towards the national health service is seen to be less intransigent than was feared from the reports of a week-end speech by Dr Guy Dain, chairman of its council. Accompanying the form is a statement of what has happened since the last plebiscite was held, including a full report of Mr Bevan's conciliatory statement in the House of Commons on April 7th and his replies to the questions subsequently put to him by the British Medical Association. The views of its council are given very briefly. It points out that the profession has succeeded on two of the main questions disputed with Mr Bevan. A whole-time salaried service will not be introduced without a new Act of Parliament, and the basic salary will not be universal. On the other hand, it has lost the fight over the ownership of the goodwill of medical practices and the right of appeal.

The council then goes on to say that in its view, "while progress has been made . . . the freedoms of the profession are not sufficiently safeguarded." But it refrains from appealing to doctors to vote against the health service. Instead it urges them to study the facts, make up their own minds and then vote. This restraint is greatly to be welcomed. But it is impossible to say which way the plebiscite will go. Undoubtedly, the profession has won a big victory, for Mr Bevan does not easily climb down to the extent that he has done. And many doctors will be content with what they have won. Others will feel so confident that they will want to stand firm until they have obtained all their demands. It may be too much to hope that the large majority against the health service shown by the last plebiscite can now be converted into a majority for it. But if this time the doctors refuse to co-operate they will meet with far less sympathy. The public recognises that Mr Bevan made a big gesture, and it will expect it to be reciprocated.

Bungling in Berlin

General Alexandrov can hardly refute, even if he rejects, the findings of the British Court of Inquiry into the Gatow air disaster. The inquiry proved beyond reasonable doubt that the Russian fighter pilot was to blame, and a normal general in normal circumstances would now retire with what grace he could muster and leave his Government to make amends for an act of tragic recklessness.

The evidence before the Court included statements by British, American and German eye-witnesses, meteorological data, and technical evidence collected from the wreckage of the Viking and the Yak. The Court was able to reconstruct with a high degree of accuracy the path followed by both aircraft; it was also able to establish that the presence of the Viking was known to the Russian authorities in the Berlin Air Control Centre while that of the Yak was not. There was no evidence to show that the collision was anything but an accident. It was caused by the antics of a pilot who disregarded not only the accepted rules of flying but also the quadripartite rules governing air traffic over Berlin.

The cause of the accident has been established: the other outstanding question—whether the "frolicking" by Russian aircraft was part of the deliberate policy to interrupt communications with Berlin—has also been partially answered. The evidence showing that the Russian officer on duty at the Berlin Air Control Centre was ignorant of the presence of the Yak makes it unlikely that orders had been issued to carry out aerobatics in the vicinity of Gatow, provided that the possibility of the Russian controller's best recorded as an example of dangerous and discourteous bungling by the Russians in what should have been a straightforward matter.

Some bungling of a different but none the less dangerous character was admitted by Mr McNeil in the House of Commons on Monday. Determined inquiries ordered by Mr Bevin had brought to light the German who composed Protocol "M," a Communist plan for strikes and political resistance in the Ruhr, which was swallowed very nearly whole three months ago by the Foreign Office and the European press. The author must have been painstaking and hopeful of reward, for the forgery was done well, but not quite well enough. Scepticism about it was made with rather bad grace.

Further inquiries would doubtless reveal other contributions which Germans are making to the East-West dissensions—in political warfare, in intelligence activities and in para-military roles. In the Russian zone no bones are made about them; in the British zone they should as a matter of principle be kept severely in check. Such German collaboration in the long run only benefits German nationalists; and a closer watch should be kept on those organisations which, in the name of security, are allowed a free hand in their treatment and use of Germans.

Joint Forces for Palestine?

The atmosphere of unreality in which the General Assembly has been re-discussing Palestine was deepened this week, when Mr Warren Austin said the United States would take its share of responsibility for enforcing trusteeship only if other Powers took theirs. It is certain that no government will offer forces

to police Palestine unless the Americans do, and it is by no means certain that any will do so even then. So, unless Mr Austin can give some more positive lead, there is little chance of the American trusteeship proposals being adopted.

If, on the other hand, America does come down to brass tacks, and if other Powers can be found to put their names to the undertaking to enforce the decision of Uno, they will certainly once more look to Britain to tide over the gap between May 15th and the earliest date on which the new international police force could go into action. It seems unlikely that the British Government and people would even then be in the mood to delay their withdrawal; but they must face the fact that they would be under a new moral pressure to do so. Naturally this point would not be reached until after the adoption of a trusteeship scheme, since any relenting by Britain before then would merely encourage the Assembly once again to evade the real issues of enforcement.

However much they might want to help to seek a new solution, the British are bound to be sceptical of the whole idea of an international force. They have their own experience, in the impossible conditions of Palestine, of the tension that may arise between different parts of the administrative apparatus even when the whole is British. It took years, for instance, to achieve real co-operation between military and civilian officers at all levels and some harmony between Government and Army intelligence. But intelligence is vital to security, and it may be imagined what chaos would arise with each national component of an international force compiling its own intelligence reports. And how could they do otherwise? New to Palestine, new to one another, they would be at the mercy of the first plausible intriguer. This is only one of the many practical problems which an international force would have to solve. No doubt its members might settle down in time, but no time would be allowed them. In the confusion they might well be doing more harm than good.

Forgotten at Geneva

Where will the Economic Commission for Europe (ECE) fit into the elaborate mechanism of the new western organisation? ECE was established by Uno last year as a sub-commission of the Economic and Social Council, and has delved into a wide range of European economic problems—coal, timber, steel, fertilisers, electric power, transport. In nearly all these fields the Commission has worthy achievements to its credit. It has allocated co-operatively the exportable surpluses of such scarce raw materials as coal and timber. By reallocating supplies of coke and coal it has increased the European output of nitrogenous fertilisers, and at the same time has helped to raise European steel production by over a million tons for the current year.

ECE has three contributions to make toward European recovery over and above what the Marshall group alone can provide. First,

The Economist by Air

The Economist can now be sent by air to countries in the Western Hemisphere at the following annual rates of subscription:—

United States and Canada

By Air Express to New York and thence by surface mail . . . \$24
By Air Express to New York and thence by Air Mail (not recommended for points east of Kansas City or Winnipeg) . . . \$27

Argentina, Brazil, Chile, Uruguay, Paraguay, Falkland Islands . . . £7
Bahamas, Bermuda, Bolivia, Cayman Islands, Colombia, Cuba, Jamaica, Peru, Trinidad and Tobago, Turks and Caicos Islands, Venezuela . . . £8

Subscriptions for the above should be sent to:

The Publisher,
The Economist, 22 Ryder Street, St. James's, London, S.W.1.

These are valuable assets. It would be rash to sacrifice them, through jealousy, distrust or indifference, for the newly-born Western group in Paris, which will need all the expert assistance that can be mustered.

There is no good reason why either the Western or Eastern bloc plans for co-operation among themselves should exclude such attempts to re-form some of Europe's prewar trade patterns.

But the chief interest in the Wolverhampton survey lies not so much in the medical support that it gives to those who want a longer working life for the community, as in the detailed descrip-

Mr Bevan has recently been criticised for his circular discouraging local authorities from setting up health centres in view of the need to cut capital expenditure. He is quite right. There may well be a case for a few experiments in health centres to determine just what types are wanted in particular localities. But, at the moment, a general establishment of health centres, each with its complement of technicians, secretaries, clerks, nurses, almoners—and, probably, statisticians—would involve another large addition to the cost of the health services. It might be justifiable. But before the community assumes the burden, someone ought to produce the justification.

This scheme has been worked out after prolonged study and discussion by a committee of representatives of Britain, the United States, China, Canada, Belgium and Colombia, and is a sincere and serious attempt to provide for a free democratic decision in Kashmir. It has had, however, a bad initial reception in India, and Pakistan is not altogether satisfied with it. Indian opinion holds that Uno has failed in its duty of judging who is to blame for what has happened in Kashmir, and is wrong in putting

Either full democracy within the state or federal control from Delhi would destroy the Moslem character of the kingdom. The Nizam and his advisers, under Indian economic pressure (which can be very serious for their land-locked territory) might go far

Most officials write grammatically correct English. Their style is untainted by the silly jargon of commerciaese, the catchpenny tricks of the worst sort of journalism, the more nebulous verbosi-

At any rate, the new regime will be on good terms with most countries of Latin America. Venezuela and Guatemala gave at least a moral support to its members in the fighting which has just ended. Important elements in Peru, Chile and other states approved of the rebels' aims. The defeated Government, however, had the active support—at a price now exacted in territorial acquisitions—of Nicaragua: a Nicaraguan General and many troops were killed in the fighting. It also found sympathy and perhaps arms in Dominica and Mexico. But the fact—noted in an article on page 676, which gives the background to the civil war—that the United States favours the Ulate faction, is likely to prove decisive. For Washington, perturbed by events in Colombia to the south of the Panama Canal, is keenly alive to the necessity for a reliable and well-disposed regime in Costa Rica a hundred miles to the north of it.

In short, this is an instructive as well as an entertaining book. And if the reviewer points out one small slip of Sir Ernest's on page 16—"about which you wrote me" ought surely to be "about which you wrote to me"—he will certainly be able to counter-attack by pointing out a dozen mistakes of the reviewer's. Is that

relative clause in the first sentence a defining one or a commenting one? Does it consequently need a comma before it or not? Let us defiantly commit what Sir Ernest considers a grave sin—and leave it to the printer.

The Mediterranean

"The Mediterranean." By Andre Siegfried. Translated by Doris Hemming. Jonathan Cape. 10s. 6d.

THE Mediterranean is variously spoken of as a highway, a lake, an atmosphere, or a civilisation. And Mr Siegfried is right to start his book on the assumption that some of the chief political problems of the globe are still to be found on its shores. But is he so justified in regarding actual command of the Mediterranean as "a vital necessity to each of the belligerents" in another world war? In the past the Mediterranean Sea has always been the heart or at least an artery of the known world. Now, not only are America and Russia succeeding Western Europe as more distant centres of power, but atom bombs may render the need to command the Mediterranean out of date.

But whatever pleas Mr Siegfried may seem to have put forward to excuse his writing this book, both in his long preface and equally long introduction, the book itself reveals that he must have written it because he wanted to. This is at once its strength and weakness. For he has poured into it much fascinating information about every conceivable aspect of the Mediterranean area—its geology, climate, flora, races, industries, agricultural methods, mineral resources, directions of trade, and even its most common diseases. His main fact-finding task, however, has been accomplished by other writers—as he is the first to indicate by means of constant references in footnotes, although he gives no listed bibliography.

What Mr Siegfried has achieved is a book which, even in translation, reads as the work of an experienced, if elderly, writer. And for anyone interested in the people and lands bordering the Mediterranean his ubiquitous survey will provide pleasantly cultured reading.

Colonial Administration

"Mining, Commerce and Finance in Nigeria." Second part of a Study of the Economics of a Tropical Dependency. Edited by Margery Perham. Faber and Faber. 35s.

To appreciate the economic and political tensions of Nigeria is to understand the colonial problem. With its population of over 22 million, its poverty, its dependence on a few export crops, its race animosities and growing anti-white prejudice, Nigeria bids fair to become Britain's main imperial pre-occupation in the next ten years. After India and Palestine, perhaps Nigeria.

From The Economist of 1848

April 22, 1848.

But what have we witnessed [in France] since the beginning of February? It is now two months since the revolution was completed. The existing constitution was destroyed. The reigning family driven from the country. The chamber of representatives overturned, and their place occupied by the mob, and a provisional government of its choice, who have ever since ruled the whole thirty-seven millions of people in France by a despotism unknown in the worst times of a monarchy. There is scarcely an excess which a government could commit which has not been committed during that period, in the name of liberty, equality, fraternity. The public treasury has been despoiled to pamper and maintain an idle train of supporters. Loans have been forced from the bank. Taxes of the most unequal and oppressive kind have been imposed. Railway property and the daily receipts have been confiscated. A national army has been formed, the officers being sworn to protect the order of things as laid down by these few men—who pretend to act only provisionally until the voice of the country can be ascertained through a national assembly about to be elected—against any decision to which such assembly may come of a different tendency. But while all this despotism, disorder, and ruin have been going forward, under the dictation of a small party in Paris, what in reality have the provinces done to avoid the inevitable ruin into which they have been plunged? Literally nothing, though two months have already passed. . . . In speaking of the French as an "unlearning" country, we did not allude to "the kind of knowledge imparted to the young" in schools, but to that practical experience and reflection which teaches men what really constitutes good government and true liberty.

There is now a sizeable literature on the whys and wherefores of Nigeria's problems, in which this book and its preceding volume will find a useful place. But they all leave off at the point where an original contribution is required. This is as true of this book as of others. What is required now from writers on Nigeria is a convincing scheme for a smooth transition, or alternatively, a reasoned case to show that such a method is unworkable, and where and to what extent collectivist techniques should be applied. Far too much energy is spent these days in attacking Nigeria's ten-year development plan without offering anything better in its place.

These two volumes which Miss Perham has edited have collected together a praiseworthy mass of informative material. As a series of monographs they have great merit. Some readers, however, may be discouraged by the sheer weight of detail and the absence of any noticeable theme. In addition, the second volume in particular loses much in clarity owing to the infuriating weakness of some of the writers for dressing up their descriptive passages and arguments in unnecessary economic jargon. This gives the book a pedantic flavour.

Studies of Industry

"Further Studies in Industrial Organisation." Edited by M. P. Fogarty. Methuen. 15s.

THIS second collection of by-products of the Nuffield College Social Reconstruction Survey enables Mr Fogarty to draw attention to some problems of industrial progress which are often overlooked. It is easy, as he points out, to direct public attention to basic industries like iron and steel, or to industries (like cotton) which fall into chaos and disaster on a resounding scale—or at the other extreme to those capitalists who run their affairs so well that they become labelled as "bloated." These four studies include no major industry in the ordinary sense, though they do include one—flour milling—which is highly mechanised and efficient, has organised itself so thoroughly as to give rise to charges of monopoly practices, and altogether has given offence by "an almost too luxuriant prosperity." But of the four industries studied here, flour-milling still comes off best; the millers, through the Millers' Mutual Association and their rationalisation scheme of the interwar years, served themselves well, but compared with more conservative industries they did not serve the public ill. Indeed, Mr Fogarty comments, "a dose of the medicine administered to flour-milling would have done the fishing industry a world of good."

For comparison, three conservative industries are examined in the same collection—white fish, granite and brewing. And within one of them, the white fish industry, the same point is repeated: only the Hull trawlers, using a technique of combination and re-equipment, succeeded in progressing when other fishing centres were losing the initiative. The Aberdeen granite industry is presented as an example of the sleepy mediocrity which gives no offence, attracts no nationalising zeal, but contributes little or nothing to economic improvement. Built up around the Aberdeenshire granite deposits, it was for a time a useful export industry; in the 'twenties and 'thirties it let its exports go and settled down in modest comfort to the processing of largely imported stone. For this decline there are no really convincing excuses; clearly, if the life force had been stronger, more could have been done.

Professor Hamilton's study of the granite industry, like Dr Rankin's study of the Edinburgh breweries, has not taken inquiry far or provided enough information to justify any very clear conclusions. *Further Studies in Industrial Organisation* is a useful collection, but by no means even in quality or thoroughness. The technique of inquiry and of presentation can still usefully be improved, if inquiries of this sort are to play the important part in economic progress which Mr Fogarty suggests.

The Marshal's View

"Italy in the Second World War." By Marshal Badoglio. Translated by Muriel Currey. 234 pages. 12s. 6d.

THE publishing of an English translation of this book will do much to help people in Britain understand the Italian point of view about the last five years. Marshal Pietro Badoglio, Chief of Staff to Mussolini when the war began, resigned in December, 1940. Then, when Fascism collapsed in July, 1943, it was he who—playing with skill and no little understanding the traditional but invidious role of "soldier-to-the-rescue"—gathered together the remnants of his country and held them for nine crucial months till Rome was liberated.

The book itself consists more of a series of short passages than a continuous whole. Its sub-title is, accurately enough, "Memories and Documents"; the last fifty pages, in fact, supply

most of the documents in the form of appendices. But there is a constant theme which runs throughout the book, the theme of Italy's effort, first, to extricate herself from a lost war which she should never have entered, then to "work her passage" with the Allies. The main interest of the book is Marshal Badoglio's own account of the way in which both the terms and application of the armistice developed, after as well as before the date (September 8, 1943) on which it was so hurriedly declared. He himself, he says, never accepted unconditional surrender. That was not what he bargained for. And he tells, sometimes a little bitterly, of how he repeatedly came up against a very different Allied interpretation from his own.

Many events can only be properly assessed when at least thirty years have passed since they occurred. Italy's move from German alliance to Allied co-belligerency is undoubtedly one

Letters to the Editor

Consumption Up or Down?

SIR,—What follows is an inquiry and a challenge. The White Paper on National Income (Cmd. 7371) claims that total personal consumption in 1947 was slightly above the 1938 level, subject to reservations about the quality of output. This seems to clash with other figures provided in the same White Paper.

The optimistic conclusion depends essentially on a postulated average increase of prices, which is taken to be 61 per cent, net of subsidies and indirect taxes (tables 21 and 22). We can calculate from information provided in the White Paper that costs of production (including profit) were up on the average by some 80 per cent. How is it possible that, costs being up by 80 per cent, the whole range of consumer goods and services, some three-quarters of the whole output (including direct work for the Government), could be offered at only 61 per cent, net of subsidy, above the old level?

It might be argued that this was due to an increase of efficiency. On this, however, we have a counter-check. We have a firm figure for the average of export prices, which was up 130 per cent. This covers a very wide range of articles, some of them identical with domestic consumer goods. This is a Board of Trade figure, which may be taken to be fully reliable. The discrepancy between a rise of 61 per cent in one large average and of 130 per cent in the other is too great to be accepted.

It is true that the cost components of the exports have risen more than those of the wide range of goods and services included in the other average. I have made some very elaborate calculations, on various assumptions, and the maximum spread between the two sets of costs which it is possible to assume would give rise to an increase of prices on the export side of under 100 per cent and on the home side of over 70 per cent.

The fact that money wage rates and other money costs per unit in the export trades cannot have risen in as high a proportion as export prices indicates a decline in average efficiency. The calculations show a decline of 13 per cent, and this does not seem unlikely. But loss of efficiency cannot be confined to the export trades. If we make the charitable assumption that the efficiency of "services" has not fallen appreciably, the decline in efficiency in the whole range of domestic consumer goods and

of them. Even now the full facts are scarcely known about such episodes as the failure to defend Rome or the decision to declare the armistice on September 8th instead of the 12th. It is in supplying part of the evidence on which historical judgments can be made that Marshal Badoglio's book is of standing value.

Shorter Notice

"The International Who's Who." 12th Edition, 1948. Europe Publications Limited, 39, Bedford Square, W.C.1. 1032 pages. £4.

THE twelfth edition of the *International Who's Who* has now been issued. Like its predecessors, it is a comprehensive book of reference which will be of assistance to those needing biographical information about the illustrious and important.

services may be put at 9 per cent. Assuming this loss of efficiency, and taking the rise in money costs of production which we know, and comparing them with the total amount of money spent on consumer goods and services, personal consumption must have declined by 12 per cent in total and consumption per head by some 16 per cent.

The discrepancy with the White Paper is probably due to (1) prices actually paid being higher in many cases than those reported to the authorities and (2) to quality having declined.

This is clearly a matter of great public moment. It is important that the truth should be established.—I am, etc.,

Christ Church, Oxford

R. F. HARROD

Educating German Youth

SIR,—Today many difficulties are said to exist regarding the democratic education of young Germans at higher schools. There are not enough teachers, trained in democratic ideas and informed about up-to-date life in foreign countries, nor available good school books, especially books concerning history. World history would be very useful.

In spite of all that, it is now undoubtedly necessary to give German youngsters a chance of overcoming the situation by action rather than theory, to give them more possibilities of free spiritual development. How is that to be done?

There are now so many foreign people living in Berlin. Why do not the English especially send representatives—perhaps regularly—to the upper classes of German higher schools. Today more than ever before this would have great influence, and many German boys are eagerly expecting this. They want to hear more about how English people carry out things in their own way—from English persons themselves. Perhaps it might be of use to place a "lecturer" or assistant in every secondary German school. Young English university students might volunteer to pass a year in a German school, living and working with the German youngsters. German youth would profit very much from this contact with England.—Yours faithfully,

Berlin, NW 40, Lehrter Str. 18/19

ANNUITIES

(Single lives : Last survivor : "Capital-protected" : "Capital-redemption" : Reversionary : Certain : Deferred, etc.)

Circumstances have made annuities an attractive proposition to an increasingly large number of people, particularly now that the capital invested in them can be safeguarded against loss due to premature death. Very considerable loss (up to £1,000 and over in individual cases) has been and is being sustained by the public due to their entrusting the purchase of their annuities to inexperienced and unrepresentative part-time agents. The undersigned has specialised for many years in every kind of annuity issued by the various Life Offices (for all of which he acts impartially and in the sole interests of his clients), and is therefore in a position to advise on those giving the highest NET yield with complete safety.

AMERICAN SURVEY

Reversal on Japan

(From an American Correspondent)

THE State Department and the Army are preparing to abandon their hitherto stern policy for the economic disarmament of Japan. Plans now taking form call for leaving the Japanese practically all of the industrial capacity with which they waged the war and for financial assistance to get it into full production again. Restoration of a "self-supporting" Japanese economy, it is revealed, has become a "primary objective of the occupation."

A "build-up" for the vastly more lenient new attitude began on March 1st when the Army, discarding its policy of secretiveness, made public a report compiled for it by a group of New York industrial engineers, Overseas Consultants, Inc., which took sharp exception to the amount of reparations removals that the American Government had advocated before the Far Eastern Commission. It received new impetus on April 6th with the return from Japan of a second group of industrialists, including Mr Hoffman, who has since been appointed head of the Economic Co-operation Administration. Speaking for the group, Mr Hoffman said it was now apparent that economic reparations, like the dollar reparations after World War I, were of little value to the recipient nations. Rather than carting off Japanese plants, therefore, he said the United States should start "spending for recovery" in Japan in order to avoid "spending and spending and spending for relief." The case being made for the new policy is distinctly reminiscent of the softening of policy towards Germany a year or so ago.

Japan has very little tillable land, it is argued, and therefore must import food to live. To buy food she must export the products of her abundant labour. By 1953 her population will be 30 per cent greater than in 1930-34, her non-farm population 60 per cent greater; therefore, she must have a much larger industrial capacity than she had before the war in order to sustain even a bare minimum standard of living. Production is the only solution to her problem; if she does not produce the United States must go on supporting her indefinitely and that would be an intolerable burden on the taxpayer.

There is a further resemblance to the transformation of policy towards Germany in the fact that the spearhead of the new policy is the Under-Secretary of the Army, Mr Draper. As a major general and economic deputy to General Clay in Germany, he is credited with having been a leading opponent of the early postwar American policy on German reparations. He has been plugging hard for a downward revision of Japanese reparations ever since he donned mufti and became Under-Secretary of the Army in 1947.

These similarities, however, are no more striking than one great dissimilarity. Now it is argued that the Japanese have discarded their warlike ways, their ideals have been "reoriented" under General MacArthur's skilful leadership. In a statement for the press, the Hoffman group declared:

We have been greatly impressed with the . . . progress made in developing representative government. . . . A thoroughly

democratic constitution has been adopted and an elected Diet . . . is actively functioning. . . . Moreover, said Mr. Hoffman, the Japanese people feel the war was a tragic mistake . . . one of the greatest misadventures of history. Consequently, they have "uprooted" . . . all military influence.

"Every Japanese," said Mr Draper, who accompanied Mr Hoffman and his party on their two-week study in Japan, is "co-operating with the occupation government."

Eight months after the end of the war Mr Pauley, the President's personal representative on reparations, declared that Japan still had a "top-heavy industrial structure"—one "incapable of functioning efficiently except when geared either to making war or preparing for war." Overseas Consultants take a different view. Japanese industry suffered greatly from bombing, they say; Japan now has "few of the raw materials needed for war" because she has lost her empire. She has been deprived by her victors of "the ability to manufacture guns, tanks, warships, airplanes and munitions [and] she has no military organisation." In their report they said:

We realise that the first requirement for waging modern warfare is a strong industrial economy. Even the ability to produce more food increases a nation's war-making potential. An industrialised Japan, therefore, unless carefully controlled, might become a strong military power. In our opinion, however, a strong industrial Japan would be less dangerous to the peace and prosperity of the Far East than a continuance of the present state of instability and economic maladjustment. . . . [Chances for permanently reorienting Japanese ideals along peaceful lines] will be improved if the Japanese are permitted a reasonable standard of living.

In a policy paper laid before the Far Eastern Commission in April, 1947, the United States proposed a level of industry for Japan which would provide her people with a standard of living roughly the equivalent of that they enjoyed in 1930-34, the period before her big campaign for conquest. Mr Draper and the others do not dispute the wisdom of this policy. They merely argue that a much higher level of industry than is contemplated by this policy paper will be necessary to provide the standard of living it aims at.

The document of twelve months ago designated 21 categories of "war supporting" industries in which Japanese capacity was to be reduced through reparations. These included steel, merchant shipping and machine tools. Overseas Consultants would leave all present pig iron, steel, machine tool and ball bearing capacity intact. Instead of 21 categories from which reparations would be allowed (exclusive of such "primary war facilities" as arsenals and airplane plants), they proposed only five: nitric acid, synthetic rubber, shipbuilding, aluminium and magnesium fabricating and magnesium reduction. To attain the 1930-34 standard of living, they argued (and the Hoffman group concurred), Japan needs "more, rather than less, productive capacity than she now has" and "at least as large a tonnage of merchant ships" as in 1937, when the war against Manchuria began. Not only would removal of present capacity destroy "any chance of her becoming self supporting" but it would "hurt world production and thus world recovery." The Far East, Mr Hoffman said, "needs Japan's production."

Full agreement on the details and degrees of change proposed by the Hoffman group and Overseas Consultants does not yet exist in the State Department. But it is known that the director of the Department's policy planning staff, Mr Kennan, who

recently made a visit of investigation to Japan, and other leading policy-makers agree with the principle of making the Japanese "self-supporting." Mr Draper announced that his request to Congress for \$150 million to finance a twelve-month economic recovery programme beginning July 1st was concurred in by the State Department.

"Off the record," military and diplomatic policy makers now say that Japan must become the fulcrum of American policy in the Far East. It had been hoped, they say, that China might emerge as the new "workshop of Asia" but China is prostrate and the rest of Asia is weak. Political instability elsewhere precludes a "redistribution" of industrial power such as was envisaged at the end of the war to insure against a re-emergence of an aggressive Japan; moreover, moved elsewhere, Japanese machines most likely would lie idle and be consumed by rust. Communism thrives on poverty and misery; production is needed to alleviate poverty and misery, ergo Japan must be revived as the "workshop" because only Japan has the capacity and the skill for production.

In preparing this new policy, the planners recognize that it will be distasteful to other Asiatic powers who have a deep and abiding fear of a resurgent Japan. In China and the Philippines, and to a lesser extent in Australia and the Netherlands East Indies, reparations are a highly emotional and explosive political subject. But fear of Russia is greater than the fear of ruffling the feelings of neighbours heavily dependent on the United States.

Electoral Geography—I: Illinois

[FROM A CORRESPONDENT IN CHICAGO]

SEVEN months before election day all signs point to a sweeping Republican victory in Illinois this November. The Republicans should carry the State for their candidate for the Presidency. They should also win the governorship and elect their candidate for the Senate. It seems likely that out of 26 Congressional seats they will win all but six or seven. The factors behind this forecast of Republican success are these:

1. The inevitable political mildew that affects the leadership of any political party that has been in office for 16 years.
2. The public's natural desire for a change after 16 years of national rule by one party.
3. The lack, on the part of President Truman, of any trace of the political glamour for which President Roosevelt was noted. The most Mr Truman can achieve in a public address is a note of intense and straightforward seriousness. This may command respect. It does not command enthusiastic loyalty.
4. The ineptness of American policy on Palestine. The votes of the majority will not be determined by the Palestine question; but the votes of a strategic and compact minority will, and of course the Zionists will vote against what they regard as the President's double cross on Palestine. If President Truman successfully insists on being nominated, the cohesion of this Zionist vote will be almost complete. If President Truman should step aside in favour of another candidate, there would be some splintering of Illinois Zionist votes, but under almost any conceivable circumstances, the Palestine fiasco will be costly to the Democrats, particularly in Cook County (Chicago) which casts more than half the State's votes.

More important than any of the preceding four points (which in themselves might be enough to ensure a Republican victory in Illinois this November) is the presence of the Henry Wallace Progressive Party. Some months ago a judicial election was held in Cook County. For many years it has been the custom of the Republican and Democratic parties to put up a joint list of judges in Cook County. Sensing that many voters were tired of this fusion practice, which gave the voter no real choice in picking county judges, Mr Wallace's supporters in Illinois recognised that the judicial election was a good place to launch a new party. They placed a complete list of judicial candidates on the ballot. The list included numerous Communist fellow-

travellers as well as a top dressing of one or two very respectable men—one a law professor of some standing from Northwestern University. Though no Progressive candidate was elected, the highest man on the ticket received 320,000 votes. The lowest man got 140,000. It is possible to dismiss the vote of the top Progressive candidate as being of little significance because it included a large protest vote of citizens who will vote Democratic or Republican this November, but who wanted to record their protest against the collusion of the party machines at the judicial election. The vote of the lowest candidate on the Progressive list can hardly be thus dismissed. It represents the hard core of Communist, fellow-traveller and perennial dissident votes, a basic minimum on which Mr Wallace can count in November.

In 1944 Franklin Roosevelt carried Illinois by 142,000 votes. In view of the four basic points made at the beginning of this discussion, no one thinks President Truman, or any unknown substitute Democratic candidate, can do better than President Roosevelt; indeed, all evidence is that the Democratic candidate, even without Mr Wallace in the race, would do rather worse than Roosevelt in 1944. It is therefore very important that the hard core of Wallace votes in Cook County alone is almost as great as Roosevelt's 1944 margin of victory. The votes that Mr Wallace will get will clearly come overwhelmingly from the Democratic party, since Henry Wallace represents extreme leftism, and there are no extreme leftists among the ranks of the Illinois Republicans. The consequence will be that the Democratic vote will be split. The Republican vote will be united.

★

The Chicago returns, particularly in the two wards where the population is some 60,000 to the square mile (as contrasted to an average of 15,000 for the city as a whole), will give some comparison of the effectiveness of Mr Truman's effort to attract the Negro vote by his Civil Rights programme, and of Mr Wallace's frequent appeals to minorities. But it is more than likely that the greater part of the Negro vote will go Republican, partly because the Republican machine traditionally knows how to reach these voters, and partly because of the extra lure that the bandwagon has for a minority.

The position of labour will also be a factor of importance. Officially, Illinois labour will support the Democratic nominee, whoever he may be. But the enthusiasm that brings workingmen to the polls in great numbers is not likely to be present unless the Democrats can pull some now unknown and very commanding personality out of the hat. Some of the members of the Congress of Industrial Organisation's extreme left wing unions will stray into the Wallace camp, despite the instructions of the CIO's national leaders. There is one qualification that should be added. If the Republican party should nominate Senator Taft as its Presidential candidate, Illinois labour would turn out in force against him. The Illinois labour vote cannot be swung as a bloc in most instances, but the hatred of Senator Taft in labour circles, a hatred that is intensified every time the Taft-Hartley Act is mentioned, would unify the Illinois labour vote and bring it out in large numbers to vote for anyone running against Mr Taft.

This automatically raises the question of pre-convention manoeuvring in both major parties. The Illinois Republican leadership is a distillate of the most extreme reaction and isolationism. Its leading light is Colonel Robert McCormick, publisher of the *Chicago Tribune* and often described as one of the most progressive minds of the 16th century. Its Senatorial incumbent, Senator "Curly" Brooks, who is up for re-election this November, yields little if anything to Colonel McCormick in either reaction or isolationism.

The Illinois Republican leadership (which was influential in financing the elaborate and entirely unsuccessful MacArthur campaign in Wisconsin) would like, first of all, to have Senator Taft as the Republican Presidential nominee. Failing that, it would prefer General MacArthur, and as third choice it would like Representative Joe Martin, the Speaker of the House of Representatives. Failing any of these, it would accept and support with only moderate enthusiasm a ticket headed by

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Senator Vandenberg of Michigan. Colonel McCormick, in the event of a Vandenberg nomination, would probably find himself so completely frustrated by a choice between a Democrat and an internationalist Republican, that readers of the *Tribune* would find the Presidential campaign reported with an objectivity and impartiality seldom found in the columns of the self-styled World's Greatest Newspaper.

The Democratic leadership in Illinois wants any candidate for President as long as his name is not Truman. Illinois Democrats say quite bluntly that they want to get rid of Mr Truman, not because they do not like him (on the whole they like him personally) but rather because he is a political liability and they feel that their candidates for the important state and county offices will get fewer votes if Mr Truman is running than if anybody else heads the Democratic ticket.

*

It is the tragedy of Illinois progressives (to use the word now in its real sense and not as a synonym for Crypto-Communism and fellow travellerism) that in 1948, when the Democratic party works under greater handicaps than at any time since 1920, the two heads of the state Democratic ticket are men of great distinction who normally would be reasonably certain to win. One is Mr Adlai Stevenson, Democratic candidate for the Governorship, who opposes the Republican incumbent, Governor Green. An attorney, Mr Stevenson was active in the Fight for Freedom Committee, and during the war served as special assistant to the Secretary of the Navy, and Deputy U.S. representative on the preparatory commission of the United Nations. Mr Paul Douglas, Professor of Economics at the University of Chicago, opposes the incumbent Republican Senator "Curly" Brooks. Mr Douglas enlisted in the United States Marines as a private at the age of 50, was wounded twice in Pacific island fighting, and rose before the end of the war to the rank of lieutenant-colonel. He is an aggressive and colourful campaigner, and the prevailing trend away from the isolationism of the past should, and probably will, attract some considerable number of votes to him. Yet the Douglas and Stevenson candidacies inevitably suffer from the weakness of the Democrats in national politics. Illinois history shows that in presidential years the momentum of the national ticket usually pulls the winning party's State ticket through to victory.

Do Professor Douglas and Mr Stevenson have any chance of winning? The answer depends on whether the Wallace Progressives nominate candidates for the Senate and the Governorship, thus splitting the Democratic vote on the State, as well as on the national, level. The Progressives seem certain to run a candidate against Mr Douglas, because the Communists behind the Wallace organisation in Illinois hate him for what (though it is not called by that name in the United States) is essentially his democratic and anti-Communist Socialism. It is less certain that the Wallace Progressives will run a candidate against Mr Stevenson for the Governorship, but the probabilities are that they will.

It makes little difference who the Wallace candidates for the Senate and the Governorship may be. If they run, they will get at least four or five per cent of the vote, possibly more. With a vote of four million expected in Illinois this November, that means 160,000 to 200,000 votes for any Henry Wallace Progressive Party candidate. That number of votes taken away from any statewide Democratic candidate in Illinois is enough to ensure the victory of the Republican.

American Notes

Mr Lewis Pays the Piper

A Washington cartoonist last week showed Mr Lewis, with a smile on his face and a package under his arm, leaving a speak-easy labelled Congress and owned by Representative Joseph Martin; he was passing a "Union Boss" and he whispered, in the idiom of prohibition days, "Rap twice and ask for Joe." Here are all the elements which entered into the coal dispute as the result of Mr Martin's intervention: Republican acquiescence in the flouting of the law passed over the President's veto; the

political gains of the Republicans in general, and Mr Martin in particular, by their settlement of the strike before the Administration's legal machinery could deal with it; and the encouragement of other labour unions in the belief that Mr Lewis's disruptive tactics are a sure road to success.

For these reasons it was hardly to be expected that the charges of contempt of court against Mr Lewis would be withdrawn, even though many miners continued to stay at home while these charges were pending. Quite apart from political prestige, the Administration was bound to put law observance before coal production, however vital that production might be not only to the nation itself but to the world at large. On Monday Mr Lewis's old adversary, Judge Goldsborough, found that Mr Lewis and his union were guilty of both civil and criminal contempt for failure to obey promptly the court order that the miners return to work. This decision was based on what the Judge called a new principle of law: "As long as the union is functioning as a union it must be held responsible for the mass action of its membership." He considered that, when the miners walked out on being told that their contract had been dishonoured, the phrase was the equivalent of a code word for "strike."

The penalty imposed for criminal contempt is a fine of \$20,000 on Mr Lewis and of \$1,400,000 on the union, twice the sum paid last year on a similar charge and exactly the amount requested by the Government. The Judge hinted that he would have been ready to impose a jail term, but the Administration evidently considered it unwise to ask for this at once. It is, however, being held over Mr Lewis's head as a possible sentence on the civil charge if the miners have not gone back to work by April 23rd. But the martyrdom of prison would not be altogether unwelcome to Mr Lewis. It was not the law, but the granting of his demands that moved him to order his miners back to work; the attempt to undermine his victory, and to re-establish the law which he has discredited, has caused many of those who obeyed him to leave work again. They will not be encouraged to return, as he has once more recommended them to do, by the coal-owners' attempt to contest the validity of the pensions settlement, or by the conversion of the temporary injunction, which Mr Lewis has been convicted of violating, into a full 80-day injunction against the strike, which he contends does not exist.

Mr Lewis is certainly calling the tune and can probably continue to do so even from a cell. Whether, and how much, he pays the piper depends upon the sentence on April 23rd and upon the result of his appeal to the Supreme Court. Last year that Court presented him with a bill, although a reduced one, but the legal issues are more complicated this year. In any case, he will have an opportunity to call another tune on July 1st, when the miners' contract expires.

*

Truman: Hobson's Choice

The primaries, in which the Republicans are conscious of helping to choose not merely a candidate, but a President, have obscured the reluctant rallying of the Democrats around President Truman. Democrats from eight mid-Western states have approved his nomination and called on the South to "come home." Although Alabama and Mississippi have taken anti-Truman steps, in Tennessee an anti-Truman resolution has been rejected by a narrow majority. In Maine, the proposal of the anti-Truman forces that the state's delegates to the convention in July should be uninstructed—that is, free to vote for another candidate—was drowned out by a brass band. The State Democratic Committee of New York, where the revolt against the President's Palestine policy is most acute, has endorsed Mr Truman.

If Mr Truman could count on these states to the bitter end, he might discount the currently unsolid South. But the spirit behind these testimonials of loyalty was summed up by the National Democratic Committeeman from Illinois who said the anti-Truman agitation was bad politics, and "I'm for Truman until it becomes unwise." The apparent victory of party regularity is largely a matter of Hobson's choice. The Democratic boom for General Eisenhower, composed almost equally of admiration for the General's political charm, and despondency over Mr Truman's chances, has been driven underground by the General's conspicuous lack of co-operation.

The ties which bind the Democrats to Mr Truman have worn very thin, and the slightest encouragement from General Eisenhower would inaugurate a bolt bearing every resemblance to a stampede. The most recent polls show Mr Truman running behind four leading Republican aspirants. The support of Mr Carey for the Eisenhower-Douglas ticket recommended by the Americans for Democratic Action is interpreted as desertion of the President by the Congress of Industrial Organisations, which

played so prominent a part in Mr Roosevelt's later victories. The CIO proposes to confine its activities to the traditional labour policy of rewarding its friends and punishing its enemies among the candidates for Congress.

There is a rumour that the strategy of the Eisenhower boosters in the Democratic party is to hold their fire until the convention, and then present the General, in the name of a "national emergency," with a unanimous nomination, which they hope he would find it difficult to refuse. In the meantime his supporters in the Democratic camp are like rain-makers who hardly dare mutter their incantations out loud for fear of offending or embarrassing the rain-god. The General, however, will not fail to see the skeleton of a party at its wits' end under the cloak of national crisis. Whether Mr Douglas, the Supreme Court Justice who is the second choice of Mr Truman's enemies, would prove as sharp-eyed is not so certain.

*

Protection for Prosperity

"The welfare of our people, the effectiveness of our foreign policy and the strength of our defences all depend on our prosperity," declared President Truman last Saturday to the American Society of Newspaper Editors. That prosperity must be protected "while we still have it" by the anti-inflationary programme which he presented to Congress last November as an essential companion to the Economic Co-operation Act. Since then the inflationary potentialities of the defence programme have been added to those of economic aid. According to the President, however, the national economy is threatened more immediately by the steel price increases, by the coal stoppage and by tax reduction. His views are similar to those expressed by his Council of Economic Advisers in their report for the first quarter of the year. Their recommendations for new taxes, credit restrictions, increased saving, stand-by authority for price, wage and indirect manpower controls and for allocations, priorities and rationing, cover the President's programme. They do not think, however, that this "rather systematic and vigorous discipline" involves a return to wartime regimentation.

The President recognised that there is no slack in the national economy to take the strain of the new demands being made upon it and this vulnerability is very disquieting to Mr Marriner Eccles

of the Federal Reserve Board. Characteristically, he takes a much longer and therefore more depressing view than either the President or the CEA and says what many are thinking: "We cannot go on year after year bearing these crushing costs without jeopardising what we seek to save." Mr McCabe, the new chairman of the Federal Reserve Board, may be more considerate of the feelings of the President who has just appointed him, and who insists that the United States is embarking upon a peace and not a war programme. It is thought that Mr McCabe will support the FRB's request for powers to increase its reserve requirements for commercial banks in order that it may restrain the undesirable expansion in bank credit which it believes will soon develop. This is a modified version of the similar request made last autumn.

The business world, however, is no more convinced now than it has been in the past that inflation is the immediate danger. It does not deny the official analysis of the present situation, but it feels that this analysis ignores deflationary pressures which are less obvious but almost as strong and that certain of the Administration's own policies have contributed to inflation. For these reasons and because Mr Truman can hardly expect Congress to give him more than a few of the powers for which he asks, it seems probable that his present anti-inflation drive is inspired more by political than by economic considerations.

*

What Kind of Preparedness?

The unique spectacle of an economy-minded House giving Mr Truman more money than he asked for was provided last week when the House approved not only the President's \$2,376 million aircraft procurement programme, but added another \$822 million for a 70-group Air Force. Only three nays were registered, all from the extreme left wing, which follows Mr Wallace's lead. The Air Force has triumphed in the inter-Service contest to make Congressional flesh creep. The effect will be to raise the purchase of military aircraft for both the Air Force and Navy from 1,500 in the fiscal year just ending to 4,370, sending welcome pins and needles through the withered airplane industry. The total funds available to the Air Force for aircraft would exceed, by \$200 million, the first year's programme for air expansion laid down by the Finletter report early this year. The aim, it should

be made clear, is less to increase the number of planes available than to ensure that they are replaced at a rate necessary to keep the Air Force abreast of every technological improvement.

The Senate may prefer the compromise programme submitted by Mr Forrestal at its request, which provides for a 66-group Air Force and would need only about half the extra funds approved by the House. If the Senate accepts this programme, its Bills for the revival of conscription and universal Military Training, which have been held up meanwhile, will probably be brought to a vote quickly. The disquiet of the Administration is based partly on the fear that in an election year Congress may feel that the allocation of dollars to the Air Force is a satisfactory and painless substitute for conscription and UMT. The Administration is also afraid that too large a preparedness programme might, by intensifying the shortage of materials and manpower, hamper the civilian production essential to the European Recovery Plan. But neither of the enlarged air power programmes seem likely to get under way sufficiently to impede civilian production before 1949. By then, if the Russians are less truculent, Congress may be less defence-minded.

* * *

The Form of a Military Guarantee

A more important question is whether the modernisation of the Air Force would, by itself, provide an appropriate "roof to the house" of European defence constructed at Brussels. In the Congressional defence hearings there has been no mention of co-operation with the European democracies. The House has reacted to what the Services presented as a menace solely to American security. In some circles it is even being asked whether the threat of a powerful Air Force in five years' time is sufficient to halt the Russians, or whether it may not simply encourage them to take new aggressive moves before it comes into being.

Although the chances of any outright military guarantee to the Marshall countries being accepted by the Senate are said to be remote, the State Department recognises how much importance is attached to a formal commitment by France, Benelux, and the neutrals. Mr Walter Lippmann has expounded the ingenious and comforting theory that if the Russians advanced across Europe they would come into conflict first with the American occupation troops in Germany; and that therefore General Clay's presence in Berlin is a more potent military guarantee than any paper pledge that America could not remain neutral. This reasoning will hardly reassure the Scandinavians, the Turks or the Greeks, for unfortu-

nately the Russians are not bound to shape their tactics to suit Mr Lippmann's theories, and might easily avoid a clash in Germany while advancing elsewhere.

It is being suggested that to meet the qualms of the western democracies Mr Truman or Mr Marshall might make one more attempt to draw a verbal line across Europe. However welcome such a statement might be, it is difficult to see how, without specific Congressional approval, it could add very much to what has already been said. And, unfortunately, the deterioration in Mr Truman's domestic prestige might encourage the Russians to discount, probably quite wrongly, the gravity of yet one more warning.

Shorter Notes

The forecast of the winter wheat crop, which appeared last week as 8,605 million bushels, should, of course, have read 860.5 million bushels.

*

The Agriculture Committee of the House has voted to continue farm price supports until June 30, 1950. Without new legislation, price supports on non-basic commodities would disappear at the end of the year. The only changes proposed are to reduce the level at which cotton prices are supported from 92½ to 90 per cent of parity, and to reduce the price supports on some non-basic commodities. The price of basic commodities, wheat, corn, tobacco, rice and peanuts will continue to be supported at 90 per cent of parity.

*

Even conservative Congressmen are somewhat alarmed that Mr Isacson, who recently won a Congressional by-election in the Bronx as a Wallace candidate, has been refused a passport on the grounds that it would "not be in the interest of the Government of the United States." Mr Isacson wanted to go to Paris to attend a meeting sympathetic to the Greek guerrillas. The State Department insists that the granting of a passport is not a right, but a privilege which implies that there is no official objection to the purposes of the journey. Mr Isacson has now applied for a visa for Palestine which may be more difficult to refuse. Mr Isacson's cause no doubt suffers from the memory of the resentment stirred up last year when Mr Wallace criticised his own country so freely on his foreign travels. But the State Department seems to be carrying export controls a little far.

THE WORLD OVERSEAS

Report from Germany—I

(From Our Special Correspondent)

FRANKFURT in spring, 1948, conveys the sense of change. An end is at hand to the first postwar period, and new ideas, new measures are taking shape. The streets of the city reflect the characteristics of the Germany which is being re-formed. They show the generous wealth, the optimism, the natural, democratic individualism of America superimposed on a resentful, hysterical, corrupt and still ruthlessly egotistic people, living a life of ordered abnormality in ruins which nobody notices any longer. The cars are symbolical. High-powered modern automobiles purr along with easy confidence, jeeps express American technical skill turned to military ends, the red Coca-Cola vans convey a peaceful if slightly crazy note, shabby Volkswagen career wildly to the danger of everyone in the neighbourhood. And between them run a few moderate-sized British Austins, sensible, inconspicuous and not very powerful.

The predominant influence of America is real. Though the British are equal partners at the top, the Americans hold the most important posts in the integrated Anglo-American bipartite administration for economic control. Since they bear the bulk of the financial burden, they have a majority voice in the body which controls Bizonia's foreign trade, the Joint Export-Import Agency. The SHAEF-type organisation at Frankfurt is working well on the whole. Anglo-American integration is much easier than co-operation of any kind with the Germans.

The steps which are to be taken now that four-power rule has ceased to function in Berlin were forecast in part by General

Robertson in Duesseldorf on April 7th. Financial reform will be carried out in the West, including the French Zone, and a Government will be set up in Frankfurt, after agreement with the French. An Occupation Statute will limit the rights of Military Government.

The preliminary steps towards currency reform have been taken. A beginning has been made on the hard task of bringing German prices into line with each other and with world levels. The final details of the currency reform itself are now being settled with the Germans. New policies, freeing German foreign trade from much of the control of the Joint Export-Import Agency, are being considered: and some measures, notably the introduction of a single conversion rate for the mark (one mark equalling thirty cents) have already been taken. Germany has entered the Marshall Plan, and the Germans have drawn up a statement of Bizonia's balance of payments. It shows an estimated deficit of \$1.2 billion to be covered by Marshall aid and US appropriated funds. And, finally, American proposals to cut to the bone further dismantlement of German factories and to stop decentralisation are now being discussed in high quarters.

Though none of these measures seem on the surface to be in opposition to a policy of State control, a trend in this direction underlies them, and the ideas which are being discussed in Frankfurt today. Western Germany is being steered away from *Planwirtschaft*, although at this moment, the control authorities, American as well as British, are still pressing the German adminis-

tration to exercise its powers over the economy in the interests of just distribution, and although the Joint Export-Import Agency, together with the central bureaucracy and the Ministries of the *Länder*, still keep a tight grip on Germany's foreign trade.

At present the movement towards free enterprise is obscured by the fact that the Anglo-American bipartite control authorities are at loggerheads with the chief German opponents of planned economy, the Christian-Democratic Union (CDU) and its counterpart, the Christian-Social Union (CSU). This party, the largest in the West, holds all the posts in the Bizonal Executive Committee, or "Cabinet," with one exception. It is largely responsible for the fiasco of the bizonal economic government, which was reformed at the beginning of this year, but has never properly functioned. Not a single law of any consequence has been implemented. The central administrative body is still practically in the same state of paralysis as a year ago, although the Americans conceded it greater central powers than its completely impotent predecessor enjoyed. Deliberate "ca'canny" is being practised by the Germans. The Council is only due to meet for two days each month, but excuses are constantly found for postponing even that amount of work—the latest reason given was that the building in which it meets was wanted for a performance by an amateur operatic society.

Away from a Planned Economy

The policy behind the delaying actions of the CDU-CSU is the party's determined opposition to State control and centralised government. More particular, it is looking after the interests of holders of hoarded goods, who are waiting for currency reform before selling their stocks. The Party recently publicly pledged itself to do away with planned economy "except where absolutely necessary." It aims to abolish rationing of everything except possibly staple food and clothes, and would retain price controls, if at all, only on one or two basic commodities. *Planwirtschaft* as a policy would be placed in the dustbin; it is constantly denounced as a failure, as indeed it is, in Germany today.

The CDU-CSU, however, is a mixed party, which is far from being wholly reactionary. It has progressive leaders such as Herr Arnold, premier of North Rhine-Westphalia, and Herr Hilpert, deputy Minister-President of Hesse, and contains industrialists who would counter Communism by granting the workers a share in enterprises—a Catholic solution which would accord well with the natural attachment of the German worker to his *Betrieb*. But the danger exists that the party will fall into the hands of its most rapacious supporters, and that jungle law will be established, in the name of free enterprise and the liberalism of Professor Röpke, the Swiss economist whose attacks on planning are widely published in Western Germany today.

At present, while German legal prices and wages are completely fictitious, and everyone knows that currency reform is round the corner, there are good arguments for not issuing even the theoretically admirable laws. They would not be obeyed, and the administration would be regarded with greater contempt than ever. The CDU-CSU can point to the fate of the so-called "Pantry Law," passed earlier this year, which required everyone, including householders, to declare stocks of food. After a huge expenditure of money and precious paper, the questionnaires were simply ignored. Out of 350,000 issued in Frankfurt, 14 were returned. Nevertheless, the Anglo-American authorities are pressing, in vain, for an anti-hoarding law to be passed, which would require goods to be placed on the market before currency reform is executed. Even if the law were ineffective, its socialist supporters think it would perhaps show the populace that some feeling for social justice exists. There is a well-founded fear that currency reform will make money so scarce that the poor will not be able to buy the goods in the shops, and the visual contrast between haves and have-nots will lead to unrest. The Communists would then have a chance to undo the effect of Marshall aid. Though not very numerous, they are in a majority in the works councils, and by this means influence four to five million workers.

Power for Private Industry

The questions of State control and centralisation are linked; and on both the views of the Americans and the German Right-wing are close. The Americans, who believe in their own system, stand firm on a decentralised constitution. They argue that, even if a planned economy were desirable, it could not work in a decentralised federation. Since the constitution will not be altered, it is necessary to alter the economic system. The not be altered, it is necessary to alter the economic system. The individual States will not plan on a national scale; they are all too keen on their local plans. Therefore, the argument runs, the best thing is to hand over planning and distribution to the

national industrial groups. This solution is one which is also supported by some influential British officials in Germany. Marshall aid and the coming abrogation of Anglo-American control will bring it to the fore. No German government will be competent to handle the vast number and quantities of goods which will be flowing into the country. Private industry and commerce must resume their proper place.

On this issue of State control versus the free market polemics rage between the Christian-Democrats and the Liberals on one side, and the Social-Democrats on the other. The issue will certainly be fought in the general elections which must be held in a matter of months.

Inside the Social-Democrat Party (SPD) there are leading men who now acknowledge that it is useless to try and impose universal controls on the German economy in conditions of such extreme scarcity, just as there are some among the Christian-Democrats who favour retaining those that work. But there are small chances of a coalition as long as Herr Schumacher leads the SPD.

The effect of Prague on some Socialist leaders in the Economic Council, where the Socialists are in a majority, was to make them seek to join forces with the Christian Democrats and to come out openly in favour of a Western Government. They would have been prepared to postpone their demands for socialisation in the Ruhr, and land reform. At least one of them courageously published an article exposing the slogan of "German unity," which has supplanted Hitler's "miracle weapon" in the minds of most Germans as a cure for all troubles. But hopes of a coalition have now faded. The Christian Democrats demand too much, and the Social-Democrats are tied to a rigid party machine, controlled by the doctrinaire and dictatorial Herr Schumacher. It is, however, not at all certain that the decision of the SPD executive to remain in opposition is wrong. The main enemy of the Communist Party in Germany as elsewhere is the Social-Democrat Party; a coalition might well give the Communists an opportunity of accusing the SPD of betraying the workers. New chances would appear of splitting the socialist rank-and-file and of forming a "Socialist Unity Party" on Eastern German lines.

At the root of present perplexities lies the problem of the millions of refugees who have crowded into the West from the annexed Eastern areas and the Sudetenland. The Germans by and large not only cling to the idea that unity of their country is feasible, but they mean by "unity" the return of Silesia, Mecklenburg, Danzig and East Prussia, and the eviction of the Czechs in favour of the Sudetenlanders. Various more or less openly revisionist groups have been formed among the refugees themselves. On their part, the local political leaders give them every encouragement, and do as little as possible to absorb the "foreign bodies" into the community.

The illusions of the revisionists are hard to take seriously. It seems comic that a leader of the refugees should reveal that he was supporting the *Bayern Partei* because it would make Bavaria a sovereign state "like the United States" as the party programme modestly puts it, and because this state could then buy arms in America and go to war with Czechoslovakia. Such ideas are indeed crazy; but it is unwise to regard the Germans as rational, and not to place the refugee question at the forefront of the innumerable problems which have to be solved at one time or another. For too many the solution lies in a war between east and west, in which the Germans believe they would be the victors.

Speculation about war is a main factor in Germany today. Fear of Russia and a Communist *coup* is very strong, particularly since the Russian campaign of chicanery began in Berlin and Vienna. Some men have refused to accept prominent posts for this reason. But the most fearful, and those who are reinsuring by attending Communist rallies, are in general not the competent men, not those mysterious "best brains" who are supposed to be hanging back somewhere, but the ordinary *bourgeoisie*, anxious not to have their businesses confiscated if the Russians arrived one day.

Competent men are undoubtedly staying in the background at present, but are probably not speculating on a Russian *coup*. The German industrialists know their bread is buttered on the West side and on the West side only. They are biding their time until the country's economy is given a chance, until an end is made to the worthless currency, the restrictions, the penal taxation, State control—as well as to dismantlement, restitution of loot, and the denazification sentences which have prohibited so many from taking posts.

In the meantime, some of the administrators, who have borne the brunt of a hopeless task in the Bizonal Executive Committee, are showing a remarkable spirit of optimism and determination,

considering the vast and multitudinous problems which they face. That they are also obstructing the will of Military Government by not passing laws before currency reform does not mean that they will remain passive once they have a government, freed from most of the Military Government controls. It will have, however, to be the kind of government that they want, one in which the power of the individual states is not subordinate to the central body. It is symptomatic that the CDU has successfully obstructed the establishment of a permanent civil service for the Frankfurt Administration. Whether such a government will be able to solve the problems which will have to be faced is very doubtful indeed.

(To be continued)

De Gaulle at Marseilles

[FROM OUR SPECIAL CORRESPONDENT]

WITH pomp and ceremony, and evidently without undue concern for cost, General de Gaulle's *Rassemblement du Peuple Français* held its first National congress in the city park of Marseilles last Sunday. The congress adopted a number of policy resolutions and confirmed the appointment of the executive council, leaving the group who have been running the movement—the *entourage*—in charge. But the congress did nothing to remove the ambiguity caused by the fact that it neither openly repudiates parliamentary democracy nor fits into the parliamentary pattern.

Positively, the congress decided that its purpose was to furnish the nation with *cadres* for patriots; negatively, that it should avoid the definition of a political party in opposition. Its declared intention of fighting the next election against the government has evidently given rise to wrong ideas. The congress deliberately underlined the difference by calling itself "National assizes" and the delegates "companions."

This is the sort of distinction which is insisted upon by the General himself, who is temperamentally unsuited to lead a political party and who makes no secret of his preference for disciples rather than associates. The 2,600 delegates who cheered him till they were hoarse were obviously delighted to oblige. There was no public debating: instead, as at gatherings of the French Communist party, all the resolutions were adopted without dissenting voices by general acclamation. Respect was ensured by the presence of an extra two thousand Gaullists, who were not regional delegates but fighting-fit *service d'ordre*, among whom were some of the best known local gangsters and a number of black troops in civilian clothes.

On foreign affairs there were no new developments, but the Gaullists went one step further in advocating a Western *bloc* against Soviet Russia. They defined for the first time the type of common defences which Europe should organise. These should consist of a professional army of 40 divisions, half to be airborne, together with a navy and air force under a joint high command. The force would be financed principally by the Americans, but it would be manned entirely by Europeans. Britain, and notably Britain's German policy, which was interpreted as the desire to reconstitute a strong Reich, was repeatedly attacked.

Away from Reality

But it was on internal affairs that the congress plunged furthest away from harsh realities. French national income, said one speaker, must indeed be redistributed, but this should be done by general accord without conflict or disturbance. (Why not? The walls of Jericho were blown down with nothing but trumpets.) The usual attacks against mythical *dirigisme* and complaints against the sacrifices imposed by René Meyer—which are always well received by every French audience from Gaullist to Communist inclusive—were made. Vague plans were also announced for co-operative ownership and a new syndicalism, which would dispense with permanent officials and cease to fight the cause of the workers it represented in favour of the higher cause of the "general good."

There was also unanimous agreement about the desirability of slashing state expenditure; but the Gaullist policy for strengthening internal defences against the Communist menace together with an imperial policy, which would maintain French sovereignty over all overseas possessions, would probably make government under the General even more expensive than it is already.

Nothing new was said about how the General would come into power. For the moment he is sticking to his demand for a general election and offering to work with all deputies, except

the Communists, who will support immediate dissolution. Whether he can induce the deputies to vote themselves out of office will depend less on himself than on the economic success of the present government and the extent of the Communist sabotage of France's recovery under the Marshall Plan.

In so far as the congress was intended to provide a demonstration of strength and to contrast de Gaulle's effectiveness with the feebleness of the existing government, it was a failure. The Third Force Minister of the Interior, Jules Moch, had the situation well under control. His local authority made the Gaullist, CGT and Communist leaders sign an agreement to keep their respective demonstrations static in order to avoid clashes. Marseilles was full of civil and military police, equipped to resist violence. The Marseilles population was worn out by the sustained propaganda campaigns before the congress met, and there was a notable absence of mass hysteria. As soon as the General moved outside the circle of his own congress, he did not inspire the same wild enthusiasm as at some of his earlier appearances.

Costa Rica's Civil War

[FROM A CORRESPONDENT RECENTLY IN LATIN AMERICA.]

THE civil war which has just ended in Costa Rica began on March 12th. The fighting, which arose out of the presidential and congressional elections held on February 8th, constitutes the first blot in many years on the record of Costa Rica—long considered one of the most democratic nations of Latin America.

Costa Rica is one of the few Latin American countries with an economy dominated by small and medium sized landholders. The coffee industry, which is the biggest element, is largely controlled by small farmers. Even in the banana industry, which is dominated by the United Fruit Company, there are many small and medium sized planters who sell their produce to the company. The outstanding importance of the small cultivator has been one of the keys to the democracy of Costa Rica. Another has been the relatively high literacy rate. For many years Costa Rica prided itself on the fact that it had more schoolteachers than soldiers—the regular army is 1,000 strong—a truly remarkable phenomenon for a Latin American country.

Yet in recent years this democracy has been in peril, and the situation finally degenerated into civil war. One must perhaps go back to 1940 for the beginning of the story. At that time Sr Rafael Angel Calderon Guardia, a representative of the moderate Left, was elected President. He sought to carry out a programme of reforms, which included the establishment of a labour code and extension of social security services.

In carrying out this programme, Calderon Guardia leaned rather heavily on the Costa Rican Communist Party. Organised in 1928, it had had but little influence, principally in the banana regions, before the coming of the Calderon regime to office. However, relations between the Government and the Communists then became very close. Even the Catholic Church became friendly with the Communists, who in 1943 had changed their name to Popular Vanguard. They had also adopted a programme one part of which congratulated Calderon Guardia on carrying out his social reform programme "based on the Encyclical Rerum Novarum of Pope Leo XIII." This and other flattering references to the Church and its doctrines apparently influenced Archbishop Sanabria, who in 1944 announced his qualified support.

During this period the Communists took advantage of the situation to infiltrate into the Government service, and in particular into the army and the police. The Opposition maintains that the whole military and police force of the Republic is honeycombed with Communists and their friends. At any rate, the Communists gained considerably. They elected eight members to Parliament, and they organised a trade union centre, which was for a time the only one in the country.

The next election in 1944 was hard fought and marked by much violence. This was a new factor in the situation, since elections had usually been quiet in Costa Rica. The Government claimed that 70 per cent of the people voted for their candidate, Sr Teodoro Picado. The Opposition claimed the election was "won" by the Government through violence, intimidation and fraud. In any case, when fresh elections approached, and it became obvious that the Government intended to have Calderon Guardia again elected President in the 1948 poll, the Opposition acted. In the summer of 1947 there occurred a twelve-day strike and lockout, backed by most of the country's merchants, bankers and such industrialists as there are, and also by the Catholic-controlled Rerum Novarum Confederation of Labour.

This demonstration succeeded in bringing about a modification of the electoral law. The appointment of a three-man electoral court was authorised, one member each to be appointed by the President, by Congress and by the Supreme Court. At the same time, all members of Congress, the rival candidates and the executive agreed that they would accept the decision of the electoral court. The election machinery was put in the hands of these three individuals. A few weeks before the polling, the member appointed by the Supreme Court became sick and was replaced by a naturalised Costa Rican citizen, a German named Max Koberg, who the Opposition maintained had been pro-Nazi during the war.

The election itself was quiet, although there had been a good deal of violence during the campaign. Late on election day the Government candidate, Calderon Guardia, announced that it was the quietest and most honest election the country had ever known. However, the next day he and the leader of the Popular Vanguard, Sr Manuel Mora, came out with statements that the election had been fraudulent and was not valid. In the meantime, the returns had begun to indicate that the candidate of the Opposition National Union, Dr Otilio Ulate, had been elected.

Opposition Victory Disputed

The members of the electoral court issued their verdict a few days later, deciding by two to one that the election had been won by Dr Ulate and that there had been no fraud. Koberg voted that there had been fraud and that there should be a new election. The whole apparatus of government publicity was then used to spread the story that the election had been fraudulent and should be annulled. The Archbishop tried to act as mediator and get a peaceful settlement of the differences of opinion, but to no avail. Finally, the Congress, whose term does not expire until May 8th, met and declared the election invalid. The Opposition points out that this was in contravention not only of the Government's pledged word, but of the constitution itself, whereby the Congress may only elect the President when no candidate gets a majority—Dr Ulate was credited by the electoral court with an absolute majority.

There were several members of the Calderon faction who refused to vote to annul the elections. Three of these actually did vote with the Opposition, and at least one of them immediately went into hiding in fear of his life. Two other supporters of the Government, who had indicated their intention of voting against it, were kidnapped and held until the session was over. Their alternates (each Congressman in Costa Rica has an alternate who attends when the principal is unable to do so) voted—and voted "correctly."

After this decision of Congress, Dr Ulate, the President-elect, went into hiding in the home of a deputy, Dr Carlos Valverde. The police came to look for him, and fired on the house with machine-guns. Dr Valverde was hit and died a few days later. Dr Ulate escaped over the back fence. However, the next day he gave himself up to the police, having been charged with criminal conspiracy. He was accompanied to gaol by the American Ambassador and the Archbishop, and was soon released with all charges dropped.

Meanwhile, negotiations went on, with the Archbishop acting as mediator. Dr Ulate agreed to withdraw his claims to the Presidency if some neutral figure could be installed and entrusted with calling a new poll. This the Government's supporters refused. Finally, all hopes of a settlement were abandoned, Dr Ulate and to the hills, other leaders of the Opposition went into hiding and the Government began rounding up those upon whom it could lay its hands. They went to the farm of Sr Jose Figueres, leader of the Social Democratic Party, one of the chief backers of Dr Ulate, with the intention of arresting him. There the Government soldiers were met by gunfire. The civil war was on.

Foreign Intervention

The rebels controlled most of the mountainous area of the country and fought more or less a guerilla war. The Government force of some ten thousand men (composed of the regular army, the police and the Popular Vanguard's militia) was unable to oust them. Considerable confusion and dissension were reported between the Communist militia and the army, each party accusing the other of shirking action. The Government forces were aided by soldiers sent from the Nicaraguan army. A number of other people, some soldiers of fortune, others probably Communist agents, are believed to have gone to Costa Rica to help the Government.

The usual struggle between the Left and the Right does not explain this civil war. The Government for the most part represents the Left, though the Social Democratic Party of Sr Jose Figueres supported the rebels. In fact, Figueres was the military commander of the rebels. On the other hand, the reactionary Nicaraguan dictator, Somoza, supported the Costa Rican Government, and there are reports that the Dominican dictator, Trujillo, who heads the most totalitarian regime in all America, also gave aid. On the other side, it is alleged that the Government of Guatemala, which is dominated by a Left-wing but anti-Communist President, Sr Jose Arevalo, sent help to the rebels. And other Left-wing Democrats in Latin America, such as Sr Raul Haya de la Torre, leader of the Peruvian *Apristas*, and Sr Romulo Betancourt, former President of Venezuela and leader of the Left-wing *Accion Democratica* Party of that country, announced their support for the rebels. The division appears to have been between those who would accept Communist support to gain their ends and those who would not.

Democracy in Singapore

[FROM A RESIDENT CORRESPONDENT]

FEARED by many as overhasty, parliamentary democracy has been established in Singapore. The custom-loving East does not take too kindly to innovations, and when all British subjects of over twenty-one years of age and with a year's residence in the colony were called upon to register their names on the Electoral Roll, the reaction was sluggish. There were several reasons for this besides novelty. There was a restriction in the qualification. "British Subject" did not include "British Protected Persons," and men and women born in the Federated and Unfederated Malay States were not eligible, though their psychological and economic differences are nil. The All Malaya Council of Joint Action and Putera, a Malay society controlled by foreign-born Indonesians, boycotted the registration on the not very logical grounds that the new Constitution of the Federation of Malaya was not to their liking. Moreover, men were chary about entering their names on lists or filling up particulars on forms. Only a short time ago they had done just these things for the Japanese during the occupation. They remembered very well how such lists became confused and how, having registered themselves as carpenters, they were sent as navvies to the Siamese Death Railway, and how others, *bona fide* clerks, were transferred to plant tapioca. Their recollections of forms and registers did not warrant wanton repetition. Of the 938,000 population of Singapore with a British citizenship total of about 100,000, only 22,395 registered for a vote. The electorate consisted of 10,141 Indians, 5,627 Chinese, 3,146 Malays, 1,918 Europeans, and 1,563 Eurasians.

There was only one organised Party, the "Progressives." Their candidates were made up, racially, of two Chinese, one Mahomedan Indian, one Hindu, one European and one Malay. The Malay fell sick at the last moment, leaving the Party to contest only five seats. Ten "Independents" appeared—racially, 6 Indians, 2 Chinese, 1 Eurasian and 1 Malay.

For a seaport with a transient population which comes and goes on business and on leave, the percentage of voting—64.2—was high. The boycott was maintained to the end, but the elections were as calm and orderly as the Trades Union Congress. The only incident was a thunderstorm that added three inches to the month's rainfall.

Of the elected candidates all have had previous service on the Advisory Council or on the Singapore Municipality. The composition of the new Legislative Council gives an unofficial majority of 13 to 10. The policies likely to be pursued in order of preference are: administrative economy, education, housing (Singapore's most pressing need) and hospitals. The tempo of reform will not be breathless, and the many problems are likely to be solved with a minimum of disturbance. The elections were fought cleanly and with great humour. Rival candidates were in most cases personal friends; in a first election, party lines were blurred and personalities counted for much. The racial harmony, of which Malaya boasts, was uninterrupted by the discords of communalism. There has, however, been the usual Communist infiltration of the unions and a frequent emphasis on the strike weapon. This influence has slightly diminished, and the number of man-days lost has fallen remarkably. But misconceptions of the functions of the unions remain to be clarified. Strikes for trivial reasons are still frequent, and most strikers consider that they are entitled to wages for the period during which they downed tools. Nevertheless, union officials are being gradually trained in the organisation and responsibilities of trade unions.

Questions about Coal

SIR CHARLES REID, production director of the National Coal Board, took advantage of what might have been merely an amiable ceremony at Edinburgh last weekend (the presentation of a trophy for high output) to express some profoundly disturbing judgments on the progress of the nationalised coal industry. His words were far more than the now customary official exhortation to an industry to pull its weight. They were the most open expression of disquiet yet made by a member of the Coal Board, and they call in question the assumptions on which the experiment of nationalisation depends for its success. Their author, it is worth remembering, has been the spokesman of progressive mining engineers and the leading advocate of technical improvement in the mining industry both under private enterprise and under public control. He is now in charge of the mechanisation of the mines and of their entire productive effort. After fifteen months of nationalised effort, what has he to say?

We are putting into the pits day by day great masses of machinery, and it does not seem to matter what we do—the output per man is not rising. The Board are very much concerned. There is something wrong somewhere. . . . We think that there is a slackening off all over and we are not getting the advantage of this machinery.

That there is, in fact, something wrong is shown by the statistics of productivity in the industry. It is managing, though barely, to produce sufficient coal to meet its output target in 1948, but that target is only sufficient to meet the most urgent, minimum needs. And it is making increasing demands upon manpower and on the output of the machinery industry. To both of these expansive policies there must eventually be a limit, and the problem of improving the quantum of the miners' effort cannot long be evaded. Sir Charles Reid's speech brings nearer the moment when that problem will have to be faced. It is not yet possible to demonstrate statistically, beyond all doubt, precisely what is wrong. It might be that the general trend of productivity is irresistibly downhill, and that mechanisation now is serving to arrest what would otherwise be a steep decline. It may be that (as the mineworkers' representatives retort when their effort is called in question) re-equipment is not always being done in the right way. But the technician's view is difficult to resist: that, by a reflex which is familiar in other industries, the installation of machinery is being offset by an automatic slackening of effort. If this is so, it argues that the maladjustment between management and labour which existed under private enterprise has survived uncorrected under public control. Its consequences under private enterprise were clearly described in 1945 in the Reid report:—

In Britain, after the stoppage of 1926, the mineworkers were generally in no mood for willing co-operation with the employers. They mostly refused to recognise that their wages, in the long run, must depend upon the progressive efficiency of the industry. Mechanisation, though seldom encountering active resistance, was not generally received by the men with enthusiasm, no doubt in the fear that more machines meant fewer men at a time when unemployment was widespread; and, where machinery was installed, its potential savings seem largely to have been dissipated by a quiet but effective determination that the number of men discharged should be kept

as low as possible. This must have been a contributory cause of the overstaffing of many of the operations at or about the coalface. In addition to this, they have steadfastly required the observance of old customs and traditions which are inappropriate to the conditions of mechanised mining, and thus have put a brake upon the modernisation of the industry. This attitude has not been generally favourable to the attainment of high productivity with the smallest labour force necessary to provide the country with the coal it required; and heavy unemployment among coalminers, and the lack of alternative work in the years between the Wars, goes some way to explain it.

The Reid report pointed out that certain districts were notable exceptions to this rule. In those districts

it is clear that there has been a definite disposition on the part of the men to co-operate, and their leaders have encouraged them to produce the limit. It can be said without any hesitation that if the same co-operation and effort had been forthcoming throughout the industry, output per man shift in 1939 would have been considerably higher than it was, notwithstanding the technical deficiencies which we have described.

How often has the argument been heard that the state of mind described in the Reid report arose from the natural dis-

trust of labour for capital: remove capitalism, and the sickness would be cured? Yet the conclusions drawn from prewar experience of mechanisation in the coal industry seem to be scarcely less applicable in 1948. The gist of Sir Charles Reid's speech in Edinburgh was that the "quiet but effective determination" and the steadfast observance of old customs still persist. There were still, he said, too many instances today of three men doing two men's jobs. To make the reconstruction programme in the mines pay, an output of about 4 tons per man-shift at the face would be needed. In 1938, output per man-shift at the face was 2.9 tons; today it was only 2.85 tons—

AT THE FRIENDLY INN

Specially drawn for The Brewers' Society by Henry Rushbury R.A.

despite an increase in coal mechanically cut from 58 per cent of the total output in 1938 to 74 per cent today (and an increase of the same order in mechanical conveying). As for disputes, it had been hoped that under nationalisation there would be improvement, but experience in 1947 and 1948 showed that there was none. More tonnage was lost through disputes in 1947, even excluding the Grimethorpe stoppage, than in 1938.

There is still room for further examination before a final diagnosis is made. Such an examination is urgent, and the impulse to keep unpleasant issues in the background does not justify the shirking of it. Losses of coal through the Grimethorpe dispute were excluded by Sir Charles Reid from his sobering analysis. But what of the issue on which the Grimethorpe dispute was fought? What has happened to the reassessment of tasks in the mines which was to have accompanied the five-day week? The procedure was to be that mine managers would go through the pits with the men's committees, reviewing the work, taking note of the changed technical conditions of modern mining, and determining by agreement a fair day's work for each man. What has happened to it? It was a part of the agreement for the five-day week. It is no less essential in the mines than in other industries where technical improvement is stultified by out-of-date price lists and restrictive practices. Yet report has it that the reassessment of tasks has made little or no progress.

That is one subject for examination. Another that cannot be avoided is the reconstruction of the mines themselves. The Coal Board has appointed Mr E. H. Browne to take charge of reconstruction and planning; it would be useful to bring long-term reconstruction into clearer relationship with the

current programme of mechanisation in the mines. There may, after all, be some force in the contention that part of the present re-equipment is wasted, or at least is not yet fully productive, because improvements in lay-out in the mines have still to be put off. A third question that is becoming urgent is the place of mine management in the Coal Board's organisation. Resignations that have recently taken place are the more disquieting because so often it has been the best men who have resigned. It seems to be not the conservative and cautious technician, but the imaginative and progressive, who finds the greatest difficulty in working effectively under the new order. Why is this? The answer usually given is that the structure of the Coal Board splits up responsibility among separate functions and avoids placing it fully at any point in any one pair of hands. The executive, consequently, does not feel himself to be fully in charge of his job, and the influences which deter him from initiative become too strong. Can this be prevented without too great a weakening of central control?

The trend of affairs in the industry is such that answers must be sought to these questions. Resources of labour, of money, and of equipment are being poured in for what, so far, seems an inadequate return. Management under nationalisation still has to solve the problem of the psychological relationship between management and labour. It has still to determine in practice whether the industry is run for the public benefit or for the benefit of the persons engaged in the industry. It has still to find for itself an administrative structure that does not disperse responsibility and muffle initiative. It has still to discover the loyalties that are to hold it together and the human motive forces that must keep it alive.

The London Bullion Market—II

Silver Trading under Difficulties

THE first of these two articles examined what was left of the London market's trade in gold bullion. Changes in silver dealings during and since the war have been no less important. The London silver market now falls into four distinct categories. The first deals with silver for essential domestic industrial users. There is also a free internal silver market. Then there is the market in what is called "pound exportable" silver, which is silver purchased in the sterling area and exportable under licence. Finally there is the most interesting but least definable section of the market, which deals in silver bought in one non-sterling country and sold to another.

Silver required for essential industrial uses in this country is now made available by the Bank of England through the recognised authorised dealers in London. It is sold at the official price which is fixed each day but which, since November 6th last year, has held rigidly at 45d. per fine ounce. This is at parity with the New York price which for some time past has been steady at 74½ cents. There was a period during 1947 when responsibility for buying and supplying silver for essential industrial users was placed on authorised dealers in the bullion market. The Bank of England withdrew from the market in February, 1947, and announced that silver for essential purposes could be acquired from the cheapest sources, irrespective of what currency had to be paid for it. Most of the silver thus purchased was dollar silver, licences for which continued to be granted long after the suspension of convertibility of sterling. It was only last December that the market was officially informed that dollars would no longer be provided to buy silver. Thereafter, the earlier practice was restored. Supplies of silver to satisfy these requirements were by then being fed by the gradual withdrawal of silver coins from circulation. Last

year essential industrial users absorbed about 12½ million ounces, and turnover continues to run at about 1,000,000 ounces a month.

The free internal silver market is of much smaller proportions. It is fed partly by jewellers' scrap which has been refined and from holdings of bar silver which sometimes find their way to the market. The silver is sold to jewellers and manufacturers who do not rank as "essential" and therefore do not qualify for the silver provided by the Bank of England. The current price for this free internal silver is 51d. to 53d. per fine ounce. The market is small, with a turnover of a few thousand ounces a week. Demand comes partly from hoarding—a more intelligent form of it than the collection of silver coins which has become such an engrossing pastime in certain sections of the agricultural community.

The two other sections of the market deal with entrepôt trade. This trade falls into two categories—silver bought in sterling countries and the rest. The "pound exportable" silver can be bought without any specific permission from the authorities, though the formalities of obtaining an import licence have to be completed in due course. This silver is largely of Australian origin and is re-exported—under licence of course—mainly to other sterling and soft currency countries. Export licences for such silver are granted with considerable freedom, and the countries to which it has been destined have included even France. Last year, imports of silver from Australia amounted to nearly 3,000,000 ounces. The price for "pound exportable silver" at present ranges between 52d. and 54d. per fine ounce.

By far the most interesting and intriguing section of the market is the residue composed of a heterogeneous collection

of import-export deals for each of which special permission has to be obtained from the Bank of England and for which no clear definition can be given and no range of prices quoted. This market is hemmed in by the restrictions on imports and exports that arise from the peculiar shape of the British balance of payments problem. Every transaction in this part of the market is a law unto itself. It must be sought, pursued and completed in isolation and without reference to any published book of rules or even to precedents suggested by similar transactions completed in the past.

During some periods last year, this section of the market acquired the semblance of a genuine free market and it handled a considerable volume of business. This was so during the period when sterling was effectively convertible, though the bulk of the turnover in this period was concentrated in the first three months of the year when India was still granting import licences for private purchases of silver. The Government of India suspended the issue of import licences in March and this removed from the market the most persistent, and certainly the most important, source of demand. For the whole of 1947, exports of silver from this country to India amounted to nearly 26 million ounces, while the greatest source of imports of silver into Britain was the United States which shipped 21.4 million ounces. This traffic in silver epitomised all the pressures to which the gold reserve was subjected during this short period of convertibility, involving as it did heavy dollar expenditure and, on the other side, heavy unrequited exports to sterling countries.

The turnover in this market for exportable silver, though drastically cut in the first instance by the Indian Government's decision to suspend import licences and later by the suspension of convertibility of sterling and the general tightening up of import and export licensing for silver, is nevertheless being maintained at a reasonable level. But business now depends upon finding silver and selling it to a country with a currency of somewhat harder quality than that of the country from which it was purchased. The list of countries ranged in order of hardness of their currencies is reputedly kept by the Bank of England. It is kept a closely guarded secret, but many attempts are made to reconstruct it by the market, where it is irreverently referred to as the "league table."

Unquestionably at the head of the table, leading by as many points as the Arsenal, is the United States. Equally unquestionably at the bottom, and in evident danger of relegation, is France. But between these two extremes, which are too obvious to allow of any doubt, there is enormous scope for guessing. Is Russia harder than Persia, Belgium than Switzerland, Holland than Norway? The authorities know, or at least they think they know, and arrange the order accordingly. The market's best problem is to find out what the order may be, and, on the basis of that calculation or guesswork, to seek operations

involving purchases of silver from countries standing lower in the table than the countries to which the silver is sold. The Bank of England will sanction licences for operations of this character. To take an extreme example, it would obviously sanction the purchase of silver from France and its export to the United States. But the more usual propositions that reach the Bank are far more subtle than this. Last year the United Kingdom imported silver from such non-dollar and non-sterling countries as Soviet Russia, Belgium, Peru, France and Yugoslavia, and exported silver to Switzerland, Turkey, Egypt, the Netherlands, Norway and Sweden. Much of the business was arranged in accordance with the league table procedure.

One difficulty about transacting this type of business is that each operation tends to consume a great deal of time and that while it is being arranged the order in the table may change. A dealer may, for example, discover that he can buy silver in country X and find a buyer at the right price in country Y. He would approach the Bank of England, which, on consulting the table, will give its general approval of the operation. It then behoves the seller in country X to get an export licence, the buyer here to obtain an import licence before proceeding to clinch the deal and get an export licence from Britain to country Y. By the time the first two steps have been completed, however, country X may have climbed above Y in the league table and the Bank of England may no longer be willing to grant the necessary export licence. The time element, which can be very considerable, and the unstable nature of the positions in the league table, make this type of silver business unusually difficult to transact. It says much for the ingenuity and pertinacity of the London market that a good many deals still find their way around the obstacles.

Finally, mention should be made of the Treasury scheme by which silver is provided for export in wholly or semi-manufactured form. This scheme corresponds closely to the gold export float scheme described in the first of these two articles. The Treasury provided a revolving fund of silver for this scheme through the Bank of England. On evidence of export the silver is replaced with a small bonus and the amount in the float is thus rising steadily. This silver is made available at the official price. The manufactured silver, sheet and wire exported under this scheme require a licence from the authorities, and it may be assumed that in granting a licence the fullest possible information about price and costs is given to the Bank of England. As in the case of the gold export float scheme, the authorities encourage the exporters to exact as high a price as possible in the markets in which they are selling. The amount of silver turned over under the scheme last year was about 4,000,000 ounces. The value of this business in maintaining valuable contacts and connections is far greater than mere turnover figures would indicate.

Business Notes

Marshall Aid and Inflation

In most City discussions on the problem of inflation the focus has shifted this week from the Budget to Marshall aid. Uncertainties about the volume and nature of the aid which Britain can expect are bound to remain for many months, but there is one source of confusion which can and should be cleared up forthwith. Most of those in the City who have considered the problem at all seem to assume that aid secured under the Marshall Plan would inject an entirely new factor into the inflation equation as it presents itself at the moment. The popular argument takes one of two forms. First it is contended that the Government, by reselling Marshall goods to people in Britain, will secure a sterling income which will reinforce its budget surplus and thus make an additional contribution to the mopping up of the excess flow of public spending power. Hence it is suggested that, if the budget surplus was, as the Chancellor claimed, sufficient in itself to stop inflation, the total surplus, including the sterling receipts from Marshall goods, will be more than is required. To that extent, it is argued, there would be an actual deflation. An alternative version of the same line of reasoning concentrates upon the fact that part, at least, of the sterling receipts from Marshall aid must be segregated in a special fund in conformity with the Foreign Assistance Act. This segregation, so it is said, would not only exert a deflationary effect, but would also provide new resources which either directly or indirectly, would give support to the gilt-edged market.

In principle, both lines of argument are fallacious. Any external means of relieving the pressure of inflation at home comes from the net import surplus as such and does not in the least depend upon the manner in which the imports are provided or financed. Marshall aid will certainly act in an anti-inflationary way, but not by reason of the fact that the goods are received by way of gifts or loans instead of being paid for in gold. The amount of the relief, in an anti-inflationary sense, will depend simply upon the extent to which Marshall aid enables Britain to raise the import surplus beyond the level at which it would have stood without such aid. But, despite Marshall aid, the prospective import surplus is scheduled to be reduced far below its present level. In other words, the external factor, so far from exerting a deflationary effect, will in fact work in an inflationary direction over the whole period in which Britain's balance of payments is being restored to equilibrium.

* * *

No Help for Gilt-edged

The effects upon the central Exchequer will be similar. The Government will indeed get a sterling income by selling Marshall goods, but this income will be less than that recently secured by selling goods paid for in gold or by drafts on the dollar credits. Thanks to the Chancellor's courage in keeping his large surplus intact, the central Exchequer should this year have a margin of funds available for debt redemption; the employment of this sum should help to relieve the pressures on the gilt-edged market. But the margin available for this purpose will not be increased by the fact that Marshall aid is available because, even with that aid, the flow of funds to the Exchequer from the reselling of goods will be much less than it was last year.

Nor will these basic principles be altered by the device of "segregation" of the sterling proceeds of Marshall goods. Even this procedure will not provide any extraneous benefit for the gilt-edged market. If there were no segregation the Treasury might use its margin to repay floating indebtedness to the banking system rather than to give direct support to the gilt-edged market. On the other hand, if the ECA Administrator insisted that the segregated funds had to be kept in long-term British Government securities, some of these might be acquired by direct purchases from the market. In that event, the debt redemption made possible by the Exchequer surplus would in fact take place by repurchases of long-term securities from the market, instead of by redemption of floating debt. It should be borne in mind, however, that even if the Administrator insisted on so rigid a provision as this, the requirement could equally be satisfied by mere transfer of long-term securities from existing internal holdings of Government departments.

Finally, any such operations as these cannot be considered in isolation from the Government's gilt-edged policy as a whole. The principle of segregation was devised in the hope that it would

serve as a means of ensuring that the recipients of Marshall aid were not dissipating it by following simultaneously a reckless budgetary and monetary policy. After Sir Stafford's latest Budget, Britain's policy emphatically does not fall into this category. If, therefore, unduly rigid rules laid down by the Administrator seemed likely to have the effect of interfering with the monetary policy which seemed to the British authorities to be right on general grounds, they could—and surely would—take steps to prevent whatever disturbance was threatened. For instance—to take a purely hypothetical example—if the Administrator insisted upon specific re-investment of Marshall proceeds by direct purchase in the market, the authorities could neutralise the market effects by simultaneous sales from departmental holdings.

* * *

How Will Economic Co-operation Work?

The first annual appropriation proposed by the European Co-operation Administration was published in Washington last Tuesday. Mr Paul G. Hoffman has asked for £1,325 million (\$5,300 million), which will include £239 million for grain, £128 million for cotton, £95 million for petroleum and £28 million for tobacco. Britain is to receive the largest allocation, amounting to £331 million. The main items include £42½ million for grain, £17½ million for dairy produce (mainly cheese), £15½ million for meat, £12 million for sugar, £11½ million for tobacco, £41½ million for cotton, £29½ million for petroleum products, £21 million for non-ferrous metals and £16 million for timber. It is uncertain whether expenditure on any particular commodity will necessarily be kept within the strict limit of the first allocation which has been published for it. The items do not represent additional supplies for this country; they will merely help Britain to secure its curtailed import programme without involving so heavy a drain on its gold and dollar reserves.

There are many points which have yet to be decided about the detailed administration of American Aid. There is, for instance, still no official ruling about "off-shore purchases"—that is, purchases made from countries other than the United States from dollars provided by the ECA. But the mention of a figure as high as £42 million for grain suggests that at least part of this sum may be made available to pay for supplies of wheat to Britain under the Canadian contract. The State Department announced last January that under the programme of aid for the first 15 months, the United States would supply Britain with only 300,000 tons of grain, and at top prices the cost of this quantity would be under £9,000,000. Canadian wheat at present costs Britain about £60 million a year—a figure which will rise to £80 million when higher prices come into effect this summer. At a guess, some £34 million of the cost of Canadian grain might be met by Marshall dollars. This off-shore purchase—if indeed it is finally approved—would provide a useful relief to Britain's visible trade deficit with Canada. But since this was running during January and February at an annual rate of £150 million, it is obvious that American Aid will not relieve this country from its major task of greatly increasing its exports to Canada.

The technique of procurement of supplies under ERP is another difficult and undecided question. There are two alternatives. It may be that the Economic Co-operation Administration would buy supplies at controlled prices and resell them to the recipient countries. Or the sixteen beneficiaries might be asked to buy their supplies directly in the American markets. If so, what effect would their uncoordinated purchases have in forcing American prices upwards? There is also the problem of Argentina. Britain has no contract with that country for the supply of wheat, though it would be a buyer at reasonable prices if it had dollars. But will Britain have a free hand in deciding what to buy and at what price, footing the bill with Marshall dollars? Or will the United States prefer to draw up contracts with countries such as Argentina on its own terms and allocate the supplies to recipient countries? As a matter of general principle, Britain would doubtless prefer to retain freedom of commercial contact with outside countries and that the American Government should procure supplies within its own borders. This is perhaps the most difficult open question about the programme.

The question of allocation of supplies among the recipient countries must also be decided. Where they are purchasing the same commodities, will they have to compete openly with one

another? A centralised buying organisation would avoid many difficulties which would arise in such circumstances. But who is to be responsible for such an organisation? Would it follow the principles of the combined boards that operated during the war? And, again, would it be centred in Washington or Paris? These are thorny problems which will need most careful consideration. But unless the administration of the Marshall Plan avoids an undue rise in prices, the programme of aid to Europe will run the danger of degenerating into a repeat performance of Britain's experience with the American loan.

The Fund and Marshall Aid

The International Monetary Fund announced this week that it would suspend sales of dollars to nations participating in the Economic Co-operation Programme, save in exceptional or unforeseen circumstances. The official communique making this somewhat surprising announcement recognises that there would be objections to drawing up rigid rules on this subject, but for the coming year, that is for the first year of ECA, the general principle to be followed is that members of the Fund participating in ECA shall look to the Economic Co-operation Administration for their essential supply of dollars and that only in quite exceptional circumstances should they be allowed to purchase dollars from the IMF. The argument on which this decision is based is that the Fund and the members participating in ECA should have as their objective the maintenance of the resources of the Fund at a safe and reasonable level during the period of ECA in order that at the end of that period such members may have unencumbered access to those resources. As further support for its decision, the Fund quotes Article 14 of its charter which states that during the transitional period members should not impair the capacity of the Fund to assist its members or impair their ability to secure help from the Fund after the transitional period.

The decision of the International Monetary Fund is based on the assumption that the reasonable dollar needs of the recipient Marshall nations will be duly looked after during the ECA programme. If that assumption is valid the decision of the IMF should give little cause for complaint. But it is prejudging the policy of the Economic Co-operation Administration to assume that this will in fact be the case. Consequently, the edict issued this week by the IMF may in effect prove to be a serious handicap to the consideration of genuine requests for assistance. An unpublishable decision by the Board of Executive Directors to tighten up the "means test" for applicants from the Fund would have achieved as much as the new decision.

This issue has again emphasised the cleavage between those members of the Fund who regard their access to its facilities as a matter of unquestioned right, and those who place the emphasis on qualitative tests regarding both the economic situation of the applicant and the uses to which he wishes to put the exchange he is purchasing from the Fund. There is little doubt about the side on which Britain stands in this debate. The list of countries which have used the Fund's facilities provides the answer.

Price Control Concessions

The changes announced by Mr Harold Wilson last week in the impending extensions of price control should avoid the worst difficulties that manufacturers and traders would have suffered from the formula first proposed; inevitably, this improvement has involved some retreat by the Board from its original objective. It will be recalled that, as part of the scheme for stabilisation of personal incomes and prices, the Board planned a tighter system of price control for those categories of goods which had been only loosely controlled in the past. The Orders made for this purpose were originally to take effect on March 15th; after pressure from trade interests, the date was postponed until April 26th; now the whole batch of Orders is to be scrapped and replaced by new ones which will operate from May 3.

The main difficulty, as a Note in *The Economist* of March 27th showed, related to what are known as "dissimilar" goods—that is, goods which could not be controlled by a "freezing" of prices at levels ruling in the base period because they were not in fact being produced or sold then by the individual manufacturer or trader concerned. Failure to control such goods, as the Board recognised, would have made nonsense of the whole plan, and nicely discriminating control was administratively impracticable, the Board chose a rough and ready method. Maximum prices of "dissimilar" goods were to be, for any particular manu-

facturer, the cost of the constituent raw material plus a prescribed margin. Such a system was bound either to hold most manufacturers in too tight a clamp or to leave many of them with such room for manoeuvre as to defeat the object of the whole policy. The Board preferred the first of these evils—apparently without realising that the new system, if not evaded, would virtually stop manufacturers from making any effort to improve the types and varieties of their products.

The new formula for dissimilar products should not have this effect, for the maximum price is now to be the total cost of production plus 5 per cent—except, of course, for the exclusion of any costs attributable to increases in wages not sanctioned by the principles of the Personal Incomes White Paper. For most of the trades concerned, a margin of 5 per cent on turnover is probably not unreasonable, but the Government is prepared to consider applications for an increase wherever it can be shown to be unduly low. In short, these changes provide no solution for the fundamental dilemma of price control. An excessively rigid system has been made more flexible, but only at the cost of making the control itself less effective. That is bad from the Board's point of view, but what is worse is that the retreat carries the formula back to the worst principles of cost-plus, and thus gives manufacturers and traders a positive incentive to inflate any or all of their costs.

Other changes in the pattern of the original Orders also seek increased flexibility and will remove a number of anomalies. In particular, the standard base period is to be varied to meet the special case of seasonal trades, and in certain other cases the price in the base period will be increased by a prescribed margin to allow for recent increases in the prices of certain raw materials, including leather (in consequence of the withdrawal of the subsidy), cotton and cloth. Apart from these special cases, the maximum price, for any particular manufacturer, of goods other than "dissimilar" goods will be the lowest price which he was charging for the same article during the first two months of this year. It should be emphasised that these provisions apply only to the particular categories of goods—mainly non-essential or unstandardised articles—prescribed in the Orders. Most other goods, especially in the utility ranges, are controlled by specific and more complicated formulæ which are not affected (except for the new rule about treatment of wages) by the new measures.

Is Australia your market?

Do the people of Australia buy your products? Or do you buy theirs? Whichever is the case, the Commonwealth Bank of Australia is able to give you considerable assistance. Guaranteed by the Commonwealth Government, the Bank has 330 branches throughout Australia and New Guinea; it has an unrivalled first-hand knowledge of Australian produce and Australian requirements; it is, therefore, unusually well equipped to facilitate trade between this country and the Commonwealth. The Managers of the London branches welcome enquiries from those whose interests lie in the Australian market.

COMMONWEALTH BANK OF AUSTRALIA

8 Old Jewry, London, E.C.2. Australia House, Strand, London, W.C.2.

Other straws in the wind of monetary reform are the announcements that foreign banks may again operate in Germany, and that for the time being the mark will be given a new conversion rate (it is not to be regarded as an exchange rate) of 30 US cents, or 1s. 6d. The announcement about the reopening of branches of foreign banks in Germany is not expected to lead to any rush on the part of British institutions. Barclays DC & O have a building in Hamburg and one or two of the British overseas banks have in the past had direct representation in Germany. It will be some time before these offices are in active operation again. The American banks are expected to show rather more active initiative in this respect and the Chase National Bank has already opened branches in Frankfurt and Stuttgart. One of the problems that will have to be solved before foreign banking can again be freely transacted by and with Germany is that of the old standstill debts. As matters stand, the creditors could attach assets normally accruing to German banks in the course of their business, and this possibility will have to be obviated by an agreed deferment of the whole standstill liability if German foreign banking is to be allowed to revive.

A certain amount of unwanted capital is evidently flowing to Australia from other parts of the sterling area. Mr Chifley has remonstrated publicly and threatened to take defensive measures. This does not mean that another nail has been driven in the coffin of the sterling area. As yet no action has been taken by Australian banks to control or restrict the movement of funds from Britain to Australia. But when would-be transferors appear they are sometimes reminded that under the Australian currency regulations they may be prevented from reversing the operation and from repatriating their capital if ever they wish to do so. The restrictions on capital movements from Australia date from the crisis of the early 'thirties and have never been annulled, though they are seldom used. The demand for Australian currency has been stimulated in recent months by rumours of a revaluation of the Australian pound in terms of sterling. The rumours have little substance behind them. Even if sterling were devalued in terms of gold and dollars it is a moot point whether any advantage would accrue to Australia if it were to take the opportunity to reduce the present 20 per cent discount on the Australian pound.

When the White Paper on Capital Investment was published the expansion programme of the iron and steel industry was still under review; the Government contented itself with the general remark that the programme—"is vital to our recovery." Mr Strauss circulated in answer to a question in the Commons on Monday a list of major schemes which have now been finally approved. It reveals that the review has not greatly affected the major parts of the scheme, which are now making good headway. The list contains 19 major schemes, beginning with

The committee which was appointed only six weeks ago to examine the question of German steel scrap supplies, has already submitted a preliminary report, and Mr. Strauss informed the Commons on Monday that "measures are being taken to provide additional facilities for obtaining scrap from Germany." He explained that this meant the provision of more tractors and cranes for handling scrap, which, so far as it goes, will be welcome. But it does not solve the problem of inducing Germans to part with commercial scrap which they do not want to sell. This central problem has still to be dealt with, and it is presumably hard for the committee to tackle it until currency reform is settled.

Progress towards the end-of-year targets, calculated in terms of values, is shown in the accompanying table. The figures are all monthly rates at current values, except for the revised targets which are expressed in end-1948 prices, computed on the Board of Trade's assumption that export prices will rise by 5 per cent during the course of this year; some allowance for this assumption should be made in any comparison between actual exports and the target figures. The weak spots in the export drive can be seen at a glance: they are coal, cotton manufactures, wool manufactures and clothing. Rayon and silk and chemicals are among the industries of which more is expected. Of the main

Despite this great effort in the expansion of exports, the visible adverse balance of trade during March rose to £51 million—the highest since September last year. This was caused by an increase in the value of imports to £178 million last month—a record except for July last year and January, 1920. The increase in imports arose from larger arrivals of grain and dairy produce, and of wool, oil-seeds and oil among the raw materials. To some extent, these increases are seasonal but it is patent that Britain is still importing at a far higher rate than was assumed in the Economic Survey, and, moreover, the full strain of higher prices for the 1948 food contracts has yet to be felt. The visible adverse balance for the first quarter of the year was £119 million, compared with £96 million in the same period of 1947.

Restrictions on the import of motor-cars have become so widespread in Europe (though by no means only in Europe) that exporters are being driven into keener competition for the limited markets still open. The competitive strength of the French car industry is therefore of increasing interest to British motor manufacturers. The accompanying table (reproduced from a recent Progress Report of the Society of Motor Manufacturers and Traders) shows that both industries are pushing sales intensively in a few of the smaller countries. Two of these surviving European markets, Belgium and Switzerland, are neighbours and old customers of France, and here the French have succeeded in holding their trading position.

They have done so in the teeth of great production difficulties and, until lately, of an adverse currency situation. The devaluation of the franc has changed the currency situation, at least for a short period, in favour of the French exporter; immediately it should have enabled him to reduce prices by 62 per cent in the dollar area and by 44 per cent in countries to which the "free" rate does not apply. Other factors will intervene, no doubt; certain components depend on imported supplies which

But there is a limit to the extent to which the French exporters can use their new advantage; the inability of their motor industry to produce in quantity sets the limit for the present. The French industry was making about 6,500 vehicles a month between August and October last year—about a quarter of the British production, and only a third of the French production in 1938; and there was a decline towards the end of the year owing to the strikes. French exports have lately been about 4,500 cars a month, an impressive proportion of total output, but not a large enough quantity to maintain the status of a major world exporter. French producers complain of the same handicaps as British, but in intensified forms: shortage of materials and components, Government control of materials, of output, of exports, and even of design. In design too they are under the same disability as many British manufacturers, owing to the technical difficulty, if not impossibility, of retooling on the scale necessary to produce new models in quantity. In general (and with such notable exceptions as the 760-cc. four cylinder rear-engined Renault) they are turning out much the same cars as before the war: for the most part, light cars with cheap running and low fuel consumption as their first recommendations. Of some of their new models a good deal has been heard, and French ingenuity in the light car field is impressive; but these are not yet in production on a commercial scale. It may not be long before they are. The SMMT report observes that it is probable that “an impetus will be given to French car exports, at least for a period,” and “British manufacturers will be inclined to keep a wary eye upon the figures.”

World cotton markets seem determined to give the Raw Cotton Commission little respite. The Alexandria market twelve days ago received a rude shock when the Egyptian Government re-imposed the export tax on cotton. It had been in abeyance for two years and although its re-introduction had been rumoured for some time, it was generally expected to be at the old rate of about $\frac{1}{4}$ d. a lb. The new tax, however, turns out to be $2\frac{1}{4}$ d. a lb. and it has been brought into immediate effect. The first reaction was a sharp fall in spot prices for all varieties by more than 2d. a lb., but later the market became firm and this week Karnak, which stood at 58d. a lb. on April 12th, was quoted at 61d. Nevertheless, exporters who contracted for sales prior to the re-imposition of the tax have been badly hit.

A week ago, cotton prices in New York rose sharply from 37.93 cents a lb. (22.6d.) to 38.67 cents (23.15d.) This rise was attributed to speculative buying in anticipation of Marshall aid. By the end of the week, however, reports suggested that the first Marshall shipments would consist entirely of foodstuffs and

Specialists and research workers, statisticians and overseas correspondents: all these contribute to the columns of *The Economist* each week. Through The Economist Intelligence Unit, the same sources can be put at the disposal of business firms and other organisations. Perhaps you could obtain the facts and appreciations that you need by applying to:

22, Ryder Street, St. James's, London, S.W.1
(Telephone : WHitehall 1511, Ext. 13.)

consequently cotton reacted to 38.12 cents a lb. (22.7d.). In the past few days the market has again been firm, aided no doubt by the publication of the first year's appropriation under the European Recovery Programme, and by Wednesday the New York spot price stood at 39.63 cents a lb. (23.6d.). Some £128 million of Marshall aid is to cover cotton purchases for all recipients, of which the United Kingdom may receive £41½ million.

These price movements may not affect British cotton prices immediately, though sooner or later the Raw Cotton Commission's prices will be adjusted to world levels. The Commission has recently concluded a bulk contract with the Sudan Government for 200,000 bales of cotton at the cost of £10 million. This quantity is all but 25,000 bales of the estimated output for 1947-48, and the average price works out at about 36d. a lb. Although the price is double last season's, it is still below Alexandrian quotations for similar types and this purchase will help to reduce British imports from Egypt. The British price for American cotton has been below replacement cost for some time and if the New York market continues to rise, prices to British spinners may have to be increased.

* * *

Redistribution of Labour

A review of the operation of the Control of Engagements Order, after five months, suggests that the Ministry of Labour is meeting with some degree of success in its measures to correct the maldistribution of labour. Employment exchanges are now placing nearly twice as many workers as they did before the Order came into force. The February and March figures of 375,000 workers placed in February and 368,000 in March compare with an average of 203,000 in the three months before October. It is true that the proportion of these men and women who were placed in "first preference" manufacturing industries is still very small. It was 46,000 in February and 45,000 in March—only about 12 per cent of total placings. On the other hand, the net increase in employment in these industries in February was 0.5 per cent, compared with 0.1 per cent for other manufacturing industries, and they actually gained 3,000 women, whereas other manufacturing industries lost over 7,000 during February. The three main "target" industries named in the Economic Survey all increased their manpower. Agriculture gained 5,000, coal mining 2,000, and textiles, where the need is greatest, showed an increase of 4,500, including 2,400 in cotton. A fall in the building labour force is, at last, recorded and the manpower engaged in distribution slightly decreased.

The process of redistribution seems irritatingly slow, but it is difficult to see by what means it could be accelerated. Without the Control of Engagements Order, there can be no doubt that the undermanned industries would have gone on losing labour.

The most obvious alternative—large-scale direction—would have been politically and administratively impracticable: only one man was directed under the Minister's new powers during February, bringing the total number of directions up to 17. The limits to redistribution of labour are set, not only by the Ministry of Labour's restricted powers and by trade union attitudes, but also by purely physical factors, such as the shortage of housing in particular areas and the lack of facilities for the employment of women.

Indeed, perhaps the most disturbing feature of what is otherwise a fairly encouraging report is the decline in the number of women in industry. Whereas 29,000 more men were added to the numbers in civil employment in February, the number of women fell by 2,000. It seems likely that men will be increasingly employed on women's jobs, unless the defects can be made good by an increase in the foreign labour force. In February, 14,000 more foreigners (Poles, EVWs and ex-prisoners of war) were recruited, compared with 12,000 in January. This is encouraging, but it will only be effective if the foreign workers can be trained and placed in productive employment with the utmost speed.

* * *

International Shipping Conventions

Shipowners have greeted the formation of the Inter-Governmental Maritime Consultative Organisation (IMCO) in a somewhat resigned manner. Sir George Christopher, speaking as president of the Chamber of Shipping of the United Kingdom, recently declared that shipowners, both British and foreign, would have preferred not to have had such an international organisation imposed on them at all. The IMCO Convention, which 21 Governments signed at Geneva in March (but which still needs ratification) still contained certain dangers, in Sir George's opinion, even after allowing for the safeguards which had been inserted. This may sound like a parochial viewpoint, but the industry is entitled to its opinion. IMCO, a specialised agency of Unesco, is to have its headquarters in London. Its main objects are to provide machinery for technical co-operation among Governments with regard to shipping engaged in international trade, and to encourage the removal of discriminatory action and unnecessary restrictions by Governments and private shipping concerns. It is known that the International Chamber of Shipping (the former International Shipping Conference) would have liked more direct representation as a safeguard against elaborate or unpractical shipping requirements which might upset the economics of the industry. But the Chamber has perforce to be content with indirect representation through its membership of the International Chamber of Commerce, which is recognised by Unesco as a consultative body.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption														

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (n) Net yields are calculated after allowing for tax at 9s. in the £. (j) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7.8 per cent.) (i) To latest redemption date. † Free of tax.

Record of distinction...

A tale of escape to freedom began the rise to fame of La Tropical de Luxe Cigars. In 1875, a company of exiles, fleeing from the Spanish Oppression in Cuba, found in Jamaica not only sanctuary, but an ideal climate and soil for the growing of fine tobacco.

To these men, with a life-long knowledge of tobacco cultivation, this was happy circumstance indeed. There and then they established the firm of Machado, and today La Tropical de Luxe Cigars remain unrivalled for their exquisite delicacy of flavour and their delightful mildness and bouquet.

Obtainable in all the usual sizes, from 2/5d. each.

LA TROPICAL

Finest Jamaican Cigars

Manufactured by the
B. & J. B. Machado Tobacco Co. Ltd., Kingston, Jamaica.

Imported solely by Lambert & Butler of Drury Lane

Branch of The Imperial Tobacco Company (of Great Britain & Ireland), Ltd. L75H

As Supplied to H.M. Forces

With watch imports severely restricted the release of Government stocks of men's high-grade Swiss watches provides an excellent opportunity. 15-jewel movements. Steel cases—waterproof, shock-absorbing and non-magnetic.

The under 35's want to know what you have to sell

The under-35's have settled down and are taking stock. After assuming greater responsibilities age for age than any other generation in history, they are now growing up as consumers. They are making comparisons and decisions and forming buying habits which are likely to remain with them for the rest of their lives—and no other age group has a longer span of buying life ahead

More than one-third of our adult population is under 35, and the *Daily Mirror* draws close on half a million more readers from this age-group than any other national daily paper

A business whose future depends on the preference of the under-35's will wisely plan to advertise in the *Daily Mirror*

470,000 more adult readers under 35 than any other national daily paper (vide independent Hulton Survey)

Cost of advertisement space (per column inch per thousand readers) lower than any other national daily

Daily Mirror

COMPANY MEETINGS

BRUSH ELECTRICAL
ENGINEERING COMPANY,
LIMITED

BRIGHT PROSPECTS

The annual general meeting of this company was held on the 20th instant at Loughborough. Sir Ronald W. Matthews, the chairman, presided.

The following are extracts from his statement circulated to stockholders.

At the annual general meeting held at the end of December, 1947, I forecast that the profit for the year 1947 would not be less than £300,000, and this forecast has proved to have been more than justified. The net profit is £337,611.

The output of the electrical division on the basis of the increased production which we are already achieving is booked for more than a year ahead. To take one instance—transformers; output during the year ending December 31, 1947, was approximately 33 per cent. in excess of that for the previous year, and the directors are confident that the rate of output by the end of 1948 will be further substantially increased.

The electrical machine department has a full order book for more than a year ahead, strengthened in the last few weeks by the receipt of a substantial order for alternators of the size in which we have been in mass production for some months.

Subject always to the possibility of unfavourable developments in international relationships, I feel justified in saying that the company's prospects for 1948 are bright. The company started the year with an order book of over £7,000,000, the results which are available to the directors for the first three periods of 1948 show that output in those periods is 100 per cent. in excess of that achieved for the similar periods of 1947, and the profits shown are satisfactory.

The report was adopted.

(Continued from page 686)

Reactions to the purposes of IMCO have been mixed. Its technical purposes have been fairly widely approved. There is a strong case for routine co-operation between Governments on matters such as the safety of life at sea, which demand co-ordination with other organisations dealing with (for example) meteorology, telecommunications, and flying. The leading maritime nations are meeting in London this week-end to consider the revision of the Safety of Life at Sea Convention, 1929; and experts from the other UNO agencies have already made detailed recommendations in preparation for the meeting. They have suggested common international practice on assistance to ships and aircraft in distress, radio communications, weather reports, radar and other radio aids to navigation. In this field the proposed Maritime Safety Committee of IMCO is likely to emerge as the ultimate international authority. There is other technical work in which IMCO may have an important part to play. But on national discrimination and restrictive practices it breaks into more difficult ground. The IMCO Convention provides for the consideration of matters of this sort, but the organisation will have no executive powers; it is purely consultative and advisory, and there is some scepticism about the practical outcome of its "consideration" of these thorny problems.

Bank Credits to Poland

London banks are still extending their foreign credits. This week details have been published of two substantial credits to Poland. The first is for £6,000,000 and takes the form of a medium term cash advance arranged by Lazard Brothers, in participation with Lloyds Bank. It is intended to finance the purchase of capital goods in Britain. This credit has been arranged in accordance with the Anglo Polish trade agreement signed last June. This agreement provided that payment for Polish purchases in Britain should be made as to 40 per cent in cash on placing the order, 20 per cent on delivery and the remaining 40 per cent in three annual instalments. The commitments are being underwritten by the Export Credits Guarantee Department.

BRITISH ROPES LIMITED

VITAL EXPORTS

The twenty-sixth ordinary general meeting of British Ropes Limited, was held on the 15th instant, in London.

Mr Herbert Smith, chairman and managing director, who presided, said that they had endeavoured to supply the needs of their customers. The company could have produced more, particularly in the wire section of their industry, if a larger supply of steel had been made available to them. An increase in the share of steel available to the industry during 1948 under the steel rationing scheme would enable the company to maintain and perhaps improve upon the results achieved.

He would stress the point that the continual improvements made in the manufacture of their many products during past years were now having the effect on profits one would expect to see, so that the more they organised and improved efficiency the more production costs were decreased. In attempting to forecast he could only say that if peaceful conditions prevailed, their present output would be maintained, and since there was some hope of a larger supply of raw materials, production figures might rise above those for 1947.

After satisfying the essential requirements of the home industry, the company's policy was to maintain and increase the sale of its products in world markets and so add their quota to the export drive, which was so vital a need of the country today. Their products had been sent to many parts of the world, including substantial sales in hard currency areas, which was a very gratifying contribution to the export drive. The net profit for the year amounted to £768,988, an increase of £274,963.

The report was adopted and the final dividend of 15 per cent., making 20 per cent. for the year, was approved.

GENERAL ACCIDENT FIRE
AND LIFE ASSURANCE
CORPORATION, LIMITED

FURTHER EXPANSION

The sixty-second annual general meeting of this company will be held at Perth on the 28th instant.

The following is an extract from the statement of the chairman, Mr Frederick Richardson, circulated with the report and accounts:

Our world-wide operations in 1947 show a net profit of £413,805. We are providing the usual dividend of 4s. on the ordinary shares; transferring a further sum of £45,000 to the fire reserve fund and £137,701 to staff pension funds, leaving a carry forward of £351,890, which is slightly more than last year. The total premium income at £17,401,565 is up by £3,243,312 and the total assets, £34,741,789 by £3,470,523.

As motor insurance is by far our largest single activity, we are constantly seeking to increase the volume of non-motor premiums, and our efforts have been very successful. Everyone should revalue his property in the light of present conditions and bring his insurances into line with the current cost of replacements.

We have shared in the phenomenal growth of insurance business in the United States, but the increase there in our premium income was not so large as it would have been had we not imposed severe underwriting restrictions. We made a modest profit, and can look forward with reasonable confidence to better results in the future. In the fire department we had another successful year, and there has also been considerable growth in the premium of the marine department during the year. We reorganised our American subsidiary, the Potomac Fire Insurance Company, in the course of the year, and provided it with ample surplus funds without calling on the Bank of England for dollar exchange.

The second Polish credit is a revolving documentary acceptance credit for £1,500,000 granted by a syndicate headed by Kleinwort Sons and Company and is intended to finance Polish purchases of wool and other raw materials.

Shorter Notes

The Government's interim index of production is provisionally given as 124 (1946 = 100) for all industries in February, the latest month covered, against 118 for the revised January figures. The component items are: Mining and quarrying, 112 (114); manufacturing, 124 (118); building and contracting, 131 (118); gas, electricity and water, 124 (121). The provisional January figures had to be revised downwards by 4 points, and some adjustment may be required to correct the February figures. The increase in industrial activity appears to have been maintained, though the seasonal recovery in building played a considerable part. The index of industrial production compiled by the London and Cambridge Economic Services advanced from 118 in January to 121 in February, the latter figures again being subject to revision.

*

The Government's decision to support the foundation of a British Institute of Management was announced by Sir Stafford Cripps (as President of the Board of Trade) nearly 18 months ago. The Institute has now completed the preliminary work of organising itself, and opened its public career at a ceremony in London on Wednesday at which the speakers were Sir Stafford Cripps, Sir Charles Renold (chairman of the Institute), Sir Frederick Bain (president of the Federation of British Industries) and Miss Florence Hancock (chairman of the General Council of the TUC). The general purpose, as defined by Sir Clive Baillieu's committee which reported in March, 1946, is to raise the standards of management practice. For its first five years the Institute is supported by Government grants up to a limit of £150,000; eventually it is to maintain itself by contributions from corporate and individual members.

COMPANY MEETINGS

CADBURY BROTHERS, LIMITED

INCREASED TOTAL PRODUCTION

COCOA EARNS DOLLARS

MR LAURENCE CADBURY'S SPEECH

The forty-ninth annual general meeting of Cadbury Brothers, Limited, was held, on the 19th instant, at Bournville, Birmingham, Mr Laurence J. Cadbury (chairman of the company) presiding.

The chairman, in moving the adoption of the report and accounts, said:

Statistically, 1947 was a good year for our company. Our total production, though still, of course, well under that of 1939, was up by 18 per cent. on 1946. This increase was due to the civilian sweet ration being raised in September, 1946, to 4 ozs at which, on average, it remained during 1947, with an additional 1 oz allowed for Christmas. But this satisfactory record was clouded in the closing weeks of the year by the knowledge of reduced supplies to come. We are now once more on a 3 oz basis.

THE SUPPLY PROBLEM

Although the cut in the ration was due to the sugar position, especially the marginal amount purchased from dollar sources, the supply of raw cocoa is our greatest anxiety. The spread of cocoa-tree disease of which I spoke last year is far from being checked. World supplies again decreased. The gap between world production and world needs is estimated as at least 100,000 tons, which is a big figure out of a crop from all sources of 600,000 tons. The shortage has been reflected in the price of £237 per ton of cocoa that is now being charged to manufacturers in this country. It is a price without precedent, and is at least six times that of the prewar price of £35-£40 per ton.

As I explained last year, the prices at which the West African Marketing Boards sell to the Ministry of Food are based upon those ruling in New York, which represent what American manufacturers in a competitive market are prepared to pay for cocoa allocated to that country.

The price paid by the Gold Coast Marketing Board to the producer was 75s. per cwt for 1947-48. This compared with 23s. 6d. before the war. The very large margin between this figure and that charged to the buyers here and in the U.S.A. goes to swell the funds of the Marketing Board, which may this year reach a total of £60 million. This is a vast sum which has been accumulated unexpectedly and undesignedly. It throws a great responsibility on those who control it to see that it is not frittered away on extraneous matters, but is used for the rehabilitation and development of the cocoa industry.

Cocoa sold at these prices in the U.S.A. has been of great value to the sterling area. But as far as this country is concerned it means that the prewar 2d. block of chocolate, already increased to 4d. has had, by agree-

ment with the price control authorities, to advance to 5½d.

GOVERNMENT AND PRICE REDUCTION

The Government is very rightly at the present time making an effort to control or reduce prices. It is a somewhat ironic commentary on this move that our industry has been forced to put up the price of an important foodstuff because the margin between the price paid to the producer and charged to the consumer has been greatly widened by decisions over which we have no control. The position may be clearly set out as follows:—

	1939	1945-46	1946-47	1947-48
Price per cwt paid to the producer...	23/6	28/0	51/4	75/0
Price to manufacturer (duty paid in U.K.)...	35/0-40/0	62/0	130/0	237/0

BUREAUCRATIC BUYING

I would like to refer to the system under which cocoa is bought for use in this country. Prior to the war, we had ourselves been buying cocoa in the markets of the world for over a hundred years. The careful study of day-to-day world prices was an essential part of our business. Now, however, we do not even know the price at which cocoa is bought by the Ministry of Food from the Marketing Boards. It is difficult to understand the reason for this bureaucratic secrecy. I suggest that it is, to say the least, unfortunate that the skilled services of the industry cannot be used more than they are in the buying of a product of which they have such expert knowledge. The Ministry of Food might well consider how another industry, that of the press, secures its raw material. The Newsprint Supply Corporation, acting for the national and provincial press, but in collaboration with Government departments, negotiates contracts, buys, transports and stores newsprint. It would, I submit, be in the national interest for some such scheme to be adopted in the case of raw cocoa.

FOOD PRODUCTION IN AFRICAN COLONIES

I have spoken about the cocoa bean position in British West Africa. It is not irrelevant to comment on the Government-sponsored schemes for developing food production in our African Colonies.

The scale and speed with which it is proposed to go ahead in these African projects require careful watching. British industry is severely restricted in supplies of materials for capital reconstruction that will show immediate returns. How far can we afford priority of supplies to colonial development that can only yield results in several years' time?

Again, it is important that the new projects should not prejudice existing productive activities. It hardly seems wise to attract labour into long-term development schemes if to do so means taking it from land already under cultivation.

In addition, we have to consider the impact of these new ventures on the British staff in the Colonial services. Your vice-chairman visited British West Africa at the end of last year to investigate the work that was being carried out to combat the cocoa disease that is rampant there. In our view, 40 European supervisors should be on this work. The Gold Coast Government have authorised 24, but there were at the time of his visit only nine men at work up country, of whom three were on the sick list!

It is disappointing that this vital matter of fighting the spread of disease has not been taken up with more speed and energy by the authorities.

HELPING THE EXPORT DRIVE

We have naturally given great attention to the question of how we could assist the export drive. Our efforts in the hard currency areas, particularly the United States, are definitely a venture. We have never been able in the past, through tariffs, other barriers and local competition, to develop a permanent sale there. I am doubtful if we shall be able to create a permanent sale now, but we may be able to sell appreciable quantities during the next few years, by introducing lines that are new to the American market.

I take this view because bilateral trade between the United Kingdom and the United States has definite limitations. The final solution of our dollar problem must be found in gearing up triangular and multilateral trade once again. We have got to increase our exports of such things as textiles, cycles and various consumable goods (including cocoa products) to the tropical dependencies; they in turn send their exports, such as rubber and tin, to the U.S.A. The U.S.A. can then sell automobiles and household equipment to Canada, and Canada can complete the circle by sending us wheat. It is in the development of trade on these lines that we shall finally solve our international indebtedness. This will take time, and if, meanwhile, the chocolate and confectionery industries can export to the U.S.A., even temporarily, they will have helped to fill this financial hiatus.

During the war years our company had a considerable overseas trade with N.A.A.F.I. and with allied governments, but its civilian exports were practically nil. Last year, apart from N.A.A.F.I. supplies, we and our associate companies in the United Kingdom pushed up our civilian exports to nearly £800,000. We hope to improve on this.

So far, I have been referring to visible exports. In addition, our company has assisted the trade balance through the operation of its overseas subsidiaries. Their earnings have provided invisible exports from this country.

COCOA BEANS A DOLLAR-EARNER

The export drive is a recent development; throughout the war, however, raw cocoa beans have played a very important part as a dollar-earner.

I have already spoken about the high price to which the competitive bidding of the chocolate manufacturers in the United States has driven cocoa prices in that country. As a result, in 1946-47 the sterling area benefited by sales of cocoa in New York to the tune of about £17 million, and the present crop should yield £25 million.

These are remarkable figures. For the sake of comparison it should be noted that in 1947 the chief U.K. sales to the U.S.A. were: Whisky £8.1 million; Textiles £9.3 million; Chemicals £2.6 million; Machinery £2.1 million; Vehicles (cars, locos, ships) £1.8 million.

EMPIRE DEVELOPMENT

It is popular in certain quarters to depreciate what has been done in the development

of our Colonial Empire. Those who do so overlook the Empire production of such things as rubber, tin, cocoa; all invaluable dollar producers today, and equally all the results of private enterprise. For let us remember that cocoa production is not indigenous to B.W.A. In the early years of the century your company took a leading part in its initial development, and can claim to have been largely responsible for stimulating its cultivation ever since.

The sale of raw beans having proved a useful source of dollars, the Treasury has kept a close eye on the beans coming into this country. It must not be forgotten, however, that if we convert beans into finished goods and sell them for dollars the result is better still. At the present time we are selling chocolate assortments in the United States at a price which is rather more than three times the return we should get if we sold the raw materials from which they are manufactured.

STAFFING PROBLEMS

Turning to more domestic matters, may I say a word about our staffing problems? We have always tried to pursue a far-sighted policy in the selection and training of our future management. Hostilities inevitably interrupted the operation of our various schemes. Since the war we have started once again to provide opportunities for candidates selected from our own ranks and for a limited number of ex-Service and University students of both sexes to qualify for training for managerial posts. We also launched schemes for filling the gaps in our factory supervisory staffs caused by the comparative cessation of recruitment and promotion in the war years when many of the staff, who would normally have retired, remained at work.

We invited anyone in the concern to apply for consideration as potential trainees. In the two years in which the scheme has been running, over 500 have applied, of whom two-thirds were ex-Service employees. Out of the 500, 79 were selected for training, and 52 out of the 64 promotions to factory managerial posts made since the scheme started had passed through it.

PLANT IMPROVEMENT

Our traditional practice has been to scrap ruthlessly whenever we could design and build machines and layouts that promised greater efficiency and economy. The war naturally interrupted our programme and our experimental work had to be put on a care and maintenance basis, but we had hoped before now to be able to resume full activities in this direction. Unfortunately the cutting-down of licences has made this impossible, and for nearly ten years we have been unable to make any substantial improvements to our plant and buildings. We regret to say the position here shows no sign of improving. On the contrary it is likely to deteriorate, as under the present Government programme labour is being cut from 25,000 to 8,000 men for work on "operational" licences for the whole of the food industries.

This inability to carry out factory improvements may have been inescapable. Some industries have clearly had to take a second place in this respect, but I suspect that our experience has been fairly general, and if this is so, the consequences are serious.

In the Government White Paper, "Economic Survey for 1948," we read that during 1947 the standard working week of 5 million people was reduced on an average by 3½ hours. We know also that thanks to the loss of overseas investments, debts contracted during the war, and adverse terms of trade, we have a formidable gap between imports and exports. A political economy which, under these circumstances, at one and the same time cannot allocate its resources to im-

proving its technical equipment, yet simultaneously decides to work fewer hours, can scarcely be described as either rational or planned.

THE OVERSEAS POSITION

Overseas, I am glad to say, the position is more cheerful. In Canada, South Africa, Australia and New Zealand, we have been enlarging our factories and installing new machinery. In Eire we have built a complete new factory at Rathmore, not far from the celebrated Lakes of Killarney. I might mention here that, without exception, all our overseas companies have increased their turnover during the past year.

The Rathmore factory is to make semi-processed milk chocolate for this country. Normally, we should have adequate supplies of milk chocolate coming from the four factories that we have erected for milk-condensing purposes in the United Kingdom. Since the early years of the war, however,

we have been debarred from using the 23 million gallons per year which pass through them from local supplies; supplies largely built up and steadily fostered by us in pre-war times. We have made it clear that we do not expect households to go short of milk for the sake of milk chocolate. There is, however, even now a considerable summer surplus of milk, and we assert our right to have a share of this. Instead, in the summer flush period milk is diverted from our depots to other creameries for the manufacture of butter, cheese, and various milk products. In the main these make an infinitesimal contribution to the nation's rations, and we regard it as unfair that our share of this manufacturing milk should be denied to us and to the consumers of milk chocolate.

The company have agreed to comply with the Federation of British Industries request for the limitation of dividends.

The report was adopted.

WM. FRANCE, FENWICK AND COMPANY, LIMITED

SATISFACTORY RESULTS—INCREASED GROSS PROFIT

MR KENNETH R. PELLY'S STATEMENT

The forty-seventh annual meeting of Wm. France, Fenwick and Company, Limited, was held, on the 20th instant, at the registered office of the company, 23, Rood Lane, Fenchurch Street, London, E.C.3.

The following is the statement of the chairman and managing director (Mr Kenneth R. Pelly, M.C.), which was circulated with the report and accounts.

TRIBUTE TO THE LATE SIR GEORGE HIGGINS, C.B.E.

Before dealing with the business of the company, I wish to refer to the death of Sir George Higgins, C.B.E., which occurred in August last year. He was the original secretary of the company on its formation in 1901, and served as such until 1909 when he was appointed a managing director, and in 1926, chairman. He resigned this position in 1941, remaining on the board as an ordinary director until his death. From this record you will see that he had given practically the whole of his active life to the company. He was held in the highest respect by his colleagues, who much appreciated the services he rendered to the company over a long period.

ACCOUNTS AND DIVIDENDS

This will be the last occasion on which our accounts will be issued in their present form. Your directors have always striven to present the balance sheet and profit and loss account in such a manner as to give as much information as possible as to the financial position of the company, so that stockholders should have the fullest information. The new Companies Act is to become effective as from July next, and therefore on the next occasion our accounts will have to conform to the Act, including a consolidated statement, which will certainly involve delay in their issue.

Turning to the profit and loss account, I am pleased to be able to report another rise in gross profit amounting to £10,107. On the other side of the account, the total charge for depreciation is some £50,000 lower. In last year's account there was placed to additional depreciation a sum of £58,000, being the reduction in income tax on account of initial allowances; the corresponding figure in the present account amounts to £6,500 and represents the net saving of profits tax for this year on these allowances. This, of course, affects the provision for taxation which it will be noted now takes an additional £46,000 compared with the previous year. The item of provision for surveys I will deal with later.

The appropriation account discloses that your directors have placed a further £51,826 to reserve, and that they recommend a final dividend on the ordinary stock of 12½ per cent. less tax, making a total of 15 per cent. less tax for the year, the same as was paid in respect of 1946.

Referring to the balance sheet, the reserve has risen by £105,000 to the figure of £990,000. The capital accretion account has been strengthened during the year by a further £12,000, and your directors propose a distribution of 3 per cent. to the ordinary stockholders, the same as on the last occasion.

Finally, this leaves a balance to be carried forward of £29,695 as against £29,825 brought in from last year.

It may be of general interest to stockholders if I draw a comparison between the nominal rate of ordinary dividend and the return on the capital employed. The ordinary issued capital of the company has little bearing on the equity capital employed, which now amounts to some £1,800,000. On this basis, the nominal dividend of 15 per cent. represents a return of 6½ per cent.

PROVISION FOR SURVEYS

I feel it is necessary to say a few words in particular reference to provision for surveys. The figure for this purpose at the beginning of 1947 stood at £86,500. During the year we have expended on carrying out surveys, £53,166. The whole fleet is now up to date as regards surveys for the first time since the commencement of the war. During the war period, surveys were out of the question, and under arrangements between the Ministry of War Transport and the Classification Societies, ships only receive a general examination from time to time.

Since the conclusion of hostilities, the problem of passing surveys has been very difficult on account of the shortage of material, the delay in obtaining dry docks, labour uncertainties, etc., but our classification surveys have been brought right up to date at a very considerable cost, and the figure of £60,000 now represents a provision for future surveys only.

THE FLEET

During the year under review, the fleet has been slightly reduced by the sale of two of the company's ships. The s.s. *Helmwood*, the oldest ship in the fleet, was sold to Chinese buyers at a very satisfactory price. The other vessel, the s.s. *Betswood*, was originally built for a specific business and

traded under a long-term charter, by which the charterers had the right of purchasing her after a stipulated period. This option, which was suspended under war conditions, became operative again, and during the year was exercised.

As I have mentioned on previous occasions, during the war years we were continuously replacing lost tonnage. Our policy proved to be right, and we have therefore been able to cease building during the past year or two whilst costs have been at an unprecedented level. However, if one is to continue to run a modern and up to date fleet, it is impossible to allow any long period to pass without constructing some tonnage, and with this in view, we have made reservations of two building berths, one for the commencement of building this autumn, and one to commence late in 1949 or early 1950.

The first of these ships will certainly be at a high figure, there being no sign at present of reduction in building costs. In fact I feel that costs are still likely to rise, probably largely on account of a further rise in coal prices which must be anticipated, and which will react on steel prices.

The whole of the present fleet stands at such a reasonable figure that your directors feel the addition of another one or two ships, although at high prices, will not unduly upset the low average at which the fleet is valued in the books, always bearing in mind the necessity of owning modern economic tonnage.

In my statement last year I made some remarks as to the then current building and repair costs. These have continued to rise and there is still no sign of any reduction. Wages, coal and material are on higher levels than a year ago. This general rise in costs was met by a 10 per cent. increase in coasting rates of freight in agreement with the Ministry of Transport, as from July 1st last.

Another point of importance is the heavy delays incurred in completing repairs. Whether it be for survey or damage repairs, a ship today is off trading for a very extended period, and in some cases may have to wait a considerable time before obtaining a dry dock. All this has its effect on profits.

In the past, the crews of coasting ships on weekly articles fed themselves. The industry now have a demand from the trade union representatives that the men should be fed by the owners in the same way as in vessels on monthly articles. In principle, we entirely approve of this practice, and in fact have commenced already to feed some of the ships. This is going to increase materially the cost of operation, and has not yet been taken into account in our rates of freight, and it may be that the matter will have to be discussed with the Ministry in the near future. On the other hand, if this change makes the coasting and near trades more attractive to personnel, so saving considerable delays in obtaining crews, the expense to the owner will not turn out so serious as it may appear.

TRADING

Since the war, up to a few months ago, there was to all intents and purposes no export of coal to the near Continental ports, a trade in which your company was previously largely engaged. During the last few months export to these countries has recommenced in a small way. You probably read in the press and heard on the wireless the description of the s.s. *Dashwood* arriving at Rouen with the first cargo of British coals since the resumption of exports. She is one of your company's fleet and received a great reception on arrival. Since then we have continued to carry cargoes from time to time to the near Continent, and I hope that it may be the beginning of an increasing tonnage for export, not only from the point of view that it is a trade your company requires, but also, because it is of the greatest importance to the national economy.

In prewar days, large quantities of coal

were sold to the Continent on a c.i.f. basis by the exporters in this country. Up to quite recently, when the National Coal Board gave an allocation of coal to an exporter, he was debarred from quoting on a c.i.f. basis. The fixing of freight was therefore in the hands of the buyer, who naturally gave preference to his national flag, the result being that British tonnage was probably only employed if the foreigner had no suitable tonnage available.

One would have thought that if this country has coal for export at a competitive price, we should be in such a strong position that the National Coal Board could insist upon British shipowners being given at least an equal opportunity of carrying the coal. I am glad to say that the National Coal Board have now changed their policy and is allowing the exporters to quote c.i.f., but it is still disturbing to see inquiries advertised for foreign tonnage only, for the carriage of British coal from British ports.

I mentioned last year that our London/Goole department, which had practically ceased to exist during the war period, had come into its own with a good volume of trade. The results, however, have not been altogether satisfactory, but with the increased rates which have now been authorised and a more steady supply of goods, the position looks considerably more healthy.

ASSOCIATED AND OTHER COMPANIES

Holdings in associated and other companies largely comprise Colliery interests and those in Coastwise Colliers, Limited. With regard to the former, it must be remembered that there is no guarantee of any interim payment after the two year period from the date the collieries were taken over by the National Coal Board. This expires at the end of 1948, and at the moment everything points to there being no settlement of compensation for a considerable time after that date. There is therefore some doubt as to what return, if any, may be received on our Colliery investments after the end of 1948.

Coastwise Colliers, Limited, completed their first year of trading during 1947. The results were satisfactory, but the board settled to strengthen the company in this early period of trading by retaining the profits in the business.

The results of our subsidiary companies are on the whole satisfactory. One of these companies suffered from the transition from war to peace and failed to pay a dividend. This, we hope, however, is of a temporary nature.

THE FUTURE

Of the future, it is difficult to say much. There appears to be every likelihood of sufficient trade being available and at reasonably remunerative rates. As I have explained, we are still faced with no signs of reduction in costs, in fact, costs are still rising. During the coming year, the fleet should show a greater number of trading days now that all arrears of surveys are completed. If delays in ports for one reason or another can be kept to a minimum, if our export of coal expands and is equally available to British tonnage as to foreigners, there is no reason why the coming year should not show satisfactory results.

I feel that no review of the company's activities is complete without a word of tribute to the staff, both ashore and afloat. It is impossible to speak too highly of their loyalty and co-operation. I can assure stockholders that they all give of their best at all times, which reacts so favourably on the wellbeing of the company. Our thanks are due to one and all.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring director, Mr J. D. Stobart, was re-elected, and the auditors, Messrs. Deloitte Plender Griffiths and Co., were reappointed.

The meeting terminated with a vote of thanks to the Chairman, directors and staff.

THE BRITISH ALUMINIUM COMPANY, LIMITED

IMPROVED RESULTS

The ordinary general meeting of the British Aluminium Company, Limited, was held in London on the 16th instant.

Mr R. W. Cooper, M.C., the chairman, in the course of his speech, said: The profit for the year 1947 amounted to £2,123,347, from which you will observe that there has again been an improvement in our trading results. The demand for alumina has been well within the capacity of our works at Burntisland and Newport and the works at Larnie are therefore still on a care and maintenance basis. The reduction plant at Foyers, constructed over 50 years ago, is too small to meet modern competition and we are taking steps to cease production of aluminium there and plan to put down plant for the manufacture of potassium and sodium chlorates and plans for this change are now being finalised. With regard to the works belonging to our Norwegian subsidiaries, the same conditions apply at Stangford as at Foyers and for this reason the works have not been restarted since the war. We have the whole question of our fabricating facilities under review and are giving close attention to plans for rationalisation, increased capacity and efficiency.

NEGOTIATION FOR NEW CONTRACT

I referred last year to the difficulties we were having at that time in negotiating a contract for our 1947 production. We finally agreed a figure, but I regret to say that we are experiencing even greater difficulty in negotiating a contract for our 1948 production. We have all along indicated to the Ministry of Supply that we are quite willing, in the interests of future large-scale development of the industry, to accept a price for our ingot which covers our costs and gives us a very low return on the capital employed. We are striving, not without success, to reduce these costs.

Last year we accepted a very low price, and at the same time we expressed our intention of proceeding with a very extensive reconstruction programme in order that our technique may be preserved and improved for future large-scale development. The price at which we sold our 1947 production was considerably below that at which metal produced anywhere else in Europe can be purchased, and we are in a position to accept an even lower price for 1948. Negotiations for the sale of our 1948 output have been proceeding since last autumn, and before the end of last year we agreed with the Ministry's accountants a close estimate of what our bare costs would be for the current year. So far, however, the Ministry have only offered us a price which is below this agreed bare cost of production.

ESSENTIALS FOR SUCCESS

If we are to bring to a successful conclusion the plans which I have outlined earlier, it is of course necessary not only to effect constant improvements in our technique but to maintain an adequate staff of skilled technicians and supervisory grades who could provide a nucleus for the development of this enterprise. It is therefore difficult to see how we could proceed to the realisation of these objects, the national importance of which I do not need to stress, unless the production of alumina and ingot metal in this country can be continued on a healthy basis.

The total profit for the year is £2,123,347, whereas in the previous year it was £1,368,095 after providing for E.P.T. We recommend a final dividend of 6 per cent. on the ordinary stock, which, with the 4 per cent. already paid, makes 10 per cent., less tax, for the year.

The report was adopted.

money the trade during 1947 was 176 per cent. more than in 1938, and the total of cars, commercial vehicles and tractors produced last year constituted an all-time record.

Export turnover, also an all-time record, was 21 per cent. greater than 1946, the previous record year, and 281 per cent. greater than in 1938.

Finally, taking cars, commercial vehicles and tractors together, we are not only the largest producer in the British motor industry, but also, we feel assured, its largest exporter—to a value of over £10,000,000 in 1947, and during the first two months of this year of £3,508,446.

We are not unmindful of the future, and in all fields of production are developing plans which we confidently believe will keep us well in the lead.

LACK OF FACTORY SPACE

We are severely hampered by lack of factory space. The curtailment of factory building, intensified since the recent Government reduction of capital expenditure, is to us a very serious matter indeed. At Dagenham we have a factory originally designed and located primarily to manufacture for export, but hitherto prevented from fully fulfilling that purpose by the barriers of quotas, currency restrictions and high tariffs which were raised in the pre-war decade. It still remains ideally sited for the inward flow of materials, for labour supply, self-contained as to low cost power supply and other services, integrated as a unit complete with blast furnace, foundry and machine shops, and with unrivalled export facilities from a deep-water jetty—the best-equipped privately owned jetty on the Thames.

Where can you find in England today a unit so ideally equipped for serving export needs? Although we own 500 acres of land on this site, there are serious restrictions on further expansion in the area, with limiting effect on future export from Dagenham.

I would suggest that national policy for location of industry should have as its prime consideration the development of economic manufacturing sites, so necessary to our ultimate survival as a low cost manufacturing nation, and that one such site is your Dagenham factory. Moreover, it must be remembered that development plans now made cannot possibly come to fruition in less than two years. It is a matter of extreme urgency that the ban on extension at Dagenham be removed at the earliest possible date.

Recently we had the great pleasure of a visit from Mr Henry Ford II, his first since the war and the first in his capacity as president of the American Ford Company. Decisions have been reached which will be of great value to your company.

Mr Ford is a man of remarkable attainments and has the advantage of youth. Last year he was acclaimed in the United States as "The Man of the Year." With Mr Ford at the head of the Ford world organisation, and a director of your company, you may have confidence in our future.

TRIBUTE TO EMPLOYEES

In the year 1947 there was almost uninterrupted production, to which all contributed by hard and consistent work. It can be said that our employees are fully conscious of their responsibility towards production and export needs, and I thank them all for their sustained efforts in the last twelve months.

The management have had no easy time during the past year, faced with shortage of materials and many other difficulties. To them also I know you would wish me to express your appreciation of their loyal and efficient service.

The report and accounts were adopted and the payment of a dividend of 10 per cent., less tax, was approved.

UNITED GLASS BOTTLE MANUFACTURERS. LIMITED

RECORD SALES AND TURNOVER

DEMAND EXCEEDS SUPPLY

SIR WALROND SINCLAIR'S STATEMENT

The thirty-fifth annual general meeting of The United Glass Bottle Manufacturers, Limited, will be held, on the 20th proximo, at the registered offices of the company, 8, Leicester Street, London, W.C.

The following is the statement by the chairman, Sir Walrond Sinclair, K.B.E., issued with the report and accounts:—

In presenting their annual report and audited accounts for the year ended December 31, 1947, your directors feel that, having regard to existing circumstances, a reversion to the war-time practice of submitting a statement by the chairman would prove to be of convenience to the shareholders. The formal proceedings at the forthcoming annual general meeting will, however, in due course appear in the Press.

PROFIT AND LOSS ACCOUNT

The manufacturing and trading profit at £528,049, after deduction of profits tax, shows an increase of £39,077. Net dividends from subsidiaries, together with sundry revenue, brought in an additional £64,738, thus giving a total credit of £592,787. The provision for depreciation is higher by £56,779 this year at £165,061, a large proportion of this increase being attributable to income tax allowances on new buildings, plant and machinery, and is reflected in the reduced provision required for income tax on the year's profits.

After charging all administration expenses, interest, pensions, group life insurance and making due provision for income tax on the year's profits, there remains a net surplus of £266,425, an increase of £7,203 over the preceding year. Including £86,745 brought forward, the disposable surplus is, therefore, £353,170 compared with £335,464 for 1946.

Having regard to the general conditions prevailing at this time, your directors have deemed it prudent to transfer £100,000 to Contingencies Account, bringing that reserve up to £275,000, and propose a final dividend of 10 per cent. on the ordinary capital for the year, but eliminating the cash bonus, thus making a similar total distribution on the ordinary capital to that of last year. You will note the dividend has been earned with a substantial margin but we are, in accordance with our usual policy, acting conservatively in the distribution of profits. The credit balance remaining to be carried forward to the current year is increased by £24,715 to £111,460.

BALANCE SHEET

Turning to the balance sheet, the fixed assets are higher by £95,296 at £2,648,184. No less than £93,625 represents the increase in land, buildings, plant and equipment, even after allowing for £165,061 for depreciation for the year to which I have previously referred. Current assets at £2,763,030 show an increase of £121,754 over the preceding year, largely accounted for by higher stocks and cost of stores and materials and partly on account of delivery packages expenditure, to which I specifically referred last year.

Sundry debtors have increased from £678,667 to £814,117. Investments in British government securities remain unchanged and the market value I am glad to say still shows an appreciation over actual cost. The reduction of cash in hand at the close of the year is due to the repayment of the bank loan necessitated by the recent elimination of the debenture stock and to the heavy expenditure on fixed and other assets previously mentioned. The various reserves and undistributed profits have risen by £120,275 to

the substantial sum of £1,611,326, due mainly to the increase in the contingency reserve and to the higher credit balance carried forward. Incidentally, these reserves, etc., comfortably exceed the total ordinary capital.

Current liabilities at £1,481,511 show an increase due to larger cash deposits for packages from customers and the amount outstanding on account of taxation. I would, however, direct your special attention to the fact that current assets exceed current liabilities, including taxation, deferred repairs and the final ordinary dividend by £1,281,519, which I think you will regard as satisfactory.

CONSOLIDATED ACCOUNTS

The consolidated accounts present a clear picture of the whole undertaking. Trading profits, after profits tax, reach the substantial figure of £801,002, the two principal charges against these being depreciation £260,102 and income tax £205,948. Net profit at £294,961, with the balance brought forward from the previous year, shows an available total of £576,529. The consolidated balance sheet discloses assets aggregating £6,400,255, to which current assets contribute £4,143,207. Current liabilities amount to £1,901,563, while the reserves and undistributed profits total £2,073,412, a position which I venture to suggest reflects considerable strength.

The trend of the past year has been to reduce administrative expense without loss of efficiency, a tendency that we endeavour to facilitate wherever practicable. In this connection, in order to simplify further the financial structure of the group and at the same time eliminate a considerable amount of unproductive clerical work, steps have been taken for the voluntary liquidation of several subsidiary companies from whose continued existence as separate entities benefits no longer accrue. The winding-up of these wholly-owned subsidiaries will, of course, in no way affect the existing productive capacity of your company.

Reference is made in the directors' report to the retirement of Mr J. S. Cannington from the board and of our deep appreciation of his many years of devoted service to our company. I am sure you will wish to join me in expressing our best wishes for his good health with many years of happiness in his well-earned retirement.

TRIBUTE TO STAFF AND EMPLOYEES

It is my privilege once again to acknowledge, through our worthy managing director, Mr Judd, the devoted service of the whole of our staff and employees throughout the organisation. They have without exception contributed their full quota to our continued success. Their whole-hearted efforts were particularly emphasised throughout the fuel crisis in the earlier months of the year under review when, through the remarkably skilful handling of technical and other details more particularly in connection with the furnaces and automatic equipment, we were able to avoid what would otherwise have been a major disaster.

As a result, despite the shortage and lack of balance of essential raw materials with the consequent loss of production, etc., we are able again to report record sales volume and turnover, although unfortunately still unable to meet our customers' full requirements. With the continued devoted co-operation of our whole organisation, our sound financial structure and general trading position, I am confident we can face the future with assurance.

GOVERNMENT RETURNS

For the week ended April 17, 1948, total ordinary revenue was £57,626,000 against ordinary expenditure of £55,611,000 and issues to sinking funds £20,000. Thus, including sinking fund allocations of £234,000 the surplus accrued since April 1st is £6,234,000 against a deficit of £19,154,000 for the corresponding period a year ago.

was importing nearly 20 per cent more than in 1913 but exporting nearly 40 per cent less. This would have called for correction long before the war, had it not been for the "favourable" trend of the terms of trade and for the moderating effect of heavy unemployment. Had there been full employment in Great Britain in 1938, the deficit on the balance of payments in that year would have been not £70 million but at least double and perhaps three times that figure. Even before the war Britain could not have paid its way and maintained full employment at the same time. If further evidence is needed that something was radically wrong before the war, it can be found in the details of technological backwardness that have been uncovered in recent years in far too many British industries.

*

To call attention to these facts is inevitably depressing. But it is not done here with any intention of reaching a defeatist conclusion. On the contrary, what is to be drawn from these painful facts is a challenge to diagnose causes and to suggest remedies. There is no reason why the British economy should not be a self-supporting, or even a flourishing, one. The native resources of the land and people have not deserted them. If, then, the economy is limping, there must be a reason, and if the cause can be found it can be put right. For the past year, public opinion has rightly been concentrating on policy for the short term, and its pressure has achieved a quite remarkable change of front by the Government. But for the moment, there is comparatively little more to be said about short-term policy. Between Sir Stafford Cripps's new realism and the fresh respite—partial though it is—granted by Marshall aid, it is moving in the right direction. The attention of the public now needs to be focused on some of the problems of the longer run.

All those problems are, indeed, wrapped up in one—and that is to make the United Kingdom once more an efficient economic mechanism. It has been said that an economic system should have three aims—to be efficient, to be stable, to be equitable. Stability and equity have had a long and fruitful innings—Full Employment and Social Security are their watchwords. It is time that the spotlight was turned on efficiency and that the energies of politicians and economists were directed towards the search for means whereby the economy can once more be brought into the happy state of delivering the goods—the goods that are needed to sustain the standard of living at home and the goods that will be acceptable to the world in payment for necessary and desirable imports. It does not necessarily follow that stability and equity will have to beat any retreat—that will be for examination. But at the very least, they will have to mark time until sheer technical efficiency catches up. In the years between the wars it is now clear that Britain was living beyond its means—that is, beyond any means that it could permanently rely on. Now, with all the added dislocations and destructions of the war, the problem is far graver. Without a mighty effort of self-analysis and regeneration, Britain will find itself dying beyond its means.

As some contribution towards the discussion of these long-range problems *The Economist* proposes in the coming weeks—not in a formal series of articles, but from time to time—to take a number of them up for what can only be brief and summary review. It need hardly be said that the intention is not to score any political points or to establish a case for either capitalism or socialism as such—though it may be appropriate, when the enquiry is completed, to discuss whether there is a greater hope of effective economic statesmanship on the Left or on the Right. Until that point is reached, however, the endeavour will be to analyse the fundamental economic problems of Great Britain as they would be seen by a consultant called in from Mars, who had no knowledge of the present doctrines or past record of any political party.

What would such a visitor from Mars single out as the chief economic problems that Britain will have to face? The biggest, overwhelmingly the biggest, is of course the problem of striking a balance in the international accounts, of getting back to a position in which not only is there no deficit in the balance of payments, but the level of imports is allowed to rise enough to make most, if not quite all, of the rationing and allocation schemes unnecessary. But our Martian would not have to look very far beneath the surface of this problem to discover that, in so far as it was not caused by dislocations in the outside world beyond the control of any British Government, the anaemia of British selling power was merely a reflection of deeper weaknesses in the national economy. The balance of payments is not so much a problem as an epitome of problems, and it is to its causes that any searching enquiry must turn. Everybody will have his own candidates for the list of the most pressing topics, but the four that follow could hardly be omitted from any.

1. Perhaps the most important problem of all is for the British community to decide how much of its resources it will devote, year by year, to the replacement and improvement of its productive equipment. Capital, in the inter-war years, was undoubtedly neglected in Britain, and if this country is to keep pace either with Russia on the one hand or with America on the other, there will have to be a vastly greater volume of capital creation than there was before the war. It will have to be enquired why there was so little, and what can be done to increase the flow of productive capital projects. And to the extent that this is successful, it will have to be asked where the savings are to come from.

2. When the share of the national resources that is to be taken by capital creation has been determined, the next problem will be to consider how much should go to another of the three great constituents, to the services of the Government. This is the problem of the Budget and taxation. Is there any prospect of any sizeable reduction in taxation without an abandonment of some of the present activities of the Government? And if this is the choice, what should the decision be?

3. The third problem is to find the means whereby the present instincts of restriction, which still so strongly influence both the management side of industry and organised labour, can be converted into the opposite instinct of expansion. It can be done, for it has been done both in Russia and in America. How can it be done here? How can both the British employer and the British worker be persuaded that he can best serve his own interest, as well as the community's, by consciously trying to produce better goods and services at lower costs?

4. Finally, there is the problem of striking a better balance than has been achieved hitherto between the individual citizen's desire for, and right to, security and dignity and the community's need for maximum economic efficiency. In abstract terms, this is the clash between Security and Progress. In more concrete terms, it is the difficulty of seeing that social security, the right of collective bargaining and the rest of the apparatus of the welfare state do not too badly impede the path of constructive enterprise, whether privately or publicly owned. It is the problem of meeting the social demand for a national minimum without wholly breaking the connection between efforts and rewards.

And perhaps behind all these difficult issues there is a fundamental matter which is more one of the spirit. That is the task of persuading the British people that they are truly members one of the other and that no one class can help itself merely by penalising another. Whatever may have been true of the past, and whatever may once again be true in the future, for the next decade or two all the inhabitants of these islands are in the same boat. They will sink or swim together.

The Sterling Area

THE sterling area is under pressure. Forces both from within and from outside the area are making for its dissolution. Much of the external pressure arises from profound misunderstanding of the genesis, character and operations of the monetary mechanism represented by the sterling area. The main misconception, and one which prevails particularly in the United States, is that the sterling area is a consciously created and centrally controlled monetary bloc, capable of being used at the bidding of authorities in London as an offensive weapon of trade discrimination. In fact there is no consciously created sterling area. There is no central authority dictating the policy of this widely scattered and commercially important group of countries. Admittedly there is among them a certain homogeneity of monetary conditions and of exchange and commercial policy. Since 1939, moreover, the sterling area has represented an element of discrimination against the rest of the world inasmuch as payments are relatively free within the area and controlled between the area and non-sterling countries. But it would be wrong to assume that these are the product of dictation from London.

The genesis of this somewhat indeterminate, yet powerful and clearly recognisable monetary system goes back to the nineteenth century, long before the term "sterling area" or "sterling bloc" had been coined. It evolved as part of the commercial and financial growth of Britain in the last century. Those were the days when sterling was not merely an international currency but the international currency. When the gold standard ruled the world and London ruled the gold standard, it might have been claimed without excessive arrogance, that the sterling area comprised nothing less than the whole globe. But, in more specific form, the sterling area evolved out of the banking and monetary arrangements that grew up around the economic development of the dominions and colonies. The trade of these new territories was transacted almost exclusively with Great Britain. The capital which developed them was provided by Britain, either in the form of sterling loans or as direct investments. Their banking facilities were provided almost exclusively by British institutions, some of them with head offices, and others with capital largely subscribed, in London.

For these, and many other reasons, the countries in question found it convenient to keep their currencies stable in terms of sterling. That meant maintaining part, if not the whole, of their currency reserves in sterling. Where, as in most colonies, there was no local currency, sterling coin constituted a large part of their circulation. For the same reasons, these countries found it convenient to keep working balances in London and to use those balances as a fund through which they conducted the whole of their payments with other countries, whether sterling or non-sterling. If they traded with Britain the payments could be made directly. When they traded with other countries it proved equally convenient and efficient to use their sterling accounts in London as the clearing through which their payments were canalised. Sterling was acceptable to the world over and could, if necessary, be converted unconditionally into any other currency, or even into gold.

Out of all these influences there gradually emerged the monetary system which, without ever having been invented without being recognised (since it was part of the international gold standard), served the needs of a large part of the trading world. Recognition of the system dawned after September, 1931, when sterling left the gold standard and other countries had to decide whether they would follow gold or sterling. For many countries, which previously had based their currencies on

sterling, the choice was virtually automatic. Their reserves were invested in London, the bulk of their trade was transacted with Great Britain, and there was no real alternative to keeping in step with sterling. For others, the ultimate decision emerged from a much more careful weighing up of pros and cons. Experience soon showed that, in this troubled period of the early 1930s, it was sterling and not gold that made the running, that sterling prices kept relatively stable while gold prices continued to fall, that Britain maintained its demands for imports far better than the United States and that, in fact, the sterling area provided a haven of comparative safety from the economic blows that continued to rain on the countries that remained within the gold bloc.

The pull of sterling proved strong and the sterling area acquired a number of new adherents from outside the Commonwealth family, among them Scandinavian countries, Argentina, Japan and, somewhat later, France. But, while it was recognisable and took definite shape, the sterling area maintained its wholly informal and voluntary character. Members of it came and went unbidden. They changed the sterling parities of their own currencies on their own volition and without reference to London, as, for example, was done by Denmark and New Zealand. Some, such as Australia, even maintained restrictions on capital movements with other members of the sterling area. Adherence to the sterling area remained a matter of the convenience and self-interest of the participating countries. But it should be added that between 1930 and 1938 this convenience and self-interest in its turn depended on the standing of sterling as a currency acceptable to the world over, convertible into any other currency without restriction, though now no longer at fixed rates, and convertible even into gold, for which London continued to provide a free and active market.

*

With the outbreak of war more formal and fundamental changes occurred in this monetary mechanism. It acquired what it had never had before, a statutory definition and recognition. Exchange control had to be imposed in Britain and other sterling countries for obvious defensive purposes. In order to place as few obstacles as possible in the way of commerce between the sterling countries, payments were left free to move between them, and the barrier of exchange control was placed between the sterling area as a whole and the rest of the world. During the weeks which immediately preceded the outbreak of the war, when sterling was depreciating rapidly in terms of dollars, the area had lost most of its non-Commonwealth members, the would-be neutrals having no wish to be linked monetarily to one of the belligerents. In essence, however, the sterling area in its wartime form remained a voluntary association. Its members pooled their common exchange resources. Each determined what its import policy should be. All recognised the primary need to conserve dollars, but any import licence issued by one of the members was automatically eligible for an appropriation of dollars or other hard currency from the central reserve, or "sterling area dollar pool" as it came to be called.

This, essentially, is what the sterling area has remained to this day. It is a voluntary association of countries which pool their reserves of foreign exchange and draw for their requirements on the central pool, which is held by the British Government. Membership of the sterling area is not quite co-terminous with the British Commonwealth of Nations, but very nearly so. Canada and Newfoundland were never in the sterling area, and Palestine was recently extruded from it as a necessary precau-

tion against the time of troubles that was clearly impending. On the other hand, there are some non-British countries in the area. Iraq was an original member; Burma remained in the area when it left the Commonwealth; and Egypt was a member until it left in a huff some months ago. The association is voluntary not only in the sense that any member is free to leave it, but also in that each member operates its own import policy, which is financed out of the central pool. The British Government may advise, and warn and suggest—but no more.

It was in its wartime form that the sterling area came under the deep suspicion of the United States Administration. American experts and officials understood and appreciated the reasons why exchange control had to be imposed during the war. But they suspected that measures taken under the stress of war might prove convenient to a somewhat enfeebled ex-belligerent and become thoroughly ingrained habits. They saw the sterling area surviving as a permanent monetary bloc and weapon of discrimination that could be used against American interests. That was why the Anglo-American Financial Agreement, signed in December, 1945, concerned itself in such detail with sterling area arrangements. It laid down conditions about the liberation of payments arrangements between the sterling area and the rest of the world. In particular, it required that the current earnings of foreign exchange by sterling area countries be made available for current payments in any part of the world. Furthermore, although the Agreement recognised that the great bulk of the wartime accumulations of sterling balances must necessarily remain immobilised in London for the time being, it stipulated that, if any of these sterling balances should be liberated, they should be made available in a form that could be spent anywhere in the world—that is, in effect, that they should be made convertible into dollars. The general intention of these conditions was, in the words of the agreement, “that any discrimination arising from the so-called sterling area dollar pool will be entirely removed.”

This reference to “discrimination” gives one important clue to the American attitude towards the sterling area. Another is also to be found in the Anglo-American financial agreement. It lies in the clause which requires that no part of the line of credit of \$3,750 millions opened to Britain should be used to repay any other creditors of the United Kingdom. The intention

was to ensure that no part of the dollars lent to Britain would go to repay the wartime accumulations of sterling balances. These balances represented debts which the Americans thoroughly distrusted and likened to the lend-lease obligations which they, as creditors, were prepared to cancel and forget. The intention of this clause could be understood and appreciated. Its application, however, presented serious difficulties. These difficulties arose out of the pooling of the sterling area's hard currency income and reserves. Once dollars were in the pool it was impossible to distinguish those that were produced by the line of credit from those earned by sterling area exports to dollar countries. When the loan had been exhausted the Americans could not altogether suppress the suspicion that this clause in the agreement had been blatantly ignored. They could not but note that in 1946 and 1947 the balances of sterling area countries had run down by £201 million, and that over the same period these countries had on balance dipped into the central gold and dollar pool to the amount of £148 million in order to meet their direct deficit with the dollar area, plus another unspecified amount in making gold and dollar payments to other countries. Putting two and two together, the Americans probably made the answer considerably more than four. They may have seen a conscious utilisation of loan dollars to pay off sterling creditors and, therefore, a direct breach of the agreement where, in fact, nothing so calculated or preconceived had occurred. But at least the evidence that could not be ignored suggested that the generosity of Britain, in liberating accumulated sterling balances and putting hard currencies at the disposal of the members of the area, had played a considerable part in the unexpectedly rapid exhaustion of the loan.

This seeming diversion of loan dollars to unauthorised purposes appeared to arise inevitably from the principle of pooling the reserves of the sterling area. When, therefore, the situation of 1945 recreated itself some two years later with the British request for Marshall aid under the European Recovery Programme, the Americans suggested that a fundamental revision of the sterling area mechanism might be called for. How far that mechanism has in fact been at fault in the past, and what might be involved in its disruption, are among the issues whose consideration must be deferred to a subsequent article.

Freedom of Information

PUBLIC diplomacy concluded in Geneva last week one of its less unsuccessful occasions. For a month representatives of 55 nations—eight of them voting solidly with the Russians—argued and exchanged documents about freedom of information. They ended by adopting with varying majorities three conventions on separate aspects of the problem, chosen by the American, French and British delegations respectively as of outstanding importance—the first on the gathering and international transmission of news; the second on the duty to correct false news and the methods of doing so; the third on freedom of information in general. The mental exercise did everyone good and quite a number of elusive principles about the freedom of the press are now pinned down as working rules. The delegates of the west displayed a very healthy rivalry even in face of east European solidarity, and a strong and professional American delegation was a little surprised to find how natural it is for most free Europeans to take the principles and practice of the British press as their standard. Little harm and quite a lot of good was done; yet the result of so much labour by so many officials at so much cost in hard currency hardly comes up to expectations.

The conference was held under the auspices of the Economic and Social Council of the United Nations. The spirit in which it tackled its work is expressed in the language of its first resolution on General Principles:

Freedom of information is a fundamental right of the people, and is the touchstone of all the freedoms to which the United Nations is dedicated, without which world peace cannot well be preserved.

This is the language and the thought of the days of the Atlantic Charter and the Charter of Uno itself, when there was hope and belief that freedom would everywhere prevail as a result of war. So strong was this hope, that freedom was subdivided into fundamental liberties, for each of which an organ of the United Nations was made responsible. That is how the Economic and Social Council came to deal with freedom of the press, radio, news-reels and other “media of information.” Unfortunately, the assumptions on which such hopes and definitions were based are no longer tenable. The desire of all governments to co-operate in the observance of certain principles does not exist; the political and moral terms they use have been given diametrically opposed meanings; the rulers of half

Europe will not and dare not concede liberties which the rulers of the other half regard as fundamental. To the Russians at Geneva freedom of the press meant its control by the representatives of the people—that is to say the government. To the vast majority of delegates it meant exactly the opposite.

What then was to be achieved by reviving out-dated assumptions and aspirations before a conference so deeply divided from the very start? One of two things. The non-Communists could close their ranks, agree to disagree with the Communists and produce a resounding and general declaration of principles to which Russia and its satellites would refuse to subscribe. Such a result might have sounded impressive; it might have been accounted an engagement fought and won in the cold war; but it would have made no difference to the conditions in which journalists and other purveyors of information have to work. Or they could try to draft workable conventions on such matters as the handling of news, the treatment of correspondents and the correction of untruths and half-truths, which might secure some slight measure of observance in Communist countries and might set up uniform standards and practice in non-Communist countries. The conference chose to follow the latter course, well aware that the non-Communist delegations would disagree strongly among themselves by the way—causing delay if not deadlock.

The disagreements in the camp of the free countries were full of interest. They demonstrated once again—what must never be forgotten when high hopes are set on international action—that the drafts presented to such conferences by national delegates always reflect the national characteristics and political preoccupations of the governments or interests they represent. At Geneva the delegates ran true to form. The Russians seemed to want above all to check that criticism and reporting about themselves and their allies which they denounce as incitement to war, and which they attribute to the fact that the press in capitalist countries is beyond government control. The British stood stoutly for free trade in ideas, the running of risks and the simple formulation “when *Pravda* is wrong who corrects the *Pravda*?” Mr McNeil, himself a journalist, made one of the best speeches of the meeting on the theme that “contest in ideas is the basic condition of advancement.” Yet, when it came to detailed drafting, the convention on freedom of information submitted by the British contained no less than ten exceptions to this “fundamental human right,” to be enforceable by law—all contributed by the British delegation and generally opposed by the Americans who, among other things, disliked the British law of libel. Even the heart of Mr Bogomolov must have warmed to the British when he found them including in their draft the right of a government to penalise “expressions which incite persons to alter by violence the system of government or which provoke disorder.”

The Americans, who put all their weight behind the con-

vention on the gathering and international transmission of news, were chiefly interested in the rights of foreign correspondents. In fact, it was the impression of most delegations that the Americans wanted to secure for their news agencies that general freedom of the market for the most efficient which has been the object of all their initiatives in commercial policy—that they regard freedom of information as an extension of the charter of the International Trade Organisation rather than as a special and important subject of its own. And the stern opposition which they offered to Indian and Chinese efforts to protect infant national news agencies confirmed this impression.

The French, very appropriately, put all their weight behind one or two simple ideas, embodied in the convention “concerning the institution of an international right of correction.” They dropped, in the course of debate, a proposal for press cards which would have created a class of professional *journalistes tolérés*; but they secured a majority for a far-reaching proposal which—if it comes into force—will create quite novel problems for news departments of foreign offices, news editors and compilers of radio bulletins. In Article 1 of their convention a procedure for the correction of “false and distorted reports” is laid down. If, for example, the British Government felt that a message sent to Russia by the Tass Agency was likely to harm Anglo-Soviet relations and was false and distorted, it could submit its version of the facts to Moscow in the form of a communique. This communique would correct news reports only and would be “without comment or expression of opinion.” In length it would be “in no case more than double the number of words in the news report to be corrected.” Moscow would then be expected within five days to “facilitate the dissemination” of the correction; if it did not do so the British Government would be entitled to send the communique to the Secretary-General of the United Nations for publication by him.

*

Here is a procedure which, used sparingly, might be valuable in a moment of international tension. Used frequently it would break down at the receiving end; for in no free country has the news department of the government the power to force the press to print such a correction, and in no totalitarian country would there be any likelihood of its being published. But in times like these, when diplomatic contacts between East and West work so slowly and noisily, this French proposal offers yet another of those subsidiary methods by which a government can indicate its willingness to negotiate or to exercise patience and restraint. It is just conceivable that it might be worked between East and West for the reason that both sides might gain equally by its use.

It would be unfair to submit all three of these draft conventions to the same test of practicability. Obviously it is easier

to secure enforcement of rules about the transmission of news and the publication of corrections than to make governments abide by the lofty principles of the British draft on freedom of information—or to dissuade them from abusing the powers conferred upon them in the “exceptions” to the freedom of the press contained in the same draft. But even then it remains true that countries which may be called free could secure by bilateral agreements all the uniformity of rights and practice that journalists need. For journalists and purveyors of ideas and information form an old-established international society, whose code of behaviour is on the whole every bit as good as the code of commercial behaviour prescribed in the charter of the ITO.

In any case the three conventions adopted in Geneva have still some way to go before they have to be signed by governments. First to the Economic and Social Council at its next session, together with the comments of governments; thence to the General Assembly next autumn; thence to individual parliaments for such action as is called for. For the time being then it will be wise to treat the draft conventions produced by the conference firstly as bodies of doctrine, in which can be

found useful definitions of many points in the democratic case which have been vague or misleading; secondly, as definitions of aim which may make it possible for regional groups of governments at a later date to make freedom of information a reality among themselves.

It is a pity that the attempt to produce a set of agreed practical proposals should have prevented the conference from drawing up a coherent and dignified body of doctrine with a Miltonic ring to it. The world was, alas, too much with the delegates. If the code of rules they have laid down is enforced by governments it will demand few important changes in the present practice of free countries, whereas in countries where freedom is seriously curtailed there is no question of making the journalist's life easier by international agreement. If he is correspondent of a Western newspaper or agency—whether native or foreigner—he will have to come to some kind of terms with the regime he is reporting or give up hope of getting or sending news. In the process he may lose the confidence of his employers. To his dilemma, which contains in brief the whole problem of freedom of information, the Geneva conference could find no answer.

Examination for Schools

SYMPATHETIC parents and their harassed offspring could have been forgiven if they had derived from announcements in the press on Monday of this week the impression that the much-dreaded School Certificate is no more and, indeed, that the public external examination as a whole is an expiring species. Let them not rejoice too soon. Examinations may in future be less rigid; the mathematically purblind and the linguistically deaf may escape the discouraging experience of repeated failure. There may also be fewer examinations. But the standards set by public examiners will still remain the main influence on the education at least of the grammar school child.

The changes now proposed in the examination system go back to the report on “Examinations in Secondary Schools” by the Secondary School Examinations Council, which was published last September. The Committee's proposals were submitted unanimously, but the report in fact contains a host of compromises which erect verbal bridges between the conflicting views of the National Union of Teachers, with their dominant interest in the “modern” secondary schools—most of which are, and for some time are likely to remain, merely promoted elementary schools—and of the spokesmen of the secondary grammar schools. The report fell into two parts. The first went a long way towards releasing the schools, or some of them, from any formal written examination, set by an external body. It suggested that schools should conduct their own internal examinations, with some ill-defined system of “external assessment” to be applied by the Ministry or the Local Education Authority. There was also much talk of “objective tests,” which apparently meant intelligence tests. All this clearly looked mainly to the “modern” schools.

The second part of the report dealt with the organisation of external examinations for those going to the universities and for those “who have followed courses substantially beyond the statutory minimum leaving age.” (The exact wording is important.) This part of the report was the outcome of very widespread criticism of the existing examination system, which, it was alleged, restricted the freedom of the schools, hampered experiment, drove boys and girls along a narrow groove, encouraged cramming, over-specialisation and other undesirable practices. Much of this criticism was well founded; but equally a good deal of it came from those who blamed the

system for defects that were all their own. The Council's recommendations were, in brief, that the external examinations should be less rigid and taken later in the school life. They retained the present three grades of examination, with School Certificate, Higher Certificate and University Scholarship, re-christened Ordinary, Advanced and Scholarship, but they proposed that there should be no “required subjects” and that it should be possible to obtain a “General Certificate of Education” at either the advanced or the ordinary level with any grouping of subjects, or even with one subject alone. They also recommended that the external examination should not be taken before the age of 16.

What has now happened is that the Minister has accepted the recommendations of this second part of the report, without expressing any opinion on the first part. But he adds the significant rider that

he agrees generally with the principle that external examinations should not be taken before the age of 17 but he is prescribing a minimum age of 16 . . . until there is a substantial increase in the number of boys staying at school till 17 or later.

The only conclusion to be drawn is that when the school leaving age is raised to 16, the minimum examination age will rise to 17. This extraordinary statement is the outcome of strong political pressure from the National Union of Teachers, who oppose public examinations partly on grounds of educational principle, but also because they shrink from any objective comparison of the results of teaching in “modern” schools with that of the grammar schools. To them “parity of esteem” does not mean allowing a few modern school children to take the examination (the proportion of successful candidates would naturally be lower) but completely debarring them by regulation from having the faintest chance of competing at all. If any bright child should stray into a modern school—and the process of selection at the age of 11 is not so perfect that there will not be many such cases—he is to be denied the opportunity of showing what he can do rather than that the quality of the teaching to which he has been exposed should be objectively tested. Parity of esteem is apparently to be achieved by widening the gulf between the two types of schools. For many years to come the modern schools will inevitably be labouring under many disadvantages. But this attitude of the National

Union of Teachers seems to put the trade-union interests of the teachers before the educational interests of the pupils.

There are, indeed, some good educational grounds for thinking that the school certificate examination is taken too young by many schools—for example, at 14. There are many people who hold the view that the only way to defend the young from the excessive zeal of their masters is to prevent them from specialising until after 16. There is some strength in this criticism. But is it right deliberately to hold back the really bright boy simply so that his less bright companion should not be over-strained? If the bright boy, without undue pressure, can pass the test of the Ordinary examination at the age of 15, but is made to wait for one or two years, what is he supposed to do with his time? If this age restriction is persisted in, the best schools of the country, which are largely independent, will set up their own examination system, the state system will lose prestige, and one more wedge will be driven into British education.

The attitude of the universities in this controversy is equivocal. On the one hand, as examining bodies in their Joint Examination Boards, they appear to be content to abandon their right to ensure that the subjects taken in the public

NOTES OF THE WEEK

Sheep and Nenni-Goats

The Labour Party Executive was undoubtedly well advised to confine its disciplinary action to one single Member of Parliament—however much indignation may be created among those who vociferously proclaimed that they would stand or fall together. Mr Platts-Mills had a long tale of incidents to his discredit, and it was on the grounds of his “general political conduct” rather than on his instigation of the Nenni telegram that he was expelled. The other MPs who signed the telegram, apart from those whose names were taken in vain or who were so politically naïve as not to know to what or to whom they were committing themselves, have been let off with a caution. They have, in fact, been warned in no uncertain terms, and unless they sign along the dotted line within a week's time that they will behave themselves in future, they too will be expelled. The border-line between the sheep and what have been appositely termed the Nenni-goats is precariously thin, but it seems likely that the 21 offenders will agree to toe the line.

In this way, the honour of the party will have been saved and the embarrassment avoided of having to take any parallel action against those Members who act against party wishes and attend The Hague conference. The analogy between Nenni and The Hague cannot, of course, be carried very far. Support for the Nenni Socialists was diametrically opposed to Labour Party policy, even if the decision to support Saragat was taken without any formality, whereas The Hague ideal of Western Union is exactly in line with British official policy, even if it means fellow-travelling with Mr Churchill. It remains to be seen how many of the forty MPs who have said they will go to The Hague will risk the party's displeasure.

The whole incident is not very edifying. The washing of political linen in public is always an unattractive process, and there is a real danger in this case that it will lead to a stifling of genuine criticism of official policy, especially on foreign affairs. If the Executive is content to let bygones be bygones, at any rate until after the Scarborough conference, it will certainly improve its standing in the eyes of the public.

Problems for the TUC

The General Council of the TUC has made a wise decision and bowed to the inevitable. Reports that there would be a violent clash with the Government on the question of profits, prices and wages have been proved unfounded. Instead, the General Council has declared its willingness to give the scheme for voluntary limitation of profits a fair trial, while keeping a close watch on the course of profits and prices. Sir Stafford Cripps, it appears, has convinced the union leaders of the realities of the situation, and at any rate the good intentions of the White Paper have been saved. What happens to the claims of individual

examinations are fairly balanced. Since there are now to be no minimum requirements or compulsory groups of subjects, a boy can take as few subjects as he and the school pleases. The idea behind this is to put full responsibility on the schools, whose skill in evading the regulations in the past has often nullified the attempts of the Examination Boards to broaden the curriculum. On the other hand, the discussions which are now taking place between the universities about their own entrance requirements will almost certainly repeat many of the earlier rules about the number and distribution of compulsory subjects. A very desirable minimum uniformity may be achieved, but as long as the universities say, for example, that two papers at Advanced and four at Ordinary level are required for university entrance, and that two languages and mathematics are essential, the new examinations will not differ so very much from the old. Perhaps the principal gainers from the new rules will be the less bright children in the better schools. These may escape the pressure of being forced to take school certificate young and their teachers will be freer to experiment. This is a real gain. But whether it is enough to offset the general tendency in the direction of “levelling down” intellectual standards is considerably more doubtful.

trade unions—whether or no they voted with the minority at the conference of trade union executives—remains to be seen. The answer will probably be “the mixture as before”—with, it is to be hoped, at any rate some dilution. The main effect should be a general slowing-down of applications for wage increases and to more compromises on the amounts granted, which may or may not lead to industrial trouble, according to the influence of the Communists within the union.

The most pressing matter for the unions to determine now is the extent to which restrictive practices impede production. This week's meeting of the Minister of Labour's National Joint Advisory Council of employers and trade union leaders seems to have been remarkably indecisive, although it may have served a useful purpose in airing a subject which many people, particularly on the trade union side, would prefer to leave in the shadows. The main question—what is a restrictive practice?—seems to have been largely left unanswered, and both sides agreed that they needed more time to consider it and to consult with their constituent organisations before attempting to give a reply, or any indication of how restrictive practices could be eliminated.

It is easy enough for the outsider to produce damning examples of restrictive practices arising from unnecessarily stringent inter-union demarcation lines or rules about limitation of output, or the number of machines per worker. It is less easy to persuade the individual rank and file worker that by these methods he is responsible for a significant loss of output, since, for the most part, the unions are still thinking in terms of the unemployment of the inter-war period. It is, nevertheless, necessary that the investigation should take place, and that both sides of industry should be drawn in. The Government has hitherto been far too chary of treading on trade union corns. The inquiry will no doubt take some time, but at any rate a start has at last been made.

Hanging in the Lords

When an arch-Conservative like Lord Templewood receives “loud Ministerial cheers,” when one Liberal peer pleads for capital punishment to be decided by the executive rather than by the courts and another treats the subject with levity, and when a bishop of the Church of England supports in public the Old Testament principle of retribution, the ordinary citizen has some reason for feeling bewildered. If there is one thing he can be certain about, it is that in leaving the abolition or retention of capital punishment to be settled at the eleventh hour the Government made a bad mistake. That it should be settled by a free vote was quite right. But the free vote should have been taken before the second reading of the Criminal Justice Bill, which would have allowed time for modification and consideration before the Bill left the Commons.

As it is, abolition has become tangled up with the Lords' power of revising Bills, and it may well be that if, as seems likely, in the committee stage the Lords delete the clause suspending capital punishment for murder for five years, the Commons will cease to treat the question on its merits and will be more concerned with upholding their own sovereignty.

On the pros and cons of abolition it cannot be said that the hilarity and savagery which at times marked the debate in the House of Lords were any improvement on the emotions of the House of Commons. The influence of the law lords was thrown in against suspension, but this was to be expected since, on penal reform, the attitude of most High Court judges notoriously lags behind public opinion—as witness Lord Oaksey's support, not only of capital punishment, but also of hard labour and whipping. On the other hand, in view of the close vote in the Commons, this does seem an occasion when they should be given a chance to change their mind or at least to adopt one or other of the compromises now being put forward. Probably what makes many people hesitate before supporting abolition or suspension is the prevalent lawlessness and violence. Could not the Bill give powers to the Home Secretary to suspend the death sentence by Order-in-Council at some future date when society is less disturbed? This should satisfy the Government's own conviction that it is the occasion rather than the principle of abolition that is wrong. If, however, this opportunity for suspending capital punishment is lost, the country might have to wait twenty years or more before another one occurs.

Teeth in the Brussels Treaty

The military implications of the Brussels Treaty are apparently being worked out with gratifying speed. The Permanent Organ in London, with Mr Gladwyn Jebb in the chair, is to meet once a week instead of once a month. The Defence Ministers of the five governments were to begin a conference on Friday at Lancaster House which should launch their military staffs on the work of the Permanent Military Committee. The recent visit to Washington of General Sir Leslie Hollis, chief staff officer to the Ministry of Defence, has put new life into the Combined Chiefs of Staff organisation; and now the French have established a joint general staff and a joint committee of inspectors-general of the armed forces.

With so much secret diplomacy under way it is difficult to sort out the realities from the appearances. But on present evidence it seems likely that co-operation on defence, with the Americans—so to speak—in remote control, will follow the example set in last summer's preliminary studies for the European Recovery Programme. That is to say, the Permanent Military Committee will first survey their resources and the means by which they could be strengthened through co-operation; they will then discuss with the Americans how the most obvious weaknesses are to be made good. Such a procedure, little though it will contribute to the immediate strengthening of western defences, is probably the only possible one in the present state of American opinion. And Mr Marshall is certainly right in assuming that a revival of lend-lease would be impracticable unless the Brussels Powers had shown in military precautions at least as much evidence of willingness to co-operate as they have shown in economic affairs.

Yet it is going to be difficult to steady the nerves of the waverers and pessimists in the West with nothing more than present sedatives. People on the Continent—especially in Germany—are still obsessed with the fear of Russian occupation and a Communist purge, and regard events in Palestine and Berlin with an alarm which is scarcely understood in this country. To find ways of reassuring them is as difficult a problem in foreign policy as has ever faced Mr Marshall and Mr Bevin.

* * *

Dalton Doctrine for Europe

Western Union has had the bloom taken off it by Mr Dalton much faster than the gilt-edged market. In the few months that he has been chief representative of British Socialists in their dealings with continental colleagues he has caused a dangerous depreciation of the ideas of western co-operation, so cautiously launched by Mr Bevin and Mr Attlee in January. The meeting of representatives of 16 Socialist parties held in Paris last weekend was the occasion for decisions and resolutions which showed obstinate misunderstanding of the difficulties which will face western Socialists as the governments of free Europe work for political and economic association.

Whereas Mr Attlee has said quite firmly that Western Union will not be achieved on an exclusive basis of Socialist governments and ideas, Mr Dalton is reported as saying in Paris

“As Socialists we must make sure that the success of the Socialist policy now being pursued in Britain, Scandinavia and other countries is not jeopardised by the premature creation of a political union, in advance of the assurance of economic stability throughout the union.”

Of the members of such a union Mr Dalton demanded “full employment and economic planning in the public interest,” giving a broad hint that Britain would choose carefully the company it keeps. Yet he must be well aware that the instruments of western co-operation which Mr Bevin has signed contained no such qualifications for membership of Western Union. And he will learn from the new continuing organisation of Socialist parties, if he does not know it already, that the trend of opinion in the most important western countries is away from planning towards more liberal economic policies. The evidence of this in France and Belgium has been visible for some time and the Christian Democrat victory in the Italian elections is bound to give impetus to the revival of Right parties.

The moral for western Socialists should be clear. Execution of the Marshall Plan demands the closest co-operation of governments whose domestic policies already range widely between right of centre and right of Marxism. Several of them derive their strength from a powerful Catholic and anti-Socialist vote. Some of them—in France and western Germany for example—may stand quite alarmingly far to the right before the four years of ERP have passed. Will the Labour Party recognise the fact that of the 16 governments interested in the Marshall Plan only four are Socialist against five of the Right, five coalitions and two non-party? Or will it ignore the balance of power among continental parties and pretend that non-Communist Europe is, or might become, solidly Socialist?

It is a difficult and momentous question on which thought might have been much clarified if the 16 Socialist parties had not decided to boycott the conference on united Europe which meets at The Hague next weekend. For there will be represented groups of the centre and right with whom Socialists could work—as they now work in France, Belgium and Holland and have worked in Italy. And those men will need all the help that the moderate Left can give them in holding off discredited elements of the Right which claim the support of America for their return to public life. Some broad measures of economic planning there must be: they are an essential part of the whole conception of ERP. That fact, plus the principles stated in the preamble of the Brussels treaty, should suffice as a basis for the co-operation of all moderate parties in western Europe, provided their leaders do not take up doctrinaire attitudes. “No friends to the Right” is as dangerous a slogan as “no enemies to the Left.”

* * *

Scandinavia and the West

The activity in Western Europe is being watched attentively in Scandinavia. The mild terms of the Russo-Finnish treaty—which seem to have been aimed at allaying the suspicions of Finland's neighbours—have done little to change their general attitude of wary suspicion. It is nevertheless an advantage for Russia that the waverers have been confirmed in their wavering for a little longer—perhaps Russia is not so bad after all. The more undecided opinion is, the less definite policy will be.

That a prominent member of the Swedish Cabinet should announce his belief that forestalling action by the West is a greater threat to Sweden than a move from the East is a sharp reminder of how far many Swedes have to go before assuming the rôle for which they are sometimes cast in Western Union. Even when allowances are made for the dialectical oratory and personal idiosyncrasies of Mr Wigforss, the influential Finance Minister, who expressed this opinion at the beginning of April, it must be admitted that he spoke for a larger body of opinion than is often realised. The liberal press and important professional circles, it is true, advocate an alliance with the West. The Premier, Mr Erlander, recently declared that his policy had four aims: to fight the enemies of democracy at home, to defend Sweden's national independence, to remain free from alliances and entanglements, and to participate wholeheartedly in the work of European reconstruction.

This statement of policy, however, leaves much to be decided. It can be argued, for instance, that the third and fourth aims are incompatible. The European Recovery Programme will result in a lasting organisation which, if it is to fulfil its purpose, will undertake political tasks. Wholehearted participation in recovery thus implies a change of policy which would be inconsistent with

neutrality. Similarly, the economic co-ordination of the Scandinavian states, the foundations for which were laid recently in Oslo, has far-reaching political implications. It may be that Sweden's participation in these projects will stop short of anything that is thought to involve an irrevocable departure from neutrality. And when, for their own interests, the great Powers place reservations on their participation in international agencies such as Uno, it would be difficult to blame a small Power for a similar course of action.

* * *

Monopoly Bill Under Fire

Mr Harold Wilson's opening speech in last week's second reading debate on the Monopoly Bill made some points which call for comment. *The Economist* has criticised the Bill on the grounds that it unduly restricts the scope of the Monopoly Commission by making reference to it by the Board of Trade a pre-condition of enquiry. This provision is justified as a protection of the Commission's time and energies against “cranks and cases of relatively small importance.” This is not entirely convincing. The Commission need not be bound to institute inquiries at the behest of any crank or victim of persecution mania; they should be able to sift out for themselves those cases which call for enquiry from those which do not. It is surely better that the initiative of the politically-minded and possibly politically-motivated President of the Board of Trade should be supplemented by the initiative of the impartial and judicial Commission itself. This superiority will grow as the Commission's expertise develops. Mr Wilson's defence of the exclusion of nationalised industries—based on the existence, by reason of their legal constitution, of bodies protecting the consumer's interests in relation to each—would be wholly convincing if these bodies were in fact the armed and active champions that they ought to be. On an analogy which should appeal to a colleague of Sir Stafford Cripps, the Commission might be given the power to conduct a once-for-all enquiry into the adequacy of these safeguards, recommend amending legislation where needed, and then retire from the field. Similarly his reasons for excluding Trade Union restrictions from the scope of the Bill—good reasons enough in themselves, and concurred in by the Opposition as represented by Sir David Maxwell-Fyfe—would carry more weight if any parallel though separate enquiry into these practices were contemplated or indeed, under this Government, imaginable.

Sir David's speech, which largely reproduced the argument of his recently published pamphlet *Monopoly*, was a model of what his recently published pamphlet *Monopoly*, was a model of what an Opposition speech should be on a topic where ends are agreed and means in dispute; and his view that any definition of prohibited practices would involve administrative chaos deserves, at least, respectful consideration. It is arguable, however, that this would be avoided if the prohibitions were few enough and the definitions tight enough. Certainly it should be possible to profit by hard American experience and avoid the type of legal drafting which benefits no one except that particularly close corporation—the legal profession.

* * *

Electoral Reform

The discussion in Committee of the Representation of the People Bill in the House of Commons only served to show the difficulties created by the Government in departing unilaterally from the recommendations of the Boundary Commission. The Government amendments, by splitting eight large constituencies and adding nine members to the representation of the larger cities, added 17 seats to the number allotted to England. This departure from the Boundary Commission's agreed proposals, while not entailing proposals in themselves objectionable, upset the balance of the Commission's scheme sufficiently to encourage the Opposition to table further amendments. Mr Churchill accordingly wrote to the Speaker pointing out that the Government's amendments had reduced the electoral quota from 58,670 to 56,730, with the result that certain suburban and rural areas were seriously under-represented and proposing that eight more constituencies should be created, two each in Surrey and Middlesex, and one each in Kent, Essex, East Sussex and Cheshire. He asked the Boundary Commission to give their advice unofficially on the demarcation of the boundaries of the new constituencies in the areas proposed.

The Speaker transmitted this request to his colleagues, and the Commission has prepared schemes of demarcation, without of course accepting any responsibility for the proposals, and Sir Rowland Burrows, the deputy chairman, points out in his

covering letter that in Essex and Middlesex the formation of additional constituencies is only possible by cutting local government boundaries, and that the creation of two additional seats in Surrey and Middlesex would result in those counties as a whole being over-represented. It remains to be seen what amendments in these circumstances the Opposition will be prepared to propose. The fear that the matter would end in a bargain between the two larger political parties was pertinently expressed by Mr Byers. There is, however, no reason why a series of Liberal amendments should not be allowed to add to the confusion. In the meantime the Government's second thoughts, inspired by Mr Dalton, have done nothing to increase the confidence of the public in its handling of constitutional questions. This has already received a sufficiently severe shock from the highly controversial proposals introduced into the Bill such as the abolition of the university seats and the representation of the City of London.

* * *

The Motor Spirit Bill

At first sight, the Motor Spirit (Regulation) Bill looks like a cheap price to pay for the ninety-miles-a-month basic ration. It should do its job. The unscrupulous garage owner cannot regard the results of conviction as a normal trade risk when those results include a year's closure of his business; nor can the peccant motorist write them down as part of his motoring overheads when faced with the loss of his driving licence and the immobilisation of his car.

The Bill is, nevertheless, a depressing index of popular and legislative ethics. The Gilbertian elegance of the penalty in kind masks the grossest discrepancies of effect; a minor inconvenience to the erring pleasure-motorist may be a professional death sentence to the “E” driver—and neither in fact to incur these results need have been guilty of more than carelessness. The provision that the mere presence of commercial petrol in a private car shall constitute proof of guilt runs clean counter to the most honoured principle of British law. A citizen in whose house a corpse is discovered certainly has to answer questions by the police; he does not automatically find himself in the dock, which is where the *corpus delicti* in the tank places the car owner. He can plead that he took reasonable precautions; but what precautions are “reasonable”? The right of entry of the police to all premises not used as dwelling-houses extends a decidedly repugnant practice; and is a private garage, not physically attached to its owner's house, part of the “premises” in question, and so immune, or not?

In general, there is something more than repugnant about the imposing of heavy penalties, including prison sentences of up to two years, for merely economic offences; for actions, that is, which, but for the fact that they clash with the intentions of a planning authority would be perfectly normal or morally unexceptionable. The assimilation of the purely economic offender to the ordinary criminal is an unmistakable hallmark of the police state; and this Bill is best regarded as part of the price, not of the basic ration, but of the determination to direct every part of the national economy by brute force against the pull of the normal price system. The blind economic forces of the old regime had their demerits; but they did not, at least, make a variation in the chemical content of petrol a more heavily punishable offence than drunken driving or cruelty to children.

* * *

Oil and the Palestine War

It has always been clear that, as soon as the Palestine war entailed a fight over Haifa, the oil supply that passes through that port must dry up. This development was inevitable for two reasons. Firstly, the source of the oil is Arab; it comes by pipe from Iraq, and the international company that extracts and pumps it could scarcely continue to dispatch its product to a terminal that might at any moment service Jewish forces exclusively. Secondly, the labour that works both the pipe-line and its terminal, as well as the British-owned Haifa refinery, is partly Jewish, partly Arab. It cannot be kept at work harmoniously while fighting proceeds in the vicinity. The refinery was temporarily shut earlier this year on account of Jewish-Arab disturbances (see *The Economist* of February 21st, p. 310), but was miraculously set to work again. On April 13th it closed once more. This time pumping from Iraq has had to stop. When work will start again no one can say.

The output of the Haifa refinery is about 4,000,000 tons per annum. This figure was made up in 1947 of some 2,200,000 tons of fuel oil, 700,000 tons of gas oil, 650,000 tons of motor spirit and 350,000 tons of kerosene. Some idea of its importance is

given by the fact that the British Economic Survey for 1948 estimated United Kingdom consumption of fuel oil at 3,500,000 tons per annum at the end of 1947 and total British consumption of all petroleum products for 1947 at 16 million tons.

The destination of the Haifa oil is interesting. More than half of it was consumed on the Mediterranean shore of the Middle East, principally in Palestine and Egypt. In 1947 Palestine alone absorbed 690,000 tons; Egypt consumed over 800,000 tons and the balance of the 1,400,000 tons consumed in the Levant was absorbed by Syria, Turkey and Cyprus.

Europe (principally Greece drawing on American account) took 900,000 tons, of which 200,000 tons went to the United Kingdom. North Africa absorbed 225,000 tons, and 500,000 tons were locally supplied to shipping from bunkers. Except for small refineries at Tripoli (Lebanon) and in Egypt, neither of which meets home consumption, there is no alternative eastern Mediterranean refinery available. At a moment, therefore, when the world is particularly short of refinery plant, a large and valuable unit is put out of commission and a large additional group of consumers must be fed from elsewhere. The situation is all the worse for Britain in that the Haifa output is largely (though not entirely) a sterling area source of supply.

So far as Palestine is concerned, the closing of the refinery means that military transport, factories, agricultural machines and the many household cooks who depended on kerosene must henceforth run on stocks, which are scanty. In view of the refinery position there are no alternative sources of supply save tanker-running for the Jews, and Lebanese self-sacrifice for the Arabs. Lack of fuel may work more effectively than anything else to determine the shape and course of the Palestine war.

Prodigal Son of the Pacific

An article from an American correspondent in *The Economist* of April 24th showed how far the pendulum has now swung in America away from the days of Morgenthau fantasy, not only as regards Germany, but also, and even more, in relation to Japan. With the feeding of the Japanese people a burden on the American taxpayer and the thunderclouds of Communism lowering over eastern Asia, there is a will to let Pearl Harbours be byones and forget the time when Main Street's dearest wish was to "gut the heart of Japan with fire."

A report on Japanese industry signed by Mr Hoffman, now appointed to administer Marshall aid in Europe, and endorsed by Mr Draper, Under-Secretary for the Army in President Truman's Administration, virtually does away with the prospect of reparations from Japan, beyond the small deliveries which have already taken place. It looks forward instead to the restoration of Japan as the "workshop of Asia." Japan, it is held, "needs more, rather than less, productive capacity than she now has," and even the idea of drastic restriction of Japan's mercantile marine has been discarded. It is clear that American experts who have recently visited Japan have been impressed not only by Japanese business and technical capacity, but also by the docility of the Japanese under American supervision, in contrast to the political disorder and economic unproductiveness characteristic of other parts of the Asiatic scene. The present American tendency is to ask what a country can now do for itself and for the United States, not what it might do in other circumstances, nor yet what it deserves.

It is not to be expected, however, that the killing of the fatted calf for the prodigal son will evoke any more enthusiasm in his virtuous brother than it did in the scriptural parable. Australians and Chinese, who have borne the burden and heat of the day in the war imposed by Japanese aggression, naturally take a dim view of Washington's new policy and ask how Japan is going to behave once it gets back its industrial strength. The United States Government ought not to disregard the opinions and feelings of its former allies in the Pacific war and should explain to them in good time what measures it proposes to take in future to ensure that Japan's revived economic power will not develop into a dangerous new war-making capacity. There is plenty of good sense in the current American plans for enabling the Japanese to become a solvent, productive community instead of a degraded pauper among the nations. But in Canberra, Nanking and Manila their conversion to innocence requires to be demonstrated more convincingly than it is by the optimistic hand-outs from General MacArthur's headquarters.

New Vice-President for China

There was nothing unexpected in the re-election of General Chiang Kai-shek as President of China by the National Assembly sitting in Nanking. Even though, as a matter of form, he had announced his intention not to seek re-election and even though one rival candidate was put up and received about a tenth of the votes cast, it was clear enough that he could not be displaced in the present critical state of China without a fatal split in the Nanking regime. But for the Vice-Presidency there was no such obvious candidate, and for this office a real contest has taken place which may turn out to be of considerable political significance. From among six nominations the electors chose General Li Tsung-jen, who was supported by those elements most insistent on administrative reform in Nanking. His reputation as a practical reformer is based on his record in Kwangsi province; it remains to be seen what he can accomplish in the central government. But at least the reform party has shown its strength in opposition to the Kuomintang party bosses, and its initial success must have caused a flutter in the dove-cotes of corruption.

The National Assembly has granted emergency powers to the Government for the waging of the war against the Communists. But it has shown a measure of independence and initiative, especially where matters affecting China's international position have come up for discussion. In demanding a conference for a peace treaty with Japan with veto rights for the Four Powers it has set itself in direct opposition to American policy, which is unwilling to admit any veto right in the making of the Japanese treaty. The Government is also urged to announce the restoration of the Luchu Islands to China, though such a course could only be embarrassing to the United States. On the other hand, this recalcitrance towards Washington does not imply any approach to Moscow, for the Assembly demands that, if Russia does not return to China the industrial plant looted from Manchuria, the case should be brought before Uno. China is indeed attending vigorously to Chinese national interests, even though the Government's jurisdiction is disputed by force not many miles from the capital.

Liberals in Conference

The Liberal Party Assembly at Blackpool last week certainly showed a vigorous diversity of opinions which gave rise to some animated discussions. European Federation was a case in point. A resolution in the same terms as the motion in the House of Commons recently supported by no fewer than 190 members of all parties, was carried by the conference, notwithstanding the objections raised by such influential members of the party as Lady Violet Bonham-Carter and Lord Samuel. Like other parties, the Liberal Party has its right and left wings, and at this conference the latter clearly gained the prevailing voice. A motion to abolish all rationing except that of food was decisively turned down, and a resolution deploring the measures taken by the Government for the compulsory direction of labour and the continuance in peace time of conscripted military service and demanding a reduction in the demand of the armed forces in both men and materials was carried, although the implications of such a proposal, at a time when the United States Government is trying to introduce conscription, were clearly pointed out by Lady Violet Bonham-Carter.

Even less happy was the passing of a resolution on compulsory co-ownership in industry, which roused the enthusiasm of the younger members of the party. Under this scheme, every industrial concern with a capital of not less than £50,000 and/or not less than 50 employees would be required to submit to a specially constituted commission an arrangement whereby, after provision has been made for maintenance and reserves and the payment of a non-cumulative return at gilt-edged rate on the ordinary share capital, the surplus profits would be apportioned between the employees and the ordinary shareholders. Workers would also be entitled to elected representation on the board of directors. This scheme is supposed to represent the Liberal Party's alternative to public ownership, but the element of compulsion, which extends far beyond any project yet put forward by the Socialist Party, makes it a little difficult to take this manifestation of Liberal principles at all seriously—quite apart from the obvious practical difficulties involved. Co-partnership in industry may be an excellent thing which needs political encouragement, but compulsory co-ownership, without any obligation of the "co-owners" to contribute any capital to the under-

taking, is an entirely different matter, which is certainly bad Liberalism and would be likely to prove disastrous economics.

The conference was on much sounder ground in its affirmation of Liberal principles on the matter of trade unionism, both as regards restrictive practices and the closed shop, and the return to the principle of "contracting-in" on the political levy. The unfair advantage which the Labour Party has enjoyed in this matter is more than ever an anomaly now that the party is in power, and the reintroduction of real freedom of choice would go far to redress the class bias of the trade union movement, though precisely for that reason it will be fought tooth and nail. Mr Clement Davies in his speech promised a programme of Liberal policy in the form of "a short comprehensive statement of the party's policy on each of the questions which immediately confront the country." It will be interesting to see how that programme will compare with the rather irresponsible manifestos of the Blackpool assembly.

A Higher Housing Target

Mr Bevan announced last weekend that the Government were already revising the housing programme for next year, and that it was going to be substantially more than the 140,000 houses announced in the House of Commons some little time ago. The reasons for this change were not given, but it cannot be due to any improvements in the country's ability to buy timber. Timber shortage was the reason given last autumn for the cuts in the housing programme, and in spite of the contributions from ERP, dollars for this purpose must be almost as short as ever. The real reason must, therefore, either be political—that the builders' unions will not consent to so drastic a thinning of their ranks, and the local authorities will not restrain their house-hungry electorates; or administrative, because the cuts in the programme were too sudden and severe to keep the industry in running order.

Both forces have probably been at work. Owing to the smoke-screen behind which the adjustments in the housing programme were made last year very few people understood what was happening. Only as the effect of the cuts resulted in the refusal of contracts and the unemployment of building workers has their significance been realised. To judge by the comments at a conference of local authorities at the Housing Centre last week, very few understand the economic and financial duress under which the cuts were made, and are, therefore, strongly critical of the present policy. The reaction from the unions is probably still more violent.

There is good reason for thinking that the administrative arguments have been important also. The initial cuts designed to reduce the numbers of houses to be completed in 1948 to 140,000 were so great that there has been acute anxiety about keeping any smooth flow of building work going. The effect of these cuts was aggravated by the pressure to get schemes for permanent prefabricated houses approved before the expiry of the subsidy in December, 1947. As the result, schemes for traditionally built pre-houses gave way temporarily before those for permanent prefabricated houses, and the demands upon the building industry proper were still further reduced. To meet this difficulty it had already been decided to increase the programme to 180,000 houses. It may be that Mr Bevan is only giving ministerial blessing to a change of policy which has already been in operation for some weeks. At any rate he is now optimistic enough to expect 200,000 houses to be completed this year and to break the back of the housing shortage by the next General Election.

How Many Welsh Counties?

The Local Government Boundary Commission, whose scheme of reform for England was discussed in the issue of April 17th, has also put forward for discussion several alternative ways of redrawing the administrative map of Wales. In any event, the industrial county of Glamorgan would be left much as at present, with the present county borough of Cardiff (and possibly Swansea as well) retaining their all-purpose character as "one-tier counties." But all the rest of Wales, outside Glamorgan, presents a particularly difficult problem. Its total population is under 1,000,000, with a density of only one person to 4½ acres, and with no towns of even moderate size. None of its eleven counties come up to the minimum population (200,000)—few come anywhere near it—which the Commission considers to be generally desirable for a major unit of local government, and

especially so where financial resources, as in Wales, are scanty.

The Commission therefore suggests alternative ways of grouping the eleven counties into larger administrative units. The simplest way would be to reduce Wales to two counties—a North and a South, but each would cover a vast and difficult terrain. Alternatively, the more populous North might be divided, making three counties in all. Perhaps the best alternative, however, is the suggested division into four new counties, which would comprise a North-west Wales (Anglesey, Carnarvon, Merioneth) corresponding to ancient Gwynedd, a South-west Wales (Cardigan, Carmarthen, Pembroke) corresponding broadly to ancient Dyfed, a convenient union of Denbigh with Flint, and a grouping of the three central counties of Brecknock, Montgomery, and Radnor

which would have some similarity to ancient Powys. The first three of these new units would be reasonably satisfactory from most points of view; but the fourth, despite its large size and very difficult communications, would have a population of only 117,000 and a rateable value of only £654,000. Although the suggestion sounds heretical, it seems likely that the only effective remedy for the depopulated border counties of central Wales would lie in their union with English counties, thus helping to solve a difficult administrative problem on both sides of the Border. If this adjustment could be made by a triumph of reason over sentiment, then the remaining part of this particular plan represents as good a reform of Welsh local government as can easily be imagined.

London Traffic Congestion

London's traffic problems are so serious that yet another attempt is now being made to solve them. A survey, announced this week, is to be made to discover the distribution of traffic converging on inner London. The new scheme follows quickly on the recent reports to the Minister on peak-hour traffic made by fourteen Local Transport Group Committees. The London octopus is so gorged that it can no longer move. Train follows on train and bus on bus and yet the queues on the pavements still jostle and the platforms seethe. To travel from Tottenham Court Road to Liverpool Street is to feel that man is lower than the beasts. Between the hours of 8.30 and 9.30 a.m. and 5 and 6 p.m. no further transport facilities can relieve the strain.

The short-term remedy which has so far been adopted by the Ministry has been to persuade employers to stagger hours. This policy has met with considerable success, and at the end of a year's work 94,000 persons out of the 500,000 who travel in the peak periods had had their hours of work staggered. As, however, during the same period the number of insured workers in the Central London area increased by 100,000, much of the benefit was absorbed. Continued efforts are now being made to increase the number of firms working either earlier or later and adjustments covering another 56,000 people are being considered. But the committees evidently do not hope to solve the problem this way. The wide acceptance of the five-day week in industry with the 44 hours spread over a shorter week has resulted in the

release of more workers between 5 and 6 p.m. The habit, formed in wartime of closing shops earlier—now 5.30 p.m.—means that floods of shop girls and shoppers emerge during, instead of just after, the peak period.

As one way of easing the difficulty it has been suggested that something approaching nearer to the prewar arrangements for "an evening in town" should be restored: that restaurants should stay open longer, and that theatres and cinemas should start later, so that more people are tempted to delay their return home. Discussions with West End managers have been continuing to this effect. This attitude on the part of the transport authorities completely exposes the excuses made by the caterers and entertainers that it was transport difficulties which brought restaurants to a standstill and plunged the theatres into darkness at 9 p.m. The real villain is the postwar convention that no one shall work outside the normal daylight hours, that no letters shall be collected after 6.30 p.m., that no cleaning shall be done before 9 a.m. and that society can be efficiently run on the basis of a five-day week without shifts.

Dollars for the Colonies

One of the many problems to be considered by the Organisation for European Economic Co-operation is the proportion of Marshall dollars that should be set aside for the colonies and dependencies of Britain, Holland, France, Belgium and Portugal. The Foreign Assistance Act defines a receiving country as including "dependent areas under its administration," and it should, therefore, be safe to assume that America intends to promote the development of the colonies as well as the recovery of Europe. But, until Mr Hoffman announces exact details of how he intends to administer Marshall aid, the powers of the OEEC to make specific allocations to the colonies must remain uncertain. Judging from the precedent of Lend-Lease, however, and guessing at the sort of machinery which will have to be used, the prospects of direct benefit to the British colonies from Marshall aid are poor.

Indeed, from Britain's point of view, such direct assistance might well prove more embarrassing than helpful. For, under

Lend-Lease, the variety and smallness of the colonies' needs made almost impossible the bulk buying which was necessary. The colonies tended to be forgotten altogether, and it has been estimated that they were left about two years behind hand with their orders. The same might happen again. At present British colonies draw what dollars they need from the sterling area dollar pool. Moreover, taken all together, they are net dollar earners. If they were to be directly involved in the ERP machinery, each of the fifty odd colonies would probably have to have its own purchasing mission and its own dollar equivalent fund. Considering, too, the small and specialised quantities of goods in which they would be dealing, it is easy to imagine the administrative chaos which would result. While they obviously need more dollars than they are getting, they benefit more under the present system than they are likely to do if they have instead to queue up for a share allotted to them by Mr Hoffman or the OEEC.

But to omit from ERP any specific allocation to the colonies does not mean that their claims should be neglected. The International Bank exists to provide loans precisely for the sort of capital expenditure they need. It should also be possible for the British Government to allow them greater latitude than they have at present in drawing dollars from the sterling area pool. The greatly increased production of rubber and tin in Malaya and the higher prices which the Gold Coast is now getting for its cocoa should provide a big net dollar surplus from colonial trade this year. It would be good business as well as fair dealing if more of that surplus were ploughed back than has hitherto been permitted.

But it would be bad business to throw good money after bad. Much more care must be taken in weighing up the relative merits of the opportunities offered in each of the colonies. For the moment, quick returns are more important than long-term projects which may not mature for many years. It is better for instance to improve the tin mines in Malaya than to open up new industries in Uganda. There are signs that the British Government is now adopting this principle. The objective should be to combine, within the limits set by the resources available, the encouragement of going concerns with pioneer work on new, long-term projects.

Letters to the Editor

D-Day for Western Union

SIR,—The article in your issue of April 24th calling for clarity appears to me to darken counsel instead—unusual in the case of an article in *The Economist*.
